# EDITOR'S NOTE

Governments have been countering the threat of terrorism and insurgency since the establishment of the Westphalia system of nation-states. However, the rapid evolution of science and technology over the past 100 years—from the invention of dynamite to commercial air travel and the Internet—has enabled new forms of terrorist and insurgent activity. It is thus likely that further technological advances over the next 100 years will yield similar results, as today's terrorist and insurgent groups have proven to be adaptable, learning organizations. This three-volume set, *Countering Terrorism and Insurgency in the 21st Century*, seeks to encourage the development of learning organizations among national security professionals by examining what we currently know about the strategic application of hard and soft power in countering the sources and facilitators of terrorism. As a collection, the thematic essays and focused case studies represent an ambitious effort to capture existing knowledge in the field of counterterrorism and counterinsurgency, and draw lessons (from successes as well as failures) that will inform new, adaptable strategies to counter the new threats that—judging from historical trends—will no doubt emerge over the next century.

At the outset, it is necessary to address why this publication covers both terrorism and insurgency, as there is confusion about these terms among many in the academic, media, and policymaking communities. In some countries that have faced the threat of violence for many years—including Colombia, Ireland, Spain, Sri Lanka, and Turkey—societies have grappled with additional terms like "paramilitaries" and "freedom fighters," but the general view reflected throughout the chapters of this publication is that all groups or individuals (including insurgents) who engage in the act of terrorism can be considered terrorists. In essence, the act of terrorism defines its perpetrator as a terrorist, regardless of the ideological motivation behind such acts.

According to the U.S. Department of Defense, terrorism is defined as "the calculated use of violence or threat of violence to inculcate fear; intended to coerce or to intimidate governments or societies in the pursuit

of goals that are generally political, religious or ideological," while insurgency is defined as "an organized resistance movement that uses subversion, sabotage, and armed conflict to achieve its aims.... [and which] seek to overthrow the existing social order and reallocate power within the country." In teaching my classes on these topics to future U.S. Army officers at West Point, the distinction I make is that insurgents can and do use terrorism (among other forms of violence), but insurgents are but one type of violent nonstate actors who may choose to use terrorism. In other words, not all insurgents use terrorism, and not all terrorists are part of an insurgency. Further, while the use of violence by insurgents to target governments is driven by a particular ideology, terrorists use violence against a range of targets (including governments) to advance their ideology.

While such distinctions may seem academic to most readers, they are actually quite important when formulating strategic, tactical, and policy responses to the threat posed by terrorism and insurgencies. As described in Volume 1 of this publication, strategies and tactics for countering insurgency are an important aspect of our knowledge base on countering terrorism, and vice versa. In both cases, experts have emphasized that the use of force to counter an organization whose objectives resonate with a larger disaffected population yields limited (if any) success. Instead, it is argued, the ideology, political, and socioeconomic aspects of an organization—through which it derives its financial support, recruits, and sympathizers from amongst the local population—must be addressed. In other words, the use of hard power in countering terrorism (including insurgencies that employ terrorist tactics) must be complemented by elements of soft power.

The link between counterinsurgency and counterterrorism is also informed by recent analyses which suggest that the al Qaeda movement can be described as a global insurgency, seeking to replace the existing Westphalia-based system of nation-states with a global caliphate in which Islamic law reigns supreme. Recent terror attacks in Bali, Madrid, London, and Cairo, as well as disrupted terror plots in Denmark, the Netherlands, and the United Kingdom, are all seen as examples of how individuals and groups around the world have been inspired by al Qaeda's ideology to commit violence as part of a strategy to change the policy and behavior of these nation-states. In other words, it is argued, al Qaeda uses terrorism tactically and operationally to advance its global insurgent strategy. When described in these terms, the U.S.-led global effort against al Qaeda can be considered to be fighting both terrorism and insurgency. Thus, *Countering Terrorism and Insurgency in the 21st Century* addresses the many challenges that stem from both types of threats to our security.

Another source of confusion in the study of terrorism and insurgency involves disagreement over the proper spelling of certain groups (or, rather, the spelling of the transliteration from the original language into English). For example, a brief survey of the literature reveals that a certain Lebanese militant group can be spelled Hizballah, Hezbollah, Hizbullah,

Hezballah, and Hizbollah. For these volumes, we have standardized the spelling of certain common names across all the chapters, such as al Qaeda (because this is how several agencies of the U.S. government are now spelling it), Hizbollah (because this is how the group spells it on their English language Web site), and Osama bin Laden (rather than Usama). Finally, it is important to note that while many chapters discuss aspects of the "global war on terrorism (GWOT)," we recognize that this term has fallen out of favor among many in the academic and policy communities. However, there currently is a worldwide effort to reduce the capabilities of globally networked terror movements like al Qaeda, and in the absence of an equally useful short-hand reference for this effort, GWOT serves an important role.

At this point in the development of the global counterterrorism effort, it is particularly important to pause for reflection on a number of critical questions. What do we know about effectively countering terrorism and insurgencies? What are the characteristics of successful or unsuccessful counterterrorism and counterinsurgency campaigns? What do we need to learn in order to do these things more effectively? *Countering Terrorism and Insurgency in the 21st Century* addresses these and related questions, and in doing so contributes to national security policy as well as to our understanding of the common threat and how it can be defeated. Chapters of this publication address many different aspects of the unconventional warfare puzzle, examining the most important diplomatic, information, military/law enforcement, and economic/financial dimensions to regional and global cooperation in countering terrorism and insurgency, and providing specific examples of these dimensions in practice.

Authors in the first volume address issues of important strategic and tactical concern, organized around the primary instruments of power through which nations pursue their counterterrorism and counterinsurgency efforts. These instruments can generally be described as either hard power (the use of force by military and law enforcement) or soft power (including diplomacy, information, and intelligence). The second volume provides a variety of insights on how to assess and combat the sources and facilitators of political violence, including state sponsors of terror, authoritarian regimes, criminal network activity, border insecurity, and the global struggle for influence among societies. As highlighted by several authors in this volume, the community of responsibly governed democracies faces uniquely complex challenges in combating terrorism and insurgencies while maintaining civil freedoms. And contributors to the third volume offer in-depth analyses of historical events and lessons learned in counterterrorism and counterinsurgency. Each volume contains a preface and introductory chapter, describing the contributed essays and providing an intellectual background for the discussions that follow.

This project is the final installment of an ambitious trilogy published by Praeger Security International. The first of these—the three-volume *The Making of a Terrorist: Recruitment, Training and Root Causes* (published in 2005)—intends to help readers understand the nature of the threat by exploring what transforms an ordinary individual into a terrorist. This was followed by the three-volume *Homeland Security: Protecting America's Targets* (published in 2006), which explored the ongoing efforts in the United States to secure our borders and ports of entry, and to protect our public spaces and critical infrastructure from future terror attacks. The volumes of *Countering Terrorism and Insurgency in the 21st Century* complement these earlier publications by focusing our attention on the broad, worldwide effort to actively confront those who threaten or use political violence against our communities. Together, these nine volumes are meant to provide a central, authoritative resource for students, teachers, policymakers, journalists, and the general public, as well as stimulate new ideas for research and analysis.

# PREFACE

The chapters of this first volume of *Countering Terrorism and Insurgency in the 21st Century* advance our understanding of national security strategy challenges, as well as raise important questions and issues for further research. Fighting terrorists and insurgents effectively requires a variety of strategies and tactics, and their success or failure is largely dependent on context. After an introductory chapter, the volume addresses the use of hard power, soft power, and intelligence, and the strategies that guide these efforts.

## PART I: STRATEGIC AND POLICY DIMENSIONS

The first section of the volume begins with a thoughtful examination of strategy and grand strategy by Brad Bowman, a U.S. Army officer and a faculty member at the U.S. Military Academy at West Point. He argues that the current U.S. grand strategy overrelies on military operations, misidentifies the nature of the conflict with al Qaeda, ignores the struggle's true "center of gravity," and neglects major sources of radicalization. After defining the terms "grand strategy" and "strategy," Bowman describes their theoretical and practical relationship to one another, and suggests that strategy—which is essentially military operations—often usurps the nation's grand strategy and political interests. He then explores the nature of the current conflict with al Qaeda, arguing that a misdiagnosis of the nature of the struggle has encouraged the United States to neglect the central role of Muslim popular opinion. He concludes by offering a set of strategic recommendations for addressing sources of Muslim radicalization.

Next, Douglas Borer and Michael Freeman of the U.S. Naval Postgraduate School provide a thoughtful discussion of strategy and establish a framework for the analysis of U.S. performance in the global war on terrorism (GWOT). At its essence, they explain, strategy is an iterative or dynamic process, one that is shaped by a given context and defined by the relational environment between various actors. As such, a successful strategy in one situation will most likely be different than a successful

strategy in another. They note that while democracy and democratization is the primary strategy by which the United States has chosen to defeat the scourge of terrorism, military force has thus far proven inadequate for democratizing either Afghanistan or Iraq. Further, democracy is an inherently risky method for organizing U.S. grand strategy in the GWOT. It may be legitimate to the average American, but it is not likely to be effective or practical. Democratization has brought into elected governments organizations such as Hizbollah in Lebanon, and Hamas in Palestine, yet neither group has given up terror. Even though many might contest the notion that Iran is democratic, the government there is chosen by the people in hotly contested multiparty elections, yet Iran remains the single most important sponsor of terror in the world. Overall, it seems that democracy—rather than security—has become an end in itself. This unjustified faith in the deterministic power of democracy to produce peace has channeled U.S. strategy away from alternative approaches that might prove more effective.

The next chapter, by Leonard Weinberg and William Eubank of the University of Nevada, explores the impact of terrorism on the success or failure of armed insurgencies the United States is likely to encounter during the twenty-first century. They begin with a brief review of 50 years' worth of insurgency, and conclude that terrorism used in isolation from other types of violence and other forms of political activity rarely succeeds. However, when combined with other forms of armed struggle and an adroit political strategy, terrorist violence may become an important device in convincing foreign forces and foreign audiences that the costs of their continued involvement outweigh the potential benefits. They conclude with a few observations of the future. First, guerrilla warfare, as in Iraq, is likely to be an increasingly city-centered activity. Second, American forces should only be committed to armed conflicts in the Third World when a vital interest is clearly at stake, one that is clear not merely to key decision makers but also to the general public (whose members, after all, will be asked to absorb the costs involved). And finally, if there is an interest to be defended but not a vital one, and political means do not succeed, the United States and the other advanced democracies would appear to be better off cultivating proxies who, in turn, would be able to act as surrogates.

The next chapter explores the unique challenges of developing and implementing counterterrorism policy in a liberal democracy. Here, Jennifer Holmes of the University of Texas at Dallas observes the tension between an aggressive, preemptive investigative response to terrorism and a response that restricts government activity to safeguard individual liberties, and argues that the state needs to be strong enough to have a functioning judicial system, discourage the emergence of violence, mount a vigorous defense, and maintain citizen support. However, good

intelligence, effective coordination, and a competent police and judiciary cannot alone squash internal terrorism with a significant domestic source of support. In this case, the political realm of the conflict is extremely important. Moreover, being responsive to understandable grievances may increase the government's popular support and decrease overt and tacit support for terrorists. Overall, creating an effective intelligence community, increasing security, and maintaining principles of good governance are essential to democracies confronting terrorism. The greatest threat to progress is impatience, which increases the temptation to emphasize one aspect of a strategy in the short term. Lopsided efforts will not bring long-term success, she concludes, and may undermine the chances of a long-term, comprehensive peace.

Similar challenges are addressed in the next chapter—by Harvey Rishikof, a professor at the National War College—on the moral, ethical, and legal aspects of the Bush administration's current "global war on terrorism." He argues that waging a war against terrorism challenges conventional norms of national security operations, and requires the state to rethink the measures, practices, and instruments used to prosecute against the "tactic of terrorism." Projection of force, clandestine activities, law enforcement cooperation, diplomacy, and covert actions are part of the arsenal in the fight against terrorism, and thus individual soldiers, airmen, sailors, marines, special forces, and other government agents are forced to rethink what "moral, ethical, and legal" orders mean. But there are a number of controversial challenges for just war theory and international law that Rishikof raises in his chapter. For example, How does one deal with the issue of "targeting" terrorists? What is the process due to "unlawful" combatants in detention? What is torture and what is lawful coercive interrogation? Thoughtful responses to these important challenges will determine how history judges U.S. actions and success (or failure) in the global war on terrorism.

This discussion is followed by a chapter on the importance of interagency cooperation in combating suicide bombings. Authored by professor James Kiras at the School of Advanced Air and Space Studies, at Maxwell Air Force Base, the chapter calls for greater cooperation between agencies in developing and implementing potential solutions to suicide terrorism. The discussion begins by looking at the peculiar challenges that suicide bombing presents to those charged with preventing terrorism, and suggests that irregular adversaries will always seek to exploit systemic and other vulnerabilities in order to carry out their attacks successfully. On the basis of those challenges, Kiras argues that greater interagency cooperation can interdict or disrupt suicide bombing throughout its life cycle. The ultimate result of seamless cooperation ideally is the prevention of all future suicide bombing attacks. Sadly, this state of affairs will remain the ideal for some time, as the concluding section of this chapter suggests.

Thus potential reformers face a particularly troublesome choice: change the mechanisms (and consequently, the nature) of democratic government in order to improve efficiency and effectiveness, or accept marginal change that leaves exploitable vulnerabilities in place.

In the final chapter of this section on strategy and policy issues, Michael Kraft describes the U.S. government's counterterrorism research and development programs. Dozens of federal agencies are working to develop a wide variety of equipment and tools, and millions of dollars go into developing devices and methods to detect conventional explosives (as well as biological, chemical, and radiological weapons) before they can cause mass casualties. These initiatives are intended to save lives by either helping prevent terrorist attacks or minimizing the damage if they do take place. Kraft provides an overview of the development of the government's testing and evaluation programs, describes the major coordinating groups—particularly the interagency coordinating body, the Technical Support Working Group (TSWG)—and offers an illustrative sampling of some of the individual agency programs. He observes a need for research in new subject areas, such as detecting improvised explosive devices, as well as improvements in older systems, including airport X-ray machines and scanners. Further, the organizational framework for these initiatives has changed and continues to evolve, most markedly since the creation of the Department of Homeland Security (DHS), and there is a significant need for more effective coordination and working relationships between TSWG and DHS. Overall, the chapters of this section provide an interesting review of important strategic and policy challenges for countering terrorism in the twenty-first century.

## PART II: HARD POWER

The next section of the volume explores the use of so-called kinetic or hard power in combating terrorists and insurgents. The first chapter of this section examines the specific role of junior officers in contemporary military engagements. Here, Amos Guiora of the Case Western University School of Law and Martha Minow of Harvard University explain that when considering the training and preparation of junior military leaders for fighting terrorism and insurgency, there are three areas in which improvements can be made: the use and gathering of intelligence, clear articulation of the mission, and awareness of legal responsibilities. In today's conflicts, special focus must be given to the needs of the junior leader—typically, it is the platoon leader and his noncommissioned officers (NCOs) who are charged with translating mission and strategy into tactics. Based on lessons learned from the Israeli experiences with countering terrorism, this chapter reveals that more can be done to prepare our junior leaders adequately for their missions. A focus on counterterrorism

puts into stark relief the kinds of real-time and accessible intelligence, advanced training in law, and clear articulation of mission that junior leaders demand.

The next chapter, by James Carafano of The Heritage Foundation and Alane Kochems of CENTRA Technologies, addresses the role of private contractors in assisting militaries and civilian government agencies throughout the world in such areas as planning, training, logistics, and security. Employing contractors in the war on terror, or for that matter any national security purpose, has both distinct advantages and disadvantages. Military contractors are seen as having inherent advantages over militaries with regard to cost, flexibility, and responsiveness. Relying on military contractors, though, does have its share of risks, including safety and liability issues, performance, force management, compliance with international and domestic laws, and lost resources because a capability is outsourced rather than retained. With this increase in contractor use and the advent of privatized military firms (PMFs), the question is now how to determine the right mix of forces to most effectively and efficiently complete a task or mission. In some cases, military contractors may be the best choice; however, they are not the perfect fit for every mission or the right solution for all skill or manpower shortages. Instead, governments should assess the risks of employing various options and then choose the best one. They conclude that government agencies should adopt comprehensive guidelines for making these decisions on the role of private military firms using a risk-based approach.

Next, Steven Marks, Thomas Meer, and Matthew Nilson—three U.S. military officers—describe a manhunting process based on law enforcement investigative methods, which can aid military forces in the hunt for terrorist fugitives in places like Afghanistan and Iraq. They begin by noting that commonalities exist among all types of manhunting, whether the hunter is pursuing a common criminal, international fugitive, or a terrorist. Then they describe methods that have yielded success for U.S. Marshals in hunting fugitives. Fugitives typically engage in "risk management" strategies, trying to reduce the risk of being captured, based on four criteria: familiarity, survivability, safety, and vulnerability. They will try to minimize their level of risk by relocating to suitable areas with access to food and water, or at least areas that are favorable for survival. In tracking fugitives, the most important aspect in investigative work is identifying and analyzing the nature and depth of relationships with friends, family members, and business associates. The authors then describe a five-step manhunting process: (1) conduct an initial background investigation via research; (2) build a social profile; (3) identify the support network; (4) analyze the hunter's constraints and limitations; (5) and conduct analysis of competing hypotheses. This manhunting process is iterative and structures the problem so as to remove certain biases from the search operation.

This analytical process provides better resolution as to the fugitive's possible locations by limiting pre-established beliefs about the fugitive's behavior or hiding location.

In the next chapter, U.S. Army officer Richard Hughbank provides an analysis of law enforcement challenges in confronting terrorist cells in the United States. He begins by describing how both domestic and international terrorist organizations employ guerrilla warfare tactics, techniques, and procedures. Terrorism, by its nature, seeks out and exploits its opponents' weaknesses. Thus, the ability to identify and defeat the members of these organizations, cripple their infrastructure, and disrupt their financial resources lies in an understanding of modern guerrilla warfare as it develops in the twenty-first century within the United States. Terrorist operations have become more prevalent in the United States and are creating new challenges for federal, state, and local law enforcement agencies. After reviewing the origin and nature of these challenges, this chapter offers some suggestions for countering guerilla warfare in twenty-first-century America.

The final chapter of this section, by Peter Spagnolo and Chadd Harbaugh of the Government Training Institute in Boise, Idaho, highlights the role of SWAT (an acronym which originally stood for Special Weapons Assault Team, but over the years has changed to the universally accepted Special Weapons and Tactics) in countering terrorism in America's communities. Nationwide, the focus for SWAT took a new direction on September 11, 2001; while the SWAT team has been the unit called in when specialized equipment and unconventional tactics are needed in situations such as hostage takings, barricaded armed criminals, and high-risk search warrants and arrests, their mission is again evolving, with SWAT teams becoming the first line of defense in the face of an armed ground assault on a target within the United States. One of the reasons for the change in direction is the fact that the terrorist is generally far better armed and trained than other types of criminals, and more likely to fight it out with the authorities. This chapter describes how the Department of Homeland Security has recently made it easier for law enforcement agencies to train their officers in critical areas of counterterrorism, antiterrorism, and SWAT tactics and techniques, and is working to bolster this vital counterterrorism organization in communities throughout the United States.

## PART III: SOFT POWER

The next section of the volume explores the use of so-called "soft power" in the fight against terrorism. The first chapter of this section—coauthored by Robert Pauly, Jr., of the University of Southern Mississippi and U.S. Army Special Forces officer Robert Redding—demonstrates how the use of civil military operations and confidence-building measures among villagers at the local level can assist the United States and its

domestic allies in minimizing support for al Qaeda and its affiliates in a given state under reconstruction. There are many examples across the world that demonstrate the growing role of U.S. military special forces (active duty and reserve units alike) in micro-level civil military operations designed to achieve progress in the GWOT one village or town at a time, in places ranging geographically from Iraq and Yemen to Mongolia and the Philippines. This chapter examines these types of operations and the grand strategy upon which they are based. The first part of their discussion provides a conceptual overview of the use of civil military operations to achieve strategic objectives. This is followed by an analysis of civil military operations in the context of the GWOT in particular. The third section examines case studies of U.S.-led civil military operations in Afghanistan, Iraq, and the Philippines, followed by an examination of the insights that U.S. policymakers should draw from these case studies. The concluding section provides some observations on the prospects for the future of the use of civil military operations by the United States and its allies.

Next, Professor Jim Robbins of the National Defense University examines the so-called War of Ideas concept. He notes that the battlefronts in the war of ideas are not the only ways in which the civilized nations may confront terrorist ideology, nor is confrontation on the ideological plane alone a sufficient means of defeating the threat posed by armed extremism. Furthermore, it would be a mistake to believe that ideas cannot be suppressed using force. The terrorists in particular know this to be the case, and it has been demonstrated when proponents of their ideology take power. For example, an Afghani liberal reformer who lived under the Taliban regime would be at great risk of life and limb were he to have spoken out. Overall, Robbins argues, the War of Ideas is an important supporting aspect of the overall war on terrorism, but cannot replace nor is more important than the efforts of the military, intelligence community, and other agencies in disrupting and defeating terrorism.

The role of ideas and ideologies is also addressed in the next chapter, by Maha Azzam of Chatham House, London. She examines the unique histories of Egypt and Saudi Arabia in countering radical Islamic terrorism, with particular focus on the core thinkers who shaped the militant ideology that has fueled violent group recruitment and attacks. In looking at how a state in the Middle East has dealt with the problem of terrorism, it is imperative to examine the way in which the revolutionary theory of the radical Islamists was countered and to a large degree discredited by the establishment. Finally, her chapter also explores the main issues that form the core of public disaffection in the region. Radical Islamist terrorism has occurred because of a confluence of a new revolutionary theory combined with widespread public disaffection toward the state. The problem the state faces is that it may be able to physically suppress these groups; it may, more fundamentally, counter and discredit their ideology. But so

long as these issues remain unresolved, she argues, the region will remain unstable and the wider populations will continue to provide a pool from which new radicals might evolve.

The discussion of ideas and ideologies is extended further by Bruce Gregory of the Public Diplomacy Institute in Washington, DC, whose chapter provides a brief historical overview of public diplomacy and strategic communication in American foreign policy. He then describes how the Bush administration has until recently failed to demonstrate a sustained commitment to public diplomacy or give it a prominent role in the struggle against terrorism. Five years after 9/11, U.S. political leaders have just begun to recognize the need for change. Experts in the academic and private sectors, meanwhile, have all agreed: public diplomacy is vital to national security; it is broken and strategic level change is needed. A flurry of reports have been commissioned, and the appointment of Karen Hughes as the Undersecretary of State for Public Diplomacy and Public Affairs (a position that was filled by a Senate-confirmed appointee for only 18 months during the Bush administration's first $4^1/_2$ years in office) are promising signs of movement in a new direction. However, he notes, "transformational public diplomacy" requires political will and a presidential directive on strategic communication that is reinforced and made permanent with bipartisan congressional support and legislation. Finally, Gregory offers a set of recommendations for the future of America's public diplomacy and strategic communication efforts.

The next chapter of this section explores the role of the Internet in mobilizing new recruits for terrorist organizations. Timothy Thomas, of the U.S. Army's Foreign Military Studies Office, observes that the cyber mobilization capabilities (mobilization enabled by computer-chip-driven devices such as cell phones, the Internet, CDs, etc.) of these organizations are designed to conduct psychological warfare activities, to propagandize insurgent successes and counter coalition allegations, and to recruit, finance, and train more fighters. Thus, he argues, a "counter cyber mobilization" strategy should be developed in order to assist in controlling the environment. His chapter discusses the precedents to the current use of the Internet in Iraq and Afghanistan; the U.S. information operations (IO) paradigm problem and its extension into understanding the virtual aspect of an insurgency; the use of the Internet by insurgents in Iraq and Afghanistan; and coalition countermeasures to insurgent efforts. The chapter then concludes with some relevant recommendations for U.S. IO and counterinsurgency doctrine.

Finally, Jerrold Post—Director of the Political Psychology Program at the George Washington University and a former member of the Central Intelligence Agency—concludes this section on soft power with a chapter on the role of psychological operations in countering terrorism. Terrorism, he notes, is a vicious species of psychological warfare waged through the

media, "a war for hearts and minds." If one accepts this premise, then the war against terrorism will not be won with smart bombs and missiles. One does not counter psychological warfare with high-tech weapons; one counters it with psychological warfare. And in this so-called war for hearts and minds, tending to overly rely on our technological superiority, we have fallen far behind our terrorist adversary. In his chapter, four elements of an integrated information operations program designed to counter terrorism are presented. A fifth element of a comprehensive security strategy, promoting societal resilience, is also discussed. In addition to these five general elements, Post gives special attention to countering suicide terrorism and weapons of mass destruction.

## PART IV: INTELLIGENCE AND COUNTERINTELLIGENCE

The final section of the volume explores the crucial role that intelligence services play in countering terrorism and insurgency, and the challenges they face in "getting it right" 100 percent of the time. The section begins with a chapter by Jennifer Sims of Georgetown University, in which she examines the requirements and future challenges of the intelligence profession. She begins with a discussion of what history can tell us about the core features of past counterintelligence missions that have been successful against transnational groups. Sims then discusses the new features of the modern conflict that are changing the nature of the tradecraft needed to defeat terrorist organizations such as al Qaeda and associated groups. A key premise of her chapter is that one cannot evaluate an intelligence effort without identifying the nature of the competition, including the adversary and his strategy. This is because intelligence, at its core, is less about getting facts right or wrong than providing competitive advantages in foresight and situational awareness to decision makers. To some extent, she notes, the techniques that have worked in the past will remain important, including human intelligence from infiltration agents, all-source data fusion (phone intercepts and human agents, for example), and collaboration with law enforcement worldwide. The ability of the federal government to conduct double agent and deception operations should be improved and will necessarily have to be coordinated with overseas partners. Finally, she advocates for greater collaboration between the federal government and local agencies, intelligence liaison with foreign governments, and outreach to universities.

Tom Lansford of the University of Southern Mississippi furthers the discussion on multinational intelligence cooperation in his chapter. He notes that one of the most significant successes of the war on terror has been the substantial increase in intelligence cooperation between the United States and a range of countries and other international nonstate actors. Because of the dominant position of the United States in global antiterror efforts,

his chapter places the United States at the center of current international efforts in intelligence cooperation. No other state currently has the military and intelligence capabilities of the United States, which makes the world's remaining superpower integral to multinational counterterrorism efforts. Concurrently, however, the United States has deep deficiencies in certain areas, especially human intelligence. Thus, he argues, only through multilateral cooperation and collaboration can the capabilities of the United States and other states be harnessed to successfully prosecute the global campaign against terrorism.

Multinational intelligence cooperation is also the topic of the next chapter, by Magnus Norell of the Swedish Defense Research Agency, who provides a detailed analysis of the benefits and challenges of this from a European perspective. While there has been considerable discussion after 9/11 about what roles various national agencies should have (the police vs. the military, for example), within the EU it is still the police force who is identified as the "lead" agency in regard to counterterrorism operations, largely because both the Union and its members have preferred to see terrorism—conceptually and legally—as a form of serious and organized crime. Norell argues that the underlying premise for this state of affairs is flawed, and does not take into account the fact that other agencies might have knowledge—unbeknownst to the police, due to a lack of coordination and the flow of necessary intelligence—that can be of critical value to any counterterrorism operation. Moreover, the structures of the EU make it inherently difficult to overcome the limitations and bureaucratic obstacles that make intelligence coordination among several actors—that is, on a Union level—so difficult. The chapter argues that as long as certain structural flaws in the system remain, nothing fundamental will change in the way the EU is trying to deal with the issue of intelligence coordination concerning counterterrorism policy. He calls upon the EU to critically examine the underlying structures in the Union, identify a "lead" agency, and provide new resources, and concludes with some recommendations that can be of value in countering these flaws in the EU's structure.

Another comparative perspective on intelligence is provided in the chapter by Ami Pedahzur of the University of Texas and Arie Perliger of the University of Haifa, who draw lessons from the experiences of the Israeli Secret Services in countering terrorism over the last four decades. They note that the Israeli intelligence community failed to forecast the rise of Shiite terror in southern Lebanon in 1982 and the Palestinian uprising in the West Bank territories in 1987, among other events. In addition, despite the imaginative stories told of the long arm of the State of Israel able to reach terrorists all over the world, reality teaches that apart from some high-profile operations where relatively low-level terrorists or those already out of operational circles were captured or assassinated, the number of terrorists targeting Israel has only increased with the years, their

capabilities have improved, and the number of victims is immeasurably higher than in the past. In the end, the wide majority of special hostage-rescue operations have ended in partial or complete failure. In their chapter, Pedhazur and Perliger examine the gap between the aura of invincibility surrounding the Israeli intelligence community and the continual deterioration of the Israeli security situation. They first describe the challenges placed before intelligence organizations charged with coping with terrorism, and then analyze how the Israeli intelligence agencies operate under such conditions, and conclude with lessons to be learned from Israel's long history of struggle with terrorism.

Next, Orion Lewis of the University of Colorado and Erica Chenoweth of Harvard University examine the sometimes overlooked value of open source information for informing intelligence analysis. In particular, they note, many Washington insiders—including CIA analysts and 9/11 Commission members—have recently argued for an expansion of open source intelligence (OSINT) capabilities. Indeed, a unit at the CIA is now dedicated specifically to OSINT collection. While these activities are a step in the right direction, they argue, the government should further develop an organizational strategy in which academic and private professionals can supplement intelligence-gathering efforts. Their chapter offers new policy ideas to improve both the technical infrastructure of government communications as well as the organizational infrastructure of U.S. intelligence that allows the United States to prevent future terrorist attacks. They suggest applying the methods of open source production to the existing intelligence infrastructure, and nurturing a broad-based "national anti-terrorism intelligence forum" (or "virtual community of experts") who would supplement the process of intelligence gathering by incorporating the collective knowledge of the terrorism research community into the government's OSINT program. This approach would help to overcome budgetary and human resource constraints that plague current OSINT efforts, and presents a mutually beneficial arrangement that would benefit government, first responders, academia, and the broader public alike.

OSINT is also addressed in the next chapter, by Aaron Danis of the Nuclear Regulatory Commission—but from a much different perspective. He provides a unique analysis of al Qaeda's use of many sources of information (including the Internet) in gathering intelligence throughout the 1990s on potential targets worldwide, as part of a long-range plan to attack the United States, the West, and "apostate" Middle East regimes. He describes how al Qaeda surveilled targets in Europe, Africa, Indonesia, the Middle East, and America, and analyzes how successful it was in penetrating American homeland security. He also examines three key questions: "Could al Qaeda attempt to do this again? What would such an attempt look like? and How could U.S. intelligence, counterintelligence, and law

enforcement organizations defeat domestic terrorist surveillance and prevent an attack?" He concludes that a domestic countersurveillance center would be a good idea, though it would require the integration of domestic and foreign immigration expertise and databases, and information on daily immigration, among other elements. Based on the haphazard (and not always successful) bureaucratic counterterrorism efforts attempted by the U.S. government since 9/11, particularly the Terrorist Threat Integration Center-to-NCTC evolution, it remains to be seen whether the U.S. government can formulate a coherent and effective terrorist countersurveillance strategy and organization in the U.S. homeland.

The final chapter of this volume, by Joshua Sinai of The Analysis Corporation, offers a model that can be used by intelligence agencies to forecast the spectrum of warfare that a terrorist group is likely to conduct against a specific adversary. He suggests that to adequately assess the likelihood and magnitude of the types of threats posed by contemporary terrorism, three issues need to be addressed. First, threat assessments need to focus on three types of warfare that characterize this spectrum of terrorist operations: conventional low impact (CLI), conventional high impact (CHI), or chemical, biological, radiological, or nuclear (CBRN) warfare, also known as weapons of mass destruction (WMD). Second, one needs to focus on the characteristics of terrorist groups that shape and define the type of warfare that they are likely to employ to achieve their objectives, starting with the nature of their leadership, motivation, strategy, supporting constituencies, and other factors such as capabilities, accelerators, triggers, and hurdles that are likely to propel them to pursue CLI, CHI, or CBRN warfare (or a combination of the three). Third, we must focus our efforts on determining the disincentives and constraints that are likely (or not) to deter terrorist groups away from CBRN warfare, which is the most catastrophic (and difficult) form of potential warfare, particularly when these groups can resort to conventional explosives which have become increasingly more lethal and "catastrophic" in their impact. Analytically, therefore, terrorist groups currently operating on the international scene (or newly emergent ones) need to be viewed as potential CLI, CHI, or CBRN warfare actors (or a combination of the three), based on an understanding of the factors likely to propel them to embark on such types of warfare against their adversaries.

**CONCLUSION**

Together, these chapters address an impressive breadth of topics related to our nation's security. As noted earlier, success in countering terrorism and insurgency requires the effective application of hard power, soft power, and intelligence, as well as comprehensive strategies that unite these in a concerted effort. However, there are obviously other issues to

explore beyond what is covered in this volume. Thus, this collection will hopefully also stimulate the reader to pursue further research on their own, in order to expand our collective understanding of how our military, law enforcement, diplomacy, and intelligence professionals can most effectively counter terrorism and insurgency in the twenty-first century.

## STRATEGIC AND TACTICAL CONSIDERATIONS: AN INTRODUCTION

James J. F. Forest

In June 1995, Chechen separatists attacked the Russian town of Budyon-novsk, 100 miles from the Chechen border, and held over 1,000 Russian hostages in the town hospital for a week in what became the single largest hostage-taking event of the twentieth century. Initial Russian attempts to resolve the situation resulted in a public relations disaster and hundreds of civilian casualties, and President Boris Yeltsin's bellicose statements on the need to annihilate the Chechen rebels did not help the situation. Prime Minister Chernomyrdin eventually agreed to the terrorist's conditions: he sent a peace delegation to Grozny, ordered a ceasefire in Chechnya, and guaranteed safe passage back to Chechnya. (Of course, Chernomyrdin was removed from his position shortly afterward). This was a pivotal episode of the war between the Chechens and Russia. Law enforcement agencies were shown to be incapable of protecting the population from terrorism, while an Organization for Security and Cooperation in Europe report criticized Russia's use of disproportionate and indiscriminate military force in this situation. And the terrorists succeeded in their goal of gaining publicity for the Chechen cause, hoping that pressure from Russian society and other countries would force a policy change in Russia's leadership.[1]

Unfortunately, the last 200 years are filled with similar examples of terrorist activity and government responses (both successes and failures), as demonstrated by many of the chapters in this book (particularly in Volume 3). What we have learned from this history is that terrorism is a

complex phenomenon, which requires a complex and comprehensive response. Military force and a robust security apparatus are necessary but insufficient components of that response. Instead, countering terrorism and insurgency requires a holistic approach that incorporates all the elements of national power. Volume 1 of *Countering Terrorism and Insurgency in the 21st Century* addresses the formulation of policies, strategies, and tactics for countering unconventional threats to national security, which are organized around the primary elements of a nation's hard power (the use of force by military and law enforcement) and soft power, including diplomatic, economic, information, and intelligence activities (with special attention given to the latter). Clearly, as Korb and Boorstin argue, the integration of these elements is critical.[2] This chapter serves to introduce central concepts and summarize some of the key points from current literature on the application of hard and soft power in countering terrorism and insurgency in the twenty-first century.

## COUNTERTERRORISM STRATEGY IN THE UNITED STATES

Despite what is commonly portrayed in the media, security strategy documents of the United States from the last decade reflect an understanding that the terrorist threat to our nation is far greater than a single extremist group led by Osama bin Laden, and that our response to terrorist threats must be global and multidimensional. For example, Presidential Decision Directive (PDD) 39, signed on June 21, 1995, by President Bill Clinton, declared:

> It is the policy of the United States to deter, defeat and respond vigorously to all terrorist attacks on our territory and against our citizens, or facilities, whether they occur domestically, in international waters or airspace or on foreign territory. The United States regards all such terrorism as a potential threat to national security as well as a criminal act and will apply all appropriate means to combat it. In doing so, the U.S. shall pursue vigorously efforts to deter and preempt, apprehend and prosecute, or assist other governments to prosecute, individuals who perpetrate or plan to perpetrate such attacks. We shall work closely with friendly governments in carrying out our counterterrorism policy and will support Allied and friendly governments in combating terrorist threats against them. Furthermore, the United States shall seek to identify groups or states that sponsor or support such terrorists, isolate them and extract a heavy price for their actions. It is the policy of the United States not to make concessions to terrorists.

PDD 39, which emphasized foreign terrorist captures, terrorist financing, and weapons of mass destruction, complemented two other PDDs issued in 1995: PDD 35, which designated terrorism as an intelligence priority, and PDD 42, which focused on combating both criminal and terrorist

organizations abroad.[3] In 1998, this administration issued further guidance in combating terrorism—PDD 62, which established the first agreed designation of which agencies had lead responsibility for the range of activities involved, and PDD 63, which called for the first plan to protect our nation's critical infrastructure, with a new emphasis on cyber security and a new budgeting mechanism that provided for cross-cutting review of all counterterrorism budgets.[4]

Shortly after President Clinton took office, the nation was confronted with several new forms of terrorism, with the fatal attack on CIA employees at Langley five days after the inauguration, the first World Trade Center bombing in February 1993, the Iraqi plot to assassinate former President George H. W. Bush in April of that year, and a plot against historic New York City landmarks such as the Lincoln and Holland Tunnels in June.[5] These terrorist threats came from disparate sources—including Sheikh Omar Abdel Rahman, who was eventually captured, prosecuted, and put in prison for life. Islamic extremists had already been recognized as the most pressing terrorist threat: during the 1980s, nearly 500 Americans had been murdered in terrorist attacks abroad by Hizbollah, Islamic Jihad, and others. Osama bin Laden's declaration of war against the United States in 1996 and 1998, and his role in the subsequent bombing of the U.S. embassies in Kenya and Tanzania, eventually brought al Qaeda to the forefront of the national counterterrorism effort.

However, when President Bush took office in January 2001, al Qaeda as an organization was stronger than ever before and had already put in motion a plot that on September 11 of that year proved to the entire nation just how serious the threat of terrorism is to our security. Amid the flurry of military activity, federal reorganization, and investigative reports that followed, the U.S. government also produced its first National Security Strategy (NSS) in 2002 and then the first National Strategy for Combating Terrorism (NSCT) in 2003. In the introduction to the NSS, President Bush noted:

> Defending our Nation against its enemies is the first and fundamental commitment of the Federal Government. Today, that task has changed dramatically. Enemies in the past needed great armies and great industrial capabilities to endanger America. Now, shadowy networks of individuals can bring great chaos and suffering to our shores for less than it costs to purchase a single tank. Terrorists are organized to penetrate open societies and to turn the power of modern technologies against us. To defeat this threat we must make use of every tool in our arsenal—military power, better homeland defenses, law enforcement, intelligence, and vigorous efforts to cut off terrorist financing. The war against terrorists of global reach is a global enterprise of uncertain duration. America will help nations that need our assistance in combating terror. And America will hold to account nations that are compromised by terror, including those who harbor terrorists—because the allies

of terror are the enemies of civilization. The United States and countries co-operating with us must not allow the terrorists to develop new home bases. Together, we will seek to deny them sanctuary at every turn.[6]

Because the NSS was written to address the full spectrum of possible or potential threats to the nation, including (but clearly not exclusively) terrorism, the document articulates how the United States will "champion aspirations for human dignity," "work with others to defuse regional conflicts," and "ignite a new era of global economic growth through free markets and free trade," among several other goals and objectives. Those seeking a more specific discussion of how the United States intends to confront the global threat of terrorism must turn to the NSCT. According to this document, "the United States' strategy for combating terrorism focuses on taking the fight to the terrorists themselves. We are using all elements of our national power and international influence to attack terror networks; reduce their ability to communicate and coordinate their plans; isolate them from potential allies and from each other; and identify and disrupt their plots before they attack."[7]

While the NSS provides the strategy framework for the NSCT, both are supplemented by additional strategic documents, including the National Strategy for Homeland Security (published July 2002),[8] the National Strategy to Combat Weapons of Mass Destruction (December 2002),[9] the National Strategy to Secure Cyberspace (February 2003),[10] the National Strategy for the Physical Protection of Critical Infrastructure and Key Assets (December 2003),[11] the National Drug Control Strategy (February 2002),[12] and the National Strategy for Maritime Security (September 2005).[13]

More recently, many of the themes addressed in these documents were sustained and expanded in the new 2006 versions of the NSS and the NSCT (both of which are provided in the Appendix). As President Bush articulates in the document's introduction, the 2006 NSS is founded upon two pillars. "The first pillar is promoting freedom, justice, and human dignity—working to end tyranny, to promote effective democracies, and to extend prosperity through free and fair trade and wise development policies. . . . Peace and international stability are most reliably built on a foundation of freedom." The second pillar involves "confronting the challenges of our time by leading a growing community of democracies. Many of the problems we face—from the threat of pandemic disease, to proliferation of weapons of mass destruction, to terrorism, to human trafficking, to natural disasters—reach across borders. Effective multinational efforts are essential to solve these problems."[14]

Multinational cooperation is also a key component of the new NSCT, which states, "Today, we face a global terrorist movement and must confront the radical ideology that justifies the use of violence against innocents in the name of religion. . . . Our Muslim partners are speaking out

against those who seek to use their religion to justify violence and a totalitarian vision of the world. We have significantly expanded our counterterrorism coalition, transforming old adversaries into new and vital partners in the War on Terror."[15]

The strategy is also multidimensional, in keeping with the approach articulated in the earlier strategic documents described above. According to the 2006 NSCT

> Our strategy also recognizes that the War on Terror is a different kind of war. From the beginning, it has been both a battle of arms and a battle of ideas. Not only do we fight our terrorist enemies on the battlefield, we promote freedom and human dignity as alternatives to the terrorists' perverse vision of oppression and totalitarian rule. The paradigm for combating terrorism now involves the application of all elements of our national power and influence. Not only do we employ military power, we use diplomatic, financial, intelligence, and law enforcement activities to protect the Homeland and extend our defenses, disrupt terrorist operations, and deprive our enemies of what they need to operate and survive.[16]

Overall, the United States has been working to counter terrorism for several decades. However, the events of 9/11 and its aftermath brought new focus and public attention to these efforts, as well as several government agency reorganizations and a flood of new resources. While debate continues on the effectiveness of the Bush administration's current approach to the terrorist threat, a global review of counterterrorism strategies informs our understanding of the challenges ahead. For example, according to a recent U.S. Institute of Peace report, "Decades of experience indicate that the most effective counterterrorist efforts are ultimately stealthy, incremental, pragmatic, and defensive, and they may only marginally affect the terrorists' perceived payoff." In other words, as mentioned earlier, the integration of hard power and soft power is paramount to the success of any strategy for combating terrorism and insurgency, and it requires nuance, patience, and a comprehensive understanding of the threat and the operating environment, as well as how a government's actions can impact either of them (positively or negatively).

Counterterrorism strategies must also incorporate knowledge of the terrorist enemy, and a large and growing body of research and analysis in terrorism studies is contributing to this goal. In particular, several publications since 9/11 have helped us understand a variety of important aspects about terrorist organizations, including methods of recruitment and training, as well as the political, ideological, and socioeconomic rationales used to justify their use of terrorist tactics. Important books by authors such as Bruce Hoffman, Cindy Combs, Martha Crenshaw, Walter Reich, Jessica Stern, David Rapoport, Brian Jenkins, and Paul Wilkinson are used

in university classrooms across the country, while several recent high-profile government reports produced by the 9/11 Commission, Downing Commission, Bremer Commission, and others have expanded our understanding of specific terror attacks in (and of the continuing threat to) the United States.[17] An array of new books and reports by think tanks and research organizations, such as the Rand Corporation, the Brookings Institution, the Center for Strategic and International Studies, the Heritage Foundation, and the Council on Foreign Relations, are continually expanding the range and deepening the quality of research and analysis in this field. Scholarly journals such as *Terrorism and Political Violence, Studies in Conflict and Terrorism,* and *Democracy and Security* are also helping us deepen and broaden our understanding of key counterterrorism challenges and effective responses. And the three-volume *The Making of a Terrorist: Recruitment, Training and Root Causes* (Praeger, 2005) provides a central resource on many of these important issues. In short, there is an impressive and growing body of knowledge that students, scholars, policymakers, and the media can draw upon in developing a solid understanding of terrorism and counterterrorism.

A particularly useful area of research in this field of study has focused on identifying and exploiting a terror group's vulnerabilities. For example, the faculty of the Combating Terrorism Center at West Point recently examined a collection of al Qaeda documents captured during recent operations in support of the Global War on Terror and revealed a range of organizational issues, particularly regarding the internal structure and functioning of the movement as well as the tensions that have emerged within the group's leadership. Drawing on organization and agency theory, the report predicts where we should expect terrorist groups to face their greatest challenges in conducting operations. In particular, organizations such as al Qaeda face difficulties in almost any operational environment, particularly in terms of maintaining situational awareness, controlling the use of violence to achieve specified political ends, and, of course, preventing local authorities from degrading the group's capabilities. But they also face problems common to other types of organizations, including private firms, political parties, and traditional insurgencies. For example, political and ideological leaders—the principals—must delegate certain duties to intermediaries or low-level operatives, their agents. However, differences in personal preferences between the leadership and their operatives in areas such as finances and tactics make this difficult and give rise to classic agency problems. Agency problems created by the divergent preferences among terrorist group members present operational challenges for these organizations, challenges that can be exploited as part of a comprehensive counterterrorism strategy. Thus, the theoretical framework described in this report helps us identify where and under what conditions organizations can expect the greatest challenges in pursuing their goals and

interests. Understanding a terrorist organization's internal challenges and vulnerabilities is key to developing effective—and efficient—responses to the threats they pose and to degrade these groups' ability to kill.[18] Overall, this study provides an important example of how research on terrorists can inform our own counterterrorism strategy, a strategy that must integrate the carefully measured application of hard and soft power.

### Hard Power

Operation Enduring Freedom, the world's first multinational military response to a terrorist organization, was launched in October 2001 and was highly successful in disrupting al Qaeda and its state sponsor, the Taliban regime. Just 2 weeks after the 9/11 attacks, the UN Security Council adopted Resolution 1373, obligating all 191 UN member states to take far-reaching domestic legislative and executive actions designed to prevent and suppress future terrorist activities. At that time, the U.S. permanent representative to the Security Council, Ambassador John Negroponte, called the UN "a unique partner in troubled times" and described Resolution 1373 as the UN's "single most powerful response" in the war on terrorism. New UN resolutions took the unprecedented steps of legitimizing military action against terrorism and globalizing the ban on it.

However, as the recent conflict between Israel and the Lebanese militant group Hizbollah aptly demonstrated, military force is often of limited use against a well-armed, disciplined, and well-supported nonstate actor. In fact, military action may sometimes be even counterproductive. For example, on July 30, 2006, Israeli air strikes killed more than 60 civilians, many of them children, in the village of Qana, Lebanon.[19] Many nations throughout the world condemned Israel for this act, while scholars of terrorism were quick to point out that never in the history of humankind has a terrorist group of Hizbollah's size and local support been destroyed by military force, particularly by air strikes. As a classic asymmetric conflict, Israel was clearly at a disadvantage despite its overwhelming military superiority. Hizbollah was operating within its own territory, where they enjoyed a much greater familiarity with the rocky terrain than the Israeli soldiers. They have been aided by a passive regime and external state sponsors (Syria and Iran). Hizbollah is also well equipped, armed, and trained, and it offers an ideology that appeals not only to local Lebanese citizens but to millions of Muslims throughout the Arab world. As a result of these factors, the Israeli military was forced to modify its main objectives. When launching the campaign, the country's leaders declared that they would destroy Hizbollah. However, when a few weeks of heavy bombardment of Lebabon's roads, bridges, and other critical infrastructure targets produced no reduction in Hizbollah's capability to fire rockets indiscriminately into Israel, the focus of the campaign changed to

pushing the militants north of the Litani River and out of the border region. Eventually, however, a UN-brokered ceasefire led to Israel ending the blockade and pulling its troops out of Lebanon without accomplishing any of its primary objectives. Even the two Israeli soldiers, whose kidnapping in June had initiated this conflict, remained in Hizbollah hands as of mid-September.

Turner Stansfield, a former chief of the CIA, argues that punitive military attacks are a remedy we should use but sporadically.[20] Clearly, as described in many of the cases offered in Volume 3, kinetic aspects of counterterrorism are an important part of the solution to terror threats, particularly in terms of attacking valid enemy targets, when they become available. But terrorists and insurgents—by the very nature of the asymmetric warfare tactics they employ—tend not to offer easy targets for conventional military strikes. For this reason, nations throughout the world have developed special military units to fight terrorism, such as the Israeli Sarayat Matkal, British SAS, German GSG9, and U.S. Delta Force. Some observers have argued that because of the special forces expertise the U.S. military has developed, we must be poised to take on a larger role in counterterrorism missions abroad, especially given the presence of friendly but "weak" allies attempting to fight terrorism.[21]

According to terrorism expert Cindy Combs, however, states must grapple with finding a delicate balance between providing enough commitment and resources to ensure the operational capability of these groups, while also imposing sufficient constraints to prevent an overuse of their skills.[22] And yet, the imposition of constraints can also lead to new problems. For example, according to Richard Schultz, a number of "mutually reinforcing, self-imposed constraints" prevented the use of U.S. special mission units in hunting down and destroying the al Qaeda terrorist network before the attacks of September 11, 2001.[23] He notes that defining terrorism as a crime made it the responsibility of the Justice Department, rather than the Department of Defense, and with the resulting lack of legal authority few Pentagon officials were willing to see terrorist attacks as grounds for war (and the deployment of military forces). The "Somalia syndrome" and other dimensions of risk aversion led Pentagon leaders to obstruct and intimidate civilians who promoted a more aggressive military response to terrorism. Further, essential intelligence requirements were defined so narrowly as to make pre-positioning and other counterterrorism operations virtually impossible.[24]

Military force also has limitations when confronting a state sponsor of terrorism. For example, during the early 1980s, Libya was implicated as a sponsor of several terrorist attacks against Western interests. In 1985, simultaneous attacks in Rome and Vienna by the Abu Nidal group, which Qaddafi called "heroic acts," killed 20 people—five of them Americans, including a 9-year-old girl. The Reagan administration responded with a

policy that would utilize escalating political, economic, and military pressures in an attempt to end Qaddafi's sponsorship of international terrorism. There were three phases to this strategy: peaceful pressure (including economic sanctions), a show of force (in January 1986, Reagan ordered the Navy to begin a week of extensive flight operations in the vicinity of Libya), and, finally, the use of force (a bombing raid on April 14, 1986, in response to a series of terrorist attacks directly linked to Qaddafi). However, as Tim Zimmerman notes, this attempt at coercive diplomacy did not significantly change Qaddafi's support for international terrorism. Indeed, as the case of Libya demonstrates, the literature on terrorism and counterterrorism indicates that there are significant limitations on the use of military force as an instrument of coercion, particularly in confronting terrorism.[25]

In truth, the law enforcement agencies of a nation play a more important role than the military in identifying and confronting terrorist threats, as recently thwarted terror plots in the United Kingdom, Denmark, and the United States demonstrate. Before 9/11, as noted above, U.S. counterterrorism efforts were mainly the responsibility of the Federal Bureau of Investigation (FBI), because terrorist acts (of both foreign and domestic origin) against American targets were viewed as crimes to be investigated and prosecuted under U.S. law. Since 9/11, according to their own analysis, the FBI has (1) shifted its counterterrorism culture and organization from reactive to proactive and "threat-based"; (2) developed a nationally driven, fully integrated Intelligence and Investigative Program; (3) improved information sharing with other federal agencies, state and local governments, and international counterterrorism partners; (4) enhanced operational capabilities within FBI headquarters and the field; and (5) evaluated lessons learned to better equip the nation in preventing terrorism.[26]

Other changes in America's domestic legal and policy environment—most notably the USA PATRIOT Act and the creation of the Department of Homeland Security—have also had a dramatic impact on the statutory capabilities and responsibilities of the FBI. In some cases, the FBI must forge relationships with new or reorganized agencies in order to achieve its counterterrorism mission. According to the FBI's Strategic Plan 2002–2009,[27] this mission is organized around five strategic objectives, each with its own set of priorities (see Table 1.1). As reflected in this document, the FBI recognizes that a broad spectrum of activities are necessary to combat terrorism effectively—a theme that is also reflected in the national strategy documents described earlier.

Of course, the FBI is also expected to meet its traditional responsibilities of investigating and prosecuting those who commit significant violent crimes (such as serial killers), transnational crimes, hate crimes, cyber crimes, public corruption, and white-collar crimes. Thus, it has often been

**Table 1.1    FBI Strategic Objectives in Combating Terrorism.**

**1. Prevent terrorist attacks against the United States and its interests.**
Limited windows of time exist for penetration of terrorist planning, and terrorists limit their exposure to insulate themselves. The FBI will increase its ability to uncover potential terrorist plots through analysis of information from the Intelligence Community coupled with robust human source reporting in field offices, as well as intelligence derived from the Foreign Intelligence Surveillance Act (FISA). Newly established threat protocols at FBI Headquarters provide rapid warning of threats and threat mitigation for successful disruption by JTTFs. Recognizing that creating an inhospitable terrorist environment within the United States is the best way to prevent attacks, the FBI will enhance local law enforcement first responders' and stakeholders' awareness of terrorist profiles and methodology through training and our enterprise-wide Intelligence Program.

Priority Actions

– Expand the intelligence base on terrorist groups and their supporters.
– Establish effective partnerships through the JTTFs.
– Expand the scope and breadth of human source reporting on terrorist groups and their supporters.
– Provide timely and accurate intelligence and analysis to the Intelligence Community, Law Enforcement, and senior policy makers.
– Engage in vigorous and effective information sharing initiatives both nationally and internationally.

**2. Deny terrorists and their supporters the capacity to plan, organize, and carry out logistical, operational, and support activities.**
The FBI will protect the United States from terrorist attack by disrupting terrorists' ability to conduct an attack. Training, financing, recruiting, logistical support, and pre-attack planning and preparation are all required components of terrorist operations and these interdependencies create vulnerabilities. As the centerpiece of its counterterrorism national strategy, the FBI will focus on exploiting intelligence developed by Special Agents and others working in the United States and overseas, and integrating Intelligence Community products into actionable information targeting those terrorist vulnerabilities.

Priority Actions

– Identify and disrupt leaders, actors, and facilitators/supporters.
– Enhance operations and intelligence gathering by developing and using emerging investigative techniques.
– Bolster international participation through foreign government liaison and enhanced Legal Attaché operations.

**3. Pursue appropriate sanctions against terrorists and their supporters.**
Prevention of a terrorist attack requires neutralizing members of a terrorist organization before their actions lead to a terrorism-related prosecution. To successfully neutralize terrorists, the full range of available and appropriate government sanctions must be used.

**Table 1.1    (continued)**

Priority Actions

– Work with other Law Enforcement and Intelligence Community partners to fully and appropriately apply criminal and non-prosecutorial sanctions.

– Deny terrorists access to financial resources, using both civil and criminal actions, to disrupt critical support for terrorist organizations.

– Provide information that denies foreign terrorists and their supporters entry into the United States, or leads to their exclusion, removal, surveillance, or prosecution.

**4. Provide incident response and investigative capability.**
Just as the terrorists targeting the United States and its interests abroad operate with adaptability and flexibility, so too must the FBI. The FBI maintains a robust incident response capability, as well as an ability to adjust to emerging and evolving circumstances provided by the new threat environment. The FBI is poised to respond immediately to any threat, both domestically and internationally, with all necessary resources to pursue terrorism investigations and intelligence operations with specially trained investigators using a wide array of tools, including state-of-the-art forensics.

Priority Actions

– Expand the capability to immediately deploy, both domestically and abroad, elements such as the FBI "Flying Squad" and Rapid Deployment Teams to emerging terrorism investigations and incidents.

– Ensure the readiness of each field office to provide crisis management.

– Develop training courses and competency baselines needed for maintaining the effective investigative capability of counterterrorism personnel.

– Establish an operational management training program for select counterterrorism personnel, ensuring ongoing management and leadership expertise.

**5. Identify and respond to WMD threats and fully coordinate the investigative response of the U.S. Government to a WMD threat or attack.**
Recent findings indicate that terrorist organizations are showing an increasing interest in the acquisition and development of weapons of mass destruction. As proven by the anthrax attacks following the 9/11 terrorist attacks and the plot by Jose Padilla to detonate a radioactive "dirty bomb," the use of WMD by terrorists is a very real possibility. The FBI must be prepared to mitigate the threat from a WMD attack through training and cooperation with state and local law enforcement partners, as well as federal agencies with homeland security responsibilities.

Priority Actions

– Each division will support a specially trained WMD coordinator to manage the preparedness and response effort in that division.

– Each division will establish and maintain a WMD Working Group with state, local, and federal first responders in the division's area of responsibility.

– Each division will conduct incident response exercises with members of the WMD Working Group and other community partners.

remarked that a state's local law enforcement personnel are now "on the front lines" of the war on terror. As the International Association of Chiefs of Police noted in 2005:

> In the aftermath of these attacks, as the nation struggled to comprehend the new menace confronting our society, our nation's law enforcement agencies realized that they now had a new and critically important mission. No longer could they focus their energies solely on traditional crime fighting efforts. Now they would be asked to confront a new threat to their communities, perpetrated by individuals and organizations that had vastly different motivations and means of attack from traditional criminals. Accepting this challenge required law enforcement agencies to reassess their operations and reevaluate their priorities.[28]

Responding to these challenges requires new strategies and tools as well as a redeployment of existing capabilities. According to Chief Deputy Jose M. Docobo of the Hillsborough County Sheriff's Office in Tampa, Florida, "Many of the objectives of terrorism prevention parallel current law enforcement policies with respect to local crime issues." In his recent analysis of the intersection between terrorism, homeland security, and community policing initiatives, Docobo observed:

> Traditional crime and terrorism are inextricably linked. International and domestic terrorist groups are well-organized and trained, and demonstrate the sophistication of other traditional organized crime groups. Terrorist groups commit ancillary crimes like fraud, money laundering, drug trafficking, and identity theft to provide the resources for their criminal activities. The investigative approach to a terrorist event is similar to that of a traditional crime incident. Creating external partnerships, citizen involvement, problem solving, and transforming the organization to take on a new mission are all key elements of community policing which must also be part of a comprehensive homeland policing strategy. Community policing, which builds trust between the community and law enforcement and gives officers knowledge of the community and resident activity, is essential to providing actionable intelligence relating to potential terrorist actions.[29]

Overall, the United States currently maintains an unparalleled dominance of military power on the global stage, and law enforcement capabilities that few other countries can match. This dominance can easily translate into seeing military and law enforcement solutions to all sort of problems, including those for which the use of force may be entirely inappropriate. However, while hard power is indeed necessary, anticipating future threats and securing our communities from political violence requires more than a military lens of policymaking and analysis. As many

of the chapters in these volumes illustrate, countering terrorism and insurgency requires the provision of governance and institutions that serve the people, not just the elites. Thus, in helping other countries develop the capacity to deter and defeat the terror threat, the United States provides them with expertise in law enforcement, economic development, the rule of law, and judiciary mechanisms. Efforts such as these illustrate the important role of a nation's so-called soft power instruments, such as diplomacy, economic leverage, information, and intelligence.

### Soft Power

According to Joseph Nye, former dean of Harvard University's Kennedy School of Government, the term "soft power" encompasses the realm of economics—where the United States, Europe, Japan, and China are major players—and the nuanced world of negotiated relationships among nations and transnational actors (e.g., multinational corporations, nongovernmental organizations, and multinational regimes such as NATO, the European Union, and OPEC).[30] In confronting the threat of terrorism, the United States draws on its soft power to convince nation-states and other entities to help counter the threat posed by globally networked terror groups. While economic and financial incentives (or in some cases, sanctions) are important, the most common forms of soft power employed daily include basic diplomacy, information efforts (including public diplomacy), and intelligence.

#### Diplomacy

Diplomatic efforts are obviously important for dealing with state sponsors and safe havens of terror groups. According to CIA veteran Paul Pillar, "Most of the issues underlying terrorism are to be found overseas, as are most things the U.S. can do to combat terrorism." Further, he notes, "most progress in the fight against terrorism ultimately depends on the perspectives and behavior of foreign governments, groups, publics and individuals."[31] Phillip Heymann agrees, noting that the United States can most effectively stem the tide of terrorism through a combination of military threats, economic and political incentives, and moral imperatives to pressure states to act against terrorist groups within their borders.[32] And when diplomatic measures fail to resolve conflicts, as they did when confronting the Taliban in Afghanistan, military force may become necessary. Unfortunately, however, al Qaeda operatives are dispersed throughout the world, and most of those countries are not willing (or perhaps, even knowing) providers of safe haven to these terror operatives. While the United States excels at fighting countries with whom we are at war, how do we counter a security threat that stems from within countries we

consider friends (e.g., Egypt, Pakistan, and Saudi Arabia)? This is one of the more daunting challenges of countering terrorism today and involves state-to-state diplomacy less and "public diplomacy" more.

Clearly, public diplomacy has an important role to play in shaping perceptions of the United States and its policies.[33] Kim Cragin and Scott Gerwehr describe these efforts using the term "strategic influence" and borrow from social and cognitive psychology studies to suggest how the environment in which such activities are conducted, along with the methods used, are essential to the success of any effort. At the same time, an ineffective strategic influence campaign can be counterproductive and may lead a population to distrust (and even grow in animosity toward) the entity conducting the campaign.[34] In his analysis of these challenges, Hassan Abbas argues that the war of ideas and the battle for the "hearts and minds" of Muslims is only beginning. He draws on analyses of U.S. public diplomacy in Pakistan and Iran to illuminate lessons learned for consideration—for example, he notes, "Closing the channels of communication and dialogue has never proved to be a productive measure."[35] His recommendations for U.S. policymakers include acknowledging past mistakes, understanding the limitations of public diplomacy, employing efficient feedback mechanisms to assess the impact of specific policies, establishing and encouraging forums for people-to-people interaction, framing important issues in more constructive ways than "you are either with us or against us," and supporting reform of the education sector in Muslim countries, especially where madrassa networks are entrenched.[36]

The relationship between foreign policies and strategic influence (or public diplomacy) is particularly important in the areas of the world from which much of the Islamist extremist threat originates. In one of the more thoughtful analyses of this issue, West Point professor Ruth Margolies Beitler highlights how American policy toward Israel remains a particularly potent source of discontent and reverberates throughout the Arab and Muslim world. Indeed, it is commonplace in the Middle East to hear comments espousing the view that if only the United States would modify or cease its support for Israel, hatred against the United States would end. Her analysis reveals that while the United States has supported Israel's existence, it has not always supported its policies; yet, she notes, the overwhelming assessment in the Muslim and Arab world is that the United States retains little objectivity when dealing with the Israeli-Palestinian issue. In reality, whether or not the United States is even-handed when it comes to the Arab world and Israel is almost insignificant, she argues—the key factor fostering resentment in the Middle East is the perception that the United States maintains a double standard. Thus, given the prominent role this issue has come to play in public statements of Osama bin Laden and others calling for a global jihad, it is imperative for the United States to lessen al Qaeda's appeal to discontented populations in the Middle East

by ensuring a greater balance—or perception of balance—with regard to its policies toward the Arab world.[37]

*Information*

As part of a comprehensive counterterrorism strategy, information efforts involve the communication of compelling ideas and visions to various audiences around the world in the hopes of influencing their behavior—often called, "winning hearts and minds," or "winning the war of ideas." Soft power is the primary means by which a state can combat the ideology of a violent group, which is typically based upon a vision of the future that the group's members believe cannot be achieved without the use of violence. Historically, ideas and visions have rarely (if ever) been defeated purely by kinetic force. In fact, the use of hard power in many cases may actually strengthen the appeal and perceived validity of a group's ideology.

Most terrorist groups engage in their own form of strategic influence—through images, words, videos, and so forth—in order to gain support and recruits. They seek to connect with an individual on an intellectual and emotional level in order to provide a rationale for using violence. Religious ideologies are of particular concern, as illustrated by the contemporary threats of al Qaeda, Hizbollah, Jemaah Islamiyah, and a host of other extremist groups.[38] Marc Juergensmeyer notes that religion gives radicals moral legitimacy to employ violence in the name of cosmic war.[39] According to Steve Simon, religious ideology and devotion provides the lens through which a group's members see their purpose in life, and thus traditional strategies of deterrence are unlikely to work, given the group's willingness to die in the process of fighting and given the messianic beliefs associated with the members of these groups.[40] Brian Jenkins describes the ideological nature of al Qaeda's threat as a global call to jihad, in which they try to convince ordinary Muslims that Islam is in mortal danger from the West and that the principal source of this threat is the United States. Thus, armed struggle is needed to drive out the infidels from Muslim lands, topple "apostate regimes" such as the House of Saud and the Egyptian government, foster religious revival, expand the Islamic community, and ultimately reestablish the Caliphate. Through its strategic communications efforts—particularly using the Internet—al Qaeda's goal is to build a following and develop a global commitment to action, including (but not necessarily) violence.[41]

As British terror expert J. P. Larsson has observed, there are several reasons that religious ideologies provide a uniquely powerful challenge for counterterrorists. First, these ideologies are often theologically supremacist, which means that all believers assume superiority over nonbelievers, who are not privy to the truth of the religion. Second, most are exclusivist—believers are a chosen people, or their territory is a holy land.

Third, many are absolutist; in other words, it is not possible to be a half-hearted believer, and you are either totally within the system or totally without it. Further, only the true believers are guaranteed salvation and victory, whereas the enemies and the unbelievers—as well as those who have taken no stance whatsoever—are condemned to some sort of eternal punishment or damnation, as well as death. Overall, religious ideologies help foster polarizing values in terms of right and wrong, good and evil, light and dark—values that can be co-opted by terrorist organizations to convert a "seeker" into a lethal killer.[42] From this perspective, the defeat of al Qaeda must involve winning the hearts and minds of the religious many in the Muslim world, not the secular few.

Today, a central battleground in this war of ideas (or ideologies) is the Internet. The struggle for influence taking place online between liberal democracies and extremists involves various forms of strategic communication. Members of the global salafi-jihadist network use the Internet to provide motivational/ideological and operational information to potential recruits and supporters. They offer a simple, clear message to all kinds of "seekers": join the global jihad. Further, there are multiple ways in which an individual can participate, such as providing funds, safe havens, or encouragement. The spectrum of participants can thus range from Web site designers to financiers to weapons experts and combat veterans. Meanwhile, the United States and its allies have launched a public diplomacy effort to dissuade these same individuals from supporting the terrorists' agenda.

Unfortunately, in an age of universal access to the means of providing information online, citizens of a liberal democracy like ours have the power to undermine our own strategic communications and public diplomacy efforts, largely through ignorance and irresponsibility. This problem is particularly acute when communicating with many corners of the Muslim world, where there is no frame of reference for understanding the implications of a free and open press, or a society that enjoys the legal protection of free speech. Thus, whether the messenger is Condoleeza Rice, Howard Stern, Pat Robertson, or the 14-year-old Web blogger down the street, messages put forward online are often given equal credence in terms of representing American policy, culture, and ideas. Thus, an effective public diplomacy agenda requires a commitment to educating our own citizens for world comprehension and responsible communication, as well as motivating a grassroots campaign to develop and disseminate an effective anti-jihad message.[43]

Overall, as several chapters of this volume describe, the United States is engaged in a global war of ideas and perceptions that fuel radical groups, some of whom resort to violence in pursuit of their ideological objectives. Our success in the strategic communications battlespace is perhaps the second most important determinant of whether or not the global war on

terror strategy will produce victory for the United States and its allies; the first and most important, though, is intelligence.

### The Critical Role of Intelligence

It can be argued that among a nation's soft power instruments, none are more vital to the success or failure of countering terrorism than accurate intelligence. On June 2, 2006, over 250 police officers in London—including 15 wearing chemical, biological, and radiological protection suits—stormed a house in Forest Gate, a large Muslim community in a multicultural area where men and women in traditional Islamic dress mingle with people of all hues and shapes, against a backdrop of buildings draped in British flags. Two suspects were arrested: Mohammed Abdul Kahar, 23, who was shot in the shoulder during a struggle to apprehend him, and his 20-year-old brother, Abul Koyair. However, they were released days later without charge when the police realized that the information they had received about a chemical bomb in the house proved faulty. While a subsequent investigation by the Independent Police Complaints Commission cleared the police of any wrongdoing (including the shooting), the community reacted with outrage. Local leaders claimed that a combination of "hysterical" media reporting and the approach taken by police reflected a suspicion of young Muslims that breeds resentment and only encourages communities to isolate themselves from wider society.[44]

Clearly, intelligence plays a critical role in effective strategies and tactics for determining where, when, and how to apply both hard and soft power in responding to terrorist threats. And yet, absolute accuracy in all intelligence gathering and analysis efforts is a Herculean task, if not an altogether impossible expectation. Good intelligence can disrupt potentially catastrophic terrorist plots, such as the one uncovered in August 2006 in which over 25 British Muslims were preparing to detonate liquid explosives on board transatlantic flights. Bad intelligence can make matters worse, as seen in the Forest Gate incident described earlier. But worst of all, ignorance resulting from a lack of accurate intelligence can be lethal, as proven by the 9/11 attacks.

According to the 2000 National Commission on Terrorism (the Bremer Commission), good intelligence is the best weapon against terrorism.[45] In addition to ensuring the highest quality and accuracy of information obtained through intelligence activities, the report also highlighted a need for eliminating bureaucratic barriers to the recruitment of informants as well as encouraging greater flow of information between law enforcement, policymakers, and analysts. Indeed, the lack of interagency cooperation at all levels has been a key criticism of the U.S. intelligence community over the past several years, including the many investigations into the attacks of September 11, 2001. The 9/11 Commission Report was also

highly critical of the U.S. intelligence community for what it called a "fail-
ure of imagination" and highlighted 10 crucial mistakes by the intelligence
community that may (according to some views) have contributed to the
inability of the CIA or FBI to prevent the attacks  (see  Table 1.2).

Another aspect of effective intelligence gathering and analysis involves
language translation. It has often been cited that the lack of Arabic speak-
ers in the FBI and CIA led to an enormous backlog of untranslated audio
recordings, which contributed to our nation's inability to counter the 9/11
plot. But similar examples have been seen in other countries as well. For
example, as Rogelio Alonso observes in his chapter in Volume 3, the small
number of professional translators in Spain's security and police services
led to a severe intelligence shortfall that hampered several terrorist-related
investigations, including the attacks in Madrid on March 11, 2004.

Many other nations have grappled with similar intelligence failures as
well. For example, Mossad—Israel's intelligence service—has achieved a
near mythical reputation worldwide for its effectiveness and precision,
particularly in on-the-ground operations. However, as Ephriam Kahana
has recently noted, several analytical failures and intelligence operations
gone awry (rooted in both underestimation and overestimation of threats)
have cost the country both on the battlefield and at the negotiating table.[46]
For example, on September 6, 2003, Israeli intelligence reported a meeting
of eight Hamas leaders allegedly gathering in a three-story Palestinian
house in the Gaza Strip to plan terrorist attacks.[47] The group included
Sheik Ahmed Yassin (the Hamas spiritual leader), Andan al-Ghoul (a ma-
jor weapons manufacture), Ismail Haniyeh (a future prime minister of
the Palestinian Authority), and Mohammed Deif (a master bomb maker).
Earlier in the conflict, because of the viciousness of the Hamas attacks,
both military and political leaders of Hamas had been determined to be
legitimate targets—bombers, bomb manufacturers, and bomb planners
were all now on the approved targeted lists.

The private house was in a crowded neighborhood, and the local chil-
dren were out of school. A decision had to be made about whether to use
an F-16 jet to bomb from 10,000 feet and about what size bomb to use.
Computer engineers ran simulations to predict how the house could be
destroyed, assessing the cement, the structure, and the size of the rooms. It
was determined that a half-ton bomb would not totally destroy the home
and a one-ton bomb would demolish a nearby apartment building hous-
ing dozens of families. The risk of collateral damage was considered too
high, and the plan was rejected by the political leadership. But at the last
moment, it was decided that since the curtains were drawn on the top
(third) floor, the meeting was taking place in a vulnerable location in the
house and a quarter-ton bomb could be used take out the third floor. Thus,
the third floor was bombed with a precision missile. However, the lead-
ers, family, and four children all survived since they had been meeting on

**Table 1.2   Intelligence Community Mistakes Highlighted by the 9/11 Commission.**

The 9/11 Commission identified ten crucial mistakes by the intelligence community that may (according to some views) have contributed to the inability of the CIA or FBI to prevent the attacks. These include:

 1. January 2000: the CIA does not watchlist Khalid al Mihdhar or notify the FBI when it is learned that Mihdhar possessed a valid U.S. visa (see the document "The Nineteen Hijackers" in chapter 6 of the 9/11 Report).

 2. January 2000: the CIA does not develop a transnational plan for tracking Mihdhad and his associates so that they could be followed to Bangkok and onward, including the United States.

 3. March 2000: the CIA does not watchlist Nawaf al-Hazmi or notify the FBI when it learned that he possessed a U.S. visa and had flown to Los Angeles on January 15, 2000.

 4. January 2001: the CIA does not inform the FBI that a source had identified Khallad, or Tawfiq bin Attash, a major figure in the October 2000 bombing of the USS Cole, as having attended the meeting in Kuala Lumpus with Khalid al Mihdhar.

 5. May 2001: A CIA official does not notify the FBI about Mihdhar's U.S. visa, Hazmi's U.S. travel, or Khallad's having attended the Kuala Lumpur meeting (identified when he reviewed all of the relevant traffic because of the high level of threat).

 6. June 2001: FBI and CIA officials do not ensure that all relevant information regarding the Kuala Lumpur meeting was shared with the Cole investigators at the June 11 meeting.

 7. August 2001: the FBI does not recognize the significance of information regarding Mihdhar and Hazmi's possible arrival in the United State and thus does not take adequate action to share information, assign resources, and give sufficient priority to the search.

 8. August 2001: FBI Headquarters does not recognize the significance of the information regarding Zacarias Moussaoui's training and beliefs and thus does not take adequate action to share information, involve higher-level officials across agencies, obtain information regarding Moussaoui's ties to al Qaida, and give sufficient priority to determining what Moussaoui might be planning.

 9. August 2001: the CIA does not focus on information that Khalid Sheikh Mohammed is a key al Qaida lieutenant or connect information identifying KSM as the "Mukhtar" mentioned in other reports to the analysis that could have linked "Mukhtar" with Ramzi Binalshibh and Moussaoui.

10. August 2001: The CIA and FBI do not connect the presence of Mihdhar, Hazmi, and Moussaoui to the general threat reporting about imminent attacks.

the ground floor and the family had been on the second.[48] Instead, the attack reinforced the widely held perception throughout the Arab world that Israel was pursuing a campaign of indiscriminate and irresponsible bombing. Further, this action certainly did not help achieve the overall goal of improving the country's security.

From an operational level, intelligence successes or failures often determine whether or not the terrorists are captured or killed. But from a strategic level, intelligence failures can exacerbate the terrorist threat, more so than failures in any other instrument of national power. In the United States, the report of the 9/11 Commission (and other entities) underscored the critical nature of "getting it right, always," in the intelligence community and led to a new National Intelligence Strategy (NIS) released in October 2005. This document identifies several important strategic objectives, separated into two categories: mission objectives and enterprise objectives. The first category draws from the NSS to highlight how the U.S. intelligence community will

1. Defeat terrorists at home and abroad by disarming their operational capabilities and seizing the initiative from them by promoting the growth of freedom and democracy.
2. Prevent and counter the spread of weapons of mass destruction.
3. Bolster the growth of democracy and sustain peaceful democratic states.
4. Develop innovative ways to penetrate and analyze the most difficult targets.
5. Anticipate developments of strategic concern and identify opportunities as well as vulnerabilities for decision-makers.[49]

In the second category, the NIS describes how intelligence agencies will improve their "capacity to maintain competitive advantages over states and forces that threaten the security of our nation."[50] These objectives emphasize integrating agencies, improving workforce initiatives (e.g., analytical expertise and diversity), providing greater access to intelligence to those who need it, exploiting new scientific and technological developments, and strengthening foreign intelligence relationships. The latter objective bears particular emphasis. According to Michael Sheehan, former deputy commissioner for counterterrorism for the New York City Police Department, the most important counterterrorism activity since the fall of the Taliban has been the close cooperation of the CIA with foreign intelligence services.

Powerful American technologies identify names, locations, phone numbers and computer addresses of suspicious people. Local intelligence services operate informant networks. The CIA station chief works with intelligence officials to follow up and coordinate hundreds of leads generated by these joint collection efforts. The connections often cross national boundaries, and periodically they "connect the dots," identify a key terrorist and have the local

services execute a nighttime raid against a terrorist safe house. Such coordinated efforts have led to the captures of key al Qaida operatives including Khalid Shaikh Mohammed, the 9/11 mastermind; Hambali, the planner of the Bali bombings; and Abd al-Rahim al-Nashiri, who oversaw the attack on the Navy destroyer USS *Cole*.[51]

Throughout the past decade, the United States has established a broad array of bilateral and multilateral relationships to facilitate intelligence gathering and sharing, as applauded by the 9/11 Commission Report.[52] As Tom Lansford notes in his chapter of this volume, states such as Egypt, Morocco, Tunisia, Jordan, and Pakistan have been especially important in providing intelligence to the United States in exchange for a variety of incentives, including foreign or military aid.[53] Much of the intelligence provided has been in response to specific requests from the United States or in instances when the security services of these states discovered information about current threats to the United States. The CIA has also established more than 25 Counterterrorist Intelligence Centers (CTICs) in foreign host countries to coordinate U.S. and allied intelligence operations. The CTICs are modeled on CIA facilities established in Latin America, and the first of these counterterrorism sites was created in the 1990s.[54] By 2005, according to a *Washington Post* report, more than 3,000 terrorists had been killed or captured as a result of foreign intelligence cooperation.[55]

Overall, while domestic intelligence (which is under the purview of local law enforcement and the FBI) is critical in effectively combating terrorism, the need for accurate and robust international cooperation on intelligence gathering and analysis has never been greater. The United States and its allies face a globally networked movement of clandestine groups with the intention and capabilities of killing innocent men, women, and children. Thus, as reflected throughout this chapter, our ability to confront this threat in a globally networked, multifaceted fashion will surely determine our eventual success—or failure—in countering terrorism and insurgency in the twenty-first century.

## CONCLUSION: STRATEGIES TO CONTAIN THE TERRORIST THREAT

In sum, a combination of hard power and soft power instruments—particularly intelligence—is needed to counter terrorism and insurgency. When these elements are brought together under a comprehensive strategy, the chances for success increase dramatically. However, as many authors have noted, containing terrorism is the only feasible objective of such a strategy. As Martin and Walcott observed in 1988, "the best laid diplomatic, economic, legal, and even military plans will only contain terrorism, not defeat it."[56] A group of Rand terrorism experts agreed in a report published a decade later, in which they argued that unlike other security

challenges such as nuclear deterrence or defense of borders, terrorism can neither be stopped nor absolutely prevented, only contained.[57]

Further, scholars have increasingly drawn our attention to the need to contain the underlying conditions that facilitate terrorism. For example, noted political theorist Benjamin Barber recently argued, "As globalization has led to increasing interdependence, we must learn to contain and regulate the anarchy that foments both the destructiveness of terrorists and the injustices of global capital."[58] And terrorism expert Steven Simon echoes these sentiments when he observes, "Traditional strategies of deterrence are therefore unlikely to work, given the groups' willingness to die in the process of fighting, and given the messianic beliefs associated with the members of these groups. Instead, the United States must adopt a strategy of containment and address the underlying causes of discontent."[59] The development of strategies and tactics for the containment of terrorism, then, is the framework to which the chapters of this volume now contribute.

## STRATEGIC AND POLICY DIMENSIONS

# CHAPTER 2

## U.S. GRAND STRATEGY FOR COUNTERING ISLAMIST TERRORISM AND INSURGENCY IN THE 21ST CENTURY

Bradley L. Bowman

Despite some important successes in the struggle against al Qaeda since 9/11, the United States is not winning the "war on terrorism." Since that tragic September day, the United States has destroyed al Qaeda's safe haven in Afghanistan, killed or captured a large proportion of al Qaeda's leaders, and cracked down on international terrorist financing. Despite these important achievements, however, the al Qaeda threat has adapted, representing as much of a danger to the United States today as it did on 9/11. The relatively traditional insurgent al Qaeda organization of the 1990s has been replaced by an international movement of like-minded, violent "jihadists" for which Osama bin Laden serves as little more than an ideological inspiration. The threat represented by al Qaeda and its legion of sympathizers continues to persist—if not expand—primarily because of four shortcomings in the current U.S. grand strategy. The current U.S. grand strategy overrelies on military operations, misidentifies the nature of the conflict with al Qaeda, ignores the struggle's true "center of gravity," and neglects two major sources of radicalization. If the United States takes comprehensive and aggressive steps to address these shortcomings, the "Long War" could be surprisingly short. If it does not address these shortcomings in the current U.S. grand strategy, "bin Ladenism" may represent the scourge of the 21st century instead of the "last gasp of the radical Islamists."[1]

This chapter will examine these issues in four sections. The first section will define grand strategy and strategy, explore their theoretical and practical relationship with each other, and suggest that strategy—which is essentially military operations—often usurps the nation's grand strategy and political interests. The second will explore the nature of the current conflict with al Qaeda, arguing that a misdiagnosis of the nature of the struggle has encouraged the United States to neglect the central role of Muslim popular opinion. The third will evaluate the 2006 National Strategy for Combating Terrorism (NSCT) and argue that the current U.S. grand strategy dangerously neglects two major sources of radicalization: the Arab-Israeli crisis and the U.S. military presence in the Middle East. The chapter concludes by providing broad recommendations for eliminating these two sources of radicalization.

## GRAND STRATEGY AND STRATEGY: SO WHAT'S THE DIFFERENCE?

Before exploring the nature of the current conflict with al Qaeda and associated movements and evaluating current U.S. grand strategy, it is essential to define key terms. In the post-9/11 deluge of commentary regarding the U.S. response to al Qaeda and its affiliated movements, the precise definitions of many terms have been blurred and confused. A prime example of this confusion has been the widespread misuse of the terms "grand strategy" and "strategy." Analysts and commentators often employ these two words interchangeably, but grand strategy and strategy actually represent distinct concepts and levels of stratagem. While some may view this as a trivial semantic distinction, confusing these concepts engenders negative consequences that extend well beyond semantics. Confusing a strategy for a grand strategy often leads to an overemphasis and overutilization of the military element of power. While various components of the current U.S. approach are certainly grand strategic in scope, the almost reflexive manner in which the United States resorts to the use of military power springs partly from the inability to distinguish between strategy and grand strategy. Therefore, in an effort to optimize the use of military power in U.S. grand strategy, it is necessary to define grand strategy and strategy, explore their ideal relationship with each other, and discuss the tendency for military operations to undercut a nation's grand strategy and political objectives.

A grand strategy is defined as a nation's (or a group of nations') comprehensive plan of action that coordinates and directs all political, economic, and military means and their associated factors in order to attain large ends. The political, economic, and military elements of power are each influenced in varying degrees by associated social, psychological, demographic, and technological factors. An effective grand strategy is derived

from a methodical and objective analysis of a state's interests, the leading threats to those interests, and the means available to secure the interests. Strategy, on the other hand, involves the application of a particular element of national power in support of its grand strategy. From a national security perspective, strategy can be seen as the "art of distributing and applying military means to fulfill the ends of policy."[2] An effective strategy employs military resources and personnel in such a way as to support the grand strategy and secure the nation's interests. While grand strategy and strategy are ultimately employed in the service of the same national interests, national security strategy narrowly focuses on the military element of power.

Two critical axioms define the optimal relationship between grand strategy and strategy. First, as the terms imply, strategy should function as the subordinate tool of grand strategy in the pursuit of the nation's objectives. Just as means should be subordinate to ends, strategy should be subordinate to grand strategy. In other words, strategy and the military operations that represent the essence of strategy must never be allowed to undercut or counteract the grand strategy and the nation's interests that the grand strategy attempts to secure. Carl von Clausewitz's description of the relationship between policy and war basically parallels the relationship between grand strategy and strategy. Approximately two centuries ago Clausewitz wrote, "Subordinating the political point of view to the military view would be absurd, for it is policy that has created war. Policy is the guiding intelligence and war only the instrument, not vice versa. No other possibility exists, then, than to subordinate the military point of view to the political."[3]

This may seem like a rather noncontroversial and obvious point, but history demonstrates that the subordination of strategy to grand strategy—or military operations to policy—has not always been a reality. Frequently, what appears prudent or necessary on the military (strategic) level may actually undercut the nation's grand strategy and endanger that nation's interests. In nineteenth- and twentieth-century Europe, many commanders often dismissed political considerations as something that impeded the tactics essential to victory on the battlefield. This was particularly true in Germany during World Wars I and II. For example, neglecting Otto von Bismarck's grand strategic thinking and maneuvering that gave birth to Germany in the first place, senior military commanders of the Reich became infatuated with the operational and tactical achievements that led to victory at Königgrätz, Sedan, and Metz.[4] When the German officer Erich Ludendorff was asked about the political and operational aspects of the 1918 Michael offensive, he replied, "We will punch a hole in [their line]. For the rest, we shall see."[5] This elevation of the tactical and strategic above greater political considerations of grand strategy would prove costly to the Germans in both world wars. The Schlieffen Plan of

World War I (WWI) and Hitler's plan for unrestricted submarine warfare during World War II (WWII) both arguably represent strategically sound decisions that proved disastrous on the grand strategic level. The Schlieffen Plan of WWI attempted to achieve rapid strategic success, but in the process it violated Belgian neutrality, precipitating Britain's entry into the war. Similarly, during WWII, Hitler recognized British dependence on open sea lanes, and in a "purely operational recipe for victory," Hitler decided to initiate unrestricted submarine warfare.[6] This decision virtually guaranteed U.S. entry into the war against Germany and represented a grand strategic blunder that would ultimately result in Hitler's defeat.

German leaders during WWI and WWII are not the only leaders that have tended to elevate strategy above grand strategy. In fact, prominent American examples during WWII and the Vietnam War demonstrate a predilection in the American military to question the grand strategic thinking of presidents in favor of strategic considerations. During WWII, President Franklin D. Roosevelt made several grand strategic decisions that engendered passionate opposition from the U.S. defense establishment. In 1940, Roosevelt divested American units of desperately needed weapons in order to bolster the British military. In 1943—at the expense of U.S. military services—Roosevelt increasingly diverted U.S. shipments to redress critical shortages in British shipping.[7] These decisions were unpopular within the defense establishment, but they demonstrated Roosevelt's great foresight as a grand strategist. Roosevelt knew that the United States would have little chance of defeating Hitler if Britain were to fall to the Nazis. The United States would later rely on the British Empire to provide the jumping off points with which to attack Germany. More succinctly, a successful D-day landing would not have been possible if the Nazis had defeated Britain in the preceding years. Although Roosevelt's actions may have appeared unwise and counterproductive on the strategic level, they were prudent and far-sighted on the more important grand strategic level in 1940 and 1943.

The Vietnam War provides another interesting example of the all-too-common myopic desire to achieve strategic objectives at the expense of the greater and more important grand strategy. As many American veterans recount with disgust, during the Vietnam War, President Lyndon B. Johnson periodically reviewed lists of targets in Hanoi and Haiphong, imposing limits on the numbers of sorties and setting rules of engagement. For many, this presidential behavior came to epitomize the political meddling that handicapped U.S. military effectiveness and ultimately lost the war despite overwhelming U.S. military superiority.[8] From a strategic perspective, it was difficult to conceive why the United States would not subject Hanoi and Haiphong to a full onslaught of U.S. bombing. However, from a grand strategic perspective, Johnson moderated the bombing for political purposes that transcended short-term strategic considerations in

Vietnam. Johnson believed that an incremental bombing campaign would be more successful in inducing the North Vietnamese to negotiate than would an all-out terror bombing.[9] More importantly, Johnson was keen to ensure that the U.S. bombing did not induce a Chinese military intervention. One must not forget that the 1965–1968 Rolling Thunder bombing campaign took place only 15 years after the traumatic Chinese intervention in the Korean War. It was perfectly reasonable for Johnson to consider Chinese intervention as a possibility if the United States were to conduct full-scale bombing campaign just south of the Chinese border. As important as the bombing of Hanoi and Haiphong may have been to the U.S. strategy in Vietnam, the potential strategic gains were not worth the grand strategic risks of a Chinese intervention.

These three examples demonstrate what B. H. Liddell Hart observed in his classic work titled *Strategy*. Hart writes, "While grand strategy should control strategy, its principles often run counter to those which prevail in the field of strategy."[10] When strategy and grand strategy contradict, political leaders must alter the strategy. The vast majority of military officers recognize—at least theoretically—that the military operations representing the essence of strategy should be subordinate to the grand strategy and the nation's policy objectives. However, as history demonstrates, this theoretical recognition does not always translate to submission of military operations (strategy) to grand strategy (policy) in practice. While this first axiom enjoys at least tacit approval, the second axiom, which defines the optimal relationship between grand strategy and strategy, enjoys no such consensus.

The second axiom of stratagem is that grand strategy and strategy are not autarkic, autonomous spheres operating independently and in each other's isolation. Rather, grand strategic considerations must pervade every aspect of military operations. Thanks to the longstanding U.S. tradition of military subordination to civilian authority enshrined in the U.S. Constitution, the vast majority of U.S. military officers at least theoretically recognize that military operations (strategy) must subordinate itself to policy (grand strategy). However, many American military officers believe that political leaders should establish the political objectives of military operations and step aside, allowing military leaders to plan and conduct military operations in almost complete autonomy.[11] In other words, political leaders should establish the "what" and the military leaders should be given the freedom to determine the "how."[12] Ironically, Clausewitz has often been cited to support such a point of view. However, nothing could be more contrary to his actual view or the optimum relationship of grand strategy and strategy. Clausewitz writes, "War should never be thought of as something autonomous but always as an instrument of policy."[13] He suggests that grand strategic policy and the political leaders who develop and implement it should not just occasionally

intervene in strategy; rather, the grand strategy (policy) should "make its influence felt throughout down to the smallest operational detail."[14]

Many members of the defense establishment consciously or subconsciously refuse to accept this second axiom because of an understandable desire to seek maximum authority and freedom to achieve military success. This reasonable but misguided desire was endowed with theoretical legitimacy by Samuel Huntington's enormously influential 1957 book, *The Soldier and the State*. This widely read book still shapes perceptions in the defense establishment regarding the relationship between grand strategy and strategy. Huntington asserted that a clear demarcation should exist between policy (grand strategy) and strategy. Huntington argued that "the line of demarcation must be drawn between politics and strategy, supply and operations. Having found this line, all sides must abstain from trespassing."[15] In other words, there should be an "autonomous military profession" in which military officers plan and execute military operations unfettered by counterproductive and dangerous civilian meddling. This theory of civil–military relations—known as the theory of "objective control"—enjoys widespread support in the defense establishment. However, "objective control" does not describe the actual or ideal relationship between grand strategy and strategy.

Many of history's leading wartime civilian leaders understood the optimal relationship between grand strategy and strategy and rejected the notion that these concepts represent autonomous spheres separated by a clear line of demarcation. In his book *Supreme Command*, Eliot Cohen describes four of the most effective wartime leaders in recent history. Examining the wartime leadership of Abraham Lincoln, Georges Clemenceau, Winston Churchill, and David Ben-Gurion, Cohen concludes that "mastery of military detail is essential" for a successful grand strategist. Whether it was Clemenceau speaking with soldiers on the front line in the face of enemy fire, Churchill "ceaselessly probing and interrogating his chiefs of staff," Lincoln "poring over every telegram coming in to the War Department," or Ben-Gurion methodically recording in his diary "every detail to the last bullet," effective grand strategies are guided by political leaders that do not hesitate to probe into the most minute military details. This is not to suggest that politicians can or should micromanage every strategic detail. However, the great grand strategists can identify key details and do not hesitate to interrogate military subordinates regarding the status of these details.

Clausewitz summarizes the second axiom of the relationship between grand strategy and strategy as follows:

> We can now see that the assertion that a major military development, or the plan of one, should be a matter for purely military opinion is unacceptable and can be damaging. Nor indeed is it sensible to summon soldiers, as many

governments do when they are planning a war, and ask them for purely military advice. But it makes even less sense for theoreticians to assert that all available military resources should be put at the disposal of the commander so that on their basis he can draw up purely military plans for a war or a campaign. It is in any case a matter of common experience that despite the great variety and development of modern war its major lines are still laid down by governments. . . . This is as it should be. No major proposal required for war can be worked out in ignorance of political factors; and when people talk as they often do, about harmful political influence on the management of war, they are not really saying what they mean. Their quarrel should be with the policy itself, not with its influence.[16]

Analysts should conceive of strategy as a subordinate—and by no means autonomous—component of grand strategy. Senior military officers are strategy's subject matter experts, but generals and admirals must never practice their profession in ignorance, isolation, or defiance of the grand strategy or the nation's political aims. There does not exist an autonomous sphere of strategy that is only the domain of generals. Grand strategy and the national interests it seeks to secure should govern the "when," "what," and "how" of strategy. The nation's desired political ends should "permeate all military operations" and serve as the "supreme consideration in conducting" them.[17] The grand strategy defined by the political leaders should in every respect govern the strategy employed by the generals.[18]

In short, the disproportionate reliance on the military element of power in current U.S grand strategy springs partly from a misunderstanding of the ideal relationship between grand strategy and strategy. It also derives from a common tendency for military operations to escalate and expand, often to the detriment of the nation's grand strategy and political objectives. Another major reason that military operations assume a counterproductive and disproportionate role in grand strategy relates to a misdiagnosis of the nature of a given struggle. The next section will explore how the misdiagnosis of the nature of the United States' current struggle with al Qaeda has led to a U.S. grand strategy that neglects the role of Muslim popular opinion in defeating or sustaining al Qaeda.

## THE NATURE OF THE CONFLICT

*Know the enemy and know yourself; in a hundred battles you will never be in peril.*[19]
—Sun Tzu

In addition to understanding the foundational principles of grand strategy, a successful U.S. grand strategy for the struggle against al Qaeda and associated movements also depends on a correct understanding of the

enemy and the nature of the conflict. The United States and its allies currently confront a global Islamist insurgency that "seeks to overthrow the status quo through subversion, political activity, insurrection, armed conflict, and terrorism."[20] Al Qaeda constitutes a decentralized threat, consisting of a diffuse global movement with varying regional objectives. While al Qaeda represents a global Islamist insurgency, the struggle against it has most commonly been referred to as the "war on terrorism." As others have suggested, terrorism represents a tactic, and declaring war on a tactic is illogical. Terrorism represents a prominent tool that the "jihadists" use to wage their global insurgency. Mischaracterizing the struggle with al Qaeda as a "war on terrorism"—as opposed to a counterinsurgency—has encouraged the United States to rely too heavily on the military element of power in its grand strategy.

As David Kilcullen writes, defining the threat as "terrorism" leads to a case-based approach emphasizing a law enforcement and military response. However, viewing the conflict as a "counterinsurgency" leads to a "whole of government" or strategic approach that emphasizes "the hearts and minds" of the respective publics and primarily utilizes a nonmilitary or less "kinetic" approach.[21] Undoubtedly, the United States should strive to kill or capture the leadership of al Qaeda. However, the United States must do so using methods that minimize innocent death, while mitigating the sources of radicalization for succeeding generations.[22] Rather than characterizing the current struggle as a "war on terrorism," the United States should accurately identify the struggle as a global counterinsurgency. This understanding will highlight the need to scale back the role of the military to its optimal level within a broad and comprehensive counterinsurgency strategy.

A military capability represents an important component of a counterinsurgency strategy, but the military is only one of many components. Counterinsurgency scholars often refer to the "80/20" ratio between nonmilitary and military approaches in a successful counterinsurgency strategy. To its credit, the U.S. Army Counterinsurgency Operations manual recognizes that the military represents only one of many tools in an effective counterinsurgency strategy:

> [Counterinsurgency] is an offensive approach involving all elements of national power; it can take place across the range of operations and spectrum of conflict. . . . Generally, the preferred methods are through assistance and development programs. Leaders must consider the roles of military, intelligence, diplomatic, law enforcement, information, finance, and economic elements (MIDLIFE) in counterinsurgency.[23]

Despite this reality, the current U.S. grand strategy for confronting this global insurgency—as reflected in the U.S. federal budget and the U.S.

government's posture in the Middle East—is overwhelmingly military in character. For example, in Iraq, the only U.S. government actors consistently present and actively confronting the insurgency to any significant degree have been the U.S. military and the CIA.[24] Beyond Iraq, in the broader struggle against al Qaeda, the overreliance on the military element of power in U.S. grand strategy is dramatically revealed by the relative allocation of resources to the Department of Defense versus the Department of State. The president's fiscal year 2007 budget allocated almost 14 times as much money to the Defense Department as the Department of State and associated programs. The Pentagon is scheduled to receive $439 billion as opposed to $32 billion for the Department of State. This $32 billion for the Department of State includes funding for programs such as education and cultural exchange, international peacekeeping, international organizations, international narcotics and law enforcement, nonproliferation, antiterrorism, de-mining, foreign military financing, U.S. Agency for International Development (USAID) operating expenses, and the Millennium Challenge Corporation.[25]

This comparative neglect of the nonmilitary elements of power has encouraged the United States to counterproductively and disproportionately overmilitarize its approach to dealing with al Qaeda. This overreliance on the military in a counterinsurgency actually aids the insurgents. Insurgents utilize tactical-level violence such as a suicide bombing or strategic-level grand terrorism such as 9/11, hoping to provoke a harsh military response or an oppressive host nation security crackdown. Insurgents hope that these responses kill or alienate large numbers of citizens, swing public opinion, and weaken the host government or the United States.[26]

The overmilitarized nature of the U.S. grand strategy in response to 9/11 springs also from an inaccurate diagnosis of al Qaeda's "center of gravity." Popularized by Carl von Clausewitz over two centuries ago, this term describes the "point of decision" at which "all energies should be directed."[27] The center of gravity represents the factor that must be addressed in order to achieve victory; it is the factor "on which everything depends." In traditional warfare, the center of gravity usually consists of the enemy's capital city or the enemy's armed forces.[28] However, public opinion represents the center of gravity for a counterinsurgency. Insurgencies require sympathetic populations in order to recruit members and conduct operations. An insurgent without a sympathetic population recruits only with great difficulty and can be quickly identified, isolated, and killed. Thus, if the U.S. struggle against al Qaeda and affiliated movements can be accurately characterized as a counterinsurgency, then the United States must develop and implement policies that will promote less negative perceptions of the United States among Islamic populations.[29] Moreover, these policies should turn Islamic public opinion against al Qaeda

and its acts of terrorism. Failure to identify the enemy's center of gravity will lead to the expenditure of finite resources in pursuit of secondary objectives that will not achieve victory.[30]

While the current U.S. grand strategy has failed to properly identify the center of gravity in the struggle with al Qaeda, senior al Qaeda leaders fully appreciate the central role of Muslim popular opinion in this global insurgency. In a 2005 letter from Ayman al-Zawahiri to Abu Musab al-Zarqawi, intercepted by U.S. forces in Iraq, Zawahiri demonstrates a nuanced understanding of the central role of Muslim popular opinion in the struggle against the United States and its allies. He writes, "The strongest weapon which the mujahideen enjoy . . . is popular support from the Muslim masses in Iraq, and the surrounding Muslim countries. . . . Therefore, the mujahed movement must avoid any action that the masses do not understand or approve."[31] In other words, the United States is currently engaged in a struggle against an enemy that thoroughly understands the struggle's center of gravity.

The United States could kill or capture every major leader in al Qaeda, but this will not end the threat to the United States and its interests. The al Qaeda threat has grown from a relatively traditional counterinsurgent organization predominantly located in the wider Middle East to a global counterinsurgent movement that relies more on ideology than the leadership of particular individuals. While U.S. successes in Afghanistan after 9/11 account for some of this change, the U.S. failure to identify the center of gravity in this struggle represents the primary reason for al Qaeda's evolution from a regionally based counterinsurgency organization to an international movement. In the global counterinsurgency campaign against al Qaeda and associated movements, popular Muslim opinion represents the center of gravity. The United States continues to infuriate and estrange Muslim populations so central to the eventual defeat of al Qaeda by neglecting to address the major sources of radicalization.

## GRAND STRATEGY AND COMBATING THE SOURCES OF RADICALIZATION

The 2006 National Strategy for Combating Terrorism (NSCT) provides a list of "what does and does not give rise to terrorism." The NSCT argues that "Terrorism is not the inevitable by-product of poverty . . . terrorism is not simply a result of hostility to U.S. policy in Iraq . . . not simply a result of Israeli-Palestinian issues . . . [and] not simply a response to our efforts to prevent terror attacks." Instead, the NSCT points to "political alienation," "grievances that can be blamed on others," "subcultures of conspiracy and misinformation," and "an ideology that justifies murder." These two lists provide a revealing glimpse into what is right and what is dangerously wrong with the current U.S. grand strategy for winning the "war on

terrorism." The formation of a successful U.S. grand strategy in the counterinsurgency against al Qaeda requires a detailed analysis of the sources of radicalization that lead to terrorism directed against the United States and its allies.

### What the Current Grand Strategy Gets Right

The NSCT correctly argues that poverty plays little to no role in causing terrorism. Interestingly, the 12 most economically destitute countries in the world were not associated with a single suicide terrorist attack between 1980 and 2003.[32] The argument that poverty has little role in terrorism is also supported by the anecdotal evidence provided by the demographics of the al Qaeda leadership and the 9/11 hijackers. It is widely known that Osama bin Laden inherited $5 billion, that Ayman Zawahiri was a surgeon in Cairo, and that Mohammed Atta's father was a lawyer, his sister a doctor, and his other sister a professor.[33] Some might respond that the leadership of al Qaeda does not provide a representative sample of the membership of al Qaeda. However, as Fareed Zakaria points out, even the lower-level al Qaeda recruits seem to be predominantly educated and middle class. In summary, economic and public health factors may play a vague or indirect role in setting the conditions for radicalization, but the most dedicated jihadists are usually *not* poor, and they consistently originate from countries that rate relatively well in terms of GNP per capita and life expectancy.[34] Therefore, arguments that call for the United States to spend more money on poverty in the developing world in order to "win the war on terrorism" should be approached with great skepticism. From a humanitarian perspective, alleviating poverty is an unambiguous good; however, evidence suggests that efforts to alleviate poverty may have little impact in the U.S. struggle against al Qaeda and associated movements.

The NSCT is also partially correct in arguing that "political alienation" serves as a source of terrorism. Throughout the Cold War, U.S. interests related essentially to oil and anticommunism.[35] The United States needs reliable access to Middle Eastern oil, and the only way to ensure that access was to promote the existence of anticommunist regimes in oil-rich countries. It was through the lens of these two interests that the United States viewed Middle Eastern regimes throughout the Cold War. The United States did not generally concern itself with the domestic character of its allies unless they began to drift into the Soviet sphere of influence. Moreover, throughout the Cold War, all of America's allies in the region were authoritarian. In 1953, the United States overthrew a democratically elected Iranian government because the United States believed that Mohammed Mossadeq had become too favorably disposed to the Soviets. In short, the United States ignored the democratic deficit in the region for

almost five decades in order to ensure U.S. access to oil and U.S. victory in the Cold War.

After September 11, many scholars and Bush administration officials came to view this Cold War policy as a major contributor to the frustration and radicalization that led in part to the tragic events of 9/11. It is this belief that provides the basis and justification for the Bush administration's calls for democratization throughout the Middle East. The NSCT lists "political alienation" as the first cause of terrorism. The document declares, "Transnational terrorists are recruited from populations with no voice in their own government and see no legitimate way to promote change in their own country. Without a stake in the existing order, they are vulnerable to manipulation by those who advocate a perverse political vision based on violence and destruction."[36] The Bush administration reasons that if U.S. support for authoritarian allies helped create the conditions in which al Qaeda could form and thrive, then changing course and aggressively promoting democratization should ultimately extinguish Islamic radicalism.[37] It is not unreasonable to believe that the availability of democratic means to change policy and rulers would reduce the tendency for many to resort to violence. Furthermore, the availability of secular venues for opposition would eliminate the situation in many countries in which the only means of regime opposition is often in the mosque at the feet of a radical cleric. However, the 2006 victory of Hamas in the Palestinian elections demonstrates that voters in the Middle East may not always exercise their right to vote in a way that supports American interests or values.

Past U.S. support for authoritarian governments served as a major source of anti-Americanism because of a widespread perception of dissonance between what the United States says and does. As the United States increasingly presses for democratization and liberalization, anti-Americanism may decline.[38] However, democratization is not likely to reform current terrorists or end the struggle with al Qaeda in the short term. Al Qaeda opposes the regimes in Saudi Arabia and other Middle Eastern states not because of their authoritarian nature, but because they perceive them to be insufficiently Islamic. According to the Salafi ideology that dominates al Qaeda, key elements of liberal democracy—such as a "man-made" constitution and separation of church and state—represent violations of the Koran and the *hadith*, and therefore constitute idolatry.[39] As these secular Islamic regimes become more democratic, it will do little to satisfy al Qaeda's demand for *sharia*-based, Taliban-style governments. In fact, there is little scholarly evidence that democracy or even liberal democracy will reduce funding, shrink recruitment, or prevent terrorism.[40] The vast discrepancy between America's rhetoric and actions in the Middle East during the Cold War may explain the enduring anti-American sentiment that indirectly creates an environment in which al Qaeda can operate. However, it does not fully explain why many

educated, middle-class men (and increasingly women) are willing to leave their families and commit suicide in order to kill Americans.

### What the Current Grand Strategy Gets Wrong

The NSCT correctly argues that poverty plays little to no role in radicalization, and the NSCT is also partially correct in its diagnosis regarding "political alienation" as a source of radicalization. However, the NSCT is dangerously misguided in minimizing the radicalizing impact of the Arab-Israeli crisis and the U.S. military presence in the Middle East. While the NSCT's repeated use of the words "not simply" in reference to "U.S. policy in Iraq" and "Israeli-Palestinian issues" seems to begrudgingly acknowledge that these factors have *some* sort of role in causing terrorism, the document quickly points to political, psychological, sociological, and ideological maladies in the Middle East as the *real* sources of terrorism. It is interesting to note that three of the four factors dismissed as sources of terrorism relate to U.S. policy, while all of the factors cited as the actual sources of terrorism relate to conditions in the Arab or wider Muslim world. By arguing that terrorism springs almost entirely from political, psychological, sociological, and ideological maladies in the Arab and Muslim world, the United States conveniently avoids the uncomfortable necessity of analyzing the impact of U.S. policy.

Unfortunately, two false dichotomies dominate the debate regarding the sources of radicalization and terrorism. The first dichotomy relates to the causes of terrorism. Terrorism does not need to spring entirely from U.S. policy or the problems of others; both can provide powerful explanations. Undoubtedly, the political, psychological, sociological, and ideological maladies present in some Muslim societies contribute significantly to terrorism. However, if the United States neglects the impact of U.S. policy—especially the radicalizing influence of the Arab-Israeli crisis and the U.S. military presence in the Middle East—the U.S. grand strategy will ultimately fail.

The second false dichotomy consists of the argument that one either favors killing and capturing hardened terrorists that are beyond redemption, or one seeks to win the "hearts and minds" of the "Arab street." Much of the debate centers on this "hawk" versus "dove" divide, but clearly, neither of these approaches can independently defeat al Qaeda and its associated movements. The fact is that some terrorists cannot be reformed and must simply be killed or captured. Ignoring this fact dangerously exposes the United States to future attack. At the same time, exclusively focusing on killing and capturing terrorists is akin to the man that continues to mop up the water in his living room without fixing the hole in his ceiling. A successful U.S. grand strategy must be comprehensive, eliminating immediate threats and shutting down the engines of

radicalization that create the next generation of terrorists. In terms of these two false dichotomies, the current U.S. grand strategy decidedly blames terrorism on widespread maladies in the Muslim world (instead of U.S. policy) and attempts to address the threat utilizing an overwhelmingly "hawkish" military-dominated approach. While this approach has some important merits, its critical shortcoming is that it neglects the role the Arab-Israeli crisis and the U.S. military presence in the Middle East have played in negatively swaying Muslim opinion. If the United States hopes to isolate al Qaeda by turning popular Muslim opinion decisively against al Qaeda and its tactics, the United States must comprehensively address both of these perceived grievances. If the United States does so, it will be able to more effectively identify, isolate, and eliminate today's terrorists, while curtailing the radicalization of tomorrow's terrorists.

Since the mid-1990s, bin Laden and his deputies have utilized the angst generated by the Palestinian crisis as a means to recruit members and inspire existing members to conduct terrorist attacks.[41] Contrary to widespread "Western" perception, bin Laden did not belatedly and shrewdly adopt the Palestinian cause after 9/11 to gain broader appeal. Bin Laden has consistently and publicly spoken out on behalf of the Palestinians since 1994. Bin Laden's first public pronouncement intended for a wider audience consisted of a December 1994 letter titled "The Betrayal of Palestine." In this letter to the chief Islamic authority in Saudi Arabia, bin Laden—seven years prior to 9/11—called attention to Palestinian suffering in the West Bank and Gaza Strip.[42] While the Palestinian cause did not initially play as prominent a role in bin Laden's call to arms as the U.S. troop presence in Saudi Arabia, the Palestinian crisis was by no means tangential to bin Laden's thinking or his call to "jihad." Bin Laden told CNN correspondent Peter Arnett in a 1997 interview:

> We declared jihad against the U.S. government, because the U.S. government is unjust, criminal, and tyrannical. It has committed acts that are extremely unjust, hideous, and criminal whether directly or through its support of the Israeli occupation of the Prophet's Night Travel Land (Palestine). And we believe the U.S. is directly responsible for those who were killed in Palestine, Lebanon, and Iraq.[43]

In the wake of 9/11, bin Laden increasingly cited the suffering of Palestinians in order to gain Muslim support, recruit and inspire al Qaeda operatives, and justify attacks against the United States. One year after the 9/11 attacks, he utilized a letter posted on the Internet to respond to Western media stories exploring the causes of the 9/11 attacks. Answering his own rhetorical question, he wrote to Americans:

> Why are we fighting and opposing you? The answer is very simple: Because you attacked us and continue to attack us. You attacked us in Palestine. Palestine, which has foundered under military occupation for more than

80 years. The British handed over Palestine, with your help and your support, to the Jews, who have occupied it for more than 50 years; years overflowing with oppression, tyranny, crimes, killing, expulsion, destruction, and devastation.[44]

Bin Laden's second in command, Ayman al-Zawahiri, echoed bin Laden's emphasis on the Palestinian crisis in his December 2001 book *Knights under the Prophet's Banner*. In this autobiography, Zawahiri demonstrates a sophisticated understanding of al Qaeda's center of gravity and reveals the central radicalizing effect of the Palestinian crisis. He writes:

> The jihad movement must come closer to the masses. We must win the people's confidence, respect, and affection. . . . The one slogan that has been well understood by the [Muslim] nation and to which it has been responding for the past 50 years is the call for the jihad against Israel. The fact must be acknowledged is that the issue of Palestine is the cause that has been firing up the feelings of the Muslim nation from Morocco to Indonesia for the past 50 years. In addition, it is a rallying point for all the Arabs, be they believers or non-believers.[45]

These assertions regarding the Palestinian crisis do not represent the isolated views of a few al Qaeda leaders. While the majority of Muslims appear to oppose bin Laden's tactics and see them as inconsistent with Islam, his support for the Palestinian cause and opposition to the Israeli presence in the Palestinian territories coincide with the majority of popular Muslim opinion.[46] In fact, a 2003 Pew Global Attitudes Project research poll found that solid majorities in the Palestinian authority, Indonesia, and Jordan—and nearly half of those in Morocco and Pakistan—expressed at least some confidence that Osama bin Laden would "do the right thing regarding world affairs."[47] There exists a widespread perception in the Arab and wider Muslim world that Israel unjustly and violently persecutes Palestinians in the occupied territories. Many Muslims believe this persecution continues because of the support or at least the inaction of the United States. The United States is widely viewed in the Muslim world as the only country with the ability to coerce Israel to permanently end the "persecution" of Palestinians, yet the United States chooses not to exercise this influence over Israel. While the United States often attempts to present itself as an honest and neutral broker in the Arab-Israeli crisis, Arab publics view the United States as neither. A 2003 Pew Global Attitudes Project discovered pluralities or majorities in 20 of 21 populations (the United States was the only exception) that believe that the United States favors Israel over the Palestinians too much.[48] Even worse, from the perspective of many Muslims, U.S. foreign aid and military sales to Israel directly enable the persecution of Palestinians. The fact that Israel utilizes American-supplied weapons, helicopters, and fighters against Palestinians is a fact not lost on most Muslims.[49]

The salience of the Palestinian crisis for Muslims around the world has increased dramatically because of 24-hour news networks, the ubiquitous nature of the Internet, and the distribution of propaganda videos capitalizing on Palestinian suffering. In August 2001, al Qaeda circulated a two-hour, professionally produced "documentary" on Internet chat rooms highlighting the persecution of Muslims at the hands of the Israelis. The film featured Israeli soldiers lashing out at Palestinian women and shooting a young Palestinian boy. These emotionally charged images played over and over again in the video for dramatic effect.[50] Al Qaeda has also used videos of the Palestinian crisis to recruit and motivate "jihadists." Nizar Trabelsi, a Tunisian who became an ardent disciple of bin Laden and traveled to Afghanistan in 2000, received and viewed a videocassette and two CDs focusing on Muslim suffering around the world. A particularly poignant section of the video showed a four-month-old baby being shot in her abdomen by Israeli soldiers while in her mother's arms. Trabelsi said, "I was deeply struck by these images and I was convinced to increase my commitment toward the [Afghan] people I loved." The consistent statements of bin Laden and his deputies, as well as the public opinion statistics and a multitude of anecdotal evidence, strongly suggest that the Palestinian crisis is an important source of radicalization that engenders popular Muslim sympathy for al Qaeda's objectives and produces the next generation of terrorists.[51]

The U.S. military presence in the Middle East represents the second— and perhaps the most significant—source of radicalization. Following Saddam Hussein's invasion of Kuwait in 1990, the United States deployed more than 500,000 military personnel to Saudi Arabia.[52] This introduction of thousands of U.S. troops into Saudi Arabia represented a dramatic turning point in U.S. strategy and military posture in the region. Throughout the Cold War, the presence of U.S. troops in the Middle East was limited and infrequent.[53] For nearly five decades before the Persian Gulf War, the United States worked through regional allies to effectively protect U.S. interests, conducting few military interventions and maintaining almost no permanent bases in the Middle East. As late as 1989, the United States had less than 700 military personnel in Bahrain, Kuwait, Oman, Saudi Arabia, and the UAE combined.[54] As of 2006, the United States maintained over 200,000 soldiers, sailors, and marines in the Middle East.

While permanently stationed U.S. troops in the region arguably provide some strategic benefits, evidence suggests that the negative impact of the large U.S. "footprint" in the Middle East may far exceed the benefits. The U.S. military presence in Saudi Arabia represents the primary reason that bin Laden and al Qaeda began to target the United States in the 1990s. As early as 1994–1995, bin Laden publicly decried the U.S. military presence in Saudi Arabia. He followed these initial public condemnations with a message in 1996 titled "Declaration of Jihad," in which he states:

> The greatest danger to befall the Muslims since the death of the Prophet Muhammad is the occupation of Saudi Arabia, which is the cornerstone of the Islamic world, place of revelation, source of Prophetic mission, and home of the Noble Ka'ba where Muslims direct their prayers. Despite this, it was occupied by the armies of the Christians, the Americans, and their allies.[55]

Two years later, in February 1998, bin Laden joined Ayman al-Zawahiri and three other Islamist leaders from Egypt, Pakistan, and Bangladesh in issuing a formal declaration regarding the religious duty of Muslims to wage jihad against American military personnel and civilians. After a paragraph of the requisite salutations and religious formalities, the authors immediately cite the preeminent reason for the jihad against the Americans:

> Firstly, for over seven years America has occupied the holiest part of the Islamic lands, the Arabian peninsula, plundering its wealth, dictating to its leaders, humiliating its people, terrorizing its neighbors, and turning its bases there into a spearhead with which to fight the neighboring Muslim peoples.[56]

The 2006 NSCT notes that "terrorism is not simply a result of hostility to U.S. policy in Iraq. The United States was attacked on September 11th and many years earlier, well before we toppled the Saddam Hussein regime." While it is true that 9/11 occurred before the U.S. military invasion of Iraq, it must not be forgotten that the U.S. military *was* in Saudi Arabia—and had been there for a decade. The U.S. military presence in Saudi Arabia certainly does not justify al Qaeda's tragic and immoral slaughter of almost 3,000 innocent Americans, but it does help explain the motivations of those who participated in the attack. Not only did bin Laden consistently cite the U.S. presence in Saudi Arabia as the preeminent justification for jihad in the years leading up to 9/11, but 15 of the 19 hijackers were from Saudi Arabia, two from the adjacent UAE, one from Egypt, and one from Lebanon. In a poll of Saudis taken after 9/11, 95 percent of Saudis agreed with bin Laden's objection to American forces in the region.[57] These facts demonstrate that bin Laden's message reflected the overwhelming consensus in the Saudi Kingdom. Bin Laden and the average Saudi citizen could not contend with American military might, so they utilized terrorism to compel the United States to depart Saudi Arabia. While the war against al Qaeda has grown more complex in the intervening years, one must not lose sight of the war's relatively straightforward origins. From bin Laden's perspective and a large segment of the Arab world, the United States was an occupying power in Saudi Arabia and the only way to compel it to leave was for al Qaeda to use the only effective tool at its disposal: terrorism.

Some acknowledge that the U.S. military presence in Saudi Arabia explains al Qaeda's initial decision to target the United States, but argue that

the current U.S. military presence plays a less significant role in souring Muslim popular opinion and motivating many to support or join movements such as al Qaeda. It is certainly accurate to suggest that bin Laden has adopted a much longer list of grievances in recent years in order to broaden his appeal. However, it would be erroneous and unwise to minimize the continuing radicalizing impact of the U.S. military presence in the Middle East and especially in Iraq. While it is not the purpose of this chapter to argue the wisdom or folly of the 2003 U.S. invasion of Iraq, Rohan Gunaratna's 2002 warning that an invasion of Iraq "will create the conditions for a fresh wave of support for Islamists" seems to have been born out.[58] Saddam Hussein is dead and Iraq will not threaten its neighbors with conventional military forces for at least 10–15 years, but these positive developments have come at significant cost. The continuing U.S. military presence in Iraq appears to be serving as a major source of radicalization and recruitment for al Qaeda within Iraq and throughout the region.[59] A poll of 4,000 Iraqis found majorities in Mosul, Kirkuk, Tikrit, and the mid-Euphrates regions who responded that the United States "should leave immediately." The numbers in non-Sunni or mixed regions echoing this sentiment, while not majorities, were still substantial.[60] Outside of Iraq, 8 out of 10 respondents polled in 2004 in Jordan, Syria, Palestine, and Egypt characterized U.S. coalition operations in Iraq as "terrorist."[61] While these statistics do not represent proof of radicalization, at a minimum they reveal a widespread opposition to the U.S. military presence in Iraq that most likely provides fertile soil for radicalization to thrive.[62] Pictures of U.S. military missteps in Abu Ghraib and Haditha, and images of U.S. soldiers lounging in Iraqi mosques prominently displayed on jihadi Web sites, only exacerbate the impact of the U.S. presence. In the minds of susceptible populations, these pictures likely provide powerful confirmation of the jihadi story: "The enemy invaded the land of our umma, violated her honor, shed her blood, and occupied her sanctuaries."[63] While it is difficult to measure the negative impact of the U.S. military presence in Iraq or the recruitment successes this has enabled, early indications seem to suggest that the U.S. military presence in Iraq may well be creating deeper and wider pools of recruitment for al Qaeda.

Some may use these unfortunate developments precipitated by the U.S. invasion of Iraq as an argument to rapidly withdraw from Iraq. However, at this point, a rapid U.S. withdrawal before Iraqi security forces are self-sufficient would inflict long-term damage on U.S. credibility and its ability to deter enemies. This would also facilitate al Qaeda's objectives. Bin Laden and other jihadists would declare the U.S. retreat from Iraq as another example of U.S. cowardice in the face of determined resistance.[64] There exists a compelling argument that U.S. withdrawals from Lebanon in 1983–84 and Somalia in 1993–94 emboldened jihadists and increased the

likelihood of attacks. Bin Laden refers to the U.S. withdrawals from Lebanon and Somalia, saying, "The Americans ran away from those fighters who fought and killed them. . . . So America left, dragging behind its tail in humiliation, defeat, and loss, without looking back. . . . So America and its allies fled in the dark of the night."[65] In Iraq, the United States has demonstrated that it will stand and fight in the face of adversity when it believes that its core interests are at stake. U.S. determination in Iraq has done much to counter previous jihadists' perceptions of the United States as a "paper tiger" that appears invincible in the media but cannot endure casualties or sustained combat. If the United States leaves prematurely, these gains will be lost and Iraq will join Vietnam, Beirut, Aden, and Somalia in the jihadi mantra regarding U.S. weakness.

A premature withdrawal from Iraq would also directly facilitate al Qaeda's objectives. In the previously mentioned letter to Zarqawi intercepted by U.S. forces in Iraq, Zawahiri lays out al Qaeda's four-stage strategy in Iraq. He argues that al Qaeda in Iraq should first "expel the Americans from Iraq." Once the Americans are gone, al Qaeda in Iraq should establish an Islamic authority or emirate, and eventually a caliphate. Third, once this is achieved, the "faithful" should extend the "jihad wave to the secular countries neighboring Iraq." Finally, al Qaeda in Iraq would prepare for a clash with Israel.[66] This extraordinary glimpse into al Qaeda's strategy reinforces the notion that the United States must make every effort to equip the Iraqi government to defeat al Qaeda in Iraq after the United States departs.

Some might cite this al Qaeda strategy as a reason for the United States to stay in Iraq indefinitely. After all, if al Qaeda's objective is to drive the United States out of Iraq, why should the United States leave any time soon? The United States should leave Iraq as soon as the Iraqi government can operate independently because nothing will undercut the "jihadist" message more successfully, or salvage U.S. credibility in the Middle East more effectively, than a complete, unambiguous, and properly timed U.S. departure from Iraq. Once the United States departs Iraq, al Qaeda in Iraq will be forced to target fellow Muslims in order to implement the second and third stages of Zawahiri's strategy. Overthrowing the Iraqi government will require a large number of attacks on Iraqi (Muslim) security forces and political leaders. This will dramatically undercut al Qaeda's popularity in the world, depriving them of the popular Muslim support that Zawahiri recognizes as essential to al Qaeda's success.[67]

If the United States departs Iraq—leaving behind a self-sufficient moderate Islamic government—it will place al Qaeda on the horns of dilemma. If al Qaeda attacks the moderate Muslim government in Iraq, al Qaeda's popularity will plummet, allowing the Iraqi government—with U.S. weapons, intelligence, financial assistance, and training—to ultimately defeat the al Qaeda insurgency. If al Qaeda decides that it cannot attack the

Iraqi government for fear of estranging popular Muslim opinion, then al Qaeda's entire strategy will have been undermined. Zawahiri's letter demonstrates serious concern over popular Muslim perceptions of al Qaeda. In this letter, Zawahiri warns Zarqawi against "slaughtering the hostages" and attacking Shia Muslims and their mosques because these activities will turn popular Muslim opinion against al Qaeda. Zawahiri reiterates his point, saying, "I repeat the warning against separating from the masses, whatever the danger. ... I say to you that we are in a battle, and that more than half of this battle is taking place in the battlefield of the media."

This analysis of the Arab–Israeli crisis and the U.S. presence in the Middle East demonstrates that both factors incite popular hostility against the United States, which in turn empowers and sustains al Qaeda. The United States wisely seeks to kill or capture the leaders of al Qaeda and associated movements. However, if the United States does not simultaneously address the engines of radicalization that are transforming many of today's Muslim children into tomorrow's terrorists, U.S. political leaders will unnecessarily bequeath this struggle to our children.

**THE WAY FORWARD**

Identifying a problem constitutes an essential first step in developing a solution. The current U.S. grand strategy misdiagnoses the causes of radicalization and terrorism. Consequently, the NSCT proposes the wrong prescriptions. While some political, psychological, sociological, and ideological maladies prevalent in much of the Muslim world may contribute to radicalization and terrorism, they do not serve as the primary catalysts. A virtually unlimited supply of "jihadi" interviews and statements, as well as public opinion polls, demonstrates that the Arab-Israeli crisis and the U.S. military presence in the Middle East serve as preeminent catalysts for radicalization and terrorism.[68] While political authoritarianism, sociological shortcomings, and perversions of the Islamic faith may exacerbate the impact of these causes of radicalization, there is little evidence to suggest that these factors would independently lead to radicalization and terrorism. Without the existence of the Arab-Israeli crisis and the U.S. military presence, many of these factors would fade into virtual irrelevance.

Furthermore, the United States has minimal ability to significantly or precisely alter the cultural characteristics or the religious interpretations of the Muslim world. Persuasive speech requires that the audience perceives the speaker to be credible. In the view of many Middle Eastern Muslims, the United States has virtually no credibility. Thus, U.S. public diplomacy efforts to "sell" tremendously unpopular U.S. policies in the Middle East or U.S. efforts to "reform" Islam inspire more contempt than

progress. Cultural and religious evolution takes generations, not one or two presidential terms. The United States cannot contribute, in any significant way, to short-term cultural or religious progress in the Middle East. What it can do is dedicate all of its available resources to resolving the Arab-Israeli crisis and reducing the U.S. military presence in the Middle East to the absolute minimum.

### Peace in the Middle East

As a sovereign nation, Israel has a moral and legal right to live in peace and security within its borders. The persecution of Jews throughout history and the horrific events of the Holocaust increase the legitimacy and necessity of a Jewish state. Recent statements by Mahmoud Ahmadinejad, the Iranian president, asserting that Israel should be "wiped off the map" and that the Holocaust is a "myth" demonstrate that severe threats to Jews and the state of Israel persist.[69] Furthermore, Israel is an important and valuable friend of the United States. However these truths must not obscure the fact that the Israeli occupation of the Palestinian territories represents a major source of radicalization. Admittedly, Israel does not occupy the Palestinian territories out of territorial ambition. The repeated attacks on Israel—whether in the form of suicide bombings of innocent Israelis on buses or the indiscriminate and terrorizing rocket attacks lobbed from Gaza or southern Lebanon—have necessitated and justified an Israeli response. However, as many Israelis and international observers are beginning to recognize, it is not in the long-term interest of Israel or the United States for the Israeli occupation of the Palestinian territories to continue.[70] An Israeli departure from the Palestinian territories will not satisfy the most radical members of al Qaeda and its associated movements who seek to wipe Israel completely off the map. A permanent Israeli departure from the Palestinian territories will also not eliminate international terrorism in the short term. However, a permanent Israeli departure from the Palestinian territories and a final return to the 1967 borders will allow Israel to reclaim the moral high ground and shift popular Muslim opinion in a positive direction. This step will not eliminate the short-term threat presented by al Qaeda and its associated movements, but it will represent an enormously significant step in reducing the radicalization of future generations.

The United States must commit itself rhetorically and substantively to the viability of Israel—an Israel living in peace and security within its 1967 borders. At the same time, the United States must apply increasing pressure on Israel to leave the Palestinian territories. While this act will mollify much of Muslim public opinion, radicals will continue to terrorize and attack Israel. Terrorist groups and radical "jihadist" leaders will attempt to completely destroy Israel, and some terrorist leaders will

attempt to retain their mass popularity and solidify their leadership positions atop terrorist organizations by conducting attacks to entice Israel to reoccupy the territories. Therefore, the United States must work with Israel and moderate Muslim governments to minimize the ability of radicals to undercut a permanent peace between the Israelis and the Palestinians. Until the Palestinian government can properly police its own territory, the United States should work with moderate Muslim governments to identify capable Muslim peacekeeping forces. These forces would patrol the West Bank and Gaza Strip in order to minimize and eventually eliminate terrorist attacks on Israel from these territories.

### Unnecessary and Counterproductive

As this chapter argues, the U.S. military presence in the Middle East serves as a preeminent source of radicalization and terrorism. However, if U.S. interests required a robust military presence in the region, the United States would simply have to manage and mitigate the negative effects of the necessary U.S. presence. Fortunately, this is not the case. The United States has three vital interests in the Middle East, and none of them requires a large U.S. military presence. Unimpeded access to Persian Gulf oil, counterproliferation, and counterterrorism do not require a large network of U.S. bases or a large number of U.S. troops.[71] As the United States departs Iraq in the coming years, the United States should avoid the temptation to maintain an unnecessarily large network of bases throughout the region.

For nearly five decades, the United States protected its vital interests in the Middle East, with virtually no permanent military presence in the region; in the wake of 9/11, the United States should rediscover the wisdom of this strategy. While the robust forward presence of U.S. troops is often necessary and helpful in some regions, it is neither in the current setting in the Middle East. By building the military self-sufficiency of Gulf Cooperation Council countries, developing a Gulf security architecture, expanding existing U.S. pre-positioned stocks, increasing low-visibility military-to-military training, holding regular joint and combined Persian Gulf military exercises, and improving the U.S. nonmilitary counterinsurgency capacity, the United States can dramatically reduce the "footprint" of the U.S. armed forces in the Middle East, while still protecting U.S. interests. Following these steps will dramatically weaken the appeal and resonance of al Qaeda's message to prospective recruits.

### CONCLUSION

In short, an effective U.S. grand strategy must aggressively seek to resolve the Arab-Israeli crisis and must dramatically reduce the U.S. military

"footprint" in the Middle East. Addressing these engines of radicalization will not eliminate terrorism in the short term. However, restoring military operations to their optimal role in U.S. grand strategy, correctly identifying the nature of the conflict with al Qaeda, swaying Muslim popular opinion, and addressing the two majors sources of radicalization will ensure that the United States does not bequeath this struggle to succeeding generations. The road ahead will undoubtedly be rough and uncertain, requiring strong political leadership and determination. However, what is certain is that the status quo will continue to create the next generation of terrorists unless bold steps are taken to correct the shortcomings of current U.S. grand strategy. If the United States pursues al Qaeda's leadership while extinguishing the sources of radicalization, the "last gasp" of "bin Ladenism" will come sooner than most expect.

Political leaders should consistently and assiduously solicit and generals should assertively and privately offer the professional military advice that is essential to strategic success. If the military lacks essential resources or personnel to achieve military victory or to support the grand strategy, military officers have a responsibility to inform their civilian superiors. Yet, in the final analysis, political leaders and the grand strategy they develop must govern in every respect the generals and the strategy they pursue.

Lee's Army of Northern Virginia. The Union army could occupy and plunder the Confederate capital and Sherman could cut a path of destruction across the South, but neither of these actions broke the back of the Confederacy and ended the Civil War. Abraham Lincoln understood that the center of gravity of the Confederacy was Lee's army. That is why Lincoln tirelessly sought a general who would aggressively pursue Lee's army in order to destroy it. Military commanders often reflexively assume that the enemy's center of gravity is either its capital city or its army. However, in a counterinsurgency, the center of gravity is neither.

A tremendous amount of wealth concentrated in the hands of a small aristocracy can distort a nation's GNP per capita. Countries in the Persian Gulf, which do not release such data, probably have higher income disparity than Egypt, but the levels in the Gulf states most likely do not approach the income disparity found in countries such as Brazil, Colombia, or Nigeria. *The Future of Freedom*, 137–138.

51. Suleiman Abu Ghaith, a Kuwaiti spokesman for al Qaeda, echoed bin Laden's views in an essay that appeared on the Internet in June 2002 cataloging the alleged atrocities of the Israelis. He writes, "For fifty years in Palestine, the Jews—with the blessing and support of the Americans—carried out abominations of murder, suppression, abuse, and exile. The Jews exiled nearly 5 million Palestinians and killed nearly 260,000. They wounded nearly 180,000, and crippled nearly 160,000." On the basis of these alleged Israeli atrocities and the American support that made them possible, Abu Ghaith argues that Muslims are justified in killing millions of Americans, even using chemical or biological weapons to exact revenge on the Americans. He asserts, "The Americans have still not tasted from our hands what we have tasted from theirs. . . . We have the right to kill four million Americans—two million of them children—and to exile twice as many and wound and cripple hundreds of thousands. Furthermore, it is our right to fight them with chemical and biological weapons, so as to inflict them with the fatal maladies that have afflicted the Muslims because of the [Americans'] chemical and biological weapons. America knows only the language of force. America is kept at bay by blood alone." *The Osama bin Laden I Know*, 346.

# CHAPTER 3

## THINKING STRATEGICALLY: CAN DEMOCRACY DEFEAT TERRORISM?

Douglas A. Borer and Michael Freeman

The outcome of the United States' global war on terrorism (hereafter GWOT) is yet to be decided. In this chapter we assert that defeat or victory in nearly all wars, including the GWOT, can be traced directly to the strategy on which they were fought. We begin this chapter with a brief discussion of strategy to establish a framework for the analysis of U.S. performance in the GWOT. At its essence, strategy is an iterative or dynamic process, one that is shaped by a given context and defined by the relational environment between various actors. As such, a successful strategy in one situation will most likely be different than a successful strategy in another. In this chapter we present a simple analytical framework, based in large part on that developed by faculty members at the U.S. Army War College. We then turn to a discussion of democracy and democratization as the primary strategy by which the United States has chosen to defeat the scourge of terrorism. This approach, first defined in the 2002 National Security Strategy[1] (NSS), and later reiterated in the 2006 NSS,[2] provides the basis for our discussion. As such, the unifying question for our analysis in this chapter is, can democracy defeat terrorism?

**THINKING STRATEGICALLY: $E \approx W + M$**

Strategy is a weighty word that carries significant influence in any discourse. If something is termed "strategic," our society deems it to be of essential importance. A "strategic plan" is one that will either ensure the success of a Fortune 500 company's wealth—or seal the fate of a

nation-state. In the realm of international politics, things strategic are most often related to grim matters of life and death, peace and war.

A brief review of the literature reveals that strategy means many different things to many different people.[3] Practitioners of military operations may favor Clausewitz's view that "strategy is the use of engagements for the object of war." For students of international relations, Gregory Foster's description, "strategy is ultimately about effectively exercising power," might suffice; unless Bernard Brodie's "strategic theory is a theory of action" is preferred. Military officers, physicists, economists, business leaders, mathematicians, historians, political scientists, and members of other professions have made contributions to the rich body of literature on the subject of strategy.

