Zooming Text

TUTORIAL

Screenshot of the Frames you will create in this tutorial:

This is a 1 layer effect (At least for now)

1. Start by writing out the word (or object) you want to make zoom in Frame #1.
2. Now select it and make it a symbol (F8).
3. Create 2 key frames (select the frame and hit F6) at Frame #20 and Frame #40.
4. At keyframe 20 select the symbol and Scale it with the Control + Alt + S command - Scale it up to 500% (Leave Key frames 1 and 40 the same).
5. Double click Frame #1 and add Motion Tweening and do the same for Frame #20.
6. Test your movie.

Done :)

Notes and other tweaking

You can get really wild with this effect

You can play around with different kinds of motion tweening - like spinning clockwise in frame 1 and counterclockwise in frame 20, and moving the start and end points of the symbol (I have enclosed another FLA as an example) What I mean is in frame 1, 20 and 40 move where the symbol is - just remember the middle frame is going to be scaled