For lack of a demonstratively superior definition, we have chosen to adopt and adapt the comparatively rigorous approach that is taught to senior officers at the U.S. Army War College.[4] Richard Yarger provides the following succinct summary: "Strategy is all about *how* (ways or concepts) leaders will use the *power* (means or resources) available to the state to exercise control over sets of circumstances and geographic locations to achieve *objectives* (ends) that support state interests."[5] As such, "grand strategy" is fundamentally comprehensive. The strategist must have an all-inclusive vision of what else is happening in the world and a good grasp of the potential interconnected "ripple" effects of various choices. As Fred Charles Ilké notes, "Strategy is not a vocation for stunted minds."[6] Strategists must think holistically, being cognizant of the fact that strategy is never developed in isolation.[7]

The army framework, derived from the realist school of international relations,[8] sees all states as having national interests that they will pursue to the best of their abilities. Vital interests include such things as survival, economic well-being, and the dissemination of national norms and values into the international system. Each state uses its power to promote or advance its national interests, either in cooperation with or in competition against other state actors. Power can be summarized by the "DIME" model, which consists of the diplomatic, informational, military, and economic elements of statecraft. As such, strategy is the pursuit, safeguarding, or advancement of national interests through the application of the DIME instruments of power.[9]

An important antecedent to thinking strategically in the international realm is that some clearly identified political purpose must dominate all strategy. Thus, Clausewitz' famous dictum "War is merely the continuation of policy by other means" is of very real importance. Policy, which is the chief progeny of each state's political intercourse, is where political purposes are embodied. As Yarger notes,

> Political purpose is stated in policy. Policy is the expression of the desired end state sought by the government. In its finest form it is clear articulation

of guidance for the employment of the instruments of power towards the attainment of one or more end states. In practice it tends to be much vaguer. Nonetheless policy dominates strategy by its articulation of the end state and its guidance. The analysis of the end state and guidance yields objectives leading to the desired end state. Objectives provide purpose, focus, and justification for the actions embodied in a strategy. National strategy is concerned with a hierarchy of objectives that is determined by the political purpose of the state. Policy insures that strategy pursues appropriate aims.[10]

Finally, to have a good chance of success, strategy must maintain an appropriate balance among the objectives sought, the methods chosen to pursue those objectives, and the resources available to achieve the methods. In other words, for the strategist, a simple formula must always be manifest in the mind's eye: *ends must be in roughly stable equilibrium with ways and means*, or $E \approx W + M$. The difficulty here is that ends and ways are usually not quantifiable, and even means (the number of tanks, quantity of money, etc.) often do not equate to absolute measures of power in terms of predictable outcomes. In other words, the nation with the most tanks, planes, ships, and soldiers does not necessarily have the greatest power. Thus, even though we have presented here what appears to be a precise and simple equation for strategizing, precision is lacking, thus making strategy a very difficult endeavor.

Indeed, most attempts to quantify the $E$, $W$, and $M$ variables will most likely end in failure; however, not all is lost. To help us gauge the likelihood of our strategy's success, we propose three standards of evaluation: practicality, effectiveness, and legitimacy.[11] Although these standards are intrinsically subjective, they do provide a starting point for calculating strategic risk, and risk assessment is a critical component of any strategic planning process. Accordingly, Yarger observes, "risk explains the gap between what is to be achieved and the concepts and resources available to achieve the objective. Since there are never enough resources or a clever enough concept to assure 100% success in the competitive international environment, there is always some risk."[12] Hence, to evaluate risk, a prudent strategists should ask themselves three basic questions based on these standards while developing a plan.

First, the means test: Is the strategy practical? Are the basic material resources available to achieve the goals? This question is one that military leaders are normally schooled in appraising because the answer is partially quantifiable, and it is one that deals with force ratios and military "science" when war is being considered. For instance, at different points in history, both Napoleon and Hitler ultimately decided that they possessed sufficient ground forces, but lacked adequate naval assets (in terms of sea lift and force protection) to invade Great Britain. The risk of failure was not in defeating the British Army on British soil, but rather

in getting those ground forces from continental Europe to the island of Britain through the protective screen of the Royal Navy. Both Napoleon and Hitler determined that sufficient naval resources were not available, thus neither attempted a crossing of the channel. The risk of failure was judged as being too high. In short, invasion of Britain did not pass the means test for either tyrant.

What if, however, sufficient material means are deemed to be available? The second, (and often much more difficult) question for the strategist is the "ways" test: Are the concepts (ways) likely to be effective? Are the methods under consideration for marshalling state resources likely to produce the desired outcome? Also, is it the best way? As illustrated by hindsight on the Cold War, George Kennan's concept of "containment" ultimately proved successful at defeating the very serious threat to the United States posed by the threat of Soviet-based communism. Even though successive U.S. presidents emphasized the elements of DIME to different degrees during their respective administrations, the fundamental concepts and methods outlined in George F. Kennan's famous 1946 "long telegram"[13] provided the intellectual continuity, or the central "way," for organizing and directing American efforts for every administration from 1947 to 1991, Republican or Democrat. In retrospect, "containment" will ensure Kennan's membership among history's small pantheon of truly elite grand strategists. The question today for American strategic thinkers is, can *democractization* serve as the best concept, or the correct "way," to defeat terrorism? We will explore this in depth below.

Finally, the strategist must always ask, Are the ends, ways, and means legitimate? This third standard for evaluation, or the "political litmus test," is an especially important concern for leaders of democracies, whose right to lead is embedded in—and ultimately dependent on—the approval of their citizens. One can imagine that shortly after the 2001 September 11 terrorist attacks, discussions in the administration of George W. Bush included a broad scope of options available for responding to al Qaeda. One available option was going nuclear. Indeed, if the desired end was the physical destruction of Osama bin Laden and the main elements of al Qaeda's leadership cadre, dropping two nuclear bombs on Afghanistan— one in Kabul and one in Kandahar—would have had a very high probability of success. However, because of the indiscriminate nature of these weapons, and the very likely high casualty toll among innocent Afghans, it is clear that such a U.S. response would have been deemed highly illegitimate not only by the international community but also by the vast majority of the citizens of the United States. The United States would have quickly morphed from being the victim of a horrendous crime to being the perpetrator of an even greater act of cruelty. Maintaining the moral high ground, and passing the legitimacy test, is a vital imperative for the broad-thinking strategist.

## DEMOCRATIZATION: A GRAND STRATEGY OF TRANSFORMATION?

In the turbulent wake of the 9/11 attacks, policymakers in the inner circle of President George W. Bush's national security team were faced with the immediate task of responding to Osama bin Laden's al Qaeda terrorist network. As a result of its partnership with the Taliban regime in Afghanistan, the decision to invade Afghanistan was a relatively straightforward one.[14] However, what was remarkable about Afghanistan was how smoothly the entire military operation went, how quickly the Taliban collapsed, and how the "American model" of government seemed exportable even to the far reaches of the Hindu Kush. As the eminent historian of U.S. foreign policy John Lewis Gaddis observes, "The Bush administration got a taste of Agincourt with its victory over the Taliban at the end of 2001, to which the Afghans responded by gleefully shaving their beards, shedding their burkas, and cheering the infidels—even to the point of lending them horses from which they laser-marked bomb targets. Suddenly, it seemed, American values were transportable, even to the remotest and most alien parts of the earth."[15]

As the Bush administration saw it, the problem was not, however, simply Afghanistan. Rather, terrorism itself had morphed into an entirely new and dangerous phenomena. Even though murder, bombings, and various other forms of political violence have been in existence since ancient times, the actions of individuals and small groups had rarely been able to undermine the security and well-being of entire states and societies. In contrast, September 11 had convinced Bush that today's superempowered individuals had the ability to deliver levels of destruction hitherto unheard of in the annals of terrorism.[16] If 18 men armed only with box cutters and a clever plan could shake the foundations of American capitalism and government, imagine what they might do with nuclear, chemical, or biological weapons?

To prevent another 9/11, the scourge of terrorism had to be cut off at its roots, and the root cause of terrorism, as the president saw it, were the reactionary/authoritarian regimes in the Middle East. These regimes—which included both America's traditional allies and its sworn enemies—were perceived to be the crucibles of terror and terrorists, because they produce generation after generation of citizens who, being both underemployed and unrepresented by governments characterized by cronyism and corruption, are easily radicalized by the likes of bin Laden. As such, an audacious and ambitious strategy was formulated by the Bush White House, one that Gaddis describes as "a grand strategy of transformation."[17] Bush's approach was nothing less than "a plan for transforming the entire Muslim Middle East: for bringing it, once and for all, into the modern world. There's been nothing like this in boldness,

sweep, and vision since Americans took it upon themselves, more than half a century ago, to democratize Germany and Japan, thus setting in motion processes that stopped short of only a few places on earth, one of which was the Muslim Middle East."[18]

Certainly we concur with Gaddis that, in terms of "sweep and vision," President Bush has laid out a commendable "end" for American strategy in the GWOT. Nevertheless, we are determined to ask, How does the present U.S. strategy fare when evaluated by a rigorous risk assessment? Does Bush's "grand strategy of transformation" pass the practicality, effectiveness, and legitimacy tests, or is there an imbalance between ends, ways, and means? If an imbalance exists, can it be corrected?

## PRACTICALITY

We begin by asking the means test question. Is democratization practical as a strategy? If states can actually influence the regime type of other states, what means can they or would they use? Within academic and policymaking circles, there is a large body of literature on the topic of democracy promotion, with most experts focusing on the use of diplomatic, informational, and economic means. These means can be used to promote civil society, support an independent media, strengthen the rule of law, reduce corruption, promote decentralization, advance civic education, and promote public-interest advocacy.[19] The question is whether any of these approaches work; or more accurately, do these efforts make democratization more likely than it would have been otherwise? Thomas Carothers, an expert on democracy promotion, is noticeably sanguine in observing, "By the late 1990s . . . it was increasingly evident that many of the efforts to achieve positive political change around the developing and post-communist worlds were proving much harder and more problematic than expected."[20] A gradualist democratic opening is "attractive to Western policymakers, [but] it is difficult and has been only rarely achieved around the world."[21]

Under the Bush administration, military force has been the primary means by which democratization is expected to take place. The invasion of Iraq (and Afghanistan to a lesser degree) has been justified in part by the need to transform the regime into a democracy, in order to ensure that terrorists based from those territories do not attack the United States. At the core of this strategy is the assumption that political change can be achieved under conditions of military occupation; history lends some support to this claim. After all, the Allied powers successfully transformed the defeated powers of Germany and Japan into liberalized democratic states. Nevertheless, some scholars suggest the prospects for successfully using military force to occupy a country and then establish a democratic regime are not good. Eva Bellin argues that the cases of Germany and

Japan should be seen more as exceptions than the norm, and so should not be used as models for Iraq or elsewhere. She posits that Iraq lacks eight characteristics that were present in Germany and Japan and were important factors in the implementation of democracy: economic development, ethnic homogeneity, effective state institutions, historical precedents, national leaders, a psychological state of defeat, the full commitment of the occupying state, and a free hand for the occupier.[22] She argues that a more analogous model to Iraq is Haiti, in which the United States militarily intervened to restore democracy, but which "is still characterized by chaos and instability."[23]

Is Bellin correct? Alternatively, it can be argued that the use of military force might be beneficial for regime change and democratization, because this process requires the security and stability that military forces can provide. Indeed, for democracy to take hold in a highly divided society, the citizens of a country must be free from violence and intimidation before they will engage in the political process. If a government cannot protect its own populace, the population will turn to local power brokers or warlords to provide security, and democracy will be stillborn. The ravages of unchecked violence not only hinder democracy, but also undermine any sort of national collective identity upon which consensus and peaceful conflict resolution can take hold.

Unfortunately, in Iraq, thus far military occupation has apparently destabilized the country. While living under Saddam Hussein's regime was undeniably brutal, stability did exist under the threat of an iron fist. Iraqis have unwillingly traded the predictable violence from their government for unpredictable violence from their neighbors. Civil war is now occurring. From the very beginning, the only options for providing security and stability in Iraq were U.S. military personnel, other international forces, or by Iraq's own troops and police. The question of *how many* troops would be enough is always a matter of debate. While serving as CENTCOM's leader in 2000, Marine General Anthony Zinni had put together OPLAN 1003-98 for the invasion of Iraq. This plan called for a minimum of 380,000 troops and foresaw an occupation that would last as long as 10 years.[24] Zinni's estimate of the necessary troops was in sharp contrast to that of Doug Macgregor, a retired army colonel (and Rumsfeld favorite), who argued that Baghdad could be attacked with as few as 30,000 troops and taken within two weeks.[25] Eventually, under constant pressure by Secretary of Defense Rumsfeld, Zinni's successor at CENTCOM, General Tommy Franks pared the number of U.S. forces that would be used to launch the war in 2003 to between 150,000 and 200,000[26]—a number that, in retrospect, has proven inadequate for the task, especially after Ambassador L. Paul Bremer, the head of the Coalition Provisional Authority, made the misguided decision to disband the Iraqi

Army, which had been part of both Zinni's and Franks' presumed security forces.

Secretary Rumsfeld's position on Iraq was clearly influenced by the relatively tiny "footprint" of U.S. soldiers in Afghanistan, where a very small number of special operations troops directing air strikes, combined with indigenous ground forces of the Northern Alliance, worked in perfect concert to overthrow the Taliban. Afghanistan seemed to confirm Rumsfeld's notions of military transformation, which envisioned lighter, faster, and technologically enabled troops whose increased lethality would more than compensate for their small numbers. This vision of future warfare, which had been promoted by defense intellectuals like Doug Macgregor, had been resisted by much of the conventional army.

In retrospect, the intellectual disconnect between various analysts here is a remarkable one. For military planners like General Zinni, OPLAN 1003 was based on the assumption that it would take significantly more troops to secure peace than it would to overthrow the regime and defeat Saddam's available forces. In other words, Zinni did not necessarily question the lethality of today's American forces, but he did clearly understand Clausewitz's most fundamental concept: war is the extension of politics my other means. As such, the old concept of *mass*, or large number of troops, remains relevant—not to win the clash of arms on the battlefield, but to win the peace afterward. Even though the final chapter in the story on Iraq is yet to be told, it is now clear that the Bush administration's choice of conventional military means was drastically underresourced in terms of troop numbers—not in terms of those required to destroy Iraq's conventional military capacity, but in the number required to provide security and stability afterward. A secure and stable environment is required for democracy to emerge.

In addition, one must recall that the practical financial and human costs of the war in Iraq are not insignificant: the United States has spent over $432 billion since September 2001,[27] with around $200 million being spent every day.[28] On the human side, as of May 15, 2006, U.S. military casualties numbered over 2,500 dead and 18,000 wounded in Iraq and Afghanistan.[29] These costs have thus far been tolerated by the American populace and their representatives in Congress, but came under renewed scrutiny after the 2006 elections. However, without clear successes to show the masses, any prudent American strategist considers public support as fickle. The longer the war continues, the greater the risk incurred. President Richard Nixon—who, despite his other flaws, often demonstrated a keen insight into the American body politic—once astutely observed, "When a president sends American troops to war, a hidden timer starts to run. He has a finite period of time to win the war before people grow weary of it."[30]

### EFFECTIVENESS

Is spreading democracy likely to be effective as a way of reducing the threat of terrorism? In this section we argue that democratization is unlikely to be an effective method because (a) it will not undermine the root causes of terrorism, (b) it will create more targets for terrorists, (c) it will weaken the response of states, and (d) it might produce fewer willing allies for fighting terrorism.

How would democracy be effective at undermining the causes of terrorism? For al Qaeda and like-minded groups, their openly articulated grievances are to restore *sharia* (Islamic law) and eventually the historic caliphate in the Islamic world. To do so, they wish to change existing governments, who they view as illegitimate and apostate. They have recognized their inability to defeat the "near enemy" (their own governments) before first defeating the "far enemy" (the United States) that has been propping up illegitimate regimes. According to bin Laden, "Every one agreed that the situation can not be rectified (the shadow cannot straighten when its source, the rod, is not straight either) unless the root of the problem is tackled."[31] The United States, and West more broadly, has become a target not just because of its support for countries like Saudi Arabia and Israel, but also because it has (in the minds of al Qaeda) physically occupied places such as Saudi Arabia, Kuwait, and now Afghanistan and Iraq. In 1996, bin Laden declared that "the latest and greatest of these aggressions . . . is the occupation of the land of the two Holy Places [Saudi Arabia] . . . by the armies of the American Crusaders and their allies."[32]

Would spreading democracy to these regions somehow ameliorate al Qaeda's complaints against the United States and its "moderate"[33] Islamic allies? It is hard to imagine how this would be true. At best, the spread of democracy would be irrelevant to al Qaeda's grievances over real or perceived occupation, and at worst, it would be counterproductive. If Saudi Arabia or Egypt suddenly became more democratic overnight, this by itself would not change the relationship between these countries and the United States and, much to the consternation of the jihadists, may actually strengthen those close relationships, which is the source of their complaint. The spread of democracy, moreover, may actually be counterproductive in terms of ameliorating the causes of terrorism, if this strategy requires the concomitant deployment of U.S. military forces to effect "regime change" as in Iraq and Afghanistan. Whatever one thinks of al Qaeda's "perception" of occupation in Saudi Arabia, the actual presence of hundreds of thousands of foreign military personnel removes any ambiguity in Iraq. Not surprisingly, the U.S. invasion of Iraq has become a ready symbol tailor-made for al Qaeda recruitment.

In general, some proponents of democratization argue that democracies are better (i.e., less violently) able to resolve nationalist disputes over

perceived occupations because they have mechanisms such as plebiscites and referenda through which minority populations might achieve some level of confederation, autonomy, or even independence.[34] In the case of al Qaeda, these "democratic" assets would be irrelevant, though, because al Qaeda does not represent an irredentist or nationalist minority seeking independence from a state, but rather, they act as the vanguard of the entire Islamic religion, and not an isolated ethnic group.

Likewise, spreading democracy would probably do nothing to mitigate al Qaeda's grievance over the insufficiently devout regimes in the region. Some might argue that potential jihadists would be less likely to turn to terrorism if they could achieve their aims through peaceful, democratic means. While some Islamic reformers would accept democracy as a legitimate political system, and would be willing to work within that system, the jihadists do not accept the legitimacy of democracy, because it gives sovereignty to the populace rather than to God.[35] In all likelihood, the spread of democracy would further enrage jihadists, because it is a move even farther away from the establishment of sharia.

While democracy would probably do little to mitigate the expressed grievances of al Qaeda (and would more likely make things worse), perhaps democracy can alter the underlying systemic conditions that act as permissive (rather than explicit) causes of terrorism.[36] Within the literature on terrorism causes, two of the most frequently mentioned conditions that make terrorism more likely are poverty and political frustration. As President Bush has argued, "we fight against poverty because hope is an answer to terror."[37] On closer scrutiny, however, the link between poverty and terrorism is weak.[38] In his pathbreaking study of the demographics of Islamic terrorists, Marc Sageman found that most of them are generally well-off compared with their own populations, and that "three-fourths of global Salafi mujahedin were solidly upper or middle class."[39] Likewise, Alberto Abadie found that "terrorist risk is not significantly higher for poorer countries."[40] Even if poverty was a permissive cause of terrorism, it is unclear how spreading democracy would alleviate poverty. Whether regime type or economic growth are even related causally or correlatively is also debatable, with Przeworski et al. finding that "political regimes have no impact on the growth of total income," nor that economic development leads to democracy.[41]

Another permissive condition that is frequently noted as a contributing factor to terrorism is political frustration. When a state is ruled by a corrupt or illegitimate authoritarian regime, citizens might be frustrated by their inability to fairly participate in the political process.[42] The conventional wisdom is that when citizens have no way to peacefully voice their dissent and achieve political change, they will resort to violence to do so. With the spread of democracy, it is assumed that new, peaceful avenues of dissent will be opened up and make violence less necessary. The

problem with this argument is that it may misrepresent the core problems of authoritarianism. It is easy for those in the West to point to the lack of liberty as the fundamental issue with authoritarian governments; yet for extremists, the problem with authoritarianism is its injustice—injustice that can be remedied by the only just legal code, the sharia. In other words, as Olivier Roy has argued, extremists (and others) seek justice from the political domain, rather than individual liberty.[43] Moreover, anything other than sharia—whether democracy or godless authoritarianism—is equally unjust and therefore illegitimate. In sum, the spread of democracy might alleviate some generalized feelings of political frustration, but for those that see only sharia as a legitimate system of justice, democracy would be no better than authoritarianism.

Are terrorists more likely to attack a democracy than an authoritarian state? There are two reasons to think that democracies make easier targets. First, operations within democracies are easier to plan and undertake. As many scholars have noted, carrying out terrorist strikes are facilitated by democracy's freedoms of speech, movement, and association and are further enabled by such legal constraints as the presumptions of innocence and rights of due process that limit the power of the state.[44] Taken together, these features of democracy make it easier for terrorists to mobilize their supporters, gain awareness for their cause, organize their operations, plan and train for an attack, and resist the coercive powers of the state if captured. This argument is supported by the work of Eubank and Weinberg, who have looked extensively into the connection between terrorism and democracy (as a target of it). They have found that "the likelihood of terrorist groups occurring in democracies is three and one half times greater than their occurrence in non-democracies."[45] As Audrey Kurth Cronin puts it, "The weight of the available evidence, as presented in descriptive historical reviews and quantitative studies, leads to the disappointing and unexpected conclusion that terrorism has been more predominant in democratic states than in states with other types of regimes."[46] In terms of specific examples, Robert Pape makes the point that Kurds, who live in both Turkey and Iraq, have exclusively targeted only democratic Turkey and not authoritarian Iraq. While this may be because democracies are seen as more susceptible to coercion (more on this shortly), it also highlights the greater ease with which they can operate in a democracy.[47]

A second reason democracies would be more likely to be targeted by terrorists is that democracies are seen as more coercible and less resilient, making their capitulation to terrorists' demands more likely. Pape claims that terrorists "often view democracies as 'soft,' usually on the grounds that their publics have low thresholds of cost tolerance and high ability to affect state policy." He notes that whether this perception of democracies is true or not does not really matter; it is this "image" or perception of

democracy in the minds of terrorists that will lead them to focus their campaigns against democratic states.[48]

Are democracies better or worse than authoritarian states at responding to terrorism? There are two reasons to think that democracies are worse. First, there is the widespread view that the freedoms and liberties in democracies constrain how they fight terrorism. This argument is the natural justification for the measures undertaken by the United States since 9/11—measures such as the use of military tribunals, the designation of individuals as enemy combatants, and the loosening of restrictions on communications surveillance. The logic is that if the country was just a little bit less democratic, then it would have a better chance of defeating the terrorists. Doing this, though, could be a permanent infringement of civil liberties; the solution (that dates back to the Roman Republic), then, is to suspend or modify these liberties *temporarily*, or only for as long as the emergency persists. Emergency powers are a compromise that allows the government to ensure the security of the state while limiting the damage to liberty and democracy. However, when democracies do become slightly more repressive (by being less concerned with liberties), they may actually make terrorism worse because of the relationship between repression and violence. At both high and low levels of repression, violence is minimized, but at the middle, violence is at its worst. In fact, Abadie draws from empirical evidence to conclude that "countries in some intermediate range of political freedom are shown to be more prone to terrorism than countries with high levels of political freedom or countries with highly authoritarian regimes."[49] It is this intermediate range where states will not use enough repression to eradicate terrorists, but will use enough to provoke a negative reaction to their policies that will serve to further mobilize support for the terrorists. As Wilkinson observes, "If the government is provoked into introducing emergency powers, suspending habeas corpus, or invoking martial law . . . there is always the risk that by using heavy repression to crush the terrorist campaign the authorities may alienate the innocent majority of citizens caught up in the procedures of house-to-house searches and interrogations."[50]

A second reason that spreading democracy may also be ineffective is that it might weaken the state in relation to society and therefore make its response to terrorism less coherent and less effective. The apparatus of the state is often weaker in a democracy than in an authoritarian regime because democracies govern more on the basis of rule of law than on the basis of the state's inherent power. This, of course, is a broad generalization, which may not be true in many cases. Nevertheless, the evidence from Afghanistan and Iraq, at least, supports this notion. In Afghanistan, the Taliban was effective in establishing law and order in a way that previous regimes and the current, democratic ones have not been able to do. The journalist and author Jason Burke compares driving from Kabul to

Kandahar in 2003 to the late 1990s. In 2003, there were kidnappings, bandits, and aid workers being shot along the road, all of which led him to choose to fly between the cities instead of driving. He writes, "The contrast with the security under the Taliban ... was strong."[51] The case of Iraq provides an even more striking example of the weakness of democratic states in projecting the power of the state throughout the country. Even with the presence of U.S. soldiers and a (somewhat) reconstituted Iraqi police and army, Iraqis now are less safe and secure than they were under Hussein, with constant bombings, attacks, and general lawlessness throughout much of the country.[52] Indeed, by June 2006, Iraqis were dying at the rate of over 3,000 a month, with over 50,000 killed since 2003.[53]

How would the democratization of the Middle East affect the United States' generally positive relationships with the countries (Egypt, Saudi Arabia, Jordan, etc.) in the region? There are three reasons to think that the United States will have better alliances with the current regimes than with future democratic ones. First, democratically elected regimes might not view the United States in as positive a light as do the current regimes, and new democratic governments would be less likely to work with us as allies. As Gregory Gause points out

> The problem with promoting democracy in the Arab world is not that Arabs do not like democracy; it is that Washington probably would not like the governments Arab democracy would produce. ... Further democratization in the Middle East would, for the foreseeable future, most likely generate Islamist governments less inclined to cooperate with the United States on important U.S. policy goals, including military basing rights in the region, peace with Israel, and the war on terrorism.[54]

The recent democratic rise to power of Hamas in Palestine provides an illustrative case. Already, there are issues over how Hamas will work with Israel in terms of the peace process, and how the international community will deal with Hamas diplomatically and in terms of financial assistance.

Second, democratically elected regimes (e.g., Hamas, Hizbollah's elected representatives in the Lebanon's parliament) might actually support and sponsor terrorism. In other words, not only might they not be U.S. allies, they may actually become enemies. Islamic extremist parties may come to power and change the foreign policies of their country—much like the Iranian revolutionaries did in Tehran after 1979—and then fund, support, and use terrorists as proxies for their political battles with other countries, including the United States.

On the other hand, the constraints of actually being in power, rather than being in opposition, may actually moderate the extremism of radical Islamists. Having to work with other states and provide social and

political goods for an entire citizenry, rather than just their narrow constituency, may make extremist regimes act much like moderate ones (just as structural theories of international relations argue that the international system makes all states, regardless of their internal characteristics, act in similar ways). Once again, the recent empowerment of Hamas in Palestine will provide an interesting test for the powers of extremism versus the powers of democracy.[55]

Third, authoritarian allies in the region, especially the ones not committed to human rights, do provide a useful function for the United States by doing some of its "dirty work" for it. This is in no way meant to condone torture or other violations of human rights, but if viewed strictly through the lens of what is seen by some as required for fighting terrorism, the ability to send uncooperative suspects to various allied, authoritarian regimes in the Middle East is useful. With the spread of democracy, liberal states would be more committed to human rights and civil liberties, but less useful to the United States in this strictly utilitarian (albeit morally unpleasant) way.

## LEGITIMACY

The final test for strategy, the legitimacy test, is one that reveals the intricate and often irreconcilable political complexities of international relations. Some strategies that might be effective and practical, thus passing the ways and means tests, might not be seen as legitimate. These kinds of concerns over legitimacy are often even more pronounced in the realm of counterterrorism strategy. After all, states could more easily and effectively defeat domestic terrorism if they became highly authoritarian and repressive police states. But when nations have moved even slightly in this direction—as the United States arguably did after 9/11 with measures such as secret surveillance, military tribunals, and enemy combatant detainees—the acceptability or legitimacy of these actions is quickly challenged. For strategies that are directed outward, such as democratization, similar issues arise.

Issues of legitimacy boil down to the perceptions of what is acceptable, and as such, they depend on who is doing the perceiving. In this case, there are three relevant audiences: the domestic U.S. populace, third-party states (such as traditional American allies), and those foreign states that may be the target of a democratization strategy. For the U.S. domestic audience, the strategy of democratization seems to be widely accepted, with 70 percent of Americans agreeing that spreading democracy is generally seen as a good idea (although half of them think it will not succeed).[56] The idea that democracy is a morally and ethically just political system that best embodies human desires for freedom and equality

goes almost without questioning in Western civilizations, in which liberal ideals predominate.[57] Therefore, spreading democracy to other states is seen as largely legitimate and has been a long-running theme in U.S. foreign policy. Even during the Cold War, when democratization often took a back seat to fighting communism, everything else being equal, democracy promotion was still a desirable goal (just not when it conflicted with more important goals). Clearly, President Bush's "grand strategy" of democratization passes the political legitimacy test for the majority of Americans.

For third-party states—such as France and Germany—the legitimacy of democratization very much depends on the means, processes, and institutional arrangements used to achieve it. In general, democratization is seen as acceptable, especially if it happens organically within a country or through the exercise of soft power (economic, diplomatic, informational, etc.). However, when it is attempted through military means, a strategy of democratization may lose its legitimacy, as witnessed by the reaction of many European (and other) states to the U.S. invasion of Iraq.[58] Democratization by force may be illegitimate because it violates the norm of state sovereignty. Additionally, some of the heavy-handed American tactics used in the "war" on terrorism—such as the use of Guantánamo Bay and Abu Ghraib, and the allegations of torture at both facilities—have eroded the legitimacy of democratization, because the United States is seen as hypocritical in its commitment to liberal norms.[59] This opposition to the use of military force in the name of democratization is not absolute among Europeans, however. Its legitimacy also depends on the perceived need to transform a state's political system. In Afghanistan, the threat of state-protected terrorism was sufficiently high that all member states of NATO accepted not only that al Qaeda needed to be eliminated, but that the Taliban regime needed to be changed so that future Afghan governments would no longer harbor terrorists. What is of critical importance to many countries, especially those in Europe, is that the invasion of Afghanistan was *made* legitimate because it was first vetted, approved, and supported by multilateral institutions, including both the United Nations and NATO. The ends can be justified, but only if the means are proper.

However, for states that are the direct or indirect targets of democratization, the legitimacy of America's strategy is by definition problematic, even for those states have been traditionally aligned with the United States. To the leaders of Saudi Arabia, Egypt, Jordan, Yemen, the United Arab Emirates, Qatar, Kuwait, Pakistan, and other Muslim states, democratization is seen as a direct threat to their rule. Not surprisingly, even though many leaders in pro-U.S. authoritarian states have undertaken some steps toward democratization in the face of renewed international pressure, they have limited the extent of these reforms and sometimes reversed them after a short time.[60] On the other hand, the citizens of

these countries desire more freedom and thus would see democratiza-tion as a legitimate process.[61] Most modernist and secularist movements would welcome increased democratization in places such as Egypt, Syria, or Jordan.[62] Even many Islamist parties have engaged in the political pro-cess and would support democratization if it means that they would have a better chance of wielding more political power. Groups such as the Mus-lim Brotherhood, Hamas, and Hizbollah have enjoyed increased political success in democratic elections.[63] Their long-term commitment to democ-racy, though, is questionable. Are they truly committed to democratic norms, or—as history taught us with the rise of Fascism in the 1930s—are today's Islamists merely using the democratic process instrumentally to gain greater political power?[64]

Despite their acceptance and even desire for democracy, though, these groups might still see a U.S.-supported democratization as illegitimate. As Thomas Carothers puts it, "[Americans] fail to realize how much the United States is perceived in the countries in which it is engaged as tak-ing sides in historical power struggles rather than advancing the abstract principles of democracy."[65] The radical jihadists, more so than any other group, would see democratization as illegitimate. Unfortunately, it is these radical jihadists, not the mainstream Islamists, who use violence and ter-rorism to achieve their goals. So, while democratization may be legitimate for peaceful groups, it will not be seen as legitimate for those engaging in violence. Moreover, the illegitimacy of democracy is one of the grievances of al Qaeda and other groups, and so democracy's illegitimacy also makes U.S. strategy ineffective in the ways described earlier.

A common refrain heard in the last few years is that the way to defeat the Islamic extremists is to do more to support the moderates and their ideology of compromise and accommodation. Cheryl Benard has written that it "seems judicious to encourage the elements within the Islamic mix that are the most compatible with global peace and the international com-munity and that are friendly to democracy and modernity."[66] The logic be-hind this argument is that there is an ideological debate within the Islamic world between secularists and modernists on one hand and fundamental-ists and traditionalists on the other, with opposing views over "political and individual freedom, education, the status of women, criminal justice, the legitimacy of reform and change, and attitudes toward the West."[67] Unless there is a clear ideological victory for the moderates, the extremists will find fertile ground for recruiting people into terrorism from within the fundamentalist or traditionalist camps. The hope in the West is that if the moderates win, it would "drain the swamp" of the ideological sup-port for the extremists willing to use violence and terror to achieve their reactionary aims.

While this idea of supporting the moderates against the extremists sounds promising, it is in fact far from being practical or legitimate, and

calls for a healthy dose of humility by Westerners. Engaging in the "war of ideas" within the Islamic world is an undertaking far more complicated than many people appreciate for several reasons.[68] First, what authority does the West have in the Islamic community to participate—even indirectly—in Islamic theological issues? One might consider a hypothetical situation in reverse.[69] We assert there would be significant nationalistic "blowback" in the United States if outside forces were even indirectly seen as influencing domestic ideologies. American Christians would not take kindly to Jews, Hindus, or Muslims explaining to them just what a "good Christian" should be. Recall the domestic uproar over the real case of the alleged Chinese influence in U.S. elections in the mid-1990s.[70]

A second reason that an American-led attempt to win the war of ideas is both impractical and illegitimate is that other groups that are much better situated to actually fight this war of ideas have not been successful. There are two main actors that would be far more likely to win this war of ideas. First, the existing Islamic state governments (Egypt, Jordan, Syria, Saudi Arabia, etc.) have all engaged in various measures to deal with Islamic extremists, ranging from repression (Turkey) to ambivalence (Pakistan) to accommodation (Egypt) and cooptation (Saudi Arabia). While some of these measures have achieved a certain degree of success, there still remains a large enough minority of Islamic extremists coming out of these countries who subscribe to ideologies that justify using terrorism to threaten the West. It would be imprudent to think the United States would have any greater success against extremist ideologues than the existing regimes in the region, which are at least equally (if not more so) threatened by extremist ideologies.

Ironically, an additional actor that might help win the war of ideas against extremist ideologies is, surprisingly, fellow jihadists. While many people in the West think of the extremists as a monolithic actor, they are in fact far from it, with tensions and outright conflicts between many of the groups. Who are the extremists, and what are their distinctions both internally and from moderates? First, within Sunni Islam (Shia Islam is a whole different story), there are mainstream moderate Muslims who, like the majority of people who practice other religions, go about their daily lives, practicing their religion as they see fit, without much thought on changing the relationship between religion and society or politics. In contrast, the Salafis seek a return to a more puritanical version of Islam based on a stricter interpretation of Islam's original texts and seek the implementation of sharia. Quintan Wiktorowicz has divided the Salafis into three groups: purists, who wish to spread their message through propagation and education; politicos (or Islamists), who wish to engage in the political process to change the laws of the state; and jihadists, who argue that violence is necessary.[71] The acceptance of violence as legitimate means for

change is a useful distinction between moderates (politicos and purists) who eschew violence and extremists (jihadists) who accept it.

However, even within the jihadists, there are large disagreements over the legitimate targets of their violence. According to Fawaz Gerges, the jihadists come in three types (which sometimes overlap).[72] *Irredentist* jihadists fight against foreign occupiers of Islamic lands and would included the mujahideen in 1980s Afghanistan, many of today's Iraqi insurgents, many of the Palestinian groups, and anti-Russian Chechen fighters. The *internal* jihadists believe in targeting their own governments (the near enemy) and would include groups in Algeria and Egypt that were prominent in the 1990s. The *global* jihadists have made the strategic decision to target the West (the far enemy) because they believe they cannot defeat their own governments unless the far enemy withdraws its support. Al Qaeda is, so far, the only transnational or global jihadi movement. Note that al Qaeda is best thought of as a decentralized network consisting of both hardcore and loosely affiliated groups, but also as an ideology of global jihad that has inspired otherwise disconnected individuals to engage in terrorism targeted against the West.[73]

Importantly, the global and internal jihadists fought their own war of ideas during the 1990s. As Gerges shows, the internal jihadists had been essentially defeated by the repressive measures of states such as Egypt and Algeria during the 1990s. As a result, they declared a cease-fire and abandoned the conflict. Osama bin Laden, with the later support of Ayman al-Zawahiri (the leader of the Egyptian Islamic Jihad—an internal jihadi group that joined al Qaeda to become a global group[74]), argued that attacking the far enemy was justifiable and legitimate according to their readings of Islamic texts. This reorientation of the targeting strategy caused a rift within the jihadi community, with global and internal jihadists alike condemning their rivals' strategies as illegitimate.[75] The most interesting point that comes out of this jihadi "civil war" is the inability of any side to win the war of ideas. Despite the condemnations of the internal jihadists, they were never able to entirely discredit the global jihadists. Likewise, the global jihadists were never able to mobilize their potential constituents to the degree that the internal jihadists had in Egypt and Algeria.[76] This should be enormously instructive. For the West to think that it can turn people away from global jihad through an informational campaign, when the jihadists' closest ideological brethren could not, smacks of hubris.

In sum, American-led democratization is legitimate to Americans, possibly legitimate to Europeans, depending on the means, and essentially illegitimate to many Muslims, depending on their outlook. As such, a democratization strategy may work in a specific target country with a given set of conditions, but may be ill-suited for most Muslim countries.

## CONCLUSION: REBALANCING THE EQUATION

One of the critical requirements for policymakers is the willingness to conduct periodic assessments that answer a simple question: is my strategy working? The important point here is to remind ourselves that the strategy equation, $E \approx W + M$, must continually be adjusted by decision makers. As such, some policy objectives (ends) may not be achievable if a working combination of ways and means to achieve those ends cannot be fashioned. If the existing elements and the configuration of strategy are not working, then three choices present themselves to decision makers: (1) strategic ways and means must be reordered and used more creatively and effectively (a new strategic mix with the same ways and means); (2) additional or alternative ways and means must be generated by policymakers to buttress the execution of strategy (it should be noted that ways and means are not always finite—new resources and methods can be obtained or formulated); and (3) policy goals must be abridged to fall within the constraints of the available ways and means.

Given that the United States has now been fighting its GWOT for five years, we conclude with a number of recommendations, none of which will be easy for the Bush administration or its successors in the White House (of either party) to implement. We are confident in observing that military force has thus far proven inadequate for achieving the administration's objective of democratizing both Afghanistan and Iraq. As such, a number of possibilities come to mind. First, reconsider the means. If there are insufficient military forces in Iraq and Afghanistan, one option (in theory) would be to drastically increase the number of U.S. troops. The United States decided in World War II to mobilize the entire country behind the war effort; as a result, from 1941 to 1945, it drafted, organized, trained, and deployed well over 16 million soldiers. A similar option was available to the U.S. government following the September 11 terror attacks, but the Bush administration decided not to take that route, even though, from the outset, it clearly had decided that the governments of both Afghanistan and Iraq would have to be overthrown.[77] However, five years later, it would now be very difficult if not impossible for the Bush administration to change course and radically increase the number of U.S. troops committed to the war. This is not to say that the United States does not have the requisite population, industrial base, and wealth-generating capacity to field a much, much larger military force, but it is highly unlikely any successor president would attempt to do so. Indeed, it is safe to say the country has the capacity, but presently lacks the will, to drastically augment its military troop strength. Unless some catastrophic new event (such as a terrorist use of weapons of mass destruction) were to change the existing climate, the option of throwing more troops into the GWOT does not pass the domestic legitimacy test. Certainly, however, the country

does have the option of increasing the use of its diplomatic, informational, and economic elements of national power.

Likewise, the Bush administration should seriously reconsider a drastic change in the forces it is using to fight the GWOT. Putting the conventional "big Army" in charge of Afghanistan and Iraq has proven to be ineffective at fighting insurgencies in both countries. One problem is that the senior U.S. commanders all come from the conventional side of a force structure that is trained to meet regularly conceived military threats. These individuals are honorable and patriotic men who are operationally brilliant when facing large formations of Soviet-built tanks, infantry divisions, and attack helicopters. Regrettably, this sort of enemy structure was last seen in Iraq more than a decade ago. The first axiom of military strategy is the need to understand the type of fight you are in. If you have a heart problem you don't go to a dentist; you go to a cardiologist. If you have an insurgency problem, you must appoint an expert in irregular war to call the shots. America has now spent as much time in the GWOT as it did in all of World War II, and not a single high-ranking general has been replaced for lack of progress on the battlefield. Putting the U.S. Army's Special Forces in charge of both Afghanistan and Iraq would be a step in the right direction of rebalancing the strategic equation.[78]

Second, reevaluate the ways. It is clear from our preceding analysis that democracy is an inherently risky method for organizing U.S. grand strategy in the GWOT. It may be legitimate to the average American, but it is not likely to be effective or practical. Democratization has brought into elected governments organizations such as Hizbollah in Lebanon and Hamas in Palestine, yet neither group has given up terror. Even though many might contest the notion that Iran is democratic, the government there is chosen by the people in hotly contested multiparty elections; yet Iran remains the single most important sponsor of terror in the world. As such, the emerging wisdom for democracy advocates might be summarized by the statement "Be careful what you wish for."

Third, review the ends. What exactly are the ends of U.S. strategy in the GWOT? In the early days following 9/11, President Bush declared that he would do "whatever was necessary" to protect the security of the United States, and he has since repeatedly restated that most noble and necessary aspiration. However, despite the president's clear articulation that security of the United States is his number one priority, we suggest that his choice to pursue a "grand strategy of democratization," as John Gaddis coined it, has inadvertently muddied the strategic waters significantly and has subsequently made maintaining the rough equilibrium of the $E \approx W + M$ equation nearly impossible. Indeed, the U.S. government seems to have focused on democracy as the only viable, long-term means for achieving security from terrorism. As such, democracy, rather than security, has become an end in itself. This unjustified hope in the deterministic

power of democracy to produce peace has channeled U.S. strategy away from alternative approaches that might prove more effective. Hope is not a viable approach for the making of strategy.

# CHAPTER 4

## TWENTY-FIRST CENTURY INSURGENCIES: UNDERSTANDING THE USE OF TERRORISM AS A STRATEGY

Leonard Weinberg and William L. Eubank

This chapter explores the impact of terrorism on the success or failure of armed insurgencies that the United States is likely to encounter during the twenty-first century. The best way to begin this exploration is by a brief review of the historical record. The record we have in mind is that of the half century following the end of World War II.

If we consider the role of terrorism and terrorist campaigns over this period, we discern three patterns. The first is one in which terrorism is the exclusive type of violence by which insurgents seek to achieve their objectives. For example, in Northern Ireland and the Basque region of Spain, the IRA and ETA waged long-term campaigns aimed at achieving, respectively, the unification of Ireland and an independent Basque homeland. Despite the protracted nature of these struggles, in neither instance did the challengers succeed in raising the level of violence beyond that of clandestine attacks carried out by small groups against unsuspecting targets.[1]

The second pattern is that of an armed insurgency without the use of terrorism. Particularly during national independence struggles against the European colonial powers and the revolutions elsewhere in the Third World in the three decades following the end of the war, guerrilla warfare (as employed by Mao and his followers in China, and Castro and his "bearded ones" in Cuba) was the widely accepted models. In these conflicts, the outposts or representatives of government authority were legitimate targets, but by and large, indiscriminate attacks on noncombatants

remained out of bounds, if for no other reason than it was thought that they did more harm than good. In some instances, revolutionary-minded military officers seized power—as in Egypt and Iraq—and either forced the deposed pro-Western rulers into exile or simply executed them. In neither case, though, did terrorism play a major role.

The third pattern we are able to identify is one in which terrorism is simply one weapon, one arrow in the quiver, at the disposal of an armed insurgency. Examples of these "combined operations" are not hard to come by. The struggle for Vietnam offers two of them.[2] French colonial control over the country was successfully challenged by the Viet Minh in the decade following the end of World War II. The result of this conflict was the temporary division of the country into two parts, North and South, on the basis of the 1954 Geneva treaty. The second conflict, really an extension of the first but with different participants, began in 1960 as a conflict between the Saigon-based and pro-Western government of South Vietnam and its revolutionary challenger, the Viet Cong. The latter received continuous and substantial support from the Communist government of North Vietnam in Hanoi. The United States, under a succession of administrations, made what became an all-out, protracted, and ultimately unsuccessful effort to defeat the Viet Cong and North Vietnamese forces. The latter achieved the unification of Vietnam in 1975 by defeating the armed forces of the Saigon regime (after the departure of American forces).

Descriptions of these Vietnam conflicts usually depict the struggles as involving two phases. The first is that of a guerrilla war, with initially the Viet Minh and then the Viet Cong launching well-planned, small-scale attacks on French, American, and South Vietnamese forces from rainforests and remote mountainous locales, where the terrain itself could offset the insurgents' ostensible disadvantages. The second phase is usually depicted as that of the "endgame"—the 1953 battle of Dien Bien Phu for the French, and the rapid advance of the regular North Vietnamese Army toward Saigon in 1975. In other words, the conflicts involved guerrilla war followed by the use of conventional military forces against a demoralized enemy. What role, then, did terrorism play in the fighting over Vietnam?

For Mao Tse-tung, Vo Nguyen Giap, and other theorists of revolutionary insurgencies in the Third World, terrorism is an attention-gaining tactic—one to be employed, along with other publicity-seeking measures, in the early "agitation-propaganda" phase of the struggle.[3] Once this task is accomplished and the consciousness of the masses is raised sufficiently, the struggle can move to a newer, higher level, producing a more serious challenge to the incumbent regime. Terrorism is then superseded by guerrilla operations.

The fighting over Vietnam did not follow this particular choreography. The Viet Minh continued to use terrorism against the French throughout their unsuccessful attempt to retain control of the country. Terrorism was

used to persuade French civilians and off-duty members of the armed forces that there were no safe places where they could relax and enjoy periods of rest and recuperation from the fighting in the hinterlands. Accordingly, Viet Minh agents threw and planted bombs in restaurants, bars, bordellos, and theaters in Hanoi, Saigon, and other cities.[4]

The same may be said in regard to the fighting over South Vietnam both before and during the American presence. In fact, the Viet Cong did go through an "agitation-propaganda" phase. For instance, as Walter Laqueur reports, "Bernard Fall [a French-American Southeast Asia specialist] relates that he returned to Vietnam in 1957 after the war had been over for two years and was told by everyone that the situation was fine. He was bothered, however, by the many obituaries in the press of village chiefs who had been killed by 'unknown elements' and 'bandits.' Upon investigation, he found these attacks were clustered in certain areas and that there was a purpose behind them."[5]

But the Viet Cong hardly stopped after it became widely known who the "unknown elements" and "bandits" really were and what they intended to achieve. In fact, the pace of Viet Cong terrorism escalated along with the insurgency itself. No systematic data are available, but the U.S. Mission estimated that the Viet Cong carried out approximately 9,700 assassinations of pro-Saigon civilians from 1960 through 1965.[6] The mission did compile a systematic record of Viet Cong terrorist attacks between 1966 and 1969, the period of maximum American involvement in the conflict (see Table 4.1).

Not only are the figures displayed in Table 4.1 extraordinarily high, comparable to or exceeding the levels of terrorism in Algeria during the 1990s or the present situation (2003–2006) in Iraq, but the vast majority of Viet Cong assassinations and kidnappings were carried out against members of the general South Vietnamese public, a type of psychological warfare intended to weaken whatever bonds existed between the Saigon government and its nominal citizens.

Viet Cong and North Vietnamese terrorism was of utmost importance in persuading the American public that the war was unwinnable. For example, consider the January 1968 "General Offensive and General Uprising" (i.e., the Tet offensive), in which Viet Cong forces invaded South Vietnam's major cities and attacked crucial American and South Vietnamese civilian installations and military bases. The most spectacular of these assaults was the suicide attack on the American Embassy compound in Saigon. Viet Cong sappers in civilian dress (some of whom had been working undercover as taxi drivers to disguise their intentions and also become familiar with the city) invaded the compound in the hope of assassinating the American ambassador, Elsworth Bunker. The attack failed in the sense that the ambassador was elsewhere at the time, but the Viet Cong did manage to seize control of a section of the compound and kill a number of guards and civilian personnel, until they were themselves killed in the course of a firefight that lasted several hours.[7]

This terrorist attack, carried out by Viet Cong cadres dressed in civilian clothing in the middle of Saigon, struck at the very heart of the American presence. The attack on the embassy compound was covered extensively by American reporters, whose dramatic television and newspaper accounts of the invasion helped persuade Americans that there was, in fact, no light at the end of the tunnel.

As with terrorist operations in general, there was an element of theater, of show business, in this event. The attack on the compound was a failure in the sense that Ambassador Bunker was not harmed and a small unit of American forces was able to restore complete American control over the compound. However, the Viet Cong clearly achieved a theatrical success: Thanks to the mass media, their audience back in the United States became persuaded of the long-term futility of American involvement.

In other words, in Vietnam the weak had defeated the strong. David had slain Goliath in an asymmetric conflict. As Ivan Arreguin-Toft notes, "When U.S. Marines came ashore at Dan Nang in 1965, the U.S. population was about 194 million, while North Vietnam's was approximately 19 million. U.S. and North Vietnamese armed forces totaled approximately 2.5 million and 256,000 respectively. . . . Multiplying population and armed forces, and dividing the strong actor's total by two results in a relative force ratio of 53:1 in favor of the United States."[8]

Furthermore, the outcome of the struggle over Vietnam is hardly unique. On the basis of data derived from the Singer and Small Correlates of War data set, Arreguin-Toft reports that in a little under 30 percent of 202 asymmetric armed conflicts fought between 1816 and 2003, the weaker side (measured in terms of population magnitude and military size) defeated the nominally stronger one. In addition, the closer in time we get to the present, the better chances the weaker opponent has of defeating the stronger.[9]

The ability of the weak to defeat the strong compels us to ask two questions. Why do the weak defeat the strong in armed conflicts? And why do they appear to be getting better at it? Observers provide us with a number of answers to the first question. Let us review some of them, bearing in mind, as we do, that these answers are not necessarily incompatible with one another.

The duration of the conflict may be worth considering as at least a contributing factor. In an early effort to systematically examine the outcomes of "internal wars" over the first 60 years of the twentieth century, George Modelski came to the conclusion that the challengers' chances of prevailing over an incumbent regime improved as the conflict persisted. If groups fundamentally opposed to the government are able to transform their opposition from rhetoric into armed struggle, and if this struggle persists over time, the opposition has—according to Modelski's calculations—about a 50/50 chance of achieving an outright victory.[10] (Some may detect an element of circularity in this reasoning. The duration of the conflict may be simply a reflection of the strength of an insurgency, or the weakness of the incumbents relative to the challengers.)

The outcome of the Vietnam War calls our attention to another explanation for the defeat of the strong at the hands of the weak. Gil Merom thinks that the nature of the "strong" government or political regime makes a difference. He argues that "democracies fail in small wars because they find it extremely difficult to escalate the level of violence and brutality to that which can secure victory. They are restricted by their domestic structure, and in particular by the creed of some of their most articulate citizens and the opportunities their institutional makeup present such citizens."[11] Democracies, then, often lack the ability to defeat insurgencies because of domestic opposition to the conflict. Mass media portrayals of civilian deaths (i.e., atrocities) along with accounts of mounting casualties suffered by the democracy's armed forces create an antiwar opposition on the home front. It is distressing, but probably true nevertheless, that defeating an insurgency (whose own fighters rarely abide by Marquis of Queensbury Rules or the Geneva Convention) may require engaging in tactics incompatible with the humanitarian values possessed by the best-educated and most articulate citizens of the democracy. These citizens give "voice" to their opposition and encourage others to do likewise. If the domestic opposition to involvement in the insurgency, particularly when the conflict is fought on foreign soil, becomes sustained and widespread, a democracy may lose by essentially defeating itself.

Authoritarian regimes do not suffer from these inhibitions. Because open opposition is repressed and the mass media tightly controlled, dictatorial regimes are better able to defeat armed insurgencies, both those waged at home and abroad. In fact, in Argentina, Uruguay, Turkey, and elsewhere during the 1970s, democracies were toppled by the military

precisely because they had failed to repress armed insurgencies. The new military juntas wasted little time in eliminating these challenges (as well as the challengers themselves) to the existing order.

The increased ability of the weak to defeat the strong in recent decades may be in part a consequence of worldwide democratization. The number of democracies has grown significantly since the mid-1970s, as what Huntington identifies as the "Third Wave" of democratization has swept over regions of the world where this form of rule was unknown or had been tried and failed at earlier times.[12] If democracies suffer from squeamishness and the kinds of inhibitions mentioned above, it follows that the more democracies there are, the better the record of the weak in defeating the strong.

The relationship, though, between regime type (democratic versus authoritarian) and the outcome of armed conflicts does not approach a completely linear type of association. A few examples provide us with grounds for skepticism. During the 1960s and 1970s, the Portuguese dictatorship, whose armed forces were equipped with modern weapons, tried and failed to defeat armed independence struggles waged by groups active in its then colonies in sub-Saharan Africa. In fact, the effort to prosecute these struggles led directly to the overthrow of the Lisbon government. The most obvious and notable example is the Soviet Union's 1988 withdrawal from Afghanistan, a defeat inflicted by local Afghan fighters supported by "holy warriors" from elsewhere in the Muslim world.

Andrew Mack, Richard Snyder, and others answer the question of why big nations lose small wars in a somewhat different way.[13] As in the case of Merom's contention about regime type, the focus is on the domestic situation in the big or strong nation. In many instances the latter will only have limited interests in the outcome of the conflict. When these interests come to be outweighed by the costs—human and material—of sustained involvement, the government at home becomes politically vulnerable. In democracies, this vulnerability typically involves growing support for opposition political parties and the formation of an antiwar movement. In "strong" countries ruled by authoritarian governments, opposition to further participation in the conflict will typically emerge from within the ruling elite. Factions within the ruling elite may very well come to clarify the limited interests at stake and the diminished benefits to be derived from further involvement. The result is often in-fighting among members of the ruling elite, resulting in a decision to reduce involvement in the conflict by those in power—or, if they refuse to change course, their replacement by members of the oppositional faction.

There is also the matter of the weaker side's level of interest to consider. If the "weak"—for example, North Vietnam, the Liberation Tigers of Tamil Eelam in Sri Lanka, Hamas—regard the outcome of the conflict as affecting their fundamental interests, they will be willing to bear very

high costs in continuing its armed struggle. As in Vietnam, the weak participant's stake in the result of the conflict may be so high (anything short of annihilation) that "cooler heads" within the strong nation with very limited interests at stake will devise and then seek to implement an "exit strategy."

Another way of explaining why the weak defeat the strong is based on strategic considerations, what Arreguin-Toft labels "strategic interaction."[14] In this understanding, the outcome of the armed conflict may very well be based on the type of approach each actor employs in its effort to defeat its enemy. Arreguin-Toft identifies two ideal strategic approaches: direct and indirect. The direct approach to the conflict involves conventional attack and defense. These conventional approaches "feature soldier on soldier contests along with codified rules as to their conduct and a shared conception of what counts as victory and defeat." For Arreguin-Toft, unconventional approaches may also be reduced to two types: "barbarism" and guerrilla warfare. Both forms of unconventional fighting are aimed at sapping the enemy's will to fight rather than its physical capacity to fight.

Guerrilla warfare probably does not need much by way of explanation, but "barbarism" does. "Barbarism targets an adversary's will by murdering, torturing, or incarcerating noncombatants."[15] The behavior of the Bosnian Serb military and the Milosevic regime in Belgrade vis-à-vis Bosnia-Herzegovina and Kosovo during the 1990s over the fate of Yugoslavia may serve as an example.

Arreguin-Toft's generalization is that when the weak employ conventional approaches in their fight with the strong, they almost always lose. On the other hand, when the weak adopt the unconventional warfare approach, their prospects for success improve substantially. Thus, guerrilla warfare and "barbarism" appear to work. The weak tend to prevail when they rely on unconventional means, especially guerrilla warfare, while the strong persist in using conventional means of fighting. In some circumstances—for example, Russia in its recent struggle with Chechen rebels—"barbarism" was employed by the strong contestant, but in the United States and other Western democracies, this approach is normally regarded as criminal conduct. And, at first glance, the ability of the "weak" side to practice "barbarism" is limited by its ability to attack the strong one's civilian population (more on this later in the discussion).

At this point we might add a corollary. In contemporary asymmetric conflicts, the armed forces of the strong are usually composed of soldiers from the advanced industrialized countries—individuals trained, for the most part, to engage in conventional approaches to armed conflict. This training may be supplemented these days with some instruction in unconventional warfare.[16] However, these First World "soldiers" (usually

sworn to uphold a code of conduct based on the Geneva Conventions) frequently confront "warriors" from tribal and clan-based societies (e.g., Somalia), for whom the unconventional *is* the conventional, and fighting a normal part of the life cycle.[17] The code of conduct governing the behavior of these "warriors" (which may include, for example, the mutilation of the bodies of those slain in battle) rarely has anything to do with the rules stipulated by the Geneva Convention. The result may often bear a close resemblance to the events depicted in Mark Bowden's volume *Black Hawk Down* and the popular film based on it.

The "weak" may also be able to overcome the "strong" because of the types of weapons possessed by the former. According to Eliot Cohen, "The enormous increase in the quality and quantity of arms in the hands of Third World nations, coupled with increased organizational competence in the handling of such weapons, renders many local conventional balances far more even than before."[18]

In 1936, for instance, the Ethiopian military sought to defend its country against the invading Italian army by using spears, bows and arrows, and a handful of primitive rifles, and the outcome was predictable. In the years leading up to 1988, the Afghan mujahideen made adroit use of grenade launchers and handheld stinger missiles to convince the Soviets about the benefits of withdrawing from this trouble-plagued region of Dar al-Islam. In other words, the types of weapons available to the nominally weaker side in internal or civil wars and other armed conflicts have improved dramatically since the Fascist dictator Mussolini's military defeated Emperor Haile Selassie's forces in the lead-up to World War II. The weaker side, as in the cases of the Afghan mujahideen and the Viet Cong, may be the beneficiary of material support—typically in the form of small arms—from third parties (e.g., the Americans and Soviets during the Cold War) who have an interest in seeing the strong defeated. In short, the diffusion of modern weapons serves as an equalizer; as a result, the gap in strength between the "weak" and the "strong" narrows, as do the odds of the former's ability to defeat the latter.[19]

This brings us to the role of terrorism in current and future armed conflicts. We should begin by noting that modern terrorism began in Europe during the last third of the nineteenth century, specifically following the repression of the Paris Commune in 1871. Up to that defeat, many social revolutionaries had believed that a working-class revolution would resemble the French Revolution of 1789–1792, with Parisian crowds armed with primitive weapons simply overwhelming the ancient regime's armed forces. The defeat of the commune persuaded many revolutionaries that the model of 1789 was no longer appropriate, and that the gap between the weapons at the disposal of the modern military and mobs equipped with shovels, pitchforks, and crowbars had grown too wide.[20] For at least some of these disappointed revolutionaries, terrorism—or "propaganda

by deed" (e.g., assassinating monarchs, political leaders and industrialists, and setting off bombs in public places)—seemed an effective way of once again narrowing the odds and fomenting revolution.

However, despite creating widespread fear throughout much of Europe over the last decade of the nineteenth and first decade of the twentieth century, terrorism as a tactic proved eminently unsuccessful in igniting revolutionary upheavals. Lenin and Trotsky, rivals of terrorism's Russian practitioners, understood the sources of the failure. Instead of inspiring the masses to action and terrifying the country's rulers, terrorism produced two results: on the one hand, it acted as a narcotic by persuading the masses that the terrorism *was* the revolution, rather than a tactic to spark it; on the other hand, it was a kind of "adventurism" that invited the repression of all revolutionary elements by the authorities.[21]

The experience of the terrorist campaigns waged by revolutionary bands in Western Europe—for example, the Red Brigades, Red Army Fraction, and Direct Action—from the late 1960s through the early 1980s is much the same. The violence of these terrorist organizations caused widespread apprehension, revulsion, and some political backlash, but nothing vaguely resembling a revolution.

Terrorism used in isolation from other types of violence and other forms of political activity rarely succeeds. Terrorism or "barbarism" as a tactic used in conjunction with other means of violence and political activity by the weak against the strong is another matter. In fact, we would hypothesize that one of the major reasons the "weak" have improved their ability to defeat the "strong" in recent decades has involved their willingness to employ terrorism both at the immediate site of the conflict and in the homeland of the "strong." Along with easier access to sophisticated small arms, the natural squeamishness of democracies to the practice of barbarism by its representatives, the differences in levels of interest and motivation, and the other factors mentioned above, terrorist activity has enhanced the capacity of weak insurgents in their struggles with foreign forces.

During the 1980s, for example, India became involved in the ethnic-religious conflict in Sri Lanka, a conflict between the Sinhalese (Buddhist) dominated government in Colombo and the secessionist Tamil (Hindu) Liberation Tigers seeking to achieve national independence.[22] The Indian government sought to help negotiate a compromise peace agreement between the two sides. It sent troops to enforce a cease-fire, and they quickly became embroiled in fighting the Liberation Tigers, who were willing to carry out terrorist attacks against Indian forces there to help achieve an equitable peace. The violence—a combination of guerrilla warfare and terrorism—became sufficiently intense by the end of the decade that the Indians withdrew. And for his efforts in pursuing a negotiated settlement,

the Tamil Tigers assassinated the Indian Prime Minister Rajiv Gandhi in the middle of his 1991 reelection campaign.

The value of terrorism to enhance the chances of insurgent success is recognized in the writings of various contemporary salafist advocates of jihad. For example, in his online work *The Management of Savagery*, Abu Bakr Naji provides readers with an account of what the movement hopes to achieve and how its jihadists intend to achieve it.[23] The replacement of the apostate regimes in the Muslim world and the expulsion of the "Crusaders" and Jews from it requires the "vexation and exhaustion" of the enemy through operations (e.g., Tunisia, Bali, and Turkey) carried out by groups and cells in every region of the Islamic world. The goal of these terrorist operations is to disorient and weaken the enemy to create the conditions for the next stage in the struggle: the administration of savagery. In those regions of Dar al-Islam where the vexation and exhaustion of the apostate regimes has had the greatest effect, the holy warriors are able to engage in the "administration of savagery." That is, the jihadists are able to engage in a sustained, wide-scale insurgency against the weakened incumbent regimes and their American and other Western supporters. As in Somalia presently (2006), the tactics of urban guerrilla warfare and mass protest, combined with terrorism against elements in the civilian population, will certainly lead to the collapse of the old order and the coming of the new one.

This leads us to Afghanistan and Iraq. In the first decade of the twenty-first century, the United States, along with sympathetic governments in Kabul and Baghdad and a handful of Western allies, will confront insurgencies whose forces combine both types of unconventional warfare, guerrilla operations, and terrorism (or barbarism). In Afghanistan, the Taliban conducts hit-and-run attacks against overstretched or thinly defended outposts of government authority as well as against American and NATO installations. These attacks are coupled with periodic terrorist attacks against government officials and other high-profile targets in Kabul and other cities.

The situation in Iraq is more complex. The conflict combines a struggle for dominance between Sunni and Shiite organizations; some religious, some secular (Baathist) (in the case of the former), and some supported by the Iranian theocracy (in the case of the latter). In addition, al Qaeda in Iraq has succeeded in recruiting "holy warriors" from other parts of the Middle East and Western Europe to enter the country to carry out suicide bombing attacks on Shiite, Kurdish, American, and various other foreign targets. In terms of tactics, then, Iraq's insurgency, like Afghanistan's, combines guerrilla warfare with terrorism. But there are obvious differences. In Iraq, guerrilla operations are largely urban, involving attacks on police stations and recruiting centers for the Iraqi Army and American military

installations. The terrorism has become indiscriminate, with daily bombing attacks on virtually all places where large numbers of people may be expected to assemble. (In 2007 the country may be on the verge of what Naji describes as "the administration of savagery.")

There is another difference between Afghanistan and Iraq. Since the initial defeat of the Taliban regime in December 2001, following the 9/11 attacks, the terrorism surrounding the subsequent struggle for control in Afghanistan has been confined to the country itself, with some spillover in Pakistan. In the case of Iraq, on the other hand, groups and cells emanating from (or inspired by) al Qaeda have carried out terrorist attacks in Madrid (2004) and London (2005). The objective of these bombings was a kind of coercive diplomacy. Beyond seeking revenge for the sufferings of fellow Muslims in Iraq, the bombers wanted to persuade the Spanish and British governments to withdraw their forces from Iraq.

## CONCLUSION

What lessons may we derive from the Vietnamese, Afghan, Iraqi, and other experiences we have discussed that will inform our understanding of the character of insurgencies that the United States is likely to confront over the balance of the twenty-first century? At the risk of being repetitive, a brief summary is worthwhile.

For reasons expressed earlier in this discussion, insurgents appear to be improving, getting better at achieving their aims. By itself, terrorism is rarely or never a winning tactic for its practitioners. When combined, though, with other forms of armed struggle and an adroit political strategy, terrorist violence may become an important device in convincing foreign forces and foreign audiences that the costs of their continued involvement outweigh the potential benefits. Television and the Internet may accelerate the decision making in this direction. Also, these channels of communication help insurgents learn from one another at a progressively faster pace. Techniques that work in one place will be emulated by insurgents elsewhere and quickly.[24]

Armed insurgencies now and in the foreseeable future are likely to be fought in Third World countries, areas whose populations are becoming increasingly urbanized but not necessarily less tribal in structure or less divided by ethnic and religious affiliation. This means that guerrilla warfare, as in Iraq, is also likely to be an increasingly city-centered activity. The distinction between urban guerrilla attacks on enemy combatants and representatives of government authority and terrorist violence directed against members of the general public seems likely to get blurrier. Likewise, in combating city-centered insurgencies, the United States and other Western democracies that become involved in these conflicts will find it harder to distinguish between combatants and noncombatants in carrying

out their counterinsurgency operations. Reactions of domestic public opinion to accounts of "barbarism" will therefore prove predictable. In fact, the squeamishness and inhibitions of democracies mentioned earlier may reduce the ability of the United States and other "strong" democracies to successfully wage counterinsurgency campaigns.

Two lessons follow, if this account represents a reasonably accurate description of the situation confronting the United States and the other Western democracies in the twenty-first century. First, American forces should only be committed to armed conflicts in the Third World when a vital interest is clearly at stake, one that is clear not merely to key decision makers but also to the general public (whose members, after all, will be asked to absorb the costs involved). Second, if there is an interest to be defended but not a vital one, and political means do not succeed, the United States and the other advanced democracies would appear to be better off cultivating proxies that, in turn, would be able to act as surrogates. Whatever the outcome of the struggle, the costs to the American and other democracies are likely to be far less than those incurred by direct involvement.

# CHAPTER 5

## DEVELOPING AND IMPLEMENTING A COUNTERTERRORISM POLICY IN A LIBERAL DEMOCRACY

### GENERAL PRINCIPLES AND STRATEGY

In counterterrorism, the general guide to success is to catch or kill as many terrorists as you can—without creating more. Although it sounds simple, in a democracy this requires both the guarantee of security and the maintenance of broad public support. When crafting a response to terrorism, different policy aims may be prioritized at one time or another. However, long-term goals should not be undermined for short-term gain. Given political pressures to act and act expeditiously, it is necessary to take sufficient time to craft a comprehensive strategy that achieves efficacy and accountability and that balances security and political integration. Most importantly, fundamentally, do no harm. Sometimes, there are no good options. Actions need to be strategically chosen with proximate and ultimate goals in mind. Otherwise, according to Bruce Hoffman and Jennifer Morrison-Taw, "individual application of selected tactics and policies without a comprehensive national plan can prolong a conflict or even lead to complete failure."[2]

Before crafting an appropriate counterterror policy, it is important to properly identify the threat. Is the group domestic or international? Is it an ethnically or religiously driven group? What is the motivating factor behind the group? One of the priorities of counterterror is to minimize

support for terrorist groups. In order to do so, it is important to understand the motivating and relevant recruitment factors. Additionally, it is important to understand the strategic importance of labeling groups terrorist or something different, such as guerrillas or revolutionaries. Martha Crenshaw, one of the nation's foremost experts on terrorism, observes that governments don't negotiate with terrorists, but do with revolutionaries. The groups may have similar actions, but the response differs: "Calling actions terrorism may dictate a military, not political response and justify exceptional measures."[3] This statement contrasts with British terrorism expert Paul Wilkinson's first principle: "no surrender to the terrorists, and an absolute determination to defeat terrorism within the framework of the rule of law and the democratic process"[4] It must be remembered that terrorism is a political term. Although some scholars believe it is a simple term to define,[5] others recognize a conceptual haziness, making it difficult to differentiate among different types of violence.[6] Nonetheless, the label frames the debate and influences policy choices.

## DEMOCRACY AS A LIABILITY OR SOURCE OF RELATIVE IMMUNITY?

Although clichés assert that democracy is more vulnerable to terrorism than authoritarian regions, history provides examples of both authoritarian and democratic regimes plagued by terrorism. Some scholars recognize a deterrent value of democracy to domestic political violence[7] and to international terrorism.[8] Democracies may have unique strengths in maintaining support, and this strength is relative to how unified the population remains. For example, according to Sir Robert Mark, "the social conditions on the British mainland heavily favor the security forces in countering terrorism, because they are democratically accountable and enjoy almost universal support in discharging that particular task, a support which would be, of course, less certain if the task was more controversial. That is the essential condition for countering terrorism, without which the most efficiently organized, trained and led security forces could not succeed."[9] It must be remembered that it is difficult for terrorists to operate without safe houses and sources of local support. Some find that democracies facilitate terrorist activities because of their concern for protecting political and civil liberties.[10] Other studies stress the destabilizing influence of uncontrolled violence, regardless of regime type.[11] How much of a threat is terrorism to democracy? According to Ted Gurr, "On the basis of the record to date, the revolutionary potential of political terrorism is vastly overrated. Where it has had any impact at all, other powerful political forces were pushing in the same direction."[12] Others have found indirect effects of terrorism to be destabilizing, through the coups they provoke to counter it. Despite the lack of academic consensus about the relative immunity or vulnerability

of democracies to terrorism, successful counterterror policies in democracies provide security and maintain popular support, without sacrificing the democracy that is to be defended.

## SECURITY

Rising, unchecked violence can quickly become a concern that trumps other priorities. The hope for "the right to life, liberty and security of person" is fundamental and remains so, regardless of the source of the threat. Spanish terrorism expert Fernando Reinares recognizes that "systematic and sustained terrorist activity not only recurrently violates human rights, it also impedes the free exercise of civil liberties, alters the normal functioning of official institutions, hinders the management of public affairs by elected authorities or disrupts the autonomous development of civil society."[13] Terrorism creates fear, a desire for safety, and a hunger for vengeance. If the government does not successfully respond to violence, fear and a lack of safety can overwhelm the public and undermine government support. At this point, citizens may even surrender their democracy in return for hopes of increased security, which may or may not occur. According to the former Israeli Prime Minister Benjamin Netanyahu, "In this regard, there is apparently a moment of truth in the life of many modern democracies when it is clear that the unlimited defense of civil liberties has gone too far and impedes the protection of life and liberty."[14]

### Risk of Underreaction and the Possible Emergence of Militias, Death Squads, and Vigilante Justice

Democracies face risks from underreaction to terrorism. First, they can lose credibility in terms of the public's evaluation of the government's provision of the basic need for security. Wilkinson notes that "if the government, judiciary and police prove incapable of upholding the law and protecting life and property, its whole credibility and authority will be undermined."[15] Even worse, if terrorism is not sufficiently controlled by the government, popular support for a dictatorship may emerge or vigilante or death squads may form. "On the other hand," according to security researcher Richard Clutterbuck, "if a government fails to protect its citizens, those citizens may take the law into their own hands by forming, first, vigilante groups and then, as law and order breaks down, their own private armies."[16] Mistakes will lead to either state terror or clandestine terror. Popular support and justification for vigilante justice can occur when there is widespread belief that the government cannot protect the populace. However, the emergence of paramilitary groups also poses a threat if they begin to usurp control and support from the government.[17] Widespread exposure to violence results in support for

paramilitary movements, such as in Northern Ireland[18] and Colombia, creating an increased cycle of violence.

## POPULAR SUPPORT AND POLITICAL INTEGRATION

Maintaining popular support and a unified political community is essential to successfully combat terrorism. The political scientist Max Manwaring believes that the outcome of any counterinsurgency effort will be determined by the legitimacy of the state, the unity of effort, the type of support for the targeted state, the ability to reduce outside aid to the insurgents, intelligence, and, finally, discipline and capabilities of the armed forces. He believes the single most important factor is legitimacy.[19] Crenshaw stresses that the crucial issue for democratic states to understand both the consequences and causes of terrorism "is the relation between terrorism and political legitimacy."[20] To do so, both a long- and short-term perspective is necessary. There are two main ways in which the maintenance of popular support and an inclusive political community lead to security: through facilitating success in the "hearts and minds" battle and by avoiding long-term damage to the political community through an overreaction to terrorism.

### Necessity of Popular Support for Hearts & Minds

The classic hearts and minds approach to internal counterinsurgency is dependent on popular support for long-term success. After separating the civilians from the insurgents, according to O'Sullivan and Miller, it is necessary to win popular support through "protection and the prospect of economic and social progress."[21] However, the military task of rounding up the insurgents or terrorists is extremely difficult to do without accurate local intelligence. This information is much more likely to be obtained if the government enjoys popular support. However, without sufficient security, it will not be possible to gain support. This highlights the dual priorities of maintaining support and providing security, as opposed to conceptualizing them as two items in balance. In the words of security experts Ian Beckett and John Pimlott, "The outcome, as far as the security forces are concerned, depends on the security of the civilian population and their separation from the insurgent, this being an absolute requisite for the essential task of 'winning hearts and minds'."[22]

### Repression and the Risk of Overreaction

Just as there is a severe risk to democracies of underreaction, there are also serious risks of overreaction. From the terrorist's perspective, popular support and the democratic process are prime targets to destabilize and

to undermine support. "Most terrorist groups realize that public support for democratic values and institutions is a major obstacle to their schemes. Hence the democratic process is a key target."[23] In terms of terrorist propaganda, overreaction helps their case politically and facilitates operations and recruitment. Clutterbuck counsels that "over-reaction would not only poison our way of life, it would also play into the terrorists hands, by building more public sympathy for them, and by increasing what is now only a tiny trickle of recruits to their ranks."[24] Similarly, Adrian Guelke warns that repression provides "evidence of the effectiveness of their campaign and therefore a reason to persist."[25] Terrorists typically hope for indiscriminate crackdowns and repressive, heavy-handed responses. Their hope is to "alienate the public from the government."[26] A recent analysis of the Uruguayan and Peruvian experiences concluded that "an indiscriminate, repressive state response undermines citizen support and harms the democracy that the state is supposedly acting to protect."[27] The result can be a loss of democracy.

In the case of domestic groups that fear the government, but have not yet turned to violence, increased scrutiny can be counterproductive by causing a security dilemma. Active investigation and infiltration reinforces the belief of many in these organizations that the government is out to get them. For example, in the United States, the organized militia groups that fear federal government power are mostly reactive, instead of proactive. As the Federal Bureau of Investigation (FBI) explains:

> These militias may indeed believe that some type of NWO [New World Order] scenario may be immanent in the year 2000, but they are more inclined to sit back and wait for it to happen. They will stockpile their guns and ammunition and food, and wait for the government to curtail their liberties and take away their guns. When the expected NWO tragedy does not take place, these reactive militias will simply continue their current activities, most of which are relatively harmless.[28]

This is an especially salient point, since only the most extreme category of militia group maintains an "openly offensive posture." The others are of a defensive nature, and their plans for "violent action are contingent upon perceived government provocation."[29] Too much investigation may confirm their beliefs about excessive authority, increase their recruitment, and radicalize their activity. Another problem with increased scrutiny is that it would take excessive amounts of surveillance to separate the truly violent from the truly passionate. In the words of the Harvard professor Philip Heymann, looking for terrorists in extremist groups is like "looking for a needle in a haystack of 'mere talk.'"[30] Allocating sparse intelligence resources to nonviolent domestic groups can distract agencies from other more pressing security needs.

Moreover, overreaction by a government can cause a diplomatic backlash, especially among nations that have commitments to human rights, as in (for example) the European Convention. Significant deviations from general human rights standards may negatively affect international cooperation, in addition to causing domestic dissent.[31] The loss of international cooperation can be harmful, especially when it comes to the sharing of intelligence, which is essential in countering international terrorism or domestic terrorist groups that have significant external support.

### Maintain Tolerance

In order to avoid overreaction, commitment to an inclusive political community must be maintained. Clutterbuck notes that a "civilization which can accommodate dissent has a better prospect of prolonged survival."[32] Creeping authoritarianism is a danger, as people start equating dissent with subversion. This problem is particularly important in terms of domestic intelligence. Heymann warns that "unless there are substantial efforts to be clear, the lines separating mere opposition or permissible dissent in politics from a real internal danger are likely to be crossed by whoever controls intelligence capabilities. It is therefore critical to define a very clear line to quiet public insecurity and the fears held by political opponents."[33] These lines have been crossed both in established, advanced democracies and in developing countries. For example, in the United States, during the 1950s through the 1970s, the FBI counterintelligence group COINTELPRO actively investigated and infiltrated numerous domestic groups that it considered seditious, such as the Socialist Workers Party, the Black Panthers, antiwar activists, civil rights groups, and women's liberation groups.[34] The FBI later admitted that it placed wiretaps on federal offices, members of Congress and their aides, and journalists in the 1970s.[35] These examples typify a case in which passionate political opposition to government policy can create deep suspicion of the patriotism of the opposition, triggering an exhaustive investigation of that group and its members. In Peru, the head of the Peruvian intelligence service, Vladimiro Montesinos, manipulated the media, infiltrated the judiciary, and bribed members of Congress. Eventually, the intelligence scandals and electoral fraud ended the regime and rule of President Fujimori, although there were efforts to reform the intelligence services.[36]

### The Democratic Process and Human Rights

A perceived trade-off between security and the protection of civil liberties, the constitution or human rights may have fundamentally destabilizing long-term effects. According to Cynthia McClintock, terrorist violence affects legitimacy because

> Government officials perceive a contradiction between respect for human rights and the defeat of the subversives. Civilian and military officials argue over the correct policy response. The democratic state loses its legitimacy both by reacting aggressively, without concern for the constitution, and by reacting more cautiously, and thereby possibly appearing ineffectual.[37]

In terms of restrictions on civil liberties, this may create future grievances and may affect other rights, through a cumulative, debilitating effect. Instead, the security researcher Laura Donohue proposes thinking "in terms of a constellation of short- and long-term tradeoffs that consider the risks imposed on the state by the suspension—and maintenance—of complex and interconnected rights."[38]

Another important decision is whether to conceptualize the main counterterror campaign as either military or law enforcement. Again, the decision of how to craft an appropriate response to terrorism depends on the type of terrorism that threatens the regime and its capacity to inflict harm. The renowned terrorism expert Brian Jenkins identifies the dilemma between treating terrorism as war or as a criminal matter. He acknowledges the difficulties in treating it as a criminal matter, especially when the group operates abroad. In treating terrorism as a war, the evidence "need not be of courtroom quality; intelligence reporting will suffice." However, he also notes the drawbacks of this approach, including the deaths of innocents, the creation of martyrs, and the provocation of retaliation.[39] The calculus may be different for a strictly domestic conflict.

Heymann highlights the tension between an aggressive, preemptive investigative response to terrorism and a response that restricts government activity to safeguard individual liberties. In particular, he is concerned about changing the rules in relation to the use of deadly force, which differ greatly between military and police forces. He concludes that "it would be a foolish gamble with deeply respected civil liberties to make changes in the protective practices of decades or centuries . . . cases of terrorism should be investigated and tried with the same procedures that we use for trying cases of organized crime and other more familiar criminal matters."[40] However, he believes that it makes sense to investigate peaceful groups that substantively agree with groups that practice terrorism. There are risks of a nonjudicial process in combating terrorism domestically, as is exemplified in the case of Northern Ireland. Even though in the short-term more terrorists may be jailed, the process typically involves the loss of due process. In order to avoid creating more division and suspicion among a divided populace, according to David Bonner, exceptions to due process "ought to be subject to binding review by a judicial body, rather than merely to reference to an adviser or advisors."[41]

These considerations need to be balanced given the type of terrorism and how much capacity for harm they have. Particular deviations from

due process need to be carefully evaluated in terms of effective intelligence yield and the cost of civil liberties to avoid "pain for no gain."[42] Some scholars question the overall effectiveness of a "get tough" approach to terrorism. For example, Christopher Hewitt concludes that "no relation is discernible between the imposition of such powers and the subsequent level of terrorist activity; nor does terrorism decline as the emergency legislation is made more severe." In addition, he finds that the two "most common counter-insurgency tactics, patrolling and indiscriminate mass searches, produce only meager results."[43] Heymann and Nayyem stress the necessity of a long-term strategy that contains accountability and the importance of an informed citizenry. They do not deny the need for extraordinary measures, but stress the "need to ensure that systems of oversight are robust" and the necessity of assessment "with some transparency, the effectiveness of new measures to combat terrorism."[44] In general, one recent study has addressed the consequences of repression. Will Moore finds that dissidents will substitute violent protest for nonviolent protest, and vice versa, when faced with government repression. He found no evidence that contextual factors of authoritarian or democratic regimes affect this relationship or that there is a difference in effectiveness of repression in the short or long term.[45]

### Increasing State Capacity

The state needs to be strong enough to have a functioning judicial system, discourage the emergence of violence, mount a vigorous defense, and maintain citizen support. Especially when countering domestic terrorism, state competence matters. "No matter how hard insurgents try, they will be frustrated if the government has a competent and capable administration that dispenses services, controls the population, and effectively coordinates a multitude of political, economic and security policies."[46] Strength, democratic accountability, impartiality, and strong public support would facilitate the work of counterterrorism forces. In a domestic conflict, even peace settlements with newly demobilized groups will fail without a strong state, "specifically in the areas of preserving public order, administering justice, and executive control over the military."[47] The intelligence agencies also need to be strong and accountable.

General studies have pointed to the importance of judicial control to counter domestic terrorism, despite the fact that the terrorists do not act within constraints of humanitarian or other guidelines. However, democracies such as West Germany and Italy generally succeeded in their internal domestic terrorist conflicts with such judicial control and oversight of both the police and the intelligence services.[48] Errors and mistakes are costly, particularly if procedures are not followed or shortcuts are taken that result in providing terrorists with propaganda gains. "To foster

corruption is always a prime terrorist aim," allowing the government to lose credibility and support.[49]

To discourage violence, the state needs defensive measures such as special counterterrorism forces, increased policing, and public awareness campaigns.[50] To provide security, state capacity needs to be increased. The security strategist Gabriel Marcella notes that "counterinsurgency is expensive business; it cannot be done on the cheap and requires the full mobilization of a nation's resources over a relatively long period of time."[51] This general principle applies to both domestic terrorism and international terrorism. Military and police strength need to be increased and professionalism maintained (or increased).

The process of intelligence involves collecting, analyzing, and sharing information with policymakers and other relevant agencies. As Richard Millett notes, "good intelligence can't guarantee success, but bad intelligence can guarantee failure."[52] Ideally, the aim of intelligence reform is to create accurate and timely intelligence; foster close cooperation among intelligence, military, and law enforcement agencies; maintain informational security; and remain accountable to civilian authorities. This aim can be undermined by interagency distrust and politicization of the intelligence community (among other factors). To avoid the politicization of the intelligence community, it is better not to mix intelligence or counterintelligence with domestic law enforcement. Democracies such as Canada, Britain, France, and Germany have had success with separate domestic intelligence agencies, which are subject to oversight but remain able to act covertly.[53] Similarly, separation should be maintained between the military and the police forces. In his review of security and democracy in Latin America, J. Samuel Fitch warns that "at a minimum, democratic governments must clearly delineate the lines between police and military roles in internal security. Insofar as possible, the armed forces should be removed from primary responsibility for internal security, without denying the need for trained counterinsurgency forces to intervene when antidemocratic forces attempt to establish a territorial base."[54]

### Reducing Grievances

Good intelligence, effective coordination, and a competent police and judiciary cannot alone squash internal terrorism with a significant domestic source of support. In this case, the political realm of the conflict is extremely important. Wilkinson recognizes that "democratic authorities need to defeat the terrorist leadership at the political level by showing that the government is capable of responding imaginatively to the legitimate demands and aspirations of the very social groups the terrorists seek to mobilize."[55] Moreover, being responsive to understandable grievances may increase the government's popular support and decrease overt and

tacit support for terrorists. However, concessions are not a panacea. In the scenarios of a polarized society with domestic terrorism, as Bonner points out, even reasonable "concessions to one side tend to alienate or antagonize the other, and such problems have bedeviled the political negotiations of the peace process"[56] —for example, this is what has occurred in Northern Ireland. Wilkinson recognizes another limitation to this option when a group lacks a base of mass support but instead looks for validation from a "religious or ideological agenda which so totally rejects the existing political and social order that there is no basis for negotiation with democratic government on political, social and economic demands."[57]

## CONCLUSION

To successfully counter terrorism, a primary (but clearly not the only) goal is to catch or kill as many of the enemy as you can—without creating more. To do so, a comprehensive campaign that increases security, builds broad public support, and maintains international support will be more successful. Creating an effective intelligence community, increasing security, and maintaining principles of good governance are essential to democracies confronting terrorism. According to Wilkinson, "The trick is to harmonize strategy on both the security and political fronts: this is the only basis for a winning strategy."[58] The greatest threat to progress is impatience, which increases the temptation to emphasize one aspect of a strategy in the short term. Lopsided efforts will not bring long-term success and may undermine the chances of long-term achievement of a comprehensive peace. Advancement in one area does not eclipse the need to progress on the others. Democracy poses both challenges and strengths in combating terrorism. To be successful, both security (including avoiding overreaction and underreaction) and political integration (including political support, tolerance to the loyal opposition, and maintenance of human rights) must be prioritized. To do so, the state must be strengthened, and transparency and accountability increased.

# CHAPTER 6

## MORALITY, ETHICS, AND LAW IN THE GLOBAL WAR ON TERRORISM (THE LONG WAR)

Harvey Rishikof

### THE CHOICE AMONG LESSER EVILS

The Global War on Terrorism (or the GWOT) has overwhelmingly defined the "brave new world" of U.S. foreign policy at the beginning of the twenty-first century. The fall of the Berlin Wall on November 9, 1989, and the terrorist attack by Islamic extremists on September 11, 2001, shattered the previous foreign policy paradigms of containment, mutually assured destruction, collective security, and the doctrine of massive retaliation[1] — in essence, the end of the Cold War doctrines that had shaped the international law of armed conflict. On one level nuclear war required us to "think the unthinkable to remain unthinkable" and be "rational about the irrational" for in the end, state annihilation would be the final outcome. The "old" world order had also established clearly defined views on the morality, ethics, and laws for limited armed conflict. Critical to this world were the distinctions between "combatants" and "non-combatants," the doctrine of *jus ad bellum* and *jus in bello*, the concept of prisoners of war, and interrogation limits. The new world order is regrettably characterized as a regime of international terrorism, international criminal networks, humanitarian disasters, failed and rogue states, and indigenous political insurgencies that have combined to create "a fluid mass of anarchy" in different regional areas.[2] This new world order has spawned threats that have strained rooted doctrines of self-defense that clash with the international Cold War regimes established by of the United Nations Charter under Article 51 and the Hague and Geneva Conventions. The concept

of "preemption" has become a doctrine of U.S. foreign policy and collapsed the distinction between prevention and preemption. The new environment for "homeland security" has blurred traditional domestic divisions among criminal law, national security law, immigration law, and the law of armed conflict. And a new age of technology has produced a threat of nonstate actors with international networks that have access to weapons of mass destruction—chemical, biological, radioactive, and nuclear (CBRN)—sometimes based in failing or failed states.

The CBRN threat in the hands of stateless enemies poses new challenges to the concept of national security. Whereas deterrence was a rational option when threats were state based, traditional deterrence doctrine appears to be weak when retaliation has no "return to sender" address. Terrorism confronts the state with a different set of challenges. Harm can only be prevented with timely information. Prevention requires access to information or intelligence to stop an event before it happens, which places a new vital emphasis on gathering information that is timely and that can be acted upon. In short, a "Prevention Paradigm," can only be successful if relevant information is placed in a timely manner in the hands of those who can take action to stop the threat. In contrast, the "Deterrence Paradigm" was based on a calculated, measured, rational response to a potential threat. Although some forms of terrorism may be containable by deterrence, all terrorism is not.

When information becomes the *center of gravity* for prevention, the focus on acquiring accurate information becomes the critical factor. Timely information can be characterized as tactical, operational, and strategic. Tactical information is the most perishable and has the most immediate impact. Imagine a captured enemy soldier or officer on the battlefield who possesses information on where a biological or chemical attack is planned for later that afternoon. For operational information, imagine a captured senior officer from the enemy's planning directorate who has participated in drawing up the battle plans to respond to an attack, and knows the secret hiding places of caches of WMD as well as when and which units are to be deployed according to a series of triggering events (e.g., when city X falls, we will do X; when city Y falls, we will do Y). Strategic information involves knowledge of the master plan of how the enemy intends to use all the instruments of power at its disposal to achieve its strategic objectives—or when a strategic compromise can be achieved. Strategic information contains the bottom line for state negotiations. "Lawful" combatants may hold any or all three types of information.

Terrorist information, however, involves civilian targets, illegitimate targets, and unprepared targets. When the holders of information are characterized as "unlawful" combatants or belligerents, or outside the lawful regime of *jus in bello*, what lethal actions can be taken against them? What due process is required for "unlawful" combatants? What types of

interrogation or procedures should be permitted to gather information? What are the appropriate moral, ethical, and legal constraints? These are critical strategic and policy questions, and frame an important discussion on our current understanding of the law of armed conflict.

## QUESTIONS OF MORALITY, ETHICS, AND LAW IN THE CONTEXT OF ARMED CONFLICT

The projection of force by a state is a collective action that involves the individual, the institution or profession of the military, the state, and the international community. At the individual level, motivations of the soldier are the moral foundation of conflict. Why does one fight? There are individuals who, regardless of the stakes involved, will never bear arms because at its heart the taking of a life can never be justified as moral or religious. This category of citizens is the classic "conscientious objector" or pacifist. There is no conflict, regardless of the authorization of the state or the international community, that can ever justify killing to them. Some conscientious objectors are unwilling to serve in the military in any capacity, while others accept noncombatant roles. The state, when confronted with those who will not participate, can offer civilian service, and if refused, it can ultimately impose imprisonment or other types punishment for refusing to serve.

In this chapter, the formulation of the issue of ethics for those who choose to fight can best be associated with the institution or the profession of the military. Military professionals are "managers of violence" who have their own ethical code, the *United States Uniform Code of Military Justice* (UCMJ),[3] which provides the ethical framework for an individual's roles and responsibilities in armed conflict. Over the last 50 plus years, building on the Leiber Code of the Civil War, the UCMJ has established the standards and behaviors that are accepted as "ethical" by modern warriors. The code provides the basis for when a soldier can kill and under what circumstances, so that either a medal is awarded or a general courts martial panel is convened. The UCMJ and its process of adjudication make this determination for the professional soldier, and over time these determinations have established a "professional ethic." The code establishes the types and forms of punishment that are just and fair for a particular offense and necessary to maintain order and discipline. On the basis of this professional ethic, a soldier can refuse to follow an order that does not meet the professional ethical standards as created by the UCMJ. For example, for centuries the victorious warrior would "rape and pillage" the defeated enemy as a form of humiliation, triumph, and greed in a form of *"guerre mortelle."*[4] In many parts of the world "rape and pillage" are still conducted by men fighting wars of genocide and "ethnic cleansing." Any U.S. soldier ordered to rape and pillage would refuse not only because

of a matter of law but a professional ethic—warfighting is different from blatantly criminal activity.[5] This ethical code, sanctioned by the state and with governmental authority, is primarily administered by military officials and only occasionally by the highest civilian judicial authority—the United States Supreme Court.

Finally, the most powerful regulator of armed conflict is the federal law. But there are two sources for law: the domestic state and the international community. Domestic law is governed by the Congress, the president, and the Supreme Court. International law is governed by international bodies but lacks an enforcement mechanism. A perfect example where domestic law and international law meet is in the arena of covert operations and the role of pardons. The U.S. domestic structure has created a process of legitimacy for covert operations under the National Security Act of 1947 and its amendments (e.g., the Hughes-Ryan Act of 1974.) Moreover, in the event that the operation runs afoul of domestic or international law, the president has the authority to pardon the individuals involved. The Iran-Contra affair, and the pardoning of those involved, is a perfect example of this conflict between policy, prosecution, and pardon.

The pardon issue is an old state problem identified by Niccolò Machiavelli in his classic work on politics and morality, *The Prince*. Private morality at times stands in stark contrast to public state requirements or necessity. In war, state managers are required to do things to save the republic that are, at times, immoral by private standards. In Machiavelli's discussion on public necessity in his section "On the Reasons Why Men Are Praised or Blamed—Especially Princes," he warns the prince that

> he need not make himself uneasy at incurring a reproach for those vices without which the state can only be saved with difficulty, for if everything is considered carefully, it will be found that something which looks like virtue, if followed, would be his ruin; whilst something else, which looks like vice, yet followed brings him security and prosperity.[6]

But like the prince, the U.S. president's moral, ethical, and legal authority does not extend to the international community. The international community is governed by different international norms that have different enforcement mechanisms and values.

## UNDERSTANDING INTERNATIONAL LAW: IT IS MORE THAN JUST REALISTS VERSUS IDEALISTS

International law is a body of customs, principles, rules, conventions, and treaties promulgated to create binding legal obligations for sovereign states and international actors.[7] State sovereignty forms the basis of our international system. State foreign policy is based on, and constrained by,

the intertwining of domestic and international law. Traditionally in the United States, the executive branch—in consultation with the legislative branch—has conducted our foreign policy. But the modern world system is not an open playing field. In fact the modern world system is characterized by a set of dominant structural constraints: decentralization, self-help, and asymmetry. This anarchy has led to a highly competitive international system with each state jockeying to enhance its interests. The system, despite the emergence of a number of international institutions, has retained a "self-help" component that relies on military force.[8] And finally, the international system has been (and remains) hierarchical, in the sense that some states are more equal than others and exercise greater power—economically, politically, and militarily.

As the twenty-first century begins, the United States stands atop the international system as a colossus. American values stand for free markets, human rights, and democracy. America is viewed by its friends and foes as a hyperpower, a hegemon, and a modern empire.[9] A long-time strain of American culture, the strain of isolationism, has clearly retreated in the face of the nation's contemporary responsibilities and capacities. From its inception, America has stood alone. The first president, George Washington, in his farewell address in 1796 advised against foreign entanglements and "interweaving our destiny with that of any part of Europe."[10] This approach was the luxury of a new, small, and emerging country.

Today's America cannot ignore the affairs of other countries, and it cannot avoid international law as if it does not play a role in the affairs of the world. The post–World War II international system involves key multinational organizations—including the United Nations, the North Atlantic Treaty Organization (NATO), the World Bank, the International Monetary Fund (IMF)—in which the United States has been a chief architect. Although in recent history these institutions have come under severe strain, with the fall of the Berlin Wall, the demise of the Soviet Union, and the creation of the World Trade Organization, international law continues to be a force for the legitimization of state action.

Often when discussing American foreign policy, the debate is framed as "realists versus idealists." As first understood by Max Weber, what makes the international state system different from individual state power is that there is no legitimate monopolization of the use of coercive force.[11] Realists and idealists both grapple with the Weberian problem of lack of international authority. Realists focus on power as the dominant feature of international relations. For realists, the defining feature of international politics is that, unlike domestic politics where state power is constrained, there are few restraints in the international system.[12] When the state loses the legitimate monopolization of force, civil war or revolution ensues. A state with no legitimate monopolization of force is in a state of anarchy until order is restored. Because of the anarchic nature of the international

system, states need power to prevail. In the end, some form of a balance of power is the only guarantor of stability. But stability for realists is an elusive goal because each state actor is constantly striving for advantage. The neo-realists of today stand for unilateral action in the international system.[13] As Mark R. Amstutz noted, realism "is distinguished not by amorality or immorality but by a morality of a different sort, one that differentiates political ethics from personal ethics and judges actions in terms of consequences."[14] One is held accountable for acts of commission and omission. For this strand of thought, the Munich Compromise by the allies in the early 1930s allowed fascist Germany to garner power—and was a failed immoral act. In this view, "preemption" as a doctrine is a moral act by a public statesman.

Idealists, on the other hand, emphasize the ideal of constraints on the exercise of power and the importance of world cooperation.[15] The idealist solution for the Weberian problem of no legitimate monopolization of force is the establishment of international institutions to promote civilizing, internationally agreed-upon norms. This is not to say that Idealists are opposed to the use of force. Idealists contemplate force, as long as the force is employed in a cooperative manner sanctioned by international norms and institutions.[16] Idealists believe in the power of big ideas to shape the world and make it a better place.[17] Recently, Michael Mandelbaum has argued that reliance on the ideals of peace, democracy, liberty, and free markets are key reasons for the current dominance of American power.[18] Modern idealists, the heirs of the Wilsonian League of Nations, are multilateralists who believe in the power of many, or at least of a small coalition of the willing who are not part of a larger, institutionally sanctioned action.[19]

But the "realist versus idealist" debate does not fully capture the rich strands of thought that compose the foundations of the American approach to international law, individual morality, and state managers acting to protect the republic. Given the international competing structure that the Weberian problem identified, four basic ideologies or schools have competed to define the appropriate approach that should dominate our foreign policy with relation to international law, morality, and state action: the exceptionalists, the legalists, the human rightists, and the pragmatists. By teasing out these key foundational core values, one can establish the impulses that have animated the debates over morality, ethics, law, and rights.

### Exceptionalism Foreign Policy

Exceptionalist foreign policy is based on the assumption that the United States is different from, and superior to, all other states in the international system; thus our foreign policy should advance our national interests,

which are (we believe) in the world's interests as well. International law, when it impedes our view or interest, should be ignored. We have a unilateral right to act, since we have a unilateral imperative based on our values. An early manifestation of this approach is reflected in the Monroe Doctrine, whereby we announced to the world that our sphere of influence was clear and paramount.[20] This former "balance of power" or sphere of influence doctrine has now morphed into a pure power doctrine. Our motives are based on "Americanism," a combination of noble and honorable aspirations and motives that are unique unto themselves. The exceptionalist basis is the justification for our action and stands above the concept of international law. Needless to say, this view is reinforced by the capacity to act and project our will with force. Therefore our laws, our approach to rights, our views on just remedies can be, and may have to be, projected onto the world. The world cannot be counted on to bring "evil-doers" to justice, but we can, and we therefore should. To carry out this mandate is to teach the world the American (or the "correct") way to enforce the law—our law, our ethics, and our morality. The latest manifestation of this approach to power was the original creation of the "military commissions" to try terrorists under U.S. custody and law, regardless of international norms. Subsequently, with the involvement of the Supreme Court, this manifestation has been curtailed, though the jury is still out as to the next institutional solution.

### International Legalist Foreign Policy

The legalist foreign policy group bases its legitimacy in international law. A number of existing, nascent, and proposed international judicial bodies (e.g., the International Court of Justice, the European Court of Human Rights), quasi-judicial entities (e.g., the United Nations Commission on Human Rights), dispute settlement tribunals (e.g., the International Labor Organization Administrative Tribunal), permanent arbitral tribunals (e.g., the Permanent Court of Arbitration), claims and compensation bodies (e.g., the Eritrea–Ethiopia Claims Commission), inspection panels (e.g., the International Atomic Energy Agency, the Asian Development Bank Inspection Policy), and regional integration agreements (e.g., the Court of Justice of the Common Market for Eastern and Southern Africa) constitute a patchwork of conventions and treaties that comprise international law.[21] The United Nations and its component units constitute only part of the world forum for international law. A guiding principle of these forums is that the respective governments voluntarily commit to, and follow, the agreements. This legal tradition is particularly important for the use of military force in the international arena.

Although the right of "self-defense" is a recognized international principle under Article 51 of the United Nations Charter, the concepts of *casus*

*belli* (an act regarded as a reason for war) or *jus ad bellum* (the law for war) or *jus in bello* (the law in war) enforce restraint. Moreover, under Article 51, although the charter does not impair the inherent right of self-defense in an armed attack, that right exists "until the Security Council has taken measures necessary to maintain international peace and security."[22] The Geneva Conventions make naked aggression an unacceptable form of behavior and constitute the basis of international humanitarian law. Since America has been a fundamental pillar of these bodies, its support and recognition of the systems' logic are essential for its maintenance. When does the use of domestic courts undermine or negate the efficacy of the international tribunals? When America chooses not to ratify a treaty, protocol or convention, but its traditional allies and friends do, what is the effect on international legalism? The latest manifestation of this approach has been the U.S. rejection of the International Criminal Court and the policy decisions to sign individual Article 98 agreements with individual nations. This U.S. approach has created a "disturbance in the force" of international law as norms for violations of the law of armed conflict become less universally accepted.

### Rights-Based Foreign Policy

The third major strand of America's approach to international law is based on its particular brand of liberalism. The Constitution and the Bill of Rights privilege individual rights over the government (although this is not the only way the individual is protected, since checks and balances, the separation of powers, and federalism also constrain governmental power). The politics of rights play a special role in American consciousness and in recent decades have played an increasingly prominent role, intermittently, in the nation's approach to international politics. Some trace this tenet to Article III of the Constitution, which specifically described federal jurisdiction as "arising under the Constitution . . . and . . . the Laws of the United States," which included international law claims based on treaty and custom.[23]

Naturally, other theorists argue that customary international law does not have the status of federal law until authorized by the appropriate political authority. International agreements are always scrutinized by powerful interests, whether governmental or private, to ensure that individual rights are protected. But American liberalism also has a deep commitment to self-determination. The tension of liberalism to define how far the duties of human rights stretch beyond borders has been a constant source of debate and strain within the foreign policy community.[24] During the Cold War, the rights of citizens of our allies were often sacrificed if our ally's government was significantly anticommunist.[25] This realist approach to rights often stood at odds with the liberal promotion of universal rights.

Another example of this tension is the Alien Tort Claims Act of 1789 (ATCA) and the Torture Victim Protection Act of 1991, which place human rights front and center as a key component of American foreign policy and international law. As stipulated by the ATCA and codified by 28 USC, §1350, "The district court shall have original jurisdiction of any civil action by an alien for a tort only, committed in violation of the law of nations or a treaty of the United States." When combined with domestic rules of evidence involving class action, these acts and procedures produce a powerful tool that has generated claims of a "legal imperialism" by some critics that potentially surpass the claimed universal jurisdiction of the International Criminal Court.[26]

### Pragmatic Foreign Policy

The final strand of thought in the foreign policy realm is pragmatism. Rather than having a grand design, an integrated philosophical approach, or privileged principle, pragmatists deal with issues or questions on an ad hoc basis. Meeting short-term goals that deal with each issue on its own merits is the essential approach. Pragmatists tend to focus more on integrating national and international interests without overly emphasizing consistency over time—a "that was then, this is now" reasoning predominates. Sometimes this is a reflection of a change in political administrations or a recalibration of the costs and benefits in each policy. Decisions for military intervention are often subject to this form of scrutiny. Each time, the case has to be made for why we are putting our soldiers in harm's way. This form of analysis is analogous to the classic "case by case" approach of the common law legal process, which is a perfect example of how a pragmatic reasoning approach, loosely guided by general principles, can produce a variety of results until the Supreme Court speaks.[27] Such an approach is a form of instrumentalism, the science of muddling through that can be guided by a philosophy of minimalism. (The concept of taking one case at a time with a general overarching principle emerging from the individual cases is an approach that creates reform as minimalism in the legal realm.) In the international world, however, the types and forms of reaction to the pragmatic case-by-case approach are more multifaceted and more potentially deadly (e.g., the counterreaction to the idea of "preemption" may result in the promotion of nuclear proliferation to avoid a "preemptive" strike by a greater power).

## JUST WAR THEORY AND INTERNATIONAL CONSTRAINTS

The four schools of thought—the exceptionalists, the legalists, the human rightists, and the pragmatists—each have had to respond to the question as to what is a *just war*. Much of the legal debate has been over the Roman maxim "Inter arma silent leges," or "In war the law is silent." For

the classic "realist" critique, "all is fair in love and war," and in the end, only victory establishes justice. For the exceptionalists and pragmatists, any restraint on the carrying out of war can be removed by the victorious state through its use of sovereignty as a matter of law to justify, or pardon, any action in the name of self-defense or raison d' état (or reason of state).

For the legalists and the human rightists of "just war" theory, war is best analyzed in the *jus ad bellum* (the justice of going to war) and *jus in bello* (justice in conducting war) tradition. As pointed out by Michael Walzer, "just" is a term of art meaning justifiable, defensible, and perhaps morally defensible given the alternatives—a lesser evil. The *jus ad bellum* tradition usually analyzes the decision to go to war under the following six norms[28]:

1. just cause (e.g., to deter aggression, to defend against unjust attack);
2. competent authority (e.g., authorized by legitimate governmental authority);
3. right intention (e.g., a goal to restore a just peace);
4. limited objectives (e.g., an unlimited war of attrition is unacceptable);
5. last resort (i.e., all nonviolent measures—diplomacy, multilateral negotiations, sanctions—must be exhausted); and
6. reasonable hope of success (e.g., good intentions are not sufficient).

As for *jus in bello*, two norms dominate: discrimination (i.e., one must distinguish between combatants and noncombatants, soldiers and civilians, and minimize civilian deaths and targets such as hospitals and schools) and proportionality (i.e., minimize the level of violence to achieve the stated aims of the war).

A third international norm is starting to gain recognition in this tradition of just war theory—*jus post bellum*—justice after war, the victor's postforce obligations for settlements.[29] As stressed by Lindell Hart, since an objective of war is a better state of peace, how wars end and how peace is established and justice institutionalized are critical questions for evaluating interventions. The GWOT raises two particular *jus post bellum* issues. First, since the GWOT is now understood to be the *long war*, and the ending is unclear, what is our end state for the regions we have "acted" upon? Second, in any "traditional" warfare, the United States is believed to have full spectrum domination and will triumph in any kinetic "clash of arms;" hence victory in this sense must be assumed. Therefore, again, what is the "occupation" or "trusteeship" or "protectorate" plan?

Audrey Cronin has argued that terrorist organizations "decline or end" as a result of one or more of seven ways[30]:

1. the leaders are captured or killed (e.g., Aum Shinrikyo in Japan)[31];
2. there is an unsuccessful generational transition (e.g., the Baader-Meinhof Gang in Germany)[32];

3. the cause is achieved (as seen in the case of Irgun, which saw the establishment of the State of Israel);

4. there is a transition to legitimate political process or negotiations (e.g., the Front de Libération du Quebec in Canada);

5. popular support is lost (as in the case of the Basque separatist group ETA in Spain);

6. the state uses repression against the group (as Turkey as done to the Kurdistan Worker's Party)[33]; and

7. there is a transition out of terrorism to criminality (e.g., the FARC in Columbia) or full insurgency (e.g., the Khmer Rouge in Cambodia).

These examples, however, are of a single state "dealing" with an internal threat. The terrorism of al Qaeda and its affiliate members poses a different threat as both Afghanistan and Iraq demonstrate.

Traditional armed conflicts usually conclude with a cease-fire, armistice or surrender, with conditions or unconditionally. The rules of occupation are governed by the Geneva Conventions. But in a "trusteeship," the victorious powers rule the country acting in a "trust" for the inhabitants and seek to establish a stable consensual politics. For some, Rwanda and Sudan are candidates for such action. In a "protectorate," the victor facilitates and continues to support the coming to power of a group or coalition that works to restore a new political order and blocks the return to power of the former regime.[34] Some observers have suggested that Iraq may become a U.S./UN protectorate. For other theorists, the protectorate phase should be followed by two more phases: a "partnership phase", with an interim political authority to rebuild the "defeated society" or "state-build;" and an "ownership phase," when sovereignty is restored and all institutions are in the control of the indigenous population.[35] The new regime, though, must safeguard the innocent, protect minorities, respect the environment, and prosecute violations of *jus in bello* by the former regime. However, for purposes of legitimacy, international prosecutorial fora may be preferable to domestic courts in order to avoid the charge of "victor's justice."

But conflict endings are sometimes not so neat. Korea was a war or "police action" during the Cold War with an ending that left unresolved issues. Post Cold War conflicts—including Iraq, Afghanistan, Bosnia, Kosovo, Rwanda, Sudan, Sierra Leone, East Timor—are conflicts in which major hostilities have ended and yet problems still fester. Waging the war against terrorism challenges these norms and requires the state to rethink the measures, practices, and the instruments used to prosecute against the "tactic of terrorism." Individual soldiers, airmen, sailors, marines, special forces and other government agents are forced to rethink what "moral, ethical, and legal" orders mean. Projection of force, clandestine activities, law enforcement cooperation, diplomacy and covert actions are part of the arsenal in the fight against terrorism. Three of the more

controversial challenges for just war theory and international law will be the focus of the rest of this chapter: How does one deal with the issue of "targeting" terrorists? What is the process due to "unlawful" combatants in detention? What is torture, and what is lawful coercive interrogation?

### Fighting the War on the Margins of Moral Space: Targeting Terrorists and Assassination

It's not an eye for an eye. It's having him for lunch before he has you for dinner . . . . They deserved a bomb that would send the dream team to hell. I said, "If we miss this opportunity, more Israelis will die." . . . There is no fair fight against terrorists. Never has been. Never will be.
    —Avi Dichter, Head of Shin Bet, Israel's Internal Security Agency, 2003

We won't get to the bottom of the barrel by killing terrorists. We'll get there through education. Dichter [Shin Bet] . . . thinks we'll kill, kill, kill, kill. That's it—we've won. . . . I don't accept that. You need strength to defend Israel and on the other hand, to be human.
    —Lt. General Moshe Yaalon, Military Chief of Staff IDF, 2002–2005

Israel has been fighting terrorism and terrorists for decades. Placing "warheads on foreheads" has become a tactic of antiterrorism that the Israeli Air Force has often been called upon to perform. As the United States increasingly wages the long war, targeting terrorists in locations where ally support is limited will become an issue and a challenge. Where allies are willing and cooperative in the fight against terrorism, the prosecution of terrorists will be more of a "law enforcement matter," since sovereignty and culture will dictate how force is applied by our allies. England's arrest of indigenous terrorists cells after the attacks of July 7, 2005 are classic examples of domestic law enforcement preventing further acts. But where there is no cooperation, counterterrorist operations will require either special forces on the ground or missiles.

Israel has confronted the issue of targeting terrorists and has produced the following guidelines.[36] A number of conditions are required before a targeted killing of a terrorist is authorized by the state: arrest is impossible; the targets are combatants; senior cabinet members approve each attack; civilian casualties are minimized; operations are limited to areas not under Israeli control; and the targets are identified as a future threat. The position of the state is that these killings are not for "revenge" but for "deterrence" against future terrorist attacks. Shin Bet authorities estimated that for every suicide bomber or terrorist caught, between 16 and 20 lives would be saved and 100 other people would not be injured. The authorities, nevertheless, still struggle with the moral and ethical problem of how many civilian casualties are acceptable when killing a terrorist, since minimizing civilian casualties is a criterion for targeting

under just war theory. According to reports, the committee charged with the task failed to create a standard, but some suggested a ratio of 3.14 civilian deaths per terrorist; a smaller ratio was suggested if the civilians were children. This utilitarian approach reflects the moral and ethical dilemma of combating an enemy imbedded in the civilian population where the use of force entails civilian deaths. Although the domestic law sanctioned the action, how will the world react to the defense of raison d'état?

This theoretical problem became concrete on September 6, 2003, when Israeli intelligence reported a meeting in a three-story Palestinian home in the Gaza Strip of eight Hamas leaders allegedly gathering to plan terrorist attacks. The group included Sheik Ahmed Yassin (Hamas spiritual leader), Andan al-Ghoul (a major weapons manufacture), Ismail Haniyeh (a future prime minister of the Palestinian Authority), and Mohammed Deif (a master bomb maker). Earlier in the conflict, because of the viciousness of the Hamas attacks, both military and political leaders of Hamas had been determined to be legitimate targets—bombers, manufacturer of bombs, and bomb planners were all now on the approved targeted lists.

The private home was in a crowded neighborhood, and the local children were out of school. The decision had to be made about whether to use an F-16 jet to bomb from 10,000 feet and about what size bomb to use. Computer engineers ran simulations to predict how the house could be destroyed, assessing the cement, the structure, and the size of the rooms. It was determined that a half-ton bomb would not totally destroy the home and a one-ton bomb would demolish a nearby apartment building housing dozens of families. The risk of collateral damage was considered too high, and the plan was rejected by the political leadership. But at the last moment, it was decided that since the curtains were drawn on the top (third) floor, the meeting was taking place in a vulnerable location in the house and a quarter-ton bomb could be used take out the third floor. Thus, the third floor was bombed with a precision missile. However, the leaders, family, and four children all survived since they had been meeting on the ground floor and the family had been on the second.

Eventually, the sheik and al-Ghoul were killed by Israeli attacks, and Deif is hiding as of this writing. Ismail Haniyeh is the current prime minister of the Palestinian National Authority and a senior political leader of Hamas. He was nominated as the candidate for prime minister in February 2006, following the Hamas "List of Change and Reform" victory in the Palestinian legislative election of January 25, 2006, and was sworn in as prime minister on March 29, 2006. One can argue that the attack's failure only cemented Haniyeh's political appeal. Israel continues to use targeted killing, and by some estimates has reduced in 2005 one civilian death for every 25 terrorists killed. The Israelis are currently working on warheads the size of soda bottles for even more efficient and controlled killings.

This new professional ethic for war reinforced by the Israeli military code will trump any personal moral objections to the contrary. What is the appropriate civilian to combatant ratio? The answer is more of a political decision than a moral or ethical one. How the domestic political structures will understand the ways in which the hearts and minds of their own public, the targeted public, and the world public will appreciate the calculation will in the end be the final answer.

U.S. Executive Order 12, 333 states that "no person employed by, acting by, or on behalf of the U.S. government shall engage in, or conspire to engage in, assassination." Since this is an executive order, the president has the power to make an exception. He may justify such action under the doctrine of self-defense and may choose to define the band narrowly, so that legitimate military targets might include the assassination of individuals.[37] Moreover, if the act was part of a covert action, under the 1947 law, the president is required to make a finding that the action is necessary for a foreign policy objective and important for national security. Congress must be informed of the action, under the phrase "in a timely manner," which has been given broad legal definition.

In the military context, wide discretion has been given to the military under the concept of "preparation of the battlefield," and no notification of the Congress is required if Congress has already authorized the use of force. Government-sponsored assassination within another sovereign state is a violation of the International Covenant on Civil and Political Rights, to which the United States is a signatory, unless the host state has taken steps to actively harbor the individual. One might argue that the invasion of Afghanistan was such a case, whereby the Taliban refused to take steps to incarcerate Osama bin Laden and the United States served a warrant for his arrest. The difference is that Afghanistan is a sovereign state not under the authority of the United States. The world community supported the U.S. action and lent support.

The subsequent relation of the United States and the United Nations to Afghanistan is one of a protectorate or trusteeship, and raises the *jus post bellum* norm. Clearly the "opium/Taliban" problem will continue to be an issue for some time. The act of "taking down" a government to "serve" an arrest warrant has "nation-state" building consequences. The issue of targeted killing under these circumstances raises much larger moral, ethical, and international law issues usually associated with the empire, the balance of power and collective security questions. Terrorism cuts across these traditional categories and requires new approaches to the idea of "intervention."

On an individual level, the new technology and war fighting will raise hard questions for the future. In November 2002, an armed Predator drone was employed to destroy a car and kill Qaed Salim Sinan al-Harethi, a senior al Qaeda leader, and five of his fellow passengers (including a U.S.

citizen) in Yemen. For U.S. purposes, the next generation for the projection of force may become armed drones being flown from bases in the United States. A "pilot" may break for lunch at the local MacDonald's with coworkers and end work at 4:30 p.m. to make sure she is at her son's soccer practice. Earlier in the day she may have been performing flying missions to fight terrorism in far away ungoverned spaces dropping precision guided missiles. Is this "pilot" a combatant who is a viable target when she is watching the soccer game? Could operatives argue that the battlefield has expanded to the continental United States and that it is moral, ethical, and lawful as a matter of the law of armed conflict to target the pilot on the sidelines of the soccer game? Is this the new battlefield for our world of technology and terrorism?[38]

### The Geneva Conventions: What Process Is Due to the "Unlawful" Combatant?

Under the Geneva Conventions (GCS), all that can be asked of any lawful prisoners of war who possess information—tactical, operational, or strategic—is name, rank, age, and serial number. Such a regime of interrogation was premised on the concept that prisoners of war (POWs), professional soldiers, were carrying out the will of their political masters and were following the rules or conventions as proscribed by the international order of conflict. For fellow professional warriors to torture or humiliate these individuals, who followed the *jus in bello* tradition, was to subject themselves to similar treatment if captured. The potential benefit of information to be gained by torture was outweighed by the potential for the increasing spiraling down of civil order that would result from mistreatment of POWs. One feared the eventual retaliation on oneself and the decomposition of the rules of war if revenge and bloodlust took over. Civilians, hospitals, places of worship would all become legitimate targets and the descent into the pre-Westphalian hell of total war, total targets, and total destruction would ensue. Fear of a world where crimes against humanity become the coinage of war lies at the heart of the Geneva Conventions.

But what are the rules for those who have decided not to follow the *jus in bello* regime, who have chosen to target civilians in large numbers and have made the killing of civilians a strategic objective? In short, once one chooses to stand outside the tradition of the laws of armed conflict—what process is due this detained unlawful combatant?

Under the GCS there are two articles that are relevant to those who fall outside the category of lawful combatants: Common Article 3 and Article 75 of the Third Convention. Each requires the Detaining Power to treat prisoners humanely and provide them with basic amenities. Moreover, at the very least, unlawful combatants must be treated by the dictates of customary international law.

Common Article 3, which is in all of the four conventions, reads as follows:

> In the case of armed conflict not of an international character occurring in the territory of one of the High Contracting Parties, each Party to the conflict shall be bound to apply, as a minimum, the following provisions:
>
> (1)  Persons taking no active part in the hostilities, including members of armed forces who have laid down their arms and those placed *hors de combat* by sickness, wounds, detention, or any other cause, shall in all circumstances be treated humanely, without any adverse distinction founded on race, color, religion or faith, sex, birth or wealth, or any other similar criteria. To this end the following acts are and shall remain prohibited at any time and in any place whatsoever with respect to the above-mentioned persons:
>
> (a) violence to life and person, in particular murder of all kinds, mutilation, cruel treatment and torture; (b) taking of hostages; (c) outrages upon personal dignity, in particular, humiliating and degrading treatment; (d) the passing of sentences and the carrying out of executions without previous judgment pronounced by a regularly constituted court affording all the judicial guarantees which are recognized as indispensable by civilized peoples.
>
> (2)  The wounded and sick shall be collected and cared for.
>
> An impartial humanitarian body, such as the International Committee of the Red Cross, may offer its services to the Parties to the conflict.
>
> The Parties to the conflict should further endeavor to bring into force, by means of special agreements, all or part of the other provisions of the present Convention.

Article 75 of the Third Geneva Convention deals with Detaining Power obligations concerning communications with the outside world, and reads as follows:

> Should military operations prevent the Powers concerned from fulfilling their obligation to assure the transport of the shipments referred to in Articles 70 (write family), 71 (receive letters), 72 (receive foodstuffs, clothing, medical supplies and articles of a religious, educational or recreational character which may meet their needs, including books, devotional articles, scientific equipment, examination papers, musical instruments, sports outfits and materials allowing prisoners of war to pursue their studies or their cultural activities) and 77 (instruments, papers or documents intended for prisoners of war or dispatched by them, especially powers of attorney and wills), the Protecting Powers concerned, the International Committee of the Red Cross or any other organization duly approved by the Parties to the conflict may undertake to ensure the conveyance of such shipments by suitable means (railway wagons, motor vehicles, vessels or aircraft, etc.). For this purpose, the High Contracting Parties shall endeavor to supply them with such

transport and to allow its circulation, especially by granting the necessary safe-conducts.

Such transport may also be used to convey:

(a) correspondence, lists and reports exchanged between the Central Information Agency referred to in Article 123 and the National Bureau referred to in Article 122;
(b) correspondence and reports relating to prisoners of war which the Protecting Powers, the International Committee of the Red Cross or any other body assisting the prisoners, exchange either with their own delegates or with the Parties to the conflict.

These provisions in no way detract from the right of any Party to the conflict to arrange other means of transport, if it should so prefer, nor preclude the granting of safe-conducts, under mutually agreed conditions, to such means of transport.

In the absence of special agreements, the costs occasioned by the use of such means of transport shall be borne proportionally by the Parties to the conflict whose nationals are benefited thereby.

Common Article 3 and Article 75 provide for some basic protections to all detained parties regardless of status—lawful or unlawful. Interestingly, "customary" international law has so rarely confronted such a category of detainees, it is unclear what obligations are due; the United States, as it acts, is helping to define what is "customary" and what is "cruel, inhuman and degrading" behavior. As for "unlawful U.S. citizen combatants," such as Jose Padilla, captured in the United States and placed in military custody, the Supreme Court, in Rumsfeld v. Padilla, 542 U.S. 426 (2004) held that some "due process" is required other than a presidential determination of terrorist activity or affiliation. In a stinging dissent in the case, Associate Justice Scalia, joined by Associate Justice Stevens, argued that as an American citizen, the appropriate prosecutorial approach for Padilla is to charge the defendant with treason in criminal court. For the majority in *Padilla,* some form of adjudication and rights for a U.S. "citizen unlawful combatant defendant" are required. The dissenters would place the defendant in the criminal law system—lawyers, rules of evidence, and multiple appeals would determine the final judgment of the citizen as unlawful combatant defendant or traitor.

In June 2006, a majority of the Supreme Court in *Hamdan v. Rumsfeld* held that the president in establishing military commissions had exceeded his authority without specific Congressional authority, and had not complied with the UCMJ or the law of war as embodied by Common Article 3 of the Geneva Conventions. Currently, legislation is being debated about how to "remedy" the statutory problems identified by the Court. Should the Congress adopt the commissions in a new Code for

Military Commissions or reinstate the UCMJ procedures? What due process should be accorded to a noncitizen unlawful combatant? How far can captors go in acquiring vital information from noncitizens terrorists who have stepped outside the *jus in bello* regime? Are unlawful combatants terrorists who target civilians and noncombatants subject to reduced protections? Should unlawful combatants have testimony from "coerced interrogations" be admissible at trail and how should defendants have access to the evidence presented against them? These questions have sparked an international debate on the lawfulness of coercive interrogations and the due process "due" for unlawful combatants under Common Article 3.

### What Is Torture, and What Is "Coercive Interrogation"?

Torture is defined by the United States under its definition for ratification of the Convention against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment (CAT/CID) (1994) as follows:

> [I]n order to constitute *torture*, an act must be *specifically intended* to inflict *severe physical or mental pain or suffering* and that mental pain or suffering refers to *prolonged mental harm* caused by or resulting from (1) the intentional infliction or *threatened infliction* of severe pain or suffering; (2) the administration or application, or *threatened* administration or application, of *mind altering substances or other procedures calculated to disrupt profoundly the senses or the personality*; (3) the *threat of imminent death*; or (4) *the threat that another person* will imminently be subjected to death, *severe physical pain or suffering,* or the administration or application of mind altering substances or procedures calculated to disrupt profoundly the senses or the personality. [emphasis added]

Under Article 130 of the Third Geneva Convention, a war crime is defined as follows (this definition is incorporated in our War Crimes Act, 18 U.S.C. 2441):

> Grave breaches to which the preceding Article relates shall be those involving any of the following acts, if committed against persons or property protected by the Convention: willful killing, torture or inhuman treatment, including biological experiments, willfully causing great suffering or serious injury to body or health, compelling a prisoner of war to serve in the forces of the hostile Power, or willfully depriving a prisoner of war of the rights of fair and regular trial prescribed in this Convention.

Under Article 5 of the *Universal Declaration of Human Rights*, "No one shall be subjected to torture, or to cruel inhuman or degrading treatment or punishment." The Uniform Code of Military Justice and U.S. domestic criminal law[39] have similar penalties for violating these norms. Passed by the Congress in 2005, the Detainee Treatment Act (DTA) specifically

prohibited cruel, inhuman, and degrading treatment or punishment of person under the custody and control of the U.S. government and adopted the *U.S. Army Field Manual on Intelligence Interrogation* as the standard for questioning.

In short, if the United States does not conduct itself appropriately, the stakes are high for U.S. personnel in the opinion of the world community and domestic law. However, noncitizen unlawful combatants who use the tactic of terror have critical information that coercive interrogation techniques may produce. The president, when approving the DTA, issued the following signing statement presenting his interpretation of the law:

> The executive branch shall construe Title X in Division A of the Act, relating to detainees, in a manner consistent with the constitutional authority of the President to supervise the unitary executive branch and as Commander in Chief and consistent with the constitutional limitations on the judicial power, which will assist in achieving the shared objective of the Congress and the President, evidenced in Title X, of protecting the American people from further terrorist attacks.

To some, the president was stating that as a matter of law he retained the power to go beyond the *U.S. Army Field Manual on Intelligence Interrogation* if "protecting the American people from further terrorist attacks" required it. If "stress techniques" or "water-boarding" are not permanent or short-lived, should they not be used if sanctioned by executive order under strict supervision regardless of the DTA?[40]

The arguments that oppose "torture" fall into three categories: pragmatic, political and moral.[41] The pragmatic argument is that torture or stress techniques do not work. Extreme torture yields false confessions. The pragmatist's argument weakens if individuals do not confess to everything but in fact reveal valuable information. As a matter of decency, no country has performed scientifically controlled experiments to establish this fact. Mark Bowden, in a rare article exploring this area, defines torture as "the intentional infliction of severe pain to force information and confession" but emphasizes that the key to successful interrogation is the manipulation of "fear and anxiety,"[42] not torture. When using fear and anxiety as the tools of manipulation, the issues become which techniques result in permanent versus temporary pain, psychological versus physical damage, and effective versus counterproductive procedures. Recent articles have explored those soldiers who "fight it out in the shadows" and the coercive techniques that have been used.[43] Anecdotal stories reveal the unsettling possibility that certain techniques, although unlawful under the GCS, can be effective. There is an example of rendition of an al Qaeda lieutenant, Abu Hajer al Iraqi, as described in the *New York*

*Times* by Michael Scheuer, a former CIA official who ran the bin Laden desk. Scheuer defends the results of the "Extraordinary Rendition," program whereby individuals were sent to countries where valuable information was obtained that led to, as described by the *9/11 Commission Report*, the "greatest number of terrorist arrests in a short period of time that we have ever arranged or facilitated."[44] The "interrogation process" of Abu Hajer al-Iraqi is never described, only the fruits of it. It appears, therefore, the pragmatic opposition to the use of coercion may require more elaboration.

As for "political opposition" to a technique that may prove effective, this debate turns on the trade-off of short-term protection for long-term political advantage in the war of ideas. What does it say to those to whom we argue that "rule of law" is essential to the world we are trying to create if the United States, in the eyes of world opinion, violates the norms of the Geneva Conventions and the other treaties and conventions to obtain critical information?

Defenders of coercion contend that it is good politics. Democracies are willing "to take the gloves off" when the enemy will not follow the rules. Taking severe action will force the participants to return to the legitimate playing field. Under this approach, democratic values will not be used against democracies; the rules should not be "a suicide pact" whereby following the rules will result in the destruction of the very citizens of the regimes themselves—hence the aforementioned Latin phrase *inter arma silent leges*.[45] Necessity becomes the state managers' defense. According to Michael Walzer, "supreme emergency" fosters "emergency ethics" and creates a paradox whereby moral communities make great immoralities morally possible—this is how he explains the bombing of German cities in World War II. Finally, to the moral defenders of *jus in bello*, any technique that distinguishes between lawful and unlawful combatants to conduct coercive interrogations is immoral; no pragmatic or political justification will ever suffice. The cure is worse than the disease. *Any* parsing of the interrogation technique that strays from the GCS or domestic law will lead down the road to self-destruction and undermine the very values of the democratic state based on due process and the rule of law. How does one balance religious rights against political rights—for example, if a female interrogator intentionally touches a praying male Muslim to gain his attention has she violated the Geneva Conventions?

## CAN AND WILL TECHNOLOGY AND SCIENCE CHANGE THE CHESSBOARD OF NORMS?

Can technological advances create a new set of questions and norms for interrogations? If America's armed forces use precision-guided munitions and "smart bombs" to minimize civilian casualties, America's

interrogation methods may rely upon new technologies to decrease the risk of "illegal abuse." What if interrogators were able to secure reasonably reliable information from their detainees without stress positions, harsh sleep deprivation, physical threats, or sexual humiliation?[46] The past decade has seen revolutions both in brain-scanning technologies and in drugs that affect the brain's functions. The tools that may radically transform tomorrow's interrogations can be found in hospitals worldwide. They help to painlessly diagnose Alzheimer's, dyslexia, epilepsy, schizophrenia, insomnia, and brain tumors. These techniques may have uses in the interrogation room that will render moot debates about the excesses of Abu Ghraib-style treatment of prisoners.

Functional Magnetic Resonance Imaging brain scans, for example, have improved so dramatically that they can now produce high-resolution movies of brain activity. Functional MRIs can measure how the brain reacts when asked certain questions, such as, "Do you know Mr. X?" or "Have you seen this man?" When you ask someone a question, the parts of the brain responsible for answering will cause certain neurons to fire, drawing blood flow. The oxygen in the blood then changes the brain's magnetic field so that a neural radio signal emitted becomes more intense. Functional MRI scanners detect and calibrate these changes. And by comparing the resulting images to those of the brain at rest, a computer can produce detailed pictures of the part of the brain answering or not answering the question—in essence, creating a kind of high-tech lie detector.

Engineers are also using less expensive technologies such as electroencephalography to track blood flow in the brain's prefrontal cortex, the region associated with decision making and social inhibition. Electroencephalography, which is painless and noninvasive, has dramatically improved in the last 10 years so that it is now able to detect, for example, where the ability to speak a second language resides in the brain. And when electroencephalography data are read alongside Functional MRI scans, we can gain even richer insight into how the brain is functioning.

Concurrent with these strides in brain imaging, scientists are learning more about how drugs influence the brain. Pharmaceuticals like Paxil, Zoloft, and Prozac have now been in general use long enough that neuroscientists are beginning to observe how they affect brain behavior and individual responses to conversation and questions. It now appears that there are safe drugs that reduce conversational inhibitions and the urge to deceive. If prisoners were wired to electroencephalographs or noninvasively examined by functional MRI scanners to see whether they were telling the truth, the images would not have turned into emblems of degradation and humiliation. Would most Americans honestly consider this torture or abuse?

More important, these new technologies may also prove more effective than traditional interrogation techniques. Such an approach would counter the pragmatic opposition to coercion, as the new technologies may minimize false confessions by monitoring involuntary responses and indicating when such fabrications occur. Under the current Geneva Conventions, any such approach would be a violation. Politically, though, would the high-tech pharmaceutical American-style interrogation approach be unacceptable? Surely we would have to be prepared to see such techniques used on U.S. citizens and soldiers.

Naturally, the moral objection would still stand. The advent of painless and temporary new drugs and brain-scanning techniques doesn't remove the moral questions about whether they should be used on any detainees. Consider a hypothetical pill, whose only side effect is slight nausea and a headache, that makes anyone who takes it tell the truth for 90 minutes. Should military and intelligence interrogators be able to force POWs or unlawful combatants to take the pill? Human rights advocates argue that forcing the pill on prisoners would violate their rights to be free from self-incrimination. Would such minimally invasive interrogation options cross a legal line? In American criminal proceedings, the state can legally draw blood, take fingerprints, and obtain DNA for testing. POWs and unlawful combatants are not in the criminal system but one where less stringent protections are typically afforded. Would this be torture or abuse? Even if torture and abuse were effective interrogation tactics, they intrinsically undermine the values American society says it stands for. By contrast, using minimally invasive technologies explicitly designed *not* to be harmful represents values that can be defended both at home and abroad.

## CONCLUSION

Where does this leave the debate, and what are the rules for the war in the shadows? For a large part of the Global War on Terrorism, Congress largely remained silent on the issues of targeted killing, due process and interrogation. Recently, with the passage of the Military Commission Act of 2006 (MCA), Congress has entered the fray. The MCA though will probably still be subject to future litigation over the controversial passages dealing with the definition of an unlawful combatant, the restricted right of habeas corpus, and how evidence resulting from coercive interrogation is placed into the record. The executive branch has conducted a number of investigations and charged a few lower ranking soldiers with interrogation abuses, but has avoided any open debate of executive power in these investigations. There has been an understandable reluctance to engage in an open debate about the issue of coercive interrogation techniques. However, a recent Harvard University study on highly coercive interrogation techniques, detentions, renditions, and other related issues has challenged

the Congress to become more involved in the debate on detainees and draft legislation to regulate the use of these instruments in the war on terrorism.[47]

Michael Ignatieff concludes that necessity may require actions that stray from our commitments to human dignity. But the best way in his view to "minimize harms" or choose the *lesser evil* is to

> maintain a clear distinction in our minds between what necessity can justify and what the morality of dignity can justify, and never to allow the justifications of necessity—risk, threat, imminent danger—to dissolve the morally problematic character of necessary measures. Because the measures are morally problematic, they must be strictly targeted, applied to the smallest number of people, used as a last resort, and kept under the adversarial scrutiny of an open democratic system.[48]

This set of restrictions resonates with the Israeli guidelines for targeted killing. On the issue of "torture" some leading civil rights advocates such as Alan Dershowitz have called for "torture warrants" and judicial review. Other respected commentators have called for a meeting of the principal G-8 allies to consider revisions to the Geneva Conventions and to develop a new set of rules and procedures to govern targeted killings, prisoner of war rights, interrogations and renditions.[49] For others, this is a policy area where the less said the better. It should remain in the world of the shadows, the world of covert action where executive power uses "dirty hands" to protect the innocent.

In the world of just war theory, if the uses of these interrogation methods are in a just cause, only in the last resort for an emergency situation, and are proportional in utilitarian terms, what is allowed? For those theorists who reluctantly advocate harsh methods of interrogation, the state needs to develop laws, institutions, and procedures to authorize, monitor, and control coerced interrogations and punish severely any unauthorized acts. One has even called for judicial procedures that need to be independent of government, the armed services and the intelligence services; the judges must have continuous and sustained authorization, observation, and control; and these judges should have the ability to impose severe criminal sanctions against any officer who authorizes, engages in or acquiesces in illegitimate acts not authorized.[50] Would U.S. soldiers contend that their moral and ethical codes allow them to participate in these actions? Ironically, this approach would remove the President from the calculus and redistribute the pardon power to the new authority.

Unfortunately, the world of the shadows has crept into the world of light, as the war on terrorism continues to capture terrorists and the process of interrogation for prevention has leaked into the press. A more open international debate may demonstrate how different and isolated the U.S. approach is to the war on terrorism, and may prove to be counter productive for the United States, while a more open domestic debate may focus

on how hard it is to regulate the unlawful without denigrating the rule of law.

Or perhaps science and technology over the next several decades will advance to the point that brain imaging, drug innovation, and gene development will enable the next generation to "crack" open the secrets of the mind when done under court order in the name of national security and prevention. How such power will then not migrate over to the domestic arena to ensure "guilt" will be a test of our rights under the Constitution. In the end, the court of history will judge Congress' silence, the executive's actions, and science's race to unlock the secrets of the mind. The moral, ethical, and legal debate and the GWOT will shape the norms of our new century. T. H. Marshall, in his 1950 classic essay on citizenship in Britain, *Citizen and Social Class*, argued that civil rights were established in the eighteenth century, political rights in the nineteenth, and universal social rights under the welfare state by the mid-twentieth century. As we enter the twenty-first century, many of Marshall's insights are under attack by the war on terrorism, as the concepts of citizen and rights are redefined by both politics and science. How we understand rights, privacy, and citizenship in this new brave world will be shaped by how we fight the war on terrorism and how we use the law to define the debate on how to fight. To paraphrase Heraclitus, "Much is in flux." The war in the shadows must be brought into the light but what will be the costs of doing so and choosing the lesser evil?

# CHAPTER 7

## THE CRITICAL ROLE OF INTERAGENCY COOPERATION IN COUNTERING SUICIDE BOMBINGS

James D. Kiras

The phrase "interagency cooperation" has become one of a number of catch phrases for those seeking to make widespread change in, and reform of, government in the United States. Such calls often result from the perceived failure of government to adequately protect the health and welfare of its citizenry after particularly traumatic or catastrophic incidents. Suicide bombings are almost always noteworthy but have been particularly traumatic in Western countries when this tactic has been employed against targets domestically. Examples of recent suicide bombings that have spurred calls for greater cooperation between governmental agencies include the September 2001 attacks on the World Trade Center and Pentagon in the United States, the March 2004 bombings on commuter trains in Madrid, Spain, and the July 2005 attacks on the London transportation system. Yet, calls for reform of processes can be based more on a need for government to be seen to be reacting to the concern of its citizens. In other words, there is a temptation for leaders to take action for action's sake without considering what those reforms are intended to achieve realistically. In a highly charged political environment, and particularly, one in which divisive partisan politics and threat inflation may be driving the agenda, does such reform make sense?

Particularly keen readers may have already divined the answer to this question based on the title of this chapter. The goal of this chapter, however, is not to build an ironclad case in support of interagency cooperation as the answer to suicide bombing. Rather, this chapter outlines how the requirement for greater cooperation between agencies in developing

and implementing potential solutions is anything but certain. The discussion begins by looking at the peculiar challenges that suicide bombing presents to those charged with preventing terrorism, and suggests that irregular adversaries will always seek to exploit systemic and other vulnerabilities in order to carry out their attacks successfully. On the basis of those challenges, this chapter argues that greater interagency cooperation can interdict or disrupt suicide bombing throughout its lifecycle. The ultimate result of seamless cooperation ideally is the prevention of all future suicide bombing attacks. Sadly, this state of affairs will remain the ideal for some time, as the concluding section suggests. As an example of the paradoxical logic of strategy,[1] potential reformers face a particularly troublesome choice: change the mechanisms (and consequently, the nature) of democratic government in order to improve efficiency and effectiveness, or accept marginal change that leaves exploitable vulnerabilities in place.

## THE PROBLEM OF SUICIDE BOMBING

Well before the attacks in the United States on September 11, 2001, terrorism specialists and counterterrorism experts recognized disturbing indicators that terrorist groups were turning more frequently to suicide bombing as a method of attack globally. Although the United States had only been targeted infrequently by suicide bombers, other nations—including Israel, Turkey, and Sri Lanka—had suffered the effects of sustained campaigns of suicide bombing by secular and religious terrorist and insurgent groups, including Hamas, Hizbollah, Partiya Karkaren Kurdistan (PKK), and the Liberation Tigers of Tamil Eelam (LTTE). According to one source, there were at least 275 documented acts of suicide terrorism from 1983 until 2000.[2] The increase in frequency was only one disturbing aspect of suicide bombing; another was the growth in the lethality of terrorist attacks in general, which correlated broadly to the increasing use of suicide bombing as a tactic.[3] The leaders of terrorist groups appeared to care little for the destruction among noncombatants that their attacks caused. For example, in the twin 1998 U.S. Embassy bombings in Kenya and Tanzania, only 5 percent of the casualties in both attacks were citizens of the target state—the United States.[4] Over 200 Kenyans and Tanzanians were killed, and more than 5,000 were injured as a result of two suicide bombings using trucks loaded with explosives. The use of suicide bombing by terrorist groups, however, raised significant questions about the ability of governments to combat the phenomenon. If terrorists were willing to kill others and die in the process, what possible incentive and threats could governments use to dissuade them from doing so? The worst-case scenario for any government would be the acquisition of nuclear material by a terrorist group with a demonstrated history of conducting suicide bombing. The potential situation in which such a group

obtains materials to conduct a suicide bombing attack using weapons of mass destruction (WMD), but cannot be discovered in time due to lack of coordination among government agencies, adds a sense of urgency to attempts to improve interagency coordination.

### Definitions and Methods of Suicide Terrorism

A significant part of the problem in tackling suicide bombing lies in defining what it is: ranging from the various methods that are used to conduct suicide bombings; coming to terms with the purpose for which they are used; and comprehending the component elements that support an attack. One problem in particular that has impeded efforts to better understand the phenomenon is spotlighting the actor rather than the purpose of the act. In looking to combat the problem, some scholars and journalists have focused exclusively on the motivation behind the act of suicide bombing, to the exclusion of its purpose. This approach has led to significant effort being placed on developing a psychological profile of a "typical suicide bomber" in order to assist law enforcement and other agencies in identifying individuals prior to attacks.[5]

For the purpose of this chapter, suicide bombing is defined as a unique form of political violence, distinguishable from other forms of violence— including hijacking, kidnappings, and non–suicide bombings—by a number of attributes, as part of an ongoing campaign of terrorist or insurgent violence to achieve political objectives through revolution or the capitulation of their adversary.[6] The form of conflict in which suicide bombing occurs, including terrorism and insurgency, is superfluous to this discussion. A number of scholars have spent considerable effort attempting to develop unifying explanations for why groups utilize suicide terrorism across different forms of conflict. In essence, terrorist and insurgent groups use suicide terrorism because it is an effective, low-cost, low-risk form of attack that is difficult to stop. In addition, suicide bombing generates fear disproportionate to the actual damage that it inflicts. This does not mean that the purpose for which suicide bombing is used is not important, but for the government facing a substate opponent who is prepared to use this specific form of violence, the distinction may be an academic one.

Suicide bombing as a tactic of violence does possess a number of attributes, some of which are unique. One unique attribute is contained in the label "suicide bombing" itself. From a functional perspective, terrorists or insurgents undertaking the act purposefully set out to sacrifice their life as part of the attack. A more recent trend has been to characterize such attacks as "homicide bombings."[7] The rationale for changing the term is twofold. By shifting focus on the results of the attack, as opposed to the characteristics of the individual committing it, the term "homicide

bombings" attempts to delegitimize the act. Homicide denotes that a crime has been committed and there are victims. "Suicide bombing," in contrast, suggests a depth of conviction and even nobility of cause—after all, what cause is worth giving one's own life and killing others in the process? Most terms associated with terrorism have subjective and even pejorative connotations, but the term "suicide bombing" offers a key qualifier that "homicide bombing" does not: the perpetrator dies in the act and does so to increase the chance of success and the psychological impact of the operation.

The second attribute of the phenomenon of suicide bombing, but one that is not unique to it, is the destructive component—the bomb itself. Although the popular depiction of suicide bombers is one of wild-eyed fanatics strapping explosives to their bodies and detonating it at a selected moment, the reality is that the only common element in the range of attacks that have been conducted is the use of chemical explosives, fuel-air mixtures, or flammable materials, individually or in coordination, to damage or destroy their intended target. The sheer variety in the size and types of suicide bombs used to date is astounding. Explosives used in suicide bombs have ranged from military munitions rigged with personal initiators to commercial and even homemade explosive compounds based on fertilizers or other readily available chemicals.[8] Anecdotal (but ultimately unconfirmed) evidence suggests that al Qaeda has tried to purchase radioactive elements for potential use in a WMD attack.[9] Some devices are transportable by individual bombers and include belt bombs carried by an individual beneath their clothing, or contained in personal items such as briefcases or knapsacks. The latter method was used by the fundamentalist Islamic cell that conducted their attacks on the London transport system on July 7, 2005. Bombs carried by individuals are generally limited in size to less than 50 pounds, in order to prevent excessive fatigue of the bomber and possible discovery before delivery. In order to carry a larger weight of explosives on land, in some cases up to several thousands pounds of explosives, terrorist and insurgent groups have used a variety of means of transportation including bicycles and motorcycles (Palestinian Islamic Jihad, or PIJ, and the LTTE), wagons (Hamas), cars (Egyptian Islamic Jihad), vans (Jemaah Islamiyyah), and trucks (al Qaeda, Hizbollah, and LTTE).[10] Terrorist and insurgent groups have used with increasing frequency secondary materials such as acetylene tanks, nails, and ball bearings, to enhance the blast and fragmentation effects of the bomb and improve their lethality.

Suicide bombings at sea have not been as frequent, but groups such as al Qaeda and the LTTE have demonstrated remarkable tenacity and technical innovation. For example, the cell that committed the attack on the USS *Cole* in Aden harbor, Yemen, had originally targeted the USS *The Sullivans* during an earlier port visit. The common harbor skiff used in the attack,

which is believed to have carried an explosive payload to maximize the effect of the explosion, originally sank before the attack could be carried out. The skiff, however, was retrieved, repaired, and used successfully against the USS *Cole* on October 10, 2000, killing 17 sailors, wounding 39 others, and causing an estimated $243 million in damage to the warship.[11] Other seaborne suicide bombings include a number of attacks conducted by the LTTE against vessels of the Sri Lankan Navy, some of which employed relatively sophisticated boats that incorporated features designed to mask their radar signature.[12] Al Qaeda also conducted a seaborne suicide bombing attack away from shore, in more open water, against the oil tanker MV *Limburg* in the Gulf of Aden on October 6, 2002.

Like seaborne attacks, aerial suicide bombings are rarer than attacks on land, for a number of pragmatic and technical reasons. Aerial suicide bombings to destroy commercial aircraft in flight, however, have been planned and/or committed by Chechen female "Black Widow" volunteers as well as al Qaeda and those inspired by its message, as recent events and captured documents suggest. Two examples of those inspired by fundamentalist Islamic messages include the foiled plot in England to smuggle liquid explosive components onto trans-Atlantic flights in August 2006, and the attempt by the so-called "Shoe Bomber," Richard Reid, to destroy an American Airlines flight from Paris in December 2001. Although these attempted suicide bombings were planned to take place in the air, the delivery method was nevertheless limited to the amount of explosives that the individual could carry onto the aircraft without detection.

The attacks on the World Trade Center towers and the Pentagon can be classified as suicide bombings for an entirely different reason. Although they did not use explosives in the conventional sense, the aircraft themselves became the bombs. The Twin Towers were engineered to withstand strikes by contemporary commercial aircraft, in particular the Boeing 707, during the design phase in the late 1960s.[13] The building's designers, however, may have only considered the kinetic energy of the impact and not the secondary effect that the burning jet fuel would have on the structure in the impact area.[14] The aircraft used for the attacks on September 11, 2001, had almost full fuel loads for cross-country flights. Although the precise effects could not be calculated in advance, there is some evidence that Osama bin Laden expected the destruction to be significant, but not necessarily catastrophic, as the transcript of a videotaped conversation suggests:

> We calculated in advance the number of casualties from the enemy, who would be killed based on the position of the tower. We calculated that the floors that would be hit would be three or four floors. I was the most optimistic of them all. [. . . Inaudible . . .] due to my experience in this field, I was

thinking that the fire from the gas in the plane would melt the iron structure of the building and collapse the area where the plane hit and all the floors above it only. This is all that we had hoped for.[15]

Terrorists and insurgent groups that plan suicide bombing attacks will make use of those means that are at hand, or that can be acquired with relative ease or as resources permit, in order to thwart detection and protection measures and best guarantee the success of their attack. The goal is to keep security forces guessing as to which method of attack the terrorist or insurgent group will try next and to compel the former to stretch their resources thin by trying to defend everywhere. A particular hallmark of al Qaeda and the groups it inspires was an ability to plan nearly simultaneous attacks or detonations regardless of the distance between targets, using cellular telephones to coordinate or initiate the bombings. The targets have been within the same vicinity, as occurred during the Madrid train bombings, or in separate countries, as in the 1998 embassy attacks in East Africa.

In some cases, the threat to conduct suicide bombing is more important than actually conducting the attacks. During the Chechen hostage taking of a Moscow theater during October 23–26, 2002, the leader of the group, Movsar Barayev, threatened the use of suicide bombings using belt bombs and rigged munitions. He backed the threat by video statements that showed some of the group's munitions and offered statements that the group was willing to die for their cause. Barayev presumably did this to demonstrate the group's resolve in order to improve their bargaining position, strike fear into the heart of the Russian population, and dissuade any potential rescue effort. The fact that Baseyev was the nephew of slain Chechen leader Arbi Barayev lent additional credibility to the threat that the group was willing to commit suicide.

Another unique attribute of suicide bombing lies in the ability of the bomber to initiate the attack, alter its trajectory, or abort it, in order to improve the likelihood of the attack's success. The chances that an attack will be more successful are improved when a suicide bomber or team disguises the method of attack until just before detonation. But this is not always the case, as any weapon is only as effective as the intelligence that guides its use. The unpredictability of the method of attack and the range of potential targets, in combination with the guidance system of the weapon, makes suicide bombing a thorny security problem. The guidance system and detonation of the suicide bomb—the mind of the suicide bomber(s)—utilizes human judgment, intuition, and ingenuity for success, and is limited only by protective measures that potentially deter or deny the suicide bomber access to their target. One advantage of using humans is their ability to seek out other approaches to the target or to adapt to unanticipated circumstances during device placement and detonation. Only in the rarest of conditions are individual terrorists thwarted and captured alive

once they are prepared, committed, and equipped to attack. No method of attack involving human beings, however, is infallible. The confession of Sajida al-Rishawi, who participated in the al Qaeda in Iraq suicide bombing of three hotels in Amman, Jordan, in November 2005, suggests that she may not have been as committed or prepared to deal with the initial failure of her detonator.[16] Other suicide bombers have preferred to detonate their device somewhere other than the designated target, in order to kill someone rather than being captured. For example, according to Russian sources, Chechen suicide bomber Roza Nagayeva observed police carrying out security checks on people before entering Moscow's Rizhskaya metro station on August 31, 2004. She subsequently targeted passers-by on a nearby busy street and exploded her device, killing 10, injuring 51, and causing damage to surrounding buildings.[17]

### The Purpose of Suicide Terrorism

At the tactical level, the suicide bomber is concerned with not failing in his or her effort to conduct the attack successfully. How a specific attack fits as part of a strategy of revolutionary violence over a period of time is often not known to the individual suicide bomber. Terrorist and insurgent group leaders are rational actors that dictate when the use of violence begins and when it stops. In other words, the political violence is harnessed for a purpose as part of a campaign to achieve objectives. Suicide bombing is one method that allows terrorist and insurgent leaders to achieve one or a combination of objectives. These objectives can include:

- achieving national liberation or freedom from occupation, which can encompass a drive for ethnic and/or religious autonomy;
- "awakening" a national, ethnic, and/or religious consciousness as the first step in a revolution;
- consolidating power by killing rival group leaders and supporters;
- competing with rival groups for popular support;
- provoking a disproportionate response that discredits their opponent in the arena of popular perception;
- raising the morale of an oppressed population; and
- demonstrating a group's power and reach, by striking at targets symbolic of a state's power and prestige.[18]

The last objective suggests to targeted citizens that the state is unwilling or unable to defend itself or protect them. Such organizational objectives underpinning the use of violence, however, must be separated from individual motivations. The specific reasons that inspire individuals to make the decision to become suicide bombers vary widely—from revenge to self-loathing—making it very difficult to determine which is the primary

factor, and is the subject of a broad range of sociological, psychological, and social science scrutiny. Overall, though the broad category of motivation and justification for suicide terrorism is important only to the extent that government agencies should coordinate their efforts to decouple the organizational rationale for the violence from the recruiting pool of future suicide bombers.

The purpose for which suicide bombing is used as a form of political violence is related to the primary audience it is intended to influence. Scholars disagree on precisely who is intended to be influenced, although they agree on the reasons why the violence is used. Robert Pape, for example, suggests that the primary audience to be influenced by suicide bombings is external. He posits that terrorist groups use suicide bombing rather than other types of terrorism because of the unique fear and costs they impose. Fear and costs translate into coercive leverage at the strategic level by threatening the targeted states with even more violence in the future.[19] According to Pape, democracies are the most susceptible to coercion by terrorist suicide bombing campaigns because of their vulnerability to attack and the ability of the populous to influence elected leaders. There is little that democratic states can do to stop suicide bombing, given the openness of their societies. What they can and should do, he argues, is to address the root cause of terrorist anger. Pape determines that the root cause of terrorist anger against the United States is the American military presence in the Middle East. In its stead, he argues, the United States should return to a foreign policy of "offshore balancing" that minimizes its risk to future attack.[20] The shortcomings in Pape's methodology and analysis, including the susceptibility of civilian will to episodic terrorist violence, have already been critiqued in detail elsewhere.[21] Overall, focusing on the effects that suicide bombing have on external audiences, in this case, leads to an exclusive foreign policy solution.

Mia Bloom and others who have studied the use of suicide bombing by Palestinian groups suggest that terrorist groups are attempting to influence a domestic audience instead.[22] Bloom suggests that the United States should utilize its soft power to address the root causes of terrorism. These core motivations, stemming from local grievances—including political and economic inequities—are only exacerbated by American military efforts to kill or capture terrorist leaders globally.[23] In a sense, delineating the effect of suicide bombing among internal and external audiences is academically interesting, but the resulting conclusions have practical implications. Some of those implications, however, can be dangerous in the sense that they may sway policymakers to choose responses optimized to counter the problem by trying to mitigate the effects on either a domestic or an external audience. It is not surprising that there are proponents for each approach within policy circles who are blindly pursuing a simple solution to a complex problem.

### The Support Structure of Suicide Bombing

The various means of terrorist attack suggest protective or defensive measures that can be taken to make such attacks more difficult to conduct and to mitigate their consequences if successful. Understanding the organizational purpose behind suicide bombings provides potential opportunities to counter the ideological message and underlying grievance(s) of—and strategic rationale for—violence. The last attribute of suicide bombing that offers insights for governments and coalition partners looking to counter the threat is the support structure that enables attacks. In all but the rarest cases, individual martyrs are only one link in a chain that allows organizations to conduct sustained suicide bombing campaigns over time. Trying to stop the individual during the course of an attack is extremely difficult, and puts the state in a defensive and reactive posture. Grasping the sequence of events in the life cycle of a suicide bombing attack can offer insights into the organizational structure that supports it, and can help us identify key links in the chain against which more proactive measures can be taken.

A number of contextual factors—including the nature of terrain, population density, economic conditions, appeal of the group's cause, the legitimacy of the government, and the nature of the government's response to the threat—have shaped whether or not previous terrorist and insurgency groups achieved their revolutionary objectives.[24] There is no shortage of models that describe the planning for and conduct of terrorist attacks. A summary of three of these models is contained in Table 7.1.

As the models suggest, terrorist and insurgent groups, no matter what their size or ideological bent, require a number of basic elements in order to conduct their operations—leaders, facilitators, operators, resources, time, space, communications, and information. Individual suicide bombers are difficult to identify among the larger population prior to their attack, and stopping them once they are equipped and en route is problematic for reasons identified above. The leaders of terrorist groups, in contrast, are elusive and adopt active and passive security, mobility, and deception measures. These measures include crossing borders, limiting communications to prevent interception, and changing locations frequently in order to protect themselves from being located and attacked. The success of al Qaeda leaders Osama bin Laden and Ayman al-Zawahiri in avoiding death or capture immediately after the September 11 attacks, and for several years after the Taliban regime fell in Afghanistan, is a striking example.[25]

If terrorist leaders are elusive, and suicide bombers are difficult to identify beforehand and prevent executing their mission, then the potential weakest links in the chain that lead up to one or more suicide bombings are the facilitators of the attack. The more sophisticated that a suicide

bombing is, especially if it involves large numbers of operatives to conduct attacks simultaneously or converge on a single location, the greater time and resources that are required to conduct the attack. The Madrid bombings, as an example of an attack limited in scale, geography, and resources, took just eight weeks to plan and execute.[29] The Moscow theater siege by Chechen rebels mentioned above, in contrast, was conducted only after a number of rehearsals of the plan (according to captured video evidence).[30] Large-scale, coordinated terrorist attacks suggest that an organizational structure supports the suicide bombing prior to attack. A recently published analysis of al Qaeda documents captured in Afghanistan and elsewhere suggests that the larger the group became, the more it suffered

from the same bureaucratic maladies and friction among its terrorist facilitators that plague state governments.[31] These afflictions are symptomatic of a wider organizational problem—how do geographically and operationally dispersed elements operate together in an effective and efficient manner? According to the authors of this report:

> Terrorist groups, and other covert organizations, face two fundamental tradeoffs. The first is between operational security and financial efficiency. Here problems of trust and control—agency problems—create inefficiencies in resource allocation. Strategies to mitigate these problems all entail security costs. The second tradeoff is between operational security and tactical control. Here agency problems and other group dynamics lead to counterproductive violence. Strategies to mitigate these problems through greater control entail security costs for groups as a whole.[32]

Terrorist and insurgent group facilitators comprise the middle management between leader and operator. They perform a variety of roles, including functional planning, acquisition and provision of logistics, technical expertise, financing, and couriering, among other roles.[33] The global chain that supported the September 11 attacks included facilitators who provided finances, safe houses, travel arrangements, and documentation from Afghanistan through Pakistan, Dubai, and possibly Iran.[34] The actions of such facilitators, however, provides government agencies with an opportunity to identify individual links in the chain, develop a picture of the network, and cripple it by removing key elements individually or simultaneously. The intelligence cues of terrorist facilitators are provided as a result of surveillance and analysis that identifies established patterns of behavior, preferred operating methods, specific technical signatures, and potentially limited sources of supply, as these facilitators continue to go about their business. For example, individual bomb makers often leave telltale signs in terms of the types of suicide bomb made, components used in the manufacture, and how the device is constructed.[35] State agencies, working together and with their foreign counterparts, can exploit these intelligence cues, provided they are identified, assessed, and acted upon before the suicide bomber support network has a chance to disperse.

## INTERAGENCY COOPERATION TO COUNTER SUICIDE BOMBING

Few doubt the need for resource and information sharing between those agencies and departments with responsibilities for countering and combating terrorism and insurgency in all its forms, including suicide bombing. The members of the National Commission on Terrorist Attacks upon the United States (the 9/11 Commission) concluded that there were at

least 10 potential opportunities in the 21 months preceding the attacks on the Twin Towers and the Pentagon that were squandered because "the handoffs of information were lost across the divide separating the foreign and domestic agencies of the government."[36] The costs of the September 11, 2001, attacks in human and economic terms, as well as the threat of potential suicide bombings by al Qaeda or similar groups using WMD, suggests that governments cannot afford bureaucratic inflexibility and dithering between agencies and departments in the face of such a catastrophic threat. Perhaps the most important questions associated with interagency cooperation are not whether is should occur, but rather, what this is, what ultimate purpose it serves, and at what level cooperation is most effective.

Although the term "interagency cooperation" is relatively new, some of the concepts underpinning it also relate to the character of democratic governance. The concepts influencing the drive toward interagency cooperation are the principles of responsibility, accountability, efficiency (which can be read in a number of ways, including economy), and effectiveness. Individuals in nations other than the United States and some of its coalition partners prefer to call such collaboration "intergovernmental cooperation"; the wording may be different, but the intent is still the same. Behind the words is a desire to force government organizations to combine their resources and use them in a coordinated fashion, make each other aware of new developments, and prioritize and focus energies against threats and emergencies that cross-organizational authorities and responsibilities. The discussion here will focus on improving the efficiency and effectiveness of government response as the purpose behind interagency cooperation.

Before September 11, 2001, terrorism (and suicide bombing in particular) was considered a problem that requires an interagency response. For example, the State Department maintained diplomatic pressure on state sponsors, supporters, and terrorist groups. The Federal Bureau of Investigation (FBI), in contrast, was the lead agency in the U.S. government for bringing terrorist suspects to justice, and led all investigations into terrorist groups domestically and terrorist acts committed against U.S. citizens and interests at home and abroad. The Central Intelligence Agency (CIA) was the office of primary responsibility for overseas intelligence collection against, analysis of, and reporting on terrorist groups and individuals through its Counterterrorist Center (CTC) and Terrorist Threat Integration Center (TTIC). The Department of Defense maintained capabilities that largely supported other agencies, although its primary contribution against terrorism was in the form of measures to mitigate the effects of terrorist attacks overseas by conducting security assessments and establishing defensive force protection measures on U.S. government facilities.[37]

Despite a well-understood need for greater collaboration between agencies, and the establishment of a number of committees and working

groups for that expressed purpose, progress in the United States toward meaningful interagency collaboration at the national or strategic level remains elusive. The reasons for this lack of success can be ascribed to a number of organizational and bureaucratic factors. It should be noted that these factors are not unique to the United States. Rather, they are common to almost all democratic governments with large bureaucracies. From an organizational perspective, departments and agencies compete to establish or maintain primacy for roles and specific missions under established law, as this determines who has leadership and (to some extent) command over other agencies. Command gives an agency the authority to task or request resources from other agencies and departments in support of missions and control (to a certain extent) over the directions of policy and actions operationally.

Primacy is almost always linked to the fiscal resources available to perform the mission, which is an element whose importance cannot be overstated. The executive agent for a particular mission also sets the functional standards and operating conditions within its own organization to conduct its affairs more effectively and efficiently. Inefficiencies include wasted time, missed opportunities, incompatible databases, exclusive information classification and data sharing systems, and squandered resources. These inefficiencies occur in government as a result of personality clashes, competition between different departments and agencies for resources (especially when those resources are shrinking), suspicion over the motives and agendas of other agencies, the spreading of authority among numerous agencies and departments, and friction between agencies when they possess similar or overlapping capabilities, among others.[38] An example of the latter is contained in the observation by the 9/11 Commission on the ability of U.S. government agencies and departments to conduct offensive clandestine or covert operations against terrorist groups globally. Their recommendation to transfer responsibility to conduct such missions from the CIA to the Department of Defense's Special Operations Command was based on a number of the inefficiencies outlined above: "Before 9/11, the CIA did not invest in a robust capability to conduct paramilitary operations with U.S. personnel. It relied on proxies instead. . . . Whether the price is measured in either money or people, the United States cannot afford to build two separate capabilities for carrying out secret military operations, secretly operating standoff missiles, and secretly training foreign military or paramilitary forces. The United States should concentrate responsibility and necessary legal authorities under one entity."[39] Since September 11, 2001, the impetus within the United States has been to achieve greater efficiency and effectiveness in combating terrorism at all levels of government.

At the lowest level, the tactical domain, the United States has made great strides in establishing interagency cooperation in response to local

conditions. In the early phases of Operation Enduring Freedom in Afghanistan, the Combatant Commander (U.S. Central Command) established a Joint Interagency Coordination Group (JIACG) in order to streamline the planning and information sharing between departments and agencies, ranging from local law enforcement in New York to the National Security Agency.[40] The JIACG facilitated the formation of interagency teams, but their efficiency and effectiveness was improved by theater-level planning and tactical information sharing. As Matthew Bogdanos has noted, "[the situation report's] real value lay in its dissemination by each member to each member. Such JIACG-wide situational awareness avoided duplication of effort and generated collaborative, multiagency solutions to every initiative."[41] The JIACG model was repeated in Iraq and other task-oriented variants related to suicide bombs and other explosives devices, such as the Combined Exploitation Cell (CEXC) and the Joint Improvised Explosive Device Defeat Task Force.[42] CEXC has operated in Iraq as the local hub that coordinates a range of coalition and interagency capabilities including explosive ordnance technicians, forensic investigators, explosives labs, and technical intelligence personnel to speed the process of identifying trends in bomb making and delivery.[43] Although the barriers to tactical-level interagency coordination have been overcome on the basis of leadership and personality, the impetus to overcome has been largely in response to immediate needs. Once the need is over, the local interagency cooperation model has a tendency to dissipate as priorities change and resources are reallocated, including experienced personnel.

**CONCLUSION**

Interagency coordination, even if perfected and seamless, is not a magic bullet that will prevent suicide bombings from occurring. No matter how effective or efficient government departments and agencies are in coordinating their activities, the suicide bomber will always find a way to get through.[44] This is not to say that interagency collaboration should not be attempted or that defensive measures are futile. Rather, it stems from the following realizations: targets for terrorists to strike—including those hardened by protective measures, and "soft" targets that are difficult to defend or are indefensible—are plentiful; governments have a limited resource pool from which to draw in responding to all challenges, and optimizing to defeat suicide bombing will almost certainly open up new vulnerabilities that terrorists and insurgents can and will exploit; and finally, terrorist and insurgent groups and cells have shown remarkable ingenuity in devising suicide bombing attacks against targets of opportunity within the limitations of the resources at their disposal.

The preceding realizations are not designed to suggest that interagency coordination is useless, but rather that there are realistic limits to how much organizations can or should share with one another. One of the keystones of democracy is deliberately engineered inefficiencies that can prove remarkably frustrating to those seeking greater efficiency and effectiveness in government. Checks and balances in the system at all levels, or distribution of power among departments and agencies, spread authority throughout the system in order to prevent the consolidation of power into an oligarchy or tyranny. Interagency coordination should be undertaken with these considerations in mind. Although suicide bombings will never be entirely prevented, they can be mitigated through interagency coordination to the extent that their effects are localized. Much of this interagency work should not focus on the suicide bomber, but rather, should connect the dots between terrorist or insurgent leaders and suicide bombers, through their facilitators who provide the key support for attacks to take place. Interagency and/or coalition coordination has facilitated a number of proactive local successes against terrorist and insurgent groups and cells in Germany, Canada, the United States, the United Kingdom, Iraq, Singapore, and elsewhere. Interagency coordination is effective and efficient, and therefore worth the effort, so long as terrorist and insurgent groups are rendered incapable of conducting catastrophic or strategically significant suicide bombing attacks.

ANFO is a relatively stable explosive compound; a sizable amount of this compound is required to cause significant damage. TATP and HMTD are extremely volatile and sensitive to heat and shock.

# CHAPTER 8

## THE U.S. GOVERNMENT'S COUNTERTERRORISM RESEARCH AND DEVELOPMENT PROGRAMS

Michael Kraft

"Better things for better living" was a major advertising slogan of the DuPont Company during the 1980s.[1] A variation of this might be "better things for staying alive" as a goal of the U.S. government's multibillion dollar program for research and development (R&D) of better equipment to counter terrorists at home and abroad. Dozens of federal agencies are working to develop a wide variety of equipment and tools. Millions of dollars go into developing devices and methods to detect conventional explosives and biological, chemical, and radiological weapons before they can cause mass casualties. Millions more go into equipment to help first responders and law enforcement or military personnel cope with an attack or to defeat hostage takers or mitigate the effects of an attack that could not be prevented.

The extensive counterterrorism R&D (CT R&D) programs are intended to save lives by either helping prevent terrorist attacks or minimizing the damage if they do take place. U.S. R&D evaluation and testing programs also involve projects to help other governments recover from a terrorist attack and assist investigators in bringing the perpetrators to justice. For example, improved first responder equipment can be useful for foreign as well as American fire departments and rescue units.

The general public sees little of these efforts except when airline passengers and their hand baggage are screened or visitors have to pass through a metal detector when entering some government buildings and museums. Most of the equipment is not readily visible, such as monitoring devices tucked inside buildings that can detect biological,

chemical, or radioactive agents. Many kinds of special equipment are usually stored away of out sight until needed—for example, protective suits for first responders, and robots used to safely render harmless suspected bombs.

This chapter will provide an abbreviated overview of the development of the U.S. federal government's counterterrorism research and development testing and evaluation (CT R&DTE) programs, describe the major coordinating groups, and provide an illustrative sampling of some of the individual agency programs. Obviously, a detailed picture of all the nearly 100 agencies and subagencies involved in one form or another of the U.S. government's counterterrorism programs is beyond the scope of this chapter.

In recent years, and especially since 9/11, the CT R&D effort in the United States has become a growth industry, growing in stages from about $10 million in the mid-1980s (for the primary interagency R&D program), to nearly $5 billion projected for fiscal year (FY) 2007.[2] While the R&D efforts have evolved over the years, and are still evolving, the types of terrorist problems have also changed, leading to the need for research in new subject areas such as detecting improvized explosive devices (IEDs) as well as improvements in older systems, such as airport X-ray machines and scanners. The organizational framework has also changed and continues to evolve, most markedly since the creation of the Department of Homeland Security (DHS).

Because so many government agencies are involved to one extent or another in counterterrorism-related research projects (and some of the research has applicability to nonterrorism situations), it is difficult to provide a complete and precise organizational and budget chart of all the nation's efforts in this realm. For example, while the FY 2007 budget request for homeland security CT R&DTE was estimated at $5.1 billion by the Congressional Research Service (CRS), a White House Office of Science and Technology fact sheet uses a figure of "over $4.8 billion."[3] As a recent CRS report for Congress noted, "Coordination of federal counterterrorism R&D is a particular challenge because relevant programs exist in many different agencies and accurate information about their activities can be difficult to obtain."[4]

The DHS receives about one-fifth (or 23%) of federal funding for R&D. Because of concerns over bioterrorism, the Department of Health and Human Services (HHS), and primarily the National Institute of Health (NIH), receives about 40 percent of the counterterrorism-related research budget. The Department of Defense (DOD), which is the largest source of funding for the interagency coordinating body, the Technical Support Working Group (TSWG), receives about 21 percent of the CT R&D funding. Not all of it goes to the TSWG, however. The Departments of Energy, Agriculture and other agencies also receive funding for CT R&D.

The budget and bureaucratic structure, however, is not the full picture. The working relationships between mid-level career government officials from different agencies are extremely important. Several of these professionals, from different agencies, have often worked together for years and serve on overlapping committees or working groups. This has been an important element in avoiding duplication and preventing potentially good projects from falling between the cracks.

In general, there are currently three types of organizational frameworks for CT R&D by the federal government:

- projects coordinated and funded on an interagency basis, primarily but not exclusively through the TSWG, a coordinating body established two decades ago;
- projects under the auspices of the DHS, which was established in 2003 and has become a hub for selecting and funding research projects previously selected and conducted by some of the individual agencies; and
- individual agencies conducting specialized research, such as the Department of Energy (DOE), the Justice Department's National Institute of Justice (NIJ), and elements of the DOD.

After a brief history of the national R&D effort, this chapter will review each of these three frameworks, focusing only on federal government programs. However, it must be acknowledged that a considerable amount of R&D is also conducted by industry, universities, and nonfederal government agencies (although often funded by federal sources).

## BACKGROUND

Although individual agencies such as the Federal Aviation Administration (FAA) and the NIJ have conducted limited CT R&D for many years, in some cases since the 1970s, their efforts were not always coordinated with other agencies until the 1990s.

Proposals to develop a coordinated federal government R&D program began materializing in 1982, when the Reagan administration's *National Security Directive 30*[5] established an interagency coordinating committee to develop U.S. government policies on terrorism. The Department of State (DOS) was made the lead agency for countering international terrorism, and chaired the group known as the Interdepartmental Working Group on Counter-Terrorism (IWG/CT). The group consisted of officials at the Assistant Secretary level from several agencies, such as the Departments of Defense, Justice and State. The DOS representative was the Coordinator for Counterterrorism Robert Oakley, a career Foreign Service officer with Ambassadorial rank.

In turn, various specialized subgroups were established, including an interagency group to coordinate R&D on equipment to counter terrorism. This was named the TSWG and brought together representatives of a dozen agencies, such as the DOS, DOD, DOE, NIJ, FBI, CIA, and the FAA. The intent was to make sure there was no duplication between the agencies and to fund worthwhile research that "is needed but not being carried out by any the agencies because it falls into the gaps between adjacent missions and jurisdictions."[6]

## THE TECHNICAL SUPPORT WORKING GROUP

The TSWG is the U.S. national forum that identifies, prioritizes, and coordinates interagency and international R&D requirements for combating terrorism.[7] The TSWG is responsible for rapidly developing technologies and equipment to meet the high priority needs of the combating terrorism community, and for addressing joint international operational requirements through cooperative R&D with major allies.

The DOS was selected to chair the organization because it was considered to be an "honest broker" with no vested interest in a particular line of research. The TSWG's establishment was endorsed by a high-level commission headed by then Vice President George H.W. Bush after the bombing of the U.S. Embassy and Marine Barracks in Beirut in 1983 by Islamic radicals. The 1991 *Vice President's Report on Combating Terrorism* recommendations supported the TSWG, still in the embryonic stage, to "ensure the development of appropriate counterterrorism technologies."[8]

The program began relatively modestly, with a $10 million appropriation in the DOS budget for FY 1987, initially authorized in the Omnibus Diplomatic Security and Anti-Terrorism Act of 1986.[9] Although the DOS chaired the organization, it did not have an existing office for administratively handling these R&D contracts. Therefore, in order to save operating and personnel costs, the DOS worked out an agreement to transfer the funds to the DOD, which already had specialists experienced in handing R&D contracts, for the purposes of executing the program under State's policy oversight.

This effort to save time and money, however, soon backfired in Congress when a key Senate Appropriations Committee staffer handling the DOS's budget asserted that the DOS was merely acting as a front for the DOD. He persuaded his subcommittee chairman, then Senator Rudman, a New Hampshire Republican, to zero out the CT R&D request in the Senate version of the DOS FY 1990 appropriations bill. This touched off a heated discussion behind closed doors between Senator Rudman, the Senate staffer and L. Paul Bremer, then the DOS coordinator for counterterrorism.[10] The final compromise bill with the House of Representatives provided only $2 million in FY 1990—barely enough to keep a handful of projects going and leaving virtually no new money to start new ones.

Finally, at the DOS's urging, the National Security Council (NSC) requested that the DOD and other agencies kick in more funding. By FY 1995, the budget was back up to $11 million, and in FY 1997 it was up to $18 million. After the August 1998 bombings of the U.S. Embassies in Nairobi and Dar es Salaam, the TSWG budget grew to $70 million, and after 9/11 the TSWG's budget grew to $180 million in FY 2003. By FY 2005, the TSWG budget reached its current funding level of $207 million, as a result of additional funds added by Congress and inclusion in a supplemental appropriation bill.

The TSWG budget comes from three basic components: (1) the so-called "core funding," which comes primarily from the DOD; (2) the Congressional add-ons as a result of appropriations incorporated by Congressional appropriations committees or floor amendments; and (3) "leveraged" funding from other agencies. For example, the FBI, FAA, and other agencies put money into specific TSWG projects of particular interest to them. In FY 2006, the core funding for TSWG was $55 million from the DOD, $1.5 million from State, $65 million from Congressional add-ons, and $25 million from the Iraq War Supplemental Appropriations Bill. The rest came from a variety of other departments and agencies, including the DHS, the NIH, and even $2 million from the DOS Bureau of Diplomatic Security, which is responsible for embassy protection. For FY 2007, the core funding request to Congress was $65 million, but as of this writing, it is too early to determine the potential amounts of Congressional add-ons or the leverage funding.

As indicated earlier, the DOD provides the bulk of the core funding for the TSWG. The DOS's contribution, however, has remained static and even declined in recent years, a product of Congressional cuts in the overall DOS budget. Nonetheless, the DOS's contribution, though small compared to the other agencies, has been important in providing policy guidance on some key issues, which are described later in this chapter.

### Technical Support Working Group Grows

The TSWG has grown and evolved over the past two decades. It began with no full-time staff—the officials from State, Defense, and other agencies contributed their time to the interagency process while attending to their duties within their home agencies. About 60 persons, some of them contractors, now work on the TSWG program, helping evaluate projects and handling the research and contract paperwork. Some 100 federal agencies and their component offices are now represented within the TSWG. Their representatives contribute their time as well as operational and technical insight in the prioritization, management, operational testing, and ultimate use of the systems developed. The contributions of these experts are one of the major reasons for the success of TSWG.

The TSWG cochairs are provided by the Departments of State and Defense. The DOE and the FBI provide technical cochairs who advise on project selection and technical approaches to addressing the requirements and gaps in existing research. Policy oversight is provided by the DOS's Coordinator for Counterterrorism, until recently Ambassador Henry Crumpton. The executive secretary is currently Michael Jakub, the counterterrorism offices' director of technical programs and a senior civil servant who has been with the TSWG program since its inception. Program execution is conducted through the DOD's Assistant Secretary for Special Operations and Low Intensity Warfare (ASD/SO/LIC), Tom O'Connell. The umbrella group for the TSWG core staff in its day-to-day operations is headed by Ed McCallum, director of the DOD's Combating Terrorism Technology Support Office.[11]

The TSWG balances its program development investments across four pillars of combating terrorism:[12]

- *Antiterrorism:* Defense measures taken to reduce vulnerability to terrorist acts;
- *Counterterrorism:* Offensive measures taken to prevent, deter, and respond to terrorism;
- *Intelligence Support:* Collection and dissemination of terrorism-related information taken to oppose terrorism throughout the entire threat spectrum; to include terrorist use of chemical, biological, radiological and nuclear materials or high-yield explosive devices; and
- *Consequence Management:* Preparation for and response to the consequences of a terrorist event.

To carry out its mission, the TSWG currently has 11 specialized subgroups (it began with six), chaired by various agency representatives, and typically including members from half a dozen agencies:

- Blast Effects and Mitigation, *chaired by the Bureau of Alcohol, Tobacco and Firearms (ATF)*;
- Chemical, Biological, Radiological, and Nuclear Countermeasures, *DOD and FDA*;
- Explosives Detection, DHS *Transportation Security Administration (TSA)*;
- Improvised Device Defeat, *FBI*;
- Infrastructure Protection, *DOD, FBI*;
- Investigative Support and Forensics, DHS (*U.S. Secret Service [USSS]*);
- Physical Security, *DOD and DOE*;
- Surveillance, Collection, and Operations Support; *Intelligence Community*
- Tactical Operations Support, *DOD, DOE*;

- Training Technology Development *DOD, DHS Office of Grants and Training (OGT)*; and
- VIP Protection, *DHS (USSS).*

These subgroups develop requirements that may come from a variety of sources: suggestions made by law enforcement or federal officials, the private sector or academic community, or from the needs perceived by the experts in each subject area. The subgroups frequently meet to evaluate the proposals and nominate the ones that they conclude are the most worthy of funding. The proposals are then examined and approved or disapproved by the TSWG Executive Committee at their annual review meetings. Priority is given to projects that could be useful to more than one agency or end user. Many of the equipment items are useful in dealing with nonterrorist events, such as chemical spills or ordinary crimes, as well as terrorist attacks, and civilian as well as military end users.

Because the officials who are members of the subcommittees are also the experts within their own agencies, this consultative process helps prevent duplication and promotes joint projects.[13]

Depending on the budget projections, a number of proposed initiatives may not make the cut and are deferred to following years, or funding might be initially provided at a lower level than originally proposed, stretching out the research an additional year or two.[14]

The TSWG focuses on relatively short-term projects that usually can be finished in two or three years, and then transitioned to one or more interested agencies before completion and testing, and then moved to the private sector for production. The actual R&D is conducted by a variety of government labs, universities, and private sector companies.

As John Reingruber—who recently retired as the DOD cochair of TSWG—described in a briefing several years ago, "Our mission is to conduct a national interagency R&D program, for combating terrorism, primarily through rapid research development and prototyping. By 'rapid,' I mean that we identify a requirement, and then within two years, field that capability."[15]

The TSWG has a large-scale outreach program to the private sector, using websites and conferences to advertise its requirements. Although TSWG had funded private sector projects earlier, the large-scale outreach effort began in 1999, through meetings with private sector representatives to explain the TSWG's requirements. The interest was enormous, with thousands of proposals submitted—17,000 in the first year following the 9/11 attacks.

A conference for defense contractors in 2006 drew some 800 persons. Within four weeks after requirements are issued each year, thousands of proposals are received. Some come from major companies and universities, others from small businessmen or inventors, sometimes two- and

three-person companies. Only a relative handful of the proposals meet the requirements and survive the review and selection process.

As for the success rate of projects that are funded, one TSWG official compared it to mutual funds—there may be some that have a relatively high chance of working out, but bring a relatively low payoff, while others have a lower chance of succeeding but offer greater benefits if they succeed. Meanwhile, some difficult problems—such as detecting explosives at a distance—are being tackled simultaneously by a variety of research approaches.[16]

### Projects

A project's costs may range from $100,000 to $10 million—a far cry from the early days when projects would typically be funded at $300,000 to $400,000. Currently funded projects range from small hand-held devices for detecting weapons to improved materials for strengthening the walls and ceilings of embassy and other buildings to withstand large blasts. About 400 projects are in the works.

Some of the research is aimed at developing new concepts and products. Funds are also allocated to develop the next generation of old concepts, such as a lightweight mask that will provide up to 20 minutes of protection against biological and chemical agents (an earlier model was developed in the early 1990s). The current version has been distributed to thousands of government workers in Washington and to Congressional offices.

The TWSG allocates about 10 percent of its funding for the development of countermeasures against chemical, biological, radiological, and nuclear measures. By its own account, the DHS has funded more than 40 projects in this area through TSWG. About 16 percent of the funding is allocated for surveillance, collection and operations support. This is a highly sensitive area, and the TSWG describes its work in this area only in general terms. Smaller allocations go to such areas as VIP protection and mitigating the effects of explosions.

Largely because of the increasing use of IEDs against American and coalition troops (as well as civilians) in Iraq and Afghanistan, the largest percentage of TSWG funding (about one fifth) is going toward projects to detect and defeat these devices. Other projects include improvements in radio controlled robots that move on small tractor treads close enough to a suspected device to fire a small water charge into it to disable the explosive. Another project includes a small tent-like structure that shields a suspected bomb from radio waves, thus providing more safety for the bomb disposal technicians. This type of equipment can be useful for local or state police departments as well as in military zones.

The Explosive Detection subgroup has also been funding projects to detect large volumes of explosives from a distance. One of the complications

in this endeavor is the pollutants in the atmosphere of most major cities. Research is being conducted along several avenues, and with at least one foreign partner. In another approach to the problem of detecting explosives, a research project developed a van equipped with equipment that can surreptitiously drive past other vehicles or cargo containers and scan for explosives and other contraband. More than 60 such vans are now in operational use and the van is commercially available.[17]

### Joint Research

A prominent feature of the TSWG program has been its ability to leverage and coordinate the U.S. government's CT R&D projects with allied countries. For example, after Pan Am 103 was blown up over Lockerbie Scotland in December 1988, killing 270 persons by bomb using plastic explosives hidden in a radio, the TSWG quickly provided funding for the American part of an international effort to identify chemical markers to help locate plastic explosives that might be hidden in luggage. The markers were listed in the 1991 *Convention on the Marking of Plastic Explosives for the Purposes of Detection.*

Later, after the FY 1993 DOD Authorization Bill approved $3 million for cooperative projects with NATO countries and major non-NATO allies, joint research agreements were established with Britain, Canada and Israel. The U.S conducts these projects on a bilateral basis. Trying to conduct joint research on the same project with three or more countries at once would be too complicated. However, sometimes different lines of research are conducted with one or more countries in order to try and address a common problem. These joint research efforts have the advantage of preventing duplication as well as gaining an additional professional perspective on a problem. In addition, research costs are sometimes lower in the other countries. The U.S. share of the joint research program has averaged about $8 million a year per country, but this varies from year to year. In 2006, Australia and Singapore joined the program.

## DEPARTMENT OF HOMELAND SECURITY, THE NEW ACTOR

Meanwhile, a major new R&D player emerged with the establishment of the DHS in January 2003.[18] However, as with other aspects of the major reorganization involved in the creation of DHS, the evolution of the R&D machinery has had its teething problems. Organizations that were used to making their own decisions and priorities and working with TSWG are now part of a huge bureaucracy. Problems also arose in potential overlapping and duplication with TSWG. Early in the creation of the DHS program, for example, a DOS official described how he received a call from a puzzled British counterpart informing him that DHS wanted to set up

cooperative research arrangements, even though such British–American agreements already existed through TSWG.

The Homeland Security Act established four directorates (or in effect, four divisions) within DHS: Border and Transportation Security, Emergency Preparedness and Response Information Analysis, Infrastructure Protection, and the Directorate of Science and Technology (S&T Directorate). The latter of these is headed by an undersecretary, and is the primary R&D arm of the department, with a mandated goal of providing federal, state and local officials with the technology and capabilities to protect the homeland.

Although the bulk of the DHS CT R&D activities are conducted under the Directorate for Science and Technology, other components—such as the Coast Guard—kept their separate budget lines as a result of Congressional action. Other R&D components, such as those in the TSA were being integrated into the directorate in 2006. The directorate's budget goes not only for counterterrorism projects; it also is concerned with all types of catastrophic threats. Some of the DHS-funded equipment can be used for both countering terrorist attacks and, for example, a spill of dangerous chemicals.

The S&T Directorate receives the largest amount of R&D funding and is becoming the coordinating body within DHS. According to the Directorate's official statement, its mission is "to protect the homeland by providing Federal and local officials with state-of-the-art technology hand other resources. The directorate fulfills its mission through strategic objectives" including the following:[19]

- Develop and deploy state-of-the art, high-performance, low-operating-cost systems to prevent, detect, and mitigate the consequences of chemical, biological, radiological, nuclear, and explosive attacks;
- Develop equipment, protocols, and training procedures for response to and recovery from chemical, biological, radiological, nuclear, and explosive attacks;
- Enhance the technical capabilities of the Department's operational elements and other Federal, State, local, and tribal agencies to fulfill their homeland security related missions;
- Develop methods and capabilities to test and assess threats and vulnerabilities, and prevent technology surprise and anticipate emerging threats;
- Develop technical standards and establish certified laboratories to evaluate homeland security and emergency responder technologies, and evaluate technologies for SAFETY Act[20] certification; and
- Support U.S. leadership in science and technology.

The directorate has four primary offices responsible for managing technologies by portfolios across a broad spectrum.[21] The Office of Plans, Programs and Requirements (PPR)[22] partners with operational end users

to identify requirements, create strategic initiatives to address these requirements, prioritize investments, and ensure both short-term and long-term goals are met in accordance with national policies. The Homeland Security Advanced Research Projects Agency (HSARPA)[23] works primarily with nonfederal performers, such as the private sector and academia, in innovative R&D, rapid prototyping, and technology transfer to meet operational needs. The Office of Research and Development (ORD)[24] executes research, development, test and evaluation programs within the national and federal laboratories, establishes the University Centers of Excellence, and maintains the nation's enduring R&D complex dedicated to homeland security. And the Office of Systems Engineering and Development[25] executes the transition of large-scale and pilot systems to the field through a project management process.

The DHS FY 2006 S&T research funding is currently appropriated to the following major categories: Biological Countermeasures; Radiological and Nuclear Countermeasures (this specific work is now accomplished in the Domestic Nuclear Detection Office [DNDO] at DHS); Threat Awareness; Chemical Countermeasures, and Explosives Countermeasures; Critical Infrastructure Protection, Cyber Security, Emergent and Prototypical Technology; Support to Components (Border and Transportation, Preparedness and Response, U.S. Coast Guard, U.S. Secret Service); Counter-MANPADS (man portable air defense systems); University and Fellowship Programs; the Office of Interoperability and Compatibility; and Standards.[26]

The DHS involvement in CT R&D programs has grown from less than $300 million in programs in 2002 to nearly $1.3 billion in FY 2006.[27] According to Maureen McCarthy, then director of the ORD—whose office executes the Directorate's research, development, testing, and evaluation (RDT&E) of programs within the national and federal laboratories and thus plays a key role in the R&D process—the effort "basically started from scratch."[28] During the next several years, DHS CT R&D appropriations rose rapidly to nearly $1.28 billion in FY 2006. However, the Administration's FY 2007 request to Congress reduced the budget by 10.3 percent, down to roughly $1.15 billion, and in June, 2006, the House Appropriations Committee made further cuts in the FY 2007 DHS appropriation, reducing the figure to $974 million. The Senate Appropriations Committee provided only slightly more, approving just under $1.05 billion.[29]

According to the American Association for the Advancement of Science, "DHS R&D after a rapid ramp-up phase, now appears to be a mature R&D portfolio and subject like other R&D funding agencies to cuts because of the tight budget situation facing domestic programs."[30] Meanwhile, in unusually strong language, the Senate Appropriations Committee report language accompanying the DHS Senate Appropriations Bill for FY 2007 criticized the DHS S&T Directorate, which is under an acting head, as a "rudderless ship without a clear way of getting back on course." The

Senate Committee directed the DHS to develop a detailed five year research plan.[31]

Both the Senate and House withheld funds until DHS provides more detailed budget accounting. The House Bill provided $668,million for the DHS S&T Directorate in FY 2007 and the Senate $712 million, a little more than half of what the Directorate received for FY 2006.[32] DHS officials have indicated that more changes are likely in the future, now that Secretary Michael Chertoff has completed a second stage review of the agency's organization.

One key consideration in DHS activities, according to McCarthy, is keeping the "customer" in mind—that is, focusing R&D on the needs of the DHS operational agencies, such as the TSA, the Coast Guard and U.S. Secret Service, and through them, local officials and first responders. As of mid-2006, the Science and Technology Directorate is in the process of realigning its functions to provide a more consumer-focused approach to the R&D mission.

McCarthy notes that proposals for projects and suggestions for equipment improvement often come up from the field, from local and state governments, police, fire chiefs, and through the DHS officials involved with the emergency preparedness portfolio.[33] Another consideration is the cost and maintenance factor. While the DHS helps develop and evaluate equipment, it is basically up to the local and state governments to decide what to purchase, either with their own funds or with federal grants. Thus, there is an incentive to develop products that are affordable by state and local governments.

Training is becoming an increasingly important part of the R&D efforts—the development of modules, simulators, videos and other tools to help train personnel in the use of equipment, coordination techniques and other crisis responses. McCarthy describes the focus of these efforts as "training the trainer," as DHS cannot be in the business of training all the end users. She also notes that training seems to be the most effective when provided in the early career stages—for example, when a person is in the police academy, as opposed to later in his or her career.

Counterterrorism research and development is generally perceived as dealing with tangible items, such as equipment or computer software, but funding is also going toward research in the behavioral sciences. Through its academic "centers of excellence" program,[34] DHS is funding research that it hopes will help officials understand the motivations, beliefs and intentions of potential terrorists. This follows the earlier work by the Justice Department's NIJ, which began funding research in the behavioral sciences in the late 1960s.

One issue facing DHS (as well as other agencies) is setting priorities for selecting projects. About three quarters of the overall DHS R&D budget is directed toward defending against weapons of mass destruction—biological, chemical, explosive, radiological and nuclear. Within DHS,

there is a heavy emphasis on countering large and catastrophic attacks, such as the explosion of a "dirty" radiological device in a major city, which would have an immediate and large-scale impact, or the release of biological agents that potentially could infect thousands of persons before the symptoms are recognized several days later.

This emphasis reflects the impact that 9/11 had on the thinking of experts both inside and outside the government. Disturbing reports have surfaced in the media indicating that Bin Laden and those he has inspired are trying to develop WMD for future large-scale attacks. The British—as a result of the attacks in July 2005, as well as the discovery of another plot in August 2006—have been particularly concerned about small cells of militant Muslim radicals trying to develop home-brewed chemical or biological agents.

There are some in the R&D community, however, who feel that despite the potential dangers of a large-scale WMD attack, terrorists are far more likely to use conventional explosives or explosives made from fertilizer, such as the one used against the federal office building in Oklahoma City or the one contemplated by the group of terrorist suspects arrested in Toronto in June 2006. Further, as one expert in conventional explosives observed about the national focus on weapons of mass destruction, "we're spending a lot of money over possible attacks that may have high consequences but low probability." Another government expert involved in countering attacks against transportation systems supported the view that conventional explosives are still the preferred weapon of choice because they appeal to the psychological makeup of terrorists.[35]

Translating these contrasting perspectives and views into decisions on funding specific lines of research and projects, the policymakers must weigh a variety of factors, including the intent and capabilities of terrorists. This requires intelligence information on the terrorists' intent and their capabilities. Decision makers also have to take into account the fact that terrorists might have difficulty in obtaining and using the necessary materials for a WMD attack, as well as the cost to society if the terrorists overcome these obstacles and succeed.

Some research projects do not present difficult choices; for example, better protective equipment that can be used by first responders in dealing with a chemical terrorist attack can also be useful in coping with an overturned railway tank car containing a dangerous chemical. As DHS Secretary Chertoff noted in a 2005 Senate committee hearing:[36]

> We must acknowledge that although we have substantial resources to provide security, these resources are not unlimited. Therefore, we as a nation must make tough choices about how to invest finite human and financial capital to attain the optimal state of preparedness. To do this we will focus preparedness on objective measures of risk and performance.

In the R&D arena, this approach to prioritization translates into a large array of important homeland security projects and initiatives.

### Projects

DHS-funded R&D projects range from improving the protective suits used by firefighters, to developing performance standards for hand-held detectors of trace explosives, to a system of networked monitors to detect the release of chemical agents in the subway systems of major metropolitan areas in the United States.[37] Some of the projects first originated in other agencies, and DHS took over the funding after it was created. For example, the subway protection system originated with NIJ and DOE funding.

One high-profile R&D project that is nearing completion is the development of equipment to defeat MANPADS, the shoulder-fired ground to air missiles that terrorists have used to try to shoot down commercial airliners.

Some military aircraft carry various types of missile counter measures, but they have not been considered feasible for large-scale use on commercial aircraft because of the cost and weight penalties and the recurring maintenance costs.[38] Interest in the concept was renewed after al Qaeda terrorists tried to shoot down an Israeli passenger plane taking off from Mombassa, Kenya in November 2002. The missile came close to the plane but failed to explode and it safely landed, as did a cargo plane that was hit in one engine while departing from the Baghdad airport in 2003. In previous years, an estimated three dozen civilian planes, including five large jets, were hit in various parts of the world, including five large jets. Questions about the feasibility of installing the equipment on a large number of aircraft remain. Spending on the counter-MANPADS project went from $61 million in FY 2005 to $109 million in FY 2006, and the program is now entering the operational testing and evaluation stage of two different designs. The DHS goal is the production of equipment that would cost no more than $1 million per plane.

## OTHER AGENCIES

As indicated earlier, many government agencies are involved in counterterrorism research development to one extent or another. The TSWG membership list includes 20 primary agencies plus their numerous component groups, such as the FBI and Bureau of Alcohol, Tobacco, Firearms and Explosives (ATF), both of which are part of the Justice Department. Nearly 100 state, local and nongovernmental organizations are affiliated with TSWG, including the New York City police and fire departments, various DOD agencies, such as those dealing with chemical and biological

warfare threats, and six Justice Department organizations, including the FBI and NIJ.[39]

There is also a great deal of collaboration and cooperation between the agencies. For example, although the largest portion of DHS S&T Directorate funding request is dedicated to bio research, DHS also works with the Department of Health and Human Resources and the NIH in this area. DHS has recently been given the responsibility to incorporate a newly created National Biodefense Defense Counterterrorism Center, and it has taken over responsibility for the UDSA's Plum Island Animal Disease Center, although Department personnel will continue to conduct research there.[40]

Another example of the interaction between the various agencies is that nearly 100 percent of NIJ's funded research in the area of weapons detection and through-the-wall surveillance technology is conducted with the administrative and technical support of the Air Force Research Laboratory (AFRL).[41] The AFRL engineers act as the Contracting Officer's Technical Representatives (COTR) while the AFRL business offices handle contract paperwork. According to John S. Morgan, NIJ assistant director for science and technology, NIJ's federal, state and local law enforcement and corrections practitioner-based technical working groups guide NIJ investment by defining the functional requirements for new systems and their relative priorities. NIJ conducts a gap analysis to determine which of those requirements cannot be met, and then it issues to the public Broad Agency Announcements (BAA) seeking proposed solutions to those requirements. Applications from the private sector and other applicants are then reviewed by panels of technical experts and practitioners as to how well they address the requirements laid out in the BAA. These review panels are another mechanism NIJ uses to coordinate its efforts. The technical experts on these panels routinely include representatives from DHS S&T and TSWG. The applications recommended for funding, and the money to fund them, are then sent to AFRL for contracting and technical monitoring. Similarly, 90 percent of the NIJ's work in the area of explosives detection and remediation was conducted through TSWG. He said that the added benefit of working through the TSWG is that it also enables NIJ to leverage other agency funds for projects, whereas NIJ normally provides all the funding required for the work it does through AFRL.

## R&D AT INDIVIDUAL AGENCIES

It would take a separate book to describe the work done by all the many agencies involved in CT R&D. To illustrate the variety of research efforts, the following sketches are provided of five agencies: the UDSA, the DOE, the NIJ, the TSA, and the FAA, both of which are currently part of DHS.[42]

### The Department of Agriculture

The USDA is involved in relatively little-known CT R&D efforts as a result of recent concerns that terrorists might try to attack the food supply, perhaps through poisoning or contaminating food before it reaches supermarket shelves, or even the raw material—crops, animals and poultry. Some of the key programs included in the food defense area are: expanding the Food Emergency Response Network (FERN) with participating laboratories, including implementation of the Electronic Laboratory Exchange Network (ELEXNET), an electronic laboratory diagnostic methods repository; and strengthening research on automated diagnostic methods for rapidly detecting and identifying pathogens and chemical contaminants and modeling food security and incident scenarios.[43]

Other Agriculture defense measures include

- Strengthening research on rapid response systems to bioterrorism agents, improving vaccines and identifying genes affecting disease resistance;
- Expanding the National Plant Disease Recovery System to ensure disease resistant seed varieties are continually developed and made available to producers in the event of a natural or intentional catastrophic disease or pest outbreak;
- Expanding the sample testing capacities of the Regional Diagnostic Networks;
- Enhancing the monitoring and surveillance of pests and diseases in plants, including national wildlife monitoring and surveillance;
- Improving diagnostic methodologies and laboratory capabilities;
- Increasing activities to safeguard plants from intentional threats to spread pests and diseases; and
- Strengthening the ability to safeguard and track biological disease agents.

As in many areas of research that can help counter security threats, these efforts have benefits for nonterrorism problems as well. There is also an economic security factor: The incidents of mad cow disease, even though not widespread, are an example of how even a small number of infected animals can hurt food exports as well as domestic sales. There is a continual effort to develop techniques for more rapid diagnosis of plant and animal diseases, especially for new diseases such as soybean rust (which has afflicted southern states in the past couple of years), or new strains of existing diseases, like the Avian influenza (bird flu) virus. Research is also being conducted into preventive pasteurizing of food products to see if current methods can be used to provide protection against a wider number of microorganisms, and whether the pasteurization process can be made more robust without adverse affects.[44]

### Department of Energy

The DOE is involved in counterterrorism through its focus on nonproliferation programs, and particularly efforts to protect former Soviet Union nuclear facilities and to employ Russian nuclear scientists. DOE has also funded or initiated a variety of other projects, some of them as small as simulated "flash bang" hand grenades for use in training exercises for protecting nuclear facilities. DOE CT R&D work has included work on detection of toxic agents, genomic sequencing and microfabrication techniques,

DOE has also been developing virtual reality software to provide more realism for exercises in protecting nuclear facilities or other buildings from potential attackers. DOE has some 30 buildings to protect, including nuclear reactors.

Another project called "Stairwell Safe Haven" turns stairwells into an area protected from dangerous chemical gas attacks. The system draws and filters air from exterior intakes and pumps it into the stairwells with sufficient pressure to block contaminants from leaking in through other entry points. The prototype was constructed and tested within a DOE facility and is available to other government agencies. This is a good example of a project that could have wide applicability.

Two other interesting projects designed for use by civilian security personnel in turn are useful in Iraq or other military environments. The "Kool Suit" is basically a thin bladder shaped by the wearer's body that fits under an armored vest. The bladder has tubes with drinking water and a solution to keep it cool. When the water gets too warm, the bladder can be replaced by a colder bladder. Although intended for DOE security personnel patrolling facilities in hot American summer weather, it is being adapted for use in Iraq. Another project modified pickup trucks by armoring them and placing a concealed machine gun in the covered cargo area. The gun can be popped up through the top and fired from within the cab, a bit like a turret on a naval ship fired from the control room below decks. As a result, it looks like a civilian vehicle, and thus less conspicuous than a humvee.

### National Institute of Justice

The NIJ was created by Congress in 1968 as the Justice Department's research, development and evaluation arm. It conducts R&D in many physical science and technology areas as well as in the social and behavioral sciences. Its designated mission is to enhance the administration of justice and public safety, and it is the only federal agency dedicated to improving the effectiveness of the criminal justice system through scientific research.[45]

NIJ's responsibilities include serving as the national focal point for law enforcement technology and developing standards and best practices to guide the work of criminal justice professionals in the use of technology, as well as developing and improving forensic science technologies and assisting crime laboratories to enhance their capacity to access and use new technology. Research areas include less lethal weapons, critical incident prevention and response, interoperable communications, sensors and surveillance (including long range detection of weapons), information sharing, electronic crime detection, personnel protection, and DNA forensics.[46] NIJ is also mandated to conduct research on "equipment for particular use in counterterrorism, including devices and technologies to disable terrorist devices."[47]

To help make commercial products available to local governments, NIJ created the Office of Law Enforcement Technology Commercialization (OLETC) to bridge the gap between the laboratory and the market. One project, the Kinship and Data Analysis Panel (KDAP), has developed a set of protocols to deal with mass fatality incidents, resulting from NIJ's response to identifying victims of 9/11.[48] NIJ has also been investing in technology to extract identifiable data from degraded DNA, such as might happen in a mass disaster or terrorist attack.[49] Some illustrative examples of NIJ projects include:[50]

*Concealed weapons detection*, including the *Handheld Acoustic System for Concealed Weapons Detection*—an inexpensive, handheld device to alert officers to the potential presence of a weapon at a greater distance than the handheld metal detectors in use today, thus providing them a greater margin of safety; the *Millimeter Wave/Infrared Concealed Weapons Detector*— a dual-mode (millimeter wave/infrared) camera to detect weapons hidden on individuals 10 to 40 feet away suspected of committing a crime, without the control or cooperation of the individual under surveillance; and the *Passive Millimeter Wave Camera for Concealed Weapons Detection*—a portable weapons detector that will be able to remotely scan groups of individuals for metallic and nonmetallic weapons using a passive millimeter wave (MMW) imager.

*Less-than-lethal weapons*, including the *Laser Dazzler*™—a handheld device that uses random, flashing, green laser light to disorient and distract a subject; and the *Ring Airfoil Projectile (RAP)*—a doughnut-shaped, rubber projectile used to deter a single individual at a standoff range by producing a sting when it strikes. NIJ also participates in working groups with the DHS and TSWG to coordinate its programs at the federal level and meets regularly with law enforcement officials at the state and local level. It has formal memorandums of understanding with the DHS Science and Technology Directorate and the Assistant Secretary of Defense on the transfer of military technology to homeland security and public safety applications.

Unlike most agencies, NIJ also funds research in social and behavioral sciences—for example, studies that examine what motivates terrorists, and explore the links between terrorists and international organized crime. There are five main categories of NIJ's social science research on terrorism: (1) database development for analysis purposes; (2) improving law enforcement responses, including developing relationships with Muslim communities; (3) hardening potential high risk targets, such as assessing the security of shopping malls; (4) vulnerabilities and emergency responses to possible attacks on the livestock industry; and (5) terrorist links to money laundering, informal financial transfer systems (including hawalas) and terrorism organization, recruitment, and motivations. NIJ began funding social science research in the late 1960s and about 15 percent of NIJ funding goes to social science research.

### The Transportation Security Administration

The TSA was created in response to 9/11. Before its creation, airport security checkpoints were operated by private companies that had contracts with either the airlines or airport operator. The TSA was originally located within in the U.S. Department of Transportation, but was moved to the U.S. DHS in 2003. Its counterterrorism research funding, about $140 million, has also been moved over to DHS.

Effective and fast screening of airline passengers is a high priority for the TSA, illustrated by the huge number of passengers—about 2 million persons a day passing through U.S. airports. As a result, some of the TSA R&D efforts are focused on developing next-generation explosives detection equipment for the screening of checked baggage.[51]

Currently, TSA uses two types of equipment to screen checked baggage—Explosives Detection Systems (EDS) and Explosives Trace Detection (ETD) equipment. EDS are the size of a mini-van and employ technology similar to a medical CAT scan, whereas ETD equipment is much smaller—about the size of large suitcase. Screeners working with the portable ETD use a swab on a piece of luggage; the swab is then analyzed for traces of explosives. Work continues on improving technology to increase the efficiency and speed of existing EDS machines, and TSA scientists are testing upgraded models of ETD equipment. TSA is also focusing on the use of biometric technology to further enhance security and customer service by helping identify passengers more quickly.

A technology known as "backscatter" is also under review at the Transportation Security Laboratory. Backscatter signals interact with explosives, plastics and metals, giving them shape and form—and making them easier for the operator to interpret on the screen. When a passenger steps into the machine, the technology produces an outline of the passenger and allows a screener to detect explosives, prohibited items, or a weapon.

However, there are privacy concerns about passengers feeling that they are overly exposed by the equipment, and TSA is working on software enhancements to resolve this issue.[52]

### Federal Aviation Administration

Also now part of DHS, the operational mission of the FAA, and particularly its recent R&D history, reflects the federal government's reorganization and evolution since 9/11. The transportation security section was established in 1974, following a series of hijackings by Cubans and Palestinians. After 9/11, its functions moved from the Department of Transportation to the newly formed Transportation Security Agency, and to the DHS Science & Technology Directorate, as part of the effort to centralize most CT R&D efforts.

The FAA still retains responsibility for non-R&D programs: the security of its personnel, facilities, equipment and data. FAA provides financial and other assistance to help airports meet security requirements. The agency works closely with TSA and other federal agencies to support aviation security, transportation security, and other national security matters. The FY 2007 budget request includes $173 million to "continue upgrading and accrediting facilities, procure and implement additional security systems, and upgrade Command and Control Communications equipment to meet the increased national security demands since the September 11th attacks."[53]

The FAA's Transportation Security R&D Division has divided its functions into four interrelated program areas: Explosives and Weapons Detection, Aircraft Hardening, Human Factors, and Airport Security Technology Integration. Projects focus on developing technologies to protect three major entry points to the aircraft: checked luggage, the checkpoint (passenger or carry-on bag), and cargo.

The Aircraft Hardening Program has been conducting tests on ways to assess the vulnerability of commercial aircraft, strengthening the cargo hold and developing cargo containers that can better withstand explosives shocks. The efforts include both hardening the cabins as well as lining the cargo holds, using lightweight materials and fabrication techniques.[54] On the ground level, equipment is being developed to X-ray shoes and also to quickly analyze the content of bottles. According to Susan F. Hallowell, Director of the Transportation Security Lab of the DHS S&T Directorate, future versions of scanning equipment must consider airport architectural design and the need to take up less space in airports where the machinery and long lines cause congestion.

The FAA's Human Factors program looks at ways to improve the selection and performance of aircraft screeners. A Screener Object Recognition Test (SORT) was developed as a selection test for hiring screeners, and

other tests were developed to evaluate screeners when they finish their courses and for the annual assessment of the proficiency of experienced screeners. The work can be hard on the eyes and performance can drop off during a shift. The program includes electronically placing images of suspicious items into the scanning of carry-on bags in order to test the alertness of the screeners to a wide variety of potential explosives and weapons.

One of the mainstays of explosives detection has been bomb sniffing dogs. Though initiated by the FAA in 1993, and later jointly funded by FAA scientists now working for TSA (along with the TSWG), very little scientific data had been garnered indicating what substances dogs have cued on or at what concentration levels. Research teams composed of scientists and research physiologists—and of course, the dogs—have produced a greatly enhanced understanding of how canines find bombs, and how to optimize their training procedures.

**CONCLUSION**

A number of officials involved in the U.S. government's CT R&D efforts note some confusion about the scope of the programs. With the emergence of the DHS as the "800 pound gorilla" and the transition of some research efforts to DHS and various reorganizations within the department, it is harder to keep up on who is doing what. Many congressional and other observers believe that the DHS as a whole (and not only its research components) continue to be in a transition stage, and it will take a few more years to work out the transition problems, partly because so many disparate agencies with their own cultures were thrown together quickly into a huge new agency.

The coordination and working relationships between TSWG and DHS is another area that has yet to be fully worked out. For many years, the TSWG has functioned effectively as the coordinating group among the many federal agencies that are involved in the nation's CT R&D efforts. But TSWG officials, and even some of the foreign partners, suddenly found DHS—an agency that was intended to deal with domestic terrorism—taking steps to become involved on the international scene and establish its own foreign partner working arrangements even though TSWG had long-established programs with the same countries. For example, in February 2006, just as the DOS and DOD were in the final stages of concluding the agreement they had been working out with Australia to join their R&D partnership efforts, the DHS Under Secretary for Science and Technology, testified to the House of Representatives Science Committee[55] that DHS was the lead agency for the umbrella joint R&D agreements with other countries. TSWG officials were not aware of the DHS testimony when asked about it several months later, and indicated

that it apparently had not been thoroughly circulated to other agencies for advance comment in accordance with usual operating procedures.

DHS officials also note that while TSWG (and hence the DOS and DOD) played a significant role in the past in "filling the gap" for civil security technology collaborations before a major domestic organization like DHS existed, that mission responsibility has been given to the DHS through the Homeland Security Act of 2002. In fact, DHS officials see TSWG as oriented more towards security needs overseas, such as embassy protection or military and intelligence considerations. However, TSWG officials note that ever since the interagency group's inception two decades ago, many of their projects have had a dual use, providing benefits for civilian law enforcement officials and first responders as well as potential overseas use. Privately, they say some of the DHS R&D efforts are simply reinventing the wheel. Resolving these different issues and developing a stronger collaborative partnership between DHS and TSWG will be vital for improving America's CT R&D efforts at home and abroad.

Finally, although the nation's R&D efforts have reached a level of nearly $5 billion, challenges remain. Post-9/11 apathy towards research spending appears to be on the rise. R&D does not typically produce quick results, and sometimes lines of research do not pan out altogether. Furthermore, when budgets are tight, officials in the White House and Congress tend to put more priority on short-term issues, and funding for longer term R&D usually suffers. It is difficult, if not impossible, to predict in advance which particular R&D project may result in deterring a possible major terrorist bombing, WMD attack or aircraft hijacking. However, the investment that prevents one catastrophic attack can at the same time save many lives as well as head off a huge economic impact. Effective R&D is an investment that requires patience and persistence, not only from the scientists and engineers involved but also from those who control the budgets.

The earlier AAAS analysis of the Administration FY 2007 budget when it was submitted to Congress in early 2006 said its tables differ from the Administration's budget documents because "AAAS has corrected inaccurate codings of non-R&D programs as R&D, added back some R&D funding left out of the Budget, and removed some non-R&D programs from the R&D data after examination of DHS Budget documents." *DS R&D Falls in 2007 Budget*, 1–2. http://www.aaas.org/spp/rd/dhs07p.htm.

## HARD POWER

# CHAPTER 9

# NATIONAL OBJECTIVES IN THE HANDS OF JUNIOR LEADERS

Amos N. Guiora and Martha Minow

What does the nation owe those who fight on our behalf? It would not seem too much for members of the armed services to expect sufficient preparation, equipment, and planning to avoid needless exposure to harm. This chapter seeks to encourage debate on an issue of enormous importance to the achievement of the nation's military objectives: are we giving adequate intelligence, articulation of mission, and legal awareness to prepare platoon-level leadership to make complex decisions?

Debates over adequate preparation leave more questions unanswered than resolved. Protective gear to guard against enemy weaponry is one example. The Office of the Armed Forces Medical Examiner reported earlier this year (2006) that between March 2003 and June 2005, in 74 of the 93 fatal wounds experienced by the marines, bullets or shrapnel hit parts of soldiers' bodies not covered by torso protective gear. Many experts disagree over whether the U.S. fighters are adequately equipped or alternatively whether they are overburdened, as North Carolina State University Professor Don Thompson suggested in a recent *National Review Online* article.[1] This example illustrates one important debate over how the nation prepares its soldiers.

When it comes to the complex decision-making skills that allow soldiers to effectively execute their missions, there is even broader disagreement. Some military leaders will insist that the training and preparation of junior leaders is adequate, while others—including many junior leaders—will suggest that they don't feel adequately prepared. This chapter will focus the debate on the three areas in which improvements can be made: the use and gathering of intelligence, clear articulation of the mission, and awareness of legal responsibilities.

Once deployed in the field, military personnel must be properly trained to maximize safety and effectiveness. Rightly, recent years have seen the development of increasingly sophisticated strategic planning and rules of engagement. As the central concern now is counterterrorism, special focus must be given to the needs of the junior leaders—typically, it is the platoon leaders and their noncommissioned officers (NCOs) who are charged with translating mission and strategy into tactics.

Based on lessons learned from the Israeli experiences with countering terrorism, this chapter reveals that more can be done to prepare our junior leaders adequately for their missions. A focus on counterterrorism puts into stark relief the kinds of real-time and accessible intelligence, advanced training in law, and clear articulation of mission that junior leaders demand.

## JUNIOR LEADERS: WHY THEY ARE CENTRAL AND WHO THEY ARE

Political leaders make key foreign policy decisions, and senior commanders develop military strategies, so it is not surprising that they become the primary focus for debate and evaluation. Yet, in the context of modern warfare and armed conflicts short of war (such as counterterrorism), the critical fights are not conducted on vast battlefields between standing armies or even air-delivered strategic bombings. Instead, critical fights are often led by junior leaders.

Modern armed conflict unfolds in the marketplace of Nablus, the streets of Grozny, and the back alleys of Mosul. Counterterrorism played out in these settings does not lend itself to the grand sweeping battlefields of the past. Key decisions are made not by generals strategically deploying battalions, fleets, and aircraft, but by junior leaders who are on the ground, organizing checkpoints, arrests, and raids while motivating and guiding soldiers under their command. These junior leaders, whom General Charles C. Krulak referred to as "The Strategic Corporal,"[2] make tactical decisions that have strategic effects; properly training them is thus crucial.

Junior leaders do not decide strategies of counterterrorism or matters of high state. Nevertheless, ultimate implementation of any counterterrorism plan depends on them. Not strategists, junior leaders are perhaps the most important tacticians. How a particular checkpoint in Baghdad will be manned reflects their leadership. The conduct of a firefight in Nablus reflects their skill level. The initial treatment of a wanted terrorist just arrested mirrors their moral compass and communications to their soldiers.

Who is the junior leader? In the U.S. context this is a soldier or Marine from the fire team level up to the platoon leader or commander. The junior leader can be an NCO or a lieutenant. Typically, a junior leader will

be responsible for as few as four and as many as seventy soldiers. With the exception of the platoon sergeant, a junior leader likely has less than ten years of military experience, yet is faced with the most critically challenging decisions on the battlefield.

Does the United States provide junior leaders with the decision-making tools necessary to fulfill their missions? If not, we do them—and ourselves—an enormous disservice. We must promise them that we "have their back," meaning we not only back up the tactics they adopt to pursue the ends we assign them, but we also provide them the critical skills necessary to achieve their mission. Before the fight against terrorism warrants the banner of "Mission Accomplished," the junior leaders—the eyes, ears, hands, and heart of the initiatives—must be equipped with the capacities and resources to do their job.

These days, that requires more than sophisticated military training. Today's junior leader needs sufficient understanding of the intelligence, mission articulation, and legal parameters to determine sensible and effective tactics in order to motivate and guide the troops.

Well before any particular moment of decision making, the junior leaders must be assured that they have a clearly articulated mission that can be translated into tactics; cogently and comprehensibly defined moral parameters; political and military superiors who are accountable for their actions and responsible enough not to hide behind a junior leader when the going gets tough; operational grounding in international law; rules of engagement that the junior leaders—and not a lawyer—can explain fully to their soldiers; sophisticated training in operations and leadership; and reliable intelligence habits. Most of these are so obvious that they speak for themselves. It is useful, though, to examine some of the less obvious ones in detail, such as mission, intelligence, and legal preparation.

### Mission

We owe the junior leader clear and realistic mission guidelines and an understanding of the strategic objectives. The guidelines must enable completion of the mission, consistent with international law and protection of the troops. After the administration's acknowledgment that no weapons of mass destruction were found, articulating the United States' mission in Iraq became more complicated. A central purpose now is to promote the development of a stable democracy and to resist the risk that Iraq becomes (or continues to be) a ground for breeding and training terrorists. Yet troops on the ground, like the rest of us, have heard the charge that the U.S. invasion has made Iraq the likely home of terrorists and their recruits. For junior leaders to comprehend and believe in the mission, they need more cogent and accurate statements of the vision both from civilian and military leaders.

Without a believable and clear statement of strategic objectives, troops may be too demoralized for junior leaders to motivate. From the Israeli experiences with counterterrorism, we have learned that soldiers have greater confidence in their junior commanders when those leaders are able to explain, both to themselves and their men, why they are in harm's way. Without a clearly articulated and consistent policy to implement, soldiers will feel as though they are merely fighting for survival rather than for a higher purpose. Of course, fighting for survival is vital, but it does not contribute to confining or overcoming enemies.

During the course of Israel's occupation of southern Lebanon, a national public debate erupted among Israelis over whether soldiers were dying for an unknown cause and an unclear mission. Ambiguity in mission undermines the effectiveness of command. Military operations are doomed to fail when the mission is not articulated effectively on a strategic or tactical level. As a result, junior leaders end up sending their increasingly incredulous forces into battle against local, largely unseen enemies who are defending their homeland against outside forces. The local enemies enjoy significant advantages when they know the terrain and the local culture is their own. Protecting "the homeland" motivates local inhabitants to justify the supreme sacrifice of their own lives.

Against this enemy, the junior leaders—armed with an unclear understanding of the strategic objectives—increasingly lose the confidence of their troops, who may fear their superiors recklessly endangering them. Junior leaders are the representatives of the senior commanders, yet they cannot articulate a clear purpose coming down from the top; they are the voice of command but cannot give a compelling justification for putting the soldiers' lives and well-being at risk. Combat effectiveness, motivation, and lack of initiative are all examples from Israeli military experience of what can happen when junior leaders cannot articulate the strategic objectives.

Even if the mission is clear and articulable, the junior leaders risk losing the confidence of their platoons if asked to sustain illusions about actual practices, such as "Americans never torture," or "America does not engage in indefinite detention." We owe the junior leaders a clear mission that comports in both means and ends with the nation's values and honor.

### Intelligence

Even with a clear mission, a junior leader cannot do the job without up-to-date intelligence—including access to language skills and information about local mores and customs, enabling meaningful use of the information. A junior leader must gain three kinds of intelligence: (1) what human sources tell their interlocutors; (2) what analysts learn from intercepted communications; and (3) what is observed by patrol. The first two are the

direct responsibilities of senior commanders; they must ensure that the junior leader's daily briefing contains the most up-to-date material and interpretations. The third component is a joint responsibility of junior and senior leaders. The junior leader directs the patrol, while the senior command establishes the conditions under which the junior leader interprets the reports from the patrol.

Consider the challenge of managing a checkpoint in an occupied land. This may be the most sensitive point between occupiers and the occupied. It is the point of friction between an angry local population, forced to respond repeatedly to the same questions, and the soldiers, who fear that the approaching individual is a human missile waiting to detonate. If intelligence information is current and comprehensive, it may alert those manning the checkpoint to heightened risk or kinds of persons deserving special scrutiny. If the intelligence information is not accurate and up-to-date, the results can be tragic.

Two years ago, at the Erez checkpoint in territory occupied by Israel, the soldier manning the post had no particular reason to suspect a woman in her twenties. The woman explained that the metal plates in her leg would make the scanner go off. She then detonated herself and killed four Israelis. Intelligence information should have been obtained to challenge the presupposition that only men could be suicide bombers. On the basis of known intelligence information, a junior leader manning a checkpoint would not have assumed a woman to be potential suicide bomber. Indeed, the intelligence at the time directed those at the checkpoint to closely scrutinize young men. The lack of operational intelligence about actual or potential recruitment of women as suicide bombers directly resulted in a lack of operational readiness and the deaths of four Israeli soldiers. Junior leaders are dependent on intelligence in determining their tactical decisions. Senior commanders must ensure that the most up-to-date information regarding terrorists' strategic and tactical decisions is made available in real time to the junior leaders.

Intelligence is not only the gathering of information, but also the interpretation and evaluation of both what is known and what could be true. Intelligence activities require explicitly considering and preparing for what had previously been considered unfathomable. It requires senior commanders to think outside of the box in order to prepare the junior leader to do so.

### Judgment about Orders: The Duty to Disobey Manifestly Illegal Orders

Because it is increasingly the junior leaders who define or carry out specific tactics, they are critically situated to assess whether a particular order or plan—when turned into operations—will or will not comport with the

law. In many ways, junior leaders are the last checkpoint between the order given and the results in the field. Ever since the Nuremberg trials, soldiers have been told that simply obeying orders is no defense against charges of violating international law. Yet the first duty of any soldier is to learn to obey orders, even those that run against civilian sensibilities.

Junior leaders should expect that orders received from superiors are lawful, and yet remain mindful that they bear responsibility, personally, for assessing the lawfulness of commands. Perhaps more palpably than any other figure in the military chain of command, the junior leaders experience potential tensions among responsibilities to their superiors, to their own soldiers, and to those enemies, civilians, and fellow countrymen who count on the observance of international norms of war.

A junior leader cannot be expected to be a lawyer. Nor should the junior leader let concerns about the law justify delay in a moment of emergency. Nonetheless, with the incidents at My Lai and Abu Ghraib in mind, the junior leader must remember that how commands are carried out (or miscarried) can make the difference between adherence to and violations of binding law. This means that the junior leader must have sufficient training long before a moment of difficulty to know what to look for in assessing orders, to know when and how to seek clarification for ambiguous orders, and to know how to proceed if orders appear to be manifestly illegal.

An episode well known to all Israelis is illustrative. Now known as the "black flag" incident at Kfar Kassem, at the onset of the 1956 Sinai Campaign, Israeli authorities imposed a curfew on Arab villages in Israel. The curfew was set to begin while villagers were in the fields, tilling the land. A border police unit was to enforce the curfew. During the preparatory briefing, a member of the force asked about the fate of those returning from the fields after the curfew was in effect. The commanding officer replied briefly: "God have mercy upon them." No one asked for further clarification. The unit interpreted his response as calling upon them to shoot anyone returning after the curfew. As a result, they killed 56 innocent men, women, and children returning from the fields. In subsequent trials arising from the incident, the Israeli courts concluded that an order to shoot curfew violators was blatantly unlawful, and those who followed such an order were to be court-martialed.

Obviously, a junior leader needs thorough training to deal with this kind of situation. Rules and regulations can offer guidelines, but crucially, the junior leader needs experience working with detailed examples in order to identify when a vague command is illegal, how to question superiors without insubordination, and what to do in the case of an apparently illegal order.

Consider what a junior leader needs to know in advance when faced with ambiguity over precisely what kinds of interrogation techniques

have been authorized by Secretary Donald Rumsfeld's decision in the aftermath of 9/11.[3] The administration denies having authorized any techniques that violate the Geneva Convention or the Convention Against Torture, as ratified by the United States. Yet human rights advocates charge that the administration has approved the illegal use of psychological techniques designed to break a person's inner strength.[4] How are junior leaders to know what is legal and what is illegal as they organize detention or interrogation?

Junior leaders are conditioned to follow orders, unless they believe that the orders are a "black flag" as articulated in the Kfar Kassem trial. In order to make that decision, they must rely on their moral compass, best judgment, and training. Should the junior leaders conclude that the order is blatantly illegal and therefore must not be followed, they must be able to explain to senior command their rationale. In the case of interrogations, when junior leaders conclude that the methods they are asked to either implement or facilitate violate international law or military regulations, they must disobey them.

A junior leader is under the direct command of neither civilian intelligence officials nor independent contractors. It is the obligation of senior command to organize operations so these different actors coordinate. Similarly, it is the obligation of the junior leader to consult with senior command if uncertainty exists. In either case, the junior leader is obligated to disobey and prevent others from obeying clearly unlawful orders.

At this moment, U.S. troops face acute difficulties in even knowing what legal framework applies. The president and his lawyers have announced that the Geneva Conventions do not govern the war on terror; if that is to be the case, then what rules do apply? Uncertainty about the legal status of enemy combatants, putative terrorists, or civilians who might be associating with terrorists may invite departures from any articulated rules. At best, such uncertainty exposes the junior leader to ex post determinations, through court martials or war crimes tribunals, without fair advance notice or clarity about the governing law. It should be the duty of those who hold higher authority to articulate and legitimate the rules governing the contemporary initiatives, whether they are deemed war, armed conflict, or criminal law enforcement.

### Practical Application: The Junior Leader Commanding a Checkpoint

Although there remains plenty of room for improvement in the Israel Defense Force (IDF), there may be some lessons to be learned from some of its approaches to training and supporting junior commanders. For example, in response to recurring occurrences of misconduct by soldiers at West Bank checkpoints, the IDF responded in two ways. The IDF created

the position of checkpoint commander and developed an intensive two-day course to prepare the junior commander for this critical posting.

The IDF School of Military Law, in conjunction with junior and senior commanders, developed an interactive video designed to teach soldiers an eleven-point code of conduct based on international law, Israeli law, and the IDF's ethical code.[5]

The video incorporates snippets from Hollywood movies and high-tech graphics intended to address the critical issues of contemporary combat. A variety of scenes from movies, including "The Siege," "Apocalypse Now," "Platoon," "The Year of Living Dangerously," "Rules of Engagement," and "The English Patient," are used to teach IDF junior commanders the eleven codes that senior commanders and officers from the IDF School of Military Law thought were operationally relevant.

The interactive video taught junior commanders a number of important principles, including the absolute requirement to treat the Palestinian population in a dignified fashion, to distinguish between innocent civilians and terrorists, and to respect religious symbols. The video also taught junior commanders to refuse to obey unlawful orders, to not interrogate captured combatants unless specifically authorized to do so, and to report violations of military law committed by fellow soldiers to their commanders.

Furthermore, international legal principles—including proportionality and the obligation to minimize collateral damage and seek alternatives—were emphasized.

Commanders choose the checkpoint commanders for this posting on the basis of the following criteria: (1) the soldier was identified as possessing a strong moral compass and (2) the soldier was perceived to be tolerant and perceptive.

The two-day course encompassed a number of different subject areas, including operational aspects of checkpoints and instruction in basic Arabic, thus enabling the junior commander to request documents and to communicate with the Palestinian population seeking to pass through the checkpoints. In addition, the future junior commanders received an hour-long lecture from officers in the IDF School of Military Law regarding morality in armed conflict and international law.

Though the available instruction time was limited, senior commanders opined that a worrisome number of unfortunate incidents at checkpoints justified the resources allocated for this effort.

Strong command influence and structure is critical to the conduct of junior commanders and the soldiers under their command. Senior commanders must be able to "talk the talk" and "walk the walk" with respect to issues that had, in the past, not been considered the core of operational considerations.

In the context of "armed conflict short of war,"[6] operational considerations have expanded to include subject areas not traditionally associated

with military operations and training. However, the reality of modern combat is that states will rarely be engaged in warfare with other states. Rather, states will be engaged in combat with nonstate entities comprising individuals dressed like innocent civilians.

Accordingly, the toolbox of contemporary junior commanders must include skills not critical to the operational success of their predecessors forty years ago. These skills must include an understanding of local cultural mores, an ability to communicate on a basic level with the local population, an understanding of morality in armed conflict and of international law, and an appreciation for the power of the media. Furthermore, the junior commanders are required to integrate these skills in stressful conditions in a foreign land while facing a hostile, local population.

Two vignettes, based on experiences in Israel and Iraq, highlight the importance of training, identifying the most appropriate individuals for particular positions and creating command structures appropriate for conflict in the post-9/11 world. Furthermore, it is incumbent that junior commanders be provided logistical support that extends beyond the traditional concept of supplies and material. As demonstrated in these vignettes, not only must the junior commander have open lines of communication with senior commanders, but there is also a clear need for developing both linguistic skills and an understanding of the local population's cultural mores. Otherwise, the junior commander's intelligence gathering ability will be severely hampered. In "armed conflict short of war," where terrorists are embedded with innocent civilians, insufficient intelligence combined with deficiencies in the areas discussed above will not only affect the commander's operational capability, but will potentially lead to unnecessary human tragedy.

### Two Instructive Vignettes

1. When a Palestinian vehicle arrived at an IDF checkpoint, the soldier manning the position noticed a bottle containing liquid in the car. The soldier's order that day stated that, for security reasons, Palestinians may not cross through checkpoints while carrying bottles. In response to the soldier's ordering her to drink from the bottle (presumably to ensure that the contents were nonflammable fluids) the elderly Palestinian in the vehicle attempted to explain to the young soldier that the bottle contained liquid soap hazardous to human consumption. The tragic ending to this confrontation was that the Palestinian drank the liquid and suffered severe injury. While the soldier was court-martialed, the training and subsequent application of the tools recommended above may have prevented this human tragedy.

2. On a patrol in Iraq, a U.S. unit suffered casualties as a result of an improvised explosive device (IED). In the immediate aftermath, one of the soldiers spotted a shepherd holding a cell phone. Suspecting that the shepherd was involved in the attack, the soldier aimed his rifle at the individual's head. The commander, a lieutenant, ordered the soldier to lower his rifle, which he promptly did. When asked why the soldier immediately responded to the order, the commander

explained that the unit's training had emphasized that not all Iraqis are the enemy and that there was an absolute intolerance on his part of referring to the local population in a derogatory fashion.

These two vignettes juxtaposed side by side are instructive for a number of different reasons. Without doubt, the conduct of the IDF soldier is reprehensible; nevertheless (and without excusing it), context is important. The stresses and strains of military service at checkpoints combined with an inability to communicate with the local population are a reality of occupation. The dual response of the IDF senior command, described earlier, represents an effort to address the complexity "head on." While the two-day training and interactive video do not guarantee that violations will not occur in the future, it is noteworthy that the International Red Cross, which participates in the checkpoint commander course, publicly commented that fewer complaints were filed after the course's implementation.

Similarly, a substantial number of IDF units requested instruction with the interactive video. The junior commanders responded extremely positively. However, without strong command influence, the video will not be an effective instructional tool and will not affect the operational conduct of its intended audience. Command influence and structure is the most significant determinant of a soldier's behavior. However, as exemplified above, junior commanders must be significantly assisted through a variety of creative measures.

## CONCLUSION

It is no exaggeration that the success of operational counterterrorism depends on junior leaders. In this chapter, we address three important issues facing the junior commander: real-time and accessible intelligence, advanced training in law, and clear articulation of mission that junior leaders demand. Our success in the war on terror depends on the knowledge, skills, and abilities of these junior commanders. We must equip the junior leaders to do the vital jobs we assign them. This means acknowledging both the limits on what their broad shoulders can carry and our duty to assist. They "have our back," but do we have theirs?

# CHAPTER 10

# ENGAGING MILITARY CONTRACTORS IN COUNTERTERRORISM AND SECURITY OPERATIONS

James Jay Carafano and Alane Kochems

Currently, military contractors are assisting militaries and civilian government agencies throughout the world and across the mission spectrum, including planning, training, logistics, and security. Their use in support of a range of counterterrorism and homeland security-related activities is growing. Employing contractors in the war on terror, or for that matter any national security purpose, has both distinct advantages and disadvantages. Military contractors are seen as having inherent advantages over militaries with regard to cost, flexibility, and responsiveness. Relying on military contractors, though, does have its share of risks—including safety and liability issues, performance, force management, compliance with international and domestic laws, and lost resources because a capability is outsourced rather than retained.

With this increase in contractor use in general, and the rise of privatized firms that are specifically organized to provide security services, the question is now how to determine the right force mix to most effectively and efficiently complete a task or mission. In some cases, contractors may be the best choice; however, they are not the perfect fit for every mission or the right solution for all skill or manpower shortages. Instead, governments should assess the risks of employing various options and then choose the best one. As this chapter will explain, government agencies should adopt comprehensive guidelines for making these decisions using a risk-based approach.

## WHAT ARE PRIVATE MILITARY FIRMS? WHAT CAN THEY DO?

### Contractors on the Battlefield—A Brief History

Military contractors on the battlefield are nothing new. They have been around in various forms throughout history. Most empires from the Ancient Egyptians to the Victorian British have used contracted troops in some form. In some cases, these were individual fighters, while in others, a power could hire a highly organized entity to fight on its behalf. It was only in the 1600s, when states became the dominant organizing force (instead of princes and kings), that the military began to be under control of the political realm and became a public sector entity. As Peter Singer notes, "[T]he monopoly of the state over violence is the exception in world history, rather than the rule."[1] It was only with the rise of the modern nation-state in Western Europe that governments began to supplant the private sector in providing the preponderance of security and law enforcement services.

By the dawn of the twentieth century, particularly among developed nations in the West, security-related services were viewed primarily as an inherently government function. That said, throughout the nineteenth and twentieth centuries, contractors provided services for wartime and homeland security services in order to supplement state defense and law enforcement assets. Within the United States, one of the most well known was the Pinkerton Detective Agency, founded in 1852. The agency collected intelligence for the Union Army during the Civil War, investigated the Molly Maguires (a secret organization that fermented labor unrest in the Pennsylvania coal mines during the 1870s), pursued the Jesse James Gang, and were employed as strikebreakers.

Within the United States, the use of private law enforcement declined with the advent of federal law enforcement agencies, such as the Federal Bureau of Investigation, and because of a backlash against the excesses of corporations employing private security companies to harass labor unions, following an armed confrontation between strikers and Pinkerton agents in Homestead, Pennsylvania, in 1892 that resulted in a dozen deaths. In 1893, Congress passed the Anti-Pinkerton Act, which prohibited the federal government from employing "the Pinkerton Detective Agency, or similar organization." The backlash against the Pinkerton company diminished the practice of employing private security firms to deal with labor unrest.

Nevertheless, the United States and other Western governments continued to use contractor support for a myriad of defense and law enforcement support needs in the areas of logistics and administration. Within the United States, despite the passage of the Anti-Pinkerton Act, there is no comprehensive prohibition employing private sector security agencies. In 1978, the 5th U.S. Circuit Court of Appeals interpreted the prohibition

to include hiring the services of any "mercenary, quasi-military forces as strikebreakers and armed guards." The court, however, defined "quasi-military forces," and as a result today the law has little practical effect in the employment of contemporary security service companies or military support contractors.

The use of contractors, particularly in support of military operations, has been unprecedented in recent years. From 1990 to 2000 the market in contractor services almost doubled to about $100 billion. The employment of contractors for military and security services is not uniform. The market is overwhelmingly dominated by the United States and Great Britain, both in terms of service providers and the use of contracted services.

### Contractors and Civil Society

Though contractors have throughout modern history remained a face on the battlefield and in the frontlines of security and law enforcement activity, their character has changed over the centuries. The private actors of the past, and even the mercenaries of today, differ from the current private military firms. Today's organizations operate as businesses, and are structured according to conventional business models. In addition, many of them have ties to—or are openly part of—broader, multinational corporations. The resurgence of the use of contractors today for what traditionally in the recent past have been considered inherently governmental functions differs both in the scale of contracting and the diversity of tasks and missions performed.

On the other hand, there is good reason for liberal, developed states not to fear the reemergence of a prominent role for the private sector in war, homeland security, and counterterrorism. There is little likelihood that the private sector's place in war will lead to the rise of a new "Middle Ages" with sovereigns losing their capacity to manage violence. "Capitalism," as Fareed Zakaria cogently argues, is not "something that exists in opposition to the state . . . [A] legitimate, well-functioning state can create the rules and laws that make capitalism work."[2] Unlike medieval kings, modern nations can use the instruments of good governance to bind the role of the private sector in military competition.

The example of the United States illustrates the means that modern, liberal states have to both enable and harness the commercial capabilities of warfare that may remain partially, or even entirely, in the private sphere. The means available to moderate interaction between the public and the private sphere include the following:

- a well-established judicial system;
- an activist legislative branch with its own investigatory instruments (such as the Government Accountability Office [GAO]);

- an independent press— the "60 Minutes" factor;
- public interest group proliferation, which provides a wealth of independent oversight and analysis; and
- an enabled citizenry with ready access to a vast amount of public information.

These assets offer unprecedented means to balance the public and private spheres—not just to constrain government conduct, but also to limit the excesses of the commercial sector.[3] In fact, these capabilities might support the argument that in the long term, liberal, free market democracies will prove far more effective at mastering the capacity of the private sector in the twenty-first century than authoritarian states with managed economies.

That said, however, the role of the private sector in war raises innumerable legal, ethical, and practical issues that must be dealt with.[4] Marrying the private sector's capacity to innovate and respond rapidly to changing demands with the government's need to be responsible and accountable for the conduct of operations is not an easy task. It will require militaries to think differently about how best to integrate the private sector into public wars. Nor can generals do this thinking in isolation. Modern military operations are an interagency activity that requires the support of many elements of executive power. The judicial and legislative branches of the government have important roles to play as well. Indeed, many of the most important instruments for constraining the role of the private sector in war lay in their hands.

On the other hand, nations that lack good governance and transparency have far greater difficulty employing contractors within the rule of law. Strong governance institutions are a prerequisite for using contract support for defense and homeland security in a manner that enhances rather than undermines the protection of society.

### Types of Organizations

Military contractors—or privatized military firms (PMFs)—today constitute the largest component of the private services companies in the security sector. These contractors can be classified on the basis of the types of services they provide. The types of contractors include military provider firms (MPFs), military consultant firms (MCFs), and military support firms (MSFs).

MPFs focus on the tactical environment. These firms engage in actual fighting, either as line units or specialists, as well as in direct command and control for field units. Examples of MPFs include Executive Outcomes, Sandline, SCI, and NFD, which have run combat operations in places such as Angola, Sierra Leone, Papua New Guinea, and Indonesia. Clients will typically use an MPF if they have comparatively low military

capability and are facing an immediate, high-threat situation. MPFs are the most controversial type of privatized military industry and often receive unfavorable publicity.

MCFs give advice and training necessary for operations and to restructure a client's military. Levdan, Vinnell, and Military Professional Resources Inc. (MPRI) are all considered to be MCFs. Their clients are usually restructuring their militaries or want to dramatically increase their capabilities. For example, MPRI lists its core competencies as security sector reform, institution building, leader development, military training and education, and emergency management. MCFs can further be divided into those firms that offer pure analysis and those which will also provide training and consultation in combination with recommendations. "The line between advising and implementing, however, sometimes can be quite fuzzy; often, if a trained soldier has been hired to teach, it is difficult to duck out of the way when the opportunity comes to put training into practice."[5]

Support firms provide supplementary military services such as logistics, intelligence, technical support, supply, and transportation. These contractors allow their clients to focus on fighting and their core mission areas while the contractors handle the support work. Clients tend to rely on MSFs where they are involved in immediate but long-duration operations (e.g., standing forces that need surge capacity). While these contractors do not directly participate in executing or planning military operations, they fulfill needs necessary for combat operations. MSFs comprise the largest component of the privatized military industry and have the most subcomponents.

Most of these firms rely on having large, accurate databases of experts that allow them to put together the types of support called for in their contracts. For instance, "MPRI maintains and draws its workforce from a carefully managed and current database of more than 12,500 former defense, law enforcement, and other professionals, from which the company can identify every skill produced in the armed forces and public safety sectors."[6] All of them tend to have minimal infrastructure, with MPFs having the least. In addition, they often incorporate where there are favorable laws but can usually change name and business structure in response to negative press (e.g., Executive Outcomes).

## HOW DO CONTRACTORS CONTRIBUTE TO COUNTERTERRORISM OPERATIONS?

### Supporting Military Operations

One of the most dramatic and significant uses for contractor support in counterterrorism operations is in support of direct military operations,

particularly in Afghanistan and Iraq. The growth of contractor support since the end of the Cold War, particularly in support of U.S. military operations, has been remarkable. According to a 2004 study by David Isenberg, "During the first Gulf War in 1991 for every one contractor there were 50 military personnel involved. In the 2003 conflict the ratio was 1 to 10."[7] In Iraq, for insistence, a Coalition Provisional Authority report listed 60 private military companies totaling about 20,000 personnel. Direct security operations involved personal security details for senior civilian officials, security for buildings and infrastructure, and nonmilitary convoy security. Most of these comprised the 14,000 Iraqi guards contracted to protect the country's oilfields.[8]

In addition to security firms, companies provided a wide range of logistical and support staff for military operations and construction. This support, in terms of dollars expended, accounted for the bulk of the contractor support for U.S. operations. According to an analysis conducted for the Center for Public Integrity in 2004, approximately 20 companies accounted for the overwhelming majority of the $5.8 billion allocated to these tasks, with Kellogg, Brown, and Root receiving contracts worth about $4.7 billion of the total.[9]

### Contractor Support for Security Operations

Contractors are also heavily engaged in a range of security activities that support governments and the private sector, and in some cases these include domestic counterterrorism support operations. The most prevalent use of contractors is in the area of physical security and screening, though they also conduct a number of other support activities, including risk assessments, staff support, and consulting.

As a global trend, reliance on security contractors is growing. The United States, for example, is fairly unique in employing government workers to screen commercial aviation passengers and cargo. When countries first tried to thwart plane hijacking in the 1970s, most nations initially used government employees to beef up airport security, either through a government transportation or justice agency. Beginning in the 1980s, European airports began developing a performance-contracting model in which the government set and enforced high performance standards that airports then met by hiring security companies or occasionally using their own staff. Belgium was the first to adopt this model in 1982, followed by the Netherlands in 1983 and the United Kingdom in 1987. The 1990s saw a new wave of conversions to the public–private partnership model, with Germany switching in 1992, France in 1993, Austria and Denmark in 1994, Ireland and Poland in 1998, and Italy, Portugal, Spain, and Switzerland in 1999. Israel and a number of other nations in the Caribbean and the Far East also use this model.

In the case of commercial aviation, contract security has proven generally worthwhile. In 2001, the GAO examined the security-screening practices of Canada, Belgium, France, the Netherlands, and the United Kingdom.[10] Its report focused on the superior performance of the European airports, all of which use the performance-contracting model. The GAO reported significant differences between their screening practices and that of U.S. airports (pre-9/11) in four areas:

- better overall security system design (allowing only ticketed passengers past screening, stationing law enforcement personnel at or near checkpoints, and so on);
- higher qualifications and training requirements for screeners (e.g., 60 hours in France versus 12 hours as then required by the Federal Aviation Administration [FAA]);
- better pay and benefits, resulting in much lower turnover rates; and
- screening responsibility lodged with the airport or national government, not with airlines.

No country has emulated the United States and federalized its passenger-screening system. Instead, contract security in the aviation field (and many other areas of critical infrastructure protection) has become ubiquitous.

### Contractor Support for Disaster Response

Contractors may also play a significant role in responding to a terrorist attack. Response assets provided by contractors could run the gambit of services from needs assessments to logistics, medical support, and construction. For example, in the wake of the 9/11 attacks, the World Trade Center site required about 10,000 skilled support personnel (heavy equipment operators, truck drivers, iron workers, carpenters, and laborers) per day during the initial search and cleanup period.[11]

Increasingly, contractors have also been used to provide security at disaster scenes. In the aftermath of Katrina, for example, private sector firms augmented security for commercial businesses as well as local, state, and federal entities. In addition to providing security services, these companies conducted damage assessments and contributed to search and rescue operations.

## TRENDS AND ISSUES IN SECURITY CONTRACTING

Contractors have become a significant factor in government security operations, and future challenges to our nation's security suggest that their role will become even more prominent.

### Why Are Contractors Increasing?

Several factors contribute to the growing phenomenon of employing security contractors. They include:

- *The world changing*. During the Cold War, a government's security and defense needs were large, but largely predictable. Standing behind NATO forces in Europe was a massive logistical base, well established and supplied. On the home front, security concerns in the West primarily regarded the threat of espionage by the Warsaw Pact. In contrast, in the post-Cold War era most military operations are "expeditionary," where militaries deploy without established lines of communications or bases of support. As a result, there is a greater need for commercial support or administration, logistics, and other support services as well as the need to manage "host-nation" support activities.

- *Post–Cold War downsizing*. After the Cold War, the United States and its European allies reduced the size of their military forces and intelligence services. Homeland security also received less emphasis, particularly with the decline of "state-sponsored" terrorism in the wake of the Cold War. Europe, for example, also reduced its emphasis on borders. The European Union moved toward eliminating border controls between member states. The dramatic increase in security resources with the outbreak of the war on terror generally found Western military and security resources inadequate for combating the challenge of transnational terrorism and protracted combat operations overseas.

- *Business practices changing*. In the wake of the Reagan and Thatcher "revolutions," strong arguments were made for reducing the size of government and (where practical) outsourcing functions to the private sector. A common assumption of modern business practices is that the private sector is more efficient, cost effective, and flexible than the government in providing goods and services.

- *The world becoming a complex place*. Modern weaponry, information technology, and integrated systems dominate many of the military and security capabilities of the West. Routinely, commercial off-the-shelf technology provides the best and most cost-effective answers to many military and security needs. Governments are thought to lack the private sector's capacity to understand and exploit complex systems and modern technology.

Together, these trends have increased the propensity for the most advanced Western economies to increasingly turn to contractors to provide security and defense-related services.

### What Are the Issues?

Outsourcing of what had been considered inherently governmental functions has not occurred without criticism and controversy. Critiques of using private sector companies for security-related functions include the following:

- Outsourcing is done not because it is more effective or inexpensive, but because governments increasingly have an ideological bias that favors the private sector.

- Outsourcing does not necessarily save money. Governments cannot outsource the cost of providing oversight and accountability. When these overhead costs are factored in, critics argue, there may be little if any real savings in overall costs.
- Employing contractors will always face an insolvable tension between contractors who must make a profit and the government, which is solely focused on the outcome of enhancing security. This is a problem that does not exist in exclusively government-provided services.
- Governments lack the capacity to determine what activities should be inherently governmental functions, or the means to determine whether operations can be more efficiently and cost-effectively performed by contractors or government employees.

In brief, critics conclude that outsourcing defense, counterterrorism, and security functions to the private sector incurs significant financial and operational risks.

## LESSONS LEARNED

In the years since the September 11 attacks, the government has taken on two of the largest private contracting efforts in history: the rebuilding of Iraq since the 2003 invasion by U.S. troops and the continued assault by insurgents and the rebuilding of the U.S. Gulf Coast from the devastation caused by Hurricanes Katrina and Rita. These efforts highlighted both the advantages and the limitations of providing contract support for large-scale operations and offered significant lessons learned.

Challenges posed by these rebuilding efforts resulted in studies on management by agencies involved, including the Office of the Special Inspector General for Iraq Reconstruction (SIGIR), the Federal Emergency Management Agency (FEMA), and the GAO. These studies presented recommendations and lessons learned for how to manage private contracting on a large scale and in a short time frame: choose the right business model, define specific and accurate requirements, know the situation on the ground, train personnel, and set up effective mechanisms for oversight and liability mitigation.

### Requirements

The first lesson learned when creating contracts is that one must know the requirements. When starting large-scale private contracting, it is important to prioritize projects and identify the necessary requirements to complete them. It is easy to get caught up in those projects that "would be nice to complete" rather than the basic projects that *must* be completed. Furthermore, though necessary projects should be completed at a high

level of quality, projects may not require high-scale materials, designs, or personnel. Developing the requirements for large contracting calls for qualified people to ask the right questions and understand the goals of the project, its technical aspects, and the process itself. Good developers will know what the customer wants and be able to create a process that is capable of producing that outcome. Developing the requirements may be a process that includes constant review and updates.

It is important to define what types of roles and responsibilities may be contracted out. A distinction should be made between allocating and administrating justice; the power of law enforcement currently lies with the state and not with private companies, but private companies may carry out the administrative functions of enforcement to ensure that the allocation of justice follows the law and due process.[12] In the past, private investigation and security company employees have secured law enforcement powers of arrest and the right to use deadly force through state and local legislation.[13] Agencies should clearly define the roles that contractors will play and the resulting legislative consequences that those roles might have.

In addition to the projects, the agency contracting to a PMF must have a clear idea of the risks that may be encountered on the ground. Before securing contracts, authorities should know what to expect at the contract site. Will the contractors need to provide a base for operations, and if so, how will that fit into the project's costs? Being prepared for security risks and having appropriate contingency plans in place is also necessary. Operations must be ready to start running immediately upon staff arrival, whether the staff is a contract manager or a contractor.

### Management and Oversight

The second lessoned learned in private contracting from Katrina and Iraq is that orchestrating the right contracts for the right projects lays the foundation for a successful contracting endeavor. Even before contracting begins, agencies should identify what type of contracts they will be awarding and then what resources are necessary to complete the contracts. Options include (1) cost plus, in which a contractor names the cost of the operations of the contract plus a mark-up, and (2) fixed fee, in which the contractor is ensured the contract for one year at a fixed price but has opt-out options the following years. Cost plus is often used when time is of the essence or when technology must be deployed as quickly into the field as possible as part of a design-build contract in which technology is deployed and tested in real-world operations, cutting the time necessary for field testing.

A smart tactic to avoid skyrocketing costs through cost plus and still reap the benefits of design-build is to set up a contract that has one year

of fixed fee followed by a set number of years where either party may back out and not renew for the following year. If needed, the agency may want to start with a short-term contract that may involve months or weeks until requirements are defined more clearly. In the process, agencies should consider the business arrangement, including (1) whether the contract should be sole source or competitive and (2) what the mix of public-private resources should be. Throughout this process, private and public bidders for a contracted service should be able to bid against one another rather than choosing one track or another.[14]

Whatever mix of public and private resources is formulated, the most important part of privatization is ensuring proper structure and accountability in the process.[15] An auditing system should be in place to oversee contract management from the beginning. This responsibility may be placed under an Inspector General (IG). Such oversight should enable real-time auditing, in which management authorities can act immediately on recommended changes suggested by auditors in the contract management process. The main responsibility of the IG would be to investigate possible fraud and abuse in the form of criminal activities and continually review whether the contract performance meets the government's requirements and is executed economically and efficiently.[16]

However, to ensure that the IG oversight does not become too much for either the IG or the contractors in large-scale contracting, another option to consider is to create a special position or board for such tasks. In the case of the Katrina response, for example, the Department of Homeland Security created a "procurement review board" that acted as an IG and conducted due diligence over all FEMA contracts. Taking recommendations, FEMA was able to respond and implement appropriate changes.[17]

Some analysts suggest that an auditor should be present in meetings throughout the entire contracting process to help agencies avoid personal interest conflicts, as well as unequal treatment of bidders, and to assure both agency and contractor that the integrity of the contract is unquestionable. Such an addition may actually hinder the contract processing and should not be necessary when working with reputable companies. Finally, public access to contract information is crucial in accountability for the contractor and government agency, as well as part of the oversight process before Congress and citizens.[18]

### Human Capital

The third lesson learned, beyond requirements and contract guidelines, is that contract management success or failure, defined by the final product delivery and level of wasteful spending, hinges on the skill of the personnel managing the awards. To start, managers must have a clear launch plan for the office in order to be ready to receive, train, and deploy staff.

Hired personnel that will manage the contracts must have a clear understanding of what their job is so that they are able to execute that job adequately. Staff rotation must create some overlap for new staff to be fully trained and ready for current staff to depart.

In addition, the number of staff must be high enough to execute the job from the very beginning of the project. Finally, contractors who will subcontract, which can cause at least 50 percent of the cost of the contract to go to overhead, must be avoided. Abuses of subcontracted workers by contractors may also arise and be difficult to track down and eradicate.

### Liability and Procedure

The fourth lesson learned is that knowing the rules, procedures, and programs that are available for technology should be a priority for any agency managing contracts in order to take advantage of available resources. The government should have a statutory and regulatory framework in place before contracting is considered, both for the protection of the contractor as an incentive to bid and as a protection for the government agency.

It is also important to understand that cooperation and collaboration among different government agencies at the local, state, and federal levels may be necessary, and private contracting efforts depend on the leveraged needs, skills, and strengths in that process.[19] A GAO report on Katrina contracting noted that excessive time was spent coordinating with other agencies—time that could have been saved if a framework for collaboration was already in place. Such a framework should include plans for communications, common definitions of contract terms, and alignment of responsibilities among key officials.[20]

## CASES OF SUCCESS: FINDING THE RIGHT BUSINESS MODEL

As in any public–private partnership, employing contractors in support of homeland security or counterterrorism will work best if the market forces are played to their advantage. Market testing is an integral part of finding the right business model. A market test will enable contractors and agencies to see pricing and performance for the services they wish to make available or of which they wish to take advantage.[21] If private contractors are used for security without a good business model backed by investment, the initiative will fail—as will the mission to secure the border from illegal entrants and international threats.

Different missions may require different business models. Agencies should look beyond contracting in Iraq and at the Gulf Coast to gain a broader perspective. Airport security policymakers, for example, explored more efficient ways to implement airport security by allowing airports to

contract out certain aspects of security to private screeners as long as security standards were being met. A few airports are now able to contract out the screening of cargo and passengers, as well as perimeter security.[22] In this case, airport security officials are able to focus on risk assessment, regulation, and oversight for the security at their respective airports rather than on building and managing a minifiefdom of screeners, perimeter security enforcers, and so forth.

It is important to select the right business model for utilizing private contractors at the border in ways the government has not considered before—such as detention. A small but growing number of communities across the United States are already using private companies to run prison operations on behalf of the federal, state, or local government. These prisons are not their own entities with special authority; instead, the operations of prison management are run under appropriate jurisdictions.

The proliferation of private prisons reemerged in the late 1970s after a century of state-run regimes. The government began to lease the operations of juvenile detention facilities to private companies; over 20 years later, private companies run two-thirds of this particular population. Privatization of adult prisons began around the same time in the form of halfway houses, then holding houses for illegal immigrants, and after 1988 spread to medium-security prisons. Today, nearly 200 privately run prisons house incarcerated populations in the United States. The reasons behind privatizing prison operations include rapid accommodation of a growing prison population; restrictions in federal, state, and local budgets for building and operating new prisons; and improvements in prison management in general.[23] The government recognized the flexibility that private contractors had to offer, and a similar model for private contractors at the border should be considered.

Out of a prison population of 1.5 million, 100,000 state and local prisoners were held in privately run prisons in 2005. As crackdowns on illegal immigration continue, more beds will be needed in detention facilities. Private companies claim that the private sector could easily provide upward of 4,000 beds for detention operations.[24] As officials consider the cost of transporting the detainees, as well as facilities for holding detainees, they should also consider increasing the utilization of beds that privately run prisons can provide with more flexibility in the changing environment of detention needs.

As the successful privatization of prisons demonstrates, the use of private contracting for a wide range of counterterrorism and homeland security tasks could be very broad. For example, private sector service companies could play a prominent role in border and transportation security or counterterrorism investigations.

Surveying what has been done in the recent past reveals the government has done large-scale private contracting before, and it can do it again even

more cleanly and efficiently. Studies and lists of lessons learned are helpful only if the lessons learned are actually applied and if measures are taken to reevaluate progress and the level of services along the way. Learning the fundamentals of large-scale private contracting gleaned from Iraq and the Gulf Coast, reconstruction in these areas has the potential to enhance other large-scale private contracting in the future, both abroad and in our backyards. These and other lessons learned from the private sector, when applied, could improve the way business is done in the public sector and make for a more effective government overall.

The key lesson to be learned for private contracting is to plan. Planning is an essential task that requires significant attention before engaging in a contract. The ability to execute any large-scale private contracting effort lies with choosing the right business model, defining specific and accurate requirements, knowing the situation on the ground, training personnel, and setting up effective mechanisms for oversight, response to oversight, and liability mitigation.

In the end, the success or failure of large-scale private contracting lies within this strong framework and the ability of the government to make good choices. Taking cues from other contracting endeavors, private contractors could enable the Department of Homeland Security to meet the security mission at the border with speed, flexibility, and low cost.

## WHEN SHOULD GOVERNMENT USE CONTRACTORS?

### Assessing the Value Added by Contractors

A sensible starting point for a discussion on when governments should contract with outside entities to support military operations is to evaluate the risks (and benefits) of each decision. A risk-based approach is beneficial because it helps to avoid unnecessary risks as well as incorporates both financial and intangible benefits and drawbacks into the calculation. Risk-benefit analyses are not new in the defense world. For instance, the Joint Field Manual on Risk Management contains a standardized approach to assessing and managing risk, which can be applied to all activities. This risk-based approach should be applied to contractor sourcing decisions.

The process consists of five steps. They are (1) identify hazards; (2) assess hazards to determine risk in terms of probability, severity, and risk level; (3) develop ways to mitigate the risks and make decisions about risk; (4) implement the mitigation processes; and (5) supervise and evaluate. To understand these steps, it is necessary to know the field manual's definitions of "risk" and "hazard." A "risk" is "the probability and severity of loss linked to hazards."[25] A "hazard" is "a condition or activity with potential to cause damage, loss, or mission degradation and any actual

or potential condition that can cause injury, illness, or death of personnel; damage to or loss of equipment and property; or mission degradation."[26]

### Risk and Risk Controls

The sourcing question raises some residual concerns. They include (1) the degree to which possible contractor shortfalls could hinder mission success; (2) the safety implications for contractor employees and equipment as well as the presence of contractors during U.S. military operations; (3) resource trade-offs or the effect that money spent on contractors offsets or consumes funds needed to pursue other goals in a resource-constrained environment; and (4) the impact that using contractors may have on the military's ability to comply with laws, regulations, and high-level policy guidance as well as to collect information. Obviously the greater the hazards and risks, the greater the scrutiny and attention is applied to the decision-making process.

In making a sourcing decision, it is also important to consider what impact mitigation strategies may have. Some considerations that are likely to affect any sourcing decision include the type of activity; the type or identity of the contractor; the nature of the contingency; the location and the battle phase for the contractor; and the quality of the government oversight of the contractors.

### When Should the Risk Assessments Occur?

If one agrees that a risk-based approach is the correct one for answering the question of when the U.S. government should use contractors, the next question is when should the assessment occur? One answer is that such assessment should support decisions that significantly affect the use of contractors "wherever those decisions occur."[27] A recently published RAND report focusing on Army decision making and contractors suggests that there are five distinct organizational venues where or when the assessments should occur. They include:

- *Outside the military*. Decisions to use contractors are often influenced by Congress' and the administration's determination of the appropriate size and operational tempo of military forces.
- *Acquisition venues*. Policies "the Army uses to choose contractors, design contracts and quality assurance plans, and oversee and support contractors in theater heavily affect the residual risk associated with their use."[28]
- *Force design and management issues*. For instance, when there is a small reserve component capability, contractors may be used more heavily to avoid continually mobilizing the same group of people.
- *System requirement plans*. Program planners and leadership may encourage dependence on long-term contractor support, depending on the vision and the

need for highly skilled support personnel. "More generally, officials use spiral development to field systems early and collect operational data on them from the battlefield to refine their designs over time. This encourages the presence of contractors on the battlefield."[29]

- *During specific contingencies*. Where the government requires a quickly assembled force, it may also require greater contractor support.

The framework articulated in the RAND report has applications for a wide range of defense, homeland security, and counterterrorism programs.

### Contractor Oversight

Once government leaders have determined through a risk-based process that contractors have a role to play in a mission, the IG should become involved. Large-scale government contracts—as the experiences of Iraq and Katrina demonstrated—are often lucrative, and charges of waste, fraud, and abuse are common. By having the IG involved at the beginning of the process, there is a ready oversight body there to report problems while there is time to correct them. In addition, government agencies should consider creating a corps of reserve contracting officers. Such an organization ideally would be identified, recruited, trained in advance, and regularly exercised to meet contracting needs in the aftermath of the crisis or conflict to assist in reconstruction.

Having a dedicated reserve component would allow for effective monitoring of contracts, better document execution, and accurate data collection during contingencies and crises. This component would have been useful both in the aftermath of Hurricane Katrina and in Iraq. For instance, "SIGIR found that the shortage of personnel (and the widespread lack of required skill and experience among those available) affected all facets of reconstruction assistance."[30] Dedicated contracting officers and an IG's presence would also provide greater transparency regarding where contractors are and what they are doing—important things to know for contingency planning and effective management.

### CONCLUSION

Today, policymakers either ignore how their decision making in an area such as end strength will increase the dependence on support from contractors for security missions, or they realize the impact of their decisions on the presence of contractors but do not use a risk-based model for making their decisions. Neither situation is a good one. Contractors often provide vital support in a vast number of ways, including training, logistics,

and security. In many situations, the decision to use contractors is the correct one. However, these decisions should be made with great care using a process that forces an examination of the risks, mitigation techniques, and benefits provided. Furthermore, when policymakers decide to use contractors, the IG should be involved from the beginning so that there is oversight and transparency in the contracting process, and a reserve contracting corps should manage the contracting.

# CHAPTER 11

## MANHUNTING: A PROCESS TO FIND PERSONS OF NATIONAL INTEREST

Steven M. Marks, Thomas M. Meer, and Matthew T. Nilson

Over the past four years, the U.S. government has drastically shifted its priorities to the Global War on Terrorism (GWOT). Billions of dollars have been spent setting up various counterterrorist centers. Academics and analysts alike have written on the perplexing issues surrounding terrorism and terrorists. Most of this work focuses on how to attack and dismantle networks, the root causes of terrorism, and the psychology behind suicide bombers, resource protection, and the like. However, one of the most important aspects of the war on terror—finding and apprehending Persons of National Interest (PONI)[1], who in the GWOT case are Islamic terrorists—has received virtually no serious strategic thought. This, in part, is because the U.S. government has not effectively analyzed the manhunting paradigm.

Although the U.S. government saw initial successes in Afghanistan, the senior al Qaeda leadership—namely Osama bin Laden and Ayman al-Zawahiri—have avoided capture. With all the resources available to the U.S. government and its allies, they still have had only limited success in locating and capturing these men. One reason why these terrorists remain at large stems from the government's inability to adapt and understand its enemy. For a variety of reasons, U.S. governmental agencies continue to rely on traditional cold war methods. But these rules do not necessarily apply to the nonconventional threats posed by terrorists. Thus, new doctrines, processes, and methodologies must be developed and

implemented if the United States is going to make headway in defeating this new enemy. The following chapter creates a formalized framework and a manhunting process based on law enforcement investigative methods, which is traditionally developed during on-the-job training (OJT).

## APPROACHES AND PROBLEMS

For the past four years, intelligence analysts have carefully reviewed incoming intelligence messages for clues that could reveal the location of the world's most infamous terrorists. These analysts conduct detailed link and social network analysis (SNA) on the basis of available classified information and closely analyze messages to determine who is talking to whom, how long they converse, and what is discussed. This information is used to gain additional insights into the al Qaeda terrorist network's structure. The hope is that analysis of known or suspected terrorist links will reveal an informal hierarchy, enabling the targeting of key personnel in the network, which could disrupt current and future al Qaeda operations.

With that in mind, an examination of the intelligence community's current framework is necessary to identify any shortcomings in the intelligence analysts' methodology. The first step in understanding why a new methodology is needed involves an understanding of how the U.S. counterterrorism community currently maps fugitive networks and the problems with that method. Since the September 11 attacks, the U.S. intelligence counterterrorism community has shown a great deal of interest in the applications of SNA for tracking and targeting terrorists. Managers within the intelligence community have aggressively sought out experts and developed software tools to conduct SNA, while at the same time instructing their subordinates to build large databases of information to analyze.

Unfortunately, this approach creates an organizational chart based on a predetermined template. Given this outdated approach, analysts construct and implement message filters that seek out specific information from intelligence messages to create a picture of the enemy and his organization. This system usually involves taking incoming classified message traffic and filtering out clues as to which individuals are subordinate to whom and how the organization interacts operationally.

Although intelligence analysts are attempting to capture all the information about fugitives, they are coming up short for four reasons. First, the system used by intelligence analysts is rooted in a cold war mentality, which lacks the flexibility for dealing with the current asymmetric and dynamic nature of terrorists.[2] Terrorists generally operate in cellular networks, which are more likely to be flat and horizontal rather then vertical organizations.[3] Horizontal structures negate the value of looking for

specific chains of command, which are either not present or ambiguous in nature. Also, horizontal structures grant the fugitive a greater degree of flexibility in interacting with other collaborators. Specifically, the fugitives will interact with those individuals who can help them with a particular problem. Therefore, the fugitives' decisions are contextually based upon their needs at a given time and place and under circumstances that prevent them from following traditional hierarchal patterns such as those used by standard military commands. Since these patterns are irregular, they are not likely to be captured by a hierarchical construct.

Second, analysts often ignore open-source information. The bias toward classified information likely stems from the days when the little information known about the Soviet Union was collected through official government assets. As a result, analysts depended on classified intelligence collection assets to fulfill almost all information requirements. However, analysts can now access a great deal of information about PONIs from online sources such as Web sites, blogs, and chat rooms. Furthermore, journalists can provide useful information because they have greater access to a broad range of different individuals, groups, and organizations, many of whom use the media to spread propaganda. Unfortunately, most analysts continue to ignore open sources for information on fugitives.

Third, the current fugitive framework concentrates only on the operational network and does not capture the fugitives' entire social network, built over the course of their lifetime. Given this situation, a large amount of information is typically missing on the fugitives' religious, educational, political, military, criminal, and economic associations. In *Dark Networks: The Structure, Operation, and Performance of International Drug, Terror, and Arms Trafficking Networks*, Brinton Milward and Joerg Raab highlight this point for al Qaeda, stating, "Unlike the drug smuggling networks, the membership of al Qaida seems to be quite diverse in terms of ethnic, national, and social background. Operatives are from a variety of countries, born Muslims and converts, highly educated men from middle class or upper class families to petty criminals with only limited education."[4] Given these wide-ranging differences, the current system fails to capture the complex nature of these relationships.

Also, as terrorism researcher Valdis Krebs recently observed, "Conspirators don't form many ties outside of their immediate cluster and often minimize the activation of existing ties inside the network. Strong ties between prior contacts, which were frequently formed years ago in school and training camps, keep the cells linked. Yet, unlike normal social networks, these strong ties remain mostly dormant and therefore hidden to outsiders."[5] Therefore, analysts have no way of knowing if the fugitives have developed strong relationships through their past activities, since these bonds do not appear in recent intelligence reports. As mentioned before, the horizontal structure of terrorist networks allows fugitives to

activate latent relationships, which baffles intelligence analysts and prevents collection assets from identifying additional associates.

Fourth, social network analysis suffers from an inherent flaw due to reliance on complete information. Specifically, traditional SNA relies on an *a priori* knowledge of relationships, but without complete information social network analysis is limited in its effectiveness. Most fugitives who are members of transnational criminal groups—such as terrorist organizations, drug traffickers, and illegal arms dealers—operate in an opaque environment. Their clandestine network's cellular structure is developed to prevent information from being gathered on the organization. As a result, any type of useful analysis must be conducted with incomplete information. Consequently, what intelligence analysts need most is a map to identify areas of missing information, which will enable analysts to construct a more complete picture of the fugitive's support network. The key to developing such a map requires an integrated framework, process, and methodology specifically designed to identify missing information. As described later in this chapter, we call this integrated approach Nexus Topography (NT).

## INVESTIGATIVE METHODS AND TECHNIQUES

In April 2005, the largest national fugitive dragnet ever, code-named Operation Falcon, arrested nearly 10,500 fugitives in the space of just a week, the result of a massive push by the U.S. Marshals service, the oldest of the federal law enforcement agencies. Although the U.S. Marshals average over 100 fugitive arrests each week, the agency wanted to see how much further it could go. By closely collaborating with the police from all 50 states—with more than 3,000 law enforcement officials from 206 state law enforcement agencies, 302 county sheriff's departments, and 366 city police departments—the U.S. Marshal service increased its apprehension rate by nearly eight times its usual weekly record. Officials said fugitives were tracked in every state, including Puerto Rico and Guam.[6]

Several factors explain the success of the U.S. Marshals. First, the ability to coordinate a massive manhunt of this size requires thorough planning and exceptional intra-agency coordination across local, state, and federal levels. Second, of those apprehended during Operation Falcon, 70 percent had prior arrests for violent crimes, meaning the marshals already had a booking sheet filled out on each felon, detailing the arrestee's name, address, biometrics, aliases, and so on. Furthermore, the standard operating procedure for first-time felons prior to entering a detention facility is to have them fill out a questionnaire to determine which prison cells should be off limits, given certain ethnic, gang, and religious affiliations. First-time offenders consider this questionnaire necessary to their survival because it is supposed to guarantee that they do not share a cell or floor with

rival gang members. The questionnaire is quite specific and probes about information on ethnicity, gang affiliation, languages, relatives, business acquaintances, girlfriends, wives, and children. All answers also require a last-known address.

No less critical to the U.S. Marshals' success has been the fact that their dedicated hunter teams are granted the authority to pursue a fugitive across jurisdictional boundaries. The team is thus able to build intimate knowledge of the fugitive's behavior at levels not possible for jurisdictionally limited law enforcement agencies. These three significant factors provide the U.S. Marshals the capability to apprehend fugitives at the local, state, and federal levels. The U.S. Marshals' best practices, therefore, are worth attention. So, too, are those of the Federal Bureau of Investigation (FBI), bounty hunters, and private investigators. By studying an array of tactics, techniques, and procedures used by the most successful manhunters, an overall manhunting methodology emerges. Such an investigative process includes identifying possible hiding locations or pinpointing individuals in the fugitive's support structure who can help locate wanted felons. As Bob Burton, the United States' leading and most feared bounty hunter notes, "Ultimately, your search will lead you to the two stars of this trade: the fugitive and the Judas who betrays him."[7]

Commonalities seem to exist among all types of manhunting, whether the hunter is pursuing a common criminal, an international fugitive, or a terrorist. Fugitives tend to choose one of three types of places to avoid capture. The fugitives' first choice is to typically ask friends or family to hide them and provide them money and support. Second, they gravitate to areas that are culturally familiar and to people among whom they feel comfortable. Third, fugitives sometimes settle down in a dense urban area where they can hide in plain sight.

There are also two general fugitive scenarios. The first is planned flight—the fugitives know that they are being pursued by authorities because they have committed a crime, jumped bail, or escaped from prison. Often, these types of fugitives have coordinated support and have access to identification cards, driver's licenses, and passports. The second is unplanned flight—those fugitives who are given an unexpected opportunity to escape or who have committed an extemporaneous crime. In this situation, the fugitives have not coordinated a support mechanism to facilitate their escape. The second situation does not allow the fugitives to consciously plan an escape. For this reason it is imperative that the search begin immediately before the fugitives have time to access any support. Putting immediate pressure on the fugitives causes stress, allows the hunter team to capitalize on the fugitives' mistakes, and improves the chances of capture.

The fugitives will try to minimize their level of risk by relocating to suitable areas with access to food and water, or at least areas that are

favorable for their survival. They will try to assimilate into the community by either blending in or making themselves invisible. Often, fugitives engage in "risk management" strategies, trying to reduce the risk of being captured. Several case studies reveal fugitives who have avoided contact with friends, relatives, and associates, thereby changing their behavioral patterns and decreasing their predictability. Of the fugitives that do get captured, some are usually caught because they have a bad habit that can be exploited or they leave an easy-to-follow signature.

Understanding the basics of investigative work allows the investigator to ask the right questions of an intelligence analyst and of potential sources. Coordinating and conducting investigations through detecting and collecting physical evidence and identifying, locating, and interviewing witnesses, victims, targets, and other third-party sources of information to compile facts, evidence, and opinions pertinent to the investigation sounds like a lot of work, but this ultimately leads to locating the fugitives. However, even the first step, understanding what is in a name, can help narrow the scope of the search. For instance, the Asian Gang Task Force Commander for the San Francisco police department must know the proper spelling of a fugitive's name and the way the full name is arranged (first and last name) prior to beginning an investigation in order to accurately search both U.S. and Chinese databases for possible leads.

Collecting information to build a fugitive's profile, to include names and aliases, date of birth, a physical description, pictures or sketches, and documentation (passports, social security numbers, birth certificates, driver's licenses, voter registration card, etc.) points the investigator in the right direction. An investigator will start with the fugitive's last-known location and work backward, interviewing friends, relatives, and neighbors, making sure to ask questions about the fugitive's personal preferences, especially relating to women and favorite hangouts. By asking questions about the fugitive's personal habits, routines, and preferred locations (home, office, and bars) the investigator is determining "comfort zones." Fugitives tend to return to these comfort zones or places of familiarity because they feel safe and at ease. If the fugitive rides a Harley Davidson, frequents biker bars, and is covered in tattoos, then there is a reasonable chance the fugitive will not be found in an upper middle-class section of town or playing golf at the local country club. For a fugitive from the Middle East or Southwest Asia, understanding the tribe, clan, and village where the fugitive is from helps the hunter narrow the search.

In his book, *Hunting the Jackal*, former Special Forces Sergeant Major and Central Intelligence Agency (CIA) operative Billy Waugh shares his 55 years of experience hunting international fugitives, including Carlos the Jackal (aka Illich Rameriz-Sanchez). Key lessons Waugh conveys are as follows: Know the environment better than your prey, and know your fugitive, the fugitive's operational profile, and behavioral patterns.

Pinpoint areas that are suitable for the fugitive, while establishing surveillance points to detect activity. Establish positive identification of the fugitive, and detect and observe enabler activities and patterns. After observing the fugitive's activity patterns, determine where the fugitive has established safe houses and hide sites. Begin surveillance on the fugitive's safe houses, hide sites, and the fugitive's enablers' activities and homes. Recognizing what habits and addictions the fugitive has may help identify how and where the fugitive is vulnerable.

It was, in fact, Carlos the Jackal's excessive drinking that helped Billy Waugh and his team find Carlos. During a drinking binge, Carlos waved a pistol at a shopkeeper, and Sudanese authorities were forced to detain him for disorderly conduct. After Hassan al-Turabi agreed to Carlos's release, Carlos made a phone call to his bodyguard Tarek, who was then directed to come to Khartoum to protect or prevent Carlos from getting into any more trouble. When Carlos's bodyguard arrived at the Khartoum airport, he was whisked away by the government's secret police. Unfortunately, the CIA team conducting surveillance at the airport was unable to follow the bodyguard. The team then began searching places where foreigners were known to stay and, as luck would have it, the CIA team located Tarek in a hotel. The team immediately began surveillance on Tarek and identified the car that he drove. The other major break in the search occurred when Tarek's car was spotted near a hospital. The team immediately began surveillance on the hospital, which is where Carlos was finally spotted. Unknown to the CIA team at the time, Carlos had genital warts, which required frequent treatments.[8] In this case, it was a string of events brought about by the fugitive's addictive behavior, which enabled the team to successfully locate the fugitive.

Essential in finding Carlos was identifying his means of transportation. Determining certain modes of travel available to fugitives and which ones they prefer allows the investigator to identify possible locations and patterns of movement. Technology can assist by providing a physical description of the fugitives even five, ten, and fifteen years after they have been sighted. Often fugitives lose or gain weight on the basis of their comfort level. Carlos, for instance, gained 30 to 40 pounds in Khartoum and grew a thick moustache. But image enhancement technology enabled investigators to anticipate these changes in his appearance.

It seems paramount to build the behavioral profile of the fugitives before deciding to spend millions of dollars moving personnel to investigate and before shifting collection assets to increase spying capability. Figuring out what terrifies or worries the fugitives and what their normative versus adaptive behavior is will also assist, when the time comes, to apply some external pressure to influence their decision making.

Databases such as Choice Point or AutoTrack are an inexpensive way to begin the process of locating a PONI inside the United States, but

the same kind of information can be found overseas. What makes these two systems unique is their ability to search public records nationwide and link together their many scattered bits and pieces of information into an electronic dossier, or profile, of an individual. Just by searching for a name, the investigator can obtain current and past addresses, telephone numbers, social security number, date of birth, and, more importantly, information regarding friends and neighbors. Local law enforcement officers will usually not only conduct an investigation on a suspected criminal, but also run background checks on the individual's neighbors. Most likely, the neighbors are aware of the individual's criminal activity and may even be affiliated with this criminal behavior. Law enforcement databases cross-reference a massive amount of publicly available data, including addresses, driver's licenses, property deed transfers, and corporate information.[9] Most private investigators and bounty hunters use databases like these as a starting point for most searches because they are short-term solutions, given limited amounts of time and money.

In most cases, especially in countries ruled by authoritarian governments, there are court houses or places where important documents and records are kept. In remote areas, the village chief will often maintain these records in order to settle land disputes or family feuds. Likewise, if an international fugitive ever attended a university, there should be a record of the fugitive's attendance, along with rosters of fellow classmates. Getting to this information is easier than expected because most universities have faculty from other countries that might provide this information for a small fee. Finally, the FBI's National Crime Information Center (NCIC), which is a database that collects and discloses information from other law enforcement agencies about crimes and criminals, is a popular source of information for those in law enforcement. The data contained in the NCIC is supplied by the FBI and the local, state, federal, and foreign criminal justice departments.[10] Every application, database, or piece of paper may hold a critical missing piece to the puzzle.

The most important aspect in investigative work is identifying potential sources, analyzing the nature and depth of their relationships with the fugitives and their relationships with other family members and business associates. According to the Los Angeles U.S. Marshals Task Force Commander, Chief Inspector John Clark, it is all about knowing "who's who in the zoo." Key tasks include locating and interviewing a fugitive's spouse, children, significant others (current and past), parents and siblings, friends, business and criminal associates, neighbors, vendors, and, most important, enemies. Capitalizing on weaknesses or character flaws of those in the "zoo," the investigator can pit one against another. Many times a fugitive's wife has no idea she is not the fugitive's only love. She may have much to disclose once she is told she is not the only one he slept with. The same can be said about business partners or criminal

associates; often they are unaware the fugitive has fled or even committed a crime.

It is also important to adapt investigative techniques and approaches to circumstances, on the basis of who is being interviewed or put under surveillance. Prior to interviewing a witness or informant, the questions need to be prepared and likely responses anticipated. Along with this it is critical to have counterresponses that can be supported with facts. Because it is possible to give more than they will get, investigators must be mindful to direct the questions and stay focused and on track. It helps to know the answers to as many questions as possible before they are asked. Once the interview is over, it is then vital to conduct surveillance on financial transactions and voice intercepts and review physical tracking to identify responses to contact and changes in patterns. Questioning witnesses and informants may require some aggressive behavior from the investigators. This includes checking to see whether there is an existing warrant for the fugitive's arrest, which can lead to parole and probation searches, and if enough probable cause exists, then this could yield a search warrant, which would enable the investigators to gather still more personal information.

A common error for the investigators is to allow a preconceived theory about a case to dictate the direction of the investigation. Everyone has a tendency to allow cognitive biases to creep into the way a problem is perceived instead of analyzing all the information and discounting none. For instance, because everyone has been saying for years that Osama bin Laden is in the Northwest Frontier Province (NWFP) of Pakistan, we ignore all other evidence suggesting anything different. Another mistake is to allow external actors such as informants, media, and other law enforcement agencies to dictate the direction of the investigation. Relying too much on intelligence that has been over-diluted or over-filtered by other investigators and analysts tends to lead the pursuer down the wrong path. It is imperative for the lead investigator to know all the details and behaviors of the fugitive and to understand who are potentially involved in hiding and abetting the fugitive—who they are and what they do—in order to look for patterns and changes in their behavior. The investigators should never discount or overlook the obvious. An informant with the correct answer could be staring you in the face, even though the informant may not look the part, speak the language, or meet the criteria normally associated with knowing important things. Individuals such as this represent the "golden nuggets" that can change the entire direction of the pursuit.

Persistence, patience, resilience, adaptability, and creativity are the keys to successfully pursuing a fugitive. Quickly recognizing the fugitive's avoidance strategies and capitalizing on mistakes made by the fugitive's associates can help in closing in on the fugitive's location. Maintaining a

level of awareness, keying in on patterns and changes to patterns allows the investigators to be more aggressive in their search. Effectively using traditional investigative techniques and manipulating witnesses and informants, while also understanding and using technology to their advantage, can only increase the level of success for the investigators. Taking a proactive approach to pursuing a fugitive and applying intense pressure will often force the fugitive into the open. The best investigators anticipate the fugitive's mistakes—the pursuer may make many mistakes, but the fugitive need only make one mistake to be caught.

## A MANHUNTING FRAMEWORK

The U.S. government's effectiveness in manhunting overseas calls into question the government's ability to learn from its domestic manhunting successes. The apparent lack of a suitable framework may be one reason why the U.S. military only achieves occasional successes in manhunting operations. That is, without a framework to properly conceptualize the problem, most of the pertinent information that impacts manhunting could be easily overlooked or mislabeled. Further, the military's development of systems and tools, which are thought to assist in solving the manhunting problem, could in fact exacerbate the situation—leading to excessive costs, misleading information, and false conclusions. Only with a proper framework can a problem be properly identified. The following example serves to illustrate this point.

In *Psychology of Intelligence Analysis*, Richard Heuer explains how judgment is affected by the lack of a proper framework.[11] Heuer describes an experiment in which experienced mechanics were given a diagram ("fault tree" in psychology) that showed them all the reasons why a car would not start. "The tree had seven major branches—insufficient battery charge, defective starting system, defective ignition system, defective fuel system, other engine problems, mischievous acts or vandalism, and all other problems—and a number of subcategories under each branch."[12] The first group of mechanics was shown a complete tree and asked to identify 100 reasons for the car not starting. The mechanics were then asked to associate each one of the 100 causes with one of the seven major branches of the fault tree. The second group of mechanics, meanwhile, was shown a partial fault tree with only four major branches (to include a branch labeled "all other potential causes"). The goal of the experiment was to determine how sensitive the test subjects were to incomplete information.

The theory behind the experiment was that if the mechanics were sensitive to the missing information, then the second group would choose the "other problems" category for faults associated with the three missing branches. But, the results of the experiment showed that the "other problems" category was chosen only half as often as predicted, indicating that

the mechanics who were shown the incomplete tree were unable to fully recognize and incorporate into their judgments the fact that some of the causes for the car not starting were missing. When the same experiment was run with nonmechanics, the effect of the missing branches was even greater.[13] This experiment illustrates how the lack of a framework can prevent an accurate in-depth analysis of a problem, suggesting that the lack of a framework for finding fugitives may also prevent military planners from adequately addressing the unique problems associated with capturing fugitives.

For example, take the Armed Forces of the Philippines (AFP) hunt for Abu Sayyaf Group (ASG) leader Khadaffy Janjalani. On July 5, 2003, Janjalani and 30 Abu Sayyaf members on board two outrigger boats arrived in Barangay Libua, Palimbang Town, Sultan Kudarat, in Southern Mindanao. The AFP immediately dispatched the 601st Infantry Brigade to the area to capture Janjalani. Yet, during the 601st's five-month deployment to the region, Janjalani was able to avoid capture while operating in a very narrow and limited zone (a 10-km-by-6-km zone). Even though the 601st made careful plans and developed friendly courses of action to apprehend Janjalani, the AFP still failed to apprehend him.[14]

The AFP framed the problem in conventional military terms and relied too heavily on technology-based intelligence collection platforms provided by the Joint Special Operations Task Force-Philippines (JSOTF-P). Upon receiving U.S. intelligence information, the AFP began its planning cycle, arrayed its units, determined likely avenues of approach, and maneuvered its forces to engage the target. However, the 601st brigade and the JSOTF-P never fully understood the fugitive's strategies to avoid being captured and never looked to the ASG's possible deception techniques. These oversights were contributing factors in the AFP's failure to apprehend this rebel group. Further, the absence of a manhunting framework led the 601st brigade to the incorrect conclusion about why the AFP was unable to capture Khadaffy Janjalani—the lack of timely actionable intelligence. Although U.S. and Philippine military planners blamed their failures on slow intelligence, closer examination reveals that key planners did not understand fugitive apprehension strategies. The 601st brigade was never able to operate inside the fugitive's decision cycle and predict Janjalani's next move.[15] The lack of a framework or the wrong framework often leads planners, decision makers, and analysts down avenues that fail to resolve the problem or accomplish the mission.

Two fundamentally different problems exist in hunting PONIs: (1) finding and apprehending known PONIs and (2) identifying and apprehending unknown criminals, terrorists, or their supporters. However, in the case of unknown criminals or terrorist elements, what becomes essential is finding latent perpetrators and facilitators who are found in fixed locations but who strive to conceal their relationships and activities. These

clandestine networks may be difficult to track and identify using technical collection means, primarily because these technical systems are designed to detect observable signatures. Yet, these systems can be easily deceived by false signals or overwhelmed by excessive signals. Further, for these technical collection means to work, they must be able to detect patterns of behavior and interactions between individuals. Few technical systems are designed to identify how relationships are formed between individuals, when these relationships are formed, or how strong these relationships are or have been. Meanwhile, if these relationships are unobservable using technical means, the network is able to function below the surface, which offers it still greater freedom of movement.

To gain a better understanding of the specific fugitive being sought, one needs a system of categorization. Through our analysis of numerous case studies, we have developed three preliminary categories: Type A—individual criminals; Type B—persons who are members of an organization; and Type C—deposed government leaders. For instance, fugitives such as Eric Rudolph, the 1996 Olympic bomber, or Mir Amal Kasi, the individual who fired upon CIA headquarters, are characteristic Type-A fugitives. These individuals are not part of any nefarious organization or government entity. Yet, they can destroy infrastructure and disrupt governmental functions. They may or may not fall under the responsibility of the local police or federal authorities but are generally a responsibility of law enforcement. The interesting phenomenon behind Type-A fugitives is that they can find sanctuary from prosecution in foreign countries. Type-A PONIs usually do not pose a direct threat to national security, but as technology evolves, these same individuals may become better positioned to challenge national security in the near future. The key thing that separates Type-A from either Type-B or Type-C individuals is that Type-A individuals don't have an organization or robust support structure supporting or guiding their activities. Unless they are independently wealthy, their resources tend to be limited. They are predominantly concerned with survival, not with achieving any strategic objective or maintaining power.

Type-B PONIs are individuals associated with a nefarious nonstate organization or network. Type-B individuals include members of crime syndicates or mafias, insurgent groups, terrorist organizations, and drug cartels. Individuals who operate in organizations or networks of this type can be further subdivided into those who belong to the leadership core, operators, and supporters. Hunting individuals who belong to criminal organizations, terrorist networks, or insurgent groups may be considered both a law enforcement activity and a mission to protect national security. Manhunts for such individuals may fall within the scope of multiple government agencies. What truly separates Type-B individuals from the Type-A lone actor is that organizations have objectives and a robust support structure, whereas individuals have limited support structures and

the finite goal of survival. Group survival is important for Type-B PONIs, but to be successful the group must recruit members and must have an objective besides pure survival.

Type-C individuals are government leaders, their cronies, and their supporters. Saddam Hussein, Radovan Karadic, and Manuel Noriega are classic examples of Type-C PONIs. What differentiates a Type-C from a Type-A or Type-B individual is that Type-C persons have recently been in power and can utilize government resources. Also, prior to becoming fugitives, these individuals typically have armed forces and government assets at their disposal to protect them and their regime. Although these individuals may be indicted, law enforcement is usually unable to make an arrest without the help of larger national assets—law enforcement does not have the military might to bring these individuals to justice. The Type-C person typically requires manhunts conducted by military or paramilitary units, and executive-level approval must be secured before this type of operation is conducted. The nature of the Type-C individual also differs in an important regard from Type-A or Type-B PONIs and is exemplified by Saddam Hussein. That is, individuals in power do not want to lose power. Leaders tend to hold on to their status well after their regime has fallen, and fortunately for the manhunters, the leader's decision to evade is often made well after the invading military has gained significant area control.

The comparison between these three different categories of PONIs accentuates another factor that affects the location and apprehension of individuals—control of the search space. Type-A, Type-B, and Type-C individuals interact differently with their environment. In some cases, the PONI has sovereign control; in others the hunter has control. The ability to control the search space is critical. In Iraq, for instance, the environment went from not being controlled by coalition forces to being semi-controlled. An environment can be considered permissive, semi-permissive, or nonpermissive for the hunter. The same applies to the PONI. It is often difficult to measure or quantify how permissive an environment is, and for the purposes of manhunting this may not be necessary. What is more important is to understand the relationship between the hunter, the evader or PONI, and the environment. That is to say, who controls the search space? If the hunters conduct a search that is external to their area of responsibility, then they may be at a disadvantage. On the other hand, if they control the area of search, their chances of success increase.

In many of the most pressing cases, the United States does not have jurisdiction over the area where PONIs are hiding, which means these individuals live and operate in a country that may or may not assist the U.S. government with their apprehension. Sometimes the U.S. government has an extradition treaty with the country where the fugitives are, and extraditions serve as a useful means for law enforcement agencies to apprehend

**Table 11.1   Manhunting Characterization Table (Case Study Examples)**

| Manhunting Categories | Nonpermissive (not-controlled space) | Permissive (controlled space) |
|---|---|---|
| Type-A: Individual | Mir Amal Kasi | Eric Rudolph |
| Type-B: Organizational | al Qaeda | Symbionese Liberation Army (SLA) |
|    I. Core Leadership | Osama bin Laden | Donald DeFreeze |
|    II. Operators | Muhammad Atef | William Harris / Patty Hearst |
|    III. Supporters | Yassin al-Qadi (financier) | Miki & Jack Scott, rented a house to the SLA |
| Type C: Government Leaders | Radovan Karadic | Saddam Hussein |

individuals who flee. But, for extraditions to be successful, the individual must be caught, and this often assumes that the foreign government has the resources, dedication, and political will to find and apprehend the fugitive. In some situations, the political context is such that a foreign government may actually assist in a rendition—the informal transfer of a prisoner to another country.

In some cases, and especially in Type-C manhunts, the U.S. government chooses a course of action that changes the rules of the game. For instance, the hunt for Saddam Hussein would normally be characterized as a nonpermissive manhunt, but after the U.S. invasion and defeat of the Iraqi military, the United States gained military control of Iraq. Hence, the U.S. military had internal control of the search space where Saddam was hiding, which increased the likelihood of capture. In comparison, Radovan Karadic, former leader of the Serb Democratic Party (SDS), and Ratko Mladic, the Bosnian Serb Army general wanted for war crimes, are believed to be living in southeastern Bosnia or Serbia. According to a BBC report, Carla Del Ponte, the United Nation's chief war crimes prosecutor, believed in September 2001 that Mladic was in Serbia,[16] and this was later confirmed by a high-ranking Serbian government official who remains anonymous. If, in fact, these former Bosnian Serb leaders are in Serbia, then SFOR—the stabilization force in Bosnia-Herzegovina—cannot be said to fully occupy the search space and this search has to be considered a nonpermissive search.

Table 11.1 offers an illustration of different types of manhunts. The table shows the type of person being pursued and the type of control the U.S. government had in each case. Type-B individuals are further labeled as leaders, operators, or supporters, since their operational characteristics impact the manhunt differently.

## A MANHUNTING PROCESS

Understanding the fugitive's strategy to avoid capture creates the foundation for understanding the fugitive's decision-making process. The fugitive's decisions are based on four apprehension avoidance criteria: familiarity, survivability, safety, and vulnerability. When the fugitive asks, "Where do I go to hide?" these four criteria help to frame the fugitive's choices. Familiarity, the first criterion, refers to the level of comfort or intimacy a fugitive feels when in a particular geographical area. This familiarity can be based on prior visits to a location, close associates who live in an area, or a shared ethnolinguistic identity. The premise here is that every individual has a cognitive bias toward "comfort zones." For instance, persons who have spent their entire lives in an urban area may find it difficult to live in a jungle because they have not developed the necessary skills to operate effectively in that environment. This cognitive bias may or may not be cultural; a cultural bias is one by which individuals interpret information according to their cultural orientation.

Fugitives may well suffer from a phenomenon termed "location familiarity effect" (LFE). LFE is a cognitive bias where people express a propensity to go to places where they have been before. Therefore, the LFE would predict that fugitives will prefer to hide in locations that are familiar. When PONIs make a decision about where to go, their decision is limited by their experiences, to include the sum of the locations they have visited. Yet, how do PONIs know whether they will be safe or have the necessary life support to survive? Again, the LFE likely plays an important role. Fugitives should choose locations where they already know or feel they can survive and be safe. When fugitives go to a location where they have limited or no knowledge, then their level of uncertainty is bound to be high. As the fugitives' level of uncertainty increases so, too, does the level of risk that they must be willing to accept. If they go to a location about which they have limited knowledge, their level of uncertainty is higher, and hence their level of risk will also be higher. Although different individuals have varying degrees of risk tolerance, fugitives should always try to minimize their uncertainty, ergo the LFE.

Essentially, the PONIs' mental map constrains their potential hiding locations. These constraints or cognitive biases are greatly influenced by the number and varying types of places they have previously visited. On rare occasions, certain fugitives are able to disassociate themselves from their previous life. However, this takes a tremendous psychological toll on the fugitives. Few fugitives are able to break all contacts from their previous life because of the immense psychological strain. For example, when Eric Rudolph was finally apprehended after five years on the run, he was very cooperative with local law enforcement—not something you would expect from such a notorious fugitive. According to Kathleen Walls, the

author of *Manhunt: The Eric Rudolph Story*, "The jail administrator, Joe Morris, was surprised at the prisoner's good manners."[17] A possible reason why Rudolph was so well behaved could have to do with his psychological state and the impact severing his social ties had; this may well have weakened his resolve. It is important to note that severing social ties is difficult for most fugitives. Most fugitives tend to maintain some type of contact with members of their social network, even if this is only limited. So long as fugitives are unwilling to depart from their previous relationships and normative behaviors, their cognitive biases will help delimit their decisions.

In addition, a fugitive's decisions are also restricted by a survivability criterion. Survivability is the ability of a fugitive to operate and live in a certain geographical space. For instance, a fugitive must have food, water, medical supplies, and shelter to survive. Without these basic necessities, a fugitive will be forced to move to another location to fulfill these basic survival requirements. However, survivability expands past simple life support when we consider fugitives who belong to organizations—members of terrorist groups, drug cartels, gangs, and mafias who attempt to avoid capture and prosecution while maintaining a link to the organizations. Organizational fugitives require, and can acquire, other types of support. For instance, they need a means to communicate and coordinate activities, transportation to conduct business, personnel and equipment to support operations, and a financial infrastructure for requisitions. In other words, both Type-A and Type-B PONIs tend to access support networks to receive different types and degrees of support. Consequently, Type-A and Type-B PONIs will not choose locations where they cannot live and operate.

Support networks not only provide physical goods, but can also provide early warning and physical security. Security is another term used to describe safety, which is the condition of being free from danger or risk. For fugitives, safety includes the degree or likelihood of apprehension avoidance. What helps to mitigate high levels of risk is the support of a trusted network that provides the PONIs with protection. The trust network is comprised of individuals who reside inside the PONIs' larger support network and have intimate knowledge of the PONIs' exact location and provide them with the necessary safety to avoid being captured. Generally speaking, fugitives are more likely to trust an individual with whom they have long-standing ties, which have been tested in moments of danger, and ties with a considerable moral component. If the fugitives' trust network is neutralized, then their ability to evade decreases significantly. For instance, as Saddam Hussein's trusted associates were apprehended, Saddam's trust network began to dissolve, which forced him to rent protection.[18] By identifying a PONI's trust network, the investigator or intelligence analyst can potentially correlate individuals to locations, which can potentially reveal the fugitive's hiding location.

The final criterion is vulnerability. Vulnerability is slightly different from safety in that safety is a condition provided by a trust network, whereas vulnerability is more a measure of the hunter's access—a subject discussed previously. Some fugitives gravitate toward areas where they don't feel vulnerable to capture. They may not have a robust support or trust network, but the lack of accessibility by the hunters ensures their freedom. Vulnerability, basically, is dictated by where the hunters operate. Certain legal and political constraints limit the physical space where the hunters can look for the fugitives. These constraints limit the time, location, and manner of a search. Furthermore, vulnerability can be geographically represented on a map. While vulnerability may seem easy for the hunters to map because they have perfect knowledge of where and how they operate, they must try to map the fugitives' assumptions about their (the hunters') locations and methods. That is, the hunters must make estimations on the basis of the level of information they believe the fugitives have on their (the hunters') capabilities and accessibility.

The four criteria mentioned above are the product of a five-step manhunting process, which is represented in the input-output model in Figure 11.1 below. The five steps of the manhunting process are as follows: (1) conduct an initial background investigation via research; (2) build a social profile; (3) identify the support network; (4) analyze the hunter's constraints and limitations; and (5) conduct analysis of competing hypotheses. This manhunting process is iterative and structures the problem so as to remove certain biases from the search operation. This analytical process provides better resolution as to a fugitive's possible locations by limiting preestablished beliefs about the fugitive's behavior or hiding location.

Step 1, the initial background investigation, enables the analyst or investigator to identify facts and assumptions about the fugitive. During the initial investigation, the analyst develops a historical timeline listing dates and locations where the fugitive has been. During this step, the analyst also builds an initial social network to include a family tree of the fugitive and a list of classmates. Certain assumptions can be made about the fugitive, but these assumptions will need to be verified. Step 1 concludes with developing an information request list to solicit information missing from the initial investigation.

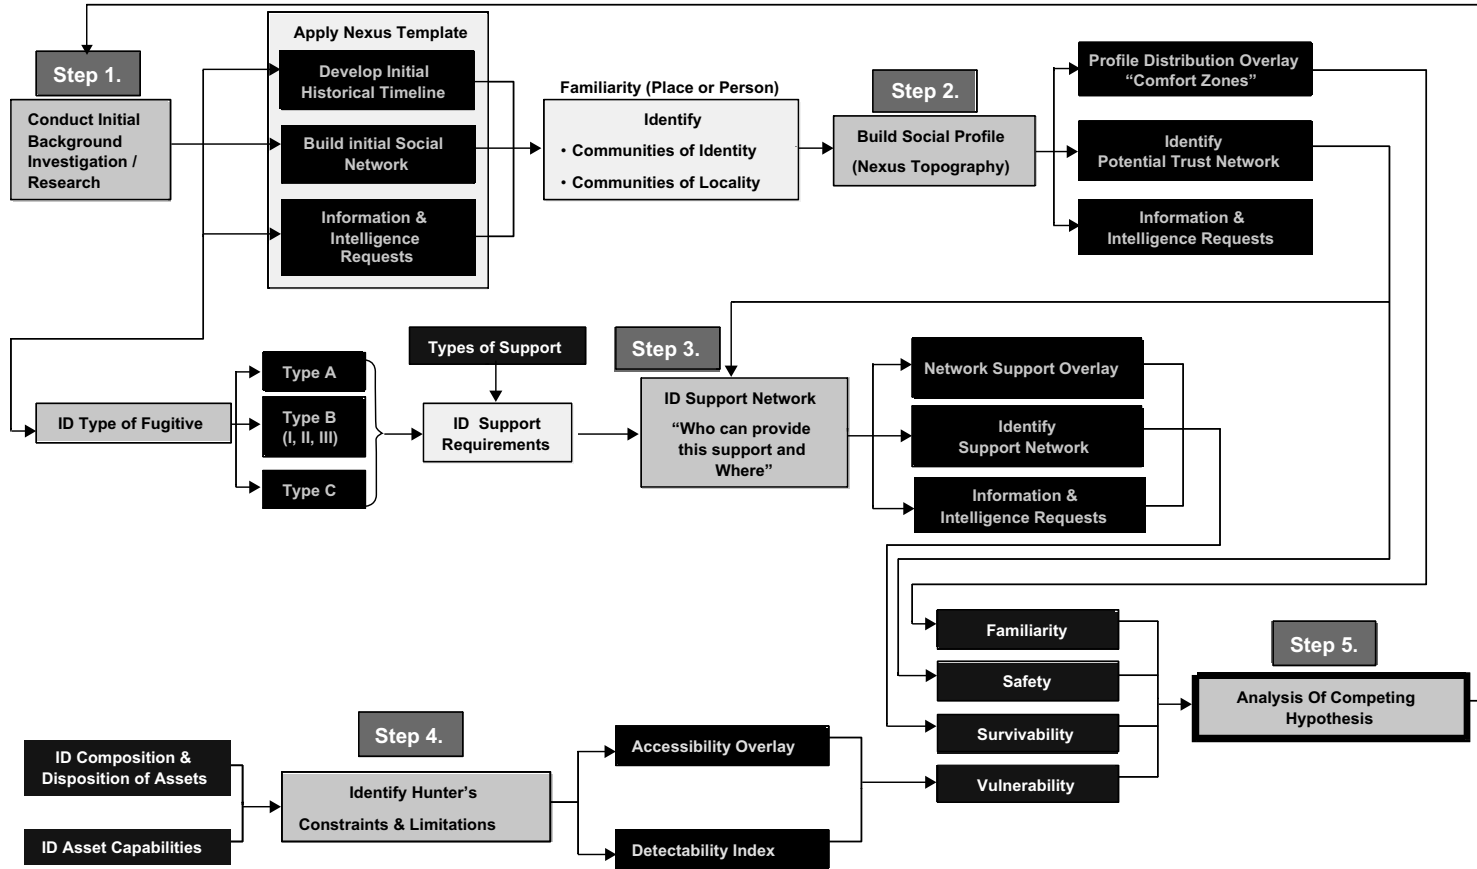
Step 2 then develops the fugitive's identity by asking several questions: Who is the fugitive? What are the fugitive's "communities of interest" and "communities of locality"? "Communities of interest" include affiliations based on hobbies, skills, and interests, while "communities of locality" define fugitives according to where they are from or where they have lived. These communities can be represented on a map as a social profile distribution overlay. Mapping these communities can also suggest other areas to search for more information about a fugitive's potential social networks.


**Figure 11.1    The Manhunting Process**

Identifying the support network is the third step in the manhunting process. Step 3 considers the different types of PONIs—for example, Type-A (individual), Type-B (organizational), or Type-C (deposed state leaders). Each PONI type will require different forms of support to survive, conduct operations, and avoid capture. After identifying the various support requirements, the analyst can identify specific individuals from the fugitive's social network who are likely to fulfill the fugitive's support requirements.

The fourth step in the process requires hunters to analyze their own capabilities and leads to the development of an accessibility overlay and detection index. The accessibility overlay graphically represents the hunter's area of operations, and the detection index identifies what the hunter can observe. The detection index examines different types of intelligence collection platforms and identifies what the hunter can or cannot detect with those collection assets. This analysis provides a better framework for understanding how a fugitive could operate in a given region without being detected. By analyzing both the accessibility and the hunter's ability to detect fugitive-related activities, the analyst can determine where the fugitive is most vulnerable to capture and, conversely, the PONI's optimal hiding location.

The final step is to take the objective analysis and apply a subjective set of metrics to identify the most likely areas where the fugitive will hide. By using a technique called the "analysis of competing hypotheses," described in Richard Heuer's book, *The Psychology of Intelligence Analysis*, intelligence analysts can greatly reduce certain cognitive biases that they may have when trying to determine the fugitive's potential hiding location.[19] Once given a list of these locations, the commander can then direct assets to search for the PONI and collect critical information. Once the information collection is complete, we have cycled through the first iteration of the five-step process. If the individual is located then the necessary apprehension operation can be initiated. If not, additional iterations should be conducted until the individual is found.

However, we would be remiss if we did not acknowledge two fundamental problems associated with this five-step process. First, this manhunting process has never been validated against a case study or real-world scenario. Unfortunately, limited academic research currently exists, and any information that is available only draws from bounty hunting and skip tracing. Most of the pertinent details behind successful and unsuccessful U.S. government efforts remain classified. Due to the lack of information available on the subject, validating this process may prove difficult until it has actually been tested in the field.

Second, there is no standardized metric to measure or compare processes. The current manhunting metric compares numbers of apprehensions to numbers of outstanding warrants. The U.S. government's success rate in finding and apprehending terrorists is sporadic, to say the least.

For every terrorist who has been killed or captured, there is an example of an individual who has avoided apprehension. Since no formalized man-hunting process exits in the U.S. government, the above process can at least serve as a starting point.

## NEXUS TOPOGRAPHY

A key step in building a social profile is the mapping of the PONIs nexus. While Social Network Analysis (SNA) documents the connections or links in a social group, Nexus Topography (NT) describes the universe of potential relationships in different social environments and cultures. The word "nexus" comes from the Latin word *nectere*, which means "to bind." So, NT maps social forums or environments that bind people to-gether. The advantage of NT is that it facilitates identification of missing information, which further allows intelligence analysts to redirect collec-tion assets.

In developing a picture of a PONI's clandestine social network, one must move from the known to the unknown. In the development of a social network, there are two constants: all social interactions occur at a specified place and at a specified time. If two individuals never occupy the same time and space, they are not likely to develop a direct link. Con-versely, the likelihood of an interaction occurring increases if two indi-viduals do occupy the same time and space, referred to from here on as spatial coincidence. The exception to spatial coincidence involves the abil-ity to create virtual relationships over the Internet in places such as chat rooms (something beyond the scope of this chapter). Therefore, the pri-mary focus of NT is to show when, where, why, and how relationships form. NT's aim is to understand the intricacies of relationship develop-ment to forecast the PONI's complete social network.

For instance, the initial social environment where relationships are formed is in the family unit. The first bonds are those formed between parents and children, brothers and sisters, grandparents and grandchil-dren, cousins, and aunts and uncles. These family ties are often considered the strongest social bonds developed between people. In many cultures, generations of family members live together in the same household and maintain close ties. The next most common set of social interactions oc-curs between teachers, students, and classmates. These bonds can last for generations, but the social interaction itself occurs at specific schools and universities. Upon completion of academic study, most people transition straight into the marketplace, which is another common location where social interactions occur. Yet another area where social interactions take place includes religion (i.e., churches, mosques, and temples).

Social interactions occur within communities of identity. There are two types of communities of identity important to the development of relationships: communities of locality and communities of interest. The

community of locality is the district or geographic region in which people live and interact or under which they are governed. An example of a community of locality is a neighborhood, village, city, town, or province. A community of interest, on the other hand, is a community formed around a common interest or shared experience. For example, prisoners or inmates, members of the military, scientists, sports enthusiasts, and hobbyists comprise communities of interest. The underlying assertion is that relationships are always developed within communities, whether these are of locality or of interest. By examining a fugitive's identity, an analyst can create the PONI's social profile, which can aide in mapping the PONI's affiliation network.

At this time, it is important to introduce the concepts of diversity, redundancy, and adaptability. Diversity of identity refers to the fact that individuals often have multiple identities: a familial identity, an employment identity, a religious identity, an academic identity, and so on. Each identity is different and helps define the individual's social networks. Redundancy refers to individuals sharing multiple identities across networks. For instance, two individuals could attend the same church, graduate from the same university, and work in the same office building. In this case, these two individuals have a redundant relationship on the basis of multiple shared identities (location, religion, education, and employment). The by-product of redundancy is that some links between sets of individuals may be disproportionately strong. Finally, relationships have the characteristic of changing over time. That is, the fugitives' social network may alter as their interests change, they move to another community, or their position within that community shifts. These changes directly influence the nature of their relationships, which will further affect their informal network. Diversity, redundancy, and adaptability are what make informal social networks, and especially clandestine terrorist networks, so powerful and why military commanders have a hard time disabling these networks.

The concepts of redundancy, diversity, and adaptability expand the understanding of affiliation networks and time analysis. In *Social Network Analysis: Methods and Applications*, Stanley Wasserman and Katherine Faust describe affiliation networks as "two-mode networks, consisting of a set of actors and a set of events."[20] Affiliation networks illustrate or map ties developed at events or activities. Such events could include sporting events, clubs, or religious meetings. These events may serve as a catalyst to unite two or more individuals into a group or clique. Unfortunately, affiliation networks are currently modeled according to traditional node and link diagrams. That is, the event serves as the central node, and individuals are linked together through attendance at such an event. This type of static analysis has limited uses in the analysis of clandestine networks.

One of the major problems with traditional network analysis is measuring and depicting time or longitudinal data. Unfortunately, longitudinal

analysis typically concentrates on how networks change and adapt over time but rarely focuses on how networks are created. This type of analysis is also depicted in only two dimensions. As Wasserman and Faust state, "Network analysis and network models have often been criticized for being static. Although much work has been done on longitudinal models, applications of this methodology are sorely lacking."[21] However, time—and the timing of relationships—is extremely important in unraveling small-world terrorist networks.

More useful is strand analysis. Traditional SNA graphically depicts nodes and links, but strands represent the life span of individuals. Strands are linked together by ties formed through various affiliations. Strand analysis is three-dimensional (3-D) analysis with individuals, time, and events, each representing a different dimension in 3-D space. The advantage of strand analysis is that it depicts where potential social links can develop. Using both strand analysis and the NT template can effectively build a picture of the PONI's potential associates that were previously unobservable.

Relationships develop inside specific regions or communities on the basis of the concepts of identity and locality. These specific regions can be categorized and used to template a range of bonds, which should help analysts investigate key areas of possible interaction. These regions of nexus are religious, political, educational, criminal, military, familial, cultural, and economic. It is important to note that many of these overlap. For instance, Islamic fundamentalist groups use religion as a source of political power, economic exchange, and cultural identity.

To determine familial relationships, analysts must identify paternal and maternal genealogy. This is especially important in tribal societies, where family lineage is extremely important, and analysts need to look for bonds or alliances created at the tribe, clan, lineage, and family levels. Social affiliations have so far received the most attention in network analyses. These affiliations include not only ties of friendship, but even more importantly, familial relations. The investigator must not only ask, "Who are the fugitive's closest friends now, and who were his closest friends when he lived or worked in such-and-such place?" but also, "What is the fugitive's family tree: is his matrilineal side more dominant than the patrilineal side? Do both sides of his family accept him? What about his wife's family (or wives' families)? What about siblings who might be married to people who show up as political or military associates?" While records about this may be difficult to construct, birth, marriage, divorce, and death records are usually available in the public domain or can be obtained by persuading or coercing local administrators or even village elders. HUMINT collection—by the CIA, Defense HUMINT Service (DHS), or third-country intelligence sharing—can provide additional information in this arena.

Educational bonds are relationships developed during the sharing or exchange of knowledge. For instance, a PONI who attended a specific university at a certain time should have developed a social network at that university. Therefore, an intelligence analyst can develop a target list on the basis of all the students and teachers who attended that university during that time. This does not mean that all individuals who attended that university are terrorists, but it does expand the fugitive's potential social network and may reveal important information on the network's infrastructure. Also, it is important to remember that education and how it is imparted to a person varies according to culture and socioeconomic status. For instance, people who live in third-world Islamic countries and who come from poor families are unlikely to attend government-sponsored schools. In contrast, families are more likely to send their sons to madrassas to gain a rudimentary education. With this in mind, analysts must understand and focus on the specific characteristics of the PONI's background so that they can gather relevant educational data for analysis.

Political bonds are bonds based on the manifestation of social power in a society. This power is based on the ability to mobilize group members in support of an idea, belief, or cause. Political affiliations may often link a fugitive to a government official or to individuals who can mobilize popular support. To begin analysis of the political nexus, an intelligence analyst must identify those direct and indirect relationships between the PONI and the individuals who hold government positions, such as town or village council members. These associations can transcend the local-level government and manifest themselves at the national level. The analyst should develop a list of political parties and politicians who hold ideological beliefs similar to those of the PONI and who may be indirectly linked to the PONI through others.

Often, the line between politics and religion is blurred. This is particularly true when discussing Islamic fugitives, since Islam recognizes no distinction between the two.[22] The fugitive's affiliations can be found, again, in open sources such as propaganda pieces, party registration records, newspaper columns, and the records of political proceedings. It is vital to understand what organizations the fugitive has belonged to. For example, Osama bin Laden's affiliations with members of the Muslim Brotherhood, certain Salafi groups, and Wahabbi clerics all helped him expand his popular support base and lent him a certain level of political power within the Islamic world. Who a fugitive associated with, campaigned with, or sponsored legislation with can also be telling. Equally important is to pay attention to those persons whom the fugitive opposed or had caustic relations with.

Religious bonds are relationships developed inside a religion. Usually these relationships begin at the local church, mosque, or temple. Yet,

religious bonds and affiliations can transcend national boundaries. Since religion is so frequently a source of identification (among those of like religion) and friction (among those of different religions), this category merits careful attention. For instance, knowing whether a PONI professes to be Muslim, Christian, or Hindu is very important since the PONI is less likely to find refuge among people of a different religion. Within the major religions it is important to distinguish whether the fugitive is loyal to a particular denomination, such as being a Sunni, Shiite, or Sufi. Within the denomination, knowing whether the PONI belongs to a sect, subsect, or splinter group with a particular ideology can be extremely helpful to an analyst.

Economic affiliations are the relationships created through economic exchange, such as business ventures or charitable organizations. One should build a list of businesses that are either funded by the fugitive or where the fugitive may find work. For example, if a fugitive is a carpenter, the fugitive will probably try to find work as a carpenter. Similarly, if a fugitive is a philanthropist and enjoys doing charity work for people, the fugitive will probably be affiliated with other individuals who do similar charity work. This makes it important to ask questions such as who has the fugitive been in partnership with, been employed by, or made significant or numerous transactions with?

Another critical component involves tracking the flow of money. In the case of al Qaeda, the "Golden Chain" has become a common term to describe the network's financial supporters in the Middle East.[23] Again, open-source reporting offers a tremendous amount of information. HUMINT can also yield valuable information, whether from interrogations of captured members of the fugitive's network or intelligence sharing among countries that have cooperative agreements in place. If a fugitive's network does business or is associated with charitable organizations within the United States, tax records and legal documents can provide valuable information about the fugitive's connections.

Criminal bonds are relationships formed through involvement in criminal enterprises as well as within the prison system. When men serve time together in prison, extremely close relationships may develop. Sometimes these bonds can be tighter than those in a family or tribe. With this in mind, analysts should ask questions such as was the fugitive incarcerated, where was the fugitive incarcerated, and when was the fugitive incarcerated? Additionally, are there any countries that have outstanding warrants for the fugitive's arrest? By developing a picture of the fugitive's criminal ties and history, one can map a network of people whom the fugitive relies on or that the fugitive may feel indebted to, or vice versa.

Military bonds are built through shared combat experiences or military training. It is easy to locate those who served in combat together, because there is usually a list of veterans that can be retrieved through databases

or records. A tightly knit group is developed through different military experiences with varying levels of commitment to each other on the basis of those experiences. Past military affiliations, such as training received, special skills studied, or unit membership, can be used to suggest a fugitive's current relationships Discovering what campaigns a fugitive fought in (such as Afghanistan in the 1980s), and alongside whom, is useful information. This information is most likely to be found on propaganda Web sites, during interrogations, or perhaps in U.S. military or CIA archives that maintain databases on political and military leaders. This type of data can also be extracted from foreign government records or local knowledge.

Ethnolinguistic and cultural bonds form because individuals share a common language or ethnic and cultural background. For example, if a fugitive only speaks Arabic, then it would be difficult for the fugitive to have close ties with anyone who does not speak Arabic. Not all ethnolinguistic and cultural ties are strong, but some are crucial to a person's cultural identity. In Afghanistan, where tribal loyalties are fundamental, a Pashtun is far more likely to find refuge in Pashtun-dominated parts of the country than in areas populated by Turkomen or Azeris. Similarly, if propaganda Web sites retelling the exploits of a PONI indicate that the PONI, as a foreigner, established a lasting alliance with a warlord of a certain ethnicity, this information could prove critical in narrowing the field of investigation. The investigator must seek to understand the relative strength of such bonds. Books, reports by investigative journalists, and propaganda are useful open sources for such information.

Although NT is a simple and straightforward concept, its strengths are multiplex. First, NT identifies key social terrain—defined as social elements that tie individuals together—that can be used to narrow areas of investigation. Developing as complete a template as possible for a PONI's potential network should be invaluable given the high turnover rate in analysts and the constant effort of maintaining continuity in analysis. Additionally, NT can be used against a variety of PONIs, thereby providing analysts with a very flexible tool. It does not matter if a PONI is a member of a drug cartel, terrorist organization, or weapons-smuggling outfit, since the model provides a standard approach that can be tailored to a specific individual or group simply by identifying how individuals are connected. A by-product of this model is increased efficiency in collection, especially when collection resources are scarce. As mentioned before, the current framework tends to focus mostly on classified information since it deals with operational connections. But nexus regions can be researched in the open-source realm even before classified collection begins. This, too, can serve to better focus limited collection assets to free up resources from other intelligence taskings.

## CONCLUSIONS

Manhunting is about identifying and locating known and unknown PONIs. Although current events have much of the public thinking about manhunting in terms of identifying and locating terrorists, it is important to bear in mind that manhunting encompasses much more than just hunting terrorists. It can range from finding war criminals, as in Bosnia-Herzegovina, to finding deposed leaders such as Saddam Hussein. Taken a step further, some of the greatest threats to U.S. national security in the future will come from small groups of nonstate actors or even individuals who will move quickly and act independently of governments or large-scale organizations. To counter such threats, the U.S. government will need to have the capability to quickly and efficiently identify and find these targets globally.

The manhunting process presented here offers a foundation on which to build a more in-depth manhunting capability, which will only help strengthen the U.S. government's capacity in the Global War on Terrorism (GWOT). The future of the GWOT, to an unprecedented degree, involves identifying and locating the next generation of terrorists. To be successful, the U.S. government must understand the manhunting paradigm and synchronize interagency capabilities and operations. Furthermore, a manhunting policy is necessary to coordinate efforts at local, national, and international levels. At the moment, no one government agency has taken the lead. No single agency has brought together the key components of an interagency manhunting program: doctrine, training, organizational structure, and strategy. These areas need to be researched in greater depth, developed, and then implemented to ensure that a seamless and proactive manhunting system is available to U.S. decision makers. As a result, the U.S. government's ability to prosecute the war on terrorism today and to find and apprehend PONIs in the future depends on its ability to develop and institutionalize a comprehensive manhunting program now.

# CHAPTER 12

## GUERILLA WARFARE AND LAW ENFORCEMENT: COMBATING THE 21ST-CENTURY TERRORIST CELL WITHIN THE UNITED STATES

Richard J. Hughbank

> The mind of the enemy and the will of his leaders is a target of far more importance than the bodies of his troops.
>                                —Samuel B. Griffith II, On Guerrilla Warfare, 1961

Domestic and international terrorism has increasingly plagued the United States over the past few decades, yet this country has actually been confronted with acts of domestic terrorism for much longer. Dating back to the days of John Brown and his actions at Harper's Ferry, Virginia, in 1859[1] and attacks perpetrated by anarchists in the early 1900s, terrorism has existed in the United States for over 150 years. Today, various forms of domestic terrorism have been conducted by hate groups—such as the Ku Klux Klan (KKK), Aryan Nations, Neo Confederates, and Black Panthers—and, to a lesser degree, by activist groups such as the Animal Liberation Front (ALF) and the Earth Liberation Front (ELF).[2] But perhaps more worrisome to policymakers and law enforcement professionals—in this post-9/11 security environment—is the current threat from international terrorist groups such as al Qaeda, Hizbollah, and Hamas. These groups have a known presence in the United States and are targets of concern for cities and municipalities of many sizes.

Both domestic and international terrorist organizations employ guerrilla warfare tactics, techniques, and procedures.[3] Thus, the ability to identify and defeat the members of these organizations, cripple their

infrastructure, and disrupt their financial resources lies in the understanding of modern guerrilla warfare as it develops in the twenty-first century within the United States.[4] The forms of asymmetric warfare[5] adopted by domestic and international terrorist groups alike is no longer intended to gain simple media exposure or governmental manipulation; they want to make an overpowering impact by causing massive loss of life and severe damage to infrastructure and are often motivated by religious imperatives and political goals.[6] As terrorism analyst Stephen Flynn has observed, "Throughout the 20th century [Americans] were able to treat national security as essentially an out-of-body experience. When confronted by threats, [America] dealt with them on the turf of our allies or our adversaries. Aside from the occasional disaster and heinous crime, civilian life [in the United States] has been virtually terror-free."[7] With the turn of the twenty-first century, terrorist operations have become more prevalent in the United States and are taking shape in the form of modern guerrilla warfare, thus creating new challenges for federal, state, and local law enforcement agencies. After reviewing the origin and nature of these challenges, this chapter will offer some suggestions for countering guerilla warfare in twenty-first-century United States.

## TERRORIST OPERATIONS WITHIN THE UNITED STATES

According to a recent book by Harvey Kushner and Bart Davis, Islamic extremist groups have been plotting within the borders of the United States for decades, originating with an exclusive network of educated leaders eventually known as "Mullahs."[8] They note that this "secret Islamic network" was formed during the mid-1980s "when a tightly knit group of Islamic radicals attended the North Carolina Agricultural and Technical State University in Greensboro."[9] After years of planning, recruiting, and training in decentralized terrorist cells located throughout the country, "[t]he founding members of the secret Islamic terror network executed a long-range plan: raise money to fund terrorist activities; support Arab and Muslim demonstrations against our government's foreign policy and its support for Israel; infiltrate our political, economic, and military system to conduct espionage and to buy influence; and use our universities to set up fronts for terrorist organizations, because our academia's commitment to Free Speech and tolerance of diversity will protect them."[10]

Meanwhile, three dramatic events since the early 1990s have illustrated to most Americans the threat of terrorism from both foreign and domestic origins. First, on February 26, 1993, a group of Islamic extremists (led by Palestinian Ramzi Yousef and inspired by Egyptian Sheik Omar Abdel Rahman) parked a van loaded with explosives in the garage of the World Trade Center in New York City. The explosion resulted in 6 deaths, 1,041

injured, and \$1 billion in damages. Then, on April 19, 1995, the Murrah Federal Building in Oklahoma City was destroyed by Timothy McVeigh (a U.S. citizen motivated by a radical right-wing extremist ideology), who conducted the attack using a truck containing approximately 5,200 pounds of Ammonia-Nitrate and Fuel Oil (ANFO). This bombing resulted in 168 deaths, hundreds of injuries, and the destruction of an entire building. And, of course, on the morning of September 11, 2001, Islamic extremists hijacked four planes and subsequently flew two of them into the World Trade Center, flew another into the Pentagon, and crashed the fourth into a field in Pennsylvania when it became clear to the terrorists that they would not be able to successfully reach their target in Washington, DC. To date, this was the most organized and sensational series of international terrorist attacks ever experienced on U.S. soil.

In an effort to gain a more thorough understanding of terrorism, recognize who the terrorists are, and contend with why Americans have been attacked in their own sanctuaries, a growing cadre of academics and security professionals have recently begun developing the field of terrorism and counterterrorism studies. However, one of the challenges that is yet to be overcome in this field is the need for a common definition. As one scholar has observed, "[W]e seek to define terrorism so as to be better able to cope with it, [but we] cannot begin to counter effectively that which we are unable to fully comprehend or agree on as to its nature."[11] The Federal Bureau of Investigation (FBI) defines domestic terrorism as

> the unlawful use, or threatened use, of violence by a group or individual based and operating entirely within the United States (or its territories) without foreign direction committed against persons or property to intimidate or coerce a government, the civilian population, or any segment thereof, in furtherance of political or social objectives.[12]

Meanwhile, international terrorism is defined as involving

> violent acts or acts dangerous to human life that are a violation of the criminal laws of the United States or any state, or that would be a criminal violation if committed within the jurisdiction of the United States or any state. Acts are intended to intimidate or coerce a civilian population, influence the policy of a government, or affect the conduct of a government. These acts transcend national boundaries in terms of the means by which they are accomplished, the persons they appear intended to intimidate, or the locale in which perpetrators operate."[13]

While these definitions are useful, from a law enforcement perspective, it is important to note that other federal and political organizations maintain (and operate under) their own definitions. This lack of a universal definition poses issues in identifying, defending against, and ultimately defeating terrorist acts in the war on terrorism.

Not only is it imperative that commonly accepted definitions of domestic and international terrorism exist, it is equally important to understand both the methods of terrorist warfare as how it's actually conducted and what type of individuals—even among U.S. citizens—would join a cause that uses terrorism to achieve seemingly unobtainable objectives. As Benjamin Netanyahu—a former soldier in an elite antiterror unit in the Israeli Army and a former prime minister of Israel—has noted, "The current breed of interlocking domestic and international terrorists is certainly not to be taken lightly. They know the West well and have developed strategies designed to take advantage of all its weaknesses."[14] Identifying the enemies' tactics and their motivational means for executing such heinous acts of political- and religious-based violence against an innocent civilian population will prove invaluable in the fight against domestic and international terrorism within the United States.

### Guerrilla Warfare Tactics

Tactics that have been successfully employed by small guerrilla-fighting forces for centuries are quickly becoming a serious problem, as domestic and international terrorist groups are utilizing standoff, overt (high-profile), and covert (low-profile) tactics to accomplish their endstate with little regard for those outside their organizations. This type of terrorist-oriented asymmetric warfare is currently used all over the world, even though such a strategy rarely leads to the type of complete victory envisioned by its adherents. Understanding guerrilla warfare requires the recognition of how terrorist cells operate within their political and religious ideologies and within their varying environmental battlefields.

According to historians Brian Loveman and Thomas M. Davies, guerrilla warfare has historically been viewed as "a war of the masses, a war of the people. The guerrilla band [has been] an armed nucleus, the fighting vanguard of the people. It draws great force from the mass of the people themselves. Guerrilla warfare [has been] used by the side which is supported by a majority but which possesses a much smaller number of arms for use in defense against oppression."[15] During the early nineteenth century, Napoleon's invasion of the Iberian Peninsula forced the Spanish landsmen to protect their countryside with what ultimately popularized guerrilla warfare in modern military history.[16] Since then, guerilla leaders, such as Mao Tse-tung in China, Ernesto "Che" Guevera in Latin America, and Carlos Marighella in Brazil, have revolutionized the art of small-unit warfare against larger and more adequately resourced opponents. Their decentralized campaign tactics have led to many victories over mighty armies and have eventually been adopted by many terrorist groups such as the Baader-Meinhoff Gang (later known as the Red Faction Army) operating in West Germany.[17] Guerrilla warfare has become the principal design from which terrorist cells are shaping their operations

from preparation to recruitment to execution. It has historically been a proven blueprint for various levels of tactical success and always provides the terrorist an opportunity to launch "himself against the conditions of the reigning institutions at a particular moment and dedicate himself with all the vigor that circumstances permit to breaking the mold of these institutions."[18] As Mao Tse-tung wrote many years ago, "A trained and disciplined guerrilla is much more than a patriotic peasant, workman, or student armed with an antiquated . . . homemade bomb. His indoctrination begins even before he is taught to shoot accurately, and it is unceasing. The end product is an intensely loyal and politically alert fighting man."[19]

## 21ST CENTURY TERRORISM AS GUERILLA WARFARE

Domestic and international terrorist groups located within the United States are demonstrating the various guerrilla warfare techniques of old as they are setting out to achieve their political and religious objectives. From the development of the organization through the execution of their attack, these groups are organized in a manner and utilize tactics, techniques, and procedures consistent with the operational phases of a traditional insurgency. These offensive measures are initiated whenever the opportunity for power, control, and socioeconomical influence favor the aggressor. Other operational fundamentals include influencing the need to defend multiple potential targets, the massive consumption of critical resources, sacrificing counter (offensive) measures, and the loss of political and law enforcement initiatives. In essence, insurgents seek to reduce resources and diminish any willingness to protect civilian communities through attrition and exhaustion.[20] One last and extremely critical impact could include the alienation of (local) communities toward law enforcement officials and local and federal governments.

Guerilla warfare groups organize their activities generally around seven areas, as described below.

### Preparation

Terrorist groups look for a location from which to base their operations and begin recruiting. Location is critical as they require an environment conducive to recruiting as well as privacy for planning their attacks. Community selection and socioeconomic structure are two critical factors in their choice of location. Like the Irish Republican Army (IRA) in Northern Ireland, terrorist groups form decentralized cells that consist of a select few individuals who can blend into an urbanized community and begin their recruiting process. This community may have easily accessible public transportation and communication, thereby providing for a solid command and control structure. The members of these sleeper cells[21] will blend into their chosen society by obtaining jobs, paying bills, and acting

and speaking like the indigenous populations within the neighborhood for months and years while preparing and recruiting for their next attack. The socioeconomic structure of a community is crucial to a cell's intelligence preparation in a given area of operation.

Understanding the sociological elements of a given city, along with its economical structure, is critical for terrorists attempting to exploit and undermine a social system while recruiting for their cause. People from every level of the social strata, from the educated to the unschooled, and from the social elite to the criminal derelicts, are potentially subject to the recruitment techniques of these local cells. As Daniel Pipes notes, although most would expect the militant Islamic to entice those individuals from the lower end of the social strata, "research finds precisely the opposite [to be] true. To the extent that economic factors explain who becomes Islamic, they point to the fairly well off, not the poor . . . Those who back militant Islamic organizations also tend to be well off. They come more often from the richer city than the poorer countryside."[22]

### Initial Contact

Over time, the organizational structure begins to take shape, and positions within the cell are filled with recruits from the local community. In order to recruit locals to meet their specific needs, cell members set clandestine operations in motion to begin identifying those who meet the special needs within a particular cell. As Mao observed, guerrilla warfare's "basic element is man, and man is more complex than any of his machines."[23] While looking for those individuals who might meet their strategic and tactical needs for future terrorist operations, cell members integrate themselves into the daily lives of their target population with absolute discretion, giving the appearance of the average U.S. citizen residing in "Anytown, USA." Carlos Marighella believed that urban guerillas would have neither the means nor the capability to maintain a job for very long, forcing them to begin expropriation tactics over long periods of time. He also spoke of the importance for guerilla insurgents to learn how to live among the indigenous people in their operational area, employing extreme discretion as they gradually integrate into their new environment. Once they have comfortably maneuvered themselves into the everyday events of their chosen community, then, and only then, will they begin their initial contact.

### Infiltration

Infiltration is defined as complete submersion into a society. In places such as Dearborn, Michigan; Brooklyn, New York; Hancock, New York; and Buena Vista, Colorado (the last two cities refer directly with cells of

the Jaamat ul-Faruqa movement), Islamic jihad extremists have infiltrated and begun recruiting, training, and plotting their next terrorist attack against the United States—all in the name of Islamic purification through violence and destruction. A critical factor for the development of the cell's structure in this stage is the process of isolating promising recruits in U.S. society who may harbor ill feelings toward either the current government or Christians and Jews. They begin to quietly spread their religious and political beliefs as a more acceptable alternative to the democratic governments in the evil empire of the Western world. Christianity is dismissed in their eyes as a lesser religion, or no religion at all, and the Islamic faith is praised as the only righteous path to Allah (Arabic for God), as revealed through the last prophet Muhammad and his universal and timeless message.

Militant Islamic terrorist cells are building mosques and other infrastructures designed to quietly train U.S.-born Muslims and others throughout the United States to engage in a continuing jihad (holy war) against the U.S. way of life in order to impose Islamic rule. Additionally, these groups engage in criminal acts such as fraud, burglary, racketeering, and illegal use and distribution of drugs (narcoterrorism) in an effort to financially provide for future training and tactical operations. Other methods of gathering funds to further facilitate their jihad are through their production and selling of militant Islamic propaganda during their teachings, training, and prayer meetings.

### Organization

Once the infiltration phase has been established in an area of operations deemed satisfactory to the needs of the newly formed insurgent group, the terrorist cell's organization begins to take shape. The traditional guerrilla forces of Afghanistan, Brazil, China, and Vietnam grew in size equaling 200–1,000 person units, but terrorist cells forming in the United States are significantly smaller and "stove-piped" in design, mostly due to the urban terrain and environments in which they have chosen to conduct their operations. A stove-pipe organization simply implies that each section of the cell is more or less oblivious to what other sections exist and who is involved within the other sections. Furthermore, each section is channeled through a section leader, and the leaders speak with usually one other representative of the main cell. This organizational technique is better known as decentralization, or networked decentralization. With decentralized cells working toward a common objective, those caught during the commission of an illegal act are unable to give any operational intelligence on other sections of their cell or on the existence of other cells. A terrorist cell evolves in both size and sophistication as new recruits enter their training and progress to any of the cell's three organizational forces:

auxiliary, intelligence, and operational. A cell's organizational structure can vary from this suggested configuration but will have similar characteristics, regardless of the structural framework.

*Auxiliary Force*: This consists of those members who conduct daily covert operations in the local environment that they have infiltrated. They are able to blend in with the current geopolitical schema and are made up of those members truly dedicated to the jihad, not those who have been recruited from the local areas. They obviously must maintain a false front and not offer any information about their organization to those who are not willing participant-recruits to their political and religious movement. Another function of this group lies in its resourcefulness to provide logistical support to the cell. The structure would most likely consist of a cell leader, with assistant leaders directly controlling and maintaining communications with cell members. As noted earlier, cell members will not know how many other members exist or who they are, and they will report directly to the assistant leader. In turn, assistant cell leaders will typically not know how many other subcells exist and will only report to their assigned cell leader.

*Intelligence Force*: These members are organized in the same decentralized manner and are charged with gathering critical information, conducting surveillance operations, and identifying and emplacing early warning systems so as to prevent detection and subsequent disruption of the cell's plans and operations. This part of the cell also conducts other reconnaissance operations in its area of operation to facilitate further recruiting—by providing the screening processes necessary to evaluate, filter, and process potential recruits—and identify potential future targets.

*Operational Force*: These members will usually remain in a covert status until the time comes for them to execute an attack and will consist of a small section of specially prepared individuals ready to conduct asymmetric warfare through clandestine operations designed to be both passive and extremely violent in nature. As with other cell parts, their structure will consist of a leader and members. The members might know each other as they work in a centralized environment out of sight from the general population they plan to ultimately attack. When this cell executes the terrorist attacks, they will be quick to act against their target when the parent cell is convinced it has an operational advantage of both power and influence over its potential environment.

### Buildup

Although the name of this phase implies there is a massing or increase in size of the cell, the size will vary with each location (and sociological environment), organization, and intended mission. As stated earlier, unlike the traditionally sizable guerrilla forces dating back to Che, Carlos,

and Mao, twenty-first-century terrorist cells located within the United States are organized in much smaller and more illusive elements in order to suit their needs for covert operations at every phase of their insurgency. Furthermore, recruits with special skills are also examined more heavily when considered for recruitment, unlike the average guerrilla fighter in previous wars. As Loveman and Davies observe, drawing on the doctrine originally espoused by Che Guevara, "Guerilla warfare, the basis of the struggle of a people to redeem itself, has diverse characteristics, different facets, even though the essential liberation remains the same."[24] Understanding this philosophy is critical for law enforcement agencies throughout the country who must identify and disrupt terrorist cells within their jurisdictions. Guevara's teachings still hold true in the forming and training of both domestic and international terrorist organizations located in the United States. On the basis of its beliefs, leadership, teachings, training, and geographical and social conditions, each organization will adapt to its natural surroundings and begin take its own shape over time. Another important parallel between guerrilla warfare of old and today's terrorist cells is that this form of war "is a war of the masses, a war of the people."[25] While terrorist cells will utilize this phase to further develop their organizations, they will only have a select few who are deceived by their fatwa to attack and kill other Americans in their own country.

### Combat Employment

Once a cell has determined that it's time to conduct "combat" operations, plans will become actions set into motion with finite precision, leaving little room for identification or interception by first responders. The asymmetric actions of typical guerilla warfare are a product of months of detailed planning, resourcing, organizing, and rehearsing. Although there are varying social strata levels joining and participating in terrorist acts, make no mistake that the delivery platform of this horrific weapon of terrorism will result from highly trained and dedicated militant Islamic jihadists who truly believe their actions are righteous and for the betterment of the Islamic nation. Once this phase has begun, law enforcement agencies and other first responders enter a mode of emergency management, while the perpetrators—if not killed in the attack themselves—take measures to avoid capture or any lasting damage to the remaining terror network members.

### Demobilization

Although the term demobilization infers that terrorist forces are maneuvering from wartime to a peacetime position through the disbanding of their organization, this is not the posture referenced here. Demobilization

during guerrilla warfare is more likely to occur in the form of a dismembering of the operational cell responsible for the actual terrorist attacks—that is, if the members do not die for their cause (e.g., homicide bombings) or are caught during the commission of their criminal act. It could also be concluded that the parent cell itself could stand down and relocate to another area or region if the situation proved dangerous to its existence and execution of bin Laden's fatwa. The organization's decentralized operational control allows the separate cells to function independently, providing uninterrupted and continuous operations. In order to successfully terminate a local cell's operational status, a way must found to demobilize the actual base facilities (e.g., mosques, school, and training camps) where they recruit, train, plan, and project terror against their intended targets.

Ultimately, the act of demobilization is a tactic used by terrorist cell leaders as a last resort to prevent law enforcement agencies from locating and capturing cell leaders or members and, more importantly, planning future jihadist attacks. This key cell adjustment will not be undertaken lightly by terrorist organizations, as it involves several critical moving pieces not only in terms of the destruction of its current base of operations, but also in the process of executing the first five operational phases over what could prove a lengthy and costly amount of time. Therefore, if a cell cannot be identified and totally eradicated by a country's intelligence and law enforcement agencies, the next best option may be to cause its members to believe that they must demobilize and move to another location. While the option of capture and prosecution of terrorists is the more desired endstate, forcing a cell to move from one location to another is a tactic that could prove beneficial as it will provide more time and opportunities for law enforcement professionals to plan, train, and respond to the next viable intelligence report.

## STRATEGIC CHALLENGES FOR COUNTERING GUERILLA WARFARE

Over 200 years after the first Spanish guerrillas, terrorist groups are still thriving on the principles that have made guerrilla warfare such a tremendous and potentially successful tactic of fighting more with less. However, there are several critical differences in how modern guerrilla warfare is executed in the United States today, as compared with other countries in the past:

1. The foundation of modern terrorist cells could be either domestic or international in nature (i.e., not always "homegrown"). This might appear irrelevant at first, but while most domestic terrorist groups are discontented with the government, they are not necessarily looking to cause massive loss of life (Timothy McVeigh's terrorist attack of the Murrah Federal Building in Oklahoma City is clearly an exception). International cells consisting of militant Islamic groups

conducting guerrilla operations in another country are not only looking to have an impact on the government; they are also plotting to attack soft targets with the intent of destroying critical economic infrastructure and cause enormous loss of life in order to carry out the following fatwa[26] issued by Osama bin Laden on February 23, 1998: "The ruling to kill the Americans and their allies—civilians and military—is an individual duty for every Muslim who can do it in any country in which it is possible to do it."[27]

2. While the cause is against a perceived oppressive government, it is not, nor will it ever be, supported by a trained, professional army constituted of U.S. citizens. Guerrilla armies in other countries have always depended on a "regular" army to sustain their governmental opposition, and the lack of popular local support will ultimately minimize the opportunities for guerrilla style warfare to win the wars of either attrition or annihilation, especially in a foreign country.

3. Terrorists are fighting for "religious ideologies" rather than for "civilizations." In a fight for religious ideological pursuits, the identified battlefield must contain multiple supporters in these perceived ideologies in order to successfully sustain the cause and have any hope for long-term success. While there are over 1,200 mosques with some two million American Muslim participants located throughout the United States,[28] clearly very few members have the desire to express their religious and political beliefs through bin Laden's fatwa.

4. As Therese Delpeche notes, terrorist acts will "contribute to reshaping international relations,"[29] and not just in the immediate area in which they are conducting operations. If terrorism was to successfully manipulate U.S. citizens and subdue or defeat the government of the United States, every other country in the world would feel the ripple effect of the most powerful nation in the world collapsing to a weaker enemy, and other economies would ultimately face unrecoverable losses as well as an onslaught of follow-on terrorist attacks. The world will not stand by and watch terrorism erode the United States to the point of defeat.

5. According to Delpeche, "The boundaries between military and civil defense are being blurred. The increasing need to protect civilians from terrorists attacks . . . will lead the most-developed countries to give a new priority to civil defense, making it harder for the terrorist[s] to strike in the middle of cities and easier for [the] government to deal with limited unconventional attacks."[30] Governments today are better equipped with intelligence-gathering techniques and technological defense mechanisms to fight modern guerilla fighters. The freedom of movement within a city or state has been limited by these modern counterinsurgency techniques, causing terrorist cells to move at a slower pace and spend more time planning and training for their next attack. The greater degree of precision placed on terrorists increases the opportunity for local law enforcement agencies and other first responders to act or react to their attacks and potentially prevent an attack from occurring.

## IMPLICATIONS FOR LAW ENFORCEMENT AGENCIES

Benjamin Netanyahu has recently noted how important it is to consider the threats of both domestic and international terrorist groups as their

efforts become intertwined: "[Terrorists] know the West well and have developed strategies designed to take advantage of all its weaknesses. An effective battle against terrorism must of necessity require a shift in the domestic and international policies that enable terrorism to grow and the intensification of those efforts that can uproot it."[31] There are several challenges in defending against terrorism, and the question must be asked whether it is possible to actually provide deterrence against future terrorist attacks. In an interview between Meir Dagan, the former head of the Israeli Counter-Terrorism Bureau, and terrorism analyst Boaz Ganor, Dagan "differentiates between two types of deterrents against terrorist organizations—the 'tactical deterrent' and the 'strategic deterrent.'"[32] Although a strategic plan must be present and clearly defined by governmental hierarchies, it's the tactical deterrents upon which law enforcement agencies in the United States can have a crucial impact and need to focus their attention. Providing the necessary general and specific deterrents is critical when dealing with an unknown and unpredictable attack against any number of ideal targets. However, deterrents are only as effective as they are perceived to be by those we seek to deter.

The focus of a general deterrence is ambiguous at best. Attempting to deny or disrupt a terrorist attack against a broad spectrum of potential targets is a daunting task, but when you factor in that a terrorist has nothing to lose, deterrence almost seems impossible.[33] Thus, as Boaz Ganor argues, anticipating future attacks by identifying potential economic and political targets becomes a critical element in the decision-making process. Further, intelligence collection of local cells will assist agencies in "becoming familiar with the terrorist organizations, their ideology, their heritage, culture, motives and objectives, their decision-making processes, and their cost-benefit considerations, in such a way that will enable that [agency] to assess and project in advance the outcomes of the organization's cost-benefit considerations, and plan its [antiterrorism and] counter-terrorism strateg[ies] on the basis of these assessments."[34]

Not unlike the populace in countries such as Israel, Afghanistan, Iraq, Iran, and Lebanon, citizens of the United States are quickly adjusting to the new reality of terrorist attacks within its borders by demonstrating short memories and hotly debating relevant security measures emplaced to deter and prevent future attacks. The United States' greatest strength—freedom—has become a foundation for its greatest weakness in this new age of terrorism. Furthermore, television and big-screen motion pictures have begun advertising and producing more shows about terrorist acts that further acclimatize the U.S. people and their views of the past, eliminating the mystery of future attacks. As Cooper argues, "This has made the terrorist's task increasingly difficult: How do [they] recapture and refocus the jaded attention of such an audience? The possibilities are really quite limited. [They] can strive to increase the toll in terms of the body

count; compared to conventional warfare, deaths resulting from acts of terrorism have been numerically insignificant."[35]

### Closing the Training Camps, Mosques, Compounds, and Schools

While militant Islamism has been a force to contend with throughout the world for many years, it is also becoming more prevalent in the United States. According to Kushner and Davis,

> It isn't an accident that many U.S. mosques have become appendages of worldwide jihad against the West. The number of Muslims coming here rose rapidly after the United States revised immigration laws in the mid-1960s. The number of mosques and Islamic community centers grew over that time, by some estimates from about fifty at the end of World War II to more than twelve hundred today. The role of the mosque has also changed—from Americanized "cultural clubs" of earlier immigrants to conservative, religion-oriented institutions that manipulate the national and cultural identities of new immigrants in an effort to avoid their inclusion in mainstream America.[36]

These terrorism analysts also point to a common thread that emerges from recent cases brought against confirmed or alleged Islamic terror cells in the United States—the connection between the terror cells' members and a local mosque.[37] State and federal law enforcement agencies must initiate and maintain aggressive intelligence-gathering operations with varying profiles, specifically targeting those individuals and organizations where militant Muslims teach others to execute bin Laden's fatwa. "Islamberg," a training camp utilized by the Jamaat ul-Faruqa movement in Hancock, New York, is a prime example of how militant Islamic teachings have penetrated the fabric of the United States' society and begun the recruiting and transformation of Islamic Americans against their democratic government. As Cooper notes, "The youngest members of Islamic society are being exposed to intolerance and hate in the Islamic religious schools from the earliest grades on."[38]

### Managing Terrorism

Therese Delpeche recently observed that having the ability to contain violence has always been the key to security.[39] Stephen Flynn agrees, arguing that

> the threat is ongoing, and [the United States] must be doing more right now to limit the consequences of future acts of terror. It will take time to implement well-conceived, layered security measures that protect the critical foundations of [the American] society. [Americans] have to make judgments

about [their] most immediate vulnerabilities, identify what stop-gap protective measures [they] can implement in a hurry, and develop and exercise plans to guide [their] response when the next attack materialize.[40]

One of the first counterterrorism measures any law enforcement agency could set into motion in the war against terrorist guerilla warfare is the most basic in nature, "community policing."[41] It could be utilized as a critical tool in countering every operational phase of terrorist cell insurgency. Patrol cars simply conducting random drive-bys in their assigned neighborhoods or patrol sectors have rendered local law enforcement organizations limited—if not totally incapable—in their ability to seek out, identify, and apprehend terrorists. Police departments must remove their officers from the disassociated comfort to which they have grown accustomed and have them interact and converse more with the public they have sworn to protect.

Another proactive mechanism that should be mentioned is the necessity for patrol officers to take the time to know the people on their "beat" so they can more readily identify "abnormal" behavior. Meeting small-business owners and inquiring into their business practices as an interested observer will assist in learning who the "community leaders" are and will afford them the opportunity to feel comfortable in the interaction process with the policing agencies responsible for the protection and well-being of their businesses and families. Interpersonal communication skills are invaluable, as police officers need to make themselves more visible to and approachable by those who need and want to trust them. Ultimately, they should be striving to become proactive instead of reactive. Properly organized and utilized local civic and neighborhood watch programs are another effective tool, as they become extended eyes and ears for local law enforcement agencies. Private industry could also aid in the early detection process by establishing its own antiterrorism measures— for example, camera systems and closed-circuit television (CCTV)—and reporting any unusual activity to the police through projects such as the Highway Watch Program. Another highly effective approach is to establish and utilize counterintelligence units within law enforcement departments and interact with other law enforcement agencies.

All of these aforementioned (and many other) counterterrorism or antiterrorism measures serve an invaluable service to local law enforcement agencies as they continue to hone their skills in deterring, identifying, and apprehending local terrorists.

## SUMMARY

Terrorism, by its nature, seeks out and exploits its opponents' weaknesses. Terrorist cells will only execute when they believe the tactical

advantage is clearly theirs and that, as Mao dictates, "chances for victory are weighted heavily in their favor."[42] The asymmetric warfare tactics practiced by domestic and international terrorist organizations have achieved some success over the years in various countries throughout the world. Arguably the most powerful and influential nation in the free world, the United States must refuse to concede to such heinous acts of violence, as its second- and third-order impacts could prove detrimental to the political and economic status of nations throughout the world. As Stephen Flynn observes:

> The reason that catastrophic terrorism holds such potential as a means to wage war on the United States is not simply because these attacks can inflict damage to systems we depend on; it is because our enemies have good reason to believe that a successful act of terror on American soil will trigger a reaction which the U.S. government exacerbates localized destruction with substantial self-inflicted national and even global costs.[43]

In order to pursue a successful counteroffensive against terrorism, the United States must analyze previous defense strategies in overseas areas of operation and begin to concentrate on the varying phases of a terrorist organization's movement within its own borders, as well as on its understanding of what Kushner and Davis describe as "the terrorist's language, culture, history, methods, and psychology."[44] Furthermore, the leaders of this democratic nation should consider how they can prevent others from joining these militant Muslim organizations as willing participants by improving the socioeconomic welfare of those subject to easy recruitment.

We are at a point in our history where "timidity" will prove an undesirable and fatal flaw in the defense of this nation. The days of Americans feeling safe within their geographical borders has come to an end, as militant Islamic jihadists penetrate the United States' societal footprint and live among their prey. Outdated security against the average criminal element will neither prevent nor protect against modern-day criminal attacks by a well-funded and highly trained terrorist cell. According to Flynn's analysis, "[Americans] must create the kind of structure that widens the breadth and quality of civic participation in making America safe. The nation, not just the federal government, must be organized for the long, deadly struggle against terrorism."[45] The War on Terror has forced the United States to face its enemies on its own soil for the first time since the Civil War, thus forcing its strategies of defense to alter as it considers the long-term effects of both massive wartime damage to infrastructure and loss of civilian life. The world is anxiously standing by to see just how effective the United States is in handling terrorism inside its own borders as well as in other foreign countries, as its actions (or lack thereof) will forever shape the diplomatic and economic policies sustained between

itself and other governments around the world. The United States cannot afford to lose this war.

## NOTES

1. John Brown has been called the father of American Terrorism as he and his 18 men took several citizens hostage and captured the federal arsenal in Harper's Ferry, Virginia. His intent was to free slaves from the surrounding territory, form them into an army, and continue to free the rest of the slaves in the South. Brown was seen as a fanatic and murderer by the slaveholders against whom the uprising was aimed. Stephen B. Oates was referenced in Pamela L. Griset and Sue Mahan, "Homegrown Terrorism in the United States," *Terrorism in Perspective* (Thousand Oaks, CA: Sage Publications, Inc., 2003), 85.

26. A "fatwa" is a legal pronouncement in Islam, issued by a religious law specialist on a specific issue. Usually a fatwa is issued at the request of an individual or a judge to settle a question where "'fiqh,'' Islamic jurisprudence, is unclear. The overwhelming majority of fatwas are on mundane matters. Several have declared war or pronounced death sentences. Because Islam has no centralized priestly hierarchy, there is no uniform method to determine who can issue a valid fatwa and who cannot and upon whom such fatwas are binding. Some Islamic scholars complain that too many people feel qualified to issue fatwas.

The complete passage cited here reads as follows: "The ruling to kill the Americans and their allies—civilians and military—is an individual duty for every Muslim who can do it in any country in which it is possible to do it in order to liberate the al-Aqsa Mosque (in Jerusalem) and the holy mosque (in Makka)

from their grip, and in order for their armies to move out of all the lands of Islam, defeated and unable to threaten any Muslim. This is in accordance with the words of Almighty God, and fight the pagans all together as they fight you all together, and fight them until there is no more tumult or oppression, and there prevail justice and faith in God."

# CHAPTER 13

## COMBATING TERROR IN U.S. COMMUNITIES: THE SWAT MISSION

Peter N. Spagnolo and Chadd Harbaugh

The acronym SWAT originally stood for Special Weapons Assault Team but over the years has changed to the universally accepted Special Weapons and Tactics. The role of SWAT has evolved since the first team was formed by the Los Angeles Police Department (LAPD) in the late 1960s. The scope of the local SWAT mission has evolved to include not just law enforcement activities, such as serving high-risk warrants and dealing with hostage situations, but also responding and reacting to a terror attack.

The terror threat to U.S. cities of all sizes is greater now than at any time in our nation's history. The threat is so great, in fact, that the U.S. government saw the need to establish a new cabinet-level agency: the Department of Homeland Security (DHS). Realizing the terrorist threat to the United States exists on multiple levels, DHS has launched a new initiative to prepare and equip local SWAT teams to assist the federal government in countering this menace. The rationale for this is clear—it is no longer a matter of Osama bin Laden threatening us from a hiding place on the Afghan-Pakistan border but, rather, of al Qaeda evolving from an organization to an idea or movement, a loose confederation of "home-grown terrorists" who live in Western communities (and in many cases are native-born citizens). There are significant populations of Arab and non-Arab Muslims in many U.S. cities, most of whom are peaceful and patriotic people. However, just as we have seen among the Muslim diaspora in Europe, some members of these communities are developing

**Table 13.1   DHS SWAT Typing Matrix**

**Type I**—A dedicated full-time team designated to handle high-risk situations requiring specialized weapons or extraordinary special operations. Team capable of operating in rural and urban environments. Team capability includes dealing with chemical, biological, radiological, and nuclear (CBRN) events. Teams should be capable of working in a CBRN environment absent of vapors.

**Type II**—A full-time or part-time team designated to handle high-risk situations requiring specialized weapons or extraordinary special operations. Team capable of operating in either rural or urban environments. Teams should be capable of working in a CBRN environment absent of vapors.

a feeling of disaffectedness due to real or perceived unfairness they may have experienced throughout life. These disaffected individuals are susceptible to being inspired by al Qaeda's goal of establishing a worldwide Islamic theocratic institution, and they are out there in many U.S. cities today, possibly plotting attacks in their "own backyards." Indeed, as recent high-profile arrests have demonstrated, there is not one U.S. community today that can claim "It's not going to happen here."

As part of the global war on terror, and to establish consistency in police SWAT teams across the nation, DHS has made it easier for law enforcement agencies to train their officers in the critical areas of counterterrorism or antiterrorism or SWAT tactics and techniques. DHS is accomplishing this by first categorizing—or "typing"—SWAT teams into one of three levels, with Type III being the most basic level of the DHS typing system (although more highly trained than many active SWAT teams) and Type I being the most advanced, highly trained, and extensively equipped (see Table 13.1).

The first significant deployment of a SWAT team took place on December 9, 1968, when—according to a founding member—the LAPD was involved in a four-hour confrontation with a group of Black Panthers. Since then, many have considered the SWAT team's role as dealing with situations that patrol officers and investigators cannot handle. The perception that SWAT picks up where a patrol and investigation end has caused some ill feelings in some agencies, as an "us versus them" atmosphere has developed between officers assigned to SWAT and those who are not. While it's true that SWAT teams have historically been more heavily armed than general patrol units, it is also true that many patrol cars are now equipped with assault rifles and the officers are trained to use them. It must also not

be forgotten that in many instances where SWAT might be called upon, the patrolman still plays a vital role—for example, a shooting spree in 1966 at Texas University ended when a patrol officer shot the perpetrator, Charles Whitman, with a .38 caliber revolver.

The focus for SWAT took a new direction on September 11, 2001; while the SWAT team has been the unit called in when specialized equipment and unconventional tactics are needed in situations such as hostage takings, barricaded armed criminals, and high-risk search warrants and arrests, the mission is again evolving into the teams becoming the first line of defense in the face of an armed ground assault on a target within the United States. One of the reasons for the change in direction is the fact that the terrorist is generally far better armed and trained than other types of criminals and more likely to fight it out with the authorities, a concept that will be covered in more detail later in this chapter.

## THREE TYPES OF SWAT

To fully appreciate what these changes mean to a police department head, SWAT team commander, administrator, SWAT operator, or other official, an explanation of the types of teams, the differences between them, and the equipment and training necessary to each team is needed.

### Level III Teams

According to the DHS typing system, a Level III team is

designated to handle high risk situations requiring specialized weapons with limited resources and capabilities. Teams should be capable of working in a Chemical Biological Radiological Nuclear (CBRN) environment absent of vapors and liquids.[1]

A Level III team is, at a minimum, manned with two long-rifle (sniper) teams equipped with day-scoped weapons for engaging at ranges of less than 500 yards; a four-officer entry team (not including the team leader); an eight-officer containment team (to include grenadiers) for securing the perimeter; and a tactical commander. It is recommended by DHS that a tactical medic and a liaison officer (to department administration, outside agencies, etc.) be added to the team, but we must take into account the fact that there are agencies out there whose size will not allow fielding a team of sufficient numbers, since doing so might require the membership of their entire force plus any reserve or auxiliary officers they may have. It's unfortunate but true that the vast majority of U.S. police agencies are significantly restricted by budget and manpower issues.

The Level III team must be trained in the use of personal protective equipment (PPE) up to levels B and C, and the entire team must be issued this equipment as well as other types of protective clothing, including tactical body armor, helmet with ballistic shield, and fire-resistant gloves and hood. Also required by DHS for a team to be qualified as Level III are soft body armor, a National Institute for Occupational Safety and Health (NIOSH)-approved protective mask, safety glasses or goggles, hearing protection, adverse-weather gear, a personal hydration system (a Camel-back water carrier or similar device), mechanical breaching equipment, shotgun breaching equipment (recommended), chemical agents and a delivery system for those agents, portable ladders, handguns, assault weapons (lighted), Noise Flash Distraction Devices (NFDDs), and hand-held ballistic shields.

The Level III SWAT team is almost always a part-time team, with the officers serving on it carrying out other responsibilities within their agencies that are generally considered their primary duties. Thus, SWAT is usually a secondary or additional assignment in this type of team. The vast majority of agencies are in this category due to the limited number of officers employed. The size and needs of the communities they serve also play a large role in determining what level team is required.

Level III is the most basic of the SWAT training programs under the new DHS typing system. The Level III qualification course is an intensive 15-day program of instruction in which the operator is tested physically in various skills as well as with written and practical exams throughout the course. Successful completion of an approved basic SWAT course (usually five days in duration) is a prerequisite for DHS to fund attendance to this level of training.

### Level II Teams

In the DHS typing system, Level II is described as

a full-time or part-time team designated to handle high risk situations requiring specialized weapons or extraordinary special operations. Team [is] capable of operating in either urban or rural environments. Teams should be capable of operating in CBRN environment absent of vapors.

A Level II SWAT team has all of the capabilities of a Level III with the additional recommended ability to conduct explosive entries. In the explosive entry, a door, window, or other portal is opened using a small, carefully placed explosive charge, or if the tactical situation calls for it, a breach point or loophole (a hole blown in a wall or other barrier) may be produced using an explosive charge, provided this may be accomplished

with an acceptable degree of safety for citizens, innocents (hostages, etc.), officers, and suspects. The skills necessary to conduct explosive breaching operations require a great deal of training. The Bureau of Alcohol, Tobacco, Firearms and Explosives (ATF) has approved local agencies to purchase, use, and store explosive materials if those agencies have adequate storage facilities.

The Level II team must be equipped with at least two night vision observation scopes, electronic listening and video equipment, rappelling equipment (and the training to rappel into an objective area), and a six-officer entry element. Recommended at Level II are a self-contained breathing apparatus (SCBA), PPE suits, and robot systems with tactical options. Additional personnel recommended by DHS for the Level II team include one or more canine elements with handlers, an electronic technician, trained explosive breachers, and a robot technician. DHS also recommends an armored personnel carrier for Level II teams. The sniper elements for Level II must be capable of engaging targets at ranges up to 500 yards with day or night capabilities.

While ballistic breaching capabilities were recommended for the Level III team, they are a requirement for a team to be counted as Level II, and while the Level III team must be capable of operating in a chemical, biological, radiological, and nuclear (CBRN) environment absent liquids and vapors, the Level II team must be able (by training and equipment) to accomplish the same tasks in the presence of liquid hazards.

Level II teams are often full-time teams but may be part-time or on call. Due to the additional skill and equipment requirements, Level II teams must have the time and assets to conduct significantly more training than Level III teams and are mostly found in mid-sized police forces serving communities in the approximate range of a principal regional city.

### Level I Teams

The final and most advanced category of SWAT teams under the new typing system is Level I, which is

> a dedicated full time team designated to handle high risk situations requiring specialized weapons or extraordinary special operations. Team capable of operating in urban or rural environments. Team capability includes dealing with chemical, biological, radiological and nuclear events. Teams should be capable of operating in a CBRN environment absent of vapors.

A Level I team has all the capabilities of Level II and III teams, with the additional ability to perform Fast Rope Insertion and Extraction System (FRIES)[2] operations as well as long-range marksmanship capabilities

beyond 500 yards, day or night. Additionally, to be considered Level I, a team must be able to employ robotic equipment for conducting searches and handling potentially hazardous objects such as explosive devices, objects that are biologically or chemically contaminated, and radiological items, among other items this team may encounter that may be too hazardous for a living officer to approach. While the robotic equipment, armored personnel carrier, and SCBA for all team members are recommended for the Level II team, they are required for Level I. Also required for Level I are night vision capabilities for the entry team (for use in both the entry and containment phases), fiber optic equipment, and transmitting equipment to include wireless and hard line. In addition, Level I requires infrared capabilities, a communications officer, two explosive breachers (one is recommended for Level II), and a robot technician (which is only recommended for Level II). Generally, only the largest of U.S. cities will field a Level I team; these are cities with populations well in excess of 1 million or with a particularly high-value target.

## ISSUES OF TRAINING AND PREPARATION

DHS has developed this "typing" of SWAT teams in order to standardize training and capabilities across the United States and territories. In the past, SWAT training varied widely throughout the U.S. law enforcement community, from a virtually untrained and loosely organized part-time team to a highly trained and organized full-time team, whose entire duty was to train for and handle emergency situations beyond the scope of training and equipment of the patrol or investigations officer.

Before the typing system, a team considered fully trained and capable in one region could be seen as untrained and nondeployable in other areas or could even be perceived as such by departments in its same area.

Under the old system, incident commanders could not always be sure of the capabilities of their own teams, much less of teams or elements sent from another department to assist them in an emergency. This problem often created a condition that opened many agencies up to significant liability and could be exacerbated if the overall incident commander had expertise in a first-responder area, such as fire, or some critical skill other than law enforcement.

As previously noted, in order for a team to qualify for training in one of the levels, its members must attend an approved basic SWAT qualification course. This requirement led to yet another problem; if there was no consistency among teams, how could there be standardization among the various training programs? And even with standardization, how could commanders or administrators be certain that their officers actually completed the training satisfactorily while still avoiding duplication between the schools offering training?

In order to answer this question, DHS established a standard of training for SWAT classes, which must contain, at a minimum, the following:

- Level of training:
  - Is the training performance-defensive (operational)?
  - Is the training performance-offensive (technician)?
  - Does the training include planning or management (incident command)?
- Program of instruction or syllabus:
  - An outline or matrix of the course content that addresses the scope of the training, course learning objectives, and duration of training (organized by module, session, and lesson)
  - Resource requirements
  - Student-instructor ratio
  - Evaluation strategy
- Training support package—all of the materials associated with the delivery of a training course, including:
  - Instructor guide or instructor outline or instructor lesson plan
    - Published instructor material that contains the course text and special instructor notes that provide the information to deliver the material
  - Participant (student) manual or guide or workbook
    - Published student material that contains the supporting information booklet or handout form that the participant has available for reference

As mentioned earlier, most police agencies must be driven in their activities and capabilities by budgetary realism. Unfortunately, the cost of all the equipment and training needed for an effective SWAT program is beyond the financial reach of all but the largest departments. Indeed, the cost of an approved training and qualification course runs between $4,000 and $6,000 per officer, while to properly equip a Level III team could cost in excess of $250,000 (with the equipment expenses rising as the team progresses from Level III to Level I). To enable agencies to send their officers to an approved qualification course, DHS has allocated funding designed to offset the considerable costs. Through the Office of Grants and Training, DHS is offering agencies funding in the form of tuition and fees, travel expenses, meals and lodging while in training or transit, and ammunition and other expendables, as well as paying the cost of overtime for the students and that of the backfill officers who must work additional shifts while their colleagues are away in class.

### Training SWAT for a New Role in Combating Terrorism

In addition to providing consistency across the United States, the development of this DHS typing system has put into motion a program to orient the local officer to a new role in responding to (and countering) a

terrorist attack on U.S. soil. In preparing officers to respond to terrorist incidents, it appears that DHS has realized that we cannot hope to defeat a determined terror attack using traditional police tactics. The local SWAT officer must adopt the mindset that we are in a state of war and must act more along the lines of a soldier than a police officer.

The government has the responsibility to ensure the security of its citizens, and DHS is the proponent agency to oversee that task within the constraints of legal and budgetary reality. To this end, the department recognizes the need for armed and trained people to provide a response to a terror strike as well as for agencies to recognize a strike while it's in the planning phase and intervene to prevent it. Most states have a Joint Terrorism Task Force made up of federal, state, and local assets to interdict these attacks in the planning stages. These task forces are usually organized under the Department of Justice and are performing well in that function. An armed, federally commanded, trained, equipped, and funded professional force would be ideal to truly secure all critical infrastructures within the United States, but such a force would be cost-prohibitive. In addition to the costs of such a federal force, many states may not want large numbers of federal agents in every city and town. The Department of Defense cannot possibly station a contingent of trained special operations soldiers in every city to combat a terror threat, not only because of laws such as the Posse Comitatus Act of 1878, but also because we simply don't have that many troops available for such duties. Even with the lack of military presence, every city in the United States has some form of law enforcement protection, and many of those agencies have SWAT teams (or at least the ability to form such teams). The day may come when the local department is all that stands between a major terror attack on its community and a group of determined terrorists.

Given the problems and legality with stationing federal agents or troops in every city, DHS has opted to train and equip local police departments and sheriff's offices—specifically these agencies's SWAT teams—to react to terror incidents. This program offers the advantage of providing training and equipment for the local agencies so their officers may competently perform all elements of SWAT operations in addition to their primary responsibilities (patrol, investigations, etc.), while serving as antiterror or counterterror elements when the need arises.

A police unit operating against terrorists will certainly be at greater risk than that same unit going against civil criminals. The reason for this additional risk is that the terrorist is generally better trained and armed and more determined than the civil criminal. Civil criminals are often committing their crime for financial purposes and will be much more likely to surrender in the face of overwhelming odds, while terrorists are motivated by social, political, or religious issues and are more likely to fight to the death. It has become common knowledge that the Islamist terrorist

believes that dying in an act of martyrdom guarantees immediate entry into heaven. We can't afford to lose sight of the fact that we may find ourselves fighting to save lives against people who are fighting to die. The terrorist task is made simpler by the fact that the terrorist has no illusion of survival and needs no escape plan, whereas the civil criminal hopes to live and needs an opportunity to escape; the escape or exfiltration is almost always the most challenging part of any operation.

At the onset of the crisis, the local commander must quickly determine if the situation is a terrorist strike or a civil crime, and in order to properly make this decision, the commander must be educated on the essence of terrorism and how it differs from other types of crime. A local commander may recognize an act of terrorism by the actions of the perpetrators at the beginning of the incident: Do the suspects make a list of political, social, religious, ideological, or special interest demands or declarations? Do the suspects make financial demands absent any connection to one or more of the terror act indicators mentioned above? According to the Federal Emergency Management Agency (FEMA), other indicators that an incident is terror related are:

- Occupancy or location:
  - Does the target have some significant historic or symbolic value?
  - Is the target a public building or assembly area, which would give the actor the ability to inflict mass casualties?
  - Is the target involved in a controversial activity such as animal or crop research?
  - Does the target represent a major infrastructure that would have a serious adverse effect on the population?
- Type of event:
  - Have explosives been used or threatened?
  - Are firearms involved?
    - Firearms, in conjunction with other indicating factors, point to a terrorist incident.
  - Are there nontrauma mass casualties?
    - Typified by many casualties with no immediately apparent reason
    - Increases as terrorist abilities become more sophisticated
- Timing of the event:
  - April 19 is the date of the Waco standoff and the Oklahoma City bombing, April 20 is Adolph Hitler's birthday, and so on.[3]
- On-scene warning signs:
  - Unexplained mass casualties
  - Substances with strange odors
  - Presence of chemical containers, bombs, and so on

While DHS has approved training programs and has agreed to fund the training and equipment needs of the three levels of SWAT, training is still driven by four inescapable items: case law, after-action reviews (AARs) from live operations, technology, and local funding considerations.

*Case Law*

While not of major concern to military special operations communities, case law can severely affect what SWAT teams can and cannot do and the way they perform certain operations. The study of case law can be overwhelming to some officers and supervisors. It can seem to be an insurmountable task to keep track of the decisions made in the courtroom daily that can affect the way officers operate. However, because of "stare decisis,"[4] courts are slow to interfere with principles announced in former decisions. While some circuit court cases seem to set decisions way outside the "norm" for the courts, if the decisions make it to the appellate or Supreme Court levels, those decisions rarely stand; therefore, the true changes in tactics caused by existing case law are not as common as some would like to believe.

*AARs from Live Operations*

AARs from live operations can profoundly change a team's tactics and techniques, and rightfully so. If a team makes a critical mistake, it needs to learn from the mistake and make changes in order to ensure that the mistake does not occur again. While teams are typically very good about learning from their own mistakes, they are not as good about learning from others'. One reason teams do not often learn from the mistakes of others is out of their control—specialized teams (including SWAT) do not like to "air their dirty laundry." That is to say, if a team makes a mistake, it doesn't want to go public with it.

There are probably several reasons that teams do not want to share their mistakes with others. One reason is fairly obvious: they pride themselves on being professional, precise, and able to handle whatever is thrown at them; therefore, mistakes are often viewed as failures. Another reason is that mistakes made in the field of law enforcement often lead to lawsuits. Lawsuits do not lend themselves to open forums in which law enforcement agencies can talk with others about how they could have done something different or better that would have had a positive effect on the outcome of the operation.

SWAT teams and officers need to have a better vehicle in which they can talk about previous missions, whether they were completely successful or left some room for improvement. They need to learn not only from their own operations but from those performed by others. Operations involving SWAT teams are occurring daily in jurisdictions throughout the United States, and if all teams could share the details of those operations—what they encountered, what mistakes they made, what they did great, and so

on—then those operations would serve as an informational force multiplier for all SWAT teams to learn from.

SWAT teams also need to think more globally and learn from AARs coming from operations overseas. What happens in other countries can—and perhaps will—occur in the United States. The perpetrators of the attacks in Russia, Spain, the United Kingdom, Iraq, and Afghanistan are affiliates or full-fledged members of groups that seek to cause destruction in the United States. We need to learn how they operate, as they are conducting missions in other parts of the world continually.

If we take into account that SWAT operations are conducted daily (if not hourly) inside the United States and believe that we can learn from events outside the United States as well, information gleaned from operations is moving very quickly, much quicker than the speed in which changes in case law progresses.

### Technology

While AARs from operations around the world move substantially quicker than case law, technological advancements that improve equipment and capabilities of SWAT teams and terrorists alike are moving even more rapidly. Consider the changes in technology that have occurred in the last ten years. We have equipment and computers that many of us would never have dreamed of. Now, imagine the advances that will occur within the next ten years. It is almost unfathomable. Right now, technological advancements are occurring at such a rapid pace that if you buy the latest "top-of-the-line" computer today, it will be replaced by a smaller yet more powerful and capable one within the next few months. Advancements in weaponry, surveillance equipment, sensors, and so on are occurring so quickly today that some people hesitate to commit to purchases unless they have the capabilities of adding quick upgrades that will, no doubt, be available in the upcoming months.

While these technological improvements can add incredible capabilities to specialized teams, they can only do so if the agency "bites the bullet" and procures the items and supplies the necessary training to the operators. These same capabilities, unfortunately, can also aid the terrorists who will gladly pay the money for the enhancements if it furthers their cause. Many new pieces of equipment require hundreds of hours of training to become proficient in their use, but once properly trained, implementing some of these items places those who posses them in an incredibly advantageous position—a bad proposition for a SWAT team that lacks the equipment, going up against a terrorist who has the latest equipment and the training.

### Local Funding Considerations

For most U.S. law enforcement organizations, budgets determine training. More often than not, when dollars get tight for a law enforcement

agency, the first thing on the chopping block is its training budget. It often comes down to this: training or equipment procurements. While equipment is no doubt essential (particularly self-protection equipment), it does little good if you do not know how to use it. An argument to the contrary can certainly be made—training on equipment does little good if you don't have the equipment—so what it amounts to is this: SWAT teams need both training and equipment.

Quality training programs can and will change the way SWAT teams operate. Teams will pick up tactics, techniques, and information from instructors and other students in the training from other jurisdictions. A quality training program for today's SWAT teams encompasses all of the aforementioned items that "drive the train" in changing specialized team tactics: 1) case law, 2) AARs, and 3) technology. When addressing case law, SWAT teams need to be made aware of cases that affect their job directly (cases involving SWAT tactics and or equipment), but they also need to be cognizant of those cases that indirectly affect them—case law that was generated by a patrol officer or detective. First and foremost, SWAT operators are police officers and need to be aware of how all major cases affect them.

Quality training programs examine AARs from everyone in the fight against criminal elements (especially terrorism) in the United States and abroad, as well as incidents that have occurred at the hands of these criminals. Regardless of the suspect's motivations, the situation must be dealt with aggressively if it is to be brought to a successful conclusion, but the perpetrators of a terror strike are usually more likely to be better armed and trained as well as willing to fight it out to the death. In the event of a confirmed terror attack, the decision must be made whether or not federal troops may be deployed. In view of the current state of the war on global terrorism, it is possible that federal troops *may* be deployed if the perpetrators are foreigners, since we could view such an attack as a form of foreign invasion. If the actors are U.S. citizens, it is probable that federal troops may not be deployed in a direct role. Good faith, sound judgment, and education are the best ways to determine what type of threat faces the local commander.

While DHS has approved funding for this advanced SWAT training, the actual allocation of funds is determined at the state and county levels, and it appears that many officials at those levels see the next terror strike as being much like the 9/11 strikes: aircraft purposely crashing into major targets. In an attack such as this, a well-trained SWAT team is not nearly as useful as a well-trained fire or rescue or Emergency Medical Services (EMS) vehicle manned by a trained crew of paramedics. Given this reasoning, local officials have demonstrated a tendency to fund fire or rescue and EMS more readily than police agencies. The problem with this type of thinking is that the next major attack will probably be nothing like

the last; we have tightened up the security on commercial airlines to the extent that our enemies are probably planning different—albeit equally devastating—attacks.

### A SWAT Scenario

The potential for a ground-based terror attack is significant because the terrorist goal is to inflict as many casualties as possible, with a large number of people watching. This may certainly be accomplished if properly planned. Consider the following scenario: You are a DHS-trained SWAT team in a western state. Your jurisdiction contains the following facilities that could present a target to a terrorist organization: a community college, several large department or discount stores, two hospitals, numerous schools, movie theaters, churches, and stadiums and event centers where large numbers of people gather. There is also a nuclear power and research facility, as well as a major chemical plant that produces large amounts of agricultural products such as fertilizers, pesticides, and herbicides. Your jurisdiction includes some 131,000 citizens, with an additional 40,000 in nearby unincorporated areas.

Terrorists have been conducting reconnaissance of your jurisdiction for some time but have been able to maintain a low enough profile such that the antiterrorism task forces and other security agencies have not detected their efforts. The terrorists had originally identified the nuclear facility as the target that would best suit their needs; nothing strikes fear into U.S. policymakers and citizens like the threat of a nuclear incident, especially one that is terrorist initiated. However, the nuclear facility has a superb guard force and an excellent security plan in operation; the force and plan are in constant training and review, which makes this facility a very hard target. Historically, terrorists have chosen easier targets over hard ones, unless there is a particular and overriding reason to strike the hard target. In this case, the terrorists have determined to strike the chemical plant.

The terrorist group's planners have made the decision to attack the chemical plant for a number of reasons:

1. This plant produces materials that have highly toxic chemicals—chemicals that can be used as Weapons of Mass Destruction (WMDs) if released into the atmosphere, river, or groundwater.

2. The plant is less well guarded than the nuclear facility and can be overrun by a determined attack force with relative ease.

3. This plant is operated by a major U.S. corporation. An attack on it (whether successful or not) will have a dramatic, negative impact on the nation's morale and economy.

It must be remembered that terrorism isn't so much about killing large numbers of people as it is about having large numbers of people watch

other people die. In the opening stages, the terrorists take over the plant, killing a number of employees to show their resolve. At this point, the terrorists *want* the word to get out that they've taken the plant. As police units arrive, they make contact with the terrorists, who begin to issue demands such as withdrawal of all "crusader forces" from all Muslim lands, cessation of U.S. support of Israel, release of all political prisoners held by all western powers, and so on. All the while, news outlets are hurriedly sending correspondents to the scene and will soon be broadcasting the event on live, international television. It is likely that the terrorists don't really expect their demands to be met but are waiting for the media to arrive and begin their broadcasts so they can release the chemicals in the full view of the world.

When terrorists assassinated Idaho Governor Frank Steunenberg in 1905, it took a significant amount of time before the news spread across the nation and longer still before it got out to the world. When President Kennedy was assassinated in 1963, the news spread across the world in a matter of hours, and the film was available on international news within a day. When al Qaeda attacked the Pentagon and the World Trade Center in 2001, the world watched live as the incident unfolded. The impact of immediate worldwide attention to the September 11 attacks cannot have been lost on our enemies, and they must surely desire to capitalize on that asset again. This terrorist desire for worldwide attention (waiting for the media to arrive) may give the authorities the opportunity to "enter into negotiations" while planning and mounting a response.

*Presidential Decision Directive 39* of June 21, 1995, designates the Federal Bureau of Investigation (FBI) as the agency with jurisdiction to handle terrorist incidents and activities on U.S. soil:

> It is the policy of the United States to deter, defeat and respond vigorously to all terrorist attacks on our territory and against our citizens, or facilities, whether they occur domestically, in international waters or airspace or on foreign territory. The United States regards all such terrorism as a potential threat to national security as well as a criminal act and will apply all appropriate means to combat it. In doing so, the U.S. shall pursue vigorously efforts to deter and preempt, apprehend and prosecute, or assist other governments to prosecute, individuals who perpetrate or plan to perpetrate such attacks. . . . The Director, FBI, as head of the investigative agency for terrorism, shall reduce vulnerabilities by an expanded program of counterterrorism.[5]

While the FBI is the proponent agency for dealing with terrorism on U.S. soil, its Hostage Rescue Team (HRT)[6] will require time to assemble and deploy, while the local SWAT team may already be on scene. Even if HRT arrives in time to assume primary responsibility, the local team will certainly have a vital role in any operation, and we must take into account

the fact that HRT may not be available in the event of several simultaneous attacks.

### Discussion

In the above scenario, the authorities must first consider whether the demands are real ones or just measures to stall for time in order to cause greater panic. Then, the authorities must decide if they will enter into negotiations with the terrorists or make an immediate attempt to retake the plant.

Whether the terrorists have a genuine goal of having their demands met or not, negotiation is a method for gaining time before mounting a SWAT operation, as well as an effort to convince the terrorists to give themselves up (if appropriate). If the command determines that the demands are merely a terrorist ploy to gain time in order to allow the media to arrive (or some other predetermined event) before the real purpose of their strike (worldwide attention to their cause) is carried out, the command may opt to enter into negotiations or some other dialogue to gain time while the SWAT operation is being prepared. In any event, the strike must be planned and executed in a timely manner.

In many cases, only the leadership of the terror group may be aware that theirs is a suicide mission, while the other terrorists actually believe that their goal is to have the demands met and that their survival is part of that plan. Whatever the terrorist intent, it is the policy of most governments that they do not negotiate with terrorists and never concede to their demands; this is also the official U.S. policy.

If the decision is made that the terrorist demands are simply a ruse to gain time, the command must develop a plan to retake the facility very quickly. This plan must be aggressive enough to successfully neutralize the threat to the community, rescue any hostages, and secure the facility—all while sending a strong message to the world that we are prepared and capable of defeating terrorism decisively. Because of the haste needed in executing the operation, a well-trained team with strong standing operating procedures (SOPs), state-of-the-art equipment, and an aggressive, warrior mindset is absolutely critical. Not all jurisdictions are able to afford high-end state-of-the-art equipment. To counter this shortfall, DHS has initiated the funding programs mentioned previously, which are designed to supplement the equipment needs of a modern SWAT team as well as the team's training.

### CONCLUDING OBSERVATIONS

Training and equipment are far less valuable if the team doesn't have the correct mindset, one that says, "I will put my life on the line to prevent

these terrorists from killing large numbers of Americans; I am prepared to sacrifice myself to accomplish this mission." In many departments, the SOP is to withdraw if the team takes casualties, and (depending on the situation) when confronted by civil criminals, this is a reasonable course of action. In the terrorist incident, withdrawal is simply not an option; the team must maximize surprise, speed, and violence of action and aggressively continue the operation in the face of casualties because once the assault has begun, the terrorists must not be given a chance to regroup. The terrorists in our scenario must not have a chance either to think about what has happened or to plan a response, since that response will almost certainly be the release of the WMD into the populated areas.

Authorities in Israel have adopted more of a warrior mindset than one of law enforcement. Howard Linett, a counterterrorism operator in Jerusalem, states that when dealing with terrorists, one must put aside the concept that "we're police officers" and take on the mindset of soldiers: "It's not a matter of arrest and prosecute; it's a matter of kill or be killed."[7] The United States is certainly not in a position where we must adopt this philosophy on a daily basis, but we may well already be in one where we must be prepared to adopt it in extraordinary circumstances.

The mission is to neutralize the ability of the terrorists to release a WMD or to execute their plan and carry out their threats. This mission is paramount and must be completed. Since most facilities such as the one in the above scenario are very large, manpower is going to be critical. The doctrine of staying with a perpetrator who has been shot must be set aside in a case such as this. Instead, the officer who did the shooting must restrain the subject and report the shooting and its location so the command can record it and medical personnel can be dispatched when the situation permits. A downed officer must, as soon as the tactical situation permits, be given immediate care and moved to a covered area and then the officer's location and condition must be reported to the command center. The team must then continue the mission, while medical personnel are dispatched to the officer immediately.[8]

Remember that terrorists views themselves as soldiers, commandos. Islamic extremists call themselves Fedayeen (commando) and consider themselves servants of God who are at war with you. Many home-grown terrorists consider themselves servants of God at war with a government that is serving the devil. If our enemy believes this to be a war, we must also adopt that view in order to prevail.

This is not to say that every SWAT operation is a case of war or that any of them are free-fire zones, where we can indiscriminately shoot anybody who is not a law enforcement officer, but in the event of a terrorist incident, on a case-by-case basis, appropriate action is needed when

civilian lives are at great risk. In a terrorist attack, we must adopt the warrior perspective and mindset of kill or be killed, rather than capture, arrest, and prosecute.

What is needed is training on the part of law enforcement officers everywhere to be aware of the terror threat to their jurisdiction, no matter how remote the possibility of an attack may seem, and the ability to recognize a terror strike when they see one. This recognition may come while the strike is in the planning stages (the best time to detect) or in the operational phase (the easiest time to recognize the threat but often so late in the game that the only option is the tactical one). The law enforcement administrator and local official must be educated on the terror threat in order to fully appreciate the responsibility they have in doing all within their power to protect their citizens from an attack by thwarting it in the planning and preparation stages (at best) or (at the very least) by aggressively and violently overcoming it after the assault has begun.

## NOTES

1. The DHS SWAT typing system contains a number of acronyms; here is a brief glossary of key terms:

> CBRN: Chemical, Biological, Radiological, and Nuclear
> PPE: Personal Protective Equipment
> APR: Air-Purifying Respirator
> SCBA: Self-Contained Breathing Apparatus
> Level-B PPE: Nonencapsulated or encapsulated chemical-resistant suit with SCBA
> Level-C PPE: Nonencapsulated chemical-resistant suit with APR
> NIOSH: National Institute of Occupational Safety and Health
> APC: Armored Personnel Carrier

2. In FRIES, a very thick rope is attached to a helicopter, and the unattached end is dropped to the ground. Operators reach out of the hovering helicopter, grab the rope, and slide to the ground much as a fireman might on a pole in the firehouse. Using this technique, multiple operators may exit a helicopter into an area of operations with the aircraft never touching the ground.

3. A list of significant dates can be obtained from the Memorial Institute for the Prevention of Terrorism at http://www.mipt.org.

4. Latin for "to stand by that which was decided."

5. The White House, *Presidential Decision Directive 39*, June 21, 1995.

6. HRT is the FBI's SWAT team; it is a world-class unit with superb skills and abilities, but the local agencies must be able to react and handle a major terror event on their own or at least hold and develop the situation until HRT can arrive.

7. Howard Linett, *Living with Terrorism: Survival Lessons from the Streets of Jerusalem* (Boulder, Colorado: Paladin Press, 2005), 47.

8. This idea will certainly be an anathema to many police officers who vow never to leave a fallen comrade, but this is an extraordinary situation. Soldiers also never leave a fallen comrade but realize they must continue the mission, often returning to assist the friendly wounded only after the operation has been successfully concluded.

# PART III

## SOFT POWER

# CHAPTER 14

## DENYING TERRORISTS SANCTUARY THROUGH CIVIL MILITARY OPERATIONS

Robert J. Pauly, Jr., and Robert W. Redding

Maryem had heard that the new Afghan National Army (ANA) was coming to her village to provide medical services. While she was not sure she could trust any men with guns anymore, she knew she could use a doctor's services for Wakil, her two-year-old son, whose sickly body made him look like he was less than a year old. The khan who controlled the lands south of the village, as well as her tribal malik (essentially, a spokesman, as the Pashtun recognize no chieftains), had told her oldest son, Masud, that everyone should show up at least to see what they could get. Maryem was familiar with that concept, since her husband had been killed in a dispute as a result of *bedal*, one of the Pashtun codes of conduct that demands revenge and retribution for any wrong committed. The cousin whose *bedal* debt had been paid by her husband's blood had been kind enough to bring her and her six children under his roof, but he had limited resources that were first distributed to his two wives and their children. Maryem was desperate and knew that when the day came, she would get whatever she could as fast as possible.

On the day of the clinic to provide medical services, the ANA arrived before dawn and set up several large tents on the village's soccer field. Into and out of each of these tents was a path outlined with stakes and marking ribbon. Maryem brought Wakil, wrapped against the morning chill, to an area below the field and huddled with the other women from the village, all of whom had come to see the doctors and get whatever supplies they could get. From her vantage point (and through the mesh of her *burqa*), she

could see many Afghan soldiers unpacking boxes of supplies and getting organized. There were a few other people on the soccer field that she could see. Some were clearly Westerners in civilian clothing.

After a few minutes of waiting, she heard a man speaking in Pashtun over a loudspeaker. He said that on behalf of the government in Kabul, the ANA was providing free medical care and other supplies to the people of her village. He said that everyone present would be able to see a doctor, so be patient. Then the loudspeakers began playing the song that goes with the Afghan national dance, after which some of the soldiers and some of the village men formed a circle and began to dance. To Maryem, it was all somewhat pleasant, but at the same time odd—unlike her past experiences, these soldiers were mostly pleasant and helpful; they were not stealing; and they were organized.

As she was thinking about that, a soldier came to the waiting area and said for the next group (which included Maryem and Wakil) to come with him. Other soldiers and leaders from the village ensured that the waiting area remained calm and orderly. She was first taken to a tent where there was a table with several Afghan soldiers, who were gathering information about them. They were mostly asking questions about what the villagers' chief medical complaints were, as well as their names and where they lived. After that, the group was queued up in another tent, waiting for the doctors. While they were there, another set of Afghan soldiers talked to them about good habits that would keep them healthy, including washing their hands and keeping bodily wastes away from where they lived. As Maryem chuckled about that with another woman from the village, her name was called to see the doctors. Immediately a knot came to her throat, as she never saw men from outside her family in a private setting. As she went into the treatment tent, however, her concern for Wakil overcame any doubts about social appropriateness.

Inside the tent, the soldier who guided her there left as another Afghan man greeted her in the traditional fashion. He said his name was Wasil and that he was a doctor. He also introduced a Western woman who was from a group of Western doctors called Mercy Relief. There was also another Westerner in the room who wore a thick beard and was dressed in Afghan clothing. Wasil asked Maryem to put Wakil on the treatment table and asked what she thought was wrong with him. After a couple of minutes of taking vital signs from Wakil, the Westerner and Wasil spoke briefly. Then Wasil told Maryem that, while she was a good mother, her son was sick because of some worms inside of him that come from the human excrement that sometimes collects in the street and in the ditch where they get their water. The doctor gave her some pills and instructions on how to give them to Wakil and sent her on her way. As she was leaving, she was given a new washbasin to take home with her. While still somewhat confused about what was going on, she knew one thing: The

ANA, and thereby the government in Kabul, had probably saved the life of her son. As she was walking home and thinking about her experiences that morning, she had no idea that she had been a willing participant in a carefully scripted operation that was planned, resourced, and executed primarily by a 12-man U.S. Army Special Forces detachment. And that was the way it was supposed to be.[1]

The above example is illustrative of the centrality of the use of civil–military operations to achieve progress in the U.S.-led Global War on Terrorism (GWOT). In particular, it demonstrates the importance of using confidence-building measures among villagers at the local level in order to assist the United States and its domestic allies (in this case, the ANA) to minimize support for al Qaeda and its affiliates in a given state under reconstruction, in this case Afghanistan.

The Afghan example is just one of many such cases across the world that demonstrate the growing role of U.S. military special forces (active duty and reserve units alike) in microlevel civil–military operations designed to achieve progress in the GWOT, one village or town at a time, in places ranging geographically from Iraq and Yemen to Mongolia and the Philippines. The balance of this chapter examines these types of operations and the grand strategy upon which they are based. The first part of this discussion provides a conceptual overview of the use of civil–military operations to achieve strategic objectives. This is followed by an analysis of civil–military operations in the context of the GWOT in particular. The third section examines case studies of U.S.-led civil–military operations in Afghanistan, Iraq, and the Philippines, followed by an examination of the insights that U.S. policymakers should draw from these case studies. The concluding section provides some observations on the prospects for the future of the use of civil–military operations by the United States and its allies.

## CIVIL–MILITARY OPERATIONS AS A STRATEGIC TOOL

Since the end of the Cold War, generally, and specifically after the events of September 11, 2001, the United States has placed a progressively greater emphasis on the use of nation- or state-building projects to achieve its strategic objectives in places such as Bosnia-Herzegovina, Kosovo, Afghanistan, and Iraq.[2] One of the most indispensable tools available to achieve progress in those projects, in turn, is the use of civil–military operations.[3] In order to best explain how civil–military operations are employed by the United States in the contemporary international system, it is first important to review some commonly used definitions as a means to ground the reader in the terminology of the field.

At its core, humanitarian and civil assistance is defined as assistance provided to the local populace in a given state or locality therein by U.S.

military forces in conjunction with their operations and exercises. Authorized under the auspices of Title 10, United States Code, Section 401, such assistance is limited to "(1) medical, dental, and veterinary care provided in rural areas of a country; (2) construction of rudimentary surface transportation systems; (3) well drilling and construction of basic sanitation facilities; and (4) rudimentary construction and repair of public facilities."[4] Each of these types of assistance has been provided by U.S. forces in a variety of nation- or state-building operations since the 1990s.

One component of humanitarian and civil assistance is military civic action (MCA), which the U.S. Department of Defense (DOD) defines as the "use of preponderantly indigenous military forces on projects useful to the local population at all levels in such fields as education, training, public works, agriculture, transportation, communications, health, sanitation, and others contributing to economic and social development, which would also serve to improve the standing of the military forces with the population."[5] The introductory section of the chapter, for instance, offers a clear example of MCA, designed to afford the ANA an opportunity to establish a favorable rapport with the local population, one likely to reduce the potential for support for al Qaeda and Taliban fighters within the region where the medical clinic was administered.

The conduct of civil–military operations, whether by U.S. forces alone or in collaboration with indigenous actors in a particular state or region therein, is one method U.S. military officers employ in order to achieve the broader goal of successful counterinsurgency. In short, such operations are considered one of the many different kinds of "military, paramilitary, political, economic, psychological, and civic actions taken by a government to defeat insurgency."[6] Civil–military operations can also be used to complement broader means of unconventional warfare, which the DOD described as "military and paramilitary operations, normally of long duration, predominantly conducted by indigenous or surrogate forces who are organized, trained, equipped, supported, and directed in varying degrees by an external source. It includes guerrilla warfare and often direct offensive, low visibility, covert, or clandestine operations, as well as the indirect activities of subversion, sabotage, intelligence gathering, and escape and evasion."[7]

These conceptual definitions articulate the ways in which civil–military operations are expected to unfold in theory. In practice, carrying out such operations falls to individual military servicemen and women, who—as the case studies provided later in the chapter demonstrate—often face unanticipated circumstances on the ground in many kinds of operating environments. In general terms, an officer engaging in civil–military operations must establish, maintain, influence, or exploit relations between military forces and civil authorities, both governmental and nongovernmental, and the civilian population in a friendly, neutral, or hostile area of

operations in order to facilitate military operations and consolidate operational objectives. Civil affairs may also include the performance by military forces of activities and functions that are normally the responsibility of the local government. These activities may occur prior to, during, or subsequent to other military actions. They may also occur, if directed, in the absence of military operations. Ultimately, tasks as wide-ranging as providing for the basic survival needs of the residents of a village or town in the aftermath of a conflict to cobbling together a rudimentary political system—and, in some cases, serving (either formally or informally) as an official within that system—all fall under the aegis of civil affairs.

While civil–military operations have been an indispensable part of U.S. participation in nation- or state-building operations since the end of the Cold War and thus received considerably more attention in the academic and policymaking communities than was previously the case, they are by no means a new concept in the history of the U.S. military. The conduct of civil–military operations by U.S. forces dates to the nineteenth century, with the United States' occupation of and development of governmental institutions inside the Philippines following its victory in the brief Spanish-American War of 1898 serving as the most notable example. The United States spent much of the quarter-century preceding the Spanish-American War establishing military bases across the globe, a process that brought U.S. forces into contact with a range of cultures in both war-fighting and civil capacities. The first U.S. base in the Pacific, for instance, was established on the atoll of Midway, which Washington annexed in 1867. The United States also secured the right to use the harbor of Pago Pago on the Samoan island of Tutuila in 1877, two years after signing a free trade treaty with the eight-island chain of Hawaii that represented the first step toward the eventual colonization and annexation of that entity.[8] These Pacific bases added a greater sense of permanence to the global reach of U.S. sea power, which was itself already manifested in the formation of permanent squadrons in the Mediterranean (1815), West India and the Pacific (1822), Brazil and the South Atlantic (1826), East India (1835), and West Africa (1843). Each of these developments demonstrated the depth of the U.S. commitment to enhancing domestic power and security through expansion during a period when the United States was considered by its rivals abroad as more of an isolated Western-hemispheric state rather than a challenger for global economic, military, and political influence. As U.S. scholar Walter Russell Mead, an expert on the history of U.S. foreign policy, asserts, "In other words, during the period of American innocence and isolation, the United States had forces stationed on or near every major continent in the world; its navy was active in virtually every ocean, its troops saw combat on virtually every continent, and its foreign relations were in a perpetual state of crisis and turmoil."[9]

After occupying the Philippines in May 1898 and assisting the natives in overthrowing the Spanish colonial regime, the United States set about establishing a U.S.-style democratic government over the islands. The process did not proceed smoothly. Instead, an insurgency erupted in 1899, which the United States spent nearly three years subduing at the cost of the lives of 4,234 U.S. servicemen.[10] The insurgency—which was instigated and carried out primarily, if not exclusively, by the Muslims inhabiting the southern half of the archipelago—served as a lesson that U.S. expansion, while generally beneficial for U.S. domestic security, would always entail costs. The challenge for U.S. forces—one that they struggled to meet successfully—was to cultivate conciliatory relations with remote villages in the south through civil–military operations designed to increase access to medical care and opportunities for economic growth while combating the insurgents militarily. The strategy was effective in the short term; however, maintaining the necessary presence to follow through on such civil–military projects proved impractical over the long term.

Perhaps the most significant example of the successful use of civil–military measures to build enduring democratic institutions following a devastating conflict came with the U.S.-led nation- or state-building efforts in the aftermath of World War II in Germany and Japan. Most significantly, the United States spent four years after the war helping to rebuild the West German economic and political systems under liberal democratic and capitalist economic auspices that culminated in the establishment of an independent Federal Republic of Germany in May 1949.[11] The U.S. military, and specifically General Lucius D. Clay, played critical roles in orchestrating the process, providing an example of the potential for civil–military operations in the modern era—albeit one that, as demonstrated later in this chapter, has not yet been replicated in the context of the GWOT.

### Civil–Military Operations and the War on Terrorism

In March 2006, U.S. President George W. Bush delivered a speech before members of the Foundation for the Defense of Democracies, in which he discussed his administration's central foreign policy theme: enhancing the prospects for the liberal democratization of the Greater Middle East and specifically Iraq. In his address, Bush emphasized his administration's strategy to protect the United States:

> [This] strategy to protect America is based upon a clear premise: the security of our nation depends on the advance of liberty in other nations. On September 11, 2001, we saw that problems originating in a failed and oppressive state 7,000 miles away could bring murder and destruction to our country. We saw that dictatorships shelter terrorists, feed resentment and radicalism, and

threaten the security of free nations. Democracies replace resentment with hope, democracies respect the rights of their citizens and their neighbors, democracies join the fight against terror. And so America is committed to an historic long-term goal: To secure the peace of the world, we seek the end of tyranny in our world. We are making progress in the march of freedom— and some of the most important progress has taken place in a region that has not known the blessings of liberty: the broader Middle East.[12]

The administration reiterated the president's point in the context of its second formal National Security Strategy (NSS), which was released the same month. In particular, the NSS states:

It is the policy of the United States to seek and support democratic move-ments and institutions in every culture, with the ultimate goal of end-ing tyranny in our world. In the world today, the fundamental character of regimes matters as much as the distribution of power among them. . . . Achieving this goal is the work of generations. The United States is in the early years of a long struggle, similar to what our country faced in the early years of the Cold War.[13]

The Bush administration's focus on the need for liberal democratic re-form across the Greater Middle East grew initially out of al Qaeda's devas-tating attacks on the World Trade Center in New York and the Pentagon on the outskirts of Washington, D.C., on September 11, 2001. In short, Bush believes that creating opportunities for freedom of expression and eco-nomic growth within the states of the Greater Middle East will reduce the support for terrorist groups such as al Qaeda therein, especially over the long term. The first step toward achieving that end, in the administra-tion's view, was to remove repressive regimes controlled by the Taliban in Afghanistan and then President Saddam Hussein in Iraq through the prosecution of Operation Enduring Freedom in the fall of 2001 and Op-eration Iraqi Freedom in the spring of 2003, respectively. The second (and ongoing) step is to help create conditions for the development of endur-ing liberal democratic institutions, albeit ones that accommodate domes-tic cultural and religious norms through the conduct of nation- or state-building operations in both Afghanistan and Iraq. Regrettably, although predictably, progress in each of those projects has been limited and has proceeded at a rather glacial pace, most notably so because of a lack of security—particularly in the heart of Iraq, where the vast majority of that state's previously powerful (and now economically and politically marginalized and embittered) minority Sunni community is situated.

Central to the administration's strategy is the use of nation- or state-building projects—with an emphasis on civil–military operations therein—to reduce the number of "failing" and "failed" states in the in-ternational systems, especially in the Greater Middle East, as a means to

decrease the pool of recruits and potential bases of operation for terrorist groups such as al Qaeda.[14] The administration places an emphasis on the use of civil–military operations and cooperation between the DOD and U.S. Department of State (DOS) therein in its NSS. In particular, the NSS points to the importance of the establishment of the Office of the Coordinator for Reconstruction and Stabilization at the DOS, characterizing it as an institution that "draws on all agencies of the government and integrates its activities with our military's efforts" and one that coordinates its activities with U.S. allies and international organizations such as the European Union (EU) and United Nations.[15] Further, the NSS points to the DOD's 2006 Quadrennial Defense Review, which calls for expansion of U.S. Special Operations Forces.[16] Such forces have been indispensable to the conduct of civil–military operations in Afghanistan, Iraq, and the Philippines, specifically in the past five years.

The administration's approach, which has been employed with varying degrees of success in both Afghanistan and Iraq, is part of the broader transformation of the U.S. military that was launched by the DOD at the start of Bush's first term in January 2001 and has continued, albeit at a rather glacial pace, in the years since. The initial calls for that transformation came concurrent with (and, to an extent, as a result of) the end of the Cold War, which left the United States and its European allies to deal with interrelated instability and intra-state conflict in places ranging from the Caribbean and the Balkans to sub-Saharan Africa and Central Asia.

The result was the emergence of a concept known in military parlance as "Fourth Generation Warfare." This concept is important to understanding the effects of civil–military operations on the modern battlefield. In a 1994 article in the *Marine Corps Gazette*, William S. Lind, Col. Keith Nightengale, Capt. John F. Schmitt, Col. Joseph W. Sutton, and Lt. Col. Gary I. Wilson presented a description of this type of warfare, noting that

> beginning with Mao's initial concept that political power was more decisive than military power and progressing to the intifada's total reliance on the mass media and international networks to neutralize Israeli military power, warfare has undergone a fundamental change. The fourth generation has arrived. Strategically, it attempts to directly change the minds of enemy policymakers. This change is not to be achieved through the traditional method of superiority on the battlefield. Rather, it is to be accomplished through the superior use of all the networks available in the information age. These networks are employed to carry specific messages to enemy policymakers. A sophisticated opponent can even tailor the message to a specific audience and a specific strategic situation.[17]

In their article, Lind, Nightengale, Schmitt, Sutton, and Wilson suggested that this new generation of war would: (a) be fought in a complex

arena of low-intensity conflict; (b) include tactics and techniques from earlier generations; (c) be fought across the spectrum of political, social, economic, and military networks; (d) be fought worldwide through these networks; and (e) involve a mix of national, international, transnational, and subnational actors. Building on that approach in a subsequent piece, Lt. Col. Thomas X. Hammes stressed that the United States'

> national security capabilities are designed to operate within a nation-state framework. Outside that framework, they have great difficulties. The drug war provides an example. Because the drug traffic has no nation-state base, it is very difficult to attack. The nation-state shields the drug lords but cannot control them. We cannot attack them without violating the sovereignty of a friendly nation. A fourth-generation attacker could well operate in a similar manner, as some Middle Eastern terrorists already do.[18]

One example of these efforts involves the use of Provisional Reconstruction Teams (PRTs). Used initially in the context of Operation Enduring Freedom (OEF) in Afghanistan and composed of U.S. military and civil government representatives to support regional reconstruction and development, these teams are now being run by other OEF partners with comparable composition. The concept has also been utilized in nation- or state-building operations in Iraq over the past three years. PRTs are intended to provide a security umbrella under which other member of civil society (e.g., relief and development nongovernmental organizations [NGOs]) can operate and bring their resources to bear. They have also been the main effort in developing closer ties to local Afghan political and religious leaders, officials, and others of significance and executed unilateral operations to support health, education, and general living condition improvement. At the broader strategic level, the DOD has incorporated civil–military measures through the use of PRTs in particular into its own doctrine, most recently through the release of *The National Defense Strategy of the United States* in March 2005, which calls for U.S. forces to develop "ways to strengthen their language and civil affairs capabilities as required for specific deployments."[19]

However, in order to function effectively, PRTs must be utilized selectively with due consideration given to the cultural norms in the area in which they are deployed. Consider, for instance, the timeless advice provided by Englishman T.E. Lawrence in his classic treatise *The Seven Pillars of Wisdom*, which was written concurrent with Britain's efforts to maintain control over its colonial possessions in the Middle East in the late nineteenth and early twentieth centuries:

> It seemed that rebellion must have an unassailable base, something guarded not merely from attack, but from the fear of it: such a base as we had in the

Red Sea Parts, the desert, or in the minds of the men we converted to our creed. It must have a sophisticated alien enemy, in the form of a disciplined army of occupation too small to fulfill the doctrine of acreage: too few to adjust number to space, in order to dominate the whole area effectively from fortified posts. It must have a friendly population, not actively friendly, but sympathetic to the point of not betraying rebel movements to the enemy.[20]

Lawrence's advice is particularly well taken when one examines the challenges American forces face in combating precisely the types of insurgent movements to which one of Britain's most famous Arabists refers. The following section of this chapter will discuss the civil–military side of the struggle against such foes in Afghanistan, Iraq, and the Philippines since the events of 9/11.

### Civil–Military Operations in Practice: Three Case Studies

The cases of Afghanistan, Iraq, and the Philippines help to illustrate both the utility of the civil–military operations to achieve progress in the GWOT and the many daunting challenges associated with such efforts. These cases show that not only are civil–military operations necessary to fulfill international obligations (such as the Fourth Geneva Convention of 1949, articles 47–79 concerning the protection of civilians during conflict), but that they are used as part of efforts to achieve operational objectives on the battlefield. Moreover, civil–military operations are more effective in achieving the desired effects when they are the main effort as opposed to being a supporting effort.

#### *Afghanistan*

Just under two months after al Qaeda's attacks on the World Trade Center in New York and the Pentagon on the outskirts of Washington, D.C., the United States launched Operation Enduring Freedom (OEF). The operation was designed to eliminate the Taliban regime that had played host to al Qaeda in Afghanistan and to capture or kill as many of the leaders of both groups as possible. While OEF did not result in the capture or death of al Qaeda leader Osama bin Laden, it did remove the Taliban from power, which helped to set the stage for the development of a democratic electoral system and government in Afghanistan.[21] The conduct of civil–military operations by a range of U.S. special operations forces units has been central to continuing efforts to both root out the remaining al Qaeda and Taliban fighters and create the necessary conditions for the establishment of enduring democratic governance and viable and trustworthy national military and policing institutions across Afghanistan's ethnically disparate and geographically remote—and often inhospitable—regions.

The United States' approach to the interconnected hunt for bin Laden and his supporters, and the development of liberal democratic governmental institutions and capable domestic security forces in Afghanistan, is demonstrative of an ongoing DOD transformation that favors relatively small deployments of highly trained special operations forces numbering in the thousands, as opposed to the large-scale deployments in the hundreds of thousands of servicemen and women that was the norm prior to the events of 9/11. U.S. force levels in Afghanistan have hovered around 8,500 over the past three years, with U.S. units often deployed to forward operating "firebases" in remote regions, where they use collaborative patrols with ANA units and humanitarian projects, such as the medical clinic described in the introduction to this piece, to generate goodwill and gather useful intelligence at the village level. Ultimately, the strategic thinking at work is that by creating such goodwill, the United States and the Afghan government of President Hamid Karzai can reduce grassroots support for al Qaeda and the Taliban and eventually liquidate the remnants of both, to include bin Laden and his chief deputy, Ayman al-Zawahiri.[22]

At its core, the U.S. strategy is one that will take time and patience to produce results, especially if judged at the macro level, where such results are not easy to discern in the short term. Most of the criticism of the Bush administration's performance in Afghanistan to date, for example, has grown out of its failure to capture or kill bin Laden or create enduring stability throughout that state. That criticism, however, does not take into account myriad examples of success in reconstruction projects and humanitarian operations at the micro level. Consider, for example, the efforts of the Joint Special Operations Task Force (JSOTF) within Combined Joint Task Force (CJTF) 180, which is headquartered at Baghram Air Base just north of Kabul and accounts for approximately one-tenth of the total U.S. military presence in Afghanistan. Composed primarily of U.S. Army Special Forces units, the JSOTF operates a series of forward firebases in the Afghan countryside, most notably in the southeastern region of the country bordering Pakistan, where al Qaeda and Taliban forces are most active. Its operators typically have thick beards and wear the Afghan kerchiefs common among natives of the region. Put simply, they do whatever possible to adapt to and, ideally, become a part of the cultural environs in which they are deployed, which proves beneficial in building a measure of trust through repeated interactions with Afghan villagers over time.[23]

Regarding current military operations in Afghanistan, there are two general categories of supporting civil–military operations that can be examined to extract some details of previously executed civil–military operations. The first category encompasses those operations conducted by special operations forces other than civil affairs units. The other category includes those civil–military operations that emanate from the provincial

reconstruction teams found throughout the Afghan countryside, usually conducted or otherwise facilitated by civil affairs units.

During the normal course of operations in Afghanistan, U.S. Army Special Forces units routinely provide humanitarian assistance, interact with the local government, or otherwise conduct civil–military operations. While there are many types of operations being conducted there by special forces, the overarching type of operation being conducted is called unconventional warfare (UW). According to the DOD, UW is "a broad spectrum of military and paramilitary operations, normally of long duration, predominantly conducted through, with, or by indigenous or surrogate forces who are organized, trained, equipped, supported, and directed in varying degrees by an external source. It includes, but is not limited to, guerrilla warfare, subversion, sabotage, intelligence activities, and unconventional assisted recovery."[24] During the course of UW, U.S. Special Forces units conduct (either unilaterally or with the support of civil affairs units) various operations that support the overall objectives of supporting the Afghan government, all the while seeking out the enemy wherever they are and destroying them.

One specialized tactic employed by U.S. Special Forces is that of MCA, defined in the U.S. Army Field Manual *FM 3-05.401—Civil Affairs Tactics, Techniques, and Procedures* as the "use of preponderantly indigenous military forces on projects useful to the local population at all levels in such fields as education, training, public works, agriculture, transportation, communications, health, sanitation, etc., contributing to economic and social development, which would also serve to improve the standing of the military forces with the population."[25] Basically, U.S. Special Forces conduct an operation where all the good outcomes appear to be the result of the efforts of the Afghan government. An example of this tactic being used in the field is in the training of the Afghan National Army. During the training, U.S. Special Forces "used military civic action missions (MCA) in order to support the legitimacy of the Transitional Islamic State of Afghanistan (TISA), provide non-combat leadership opportunities prior to confidence missions, as well as to provide training in handling the Afghan civilian populace."[26] One technique that was often used to accomplish this was the Medical Civic Action Program (MEDCAP). During the course of the training program for newly established Afghan army units, a MEDCAP was planned to be executed by the Afghan unit in an area that was relatively pacified. In conjunction with U.S. forces and nongovernmental relief organization partners, U.S. Special Forces facilitated and ensured the success of what appeared to the public to be an Afghan event to provide healthcare, public sanitation education, and similar support to a remote village, a needy neighborhood, or other like entity. During the course of deployment, the 5th Battalion, 19th Special Forces unit used this tactic frequently with impressive results in improving the legitimacy

of the Afghan government and its army.[27] Another specific example of this occurred at the Kabul Children's Hospital. The Afghan National Army's 3rd Brigade regularly visits the hospital to provide needed supplies and toys for the children.[28]

One of the emerging tactics from OEF is the use of PRTs. Typically based in the capital of the province they are supporting, these military teams provide the coalition and the Afghan government the ability to "extend the authority of the Afghan central government, promote and enhance security, and facilitate humanitarian relief and reconstruction operations"[29] PRTs are critical to removing internal hiding places and sanctuaries for the insurgents; this is particularly true concerning the PRTs located in the provinces neighboring Pakistan. The nature of the conditions of the border region, particularly noncentrally governed Pakistani border provinces, makes these areas more important because of the transit of people, money, and supplies that are intended to support the insurgency. As is typical of any insurgency, the auxiliaries of the insurgency usually live undercover (and sometimes in the open) within the general population and run the "underground" support structures of the insurgency, such as "ratlines" (surreptitious networks of routes and safe houses used by the insurgents to support operations). The PRTs in Afghanistan are typically staffed with military and civilian reconstruction specialists. Additionally, the PRTs are staffed with combat soldiers who secure the PRTs' base, as well as provide force protection for the reconstruction specialists when they are performing their duties "outside the wire." When appropriate, PRTs support tactical units' mission objectives within their operating area, but are essentially the main effort for nonlethal supportive effects for the province.

In large part because of civil–military operations carried out by special operations units, the United States and its North Atlantic Treaty Organization (NATO) allies have made some progress in creating a more stable and democratic Afghanistan. For instance, the state now has a democratically elected president (Karzai) and parliament, which were put in place by way of national votes in the fall of 2004 and 2005. Yet, it is also clear that much work remains to be done. Above all, the problem is that maintaining order in ethnically and tribally diverse regions is a difficult task, one that demands a commitment that may last decades and is best measured locally in a particular region or village rather than at the broader national level, where any manifestation of violence in one place or another tends to trump more positive but less sensationalistic success stories elsewhere.

### Iraq

In March and April 2003, the United States prosecuted one of the most effective wars in its history, eliminating the regime of Iraqi President Saddam Hussein in less than a month through the conduct of Operation Iraqi Freedom (OIF).[30] In terms of war-fighting, the operation was nearly

flawless. The challenges faced by U.S. forces in the immediate aftermath of the fall of Baghdad and in the context of U.S.-led nation- or state-building operations in Iraq in the years since then, on the other hand, have been considerably more daunting. As with Afghanistan, the conduct of civil–military operations has been indispensable to the progress achieved in terms of economics, politics, and security at the local level in towns and villages across Iraq. However, unlike the situation in Afghanistan, especially in the immediate aftermath of the fall of the regime, civil–military tasks fell in many cases to servicemen and women who lacked the training to carry out such tasks and thus simply adapted to the circumstances they faced on the ground.

The U.S. military "footprint" in Iraq is markedly larger than that in Afghanistan, and organized resistance to the U.S. occupation has been considerably greater in Iraq. In short, both the challenges faced by U.S. forces and the stakes associated with success and failure in Iraq have increased at a proportionally higher rate than in Afghanistan. Two of the most significant reasons for this are the emphasis placed on pursuing nation- or state-building operations in Iraq by the Bush administration and countering efforts by domestic insurgents and foreign fighters aligned with al Qaeda to undermine those operations. Collectively, these factors have raised the relative costs of the U.S. presence in Iraq, which has resulted in the deaths of 2,376 U.S. servicemen and women there between March 2003 and April 2006.[31]

The extent of the troop presence in Iraq—and consistent calls by some critics of the Bush administration to increase that presence—grow out of a broader debate within the DOD over the manner in which military forces should or should not be utilized in nation- or state-building projects. Generally speaking, one side of this debate does not think the military should play a central role in nation- or state-building projects; its proponents suggest, instead, that U.S. forces should focus much more on traditional war-fighting tasks, which those forces carried out quite effectively in OIF. Those on the other side of the debate recognize the importance of using nation- or state-building projects—and civil–military operations therein—to reduce the number of failing and failed states in the Greater Middle East and diminish the capabilities of terrorist groups in that region.[32]

As is true of Afghanistan, the conduct of civil–military operations has resulted in a great deal of progress in terms of the development of physical infrastructure and political institutions in selected cases at the local level, but projects such as the reconstruction of schools and negotiation of power-sharing arrangements on village councils are typically overshadowed by the daily violence generated by the insurgency. Regrettably, regardless of how many schools one builds or public works projects one

launches, these types of endeavors simply do not generate the same extent of media coverage as the detonation of improvised explosive devices and commission of homicide bombings by insurgents with roots inside and outside of Iraq. For example, although hundreds of new schools have been opened in Iraq over the past three years, 26,496 insurgent attacks were carried out therein in 2004 and 34,131 in 2005.[33] Not surprisingly, the latter figures tend to draw much more public attention than the former.

If one examines the situation in Iraq closely enough, there are certainly signs of progress that have been achieved primarily as a result of the actions of U.S. servicemen and women in the contexts of civil–military operations at the local level. Consider, for instance, the example of Army Maj. James A. Gavrilis, whose 12-man special forces team established a functioning municipal democracy in Ar Rutbah, a Sunni city of 25,000 in the Anbar province of Iraq near the Syrian and Jordanian borders. Working closely with civil administrators, policemen, and tribal leaders, Gavrilis' unit orchestrated the development of representative political institutions and public services that were staffed and administered by the citizens of the town.[34] It is an example that has been replicated in locales across Iraq. Yet, until similar successes are achieved at the national level, such examples are more likely to be overlooked than lauded as indicators of the potential for a positive future for Iraqis.

### The Philippines

Roughly concurrent with the prosecution of OEF and its aftermath in Afghanistan, U.S. forces were also carrying out a Southeast Asian component of the GWOT several thousand miles to the east in the Philippines. In the days and weeks following the events of 9/11, Bush and the members of his national security team emphasized repeatedly that the GWOT was indeed a global struggle and would be approached as such by the United States. The United States' efforts in the Philippines were one of the first examples of the application of the administration's "global" approach in practice.[35] Similar to its strategy in Afghanistan, the United States sought to minimize terrorist threats to U.S. interests emanating from the Philippines by using civil–military operations to reduce support for al Qaeda affiliate Abu Sayyaf in the jungles of southern islands of that Asian archipelago.[36] Since January 2002, on Mindanao—the largest of the Muslim majority islands in the Philippines—and neighboring Basilan island, U.S. Army Special Forces units have led the effort in using various types of civil–military operations as part of a campaign to reduce the strongholds of Abu Sayyaf by isolating the terrorists from the civilian population that they need for logistical support and a pool of recruits. As noted earlier, the Muslims of the south—culturally and religiously isolated from the Roman

Catholic majority in the northern half of the Philippines—mounted a fierce insurgency against U.S. forces in the aftermath of the U.S. victory in the Spanish-American War of 1898, one that was not fully quelled until 1913. Nearly a century later, the United States faces a comparable challenge— one, as is the case in Afghanistan, it has confronted collaboratively with the Philippine military over the past four years.

Originally administered by Joint Task Force 510, U.S. operations in the Philippines in the context of the GWOT now come under the umbrella of the JSOTF, which is headquartered in the town of Zamboanga, just across a narrow strait from Basilan Island. OEF-Philippines commenced in January 2002 with a "force cap" of 600, negotiated by officials in Washington and Manila. While substantially smaller than the U.S. presence in Afghanistan, some of the methods used by special operations units in Zamboanga and on Basilan Island are comparable. Most significantly, U.S. units have worked with troops from the Philippine Army in conducting MEDCAPs designed to improve sanitation and related health concerns in villages situated in the thick tropical jungles on Mindanao and Basilan. The problem, as in Afghanistan, is that building confidence among villagers fearful of reprisals from Abu Sayyaf is a time-consuming task that requires persistent follow-up on behalf of Philippine forces. The extent to which that will occur over the long term remains open to debate.[37] As Robert Kaplan—a correspondent at *The Atlantic Monthly*, who has spent much of the past three years living and working with U.S. military units stationed in places as wide ranging as Colombia, Iraq, Afghanistan, the Philippines, Yemen, and Mongolia—explains:

> The ostensible mission was to help Philippine troops kill international terrorists. But that was accomplished by orchestrating a humanitarian assistance campaign, which severed the link between the terrorists and the rest of the Muslim population—exactly what successful middle level commanders had done in the Philippines a hundred years before.... [But] America could not change the vast forces of history and culture that had placed a poor Muslim region at the southern edge of a badly governed, Christian-run archipelago nation, just as America could not clap its hands and give governments in the mountains of Colombia and Yemen complete control over their lawless lowlands.[38]

Different from both Iraq and Afghanistan, civil–military operations in the Philippines are almost all under the auspices of the Coalition JSOTF and U.S. Army Special Forces. As part of the counterinsurgency campaign being conducted there, civil–military operations are integral, albeit supporting efforts in the Philippines.[39] civil–military operations in OEF-Philippines have been conducted in order to build government legitimacy and control, which is a significant effort (if not the main effort) as part of

any counterinsurgency campaign. It is important to note that in the Philippines, the feedback from postoperational assessments led to different techniques being used in different locations, even though those locations were only a few miles apart. For example, in one village on Basilan Island, the provision of better education best supported the effect of promoting government legitimacy. Meanwhile, in a village close by, that effect was best achieved by the construction of a well. Similar observations have been made in Iraq and Afghanistan and reinforce the tactic of gathering information at the lowest level for the purposes of operational assessment.

As with the two other theaters, MEDCAPs are an important component of the overall strategy for promoting government legitimacy and thereby removing safe havens for insurgents and terrorists. As a "carrot" in the carrot-and-stick approach to nation building, MEDCAPs and other forms of humanitarian aid are essential to establishing (or reestablishing) the power of the central government and circumventing other forms of authority in a particular area. As with previously described programs in Afghanistan and Iraq, MEDCAPs are excellent opportunities for military civic action projects, where the host nation (in this case, the government of the Philippines) receives most, if not all, the credit for any humanitarian aid or development project.

### Strengths and Weaknesses of Use of Civil–Military Operations in the War on Terrorism

Above all, U.S. policymakers can draw several insights from the United States' participation in and use of civil–military operations in the conduct of nation- or state-building projects since the end of the Cold War generally and in the context of the GWOT on terrorism in particular—each of which is discussed in the following section of this chapter. First, nation- or state-building projects are at present (and will remain) central to U.S. efforts to reduce the number of failing and failed states in the international system. Second, the military will continue to play an indispensable role in such operations, most notably so through the deployment of special operations teams with capabilities in the interconnected issue areas of security, civil affairs and humanitarian crisis management, and intelligence gathering. Third, at the broader strategic level, the military must accept—if not embrace—the need for adaptation in dealing with the complex blend of war-fighting and civil affairs tasks conducted in places such as Iraq and Afghanistan. Fourth, achieving success in nation- or state-building operations will demand more effective coordination between U.S. military officers and civilian officials—as well as between those actors and representatives of international and NGOs—in the planning and implementation of those operations. Fifth, U.S. leaders and policymakers will need to do a better job of selling nation- or state-building projects and civil–military

operations therein to the general public as essential means to securing U.S. interests in the future.

### Centrality of Nation or State Building to the Pursuit of U.S. Interests

In the aftermath of the Cold War and subsequent victory of U.S. and coalition forces over Iraq in the 1991 Persian Gulf War, U.S. civilian and military policymakers faced an uncertain situation in terms of the types of threats and resultant operations they would have to plan for and implement in the succeeding years. The 1992–1995 civil war in Bosnia-Herzegovina and ensuing use of NATO forces in postconflict reconstruction operations therein served as a preview of what was to come. In short, intervention in Bosnia demonstrated to the William J. Clinton administration that nation- or state-building projects are time-consuming undertakings that do not lend themselves to concrete exit strategies but are necessary to minimize the dangers of failing and failed states in regions deemed vital to the interests of the United States and its allies. For their part, the events of 9/11—which were planned and orchestrated by al Qaeda from bases of operations in the failed state of Afghanistan—forced the Bush administration to recognize that, despite its earlier misgivings about the use of military forces in nation- or state-building operations, such projects would be essential to making progress toward its vision of political reform in the Greater Middle East. With the United States now committed to nation- or state-building projects in both Afghanistan and Iraq and the number of failing and failed states in the surrounding region rising rather than falling, it is equally clear that such projects will continue to be the rule rather than the exception in the formation and implementation of U.S. foreign policy and strategy in the future.

### Role of the Military in Nation- or State-Building Operations

Notwithstanding differences of opinion among military leaders over whether U.S. forces should play a major role beyond the provision of security in the contexts of nation- or state-building projects, their participation in a range of civil and traditional war-fighting tasks on the ground in the years since the prosecution of OEF and OIF is already a fact on the ground in both Afghanistan and Iraq. On balance, the military has done well in performing those tasks, particularly when one examines the efforts of individual officers and units in local contexts rather than focusing on the lack of effective preinvasion planning in the Pentagon that complicated the management of the occupation and administration of occupied Iraq, following the successful elimination of Saddam's regime. The ongoing debate in the DOD over the transformation of the military is one that will necessarily focus on the increasing importance of civil–military operations as a tool to achieve progress in the physical reconstruction and economic and political transformation of failing and failed states such as

Afghanistan and Iraq. Ultimately, military policymakers must recognize that the postconflict stages of the wars of the twenty-first century will be as important as (or perhaps more than) the operations that created the opportunity for economic, political, and social reforms through regime change in the first place.

### The Need for Operational Adaptation in the Transformation of the Military

One of the most daunting challenges U.S. servicemen and women—whether officers or members of the enlisted ranks—face when conducting civil–military operations is the need to adapt as circumstances dictate while dealing with the bureaucratic minutiae of an often complex chain of command. Such difficulties are most problematic when decisions at the level of an individual unit or forward operating base must be sent on to headquarters for approval in a given area of operations (say Afghanistan, Iraq, or the Philippines). Without greater freedom of action, operations in a particular village in an isolated region can be much more difficult to carry out expeditiously and effectively. As a general rule, it is prudent to afford special operations forces as much flexibility as possible in planning and carrying out civil–military strategies in the localities where they have been deployed and have thus developed an expertise often lacking at the higher levels of command in the theater in which the U.S. military has established a larger footprint. The more interaction U.S. forces have with the indigenous population in a village or town, the better. Unfortunately, sometimes the rules of engagement set by commanders at the more overarching strategic levels limit that type of interaction as a result of the inherent security risks involved. Above all, it would be useful to move toward a culture in which U.S. servicemen and women are afforded more freedom of action to adapt to local circumstances rather than being forced to wait for specific orders of precisely what to do and when to do it. Additionally, it is essential that they receive the requisite training to adapt to the cultural environment within which they are operating at a given juncture.

### Collaboration and Coordination between Military and Civilian Officials and Organizations

While it is essential that the U.S. military play a significant role in the conduct of nation- or state-building operations, it is also clear that U.S. civilian agencies, such as the DOS and U.S. Agency for International Development, must contribute a great deal as well. The same is true of international organizations and NGOs. Carrying out an effective civil–military operation, whether building a school or setting up a clinic to provide medical treatment in a remote mountain town in Afghanistan or jungle village in the Philippines, typically demands contributions from several, if not

all, of the above actors. Collaboration and coordination among those actors, on the other hand, is often difficult to achieve, both at the policy-making level and in practice on the ground in a given state. Both the DOS and DOD have placed increasing emphasis on the issue area of postconflict reconstruction and nation or state building since the events of 9/11. They must continue to focus on that issue area and encourage interaction among representatives of government agencies, the military, international organizations, NGOs, and the academic communities to develop ever-better strategies for the humanitarian and civil–military components of nation or state building in the future.

### Selling an Evolving Approach to the Public

One of the greatest challenges associated with nation or state building in general, and civil–military operations specifically, is in promoting those concepts to the U.S. public with a limited attention span for foreign and security affairs unless directly threatened at home. The events of 9/11 led to a greater awareness of the international system broadly and of failing and failed states in the Greater Middle East in particular. However, it is much more difficult to transform that interest into support for concepts such as nation- or state-building and civil–military operations, with which the public is not familiar and unwilling to advocate if it is perceived to entail a substantial financial cost to the government (and thus the taxpayers). In short, unless there is a sense within the U.S. public that the threats posed by terrorists are as significant as was the case in the aftermath of al Qaeda's attacks on the World Trade Center and the Pentagon, and also that creating an atmosphere conducive to economic growth and democratic reforms through nation or state building in foreign lands will reduce those threats, apathy and disinterest (if not outright opposition) toward such concepts is likely to be the prevalent sentiment among Americans. Consequently, above all else, nation- or state-building and civil–military operations must be linked to security in order to achieve even a measure of support within the U.S. population.

## CONCLUSIONS

During the Cold War, most dangers the United States had to counter grew out of its adversarial relationship with the Soviet Union. Since the end of that bipolar struggle, by contrast, U.S. presidents have had to respond to challenges related to the emergence of failing and failed states that threaten military security, economic vitality, and political stability in regions deemed vital to the interests of the United States and its allies. These entities have been of particular concern to U.S. policymakers since the 1990s. The Clinton and Bush administrations both intervened militarily in states that could be defined as either failing or failed in terms of

governmental maintenance of, control over, or humane treatment of their populations. The former took action in Bosnia in 1995 and Kosovo in 1999 and the latter in Afghanistan in 2001 and Iraq in 2003. In each case, the use of force was followed by the conduct of postconflict civil–military operations that have since been defined as nation- or state-building endeavors.

The use of civil–military tools in the conduct of nation- or state-building projects is, by no means, a new concept. It was, for example, employed effectively in the transformation of Germany and Japan from dictatorships to democracies in the aftermath of World War II. However, both the frequency of the application of nation- or state-building operations and the threats such projects are designed to counter have changed markedly over the past decade. The primary purpose of the Clinton administration's participation in nation- or state-building operations in the Balkans was to ensure political stability in a region adjacent to the borders of member states of NATO and the EU. The Bush administration, on the other hand, has supported the reconstruction and democratization of Afghanistan and played the lead role in nation- or state-building operations in Iraq in order to reduce the threats posed to U.S. interests by terrorists and their sponsors in two ways: first, by replacing regimes that supported al Qaeda either directly or indirectly and, second, by improving the standard of living of—and affording political freedom to—the people of the Greater Middle East.

Above all, the physical and economic reconstruction and political liberalization of Iraq is absolutely indispensable to the broader transformation of the Islamic world. That much Bush and his advisors have emphasized repeatedly since the elimination of Saddam's regime in April 2003 and the commencement of reconstruction operations the ensuing month. In April 2004, for instance, Bush stressed that "a free Iraq will stand as an example to reformers across the Middle East. A free Iraq will show that America is on the side of Muslims who wish to live in peace, as we have already shown in Kuwait [by way of the conduct of the 1990-91 Persian Gulf War] and Kosovo, Bosnia and Afghanistan. A free Iraq will confirm to a watching world that America's word, once given, can be relied upon, even in the toughest of times."[40]

Bush's remarks opened a nationally televised press conference addressing the many challenges associated with nation or state building in Iraq. The president's comments were demonstrative of two underlying points. First, Bush recognized at that juncture that the transformation of Iraq continued to present economic, military, and political roadblocks that would take years, rather than weeks or months, to overcome. Second, he emphasized the importance of seeing the Iraqi nation- or state-building project through to completion, implying that subsequent administrations should maintain the commitment to the broader liberalization and democratization of the Greater Middle East over the long term.

At the core of insurgent efforts to undermine nation-building operations in Iraq is the fear that the United States will establish an enduring free market economy and representative government there. That outcome could eventually lead to two developments that dictatorial regimes and terrorist groups alike would abhor: an improved standard of living for members of the lower classes of society and the creation of a political atmosphere in which individuals are free to elect—and, if they choose, criticize—those in power. With Iraq as a model, other countries possessing autocratic characteristics comparable to those of Saddam's former regime (examples range from Islamic states, such as Saudi Arabia and Iran, to more secular-oriented states such as Egypt and Syria) could be the next candidates for economic and political transformation.

U.S. efforts to promote democratic change in Afghanistan and Iraq scare the leaders of both autocratic states and terrorist organizations, including, but not limited to, al Qaeda. There are two reasons why. First, those groups thrive on discontent, if not outright desperation, to recruit members willing to sacrifice their lives to battle the adversaries they blame for the dearth of economic growth and political freedom prevalent across much of the Arab world. One such adversary (the United States) is perceived by many Muslims to be responsible for the majority of these shortcomings. Should Bush—or, for that matter, any other U.S. president— manage to use a successful transformation of Iraq to start the engine of reform at the broader regional level, the pool of terrorist recruits would decrease substantially. Second, while bin Laden and his cohort also seek the elimination of the present governments in control of states throughout the Middle East, they would prefer that those changes come under their auspices. That would, of course, allow them to take control and install equally repressive regimes, which they could then administer in a style similar to that of the Taliban in Afghanistan. The establishment of representative democracies, by contrast, would encourage the free expression of dissent to prevent the development of any type of autocracy, whether Islamic or secular in character.

Putting forward the effort to overcome these hurdles—and accepting the requisite economic, military, and political costs that accumulate along the way—will provide an opportunity to alter the broader relationship between Islam and the West in an equally favorable manner. The United States has embraced comparably daunting challenges in the past, most notably its commitment in the aftermath of World War II to the idea of a Europe whole and free. That project is now nearly 60 years old and gradually nearing completion, with the EU and NATO both moving forward with their most recent enlargement processes in 2004. Lacking the economic, military, and political sacrifices the Americans and Western Europeans made during the Cold War, the European continent, too, might

still lack the freedom the Bush administration now hopes to spread to the Greater Middle East.

# CHAPTER 15

## BATTLEFRONTS IN THE WAR OF IDEAS

James S. Robbins

The United States has launched an ambitious undertaking to encourage liberal democratic development in the Middle East. In what President Bush has called a "forward strategy of freedom," the administration has placed promoting democracy at the center of U.S. national strategy.[1] More expansively, the administration's June 2004 "Broader Middle East and North Africa Initiative" seeks to encourage regional social, political, and economic development to promote stability and stave off potential future outbreaks of violence.[2] Likewise the G-8 nations' Greater Middle East Partnership plan seeks to promote freedom, knowledge, and women's empowerment in the region. Underlying the strategy is the idea that "the advance of freedom will increase chances for peace and security for Americans as well as for the people of the Middle East."

Nevertheless, there is another, older peace theory, as enunciated by Egyptian Islamist and member of the Muslim Brotherhood Sayyid Qutb in 1964:

> Obedience to the *Shari'ah* [revealed law] of God is necessary for the sake of harmony. . . . Total harmony between human life and the law of the universe is entirely beneficial for mankind, as this is the only guarantee against any kind of discord in life. Only in this state will they be at peace with themselves and at peace with the universe, living in accord with its laws and its movements.[3]

Both the United States and the radical Islamists seek peace but through very different means. The enemy sees peace developing not through societies adopting democratic systems of government but through universal

subjugation of all people to a preexisting set of divine laws. Thus, the radical Islamist movement presents a distinct ideological challenge; it does not object to the manner in which the West seeks to promote freedom and democracy but to the liberal ideal itself.

## RESISTANCE TO GLOBALIZATION

The radical Islamists' war on liberalism is the political component of general resistance to the wide-scale changes caused by globalization or westernization, which they diagnose as a form of imperialism.[4] Their critique of democracy is an echo of the early resistance to colonial influences from over a century ago. For example, the following early twentieth century passage from Egyptian Sheikh Ahmad Muhammad Shakir has contemporary relevance to radical Islamists challenging the legitimacy of western-style democracy:

> Is it then lawful with this in the *Shari'ah* of Allah that he judge the Muslims in their lands by the legislation of pagan, atheistic Europe? On the contrary, the legislation comes from false and fabricated opinions. They change it and replace it according to their whims. . . . Thus in these clearly invented laws, as clear as the sun, it is clear *kufr* [blasphemy], no doubt about it. There is no persuasion and there is no excuse for any one who is affiliated to Islam, being whoever it may, in acting on it, submission to it or establishing it.[5]

The contemporary Islamist resistance to Western incursion is manifested not only in politics but also in the economic, social, and cultural spheres. In an October 2001 interview, Osama bin Laden was asked whether a Huntingtonian "clash of civilizations" was inevitable, and he responded, "I say there is no doubt about that."[6] He offered a comprehensive indictment of the U.S. way of life in his October 2002 "Letter to the American People," in which he declares, "We regret to inform you that you are the worst civilization in the history of mankind."[7] Bin Laden's deputy Ayman al-Zawahiri effectively summarized the group's litany of grievances about U.S. culture and its impact on the region in his preelection message of January 2005 to the Iraqi people. He stated that Muslims should "confront America in the sphere of principles" in order to "expose its polytheism, immorality, and hypocrisy."

> The freedom we seek is not the low and despicable freedom of America. It is not the freedom of the banks of usury, giant companies, and misleading media. It is not the freedom of destroying others for material interests. It is not the freedom of AIDS, prostitution, and same-sex marriage. It is not the freedom of gambling, alcohol, and family disintegration. It is not the freedom of using women as a commodity to lure customers, sign deals, draw travelers,

and promote goods. . . . Genuine freedom is to acquiesce to *Shari'ah*, which rises above ambition, hostility, or heretic tendencies.[8]

In the opinion of al Qaeda and most other radical Islamist groups, none of the governments in the Middle East has adequately resisted the incursion of Western values, practices, and attendant moral corruption. The regimes are either overtly and shamelessly secular or hypocritically sectarian, claiming to be Islamic but not enforcing *Shari'ah*. Of the two, the latter are worse because they pretend to be something they are not. The Saudi regime in particular has been singled out for bin Laden's ire.[9] In this respect, al Qaeda is following in the tradition of many previous insurgent movements claiming to be better protectors of the faith.[10]

## THE ROLE OF IDEOLOGY IN TERRORIST MOVEMENTS

Religiously oriented terrorist and insurgent groups operate in many respects like any other such groups. They use similar tactics and follow the same organizational principles as secular violent political movements. In contemporary Islamic terrorist movements, religion is operationalized as ideology and plays the same role as other more familiar ideological frameworks such as various forms of Marxism, socialism, or nationalism. Kwame Nkrumah, African revolutionary and founder of modern Ghana, said the role of ideology in a revolutionary movement is to clarify, denounce, explain, solve, and mobilize.[11] This is also true of the role of religion as ideology, which serves the same functions with respect to organization, propaganda, operations, recruitment, and training. Religious ideology plays an important role on several levels:

- At the individual level, religion can motivate, inspire, and mobilize.
- At the tactical level, religion can inform means of attack and targeting, such as suicide bombing, and provide justification for killing innocent people.
- At the operational level, religion can guide campaign planning against theater-level targets.
- At the strategic level, religion can provide explanation, justification, legality, and legitimacy. It can be used to establish strategic goals and objectives and provide an overall framework for the revolutionary insurgency.

Religion seeks to inspire the faithful, persuade the hesitant, and intimidate the adversary. Like any good revolutionary dogma, it is not just a description of the world or justification for specific attacks but a self-sanctifying program of comprehensive action that helps recruit, motivate, mobilize, and direct the activities of the group. It is the primary framework within which the insurgency communicates to the outside world,

whether through communiqués or violence. Above all, ideology legitimates the struggle—it converts brute power to rightful authority. As J. P. Larsson observes, religious ideologies are a uniquely powerful mobilizing force because they are theologically supremacist—meaning that believers assume superiority over nonbelievers, who are not privy to the truth of the religion—and absolutist (you are either totally within the religion or totally outside). Overall, religious ideologies help foster polarizing values in terms of right and wrong, good and evil, light and dark—values that can be co-opted by terrorist organizations to convert a "seeker" into a lethal killer.[12]

Radical Islam therefore does very well as a mobilizing and legitimizing ideology. It espouses a consistent worldview that reaches deep into historical consciousness and adequately explains all the troubles of the region by blaming its chief foes: the United States, Israel, the West generally, the United Nations, capitalism, globalization, and the local "apostate" regimes. Like Marxism, any new event can be neatly folded into the model, and it is noteworthy that many Islamic radical thinkers are former Marxists.[13] This demonstrates the nonlinearity of ideology taken on its face as a collection of ideas. Those seeking to wage ideological war must understand that to many adherents of radical ideologies, the primary attraction is to radicalism per se, and the content of the ideology serves principally as a vehicle to express and justify this psychological and emotional predisposition.[14] Thus simply coming up with a good counterargument to their viewpoint will not shake them from their path. Fortunately, vast numbers of people are not particularly vulnerable to the blandishments of the truly radical. Unfortunately, given the destructive power of modern weapons, not many radicals are required to generate a threat to global stability and peace.

### Attacking the Link between Islam and Violence

The radicals with whom civilization is at war are not all people with *salafist* beliefs or tendencies but only those who seek to impose these beliefs on others by force—to overthrow the local regimes, establish a caliphate, and export their revolution abroad. Thus, combating the radical Islamist ideology need not and should not involve a broad campaign against all aspects of their program. This would necessarily involve a critique of Muslim thought per se, which in fact is what the enemy desires; this approach would serve to justify the enemy's claim that the West is at war with Islam and provide a pretext for unifying and mobilizing the entire Muslim world in a defensive struggle.

A more focused approach is to seek the critical nodes and junctures in the ideological schema that transform faith into threat. The most important ideological juncture is that that creates a link between Islam and

violence (in their parlance, *jihad*) in an attempt to use the former to legitimize the latter. Thus a critical objective of the battle of ideas is to isolate those aspects of the terrorist ideology that seek to use Islam to encourage, justify, and sanctify acts of violence and drive wedges between proponents of terrorist violence and the religion as a whole.

It is characteristic of adherents to the *jihadist salafist* ideology that they see Islam as a universalizing force that is legitimately spread through violence. That is, it is an offensive doctrine. Sayyid Qutb, one of the most noted progenitors of contemporary radical thought in the Muslim world, wrote that the mere defense of Muslim lands "is not the ultimate objective of the Islamic movement of jihad, but it is a means of establishing the Divine authority within it so that it becomes the headquarters for the movement of Islam, which is then to be carries throughout the earth to the whole of mankind, as the object of this religion is all humanity and its sphere of action is the whole earth." The Ayatollah Khomeini, speaking in 1942, stated that the universalizing tendency of Islam is for the good of the conquered, since "all the countries conquered by Islam or to be conquered in the future will be marked for everlasting salvation." Furthermore, the expansion of the faith is necessarily linked to violent action, since "Islam says: Whatever good there is exists thanks to the sword and in the shadow of the sword! People cannot be made obedient except with the sword! The sword is the key to paradise, which can be opened only for holy warriors!"[15]

This belief that violence is necessary, obligatory, and offensive in nature is reflected in this definition of *jihad* from the current party program of the radical Islamic group *Hizb ut-Tahrir*:

> *Jihad* originally is *fard kifayah* (a collective duty to be fulfilled by a sufficient number of Muslims), but when the enemy attacks it becomes an individual duty for all Muslims. The meaning that *jihad* is *fard kifayah* originally is that we begin fighting the enemy even if he did not start fighting us. If no one from the Muslims begins fighting in any period of time, all Muslims then would have committed a sin by leaving *jihad*. And therefore *jihad* is not a defensive war; it is in fact a war to raise the Word of Allah (swt), and it is compulsory originally in order to spread Islam and to carry its message even if the disbelievers did not attack us.[16]

*Jihadist salafists* also appeal to self-defense as a legitimizing agent for armed struggle, since defensive war is recognized as rightful in most "just war" frameworks. As Osama bin Laden wrote in 2002:

> In our religion, Allah, The Lord of the Worlds, gave us the permission and the option to take revenge and return to you what you gave us. Anyone who tries to destroy our villages and cities, then we are going to destroy their

villages and cities. Anyone who steals our fortunes, then we must destroy their economy. And anyone who kills our civilians, then we are going to kill their civilians.[17]

The last point is controversial and one of the most important levers for delegitimizing terrorist violence. Most terror attacks explicitly target civilians, which is generally recognized as an illegitimate and unsanctioned activity. In an interview published shortly after 9/11, bin Laden himself said, "Islam strictly forbids causing harm to innocent women, children, and other people. Such a practice is forbidden ever in the course of a battle."[18] However, a year later, after having taken credit for the attacks, bin Laden felt it necessary to come up with justifications for killing innocents. "You may then ask why we are attacking and killing civilians because you have defined them as innocent," he wrote. "Well this argument contradicts your claim that America is the land of freedom and democracy, where every American irrespective of gender, color, age or intellectual ability has a vote." Through the act of electing leaders, he reasoned, Americans became complicit in the "crimes" being committed against Muslims. They also share guilt by paying taxes and being eligible to volunteer for military service. "This is why the American people are not innocent," he concluded. "The American people are active members in all these crimes."[19]

This argument is no more than a rationalization but provides a useful fig leaf for those who are predisposed to violence. However, bin Laden did not address the fact that his and other terror attacks more often than not result in the deaths of innocent Muslims with no links to the U.S. government, tax system, or military. The 1998 U.S. embassy attacks in Kenya and Tanzania, for example, resulted in few U.S. casualties but killed or wounded many Muslims and other locals. More recent attacks in Saudi Arabia, Jordan, Egypt, and Iraq have killed many innocent Muslims. The November 2005 hotel bombings in Jordan, for example, could not in any way be rationalized as targeting U.S. citizens or officials. The impact on the hearts and minds in Jordan was not what al Qaeda may have expected; Jordanian public opinion swung from mild sympathy to the terrorists' aims to hard opposition. In particular, the negative symbolism of bombing a wedding party solidified the image of al Qaeda as heartless savages.[20]

In May 2005, al Qaeda sought to address the problem of Muslims killing Muslims. In an audio tape released on a Web site, al Qaeda's former Emir in Iraq Abu Musab al-Zarqawi appealed not to recognized Koranic principles or the precedents set by Mohammed but to simple utility and practicality. "The shedding of Muslim blood . . . is allowed in order to avoid the greater evil of disrupting jihad," he stated. "God knows that we were careful not to kill Muslims, and we have called off many operations in the past to avoid losses . . . but we cannot kill infidels without killing some Muslims. It is unavoidable." Zarqawi claimed that this balancing test

approach "has been sanctified by many scholars" without going into specifics, and the actual theological support for the proposition is highly questionable. As consolation, the *jihadists* consider innocent Muslims killed in the course of their operations to be "holy martyrs," though public opinion is decidedly against the claim that "we had to martyr them in order to save them." This line of argument, while necessary to justify the terrorists' tactical needs, does them more harm than good. It is the kind of argument that bears repeating in order to demonstrate the ad hoc, opportunistic nature of their thinking. Furthermore, it fails to explain attacks, such as the Jordanian hotel bombings, in which innocent Muslims were not merely caught in the crossfire but were the primary targets.[21]

Despite Zarqawi's claim that killing innocents is legally sanctioned in Islam, a substantial body of argument exists to the effect that it is not, and from much more respected authorities. For example, on April 21, 2001, the Grand Mufti of Saudi Arabia, Shaykh Abd al-Aziz bin Abdallah Aal al-Shaykh, said that Islam forbids suicide terrorist attacks. "What you call suicide bombings in my view are illegitimate and have nothing to do with jihad in the cause of God. I am afraid it is another form of killing oneself." He also later denounced the 9/11 attacks in strong terms and said it was obligatory for clerics to explain that such actions were never permissible.

In November 2003, Saudi Imam Sheikh Nasser Al-Fahd, who had previously issued rulings supportive of the use of violence for purposes of "resistance," and was a major figure to whose views terrorists would appeal to justify their actions, retracted his rulings in the wake of al Qaeda bombings in Riyadh. "Such suicide operations do not result in martyrdom," he wrote. "How can those responsible kill innocent Muslims and non-Muslims and destroy property in the home of Islam? We did not think that matters would reach this extent. My message is: Fear God and stop shedding blood. Fear God and repent your mistakes. It is not shameful to admit mistakes."[22]

A very useful and well-reasoned fatwa was issued by the Islamic Commission of Spain on March 17, 2005, in response to the al Qaeda bombings of commuter trains in Madrid a year earlier in which 191 people were killed and 2,050 injured.[23] The fatwa is a rigorously logical and meticulously sourced document that takes on the various aspects of the terror ideology that link religion to violence.

The fatwa is grounded on the Koranic verse that states, "Do good unto others as God has done unto you; and do not wish to plant the seeds of corruption upon Earth, for God does not love those who sow corruption" (28:77). The term "corruption" is interpreted to include "all forms of anarchy and terrorism that undermine or destroy peace and Muslim security." The fatwa marshals numerous Koranic verses and sayings from the Hadith to demonstrate that non-Muslims should be treated with respect, that murder is the chief of all sins, that paradise is reserved for those who

do good, that war may only be just when it is strictly defensive in nature and conducted within limits, and that even in times of war, it is always a crime to kill innocents, especially women and children. The authors of the fatwa come to five conclusions, summarized as follows:

- Islam rejects terrorism in all its manifestations.
- Islam is the main victim of terrorist attacks made by groups that falsely call themselves "Islamic," by both killing Muslims and giving the faith a bad image.
- Such groups manipulate interpretation of the sacred texts in an attempt to gain support among Muslims or to recruit new followers.
- Those who commit terrorist acts violate Koranic teachings and thus become apostates.
- It is the duty of every Muslim to fight actively against terrorism, in accordance with the Koranic mandate that establishes the obligation to prevent corruption from overtaking the Earth.

The fatwa from the Islamic Commission of Spain is a model for reasoned argument, supported by sacred texts and other legitimate authorities, in the campaign to delegitimize the terror tactics of the *jihadist salafists*.

### Promoting Education Reform

One longer-range effort in the battle against the radical Islamist ideology is on the education front. If this is in fact a "long war" as many believe, a long-term, sustained approach is required, and education reform should play a key role.

The enemy has long sought control over the sinews of educational and religious institutions. For example, 50 years ago the Egyptian Muslim Brotherhood focused its attention on achieving influence in the al-Azhar Secondary School, which among other things certified the *muezzin* (those who call to prayer) at Egyptian mosques. Radical groups have also traditionally sought to wield power at universities, which are prime breeding grounds for revolutionary cadres. Perhaps mindful of this, Iranian President Mahmoud Ahmadinejad has called for a purge of liberal and secular professors from Iranian universities. In a speech to student activists, Ahmadinejad sated that "our academic system has been influenced for 150 years by secularism. We have started to make change happen but we need special support for it. . . . Today, students should shout at the president and ask why liberal and secular university lecturers are present in the universities."[24]

Much attention has been given to the problems of the religious schools known as madrassas or, more properly, *madaris*.[25] There has been particular focus on religious schools in western Pakistan that have been linked to the Taliban and al Qaeda.[26] Granted, neither are all such schools

"laboratories of hatred," nor is the problem limited only to certain parts of the world. However, it would be wrong to conclude that just because *madaris* do not contribute to the ideological support for terrorism in all cases, they can safely be ignored.[27] Furthermore they function as a useful example of what can go wrong in an education system.

The growth in *madaris* in western Pakistan was originally a response to the lack of educational opportunity in the region. Literacy rates in Pakistan are around 62 percent for men and 35 percent for women, on average, and in the rural areas these rates are much lower. Education efforts in rural areas are hampered by lack of money and expertise. Furthermore, money from the central government sent to the frontier areas for education is frequently skimmed by local *sardars* (local chieftains) and projects diverted to their own ends (a school under construction being turned into a mansion, for example).

The *madaris* also proliferated during the 1980s in response to the Soviet invasion of Afghanistan, particularly among the Afghan refugee population. Schools were funded by the United States, various European countries, Saudi Arabia, and other Gulf states in order to create a motivated, educated group of young *mujahedin* to fight the Soviets. Curricula and textbooks were devised with religious themes explicitly supporting *jihad* and anti-Soviet violence generally. For example, a fourth-grade math problem asked, "The speed of a Kalashnikov bullet is 800 meters per second. If a Russian is at a distance of 3,200 meters from a *mujahed*, calculate how many seconds it will take for the bullet to strike the Russian in the forehead."[28] Such books were distributed by the Education Center for Afghanistan, which was funded by the Education Program for Afghanistan at the University of Nebraska at Omaha. The effort was funded under a $50 million grant from the United States Agency for International Development (USAID) between 1986 and 1994.[29] This was a very successful program, unfortunately too much so; once the Soviets withdrew from Afghanistan, the propensity for *jihadist* violence remained. The Taliban (i.e., students) movement began among young men attending *madaris* in Pakistan.

The *madaris* continued to flourish in the 1990s on the basis of funding from two sources. One is *zakat*, or charity, an obligation of the Muslim faith. People give *zakat* to religious groups to meet this obligation, and some of it underwrites the schools. A second, and perhaps more powerful influence, is foreign money. For example, Saudi Arabia sends funds to support the efforts of groups of the Wahabbist tendency. Because of their independent funding bases, it is difficult for the government to exert influence over the schools.

The *madaris* serve an important social function. There are many families in the frontier areas with large numbers of children and little money. The parents send their children to these schools where they not only get

an education but are also fed, clothed, and protected. Said one Pakistani, "It keeps them off the streets." Thus, the root impulse of the parents is not to turn their children into raving ideologues but to give them better opportunities than they might have otherwise. In many cases, this is the only chance they have to enjoy a formal learning environment. Nevertheless, those who receive purely religious education may find it does more harm than good. "They are of no use to the society," said one Pakistani. "They have no skills. They can only go out and become Imams. And we already have enough of them." Simply closing the schools down would be the worst solution to this problem because it would leave many children completely uneducated and drive the efforts of the religious teachers underground, where it will be even more subversive.

Education reform is an important policy issue in the Muslim world generally. The December 2005 Mecca Declaration of the Organization of the Islamic Conference summit called for a ten-year program of action in which education would play a leading role. A Saudi editorial noted:

> At the heart of the Organization of the Islamic Conference (OIC) discussions being held in Makkah is a simple formula: Education breeds tolerance and tolerance breeds peace. Its antithesis is that poverty breeds ignorance and ignorance breeds violence. . . . Religious education, in which the Kingdom has played such a leading role globally, is only part of the story. Muslims also need to be equipped with a general education which will also enable them to improve the lives of their families and their communities.[30]

A comprehensive, broad-based, and long-term plan for education reform would contain several elements:[31]

- *Increase aid for education in the Muslim world*. Money spent on education is an inexpensive way to have a large impact. Yet, these efforts are greatly underfunded. USAID has budgeted $100 million in a five-year plan to improve educational opportunities in Pakistan, or $20 million per year.[32] The Middle East Partnership Initiative funding for its "education" pillar amounted to $8 million in 2002; $25 million in 2003; $22 million in 2004; and $14.4 million in 2005. By contrast, the war in Iraq costs on average about $10million/day. This represents a significant resource mismatch in the overall effort to combat global extremism.

- *Pursue curriculum reform*. At many of the religious schools, subjects other than religion are neglected or completely absent. Schools should be required to adhere to more standardized and mainstream curricula—teaching history, science, language, arts, mathematics, civics, and other topics, in addition to religion. This would require a major effort to strengthen the education bureaucracies in these countries. For example, in Bangladesh an effort has been under way to impose accreditation standards on local religious schools. Students who graduate from unaccredited schools will not be considered to have valid diplomas and will thus be cut off from many employment opportunities, particularly in

the government. This creates pressures from parents and students for *madaris* to meet the accreditation requirements. Pakistan has undertaken a registration initiative for the thousands of religious schools under the purview of the Ittehad-e-Tanzeemat Madaris-e-Deeniya (ITMD), an alliance of five religious boards (*Wafaqs*), which in this capacity functions as the accreditation agency. In return, the ITMD promises to help modernize syllabi.[33] According to President Musharraf, "All of [the *Wafaqs*] are on board to teach subjects that we are demanding, to take examinations of all the boards so that the children can be mainstreamed into life and not become only the clerics."[34]

- *Reform finances.* Countries should seek tighter reporting requirements on charitable giving and religious expenditures. Pakistan has already undertaken an effort to reform the collection and distribution of *zakat*. As well, countries should seek to regulate money from foreign sources not regulated by the government. A third effort would seek to fight corruption in the education system and make sure money allocated for education is actually spent on students.

- *Promote the education of women.* Some have theorized that promoting opportunities for women is the central struggle in the war against Islamic extremism. Efforts to provide educational opportunities for women and girls should be encouraged and supported in all possible ways. The United Nations and G-8 nations have both undertaken literacy programs that target women and girls. A key element of this effort would also be the training of female teachers and the construction of separate girls' schools. It is worth noting that such efforts have been the subject of fierce denunciation by the enemy, and girls' schools in Afghanistan and Pakistan have been repeatedly subjected to attacks and intimidation.

- *Supply textbooks and other reading material.* Modern, secular, up-to-date textbooks are needed throughout the Muslim world. A program similar to the effort undertaken during the Soviet period should be implemented but with more benign content. It would also be useful to translate into local languages the classics of Western literature and books that promote the general freedom agenda.

- *Expand access to digital knowledge.* The Middle East region has among the lowest rates of Internet connectivity in the world. Giving more access to the Web will improve educational opportunities as well as future employment prospects. Access to the Web would give students an entrée into a much wider world, in which they will see and learn about things they cannot imagine.

It may be considered a measure of the effectiveness of current efforts to reform education that Osama bin Laden has objected to them. "The Americans' intentions have also become clear in statements about the need to change the beliefs, curricula, and morals of the Muslims to become more tolerant, as they put it."[35] A Pakistani editorial that is pro-education reform but against certain changes in the curriculum noted that "it is a desire of the Jews and Christians to purge the Pakistani curriculum of its *jihadi* contents. They want to eliminate the spirit of *jihad* from Pakistani Muslims. Therefore, if the objective of the government is to bring changes in the curriculum with a view to introducing new research in modern

sciences, it will undoubtedly be a good step and it should have been taken much earlier. But if it is aimed at excluding the verses of the Koran relating to *jihad* to please foreign masters, the entire nation will oppose such attempts."[36] More ominously, in January 2006, some radical Pakistani religious schools reached an agreement with their counterparts in Iran to "launch a joint struggle to resist global pressure" to reform them.[37]

### Encouraging a Climate of Openness in Combating Terrorism

The war on terrorism has largely been a secret war. The government has shown little inclination to increase the visibility of its efforts to combat terror networks and has rarely released information about victories in the war against extremism. In some respects, a degree of confidentiality is necessary; sources and methods need to be kept secret in order to remain useful. Yet, the bias toward secrecy has been so extreme as to be counterproductive in other areas. The public needs to be kept informed about the war in order to maintain its support; yet the government has done a very poor job at communicating how the war is being conducted. The result has been to create an environment of cynicism; the only time people hear about successful antiterrorist programs is when details are leaked in major newspapers, with the implication of abuse and scandal of one form or another. This has made it difficult to maintain the level of public support necessary to prosecute the war effort in the long run. Public opinion is a critical vulnerability that the terrorists recognize and attempt to influence. It can neither be ignored, nor does the public find repeated government reassurances that all is well to be in any way compelling.

By contrast, the Hashemite Kingdom of Jordan under the leadership of King Abdullah II has adopted a very constructive approach to the issue of informing the public about his government's efforts in the war against terrorism.[38] The Jordanians have sought to be as open and responsive to the public as possible, under the theory that citizens will be more involved, more invested, and more trusting when government channels are open. When such channels are closed, the citizens are more likely to believe terrorist propaganda because their charges will be left unanswered.

An example of this openness policy in action took place in April 2004, when Jordanian security forces broke up a plot to attack the military intelligence headquarters, the prime minister's office, and the U.S. embassy with chemical weapons. The bombings, had they been successful, could have left tens of thousands dead. Within a few weeks of the takedown, Jordanian television carried interviews with captured members of the attack teams, including the leader of the group, a Jordanian named Azmi al-Jayousi, a long-time member of al Qaeda, who was ordered to undertake the attack by Abu Musab al-Zarqawi. The televised interviews revealed many details of the plots, sometimes in the terrorists' own words. Later, at

his trial, Jayousi defiantly denounced the court and the King, among others. "Abu-Musab al-Zarqawi will chop off your heads and stuff them in your mouths, you enemies of God!" he pledged from the dock, throwing his shoes at the judge. In response, security services released a video of the counterterrorist operation in progress, including close-in tactical footage of confrontations with the terrorists, some of whom fought to the death. Most telling was the video showing the capture of Jayousi and his on-the-spot dealing with security forces to sell out his comrades in exchange for leniency. He had revealed the location of every safe house in his network. Video footage of this nature clearly undermines the perception of *jihadi* terrorists as noble warriors and serves an important role in countering recruitment and support activities of groups such as al Qaeda.

However, the United States has been unwilling to engage in this type of information operation. Prisoners apprehended during the war on terrorism are kept in conditions of extreme secrecy, which has the negative effect of allowing those who wish to mischaracterize prison conditions to have free reign in harnessing public imagination. Adopting a degree of transparency would raise the credibility of the U.S. antiterrorism effort. Some may worry that putting terrorists on television gives them a platform for their ideology, but their views are likely not going to attract widespread approval outside of the narrow confines of their own violent communities. For example, the trial of Zacarias Moussaoui produced a number of bizarre statements and tragicomic moments that did not help al Qaeda's cause and engaged audiences in the United States and around the world. As well, the public is interested in terrorist plans and techniques, and exposing the details of terror plots is educational as well as dramatic and entertaining.

Operational security is important, but it is subject to risk balancing like any other aspects of warfighting. The reflexive secrecy that has characterized the U.S. approach to the war on terrorism damages the effort to keep the public engaged. The public wants and needs to hear stories about the conduct of the war effort; stories that inform, explain, and entertain. Lacking this, we cede the information domain to both terrorists and disgruntled former government officials pursuing personal agendas, either publicly or through leaks.[39] Above all, the government should facilitate releasing information that shows what it does right, and does well, to keep the U.S. people secure.

### Highlighting Humanitarian Support Efforts

There is growing awareness of the value of humanitarian relief in the war or ideas. For example, the February 1, 2006, *National Military Strategic Plan for the War on Terrorism* lists humanitarian operations as one of the means whereby ideological support for terrorism can be undercut.

Its authors stated, "The American military's efforts to aid tsunami victims in Indonesia [in 2004] and to assist victims of Pakistan's [October 8, 2005] earthquake did more to counter terrorist ideology than any attack mission."[40] A poll conducted by ACNielson Pakistan in November 2005 showed that U.S. favorability among Pakistanis doubled from 23 percent in May to more than 46 percent, while the percentage of Pakistanis with very unfavorable views declined from 48 percent to 28 percent. For the first time since 9/11, more Pakistanis were favorable to the United States than unfavorable. Eighty-one percent said that earthquake relief was important for them in forming their overall opinion of the United States. Seventy-eight percent of Pakistanis had a more favorable opinion of the United States because of the U.S. response to the earthquake, with the strongest support among the critical group of young people under 35. Of note, even 79 percent of those with confidence in Osama bin Laden had a more favorable view of the United States because of U.S. earthquake aid. The tsunami relief effort also improved the U.S. image worldwide, particularly in countries, such as Indonesia, that benefited from the majority of U.S. assistance.[41]

The point is that "hearts and minds" operations need not be dogmatically ideological. Humanitarian operations can win over as many people (if not more) as abstract appeals to freedom. Insurgent groups such as Hizbollah have had noteworthy success in swaying local populations by providing the social services that the Lebanese government has been unable to supply. People who have been assisted in meeting their basic needs will be more open to the ideas and appeals of those who have assisted them. This is a playing field in which the United States has substantial advantages, since the U.S. economy is the largest in the world. Kinetic solutions to terrorist and insurgent challenges are much more expensive and less effective in swaying local populations. In some cases, we should consider purchasing less bang for the buck.

### Continuing to Pursue a Broad Freedom Agenda

In the long run, the freedom agenda being pursued by the United States and other countries will be successful. The effects of globalization to which the radicals are responding are demand-driven—people in the region, especially young people, want to buy Western products, live a Western lifestyle, and enjoy the benefits of liberal freedoms. A 2002 Gallup poll of the Islamic world showed that while many people in the region are opposed to specific U.S. policies, U.S. technology and culture fare much better. One example of the popularity of Western influences is the Lebanese Broadcasting Company's reality show "Star Academy," a talent contest featuring 16 young men and women living in a house north of Beirut. The program aired throughout the region and was denounced by the Higher

Ulema Committee in Saudi Arabia, which issued a *fatwa* outlawing the show. The ruling stated that "Star Academy" was banned for showing mingling between the sexes and lewdness and for "killing shame and honor in the hearts of Muslims by letting them get used to these shameful scenes." Yet it was the most popular show on television in any country in which it aired, and in Lebanon the weekly broadcast drew 80 percent of the 15–25-year-old demographic.

One should note in this regard the difference between promoting democracy in the region and promoting freedom. The former implies specific changes in regimes and political systems that implicitly or explicitly threaten almost all the established governments. As well, recent local elections in Egypt, Saudi Arabia, and especially the Palestinian Authority demonstrate that free, fair, democratic elections can result in victories for well-organized radical parties seeking to impose a revolutionary agenda. However, promoting the norm of freedom (as opposed to the institution of democracy) is a much less threatening approach that can be adapted better to governments and societies already in place. Such an approach could be accompanied by a greater emphasis on civil society building in areas, such as combating corruption, promoting rational legal frameworks that protect property rights, rationalizing tax systems, and generally lowering tax rates in order to promote the development of a healthy middle class.

Generally speaking, the views of the radicals are decidedly unpopular among most Muslims.[42] Sometimes radical leaders do well in polls, such as the June 2004 Zogby poll that showed Hizbollah leader Hasan Nasrallah and Osama bin Laden ranking third and fourth respectively among the most admired world leaders. But the second most admired leader was long-deceased Egyptian secularist ruler Gamel Abdel Nasser (who ordered the execution of Sayyid Qutb and is despised by the Muslim Brotherhood), and first ranking was French President Jacques Chirac, who had recently banned wearing Muslim head scarves in schools and hospitals.[43] What a poll like this demonstrates is not a particular affinity for the radical agenda but admiration for people who stand up to the United States.

Specific opinion polling on the radical program reveals little support for a *Shari'ah*-based theocracy. Polls in Iraq, for example, have shown support for the role of religion in politics in general terms but not for the program touted by the extremists. The National Voter Attitudes and Awareness poll, conducted in August 2004 by the International Republican Institute (IRI) and the Independent Institute for Administrative and Civil Society Studies, asked, "Which of the following would be the most important in regards to the status and role of religion in Iraq?" Only 7.27 percent of Iraqis gave as their first response, "Islam and the *Shari'ah* form the basis of all laws and legislation." A slightly smaller percentage (6.46%) responded, "Iraq maintains a separation between religion and government." The

plurality response, 44.44 percent, was for "All religions and sects can practice freely." In an April 2004 poll, when asked what the most appropriate system for an Iraqi government would be, 63.6 percent chose a parliamentary, mixed parliamentary, or presidential system, while 22 percent chose a system based on religion.

In the Oxford Research International *National Survey of Iraq* of June 2004, 24 percent of those surveyed "agreed strongly" that Iraq should have a government made up of religious leaders, but 70 percent supported having a democracy. When asked about the top priority for the next 12 months, only 2 percent listed "Ensuring that religious ideals are followed;" 70 percent said "regaining public security in the country." When asked what country could serve as a model for Iraq, 3 percent listed Iran, and an equal number listed Saudi Arabia, either of which might be seen as an example of some form of *Shari'ah*-based government. Yet 5 percent chose the United States as a model, and 5 percent chose Japan. The comparatively liberal United Arab Emirates was noted by 26 percent, coming in second to "Iraq needs no model" at 35%. An IRI poll in September-October 2004 found that 52.3% of Iraqis believed that "religion and government should respect one another by not impeding on the rights, roles and responsibilities of the other," while 37.9 percent felt that "religion has a special role to play in the government." Yet, of the latter group, strong majorities believed that the special role would not impede freedom of worship by all faiths; it was not an endorsement of *Shari'ah* as the dominant force in the new government.[44]

It is important to distinguish between those who want elected governments to pass laws reflecting Muslim values and those who seek to establish an Islamist state. The former approach could be interpreted as a mechanism for the government to limit itself by obeying Muslim precepts. Proponents of liberalism should not be alarmed by those who seek to have what they see as a good and moral government, particularly given the recent history. Furthermore, voting shows the people's desire to have input, to have checks, and to allow their voices to be heard. Simply because people want Koranic law to influence legislation does not automatically place them in the radical camp or mean that they wish to see the creation of a theocracy.

Yet, these popular views are irrelevant to al Qaeda. To the radicals, it does not matter that the people would not choose the form of government they espouse. Al Qaeda has no interest in social preference; they want to give people the government they need for their own good, whether a majority chooses it or not. Zarqawi noted that "absolute right—which should be obeyed and grabbed with the teeth even though the masses of people disagree with you—is the right written in the Koran and *Sunnah* . . . even if the masses agree otherwise. The rule is for God alone, and not for the human race or the majority."[45] Even having a democratic polity with laws

based on *Shari'ah* is illegitimate. The entire radical program must be implemented as a whole, because all is equally important, and there is no human basis (or legitimate power) for deciding which aspects of *Shari'ah* should apply and which should not. Bin Laden said, "If we suppose, for the sake of argument, that 90% of the laws and regulations are derived from the Islamic *Shari'ah* and 10% are derived from man-made legislation, then this constitution, according to Islam, is a constitution of infidelity."[46]

In addition, the radicals are not under the illusion that the Islamic utopia can be built by consensus. Rather, it will be arrived at by coercion. "There is no doubt," Zarqawi declared, "that the Imamate [universal authority in all religious and secular affairs] is established by means of fealty from the proponents of valor—in other words, force."[47] He decried the people who voted for "those who claim they are Islamists in parliamentary elections" but would not join the *jihad*, asking, "What valor do these people have when the power of armies is with infidels? The state is for those who possess power, and power is men, weapons, and supplies." For these and other reasons Zarqawi was skeptical that an Islamic government could be established any time soon. "Our countries cannot be purified from the filth of occupiers and their lackeys of apostate traitors except by valor, or force."[48] In any case, given his timely demise, such a state will not be established by Zarqawi.

## CONCLUSIONS

The above-mentioned battlefronts in the war of ideas are only some of the ways in which the civilized nations may confront terrorist ideology. Furthermore, confrontation on the ideological plane alone is not a sufficient means of defeating the threat posed by armed extremism. The expression "war of ideas" or "battle of ideas" has a long provenance; was used in the American Civil War, World War I (by both sides), World War II, the Cold War, and now in the war on terrorism. It has yet to be demonstrated that the "idea" portion of those wars played the decisive role in concluding them, or in settling the outstanding ideological issues. In all these cases, other elements of national power, especially military power, either used directly or as a deterrent force, played a critical role. (It is said that when asked why the Italian Communist Party did not come to power following the Second World War, Josef Stalin replied, "No Red Army.")

Furthermore, it would be a mistake to believe that ideas cannot be suppressed using force. Terrorists, authoritarian and totalitarian regimes, and other proponents of illiberal belief systems, have demonstrated their willingness to use violence and coercion to stamp out manifestations of free thought. Afghani liberal reformers who lived under the Taliban regime were at great risk of life and limb, particularly when they expressed their views openly. Proponents of change in Iran or Syria face official harassment, arrest or imprisonment. Christians and Jews in many countries

face persecution, or are relegated to second-class status. Even today in Afghanistan, Christian converts face the death penalty.[49] John P. Roche used to illustrate the efficacy of official suppression of ideas by suggesting that students write a brief history of Protestant Spain from 1478 to 1834 (the period of the Spanish Inquisition). Thus while the war of ideas is a critical requirement for the successful prosecution of the war against terrorists and their sate sponsors, it cannot stand alone but must work along side and be integrated with the efforts of the military, intelligence community, and other agencies in disrupting and defeating terrorism.

# CHAPTER 16

## THE CENTRALITY OF IDEOLOGY IN COUNTERTERRORISM STRATEGIES IN THE MIDDLE EAST

Maha Azzam-Nusseibeh

In the aftermath of 9/11, but increasingly in the context of the democratization initiative in the Middle East, it becomes imperative to better understand the counterterrorism strategies of states against their Islamist opponents. These strategies of engagement are part of a complex picture of political and religious radicalization in the region.

The experience of Egypt provides interesting insights, not only because in many ways, it was the Egyptian Islamist groups that formed the core of the thinkers who shaped militant Islamic ideology, but also because it offers an example of a state able to substantially suppress the terrorist threat domestically (although some would argue that this success came at the price of exporting the problem to the rest of the world). However, one should also keep in mind that there are some peculiarities to the Egyptian example, not least of which is related to the Islamist groups themselves. It might therefore be worthwhile to draw some comparisons with Saudi Arabia, which is seen by some analysts—given the nationality of the majority of terrorists involved in 9/11—as another main front in the fight against terrorism.

In looking at how the state has dealt with the problem of terrorism, it is imperative to examine the way in which the revolutionary theory of the radical Islamists was countered and to a large degree discredited by the establishment. The true threat that the jihad in Egypt—and its offshoot al Qaeda—presented to governments in the Middle East was not that jihadists were a group of radicals practicing random violence against the state; the real threat they posed was fundamentally based on the political

theory they developed and provided a roadmap for confronting the state (as well as other enemies). Although they themselves would greatly resent the analogy, one can draw some parallels with the importance of Marxist-Leninist theory to the development of communist revolutionary movements. Since this revolutionary theory was essentially couched in theological language, the debate, by necessity, involved theological discourse.

Finally, this chapter will briefly touch on the main issues that form the core of public disaffection in the region. Radical Islamist terrorism has occurred because of a confluence of a new revolutionary theory combined with widespread public disaffection toward the state. The problem the state faces is that it may be able to physically suppress these groups; it may, more fundamentally, counter and discredit their ideology. But so long as these issues remain unresolved, the region will remain unstable and the wider populations will continue to provide a pool from which new radicals might evolve.

## SHADES OF THEOLOGY

A major plank of the attack on Islamist extremists by governments in the Middle East has involved a theological counterargument to the theory put forward by the Islamists to help legitimize both their political agenda and their operational methods, notably the use of terror. However, there is a tendency among some Western analysts to oversimplify the theological debate by seeing a divide between "traditional" theological interpretations, exemplified by the Wahhabi school of thought (which is believed to be backward looking, anti-Western, and illiberal), and, what some hope to see develop, a more "modernist" interpretation of Islam, at ease with democracy, modernity, and women's rights and which it is believed will act as a counterweight to traditional Islam, which in turn is blamed for the extremist views held by Islamists. This viewpoint is particularly reflected in the European search for "European-educated" Islamic clergy to serve the Muslim immigrant community and can be clearly seen in the comments made by Mr. Blair during a recent news conference in California.[1]

This view has two main repercussions. First, it blinds these analysts to a major theological debate that has been raging with increasing intensity for over 15 years in the region about the legitimacy of the use of terrorism. Second, it can lead to a serious misunderstanding of the ideological battle lines *as seen from within the Muslim community itself.* In fact, the main opponents—from a theological standpoint—of the extreme Islamists have so far been the traditional or orthodox Islamic hierarchy. One can see this in the active involvement of the al-Azhar[2] in issuing fatwas against these Islamists (as explored later in this chapter) as well as the stance of the Wahhabi establishment in Saudi Arabia, which had taken a position against suicide bombings even before 9/11. However, that is not to say

that the traditional Islamic establishment, because it is opposed to the Islamists methodology, entirely disagrees with either their world view or their aspirations. Both parties, the traditional clerics and the Islamist activists, share and reflect the aspirations and views of their societies at large. One could go further and say that among Muslims in the Middle East, there is a growing consensus for the need for a greater degree of Islamization, for political reform, and for a more robust attitude toward Israel and U.S. involvement regionally. Therefore, the ideological debate waged by the Egyptian or Saudi states is not about moving the region closer to Western principles or Western interests, but rather it involves discrediting the methodology of the Islamists as a means of weakening and eventually eliminating their appeal among the public.

It may also be worthwhile to look at another issue related to understanding the nuances of secularism in the context of the Middle East. In the Middle East, the term has connotations that arguably involve not only a separation of religion and state, but also an element of excessive antagonism toward religion. Secularism as an ideal in the Middle East was usually held by a small Western-educated elite who saw religion as part of a culturally and politically backward past. The problem is that because they have command of Western languages and contacts with Western institutions, they manage to convey the view that the secular trend is deeper than is the reality, and they fail to see the separation of their world view from that of the majority. Ultimately, the defeat of terrorism must involve a winning of the hearts and minds of the religious many in Middle Eastern society, and not the secular few.

### Egypt: The Cradle and Grave(?) of the Extremist Islamist Movement

In many ways, Egypt is where it all started. The Muslim Brotherhood, considered by many to be the ideological forefather of the modern Islamist movements, was born in parliamentary Egypt, was suppressed under Nasser, and evolved into a nonviolent (albeit essentially repressed) main opposition party under Mubarak. Likewise, the Sadat era saw the birth of both extremist violent movements, such as the jihad and the Gama'a, as well as the more cult-like Takfir wal-Hijra.

That Egypt produced and ultimately exported these political trends is significant. This was not only a reflection of a perhaps more active dissident political scene in Egypt than elsewhere in the Arab world, but rather the result of a more active ideological debate waged by the Egyptian Islamic opposition, which gradually developed into a more ruthless theory of revolution. The significance of the assassination of Sadat was not that he was assassinated by an officer (indeed political assassinations were not uncommon either in modern Egyptian political history or in that of the wider Arab arena), but that the assassin secured a fatwa by Sheikh Omar

Abdul-Rahman[3] legitimizing the assassination. The well-documented *al-Farida al-Gha'iba*[4] provided the theory for active physical opposition to both the corrupt state and external enemies (which eventually extended not only to Israel but also to the United States). In many ways, the attempts of Ayman al-Zawahiri (yet another Egyptian from the jihad movement of the 1980s) at developing the theory for justifying suicide bombings and the targeting of soft targets is simply a continuation of the development of this "revolutionary" theory.[5]

It is therefore particularly significant that in Egypt, we have recently seen the main Islamist group, the Gama'a al-Islamiyya, essentially renounce the main aspects of this theory—aspects that legitimized terrorism especially against the state whose personnel qualify as fellow Muslims and even against noncombatant U.S. civilians. It did this both by renouncing terrorism in the media[6] and by publishing its own "revisionist" theory in *Nahr al-Zikrayat* (River of Memories) and more critically in *Tafjeerat al-Riyadh-Al-Ahkam wal Athar* (The Riyadh Explosions—Judgments and Effects) in 2003.[7]

The path that led to such a fundamental revision was neither direct nor particularly clear. In fact, one could argue that the Egyptian government's policy toward the Islamist groups was riddled with inconsistencies, notably the difference between a more accommodative phase prior to 1992 and a more robust prosecution of the war against terrorism post-1992. Despite the emergency laws in force since Sadat's assassination, and the continued government clampdown on any form of opposition, there is evidence that in the late 1980s and early 1990s, at least in some areas—typically very poor slums in Cairo or remote regions in upper Egypt—the authorities and the Gama'a seemed to have arrived at some kind of modus vivendi where, provided the Gama'a stayed on its patch, the authorities let it be. Examples of this can be found in Minya, where both the police and the Gama'a seemed to cooperate in combating a Copt-run prostitution ring in March 1990,[8] or in Manfalout, where again the police and the Gama'a seemed to gang up on the Copts.[9] The Gama'a also seemed to control certain slums in Cairo, such as Imbaba or Ain Shams, where according to one account, until 1988 "you would feel right away you were in Afghanistan. All men were bearded, wearing short galabiyas (traditional Arab dress, the shortened length denoting a salafi commitment) and women were in niqabs (full face cover, as opposed to the more common head-scarf)."[10] Moreover, the Gama'a could in certain cases show a public profile in the sense of holding book fairs, at least in Asyut University, or Eid prayers in mosques where they would fly their banners openly.[11]

What is not clear is how much this reflected an official policy, as opposed to local commanders simply keeping out of areas (slums and the remote countryside) where they knew government writ was hard to enforce without a serious resort to force. In one confrontation in 1988, in the

Adam mosque in the Cairo slum of Ain Shams, the residents cheered as members of the Gama'a murdered a police officer named Essam Shams.[12] Similarly, the remote areas of Upper Egypt are often a haven for groups operating outside the law, including common criminals, precisely because of the remoteness of the area, the difficulty for the local constabulary to gain local information and support, and the paucity of manpower and resources available to them.

It may also have reflected a degree of uncertainty among the security apparatus about the best method to tackle the problem. There is some evidence to suggest that the security apparatus considered three distinct policies. The first was an all-out confrontation proposed by General Zaki Badr, the ruthless Minister of the Interior (1986–1990). The second involved a process of dialogue and theological counterargument proposed by Hassan Abu Basha, former head of the security department under Sadat (1975–1982) and Minister of the Interior after Sadat's death (1982–1984), who acknowledged that the Islamist extremism was founded on faith. Finally, the third involved "clipping the tails and chopping the heads." In other words, the policy envisioned concentrating the security attack on the support base through a campaign of mass arrests and "persuasion," while assassinating the leadership. This is combined with a polemical assault via the media as well as a total media clampdown on any elucidation of the Gama'a ideology.[13]

It is clear that from the passing of Law 97 in 1992, known as the counterterrorism law (which in fact was a modification of existing legislation but allowed the security forces more powers and was supplemented by Presidential Decree No. 375 that allowed for the trial of terror cases by military tribunals),[14] the security forces increased the vigor of their prosecution of the counterterrorism campaign. This is reflected in the increase in the number of militants killed by the security forces (from 7 in 1991, to 37 in 1992, to 59 in 1993, to 134 in 1994, then peaking at 193 in 1995 before dropping again to only 4 in 1999).[15] This is also reflected in the perception of the Gama'a itself. Despite the assassination of its spokesman Dr. Ala Mohiedeen by the security forces in 1990, and its retaliatory assassination of Refaat el-Mahgoub, the Speaker of Parliament, it did not see the situation as particularly confrontational at that time.[16] This is not necessarily as bizarre as it may sound. It is clear that in the interaction between the security forces and the Gama'a, and especially violent interaction, both parties incorporated the Upper Egyptian traditional concept of *Tar* (or vendetta), which formed part of their shared cultural worldview. It is only post-1992 that the Gama'a felt a shift in government policy, starting with the roundup of many Gama'a and jihad members in 1992 and 1993 and then members of the Muslim Brotherhood from 1995 onward. The security forces then followed up with a policy of liquidation from 1994 onward, where all fugitives were targeted for assassination on sight,

including members of the "preaching" (as opposed to the "military") wings. One case was cited where the security forces entered the home of a cell in al-Zawiya al-Hamra in 1994 and killed all seven occupants of the house. At the same time, relatives and friends of the suspects were also rounded up and interred for long periods, essentially used as hostages until the suspects gave themselves up.[17] This iron-fist approach seemed to work, with confrontation between the state and the group calming post-1995 and culminating in the ceasefire announced by the Gama'a leadership (from jail) in 1997.

While this strategy adopted by the security forces seems to echo the policy advocated by Colonel el-Sawah and Captain el-Hegawi,[18] it was nonetheless combined with a concerted effort at countering the theology used as the basis for the militants' revolutionary theory. This started with debates between members of the al-Azhar clergy and preachers of the Gama'a in various mosques during the 1980s[19] but then expanded to a much wider campaign conducted in the mass media.

This theological debate has been ongoing since the Sadat era, but it appears that it gathered momentum in the 1980s and into the 1990s. Secular commentators and Islamists alike have both made the assumption that the views of the clerics from the Azhar simply reflected government wishes and policies. Indeed, a discrediting of mainstream theologians as lackeys of the state was started by the Muslim Brotherhood much earlier and has been maintained by the various Islamist factions today. However, such assertions need to be seen for what they are, that is, an attempt to win the argument before engaging in debate by negating the "academic purity," if you will, of the other side. To accept this view (in essence that senior theologians simply follow state directives) hinders an understanding of the dynamic of this debate. The point is that for both parties—the traditional religious establishment and the Islamists—the centrality of faith is a given, and arriving at the correct interpretation of Islam leads to saving one's soul. To assume that senior Muftis—such as Sheikh Mohammad al-Ghazzali or Sheikh Tayyib al-Naggar—issued fatwas that they did not wholly and fully believe in is to claim that they did not care about their immortal soul, which seems highly improbable.

The mainstream theological establishment's view is that the use of violence against civilians and fellow Muslims is incorrect theologically. That such a position simply buttressed the arguments of the government looks as if it was incidental to their conviction. The best way to support this argument is to look at one of the many fatwas used by the government during the 1980s against the Gama'a. As discussed previously, by 1989 the Gama'a had control of certain areas within Cairo and in the countryside. Within those areas, the Gama'a appears to have applied Islamic Law (all Islamists, moderate and radical alike, call for the application of Islamic

law) including punishment (Hudud). In part, this was an attempt by the Gama'a at embarrassing the Egyptian government (whose legislation, although based on the Napoleonic code, claims to be founded on Islamic law) by showing that it had taken the initiative to apply God's law where it could. Clearly, all Muslim clerics believe that the Shari'a should be applied, and yet a council of senior clerics—including Sha'rawi, Ghazali, al-Naggar, and Qaradawi—announced in 1989 that individuals could not apply the Hudud and thus denounced the Islamists' practice as Islamically unsound.[20] Later fatwas by the Azhar include one against assaults on tourists[21] and one against terrorism in general.[22]

The interesting point is that Qaradawi was a co-signatory of the 1989 edict. This is the same man seen by many in the Western media as a supporter of terrorism because of his refusal during the late 1980s to condemn suicide bombings in the West Bank as un-Islamic. He argued that the West Bank was a special case (all Israeli civilians were part of the military, he said, and therefore they do not come under the protection of civilians provision in Islamic law, and the Palestinians had no other weapon of significance available; therefore they could commit suicide during combat). But one cannot simply draw a line and state that Qaradawi represents extremist ideology while those who condemn suicide bombings are moderates. Both sides share a large area of theological agreement. For Qaradawi, the debate about suicide bombing in the West Bank was specific, and his view reflects a divide among Muslim theologians about that issue. Some, such as the head of the Saudi Commission of senior Islamic scholars, oppose it (as did the Shiite Lebanese scholar Fadlallah—hardly a moderate—in the 1980s, eventually leading to Hizbollah abandoning the tactic), while others, such as Sheikh Sayyid Wafa, secretary-general of the Islamic Research Centre at the al-Azhar, supported it, as did Sheikh Tantawi, the Mufti of Egypt.[23]

It is precisely because this is a theological debate conducted among believers that the counterattack by the Azhar on the "theory" of the Gama'a was eventually so effective. Qaradawi's view that they could not enforce the Hudud in the slums had resonance partly because it was known that he believed suicide bombing in the West Bank was legitimate. It was clear that he was no government lackey, and so his view added to the weight of the argument against the Gama'a. Likewise, the constant rulings by the senior Azhar clerics that attacks on tourists and general terrorist acts were un-Islamic eventually made a deep impact, not only on the general population who would move away from the extremists' interpretation, but also on the Islamists themselves, who must have begun to doubt their position, especially if they and their Azhar opponents agreed on many other issues such as Shari'a, Palestine, and so on. That this is in large part a debate about theology can be seen in the contorted way Zawahiri tries to extend

the opinion allowing suicide bombings in the West Bank further to justify 9/11[24] from a theological standpoint. It is also significant that his view has not been accepted by any mainstream theologian.

The Egyptian government used other weapons in its arsenal in its propaganda war against the Gama'a, including soap operas in the 1990s that depicted Gama'a members as sex-engrossed deviants in an attempt to strip away public sympathy. However, neither the iron-fist policy used by the security apparatus nor the propaganda war can fully explain the decision of the Gama'a leadership to revise its view on the use of terror. After all, the Egyptian state continued (in Islamist perceptions) to be autocratic, unwilling to apply Islamic law and subservient to U.S. interests. Moreover, previous attempts at an iron-fist approach had failed in the past, producing ever more extremist movements. Nonetheless, the main extremist Islamist movement in Egypt appears to have renounced a major pillar of jihadist ideology. It is not that the Gama'a moved in terms of its aims; it is simply that it became convinced that its revolutionary theory was theologically flawed; and while the argument could be made that this epiphany happened after many years in detention (an argument put forward by London-based Yasser al-Sirri[25] ), it is notable that this revisionist stance was adopted by Gama'a members not in detention (in part because of their particularly disciplined structure, which had made the ceasefire of 1997 possible. This disciplined structure meant that the rank and file accepted the views of their imprisoned leadership). In other words, the government in Egypt won a significant battle not by instigating political reform, or through security measures, but primarily through a shift in the theological stance of the Gama'a members (irrespective of whether this was the result of their deprivation in prison or the proselytization of their fellow Muslim Brotherhood inmates). That is not to say that the threat of terrorism was lifted from Egypt—as indeed recent events in Sharm el-Sheikh in July 2005 and the resort of Dahab in April 2006[26] demonstrate that it has not—but the Gama'a's new position fundamentally weakens the position of any Islamist terrorist not only in the eyes of the public at large but more importantly in the eyes of Islamist sympathizers in particular.

### Saudi Arabia: The New Frontier

The nationality of the hijackers in the 9/11 attack pushed Saudi Arabia into the limelight as the new hotbed of radicalism, and much was made in the West of both its Wahhabi heritage and previous tacit support of a radical Islamic agenda abroad, especially vis-à-vis Israel and Afghanistan. However, from a Saudi perspective, 9/11 posed four main problems. First, how could the regime repair its relationship with its main sponsor, the United States? Second, how did al Qaeda—which, notwithstanding the

leadership of bin Laden, is seen as an offshoot of the Egyptian jihad—manage to infiltrate so deeply in Saudi society without the knowledge of the security forces? Third, how much was the House of Saud at risk? And finally, how could the ruling family face down this threat without appearing to lose its Islamic credentials in front of its own population?

The argument that the House of Saud derives its legitimacy from supporting and applying the Wahhabi doctrine has been well rehearsed. Indeed, Saudi Arabia differs in one essential aspect from Egypt in that it applies Islamic law. Islamist opposition to the regime had therefore concentrated its attack on aspects of corruption, acquiescence to U.S. policy, and the general lack of respect for the rule of law (manifesting itself as a lack of accountability). However, the Gulf War had resulted in one major policy that all parties (including the religious authorities supporting the state) had agreed might be in breach of Islamic practice—namely, the stationing of Christian troops (i.e., U.S. troops) on Arabian soil.

The regime realized that before it could mount an effective ideological counterattack, it had to remove this one policy that it knew it could not defend theologically in the Wahhabi-dominated kingdom. Its problem was squaring that requirement with its need for U.S. protection and its continuing efforts at countering the damage done to its image in the United States by 9/11. The eventual solution found benefited all parties concerned. The removal of U.S. troops to Qatar in May 2003 allowed the United States to maintain its military presence in the region while relieving the pressure from the Saudi regime, by removing the one issue that the regime found indefensible before its population at large.

Once free of this burden, the Saudi regime could pursue its ideological campaign with more vigor than the Egyptian regime, precisely because of its strong religious credentials. What is interesting is that it chose to follow a slightly different tack to that of Egypt. While in Egypt the Islamists' ideology was attacked with the heavy guns of the Azhar clerical opinion often attacking their methodology and practice, the Saudis went out of their way to win back the hearts and minds of Islamist supporters, especially among the younger Saudi population, by "wooing" them back to the fold. They did this, among other means, through television programs essentially designed for this purpose. One good example of this methodology can be found in a Saudi TV special aired in November 2004, titled "Dakhil al-Khaliyya" (inside the cell). A panel of experts discussed the structure of al Qaeda cells in the kingdom, the difficulties in tracking them, and the damage they were doing. What was noticeable was how little time was spent in a direct discourse against the ideology of al Qaeda. Instead, the program focused (with the help of a couple of ex-members) on conveying how the cells essentially operated as a cult. Much was made of the fact that the ex-members were forbidden to contact their relatives and were isolated from the outside world. Specifically, the point was made that the

ex-members were unaware of the carnage the terrorist attacks wreaked among Muslim Saudi citizens. The impression was given that gullible but well-meaning Saudi youngsters were being manipulated by "foreign" forces to operate "outside" society. In a final twist, the panel played on Saudi society's xenophobia by asking why all the leadership of these cells was Egyptian and remained safe as finance directors and planners, while the troops—who essentially became suicide fodder—were Saudi citizens.

In other words, while the regime in Egypt essentially engaged over several years in a debate with the Islamists (with the help of the mainstream theologians) to fundamentally discredit the foundations of the extremists' ideology from a religious standpoint, the Saudi regime chose to side-step the issue, effectively refusing to accept that the extremists had any valid argument to rebut. One should remember that the position of the Mufti of Saudi vis-à-vis suicide bombings preceded 9/11 and was part of a general (as opposed to a particular or national) theological debate. This was probably because Saudi Arabian society sees itself as orthodox not only in terms of personal faith but also in terms of civic makeup. Therefore, the regime felt confident that it could present this issue as one of an enemy political entity using cult-like methodology to entrap and use insecure Saudi youngsters. In this way, the regime enlisted the help of society at large, but particularly older members, to tackle what was being presented as a youth problem, while sending out the message that the regime was willing to help youngsters who had mistakenly strayed into al Qaeda if they gave themselves up.

This "paternalistic" approach seems to have been mainly a propaganda campaign, as evidenced by the very tough security measures the government undertook against all Islamist operatives on the ground. In May 2003, the Saudi government released the names of 19 fugitives. Following the suicide bombings against Western housing compounds in Riyadh, all nineteen were tracked down and killed,[27] with apparently no attempt at deprogramming any of the Saudi youngsters. In December 2003, a further 26 names were published by the security forces. Following the attack on the U.S. Consulate in Jeddah on December 6, 2004, and the suicide bombing of the Ministry of the Interior on December 29, all 26 were captured or killed. As a result of information gathered from those captured, a further list of 36 was published in June, and by December, ten of these were either killed or captured. The security forces then widened their net, arresting a much wider circle of sympathizers and supporters.[28] By the end of 2004, some 48 Saudi security officers had been killed in the various showdowns with al Qaeda supporters, so that the government felt the need to provide special financial compensation to their families. Furthermore, notwithstanding the propaganda campaign of a paternalistic government seeking to help its misguided youth, the government resorted to offering

rewards of up to $1.87 million for information leading to the arrest of any al Qaeda operatives.[29] In terms of a security campaign, there are clear parallels with the vigorous Egyptian security campaign against the Islamists between 1992 and 1995. However, the nearest the Saudi Arabian government got to anything like the theological debate seen in Egypt was the call of the Grand Mufti for all clerics who supported violence through unlicensed fatwas to be investigated in September 2005.[30]

The Saudi Arabian government pursued an additional avenue to attack the Islamists namely, a concentrated attack on the various financial avenues and resources used by the Islamists to bankroll their activities. In 2003, the government chartered the Financial Investigations Unit, which became operative in 2005. This and the Financial Action Task Force went after the financing of the Islamists. First, they required all banks to report any suspicious transactions to them. The year 2003 also saw a ban on the collection of cash donations in mosques for charities, which remains in place. In this way, they made it difficult for the Islamists to bankroll their activities from the donations of either active supporters or unwary charity donors in mosques. They further tightened the control of the government on the free flow of capital, with the application of a law in fall 2005 restricting the transportation of cash (or equivalent assets) in or out of the Saudi Kingdom to $16,000. This was clearly a copy of the U.S. law requiring the reporting of the transfer of cash over $10,000, and indeed U.S. customs officers helped train the Saudi officers to enforce these restrictions.[31] These measures in combination effectively, slowly starved the Islamist operatives from the financing needed to carry on their activities or to send money to help other al Qaeda operatives in other countries.

Finally, in terms of repairing the damage done to its relationship with the United States, the Saudi Arabian government pursued two main strategies. First, it cooperated fully with the U.S. government in terms of sharing information through initiatives such as the U.S.-Saudi Strategic Dialogue and by providing information on terrorists wanted by the U.S. government, such as a Jordanian American man named Abu-Ali who was arrested in Mecca in 2003 and handed over to the U.S. authorities. He was later convicted in 2005 of plotting to assassinate President Bush.[32] Second, the Saudi regime tried to take the initiative to mount a movement among Muslim regional governments to combat terrorism. They held an emergency meeting of the Organization of Islamic Conference (OIC) in Mecca in December 2005 and an "International" Counterterrorism Conference in Riyadh in the same year. The final report of that conference, published on the Internet, demonstrates the extent to which these conferences were public relation events aimed at showing the U.S. government and media what a good global citizen the Saudi regime was. Judging by a nonempirical observation on the comments made by the U.S. media on Saudi Arabia, the regime had failed to repair the damage done to its image there, even

if it has done much to convince the U.S. authorities of its sincerity and commitment.

However, in its other aims, the Saudi regime seems to have been as reasonably successful as the Egyptian government. The regime has effectively prosecuted its campaign on the al Qaeda network in the Saudi Kingdom by assassinating its main personnel, arresting its supporters, and restricting its financial lifeblood. Ideologically, it could attack the theology of these groups as deviant because of the Wahhabi nature of the state as a whole. Meanwhile, the spike in oil prices over the last two years has reversed a decline in per capita GDP experienced by the Saudi Kingdom over the previous twenty years and has allowed the House of Saud to pump more money into the state to bolster its popular support.

## THE GORDIAN KNOT

The problem for both regimes is that notwithstanding these advances, all they manage to do is suppress, but not eliminate, the problem. In some ways, major strides have been made in the war against terrorism, and not all were due to successful government policy. The attack on Dahab in Egypt and on the Interior Ministry in Riyadh, which resulted in the loss of Muslim civilian lives, were huge tactical mistakes on the part of al Qaeda in that they helped bolster the argument being put forward by orthodox Muslim clerics that the tactics of suicide bombing and the targeting of civilians were un-Islamic practices.

While the majority of the public in the Muslim world chose to ignore the civilian toll of the 9/11 attack, there is now a growing conviction among that public that no matter the political justification, such acts are unacceptable religiously (although an exception is still made for attacks on Israel). This has also been helped by the repulsion felt at the activity of al Qaeda (where it involves Iraqi civilians but not the U.S. military) in Iraq and the attacks in Jordan, especially the bombing of a wedding party and the resulting death toll. In some ways, the satellite TV network al-Jazeera has helped in this transformation by widely broadcasting pictures of the carnage resulting from these attacks.

The issue for the counterterrorist policies of the Egyptian and Saudi governments is that while the methodology of the extremists has been effectively discredited in the eyes of the majority in the region, their general aims have gained greater credence among the population at large. This is because the terrorist groups represent the extreme end of widespread popular disaffection with the regimes, so that while the extreme element can be cauterized, the underlying tension in society remains unresolved. In essence, there is a consensus among the vast majority in Middle Eastern societies for three general aims, although the degree of support for each specific aim might vary. First, there is clearly an ever-growing demand

for an increasing Islamization of all aspects of society, even if it is fiercely resisted by the secular minority. This is not, as Tony Blair recently stated in a speech in July 2006, an attack on modernity but simply a choice to adopt a different worldview, possibly related to issues of identity, but certainly rooted in an increasing religiosity. Thus, counterterrorist initiatives aimed at radical Islamists are being conducted against a background of a strengthening current of Islamization.

Second, there is a general demand for political reform, whether through parliamentary democracy or an Islamic system with greater accountability. This in itself weakens the foundations of the regimes in the region, who realize that reform by necessity means the end of their monopoly on power. The U.S. administration has taken the view that furthering democracy will help stabilize the region and has pressured its regional allies to instigate some steps in that direction. The problem for both the United States and its local allies is that the less extreme Islamists have taken the lead as the main political opposition and have clearly capitalized on this and the trend for increasing religiosity to gather a large degree of popular support. Nowhere is this better illustrated than in Egypt, where the secular, Western-friendly Kifaya movement and the more traditional opposition parties failed to make any real political impact, while the Muslim Brotherhood became the main opposition party and, in any normal democratic setup, the government in waiting. In other words, the ideological and physical setback suffered by the extremist Islamist movements as a result of effective government counterterrorist campaigns have not resulted in the retreat of Islamist ideology; rather, it has benefited the moderate Islamist faction, which has regained lost ground among the grassroots and boosted its political position in society as a whole.

Finally, there is a general consensus that in terms of regional politics, Middle Eastern governments have consistently failed in their duty to uphold the interests of their citizens. The United States is often cited as the main enemy of the Islamists, especially in light of the ongoing fallout from the Iraq War, but the root of the problem remains the Arab-Israeli issue. Whatever the perception in the West, the overwhelming majority in the Middle East see Israel as the last of the European settler or colonial states. Its very existence on what is seen as Arab soil—which involved a displacement of the indigenous population—is perceived as a grave injustice perpetuated by military might and the unquestioning support of the United States, hence the antagonism toward the United States. Moderates and extremists in the region alike agree on this view. The moderates take the position that one has to accept the reality that the state is now established (the famous Israeli principle of facts on the ground) and work toward seeking the best possible terms for the indigenous Arab population. The extremists believe that to accept the legality of Israel simply because it has superior force of arms is morally unacceptable and thus turn their

ire on Israel's main sponsor, the United States—without whom, they erroneously believe, Israel could not survive.

In terms of regional politics, as long as the regimes are seen as at least trying to achieve the best outcome for the Palestinian people, the moderate element within society can be convinced to support their governments, which in turn helps bolster their counterterrorism initiatives. However, all factions within society become more antagonistic when the process is stalled or when they see, courtesy of al-Jazeera, daily pictures of Palestinian suffering. At times when the situation deteriorates, as it has done recently in southern Lebanon, many in society tend to move closer to the extremist camp, and that in turn bolsters the Islamists, who are seen as the only political party standing for what is perceived as "right" in this situation, as well as the extremists whose anger appears to be vindicated by events.

The Israeli incursion into southern Lebanon has backfired in another way. The orthodox clergy might have won the battle for convincing the majority in the region that attacks on civilians are un-Islamic, thus bolstering the government's counterterrorism drive. However, the resulting casualty list from this war—with the heavy loss of civilian life in Lebanon as a result of what is seen as a legitimate attack on an army unit—is contrasted against a primarily military casualty list on the Israeli side. The position of the Arab governments, given their perceived impotence, becomes untenable precisely because of the unacceptability of civilian casualties.

While the Arab-Israeli issue is only one among several factors that feeds into support for the Islamists, it provides at times of heightened crises the impetus for increasing the support base of the Islamist movement at large, so that no matter what advances they make elsewhere, Middle Eastern governments inevitably lose ground whenever the crisis flares up.

## CONCLUSION

Looking back at images of celebration on the Arab streets following 9/11, it seemed for a while that al Qaeda had managed to take the politics of the jihad from the fringe to the mainstream and from its original Egyptian milieu to a much wider arena. Al Qaeda seemed to represent more than simply a terrorist organization. Its main weapon was a new revolutionary ideology that rejected, first, the traditional political system in the region; second, the traditional compromise arrived at between religion and the state in Middle Eastern society (especially outside the Gulf); and third, the restriction imposed on the avenues open for confrontation with the "enemy" by traditional Islam, specifically the legitimacy of the use of terror.

The counterattack undertaken by Arab governments, at least in the case of Egypt and Saudi Arabia, has largely been successful particularly in

countering this last point. "Traditional" Islam seems in the process of effectively winning back much of the lost ground in the hearts and minds of Muslims by rebutting the attempts at reinterpreting Islam by the extremists. Al Qaeda had indirectly started a reformation in Islam in that it has attempted to take away the business of expounding on theology from trained clerics, believing that those clerics chose not to see their viewpoint out of fear or personal interest. Yet those same clerics, who might share much of the political concerns of al Qaeda, managed to hit back with their well-argued religious reasoning. This was a battle of ideology between traditional Islam and revolutionary Islam, and traditional Islam seems to have won.

Moreover, the extremists lost out physically in that in both these countries, their ability to operate and expand their "war" has been severely restricted with the incapacitation of many of their senior operatives, as has their ability to attract a wider grassroots base. To borrow an imperfect but useful analogy from nineteenth-century Europe, al Qaeda has been relegated from becoming a Bolshevik movement into becoming merely an anarchist movement.

However, in other crucial aspects, the regimes have lost ground. The extremists' loss of the theological argument has not resulted in the retreat of the Islamist trend as a whole; rather, it has resulted in exactly the opposite outcome, with moderate Islamists gaining momentum and support in society at large, partly because the emphasis on traditional Islam bolstered their own position and partly because they represented a popular trend toward a greater Islamization of society. Thus the rejection of the traditional compromise between religion and the state in the Middle East, one of the general aims of the radicals, became a wider trend among a larger component of society. This is also partly because separately from the activities of extreme Islamists, the moderates had long worked through nonviolent politics and charitable activity on winning the hearts and minds of the population at large.[33]

Likewise, the radicals' wish to see fundamental change to the political system in the region seems to be gaining momentum. In this they have been aided by the United States in that any democratization initiative simply allows the moderate Islamists, who are the most popular opposition group, to gain in power and prestige. The understandable reluctance of the regimes to move further in this direction (which is ultimately a form of political suicide) simply adds to the resentment of the population and consequently to the support for the moderate Islamist movement. Similarly, the impotence of these governments to achieve any form of regional redress for perceived wrongs further bolsters the position of the moderate Islamist movement.

That is not to say that al Qaeda is totally eliminated as a political player. It is clear from the continuous stream of its statements that it is desperate

to remain relevant in the political equation in the region. Moreover, the bombings in Madrid in March 2004 and in London in July 2005 as well as the foiled plot in London in August 2006 demonstrate that it is able to mobilize small cells of fanatical adherents to devastating effects. However, the indications are that while al Qaeda can still cause carnage, it has, partly as the result of a concerted attack by traditional Islam and partly because of the success of the security measures adopted by governments, failed as a revolutionary movement. The problem for the West and the Arab regimes is that this failure seems to have led to the increasing entrenchment and success of the moderate Islamist movement.

# CHAPTER 17

## PUBLIC DIPLOMACY AS STRATEGIC COMMUNICATION

Bruce Gregory

Americans "discover" public diplomacy in wartime. Seeking allies and loans for the American Revolution, Benjamin Franklin and John Adams worked as hard to gain support from the citizens of France and Holland as they did to persuade their governments. In the twentieth century, U.S. international information and cultural agencies came and went with two world wars and the Cold War. Combating terrorism is having a comparable impact in the twenty-first century. Political and military leaders are transforming instruments of national security in response to new threats and opportunities. Again they are finding it necessary to understand, engage, and influence what publics think and do, not just their governments. Public diplomacy is not the instrument to combat terrorists directly. This is work for coercive instruments of power. Public diplomacy is a means to challenge ideas that give rise to terrorism. Importantly, public diplomacy must also be an adaptive and resourceful way to engage global publics on consequential issues other than terrorism.

Although turning to public diplomacy in times of conflict is not new, the conditions in which public diplomacy instruments are used today are radically different. First, there are differences on the level of ideas. Twentieth-century wars were state-sponsored contests between democratic and authoritarian visions of society rooted in secular worldviews. The Cold War was fought by competing heirs to the Enlightenment traditions of reason and science—and the legacies of Karl Marx and Thomas Jefferson. Ideas are no less influential in today's conflicts. But they compete in multiple public spheres on a broader range of diverse and complex issues. Much attention justifiably is given to contending views within Islam and to mindsets of extremists who use violence and utopian visions in support of

political and religious goals.[1] Fixation on terrorism, however, risks missing public diplomacy's relevance to contested ideas about democracy, global governance, the distribution of public goods, and many other cross-border challenges.

Second, there are differences on the level of political process. Central governments are less powerful relative to nonstate and substate actors. Vertical, state-centric models matter less. Horizontal, network models matter more. Diplomats still act as gatekeepers between states, but more often they are what Brian Hocking calls "boundary spanners," mediators between states and nonstate actors on multiple issues in changing patterns of interaction.[2] There are many more democracies in the world. Scholars debate the problems democratization creates in fragile societies and the benefits of "efficiency gains" ranging from zones of democratic peace to collaboration on common concerns.[3] Coinciding with these changes are sustained high levels of anti-Americanism based on policy disagreements and resentment of U.S. power, which have been documented by the Pew Research Center's Global Attitudes Project and other surveys.[4] Declines in favorable attitudes also reflect what one analyst calls a "secession of elites," meaning a loss of support from opinion leaders, driven by generational change. These trends have immediate and long-term costs.[5] When global publics—elites and masses—become more powerful and hold negative opinions at the same time, public diplomacy becomes more important and more difficult to execute.

Third, there are differences on the level of media and information technology. Fifty years ago, much of the world lacked access to credible news and information. Today, information saturation is the norm. This creates, in Joseph Nye's words, a "paradox of plenty." Attention is the scarce resource, and "those who can distinguish valuable signals from white noise gain power." When there is too much information, "political struggles occur over the creation and destruction of credibility."[6] Thomas L. Friedman tells us the "world is flat," by which he means a new generation of software applications linked to fiber-optic networks is enabling many more groups and empowered individuals, especially non-Westerners, to collaborate and compete globally.[7] Media coverage, and rapid public reactions to that coverage, occur in relentless 24/7 news cycles. Public diplomacy must adapt to an environment shaped by greater transparency and by greater opacity. Multiple state and nonstate actors gain access to public spheres made more transparent by the Internet, satellite television, and an array of low-cost communication technologies. Transparency creates advantages for those skilled at shaping perceptions with credible narratives. It creates disadvantages when tactical events, such as prisoner abuse at Abu Ghraib, become a global strategic problem at the touch of a keyboard. Public spheres are opaque as well. Individuals and terrorist groups hide their identities on the Internet. Web-based

content (text, audio, and video) is detached—to a greater degree than content in earlier media—from the social contexts that provide meaning and credibility.

The significance of mediating technologies in shaping thoughts and actions is not new. Nearly a century ago, Walter Lippmann diagnosed problems arising from the influence of industrial-age information technologies in the space between a complex world "out of reach, out of sight, out of mind" and the "pictures in our heads."[8] The hot and cold wars of the twentieth century became meta-narratives for citizens, the media, and political leaders looking for ways to simplify and frame national security issues. Presidential speeches—including Wilson's "Fourteen Points" (1918), Roosevelt's "Four Freedoms" (1941), and Truman's "Campaign of Truth" (1950)—were emblematic of these metanarratives and used by policymakers, diplomats, and military commanders to set agendas, explain threats and opportunities, advocate policies, and shape public diplomacy strategies. The absence of a comparable meta-narrative after the Cold War created two problems for strategists. First, it deprived them of a way to frame national security issues simply, powerfully, and advantageously. Second, as political scientist Robert Entman points out, it gave citizens and the media more power to frame the national security environment independently.[9] Recognizing this, the Bush administration settled on terrorism as a new meta-narrative immediately after 9/11. "Our war on terror . . . will not end until every terrorist group of global reach has been found, stopped, and defeated," President Bush stated a week after the attacks.[10] Five years later, the *National Security Strategy of the United States,* began with the words "America is at war" and outlined a strategy grounded on two "inseparable priorities—fighting and winning the war on terror and promoting freedom as the alternative to tyranny and despair."[11] There are reasons for skepticism about the "war on terror" as a dominant narrative. Its adequacy is challenged by its oversimplification in a multi-issue, multipolar political environment and by the *National Security Strategy's* own description of many other problems and cross-border challenges. Its appropriateness is questionable on the grounds of rhetorical excess and misunderstanding by the global publics that political leaders seek to persuade.[12]

Because public diplomacy faces very different conditions on the levels of ideas, political process, and mediated information, its instruments and institutions must change. Five years after 9/11, U.S. political leaders have begun to recognize the need for change, and they are looking critically at legacy tools and structures. They promise "transformational public diplomacy," by which they mean both increased resources for "programs we know work" and "fundamentally changing the way we do business."[13] Questions occur on the scope, durability, and scale of their reforms.

## PUBLIC DIPLOMACY AFTER 9/11

A few forward-looking practitioners and scholars wrote thoughtfully about public diplomacy's new strategic environment in the decade after the Cold War.[14] Their efforts were largely ignored. The attacks of 9/11, however, turned this analytical trickle into a fire hose of reports, articles, and opinion columns. In contrast, most political leaders on a bipartisan basis did little more than lament "Why do they hate us?" or "Why can a man in a cave out-communicate the world's leading communications society?"[15] Some useful early initiatives did occur. In October 2001, the State Department created a 24/7 Public Diplomacy Task Force with links to agencies, embassies, and U.S. combatant commands to coordinate participation in a "strategic information campaign." Secretary of State Colin Powell led a stream of White House officials and cabinet secretaries in appearances on Al Jazeera and other global media. The White House, adapting methods used in U.S. and British political campaigns and by the North Atlantic Treaty Organization (NATO) in Kosovo, created a Coalition Information Center network linking Washington, London, and Islamabad. For a few months, the United States and the United Kingdom used this network to respond to breaking news and communicate messages within news cycles. These efforts had merit, but they were tactical and were discontinued following the defeat of the Taliban in Afghanistan, the departure of key players, and the inability of executive branch organizations to turn temporary measures into durable institutional changes.

Attempts were also made to transform public diplomacy at the strategic level. The House of Representatives passed bills that would require the State Department to develop a public diplomacy strategy. No counterpart measures passed the Senate. In 2002, National Security Advisor Condoleezza Rice created an interagency Strategic Communication Policy Coordinating Committee to develop "strategic communications capabilities throughout the government." The committee met twice. By executive order, the White House created an Office of Global Communications in 2003 to develop a strategic approach to public diplomacy among "appropriate agencies" of the government. It failed to do so, and the office closed in 2005. The Department of Defense (DOD) created an Office of Strategic Influence for its "strategic information campaign in support of the war on terrorism." Opposition from U.S. government public affairs officials and widespread negative press coverage forced Secretary of Defense Donald Rumsfeld to dissolve the office in February 2002. Until the appointment of Karen Hughes in August 2005, the position of Under Secretary of State for Public Diplomacy and Public Affairs was filled by a Senate-confirmed appointee for only 18 months during the Bush administration's first four and one-half years in office.[16]

While the government was dithering, the private sector was paying attention. Driven by 9/11 and surveys showing widespread anti-Americanism, public diplomacy became part of a national and global conversation in the media, on college campuses, and in research organizations and advisory panels. Journalists and opinion writers found much to criticize in the United States' information, cultural, and international broadcasting activities. Universities in the United States and abroad added courses on public diplomacy. Task forces and advisory panels wrote reports.

There was a consensus among the experts: public diplomacy is vital to national security; it was broken and strategic-level change was needed. Opinions about what to do, however, varied widely. For some, the rearview mirror was the best optic. Public diplomacy is what Foreign Service Officers, cultural diplomats, and international broadcasters had done well in the past, often very well, usually in separate competing organizations. By focusing on past accomplishments, advocates could justify priorities and budget increases advantageous to the tribal cultures in which they were comfortable. Others, however, want to retain what is best from the past, but view public diplomacy as an instrument that requires new thinking and new tools. Some are turning to networking and strategic direction models.[17] Reports of the Defense Science Board, Council on Foreign Relations, and U.S. Advisory Commission on Public Diplomacy recommended a presidential directive to advance a variety of implementing strategies. An advisory group led by former Ambassador Edward Djerejian urged "a new strategic direction" for public diplomacy in the Arab and Muslim worlds. Government Accountability Office (GAO) reports addressed deficiencies in the strategic approach of U.S. international broadcasting, the absence of a State Department public diplomacy strategy, and the lack of a "national communication strategy." By the summer of 2005, these and other studies had offered a rich tapestry of recommendations for reform, leading some observers to suggest "report fatigue" and call for moving beyond recommendations to business plans and action.[18]

Exogenous events and the outpouring of private sector interest had an impact on government. Rhetorically, the United States' leaders no longer neglect public diplomacy. The time for public diplomacy reform is "now," Secretary of State Condoleezza Rice stated emphatically when she announced the appointment of Under Secretary of State for Public Diplomacy and Public Affairs Karen Hughes. Defense Secretary Donald Rumsfeld argued, "We are engaged in a test of wills, and it will be won or lost with our publics and the publics of other nations."[19] The need to engage publics and the ideas that are underlying sources of threats and opportunities is reflected in actions as well as speeches. U.S. leaders show greater concern about "listening" to others and "understanding" their opinions and cultures. There have been modest gains in public diplomacy

resources. A "Strategic Language Initiative" encourages professionals and U.S. citizens to learn foreign languages. New public-private partnerships are emerging with the United States' universities, corporations, and media industries. There is greater emphasis on recruiting and training public diplomacy professionals. Government agencies pursue imaginative efforts to leverage the Internet and other communication technologies. As Hughes summarized, "There were 30-plus reports that had made very sound recommendations about what we should do, and I view my job as trying to get it done."[20]

### Defining Public Diplomacy and Strategic Communication

Definitions are a first step in "getting it done." Beginning in the 1960s, a few practitioners and scholars used the term public diplomacy to describe information and cultural activities of U.S. missions, the U.S. Information Agency (USIA), the State Department's Bureau of Educational and Cultural Affairs, the Voice of America, and other U.S. broadcasting services. During the next 40 years, public diplomacy came into widespread use in the United States and abroad through its use in congressional hearings, reports of the U.S. Advisory Commission on Public Diplomacy, and increasing acceptance of the term by practitioners. Recently, the term strategic communication has gained traction primarily in national security circles. The position of Deputy National Security Advisor for Strategic Communications and Global Outreach was added to the National Security Council staff in March 2005. On April 8, 2006, President Bush established a Policy Coordination Committee on Public Diplomacy and Strategic Communications led by Under Secretary of State Karen Hughes.[21] The Joint Chiefs of Staff updated the U.S. military's information operations doctrine in 2006 to define strategic communication as "focused USG efforts to understand and engage key audiences in order to create, strengthen, or preserve conditions favorable for the advancement of USG interests, policies, and objectives."[22]

These labels prompt analytical questions. Are the terms public diplomacy and strategic communication interchangeable? Or is strategic communication an umbrella concept that embraces distinct components such as public affairs, public diplomacy, cultural diplomacy, democratization, international broadcasting, and open military information operations? Organizational missions and structures provide no easy answers. For example, when remarks by a military commander at a Pentagon press briefing are carried on global media platforms, is it public affairs, public diplomacy, or a military information operation? These activities are distinguished less by audience and conceptual differences than by doctrines, budgets, and bureaucratic turf. Should strategic communication, as one scholar suggests, be used to describe short-term instrumental activities as

a subset of public diplomacy, separating them from long-term exchanges of people and ideas?[23] Do public diplomacy and strategic communication describe only what governments do, or do they also describe global governance activities of nonstate actors? What is the meaning of related terms such as advocacy, propaganda, spin, branding, and perception management, and how are understandings shaped, positively or negatively, by their use? These are not trivial questions. Naming is part of a struggle over meaning. In naming, we judge as well as describe.

I propose defining public diplomacy and strategic communication as analogous terms that can be used separately and synonymously to describe activities by governments, groups, and individuals, intended to *understand* attitudes, cultures, and mediated environments; *engage* in a dialogue of ideas between people and institutions; *advise* political leaders, diplomats, and soldiers on public opinion and communication implications of policy choices; and *influence* attitudes and behavior through communication strategies and messages. These are core components of an instrument of statecraft that embraces a variety of means: diplomacy, cultural diplomacy, international broadcasting, political communication, democracy building, and open military information operations. Analytically, these components and means comprise one instrument among a range of persuasive, cooperative, and coercive instruments available to strategists. At another level, public diplomacy and strategic communication cut across all political, economic, and military instruments of statecraft and are critical to their use and success.

Public diplomacy is instrumental and essential to governance. Its purposes are broadly political. It serves interests and values. Public diplomacy differs from education, journalism, advertising, public relations, and other ways groups communicate in societies apart from governance. To succeed, public diplomacy imports discourse norms from society and depends greatly on private sector partnerships. Education norms matter in Fulbright scholarship programs. Peer review ensures that scholars funded by government grants are chosen on the basis of academic merit, not for partisan reasons or their policy views. International broadcasters value journalism norms and institutional shields that protect them from interference by policymakers in news gathering and reporting. Public diplomats and military public affairs officers know they cannot operate effectively unless they are truthful and credible. Institutional firewalls are needed to separate what they do from deception techniques used legitimately in war. Firewalls are not appropriate, however, as shields against strategic direction, management, and oversight. Choosing to fund more exchanges in Pakistan and fewer exchanges in Germany or trade-offs among broadcasting languages and technologies, for example, are strategic decisions to be made by political leaders.

Public diplomacy operates in three time frames. One is the news cycle. Policymakers and communication strategists cannot ignore the relentless demands of 24/7 news and media relations. If diplomats, soldiers, and political leaders do not get inside news cycles, others will, often with disadvantageous perspectives. A second time frame relates to communication campaigns on high-value policies that may last months and years. Here strategists need to make choices. Not all policies require public diplomacy campaigns. Nor are resources available to carry them out effectively on all policies. Choices raise questions. What policies are most important? What are the best narratives? How should consistent themes be tailored to different countries and regions? When is an ambassador the best messenger? A cabinet secretary? A combatant commander? A credible third party? What themes, messages, messengers, symbols, and communication tools are best suited to persuade, tap favorably into emotions, mobilize alliances, and serve political objectives? A third time frame is long-term engagement—the development of relationships between people, groups, and institutions—in the realms of ideas, culture, shared knowledge, common ground, discourse norms, reasoned dialogue, and vigorous debate about issues. Here, investments must be made for years, decades, and generations.

Each time frame is essential to a comprehensive understanding of public diplomacy and strategic communication, whether the policy issue is combating terrorism, nuclear weapons proliferation, bilateral relations between countries, or many other important national security concerns. Public diplomacy in each time frame has limits. Public diplomacy does not trump flawed policies or weak political leadership. Shared understandings may not overcome deep disagreements or interests in conflict. Cross-cultural experiences may reinforce hostilities and competing values. Governments are constrained because much of what their citizens and societies project—and much of what global publics perceive—is beyond government control. Results can take years to achieve or may never be achieved. Success is difficult to measure, although not impossible with appropriate methods and sufficient resources. Without longitudinal studies of U.S. civilian and military exchanges in Indonesia, it is difficult to draw sturdy conclusions. Nevertheless, it is reasonable to assume that years of investment in academic exchanges and International Military Exchange and Training programs have contributed positively to civil society and democratization in the world's largest Muslim country.

Public diplomacy agencies could not function without private sector partnerships. Most government-sponsored international exchange and democratization programs are administered by nongovernmental organizations (NGOs). Many exchange programs receive funding from corporations as well as foreign governments. Foreign opinion research is

done though contracts with commercial polling organizations. Increasingly, public diplomacy seeks to leverage private sector talents and creativity to enhance operational capacity in knowledge domains, product identification and development, services and skills, and evaluative feedback.

Public diplomacy is also used by nonstate and substate actors and by international organizations when they act in ways that further regional and global governance. Political party institutes, labor unions, and corporations conduct public diplomacy when they support civil society and democratization programs. The governor of Washington engages in public diplomacy when she proposes a Chinese cultural center in Seattle and a Washington state educational center in China. It is public diplomacy when the European Union influences citizens in member states on trade and monetary policies and when the United Nations shapes perceptions on its governance activities in Kosovo.

### Institutions and Tribal Cultures

The goals of public diplomacy are well established and relatively non-controversial: comprehending other cultures, encouraging dialogue about ideas on issues of common concern, fostering mutual understanding, expanding democracy, reducing anti-Americanism, and influencing attitudes and actions in support of interests. These goals have deep historical roots; Ben Franklin would recognize each. The institutional means to achieve these goals, however, are diverse, changing, and contested. There is consensus that public diplomacy includes legacy activities of the USIA, distributed throughout the Department of State: press briefings, ambassadors' media interviews, foreign opinion research, conferences, book translations, embassy Web sites, and exchanges. Most observers also include U.S. international broadcasting services directed by the independent Broadcasting Board of Governors (BBG), although many broadcasters are not comfortable with the public diplomacy label. The BBG directs a suite of federal and corporate international broadcasting services that include the Voice of America (VOA), Radio Sawa and Al Hurra (Arabic language radio and television networks), Radio Free Europe or Radio Liberty, (broadcasts to Europe, Russia, Central Asia, Afghanistan, Pakistan, and Iran), Radio Free Asia, Radio Farda (radio and television broadcasts to Iran and other Farsi-speaking areas), and Radio or TV Marti (broadcasts to Cuba).

Public diplomacy institutions have multiplied since USIA and VOA were the primary actors. Press officers in the White House, National Security Council, DOD and other cabinet departments, and the military's combatant commands focus increasingly on global publics in briefings and outreach activities. Many U.S. agencies fund educational and professional

exchanges. According to the U.S. General Accountability Office, "An in-teragency working group meets quarterly to coordinate the exchange and training activities of 12 federal departments and 15 independent agencies."[24] The U.S. Agency for International Development (USAID), in addition to funding democratization programs, funds Fulbright scholar-ships in Pakistan, VOA broadcasts in Africa, and Sesame Workshops in Egypt. More than 100 USAID "Development Outreach and Communica-tions Officers" work side by side in U.S. missions with the State Depart-ment's public diplomacy officers. The National Endowment for Democ-racy and other publicly funded private entities engage in democracy building. The Center for Disease Control (CDC) consults on ways to put health-related narratives in the entertainment programs of U.S. and for-eign media. The DOD provides Military Information Support Teams to assist with outreach in some embassies and contracts with U.S. private sec-tor companies to fund projects intended to improve foreign public opin-ion about the United States. The U.S. Central Command seeks to com-municate its regional vision "to a global audience" in "winning the war of ideas."[25] The proposition that these departments and agencies engage in public diplomacy is contested. Not all diplomats agree that the CDC, USAID, and U.S. combatant commands can be said to carry out public diplomacy activities. Soldiers and civilians in the DOD debate whether they "execute" or "support" public diplomacy.

Another way of looking at public diplomacy is though its tribal cultures—groups whose identity and behavior are associated with par-ticular norms, rules, and skills.[26] These include:

1. Foreign service officers in embassies and foreign ministries who emphasize face-to-face communication, the priority of "the field" over headquarters, lan-guage skills, opinion elites, and the importance of dialogue;

2. Cultural diplomats and professionals in academic institutions and NGOs who privilege exchanges, educational norms, fostering of private cultural connec-tions, deep knowledge of other cultures, and long-term results that are difficult to predict or measure;

3. International broadcasters who stress mass audience communication, journal-ism norms, audience research, gaining of market share, and media channels (radio, television, and the Internet in descending priority);

4. Communication strategists and public affairs advisors to presidents, cabinet secretaries, and agency directors, who focus on press relations, messages and talking points, occupation of space advantageously within news cycles, the relevance of political campaign strategies, and building of domestic consent (a priority) and foreign consent for policies;

5. Military officers who specialize in strategic communication defined to include public affairs, defense support for public diplomacy, and open information operations and who value communication strategies, doctrine, training and

education, media tools, innovative technologies, leveraging of NGOs, and information as an instrument of national power; and

6. Democracy-building professionals in government and private sector organizations who give priority to civil society initiatives, partnerships with NGOs, training, and working with indigenous groups.

Each group has a distinct self-identity and operational preferences. Each competes for resources and freedom of action. Each tends to exclude rather than include: members of different groups seldom attend the same conferences, participate on the same task forces, or value interagency assignments. Some relationships do exist. The Secretary of State sits *ex officio* on the BBG, and the State Department hosts useful interagency fusion teams that share information. Foreign Service Officers carry out press and cultural activities sequentially and simultaneously. Diplomats are assigned to military units; soldiers serve in embassies. Overall, however, public diplomacy is executed by a maze of diverse institutions and competing tribal cultures. Expertise, experience, and focused effort are strengths of this specialization. Homogeneity is both impossible and unwise. But laissez faire has its price: missed collaborative opportunities, weak interactive networks, and the absence of overall strategic direction.

### Transforming Public Diplomacy

How should we think about transforming public diplomacy and its role in combating terrorism? First, it is important to recognize that these are separate questions. Transformation matters because public diplomacy supports not only counterterrorism, but other important interests. Second, it is prudent to consider that strategic transformation may not be achievable. Karen Hughes during her first year in office as under secretary accomplished more than her predecessors in institutionalizing public diplomacy reforms in the State Department and at U.S. missions abroad. These reforms are important, especially if they help to transform the State Department's traditional diplomacy culture. Reforms in one organization, however, will not achieve changes on the scale required for a public diplomacy instrument comprised of diverse actors, each of whom is facing complexity in a world of states and networks. The United States' tradition of episodic commitment to public diplomacy and preference for military and economic instruments of power are reasons for prudence. Other reasons are grounded in the U.S. political system. University of California, Los Angeles (UCLA), political scientist Amy Zegart has voiced doubts about achieving reforms in the intelligence community. Her reasons are instructive for public diplomacy. Organizations, especially government agencies, seldom adapt from within to changes in their external environment.

Separation of power in the federal government makes reform legislation rare and difficult. Presidents and lawmakers value effective organizations. Nevertheless, with limited time, finite political capital, and few electoral benefits to be gained, they seldom take on the hard work of institutional reform.[27]

These barriers are not insurmountable. Public diplomacy transformation has occurred, but only when presidents and congressional leaders, driven by war and the inability of institutions to adapt to their external environment, made transformation a personal priority. Studies of public diplomacy recognized the need for presidential leadership in achieving reform long before 9/11.[28] Recent studies have done so as well. Seldom if ever, however, have these studies offered roadmaps leading from general recommendations to outcomes that could prevail over political and bureaucratic obstacles. Detailed roadmaps are beyond the scope of this chapter, but it is possible to identify four characteristics essential in their construction.

**First, map change in three convergent dimensions.** Public diplomacy actors at all levels—in embassies, in regional networks, and in national departments and agencies—have three strategic communication requirements. They must listen. They must choose. They must adapt. Transformation roadmaps must connect and strengthen all three.

*Listening* means comprehending cultures, attitudes, memories, beliefs, demographics, media trends, and social networks at a very high level. This means more than just a rich appreciation of others. It means seeing ourselves the way others see us rather than through the "looking-glass perceptions" of our own views and beliefs.[29] It means recognizing that countries, cultures, subcultures, tribes, religions, influence structures, and virtual communities are extraordinarily diverse and require a variety of interpretive tools. It means investing much more in penetrating cultural analysis, ethnographic studies, hard languages, social network analysis software, media analysis, and polling—and sharing what is learned from these efforts among agencies and coalitions. It also means anticipating: the United States has strong ties with elites in Pakistan, for example, but not with millions in Pakistan's successor generation who will determine its future.[30] Stakeholders in public diplomacy minimize both the difficulty and the desirability of listening. Diplomats tend to think they understand indigenous cultures sufficiently through their own perceptions. Military doctrine only recently has begun to include the need to "understand" others in strategic communication and information operations. Political leaders spend large sums on opinion and media research to win elections; then, when in office, they routinely ignore these tools in their public diplomacy. The State Department's paltry annual worldwide budget for foreign opinion surveys was estimated by the GAO in fiscal year 2005 to be $4.4 million.[31]

*Choosing* means deciding where to concentrate effort. With finite resources and political capital, policymakers, diplomats, soldiers, democratizers, and broadcasters cannot be everywhere and do everything. The United States' buffet of issues—nuclear proliferation, counterterrorism, China's projection of hard and soft power, famine, genocide in Africa, global pandemics, trade, energy, science, climate change, and much more—may not exceed the nation's appetite, but it surely exceeds its capacities. The challenge in determining priorities is two-fold: first, to avoid preoccupation with one thing (e.g., combating terrorism and the war in Iraq) while consigning everything else to checklists of threats and opportunities and, second, to concentrate resources effectively in time horizons that range from news cycles to generations.

*Adapting* means using approaches, narratives, messengers, technologies, and instruments tailored to situations and linked to listening and choosing. What works well in Mexico may not work in Egypt. NGO partnerships may be just the thing in South Africa but not in North Korea. Shortwave broadcasting may reach publics in parts of Africa but not young people in Russia occupied with video games. Political leaders, ambassadors, and combatant commanders play different roles in adapting actions to situations. Each needs talented strategic communication advisors with something useful to say when options are considered, decisions are made, and policies are communicated.

**Second, design roadmaps that connect hierarchies and networks.** Scholars and forward-leaning practitioners have been clear for some time: networks are dominant social structures in information societies. In Manuel Castells' pathbreaking account, all societies are "penetrated, with different intensity, by the pervasive logic of the network society, whose dynamic expansion gradually absorbs and subdues pre-existing social forms."[32] Networks, Castells argues, are flexible and better than hierarchies in adapting to interactive complexity in human relationships. NGOs (good and bad) have adopted network structures more quickly than governments. Doctors Without Borders and al Qaeda are emblematic of networks capable of adapting to complexity and using information technologies to their advantage. Recent organizational changes in U.S. national security agencies consist almost entirely of establishing new hierarchies (e.g., the Department of Homeland Security and the Director of National Intelligence) and making changes in old hierarchies (such as the DOD's emphasis on Special Operations Forces and the State Department's transformational diplomacy). Flexibility, shared knowledge, and adaptability are stated goals of these changes. Achieving these goals in new and old hierarchies is far from certain.

Missing in the U.S. government's organizational changes are robust networks that connect government and civil society, diplomats and soldiers, and public diplomacy's institutions and tribal cultures. Eliminating

hierarchies in governance is neither desirable nor possible. Changing organizations so they act more like networks and less like hierarchies, however, is both desirable and possible. In public diplomacy this means knowledge sharing and operational collaboration. Broadcasting research should be made available routinely to diplomats. Cultural analyses by the military's foreign area officers should be shared with broadcasters. Embassy analyses of social networks are useful to military public affairs officers. Knowledge products developed by civil society NGOs can help all government entities. Bright lines between career paths for political and public diplomacy officers matter less, because much more of what ambassadors and political officers do involves outreach beyond government ministries. Canada's diplomats are merging these career paths. U.S. diplomats could learn from their example. Adapting hierarchies to networks means more interservice, interagency, and private sector assignments. Diplomatic career systems could achieve this by making such assignments career enhancing and by emulating military personnel practices in which senior officer promotions have long been contingent on experience in cross-service assignments. Changes in recruitment and training are needed if organizational cultures are to blend the strengths of networks and hierarchies.

Strategic communication networks require more than coordinating committees and fusion teams. Indeed, the case against mere coordination is strong. Public diplomacy coordination committees occasionally worked well for short periods of time with presidential interest and strong leadership, but they were never effective on a sustained basis. This is not to say teamwork and information sharing are not desirable. Clearly they are. But successful networks require strategic direction as well. There must be authority to direct and task, to assign operational responsibilities to departments and embassies (but not to manage the execution of their programs), to concur in the appointment of senior public diplomacy officials, to set priorities, and to move resources. In embassies, the chief of mission must provide strategic direction. Whether the "quarterback" for today's multiagency, multi-issue public diplomacy should be placed over time in a subcabinet position in the Department of State is a question that needs to be addressed. Cabinet departments typically do not think and act in interagency terms. Departments are organized around preferences, outputs, and constraints that make it difficult for them to set interagency priorities and move resources. Reformers need also to guard against reorganizations as panaceas driven by frustration. Moises Naim, in his analysis of countering global criminal enterprises, talks about defragmenting government:

> This is what defragmenting means: bring together scattered efforts in order to be more effective. But just as an overreliance on technology can create the illusion of a solution, integrating government efforts by just moving

organizational "boxes" around and placing them under the authority of a
"czar" can be an equally dangerous illusion . . . Defragmenting government
can work only if there are clear plans, multiyear budgets that extend the
time horizons beyond the most immediate emergencies, and solid, compe-
tent leadership.[33]

Secretary of Defense Rumsfeld, concerned that the United States' ene-
mies have adapted more skillfully to the global information environment,
argues the United States will need "new institutions to engage people
across the world." What, he asks, "should a U.S. Information Agency,
or a Radio Free Europe for the 21st century look like?"[34] Structures that
answer the secretary's question should look more like networks than hi-
erarchies. Roadmaps are needed that bridge hierarchies and networks,
provide strategic direction, avoid reorganization for the sake of doing
something, and map public diplomacy to interests, values, and policies.
Reformers clearly have more intellectual and practical work to do.

**Third, institutionalize private sector collaboration.** Much of what pub-
lic diplomacy needs to know and to be successful lies outside the govern-
ment. Academic and research communities offer untapped resources for
education, training, area and language expertise, and planning and con-
sultative services. The commercial sector has a competitive edge in multi-
media production, opinion and media surveys, information technologies,
program evaluation, and measuring of communication impact. Most re-
cent studies of public diplomacy recommend that government agencies
do more to leverage private sector talents, creativity, and best practices.
A few also recommend that agencies adopt sophisticated private sector
strategies used in planning and integrating complex communication ef-
forts involving multiple actors. There are two basic approaches to collab-
oration. One is for each department and agency to continue to contract
with private sector organizations as needed for program support and ad
hoc projects. This is business as usual.

The second approach would be to create an independent, nonprofit,
and nonpartisan center to serve as a magnet for knowledge and skills in
the academic, business, media, and NGO communities. This approach has
been recommended by the Defense Science Board, the Council on Foreign
Relations, and others.[35] Beyond general agreement that such a center
should not duplicate what governments do best, proponents differ on
questions relating to structure, funding, and purpose. Some focus on at-
tracting creative imagination in developing media products and commu-
nication technologies. Others emphasize research and analysis. Still others
accentuate a center's role in crisis response and providing supplementary
skills and credible voices. It is possible to imagine a single multipurpose
public diplomacy center—related to but outside the government—that
would harness expertise on foreign cultures and languages, education and

training, media creativity and skills, consultative services, and opinion and media analysis. It would serve embassies and multiple government departments in four areas:

- *Knowledge*: cultural influences (values, religion, entertainment, education), demographics, global public opinion, and media trends;
- *Products*: support for communication strategies, plans, themes, messages, and media products;
- *Services*: support for cross-cultural exchanges of ideas and people, deployment of temporary communication teams, language and skills databases, and technology development; and
- *Evaluation*: studies of changes in attitudes and public diplomacy metrics.

Effective partnerships between the government and society in the conduct of public diplomacy are not new. Government grants to private organizations have long been a way to carry out exchanges, foreign opinion polling, democratization programs, and media training. An independent public diplomacy center would institutionalize the relationship in areas that go beyond traditional program support and take collaboration to a new level. Whether it is developing video games that support public diplomacy objectives, analysis of Web-based networks that present threats and opportunities, understanding cultures in strategically important areas, or maintaining databases of language-qualified participants for crisis response teams, a public diplomacy center has the potential to leverage more effectively the knowledge in U.S. universities, the skills of NGOs, and the imagination of its corporations and media industries.

The initiative to build flexible, adaptive networks within the government must come from the president and Congress. The initiative to create flexible, adaptive public diplomacy institutions outside the government must come from the private sector. Governments often fund private sector entities. They seldom build them. A roadmap to a successful partnership requires receptive government agencies and collaboration by private sector groups in developing a business plan that will build on the best ideas of those calling for increased support for public diplomacy.

**Fourth, engage the political will of the president and Congress.** Transformation occurs in public diplomacy when presidents and lawmakers provide strong personal leadership. VOA, Radio Free Europe or Radio Liberty, the Smith-Mundt Act of 1948, USIA, the Fulbright program, and the National Endowment for Democracy would not have become cornerstones of twentieth-century public diplomacy without the efforts of Presidents Roosevelt, Truman, Eisenhower, and Reagan; Senators Karl Mundt and J. William Fulbright; and Congressman Dante Fascell. Presidential and congressional leadership are needed in two areas: connecting actions

and words and building a durable strategic communication structure at the White House level. Analysts have long recognized that deeds count more than words in public diplomacy. As President Eisenhower's "Jackson Committee," established in 1953 to examine the State and Defense Departments and Central Intelligence Agency (CIA) "information and propaganda activities," put it:

> The United States is judged less by what it says through official information outlets than by the actions and attitudes of the Government in international affairs and the actions and attitudes of its citizens and officials, abroad, and at home.[36]

A half century later, opinion polls correlate anti-Americanism to U.S. policies such as the war in Iraq, to actions such as rendition and prisoner interrogation tactics, and to attitudes such as resistance to management of the nation's harbors by an Arab-owned company. Conversely, opinion research suggests a positive correlation between actions such as the United States' tsunami relief efforts and favorable attitudes in Indonesia. It is no accident that Under Secretary of State Karen Hughes made working with U.S. CEOs to raise millions for earthquake relief in Pakistan an important part of her work.

In combating terrorism and other threats, U.S. strategic communicators face two quite different strategies: emphasize better *communication* in hopes of improving the United States' image and focus on *actions*, anticipating favorable attitudes as a long-term by-product. Both are important. Geography, time to react, and military dominance are no longer sufficient to ensure national security. Nor is the episodic pattern by which public diplomacy instruments are permitted to rust after wars—only to be "rediscovered" when the next challenge occurs. There has been no presidential directive on public diplomacy since President Clinton's Presidential Decision Directive 68 in 1998. Other than appropriations bills, which provide funding and some policy direction, there has been no legislation on public diplomacy authorities and structures since the merger of USIA with the State Department in 1999.

Americans are combating terrorism by using and transforming instruments of hard power on a scale comparable to national security initiatives taken in the 1940s and 1950s. Military, intelligence, and law enforcement instruments are changing in response to leadership from the White House and Congress. In contrast, the transformation of public diplomacy has been subcontracted to departments and agencies. Reforms within organizations are not substitutes for the kind of public diplomacy transformation that can only occur when led at the presidential level. Nor are organizational reforms substitutes for enduring networks that connect policies and public diplomacy, departments and agencies, and the government and the

private sector. Transformation of this kind requires political will and a presidential directive on strategic communication that is reinforced and made permanent with bipartisan congressional support and legislation.

Nye's other two dimensions are "daily communications," which explain "the context of domestic and foreign policy decisions," and the "development of lasting relationships with key individuals, over many years through scholarships, exchanges, training, seminars, conferences, and access to media channels." His dimensions are distinguished by two central characteristics: time and "different relative proportions of government information and long-term cultural relationships." *Soft Power: The Means to Success in World Politics* (New York: Public Affairs, 2004), 107–110.

For more than fifty years, reports of the U.S. Advisory Commission on Public Diplomacy and its predecessors routinely called for presidential direction in public diplomacy and systematic consideration of the implications of foreign public opinion in formulating and communicating policies. Recently the Defense Science Board, the Council on Foreign Relations, and the Advisory Group on Public Diplomacy for the Arab and Muslim World led by former Ambassador Edward Djerejian have also urged strong presidential leadership. The Defense Science Board recommended that the president issue a directive to establish a permanent strategic communication structure within the National Security Council and work with Congress to create legislation for a Deputy National Security Advisor for Strategic Communication and a permanent interagency Strategic Communication Committee. *Defense Science Board Task Force on Strategic Communication*: 62–64. The Council on Foreign Relations called for a presidential decision directive that would "outline America's new [public diplomacy] strategy and provide a coordinating structure to harness the government's civilian and military public diplomacy assets." *Finding America's Voice: A Strategy for Reinvigorating Public Diplomacy*, Report of an Independent Task Force Sponsored by the Council on Foreign Relations (New York, 2003), 10, 34–35. Stating "There can be no success without the seriousness of purpose and interagency coordination provided at the direction of the President of the United States," Ambassador Djerejian's group concluded that the president "must be considered the ultimate director of public diplomacy and urged appointment of a Cabinet-level Special Counselor to the President for Public Diplomacy." *Changing Minds, Winning Peace: A New Strategic Direction for U.S. Public Diplomacy in the Arab & Muslim World*, Report of the Advisory Group on Public Diplomacy for the Arab and Muslim World (Washington, DC, October 2003): 58–61. # CHAPTER 18

## CYBER MOBILIZATION: THE NEGLECTED ASPECT OF INFORMATION OPERATIONS AND COUNTERINSURGENCY DOCTRINE

Timothy L. Thomas

For over two years, the U.S. armed forces have focused on seeking ways to counter insurgent use of improvised explosive devices (IEDs) in both Afghanistan and Iraq. Less attention has been paid to countering the mobilization process that produces the seemingly unending line of insurgents willing to (1) become suicide bombers (walking IEDs, or WIEDs), (2) prepare the IEDs, and (3) fight street battles. The insurgents use the Internet's "cyber mobilization" potential to fuel and supply this line of volunteers. They have been particularly successful in recruiting volunteers from other countries such as Saudi Arabia and Egypt.[1] This success has forced coalition forces to continually react to the environment instead of controlling it.

According to U.S. Army publications, two types of offensive actions are key components of the insurgency doctrine: armed conflict and mass mobilization. It is clear that the insurgents use IEDs as their main instrument to conduct armed conflict. It is just as clear that they have learned how to mobilize and conduct conflict-related cognitive activities using cyber capabilities. Coalition forces have reacted to the former with speed and money. IED study groups have proliferated. Coalition forces have responded to the latter mobilization concept with an ill-equipped concept, information operations (IO). Fighting IEDs with artillery is akin to fighting cyber mobilization with U.S. IO paradigms.

Insurgent cyber mobilization capabilities are designed to conduct psychological warfare activities, to propagandize insurgent successes and counter coalition allegations, and to recruit, finance, and train more fighters. Insurgents designate public affairs specialists to be their spokespersons and establish video production centers to promote their cause. During congressional testimony in early May 2006, one report noted that "al Qaida has advertised online to fill jobs for Internet specialists, and its media group has distributed computer games and recruitment videos that use everything from poetry to humor to false information to gather support. The media group has assembled montages of American politicians taking aim at the Arab world."[2] IO, on the other hand, doesn't even recognize the cyber mobilization concept. In fact, IO is devoid of cyber terminology in general, other than the term cyberspace, and it nearly ignores the concept of counterpropaganda.

If an insurgency's strength is predicated on the support of the local population, then coalition IO and counterinsurgency efforts must take cyber mobilization (mobilization enabled by computer chip-driven devices such as cell phones, the Internet, compact discs [CDs], and so on) into account.[3] A "counter cyber mobilization" strategy should be contemplated to assist in controlling the environment, and a new doctrinal section on cyber mobilization should be developed for U.S. IO and counterinsurgency manuals. Cyber mobilization is a problem that will be with us for a long time.

This chapter will discuss the precedents to the current use of the Internet in Iraq and Afghanistan; the U.S. IO paradigm problem and its extension into understanding the virtual aspect of an insurgency; the use of the Internet by insurgents in Iraq and Afghanistan; and coalition countermeasures to insurgent efforts. The chapter will then conclude with some relevant recommendations for U.S. IO and the counterinsurgency doctrine.

## PRECEDENTS

Communication devices have long been an important means of facilitating an uprising. The French Revolution witnessed the radicalization, education, and organization of the populace in large part due to the power of journals, newspapers, pamphlets, printers, and publishers. The latter communication devices were particularly effective at the time of the deregulation of the French press, when there were no rules on copyright, no rules on publications, and no libel laws. Today, gangs, terrorist groups, insurgents, and other hate groups use the Internet and cyberspace under similar conditions.[4] Audrey Kurth Cronin notes that blogs are today's revolutionary pamphlets, Web sites are news dailies or TV stations, list servers are broadsides, images are projected like caricatures or symbolic pictures of the past, and every item is passed faster than ever before and is available 24/7. The Internet is creating identity and a sense of unity, building a

cause-driven conscience, and returning segments of the populace to mob-driven feudal forms of warfare.[5]

Cronin adds that the Internet is different from past propaganda methods in that it can demonstrate the ruthlessness and power of an insurgency in ways not available to former communication devices. By crafting their version of events, insurgents can inspire more violence. Videos showing insurgent attack successes and the publication of fiery speeches impart a tremendous emotional appeal to potential insurgents.

Ben Venske, a specialist in jihadi videos, has noted that such videos can be divided into seven divisions or purposes: production videos (1–2 hours in length, with a wide range of source material); operational videos (short, quick clips of attacks, typically 1–8 minutes); hostage videos (tools in ongoing operations, which increase attention on a group); statement videos (featuring mid to senior tiers of a group and intended for morale boost, recruiting, fundraising, and political positions, often released to media as well as the Internet); tribute videos (when significant group members or large numbers are killed); internal training videos (usually not intended for the public); and instructional videos (how to accomplish a specific skill).[6] The videos as a whole impart a type of follow-on psychological attack on viewers, since they amplify attack effects and demonstrate success, according to Venske.[7]

Cronin and Venske's comments indicate that the warning signs of the advent of the cell phone and Internet mobilization of the population were evident long before the wars in Afghanistan and Iraq. They were even evident in the United States. In December 1999, the Internet was used to organize resistance to the World Trade Organization (WTO) meeting in Seattle. Internet-recruited protestors converged on Seattle from all directions. They frustrated well-designed police control plans by using cell phones to move crowds to areas left unattended or to focus on other advantageous spots. Both television and the Internet picked up coverage of these successful efforts that encouraged similar demonstrations elsewhere utilizing the same technologies to champion various causes.

Thus the Internet, and to a lesser degree CDs and cell phones, have become key insurgency tools due to their ubiquity, cyber mobilization potential, and anonymity. Women can participate on the Internet at little risk, even in male-dominated societies, since they appear anonymous. There is even an Internet site hosting a madrasa (Islamic school).[8] Web sites associated with jihadist movements reportedly have grown from 20 to over 4,000 in just five years. Today, the spin on Arab specialist T. E. Lawrence's 1920 idea that "the printing press is the greatest weapon in the armory of the modern commander"[9] would be that "the Internet is the greatest weapon in the armory of the modern jihadist."

Gabriel Weimann, one of the most well-known authors on the use of the Internet by terrorists and insurgents, noted that the Internet allows groups

to challenge a state's media domination of political discourse and even its political culture. It also permits interaction among elements to an extent never before contemplated (via e-groups, chat rooms, forums, online magazines, message boards, and online manuals), and it allows for extensive targeting (potential supporters, enemies, international public opinion, and journalists).[10]

Internet broadcasts also have a tremendous psychological appeal that is often overlooked. Videos or statements have generated a stimulus and response pattern among insurgents and audiences, according to Weimann, that includes both supporters and nonsupporters alike. A conditioned reflex is generated when statements are made about potential violent actions that cause anxiety in the audience.[11] Further,

> From a psychological perspective, two of the greatest fears of modern times are combined in the term "cyberterrorism." The fear of random, violent victimization blends well with the distrust and outright fear of computer technology. An unknown threat is perceived as more threatening than a known threat. Although cyberterrorism does not entail a direct threat of violence, its psychological impact on anxious societies can be as powerful as the threat of terrorist bombs.[12]

Weimann notes that the biggest obstacles to our understanding the actual threat of cyberterrorism are a fear of the unknown and a lack of information or, worse, too much misinformation.[13]

It should be highlighted that the Internet is also fostering future generations of insurgents through the spread of hate propaganda aimed primarily at Jews and Christians. For example, the Web site www.memritv.org has hosted cartoons from Hizbollah[14] TV that show Jews turning into animal forms. The computer game *Special Forces* was developed by the Hizbollah Central Internet Bureau. It places players in operations against Israelis, based on actual Hizbollah battles with Israeli forces.[15] It is a violent game that praises martyrs and gives credit to players who shoot Israeli politicians and others.[16]

The Hamas site al-Fateh (The Conqueror) discusses jihad, science, and tales of heroism. The site also posts messages promoting suicide terrorism.[17] Other sites, which host photos and videos of jihadi summer camps for kids, display images of young Arab children dressed as suicide bombers, while others conduct mock beheadings. Such programs for children are very likely to produce at least a few future insurgents because of their contribution to what Stanford psychologist Albert Bandura refers to as "moral disengagement." In order for individuals to become lethal terrorists, according to Bandura, they must acquire an ability to sanctify harmful conduct as honorable and righteous, which is achieved by moral justification, exoneration of comparison with graver inhumanities, sanitization of language, displacement of responsibility, and dehumanization.[18]

Similarly, psychologist Anthony Stahelski's research led him to develop a model of social psychological conditioning through which individuals are conditioned to identify a group's enemies as evil subhumans or nonhumans who should be killed.[19]

Al-Arabiya, an Arabic language television news channel located in Dubai, offered a view of the Internet's impact on youth from director Abd al-Rahman al-Rashed. He noted that the videos of Iraq's former al Qaeda insurgent leader, Abu Musab al-Zarqawi, have been "broadcast directly over the Internet to hundreds of thousands of youth who see and hear and read most of their information from it . . . Most of the terrorist crimes are tied to the Internet as the preferred theater."[20] Al-Rashed's comments are frightening if true.

## U.S. PARADIGM PROBLEM

The U.S. military would label most of these insurgent activities that involve the use of the Internet as "information operations." The U.S. Armed Forces *Joint Publication 3-13, Information Operations* (published February 13, 2006) defines IO as "the integrated employment of the core capabilities of electronic warfare, computer network operations, psychological operations (PSYOP), military deception, and operations security, in concert with specified supporting and related capabilities, to influence, disrupt, corrupt or usurp adversarial human and automated decision making while protecting our own."[21] It is important to note that the *Joint Publication* only defines one cyber-related term—cyberspace. This relative lack of attention toward cyber-related terms, and their absence from IO and the counterinsurgency doctrine, is a secondary focal point of this chapter, close behind the emphasis on cyber mobilization as an overlooked modern phenomenon.

Other armed forces publications reflect much the same attitude. The U.S. Army's November 2003 *Field Manual 3-13, Information Operations* declares that the term information operations has five categories of activity: PSYOP, operational security, computer network operations, military deception, and electronic warfare. The term also includes specified supporting and related capabilities. A newly contemplated U.S. Army definition of IO states that it is "actions taken by forces and individuals to affect attitudes, behaviors, information systems, and information, while protecting one's own through the integrated employment of the capabilities of electronic warfare, computer network operations, PSYOP, military deception and operational security, in concert with specified supporting and related capabilities throughout the information environment."[22] The focus of both the *Joint Publication* and the *Field Manual* on attitudes, behavior, and decision making indicates that their emphasis is clearly not on developing the capabilities required to offset an insurgent's cyber mobilization process. In fact, in the *Joint Publication*, the term "counterpropaganda" is used only

twice (in an appendix and not the main text), and it is not included in the glossary. The terms counterintelligence and countermeasures, on the other hand, are used often.

The Internet has clearly become a weapon of mobilization that is interactive, fast, and cheap, with few (or, as in the insurgent's case, zero) regulations or laws to control it. To put it more bluntly, the Internet has allowed a group of insurgents, without any formal theoretical and doctrinal information operations background, to successfully confront a colossal U.S. and coalition IO force that is not only well organized (the United States has an IO Corps, IO doctrine, IO magazines, IO courses in military institutions, and so on) but also well financed. With thousands of IO personnel, former Secretary of Defense Donald Rumsfeld sounded mystified when observing that "the extremist groups are able to act quickly on the information front, with relatively few people, while the U.S. government bureaucracy has yet to keep up in an age of e-mail, web logs and instant messaging . . . We in the government have barely even begun to compete in reaching their audiences."[23]

This is quite a damning statement for a country that invented the Internet. The overwhelming implication is that U.S. PSYOP and computer network operations need refinement or greater elucidation to take into account cyber-related terms, a concept that is ubiquitous in civil society. Why cyber-related terminology hasn't made its way into the military lexicon is a mystery. There are now hundreds of cyber-related terms and concepts in online dictionaries. One surmises under such circumstance that the military is a prisoner of sorts to its own IO paradigm and sound bytes.

Including cyber terminology in IO and the counterinsurgency doctrine is now a necessity, since the military and civilian worlds have been drawn much closer together by the Internet. The interaction of the military and civilian worlds is inherent in the idea of insurgent warfare. Such was not the case in 1991 during Operation Desert Storm, when two military forces confronted one another. At that time, *CNN* was the only comprehensive news outlet available worldwide. Now, just 15 years later, in addition to a much broader range of international news services, the battle for influence rages in numerous cities between militaries, insurgents, and civilians. There are a multitude of insurgent Web sites taking advantage of this environment, offering images, directives, and testimonials that compete for the minds and emotions of the local populace and world opinion. These Web sites take advantage of the prejudices and beliefs of a respective society and espouse disadvantaged or extremist points of view. For the most part, these sites are anticoalition and try to drive a wedge between legitimate local police or military forces and the international coalition supporting these forces.

Insurgents have used the Internet to cyber-mobilize primarily in two ways. First, the Internet is used to respond to unfolding events before

coalition forces have a chance or opportunity to respond. As a result, coalition forces are often blamed for actions the insurgents commit. Second, the Internet is used to post influential information items to include jihadi training materials, an ideological rationale for actions, instructional manuals, propaganda, and agitation materials online. Some creative methods have been used. For example, a recent posting to a jihadi Web page announced a competition to design a new Web site for an Iraqi militant group. The motivating prize was the chance to fire missiles by remote control at a U.S. military base.[24] Insurgent Web sites have created, to some degree, a paperless environment in which insurgents can operate.

Other cyber-age developments are also of tremendous value to an insurgent. For example, the CD is one such device. CDs, with messages from suicide bombers (or more likely with just extremist songs or music), have been found in places as far apart as Riyadh, Saudi Arabia, and Lansing, Michigan. Thus it is not always necessary for potential Middle East recruits to possess a computer or Internet connection to obtain insurgent propaganda—just access to some device that plays a CD. Insurgents are also using some traditional forms of PSYOP. For example, in April 2006, insurgents in Iraq firebombed several bookstores, news kiosks, and distribution points and scattered leaflets that read, "All who associate with these newspapers will be the legitimate target of the mujahideen wherever they are, and the mujahideen will not waver in targeting them and killing them."[25] Further, insurgents use many other old propaganda techniques. They distort facts and sequences of events, they place blame on the innocent, they make comparisons that are favorable only to them, and they berate their enemies. The difference between old uses of propaganda and new uses, of course, is that the Internet can quickly spread insurgent claims around the world with speed, clarity, and efficiency. In some regions of the world, even the wildest insurgent claims are accepted at face value.

### U.S. Terminology: Does It Neglect the Virtual Insurgency Aspect of Conflict?

The terms insurgency and insurgent are used throughout this chapter, but each term carries with it a traditional utilization that has no virtual association. This is clear from both formal and informal explanations of the terms. It is important for planners to develop and elucidate virtual insurgency terminology, as the cyber world begins to influence operations and summon insurgents to the front much like radio transmissions once did.

Both U.S. President George Bush and former Defense Secretary Donald Rumsfeld shied away from the term insurgent and its virtual implications.

Rumsfeld, speaking at a press conference in 2005, said he was a little reluctant to call the people the coalition is fighting in Iraq "insurgents." He preferred the words "enemies of the legitimate Iraqi government."[26] In response, language expert William Safire noted that "insurgent, from the Latin *insurgere*, 'to rise up,' means 'a rebel, one who revolts against an established government.' The insurgent in rebellion does not have the status of a belligerent, rooted in Latin for 'waging war,' and thus does not have the protections in law of a member of a state at war."[27]

It appears that when Secretary Rumsfeld speaks of enemies of the legitimate government, he is indeed talking about an insurgent, since Safire's definition (which corresponds closely with the dictionary definition) is so similar (an insurgent is a rebel who revolts against an established government). One who revolts is often considered an enemy—or can turn into one when the "revolt," as in Iraq, lasts for a period of time and involves brutal slayings. Safire believes that Rumsfeld does not like the term insurgent for two reasons: it is often applied to a group seeking to oust the leadership of a political party or a union (acting much like an underdog and attaining the sympathies of the population), and it unifies disparate elements into an "insurgency."[28] These factors are cause for concern. For example, a Jihad Academy video showed operations carried out by the Mujahideen Army, the Islamic Army in Iraq, the Ansar al-Sunnah Army, and al Qaeda in the Land of the Two Rivers, indicating that several insurgent groups do exist and their unification could make them even more difficult to handle.

President Bush, in his 2005 commencement speeches at the Naval Academy and at Kansas State University, also avoided the term insurgent. He defined the coalition's enemy in Iraq as "a combination of rejectionists, Saddamists and terrorists." The president believes rejectionists are resentful Sunnis who can be brought into the Iraqi democratic folds, Saddamists are those wanting to return to power, and terrorists are foreigners fighting freedom's progress in Iraq, according to an explanation by Safire. By not lumping these three together into the term "insurgents," the president hopes to keep them from uniting in the minds of Iraqis (keep the violent factions separate from the rejectionists).[29] Again, no mention is made of the virtual arena in which these groups operate.

*Joint Publication 1-02*: *The U.S. Armed Forces Dictionary of Military and Associated Terms,* last updated in March 2006, defines an insurgency and an insurgent as follows:

- *Insurgency*: an organized movement aimed at the overthrow of a constituted government through use of subversion and armed conflict
- *Insurgent*: member of a political party who rebels against established leadership[30]

Again, as expected, there is no mention of a "virtual" insurgent. There would also appear to be a disconnect, however, between these definitions and others previously noted. In fact, the "official" *Joint Publication 1-02* descriptions can serve as a source of confusion. An insurgency, according to the *Joint Publication* definition, does not necessarily have to be an organized "political" movement, yet an insurgent is defined as one who is a member of a political party. This is odd and inconsistent. The definitions also do not conform to the *Webster's Dictionary* definition of the terms either. As with other terms[31], it is clear that more precision is needed in U.S. military terminology. Such imprecision may be the impetus that motivates presidents and defense secretaries to start interpreting the meaning of words, which generates further confusion in society and among the armed forces as to what or whom our forces are fighting.

British military expert John Mackinley, whose recent work has centered on a concept called "the virtual arena of war," sees a new type of insurgency emerging—one that neither President Bush nor Secretary Rumsfield nor *JP 1-02* have mentioned. According to Mackinley, "The global insurgents that oppose the international coalition can be characterized as a complex insurgency; they grow organically and exist in considerable depth beyond the operational area.[32] A complex insurgency grows organically like a virus and acts intuitively. To defeat it may require reorganized security structures and an unfamiliar modus operandi."[33] The idea of a complex insurgency and the concept of organic growth much like a virus would complement nicely Secretary Rumsfield's fears that the disparate units could integrate forces intuitively and spread. One must be careful, however, not to overlook the virtual aspect of this complex, growing virus. The virtual arena can operate in considerable depth beyond the operational area (in fact, it can operate all over the globe) while simultaneously resting in the palm of an insurgent as a cell phone at the tactical level.

Mackinlay adds that "the virtual dimension should not be confused with information warfare and must be regarded as an arena of activity that no single party controls; it is not, therefore, a special weapon exclusively in the hands of any particular user. Just as friendly and enemy forces act against each other in the strategic and operational spaces, so they do in the virtual dimension."[34] Mackinley believes that the virtual dimension's proliferation of actors has created another theater of war with key objectives and tactical areas that can be seized by either side, and that a counterstrategy must contain interconnected strategic, operational, and virtual dimensions.[35] This arena is turning PSYOP into CYOP, a cyber-enabled psychological mobilization and recruitment factor of which coalition defense planners must be aware.

*Joint Publication 1-02* defines a counterinsurgency as "those military, paramilitary, political, economic, psychological and civic actions taken by a government to defeat insurgency. Also called COIN."[36] Once again, no

virtual element is noted. The closest definition in *Joint Publication 1-02* to a counter cyber mobilization capability would be the term "cyber counterintelligence," which is defined as "measures to identify, penetrate, or neutralize foreign operations that use cyber means as the primary tradecraft methodology, as well as foreign intelligence service collection efforts that use traditional methods to gauge cyber capabilities and intentions."[37] This focus relates more to conventional computer network operations than it does to any mobilization activity. Overall, one is left with the feeling that the mobilization aspect of the insurgency and counterinsurgency doctrine has received short shrift and that IO has ignored the cyber element so prominent in civil society.

To counter the impact of these mobilizing Web sites and devices in theater, U.S. brigade commanders and other coalition leaders—in the absence of an adequate information operation "quick response" template (IO is one of the designated concepts to counter insurgent information actions)—have developed IO actions "on the fly." This fact alone indicates that something is at work in the cyber domain that current IO policy and strategy cannot address. Such actions are deemed more appropriate and conducive for the insurgency environment. Lieutenant General David Petraeus, former commander of the Combined Arms Center at Fort Leavenworth (and now the commanding officer of the troops in Iraq), noted at a recent IO conference that the key is speed.[38] Coalition forces need to respond to a situation by providing information to the population before the insurgents can act. While coalition forces admittedly did not receive much training (if any) on this issue in the past, the actual problem may lie elsewhere in the formulation of IO and the counterinsurgency doctrine.

### Insurgents in Iraq and Afghanistan: How They Use Cyber Capabilities

Insurgents interpret and use cyber-generated information and actions differently than U.S. operators. This is because the insurgents' context for decision making (no need to adhere to any law other than their own interpretation of the Koran), jihadist prism for viewing the environment, and indifference to killing innocent people allows them to intimidate, influence, and mobilize their believers in ways unacceptable to civilized commanders. Insurgents use the Internet to mobilize, recruit, manipulate, respond, and exploit modern conflicts faster than their opponents. Recently, Abu-Mus'ab al-Zarqawi, the former al Qaeda leader in Iraq, used the Internet to speak about U.S. casualties, the Iraqi elections, Israel, and other issues. He also used the Internet to show the preparation and execution of an attack on a hotel complex in Baghdad. Meanwhile, the so-called Mujahideen Army posted a video titled "The Sniper of al-Fallujah." Such multimedia messages are often the persuasive and convincing element

that influences the ideological or religious fence sitters to adopt their cause.

The Web facilitates the recruitment of suicide bombers from amongst these fence sitters. Terrorism researchers Scott Atran and Jessica Stern note that jihadist Web sites have played a key role in forging the mindset of a suicide bomber. The Internet provides a way to bond individuals and give them direction as they surf jihadi Web sites. Efforts are needed to provide a positive counter to them on the Internet, whether it be positive alternatives for those who might succumb to the recruiters or simply counters to these negative influences.[39]

Insurgent use of the cyber element has introduced an operating pattern different from a well-known U.S. military procedure, the OODA loop—a concept based on former U.S. pilot John Boyd's observe, orient, decide, and act paradigm. Boyd's paradigm determined a method for identifying and targeting an opposing force that worked well in the Cold War environment. Even while in flight there was time for Boyd to utilize all four elements. The paradigm works in Iraq or Afghanistan when coalition forces take the initiative, such as in the fight for Fallujah.

In Iraq and Afghanistan, however, it is often the invisible enemy that takes the initiative. Where (or who) they may be is often unknown. Insurgents hide and may initiate confrontation by remote control—as seen with IEDs—without ever confronting coalition forces. Only after an insurgent-generated incident does, or can, the coalition react. Coalition forces, given this scenario, cannot observe and orient—they must decide and act (or react). The invisible enemy has stolen the key elements of observation and orientation from them. Coalition forces must process the action that has taken place and coordinate it with policy before acting in many instances.

Insurgents use a different paradigm. A physical action occurs at their initiative and then they cyber-respond. The physical action, information response (PAIR) loop allows them to be the first to provide a version of a story to an audience with whom they have some credibility—one which offers them influence and support. The virtual dimension allows them to manipulate how an event is perceived before coalition forces can react.

U.S. Colonel Rob Baker, a former brigade commander in Iraq, recently provided a battlefield example of the PAIR paradigm by describing how an insurgent suicide bomber detonated his belt too early and killed a number of Iraqis, narrowly missing his intended target, a U.S. installation. Baker noted that it was vital for U.S. forces to immediately distribute suicide bomber or IED "handbills" that told Iraqis what had happened.[40] However, in this case, before information could be sent up the line to create the handbills, the insurgents beat U.S. forces to the information punch, spreading word that the U.S. had carried out a missile strike on

the Iraqi populace (to cover up the insurgent's failed suicide mission). An anti-American crowd soon appeared, threatening to riot. Perhaps the crowd was not a result of an immediate Internet assemblage, but its actions would be reported there nonetheless. Meanwhile, our forces were properly running the incident through channels and awaiting word on what to do next. That is, the insurgents used the PAIR paradigm to perfection to gain advantage even from a failed operation.

Press reports indicate that coalition forces are now less concerned with an insurgent's use of viruses and other malware than with these cyber-related issues of mobilization and manipulation. Even the U.S. Federal Bureau of Investigation (FBI) noted that terrorist groups lack the ability to damage the United States via an Internet-based attack.[41] Thus the incredible force the United States has assembled to protect its information security is working well. But we have not done nearly as well at anticipating the insurgent's use of other cyber capabilities. A *Washington Post* article of August 9, 2005, described several ways in which the Internet can serve as a weapon for insurgents, such as:

- intertwine real-time war with electronic jihad,
- immortalize suicide bombers,
- taunt the U.S. military,
- release tactical details of operations many times each day,
- publish a monthly Internet magazine, and
- negotiate with bin Laden.[42]

By utilizing the Internet in this manner, the insurgents have become very effective, with a far smaller staff and effort than that which is employed by its coalition opponents. Jihadi Web sites now compete with global news agencies for media attention in Iraq and Afghanistan. There is no need for rationality or balanced news coverage on their sites. Insurgents are interested in attracting true believers to their cause as well as in convincing a broader audience of their political objectives.[43] Some insurgent audiences may not be as large as others, but they can be far more committed.

It is estimated that over the past five years, jihadi Web sites have increased from fewer than 20 to more than 4,000.[44] In this manner, the insurgency grows like a virus and acts intuitively. The Web sites enable insurgents to discuss their tradecraft and to exchange jihadist justifications for actions, both accomplished and planned. To add veracity to their claims, they often include video clips as an integral part of their online activities. To jihadists, the Internet is not merely a place to publish open-source material; it is a place to conduct open-source war.[45] The Internet battle for influence and persuasion is second only to physical confrontation, some

jihadists believe. A November 28, 2005, posting on the al-Safinat forum site noted the following:

> There is no doubt that the jihadi forums play a critical role in providing aid to the mujahideen on the battlefield. Who could have thought that it would break the ring of steel that the Crusaders and Jews have attempted to erect in order to conceal the voice of the jihad, and cover up their humiliations on the battlefield?[46]

A March 2005 statement on the jihadi forum Minbar Ahl al-Sunna wal-Jama'a noted that an Information Jihad Brigade had been formed—not an IO brigade, just an information brigade. The brigade's aim is to conduct a full-scale propaganda war to "influence the morale of our enemies." It is composed of design, language, and publication divisions. In December 2005, the Middle East Media Research Institute reported that insurgents are using Yahoo.com as a gateway for indoctrination and incitement of aspiring insurgents.[47] Perhaps this gateway is a product of the information brigade.

Web sites also allow jihadists to spread tactical and targeting information. An individual known as "al-Mohager al-Islami" ("The Islamic Immigrant") has been posting messages to dozens of jihadist e-group forums, both public and password protected, about the locations and equipment of U.S. and British sites in Kuwait, Qatar, and other areas. The postings include photos of embassies and living areas. Besides posting the introductory message, "Al-Mohager al-Islami" provides logistic information about several bases in Iraq and calls upon the mujahideen to target these sites. Thus, the Internet serves as an intelligence and reconnaissance asset for jihadists even in the planning stages of armed conflict. "Al-Mohager al-Islami" also provided a nearly 40-page pamphlet on "The Art of Kidnapping—The Best and Quickest Way of Kidnapping Americans." The manual includes information for planning raids, the composition of support crews, general rules for these crews to follow, observation points, kidnapping suggestions, and methods of capturing Americans."[48] On other Web sites, insurgents have actually placed warning orders to their subordinates when aware of future coalition activities. In one case, subordinates were warned to hide all papers and weapons because coalition troops would be searching their houses soon. Music and speeches can be uploaded on Web sites and forums as well.

### Insurgent Targets

Insurgents have different targets in mind when developing Internet messages. In some cases, the main cyber mobilization targets appear to be the minds of humiliated or resentful Muslim emigrants. A January 23, 2006, video produced by the Global Islamic Media Front, entitled "Jihad

Academy," demonstrates this point more vividly. A voice at the start of the video recites, "The roots of humiliation cannot be removed except with the showers of bullets. Without the spilling of blood, dishonor cannot be wiped off the forehead."[49] Once recruited, insurgents offer new recruits actual targets on the Internet against which action can be taken. For example, a review of Internet documents reveals a jihadist interest in targeting U.S. economic assets, especially oil installations or infrastructure in the United States.[50]

Insurgent use of the Internet for such targeting purposes represents a significant change in how warfare is perceived and understood, especially amongst the general population. One conclusion is that the Internet and associated Web sites, to put this in "army speak," may be the second most important insurgent force multiplier (improvised explosives remain number one). It enables insurgents to shape and influence local popular opinion and thereby manipulate the perceived outcome of coalition operations via the Web. No such resource was ever afforded insurgents in the past. Counterinsurgency plans to limit this capability will require extreme coalition sensitivity to local customs, values, and beliefs, as well as an understanding of both insurgent Internet operating procedures and methods to counter them.

### American and Coalition Forces in Iraq and Afghanistan: How They Use Information Operations

As explained earlier in this chapter, the U.S. military would label most of these insurgent activities that involve the use of the Internet as "information operations"—an area of activity in which the military already has significant operational capacity and a strategic doctrine. Before U.S. forces entered Iraq in March 2003, they methodically prepared the proposed "information battlefield" based on nearly identical IO principles. This phase of the IO plan ended shortly after coalition forces arrived in Baghdad. Then a new phase of intensive IO planning ensued. Not unexpectedly, U.S. forces did not know completely what was being broadcast on the city's 15 radio stations, satellite TV networks, and the pages of newspapers that were still operating. The battle for Baghdad ended abruptly, and little planning, understandably, had been conducted for such an eventuality. It was more important to prepare for extended city fighting. Further, this was the first time our forces had encountered an information environment in an enemy city of this size. IO planners set about attacking this challenge, one that grew quickly once insurgent activities proliferated.

Army Captain Bill Putnam, a U.S. Army reservist who headed the coalition's Open Source Intelligence effort in Iraq for a period of time (which included the publication of the "Baghdad Mosquito," a document that reports on the latest street rumors in Baghdad), commented on this early

effort. He noted that U.S. IO and the public affairs doctrine in Iraq were focused on making the Iraqi information environment conform to its doctrine. That is, the focus was on how things should be done (according to the doctrine), rather than allowing the environment to determine how IO should be conducted.[51] This is a huge problem according to Putnam, since he believes that "it is virtually impossible for a counterinsurgency campaign to be successful without some level of the local population's support."[52] Putnam therefore identified "how" the Iraqis receive information and formulate opinions as the most important issue for IO professionals to consider. Iraqis do so, he wrote, via satellite television channels, one's family and friends, the street (rumors), religious figures, and newspapers. It was this "circle of influence" that must be targeted if successful IO were to be conducted, Putnam believed. The IO template based on the doctrine did not correspond to the reality on the ground, a reality strongly influenced by cultural factors. But the U.S. armed forces have since responded aggressively to this oversight. Cultural factors are now an intense focus of armed forces time and planning, and IO strategy is showing renewed creativity.

At Fort Leavenworth's December 2005 IO conference, Colonel Baker confirmed the necessity of developing practical solutions to the IO challenges they faced and not relying solely on doctrine. He stated that intelligence and IO were the two most important aspects of the fight from his perspective. He felt it necessary to bypass the IO doctrine on several occasions and use his staff's creativity when the situation required. Baker noted that "information operations have to be more than a plan on a piece of paper. You have to have the ability to operationalize it and make it important to all of your leaders so they embrace it and integrate it into everything they do."[53]

Colonel Baker developed an "information battle rhythm" matrix that forced him and his staff to perform specific information-oriented events on specific days of the week (meetings with the media, local leaders, and so on). This matrix enabled him to not only keep his finger on the information pulse of the insurgency but integrate the local media and culture into his IO plan. He also became a strong proponent of the quick-reaction handbill that would offer a coalition explanation of an action. This often allowed his forces to beat the insurgents to the information punch.[54]

There have been other coalition information successes in the war against the insurgents. For example, Iraqi state TV has publicized police hotline numbers for people to call to turn in potential or actual insurgents. There are also popular shows where captured insurgents confess to their crimes on TV under the tearful questioning or threats of those whose relatives the insurgent killed.

Thus, traditional IO ways of conducting business in Iraq were helpful but had to be supplemented with other measures. Commanders who were

focused on maintaining an influence advantage had to create responses on the fly due to the situations they encountered. They were not focused on cyber mobilizing because they had all of the other resources (radio, TV, and news outlets) available to them in addition to the Internet. Perhaps this operating paradigm has inhibited our ability to get inside the insurgents' "cyber skin" and think or manipulate as they do.

As mentioned earlier, a major event involving our forces required a vetting process to understand what occurred before responding. This slow response mechanism is necessary, because it helps ensure that coalition forces aren't being manipulated by the insurgents. Too slow a response, however, gives insurgents time to develop a virtual force multiplier by providing the populous with a culturally astute version of an event modified to the insurgents' benefit. This enables a group of insurgent Web site designers and Internet responders to influence the population much to the same extent as the coalition's highly organized and financed IO effort. Coalition forces need to develop an insurgent-oriented "countercyber capability" for their IO lexicon and action portfolio. They need to get outside their IO think box and into the insurgent's cyber think box.

### Learning from the Two Lawrences

Lessons learned from Iraq and Afghanistan are being spread amongst coalition forces, and they are adapting to the insurgent's operating environment. Those studying the cultural aspect often note that in order to better understand how to deal with insurgent behavior, one should read the work of T. E. Lawrence that describes his dealings with Arabs in the 1920s. The *London Times* on May 22, 2005, wrote that General John Abizaid, CENTCOM commander, quotes Lawrence on a regular basis. The cultural lesson most often cited from the work of T. E. Lawrence, it seems, is reflected in his oft-cited advice:

> Do not try to do too much with your own hands. Better the Arabs do it tolerably than that you do it perfectly. It is their war, and you are to help them, not to win it for them. Actually, also, under the very odd conditions of Arabia, your practical work will not be as good as, perhaps, you think it is.[55]

However, if the Internet, as stated earlier, "is the greatest weapon in the armory of the modern jihadist," then this is because the civilized world has provided jihadi commanders with both the infrastructure and means to run their "modern printing press." Meanwhile, modern armies appear unprepared to handle the consequences of this fact—that is, the development of a proper counterinsurgent or other suitable neutralizing capability. The topic of jihadist Internet usage was hardly mentioned at the December 2005 IO conference.

Insurgents are using the Internet more effectively than coalition forces due to their lack of moral or legal restrictions and due to the situational context (particularly the coalition presence in a Middle East country). Many disaffected Internet surfers believe what is written on jihadi Web sites and want to support their cause. Further, the irrational tenth tactic that Lawrence discussed (that tactic "not taught but ensured by instinct, sharpened by thought") also has an insurgent application. Their tactics are developed in a context void of laws and mercy but with a deep cultural and instinctive understanding of what their messages will mean (both factual and implied) to their audience. Coalition forces do not possess this instinct for connecting with the population. This insufficiency should embolden further cultural studies in the U.S. armed forces to develop a higher degree of proficiency in this area.

Another Lawrence whose sayings also have tremendous applicability to the current insurgency in Iraq and Afghanistan is an unlikely source—that being Lawrence "Yogi" Berra. Berra, a tremendous New York Yankee catcher in the 1950s and 1960s, is well known for his sayings of counterintuitive malaprop value. Of relevance here is his saying that "in theory, there is no difference between theory and practice. In practice, there is." That is, one can read about insurgencies and stability operations and IO, but one cannot foresee the context in which these operations are conducted or interpreted. One can read about IO, but its application in practice, as Colonel Baker pointed out, requires an entirely different type of thinking, one tied to the environment and the target set to be affected.

Coalition forces are finding this out as they confront insurgent forces that have access to an information means (the Internet) that enables them to cyber-plan, finance, recruit, mobilize, and exploit faster than their opponents in the virtual theater of war. They are able to exploit a cyber echo effect through a multitude of Web sites today and do so with one-tenth or less of the coalition's IO infrastructure. This is a key observation of which all coalition IO experts should take note.

## CONCLUSION

Noted author Hans Magnus Enzenberger stated over a decade ago that the nature of war was changing from "purposive, ideologically driven enterprises undertaken by highly organized industrial powers" to "molecular civil war."[56] Insurgent tactics worldwide appear to fit Enzenberger's description.

The Internet offers a new spin, however, on Enzenberger's molecular civil war theory. Insurgents have gained an ideological and motivating force multiplier with the Internet, as it communicates insurgent-generated interpretations of events via images and messages. Insurgents are often

more culturally attuned to the needs and desires of the local population than an occupying force and are able to adapt their messages to these sensitivities.

Coalition forces, on the other hand, have a limited frame of reference for understanding the world around them. They are not closely associated with the populations with whom they are interacting in many cases and thus have difficulty associating with cultural sensitivities as well as monitoring and analyzing the plethora of Web sites available to insurgents and their potential sympathizers. The Internet allows jihadists to produce a cacophony of culturally related responses (both messages and pictures) to actions they take or mistakes the coalition makes. Insurgents apply no ethical standards to their Internet use. They utilize hate propaganda and one-sided interpretation of events to generate support. Coalition forces must do as much as possible to counteract this capability. Demonstrating how insurgent Web sites differ in content based on their target language is an example of one counterpropaganda possibility. That is, coalition forces could translate serious disparities in content between Arabic and English sites back into the original Arabic for Iraqi domestic political consumption. This would allow them to see the two-sided linguistic game the insurgents are playing.

The civilian community offers some other optimistic developments. Recently, the Foundation for the Defense of Democracies, which purportedly includes Muslims, Christians, Jews, and secular organizations in its membership, started the "Coalition against Terrorist Media." Its Web site[57] has several interesting sections such as "What is Terrorist Media?" "Terrorist Media in the News," and "View Terrorist TV." Weimann offers other possible countermeasures in his study. These are some of the first steps toward the counterpropaganda mechanism that needs to be developed by coalition forces for contemporary and future conflicts.

Further, the civilized world must continue to closely watch the impact of jihadist propaganda on children, particularly in the Middle East, where poverty and alienation make the Internet messages more alluring. Children under the influence of this virtual arena of the insurgent's cognitive warfare, whether it be video games or Internet cartoons, could turn out to be tomorrow's IED specialists.

Coalition commanders recognize the fact that they need to act more creatively when attempting to manage the cyber-information problem. They have implemented plans on their own in many cases, as Colonel Baker's experience indicates. Noted military journalist Ralph Peters agrees, writing, "Counterinsurgency warfare is the realm of the officer who can think beyond the textbook, who thrives in the absence of rules."[58]

If Colonel Baker is correct, that intelligence and IO are the two most important aspects of the environment in Iraq and Afghanistan, then more

attention must be paid to them. This probably requires a different IO tool or mindset than that currently available within the Department of Defense. U.S. IO specialists must study the Internet's use by insurgents and learn to focus on "how" the circle of influence works in a particular culture, what the images are that matter, and so on.[59] They must learn how to develop "countercyber" plans and actions and how to manage the consequences of these actions. As a result, both the elements of the IO doctrine and the term counterinsurgency as currently defined should be expanded. As noted above, counterinsurgency is officially defined as "those military, paramilitary, political, economic, psychological and civic actions taken by a government to defeat insurgency. Also called COIN." The definition should also add some form of the "cyber mobilization monitoring or destruction tool" concept. The IO list of core capabilities requires similar refinement.

Jihadi worldwide cyber mobilizing and recruiting activities do not stop at U.S. borders, according to the Web site of Laura Mansfield. Mansfield, who has appeared as a guest speaker on *CNN* with talk show host Anderson Cooper, notes that there is an emerging danger unfolding on the Web pages of MySpace, the social networking site for teenagers. Her analysis indicates that there are several sites on MySpace advocating jihadist activities,[60] which, if true, indicates that jihadist cyber activities are truly now in "our space." One of the functions that MySpace performs is to list the number of "friends" that a certain site attracts. These "friends" of jihadist sites on MySpace indicate that, while not of any particular danger at the present (some subscribers advocating jihadist activities list friends in the low hundreds), MySpace is developing as a potential local recruitment tool for insurgents.

The conclusion drawn from this discussion is that virtual elements are the agitators and propagandists of today's insurgency much like pamphlets, journals, and leaflets were at the time of the French Revolution. These virtual or cyber elements mobilize the population much like leaflets and pamphlets once did. However, the effect of the virtual arena is more effective in that it is incredibly responsive and dramatic, offering videos, testimonials, and other images often directly from the site of some significant operation. Cyber elements are immediately responsive to breaking news and are available 24/7.

The U.S. IO doctrine will have to take this fact into account, as will the counterinsurgency terminology and doctrine, if both want to stay engaged and productive in the information field. With warfare changing from armies massed against one another to high-tech local wars in which insurgents can play a primary role, the virtual arena becomes very important. Armies cannot stand between cyber-generated stories and the interpretations and fears of the local populace. Past insurgencies did not rely on the Internet's power to cybermobilize as do today's insurgencies.

Fine-tuning our IO counterinsurgency definitions and enhancing our understanding of cyber mobilization is required if we are to be more aware and adept at handling this emerging cyber challenge.

# CHAPTER 19

## THE KEY ROLE OF PSYCHOLOGICAL OPERATIONS IN COUNTERING TERRORISM

Jerrold M. Post

Terrorism is a vicious species of psychological warfare waged through the media.[1] It is "a war for hearts and minds." If one accepts this premise, then the war against terrorism will not be won with smart bombs and missiles. One does not counter psychological warfare with high-tech weapons; one counters it with psychological warfare. And in this so-called "war for hearts and minds," tending to overly rely on our technological superiority, we have fallen far behind our terrorist adversary.

In this chapter, four elements of an integrated information operations program designed to counter terrorism are presented. A fifth element of a comprehensive security strategy, promoting societal resilience, is also discussed. In addition to these five general elements, special attention is given to countering suicide terrorism and weapons of mass destruction (WMD) terrorism.

According to Chinese strategist Sun Tzu, whose *The Art of War* continues to inform political-military strategy after 2,000 years, "What is of supreme importance in war is to attack the enemy's strategy. . . . Next best is to disrupt his alliances. . . . The next best is to attack his army. . . . The worst policy is to attack cities." Sun Tzu also observed that of the five fundamental factors affecting war, the first is moral influence: "that which causes the people to be in harmony with their leaders so that they will accompany them in life and unto death without fear of mortal peril." Elsewhere, he observes that "to subdue the enemy without fighting is the acme of skill." In effect, Sun Tzu is advocating psychological undermining of the enemy, a prescription still valid today.

Psychological operations (PSYOP) have been defined as "the planned use of communications to influence human attitudes and behavior. PSYOP consist of political, military and ideological actions conducted to induce in target groups behavior, emotions, and attitudes that support the attainment of national objectives."[2] The term "psychological operations," especially when combined with political warfare, denotes "operations, whether tactical or strategic, on the battlefield or in the theater, in peacetime or in war, directed primarily at our adversary's mind rather than his body."[3] Yet historically, PSYOP have for the most part only been employed tactically, in wartime. There has been little attention given to the potential of strategic PSYOP in undermining the enemy to prepare the battlefield. Properly conducted, they should "precede, accompany, and follow all applications of force"[4] and be an integral component of the overall strategic plan. Yet, because planners too often overrely on technological superiority and pay insufficient attention to an enemy's psychology, they either are omitted or are a late afterthought. But mapping the information battlespace, and preparing the information battlefield, must be integrated with battle planning from inception and involve PSYOP, not only at the tactical level but also at the strategic level. Enemy resistance is not undermined with the turn of a switch; it is a long process. Influencing attitudes requires deconstruction of the enemy, which involves identifying the constituent elements—and audiences—of its power base and the sources of its influence.

Research on the effects of retaliation on terrorist behavior has demonstrated that the major goal of retaliation was to convey to the public that the government was strongly defending it.[5] However, there is no statistical evidence in several cases—including Israeli retaliation against the Palestinian terrorist campaign in the 1970s and U.S. retaliation against Libya for the Berlin disco attack on U.S. troops in 1986—that retaliation deterred future terrorist actions. To the contrary, in some cases there is evidence suggesting that it reinforced the terrorist group. Thus, instead of a primary focus on the role of PSYOP in a retaliation campaign (e.g., Afghanistan in 2001), this chapter argues that the way to counter psychological warfare is with psychological warfare, and thus PSYOP should be not only an important weapon in the war against terrorism, but the principal weapon.

Four major elements of a psychological program designed to counter terrorism are:

- inhibiting potential terrorists from joining the group in the first place,
- producing dissension within the group,
- facilitating exit from the group, and
- reducing support for the group and its leaders.

These elements are components of a strategic PSYOP program that must be conducted over decades, for these attitudes are not easily changed "when hatred is bred in the bone."[6] Vladimir Lenin once stated that "the goal of terrorism is to terrorize." This suggests a fifth element of a sustained campaign of strategic PSYOP: insulating the target audience (the public) from the intended goals of the terrorist (to terrorize). These five elements of a sustained strategic PSYOP campaign deserve a closer look.

## INHIBITING POTENTIAL TERRORISTS FROM JOINING THE GROUP

It has been observed that for every terrorist killed or captured, there are ten more waiting to take that terrorist's place. Thus, the first element of the strategy articulated in this chapter—inhibiting potential terrorists from joining terrorist organizations in the first place—is the most important and complex of the five. It is designed to slow down the terrorist assembly line. Once an individual is in a terrorist group or organization, especially an underground group, a variety of group dynamics will reinforce the individual's psychological commitment to its goals.[7] From childhood, there is a normalization and social value attached to joining a terrorist group, especially in the constituencies of particular concern to Israel. In one recent study,[8] 35 incarcerated Middle Eastern terrorists in Israeli and Palestinian prisons were interviewed: 21 radical Islamist terrorists from Hamas, Islamic Jihad, and Hizbollah and 14 secular nationalists from Fatah and its military wing, as well as from the Palestinian Front for the Liberation of Palestine and the Democratic Front for the Liberation of Palestine.[9]

It was clear from these interviews that the major influence behind an individual's decision to become a terrorist was the social setting. Individuals from strictly religious Islamic backgrounds were more likely to join Islamist groups, while those with no religious background might join either a secular or a religious group. Peers were of great influence and often recruited these individuals. For the secular groups, the social environment centered on schools and clubs, while for Islamists the mosque, religious organizations, and religious instruction dominated. Some 64 percent of secular members, but only 43 percent of Islamist members, reported that their group was the most active in their community. Over half of the secular group members interviewed cited their community or a youth club as the primary influence. For Islamist groups, almost half cited the mosque, Muslim Brotherhood, or other religious influence as central, and another 20 percent cited a university or professional school. Only 30 percent of the secular group members and 20 percent of the Islamist group members reported their families as a vital influence. Although introduction to the terrorists' cause varied, almost all subjects grew up in villages or refugee camps that were active in the struggle. Some 80 percent of the secular group members were raised in communities that were radically involved,

compared with 75 percent of the Islamist members. Less than a tenth of each group of interviewees came from communities that were not particularly active.

The following quotes reflect the types of perspectives encountered among the Islamist group members during this research project:

— *Religion played a powerful role*:

> I came from a religious family which used to observe all the Islamic traditions. My initial political awareness came during prayers at the mosque. That's where I was also asked to join religious classes. In the context of these studies, the sheik used to inject some historical background in which he would tell us how we were effectively evicted from Palestine. . . . The sheik also used to explain the significance of the fact that there was an [Israeli] military outpost in the heart of the camp. He compared it to a cancer in the human body which was threatening its very existence.

> At the age of 16, I developed an interest in religion. I was exposed to the Muslim Brotherhood and began to pray in a mosque and to study Islam. The Koran and my religious studies were the tools that shaped my political consciousness. The mosque and the religious clerics in my village provided the focal point of my social life.

— *Community support was important to the families of the fighters as well*:

> Families of terrorists who were wounded, killed, or captured enjoyed a great deal of economic aid and attention. And that strengthened popular support for the attacks.

> Perpetrators of armed attacks were seen as heroes. Their families got a great deal of material assistance, including the construction of new homes to replace those destroyed by the Israeli authorities as punishment for terrorist acts.

> The entire family did all it could for the Palestinian people and won great respect for doing so. All my brothers are in jail, and one is serving a life sentence for his activities in the Izz a-Din al-Qassam battalions. My brothers all went to school and most are university graduates.

— *The emir blessed all actions*:

> Major actions become the subject of sermons in the mosque, glorifying the attack and the attackers.

— *Joining Hamas or Fatah increased social standing*:

> Recruits were treated with great respect. A youngster who belonged to Hamas or Fatah was regarded more highly than one who didn't belong to a group and got better treatment than unaffiliated kids.

— *It was the social norm to join*:

> Everyone was joining. . . . Anyone who didn't enlist during [intifada] would have been ostracized.

— *The hatred toward the Israelis was remarkable, especially given that few reported any contact with them*:

> You Israelis are Nazis in your souls and in your conduct. In your occupation, you never distinguish between men and women, or between old people and children. You adopted methods of collective punishment, you uprooted people from their homeland and from their homes and chased them into exile. You fired live ammunition at women and children. You smashed the skulls of defenseless civilians. You set up detention camps for thousands of people in subhuman conditions. You destroyed homes and turned children into orphans. You prevented people from making a living, you stole their property, you trampled on their honor. Given that kind of conduct, there is no choice but to strike at you without mercy in every possible way.

Secular influences also had an impact, beginning with family background and early life. As with other Palestinian terrorist organizations, there is a dichotomy between how families felt in theory and how they felt in reality. Publicly, families supported the organization and were proud of their sons for joining. Privately, they feared for their sons and often for what the security forces might do to the families. Families who had paid their dues to the war effort by allowing the recruitment of a son tried to prevent other sons from enlisting too. One mother who lost a son to a martyrdom operation, and feared that her second son was embarked on the same path, reported that if possible she would "cut open her heart and sew her remaining son inside for safety."[10]

While most Fatah members reported that their families had good social standing, their status and experience as refugees were paramount in developing self-identity:

> I belong to the generation of occupation. My family are refugees from the 1967 war. The war and my refugee status were the seminal events that formed my political consciousness and provided the incentive for doing all I could to help regain our legitimate rights in our occupied country.

— *Enlistment was a natural step for the secular terrorists as well*:

> In a way, [enlistment] can be compared to a young Israeli from a nationalist Zionist family who wants to fulfill himself through army service. My motivation in joining Fatah was both ideological and personal. It was a question of self-fulfillment, of honor, and a feeling of independence. . . . The goal of every young Palestinian was to be a fighter. . . . After recruitment my social status was greatly enhanced. I got a lot of respect from my acquaintances and from the young people in the village.

Combating such deeply ingrained attitudes will be difficult. Yet, failing that, there will be a growing stream of terrorists to replace those killed or arrested. Particularly problematic is schooling. The virulent anti-Western brand of Islam being taught in the radical madrasas of Pakistan and other countries is a case in point. What steps might ameliorate the poison being dispensed? How can moderate clerics be encouraged to temper the curricula? The U.S. Department of Labor recently funded a $25 million program in Pakistan to combat child labor. For $80, a student can receive a year's education at a secular school. Each child enrolled is one not exposed to the anti-Israel, anti-West propaganda found in the radical madrasas.

In contrast to the bleak despair in which they live, there is something empowering about taking action—power to combat powerlessness, action to combat passive helplessness—as suggested by the following quote from a member of Fatah:

> I regarded armed actions to be essential, it is the very basis of my organization and I am sure that was the case in the other Palestinian organizations. The aim was to cause as much carnage as possible. The main thing was the amount of blood. An armed action proclaims that I am here, I exist, I am strong, I am in control, I am in the field, I am on the map. An armed action against soldiers was the most admired. . . . The armed actions and their results were a major tool for penetrating the public consciousness.

This passage makes clear how difficult it is to leave the path of terrorism, and emphasizes why this will indeed be a "long war." It is also indicative of the requirement to provide alternate pathways for youth, taught by hatemongering leaders, who see a bleak future and are drawn toward violence out of despair. What can be done to open pathways for ambitious young people within their society? Support for programs that encourage economic development and opening of societies—be it Pakistan, the West Bank, or Gaza—can shrink the reservoir of dispirited youngsters.

Both measures—educational support and economic programs—require funding by government agencies or nongovernmental organizations, but the investment would go a long way toward reducing the population that sees no path other than terrorism.

### Producing Dissension within the Group

The second element of a robust PSYOP strategy is to produce dissension within the group. Terrorist organizations are often hothouses of tension. When they are attacked, internal tensions disappear and it becomes them against the world. What would magnify tension, sow distrust, recast the image of the leader or pretenders to the throne, or worsen the already stressed climate and paralyze the group? Injecting such influences into a closed body is by no means easy but would reduce group cohesion and effectiveness.

This is a central theme of a recent important monograph by the Combating Terrorism Center (CTC) at the United States Military Academy.[11] Based on an analysis of papers, manuals, and other documents, which al Qaeda leaders have written to guide and discipline their organization, the report—titled *Harmony and Disharmony: Exploiting al Qaida's Organizational Vulnerabilities*—demonstrates how al Qaeda is indeed a learning organization that studies its successes and failures and continually attempts to examine itself and profit from lessons learned. Insofar as these documents identify organizational vulnerabilities, they provide a valuable guide for actions that will magnify these organizational clefts and create internal disharmony.

For any secret criminal enterprise, be it organized crime or a terrorist organization, there will be an inherent tension between security and secrecy, on the one hand, and organizational efficiency, control, and morale on the other. The authors of the CTC monograph recommend the following 12 actions to exploit al Qaeda's organizational vulnerabilities:

1. Disrupt al Qaeda's control of operations and limit its financial efficiency.
2. Constrain al Qaeda's security environment.
3. Prioritize efforts based on subgroup vulnerabilities.
4. Conduct an aggressive study of jihadi strategy and foreign policy.
5. Deny jihadi groups the benefit of security vacuums they seek to create and exploit.
6. Turn the jihadi vanguard back on itself.
7. Confuse, humiliate, demoralize, and embarrass the jihadi rank-in-file.
8. Subvert the authority of senior commanders.
9. Facilitate misunderstandings as well as an understanding of the United States' intentions and capacity.
10. Force jihadi propagandists back on their heels.
11. Understand and exploit the ideological breaks in the jihadi movement.
12. Anticipate al Qaeda's transformation from an organization to a social movement.

Clearly, there are many implications for policies and practices of PSYOP among these recommendations.[12]

### Facilitating Exit from the Group

The third element, facilitating exit from the group, emphasizes the dangers of becoming a terrorist: once one has made that choice, there is no turning back, for an early hurdle for full acceptance by the group is often a requirement to carry out a terrorist action, which in turn leads to a

criminal sanction. Indeed, it has become almost ritualized not only to demonstrate one's commitment to the group, but also to ensure against defection. This of course poses a major problem for intelligence agencies seeking to penetrate a terrorist group. A number of governments countering terrorism, recognizing this impediment to leaving the group, have instituted creative amnesty programs, akin to the U.S. protected witness program, in which amnesty is given in return for cooperation and information. The bargain includes financial support for a new life and can extend to resettlement in other countries and even plastic surgery, as Spanish authorities provided Basque Fatherland and Liberty (ETA) defectors. The Italian *pentiti* program was instrumental in breaking the back of the Red Brigades.[13] Moreover, information developed by defectors can be fed back to the group to strengthen option two, producing internal dissension.

### Reduce Support for the Group and Its Leader

The fourth element is information operations directed against the group in order to reduce public support. An exemplar of this goal is al Qaeda. For years, Osama bin Laden has been unchallenged in the arena of marshalling support for his view of Islam and the West. The virulent brand of Islam he has championed and the violence he has justified with his extreme interpretation of the Koran are consistent with those of Hamas and Islamic jihad leaders and have not been countered. Al Qaeda has attracted alienated Muslim youth sensitized in the madrasas and mosques. Testimony from the 2001 trial of the al Qaeda bombers of the U.S. embassies in Tanzania and Nairobi, in federal court in New York, highlights the roles of the madrasas and the mosque in this radicalization process.[14] In the madrasa in Zanzibar, the future bombing participant was taught never to question learned authorities, especially those with religious credentials. In the mosque in Dar es Salaam, where he felt welcomed as a member of the *umma* (the community of observant Muslims), he learned of the obligation to help other Muslims wherever they were. He was shown films of Serbian soldiers and Muslim mass graves in Bosnia, and of Russian soldiers and the bodies of Muslim women and children in Chechnya.

Alone and isolated except for the mosque, he vowed (in his words) to become a soldier for Allah and defend these innocent victims against the soldiers of Serbia and Russia. When he gave voice to these sentiments, he was informed by a spotter for al Qaeda that to be a soldier for Allah he must get training; so, using his own money, he went to Pakistan to be screened, and was then sent to a training camp in Afghanistan. After seven months there, when he was offered only participation in the Kashmir conflict rather than fighting soldiers in either Bosnia or Chechnya, he returned to Dar es Salaam and was again isolated in the community, working as an assistant grocery clerk. Still participating at the mosque—the one

place he felt he belonged—he eventually received the call to take part in a "jihad job" three years later, to which he responded immediately. His pious wish to defend Muslim victims was bent into participating in an act of mass casualty terrorism. As he was confronted with the consequences of the bombing, in contrast to other terrorists, he was overwhelmed with the death of innocents, which he saw as inconsistent with his views of jihad: "Their jihad is not my jihad." Nor is it the jihad of the majority of mainstream Muslims; yet, they have been remarkably mute, giving free rein to the extremists to steer alienated youth into violence in the name of Islam. Osama bin Laden's justifications, as spelled out in al Qaeda terrorism manuals and other documents,[15] are inconsistent with the Koran, and yet to the alienated youth, they are justification for killing in the name of God.

What can counter these religiously based arguments? This will take moderate Islamic clerics and leaders reclaiming the focus of their religion and depicting Osama bin Laden and his ilk as distorting the meaning of the Koran and violating the spirit of Islam in the service of self-aggrandizing motivations. The goal is to make the group not a mainstream path for alienated youth but a deviant path, and to not have the leaders seen as romantic heroes but as preachers of a perverted and distorted version of Islam. This requires activating voices not currently heard, for these changes must come from within Islam, and at present the extremist view is uncontested.

### Insulating the Public

Thus far, this chapter has offered a fourfold approach to countering terrorism by reducing the attraction to the group, undermining internal cohesion, facilitating exit from the group, and reducing support for the group and its leader. But of equal importance is the fifth element: defending against the central goal of terrorism—to terrorize. If the act of one extremist youth can derail the fragile movement toward dialogue and reconciliation, terrorism is being rewarded. Sustained public education is needed. Israel has come a long way in this direction, but the United States—as witnessed during the paralyzing effects of the Washington area snipers—has far to go.

The need for a strategic information campaign includes a coordinated information policy, so statements from the White House or the office of the prime minister are in sync with the messages coming out of the operational units in a combat theater. Indeed, public diplomacy statements designed to reassure the domestic constituency too often undermine the information goals of those conducting PSYOP. It is difficult in a large bureaucracy to integrate and coordinate information campaigns among key elements of the government, for many of the targets of influence will

require pressure and inducements for which the Department of State or foreign ministry might take the lead. To inject destabilizing information within the inner circle may require the sophisticated and covert techniques of the Central Intelligence Agency or Mossad. And to undermine the legitimacy of the group leaders will require moderate Muslim clerical and political leaders to counter the extremists in their midst and try to regain the focal point of their religion.

To develop nuanced PSYOP programs requires a nuanced understanding of the adversary, for the messages must be tailored to the target. One cannot deter an adversary one does not understand. This is particularly true for two problems of special concern: utilizing psychological operations to counter suicide terrorism and to counter WMD terrorism.

### Countering Suicide Terrorism

The Koran, in fact, prohibits suicide.

> Whoever kills himself with an iron weapon,
> Then the iron weapon will remain in his hand,
> And he will continually stab himself in the belly with it,
> In the fire of hell eternally, forever and ever.

But in fact, when interviewing suicide bomb commanders,[16] one commander asked how he could justify suicide terrorism (since he claimed that they are carrying out these acts in the name of Allah, and the Koran proscribes suicide) he responded angrily, "This is not suicide. Suicide is weak, it is selfish, it is mentally disturbed. This is istishad" (martyrdom or self-sacrifice in the service of Allah).[17] Perhaps the most famous leader of suicide bombers, Hassan Salame—now serving 46 consecutive life sentences in Israeli prisons for the wave of suicide bombings he orchestrated in the spring of 1996 during the run-up to the Israeli election that year— explained the use of this tactic as follows: "A martyrdom operation bombing is the highest level of jihad, and highlights the depth of our faith. The bombers are holy fighters who carry out one of the more important articles of faith." Another suicide bomb commander stated that "it is martyrdom bombing attacks which earn the most respect and elevate the bombers to the highest possible level of martyrdom."[18]

In a quote revealing the "normalcy" of these actions in the minds of the operators, a commander now serving 26 consecutive life sentences recounted his disappointment when he was not asked to join a martyrdom bombing operation squad:

> I asked Halil what it was all about, and he told me that he had been on the wanted list for a long time and did not want to get caught without realizing his dream of being a suicide bomber. He was completely calm and explained

to the other two bombers, Yusuf and Beshar, how to detonate the bombs, exactly the way he had explained things to the bombers in the Mahane Yehuda attack. I remember that besides the tremendous respect I had for Halil and the fact that I was jealous of him, I also felt slighted that he had not asked me to be the third suicide bomber. I understood that my role in the movement had not come to an end and the fact that I was not on the wanted list and could operate relatively freely could be very advantageous to the movement in the future.

For several years, the Israelis have conducted "suicide postmortems" (i.e., reconstructions of the lives of suicides).[19] In one study (conducted during the early 1990s), the perpetrators were young men, ages 17–22, unemployed (the unemployment rates in the refugee camps were running at 40–70%), uneducated, and unmarried. They were unformed youth who, when they entered the safe house, were told by the suicide bomb commander something like the following:

> You have a worthless life to look forward to. By carrying out his act of martyrdom, you will be doing something significant with your life. You will be enrolled in the hall of martyrs. Your parents will be proud of you. This will give them prestige. And they will get a large financial benefit.

And once they entered the safe house, they were never left alone. On the night before the operation, a staff member slept in the same bedroom to make sure they didn't backslide, and they were physically escorted to the pizza parlor or shopping mall. More recent demographic profile studies suggest a much wider age range, and now women too are carrying out these "martyrdom operation" bombings.

The demographic profiles of the 9/11 suicidal hijackers differ significantly from those of Palestinian suicide bombers. They were older—28–33 in age; Mohammad Atta, the alleged ringleader was 33. And they were well educated; indeed Atta and two of his colleagues were enrolled in master's degree programs in the Technological University in Hamburg. Moreover, they were economically comfortable, with the majority coming from middle-class families in Saudi Arabia or Egypt. (There was a younger group, brought in late to provide "muscle," who probably were not aware this was not a conventional hijacking.)

These terrorists can be seen as fully formed adults who had subordinated their individuality to the group identity. They had subordinated their individuality to the destructive charismatic leadership of Osama bin Laden, and what he declared was moral and just was indeed moral and just. They believed that on 9/11, they were carrying out a sacred act for the cause of the Muslim people. Demographic data are not yet available for the suicide bombers in Iraq, but they, too, would seem to be inspired by charismatic leadership to give their lives for the cause.

Terrorism scholar Mohammad Hafez has observed that there are three requisite conditions for a suicide bomb campaign: a culture of martyrdom, a strategic decision by the organization to employ this tactic, and a willing supply of recruits.[20] He also notes that there are actually three prohibitions against such acts in the Koran—not just the prohibition against suicide, but also prohibitions against killing innocents and against killing Muslims.

These prohibitions provide a useful foundation for a PSYOP campaign against suicide terrorism. What is necessary is to reframe these attacks not as noble acts of martyrdom, but as murderous acts that violate the three prohibitions found in the Koran. But this requires that Muslim clerics challenge those misrepresenting Islam in the name of their cause, something we have not yet seen on a global scale.

### Countering WMD Terrorism

Although a major goal of terrorism is to influence an audience beyond the immediate victims, for most terrorist groups, WMD terrorism would be counterproductive. One exception to this is radical Islamist terrorists, who are not interested in influencing the West but in expelling the West (along with our corrupt, secular, and modernizing values) from any interaction with the Muslim world.[21] Interviews with incarcerated Muslim terrorists on the subject of mass causalities and WMD for the most part did not show a reluctance to consider WMD, but for most, a typical response was "just give me a good Kalashnikov." However, several thought it would be a good idea to have a weapon that could kill thousands. According to one interviewee:

> The more an attack hurts the enemy, the more important it is. That is the measure. The mass killings, especially the suicide bombings, were the biggest threat to the Israeli public and so most effort was devoted to these. The extent of the damage and the number of casualties are of primary importance.

Another, when asked if there are any limits on the extent of violence, responded simply, "In a jihad, there are no red lines."

However, two themes did emerge from this study, which has potential application for a PSYOP campaign. One was the fear of "silent death." In effect, these weapons were scary, and not everyone was seeking instant martyrdom.

> Personally I made do with a pistol. But I would like the organization to have arms that could wipe out a village or a neighborhood. Atomic and chemical weapons, and things like that, though, frighten me, and I would worry about their impact and consequences of using them.

And several remarked on the Koran's prohibition against poisoning the Earth:

> As for the question of weapons of mass destruction or non-conventional weapons, the question never arose. All I wanted was a pistol. But we did discuss the subject once. Islam wants to liberate, not kill. Under Islamic law, mass destruction is forbidden. For example, chemical, biological or atomic weapons damage the land and living things, including animals and plants, which are God's creations. Poisoning wells or rivers is forbidden under Islam.

These themes, as well as the themes prohibiting the killing of innocents and Muslims, could be important to emphasize in an information operations campaign.

## CONCLUSION

In sum, coordinated information operations are seen as an underutilized but critical weapon in combating terrorism. A five-pronged strategy has been offered here for strategic PSYOP, with particular attention given to the challenges of combating suicide terrorism campaigns and WMD terrorism. As powerfully demonstrated by internal al Qaeda documents in the CTC monograph, al Qaeda and the global Salafi jihad are not a monolithic well-coordinated organization. They are not only prey to the disconnections and cleavages that affect any large organization, but because they are a secret organization, these vulnerabilities are magnified. A sophisticated information operations program should be informed by and focus on these vulnerabilities. But this will require a sustained campaign.

It will take years to alter the extremist attitudes that lead alienated youth onto the path of terrorism, for "when hatred is bred in the bone," it does not easily yield. Indeed, many terrorist experts believe that the current generation has already been lost, and the goal must be to gradually affect psychocultural attitudes of the next generation. How can we mobilize parents to impede their children's entrance onto the path of terrorism? For the United States to attempt directly to counter the extreme negative image that is portrayed on the radical Islamist Web sites is doomed to failure, for any such efforts will automatically be suspect as U.S. propaganda. But how can we mobilize moderate Muslim clerics to counter the extremists in their midst, to mobilize modernizing Muslim political leaders to challenge the extremists who in fact are targeting them? This will be a difficult challenge. Thus it will indeed be a "long war," as identified in the most recent Quadrennial Defense Review, and information programs need to be instituted than can be sustained over decades.

## THE CONTEMPORARY CHALLENGES OF COUNTERTERRORISM INTELLIGENCE

Jennifer E. Sims

In August 2006, U.S. officials applauded as British officials nabbed terrorists planning to bring down transatlantic airliners. It was, at least in part, victory by association. In fact, as U.S. counterterrorism officials have fought to stay ahead of deadly enemies, their intelligence system has been in crisis. In May 2006, John Brennan—the former director of the Terrorist Threat Integration Center—called the intelligence community "flawed"; he blamed the Intelligence Reform and Terrorism Prevention Act of 2004 for sewing confusion about roles and responsibilities, and warned that U.S. intelligence was left without a "strategic blueprint."[1] Other experts have argued that the structural defects in U.S. intelligence are decades old and have predicted lengthy repairs.[2] Nowhere have the repairs seemed more pressing than in the Central Intelligence Agency (CIA). Recently, the CIA has shuffled bosses, lost its former access to the White House, and been plagued with low morale and high attrition among its most experienced officers. Rightly or wrongly, CIA employees have been accused of leaking, political preference, and—in the case of former director Porter Goss's subordinates—possible criminal activity. The Pentagon, witnessing the weaknesses at CIA, has expanded its human intelligence missions—arguably at CIA expense. Ambassadors and chiefs of station have lost their purchase on the overseas operations of the U.S. government, arguably increasing the kinds of risks in the field that improved

coordination by the new Director of National Intelligence (DNI) was meant to reduce.

As predictable as the Pentagon's apparent grab for power might have been to critics of the 2004 intelligence reforms, the attendant political defeats for the DNI have not been welcomed by any intelligence professional. As one former clandestine officer observed, it took five years to defeat Hitler; in about the same amount of time, a supposedly modernized U.S. intelligence apparatus seems still to be floundering.[3]

It thus would appear that recent U.S. intelligence reforms have failed in their purpose—to enhance the performance and coordination of multiple agencies in the aftermath of the 9/11 attacks—even as the number of employees working under the new Director of National Intelligence has increased from two to almost 1,500 in just one year. But, appearances aside, the most important question remains: is the counterterrorism intelligence *mission* truly in trouble? After all, the U.S. government has claimed impressive successes, including 253 convictions against 435 defendants in terrorism-related cases with a "clear international connection."[4] And the British victory against the airline plotters did presumably involve American intelligence cooperation.

The absence of declassified information on the daily performance of intelligence agencies makes the evaluation of intelligence reforms difficult. Excessive attention to arrest numbers or squabbles among intelligence bureaucracies may distract from the true measures of success for intelligence systems: whether intelligence is improving decision making against adversaries attempting to put American and allied lives in jeopardy. Critics of the 2004 reform legislation who have argued that reshuffling, reorganizing, and creating new bureaucracies will do little to improve intelligence performance, ought not fall into the trap of judging U.S. intelligence performance now by the number of employees or bureaucratic brawls at the top of these same institutions. Instead, they should consider what constitutes sound counterterrorist intelligence, compare current practices to it, and recommend improvements wherever the fit is imperfect.

This chapter will, therefore, focus less on the tactics of counterterrorist intelligence—such as how Khalid Sheik Mohammed was tracked and eventually caught—than on broader requirements and future challenges.[5] It begins with a discussion of what history can tell us about the core features of past counterintelligence missions that have been successful against transnational groups. It then discusses the new features of the modern conflict that are changing the nature of the tradecraft needed to defeat terrorist organizations such as al Qaeda and associated groups. A key premise of the study is that one cannot evaluate an intelligence effort without identifying the nature of the competition, including the adversary

and his strategy. This is because intelligence, at its core, is less about getting facts right or wrong than providing competitive advantages in foresight and situational awareness to decision makers.[6]

## SOME THINGS OLD . . .

Despite occasional suggestions to the contrary, the intelligence challenge posed by a global network of terrorists—one that seeps across state boundaries for the purpose of sabotage and disruption—is not all that new.[7] Following the French Revolution—and especially after Napolean's defeat at Waterloo—France became the central hub for a network of frustrated revolutionaries and anarchists. As a result, nascent French security services built *chambers noirs* focused on intercepting domestic mail. With the police in the lead, France successfully tracked anarchists and radicals through expanded police powers.[8] In contrast, the elaborate intelligence institutions of the Dual Monacrchy of Austria–Hungary were famously challenged by Serb nationalists later in the century; their ineffectual counterterrorists efforts were punctuated by the assassination of Archduke Ferdinand.[9]

Some years later, intelligence-gathering tools were used by the left against monarchists in Russia. After the Bolshevik revolution, Lenin faced a counterrevolutionary movement dedicated to reversing what he and his cohorts had accomplished. The government's enemies were particularly worrisome because they were indistinguishable from Bolshevik loyalists. "Now the enemy is here, in Petrograd, at our very hearts," said Felix Dzerzhinsky, Lenin's chief spy and the founder of the Cheka (the Soviet Secret Police).[10] The Cheka proceeded to terrorize the recalcitrant monarchists so effectively that they fled, establishing a network and operatives throughout Europe. The organization and methods that Dzerzhinsky created to locate, dupe, and eventually defeat them stood, for most of the twentieth century, as one of the most successful transnational counterintelligence endeavors ever undertaken.[11] Called simply The Trust, its techniques became an example—albeit an extreme one—for post–World War II counterintelligence chiefs seeking to defeat international communism, another transnational twentieth century threat.[12] For this reason, and because it is still influential in modern counterintelligence practice, The Trust is worth considering in greater detail.

### The Trust

This counterintelligence operation began in 1921 and ended about a year and a half after the entrapment and death of Sidney Reilly in late 1925. Reilly was a British citizen who, since at least 1918, had associated

with officers of the British Secret Intelligence Service and conceived of himself as a master spy and anti-Bolshevik conspirator.[13] During this time, the Cheka carefully infiltrated the White Russian émigré community in Europe, including the Supreme Monarchist Council and the Russian Combined Services Union. As it did so, it spread the fabrication that a counter-revolutionary organization called the Trust was working underground to overthrow the Bolsheviks. In this way it not only uncovered the monarchist network but lured its ringleaders to their deaths.

There were four keys to the Trust's success against its adversary—a transnational network of operatives: double agents, doubled logistics, deception, and data fusion. According to Jeffrey Richelson:

> Through the Trust, the Cheka and its successors were able to thoroughly penetrate the main White Guard émigré groups and identify their sympathizers in Russia, the Baltic states, Poland, Britain and France. Estonian and Polish diplomats even permitted the Trust to send its messages via their diplomatic bags.[14] . . . The émigrés were assured that the best chance of achieving their goals was to let the Trust operate quietly to undermine the Soviet regime. It was also employed to feed false information to British and Polish intelligence and to encourage them to send agents to attempt to subvert the Bolsheviks. The Trust also siphoned funds from White émigrés, funds that might have been used to support insurrections. Additionally, it was employed to expose and entrap the remaining anti-Soviet underground.[15]

By preempting the monarchists' operations and going after them in their sanctuaries, the Cheka avoided being thrown on the defensive. The techniques employed, however, were brutal. Reilly, like many of the captured operatives before him, was harshly interrogated, forced to reveal details of the intelligence and counterintelligence capabilities of Moscow's adversaries and ultimately murdered. The Trust offers, therefore, a highly controversial model for modern democratic states attempting to defeat transnational, ideologically driven networks.

### Countering Soviet Interwar Espionage

Of course, democracies had their own counterintelligence successes against transnational adversaries during the twentieth century. The British developed a highly intrusive counterespionage effort that weeded Soviet agents—including some born and raised in Britain—out of British party politics during the period between the two world wars.[16] Domestic intelligence, spearheaded by MI5, ultimately disrupted Soviet cells and exposed their links to a network of communist operatives within many democracies—a wide and tightly controlled web that became apparent only gradually.

The key to MI5's success was data fusion: domestic signals intelligence (SIGINT) combined with human reporting (HUMINT) and defensive counterintelligence operations, such as surveillance of the Communist Party of Great Britain (CPGB). Nigel West describes the importance of data sharing in detail in his recent and comprehensive book on the subject:

> Once the address from which the illicit transmitter had been operating . . . had been ascertained, the sole occupier was watched, and his identity established . . . MI5's B3 watchers, led by Harry Hunter, noted that he regularly met Alice Holland, another CPGB [Communist Party of Great Britain] member who was also placed under surveillance. Neither realized that their mail and telephones were being intercepted, nor that they were followed wherever they went. Anyone they met was also watched, and over a period of months MI5 was able to build a comprehensive picture of the CPGB's underground network . . . an apparatus that existed sub rosa and in parallel to the overt Party . . . MI5's task was to infiltrate the clandestine organization, identify its membership, monitor its activities and assess the degree to which it was engaged in sedition or espionage. The undertaking was of enormous sensitivity.[17]

West's story is about the successful defense of a liberal democracy using illiberal means—albeit, means far less offensive than those employed by the Trust—which, in defense of Bolshevism, massacred about 200,000 people. Other democracies have, however, gone further than the British did in this case. For example, France at least temporarily defeated terrorist insurgents during the Battle of Algiers by demonstrating a capacity for ruthlessness, including torture, for intelligence ends.[18] And the British have apparently used their own agents as pawns or bait—even allowing them to torture and be tortured in order to gain intelligence on the evolving conflict in Northern Ireland.[19] Victors in battles with clandestine networks, including democracies, have used lying, fabrication, and intrusive domestic methods to corral, arrest, and finish off their adversaries. But in doing so, they have sometimes put their own societies, including the fabric of morals, culture, and respect for individuals on which they are based, at risk in other ways. Democracies have successfully fought transnational groups but, in doing so, they have had to balance gains against their adversaries against losses to their own cultural and political integrity.

### Implications and Lessons Learned?

Indeed, these and other historical examples offer lessons for modern counterterrorist intelligence operations, four of which are worth noting here. First, past successes against transnational groups have required close cooperation between law enforcement and intelligence. When

intragovernmental cooperation has been poor or bureaucracies highly competitive, success has been elusive at best.[20] Second, communications have often been the Achilles heel of transnational operations, making signals intelligence (SIGINT) and decryption at least as important as human intelligence (HUMINT) for tactical counterintelligence. Third, the intrusive measures taken during the periods of highest threat have generally been scaled back after threats have subsided. In democracies in particular, the need to balance intrusiveness with public accountability in domestic counterintelligence operations has proven to be a competitive disadvantage—one that smart adversaries can exploit.

This vulnerability is vexing because it is so critically tied to the way of life democracies are defending. Yet, it may also be one reason the United States in its current counterterrorism endeavors, has not drawn as bright a line as some critics would like in separating cruel, degrading, and inhumane treatment from acceptable intelligence gathering practices. Proponents of a fuzzy line note that, given the stakes involved, it may be important to keep some of the more extreme options open—such as secret detentions, renditions, and perhaps even harsh interrogations bordering on torture—because they intimidate and deter.

However, others note that terrorists seek to sway public opinion for strategic gain, and fuzzy lines can be used to mischaracterize American intentions. Insofar as defeating transnational networks requires liaison with other governments, one country's use or threatened use of extreme methods can implicate all of its partners, jeopardize important intelligence exchanges, and get in the way of good relations with domestic communities whose cooperation is needed to fight domestic terror. Baltasar Garzon, a well-known investigative magistrate in Spain, has argued forcefully for the shutting down of the U.S. terrorist detention facility at Guantanamo Bay, Cuba, calling it "an insult to countries that respect laws" and a place that "delegitimizes us" and that "needs to disappear immediately."[21] Britain's attorney general, Lord Goldsmith, and Italy's prominent jurist, Armando Spataro, have made similar statements.[22]

Herein lies the fourth lesson and central conundrum for liberal democracies fighting global terrorist networks: although the mission is not new, past models for success have often involved bloody or politically offensive intelligence practices.[23] Yet, we entered the post–Cold War era optimistic that the United States could reasonably promote democracy and the rule of law worldwide. Do the illiberal requirements of fighting terror inevitably sabotage this larger vision of helping societies embrace individual rights, freedoms, and self-determination? Or is it possible to render the intelligence aspects of fighting terror part of the solution to the conundrum itself?

While the issues involved in reconciling ethics, law, democratic culture, and counterterrorism cannot be explored in depth in this chapter, it is

worth noting that neither the United States nor most of its allies wish to win the conflict at the expense of their civil societies; yet they are tempted to do so because these methods have seemed to work in the past and the consequences of failure seem so high.[24] The question that will be explored at least minimally in this chapter is whether some of the ingredients of these past successes can be combined with something new, in strategy or in intelligence practice, that can make what is likely to be a protracted war a successful and tolerable one as well.

## . . . SOME THINGS NEW

The modern conflict with terrorism, including intelligence operations, involves five aspects that suggest some departures from past intelligence practices may not only be possible but necessary. These five aspects will affect counterterrorism operations in the future and should, therefore, be considered when building today's intelligence architecture. They include the information revolution; the standardization of intelligence practices; the changing nature of warfare; the increasing role of the private sector in espionage, surveillance, and intelligence analysis; and, perhaps most important, the nature of the modern terrorist adversary.[25] The implications of these developments for intelligence operations generally, and counterterrorism operations in particular, are potentially profound and are likely to adjust—at least at the margins but possibly to the core—the balance that past counterintelligence efforts have struck between data fusion, state intrusiveness, and civil liberties.

### The Information Revolution

Tired as the phrase is, the "information revolution" is real, ongoing, and deeply affecting international politics, including the operations of transnational terrorists. It concerns more than the increased capacity of computers and software, which have in turn increased the volume and speed of communication. It is as much about individual access both to ideas and to worldwide audiences. With the advent and growth of the Internet, people now have the opportunity to acquire "actionable" knowledge, to interact across international boundaries, and to make choices based on their personal research much more quickly than in the past. For example, the terrorist attacks at Sharm-el Sheikh and in London during 2005 were facilitated by training that was available electronically. Terrorists have been quick not only to adopt the latest communications technologies, such as cell phones, but also to exploit the highly competitive market by finding vendors willing to sell to purchasers that refuse to give their names.[26]

Given the ease with which terrorists assimilate new technologies into their organizations, counterterrorism officials must also anticipate next

steps and prevent them. For example, cyberterrorism, which received some attention prior to 9/11, appears to have slipped off the public agenda. But as governments increasingly rely on databases of terrorists and inferencing engines to sort data, the vulnerability is arguably getting worse. Of greatest concern are not the apocalyptic scenarios of Internet collapse some once predicted; transnational organizations such as al Qaeda probably rely too much on the Internet for logistical purposes to plot its collapse.[27] Rather, terrorists are more likely to use the Internet as an adjunct to terror in its more traditional form. They may penetrate databases to gain visas and tamper with security systems and even electrical grids for instrumental purposes known in military jargon as "preparation of the battlefield." Scott Borg, the director and chief economist of the U.S. Cyber Consequences Unit (CCU), an organization that advises the U.S. Department of Homeland Security, reportedly worries principally about Supervisory Control and Data Acquisition (SCADA) systems.[28]

> Control systems are a particular worry, because these are the computer systems that manage physical processes. They open and shut the valves, adjust the temperatures, throw the switches, regulate the pressures. . . . Think of the control systems for chemical plants, railway lines, or manufacturing facilities. Shutting these systems down is a nuisance. Causing them to do the wrong thing at the wrong time is much worse.[29]

Vulnerabilities to cyberterrorism arise as industries and governments automate their operations, acquiring low-cost products for their encryption and information processing needs. In the first instance, this demand generates an ever-growing market for more data processing tools available to the public and private sectors.

As James Gosler of Sandia Labs has shown, this rising demand has created new and sometimes surprisingly complex vulnerabilities in modern, industrial economies.[30] Advanced technology firms have been hiring more foreign companies to assist in creating components for complex information systems. Years ago, national security experts saw this coming. One commented on a computer part sent to him by a friend: "On the back was written: 'This part was made in Malaysia, Singapore, the Philippines, China, Mexico, Germany, the U.S., Thailand, Canada and Japan.'"[31] There is little "made in America" about the nation's critical infrastructure. The distributed nature of the information industries, a by-product of globalization, has thus created new avenues for malicious tampering or "sleeper" sabotage of critical infrastructure.[32] Put simply, commercial technology may be a Trojan Horse—a welcome gift bearing unwelcome surprises. The best way to counter such sleeper technologies may be to embed countermeasures in critical systems that can identify the sleeper technologies before, or as, they act.

In any case, a corollary to the new intimacy between the individual and the state is the enhanced role individuals play in making national news. As Thomas Friedman has noted, one feature of globalization is that we are all now broadcasters.[33] The national media find themselves chasing stories first revealed by local reporters or Internet bloggers. Not only can a cartoon published in the Netherlands or a Koran mishandled at Guantanamo offend Muslims in Turkey, Pakistan or Indonesia within hours or minutes, but the information received is often laced with gossip and conspiracy theories. Reactions to the distorted picture can in turn quickly affect decision making back in Washington or within Bin Laden's inner circle. Whether stories are apocryphal or not, they spread. This phenomenon underscores the importance of open source intelligence for both intelligence and counterintelligence purposes.[34] Deception—a technique of intelligence masters of the past—can become a much more widely used instrument today. In the hands of terrorists, deception creates at the very least more "noise" for counterterrorism analysts to sift through; at worst, it could mask tomorrow's strategic surprise.

For this and other reasons, it is not clear that an increasingly bloated information environment improves international discourse or that more connected citizens make decisions any more wisely than their less connected forbearers. In fact, research suggests that people tend to use their improved access to information, and the Internet in particular, less for learning than for finding and interacting with those with similar biases and viewpoints.[35] In any case, the information revolution would seem to render individuals and the civil societies they populate more empowered in relation to their governors, for better or for worse. This circumstance does not suggest that state-run intelligence systems have been eclipsed by the information revolution; it suggests only that they must adjust to the information environment and, in particular, the new ways in which competitors, adversaries, and potential nongovernmental allies are organizing.

### Social Organization, Politics, and the Standardization of Intelligence Operations

Changes in the information environment affect social organizing and all forms of political competition—often in surprising ways. In the realm of national security policy and terrorism in particular, the most discussed effects have been the rise of networked organizations that rely on distributed decision-making and semi-independent cells for flexible operations, clustering, and "swarming."[36]

Sociologists have developed a literature that describes these new organizational modalities in some detail—a body of work that can only be summarized in the briefest terms here. Networks rely on distributed

decision-making and semi-independent cells for flexible and compartmented operations. In their modern form, these cells emerge and connect particularly efficiently. The Internet enables extremists to find each other quickly and within these "clusters" reinforce each other's views. "Swarms" can be thought of as clusters on the move—or, more accurately, clusters forming on the move. A swarm resists preplanning.[37] It just emerges as a result of individualized communications. Howard Reingold, author of *Smart Mobs: The Next Social Revolution*, has called the phenomenon (less simply but perhaps more accurately), "cybernegotiated public flocking behavior."[38] What is important about swarming for intelligence and counterterrorism is its sociological substructure. Collective action comes about quickly as a result of very rapid decision making by a gradually forming, self-identifying group that may melt as fast as it forms.

Once recognized, swarming can be adopted as a deliberate technique and used for operations in which the speed of decision making is more important than security. The CIA has allegedly used swarming techniques when conducting renditions (apprehending a subject on foreign soil and bringing him to face justice in the United States or a third country). After the imam Hassan Mustafa Osama Nasr was seized as he walked to his mosque on February 17, 2003, the Italian police identified the suspected kidnappers by examining all cell phones in use near the abduction, and then tracing the web of calls placed. The forensics used by the police helped them to identify a form of swarming behavior among thirteen alleged CIA officers, but the kidnapping was so quickly accomplished that the technique was recognized only after the imam had disappeared.[39] If this had been a terrorist attack, the bomb would have already gone off.

In the modern age of terrorism, swarming, clustering, and networking reflect how the enemy can and will behave; they will be making decisions on the move. The Italian case, though a possible example of counterterrorist swarming, nonetheless shows how tactical defense can fail if employing traditional law enforcement techniques, whether among special operations forces or within civil societies threatened by attack. It illustrates the tactical challenge modern operations pose for those trying to defeat terrorism before it occurs.[40]

The second, more political effect of the information revolution has been what might be termed the "standardization" of intelligence operations alluded to above. As intelligence services increasingly exploit open source information available on the Internet, share sources and methods, and conduct joint operations, the more they are learning from each other and the greater the stakes they have in how each other performs.

The popularization of the intelligence business began with the end of the Cold War and picked up momentum in the early 1990s as budget pressures led the U.S. intelligence community to disclose more of what it did to a skeptical Congress and the public. The National Reconnaissance Office was formally acknowledged; the existence of aerial surveillance

and early satellite imagery programs was disclosed; and professionals from once secretive agencies granted authorized interviews to historians such as James Bamford, Christopher Andrew and Amy Zegart, who wrote detailed histories.[41] It was not just declassified information on past intelligence activity and terminology that became available, but also musings on best practices derived both from the historical record and from theoretical work. By the end of the 1990s, an international spy museum had even opened in Washington, DC. By 2001, mid-career intelligence officers pursuing master-level degrees were expressing surprise at the quality and breadth of material available to the public, including foreigners, and covered in unclassified intelligence classes at the graduate level.[42]

On the one hand, this growing public awareness of intelligence has arguably been a good thing; terrorists and criminals should not be the only ones using modern communications to learn from each other. Intelligence is now part of local and state governance as well as national politics, it affects citizens' daily lives, and it is practiced by businesses that train their employees in skills very similar to those employed by national intelligence officers. Intelligence is, in short, no longer an obscure business. But its greater public visibility leads to legitimate concerns about protecting sources and methods and the proper limits to public dialogue on intelligence matters, including the proper relationship among scholars, historians, and intelligence practitioners.

The emergence of intelligence as a discipline of study will likely improve and standardize its practice among organized intelligence services, businesses, and, unfortunately, criminal organizations. The study of intelligence, including theoretical work that develops rigorous metrics for success, offers a historical "lessons learned" literature that could soon surpass that available within the U.S. government. The question is not whether this process is happening or can be stopped, but which intelligence services will learn—and learn faster—from it. If counterintelligence officials focus on leaks from formal intelligence institutions to the public at the expense of exploiting the learning and innovation being transferred within the private sector itself, they may find themselves at a competitive disadvantage in the future. This is not just because foreigners are reading books on intelligence and taking university courses; it is because the new intelligence scholarship is building on lessons from business intelligence and the criminal record as much as from government and, in some cases, deriving unique insights as a result.

### The Role of the Private Sector and the Changing Nature of Warfare

The foregoing discussion has suggested that private sector developments have already had a profound effect on how modern intelligence services operate. Firms specializing in advanced technologies have brought powerful data management and processing tools—including

extraordinarily strong encryption—to individuals worldwide at a steadily diminishing cost. And, as discussed briefly above, as the capacity of individuals to learn from and report to others has increased, so have the vulnerabilities of complex information systems designed and built by a highly distributed information industry.

But the impact of the private sector on modern intelligence and counterterrorism extends much broader and deeper than this. Private sector surveillance has increased sharply as owners of information—such as cell phone purchasers, patients in hospitals or online shoppers—cede their control of it in order to increase the efficiency and quality of their transactions. Commercial holders may then combine what they know into databases that they can sell for a profit or share for a larger public good. As citizens have adjusted to both the benefits and risks of this private sector data sharing, they have become more inured or perhaps complacent with the notion that the government has occasionally been on the receiving end of their largesse.

This change in public attitude is most striking in the United States. American political culture has long been heavily seasoned with distrust of the federal government and distaste for its intrusion in private matters[43]; yet Americans, so instinctively entrepreneurial and receptive to new technologies, are taking advantage of the speed and scope of individual transactions made possible by the Internet. Consumers are gradually and incrementally forfeiting their privacy for small but copious goods: quick purchases on E-Bay, the accumulation of airline miles, and tailored reading lists from Amazon.com. Reading the fine print of commercial contracts might trigger worries, but the consequences of giving up one's information seem more remote than the gains achieved through faster decision making. Time is money; people are choosing to make more by selling bits of themselves.

Yet, if this were just a profit-driven phenomenon, the accumulation of data in private hands would mean little beyond the marketplace. In fact, the larger push toward data aggregation is coming from institutions and corporations responsible for managing risk, such as insurers, and providing for the public's safety, such as law enforcement. Here, the digitization of data has allowed the compiling of such diverse "inputs" as video, still photos, voice recordings and temperature measurements into consolidated or linked databases that, properly analyzed and mined, can provide complete pictures of private sector environments. Whether looking at human bodies or the "health" of buildings made of concrete and glass, digital databases are permitting individuals at key nodes within civil society to develop the kind of situational awareness within their domains that the military seeks on the battlefield.

Operations centers that once inspired awe among civilians on State Department or Pentagon tours are now springing up in hospitals and

skyscrapers. And certain cities are getting the idea that lashing these centers together—along with the surveillance cameras of, say, local delicatessens—could not only track perpetrators of crimes, but signal patterns of urban activity that might presage the crimes. After the terrorist bombings in London in 2005, press stories rolled in from across the United States about the wiring of Chicago, Baltimore, and New York City for the purpose of surveillance. In a small town in Vermont, citizens voted to install surveillance cameras on their streets for security reasons; when reporters asked if privacy was a concern, the residents said, in essence, that security was a greater one.

This deepening and broadening of private sector surveillance, together with its public acceptability, represents a double-edged sword. On the one hand, the prospective reach of national intelligence is increased for the purpose of warning and crisis management; on the other hand, terrorists have at hand a society prewired for their own purposes, such as threats and crisis creation. A wired society, especially one with its guard down, could become a resource for criminals and terrorists.

In fact, this circumstance is changing the nature of crime and espionage faster than federal intelligence systems are able to keep up. Terrorists achieve their purposes best when they are able to infiltrate civil society, lying in wait among noncombatants in order to inflict maximum damage. A wired private sector not only provides a logistical treasure trove for terrorists in the form of accessible databases for identity theft and more rapid and encrypted communications, it also offers new weapons: subway systems, ships, and buildings that, increasingly centrally controlled, can become hijacked in a similar manner as planes were on 9/11. Combined with a stated intention of pursuing weapons of mass destruction, such as biological, chemical, and nuclear devices, terrorists are acquiring a disturbing arsenal from which to choose—an arsenal largely constructed, maintained, and improved by the superior powers that they are fighting.

Of course, from a larger perspective, the cumulative effect of all the changes brought about by the spread of technology may be to change the nature of warfare.[44] But whether these changes turn out to be fundamental or at the margins, their impact is disproportionately felt in the counterterrorism domain. One reason is that counterterrorism hinges on transnational cooperation, which, in turn, is communications dependent. Because of the speed with which terrorists can act, state governments must not only learn from their own police, businesses, and citizenry, they must exchange or barter for information and work with other governments and their local authorities to stop the planning of cross-boundary attacks. In fact, the importance today of such liaison operations to all source collection may be greater than at any time in the past. Of course, for reasons elaborated elsewhere, liaison can never be a substitute for unilateral collection efforts.[45]

A second reason counterterrorism operations are disproportionately affected by technological change is that the larger conflict between Islamists and Western states is shaped, as Lawrence Freedman has so aptly pointed out, by the contending narratives offered by both sides.[46] With information spreading fast and free, the winning over of public opinion is vital to preventing the long-term recruitment and cohesion of jihadist cells and to establishing the legitimacy of interventions against states believed to be facilitating them. Third, terrorists—who are preferentially tactical in orientation—can nonetheless plot on a global scale when necessary. Connecting via the Internet, they can regroup and retool. Newer cells can locate and integrate with established ones exploiting local battles, such as in Chechnya or Iraq, for the purposes of hardening and sharpening their operatives. Although this gives modern terrorism the appearance of an international insurgency, it is one that is loosely organized at best, and rides on a splintered criminal underworld that masks sharp divisions among its perpetrators.[47]

This last point warrants emphasis. Even with a more comprehensive discussion of the technological and political environment than is presented here, a sound intelligence strategy against the threat of Islamist terrorism cannot be designed without deep appreciation of what the adversary is and is not. This is because intelligence must, as its primary objective, provide advantages to decision makers operating on the offense, defense, and at all levels of engagement with the adversary. If the principal test of an intelligence service is whether it develops information that helps beat competitors, the pursuit of such an advantage necessarily entails a thorough understanding of the adversary's strategy, tactics, organization, and mindset—as well, of course, as one's own. Although the nature of the present adversary is covered at length elsewhere in these volumes, a somewhat specialized summary is appropriate here; this is because understanding Islamist terrorists' diversity as well as the divisions in the societies and cultures from which they spring, is the fifth and perhaps most important ingredient of designing an optimized intelligence system against modern terrorism. Such a sophisticated understanding should ideally permeate all levels of national security decision making, including arguably at the level of the foot soldier, because terrorism often rides opportunistically on the back of insurgency. As Max Boot has observed:

> To defeat this Islamist insurgency we must be able not only to track down and capture or kill hard-core terrorists but also to carry out civil affairs and information operations to win the "hearts and minds" of the great mass of uncommitted Muslims. We are very good at eliminating top terrorists, once they have been found (witness Abu Musab al-Zarqawi's death); less good at finding them (Osama bin Laden and Ayman al-Zawahiri are still at large);

and less skilled still at changing the conditions that breed terrorism in the first place.[48]

## Islamist Terrorism as an Intelligence Target

A sound intelligence enterprise knows its adversary. Indeed, it identifies the critical decision makers on both sides—those who must be served and those with whom they will engage—and the nature of the competitive game they are playing.[49] In the post-9/11 world, the strategic dimensions of this question have competed, often unsuccessfully, with the objective of getting intelligence on the next attacks. The reasons for this imbalance are not hard to fathom. Yet, an emphasis on current intelligence at the expense of strategic intelligence puts counterterrorist strategists on the endless defensive, seeking to block a tactical weapon rather than the adversary himself. Imagine if the Cheka had defined its objective as stopping assassinations and sabotage at home rather than rooting out the network that was sponsoring these attacks. To do the latter, Felix Dzerzhinski had to understand his enemy and develop a long-term strategy to defeat him strategically—not just tactically.

As experts on the subject remind us, terrorism is a weapon; its use does little to describe the adversaries who wield it other than that they are ruthless, violence prone, and generally less powerful in traditional terms (arms, money, and legal or institutional resources) than those they are fighting. Even national security experts are prone to lumping terrorists together on the presumption that the tool binds its users into a cohesive set for targeting and planning purposes. For example, many U.S. officials still use—and an otherwise well-informed public still accepts—terms such as the "Global War on Terror." Prior to the 2003 Iraq War, the implicit assumption that terrorists were allied, and that fighting one required fighting all, seemed to require skeptics to disprove Saddam's links to Bin Laden's network rather than the other way around.

If this assumption was ever valid, it is no longer so, and acting on it would be a mistake. As Bruce Hoffman has observed, "we have to reconceive of this as something more akin to a global insurgency or a global counterinsurgency" in which "kill and capture" is no longer the chief measure of success. Instead, Hoffman believes we should gauge success by our ability to disrupt "the cycle of terrorist recruitment and replenishment that we have seen unfold . . ."[50] Intelligence cannot contribute to this strategic competition unless it can develop a reserve capacity to solve more than the man- and bomb-hunt aspects of the enterprise

The problem is not just that spurious links may be made between anti-American leaders such as Iraq's Saddam Hussein and Islamist extremists, but that Islamist extremists will be regarded as more cohesive than they

are. Conflation of terrorist plotting with a movement may lead to strategic error if it throws al Qaeda's opponents into a defensive crouch while allowing minor criminals, insurgents, and extremist Muslims to augment their prestige by claiming roles grander than they in fact play in global affairs. Remembering the earlier discussion of the importance of strategic narrative, such conflation enhances the enemy and may lead national decision makers to expend excessive intelligence resources on ad hoc actors best left to traditional law enforcement. The trial of Zacarias Moussaoui threw such issues into relief as the prosecution claimed, to the defendant's apparent delight, Moussaoui's complicity in 9/11, while the defense argued the contrary. Bin Laden himself publicly denied any connection between Moussaoui and the 9/11 plotters, which means little except that the issue has propaganda value for the wrong side.

## CONCLUSION: OPTIMIZING U.S. INTELLIGENCE FOR COUNTERTERRORISM

For these reasons, constructing strategies for post-9/11 conflicts based on generalizations about the adversary can be misleading and perhaps even dangerous. But they are also necessary and useful when done with care. If, in fact, the competition is at least in part about the future of Islam, then the terrorists may act instrumentally—to trigger U.S. and allied moves that will help the extremists solidify their case against moderate trends and secular regimes in the Muslim world. If this is the case, intelligence analysis and collection efforts that focus principally on how Islamists are likely to shape their next attacks may be describing asymmetric threats while overlooking important asymmetric opportunities that more powerful states have available for outmaneuvering the terrorists at the strategic level.[51] Intelligence of this type would then be skewing choices in the adversaries' favor, playing into their hands and making matters worse. Intelligence, done well, must not only avoid falling into such traps, but provide decision makers with the capacity to see the traps coming and spring them ahead of time.

Emphasizing this strategic point is not meant to suggest that tactical intelligence and the decision makers it supports are unimportant. At this level, modern Islamist terrorists operate similarly to transnational threats decades ago—albeit in swarms and clusters that act at much faster speed. To some extent, the techniques that have worked in the past will remain important: human intelligence from infiltration agents, all-source data fusion (phone intercepts and human agents for example), and collaboration with law enforcement worldwide. The ability of the federal government to conduct double agent and deception operations should be improved and will necessarily have to be coordinated with overseas partners.

However, the changes in the technological landscape outlined above suggest that the most far-reaching tactical challenges may be domestic. First responders at the state and local level—including private citizens and businesses—may be the first to receive warning and indications of an attack. These individuals, many of whom may have never been exposed to national intelligence institutions or their products, will be first line collectors as well as decision makers as the crisis unfolds.

The federal government needs to develop ways to connect with first responders prior to crises so that protocols for information handoff from the local to the federal level will be smooth should an emergency unfold. The federal intelligence system must begin by identifying who the decision makers are likely to be in a crisis and what information systems they are most likely to use. Then federal intelligence agencies, with the Department of Homeland Security in the lead, should figure out how to support and learn from them at the same time. For example, hospitals that make arrangements to compile, analyze, and share information during emergencies could include protocols in their data sharing systems to ensure that any indicators of a biological attack are rapidly handed off to the national intelligence system so that other cities worldwide could be placed on alert. Since these protocols, likely based on automated inferencing technologies, could be put in place ahead of time, citizens' privacy could be protected.

The federal government urgently needs to map these emerging solutions to information sharing at the local level and (rather than regulate them) adapt them to meet federal needs wherever possible in a "plug and play" system that can be taken apart and reconfigured as needed. In the meantime, the federal government should help sponsor civilian industries' research and development of technologies that can help first responders manage crises, archiving technological solutions that may help other localities trying to get up to speed at home and abroad.

Of course, given the transnational nature of terrorist networks, tactical success will depend on other governments adopting similar approaches and the use of diplomacy, overseas military support, and intelligence liaison with foreign governments. Indeed, from the tactical perspective, the urgent need to provide support to field-based operations suggests that the U.S. Department of Defense's move to organize intelligence support to special operations forces engaged in counterterrorist operations is not only wise but essential, and hardly a sign of weakness at the top levels of civilian intelligence agencies. If such military support is not, however, coordinated with embassy and civilian intelligence operations, it may create more problems than it solves. Civilian tactical intelligence operations will continue to be vital and will touch on matters in which the Department of Defense has a stake. As Dan Byman reminds us, states can also be adversaries, sponsoring terrorism in either the active or passive sense and using liaison to influence U.S. actions in debilitating ways.[52] Whether

active, passive or part-time sponsors, these governments will necessarily be intelligence targets even if they occasionally cooperate on tactics from time to time or are otherwise considered liaison "partners." The Pentagon will want and need to know what civilian intelligence learns and will not want its operations conflicting with civilian ones.

In any case, the conventional wisdom that human intelligence against terrorist adversaries must operate principally outside traditional diplomatic circles is wrong. Classic modes of collection, including official cover, are crucial to detect and counter state sponsorship of terrorism and to work with foreign agencies engaged in domestic intelligence and law enforcement at the local level. Passive sponsors and liaison partners may coexist in one country's government. Just as when targeting terrorists, intelligence must discern the differing motivations and roles within and among these governments if it is to help with plans to engage, coerce, pressure, manipulate, cajole or trick them while at the same time avoiding blowback or other unintended consequences.[53] As Byman points out, France had a defensive "sanctuary doctrine" until 1986 that allowed terrorists to operate within its borders so long as French interests were not jeopardized. While France was not successful in preventing terrorist attacks against its citizens, and it slowly changed course, U.S. efforts to influence a state making similar choices today would necessarily differ radically from one taken toward, for example, a state providing sanctuary of the kind the Taliban offered to Bin Laden in Afghanistan.

Finally, the strategic requirements of countering terrorists are particularly critical in an era of globalization. Thomas Friedman, in *The Lexus and the Olive Tree*, discusses the need for generalists who can make connections among disciplines and track ripple effects from one domain, such as genetic engineering, to other domains, such as international organized crime or finance.[54] At the strategic level, counterterrorism intelligence demands this kind of cross-disciplinary analysis. For this reason, the formation of counterterrorism centers focused on current operations and threat reporting may not be enough. Driven by today's agenda, these centers are likely to show preference for current operations over the bigger picture.

To augment the centers' efforts, the U.S. intelligence system needs to strengthen its strategic capabilities, ideally under the auspices of the National Intelligence Council, dedicated to understanding the conflict with Islamist extremism at a deeper level, including who the parties are and how their interests are evolving. This strategic unit should nonetheless provide policy support to the diplomats and narrative builders—principally public relations officers and ambassadors—who can articulate the themes most likely to influence opinion in countries of concern. Because stories and deceptions build and dissipate quickly, these strategic analysts will have tactical roles to play from time to time. But their principal concern will be to paint the larger picture of the conflict in which we

are engaged, distinguishing the networks from the ad hoc actors and the big wins from the small.

Such strategic analysis cannot, however, be accomplished without strategic collection to accompany it. This will require a long-term investment in deep cover human intelligence officers and open source collectors whose purpose will be to sense the deep cultural shifts Friedman has described. These collectors should also be encouraged to be analysts as well, so steeped in the societies and subjects they explore that they understand them intuitively and are able to generate their own, flexible and focused requirements. In this way, strategic warning can smoothly lead to tactical anticipation and ultimately actionable intelligence. These should be seamlessly connected, not artificially separated by the walls of intelligence centers or the artificially distinct career paths of "analyst" and "collector."

It will also be necessary to forge a constructive working relationship with universities where programs are offered in the intelligence domain— either the art and practice of the profession itself or the substantive areas that future intelligence and national security analysts are absorbing. On university campuses, the public dialogue is already engaged; it concerns how democratic societies might best adjust to a world of much more intrusive surveillance and dispersed threat. This should be received as good news among intelligence professionals. Without this informed and disciplined dialogue, the politics of intelligence would likely continue to be affected by cultural bias, anecdotal evidence, and suspicion. At a time when the intelligence community has been criticized for risk aversion, it would seem that this would be one area where the risk would be worth the gain.

7. The idea that the challenge is "new" stems from institutional and official preoccupation with shifting from Cold War adversaries to the post–Cold War international environment. Thus, accompanying calls for a Revolution in Military Affairs have come, and so has much discussion of the meaning and purpose of "transformation." That intelligence systems have to shift targets from the "old" state-centric approach to the "new" focus on transnational groups does not mean, however, that transnational challenges have not confronted states in the past.

According to Jeffrey Richelson, the Trust was just one of many successful counterintelligence operations run by the Cheka. Another was known as SINDIKAT, and it targeted one monarchist in particular, the former terrorist and revolutionary, Boris Savinkov. The Cheka regarded him as a hub of the monarchist network and plotted traps for him—ones with good bait and delayed springs. First, they sent an operative to his base in Poland carrying documents establishing his bona fides as deputy chief of staff of Internal Service Troops and a secret counterrevolutionary. Savinkov believed him, recruited him, and used him as a trusted agent. The Bolsheviks quickly wrapped up the Polish network when they had enough evidence and Savinkov fled to Paris. Surprisingly, he remained vulnerable to the ploy and was eventually lured to Russia where he was arrested. It was never clear whether he fell, jumped or was pushed from a window in Moscow's Lubyanka prison. See Jeffrey T. Code Red worm (summer of 2001) burrowed into hosts and then launched traffic at whitehouse.gov. Automated virus. Cascading failure of other routers resulting from the redirection of traffic smaller nodes would finish the job. 37. Similarly, young people used text messaging and the Internet to energize the Democratic Party's base during the last presidential election. Though the campaign that spearheaded the innovation was Howard Dean's, an early loser in the primaries, his recognition of the potential political impact of instant communication and swarming catapulted him to the head of the party nonetheless.

42. Although traditional scholars have been slow to accept intelligence within the disciplines of political science or international relations, their resistance is gradually giving way to student demand. Many universities now offer intelligence courses at the undergraduate and graduate levels. Specialized schools also advertise professional intelligence training and have begun to organize nationally to promote private sector training for prospective and mid-career intelligence officers. The intelligence products generated by these schools, including current intelligence digests derived from open source information, are read within the U.S. government. This productivity is hardly surprising; open source intelligence firms started springing up in the private sector over 15 years ago as private firms recognized that competitive intelligence was useful to businesses competing in the marketplace and began hiring former intelligence professionals to conduct research, improve decision making and protect their proprietary information.

# CHAPTER 21

# MULTINATIONAL INTELLIGENCE COOPERATION

Tom Lansford

The key to successful counterterrorism is accurate and timely intelligence. Effective intelligence capabilities provide states with the ability to interdict terrorists before they conduct strikes. Intelligence resources provide the first line of defense against both domestic and international terrorists and are the main tool by which governments can be proactive in their efforts to disrupt terrorist organizations and planning. Through history, most terrorist groups were substate and not transnational. Organizations such as the Irish Republican Army (IRA) or the Basque Homeland and Freedom group (*Euskadi Ta Askatasuna*, or ETA) carried out attacks and operations against specific national governments (the IRA against the United Kingdom and the ETA against Spain). However, by the waning days of the twentieth century, the most potent terrorist groups had developed transnational capabilities that gave them a truly global reach. The rise of groups such as al Qaeda dramatically underscored the need for increased intelligence cooperation and collaboration. During the Cold War, Western intelligence agencies had institutionalized various degrees of cooperation. The post–September 11 war on terror reinforced the need for continued, and even expanded, intelligence-sharing and joint operations.

One of the most significant successes of the war on terror has been the substantial increase in intelligence cooperation between the United States and a range of states, as well as other international actors. Because of the dominant position of the United States in global antiterror efforts, this chapter places the United States at the center of current international efforts in intelligence cooperation. No other state currently has the military and intelligence capabilities of the United States, which makes the world's remaining superpower integral to multinational counterterrorism efforts.

The 9/11 Commission even declared that "without question, the United States has the most capable intelligence apparatus of any county in the world."[1] Concurrently, however, the United States has deep deficiencies in certain areas, especially human intelligence. Only through multilateral cooperation and collaboration can the capabilities of the United States and other states be harnessed to successfully prosecute the global campaign against terrorism.

## INTELLIGENCE AND COOPERATION

Intelligence includes a range of activities such as espionage or spying, covert planning, and counterintelligence operations. Jeffrey Richelson offers a general definition of intelligence as "the product resulting from the collection, evaluation, analysis, integration and interpretation of all available information which concerns one or more aspects of foreign nations or areas of operation which is immediately or potentially significant for planning."[2] Stephen Sloan developed a more narrow and more U.S.-focused definition, in which he asserts that intelligence at the national level "is primarily with providing information for 'planning,' that is, it is essentially intended to assist the national government in developing the diplomatic, economic, and military policies and strategies to defend or enhance United States international objectives."[3] Both definitions affirm the utilitarian nature of intelligence as a tool with which policy- and decision-makers craft strategies and make choices. There are a range of agencies involved in intelligence in the United States. Collectively, these bodies are formally described as the "Intelligence Community," which, according to a recent U.S. Commission report, comprises 15 federal agencies, offices, and elements of organizations within the Executive branch that are responsible for the collection, analysis, and dissemination of intelligence. These include 14 departmental components—eight in the Department of Defense, two in the Department of Homeland Security, one each in four other departments (State, Energy, Treasury, and Justice) and one independent agency, the Central Intelligence Agency.[4]

Intelligence can be broadly divided into three broad categories: signal intelligence (SIGINT); imagery intelligence (IMINT); and human intelligence (HUMINT). SIGINT involves gathering information through intercepting signals sent over the airwaves, including radio, broadcast and other forms of telecommunications such as emails or encrypted messages.[5] IMINT is the use of aerial and satellite photography to secure intelligence.[6] HUMINT is the most common form of intelligence gathering. It is based on the use of people to collect information. Many consider HUMINT to be the most important of the three categories. A publication by the Czech government describes HUMINT as the "oldest method of information gathering and it is the queen of intelligence activity."[7] U.S.

Senator Saxby Chambliss underscored the importance of this traditional form of espionage when he noted that HUMINT, "relative to the other intelligence disciplines, can tell us what the enemy is thinking. The strength of good HUMINT is that it can answer this key question: What are the enemy's intentions about when, where, and how to strike?"[8]

### Imperatives for Cooperation

Compared with other states, the United States has enormous advantages in SIGINT and IMINT. Some of these comparative advantages are because of scale. For instance, in 2005, the intelligence budget of the United States was $44 billion.[9] In comparison, the UK spent $2.57 billion.[10] The United States also enjoys a range of technological advantages in terms of satellite and other sophisticated SIGINT and IMINT capabilities.[11] Nonetheless, SIGINT and IMINT have clear limitations, as was famously demonstrated in the failure of the U.S. intelligence community to predict the detonation of nuclear weapons by India in 1998.[12] To maintain effective information gathering capabilities, technological intelligence resources must be balanced with robust HUMINT assets.

U.S. HUMINT capabilities were constrained by a series of restrictions put in place beginning in the 1970s.[13] These limitations were expanded in 1995 by new prohibitions on the ability of the CIA and other intelligence agencies to recruit or work with people who may have committed human rights violations.[14] Former CIA Director James Woolsey criticized the restrictions in the following manner: "It's like telling the FBI they can recruit informants inside the mafia, but they can't recruit crooks."[15] The result was an "overly cautious approach" in reviews of applications from field agents for electronic surveillance against suspected foreign terrorists prior to September 11.[16] Clifford Beal, the editor of the prestigious security paper, *Jane's Defence Weekly,* highlighted the HUMINT failures of the U.S. intelligence community in 2001 when he summarized some of the more spectacular pre-9/11 lapses:

> U.S. intelligence about terrorist activities, particularly in the Middle East, has experienced shortfalls for many years. In 1983, two suicide bombers eliminated the U.S. military presence in Lebanon. In August 1998, the destruction of U.S. embassies in Kenya and Tanzania also took the U.S. intelligence community by surprise. In August 2000, the USS *Cole* was taken out of action by terrorist action in Yemen.[17]

Further, in writing about the intelligence failures surrounding the possibility of Iraqi weapons of mass destruction initiatives, Chambliss points out that "the fact remains that the CIA did not have a single agent inside Iraq to verify the true state of these programs before coalition forces, led by

the United States, attacked Iraq in 2003."[18] The restrictions on HUMINT were dropped following the terrorist attacks; however, U.S. intelligence agencies have still faced a range of obstacles. It takes considerable time and effort to develop the networks necessary to successfully infiltrate foreign governments and terrorist organizations.[19] As a result, the U.S. intelligence community has increasingly come to rely on data and information from allied states.

Intelligence cooperation is often prompted by the need or desire to pool resources. Especially when states face a common enemy, burden sharing among the allies becomes an important goal. Burden sharing is a means to better allocate assets and reduce redundancy and duplication of effort. Examples of this phenomenon include Anglo-American programs during World War II that led to the decryption of both German and Japanese codes.[20] Collaboration under such circumstances improves transparency among allied states and leads to closer cooperation in other areas.[21]

In the twentieth century, such patterns of cooperation became a common component of U.S. intelligence policy, as programs were initiated to share information and engage in joint intelligence gathering with other states, such as Israel, and multilateral institutions, including NATO.[22] The perceived menace of the Soviet Union created a high threat quotient, which prompted the United States and its allies to engage in a range of collaborative behavior, including policies to promote joint defense and multilateral intelligence gathering.[23] The result was that the United States developed a series of intelligence-sharing agreements. These arrangements existed on both a bilateral and multilateral level. Hence, the United States had individual accords with states such as the United Kingdom and with international institutions such as NATO.

The demise of the Soviet Union did not substantially alter the patterns of cooperation established during the Cold War. Furthermore, the rise of global terrorism created renewed incentives for closer collaboration. In the aftermath of the September 11 attacks, new initiatives created additional forums to facilitate information exchanges and monitor common enemies.

### Impediments to Cooperation

While states have a variety of incentives to cooperate on intelligence matters, there are also a number of disincentives that constrain collaboration. Intelligence cooperation is often undertaken as much for political reasons as to enhance or bolster capabilities. Such collaboration becomes part of broader linkage strategies that bind states to one another; however, the political basis of the partnership may lead to less than full compliance with the spirit of intelligence agreements.[24] In addition, intelligence is by its very nature secret, and sharing data or information may compromise

a nation's HUMINT and expose the capabilities of its SIGINT or IMINT. Furthermore, sharing intelligence can reveal deficiencies in a state's resources, since data can show both what information a state has and what it does not have.[25] The greatest fear of all intelligence services is that a state that is currently considered an ally will become an enemy or adversary and use information or data—or even knowledge about a former ally's capabilities—against it. For instance, the fall of the pro-U.S. regime of the Shah of Iran in 1979 led to the loss of significant U.S. HUMINT capabilities in the Persian Gulf.[26] Also, while the CIA developed a good working relationship with Pakistani intelligence during the period of the Soviet occupation of Afghanistan, elements within those same intelligence assets later supported the Taliban regime. Pakistani intelligence officials were even suspected of protecting Taliban leaders after the U.S.-led invasion of Afghanistan.[27]

A nation's intelligence community often has institutional biases against revealing data. Critics of the U.S. intelligence community point out that agencies such as the CIA and the FBI did not cooperate well with each other prior to the September 11 attacks.[28] The tendency among intelligence agencies is to limit the flow of information, rather than accelerate the distribution of hard-won data. One enduring reason for the reluctance by intelligence communities to cooperate is the fact that even close allies spy on each other. This uncomfortable aspect of national intelligence was highlighted for the United States by the case of Israeli spy Jonathan Pollard, a U.S. citizen who passed classified materials to Tel Aviv and whose capture and trial placed a severe strain on U.S.–Israeli relations.[29]

### Twentieth-Century Patterns of Cooperation

One long-standing reason for intelligence collaboration is reciprocation, the belief that contemporary cooperation will be rewarded by future interactions with one's allies.[30] Another side to this phenomenon is known as the "shadow of the future": the fact that a state's actions in the present will be either rewarded or punished at a later time by other actors.[31] The United States has a history of intelligence cooperation that dates back to World War I. Cooperation with the United Kingdom, Canada, Australia, and New Zealand became particularly close during World War II and remained so in the Cold War period.[32] In 1947, the United States and the United Kingdom signed an intelligence-sharing treaty, which was subsequently expanded to include the three other states. The accord regulated the exchange of SIGINT and divided the world into geographic zones. Each country was given responsibility for the collection of information in particular zones. Multinational committees were established and liaison officers were stationed with the intelligence services of their counterparts. The United States also expanded its bilateral collaboration. For instance,

U.S. intelligence collaboration with Germany became increasingly formalized in the 1960s.[33]

As time progressed, the United States provided an increasing amount of the funding and technological resources for the partners; however, the participation of the allied states meant that the United States did not have to pay for 100 percent of the costs of the intelligence (and meanwhile, the allies gained access to information and intelligence that they otherwise would not have been privy to).[34] As the initially bilateral system became a multilateral forum, information began to be shared with states outside of the signatory group, including close allies such as NATO partners Norway and Turkey, and even South Korea.[35]

U.S. intelligence cooperation with its allies was institutionalized through NATO. There were a range of bodies established in NATO to facilitate intelligence sharing—for example, the Current Intelligence Group was assigned a staff and tasked to distribute information to the Alliance's smaller members that might otherwise not have the ability to monitor actions by the Soviet bloc.[36] The withdrawal of France from NATO's integrated command system diminished the overall utility of the Alliance's intelligence groups, but these bodies continued to disseminate information and facilitate cooperation.[37] However, with the French estrangement from the Alliance, intelligence collaboration became increasingly ad hoc and managed through working groups that were established to deal with specific threats or events.

A second multilateral forum was TRIDENT. Organized in 1958, TRIDENT was an intelligence cooperation group that included Israel, Iran, Turkey, and Ethiopia. TRIDENT was established by the Treaty of the Periphery. The informal organization was backed by the United States and the United Kingdom as a means to counter growing Arab nationalism, especially in the aftermath of the Suez Crisis. TRIDENT established regular contacts between the various intelligence agencies and provided a conduit to disseminate data gathered by the United States and other Western intelligence agencies. The TRIDENT members also deployed liaison officers with their counterparts. TRIDENT disbanded after the Iranian Revolution in 1979.[38]

Throughout the twentieth century, the United States shared its own and allied intelligence with various multilateral bodies, such as the United Nations (UN) or the Organization of American (OAS). The 9/11 Commission summarized U.S. interaction with multilateral bodies in the following manner:

> Information derived from intelligence also forms an important element of U.S. participation in international organizations, such as the United Nations. The United States frequently uses such information to alert organizations to impending crises or to motivate action in appropriate circumstances. When

international bodies do act, for example, by sending in peacekeeping forces or by imposing sanctions on a "rogue" state, the United States often provides information derived from intelligence to protect the forces or detect violations of sanctions.[39]

However, the United States has been accused of selectively presenting information so as to unduly influence decisions and shape policy. For instance, the United States was widely criticized for presenting what was perceived to be misleading and selective intelligence to the UN and its inspectors in Iraq prior to the 2003 U.S.-led invasion.[40]

## POST–COLD WAR INTELLIGENCE SHARING AND THE WAR ON TERROR

By the 1990s, cooperation between the United States and its allies could be classified into three broad levels.[41] These levels are often overlapping, and not mutually exclusive. First, there is the macro level. This is the most formal level and involves government-to-government accords and international agreements. At the macro level, cooperation is multifaceted and extends across several areas. Cooperation is also long-term and usually ongoing. The 1947 U.S.–U.K. Treaty and the Treaty of the Periphery are examples of frameworks that created macro-level interactions. Second, there is the meso level. The meso level revolves around bilateral or multilateral agreements that govern day-to-day operations or collaboration on intelligence matters. Meso accords can be either short- or long-term and are usually limited to one issue area of intelligence, such as terrorism or nacro-trafficking. Examples of meso-level activity include agreements on communications systems or regular meetings or the exchange of liaison personnel. Finally, the micro level centers on specific and short-term cooperation. Most often, micro interactions involve a specific case and are commonly in response to requests by governments or international bodies for assistance.[42]

In the aftermath of the Cold War, SIGINT and IMINT continued to be shared widely between the United States and other allies, and the United States and its partners even operated joint facilities and equipment as a form of burden sharing.[43] NATO provided the main U.S. intelligence interaction at the macro level. These facilities were known as joint intelligence centers. In addition, the Joint Analysis Command (JAC) at Molesworth Royal Air Force base was created to provide not only multinational intelligence, but also multiservice and multisource information. The operational section of JAC offered 24-hour, real-time intelligence to a range of NATO operations, most notably for the Alliance members participating in the NATO-led peacekeeping missions in the Balkans.[44] At the core of JAC is the Multinational Intelligence Coordination Cell, created in 1995

to manage the flow of data between the Untied States and its NATO partners.[45]

In order to provide secure information to the allies, NATO has its own communications system, the Linked Operations-Intelligence Centers Europe (LOCE). LOCE is an example of meso interaction. LOCE provides a gateway for allies to gain access to secure information and joint intelligence. Eileen Mackrell, the chief of the operations division of JAC summarizes LOCE in the following fashion:

> From a systems standpoint, the backbone of theater intelligence sharing within NATO is the LOCE network, the only secure voice and data system common to all NATO allies. There are over 283 networked terminals worldwide; most of these terminals are deployed in support of theater operations, including Operation Joint Guard in the former Yugoslavia. LOCE provides users with connectivity among NATO and U.S. operational units and decision-makers in the form of gateways such as the Allied Battlefield Information Collection and Exploitation (BICES) Initiative, SHAPE's [Supreme Headquarters Allied Powers Europe] CRONOS network and . . . SACLANT's [Supreme Allied Command Atlantic] Maritime Command and Control Information System (MCCIS), as well as such features as bulletin boards and electronic mail.[46]

An example of micro-level cooperation would be U.S. intelligence cooperation with Kenya and Tanzania in the aftermath of the 1998 terrorist bombings in Nairobi and Dar es-Salaam. The United States lacked HUMINT in the region and was forced to rely on Kenyan and Tanzanian systems, as well as the capabilities of other allies, particularly the British, who had HUMINT resources in the area.[47] Other countries also aided the United States in the investigation. For instance, Albanian officials raided the offices of suspected terrorist groups with links to al Qaeda, while Pakistani provided information about bin Laden and al Qaeda's ongoing operations.[48] Cooperation, including law enforcement interaction, allowed the U.S. government to identify suspects in the attacks. Eventually, 11 individuals, including bin Laden were indicted in the strikes.[49]

Micro-level interactions can serve as the basis to expand cooperation. For instance, in the aftermath of the Cold War, Russia provided intelligence to the United States and its allies during the first Gulf War.[50] NATO-Russian intelligence cooperation expanded throughout the 1990s, rising from the micro to the meso to the macro level. Areas that prompted expanded Russian intelligence cooperation included terrorism and the proliferation of weapons of mass destruction—for instance, in 2000 the United States and Russia agreed to exchange information on weapons proliferation and the threat of ballistic missiles.[51] By 2003, NATO Secretary General Lord Robertson acknowledged that the Alliance regularly exchanged information and intelligence with its former Cold War nemesis, Russia.

In describing the interaction in an interview, Robertson declared "We [NATO and Russia] are on the level with one another. We exchange information we have never exchanged before. We even share classified intelligence information."[52] Russian intelligence cooperation has been particularly useful in tracking terrorist groups in Central Asia.[53]

### The September 11 Attacks

On the eve of the September 11 terrorist attacks, the United States had a range of bilateral and multilateral intelligence agreements, which ranged from the macro to the micro level. In fact, the U.S. intelligence community's heavy reliance on SIGINT and IMINT led it to depend on HUMINT provided by other countries prior to 2001.[54] George Tenet, then CIA Director, reported that before the September 11 attacks, the CIA relied on foreign sources for HUMINT and that the agency "worked with numerous European governments, such as the Italians, Germans, French, and British to identify and shatter terrorist groups and plans against American and local interests in Europe."[55]

Following the 2001 attacks, the Bush administration enacted a range of reforms to the intelligence community, including the 2002 creation of the Office (later Department) of Homeland Security, and then the establishment in 2004 of the office of the Director of National Intelligence as a means to overcome interagency problems.[56] In addition, a new emphasis on HUMINT was mandated.[57] Furthermore, the director of the CIA was appointed as the National HUMINT Manager tasked with the "facilitation, coordination and deconfliction of clandestine HUMINT across the [Intelligence] Community" and to "draft standards, doctrine, and guidelines for training, tradecraft, and general conduct of clandestine HUMINT operations."[58] The administration and various government and Congressional bodies also broadly called upon the nation's intelligence community to transition from a "passive gatherer" to a "proactive hunter" in terms of counterterrorism.[59]

Meanwhile, the general patterns of cooperation with other states were greatly expanded after the attacks of September 11. The administration of George W. Bush sought to develop a "coalition of the willing," which included states and international institutions that provided varying levels of support and resources depending on the individual capabilities and preferences of the actor. Mirroring the broader diplomatic and military effort, the Bush administration enhanced intelligence cooperation in a manner that resembles concentric circles. The inner circle included those states with which the United States already had macro patterns of cooperation (and an increasing number of states with which the United States significantly increased cooperation), while the outer circles were made up of states with meso and micro levels of engagement.

As part of the intelligence offensive, Bush signed an executive order that froze the assets of several terrorist organizations and directed the Treasury Department to aggressively seek out the financial assets of known terrorist groups in conjunction with allies and international institutions. Specifically, Bush ordered the department to

> make all relevant efforts to cooperate and coordinate with other countries, including through technical assistance, as well as bilateral and multilateral agreements and arrangements, to achieve the objectives of this order, including the prevention and suppression of acts of terrorism, the denial of financing and financial services to terrorists and terrorist organizations, and the sharing of intelligence about funding activities in support of terrorism.[60]

Then National Security Advisor Condoleezza Rice emphasized that the main component of the U.S.-led global war on terror was not the nation's military action in Afghanistan, but rather the multifaceted intelligence and law enforcement operations. Rice stated in 2001 that

> while everybody understandably wants to focus on military contributions, this is not the Gulf War. . . . If you imagine that there are cells out there in 60-plus countries that could be continuing to plot, continuing to look for ways to wreak havoc, the intelligence and law enforcement efforts that have resulted in over 300 arrests of known and suspected al Qaida operatives is as important to this war on terrorism and to trying to avoid another attack, either on ourselves or on others, as is the war in Afghanistan. And so I think that's what the president will say to this coalition. It's financial assets; it's intelligence and information sharing.[61]

The U.S. counterterrorism effort was aided at the macro level when the U.N. Security Council passed Resolution 1373, which required all states to take action against terrorists and their financial networks. Within a few months after the attacks, more than 100 countries had offered intelligence or information on terrorist groups. Concurrently, the Bush administration bolstered counterterrorism operations with 200 different intelligence or security services throughout the world. More than 30 countries agreed to collaborate with the United States in criminal investigations, while 27 states offered varying degrees of military support. One immediate result of the cooperation was that the U.S. Treasury Department was able to freeze 20 foreign bank accounts linked to al Qaeda, and more than 200 people were arrested in other countries because of ties to al Qaeda.[62] In addition, bilateral intelligence collaboration had forestalled a number of potential attacks, including one on the American Embassy in the Netherlands in 2001.[63] By the end of the year, U.S.-backed forces had overthrown the Taliban regime and al Qaeda's global organization had been weakened.

## CONTEMPORARY MULTINATIONAL COOPERATION

The 9/11 Commission found that the United States gained significant benefits from ongoing intelligence collaboration. In its final report, the Commission declared that "the United States is deriving great benefits from these [international] cooperative relationships."[64] However, the report also acknowledged that such cooperation sometimes places additional burdens on the U.S. intelligence community, especially in regards to the need to "sanitize" some information before presenting it to foreign entities and the risk that U.S. interests could be harmed by involvement with unsavory regimes or individuals.[65]

U.S. intelligence cooperation has increased at all levels. For instance, at the macro level, new ties have been initiated between the United States and the EU, including the establishment of regular (annual) meetings on counterterrorism at the cabinet level between the U.S. secretaries of State, Justice, and Homeland Security and their European counterparts. The United States and the EU have also created a "high policy dialogue" on border and transport security, as well as groups that study and make recommendations on combating terrorism financing. In 2001 and 2002, the United States and Europol signed new agreements to facilitate the sharing of information ranging from "threat tips, crime patterns, and risk assessments" to "personal information" such as "names addresses, and criminal records."[66] These agreements were followed by a new extradition treaty in 2003. One ongoing challenge to multilateral intelligence cooperation remains differences in the scope of national law and civil liberties among allied states.[67] For example, EU privacy laws had to be addressed as part of the 2002 U.S.-Europol agreement.[68] In addition, Germany currently only shares data on individual terrorists and groups on a case-by-case basis with the United States because the government believes that the U.S. use of sensitive information conflicts with German privacy laws.[69]

Intelligence cooperation has also increased at the bilateral level. For instance, in spite of the constraints on U.S.–German cooperation, the two nations worked together to identify and seize a ship bound for Libya in 2003 that contained banned nuclear materials, believed to be destined for a terrorist organization.[70] Also, despite highly publicized differences over the U.S.-led invasion of Iraq, the United States and France have particularly close intelligence relations.[71] Franco-American intelligence collaboration extends across a range of areas, including a multilateral, secret counterterrorism facility in Paris that includes French, U.S., British, German, Australian, and Canadian personnel.[72] The center serves as a clearinghouse for data sharing among the allies. France is also one of a number of countries that provides HUMINT to the United States for regions in which the United States lacks significant assets.

In the war on terror, states such as Egypt, Morocco, Tunisia, Jordan, and Pakistan have been especially important in providing intelligence to the

United States in exchange for a variety of incentives including foreign or military aid.[73] The majority of intelligence provided has been in response to specific requests from the United States or in instances when the security services of these states discovered information about current threats to the United States. The CIA has also established more than 25 Counterterrorist Intelligence Centers (CTICs) in foreign host countries to coordinate U.S. and allied intelligence operations. The CTICs are modeled on CIA facilities established in Latin America and the first of these counterterrorism sites was created in the 1990s.[74] By 2005, according to a *Washington Post* report, more than 3,000 terrorists had been killed or captured as a result of foreign intelligence cooperation.[75]

In some cases, intelligence collaboration has steadily matured among the states in the outer bands of the U.S. coalition of the willing. For instance, in 2002 U.S. law enforcement agencies began assisting Pakistan with counterterrorism intelligence and technical aid and the two countries established the U.S.–Pakistan Joint Working Group on Counterterrorism and Law Enforcement.[76] The FBI and the CIA played a prominent role in the campaigns to capture high-level al Qaeda figures such as Khalid Sheikh Mohammed.[77] Pakistani security forces have conducted operations against at least 185 of the 247 "entities" that the United States has designated as terrorist figures or groups.[78] In return, the United States has provided Pakistan with billions of dollars in aid, equipment and assistance, and the U.S. intelligence community was shared data with Pakistan on antigovernment groups.

### Criticisms of U.S. Cooperation

The example of Pakistan highlights a criticism of the one of U.S. intelligence community's tactics in its antiterror campaign. Critics charge that U.S. agencies routinely use foreign facilities to conduct interrogations and torture prisoners using methods that would be illegal in the United States. For example, Human Rights Watch asserts that

> prisoners suspected of terrorism, and many against whom no evidence exists, have been mistreated, humiliated, and tortured. But perhaps no practice so fundamentally challenges the foundations of U.S. and international law as the long-term secret incommunicado detention of al Qaida suspects in "undisclosed locations." "Disappearances" were a trademark abuse of Latin American military dictatorships in their "dirty war" on alleged subversion. Now they have become a United States tactic in its conflict with al Qaida.[79]

These prisoners have been held at "black sites"—CIA facilities in foreign states, separate and distinct from the CTICs. According to a British news report, black sites have been run in at least eight foreign countries in Eastern Europe and the Middle East.[80] The interrogation techniques used at

the black sites have subjected the United States to criticism from both international and domestic groups and undermined the credibility of the American cause, especially among Muslims.[81]

The U.S. intelligence community has also faced the same sort of criticism that it confronted during the Cold War for its support for dictatorial regimes. The community has engaged in meso and micro levels of cooperation with states such as Syria and Yemen, as well as the monarchies of the Persian Gulf and antidemocratic regimes in Central Asia. Critics of U.S. policy contend that intelligence collaboration with these regimes provides aid and assistance to undemocratic forces, and undermines the broader goals of U.S. policy, including the promotion of democracy.

## CONCLUSION

The United States has a long history of intelligence cooperation with other countries and international institutions. This cooperation has occurred at a variety of levels and has involved varying degrees of formality. By the end of the Cold War, the United States had institutionalized collaboration with a range of bilateral and multilateral entities. By the 1990s, such relationships helped offset deficiencies in HUMINT, but also reinforced the U.S. intelligence community's overreliance on technical means of intelligence gathering, SIGINT and IMINT. The war on terror has reaffirmed the utility of intelligence cooperation and added new imperatives for expanded collaboration.

As with the military and law enforcement components of the U.S.-led war on terror, the intelligence campaign has centered on the development of a coalition of the willing. This coalition included an inner band of states with which the United States has long-standing and formal intelligence arrangements, and states in the outer bands that collaborate on a more ad hoc, case-by-case basis. By working with foreign intelligence services, the United States has been able to expand its capabilities and assist allies in counterterrorism activities. While the intelligence coalition has scored a range of successes, it has also opened the U.S. intelligence community to criticism over tactics such as the black sites. Nonetheless, continued intelligence cooperation will remain a cornerstone of international counterterrorism strategies.

The Commission notes that the purpose of the U.S. Intelligence Community is clear-cut: "to collect and convey essential information needed by the president and other members of the U.S. policymaking, law enforcement, and military communities for the performance of their duties and responsibilities. This includes collecting and assessing information concerning international terrorist and narcotic activities; other hostile activities by foreign powers, organizations, persons, and their agents; and foreign intelligence activities directed against the United States. The president also may direct the Intelligence Community to undertake special activities, including covert action, as needed to support intelligence collection activities and to protect against foreign threats to U.S. security interests" ibid.

Clifford Beal, the editor of *Jane's Defence Weekly* summarizes the failure of the U.S. intelligence community in 1998 in the following manner: "Indeed even US technical means have been 'fooled' by those determined to avoid them. India's nuclear detonations in June 1998 were timed to escape detection by US surveillance satellites through a sophisticated deception programme. The timing of India's arrival as a new nuclear power caught the intelligence community

by surprise"; Clifford Beal, with Andrew Koch, "Chronic Underfunding of US HUMINT Plays a Role in Intelligence Failures," *Jane's Defence Weekly*, September 11, 2001, http://www.janes.com/security/international_security/news/jdw/jdw010911_1_n.shtml.

13. In 1999, the National Commission on Terrorism (also known as the Bremer Commission after its chair, L. Paul Bremer, III), recommended eliminating the restrictions:

> The guidelines set up complex procedures for seeking approval to recruit informants who may have been involved in human right violations. In practice, their procedures have deterred and delayed vigorous efforts to recruit potentially useful informants. The CIA has created a climate that is overly risk aversive. This has inhibited the recruitment of essential, if sometimes unsavory, terrorist informants and forced the United States to rely too heavily on foreign intelligence services. The adoption of the guidelines contributed to a marked decline in Agency morale unparalleled since the 1970s, and a significant number of case officers retired early or resigned.

# CHAPTER 22

## INTELLIGENCE COORDINATION AND COUNTERTERRORISM: A EUROPEAN PERSPECTIVE

Magnus Norell

*All it takes for evil to triumph is for good men to do nothing.*

—Edmund Burke

The purpose of this chapter is to examine key issues of intelligence co-ordination and counterterrorism (CT) from a European perspective.[1] The backdrop behind this analysis is the debate in Europe over how the leading political actor, the European Union (EU), should handle the post-9/11 world in which we find ourselves. In the immediate aftermath of 9/11, the EU proposed several plans and put forth proposals for new laws to tackle the scourge of terrorism.[2] Underlying much of the discussions at that time were issues such as what roles various agencies should have (the police vs. the military, for example) and how the EU's executive power could be enhanced in the area of CT. Overall, within the EU it is still the police force that is identified as the "lead" agency in regard to CT operations.

Before the kind of mass-casualty terrorism witnessed in the United States on 9/11, and despite the EU's long history of fighting an older, po-litically motivated terrorism, the Union did not really pay a lot of atten-tion to terrorism as a matter of national security. It has traditionally been viewed mainly as a matter of criminal activity, albeit of a serious kind, and therefore a matter handled first and foremost by the police and/or civil in-telligence agencies. In other words, both the Union and its members have preferred to see terrorism—conceptually and legally—as a form of serious and organized crime.

This chapter argues that the underlying premise for this state of affairs (and for the related discussion about CT issues) is flawed, in that it does not question the notion of the necessity of a "lead" agency (who, therefore, has the sole responsibility of deciding what help, if any, might be needed). Furthermore, this underlying basis (of a lead agency) does not take into account the fact that other agencies might have knowledge—unbeknownst to the police, due to a lack of coordination and the flow of necessary intelligence—that can be of critical value to any CT operation. Finally, the discussions within the EU do not critically examine the underlying structures in the Union that both identify a "lead" agency (as opposed to topic and/or event-centered crisis-management operational centers, based on, for example, National Crisis Management Centers), and at the same time—when that lead agency can't cope by itself—want to add resources on an "ad-hoc" basis. Adding to the structural flaws within the EU is the lack of executive power with respect to regulating member states' behavior in responding to common threats such as terrorism. This raises the question of whether the Union is the right vehicle in Europe to combat terrorism, or whether an alternative body or forum would be more appropriate for effectively confronting the threat of terrorism in Europe.

The chapter argues that as long as these structural flaws in the system remain, nothing fundamental will change in the way the EU is trying to deal with the issue of intelligence coordination concerning CT policy. An underlying tenet of this discussion is that enhanced intelligence coordination is paramount for the EU's ability to effectively combat terrorism. Over the years, the EU has proposed and tried to implement several action plans, laws, and legal initiatives (on a multilateral level) to achieve a more robust capacity in this regard. Looking back over the 12 years since the Union was established, it is clear that intelligence coordination and intelligence sharing has worked best on a bilateral level—that is, when the intelligence concerns operations and actions, and not only intelligence sharing. Moreover, as will be explained later in this chapter, the structures of the EU make it inherently difficult to overcome the limitations and bureaucratic obstacles that make intelligence coordination among several actors—that is, on a Union level—so difficult. Finally, the chapter will conclude with some recommendations that can be of value in countering these flaws in the structure.[3]

## INTERNATIONAL DEVELOPMENTS AND REGIONAL EUROPEAN COUNTERTERRORISM POLICY

When the Soviet bloc collapsed in the late 1980s and early 1990s, it was widely assumed that a new era of heightened prosperity and peace would come about in the international system. Democracy had "won," and this was seen as a starting point for a new world order, based on parliamentary

democracy and an integrated, free-market economy. It was also assumed, as this new world order extended its influence, that disruptive elements to international stability would become increasingly marginalized. Since the collapsed Soviet Union had been a major contributor—financially and ideologically—to the various groups and organizations that had posed a terrorist threat against the West, the prediction was that these groups would wither away. To a certain extent this did happen. For the many left-wing, ideologically committed groups from all over the continent, the demise of the Soviet empire in effect dealt them a severe blow.

However, the initial euphoria soon gave way to a growing sense of unease, and even despair, when conflicts over territory, economics, ethnic belonging, and religious and political issues increasingly occurred as a result of the lifting of the "totalitarian lid" that had hitherto kept these sentiments capped. These concerns were heightened by an increased fluidity in the international system, a fluidity that now characterizes international politics, and in which it is much more difficult to attribute exactly who is doing what to whom. The establishment of a "new security order" might have reduced the danger of interstate conflict, but at the same time it has raised the risks of increased substate, subnational forces being used, thereby making low-intensity conflicts—including terrorism—much more common.

Today, the underlying root causes for many of the world's most protracted conflicts are still unresolved, either because they predated or remained unaffected by the East/West struggle, and thus these conflicts remain as complex and irritating as ever. As a result, the number of terror attacks has not declined since the fall of the Iron Curtain—on the contrary, there was an increase during the 1990s (even before 9/11) of incidents of this particular mode of violence. The potential for terrorism is obviously still present, but it has, to a large extent, taken new roads by using religion as an imperative and bringing a globalized struggle to the fore of these long-standing conflicts.

There are many differences between the politically and socially motivated terrorism of the 1960s and 1970s and today's religiously motivated terrorism. First, the motives behind religious terrorists are a mixture of seemingly inseparable political and religious ideas. This is fuelled by a zealous and grave sense of doing God's work, or at least protecting His work. The people committing these crimes also see themselves as acting on God's command, thus making them immune to moral or ethical objections about their acts. God's command is not to be questioned. Since the victims are seen as enemies, often by simply being where they are at the time of the terrorist act, the perpetrators can also justify their killings.

Another difference concerns the "modus operandi" of the religious terrorists. Since the killing of "enemies" is the main objective in the first place, the higher the death toll the "better," from the terrorist viewpoint.[4]

This makes terror attacks carried out by religiously motivated terrorists potentially more lethal than the former, politically motivated terrorists, in the context of which every act was calculated against a political goal, and where one aim was to gain public support for a cause—however twisted the reasoning behind that was. Violence, often leading to death, in the name of religion and sanctioned (even mandated) by God thus has the hallmark of being lethal and indiscriminate at the same time.

A third difference concerns the mixture, conscious or not, of religious and sociopolitical issues referred to as a cause, or excuse, of the violence applied. Today's terrorist may also pursue a nationalist/separatist agenda, in which the religious component is tied into a complex web of cultural and linguistic factors. This makes combating this kind of terror even more difficult. The lack of any clear-cut "cause" is not only a break with the picture from earlier years, but it also makes political remedies hard to come by. Attempts by Western European governments to follow a two-tiered track (the stick and the carrot) to fight terror is of very little use if the perpetrator in question is more interested in killing you than to reach a compromise aimed at changing a perceived political or social injustice. This is, of course, not to say that social and/or political grievances cannot serve as a cause for some religiously motivated terror. But this is not enough to explain it, or to remedy the causes behind the terror.

Finally, a fourth difference is the phenomenon of suicide terrorism (first used to a larger extent by the Tamil Tigers in Sri Lanka during that country's civil war in the 1980s). When people are not afraid of the (hitherto) ultimate deterrent that society has to offer, and sometimes even want to die, the difficulties of preventing a terrorist act increases considerably.

These problems remain today, even though changes in the methodology of those who combat terror can be detected. The capture of some terrorists, both before and after 9/11, illustrates both the new and current trends in today's terrorism, as well as the attempts at interstate coordination in combating a threat that has become increasingly global. Until the 1990s, the above-mentioned attempts to combat terror had been mostly intrastate affairs, with specific cases sometimes providing means for more international cooperation. With the new threat, it is apparent that this intrastate approach is no longer sufficient.

All these changes have affected the way in which we must combat terror today. This shift forced law enforcement agencies to rethink some of their strategies and tactical procedures when dealing with the terrorist threat. As the insight started to sink in that enhanced cooperation—and one that transcended the "specific-case kind"—was a necessity to handle the "new" kind of terrorism threat appearing, several initiatives were taken at both governmental and intergovernmental levels.

At the beginning of the 1990s, the major international tools that existed for this kind of law enforcement were international treaties concerning

flight security (including airport control), extradition treaties, and yearly conventions where various law enforcement representatives assembled to (in theory at least) share information. For countries like the United Kingdom, Germany, Spain, and Israel—all of whom had first-hand experience with various kinds of terrorism—these tools did not add much to what they already had, by necessity, been forced to develop. For years, the most affected governments, or at least their law enforcement agencies, had built up channels for emergencies in specific cases. There was, however, no central body at the EU level or any other transnational level to coordinate the struggle against terror. Neither was there any attempt by countries more or less unaffected by terrorism—for example, Sweden—to build up a capacity in this regard.

What the new kind of terrorism—religiously motivated and without any clear, discernible political goals other than the destruction of one's enemies (at least, that was how it appeared to many in the West)—brought with it was an awareness that this threat was different, in that it had its origins outside Europe, while at the same time many of its perpetrators got their final orders (and sometimes ideological injections) in the West. This, of course, made it more difficult to combat. As is so often the case, this awareness did not really evolve into practical initiatives until it became politically impossible not to. The external event that connected the terror threat, emanating from the Middle East with a European and American context was the Middle East Peace Process (MEPP), and the political changes this process brought with it. Because so many aspects of the conflict were included in the peace process, among them the threat of terrorism, it became possible to seriously engage in efforts to increase international cooperation. Several states now had a new interest in suppressing terrorism, and this brought to the fore the possibility of using military forces and intelligence agencies in a struggle that so far, for the Europeans at least, had been primarily a police issue. Countries in the Middle East region, like Israel, Egypt, and Jordan had long reached the conclusion that without full intra-agency cooperation, success was not possible in fighting terror. In Israel, this understanding has led to—at least on the face of it—a rather successful tactic in combating terrorism.[5] In various operations, a certain "job-sharing" practice has developed, where undercover units from elite forces within the army are employed when heavy firefights might erupt, or for hostage rescue operations where their particular skill is needed. The police or border police are in charge of overall security, and have their own undercover units to employ when a more low-key operation is asked for. When it comes to intelligence, there is constant information sharing.

For the EU, looking from the outside and getting increasingly drawn into the Middle East conundrum through the MEPP, this model became more feasible, as the political stakes in the MEPP were also raised back

home. This was easier in countries like the United Kingdom and Spain, where there already existed a structure that could be used, with some modification. The so-called dirty war between the British and the various groups in Northern Ireland had given the forces employed in this "war" a solid experience in this kind of unconventional combat. The new component was that the enemies of the MEPP—more often than not, basing themselves on religious imperatives—took the struggle to the countries seen as supporting the "enemy." This brought home the need to be more efficient in the cooperative efforts to fight terror, and it also helped carry the discussion about CT measures over to a post-9/11 context.

However, it appears that Europe's long history and past experience with terrorism and CT is getting in the way of it adapting to this new threat. The fact that the EU, first and foremost, still views combating terrorism as a police matter, makes the so-called justice model the preferred tool in this regard. This carries with it the structural problems with intelligence coordination which such a system brings with it.

This is all the more glaring considering that the division between the "justice model" and other approaches—up and including the so-called war model of combating terrorism—is not so Manichean. And, even though the policymaking bodies within the EU, judging by recent efforts at integrating of intelligence resources for CT purposes on various levels, have been considering other means than classical police work in the fight against terrorism, that approach is still a far cry from any "integral model" that combines law enforcement and intelligence with military muscle as well as public information operations. In addition, the problem is exacerbated by some foot dragging by several EU members with reference to some of the measures supposedly adopted according to the *EU Framework Decision of 13 June 2002 on Combating Terrorism.*[6]

At the same time, the "globalization" of terror—as well as globalization in other, more peaceful ways—makes Europe a potentially interesting region to use as a base for propaganda, fundraising, and as a resting place for violent groups. And, of course, there are already active networks that also propagate violence and use terrorist attacks within the EU.

To be sure, there was some rather hectic activity in the immediate aftermath of 9/11 (the so-called month of transformation), and there was a rather rushed enactment of reasonably coherent CT policy measures along with a more outspoken acknowledgement that more had to be done in the areas of CT and coordination (and not only concerning intelligence coordination).

Nevertheless, it cannot be taken for granted that the EU is necessarily the best vehicle in Europe when it comes to the multilateral struggle against terrorism. This is mainly due to structural flaws in the way the Union is shaped. As mentioned above, the lack of EU's executive powers, as opposed to the constituent members, begs the question of whether the

Union itself is really suited to initiate, drive, and coordinate CT measures in Europe. If the ambition is also to assume the leading role as the political leader concerning CT policy in Europe, it is questionable whether the Union at present has the ability to devise and facilitate a comprehensive and robust CT policy, and to do so within a common CT jurisdiction. Thus, an overhaul of the structure might be needed—an overhaul that includes the preparedness of the proper public authorities, and other public bodies, to prevent, combat, and generally deal with large-scale terrorist attacks.

A major problem that the post-9/11 EU encountered was the lack of capacity for cooperation between the various agencies that might get involved in case of a major terrorist attack. In this regard, it is worth bearing in mind that even though a plan and model for cooperation may look good in theory, it may not work that well "when push comes to shove." Furthermore, the EU "justice model"—with very clear lines between various agencies and authorities—may not be entirely suitable and efficient enough to counter a serious terrorist threat, should it arise.[7] It might work in peacetime, and during a small crisis, but the weaknesses and shortcomings of this approach for a global war on terror have already shown themselves.[8] Examples of this are lack of coordination and difficulties in cooperation between various agencies.

These regional difficulties are borne out when compared with the visible trends concerning international CT policy. During the 1970s, when terrorism became more international (for example, through hijackings of planes and hostage-taking), the need for international conventions and laws resulted in various initiatives.[9] At the national level, terrorism was (and is still mostly) a question for national police forces. This follows the general idea that terrorism is a crime and therefore a task for the police. During the 1970s, most Western countries developed special units for combating terrorism. Not surprisingly, this development went furthest in countries where terrorism became a real problem, like in the United Kingdom and West Germany.[10] Mainly, this development took place within the police and paramilitary units, while there was also a realization that better intelligence was needed. It was a reactive rather that proactive approach to combating terrorism.

Military units, on the other hand, have been used more sparingly in CT operations (with Israel as a notable exception), and research and development has been most marked within paramilitary and police forces. The changes in international terrorism (often branded as "new") and the heightened perceptions of a threat have accentuated the need to develop new tactics and strategies to combat this threat. This includes both a renewal of traditional methods, such as an emphasis on human intelligence sources (HUMINT), as well as using new technologies (such as newly developed listening and communication devices) in fighting these truly global terrorist threats.[11]

Internationally, attempts to classify some cases of terrorism as "acts of war" will probably force changes to international law and, as a consequence, force changes in national laws as well.[12] In cases where military units have been used for CT operations in other countries, it has been based on some important principles that could possibly be relevant for the EU in the future:

1. The clear and present transnational profile of international terrorism demands a greater scope of international cooperation, from interoperability to intelligence cooperation on a scale we haven't seen so far.

2. Of the few units adapted and available (in countries where they exist), various kinds of Special Forces (SF) are the most versatile and suitable to further develop for use in current and future operations against international terrorism.[13]

3. There is an urgent need for enhanced intelligence gathering and analysis within a system that can combine various tools such as HUMINT and Technical intelligence (TECHINT).

4. There is a shared understanding that all relevant political actors need to coordinate and cooperate more, in order to reach a common threat perception. Combating terrorism is always, at the end of the day, a political decision. Active operations are, and should continue to be, the result of a political decision-making process.

The lessons to be learned from the last decade—when combating the type of international terrorism that dominates today—is that a "honing of the tools" is necessary for success. For this to work, it is also paramount that police and military operations, whether international or domestic, are tailor-made to suit the specific threat at hand. In this regard, it deserves to be underlined that the political and transnational dimension of CT today, as well as current cross-border forms of terrorism, demands an international cooperation that we are not yet equipped to handle. It is a dimension constantly mentioned in the political rhetoric, but one that is very difficult to translate into practical political steps. This is even more difficult when countries that are not used to cooperate in such sensitive areas as CT are forced by circumstances to cooperate against a common threat. The risk for unilateral actions will be there as long as different perceptions, actions, and policies are applied.

## FUNDAMENTALS OF A EUROPEAN COUNTERTERRORISM POLICY

As early as in the 1980s, more people in Europe with ties to the Middle East and North Africa were beginning to forge ties with—and work actively to promote—the global Islamist movement. Today, scores of people living in several EU countries are claimed by various national security

services to have visited militant Islamist camps in Pakistan (and also Afghanistan before the war that removed the Taliban regime in late 2001). Some of these activists are also claimed by the security services to have ties with the "hard core" of al Qaeda. As a consequence, there has been a growth of new, younger cadre of extreme Islamic activists living in EU countries, many with EU citizenship and often well integrated in society, and with religious education from countries such as Pakistan, Saudi-Arabia, and Yemen.[14]

All in all, the EU structure for dealing with international terrorism went unchallenged until 9/11.[15] After that, however, and due to the fact that the EU decided to take part in cooperating with the larger international community in the struggle ("war" was never a suitable word to use in European vocabulary), a debate on the pros and cons of the structures in the EU has surfaced.

A broader debate also emerged in the public domain, with two components. First, 9/11 triggered a debate that sometimes brought with it inflated risk scenarios and worst-case scenarios that hardly fit the European context at all. Second, complaints were heard from inside the security services, that outsiders (meaning people from outside the service) stepped into their territory and without the proper experience and knowledge, passed judgment on Europe's performance. Furthermore, it was argued by the security services, that people outside the service were not in a position to properly assess activists' motivations and capabilities.

The first complaint, with exaggerated threat assessments coming from some strange directions, certainly had some merit to it. In particular, the media showed some innovative scenarios in this regard.[16]

The second complaint, however, is more serious, since it demonstrates a clear unwillingness to realize the importance of a wider study of the phenomenon of terrorism—that is, studies conducted outside traditional police channels. This is serious, because it also points to the heart of the debate in Europe about whose responsibility it is to examine the issue of terrorism, suggesting an inability to understand that the problem is too big to be the sole responsibility of one agency, be it the police or someone else. To assess motivations and capabilities of activists and potential terrorists, it is more often than not a clear advantage of being free of any police or (even more important) security service connection, in order to get people to talk.

The argument has probably more to do with various national debates on whose main responsibility terrorism should be. As noted elsewhere in this chapter, 9/11 triggered a discussion in Europe on whether agencies other than the police (including the security services) should have a larger role to play in combating terrorism, and, if so, what kind of role.

Tied into this discussion is a very relevant argument about risk and threat analyses. When a broader discussion about terrorism does occur (in itself a good thing in a democracy), there is always a necessity to correctly

assess what the stakes are—that is, what are the relevant threats and risk (and their consequences for society) that terrorism can pose? In this regard, it is paramount to remember that a threat of terrorism comes from a combination of factors, including intent as well as an operational capability and motivation to activate an operation/attack. In addition, factors such as vulnerability and negative consequences need to be assessed. After the terrorist attacks in Spain in March 2004 and in the United Kingdom in July 2005, there can hardly be any doubts that this kind of terrorism is already inside the EU. Since 9/11, there have been several "close calls" (whereby planned attacks have been avoided), showing that the threat is real in Europe and that the issues discussed here will not go away anytime soon.

It seems that at the core of the problem with the structural flaws within the EU's CT capability and its intelligence coordination is the absence of a robust (i.e. executive) mandate for the Union to really build a leadership role for combating terrorism in Europe. In addition, a major problem is that as of today, the EU's coordination activity is largely shaped by intergovernmental, not supranational, consultation. In other words, instead of being a decision maker in its own right, the Union—even in its coordinating capacity—is acting more like a multilateral forum for consultation between individual governments.

Herein lies some of the basic problems for the Union in regard to a more coordinated CT policy. Initially, the EU was intended as a full-fledged political union (1952). But by the Treaties of Rome (1957), it was reduced to an economic union (the European Economic Community, the EEC). Currently, the EU is more of an organic economic juggernaut that is flowing into other areas such as internal and external security.[17] As of today, the EU lacks both a mandate and the legitimization required to become a truly collective security organization with a security mandate for Europe. Therefore, and due to the member states' concerns about "supranational" tendencies in Brussels as well as fear of infringement on national sovereignty, the EU's role in the security sphere must remain confined to nonexecutive tasks.

Therefore, in the final analysis (and more than a decade after the Union was established), the EU ambition and stated objective to be a "force multiplier" in the area of CT remains a remote possibility. This is not to say that important achievements have not been forthcoming. But the often coherent and highly relevant CT measures taken by member states have not been translated onto the European level.

## THE BASICS OF A EUROPEAN COUNTERTERRORISM POLICY DISCUSSION

The terrorist attacks of 9/11 brought to the fore the questions of when and how society's different tools for combating terrorism should be used.

Within the EU, there was never a coherent CT policy as such; terrorism has always been regarded, if at all, as something exclusively for the national police to deal with, meaning that no one else needed to get involved.

To some extent 9/11 did change this. Questions started to be asked about the best way to combat international terrorism, and if something should happen, whether Europe was really sufficiently prepared. The very sensitive issue of whether (in extreme circumstances) military forces could be used within member states or (and even more sensitive) regionally, as a consequence of collective security measures, was not really raised.

These issues are of course not new, as the EEC focused for several years on multilateral cooperation against terrorism.[18] With the Maastricht Treaty and the Schengen Agreement (especially Schengen II of 1990), many of these multilateral CT tools were placed under the so-called third pillar (judicial and home affairs cooperation). Since "modern" terrorism was born in the 1960s and 1970s, the role of the police, the military, and the intelligence and security services have been constantly debated. The major dividing line is between those who claim there should be a continued clear "division of labor" between what the police and those on the military and intelligence/security services may do, and those who argue for extending the role for the military and intelligence/security services into "traditional" police activities.

It should be emphasized that this discussion is more pronounced in countries with a constitutional democratic order and market-oriented economies. In countries where problems of violent terrorism have been constant for a prolonged time, and/or where democracy has been under pressure (or has never gained a foothold), this discussion hardly exists. This is important because it touches upon the nature of the society that we claim to defend in this "war" against terrorism now being fought on a global scale.

It is also possible to find distinct differences in how countries in the EU have dealt with these problems. In countries where terrorism has not been a real problem, it has for obvious reasons been easier to adopt the approach that the police and the military have clear and separate tasks. In democracies such as the Scandinavian countries, it is clearly of great importance that these clear lines exist and are respected. Problems arise, however, when the threats (real or potential) are found in the "gray" zone between "ordinary" criminality and full-scale war, or at least a war-like situation. International terrorism can very often be found in precisely this "gray" zone.

In countries which have had serious problems with terrorism—like the United Kingdom, Italy, and Spain—even if it hasn't been of the international, global type we saw in the United States on 9/11, there has been a greater understanding that the armed forces, under certain specific circumstances, can be used within the country.

The "division of labor" notion described earlier is also mirrored in the ongoing debate within the European Union, where members are constantly trying to find a common line in the fight against terrorism, something that certainly began prior to 9/11. As there are considerable differences between various countries within the Union, this task will hardly be finished in the near future. Hence, the guidelines that have been produced are relatively general in character. Even if this doesn't have to be an insurmountable obstacle to finding a common policy (a less specific policy outline can leave room for more unconventional solutions), it does pose a problem when one is trying to find more concrete policy recommendations on a wider scale. The new and enhanced information system introduced by Europol is, if fully implemented, an important step toward a more comprehensive and common tool to deal with cross-border crime, such as terrorism.[19]

If one then looks at how different European countries have been handling the challenge of terrorism, one can discern some patterns in those cases where this struggle has been successful—when the terrorist "infrastructure" (organization, training, and modus operandi) has been destroyed—and some sort of solution to the underlying causes have been found. For example, in the cases of (then) West Germany, Spain, Italy, and the United Kingdom—cases where the scope of the conflicts have been considerably reduced, if not entirely eliminated—the fight led by the military and police was followed by some sort of political processes. These strategies can work where there are underlying conflicts of a type that can be remedied by political means, and where there is support for such actions among a large part of the general population. However, and this is the important part, in all these cases it was necessary to use a combination of tools in order to succeed; military, judicial, and political. How these tools were used differed, of course, depending on the country in question. In France and Italy, for example, there was in fact a tool already available when the threat of terrorism appeared in the earlier mentioned "gray" area between the civilian and military areas of responsibility—namely, in the form of paramilitary forces (the "Gendarmérie" and the "Carabinieri" respectively). These represent a type of force not readily available in the EU at large.

These European conflicts have also shown the stability of a liberal, constitutional, and democratic society. In none of the cases mentioned above was the democratic structure seriously threatened. In the case of Spain, on the contrary, a democratic development could contribute to solving the conflict successfully, and through this leave room for a process of conflict resolution. In the United Kingdom and in West Germany, limited restrictions on civil rights were periodically implemented, but they were not permanent, and those measures were intensively and continuously discussed and debated. This is, of course, in itself no guarantee that such

actions may not in the future lead to serious disturbances in the structures of democratic countries were they to be implemented. Furthermore, there will always be a risk that limited changes can be made permanent. Nevertheless, the outcome indicates that an open and democratic society can handle comparatively serious challenges during a rather extended period of time.

In this context it is also appropriate to clarify (yet again) that the kind of international terrorism we witnessed on 9/11 is of another kind than the above-mentioned terrorism in Europe. In these European cases, the terrorists were politically and ideologically motivated. In the case of 9/11, it was a religiously motivated terror that showed its face. Moreover, it is this latter form of terror that has been dominating the scene for the last decade or so. Because the objectives for these groups or networks are considerably more diffuse in shape, and the attackers view themselves as warriors at war, it becomes much more difficult to counter with traditional means.

In all of the cases above, intelligence cooperation, sharing, and coordination was a critical tool for ensuring success. But this was done on a bilateral or domestic level. And yet, during these years, the EU was fully aware of the transnational ramifications of the problem, and showed a willingness to treat terrorism as a multilateral problem that ought to be dealt with on a (at the time) EEC level.

As the process toward a Union progressed, the issue of terrorism was tacked onto various legal and judicial initiatives, and by the time of the Amsterdam treaty (signed in 1997 and ratified in 1999), terrorism was clearly acknowledged as an item in the context of police and judicial cooperation.[20] Since then, however, terrorism has been put at the top of the list of the Union's defense and security priorities, where it has remained despite the massive enlargement from fifteen to twenty-five countries on May 1, 2004. A key notion of putting CT competencies within the third pillar was the insight that terrorism was no longer exclusively a domestic criminal issue of each member state, but an internal security problem for the Union as a whole. Since the model that the Union adopted for handling terrorism is a criminal justice CT model, the nature of the third pillar—in regard to the justice model—reflected two fundamental notions of a majority of the member states. First, there was a shared belief that issues such as drug trafficking and illegal immigration, as well as other types of organized crime, were closely linked to terrorism. From that followed the understanding that dealing with each of these criminal activities separately made little sense. Secondly, member countries were generally deeply suspicious of allowing external agencies or organizations to interfere in sensitive domestic internal security matters (this as opposed to criminal justice affairs). These notions acted as powerful impediments toward a more multilateral approach in regard to CT, as borne out of the

necessity of the Dublin agreement—that is, "apolitical" criminals could be extradited, but not terrorists, which were one's own affair.[21]

## THE DYNAMICS OF THE EUROPEAN DEBATE
## ON COUNTERTERRORISM

This aspect of international terrorism, of the religiously motivated kind, ties in with another key feature of the European discussion on terrorism—namely, the difficulty in maintaining the hitherto developed rules and regulations driving various agencies' capabilities and powers when it comes to domestic and regional distinctions respectively. This distinction between what is domestic and regional terrorism is becoming more and more difficult to clarify, with immediate consequences for the Union's policy to combat this threat.

The dramatic changes within the EU brought forth after 9/11—for example, the Anti-Terrorism Action Plan contained close to 150 measures—showed the inherent weaknesses in the EU structure and the difficulty in overcoming those obstacles raised through these structures. And while the issue of intelligence coordination comes up in several of the measures initiated, the pitfalls of not having a pan-European CT coordination tool available is at the same time acknowledged by the EU itself.[22]

The Action Plan also envisaged the introduction of an EU strategy for the suppression of terrorists financing, as well as a common and comprehensive definition of terrorism, a definition that could be used as a tool for the Union in a multilateral sense. Of special interest here were suggestions for facilitating greater coordination and cooperation in intelligence between police and security services throughout the Union. To ease this process, the Europol–Eurojust cooperation agreement (signed June 9, 2004) was intended to establish a link between the EU law enforcement agency and the EU judicial cooperative agency.

It is beyond doubt that the EU needs to carry out this struggle against terrorism within the democratic and constitutional parameters that the liberal, democratic EU societies have developed, but with the addition that these parameters must be defended. These last few years have yet again underlined the enhanced need for extended regional (and international) cooperation. This is nothing new, but what is "normal" and uncontroversial in peacetime can become much more difficult in times of crises.[23] For the member states of the Union this carries with it the need for new and enlarged judicial tools, as well as an understanding that when faced with a threat—even if it isn't of the "clear and present kind"—that does not fit into the present structure, changes might be necessary. The challenge will be to do this without in any way endangering the democratic and liberal constitutional structure that the EU is rightly proud of having developed.

The need to develop well-trained units with broad competencies is clear and will not be any less needed in the foreseeable future. On the contrary, the global threat presented by religiously motivated terrorists will most likely only demand a better and swifter "rapid response mechanism" to counter it. Furthermore, this heightened global dimension of international terrorism will also demand more in areas of interoperability and a more developed capacity to operate in different geographical and political contexts.

In this regard, it is also important to point out that these new resources must be developed *before* "push comes to shove." When the need for these new resources appears, it is already too late to develop and construct them. Furthermore, in times of stability and peace, these resources are questioned, not the least because they do carry costs and the use of them which is not clearly apparent during peacetime. In some EU countries, there is also a reluctance to divert or add new means to develop a capacity for which there is no perceived need. In addition, there is a need to develop, and perhaps change, certain legal parameters for military resources to be used in peacetime inside the country and within the legal framework of a constitutional democracy. These changes must not come easy and should be worked through the system properly to make them acceptable both to the populations at large as well as to the polity. It is, again, necessary to point out that no changes should of course be instituted unless they are deemed necessary. This is especially true when it comes to legal changes. Changes ought to be considered only if there is a de facto threat (either at present or in the future); if current legislation is deemed ineffective, eventual restrictions on civil liberties are judged to be acceptable, and existing countermeasures are deemed insufficient.

To properly understand the current debate on CT in the Union, it is necessary to look also at the present legal framework. As noted earlier, Union responses to terrorism are based on the criminal justice model. As is the case with most Western democracies, terrorism is regarded as a crime, and thus responsibilities for CT rest on ministries such as Justice and Home Affairs.[24]

Criticism against both older (pre-9/11) laws and the new terrorist laws and initiatives discussed, suggested, and (in some cases) implemented since then, have been focusing on aspects that are, the critics say, violating basic human rights and lacking in parliamentary transparency. Criticism has also been leveled against international efforts to combat terrorism and its effect on European legal proceedings, saying, in effect, that different legal and political cultures within the EU are being disregarded in favor of very broad and loose definitions of terrorism—definitions that would mean that an individual EU country would loose its right to try evidence before responding to demands from other EU countries for extradition.[25]

What all this adds up to is a picture in which the EU is trying to cope with a widening policy gap between taking part in the fight against *international* terrorism and how this fight is being structured at the regional and national level within the Union.

Therefore, a key question in regard to the Union's CT efforts is what has been achieved over and above the EU acting as a facilitator, coordinator and, more generally, a political platform. The scope of the Union's CT policy looks ambitious, particularly when it comes to intelligence matters. Within the framework of the ESDP (European Security and Defense Policy) Conceptual Framework, CT was introduced as a major issue and in order for intelligence to be more streamlined within various agencies, there is a vital need for interoperability between military and civilian capabilities. This is a sensitive issue that raised the temperature of the domestic debate (within the EU) on the roles of the military and civilian police vs. terrorism. On a more practical level, the Action Plan wants to ease cooperation and coordination for member states' defense intelligence organizations by creating a Joint Situation Center.

However, implementation of all these ambitious initiatives seems to be a far bigger problem. The relevant follow-up question is whether the Union's operational and legal CT tools have been robust enough (i.e., democratically endorsed and operationally efficient) to really impact international terrorism beyond what member states already do on an individual level. It is therefore relevant to look at the various tools that the Union has developed for combating terrorism, bearing in mind that not all of them were designed for CT purposes specifically, but for more general purposes.

This question is especially pertinent in regard to intelligence. There exist outside the EU several hubs where individual EU member states participate. Examples include the Club of Berne, the PWGOT and, more clouded in a shroud of secrecy perhaps, the Kilowatt Group.[26] The problem is that these efforts are not necessarily coordinated within the Union, and as long as there is a prevailing suspicion among many EU countries to share—or, even more sensitive, cooperate—on anything more than a bilateral level, it is difficult to see this changing in the near future.

## ASPECTS OF A REGIONAL EUROPEAN COUNTERTERRORISM POLICY IMPLEMENTATION

Today it is very likely that the EU, pressed by demands for changes concerning CT policy both by the wider international community, as well as by domestic demands of better protecting its citizens, will have to adapt to an international approach stressing more offensive CT (as opposed to more defensive antiterrorism mechanisms) capabilities. This adaptation should of course not be implemented due to pressure from abroad, nor

if there is no visible need for making these changes. On the other hand, if there is such a need, it is far better that these changes and adaptations come as a result of a planned, thorough, and balanced debate inside the Union, than as the result of imposed changes forced through international pressure and/or through terrorist attacks. After the attacks in Spain and the United Kingdom in 2004 and 2005, this issue is obviously even more relevant.

Thus, looking at the international scene concerning CT capacity building there are reasons to believe that the near future will, if anything, demand even more international cooperation in the "war against terrorism." On the face of it, there seems to be two main development channels internationally for CT, both with repercussions for the Union.

1. An extreme multilateral approach, with standing units including both police/paramilitary and military forces. This would be developed in combination with an international legal framework, evolving into a rather "federal" system where terrorists can be both apprehended and put behind bars internationally.
2. A continued development of CT capacity at the national level, with a political will to use developed resources on an ad hoc basis. In this case, this would have to be combined with new judicial tools (where necessary), but with the emphasis at the national level.

Both of these alternatives will bring demands at the regional, Union, level:

1. A new and supplementary legislation where authorities are given the means to use, if necessary, military CT resources in peacetime, on a *regional* level. Through this, society would also show a willingness to stand up for the constitutional democratic system of the EU, and to use resources more economically.
2. Establishing, if necessary, a "European Union Security and Crisis Council/Center" that could have, in a democratic and acceptable way, powers to deal with extreme threats and/or extraordinary events. These regulations should be put in place during peacetime in the event that, in an emergency, time is not available to wait for a Council decision.
3. Continued development of military and police resources to CT threats, both regionally and internationally.
4. Enhanced possibilities for the police to cooperate more at the counterintelligence level with military and nonpolice intelligence agencies.

In addition to the above proposal, there is of course a third path of development that might be more pronounced—namely, that the so-called great powers (and not only the United States) use unilateral means more frequently to deal with what might be viewed as clear and present threats.

Such an evolution, however, will hardly diminish the need for smaller countries to develop their own capacity to act. Today, with the "movers and shakers" within the EU (i.e., the G5) already doing this, it is again difficult to see how these changes can and/or will be brought about.

This need for enhanced capacity concerning CT competence becomes even clearer when one takes into account the importance of both the political and military component in combating international terrorism. To be successful, the whole toolbox must be used. To develop such a toolbox is a priority for any serious attempt to formulate a comprehensive CT policy, regionally as well as internationally.

There are (as of today) five major weapons in the Union's legal and judicial arsenal that can be viewed as paramount in the fight against terrorism, and especially in regard to CT measures. These are the European Arrest Warrant (EAW), the Joint Investigations Teams, the European Judicial Cooperation/Eurojust, the European Police Office/Europol, and finally, the Office of the Coordinator for Counterterrorism.

*The European Arrest Warrant* is intended to ease extradition requests between member states. It also dispenses with the rule of "dual criminality," which is the principle in which the crime has to be a crime in both the requesting and the requested state. A complementary project, the European Evidence Warrant—whereby a requesting state can obtain relevant evidence from another member state—is currently under way.

*The Joint Investigation* teams are very much a brainchild of the conceptual Union model of the preferred "justice model" as applied to combat terrorism. These teams can be set up at the request of any member state and are not limited to CT, but are also applicable to any criminal case.

*The European Union Judicial Cooperation/Eurojust.* This is the Union's judicial network. The Eurojust mandate is to enhance cooperation and effectiveness between various legal and judicial bodies within member states in regard to serious cross-border and organized crime. It is not only concerned with CT per se, but under the Action Plan, member states were actually asked to abrogate their right to refuse any Eurojust request if the investigation involved terrorism.

*The European Police Office/Europol.* Europol is arguably the most operative of the various EU initiatives launched so far. Its principal mandate is to ease cooperation between member states and to facilitate the exchange of information, including intelligence, between member states. Europol is also tasked with several CT measures on a multilateral level. Resistance from several Union members to share intelligence and to give Europol a more serious CT role on a supranational level have been clear from the outset. In this, Europol mirrors the larger problems that the Union has with different CT efforts. Despite the obvious need for more and better multilateral cooperation, national security and interests still take precedence.

*The Office of the Coordinator for Counterterrorism*. This office is a direct outcome of the March 2004 terrorist attacks in Madrid. The office is one of the more tangible results of the 9/11 and (so-called) 3/11 (Madrid) attacks, and it was hoped by many within the Union that the office would be given some real muscle to be an efficient CT player on the Union level. However, this did not come about, as some of the "movers and shakers" in the Union (most notably within the G5 group) vetoed the idea of a "CT czar" and a kind of pan-European Intelligence Agency.[27] In the end, to effectively utilize the CT capacities of the Union, the Coordinator would have to be given the same powers on the Union level as that of interior ministers on the national level.

## CONCLUSION

It is probably safe to say that terrorism, in its various shapes and forms, will continue to be a feature of the "brave new world" that evolved after the demise of the Soviet empire. Political violence is not a new phenomenon, nor is there a lack of "causes" for using indiscriminate violence, either to underline a political, religious, or social point of view, or to kill infidels (or enemies of the "Faith,"), whoever they are, in the name of "God."

Combating terrorism involves two sets of action: antiterrorism, which is taking defensive measures, and CT, which deals with the offensive measures taken. Antiterrorism is defined as defensive measures taken in order to reduce the vulnerability of individuals and property, including limited responses and containment by local forces, which can be both police and military forces. CT is defined as involving those offensive measures taken to prevent, deter, and respond to terrorism. For obvious reasons, programs for CT are classified, whatever country one is looking at, and therefore information about them is limited and difficult to assess. At the same time, where the military and intelligence play an important role (and sometimes the most important role) is precisely in the area of CT.

Within countries that have gone through periods when terror, for different reasons, has been a real threat and a cause for concern, there has been progress in regard to the way terror is combated. In such cases, the conventional terror-fighting agency, the police, has sometimes borrowed the "modus operandi" from the military. The creation of special anti- and counterterrorist squads or special assault teams bears this out. More often than not, these units are trained by the military, and very often the personnel recruited have a military background. In countries in the Middle East, Asia, or Africa, these forces are grouped together under the heading "security forces." The certain lack of distinction that this term embodies, as well as a slightly derogatory taint sometimes, overshadows the fact that this is precisely what a number of Western democracies have created, and very often for the same reasons; namely, to combat terrorism.

The creation of special forces within the police, backed up by resources from the military, are perhaps the most vivid expression of the seriousness with which the target of these forces, the terrorists and their organizations, are seen. As stated above, the internal conditions responsible for domestic initiatives like the creation of special forces, built up exclusively to combat terrorism, have been difficult to "translate" into other fields of operations. Again, the various national agendas, specifics, and different areas of responsibility are formidable obstacles to a more unified approach to fight terrorism.

All this is evident within the European Union as well, but more on a national level than on a multilateral level. As is clear from the discussion above, national interests and security concerns still trump any attempts to form a more comprehensive Union CT body with enough muscle to really make a difference.

One major trend in today's terrorism involves fewer[28] but deadlier attacks, as well as a shift to a tactic by the terrorists, where the intent is not so much an attempt to use terror as a tool to bring home a "political point," but rather to provoke as much damage, human or otherwise, as possible. This trend has also brought the question of who has the responsibility for combating various terrorist attacks to the fore. One of the main problems in this regard is when various agencies, police and/or the military have overlapping jurisdictions and charters. When this happens, friction is bound to occur.

Another trend in today's international terrorism, creating additional problems for law enforcement agencies, is the evolution of terror *networks*, as opposed to more "classical" terrorist groups and organizations with clear hierarchies. In their major work on networks and netwar, Arquilla, Ronfeldt, and Zanini[29] argue the following points:

- Hierarchies have a difficult time fighting networks.
- It takes a network to fight another network.
- Whoever masters the network form first and best will gain major advantages.
- As a consequence, it will take more effective and better interagency approaches in a more networked structure to fight radical and/or extremist networks.[30]

An additional problem for Western democracies in this context is the different "ethos" of the police on one hand, and of the military on the other. For the police, in theory at least—and in consequence with the liberal tradition which should guide the conduct of the police—they operate according to the principle of "minimum force." In essence, this means using only the minimum level of force necessary to deter, restrain, or contain violence. It is a true defensive, antiterrorist line of operation.

The military, on the other hand, are taught to apply the maximum level of force from the beginning in order to reach a stipulated goal as soon

as possible. When these two roles come in proximity, and perhaps even overlap, problems and tensions occur. The concept of "minimum force" is used for the protection of the individual and his/her rights within society. It is probably for this reason that in the cases where the police forces have undergone a certain "militarization" (in the shape of special paramilitary antiterrorist units), it has been done with the goal that the operational fight against terrorism should continue to be shouldered mainly by the police, but with better tools, tools that can be provided by the military.[31]

These units occupy a position somewhere between the police and the military, and therefore help to blur the distinctions between the army and the police. Since terrorism is seen as a direct challenge to the state and its monopoly of coercive violence, the principle according to which they act has been extended from one of minimum use of force to one of *sufficient* force. All this has had the effect of transforming the traditionally defensive, antiterrorist-oriented role of the police to a force that has a more overt offensive capacity. And when that capacity is there, it is of course tempting to use it, even when it might not be necessary.

It can hardly be overestimated how important solid, "hard" intelligence is in the war against terrorism. This has been evident all along. The novelty is that it has been easier to use the whole gamut of resources within the intelligence agencies in the fight against terror. The necessity of using intelligence in its wider aspects (since the threat is truly international) is, on the other hand, quite evident. The challenge for the EU (and the West in general) is similar to the challenge of integrating military components in police work: the danger to the individual and his/her rights within society.

Taken together, these changes in the way terrorism is combated—integrating tactics and strategies from the police, the military, and the intelligence agencies in the light of the terrorist threat—demonstrate that there is an awareness of the fact that the threat posed by terrorism can be a very real one. This awareness, however, has not been translated into a more general and truly transnational approach to the problem. Without such an approach, it is doubtful whether the countries concerned can develop successful strategies to combat terrorism on an international level. Not because the know-how is lacking, or the will, but because a more narrow, nationalist agenda, is still "when push comes to shove," the dominating factor in creating policies to face up to the threat of terrorism. And also, on the national level, there remains a consistent problem with intra- and inter-agency rivalry within concerned agencies, as well as a lack of communication between law enforcement agencies

It seems clear that for the fight against terror to be effective and successful, the various actors involved need to, in a sense, "square the circle" in combining efficient transnational cooperation (using "all the necessary means at one's disposal") with a framework that is safeguarding

the democratic structure and does not infringe, unnecessarily, on the civil liberties (of the citizens) that the struggle against terror is supposed to protect.

In order to do this properly, it is paramount to analyze carefully and plan ahead before changes (legal and other) to the structure are implemented. Debate and discussion about these changes must have a role, and the fact is that participation in the fight against terrorism has forced the EU to adapt to new international legislation faster than otherwise would have been the case.

At the same time, it is equally clear that the current state of affairs in the Union is that many of the CT tools in the arsenal still seems to suffer from the same flaws, including a lack of democratic robustness as well as enough muscular impact to efficiently utilize the Union's quite extensive capacities. Compounding this problem is that these weaknesses are effects of structural components within the Union. To overcome this, it seems that some of the very basic tenets of the Union have to be changed, that is, a much more thorough supranational CT competence, with the accompanying powers, is required. As of today, with the "justice model" as the sole model in combating terrorism, and a continued division between internal and external security on the conceptual level (with citizens and polity alike), considerable difficulties exist which challenge a more integrated and multilateral approach.

Despite several legal and judicial initiatives and ambitious policy measures in the area of CT, it is clear that many Union members lack the will to truly make the Union the main vehicle to combat terrorism. It is still viewed as a national rather than a transnational issue. On the political level, the Union still lacks the powers to devise and implement a coherent, robust, and comprehensive CT policy. On the legal level, the problems with enacting a more coherent and comprehensive role for the Union are also evident. For example, the EU's list of terrorist organizations makes a distinction between the organization itself and the individual members, making it perfectly legal for individual members to apply for and receive visas for EU countries at the same time as the organizations they belong to are banned.[32]

Finally, on the operational level, Europol lacks both the means and personnel resources to tackle CT issues. This runs the gamut from budgets to the sharing of intelligence, the last point being a constant source of friction and something that renders much of what is done insufficient. The Union's criticism of its own members in regard to Europol bears this out loud and clear.[33]

In the final analysis, therefore, it seems right to ask the question whether the EU is really the best vehicle to combat terrorism in Europe at the beginning of twenty-first century, or whether it is time to discuss an alternative. If, as is argued here, the inherent structures of the Union make it

impossible to create a necessary multilateral body to tackle the challenges of terrorism, maybe a quest for a different multilateral fora to combat terrorism in Europe should be put on the table.

**NOTES**

1. Europe is of course much more than only the European Union. But for the purpose of this study, and since the EU is the most important political, economic, and military player in Europe, "Europe" in the context of this study is really synonymous with the EU.

2. For an overview see Doron Zimmermann, "The European Union and Post-9/11 Counterterrorism: A Reappraisal," *Studies in Conflict & Terrorism* 29, no. 2 (2006): 123–145.

3. It is important to note that this discussion limits itself to the issue of intelligence coordination in relation to CT. This does not mean that other issues related to CT will not be dealt with at all. But it does mean that the focus is on CT and, more specifically, on its policy implications for the EU. Furthermore, the purpose from a methodological point of view is first and foremost to shed light on the problems related to the issue of intelligence coordination concerning CT policy within the EU today—that is, the limitations on what can be done within the present policy structures.

4. It should be pointed out here that the fact that the "killing of enemies," in no way means that other criteria does not matter. Behind the killing might lie, and very often *does* lie, social and political factors as well. But it must be underlined that the religious dimension and motivational factors are the main ones. Reaching the ultimate goals of "cleansing one's society from enemies" or "creating justice for one's people" means, in the context of the religiously motivated terrorists, death and destruction of one's enemies.

5. The failed attempt to kill one of Hamas' leaders in Jordan in September 1997 (The Maashal affair), points to the fact that no one is completely immune to interagency rivalry. On the whole though, Israel still presents a picture where the intelligence agencies are careful to pool resources and information, if for no other reason than to dilute the blame if things should go wrong. The Maashal-affair will probably only bring this point home more forcefully.

15. This is of course not to say that there were no *national* debates on CT policy. As an example, one can look at the sometimes very loud discussions in the United Kingdom concerning the way Britain handled the Irish "troubles" (as they were euphemistically called for a long time).

16. As a case in point, and as a rather odd example, one can look at the debate in Sweden after the murder of then Swedish Foreign Secretary of State, Anna Lindh, in September 2003, when wild speculations about connections to terrorism were made in a case that evidently had nothing to do with any kind of terrorism.

# CHAPTER 23

## COPING WITH TERRORISM: LESSONS LEARNED FROM THE ISRAELI INTELLIGENCE COMMUNITY

Ami Pedahzur and Arie Perliger

On the night of July 3, 1976, an Israeli Defense Force (IDF) commando unit gained control of the old terminal of the Entebbe airport in Uganda and freed ninety-eight Jews and Israeli citizens being held hostage there. These were the passengers of Air France flight 139, which had been hijacked the week before during a flight from Israel to Paris. The hijackers, two Germans from the Red Army Faction and two Palestinians from the National Front for the Liberation of Palestine (PFLP) who had joined the flight during a stopover in Athens, forced the pilots to land in Benghazi, Libya, where ten more Palestinians joined the group. From there they had flown to Entebbe.[1]

Three days after the hijacking, the terrorists freed all passengers not carrying Israeli passports or suspected of being Jewish. The remaining hostages were concentrated in the transit hall of the old airport terminal. The hijackers, with support from Uganda's leader at that time, Field Marshall Idi Amin, announced that if fifty-three of their comrades imprisoned in countries around the world were not released by July 1, the hostages would be executed. Following intensive negotiations between Israel and the hijackers (with Amin acting as middleman), the terrorists agreed to extend the deadline by three days, a decision that was to prove fateful.

Two days after the original deadline, four Israeli Air Force Hercules C-130 transport aircraft took off from Sharm el'Sheikh (at that time

under Israeli control) for Entebbe. The planes carried forces belonging to the elite General Staff Reconnaissance Unit (GSRU or *Sayeret Matkal*) as well as from the Paratrooper and *Golani* Infantry Divisions.

At 11:00 P.M. Uganda time, the planes landed at Entebbe airport. Within seconds the cargo bay doors opened and soldiers and vehicles spilled out. Thirty-two soldiers advanced toward the terminal in two Land Rovers and an official-looking black Mercedes that were to have fooled the Ugandan soldiers into thinking Idi Amin was paying a visit.

According to Mooki Betzer, commander of the assault on the terminal, the soldiers were on high alert, their eyes trained on the terminal. But they had miscalculated. Two Ugandan sentries signaled them to approach and identify themselves. Betzer was familiar with this routine from his experience as military advisor to Amin[2] and implored Yoni Netanyahu, sitting next to him, to ignore the two. Netanyahu opened fire and soldiers in one of the Land Rovers followed suit.[3] Thus, the element of surprise was lost. Heavy fire poured from the control tower on the assault team. The Israelis abandoned their original plan and stormed the entrances to the terminal, sometimes creating bottlenecks. Luckily, the terrorists never imagined Israeli forces were responsible for the chaos outside the terminal, and the Israelis surprised and quickly eliminated them. Three hostages were also killed during the attack.[4]

The rescue was lauded throughout the world as a heroic undertaking; the IDF units involved were accorded the highest prestige and the operation even spawned three feature films. However, this was a glorified version of reality. From statements made by some participants, it is clear that the line between success and failure had been very fine indeed.[5]

The real success story of Operation Entebbe actually occurred during the preparatory stage—that is, during the time intelligence was collected and analyzed. It is in the nature of things, however, that such work is secret and remains in the shadows. Accordingly, even though it was critical to the success of the operation, that part of the operation has remained far from the limelight. Until the day of the hijacking, Israeli intelligence activities in central Africa had been negligible.[6] From the moment the hijacked plane landed in Entebbe and until the hostages were freed six days later, the Israeli intelligence community was able to gather the detailed information necessary to carry out an unprecedented operation, including maps, aerial photographs, and detailed blueprints of the building where the hostages were being held.

The first intelligence was gathered by debriefing officers and pilots who had served in Uganda during the period Israel had collaborated with Amin's government and trained his army. They handed over photos and films they had in their possession from their time spent in the country. In addition, Mossad agents in Paris interviewed the non-Jewish hostages who had been freed soon after the hijacking, who provided information

on the hijackers and described the scene in the terminal. Israeli Air Force Intelligence possessed photos and maps of Jefferson-type airports, which provided important background material since Entebbe airport had been built on this model.[7]

At 8:00 P.M. the second day after the hijacking, representatives of all sectors of the Israeli intelligence community met at General Staff Headquarters in Tel Aviv. They distributed the materials in their possession and after evaluating them, identified the incomplete parts of the picture and decided to focus their efforts on tactical intelligence in preparation for the operation.[8] Their efforts met with success. Interviews with pilots who had flown to Uganda, Foreign Ministry personnel who had been stationed there, and employees of *Solel Boneh*, the Israeli construction company that had built the airport,[9] made it possible to draw a blueprint of the terminal. Burning questions regarding the location of rooms, exits, and stairwells were answered.[10] In order to confirm the information, *Mossad* agents were sent to Uganda. They were able to get close to the area the morning of the planned operation and sent up-to-date photos of the airport and its surroundings. They also identified and mapped out alternative escape paths in case the rescue units would be forced to leave the area by land.[11] Simultaneously, intelligence operations were carried out to prepare flight paths to the objective. Military Intelligence was given the task of supplying up-to-date information on the Ugandan air force and its anti-aircraft capabilities, as well as on weather conditions in the six countries the C-130s needed to cross. This information made it possible to find relatively safe flight paths, especially above the Suez Canal and the Indian Ocean.

As noted above, the Entebbe rescue mission accorded the Israeli intelligence and commando units a reputation of rare capabilities in the fight against terrorism. However, this reputation raises a thorny question. The success of organizations in general, and intelligence and military organizations in particular, is usually measured by the outcome of their operations. Consequently, success in the fight against terrorism should be defined as a decrease in the number of terrorist events and their victims, and even the complete eradication of terrorism. A close look at intelligence operations carried out by Israel against terrorist organizations indeed reveals impressive tactical accomplishments ranging from infiltration of terrorist networks in the far corners of the globe to effective gathering of intelligence and prevention of high profile attacks before they could get off of the ground, together with not a few failures. However, if the camera is aimed higher, at the strategic level, the picture, at the very least, is one of scathing failure.

Among other events, the Israeli intelligence community failed to forecast the rise of Shiite terror in southern Lebanon in 1982 and the Palestinian uprising in the West Bank territories in 1987.[12] It also underestimated the ability of the Hizbollah to continue functioning in the face of

Israeli attacks on southern Lebanon in August 2006.[13] Because of this failure, military readiness was at a low and an arsenal of effective tools to deal with the threat had not been developed. Israelis, Palestinians, and Lebanese alike paid the price. In addition, despite the imaginative stories told of the long arm of the State of Israel able to reach terrorists all over the world, reality teaches that apart from some high-profile operations where relatively low-level terrorists or those already out of operational circles were captured or assassinated, the number of terrorists targeting Israel has only increased with the years, their capabilities have improved, and the number of victims is immeasurably higher than in the past. In the end, the wide majority of special hostage rescue operations have ended in partial or complete failure. In this chapter we will deal with the gap between the aura of invincibility surrounding the Israeli intelligence community and the continual deterioration of the Israeli security situation.

The chapter is structured as follows: In the first part we will present the challenges placed before intelligence organizations charged with coping with terrorism. We will then describe and analyze how the Israeli intelligence agencies operate under such conditions. We will end the chapter with lessons to be learned from Israel's long history of struggle with terrorism.

## INTELLIGENCE AND TERRORISM

Quality intelligence is the first step up the slope of effective response to the threat of terrorism.[14] It eliminates the aspect of surprise that allows terrorists to circumvent security measures and prevents them from using the tactical methods of their choice. When effective intelligence is available, security forces can be prepared to face actual threats and need not spread themselves thin defending targets that are not under immediate threats.[15]

Three main stages characterize the work of the intelligence services: In the first, objectives are set out; in the second, information is gathered and evaluated; and in the third, conclusions are drawn on the basis of the accumulated information and disseminated to the political echelons.[16] To those a fourth should be added: the operational stage in which the threat is confronted and terrorist operations are averted.

During the first stage, security services identify and define crucial objectives. Information cannot be collected in a vacuum. Intelligence agencies have limited resources and there is therefore great importance in setting out a clear list of priorities that undergo periodic review. In other situations, like the Entebbe hijacking, intelligence agencies must respond quickly to unexpected developments,[17] an ability that should be inherent in all intelligence organizations. At the same time, this is an especially difficult demand to make, even from intelligence bodies that are considered flexible in comparison to other types of organizations.[18]

Gathering takes place during the second stage.[19] Compiling quality intelligence on enemy nations is not a simple task. In most cases use must be made of a combination of agents and operatives (HUMINT),[20] intensive use of electronic monitoring methods (SIGINT),[21] and visual intelligence (VISINT),[22] in addition to information taken from open sources (OSINT).[23] Gathering quality intelligence about terrorists is more difficult by far. In contrast to nations, groups of terrorists are especially evasive entities—appearing, changing their form, and disappearing quickly. They are frequently supported by sympathetic countries or take advantage of the freedom of movement inherent in democratic regimes. Intelligence agencies are responsible for collecting information regarding the capabilities of these groups while simultaneously assessing their intentions and frustrating their plans.[24] This is an ongoing and nerve-wracking struggle that requires the intelligence branches to constantly improve their methods of collection and surveillance.[25]

Many countries, especially the United States, have developed extremely sophisticated SIGINT technologies.[26] It is thus possible to intercept and decipher telephone conversations or computer communications from almost all corners of the world. VISINT has undergone such dramatic technological advancement in the last 20 years that it is now possible to follow the movements of players in real time on the other side of the globe, using satellite technologies and unmanned aerial vehicles (UAV) controlled from intelligence headquarters, eliminating the need for traditional informants.[27] But there is a catch. Armies are large organizations possessing distinct structures and clear command channels. Intelligence agencies can study them for years using monitoring and surveillance techniques and discern changes in their daily routine, consequently estimate their capabilities and even their intentions. Any similarity between this organizational model and that of terrorist groups is coincidental at best. Here, the ability to use VISINT techniques effectively is contingent on having intelligence that can target a small group of terrorists hidden in a one-room apartment in a crowded Middle East metropolis, in Europe, or even in the United States or a cave in some Asian country.[28] Dependence on this initial intelligence necessarily places HUMINT—agents, spies, soldiers, and investigators—on the front line.[29]

Despite its many advantages, HUMINT is very problematic. First of all, most terrorist cells are small and close-knit. Infiltrating such a cell or recruiting an agent from its membership are extremely complex operations.[30] Secondly, such agents run the risk of being exposed and turned into double agents.[31] Third, most terrorist organizations strictly compartmentalize their cells and members. Most information is in the hands of a few leaders who take extraordinary security precautions.[32] Compartmentalization is inherent to terrorist networks; their groups act independently on a local basis and frequently are not tied to any one

central command.[33] These problems force intelligence agencies to meticulously sift through the information arriving from HUMINT sources,[34] to constantly control their activities, and to make every effort to transfer responsibility as much as possible from collaborators onto field agents and especially onto the less vulnerable surveillance and monitoring units.[35]

During the third stage, gathered materials are turned over to the analysis and dissemination units. These include subunits that deal with long-range planning and providing routine support to operational bodies dealing with the terrorist threat. In the case of special operations, there is great importance to close coordination in real time between the bodies that collect the information, those who evaluate it, and the forces in the field.[36]

There are a number of components critical to effectual effective evaluation and dissemination of intelligence. One of the most important is the existence of pluralistic thought within assessment units. In order to encourage such thought, intelligence agencies around the world retain a number of evaluation bodies to analyze raw intelligence simultaneously. Four such bodies officially exist in Israel:[37] the research unit of the IDF Intelligence Branch (Military Intelligence), the research unit of the Mossad, and two smaller units belonging to the General Security Service (GSS) and the Foreign Ministry.[38] Further, intelligence agencies may occasionally employ a "devil's advocate" to present assessments that run counter to those accepted by other units and so challenge the thinking of agency heads and prevent them from becoming set in their outlook.[39]

Moreover, intelligence bodies must refrain from drawing conclusions regarding the intentions of adversaries based only on their capabilities. Frequently, agencies afraid of intelligence failures and consequent criticism tend to present gloomy pictures of reality based more on enemy operational capabilities that are relatively easy to monitor, and less on direct information regarding their real intentions. This is even more the case with terrorist groups, where even collecting operational capability intelligence about them is a difficult task. The inclination here is to present a bleak canvas that can lead to inefficient allotment of resources and even implementation of unnecessary preventative measures.

In summary, intelligence analysis and evaluation is an unceasing process that attempts to put together a jigsaw puzzle with only a limited number of pieces. In most assessment units, the process begins when junior analysts formulate their evaluations individually and present them to their supervisors. At this point, each of the analysts must defend his or her evaluation during joint deliberations; the unit head then decides to which he gives the most weight. In the end, responsibility for formulating the final assessment for the political echelon is his.[40]

Disseminating intelligence is largely a matter of marketing. Evaluation unit heads are first of all responsible for ensuring their assessments reach the upper echelons of the agency without being blocked or diverted.

Secondly, it is of extreme importance that an assessment, in all its complexity, be understood by those at the decision-making level. In order for this to take place, the decision-makers must be made available to the directors of the intelligence agencies. Informal relations and mutual trust are the keys to the success of their mission.[41] The existence of a number of intelligence evaluation agencies opens the way for competition between the intelligence branches. This may bring pressure to bear at the decision-making level and cause confusion.[42]

The fourth stage is operations. On the basis of information provided by the intelligence community, decision-makers determine which courses of action to take. There are a wide range of operations available against terrorist groups, including striking their organizational and financial infrastructure, detention or assassination of their leaders, foiling attacks, and reaction to crisis situations such as hostage-taking. Though the operational branches of the intelligence organizations are involved in all these activities, they are extremely small units and most of the burden falls on the shoulders of the army and the police. While it is possible to use infantry forces in antiterrorist operations, striking terrorist infrastructure and leaders is usually the preserve of Special Forces belonging to the Army, Air Force, and Navy. When surgical strikes are in order, intelligence agency units usually carry out the mission.

During crisis situations, assault units specializing in terror-event response are activated, especially when hostages are involved. Since these units may require a few hours to organize and deploy, until their arrival the site is usually under the command of local intervention teams for whom fighting terror is only secondary. These teams are responsible for preventing the situation from escalating and collecting intelligence for the assault teams.

## ISRAELI INTELLIGENCE AND COUNTERTERRORISM

The State of Israel has a large and resource-rich intelligence community which devotes a great proportion of its efforts to counterterrorism. Once a year, the directors of the various intelligence services meet in order to set out intelligence objectives for the following year.[43] In preparation for the meeting, the research branches of each of the agencies carry out background work and make suggestions as to what they consider should be the critical objectives. The final decision is in the hands of the service directors, who examine the previous years' objectives and update them in accordance with changing circumstances and assessments received from their research units.[44] The process is entirely under the leadership of the director of the IDF Intelligence branch with minimal political interference.[45] The critical objectives defined during the meeting are binding on the three agencies. The agencies, however, are accorded a large

measure of freedom regarding the operational dimension of the intelligence information gathering.[46]

### Gathering Intelligence

Any attempt to define the boundaries of the activities of each of the Israeli intelligence agencies is from the start doomed to failure. On paper there is a clear separation based on geographical boundaries. The GSS is in charge of intelligence within the State of Israel and the territories under its control (that is, the West Bank); the IDF Intelligence branch is in charge in Arab states and the Middle East, and the Mossad in the rest of the world.[47]

The operational maps of terrorist organizations, however, are not as cut-and-dried. Palestinian groups frequently operate simultaneously in the occupied territories and in Arab and other countries, especially in Europe and Africa, and may indeed cooperate with groups and governments within those countries. This may cause one or another of the Israeli intelligence agencies to expand its operations and encroach on the territory of another.[48]

The operational spheres of the agencies are similarly differentiated on paper. The role of the IDF Intelligence branch in collecting and assessing intelligence on terrorist groups should be marginal in comparison to that of the GSS and Mossad, since by definition it generally operates in the military realm[49] and its methods of gathering intelligence derive from that task. The IDF Intelligence branch specializes mainly in SIGINT through its 8200 Signals Intelligence Unit[50] —which is a small Israeli equivalent of the American National Security Agency (NSA)—and through VISNIT, using an array of unmanned aerial vehicles, special units responsible for aerial photography of enemy facilities, and satellites.[51] In addition, it operates on-the-ground forces whose task is collecting tactical intelligence. During 2000, the Field Intelligence Corps was formed to incorporate all these units together with the Corps' radar units.

As a result of sophisticated monitoring and reconnaissance methods, it is possible to follow enemy troop movements, monitor military and political communications, and assess the intentions of the enemy. The IDF Intelligence branch is the largest organization within the Israeli intelligence community and the one with the most resources. One of its most important assets is quality human resources. Because of Israel's compulsory military service, the Intelligence branch enjoys a constant pool of talented young people available to it in the computer and electronics fields. Arabic-fluent recruits who have specialized in Middle Eastern studies serve in its field intelligence units. The main drawback is that these soldiers serve for a relatively short period of time and only a few remain in the regular army; new waves of inductees must be constantly trained.[52]

Within the secret services, whose main tasks are collection and assessment of intelligence that is more elusive, such as following political

leaders and counterintelligence, HUMINT has historically held a pivotal position.[53] The GSS, with its counterterrorism and political subversion functions, has enjoyed considerable success in extending its intelligence net in the West Bank and Gaza. The intelligence coordinators of the agency are divided into defined sectors and are responsible for enlisting collaborators and collecting information regarding the current situation in their sector. The interrogation unit of the GSS also plays its part in HUMINT. Its agents use sophisticated methods of interrogation in the field and in detention facilities to extract intelligence on the structure and intentions of terrorist organizations.[54] Their methods are based on psychological stress and until the early 1980s included the use of physical force. The Route 300 Affair[55] brought about a significant decrease in the ability of interrogators to bring physical pressure to bear on detainees.

Since the late 1960s, the Mossad has also been entrusted with many tasks involving counterterrorism. Its HUMINT methods are somewhat different. Besides the officers stationed around the globe who recruit agents or collaborators from within terrorist groups or on their fringes, the agency also controls a network of citizens in various countries who supply information out of a variety of motives that may include identification with the State of Israel and a feeling of obligation toward it. In the forefront of Mossad HUMINT intelligence gathering activities are its agents, the regular spies who take on false identities and infiltrate enemy countries or terrorist networks.[56] The process of training these agents is especially long and during their missions they are supported by a network that provides them logistic support and ensures they are not exposed.[57]

In addition, the IDF Intelligence branch operates the relatively small HUMINT Unit 504, made up mostly of soldiers in the standing army. In addition to special agents, this unit mainly recruits intelligence sources in border areas, such as shepherds, enemy soldiers, and residents.[58] The officers are called "special purpose officers," and are trained to be either handlers or detainee interrogators.

The unit's position within the army is problematic: on one hand, it is a small, elite unit that resembles its brothers in the GSS and Mossad. On the other, it is frequently considered the black sheep of the IDF Intelligence branch. In contrast to most of the intelligence gathering units of the Intelligence branch that have no direct contact with their targets, Unit 504 officers carry out the "dirty work" of handling agents and interrogation. The unit is most active in the southern Lebanon sector, where it established networks of locals to supply information. As a result of the outbreak of the Al-Aksa Intifada, the unit was also given the task of controlling HUMINT among Palestinians, a sphere that had previously been almost entirely the province of the GSS.[59] Today, both organizations act independently in the West Bank and as far as can be discerned, operate independent and separate networks of agents. While the GSS focuses almost completely on aspects of prevention—that is, specific information that will thwart terrorist

attacks during the preparation and operational stages—Unit 504 focuses on information dealing mostly with activities of the military in the West Bank.[60]

Subsequently, despite what has been said regarding intelligence gathering by the State of Israel in general and counterterrorism in particular, there are no clear demarcations between the various organizations. Occasionally, cooperation between the services leads to results, but at other times competition and concealment of information leads to intelligence failures. It is therefore appropriate to mention that resources are frequently budgeted for units in the various agencies that possess similar specialties. The question is whether Israel, a country with limited financial resources, can afford such duplication of services.

### Research, Evaluation, and Dissemination

Jurisdictional boundaries for the analysis and evaluation of raw intelligence are similarly blurred. The GSS and Mossad were traditionally responsible for analyzing terror-related intelligence materials and presenting their assessments to policymakers. In contrast to the IDF Intelligence, however, these two agencies are civilian bodies with an extremely limited pool of human resources. Over the years, it became involved in evaluating terrorism-linked intelligence and established its own section (*Arena*). This section operates within the research division and is a cross-command entity alongside regional sections such as those dealing with the Syrian–Lebanese and Iranian sectors.[61] The section was established as a result of the intensification of Palestinian terrorist activities in the West Bank and those of Shiites along the borders, at a time when Military Intelligence came to recognize the need for a body that would constantly analyze the methods of operation, thought processes, and organization of terrorist groups. The result was the establishment of an independent section for terror-related intelligence that supplies information to the regional sections and makes assessments as part of the regular threat-evaluation process.[62]

Like the gathering apparatus, during the early years of the State research within the Israeli intelligence community focused largely on the capabilities and intentions of the Arab states to attack Israel. The intensification of terrorist attacks against Israeli and Jewish targets that began during the mid-1960s caused the GSS and the Mossad to devote more resources to basic research—that is, to understanding the background, structures, leadership, and tools the terrorist groups have at their disposal—and to operational research that can immediately process information brought in from the intelligence gathering units. In the Mossad, this takes place within the research unit, which is a part of the administrative division of the agency. This unit underwent a period of accelerated development

after the Yom Kipper War of 1973, and since then has been constantly involved in processing raw intelligence materials and converting them to independent assessments for the political echelon, as a counterbalance to those of the IDF Intelligence branch. Regarding terrorism, the intelligence unit of the Mossad focuses on alliances between the Arab states and terrorist groups,[63] charting the geographic deployment of terrorist groups and identifying their operational networks. The GSS's research unit focuses mainly on events in the West Bank and Gaza, and identifying networks and central players within the Palestinian terrorist arena and keeping track of their methods.[64]

After the murder of the Israeli athletes during the Munich Olympics in 1972, the government of Israel, led by Golda Meir, initiated the establishment of a new entity—the Prime Minister's Advisor on Counterterrorism.[65] The first advisor was the former head of the Military Intelligence branch, Aharon Yariv. Over the years the position expanded and was replaced by the Counterterrorism Bureau, a branch of the National Security Agency, formally established in 1999. One of its functions was to define the areas of jurisdiction of the bodies dealing with terrorism and to raise the level of cooperation between them.[66] Another objective of the council, through the NSA director, is to coordinate with the prime minister.[67] Benjamin Netanyahu, prime minister at the time the agency was formed, declared that "This entity coordinates between the branches. It has no authority. The coordinating body can rectify a situation by reporting to the prime minister. The coordinating body frequently made successful efforts that solved disputes, brought up issues, and decisions were made. This framework is essential in Israel . . ."[68] According to Netanyahu, the Counterterrorism Bureau is at the most a coordinating group with no influence over counterterrorist intelligence activities. The former head of the GSS, Yaakov Peri, was even more derisive: " . . . none of these [apparent coordination problems], in my opinion, harm the strength, initiative, or intelligence-gathering and prevention measures of the State of Israel against terrorism, and so I believe both the advisor and the council are superfluous; they were never needed. They were solutions to personnel problems and did not provide any professional assistance."[69]

The fact that cooperation between the research divisions of the various security agencies exists only serves to bolster Perry's view. This cooperation usually occurs when the intelligence picture of a certain subject must be completed. Thus, for example, during the Wrath of God[70] operation, a direct and uninterrupted channel of communications was opened between the Mossad and Military Intelligence. Rapid communication between the research and operations departments of the intelligence services and those of the army and police are also critical. During the Al-Aksa Intifada, such channels between the GSS and the IDF helped to foil suicide terrorists on the way to their targets, and to zero in on terror network

leaders by way of aerial attacks—known as the "surgical strikes" policy. In the age of international terrorism there is also great importance to quick dissemination of information to intelligence services around the world. In Israel, this is the function of the international division of the Mossad. The Mossad began to cooperate during the 1960s with foreign, especially Western, intelligence agencies, chiefly by passing information.[71] In recent years, this cooperation has expanded to include thwarting attacks, particularly when foreign intelligence agencies began to see the increased threat of terrorism to Western democracy.

Of all the above points, the most significant is that coordination between the evaluation units of the various services depends mainly on informal relations between them and the good will of their directors, while formal mechanisms are secondary and sometimes even devoid of content.[72] The personnel aspect is therefore of critical importance. As long as good relations reign between the agency directors and they put national interests above all else, the intelligence community operates effectively. In the absence of effective formal controls, disputes between agency directors can bring about intelligence failures.[73]

### Prevention

During its first years, as mentioned, terrorism was of marginal importance in comparison to the strategic challenges faced by the young State of Israel. Consequently, the intelligence branches devoted only limited efforts to terrorism. By August 1953, however, the IDF had already established "Unit 101," a small commando unit whose objective was to raid military and civilian bases in Jordan and Egypt from which terrorists were sent to infiltrate Israeli territory. The unit's goals foreshadowed Israeli policy in the following years: to fight terrorism through aggressive means with the aim of eradicating it completely or at least minimizing the damage it causes and consequently its influence on the citizens of Israel.[74]

Despite the superior military capabilities shown by the unit, it was merged with the Paratrooper Division a short time after it was established. This was partly the result of the criticism hurled at Prime Minister David Ben-Gurion and unit commander Ariel Sharon because of the characteristic excessive cruelty of its operations, especial after the massacre of five Palestinian citizens from the village of Quibya in the West Bank on October 14, 1953. Four years later, in late 1957, the General Staff Reconnaissance Unit (GSRU or *Sayeret Matkal*), now under the direct command of the IDF Intelligence branch, was formed. This unit—with its mythic reputation resulting from its successful assault on a hijacked Sabena plane at Lod Airport in 1972, as well as the Spring of Youth operation (in which its soldiers, some dressed as women, assassinated three PLO commanders in the heart of Beirut), and of course, the rescue of Israeli hostages in Entebbe—was actually established to improve the intelligence gathering

capabilities of the IDF Intelligence branch. The GSRU, known simply as
"*The Unit*," cloaked in secrecy and hidden from the Israeli public for many
years, was formed to supply quality intelligence on the Arab states.[75] Its
commanders modeled the unit on the British Special Air Service (SAS).
Its members were trained to work in small teams, to penetrate enemy ter-
ritory and plant eavesdropping and monitoring devices in strategic loca-
tions. One of the characteristics of the unit was (and remains) finding un-
conventional solutions to unconventional problems[76] using camouflage
and advanced technological instrumentation. It is possible to describe
the GSRU as the muscle of the collection arm of the Intelligence branch.
Structurally, the unit is divided into several outfits under the direct com-
mand of the unit commander and his deputy. They are charged with train-
ing and with managing the unit's headquarters, which includes the offi-
cers in charge of intelligence, operations, weaponry, and other functions.
These outfits include operations, training, hostage rescue operations, and
weaponry and explosives.[77]

The daring and creativity of the GSRU soldiers who specialize in close
quarter battles, navigation, and the use of technological resources brought
them to spearhead the IDF assault units when Palestinian terrorism inten-
sified during the 1960s. While there is no argument concerning their effec-
tiveness in carrying out special intelligence operations such as the kidnap-
ping of Sheikh Abdul-Karim Obeid, and later Mustafa Dirani, from their
homes in Lebanon, when a hostage rescue situation arises, there is always
controversy as to whether they should be dealing with it at all, since it is
only their secondary raison d'etre. In 1975, the *YAMAM* (Acronym in He-
brew of "The Police Unit for Counter Terrorism Operations"), part of the
Border Police, was established to take on just such responsibilities in light
of the failure of the GSRU to successfully rescue a group of school children
held hostage in the town of Ma'alot.

One of the proposals made by the Horev Commission, established fol-
lowing that event, was to transfer responsibility for antiterrorism activ-
ities within Israeli territory, especially hostage rescue operations, to the
*YAMAM*.[78] Its troops, in contrast to those of the GSRU, are not conscripts
who leave the unit after $3^1/_2$-year tours of duty. Most join the force in
their early 20s after compulsory military service in combat units and
stay until retirement at age 40.[79] Besides the *YAMAM*, the Border Po-
lice has other intervention units—the tactical *YAMAG* countercrime and
counterterror rapid deployment unit; the *MATILAN* intelligence gath-
ering and infiltrations interception unit; the Jerusalem-based *Gidonim*
Unit; and the Lebanese Border Unit. Members of all these units receive
intensive antiterrorist training.

Despite the many resources allocated to *YAMAM* and its high level of
professionalism, preference is usually given to the GSRU during hostage-
rescue situations. In fact, 13 years passed before the *YAMAM* was given
its first opportunity to prove its military talents during the "Mothers' Bus"

attack.[80] This was due in no small measure to the fact that many leaders in top political and security spots are GSRU veterans and have loyalties to the unit.[81]

During its assault operations, the GSRU receives logistic support from other elite units, foremost among them the Israeli naval commando unit *Shayetet 13* (Hebrew name for Flotilla 13),[82] whose members also receive intensive antiterror training. Thus, during the "Spring of Youth" operation in Beirut, Flotilla personnel landed the GSRU soldiers on Lebanese shores. Mossad agents were waiting there and brought them to their targets in rented vehicles.

A similar operational pattern was used during the assassination of Yassir Arafat's deputy Khalil al-Wazir in Tunis on April 16, 1988. Mossad agents working with the GSRU were part of the *Massada* Unit (its name has been changed several times), the operational unit of the Mossad which includes a smaller unit, called *Kidon*. This unit was trained intensively in close combat and was responsible, among other operations, for an earlier version of pinpoint assassinations within the framework of Operation Wrath of God.[83]

Most antiterrorist operations, however, take place close to the borders of the State, especially within the West Bank and the Gaza Strip. The dominant operational bodies in this arena are the Operational Branch of the GSS, which has at its disposal agents who are veterans of IDF combat units,[84] the elite IDF units discussed above, and other units that have received antiterror training as a secondary function, including several infantry units. The original task of these units was to provide their brigades with tactical intelligence regarding field conditions in areas the troops would be fighting during a war. Their soldiers received intensive training in close combat, and after the occupation of the West Bank and the Gaza Strip they were natural candidates to reinforce the antiterrorism specialty units.

During this time, most terrorist cells operated within the occupied territories. Consequently, the IDF decided to put in place local antiterrorist units that would combine extensive knowledge of their territory with high close-combat capabilities. In 1970, Ariel Sharon, then commander of the IDF Forces in Southern Israel (*Southern Command*), ordered the establishment of the *Rimon* Unit. For a short time it was active against terrorist cells in the Gaza Strip. Its members would infiltrate the Strip dressed up as local villagers and attack and kidnap terrorist operatives. Years later, some of the members confessed that at least some of them could not follow basic ethical standards and frequently harmed innocent citizens. A decade and a half later the *Duvduvan*, *Shimshon*, and *YAMAS* counterterrorism undercover units were formed. *Duvduvan* operated in the West Bank and *Shimshon* (which has since been disbanded) in the Gaza Strip. Besides receiving intensive training in close combat, their members were taught to

blend in with the local Arab population. They were trained to disguise themselves as Palestinians, to speak Arabic, and learned the habits of the local population. Both the units worked closely with the GSS.[85] In Hebrew they are collectively called "*mistarvim*," a word that has its origins in the pre-State Palmach militia.

The IDF also adopted this model for its anti-Hizbollah operations in South Lebanon, when in 1995 it established the *EGOZ* Unit (Acronym in Hebrew for Anti-Guerilla and Micro-Combat). The framework of the unit's training was dictated by Lebanon's distinct terrain and Hizbollah activities, which were different from those of the Palestinian terrorist organizations—it was engaged in a successful guerilla war against military targets. *EGOZ* was largely trained in camouflage and open-field warfare. When the IDF pulled out of Lebanon in May 2000, *EGOZ's* mission changed and then integrated into the West Bank and Gaza antiterrorist campaigns. An additional unit formerly active in Lebanon and now operating in the West Bank is *MAGLAN*—formed in the mid-1980s and at first made up of soldiers transferred from other such units. It specializes in the use of antitank weaponry and antiterrorist activities. Since the outbreak of the first Intifada it has been reinforcing difficult missions such as detaining fugitives under especially dangerous conditions.[86]

Since the end of the 1990s, the Air Force—in particular its helicopter squadrons—has taken a key roll in antiterrorist activities. When detailed tactical intelligence is available pinpointing the location of targets, precision-armed helicopters are a very effective tool. They are usually able to carry out surgical strikes with minimal danger to fighting forces and then to immediately leave the scene. The use of helicopters is not a new idea. According to Aharon Klein, during the 1980s there had already been an attempt to assassinate Yassir Arafat using a helicopter. The plan was scrubbed, however, due to poor visibility.[87] On February 16, 1992, Apache helicopters attacked a convoy of vehicles belonging to Hizbollah General Secretary Abbas Musawi, killing him, his wife, his son, and five bodyguards. This was a portent of the role the Air Force would take in the coming years. Since the outbreak of the Al-Aksa Intifada, the GSS and Air Force have maintained close contact, sharing tactical intelligence in real time and collaborating on surgical strikes. The Air Force usually uses Apache AH-64 helicopters or AH-1 Cobras fitted with precision weaponry.

Surgical strikes have evoked criticism on both ethical and judicial grounds. During the "Wrath of God" operation, voices were already asserting that this type of action is devoid of any benefit and only escalates the cycle of violence.[88] In fact, despite the extensive use of this method during 2001, the number of suicide terrorist attacks almost doubled in 2002. In any case, it is difficult to point to direct proof linking the use of this tactic with any real decrease in the ability of terrorist groups to carry out

suicide attacks. More criticism, no less profound, arose after the assassination of Hamas operative Salah Shahade, when a 16-ton bomb was dropped on his house from an F-16 aircraft. Besides Shahade, his wife, three of his children, his personal assistant, and ten other neighbors were killed. Since then, the Air Force has tried to avoid carrying out such strikes, but hasn't stopped entirely. Among other such operations was the March 22, 2004 assassination of Hamas leader Ahmed Yassin by helicopter fire and the similar elimination a month later of his replacement, Abad el-Aziz el-Rantisi.

In any case, it is important to note that surgical strikes make up a relatively small portion of available antiterrorist preventative measures. Most of the weight falls on the assault and intervention units of the IDF and the Border Patrol to carry out defensive prevention—that is, interception of terrorists after they have already set out on their missions, and capture of their controllers. The crucial objective is to stop them before they reach Israeli territory. If this fails, the last line of defense is the *Yoav*, *Horev*, and *Nitzan* Units, whose job it is to protect public transportation.

As can be deduced from this discussion, Israel is near the top of the list of nations possessing numerous antiterrorist Special Forces units. In this case, however, there is no safety in numbers. For example, interservice rivalry between the GRSU and *YAMAM* regarding hostage rescue has existed for years. Even though as far back as the 1970s, the advantage of having a police unit responsible for such events within Israeli territory was recognized, and *YAMAM* officers are considered specialists in such situations, political and security leaders—many of whom are linked one way or another with the GRSU—tend to prefer handing such operations over to the GRSU. Even its long series of failures hasn't weighted the scales in favor of *YAMAM*. It should be apparent that the existence of so many units increases the importance of having a central coordinating body that reaches decisions following established and acceptable procedures. Interservice rivalry between the units would be avoided and the division of work among them would be clearer. Such a body would also solve the problem of readiness for an attack that has already begun. At this stage, the question that should be asked is whether—during this age of suicide terrorism and high-trajectory weapons—there is still room to invest so many resources on antiterrorist assault and intervention teams specializing in the hostage situations of the 1970s and 1980s.

## THE ISRAELI INTELLIGENCE COMMUNITY AND COUNTERTERRORISM—CONCLUSIONS

A comprehensive look at the issues explored in this chapter reveals that the responsibility for Israel's strategic failure in its fight against terrorism lies in the gap between the flexibility of terrorist groups that constantly change shape, place, and tactics, and the inflexibility of most established

and conservative intelligence agencies. An additional problem is the tendency of the agencies to be fixated on certain conceptions, the result of a combination of too little information and too much pressure to produce assessments. Gaps between existing information and assessments are frequently filled with guesswork, dependence on superficial knowledge of the subject, and past experience. Failure to predict the first Intifada, the rise of the Shiites, and suicide terrorism reminds us how problematic the situation really is.

The tendency to ignore formalities, if such formalities exist at all, is deep-rooted in the Israeli intelligence community. Informal relationships between agency directors are widespread, as are those between the lower echelons. As long as these relations are good they can be a real asset, with each side putting the good of the whole intelligence community before its own. When relations are troubled, however, information may be withheld, one agency may encroach on the activities of another, and it may be difficult to set clear counterterrorism intelligence objectives. Considerable duplication of responsibilities exists among the units belonging to the various agencies. The fact that only limited resources are available to the Israeli intelligence community only serves to strengthen the conviction that each of the agencies should specialize in a certain field of intelligence gathering, research, and operations and then share its intelligence with the other agencies. In actuality, each agency collects HUMINT, VISINT, and COMINT, and engages in research and operations. While there is a positive side to this situation—a variety of sources and assessments can help policymakers come to more rational conclusions—it is also problematic. It is reasonable to suppose that a clearer division of roles and a central intelligence body following well-defined regulations would bring about more effective administration overall and more widespread information sharing.

Though we have not discussed the political echelons in this chapter, policymakers play a major role in both strategic and tactical failures. At the strategic level, the nation's leaders make the decisions that to a large extent shape reality. Consequently, they frequently are the origin of changes in the constellation of strategic threats that are the *raison d'etre* of the intelligence agencies. Agency directors may be pleased that policymakers tend not to interfere with their decisions, but autonomy brings with it responsibility—as well as another most important by-product, politicians are distanced from blame in case of failure.

From the tactical aspect, policymakers sometimes tend to buy into the Superman myth of the intelligence and the Special Forces units and be blind to their inherent limitations. As a result, they may have them carry out operations that have little chance for success. The unit commanders, for their part, find it difficult to refuse. They do not want to tarnish the reputation of their unit when another one does take on the mission. The

result: flawed operations resulting from poor planning because of limited time and the absence of quality tactical intelligence. Competition between the elite units is an affliction. When a multiplicity of elite units are in a state of constant training and readiness and strive for ever-larger pieces of the resource pie—not to mention fame—their wish to execute missions is strong and sometimes overshadows good judgment.

# CHAPTER 24

## FACILITATING INTERAGENCY COMMUNICATION AND OPEN SOURCE INTELLIGENCE FOR COUNTERTERRORISM

Orion A. Lewis and Erica Chenoweth

The most common assessment of U.S. intelligence prior to the September 11th attacks is the oft-cited failure to "connect the dots."[1] This was the principal finding of the 9/11 Commission, and it has since been echoed by pundits and policymakers alike to justify various reforms. However, despite progress in some areas, barriers to "information sharing" across agencies and between various levels of government remain an obstacle to a more effective counterterrorism strategy. To be sure, the creation of a new Director of National Intelligence (DNI) as well as a National Counterterrorism Center are unifying steps forward, but some critics are skeptical as to the efficacy of the government's actions to create "incentives for information sharing."[2]

This chapter attempts to offer new policy ideas to improve both the technical infrastructure of government communications, as well as the organizational infrastructure of U.S. intelligence that allows the United States to prevent future terrorist attacks. Different forms of open source media offer potential solutions to some of the problems faced by U.S. counterterrorism agencies.

"Open source" is a general term that describes a particular form of production and development. It refers to practices that are based in part on information sharing between producers and users. This allows for access to a final product, in terms of contribution, distribution, and communication.

Most importantly, the product development benefits from the voluntary contributions of a "community" of experts. While this term originated as a way to describe computer software with flexible program codes, it can be used more generally to describe various information networks and production in knowledge-intensive industries. With respect to intelligence, public media, Internet sources, and academic articles in the public domain could all be considered "open source" media.

The argument is based on two lines of analysis. First, open source software (OSS) provides a technical solution that improves communication across government agencies. As the 9/11 attacks and the federal government's response to Hurricane Katrina have demonstrated, communication horizontally across federal government bureaucracies and vertically to state and local first responders is a key impediment to crisis response. OSS is constructed to be "interoperable," thereby allowing various technological standards to work together. Thus, its widespread adoption can serve to streamline technology standards and facilitate efficient communication between bureaucracies. Moreover, because OSS is often free or requires minimal licensing fees, it is often far more cost-effective and accessible than other types of software. Thus, local governments and first responders can maximize their budgetary dollars and contribute to a more seamless communications network.

Second, "open source" is an organizational strategy that can be applied to intelligence gathering operations. Open source intelligence (OSINT) is not a new concept for intelligence agencies. Indeed, OSINT has been an important foundation for intelligence analysis; as Allen Dulles, former director of the CIA, testified before the Senate Armed Services Committee in 1947, "a proper analysis of the intelligence obtainable by these overt, normal, and aboveboard means would supply us with over 80 percent, I should estimate, of the information required for the guidance of our national policy."[3] Thus, even at the birth of the CIA, emphasis was placed on the value of open sources for intelligence analysis. Many Washington insiders, including CIA analysts and 9/11 Commission members, have recently argued for an expansion of OSINT capabilities.[4] Indeed, a unit at the CIA is dedicated specifically to open source intelligence collection.[5] While these activities are a step in the right direction, the government should further develop an organizational strategy in which academic and private professionals can supplement intelligence gathering efforts.

This policy proposal would apply the methods of open source production to the existing intelligence infrastructure. While open source methods of production originated in the software industry, it is increasingly viewed as a methodology that can be applied to other "knowledge-intensive" industries, of which intelligence is the perfect example. For example, the key factor in the success of open source software companies is their ability to utilize the knowledge, time, and voluntary contributions of the broader

"community" of software engineers. In a similar fashion, the U.S. intelligence network must learn how to exploit the reservoir of knowledge and expertise of its citizens, particularly those working in academia, the media, and the private sector. Information infrastructure and the Internet present new challenges to the collection and analysis of open source intelligence, but they also provide potential solutions in that they allow counterterrorism researchers from all professions to gather and share information on a previously unimaginable scale.

Thus, a "national anti-terrorism intelligence forum" would be incorporated into the existing intelligence structures. This public forum would provide additional outer layers of OSINT to the intelligence community at little or no cost. This virtual community of experts would supplement the process of intelligence gathering, by creating a mechanism to incorporate the collective knowledge of the terrorism research community into the government's OSINT program. Because it is based in part on the voluntary contributions of the broader research community, this program would help to overcome budgetary and human resource constraints that plague current OSINT efforts. Such a policy presents a mutually beneficial arrangement that would benefit government, first responders, academia, and the broader public alike.

## THE FAILURES OF 9/11: THE NEED FOR AN INTELLIGENCE PARADIGM SHIFT

The 9/11 Commission Report determined that the main problem with preparation was an inability of the U.S. intelligence community to "connect the dots" regarding volumes of critical intelligence pouring in from various sources. They argue that government agencies prior to the attacks were analogous to specialized physicians, each working on the same problem, but without an attending physician to coordinate activities and ensure that everyone works as a team.[6] The results made it clear "how hard it is for the intelligence community to assemble enough of the puzzle pieces gathered by different agencies to make some sense of them and then develop a fully informed joint plan."[7]

These findings highlight two main problems in intelligence gathering operations during this period. First, agencies were either unable or unwilling to communicate with each other. This may be due principally to different bureaucratic specializations, but part of the problem may also be attributed to structural barriers in the communication infrastructure of agencies. Different government bureaucracies often adopt different technology standards and may not in fact have the capacity to communicate even if they wanted to.[8]

Second, it is apparent that the intelligence community remains mired in a "cloak and dagger" cold war paradigm. Prior to 9/11, intelligence

agencies were plagued by a bias for "clandestine" information, aversion to interagency cooperation due to rivalries, and a decentralized institutional arrangement that exacerbated these existing tensions. In sum, the intelligence community continues to emphasize "secrecy" as the best means to measure the value of information. This is due in part to the fact that cold war intelligence relied heavily on classified data from clandestine sources.[9]

Yet, this also created the commonly held perception that information has to be "stolen" and classified for it to be considered valid intelligence. This point is underscored by analysts, such as J.F. Holden-Rhodes, who argues that the Gulf War made it "painfully clear that the intelligence community had chosen to rely on highly classified, sensitive material, which is very narrow in perspective, while ignoring for the most part that information which could have come from the judicious use of open source intelligence."[10] Indeed, this bias for secrets continues today. As Stephen Mercado, an analyst in the CIA Directorate of Science and Technology, argues, "too many people still mistake secrets for intelligence."[11]

The problem with mistaking secrecy for intelligence is that such a view fails to recognize the important role that open sources can play in intelligence gathering—particularly in dealing with a transnational organization like al Qaeda, where human intelligence is very hard to come by. As one analyst commented, "It is virtually impossible to penetrate a revolutionary terrorist group . . . The responsibility falls on the intelligence community's overt collectors and analysts."[12] Thus, the majority of what the United States knows about the organization comes from open sources.

Terrorist groups themselves are now able to exploit a wide array of open sources of communication on the Internet. As many authors and journalists have pointed out, al Qaeda's core organization uses the Internet to communicate and recruit. For example, Al-Jazeera interviews with Khalid Shaikh Mohammed and Ramzi bin al-Shibh revealed that the terrorists communicated openly in online chat rooms using code words.[13] Analysts at the Combating Terrorism Center at West Point have noted that the salafi jihadi movement has been particularly adept at using the Internet to communicate with its followers.

There are certainly risks to using the Internet as a source of intelligence. For one, the Internet has vastly expanded the opportunities for "noise" to exist in cyberspace. Thus, information gleaned from Internet sources may be unreliable or, at worst, counterproductive. Terrorists could use an overreliance on open source intelligence to thwart and confuse U.S. intelligence agencies. On the other hand, information technology presents opportunities for the intelligence community as well, provided that its resources are properly harnessed.

Returning to the 9/11 Commission Report, two main suggestions highlight the potential relevance of open source for counterterrorism. First,

with respect to horizontal information sharing across bureaucracies, they recommend a "decentralized network model, the concept behind much of the information revolution."[14] This would mean that agencies still have their own databases, but they are in fact integrated in a network that can be accessed by other agencies.

Such technological integration removes barriers to communication across agencies, thereby providing the foundation for reform of U.S. intelligence. In this regard, the Commission argues, "a 'smart' government would *integrate* all sources of information to see the enemy as a whole. Integrated all-source analysis should also inform and shape strategies to collect more intelligence."[15] Given the fact that open source intelligence is the foundation of "all-source analysis," this statement implies that it should be expanded to help the government get a full picture of its terrorist adversaries. Indeed, the Commission recommended greater support for OSINT, and the Director of National Intelligence recently established an "open source center." While these are important steps, they should be extended to their logical conclusion—adding an outer layer of OSINT to further supplement the nation's intelligence capabilities.

Such changes require the intelligence community to abandon some of the cold war biases for secrecy and clandestine methods, and recognize that OSINT is an increasingly prevalent and important source of intelligence that supplements traditional forms of intelligence gathering. This is particularly true when confronting a transnational terrorist threat. This form of networked threat, which utilizes the tools of technology and constantly adapts to counterterrorist measures, requires a similar networked response. There are two potential responses: (1) the integration of open source standards and software for improving horizontal communication across agencies as well as vertical communication between levels of government; and (2) creation of an open source intelligence forum with a greater capacity for information gathering, sharing, and analysis.

## TECHNICAL SOLUTIONS: OPEN STANDARDS AND OPEN SOURCE SOFTWARE

Homeland security and counterterrorism require the coordination of multiple stakeholders with a wide array of standard operating procedures—including all levels of government, the private sector, critical infrastructure, and individual citizens. However, such coordination is often constrained by technical and other difficulties.[16] For instance, the investigation of the events leading up to 9/11 demonstrated that the intelligence community was quite dispersed in its collection and analysis of information, with some agencies neglecting the efforts of others. More recently, the U.S. response to Hurricane Katrina in 2005 was fraught with miscommunication about the nature of the situation at all levels of

government, as well as confusion concerning the proper response agency. The result of these difficulties was wasted time, increased transaction costs, and poor performance.

Such problems are not unique to the U.S. intelligence community. For example, after the Asian tsunami struck in 2004, the Thai government found it difficult to coordinate a response with nongovernmental organizations, since different organizations used different file formats and communication standards.[17] It is thus necessary to recognize how open source solutions can integrate IT systems, thereby promoting efficiency of communication and overcoming the types of communication breakdowns seen on September 11 and during Hurricane Katrina.

### The Open Source Method of Production

Lack of technological standardization is an important barrier that must be overcome. Given the federal system, IT policy throughout the government is highly compartmentalized, with different bureaucracies often having different technology standards and tools. This chapter focuses on two types of "open" outcomes: standards and software.

#### Standards

Open standards refer to the technological infrastructure that supports collaboration within and between organizations, and they provide the basis for an information economy by ensuring the interoperability and access by the broadest community possible. An "open" IT ecosystem is defined as one that is "capable of incorporating and sustaining interoperability, collaborative development and transparency."[18] This focus on standards emphasizes the importance of the broader policy environment in which technology is employed. Indeed, a discussion of open standards highlights the actors, policies, technologies, and norms that comprise an IT environment.

At this point, it should be noted that an open IT environment is not based exclusively on a single type of software—open source or proprietary—but may be comprised of a variety of technologies and software. One type of software alone will never meet the needs of organizations and the IT environment as a whole. What is clear, however, is that an IT environment will maximize efficiency, productivity, and transparency if it is based on open standards.

#### Software

In contrast to the broader environment of open standards, open source software refers to software whose source code is open for viewing and modification. While there is a broad array of licenses under which OSS is distributed, the basic tenets of this software development model are

based on the concept of transparency. Anyone can view and modify the source code. This set of rules regarding the transparency of the software engineering means that OSS is often developed by a "community" of developers, many of whom volunteer their time and effort playing two roles: developers and users. As developers, the community may contribute new solutions to the project, and as users they provide feedback regarding problems with the software, which helps the core developers improve their work more quickly.

Red Hat and IBM are two companies that have benefited from such a community. While Red Hat employs about one thousand engineers, their product development is greatly bolstered by the broader Linux community, which is estimated at about ten thousand developers.[19] Dr. Albert Spector, an executive at IBM, points out that his company supports OSS development because IBM benefits greatly from the efforts of many smart people and views it as a very effective development methodology.[20] Executives at companies like Red Hat and IBM have emphasized how vitally important the maintenance of good relations with this broader community is to their business.[21] Not only do companies benefit from the voluntary contributions of the community, but this user-driven interaction is seen as the main reason why OSS is often viewed as more stable and reliable than its proprietary counterparts.

### The Benefits of Open Standards and OSS

Returning to the technical aspects of open standards and OSS, there are two widely perceived benefits that are important for interagency communication: interoperability and cost-effectiveness. One of the primary strengths of OSS is the efficiency gained by having interoperable technology and standards that allow a variety of bureaucracies and organizations to communicate with one another easily. This is due to the fact that OSS is often designed in a modular fashion and engineered to work with other software, something that is not guaranteed with proprietary software. Interoperability is particularly appealing for governments, which often need to communicate across a wide range of bureaucracies. Moreover, interoperability leads to increased network effects, where larger networks are able to tackle various challenges. Thus, OSS and open standards incorporate the ideals of the networked information economy, where ease of communications leads to large-scale collaboration and improved innovation.

Second, one of the main concerns for most IT strategists and the government in particular is to maximize the cost-effectiveness of their procurement decisions. While OSS often requires licensing or subscription fees, it is usually far less costly than proprietary alternatives. In addition the use of OSS prevents vendor lock-in, which can become problematic if organizations are dependent on a single vendor. Indeed, this consideration is

found in a survey of public institutions, where cost savings was cited as the second most important motivation behind the use of OSS.[22]

This combination of interoperability and cost savings could have an important effect on information sharing within the government. In effect, the more widespread use of OSS and adoption of open standards could serve to create a much more integrated and larger network. Technological interoperability facilitates efficient horizontal communication, while cost savings make it easier for local governments and first responders to vertically integrate their systems. To be sure, this is not a panacea for some of the major communications breakdowns, such as the lack of emergency frequencies, but it is nevertheless an important step in improving government communications and crisis response.

### Policy Prescription: Open Source Standards and Software for Counterterrorism and Homeland Security

In light of the potential benefits of open source technology, agencies engaged in counterterrorism and homeland security should adopt open source standards and software to increase interoperability between units. The benefits of adopting such a strategy are numerous, whereas the risks are few. Adopting open standards and OSS would allow the integration of existing criminal offender databases, immigration lists, and terrorist watch lists from a wide array of agencies from federal, states, county, and local law enforcement to the Immigration and Naturalization Service. Moreover, such databases could increase information sharing between different levels of government, so that those responsible for responding to terrorist attacks can share strategies for success.

In sum, as Linus Torvalds—the creator of the Linux operating system has often argued—all software problems are small when there are numerous pairs of eyes looking for them. Indeed, this community-based model of production can serve as a useful framework for the collection of intelligence as well, where one might assume that networks of individuals in the community might be more effective at turning up problems than a few specialists. This approach also complements a second policy suggestion—the creation of a public forum for the collection and distribution of open source intelligence.

## ORGANIZATIONAL SOLUTIONS: OPEN SOURCE INTELLIGENCE

Efforts should be made to further exploit open source intelligence. To clarify, OSINT is "open source" because it is based on materials that are often available to the public, such as news broadcasts, academic analyses, etc. Thus, while there are similarities with the concept of open standards

and open source software, OSINT refers explicitly to the gathering and analysis of such information for intelligence purposes.

As indicated, the threat of transnational terrorism presents new challenges because groups have utilized information technology to communicate and network with one another. Given this proliferation of terrorist activities online, it is clear that the United States must respond with a new emphasis on OSINT. While the "clandestine" mode of intelligence is still important, there are new opportunities to exploit OSINT, which can serve to supplement other forms of intelligence, thereby helping to present a more complete picture of security threats.

Given the common "cloak and dagger" perception of intelligence, some may be surprised to know that intelligence agencies have long utilized OSINT. For example, during the cold war, the Foreign Broadcast Information Service (FBIS) was instrumental in discovering tensions between the USSR and China.[23] Moreover, as Stephen Mercado points out, OSINT is often the only form of intelligence that the United States has on closed regimes or organizations, such as the Democratic Peoples' Republic of Korea or al Qaeda.[24] In addition, OSINT is widely known to be the foundation upon which all other intelligence analysis takes place. Most analysts agree that it forms the vast majority of what we call intelligence.[25] Numerous analysts and surveys have found that OSINT in fact makes up around 70–80 percent of U.S. intelligence.[26]

However, while OSINT is an old form of intelligence gathering, information technology has revolutionized its impact. This has a number of important implications for the field of OSINT. First, open sources have proliferated dramatically. Second, they are much more readily available to all members of society—including CIA analysts and private citizens alike. Finally, the cost of collecting this information has decreased dramatically. Each of these changes illustrates the benefits of OSINT and how they help to address the needs of the United States.

### The Benefits of OSINT

The Internet has produced a proliferation of open sources of information. Different analysts have taken different positions as to whether this is a beneficial or problematic phenomenon. Some see the proliferation as beneficial because the variety of media online can essentially provide the analyst with a large number of informal surrogates that aid the collection and aggregation of information.[27] However, John Nokimos, Director of Research at the private International Security and Research Agency, argues that "the greatest problem is the excess of open sources now overwhelming the ability of analysts to sort through it."[28] Thus, it would seem that the proliferation of open sources online can be viewed as a double-edged sword, where harvesting information can be quite beneficial for

its content, but also overwhelming to intelligence agencies due to its volume.

Second, the information revolution has made the tools of intelligence gathering much more accessible to the broader population. The fact that more people are able to access, disseminate, and share information online creates "network effects," where the collection and dissemination of information has become virtually costless. This enables ever-larger networks of people to engage in the process of information creation and sharing, which at times will produce important intelligence.

What do these changes mean for OSINT? First, it means that it is now far more cost-efficient to conduct some OSINT operations. Whereas the CIA was formerly forced to send analysts to China to monitor radio broadcasts, they can now do so from anywhere in the world. Now, with minimal technology investments, analysts can access foreign media sources online. As J.F. Holden-Rhodes argues, "OSINT is the power of knowledge at a cost that nearly anyone can afford."[29] Second, as Mercado's position (described earlier) indicates, there are far more people engaged in information collection and dissemination than once existed. Citizen journalists, bloggers, academics, pundits, and the media are breaking down the traditional hierarchies of information, all of which present new opportunities for OSINT analysts.

To summarize, there are many potential benefits of OSINT. Not only is it increasingly cost-effective for intelligence agencies, but also information technology brings together into a network increasingly complex groups of individuals that study similar phenomena. These groups of people present an opportunity for intelligence agencies to benefit from the efforts of the broader society. Finally, as Eliot Jardines—president of Open Source Publishing Inc—points out, the unclassified nature of OSINT makes it very useful for Homeland Security, because it can be shared extensively with local governments and first responders without eroding national security.[30]

Clearly, OSINT is recognized as increasingly important to counterterrorism efforts. However, Stephen Mercado highlights two important constraints on the ability of the United States to leverage it effectively. The first is budgetary, where he states that despite its significance to government operations, OSINT only receives roughly 1–2 percent of the overall intelligence budget.[31] The second constraint is human resources, where he argues "the United States lacks the education base upon which to develop tomorrow's intelligence officers."[32] In this regard, Americans' general aversion to international studies and foreign languages hurts the U.S. capacity to access the available open sources of intelligence. What is needed, therefore, in order for U.S. intelligence agencies to fully exploit the knowledge and expertise of their citizens, is an expansive effort to integrate the

terrorism research community into existing open source intelligence frameworks.

### Policy Prescription: A National Anti-Terrorism Intelligence Forum

Clearly the intelligence community faces new challenges and opportunities in the collection of OSINT. The primary challenges center around the availability of resources, both financial and human. The government is trying to fix some of these problems by creating new bureaucracies, such as the DNI Open Source Center. However, these efforts can be extended a step further by allowing the broader terrorism research community to participate in information sharing in a more direct and durable fashion. Consequently, the U.S. government should create a "national anti-terrorism intelligence forum," which would provide an additional, declassified outer layer to existing information infrastructure of the intelligence community.

This concept has already been applied within the intelligence community. Joseph Markowitz, director of the CIA's Community Open Source Program Office, has argued that the existing Open Source Information System (OSIS), the network created to make OSINT more available to all intelligence analysts, "should serve as the unclassified outer-most layer of Intellink" (i.e., the online intelligence sharing system within the government).[33] While the creation of the OSIS and the DNI Open Source Center demonstrate the government's efforts to improve the collection and dissemination of OSINT, these efforts can certainly be streamlined and expanded. For example Eliot Jardines recommends that the CIA's OSIS be extended to the Department of Homeland Security, and the 9/11 Commission has also recommended an integrated bureaucracy to oversee OSINT.

While such measures are certainly valuable, they should be taken a step further to extend beyond the intelligence community itself. The DNI Open Source Center should establish an additional *public* open source forum, which would serve to supplement the gathering of OSINT and perhaps at times in its analysis. This network would allow academics, journalists, and the private sector to contribute to the collection of OSINT. Academics, for example, often have extensive information regarding terrorists and their leaders due to their access as researchers. However, there is often a disconnect between academic researchers and government policymakers. Recent efforts have attempted to bridge this gap, such as the Homeland Security Centers of Excellence program, in which academic institutions provide research to the government on terrorism, homeland security, and threat forecasting in exchange for research funds. Some think tanks and research organizations have devoted nearly all of their time and energies

to the study of terrorism and counterterrorism, such as the Combating Terrorism Center at West Point. Moreover, Internet blogs have developed out of a need for counterterrorism experts to communicate information more immediately.[34] Some individual researchers have devoted their entire life's work to the study of terrorism and its processes. While such sources are invaluable to the gathering and analysis of intelligence, an institutionalized forum for their engagement could greatly benefit the nation's efforts to counter terrorism.

The logistics of such a proposal may appear somewhat complicated. However, the organization of such a forum would apply the methods of open source software production to intelligence, which is another knowledge-intensive industry. As described earlier, OSS companies are not simply a decentralized network of engineers. Each successful organization has a hierarchy to oversee production. However, as mentioned earlier, the key to successful open source software development is the fact that the hierarchy benefits from the voluntary contributions of the broader software development community. Online forums allow community members to submit new code or information that aids in the development of the product. Those contributions are sometimes rejected and discarded by the production hierarchy, but sometimes valuable pieces of code are incorporated into the product. In this way "network effects" are achieved, because the end product is greater than what the production hierarchy could have created on its own.

These same methodologies can be applied to the production of intelligence. Following from the OSS metaphor, the Director of National Intelligence would head the hierarchy, and the OSINT analysts would be the ones tasked with filtering and assimilating available information. This community-based model of intelligence gathering would not supplant existing intelligence structures, but instead it would supplement them. To be sure, this may imply that the intelligence hierarchy direct more resources and analysts to collecting and filtering OSINT, but this proposal is a logical extension of efforts to meet the goals of the 9/11 Commission.

In the intelligence world, concerns naturally arise regarding sensitive information. Certainly, some information would, by necessity, be restricted only to those with certain security clearances. It is true that some intelligence requires the most sensitive handling and dissemination. However, the U.S. government could best prepare itself against a networked adversary by exploiting its own knowledge base in a systematic fashion. By creating an OSINT forum, the United States would be tapping into an information resource that has previously been underutilized. In order to address concerns of intelligence sensitivity, however, the forum could require varying degrees of expertise to obtain membership. For example, the first additional outer layer could be limited to those focused on terrorism research, such as private specialists, academics, and media. A

second layer might be completely unrestricted and available to the general public.

Most importantly, this policy would help to overcome many of the constraints that plague existing efforts to produce OSINT. First, because the contributions of the terrorism research community would be voluntary, it would help to overcome the budget constraints faced by OSINT. Second, given the fact that academics specialize in the type of transnational expertise that is so difficult to come by, this program would help to overcome human resource shortfalls. Indeed such a forum makes sense, because the academic community already works in the realm of open source information. Finally, this program would be an important step toward what Robert Clark has called a "target-centric approach" to intelligence gathering, which is more effective because of the iterative and collaborative approach.[35] Indeed, understanding the importance of collaboration and the network effects that are achieved from it is the foundation of the open source method of production.

## CONCLUSION: OPEN METHODOLOGIES AND A MORE EFFECTIVE COUNTERTERRORISM STRATEGY

In sum, the methods of the open source software community can enhance the production of intelligence. Adopting open source standards and software can enhance the interoperability of different agencies engaged in terrorism prevention and response. The national open source intelligence forum recommended here is based on a similar premise and represents the logical extension of many of the government's efforts already underway. This mode of collective information sharing and collaboration would help to improve the big picture analysis of the terrorist threat. Moreover, it can be viewed as mutually beneficial for everyone involved. The intelligence community would benefit from the voluntary contributions of the research community, while academics would benefit from a forum in which to share and discuss knowledge. First responders would also benefit from the broader array of OSINT that is produced, and the general public would benefit from having better information available to them regarding the threats they face.

A combination of developing open technology standards within the government as well as open standards of intelligence gathering would work together to create virtuous cycles of information sharing. This collaborative method of OSINT will help to construct a more complete picture of current and emerging threats. To be sure, it requires a rethinking of Cold War intelligence paradigms, but as the growing body of literature on the topic—including the *9/11 Commission Report*—indicates these methods are much needed in an age where the U.S. must "connect the dots" of a transnational terrorist threat.

# CHAPTER 25

## AL QAEDA'S SURVEILLANCE OFFENSIVE AGAINST AMERICA, 2000–2003: IMPLICATIONS FOR U.S. HOMELAND COUNTERSURVEILLANCE

Aaron A. Danis

In the 1990s, al Qaeda collected intelligence on potential targets world-wide as part of a long-range plan to attack the United States, the West, and "apostate" Middle East regimes. Al Qaeda surveilled[1] targets in Europe, Africa, Indonesia, the Middle East, and America. The targeting of the United States continued even after the 9/11 attacks, to prepare for potential follow-on "second wave" attacks still in the conceptual stage when 9/11 mastermind and senior operational planner Khalid Sheik Mohammed (KSM) was captured in March 2003.[2] KSM has emerged as a key figure in this centralized targeting effort against the United States.

This chapter will outline how al Qaeda conducted this surveillance offensive, and how successful it was in penetrating American homeland security. More importantly, it will examine three key questions: Could al Qaeda attempt to do this again? What would such an attempt look like? and How could U.S. intelligence, counterintelligence, and law enforcement organizations defeat domestic terrorist surveillance and prevent an attack? As noted terrorism expert Bruce Hoffman observed soon after the 9/11 attacks, "Relatively sophisticated terrorist groups do not attack people or places without a basic level of planning and reconnaissance. Therefore, arguably the greatest return on investment is in the identification

and disruption of pre-attack planning operations. It is crucially important to intercept the terrorists' own intelligence-gathering processes."[3]

## AL QAEDA'S WORLDWIDE COLLECTION PLAN

Surveillance is the first—and arguably the most important—step in a terrorist group's attack cycle. Even if a group knows the types of targets it would like to attack as part of its operational goals, it will usually rely on active surveillance to determine whether a target is within the group's operational capabilities. Such was the case with al Qaeda prior to the 9/11 attacks. The group taught and used a four-part attack cycle, each carried out by a distinctly different group or cell for operational security purposes: surveillance and information gathering (surveillance cell), target selection (al Qaeda leadership), logistics preparation (logistical cell), and the attack itself (attack cell).[4] While al Qaeda senior leadership generally knew what type of targets it wanted to hit, direct ground surveillance drove final target selection.

For example, as early as 1993, when Osama bin Laden was still located in Sudan, the nascent al Qaeda network began to surveil targets in East Africa at his direction. Former U.S. Army Sergeant Ali Mohammed stated in his plea agreement with the U.S. government that in late 1993, bin Laden asked him to conduct surveillance of American, British, French, and Israeli targets in Nairobi. He described how he prepared detailed targeting packages (including photos and diagrams) of the American Embassy, the USAID Building, the U.S. Agricultural Office, the French Cultural Center, and the French Embassy, all in Nairobi. These targets were selected as a way to retaliate against the United States for its involvement in Somalia. He brought the packages to bin Laden in Khartoum, where bin Laden personally selected the placement of the truck bomb used in the 1998 U.S. Embassy bombing in Nairobi.[5] Note that while many targets were surveilled, only two were attacked. Ali states that he subsequently conducted surveillance in Djibouti and Senegal in 1994, as well as trained other al Qaeda operatives in surveillance techniques while in Sudan.[6]

Other evidence exists of al Qaeda's centralized, methodical surveillance effort. After U.S. forces invaded Afghanistan in late 2001, a targeting video and diagrams of a public train station were found in the rubble of former al Qaeda military leader Muhammed Atef's house, which had been hit by a U.S. air strike, killing Atef. Singaporean authorities, who had just started rounding up suspected Jemaah Islamiya (JI) operatives—many whom had trained in al Qaeda camps—linked the materials to plans for attacking U.S., British, Israeli, and Singaporean government and military targets (an original copy of the video was recovered during these arrests). Authorities discovered that in 1999, al Qaeda leaders had watched the video, narrated by JI operatives, and gave the go-ahead for an operation that was

never conducted, for reasons that are currently unknown. The al Qaeda-to-Jemaah Islamiya link ran through a JI leader named Hambali, who was a confidant of KSM.[7]

The *9/11 Commission Report* describes additional cases of centrally directed surveillance before 9/11. In late 1998, al Qaeda operative Abd al Rahim al-Nashiri proposed attacking a U.S. vessel, which bin Laden approved. He reportedly directed al-Nashiri to start the planning and send operatives to Yemen, and he later provided funding. Al-Nashiri reported directly to bin Laden, and when al-Nashiri had difficulty finding U.S. naval vessels to attack along the western coast of Yemen, bin Laden allegedly instructed him to surveil the Port of Aden instead. In January 2000, al Qaeda operatives tried and failed to attack the USS *The Sullivans* when their explosives-laden boat sunk; it was followed 10 months later by the successful attack on the USS *Cole* in October 2000.[8]

In December 1999, KSM directed Walid Muhammed Salih Bin Attash (aka "Khallad") and another operative to observe security measures on U.S. aircraft flying southeast Asian routes, in order to hijack and crash several aircraft there as an adjunct to the original 9/11 plan. The surveillance flights occurred in January 2000, and on one leg from Bangkok to Hong Kong, Khallad tested security by carrying a box cutter in his toiletries kit. While it was searched and he was questioned, he was allowed to continue travel. This part of the 9/11 plot was later cancelled by bin Laden because it added too much complexity to the core 9/11 operation.[9]

More recently, an al Qaeda document captured in Afghanistan and released by the U.S. government indicates that the group had, at least up to the 9/11 attacks, a Surveillance Committee as part of its command structure in Afghanistan, strongly suggesting a centralized collection program. The document, titled "Interior Organization," is undated and gives no details of the duties of this committee, or who is assigned to it. However, based on the other committees co-listed (Military, Political, Administrative and Financial, and Security), there is little doubt that the Surveillance Committee was considered important in the al Qaeda command structure.[10] This, along with the numerous surveillance training texts promulgated through the years, indicate the importance the group placed on this facet of its attack cycle.[11] A chapter in the well-known *Manual of Afghan Jihad* found in Afghanistan by the media in February 2002 was titled "External Pressure," and contained a laundry list of potential terrorist targets. "There must be plans in place for hitting buildings with high human intensity like skyscrapers, ports, airports, nuclear power plants and places where large numbers of people gather like football grounds," the chapter said. It also recommended major public gatherings such as Christmas celebrations.[12] This general list must carry some weight within extremist circles since al Qaeda associates have attacked or plotted against nearly all of the targets on it at one time or another.[13]

## CENTRALIZED COLLECTION AGAINST THE UNITED STATES

In October 2005, the White House released a list of thwarted terrorist plots. While the list is clearly incomplete,[14] it included five "Casings and Infiltrations" that were uncovered and presumably thwarted as a result of U.S. and allied law enforcement or intelligence counteraction. An analysis of known counterterrorism cases,[15] combined with this list of thwarted plots, reveals the following:

– *2001 Tasking:* In 2001, al Qaeda sent Ali Saleh al-Marri to facilitate post-September 11 attacks in the United States, but law enforcement authorities arrested the individual.

– *The Gas Station Tasking:* In approximately 2003, Majid Khan was tasked to collect targeting information on U.S. gas stations and their support mechanisms on behalf of a senior al Qaeda planner.

– *Iyman Faris and the Brooklyn Bridge:* In 2003, and in conjunction with a partner nation, the U.S. government arrested and prosecuted Iyman Faris, who was exploring the destruction of the Brooklyn Bridge in New York. Faris pleaded guilty to providing material support to al Qaeda and is serving a 20-year sentence in a Federal correctional institution.

– *2003 Tasking:* In 2003, an unidentified individual was tasked by an al Qaeda leader to conduct reconnaissance on populated areas in the United States.

– *The U.S. Government and Tourist Sites Tasking:* In 2003 and 2004, an unidentified individual was tasked by al Qaeda to case important U.S. government and tourist targets within the United States.[16]

The cases highlighted by the White House, along with others outlined in this chapter, all have common threads: the operatives were directed personally by KSM, met with or were hand-selected by al Qaeda senior leadership (bin Laden and Atef), and the potential targets were considered for attack on or well after 9/11.

These cases do not represent the first time that Islamic militants conducted surveillance and operations in the United States. In the first World Trade Center bombing in 1993,[17] the New York Landmarks Plot (Lincoln and Holland Tunnels, the United Nations, and 26 Federal Plaza) in 1994, and in the Ahmed Ressam case (Los Angeles International Airport), Islamic militants conducted—or were planning to conduct—surveillance of U.S. targets. In December 1999, Ahmed Ressam, an operative run by senior al Qaeda "emir" (leader) Abu Zubayda, planned on his own to go to Los Angeles from Canada and surveil one of three airports in Los Angeles with an associate until he found "a good one" in which to conduct a suitcase bombing during the millennium celebrations.[18] Fortunately, he was caught crossing the border into Washington on December 14 before he could scout any targets. Abu Zubayda, who Ressam testified was a "talent

scout" for al Qaeda, was also responsible for bringing American Jose Padilla to KSM for possible use in a future terrorist attack.[19]

### Khalid Sheik Mohammed

While one of Abu Zubayda's operatives came close to infiltrating the United States on his own, KSM was successfully recruiting a variety of operatives for multiple, parallel U.S. missions to collect potential targeting information. KSM himself had lived in the United States from 1986 to 1987 in North Carolina while attending college. Being familiar with life in the United States, and having traveled extensively around the world, he personally taught most of his operatives to communicate, travel, and survive in the West.[20] He had a good feel for who would make a successful operative. He was involved in the selection and vetting of at least four compartmentalized groups of operatives who would operate in the United States surveilling potential future targets, as well as an additional operative who would manage a way station to resettle future al Qaeda members arriving in the United States (see Figure 25.1).

KSM reportedly told interrogators that he believed that New York City was the economic capitol of the United States.[21] The purpose of the 9/11 attack was to "wake the American people up," and this could not be done by hitting strictly military or government targets.[22] This explains his preoccupation with hitting financial or economic targets, particularly in the New York area, and his operatives were tasked accordingly.

### Group 1: The 9/11 Hijackers

The first and most successful group KSM worked with was the 9/11 pilots, who not only surveilled their targets, but attacked them as well.[23] The initial target selection was done by bin Laden, Muhammed Atef, and KSM in the spring of 1999, and included the White House, the U.S. Capitol, the Pentagon, and the World Trade Center.[24] While bin Laden personally communicated this targeting preference to lead pilot Muhammed Atta in early 2000 in Afghanistan, ultimately, the final decisions on which targets to hit rested entirely in the hands of the hijacker pilots. Atta would not finalize them until late August 2001, after surveillance was complete.[25]

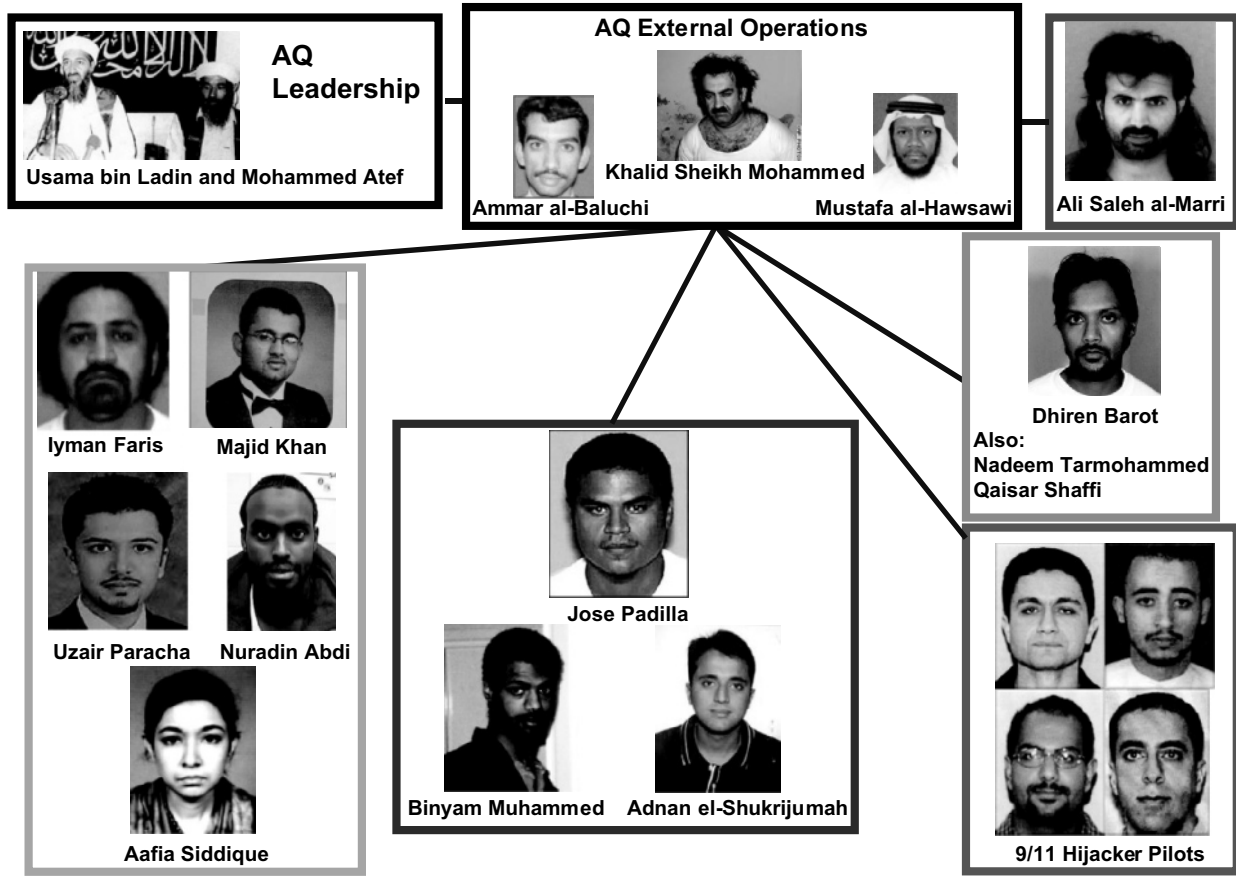
Once they entered the United States in May and June 2001, Atta, the other three pilots, and muscle hijacker Nawaf al-Hamzi (who had been designated second-in-command to Atta) conducted a number of transcontinental surveillance flights in the United States to determine passenger screening, aircraft internal security, the best places to sit, and attack timing and coordination. They encountered no problems bringing box cutters aboard the flights, and determined that the best time to take over the


**Figure 25.1    Al-Qaeda Surveillance Operatives in the United States, 2000–2003.**

cockpit was 10–15 minutes into the flight, when the cockpit doors were open for the first time.[26]

Training and practice flights to hone pilot skills clearly played a role in refining the group's preparation for the attack. Hani Hanjour and Ziad Jarrah both flew the Hudson Corridor along the Hudson River which passes New York landmarks like the World Trade Center. Hanjour and al-Hamzi also flew from New Jersey to Maryland, which would have allowed him to fly near Washington, DC. Atta reportedly stated that these two operatives also had rented a small plane and flown reconnaissance flights near the Pentagon, Hanjour's ultimate target. Atta stated to an intermediary at a meeting in Spain that he had considered targeting a nuclear facility—which had been on KSM's original ten-plane target list—he had seen during familiarization flights near New York, but dropped it because the other pilots thought the airspace around it would be restricted, making reconnaissance flights impossible and increasing the possibility that the jet would be shot down prior to impact.[27] Additionally, according to KSM, Atta used a computer program to locate a nuclear power plant in Pennsylvania, which bin Laden initially agreed to add to the target list, but which was later scratched.[28] The 9/11 pilots benefited because they did not have to do close-in, on-the-ground surveillance of their targets, reducing their exposure to local security and law enforcement scrutiny, minimal as it was prior to the 9/11 attacks.[29] They were utilizing large weapons against large targets, and flying over whatever security existed on the ground. Their primary barriers were at the airports and on the planes themselves, and they devised simple, effective workarounds based on their cross-country surveillance flights. Their travel document and communications tradecraft worked well in the pre-9/11 world, and only one muscle hijacker, Mohammed al-Qahtani, currently held in the Guantanamo Bay detention facility, was unable to enter the United States when he arrived in Orlando, Florida, on August 4, 2001.[30] Mustafa Ahmed al-Hawsawi, KSM's money-man located in the United Arab Emirates, kept the hijackers well supplied with cash for their training and expenses.[31] After 9/11, however, things were to get more difficult for operatives entering the United States.

### Group 2: Dhiren Barot and Financial Targets

KSM reportedly told his debriefers that he was always working on more than one operation at a time. KSM claimed to anticipate "some residual effects from September 11. He knew he would no longer be able to use operatives from the Middle East,"[32] but he apparently never counted on the security dragnet that occurred in the United States and elsewhere, nor the international cooperation. KSM started adapting prior to 9/11 by trying to find operatives who already lived in the United States, or at least in

countries with preferential access to the United States, such as the United Kingdom. Therefore, at bin Laden's direction, he sent operative and British citizen Issa al-Britani to the United States in early 2001 to case potential economic and "Jewish" targets in New York City.[33] Issa, whose real name is Dhiren Barot, is a Hindu convert to Islam born in either the United Kingdom or India, and British-educated. He allegedly had been an instructor at an extremist training camp in Afghanistan in 1998, and claimed that he fought in Kashmir, writing a book about his experiences titled *The Army of Madinah in Kashmir*.[34]

Barot, using a student visa, reportedly applied to a New York area college in June 2000, and even though he was admitted to that school in 2000–2001, he never enrolled or attended any classes at that college. He flew to the New York area twice from the United Kingdom: first from August 17 to November 14, 2000, with conspirator Nadeem Tarmohamed, and again from March 11 to April 8, 2001, with Tarmohamed and Qaisar Shaffi. According to a Department of Justice indictment, during this time they visited and conducted surveillance

> . . . on buildings and surrounding neighborhoods in the United States, including the International Monetary Fund World Headquarters and the World Bank Headquarters in Washington, D.C., the Prudential Corporate Plaza and World Headquarters Building in Newark, New Jersey, and the New York Stock Exchange Building and the Citigroup Center in Manhattan, New York. This surveillance allegedly included, among other things, video surveillance conducted in Manhattan in or about April 2001. The indictment alleges that the surveillance was part of the conspiracy to use weapons of mass destruction.[35]

Barot reportedly lived in New Jersey, using his student status as a cover.[36] This cover apparently worked well, for the surveillance plans he outlined reportedly were very detailed, according to press accounts. They included descriptions of what vehicles would be able to enter the basement of the Prudential building, potential getaway routes (implying they were not suicide attacks), and notes on a visit to Newark City hall to (unsuccessfully) gather blueprints.[37] However, Barot was not arrested in the United States, but in the United Kingdom in early August 2004, soon after the July arrest of alleged al Qaeda operative and computer expert Mohammed Naeem Noor Khan in Pakistan, who reportedly had copies of the surveillance plans on his computer and compact discs. The discovery led U.S. Department of Homeland Security (DHS) officials to declare an "orange alert" for the financial sector on August 1, 2004, even though the casing reports were old.[38] Little else is known about these plans, such as whether Barot was going to be responsible for carrying them out, or if they

were meant to be tasked to another team of al Qaeda operatives; perhaps more will come to light when Barot is put on trial in the United Kingdom or extradited to the United States.

### Group 3: Iyman Faris and Bridges, Cargo Planes, Gas Stations, and Malls

The fact that Barot remained at large for almost a year after KSM's arrest in March 2003 made him an anomaly. Most of KSM's operatives in the United States were rounded up soon after his capture. Iyman Faris, his relative Majid Khan, and associate Nuradin Abdi were arrested within weeks or months of KSM's capture, as was Khan associate Uzair Paracha (see Figure 25.2, shaded area).

Faris, a naturalized U.S. citizen born in Kashmir and living in Columbus, Ohio, is known as the operative who admitted in his plea bargain to surveilling the Brooklyn Bridge for KSM, as well as researching the types of means necessary to destroy it. Faris was a cross-country truck driver, an occupation that could afford him many opportunities to surveil almost any U.S. target al Qaeda wished. As part of his plea bargain, he described meeting bin Laden while at a training camp in Afghanistan, and in early 2002 met "the number three man" to bin Laden, clearly a reference to KSM.[39]

KSM asked him what he could do for the group, and Faris volunteered information on his occupation as a truck driver, his trucking routes, and deliveries for airport cargo planes, in which KSM said he was interested because cargo planes would hold "more weight and more fuel."[40] Faris was eventually tasked with the Brooklyn Bridge surveillance, obtaining "gas cutters" to sever the suspension cables, and tools to derail trains. Faris traveled to New York City in late 2002 to examine the bridge, and concluded that the plot to destroy the bridge by severing cables would fail because of the bridge's security and structure. In early 2003, he sent a coded message that "the weather is too hot"—an indication that the bridge plot was unlikely to succeed.[41] In March 2003, he reportedly turned himself over to U.S. authorities.[42]

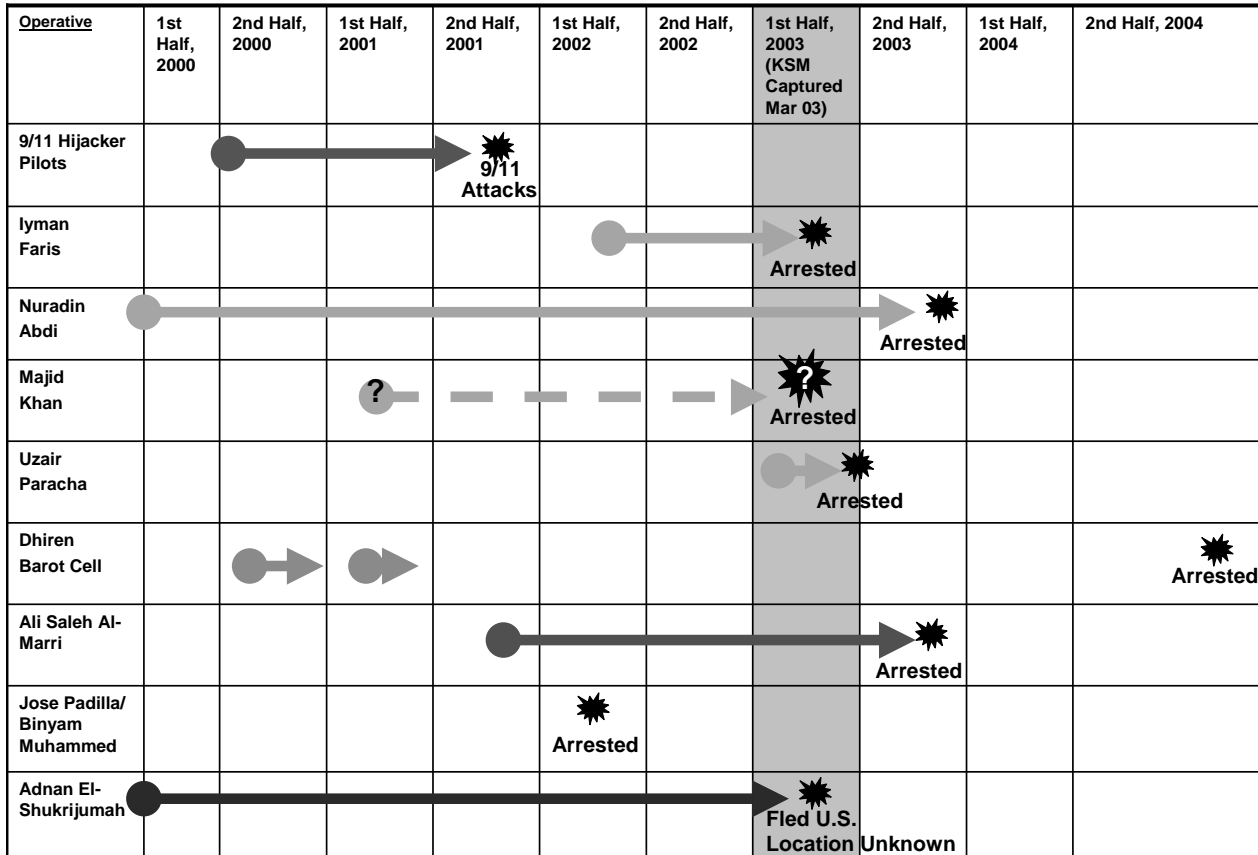
Little is known of Faris' associate, Nuradin Abdi. He reportedly owned a cellular telephone business in Columbus, Ohio, where he lived for two to three years and has a family.[43] While he was accused by the Justice Department of plotting to blow up an area mall, he was formally charged with immigration fraud. The indictment alleges that on April 27, 1999, Abdi applied to immigration officials for a travel document, allowing him to leave the United States and later return. Abdi indicated in the application that he intended to visit Germany and Saudi Arabia. The FBI alleges that Abdi's true destination was to attend a military-style terrorist training camp in Ethiopia. According to a detention motion, Abdi sought training


**Figure 25.2   Timeline of AQ Operatives in the US, 2000–2003.**

in guerilla warfare and in using radios, weapons, and explosives. The FBI stated in a detention motion that Abdi's purpose in seeking training was to ready himself to participate in violent Jihad conflicts overseas and to lend support to activities that his al Qaeda co-conspirators might ask him to perform in the United States.

In March 2000, Abdi reentered the United States from Africa, using a fraudulent immigration document. According to the FBI, Faris picked him up at an airport, and upon their return to the Columbus area, Abdi, Faris, and other unnamed conspirators allegedly initiated a plot to blow up a Columbus-area shopping mall. It is also alleged that in pursuit of this plot, Abdi received explosives training from one of the conspirators. Abdi was arrested on November 28, 2003. Since the plot apparently was disrupted in the early planning stages, it is unclear how much, if any, formal surveillance had been accomplished against potential targets. A soft target like a mall could be surveilled at the operative's leisure, while conducting normal and legitimate business.

Finally, after the 9/11 attacks, KSM reportedly revived plans that he had previously been contemplating to attack a series of gas stations in the United States. He reportedly tasked a former resident of Baltimore and relative of Faris named Majid Khan to "move forward" on Khan's plan to destroy several U.S. gas stations by "simultaneously detonating explosives in the stations' underground storage tanks."[44] Khan traveled at least briefly to the United States, where he tried unsuccessfully to seek asylum. His family members reportedly are longtime Baltimore residents and own gas stations in that city. When Khan reported that the storage tanks were unprotected and easy to attack, KSM wanted to be sure that explosive charges would cause a massive eruption of flame and destruction. KSM told interrogators that he and Khan discussed a plan to use a Karachi-based import–export business run by the father of convicted operative Uzair Paracha to smuggle explosives into the United States.

Paracha agreed to help Khan obtain a travel document that would allow Khan to reenter the United States. According to U.S. prosecutors, in February and March 2003, Paracha posed as Khan during telephone calls with the Immigration and Naturalization Service, called Khan's bank, and attempted to gather information about Khan's immigration paperwork via the Internet. Paracha also agreed to use Khan's credit card to make it appear that Khan was in the United States, when in fact Khan was in Pakistan. In addition, KSM reportedly told interrogators that a woman named Aafia Siddiqui, a U.S. visa holder who lived in the United States for a decade, rented a post office box to help Khan establish his U.S. identity. Siddiqui was supposed to support "other AQ operatives as they entered the United States," according to a description of the plot. Siddiqui reportedly fled to Pakistan, and is the subject of an FBI "Seeking Information" notice.[45]

### Group 4: Jose Padilla and Apartment Buildings

The story of alleged "dirty bomber" Jose Padilla is well known, and the subject of a lengthy Department of Defense (DOD) statement previously cited in this chapter.[46] It is now alleged that he and his accomplice, U.K. resident Binyam Muhammed, were en route to the United States to bomb apartment buildings in New York (and possibly gas stations), not to conduct a radiological attack, as first stated by U.S. Attorney General John Ashcroft.[47] They were both arrested—Padilla on May 8, 2002, at Chicago O'Hare airport, and Muhammed on April 10, 2002, at a Pakistani airport, where he was traveling on a forged passport—before they could conduct surveillance. However, Padilla, as a U.S. citizen, would already know the ins and outs of renting an apartment in the United States, which is clearly a "soft" target. He allegedly was to conduct Internet research once he arrived in the United States to locate apartments using natural gas heating. The gas was to be trapped in the apartment and detonated with an explosive device, destroying the building.[48]

His original partner in this plot, Adnan el Shukrijumah, allegedly trained with Padilla in Afghanistan. Padilla recognized him from the United States (el Shukrijumah had lived in Pembroke Pines, Florida, when Padilla attended a mosque there), but the mission was abandoned when the two could not get along, and eventually Muhammed was substituted for el Shukrijumah.[49] El Shukrijumah, like Padilla, would have already known how to rent rooms in targeted apartment buildings. He reportedly lived in the United States for six years and received an associate's degree from a Florida college. He reportedly surveilled targets in New York, as well as the Panama Canal, although this cannot be confirmed by official sources.[50] All three met previously defined criteria for a U.S. mission: they were hand-selected and trained by al Qaeda senior leadership, and two were tasked directly by KSM. Binyam Muhammed and Padilla were both apprehended shortly after senior facilitator Abu Zubayda's arrest on March 28, 2002, in Pakistan, implying that his arrest subsequently led to theirs.[51] El Shukrijumah is still at large and the subject of an FBI manhunt.

### The Lone Wolf: Ali Saleh al-Marri

Little was known publicly about Qatari national Ali Saleh Kahlah al-Marri until April 2006, when a declassified DOD document was filed in a South Carolina federal court.[52] Al-Marri, who was designated as an enemy combatant by the United States in June 2003, was arrested in December 2001. The initial indictment against al-Marri charged him only with making false statements to FBI agents, banks in Illinois, identity fraud, and access device (credit card numbers) fraud. Al-Marri was asked if he had ever called a telephone number in the United Arab Emirates that the FBI

believed was associated with KSM financial facilitator Mustafa Ahmed al-Hawsawi. Al-Marri allegedly told the agents he had not called the number when, in fact, he had called the number on several occasions. He entered the United States on September 10, 2001, purportedly to pursue a graduate degree in computer information systems from Bradley University; when asked by the FBI if he had visited the United States previously, he stated that he had in 1991, when in fact he had been in the United States as recently as the summer of 2000.[53]

The declassified DOD statement paints a fuller picture of his alleged activities. Al-Marri is alleged to be a "sleeper agent" of sorts, specifically tasked by KSM to travel to the United States because, as a married father of five who had no criminal record and had studied in the United States, he could blend in more easily than a bachelor. The DOD statement against him claims that he was sent to the United States for "the purpose of engaging in and facilitating terrorist activities subsequent to" 9/11. He reportedly met personally with bin Laden, and was asked to explore computer hacking methods to disrupt the U.S. financial system. He was also trained in the use of poisons, and authorities discovered detailed information concerning poisons on his computer. He reportedly had bookmarks in an almanac, marking entries for dams, reservoirs, and railroads.[54]

Al-Marri's profile fits the stated desire of KSM to have a new type of operative in the United States post-9/11. He does not appear to be a surveillant in the traditional physical sense, but more of a "cyber surveillant" who would look for financial targets to attack. More importantly, his ability to set up a "way station" in the United States and resettle follow-on operatives would make him more valuable for facilitating future operations. As he admitted, KSM underestimated the post-9/11 security environment in the United States, the sudden suspicion by average Americans of all Muslims, and the retooled capabilities of the FBI and the broader intelligence community. His operatives also didn't suspect that KSM apparently would provide key clues leading to their arrests so soon after his own.[55]

## DEFEATING TERRORIST SURVEILLANCE IN THE U.S. HOMELAND

Having looked at KSM's effort, although only partially successful, to conduct terrorist intelligence and reconnaissance activities in the United States, three basic questions come to mind:

– Could al Qaeda attempt another surveillance effort against the United States again?
– What would such an attempt look like? and
– How can the United States detect and disrupt such an effort?

### Could al Qaeda Attempt It Again?

Certainly, al Qaeda still has operatives—such as Adnan el Shukrijumah, Aafia Siddique, and U.S. citizen Adam Gadahn—who are available to try and infiltrate the United States, but they are now well known and the subjects of FBI "Seeking Information" bulletins.[56] Surveillance attempts in the future would thus likely rely more heavily on non-Arabs with "clean" backgrounds. KSM, as part of this Southeast Asia plotting, was looking for operatives from that area of the world. Europe has discovered the perils of having large, poorly documented Pakistani, North African, and African Muslim populations, as attested by the Madrid and London subway bombings, as well as several thwarted attacks. The revelation in November 2005 that a Belgian female convert to Islam, Muriel Degauque, conducted a suicide attack in Iraq increases the range of potential Western operatives exponentially.

### What Would Such an Attempt Look Like?

Such a surveillance operation in the future will likely be without the central direction that KSM attempted. The ongoing, relentless destruction of the pre-9/11 "core" al Qaeda senior and mid-level leadership by the United States and its allies makes it more difficult to conduct KSM's "hands-on" management style. KSM and his two reported replacements as al Qaeda #3, Abu Faraj al-Libi and Hamza Rabia, have been captured or killed, as has been the group's "emir" in Iraq, Abu Musab al-Zarqawi. It is undoubtedly more difficult, if not impossible, for bin Laden or Ayman al-Zawahiri to handpick future U.S. operatives. In this case, the globally inspired, locally directed, decentralized operational model seen in the Madrid and London subway attacks, and the June 2006 arrests in Toronto, will be the norm. These operatives can directly surveil any soft target easily, probably in the course of their daily routine, and supplement it with innocuous Internet and library research. While future operatives probably will not be formally trained in surveillance techniques, there is certainly enough jihadist and other training material available on the Internet—along with readily available commercial technologies such as digital cameras and satellite imagery—to create useful targeting packages.

One recent example is the case of Ehsanul Islam Sadequee and Syed Haris Ahmed, two Atlanta-area men arrested in an international terrorism investigation. In April 2006, federal prosecutors alleged that they reportedly videotaped the U.S. Capitol, the Masonic Temple, the World Bank, and a fuel storage facility a year earlier, and were preparing to send the casing videos to "overseas brothers," a possible reference to fellow jihadists. They also allegedly traveled to "the mountains of Georgia to

conduct military-style training exercises."[57] There are also numerous press accounts linking the two men to the June 2006 Toronto arrests previously mentioned.[58]

### How Can the United States Detect and Disrupt Such an Effort?

Returning to Bruce Hoffman's premise (offered at the beginning of this chapter), he also usefully suggested that the United States "establish a dedicated counterintelligence center to obstruct terrorist reconnaissance."

> Given the highly fluid and transnational nature of the threat faced by the United States, a separate counterterrorism unit should be established within the U.S. intelligence community. This unit should be dedicated specifically to identifying and targeting the intelligence-gathering and reconnaissance activities of terrorist organizations.[59]

The first and most effective use of such a counterintelligence center (or perhaps, "countersurveillance center") would be to aggressively investigate and "run-to-ground" the most serious or suspicious of the many "suspicious activity" reports received by the U.S. government on a daily basis through a variety of channels.[60] This includes cross-referencing them with known threat reporting or ongoing terrorism cases. While this is a basic law enforcement and counterintelligence function, it is more difficult than it looks, and to date, there are no known cases in the United States where terrorists have been detected or caught while in the act of surveilling U.S. targets, including all of the cases previously cited in this chapter.

Recent case history suggests that even the most apparent and well-documented cases of alleged preoperational surveillance are not always what they appear at first blush, and demonstrate some of the limitations of this approach. For example, in July 2004, Pakistani national Kamran Akhtar—accused of living in the United States illegally—was arrested while videotaping skyscrapers in Charlotte, North Carolina, including one that held the local FBI office. A subsequent FBI review of other videos taken by Akhtar reportedly found footage of the Bank of America building, the Texas governor's mansion, and the public transit systems in Atlanta, Houston, Dallas, and New Orleans. He ultimately was deported in early 2005 on immigration violations, but background checks turned up no links to terrorism, and his lawyer claimed he was just a video buff.[61] Similar suspicious filming activity by three men around the Sears Tower (considered by both bin Laden and KSM for 9/11 and post-9/11 attacks[62]) and the Boeing Corporate Headquarters in Chicago in March 2006 made the news, but has not been linked to actual terrorist activity.[63]

Realistically, the probability of detecting and catching a terrorist in the act of surveilling a target, particularly a target without a dedicated countersurveillance team assigned to it, is extremely low. Consider the potential probabilities for each of the following steps to be accomplished in order for a suspected surveillance incident to be witnessed, reported, and acted on:

– *Step 1:* Probability that someone sees an individual(s) carrying out possible surveillance
– *Step 2:* Probability that the eyewitness accurately records pertinent information
– *Step 3:* Probability the eyewitness reports the incident to the proper authorities in a timely manner
– *Step 4:* Probability that the authorities conduct a timely and thorough investigation before the operatives leave the target area

If one assigns a very optimistic probability of a 90 percent success rate to each of these four steps, then the overall probability of a successful interdiction is about 65 percent. If the probability of success of any of the steps drops, then the overall probability of detection drops with it. For example, if the probability of initially seeing a suspected surveillance incident drops to a more realistic 50 percent (taking into account any effective tradecraft on the part of the surveillant), then the overall interdiction success rate drops to 36 percent, and so forth with a reduction in each of the four simple variables listed here (each of which can have its own subvariables in more complicated formulations). Factoring in that there may only be a handful of al Qaeda surveillance operatives active in the United States at any given time (a judgment based on the KSM-directed cases outlined in this chapter), then the probability of catching a particular operative in the act of conducting surveillance against a narrow set of "soft" targets such as malls or gas stations is lower still.

Moreover, practical experience suggests that trying to track and correlate *all* reported suspicious incidents is unlikely to produce much actionable intelligence either, especially considering the manpower that would be needed to collect, catalog, and analyze thousands of such incidents every year, many of which lack sufficient detail (such as name(s), drivers license information, license plate number, etc.) to properly investigate. Such a "needle in a haystack" approach, taking into account the thousands of possible targets in the United States, is counterproductive. For example, if there are five incidents in a week at a single tourist site involving an unidentified blue car possibly videotaping the site, is it indicative of pre-operational planning, or is it just a popular site to visit and perhaps local car rental agencies rent a lot of blue cars to tourists? It is impractical for local law enforcement agencies to chase around blue cars and question

every tourist at every popular tourist site; it is also dangerous to make threat predictions based on such unconfirmed data.

A key component of a successful countersurveillance center will be the integration of domestic and foreign immigration expertise and databases, and information on daily immigration "stops" at U.S. ports of entry. An excellent study published on the fourth anniversary of 9/11 revealed that out of 94 foreign-born terrorists who operated in the United States, the study found that about two-thirds (59) committed immigration fraud prior to or in conjunction with taking part in terrorist activity.[64] Out of 59 terrorists who violated the law, many committed multiple immigration violations—79 instances in all. Most notably, 20 out of 21 foreign terrorists became naturalized U.S. citizens, demonstrating that the "homegrown" terrorism problem is not a new phenomenon in the United States. Many of the terrorists cited in the report had telltale indications of illegal activity that, at a minimum, should have resulted in detention and further investigation, if not outright deportation or jail time. The report concludes that "strict enforcement of immigration law—at American consulates overseas, at ports of entry, and within the United States— must be an integral part of our efforts to prevent future attacks on U.S. soil."[65]

Finally, as seen in the KSM surveillance network, a countersurveillance center will have to be proactive in the questioning of newly captured terrorist planners, financiers and facilitators, and exploiting documents and other media seized with them. Preparing a standing list of questions for interrogators would be useful. How many of KSM's operatives would still be at large if he did not play a role in turning them in? As Figure 25.2 illustrates, most were caught soon after KSM's arrest, while others—notably Jose Padilla and Binyam Muhammed—were caught only weeks after Abu Zubayda's arrest. The rapid exploitation of information from newly detained terrorists has been at the heart of good investigative work throughout the history of modern counterterrorism, and is no different today in protecting the United States from al Qaeda surveillance teams.

A domestic countersurveillance center, while a good idea, will have to be carefully constructed to include the measures discussed here. In addition, the U.S. government will have to determine in which agency it will reside—the National Counterterrorism Center (NCTC), DHS, or the FBI. It will clearly have to be interagency in nature, integrating experts from a number of disciplines, and have counterterrorism, counterintelligence, and law enforcement capabilities and databases. Based on the haphazard and not always successful bureaucratic counterterrorism efforts attempted by the U.S. government since 9/11, particularly the Terrorist Threat Integration Center-to-NCTC evolution, it remains to be seen whether the U.S. government can formulate a coherent and effective terrorist countersurveillance strategy and organization in the U.S. homeland.

## NOTES

1. I use the word "surveillance" as opposed to the word "reconnaissance." The first word implies a more passive collection of information, usually through long-term observation, whereas the second implies a more proactive probing of target security. For the purposes of this chapter, the two concepts are interchangeable. The verb "case" or "casing" also is sometimes used.

29. An interesting side story to the 9/11 attacks is the infamous alleged casing video shot inside the World Trade Center by Ghasoub al-Abrash Ghalyoun, a Syrian living in Spain who claimed to be vacationing in the United States. Ghalyoun was an alleged member of a Spain-based al Qaeda cell led by Eddin Yarkas. The video came to light during the Spanish investigation into the cell, and also reportedly showed a number of other U.S. landmarks, including the Statue of Liberty, the Brooklyn Bridge, the Sears Tower, the Golden Gate Bridge, the Hollywood sign, and Disneyland, shot in five cities over 21 days in August 1997. The Spanish believe the video exceeds basic tourist curiosity and was passed to an al Qaeda courier and sent to Afghanistan, but could offer no proof. Ghalyoun was ultimately acquitted. # CHAPTER 26

# FORECASTING TERRORIST GROUPS' WARFARE: "CONVENTIONAL" TO CBRN

Joshua Sinai

To forecast the spectrum of warfare that a terrorist group is likely to conduct against a specific adversary, this chapter proposes an indications and warning (I&W) methodology to comprehensively and systematically map all the significant indicators (as well as subindicators and observables) that need to be examined and correlated.

The methodology presented in this chapter is intended to enable the counterterrorism community to forecast a terrorist group's general warfare proclivity, as opposed to predicting an imminent attack. Forecasting is not the same as prediction. Predicting terrorism, in which individual actors act covertly, is vastly different from anticipating attacks by hostile conventional militaries which operate from conventional formations. Unlike conventional militaries, most terrorists do not use elaborate command and control infrastructures or mobilize large numbers of troops and equipment in their operations, which are typically small scale and surprise attacks.[1]

Moreover, prediction entails anticipating through the acquisition of tactical intelligence about an imminent terrorist attack. This involves uncovering a plot, identifying a group's operatives and the attack's timing, location, tactics, type of weapon, and target. For those tasked to predict imminent attacks, acquiring such tactical I&W is extremely difficult, and requires covert means, such as continuously surveilling a group's activities or acquiring and using informants.

Forecasting, on the other hand, involves determining at a more general level what a group's modus operandi is likely to be, such as whether it is likely to conduct "conventional" versus "suicide" attacks (whether or not operatives will seek to stay alive or blow themselves up when conducting an operation), to be conservative or innovative in its tactics, or to resort to conventional low impact (CLI), conventional high impact (CHI) or chemical, biological, radiological or nuclear (CBRN) warfare,[2] also known as weapons of mass destruction (WMD).[3]

It is also difficult to predict future terrorist operations, because in most cases such operations are "rare" events due to a number of factors, including the difficulty of executing an operation against a more powerful state adversary or the ability of security services to thwart potential operations. Further, predicting imminent terrorist attacks is made more complicated because of the organizational learning nature of these groups, reflected in the continuous shifting of their modes of operation in order to exploit new vulnerabilities in their adversaries' defenses.[4] Moreover, the organizational formations of modern-day terrorism have been transformed from highly hierarchical to loosely affiliated and network-based, making it difficult to identify or track the activities of such less structured groupings.

In addition, unlike the controlled environment of a scientific laboratory where scientific prediction is possible, the past is not always the best predictor of future terrorist operations. In the natural sciences, for example, meteorologists, have used sophisticated tools to attain a relatively high degree of accuracy in monitoring weather conditions, allowing them to predict the likelihood of rain or snow over a short-range period. Similarly, scientists can forecast months in advance the likelihood of hurricanes in a specific geographic region. This is due to the capability of "hindsight" projections based on previous historical data, or predictive projections based on the relatively constant nature of tropical weather and the ability of satellite and radar technologies to track hurricanes at the earliest phases of their development and paths. Similarly, early prediction of potentially damaging earthquakes is made possible by studying previous historical frequency patterns in a specific area, locations of fault systems, or the rate at which strain accumulates in the rock.[5] However, even though it is possible to estimate where earthquakes are likely to occur, as Ruth Ludwin observes, "there is currently no reliable way to predict the days or months when an event will occur in any specific location."[6]

Although not yet attaining the reliability level of predicting natural disasters, it is possible to forecast at a more general level the type of warfare likely to be launched by a terrorist group (or loosely affiliated grouping of individuals). For example, computer-based analyses of incident chronology databases can generate knowledge about terrorist incidents—whether aborted, thwarted, or successful—in order to map the likely geographical location and distribution of attacks and identify regions of greatest risk.

Thus, for each terrorist group, the data produced by details and characteristics of previous attacks and "unsuccessful" operations can generate warning signals to predict the likelihood, frequency, and geographical locations of future attacks.

It is still unknown, however, whether such data-driven trend analyses can attain the predictive validity of comparable analyses in the natural sciences. For example, can mathematical algorithms be incorporated into such tools, with appropriate weighting properties, to generate predictions of an imminent terrorist attack's date, location, tactics, weapons, and targets? At the very least, the social sciences can provide a rigorous framework to forecast such data in more general terms—for example, by assigning the components of a group's modus operandi as independent variables and the level or magnitude of terrorism as the dependent variable, in order to project likely future trends (as opposed to tactical information about imminent attacks). Thus, forecasting methodologies and tools can help us understand the evolution, patterns, and trajectory of terrorist activity conducted by an individual group or multiple groups, including changes in the profiles and characteristics of their operatives, and warfare trends such as "conventional" versus suicide attacks, or CLI, CHI, or CBRN operations.

Due to these considerations, a key proposition in this chapter is that to adequately assess the likelihood and magnitude of the types of threats posed by contemporary terrorism, three issues need to be addressed. First, threat assessments need to focus on three types of warfare that characterize this spectrum of terrorist operations: CLI, CHI, and CBRN. Second, one needs to focus on the characteristics of terrorist groups that shape and define the type of warfare that they are likely to employ to achieve their objectives, starting with the nature of their leadership, motivation, strategy, supporting constituencies, and other factors such as capabilities, accelerators, triggers, and hurdles that are likely to propel them to pursue CLI, CHI, or CBRN warfare (or a combination of the three). Third, we must focus our efforts on determining the disincentives and constraints that are likely (or not) to deter terrorist groups away from CBRN warfare, which is the most catastrophic (and difficult) form of potential warfare, particularly when these groups can resort to conventional explosives which have become increasingly more lethal and "catastrophic" in their impact. Analytically, therefore, terrorist groups currently operating on the international scene (or newly emergent ones) need to be viewed as potential CLI, CHI, or CBRN warfare actors (or a combination of the three), based on an understanding of the I&W factors likely to propel them to embark on such types of warfare against their adversaries.

To forecast the type of warfare that a group is likely to choose, we must first gain an understanding of terrorism. Terrorism is a tactic of warfare involving premeditated, politically motivated violence by subnational

groups or clandestine agents against citizens of a state, whether civilian or military, in order to influence, coerce, and (sometimes) cause mass casualties and physical destruction upon their targets. This definition is a crucial component of forecasting, because one must consider whether future attacks will be carried out against civilian and military targets, as well as future trends in warfare such as mass casualty attacks.

The type of warfare chosen by a terrorist group is also motivated by psychological considerations. Thus, terrorism is not only a form of physical warfare, as discussed above, but also a form of psychological warfare by nonstate actors against their more powerful state adversaries. In the terrorists' decision-making calculus, the localized incident of the physical attack is intended not only to cause casualties and structural damage, but also to spread fear and anxiety throughout the larger society. Terrorists generally calibrate their warfare to maximize these objectives.

The simultaneous suicide attacks by al Qaeda on September 11, 2001 and the poisonous anthrax letter campaign later that year by a still undetermined perpetrator ushered in a new era of catastrophic terrorist warfare. Since then, reports in the media about training by al Qaeda operatives in chemical and biological warfare, as well as the group's interest in acquiring radiological and nuclear weapons, are strong indicators that of their intention and potential capability to carry out catastrophic warfare involving chemical, biological, radiological, and nuclear weapons and devices against their adversaries. For example, captured al Qaeda documents and training films demonstrate the magnitude of its interest and training in employing chemical weapons. Moreover, media reports about black market transactions by Russian and other organized criminal groups involved in trafficking various CBRN components are additional indicators that CBRN represents the next phase in catastrophic terrorist warfare. With the growing availability of CBRN weapons and devices, the final indicator to drive such catastrophic warfare is motivation. Leaders such as Osama bin Laden and his coterie of top advisers are considered most likely to engage in such warfare because of their ambition to propel their group and its affiliates on the international arena as a first order of magnitude technological destroyer and menace.

Thus, the threat of terrorist CBRN catastrophic warfare is real and imminent. It is also based on several historical cases where at least some of the factors necessary to conduct such warfare have coalesced:

- The 1984 Rajneeshee salmonella poisonings of the salad bars of several restaurants in Oregon;
- The 1990 Tamil Tiger's chlorine gas attack on the Sri Lankan military;
- The 1995 Aum Shinrikyo sarin gas attack against the Tokyo subway system;
- The post 9/11 poisonous anthrax letter campaign;

- The May 2002 arrest at Chicago's O'Hare International Airport of Jose Padilla, an al Qaeda operative, charged with plotting to detonate a radiological "dirty" bomb in the United States; and
- The January 2003 plot by an al Qaeda cell to employ ricin to lace the food supply at a British military base.

Whether actually executed, thwarted, or nascent plots, these efforts by terrorist groups have cumulatively crossed the threshold from "conventional" to CBRN terrorism, about which terrorism experts have been warning with increasing frequency since the mid-1990s. As a result, governments around the world have been spending billions of dollars annually in homeland security-related protective training, technologies, new organizational structures, preemptive strategies, and emergency response preparation.

Nevertheless, "conventional" warfare still represents the predominant form of attacks by contemporary terrorist groups. In fact, "conventional" warfare can produce a large impact on the targeted adversary with minimal forces,[7] as exemplified by the attacks against the transport sector in Madrid in March 2003 and London in July 2005.

## PREDICTING TYPES OF TERRORIST WARFARE

In order to forecast the types of warfare most likely to be engaged in by terrorist groups, a trichotomous outcome (CLI, CHI, or CBRN warfare) approach is hypothesized. The pre-incident activities by terrorist groups are the independent variables ($X$), while the trichotomous outcome is the dependent variable ($Y$). As discussed later in this chapter, the independent variables are related to each other, so they need to be correlated simultaneously. The premise is that if one can collect this type of intelligence information about terrorist groups, it will be possible to attain a sufficiently predictive accuracy, while recognizing that there will always remain a certainamount of "real world" uncertainty built into any I&W forecasting system.

As demonstrated in Table 26.1, there are 31 I&W indicator categories that many analysts generally consider important for influencing and shaping a terrorist group's warfare proclivity.

Figure 26.1 illustrates the ordered grouping of these 31 I&W indicators by phases along the lethality and propensity axes (the phased ordering of the indicators is for analytic purposes only).

Developing an accurate, timely, and actionable I&W indicators system to forecast a terrorist group's warfare proclivity involves several steps. First, a threat assessment needs to be formulated that will generate warning "flags" that indicate a terrorist group's "attack potential." Several formulas can be used to derive a group's "attack potential" (see Figure 26.2).

**Table 26.1   The Pre-Incident Four Phases of Terrorism's 31 I&W Indicator Categories**

| Group Formation ➲ | Plan ➲ | Develop ➲ | Execute |
|---|---|---|---|
| (1) Societal conditions | (14) Decisive meeting | (17) Acquisition | (22) Tactics |
| (2) Radical subcultures | (15) Recruitment | (18) Development/ production | (23) Security |
| (3) Types of groups | (16) Training | (19) Testing | (24) Communica-tion |
| (4) Leadership | | (20) Weaponization | (25) Logistics |
| (5) Motivation | | (21) Storage facilities | (26) Surveillance |

Second, a terrorist group's attack potential is derived from formulating hypotheses, which are broad explanatory statements that generate *factors*, which are more *specific indicators* suggesting a *type of terrorist warfare proclivity*. *Indicators* need to be considered *in combination* because no single factor is likely to indicate a particular warfare proclivity. Indicators can be combined to generate a group's warfare proclivity by performing four tasks:

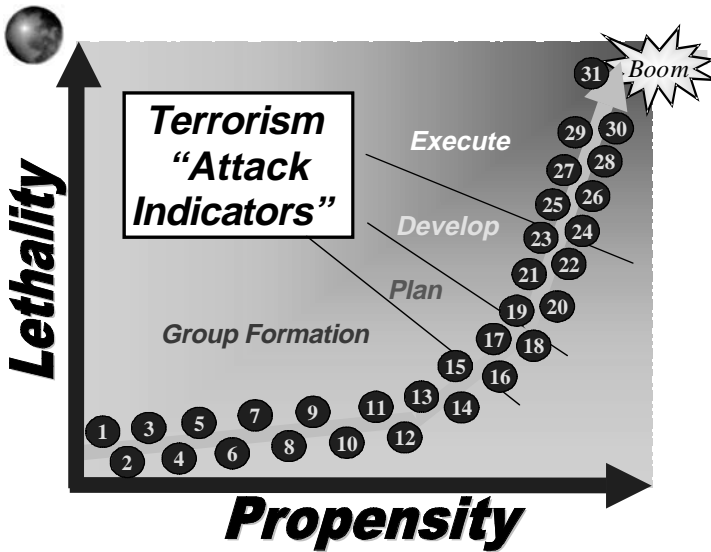
- *Task 1:* Identifying the *key observable CLI/CHI/CBRN characteristics* concerning the 31 I&W indicator categories (i.e., information available to analysts from various sources) regarding terrorist group motivations and capabilities, and access to weapons, devices, and delivery systems, as well as accelerators, triggers, and internal and external hurdles, that would indicate a proclivity or disinclination to engage in "catastrophic" warfare.
- *Task 2:* Determining how to *properly weight* those indicators/observables in order to assign higher weights to potential CLI/CHI/CBRN proclivities that indicate a group is likely to pursue a particular type of warfare. For example, the


**Figure 26.1 A Model of Terrorism Attack Indicators**

indicators might be weighted by a rating system on a scale of 1 to 10, with 1 being the lowest and 10 being the highest threat potential, indicating the presence of the necessary motivation and operational capability by a terrorist group to carry out a particular type of attack.

- *Task 3: Providing a quantifiable system for aggregating the weights* assigned to the observable characteristics in order to arrive at an overall CLI/CHI/CBRN threat rating, which accurately indicates the likelihood that a group is planning an attack exhibiting the characteristics of a particular type of warfare.

- *Task 4:* Setting an appropriate numerical *threshold* for those aggregated weights in order to indicate a probability that a group will resort to CLI or CHI or CBRN warfare, thus reaching a point at which it would be prudent to issue an appropriate warning concerning that group. The warning may take the form of distinct colors to indicate the spectrum of warfare, such as green, yellow, or red warnings.

- **Intention + Capability = Threat**

- **Threat + Indicators (activities/observables) = Warning**

- **Warning + Adversary Vulnerability = Risk Assessment**

- **Intention + Capability + Accelerators/Triggers + Overcoming Hurdles +**

  **Adversary Vulnerability = Attack Indicators/Attack Potential**

**Figure 26.2 Formula for Determining a Group's "Attack Potential"**

However, unlike an I&W system for "conventional" terrorism that must effectively warn about a "conventional" type attack (for which there would also be a much higher probability), a CLI/CHI/CBRN-oriented I&W system must be customized to focus on the likelihood that a particular terrorist group has attained any of these three types of warfare operational capability and that it intends to carry out a CLI-, CHI-, or CBRN-type attack. Here, there is a spectrum of probabilities ranging from low to high, including lower to higher consequences in terms of casualties and panic throughout society caused by one of the three types of attack.

Moreover, there are significant differences between "conventional" and CBRN warfare in terms of their types of weapons, devices, and delivery systems that will affect the way an I&W system will be designed. For example, the lead time needed by a terrorist group to develop the capability to launch a nuclear attack is much greater than the time needed to prepare for a biological, chemical, radiological, or conventional attack. Therefore, the I&W indicators for the former will probably be based on a much more comprehensive list of factors, developed over a longer period of time, than for the latter weapons, devices, and delivery systems. Similarly, the threshold for warning about a possible terrorist nuclear attack is probably lower than that for a biological, chemical, radiological, or "conventional" attack, because the consequences of a nuclear attack (and, therefore, the probable reactions of law enforcement agencies and military forces) are likely to be much more severe than for most terrorist attacks.

Thus, the I&W system for CLI, CHI, or CBRN warfare should be based on a series of databases and attributes for each of the CLI, CHI, or CBRN weapons and devices that the terrorist group under examination may be considering. As a result, one database of I&W attributes could examine the characteristics regarding motivations and operational capabilities by the terrorist group to determine *which kinds of CLI, CHI, or CBRN weapons, devices, and delivery systems* they are most likely to employ. The second database of I&W attributes would identify the *key* characteristics that an analyst should look for in determining whether a group is becoming more or less likely to *actually launch an attack* for which they have the theoretical capability.

The objective of developing such an I&W methodology is to provide the intelligence and security community with a toolkit to chart as many significant indicators (including subindicators and observables) as possible. Focusing on these indicators provides an analytical framework in which to collect information and data that, once correlated, would provide the necessary aggregation to issue warnings (at the earliest as possible time frame) that a group is likely to pursue a "worrisome" type of warfare. Such an objective, however, is inherently limited in several respects. First, without penetrating a group with one's own operatives or debriefing defectors, it is difficult to obtain tactical intelligence about a terrorist

group's intentions, capabilities, and targeting. Thus, without such optimal counterintelligence conditions, any predictive analytic tool can only raise a warning flag based on secondary—not "primary"—indicators about a certain terrorist group, generating a spectrum of potential "worrisome" scenarios, as opposed to pinpointing the time frame for an actual attack.

Second, as mentioned previously, contemporary terrorist groups tend to be loosely affiliated, ad hoc groupings that coalesce for a single operation, leaving few "footprints" or "signatures" of their activity, thus making it difficult for an analyst to monitor their activities and intentions.[8] Third, additional limitations include (1) the difficulty of monitoring CLI-, CHI-, or CBRN-associated activities by groups that engage in clandestine activities; (2) the need for significant lead time in tracking high-technology-based terrorist attacks; and (3) the problem of aggregating all the indicators (even once information is gathered about a group's activities), because the likelihood of a group turning to CLI, CHI, or CBRN terrorism will probably be more a function of the interaction of several indicators than the force of any single indicator alone.

Nevertheless, despite these inherent shortcomings, an effective I&W methodology can provide analysts and counterterrorism planners with a conceptual approach "to collate diverse sources of information and to understand complex relationships and data."[9] To display the pre-incident's processes, paths, and links involved in the likelihood that a terrorist group will resort to CLI, CHI, or CBRN warfare, this analysis groups the I&W indicators into four phases, as shown in Table 26.1 and Figure 26.1. These four phases are distinguished for analytical purposes and, in reality, some of the indicators or phases could be carried out contemporaneously or bypassed altogether. Moreover, within these four phases, the thirty-one I&W indicators should be considered in combination, because no single factor has sufficient independent explanatory value.

- Phase I—the Group Formation phase
- Phase II—the Planning phase
- Phase III—the Developmental phase
- Phase IV—the Execution phase

These four phases of the pre-incident process can be broken down further into eleven levels of analysis:

- First, which *geographic areas/states* require monitoring for precipitating *societal conditions (#1)* and the *proliferation of radical subcultures (#2),* from which terrorist groups emerge?
- Second, which *particular terrorist groups (#3)* are inclined, in terms of their *leadership (#4), motivation (#5), strategy (#6), and agenda (#7)* to transition from

conventional to CBRN warfare, and why would they choose CBRN "catastrophic" warfare when "conventional" warfare might be sufficiently lethal?

- Third, what is the nature of the terrorist group's core *constituency (#11)* and how would it react to mass casualty/CBRN-type attacks, as opposed to "low casualty" attacks with conventional weapons (although certain CBRN weapons might result in few casualties but cause mass panic throughout society)?

- Fourth, what kinds of *accelerators (#14) and triggers (#15)* are likely to drive terrorist leaders to plan a "high casualty" (as opposed to a "low casualty") type attack?

- Fifth, what kinds of *organizational (#8), funding (#10), recruitment (#17), acquisition (#19), development (#20), and logistical (#27)* capabilities will a terrorist group need to attain in order to have the operational capability to execute either a "conventional" or CBRN attack?

- Sixth, will "conventional" or "martyrdom" suicide tactics be employed to carry out CLI, CHI, or CBRN warfare? This has a bearing for both motivation and capabilities of a group.

- Seventh, in terms of the terrorist group's targeting options, what *vulnerable "key targeting (#29) points"* are they most interested in attacking, and are there certain key anniversaries around which they are likely to attack?

- Eighth, how does a terrorist group's decision to attack a particular target affect their *choice of CBRN weapons, devices, and delivery systems*?

- Ninth, can the terrorist group conduct terrorist warfare *on its own* or with the *support of a state sponsor (#13)*?

- Tenth, what *internal (#30) and external (#31) hurdles* must terrorist groups overcome in order to execute a CBRN attack?

- Finally, what can the targeted adversary do during the pre-incident process to *harden its defenses* against the spectrum of potential terrorist attacks?

Applying these 31 indicator categories to currently operating or emerging terrorist groups will reveal whether a group is planning an attack, its motivation and strategy, the type (or types) of weapons it plans to use (particularly "conventional" or CBRN), and its likely targeting. In such a way, this methodology enables an analyst to correlate along the pre-incident's four phases a terrorist group's *internal factors* (such as the nature of its leadership, motivation and strategy, organization, funding, recruitment, training, front organizations, constituency, logistical network, and surveillance of potential targets), with *external factors* (such as linkages with foreign groups, state sponsors, and foreign suppliers), as well as potential *accelerators and triggers* (such as access on gray or black markets for acquiring needed components or devices, or a dramatic event that would precipitate a group to take drastic action), and a group's capability to overcome various *internal and external hurdles* (such as defections, breakdowns in security, testing failures or accidents with devices, or monitoring or penetration of a group by external intelligence or counterterrorism

organizations), in order to ascertain a group's *"attack potential."* Thus, if these indicator categories and their subindicators and observables could be *correlated*—recognizing that some indicators are more significant and have higher quantifiable weighting properties than others—such analysis might indicate increasing threat possibilities, including the possible resort to conventional or single or multiple CBRN weapons and devices, as well as their likely targeting.

Once this methodology yields the appropriate I&W information concerning a terrorist group's warfare proclivity, then an analyst would utilize a multitiered approach to develop a spectrum of warnings. Filter sets can be used to focus attention on current or emerging terrorist groups most likely to embark on CLI/CHI/or CBRN-type warfare. A multitiered approach can be used to identify groups likely to embark on CLI/CHI/or CBRN warfare, with increasingly "tight" filters for moving a group from CLI to CHI, and to the higher-tier CBRN warfare (see   Figure 26.3).

Once sufficient "attack indicator" information and data coalesce into a thorough forecast, leading authorities to issue warnings about a group's imminent warfare proclivity, then other agencies or personnel would be tasked to operationally preempt or prevent that terrorist group from carrying out an attack (if such a governmental preemptive capability existed). In such a way, a robust I&W methodology can be made sufficiently comprehensive and systematic, allowing the analyst to exhaust all possible relevant indicators involved in the pre-incident process, and yet avoid becoming too general or abstract to be of practical use.

**CONCLUSION**

In conclusion, the analytical approach offered in this chapter is intended to highlight some of the internal and external factors, requirements, and hurdles that need to be considered in assessing a terrorist group's current and future development status and operational capability for conducting CLI, CHI, or CBRN warfare. Correlating these internal and external factors and hurdles would make it possible to assess which terrorist groups and state sponsors are likely to pursue any of these types of warfare, the adaptations and changes that are required to transition from simple to complex warfare, the types of weapons and targeting that a group is likely

to pursue (including the possible resort to single or multiple weapons and devices), the timelines for such attacks, and vulnerabilities that could be exploited by a government's intelligence and counterterrorism agencies to constrain terrorist groups—and, when applicable, state sponsors—from doing so.

Hopefully, such a conceptual approach will make it possible for the counterterrorism community—whether policymakers, warfighters, or analysts—to efficiently calibrate their resources in order to intervene at the earliest possible phases in ways that will influence, preempt, deter, prevent, and defeat terrorist actions, whether CLI, CHI, or CBRN.

## THE NATIONAL SECURITY STRATEGY OF THE UNITED STATES

### INTRODUCTION

My Fellow Americans,

America is at war. This is a wartime national security strategy required by the grave challenge we face—the rise of terrorism fueled by an aggressive ideology of hatred and murder, fully revealed to the American people on September 11, 2001. This strategy reflects our most solemn obligation: to protect the security of the American people.

America also has an unprecedented opportunity to lay the foundations for future peace. The ideals that have inspired our history—freedom, democracy, and human dignity—are increasingly inspiring individuals and nations throughout the world. And because free nations tend toward peace, the advance of liberty will make America more secure.

These inseparable priorities—fighting and winning the war on terror and promoting freedom as the alternative to tyranny and despair—have now guided American policy for more than 4 years.

We have kept on the offensive against terrorist networks, leaving our enemy weakened, but not yet defeated.

We have joined with the Afghan people to bring down the Taliban regime—the protectors of the al Qaeda network—and aided a new, democratic government to rise in its place.

We have focused the attention of the world on the proliferation of dangerous weapons—although great challenges in this area remain.

We have stood for the spread of democracy in the broader Middle East—meeting challenges yet seeing progress few would have predicted or expected.

We have cultivated stable and cooperative relations with all the major powers of the world.

We have dramatically expanded our efforts to encourage economic development and the hope it brings—and focused these efforts on the promotion of reform and achievement of results.

We led an international coalition to topple the dictator of Iraq, who had brutalized his own people, terrorized his region, defied the international community, and sought and used weapons of mass destruction.

And we are fighting alongside Iraqis to secure a united, stable, and democratic Iraq—a new ally in the war on terror in the heart of the Middle East.

We have seen great accomplishments, confronted new challenges, and refined our approach as conditions changed. We have also found that the defense of freedom brings us loss and sorrow, because freedom has determined enemies. We have always known that the war on terror would require great sacrifice—and in this war, we have said farewell to some very good men and women. The terrorists have used dramatic acts of murder—from the streets of Fallujah to the subways of London—in an attempt to undermine our will. The struggle against this enemy—an enemy that targets the innocent without conscience or hesitation—has been difficult. And our work is far from over.

America now faces a choice between the path of fear and the path of confidence. The path of fear—isolationism and protectionism, retreat and retrenchment—appeals to those who find our challenges too great and fail to see our opportunities. Yet history teaches that every time American leaders have taken this path, the challenges have only increased and the missed opportunities have left future generations less secure.

This Administration has chosen the path of confidence. We choose leadership over isolationism, and the pursuit of free and fair trade and open markets over protectionism. We choose to deal with challenges now rather than leaving them for future generations. We fight our enemies abroad instead of waiting for them to arrive in our country. We seek to shape the world, not merely be shaped by it; to influence events for the better instead of being at their mercy.

The path we have chosen is consistent with the great tradition of American foreign policy. Like the policies of Harry Truman and Ronald Reagan, our approach is idealistic about our national goals, and realistic about the means to achieve them.

To follow this path, we must maintain and expand our national strength so we can deal with threats and challenges before they can damage our people or our interests. We must maintain a military without peer—yet our strength is not founded on force of arms alone. It also rests on economic prosperity and a vibrant democracy. And it rests on strong alliances, friendships, and international institutions, which enable us to promote freedom, prosperity, and peace in common purpose with others.

Our national security strategy is founded upon two pillars:

The first pillar is promoting freedom, justice, and human dignity—working to end tyranny, to promote effective democracies, and to extend prosperity through free and fair trade and wise development policies. Free governments are accountable to their people, govern their territory effectively, and pursue economic and political policies that benefit their citizens. Free governments do not oppress their people or attack other free nations. Peace and international stability are most reliably built on a foundation of freedom.

The second pillar of our strategy is confronting the challenges of our time by leading a growing community of democracies. Many of the problems we face—from the threat of pandemic disease, to proliferation of weapons of mass destruction, to terrorism, to human trafficking, to natural disasters—reach across borders. Effective multinational efforts are essential to solve these problems. Yet history has shown that only when we do our part will others do theirs. America must continue to lead.

## I. OVERVIEW OF AMERICA'S NATIONAL SECURITY STRATEGY

It is the policy of the United States to seek and support democratic movements and institutions in every nation and culture, with the ultimate goal of ending tyranny in our world. In the world today, the fundamental character of regimes matters as much as the distribution of power among them. The goal of our statecraft is to help create a world of democratic, well-governed states that can meet the needs of their citizens and conduct themselves responsibly in the international system. This is the best way to provide enduring security for the American people.

Achieving this goal is the work of generations. The United States is in the early years of a long struggle, similar to what our country faced in the early years of the Cold War. The 20th century witnessed the triumph of freedom over the threats of fascism and communism. Yet a new totalitarian ideology now threatens, an ideology grounded not in secular philosophy but in the perversion of a proud religion. Its content may be different

from the ideologies of the last century, but its means are similar: intolerance, murder, terror, enslavement, and repression.

Like those who came before us, we must lay the foundations and build the institutions that our country needs to meet the challenges we face. The chapters that follow will focus on several essential tasks. The United States must:

- Champion aspirations for human dignity;
- Strengthen alliances to defeat global terrorism and work to prevent attacks against us and our friends;
- Work with others to defuse regional conflicts;
- Prevent our enemies from threatening us, our allies, and our friends with weapons of mass destruction (WMD);
- Ignite a new era of global economic growth through free markets and free trade;
- Expand the circle of development by opening societies and building the infrastructure of democracy;
- Develop agendas for cooperative action with other main centers of global power;
- Transform America's national security institutions to meet the challenges and opportunities of the 21st century; and
- Engage the opportunities and confront the challenges of globalization.

## II. CHAMPION ASPIRATIONS FOR HUMAN DIGNITY

### A. Summary of National Security Strategy 2002

The United States must defend liberty and justice because these principles are right and true for all people everywhere. These nonnegotiable demands of human dignity are protected most securely in democracies. The United States Government will work to advance human dignity in word and deed, speaking out for freedom and against violations of human rights and allocating appropriate resources to advance these ideals.

### B. Successes and Challenges since 2002

Since 2002, the world has seen extraordinary progress in the expansion of freedom, democracy, and human dignity:

- The peoples of Afghanistan and Iraq have replaced tyrannies with democracies.
  - In Afghanistan, the tyranny of the Taliban has been replaced by a freely elected government; Afghans have written and ratified a constitution guaranteeing rights and freedoms unprecedented in their history; and an elected legislature gives the people a regular voice in their government.

○ In Iraq, a tyrant has been toppled; over 8 million Iraqis voted in the nation's first free and fair election; a freely negotiated constitution was passed by a referendum in which almost 10 million Iraqis participated; and, for the first time in their history, nearly 12 million Iraqis have elected a permanent government under a popularly determined constitution.

• The people of Lebanon have rejected the heavy hand of foreign rule. The people of Egypt have experienced more open but still flawed elections. Saudi Arabia has taken some preliminary steps to give its citizens more of a voice in their government. Jordan has made progress in opening its political process. Kuwait and Morocco are pursuing agendas of political reform.

• The "color revolutions" in Georgia, Ukraine, and Kyrgyzstan have brought new hope for freedom across the Eurasian landmass.

• Democracy has made further advances in Africa, Latin America, and Asia, with peaceful transfers of power; growth in independent judiciaries and the rule of law; improved election practices; and expanding political and economic rights.

The human desire for freedom is universal, but the growth of freedom is not inevitable. Without support from free nations, freedom's spread could be hampered by the challenges we face:

• Many governments are at fragile stages of political development and need to consolidate democratic institutions—and leaders that have won democratic elections need to uphold the principles of democracy;

• Some governments have regressed, eroding the democratic freedoms their peoples enjoy;

• Some governments have not delivered the benefits of effective democracy and prosperity to their citizens, leaving them susceptible to or taken over by demagogues peddling an anti–free market authoritarianism;

• Some regimes seek to separate economic liberty from political liberty, pursuing prosperity while denying their people basic rights and freedoms; and

• Tyranny persists in its harshest form in a number of nations.

### C. The Way Ahead

The United States has long championed freedom because doing so reflects our values and advances our interests. It reflects our values because we believe the desire for freedom lives in every human heart and the imperative of human dignity transcends all nations and cultures.

Championing freedom advances our interests because the survival of liberty at home increasingly depends on the success of liberty abroad. Governments that honor their citizens' dignity and desire for freedom tend to uphold responsible conduct toward other nations, while governments that brutalize their people also threaten the peace and stability of other nations. Because democracies are the most responsible members of

the international system, promoting democracy is the most effective long-term measure for strengthening international stability; reducing regional conflicts; countering terrorism and terror-supporting extremism; and extending peace and prosperity.

To protect our Nation and honor our values, the United States seeks to extend freedom across the globe by leading an international effort to end tyranny and to promote effective democracy.

### 1. Explaining the Goal: Ending Tyranny

Tyranny is the combination of brutality, poverty, instability, corruption, and suffering, forged under the rule of despots and despotic systems. People living in nations such as the Democratic People's Republic of Korea (DPRK), Iran, Syria, Cuba, Belarus, Burma, and Zimbabwe know firsthand the meaning of tyranny; it is the bleak reality they endure every day. And the nations they border know the consequences of tyranny as well, for the misrule of tyrants at home leads to instability abroad. All tyrannies threaten the world's interest in freedom's expansion, and some tyrannies, in their pursuit of WMD or sponsorship of terrorism, threaten our immediate security interests as well. Tyranny is not inevitable, and recent history reveals the arc of the tyrant's fate. The 20th century has been called the "Democracy Century," as tyrannies fell one by one and democracies rose in their stead. At midcentury about two dozen of the world's governments were democratic; 50 years later this number was over 120. The democratic revolution has embraced all cultures and all continents.

Though tyranny has few advocates, it needs more adversaries. In today's world, no tyrant's rule can survive without the support or at least the tolerance of other nations. To end tyranny we must summon the collective outrage of the free world against the oppression, abuse, and impoverishment that tyrannical regimes inflict on their people—and summon their collective action against the dangers tyrants pose to the security of the world.

An end to tyranny will not mark an end to all global ills. Disputes, disease, disorder, poverty, and injustice will outlast tyranny, confronting democracies long after the last tyrant has fallen. Yet tyranny must not be tolerated—it is a crime of man, not a fact of nature.

### 2. Explaining the Goal: Promoting Effective Democracies

As tyrannies give way, we must help newly free nations build effective democracies: states that are respectful of human dignity, accountable to their citizens, and responsible towards their neighbors. Effective democracies:

- Honor and uphold basic human rights, including freedom of religion, conscience, speech, assembly, association, and press;

- Are responsive to their citizens, submitting to the will of the people, especially when people vote to change their government;
- Exercise effective sovereignty and maintain order within their own borders, protect independent and impartial systems of justice, punish crime, embrace the rule of law, and resist corruption; and
- Limit the reach of government, protecting the institutions of civil society, including the family, religious communities, voluntary associations, private property, independent business, and a market economy.

In effective democracies, freedom is indivisible. Political, religious, and economic liberty advance together and reinforce each other. Some regimes have opened their economies while trying to restrict political or religious freedoms. This will not work. Over time, as people gain control over their economic lives, they will insist on more control over their political and personal lives as well. Yet political progress can be jeopardized if economic progress does not keep pace. We will harness the tools of economic assistance, development aid, trade, and good governance to help ensure that new democracies are not burdened with economic stagnation or endemic corruption. Elections are the most visible sign of a free society and can play a critical role in advancing effective democracy. But elections alone are not enough—they must be reinforced by other values, rights, and institutions to bring about lasting freedom. Our goal is human liberty protected by democratic institutions.

Participation in elections by individuals or parties must include their commitment to the equality of all citizens; minority rights; civil liberties; voluntary and peaceful transfer of power; and the peaceful resolution of differences. Effective democracy also requires institutions that can protect individual liberty and ensure that the government is responsive and accountable to its citizens. There must be an independent media to inform the public and facilitate the free exchange of ideas. There must be political associations and political parties that can freely compete. Rule of law must be reinforced by an independent judiciary, a professional legal establishment, and an honest and competent police force.

These principles are tested by the victory of Hamas candidates in the recent elections in the Palestinian territories. The Palestinian people voted in a process that was free, fair, and inclusive.

The Palestinian people having made their choice at the polls, the burden now shifts to those whom they have elected to take the steps necessary to advance peace, prosperity, and statehood for the Palestinian people. Hamas has been designated as a terrorist organization by the United States and European Union (EU) because it has embraced terrorism and deliberately killed innocent civilians. The international community has made clear that there is a fundamental contradiction between armed group and militia activities and the building of a democratic state.

The international community has also made clear that a two-state solution to the conflict requires all participants in the democratic process to renounce violence and terror, accept Israel's right to exist, and disarm as outlined in the Roadmap. These requirements are clear, firm, and of long standing. The opportunity for peace and statehood—a consistent goal of this Administration—is open if Hamas will abandon its terrorist roots and change its relationship with Israel.

The elected Hamas representatives also have an opportunity and a responsibility to uphold the principles of democratic government, including protection of minority rights and basic freedoms and a commitment to a recurring, free, and fair electoral process. By respecting these principles, the new Palestinian leaders can demonstrate their own commitment to freedom and help bring a lasting democracy to the Palestinian territories. But any elected government that refuses to honor these principles cannot be considered fully democratic, however it may have taken office.

### 3. How We Will Advance Freedom: Principled in Goals and Pragmatic in Means

We have a responsibility to promote human freedom. Yet freedom cannot be imposed; it must be chosen. The form that freedom and democracy take in any land will reflect the history, culture, and habits unique to its people. The United States will stand with and support advocates of freedom in every land. Though our principles are consistent, our tactics will vary. They will reflect, in part, where each government is on the path from tyranny to democracy. In some cases, we will take vocal and visible steps on behalf of immediate change. In other cases, we will lend more quiet support to lay the foundation for future reforms. As we consider which approaches to take, we will be guided by what will most effectively advance freedom's cause while we balance other interests that are also vital to the security and well-being of the American people.

In the cause of ending tyranny and promoting effective democracy, we will employ the full array of political, economic, diplomatic, and other tools at our disposal, including:

- Speaking out against abuses of human rights;
- Supporting publicly democratic reformers in repressive nations, including by holding high-level meetings with them at the White House, Department of State, and U.S. Embassies;
- Using foreign assistance to support the development of free and fair elections, rule of law, civil society, human rights, women's rights, free media, and religious freedom;
- Tailoring assistance and training of military forces to support civilian control of the military and making military show respect for human rights in a democratic society;

- Applying sanctions that are designed to target those who rule oppressive regimes while sparing the people;
- Encouraging other nations not to support oppressive regimes;
- Partnering with other democratic nations to promote freedom, democracy, and human rights in specific countries and regions;
- Strengthening and building new initiatives such as the Broader Middle East and North Africa Initiative's Foundation for the Future, the Community of Democracies, and the United Nations Democracy Fund;
- Forming creative partnerships with nongovernmental organizations and other civil society voices to support and reinforce their work;
- Working with existing international institutions such as the United Nations and regional organizations such as the Organization for Security and Cooperation in Europe, the African Union (AU), and the Organization of American States (OAS) to help implement their democratic commitments, and helping establish democracy charters in regions that lack them;
- Supporting condemnation in multilateral institutions of egregious violations of human rights and freedoms;
- Encouraging foreign direct investment in and foreign assistance to countries where there is a commitment to the rule of law, fighting corruption, and democratic accountability; and
- Concluding free trade agreements (FTAs) that encourage countries to enhance the rule of law, fight corruption, and further democratic accountability.

These tools must be used vigorously to protect the freedoms that face particular peril around the world: religious freedom, women's rights, and freedom for men, women, and children caught in the cruel network of human trafficking.

- Against a terrorist enemy that is defined by religious intolerance, we defend the First Freedom: the right of people to believe and worship according to the dictates of their own conscience, free from the coercion of the state, the coercion of the majority, or the coercion of a minority that wants to dictate what others must believe.
- No nation can be free if half its population is oppressed and denied fundamental rights. We affirm the inherent dignity and worth of women, and support vigorously their full participation in all aspects of society.
- Trafficking in persons is a form of modern-day slavery, and we strive for its total abolition. Future generations will not excuse those who turn a blind eye to it.

Our commitment to the promotion of freedom is a commitment to walk alongside governments and their people as they make the difficult transition to effective democracies. We will not abandon them before the transition is secure because immature democracies can be prone to conflict and vulnerable to exploitation by terrorists. We will not let the challenges of

democratic transitions frighten us into clinging to the illusory stability of the authoritarian.

America's closest alliances and friendships are with countries with whom we share common values and principles. The more countries demonstrate that they treat their own citizens with respect and are committed to democratic principles, the closer and stronger their relationship with America is likely to be.

The United States will lead and calls on other nations to join us in a common international effort. All free nations have a responsibility to stand together for freedom because all free nations share an interest in freedom's advance.

## III. STRENGTHEN ALLIANCES TO DEFEAT GLOBAL TERRORISM AND WORK TO PREVENT ATTACKS AGAINST US AND OUR FRIENDS

### A. Summary of National Security Strategy 2002

Defeating terrorism requires a long-term strategy and a break with old patterns. We are fighting a new enemy with global reach. The United States can no longer simply rely on deterrence to keep the terrorists at bay or defensive measures to thwart them at the last moment. The fight must be taken to the enemy, to keep them on the run. To succeed in our own efforts, we need the support and concerted action of friends and allies. We must join with others to deny the terrorists what they need to survive: safe haven, financial support, and the support and protection that certain nation-states historically have given them.

### B. Current Context: Successes and Challenges

The war against terror is not over. America is safer, but not yet safe. As the enemy adjusts to our successes, so too must we adjust. The successes are many:

- Al Qaeda has lost its safe haven in Afghanistan.
- A multinational coalition joined by the Iraqis is aggressively prosecuting the war against the terrorists in Iraq.
- The al Qaeda network has been significantly degraded. Most of those in the al Qaeda network responsible for the September 11 attacks, including the plot's mastermind, Khalid Shaykh Muhammad, have been captured or killed.
- There is a broad and growing global consensus that the deliberate killing of innocents is never justified by any calling or cause.
- Many nations have rallied to fight terrorism, with unprecedented cooperation on law enforcement, intelligence, military, and diplomatic activity.

- Numerous countries that were part of the problem before September 11 are now increasingly becoming part of the solution—and this transformation has occurred without destabilizing friendly regimes in key regions.
- The Administration has worked with Congress to adopt and implement key reforms like the Patriot Act, which promote our security while also protecting our fundamental liberties.

The enemy is determined, however, and we face some old and new challenges:

- Terrorist networks today are more dispersed and less centralized. They are more reliant on smaller cells inspired by a common ideology and less directed by a central command structure.
- While the United States Government and its allies have thwarted many attacks, we have not been able to stop them all. The terrorists have struck in many places, including Afghanistan, Egypt, Indonesia, Iraq, Israel, Jordan, Morocco, Pakistan, Russia, Saudi Arabia, Spain, and the United Kingdom. And they continue to seek WMD in order to inflict even more catastrophic attacks on us and our friends and allies.
- The ongoing fight in Iraq has been twisted by terrorist propaganda as a rallying cry.
- Some states, such as Syria and Iran, continue to harbor terrorists at home and sponsor terrorist activity abroad.

## C. The Way Ahead

From the beginning, the War on Terror has been both a battle of arms and a battle of ideas—a fight against the terrorists and against their murderous ideology. In the short run, the fight involves using military force and other instruments of national power to kill or capture the terrorists, deny them safe haven or control of any nation, prevent them from gaining access to WMD, and cut off their sources of support. In the long run, winning the war on terror means winning the battle of ideas, for it is ideas that can turn the disenchanted into murderers willing to kill innocent victims.

While the War on Terror is a battle of ideas, it is not a battle of religions. The transnational terrorists confronting us today exploit the proud religion of Islam to serve a violent political vision: the establishment, by terrorism and subversion, of a totalitarian empire that denies all political and religious freedom. These terrorists distort the idea of jihad into a call for murder against those they regard as apostates or unbelievers—including Christians, Jews, Hindus, other religious traditions, and all Muslims who disagree with them. Indeed, most of the terrorist attacks since September 11 have occurred in Muslim countries—and most of the victims have been Muslims.

To wage this battle of ideas effectively, we must be clear-eyed about what does and does not give rise to terrorism:

- Terrorism is not the inevitable by-product of poverty. Many of the September 11 hijackers were from middle-class backgrounds, and many terrorist leaders, like bin Laden, are from privileged upbringings.
- Terrorism is not simply a result of hostility to U.S. policy in Iraq. The United States was attacked on September 11 and earlier, well before we toppled the Saddam Hussein regime. Moreover, countries that stayed out of the Iraq war have not been spared from terror attack.
- Terrorism is not simply a result of Israeli-Palestinian issues. Al Qaeda plotting for the September 11 attacks began in the 1990s, during an active period in the peace process.
- Terrorism is not simply a response to our efforts to prevent terror attacks. The al Qaeda network targeted the United States long before the United States targeted al Qaeda. Indeed, the terrorists are emboldened more by perceptions of weakness than by demonstrations of resolve. Terrorists lure recruits by telling them that we are decadent and easily intimidated and will retreat if attacked.

The terrorism we confront today springs from:

- Political alienation. Transnational terrorists are recruited from people who have no voice in their own government and see no legitimate way to promote change in their own country. Without a stake in the existing order, they are vulnerable to manipulation by those who advocate a perverse vision based on violence and destruction.
- Grievances that can be blamed on others. The failures the terrorists feel and see are blamed on others, and on perceived injustices from the recent or sometimes distant past. The terrorists' rhetoric keeps wounds associated with this past fresh and raw, a potent motivation for revenge and terror.
- Subcultures of conspiracy and misinformation. Terrorists recruit more effectively from populations whose information about the world is contaminated by falsehoods and corrupted by conspiracy theories. The distortions keep alive grievances and filter out facts that would challenge popular prejudices and self-serving propaganda.
- An ideology that justifies murder. Terrorism ultimately depends upon the appeal of an ideology that excuses or even glorifies the deliberate killing of innocents. A proud religion—the religion of Islam—has been twisted and made to serve an evil end, as in other times and places other religions have been similarly abused.

Defeating terrorism in the long run requires that each of these factors be addressed. The genius of democracy is that it provides a counter to each.

- In place of alienation, democracy offers an ownership stake in society, a chance to shape one's own future.

- In place of festering grievances, democracy offers the rule of law, the peaceful resolution of disputes, and the habits of advancing interests through compromise.
- In place of a culture of conspiracy and misinformation, democracy offers freedom of speech, independent media, and the marketplace of ideas, which can expose and discredit falsehoods, prejudices, and dishonest propaganda.
- In place of an ideology that justifies murder, democracy offers a respect for human dignity that abhors the deliberate targeting of innocent civilians.

Democracy is the opposite of terrorist tyranny, which is why the terrorists denounce it and are willing to kill the innocent to stop it. Democracy is based on empowerment, while the terrorists' ideology is based on enslavement. Democracies expand the freedom of their citizens, while the terrorists seek to impose a single set of narrow beliefs. Democracy sees individuals as equal in worth and dignity, having an inherent potential to create and to govern themselves. The terrorists see individuals as objects to be exploited, and then to be ruled and oppressed.

Democracies are not immune to terrorism. In some democracies, some ethnic or religious groups are unable or unwilling to grasp the benefits of freedom otherwise available in the society. Such groups can evidence the same alienation and despair that the transnational terrorists exploit in undemocratic states. This accounts for the emergence in democratic societies of homegrown terrorists such as were responsible for the bombings in London in July 2005 and for the violence in some other nations. Even in these cases, the long-term solution remains deepening the reach of democracy so that all citizens enjoy its benefits.

The strategy to counter the lies behind the terrorists' ideology is to empower the very people the terrorists most want to exploit: the faithful followers of Islam. We will continue to support political reforms that empower peaceful Muslims to practice and interpret their faith. The most vital work will be done within the Islamic world itself, and Jordan, Morocco, and Indonesia have begun to make important strides in this effort. Responsible Islamic leaders need to denounce an ideology that distorts and exploits Islam for destructive ends and defiles a proud religion.

Many of the Muslim faith are already making this commitment at great personal risk. They realize they are a target of this ideology of terror. Everywhere we have joined in the fight against terrorism, Muslim allies have stood beside us, becoming partners in this vital cause. Pakistan and Saudi Arabia have launched effective efforts to capture or kill the leadership of the al Qaeda network. Afghan troops are in combat against Taliban remnants. Iraqi soldiers are sacrificing to defeat al Qaeda in their own country. These brave citizens know the stakes—the survival of their own liberty, the future of their own region, the justice and humanity of their own traditions—and the United States is proud to stand beside them.

The advance of freedom and human dignity through democracy is the long-term solution to the transnational terrorism of today. To create the space and time for that long-term solution to take root, there are four steps we will take in the short term.

- *Prevent attacks by terrorist networks before they occur*. A government has no higher obligation than to protect the lives and livelihoods of its citizens. The hard core of the terrorists cannot be deterred or reformed; they must be tracked down, killed, or captured. They must be cut off from the network of individuals and institutions on which they depend for support. That network must in turn be deterred, disrupted, and disabled by using a broad range of tools.
- *Deny WMD to rogue states and to terrorist allies who would use them without hesitation*. Terrorists have a perverse moral code that glorifies deliberately targeting innocent civilians. Terrorists try to inflict as many casualties as possible and seek WMD to this end. Denying terrorists WMD will require new tools and new international approaches. We are working with partner nations to improve security at vulnerable nuclear sites worldwide and bolster the ability of states to detect, disrupt, and respond to terrorist activity involving WMD.
- *Deny terrorist groups the support and sanctuary of rogue states.* The United States and its allies in the War on Terror make no distinction between those who commit acts of terror and those who support and harbor them, because they are equally guilty of murder. Any government that chooses to be an ally of terror, such as Syria or Iran, has chosen to be an enemy of freedom, justice, and peace. The world must hold those regimes to account.
- *Deny the terrorists control of any nation that they would use as a base and launching pad for terror.* The terrorists' goal is to overthrow a rising democracy, claim a strategic country as a haven for terror, destabilize the Middle East, and strike America and other free nations with ever-increasing violence. This we can never allow. This is why success in Afghanistan and Iraq is vital, and why we must prevent terrorists from exploiting ungoverned areas.

America will lead in this fight, and we will continue to partner with allies and will recruit new friends to join the battle.

### Afghanistan and Iraq: The Front Lines in the War on Terror

Winning the War on Terror requires winning the battles in Afghanistan and Iraq.

In Afghanistan, the successes already won must be consolidated. A few years ago, Afghanistan was condemned to a premodern nightmare. Now it has held two successful free elections and is a staunch ally in the war on terror. Much work remains, however, and the Afghan people deserve the support of the United States and the entire international community.

The terrorists today see Iraq as the central front of their fight against the United States. They want to defeat America in Iraq and force us

to abandon our allies before a stable democratic government has been established that can provide for its own security. The terrorists believe they would then have proven that the United States is a waning power and an unreliable friend. In the chaos of a broken Iraq the terrorists believe they would be able to establish a safe haven like they had in Afghanistan, only this time in the heart of a geopolitically vital region. Surrendering to the terrorists would likewise hand them a powerful recruiting tool: the perception that they are the vanguard of history.

When the Iraqi Government, supported by the Coalition, defeats the terrorists, terrorism will be dealt a critical blow. We will have broken one of al Qaeda's most formidable factions—the network headed by Zarqawi—and denied him the safe haven he seeks in Iraq. And the success of democracy in Iraq will be a launching pad for freedom's success throughout a region that for decades has been a source of instability and stagnation.

The Administration has explained in some detail the strategy for helping the Iraqi people defeat the terrorists and neutralize the insurgency in Iraq. This requires supporting the Iraqi people in integrating activity along three broad tracks:

### *Political: Work with Iraqis to:*

- *Isolate* hardened enemy elements who are unwilling to accept a peaceful political process;
- *Engage* those outside the political process who are willing to turn away from violence and invite them into that process; and
- *Build* stable, pluralistic, and effective national institutions that can protect the interests of all Iraqis.

### *Security: Work with Iraqi Security Forces to:*

- *Clear* areas of enemy control by remaining on the offensive, killing and capturing enemy fighters, and denying them safe haven;
- *Hold* areas freed from enemy control with an adequate Iraqi security force presence that ensures these areas remain under the control of a peaceful Iraqi Government; and
- *Build* Iraqi Security Forces and the capacity of local institutions to deliver services, advance the rule of law, and nurture civil society.

### *Economic: Work with the Iraqi Government to:*

- *Restore* Iraq's neglected infrastructure so that Iraqis can meet increasing demand and the needs of a growing economy;
- *Reform* Iraq's economy so that it can be self-sustaining based on market principles; and

- *Build* the capacity of Iraqi institutions to maintain their infrastructure, rejoin the international economic community, and improve the general welfare and prosperity of all Iraqis.

## IV. WORK WITH OTHERS TO DEFUSE REGIONAL CONFLICTS

### A. Summary of National Security Strategy 2002

Regional conflicts are a bitter legacy from previous decades that continue to affect our national security interests today. Regional conflicts do not stay isolated for long and often spread or devolve into humanitarian tragedy or anarchy. Outside parties can exploit them to further other ends, much as al Qaeda exploited the civil war in Afghanistan. This means that even if the United States does not have a direct stake in a particular conflict, our interests are likely to be affected over time. Outsiders generally cannot impose solutions on parties that are not ready to embrace them, but outsiders can sometimes help create the conditions under which the parties themselves can take effective action.

### B. Current Context: Successes and Challenges

The world has seen remarkable progress on a number of the most difficult regional conflicts that destroyed millions of lives over decades.

- In Sudan, the United States led international negotiations that peacefully resolved the 20-year conflict between the Government of Sudan and the Sudanese People's Liberation Movement.
- In Liberia, the United States led international efforts to restore peace and bolster stability after vicious internal conflict.
- Israeli forces have withdrawn from the Gaza Strip and the northern West Bank, creating the prospect for transforming Israeli-Palestinian relations and underscoring the need for the Palestinian Authority to stand up as an effective, responsible government.
- Relations between India and Pakistan have improved, with an exchange of high-level visits and a new spirit of cooperation in the dispute over Kashmir—a cooperation made more tangible by humanitarian actions undertaken following a destructive earthquake.
- The cooperative approach to the relief effort following the tsunami that hit Indonesia resulted in political shifts that helped make possible a peaceful settlement in the bitter separatist conflict in Aceh.
- In Northern Ireland, the implementation of key parts of the Good Friday Agreement, including the decommissioning of weapons, marked a substantial milestone in ending that longstanding civil conflict.

Numerous remaining regional challenges demand the world's attention:

- In Darfur, the people of an impoverished region are the victims of genocide arising from a civil war that pits a murderous militia, backed by the Sudanese Government, against a collection of rebel groups.
- In Colombia, a democratic ally is fighting the persistent assaults of Marxist terrorists and drug traffickers.
- In Venezuela, a demagogue awash in oil money is undermining democracy and seeking to destabilize the region.
- In Cuba, an anti-American dictator continues to oppress his people and seeks to subvert freedom in the region.
- In Uganda, a barbaric rebel cult—the Lord's Resistance Army—is exploiting a regional conflict and terrorizing a vulnerable population.
- In Ethiopia and Eritrea, a festering border dispute threatens to erupt yet again into open war.
- In Nepal, a vicious Maoist insurgency continues to terrorize the population while the government retreats from democracy.

### C. The Way Ahead

Regional conflicts can arise from a wide variety of causes, including poor governance, external aggression, competing claims, internal revolt, tribal rivalries, and ethnic or religious hatreds. If left unaddressed, however, these different causes lead to the same ends: failed states, humanitarian disasters, and ungoverned areas that can become safe havens for terrorists.

The Administration's strategy for addressing regional conflicts includes three levels of engagement: conflict prevention and resolution; conflict intervention; and post-conflict stabilization and reconstruction.

Effective international cooperation on these efforts is dependent on capable partners. To this end, Congress has enacted new authorities that will permit the United States to train and equip our foreign partners in a more timely and effective manner. Working with Congress, we will continue to pursue foreign assistance reforms that allow the President to draw on the skills of agencies across the United States Government.

#### 1. Conflict Prevention and Resolution

The most effective long-term measure for conflict prevention and resolution is the promotion of democracy. Effective democracies may still have disputes, but they are equipped to resolve their differences peacefully, either bilaterally or by working with other regional states or international

institutions. In the short term, however, a timely offer by free nations of "good offices" or outside assistance can sometimes prevent conflict or help resolve conflict once started. Such early measures can prevent problems from becoming crises and crises from becoming wars. The United States is ready to play this role when appropriate. Even with outside help, however, there is no substitute for bold and effective local leadership.

Progress in the short term may also depend upon the stances of key regional actors. The most effective way to address a problem within one country may be by addressing the wider regional context. This regional approach has particular application to Israeli-Palestinian issues, the conflicts in the Great Lakes region of Africa, and the conflict within Nepal.

### 2. Conflict Intervention

Some conflicts pose such a grave threat to our broader interests and values that conflict intervention may be needed to restore peace and stability. Recent experience has underscored that the international community does not have enough high-quality military forces trained and capable of performing these peace operations. The Administration has recognized this need and is working with the North Atlantic Treaty Organization (NATO) to improve the capacity of states to intervene in conflict situations. We launched the Global Peace Operations Initiative at the 2004 G-8 Summit to train peacekeepers for duty in Africa. We are also supporting United Nations (U.N.) reform to improve its ability to carry out peacekeeping missions with enhanced accountability, oversight, and results-based management practices.

### 3. Postconflict Stabilization and Reconstruction

Once peace has been restored, the hard work of postconflict stabilization and reconstruction must begin. Military involvement may be necessary to stop a bloody conflict, but peace and stability will last only if follow-on efforts to restore order and rebuild are successful. The world has found through bitter experience that success often depends on the early establishment of strong local institutions such as effective police forces and a functioning justice and penal system. This governance capacity is critical to establishing the rule of law and a free market economy, which provide long-term stability and prosperity.

To develop these capabilities, the Administration established a new office in the Department of State, the Office of the Coordinator for Reconstruction and Stabilization, to plan and execute civilian stabilization and reconstruction efforts. The office draws on all agencies of the government and integrates its activities with our military's efforts. The office will also coordinate United States Government efforts with other governments building similar capabilities (such as the United Kingdom, Canada, the

EU, and others), as well as with new international efforts such as the U.N. Peacebuilding Commission.

### 4. Genocide

Patient efforts to end conflicts should not be mistaken for tolerance of the intolerable. Genocide is the intent to destroy in whole or in part a national, ethnic, racial, or religious group. The world needs to start honoring a principle that many believe has lost its force in parts of the international community in recent years: genocide must not be tolerated.

It is a moral imperative that states take action to prevent and punish genocide. History teaches that sometimes other states will not act unless America does its part. We must refine United States Government efforts—economic, diplomatic, and law-enforcement—so that they target those individuals responsible for genocide and not the innocent citizens they rule. Where perpetrators of mass killing defy all attempts at peaceful intervention, armed intervention may be required, preferably by the forces of several nations working together under appropriate regional or international auspices.

We must not allow the legal debate over the technical definition of "genocide" to excuse inaction. The world must act in cases of mass atrocities and mass killing that will eventually lead to genocide even if the local parties are not prepared for peace.

## V. PREVENT OUR ENEMIES FROM THREATENING US, OUR ALLIES, AND OUR FRIENDS WITH WEAPONS OF MASS DESTRUCTION

### A. Summary of National Security Strategy 2002

The security environment confronting the United States today is radically different from what we have faced before. Yet the first duty of the United States Government remains what it always has been: to protect the American people and American interests. It is an enduring American principle that this duty obligates the government to anticipate and counter threats, using all elements of national power, before the threats can do grave damage. The greater the threat, the greater is the risk of inaction—and the more compelling the case for taking anticipatory action to defend ourselves, even if uncertainty remains as to the time and place of the enemy's attack. There are few greater threats than a terrorist attack with WMD.

To forestall or prevent such hostile acts by our adversaries, the United States will, if necessary, act preemptively in exercising our inherent right of self-defense. The United States will not resort to force in all cases to preempt emerging threats. Our preference is that nonmilitary actions

succeed. And no country should ever use preemption as a pretext for aggression.

Countering proliferation of WMD requires a comprehensive strategy involving strengthened nonproliferation efforts to deny these weapons of terror and related expertise to those seeking them; *proactive counterproliferation efforts* to defend against and defeat WMD and missile threats before they are unleashed; and *improved protection* to mitigate the consequences of WMD use. We aim to convince our adversaries that they cannot achieve their goals with WMD, and thus deter and dissuade them from attempting to use or even acquire these weapons in the first place.

### B. Current Context: Successes and Challenges

We have worked hard to protect our citizens and our security. The United States has worked extensively with the international community and key partners to achieve common objectives.

- The United States has begun fielding ballistic missile defenses to deter and protect the United States from missile attacks by rogue states armed with WMD. The fielding of such missile defenses was made possible by the United States' withdrawal from the 1972 Anti-Ballistic Missile Treaty, which was done in accordance with the treaty's provisions.

- In May 2003, the Administration launched the Proliferation Security Initiative (PSI), a global effort that aims to stop shipments of WMD, their delivery systems, and related material. More than 70 countries have expressed support for this initiative, and it has enjoyed several successes in impeding WMD trafficking.

- United States leadership in extensive law enforcement and intelligence cooperation involving several countries led to the roll-up of the A.Q. Khan nuclear network.

- Libya voluntarily agreed to eliminate its WMD programs shortly after a PSI interdiction of a shipment of nuclear-related material from the A.Q. Khan network to Libya.

- The United States led in securing passage in April 2004 of United Nations Security Council (UNSC) Resolution 1540, requiring nations to criminalize WMD proliferation and institute effective export and financial controls.

- We have led the effort to strengthen the ability of the International Atomic Energy Agency (IAEA) to detect and respond to nuclear proliferation.

- The Administration has established a new comprehensive framework, *Biodefense for the 21st Century*, incorporating innovative initiatives to protect the United States against bioterrorism.

Nevertheless, serious challenges remain:

- Iran has violated its Non-Proliferation Treaty safeguards obligations and refuses to provide objective guarantees that its nuclear program is solely for peaceful purposes.

- The DPRK continues to destabilize its region and defy the international community, now boasting a small nuclear arsenal and an illicit nuclear program in violation of its international obligations.

- Terrorists, including those associated with the al Qaeda network, continue to pursue WMD.

- Some of the world's supply of weapons-grade fissile material—the necessary ingredient for making nuclear weapons—is not properly protected.

- Advances in biotechnology provide greater opportunities for state and nonstate actors to obtain dangerous pathogens and equipment.

### C. The Way Ahead

We are committed to keeping the world's most dangerous weapons out of the hands of the world's most dangerous people.

### *1. Nuclear Proliferation*

The proliferation of nuclear weapons poses the greatest threat to our national security. Nuclear weapons are unique in their capacity to inflict instant loss of life on a massive scale. For this reason, nuclear weapons hold special appeal to rogue states and terrorists.

The best way to block aspiring nuclear states or nuclear terrorists is to deny them access to the essential ingredient of fissile material. It is much harder to deny states or terrorists other key components, for nuclear weapons represent a 60-year-old technology and the knowledge is widespread. Therefore, our strategy focuses on controlling fissile material with two priority objectives: first, to keep states from acquiring the capability to produce fissile material suitable for making nuclear weapons; and second, to deter, interdict, or prevent any transfer of that material from states that have this capability to rogue states or to terrorists.

*The first objective* requires closing a loophole in the Non-Proliferation Treaty that permits regimes to produce fissile material that can be used to make nuclear weapons under cover of a civilian nuclear power program. To close this loophole, we have proposed that the world's leading nuclear exporters create a safe, orderly system that spreads nuclear energy without spreading nuclear weapons. Under this system, all states would have reliable access at reasonable cost to fuel for civilian nuclear power reactors. In return, those states would remain transparent and renounce the enrichment and reprocessing capabilities that can produce fissile material for nuclear weapons. In this way, enrichment and reprocessing will not be necessary for nations seeking to harness nuclear energy for strictly peaceful purposes.

The Administration has worked with the international community in confronting nuclear proliferation.

We may face no greater challenge from a single country than from Iran. For almost 20 years, the Iranian regime hid many of its key nuclear

efforts from the international community. Yet the regime continues to claim that it does not seek to develop nuclear weapons. The Iranian regime's true intentions are clearly revealed by the regime's refusal to negotiate in good faith; its refusal to come into compliance with its international obligations by providing the IAEA access to nuclear sites and resolving troubling questions; and the aggressive statements of its President calling for Israel to "be wiped off the face of the earth." The United States has joined with our EU partners and Russia to pressure Iran to meet its international obligations and provide objective guarantees that its nuclear program is only for peaceful purposes. This diplomatic effort must succeed if confrontation is to be avoided.

As important as are these nuclear issues, the United States has broader concerns regarding Iran. The Iranian regime sponsors terrorism; threatens Israel; seeks to thwart Middle East peace; disrupts democracy in Iraq; and denies the aspirations of its people for freedom. The nuclear issue and our other concerns can ultimately be resolved only if the Iranian regime makes the strategic decision to change these policies, open up its political system, and afford freedom to its people. This is the ultimate goal of U.S. policy. In the interim, we will continue to take all necessary measures to protect our national and economic security against the adverse effects of their bad conduct. The problems lie with the illicit behavior and dangerous ambition of the Iranian regime, not the legitimate aspirations and interests of the Iranian people. Our strategy is to block the threats posed by the regime while expanding our engagement and outreach to the people the regime is oppressing.

The North Korean regime also poses a serious nuclear proliferation challenge. It presents a long and bleak record of duplicity and bad-faith negotiations. In the past, the regime has attempted to split the United States from its allies. This time, the United States has successfully forged a consensus among key regional partners—China, Japan, Russia, and the Republic of Korea (ROK)—that the DPRK must give up all of its existing nuclear programs. Regional cooperation offers the best hope for a peaceful, diplomatic resolution of this problem. In a joint statement signed on September 19, 2005, in the Six-Party Talks among these participants, the DPRK agreed to abandon its nuclear weapons and all existing nuclear programs. The joint statement also declared that the relevant parties would negotiate a permanent peace for the Korean peninsula and explore ways to promote security cooperation in Asia. Along with our partners in the Six-Party Talks, the United States will continue to press the DPRK to implement these commitments.

The United States has broader concerns regarding the DPRK as well. The DPRK counterfeits our currency, traffics in narcotics and engages in other illicit activities, threatens the ROK with its army and its neighbors with its missiles, and brutalizes and starves its people. The DPRK regime

needs to changes these policies, open up its political system, and afford freedom to its people. In the interim, we will continue to take all necessary measures to protect our national and economic security against the adverse effects of their bad conduct.

*The second nuclear proliferation objective* is to keep fissile material out of the hands of rogue states and terrorists. To do this we must address the danger posed by inadequately safeguarded nuclear and radiological materials worldwide. The Administration is leading a global effort to reduce and secure such materials as quickly as possible through several initiatives including the Global Threat Reduction Initiative (GTRI). The GTRI locates, tracks, and reduces existing stockpiles of nuclear material. This new initiative also discourages trafficking in nuclear material by emplacing detection equipment at key transport nodes.

Building on the success of the PSI, the United States is also leading international efforts to shut down WMD trafficking by targeting key maritime and air transportation and transshipment routes, and by cutting off proliferators from financial resources that support their activities.

### 2. Biological Weapons

Biological weapons also pose a grave WMD threat because of the risks of contagion that would spread disease across large populations and around the globe. Unlike nuclear weapons, biological weapons do not require hard-to-acquire infrastructure or materials. This makes the challenge of controlling their spread even greater.

Countering the spread of biological weapons requires a strategy focused on improving our capacity to detect and respond to biological attacks, securing dangerous pathogens, and limiting the spread of materials useful for biological weapons. The United States is working with partner nations and institutions to strengthen global biosurveillance capabilities for early detection of suspicious outbreaks of disease. We have launched new initiatives at home to modernize our public health infrastructure and to encourage industry to speed the development of new classes of vaccines and medical countermeasures. This will also enhance our Nation's ability to respond to pandemic public health threats, such as avian influenza.

### 3. Chemical Weapons

Chemical weapons are a serious proliferation concern and are actively sought by terrorists, including al Qaeda. Much like biological weapons, the threat from chemical weapons increases with advances in technology, improvements in agent development, and ease in acquisition of materials and equipment.

To deter and defend against such threats, we work to identify and disrupt terrorist networks that seek chemical weapons capabilities, and seek to deny them access to materials needed to make these weapons. We are

improving our detection and other chemical defense capabilities at home and abroad, including ensuring that U.S. military forces and emergency responders are trained and equipped to manage the consequences of a chemical weapons attack.

### 4. The Need for Action

The new strategic environment requires new approaches to deterrence and defense. Our deterrence strategy no longer rests primarily on the grim premise of inflicting devastating consequences on potential foes. Both offenses and defenses are necessary to deter state and nonstate actors, through denial of the objectives of their attacks and, if necessary, responding with overwhelming force.

Safe, credible, and reliable nuclear forces continue to play a critical role. We are strengthening deterrence by developing a New Triad composed of offensive strike systems (both nuclear and improved conventional capabilities); active and passive defenses, including missile defenses; and a responsive infrastructure, all bound together by enhanced command and control, planning, and intelligence systems. These capabilities will better deter some of the new threats we face, while also bolstering our security commitments to allies. Such security commitments have played a crucial role in convincing some countries to forgo their own nuclear weapons programs, thereby aiding our nonproliferation objectives.

Deterring potential foes and assuring friends and allies, however, is only part of a broader approach. Meeting WMD proliferation challenges also requires effective international action—and the international community is most engaged in such action when the United States leads.

Taking action need not involve military force. Our strong preference and common practice is to address proliferation concerns through international diplomacy, in concert with key allies and regional partners. If necessary, however, under longstanding principles of self-defense, we do not rule out the use of force before attacks occur, even if uncertainty remains as to the time and place of the enemy's attack. When the consequences of an attack with WMD are potentially so devastating, we cannot afford to stand idly by as grave dangers materialize. This is the principle and logic of preemption. The place of preemption in our national security strategy remains the same. We will always proceed deliberately, weighing the consequences of our actions. The reasons for our actions will be clear, the force measured, and the cause just.

### Iraq and Weapons of Mass Destruction

This Administration inherited an Iraq threat that was unresolved. In early 2001, the international support for U.N. sanctions and continued

limits on the Iraqi regime's weapons-related activity was eroding, and key UNSC members were asking that they be lifted.

For America, the September 11 attacks underscored the danger of allowing threats to linger unresolved. Saddam Hussein's continued defiance of 16 UNSC resolutions over 12 years, combined with his record of invading neighboring countries, supporting terrorists, tyrannizing his own people, and using chemical weapons, presented a threat we could no longer ignore.

The UNSC unanimously passed Resolution 1441 on November 8, 2002, calling for full and immediate compliance by the Iraqi regime with its disarmament obligations. Once again, Saddam defied the international community. According to the Iraq Survey Group, the team of inspectors that went into Iraq after Saddam Hussein was toppled and whose report provides the fullest accounting of the Iraqi regime's illicit activities:

*Saddam continued to see the utility of WMD. He explained that he purposely gave an ambiguous impression about possession as a deterrent to Iran. He gave explicit direction to maintain the intellectual capabilities. As U.N. sanctions eroded there was a concomitant expansion of activities that could support full WMD reactivation. He directed that ballistic missile work continue that would support long-range missile development. Virtually no senior Iraqi believed that Saddam had forsaken WMD forever. Evidence suggests that, as resources became available and the constraints of sanctions decayed, there was a direct expansion of activity that would have the effect of supporting future WMD reconstitution.*

With the elimination of Saddam's regime, this threat has been addressed, once and for all.

The Iraq Survey Group also found that prewar intelligence estimates of Iraqi WMD stockpiles were wrong—a conclusion that has been confirmed by a bipartisan commission and congressional investigations. We must learn from this experience if we are to counter successfully the very real threat of proliferation.

*First, our intelligence must improve.* The President and the Congress have taken steps to reorganize and strengthen the U.S. intelligence community. A single, accountable leader of the intelligence community with authorities to match his responsibilities, and increased sharing of information and increased resources, are helping realize this objective.

*Second, there will always be some uncertainty about the status of hidden programs* since proliferators are often brutal regimes that go to great lengths to conceal their activities. Indeed, prior to the 1991 Gulf War, many intelligence analysts underestimated the WMD threat posed by the Iraqi regime. After that conflict, they were surprised to learn how far Iraq had progressed along various pathways to try to produce fissile material.

> *Third,* Saddam's strategy of *bluff, denial, and deception is a dangerous game that dictators play at their peril.* The world offered Saddam a clear choice: effect full and immediate compliance with his disarmament obligations or face serious consequences. Saddam chose the latter course and is now facing judgment in an Iraqi court. It was Saddam's reckless behavior that demanded the world's attention, and it was his refusal to remove the ambiguity that he created that forced the United States and its allies to act. We have no doubt that the world is a better place for the removal of this dangerous and unpredictable tyrant, and we have no doubt that the world is better off if tyrants know that they pursue WMD at their own peril.

## VI. IGNITE A NEW ERA OF GLOBAL ECONOMIC GROWTH THROUGH FREE MARKETS AND FREE TRADE

### A. Summary of National Security Strategy 2002

Promoting free and fair trade has long been a bedrock tenet of American foreign policy. Greater economic freedom is ultimately inseparable from political liberty. Economic freedom empowers individuals, and empowered individuals increasingly demand greater political freedom. Greater economic freedom also leads to greater economic opportunity and prosperity for everyone. History has judged the market economy as the single most effective economic system and the greatest antidote to poverty. To expand economic liberty and prosperity, the United States promotes free and fair trade, open markets, a stable financial system, the integration of the global economy, and secure, clean energy development.

### B. Current Context: Successes and Challenges

The global economy is more open and free, and many people around the world have seen their lives improve as prosperity and economic integration have increased. The Administration has accomplished much of the economic freedom agenda it set out in 2002:

*Seizing the global initiative.* We have worked to open markets and integrate the global economy through launching the Doha Development Agenda negotiations of the World Trade Organization (WTO). The United States put forward bold and historic proposals to reform global agricultural trade, to eliminate farm export subsidies and reduce trade-distorting support programs, to eliminate all tariffs on consumer and industrial goods, and to open global services markets. When negotiations stalled in 2003, the United States took the initiative to put Doha back on track, culminating in a successful framework agreement reached in Geneva in 2004. As talks proceed, the United States continues to lead the world in advancing bold proposals for economic freedom through open markets. We also

have led the way in helping the accessions of new WTO members such as Armenia, Cambodia, Macedonia, and Saudi Arabia.

*Pressing regional and bilateral trade initiatives.* We have used FTAs to open markets, support economic reform and the rule of law, and create new opportunities for American farmers and workers. Since 2001, we have:

- Implemented or completed negotiations for FTAs with 14 countries on 5 continents, and are negotiating agreements with 11 additional countries;

- Partnered with Congress to pass the Central America Free Trade Agreement—Dominican Republic (CAFTA-DR), long sought by the leaders of El Salvador, Honduras, Guatemala, Nicaragua, Costa Rica, and Dominican Republic;

- Called in 2003 for the creation of a Middle East Free Trade Area (MEFTA) by 2013 to bring the Middle East into an expanding circle of opportunity;

- Negotiated FTAs with Bahrain, Jordan, Morocco, and Oman to provide a foundation for the MEFTA initiative;

- Launched in 2002 the Enterprise for ASEAN Initiative, which led to the completion of a free trade agreement with Singapore, and the launch of negotiations with Thailand and Malaysia;

- Concluded an FTA with Australia, one of America's strongest allies in the Asia-Pacific region and a major trading partner of the United States; and

- Continued to promote the opportunities of increased trade to sub-Saharan Africa through the African Growth and Opportunity Act (AGOA), and extended opportunity to many other developing countries through the Generalized System of Preferences.

*Pressing for open markets, financial stability, and deeper integration of the world economy.* We have partnered with Europe, Japan, and other major economies to promote structural reforms that encourage growth, stability, and opportunity across the globe. The United States has:

- Gained agreement in the G-7 on the Agenda for Growth, which commits member states to take concrete steps to reform domestic economic systems;

- Worked with other nations that serve as regional and global engines of growth—such as India, China, the ROK, Brazil, and Russia—on reforms to open markets and ensure financial stability;

- Urged China to move to a market-based, flexible exchange rate regime—a step that would help both China and the global economy; and

- Pressed for reform of the International Financial Institutions to focus on results, fostering good governance and sound policies, and freeing poor countries from unpayable debts.

*Enhancing energy security and clean development.* The Administration has worked with trading partners and energy producers to expand the types and sources of energy, to open markets and strengthen the rule of law,

and to foster private investment that can help develop the energy needed to meet global demand. In addition, we have:

- Worked with industrialized and emerging nations on hydrogen, clean coal, and advanced nuclear technologies; and
- Joined with Australia, China, India, Japan, and the ROK in forming the Asia-Pacific Partnership for Clean Development and Climate to accelerate deployment of clean technologies to enhance energy security, reduce poverty, and reduce pollution.

  Several challenges remain:

- Protectionist impulses in many countries put at risk the benefits of open markets and impede the expansion of free and fair trade and economic growth.
- Nations that lack the rule of law are prone to corruption, lack of transparency, and poor governance. These nations frustrate the economic aspirations of their people by failing to promote entrepreneurship, protect intellectual property, or allow their citizens access to vital investment capital.
- Many countries are too dependent upon foreign oil, which is often imported from unstable parts of the world.
- Economic integration spreads wealth across the globe, but also makes local economies more subject to global market conditions.
- Some governments restrict the free flow of capital, subverting the vital role that wise investment can play in promoting economic growth. This denies investments, economic opportunity, and new jobs to the people who need them most.

### C. The Way Ahead

Economic freedom is a moral imperative. The liberty to create and build or to buy, sell, and own property is fundamental to human nature and foundational to a free society. Economic freedom also reinforces political freedom. It creates diversified centers of power and authority that limit the reach of government. It expands the free flow of ideas; with increased trade and foreign investment comes exposure to new ways of thinking and living which give citizens more control over their own lives.

To continue extending liberty and prosperity, and to meet the challenges that remain, our strategy going forward involves:

### 1. Opening Markets and Integrating Developing Countries

While most of the world affirms in principle the appeal of economic liberty, in practice too many nations hold fast to the false comforts of subsidies and trade barriers. Such distortions of the market stifle growth in developed countries, and slow the escape from poverty in developing countries. Against these short-sighted impulses, the United States promotes the enduring vision of a global economy that welcomes all participants

and encourages the voluntary exchange of goods and services based on mutual benefit, not favoritism.

We will continue to advance this agenda through the WTO and through bilateral and regional FTAs.

- The United States will seek completion of the Doha Development Agenda negotiations. A successful Doha agreement will expand opportunities for Americans and for others around the world. Trade and open markets will empower citizens in developing countries to improve their lives, while reducing the opportunities for corruption that afflict state-controlled economies.

- We will continue to work with countries such as Russia, Ukraine, Kazakhstan, and Vietnam on the market reforms needed to join the WTO. Participation in the WTO brings opportunities as well as obligations—to strengthen the rule of law and honor the intellectual property rights that sustain the modern knowledge economy, and to remove tariffs, subsidies, and other trade barriers that distort global markets and harm the world's poor.

- We will advance MEFTA by completing and bringing into force FTAs for Bahrain, Oman, and the United Arab Emirates and through other initiatives to expand open trade with and among countries in the region.

- In Africa, we are pursuing an FTA with the countries of the Southern African Customs Union: Botswana, Lesotho, Namibia, South Africa, and Swaziland.

- In Asia, we are pursuing FTAs with Thailand, the ROK, and Malaysia. We will also continue to work closely with China to ensure it honors its WTO commitments and protects intellectual property.

- In our own hemisphere, we will advance the vision of a free trade area of the Americas by building on North American Free Trade Agreement, CAFTA-DR, and the FTA with Chile. We will complete and bring into force FTAs with Colombia, Peru, Ecuador, and Panama.

### 2. Opening, Integrating, and Diversifying Energy Markets to Ensure Energy Independence

Most of the energy that drives the global economy comes from fossil fuels, especially petroleum. The United States is the world's third largest oil producer, but we rely on international sources to supply more than 50 percent of our needs. Only a small number of countries make major contributions to the world's oil supply.

The world's dependence on these few suppliers is neither responsible nor sustainable over the long term. The key to ensuring our energy security is *diversity* in the regions from which energy resources come and in the types of energy resources on which we rely.

- The Administration will work with resource-rich countries to increase their openness, transparency, and rule of law. This will promote effective democratic governance and attract the investment essential to developing their resources and expanding the range of energy suppliers.

- We will build the Global Nuclear Energy Partnership to work with other nations to develop and deploy advanced nuclear recycling and reactor technologies. This initiative will help provide reliable, emission-free energy with less of the waste burden of older technologies and without making available separated plutonium that could be used by rogue states or terrorists for nuclear weapons. These new technologies will make possible a dramatic expansion of safe, clean nuclear energy to help meet the growing global energy demand.

- We will work with international partners to develop other transformational technologies such as clean coal and hydrogen. Through projects like our Future-Gen initiative, we seek to turn our abundant domestic coal into emissions-free sources of electricity and hydrogen, providing our economies increased power with decreased emissions.

- On the domestic front, we are investing in zero-emission coal-fired plants; revolutionary solar and wind technologies; clean, safe nuclear energy; and cutting-edge methods of producing ethanol.

Our comprehensive energy strategy puts a priority on reducing our reliance on foreign energy sources. Diversification of energy sources also will help alleviate the "petroleum curse"—the tendency for oil revenues to foster corruption and prevent economic growth and political reform in some oil-producing states. In too many such nations, ruling elites enrich themselves while denying the people the benefits of their countries' natural wealth. In the worst cases, oil revenues fund activities that destabilize their regions or advance violent ideologies. Diversifying the suppliers within and across regions reduces opportunities for corruption and diminishes the leverage of irresponsible rulers.

### 3. Reforming the International Financial System to Ensure Stability and Growth

In our interconnected world, stable and open financial markets are an essential feature of a prosperous global economy. We will work to improve the stability and openness of markets by:

- *Promoting Growth-Oriented Economic Policies Worldwide*. Sound policies in the United States have helped drive much international growth. We cannot be the only source of strength, however. We will work with the world's other major economies, including the EU and Japan, to promote structural reforms that open their markets and increase productivity in their nations and across the world.

- *Encouraging Adoption of Flexible Exchange Rates and Open Markets for Financial Services*. The United States will help emerging economies make the transition to the flexible exchange rates appropriate for major economies. In particular, we will continue to urge China to meet its own commitment to a market-based, flexible exchange rate regime. We will also promote more open financial service markets, which encourage stable and sound financial practices.

- *Strengthening International Financial Institutions*. At the dawn of a previous era six decades ago, the United States championed the creation of the World Bank and the International Monetary Fund (IMF). These institutions were instrumental in the development of the global economy and an expansion of prosperity unprecedented in world history. They remain vital today, but must adapt to new realities:
  - For the World Bank and regional development banks, we will encourage greater emphasis on investments in the private sector. We will urge more consideration of economic freedom, governance, and measurable results in allocating funds. We will promote an increased use of grants to relieve the burden of unsustainable debt.
  - For the IMF, we will seek to refocus it on its core mission: international financial stability. This means strengthening the IMF's ability to monitor the financial system to prevent crises before they happen. If crises occur, the IMF's response must reinforce each country's responsibility for its own economic choices. A refocused IMF will strengthen market institutions and market discipline over financial decisions, helping to promote a stable and prosperous global economy. By doing so, over time markets and the private sector can supplant the need for the IMF to perform in its current role.
- *Building Local Capital Markets and the Formal Economy in the Developing World*. The first place that small businesses in developing countries turn to for resources is their own domestic markets. Unfortunately, in too many countries these resources are unavailable due to weak financial systems, a lack of property rights, and the diversion of economic activity away from the formal economy into the black market. The United States will work with these countries to develop and strengthen local capital markets and reduce the black market. This will provide more resources to helping the public sector govern effectively and the private sector grow and prosper.
- *Creating a More Transparent, Accountable, and Secure International Financial System*. The United States has worked with public and private partners to help secure the international financial system against abuse by criminals, terrorists, money launderers, and corrupt political leaders. We will continue to use international venues like the Financial Action Task Force to ensure that this global system is transparent and protected from abuse by tainted capital. We must also develop new tools that allow us to detect, disrupt, and isolate rogue financial players and gatekeepers.

## VII. EXPAND THE CIRCLE OF DEVELOPMENT BY OPENING SOCIETIES AND BUILDING THE INFRASTRUCTURE OF DEMOCRACY

### A. Summary of National Security Strategy 2002

Helping the world's poor is a strategic priority and a moral imperative. Economic development, responsible governance, and individual liberty are intimately connected. Past foreign assistance to corrupt and ineffective governments failed to help the populations in greatest need.

Instead, it often impeded democratic reform and encouraged corruption. The United States must promote development programs that achieve measurable results—rewarding reforms, encouraging transparency, and improving people's lives. Led by the United States, the international community has endorsed this approach in the Monterrey Consensus.

### B. Current Context: Successes and Challenges

The United States has improved the lives of millions of people and transformed the practice of development by adopting more effective policies and programs.

- *Advancing Development and Reinforcing Reform*. The Administration pioneered a revolution in development strategy with the Millennium Challenge Account program, rewarding countries that govern justly, invest in their people, and foster economic freedom. The program is based on the principle that each nation bears the responsibility for its own development. It offers governments the opportunity and the means to undertake transformational change by designing their own reform and development programs, which are then funded through the Millennium Challenge Corporation (MCC). The MCC has approved over $1.5 billion for compacts in eight countries, is working with over a dozen other countries on compacts, and has committed many smaller grants to other partner countries.

- *Turning the Tide Against AIDS and Other Infectious Diseases.* The President's Emergency Plan for AIDS Relief is an unprecedented, 5-year, $15 billion effort. Building on the success of pioneering programs in Africa, we have launched a major initiative that will prevent 7 million new infections, provide treatment to 2 million infected individuals, and care for 10 million AIDS orphans and others affected by the disease. We have launched a $1.2 billion, 5-year initiative to reduce malaria deaths by 50 percent in at least 15 targeted countries. To mobilize other nations and the private sector, the United States pioneered the creation of the Global Fund to Fight HIV/AIDS, Tuberculosis, and Malaria. We are the largest donor to the Fund and have already contributed over $1.4 billion.

- *Promoting Debt Sustainability and a Path Toward Private Capital Markets*. The Administration has sought to break the burden of debt that traps many poor countries by encouraging international financial institutions to provide grants instead of loans to low-income nations. With the United Kingdom, we spearheaded the G-8 initiative to provide 100 percent multilateral debt relief to qualifying Heavily Indebted Poor Countries. Reducing debt to sustainable levels allows countries to focus on immediate development challenges. In the long run, reducing debt also opens access to private capital markets which foster sound policies and long-term growth.

- *Addressing Urgent Needs and Investing in People*. The United States leads the world in providing food relief. We launched the Initiative to End Hunger in Africa, using science, technology, and market incentives to increase the productivity of

African farmers. We launched a 3-year, $900 million initiative to provide clean water to the poor. We have tripled basic education assistance through programs such as the Africa Education Initiative, which will train teachers and administrators, build schools, buy textbooks, and expand opportunities inside and outside the classroom.

- *Unleashing the Power of the Private Sector*. The Administration has sought to multiply the impact of our development assistance through initiatives such as the Global Development Alliance, which forges partnerships with the private sector to advance development goals, and Volunteers for Prosperity, which enlists some of our Nation's most capable professionals to serve strategically in developing nations.
- *Fighting Corruption and Promoting Transparency*. Through multilateral efforts like the G-8 Transparency Initiative and our policy of denying corrupt foreign officials entry into the United States, we are helping ensure that organized crime and parasitic rulers do not choke off the benefits of economic assistance and growth.

We have increased our overall development assistance spending by 97 percent since 2000. In all of these efforts, the United States has sought concrete measures of success. Funding is a means, not the end. We are giving more money to help the world's poor, and giving it more effectively.

Many challenges remain, including:

- Helping millions of people in the world who continue to suffer from poverty and disease;
- Ensuring that the delivery of assistance reinforces good governance and sound economic policies; and
- Building the capacity of poor countries to take ownership of their own development strategies.

### C. The Way Ahead

America's national interests and moral values drive us in the same direction: to assist the world's poor citizens and least developed nations and help integrate them into the global economy. We have accomplished many of the goals laid out in the 2002 National Security Strategy. Many of the new initiatives we launched in the last 4 years are now fully operating to help the plight of the world's least fortunate. We will persevere on this path.

Development reinforces diplomacy and defense, reducing long-term threats to our national security by helping to build stable, prosperous, and peaceful societies. Improving the way we use foreign assistance will make it more effective in strengthening responsible governments, responding to suffering, and improving people's lives.

### 1. Transformational Diplomacy and Effective Democracy

Transformational diplomacy means working with our many international partners to build and sustain democratic, well-governed states that will respond to the needs of their citizens and conduct themselves responsibly in the international system. Long-term development must include encouraging governments to make wise choices and assisting them in implementing those choices. We will encourage and reward good behavior rather than reinforce negative behavior. Ultimately it is the countries themselves that must decide to take the necessary steps toward development, yet we will help advance this process by creating external incentives for governments to reform themselves.

Effective economic development advances our national security by helping promote responsible sovereignty, not permanent dependency. Weak and impoverished states and ungoverned areas are not only a threat to their people and a burden on regional economies, but are also susceptible to exploitation by terrorists, tyrants, and international criminals. We will work to bolster threatened states, provide relief in times of crisis, and build capacity in developing states to increase their progress.

### 2. Making Foreign Assistance More Effective

The Administration has created the new position of Director of Foreign Assistance (DFA) in the State Department. The DFA will serve concurrently as Administrator of U.S. Agency for International Development (USAID), a position that will continue to be at the level of Deputy Secretary, and will have, consistent with existing legal requirements, authority over all State Department and USAID foreign assistance. This reorganization will create a more unified and rational structure that will more fully align assistance programs in State and USAID, increase the effectiveness of these programs for recipient countries, and ensure that we are being the best possible stewards of taxpayer dollars. And it will focus our foreign assistance on promoting greater ownership and responsibility on the part of host nations and their citizens.

With this new authority, the DFA/Administrator will develop a coordinated foreign assistance strategy, including 5-year, country-specific assistance strategies and annual country-specific assistance operational plans. The DFA/Administrator also will provide guidance for the assistance delivered through other entities of the United States Government, including the MCC and the Office of the Global AIDS Coordinator.

To ensure the best stewardship of our foreign assistance, the United States will:

- Distinguish among the different challenges facing different nations and address those challenges with tools appropriate for each country's stage of development;

- Encourage and reward good government and economic reform, both bilaterally and through the multilateral institutions such as international financial institutions, the G-8, and the Asia-Pacific Economic Cooperation (APEC);
- Engage the private sector to help solve development problems;
- Promote graduation from economic aid dependency with the ultimate goal of ending assistance;
- Build trade capacity to enable the poorest countries to enter into the global trade system; and
- Empower local leaders to take responsibility for their country's development.

Our assistance efforts will also highlight and build on the lessons learned from successful examples of wise development and economic policy choices, such as the ROK, Taiwan, Ireland, Poland, Slovakia, Chile, and Botswana.

## VIII. DEVELOP AGENDAS FOR COOPERATIVE ACTION WITH THE OTHER MAIN CENTERS OF GLOBAL POWER

### A. Summary of National Security Strategy 2002

Relations with the most powerful countries in the world are central to our national security strategy. Our priority is pursuing American interests within cooperative relationships, particularly with our oldest and closest friends and allies. At the same time, we must seize the opportunity—unusual in historical terms—of an absence of fundamental conflict between the great powers. Another priority, therefore, is preventing the reemergence of the great power rivalries that divided the world in previous eras. New times demand new approaches, flexible enough to permit effective action even when there are reasonable differences of opinions among friends, yet strong enough to confront the challenges the world faces.

### B. Current Context: Successes and Challenges

The United States has enjoyed unprecedented levels of cooperation on many of its highest national security priorities:

- The global coalition against terror has grown and deepened, with extensive cooperation and common resolve. The nations that have partnered with us in Afghanistan and Iraq have developed capabilities that can be applied to other challenges.
- We have joined with other nations around the world as well as numerous multilateral organizations to improve the capability of all nations to defend their homelands against terrorists and transnational criminals.

- We have achieved extraordinary coordination among historic rivals in pressing the DPRK to abandon its nuclear program.
- We have partnered with European allies and international institutions to pressure Iran to honor its nonproliferation commitments.
- The North Atlantic Treaty Organization (NATO) is transforming itself to meet current threats and is playing a leading role in stabilizing the Balkans and Afghanistan, as well as training the Iraqi military leadership to address its security challenges.
- We have set aside decades of mistrust and put relations with India, the world's most populous democracy, on a new and fruitful path.

At the same time, America's relations with other nations have been strong enough to withstand differences and candid exchanges of views.

- Some of our oldest and closest friends disagreed with U.S. policy in Iraq. There are ongoing and serious debates with our allies about how best to address the unique and evolving nature of the global terrorist threat.
- We have disagreed on the steps to reduce agricultural subsidies and achieve success in the WTO Doha Round of trade negotiations. We have also faced challenges in forging consensus with other major nations on the most effective measures to protect the environment.

### C. The Way Ahead

The struggle against militant Islamic radicalism is the great ideological conflict of the early years of the 21st century and finds the great powers all on the same side—opposing the terrorists. This circumstance differs profoundly from the ideological struggles of the 20th century, which saw the great powers divided by ideology as well as by national interest.

The potential for great power consensus presents the United States with an extraordinary opportunity. Yet certain challenges must be overcome. Some nations differ with us on the appropriate pace of change. Other nations provide rhetorical support for free markets and effective democracy but little action on freedom's behalf.

Five principles undergird our strategy for relations with the main centers of global power.

- First, these relations must be set in their proper context. Bilateral policies that ignore regional and global realities are unlikely to succeed.
- Second, these relations must be supported by appropriate institutions, regional and global, to make cooperation more permanent, effective, and wide-reaching. Where existing institutions can be reformed to meet new challenges, we, along with our partners, must reform them. Where appropriate institutions do not exist, we, along with our partners, must create them.
- Third, we cannot pretend that our interests are unaffected by states' treatment of their own citizens. America's interest in promoting effective democracies rests

on an historical fact: states that are governed well are most inclined to behave well. We will encourage all our partners to expand liberty, and to respect the rule of law and the dignity of the individual, as the surest way to advance the welfare of their people and to cement close relations with the United States.

- Fourth, while we do not seek to dictate to other states the choices they make, we do seek to influence the calculations on which these choices are based. We also must hedge appropriately in case states choose unwisely.

- Fifth, we must be prepared to act alone if necessary, while recognizing that there is little of lasting consequence that we can accomplish in the world without the sustained cooperation of our allies and partners.

### 1. The Western Hemisphere

These principles guide our relations within our own Hemisphere, the frontline of defense of American national security. Our goal remains a hemisphere fully democratic, bound together by goodwill, security cooperation, and the opportunity for all our citizens to prosper. Tyrants and those who would follow them belong to a different era and must not be allowed to reverse the progress of the last two decades. Countries in the Hemisphere must be helped to the path of sustained political and economic development. The deceptive appeal of anti–free market populism must not be allowed to erode political freedoms and trap the Hemisphere's poorest in cycles of poverty. If America's nearest neighbors are not secure and stable, then Americans will be less secure.

Our strategy for the Hemisphere begins with deepening key relationships with Canada and Mexico, a foundation of shared values and cooperative policies that can be extended throughout the region. We must continue to work with our neighbors in the Hemisphere to reduce illegal immigration and promote expanded economic opportunity for marginalized populations. We must also solidify strategic relationships with regional leaders in Central and South America and the Caribbean who are deepening their commitment to democratic values. And we must continue to work with regional partners to make multilateral institutions like the OAS and the Inter-American Development Bank more effective and better able to foster concerted action to address threats that may arise to the region's stability, security, prosperity, or democratic progress. Together, these partnerships can advance our four strategic priorities for the region: bolstering security, strengthening democratic institutions, promoting prosperity, and investing in people.

### 2. Africa

Africa holds growing geo-strategic importance and is a high priority of this Administration. It is a place of promise and opportunity, linked to the United States by history, culture, commerce, and strategic significance. Our goal is an African continent that knows liberty, peace, stability, and increasing prosperity.

Africa's potential has in the past been held hostage by the bitter legacy of colonial misrule and bad choices by some African leaders. The United States recognizes that our security depends upon partnering with Africans to strengthen fragile and failing states and bring ungoverned areas under the control of effective democracies.

Overcoming the challenges Africa faces requires partnership, not paternalism. Our strategy is to promote economic development and the expansion of effective, democratic governance so that African states can take the lead in addressing African challenges. Through improved governance, reduced corruption, and market reforms, African nations can lift themselves toward a better future. We are committed to working with African nations to strengthen their domestic capabilities and the regional capacity of the AU to support postconflict transformations, consolidate democratic transitions, and improve peacekeeping and disaster responses.

### 3. Middle East

The Broader Middle East continues to command the world's attention. For too long, too many nations of the Middle East have suffered from a freedom deficit. Repression has fostered corruption, imbalanced or stagnant economies, political resentments, regional conflicts, and religious extremism. These maladies were all cloaked by an illusion of stability. Yet the peoples of the Middle East share the same desires as people in the rest of the world: liberty, opportunity, justice, order, and peace. These desires are now being expressed in movements for reform. The United States is committed to supporting the efforts of reformers to realize a better life for themselves and their region.

We seek a Middle East of independent states, at peace with each other, and fully participating in an open global market of goods, services, and ideas. We are seeking to build a framework that will allow Israel and the Palestinian territories to live side by side in peace and security as two democratic states. In the wider region, we will continue to support efforts for reform and freedom in traditional allies such as Egypt and Saudi Arabia. Tyrannical regimes such as Iran and Syria that oppress at home and sponsor terrorism abroad know that we will continue to stand with their people against their misrule. And in Iraq, we will continue to support the Iraqi people and their historic march from tyranny to effective democracy. We will work with the freely elected, democratic government of Iraq—our new partner in the War on Terror—to consolidate and expand freedom, and to build security and lasting stability.

### 4. Europe

The NATO remains a vital pillar of U.S. foreign policy. The Alliance has been strengthened by expanding its membership and now acts beyond its borders as an instrument for peace and stability in many parts

of the world. It has also established partnerships with other key European states, including Russia, Ukraine, and others, further extending NATO's historic transformation. The internal reform of NATO structures, capabilities, and procedures must be accelerated to ensure that NATO is able to carry out its missions effectively. The Alliance's door will also remain open to those countries that aspire for membership and meet NATO standards. Further, NATO must deepen working relationships between and across institutions, as it is doing with the EU, and as it also could do with new institutions. Such relationships offer opportunities for enhancing the distinctive strengths and missions of each organization.

Europe is home to some of our oldest and closest allies. Our cooperative relations are built on a sure foundation of shared values and interests. This foundation is expanding and deepening with the ongoing spread of effective democracies in Europe, and must expand and deepen still further if we are to reach the goal of a Europe whole, free, and at peace. These democracies are effective partners, joining with us to promote global freedom and prosperity. Just as in the special relationship that binds us to the United Kingdom, these cooperative relationships forge deeper ties between our nations.

### 5. Russia

The United States seeks to work closely with Russia on strategic issues of common interest and to manage issues on which we have differing interests. By reason of geography and power, Russia has great influence not only in Europe and its own immediate neighborhood, but also in many other regions of vital interest to us: the broader Middle East, South and Central Asia, and East Asia. We must encourage Russia to respect the values of freedom and democracy at home and not to impede the cause of freedom and democracy in these regions. Strengthening our relationship will depend on the policies, foreign and domestic, that Russia adopts. Recent trends regrettably point toward a diminishing commitment to democratic freedoms and institutions. We will work to try to persuade the Russian Government to move forward, not backward, along freedom's path.

Stability and prosperity in Russia's neighborhood will help deepen our relations with Russia, but that stability will remain elusive as long as this region is not governed by effective democracies. We will seek to persuade Russia's government that democratic progress in Russia and its region benefits the peoples who live there and improves relationships with us, with other Western governments, and among themselves. Conversely, efforts to prevent democratic development at home and abroad will hamper the development of Russia's relations with the United States, Europe, and its neighbors.

### 6. South and Central Asia

South and Central Asia is a region of great strategic importance where American interests and values are engaged as never before. India is a great democracy, and our shared values are the foundation of our good relations. We are eager to see Pakistan move along a stable, secure, and democratic path. Our goal is for the entire region of South and Central Asia to be democratic, prosperous, and at peace.

We have made great strides in transforming America's relationship with India, a major power that shares our commitment to freedom, democracy, and rule of law. In July 2005, we signed a bold agreement—a roadmap to realize the meaningful cooperation that had eluded our two nations for decades. India now is poised to shoulder global obligations in cooperation with the United States in a way befitting a major power.

Progress with India has been achieved even as the United States has improved its strategic relationship with Pakistan. For decades, outsiders acted as if good relations with India and Pakistan were mutually exclusive. This Administration has shown that improved relations with each are possible and can help India and Pakistan make strides toward a lasting peace between themselves. America's relationship with Pakistan will not be a mirror image of our relationship with India. Together, our relations with the nations of South Asia can serve as a foundation for deeper engagement throughout Central Asia. Increasingly, Afghanistan will assume its historical role as a land-bridge between South and Central Asia, connecting these two vital regions.

Central Asia is an enduring priority for our foreign policy. The five countries of Central Asia are distinct from one another and our relations with each, while important, will differ. In the region as a whole, the elements of our larger strategy meet, and we must pursue those elements simultaneously: promoting effective democracies and the expansion of free-market reforms, diversifying global sources of energy, and enhancing security and winning the War on Terror.

### 7. East Asia

East Asia is a region of great opportunities and lingering tensions. Over the past decade, it has been a source of extraordinary economic dynamism and also of economic turbulence. Few regional economies have more effectively harnessed the engines of future prosperity: technology and globalized trade. Yet few regions have had greater difficulty overcoming the suspicions of the past.

The United States is a Pacific nation, with extensive interests throughout East and Southeast Asia. The region's stability and prosperity depend on our sustained engagement: maintaining robust partnerships supported

by a forward defense posture supporting economic integration through expanded trade and investment and promoting democracy and human rights.

Forging new international initiatives and institutions can assist in the spread of freedom, prosperity, and regional security. Existing institutions like the APEC forum and the Association of Southeast Asian Nations (ASEAN) regional forum, can play a vital role. New arrangements, such as the U.S.–ASEAN Enhanced Partnership, or others that are focused on problem-solving and action, like the Six-Party Talks and the PSI, can likewise bring together Asian nations to address common challenges. And Asian nations that share our values can join us in partnership to strengthen new democracies and promote democratic reforms throughout the region. This institutional framework, however, must be built upon a foundation of sound bilateral relations with key states in the region.

With Japan, the United States enjoys the closest relations in a generation. As the world's two largest economies and aid donors, acting in concert multiplies each of our strengths and magnifies our combined contributions to global progress. Our shared commitment to democracy at home offers a sure foundation for cooperation abroad.

With Australia, our alliance is global in scope. From Iraq and Afghanistan to our historic FTA, we are working jointly to ensure security, prosperity, and expanded liberty.

With the ROK, we share a vision of a prosperous, democratic, and united Korean peninsula. We also share a commitment to democracy at home and progress abroad and are translating that common vision into joint action to sustain our alliance into the 21st century. With Southeast Asia, we celebrate the dynamism of increased economic freedom and look to further extend political freedom to all the people in the region, including those suffering under the repressive regime in Burma. In promoting greater economic and political liberty, we will work closely with our allies and key friends, including Indonesia, Malaysia, the Philippines, Singapore, and Thailand.

China encapsulates Asia's dramatic economic successes, but China's transition remains incomplete. In one generation, China has gone from poverty and isolation to growing integration into the international economic system. China once opposed global institutions; today it is a permanent member of the UNSC and the WTO. As China becomes a global player, it must act as a responsible stakeholder that fulfills its obligations and works with the United States and others to advance the international system that has enabled its success: enforcing the international rules that have helped China lift itself out of a century of economic deprivation, embracing the economic and political standards that go along with that

system of rules, and contributing to international stability and security by working with the United States and other major powers.

China's leaders proclaim that they have made a decision to walk the transformative path of peaceful development. If China keeps this commitment, the United States will welcome the emergence of a China that is peaceful and prosperous and that cooperates with us to address common challenges and mutual interests. China can make an important contribution to global prosperity and ensure its own prosperity for the longer term if it will rely more on domestic demand and less on global trade imbalances to drive its economic growth. China shares our exposure to the challenges of globalization and other transnational concerns. Mutual interests can guide our cooperation on issues such as terrorism, proliferation, and energy security. We will work to increase our cooperation to combat disease pandemics and reverse environmental degradation.

The United States encourages China to continue down the road of reform and openness, because in this way China's leaders can meet the legitimate needs and aspirations of the Chinese people for liberty, stability, and prosperity. As economic growth continues, China will face a growing demand from its own people to follow the path of East Asia's many modern democracies, adding political freedom to economic freedom. Continuing along this path will contribute to regional and international security.

China's leaders must realize, however, that they cannot stay on this peaceful path while holding on to old ways of thinking and acting that exacerbate concerns throughout the region and the world. These old ways include:

- Continuing China's military expansion in a nontransparent way;
- Expanding trade, but acting as if they can somehow "lock up" energy supplies around the world or seek to direct markets rather than opening them up—as if they can follow a mercantilism borrowed from a discredited era; and
- Supporting resource-rich countries without regard to the misrule at home or misbehavior abroad of those regimes.

China and Taiwan must also resolve their differences peacefully, without coercion and without unilateral action by either China or Taiwan.

Ultimately, China's leaders must see that they cannot let their population increasingly experience the freedoms to buy, sell, and produce, while denying them the rights to assemble, speak, and worship. Only by allowing the Chinese people to enjoy these basic freedoms and universal rights can China honor its own constitution and international commitments and reach its full potential. Our strategy seeks to encourage China to make the right strategic choices for its people, while we hedge against other possibilities.

## IX. TRANSFORM AMERICA'S NATIONAL SECURITY INSTITUTIONS TO MEET THE CHALLENGES AND OPPORTUNITIES OF THE 21ST CENTURY

### A. Summary of National Security Strategy 2002

The major institutions of American national security were designed in a different era to meet different challenges. They must be transformed.

### B. Current Context: Successes and Challenges

In the last four years, we have made substantial progress in transforming key national security institutions.

- The establishment of the Department of Homeland Security brought under one authority 22 federal entities with vital roles to play in protecting our Nation and preventing terrorist attacks within the United States. The Department is focused on three national security priorities: preventing terrorist attacks within the United States; reducing America's vulnerability to terrorism; and minimizing the damage and facilitating the recovery from attacks that do occur.

- In 2004, the Intelligence Community launched its most significant reorganization since the 1947 National Security Act. The centerpiece is a new position, the Director of National Intelligence, endowed with expanded budgetary, acquisition, tasking, and personnel authorities to integrate more effectively the efforts of the Community into a more unified, coordinated, and effective whole. The transformation also includes a new National Counterterrorism Center and a new National Counterproliferation Center to manage and coordinate planning and activities in those critical areas. The transformation extends to the FBI, which has augmented its intelligence capabilities and is now more fully and effectively integrated with the Intelligence Community.

- The Department of Defense has completed the 2006 Quadrennial Defense Review, which details how the Department will continue to adapt and build to meet new challenges.

  ○ We are pursuing a future force that will provide tailored deterrence of both state and nonstate threats (including WMD employment, terrorist attacks in the physical and information domains, and opportunistic aggression) while assuring allies and dissuading potential competitors. The Department of Defense also is expanding Special Operations Forces and investing in advanced conventional capabilities to help win the long war against terrorist extremists and to help dissuade any hostile military competitor from challenging the United States, its allies, and partners.

  ○ The Department is transforming itself to better balance its capabilities across four categories of challenges:

    ▪ *Traditional* challenges posed by states employing conventional armies, navies, and air forces in well-established forms of military competition.

    ▪ *Irregular* challenges from state and nonstate actors employing methods such as terrorism and insurgency to counter our traditional military advantages,

or engaging in criminal activity such as piracy and drug trafficking that threaten regional security.

- *Catastrophic* challenges involving the acquisition, possession, and use of WMD by state and nonstate actors; and deadly pandemics and other natural disasters that produce WMD-like effects.

- *Disruptive* challenges from state and nonstate actors who employ technologies and capabilities (such as biotechnology, cyber and space operations, or directed-energy weapons) in new ways to counter military advantages the United States currently enjoys.

### C. The Way Ahead

We must extend and enhance the transformation of key institutions, both domestically and abroad.

At home, we will pursue three priorities:

- *Sustaining the transformation already under way in the Departments of Defense, Homeland Security, and Justice; the Federal Bureau of Investigation; and the Intelligence Community.*

- *Continuing to reorient the Department of State towards transformational diplomacy,* which promotes effective democracy and responsible sovereignty. Our diplomats must be able to step outside their traditional role to become more involved with the challenges within other societies, helping them directly, channeling assistance, and learning from their experience. This effort will include:

- Promoting the efforts of the new Director for Foreign Assistance / Administrator to ensure that foreign assistance is used as effectively as possible to meet our broad foreign policy objectives. This new office will align more fully the foreign assistance activities carried out by the Department of State and USAID, demonstrating that we are responsible stewards of taxpayer dollars.

- Improving our capability to plan for and respond to postconflict and failed-state situations. The Office of Reconstruction and Stabilization will integrate all relevant United States Government resources and assets in conducting reconstruction and stabilization operations. This effort must focus on building the security and law enforcement structures that are often the prerequisite for restoring order and ensuring success.

- Developing a civilian reserve corps, analogous to the military reserves. The civilian reserve corps would utilize, in a flexible and timely manner, the human resources of the American people for skills and capacities needed for international disaster relief and postconflict reconstruction.

- Strengthening our public diplomacy, so that we advocate the policies and values of the United States in a clear, accurate, and persuasive way to a watching and listening world. This includes actively engaging foreign audiences, expanding educational opportunities for Americans to learn about foreign languages and cultures and for foreign students and scholars to study in the United States; empowering the voices of our citizen ambassadors as well as those foreigners

who share our commitment to a safer, more compassionate world; enlisting the support of the private sector; increasing our channels for dialogue with Muslim leaders and citizens; and confronting propaganda quickly, before myths and distortions have time to take root in the hearts and minds of people across the world.

- *Improving the capacity of agencies to plan, prepare, coordinate, integrate, and execute responses* covering the full range of crisis contingencies and long-term challenges.
  - ○ We need to strengthen the capacity of departments and agencies to do comprehensive, results-oriented planning.
  - ○ Agencies that traditionally played only a domestic role increasingly have a role to play in our foreign and security policies. This requires us to better integrate interagency activity both at home and abroad.

Abroad, we will work with our allies on three priorities:

- *Promoting meaningful reform of the U.N.*, including:
  - ○ Creating structures to ensure financial accountability and administrative and organizational efficiency.
  - ○ Enshrining the principle that membership and participation privileges are earned by responsible behavior and by reasonable burden-sharing of security and stability challenges.
  - ○ Enhancing the capacity of the U.N. and associated regional organizations to stand up well-trained, rapidly deployable, sustainable military and gendarme units for peace operations.
- Ensuring that the U.N. reflects today's geopolitical realities and is not shackled by obsolete structures.
- Reinvigorating the U.N.'s commitment, reflected in the U.N. Charter, to the promotion of democracy and human rights.
- *Enhancing the role of democracies and democracy promotion throughout international and multilateral institutions*, including:
  - ○ Strengthening and institutionalizing the Community of Democracies.
  - ○ Fostering the creation of regional democracy-based institutions in Asia, the Middle East, Africa, and elsewhere.
  - ○ Improving the capacity of the U.N. and other multilateral institutions to advance the freedom agenda through tools like the U.N. Democracy Fund.
  - ○ Coordinating more effectively the unique contributions of international financial institutions and regional development banks.
- *Establishing results-oriented partnerships* on the model of the PSI *to meet new challenges and opportunities*. These partnerships emphasize international cooperation, not international bureaucracy. They rely on voluntary adherence rather than binding treaties. They are oriented towards action and results rather than legislation or rule-making.

## X. ENGAGE THE OPPORTUNITIES AND CONFRONT THE CHALLENGES OF GLOBALIZATION

In recent years, the world has witnessed the growing importance of a set of opportunities and challenges that were addressed indirectly in National Security Strategy 2002: the national security implications of globalization.

Globalization presents many opportunities. Much of the world's prosperity and improved living standards in recent years derive from the expansion of global trade, investment, information, and technology. The United States has been a leader in promoting these developments, and we believe they have improved significantly the quality of life of the American people and people the world over. Other nations have embraced these opportunities and have likewise benefited. Globalization has also helped the advance of democracy by extending the marketplace of ideas and the ideals of liberty.

These new flows of trade, investment, information, and technology are transforming national security. Globalization has exposed us to new challenges and changed the way old challenges touch our interests and values, while also greatly enhancing our capacity to respond. Examples include:

- *Public health challenges like pandemics (HIV/AIDS, avian influenza) that recognize no borders.* The risks to social order are so great that traditional public health approaches may be inadequate, necessitating new strategies and responses.

- *Illicit trade, whether in drugs, human beings, or sex, that exploits the modern era's greater ease of transport and exchange.* Such traffic corrodes social order, bolsters crime and corruption, undermines effective governance, facilitates the illicit transfer of WMD and advanced conventional weapons technology, and compromises traditional security and law enforcement.

- *Environmental destruction, whether caused by human behavior or cataclysmic mega-disasters such as floods, hurricanes, earthquakes, or tsunamis.* Problems of this scope may overwhelm the capacity of local authorities to respond, and may even over-tax national militaries, requiring a larger international response.

These challenges are not traditional national security concerns, such as the conflict of arms or ideologies. But if left unaddressed they can threaten national security. We have learned that:

- Preparing for and managing these challenges requires the full exercise of national power, up to and including traditional security instruments. For example, the U.S. military provided critical logistical support in the response to the Southeast Asian tsunami and the South Asian earthquake until U.N. and civilian humanitarian responders could relieve the military of these vital duties.

- Technology can help, but the key to rapid and effective response lies in achieving unity of effort across a range of agencies. For example, our response to the Katrina and Rita hurricanes underscored the need for communications systems

that remain operational and integrated during times of crisis. Even more vital, however, is improved coordination within the Federal government, with state and local partners, and with the private sector.

- Existing international institutions have a role to play, but in many cases coalitions of the willing may be able to respond more quickly and creatively, at least in the short term. For example, U.S. leadership in mobilizing the Regional Core Group to respond to the tsunami of 2004 galvanized the follow-on international response.

- The response and the new partnerships it creates can sometimes serve as a catalyst for changing existing political conditions to address other problems. For example, the response to the tsunami in Southeast Asia and the earthquake in Pakistan developed new lines of communication and cooperation at a local level, which opened the door to progress in reconciling longstanding regional conflicts in Aceh and Kashmir.

Effective democracies are better able to deal with these challenges than are repressive or poorly governed states. Pandemics require robust and fully transparent public health systems, which weak governments and those that fear freedom are unable or unwilling to provide. Yet these challenges require effective democracies to come together in innovative ways.

The United States must lead the effort to reform existing institutions and create new ones—including forging new partnerships between governmental and nongovernmental actors, and with transnational and international organizations.

To confront illicit trade, for example, the Administration launched the Proliferation Security Initiative and the APEC Secure Trade in the APEC Region Initiative, both of which focus on tangible steps governments can take to combat illegal trade.

To combat the cultivation and trafficking of narcotics, the Administration devotes over $1 billion annually to comprehensive counternarcotics efforts, working with governments, particularly in Latin America and Asia, to eradicate crops, destroy production facilities, interdict shipments, and support developing alternative livelihoods.

To confront the threat of a possible pandemic, the Administration took the lead in creating the International Partnership on Avian and Pandemic Influenza, a new global partnership of states committed to effective surveillance and preparedness that will help to detect and respond quickly to any outbreaks of the disease.

## XI. CONCLUSION

The challenges America faces are great, yet we have enormous power and influence to address those challenges. The times require an ambitious national security strategy, yet one recognizing the limits to what even a

nation as powerful as the United States can achieve by itself. Our national security strategy is idealistic about goals, and realistic about means.

There was a time when two oceans seemed to provide protection from problems in other lands, leaving America to lead by example alone. That time has long since passed. America cannot know peace, security, and prosperity by retreating from the world. America must lead by deed as well as by example. This is how we plan to lead, and this is the legacy we will leave to those who follow.

# APPENDIX B

# THE NATIONAL STRATEGY FOR COMBATING TERRORISM

September 2006
http://www.whitehouse.gov/nsc/nsct/2006/

**OVERVIEW OF AMERICA'S NATIONAL STRATEGY FOR COMBATING TERRORISM**

America is at war with a transnational terrorist movement fueled by a radical ideology of hatred, oppression, and murder. Our National Strategy for Combating Terrorism, first published in February 2003, recognizes that we are at war and that protecting and defending the Homeland, the American people, and their livelihoods remains our first and most solemn obligation.

Our strategy also recognizes that the War on Terror is a different kind of war. From the beginning, it has been both a battle of arms and a battle of ideas. Not only do we fight our terrorist enemies on the battlefield, we promote freedom and human dignity as alternatives to the terrorists' perverse vision of oppression and totalitarian rule. The paradigm for combating terrorism now involves the application of all elements of our national power and influence. Not only do we employ military power, we use diplomatic, financial, intelligence, and law enforcement activities to protect the Homeland and extend our defenses, disrupt terrorist operations, and deprive our enemies of what they need to operate and survive. We have broken old orthodoxies that once confined our counterterrorism efforts primarily to the criminal justice domain.

This updated strategy sets the course for winning the War on Terror. It builds directly from the National Security Strategy issued in March 2006 as well as the February 2003 National Strategy for Combating Terrorism,

and incorporates our increased understanding of the enemy. From the beginning, we understood that the War on Terror involved more than simply finding and bringing to justice those who had planned and executed the terrorist attacks on September 11, 2001. Our strategy involved destroying the larger al Qaeda network and also confronting the radical ideology that inspired others to join or support the terrorist movement. Since 9/11, we have made substantial progress in degrading the al Qaeda network, killing or capturing key lieutenants, eliminating safehavens, and disrupting existing lines of support. Through the freedom agenda, we also have promoted the best long-term answer to al Qaeda's agenda: the freedom and dignity that comes when human liberty is protected by effective democratic institutions.

In response to our efforts, the terrorists have adjusted, and so we must continue to refine our strategy to meet the evolving threat. Today, we face a global terrorist movement and must confront the radical ideology that justifies the use of violence against innocents in the name of religion. As laid out in this strategy, to win the War on Terror, we will:

- Advance effective democracies as the long-term antidote to the ideology of terrorism;
- Prevent attacks by terrorist networks;
- Deny terrorists the support and sanctuary of rogue states;
- Deny terrorists control of any nation they would use as a base and launching pad for terror; and
- Lay the foundations and build the institutions and structures we need to carry the fight forward against terror and help ensure our ultimate success.

## TODAY'S REALITIES IN THE WAR ON TERROR

The terrorist attacks of September 11, 2001, were acts of war against the United States, peaceful people throughout the world, and the very principles of liberty and human dignity. The United States, together with our Coalition partners, has fought back and will win this war. We will hold the perpetrators accountable and work to prevent the recurrence of similar atrocities on any scale – whether at home or abroad. The War on Terror extends beyond the current armed conflict that arose out of the attacks of September 11, 2001, and embraces all facets of continuing U.S. efforts to bring an end to the scourge of terrorism. Ultimately, we will win the long war to defeat the terrorists and their murderous ideology.

### Successes

- We have deprived al Qaeda of safe haven in Afghanistan and helped a democratic government to rise in its place. Once a terrorist sanctuary ruled by the

repressive Taliban regime, Afghanistan is now a full partner in the War on Terror.

- A multinational coalition joined by the Iraqis is aggressively prosecuting the war against the terrorists in Iraq. Together, we are working to secure a united, stable, and democratic Iraq, now a new War on Terror ally in the heart of the Middle East.

- We have significantly degraded the al Qaeda network. Most of those in the al Qaeda network responsible for the September 11 attacks, including the plot's mastermind Khalid Shaykh Muhammad, have been captured or killed. We also have killed other key al Qaeda members, such as Abu Musab al-Zarqawi, the group's operational commander in Iraq who led a campaign of terror that took the lives of countless American forces and innocent Iraqis.

- We have led an unprecedented international campaign to combat terrorist financing that has made it harder, costlier, and riskier for al Qaeda and related terrorist groups to raise and move money.

- There is a broad and growing global consensus that the deliberate targeting of innocents is never justified by any calling or cause.

- Many nations have rallied to fight terrorism, with unprecedented cooperation on law enforcement, intelligence, military, and diplomatic activity.

- We have strengthened our ability to disrupt and help prevent future attacks in the Homeland by enhancing our counterterrorism architecture through the creation of the Department of Homeland Security, the Office of Director of National Intelligence, and the National Counterterrorism Center. Overall, the United States and our partners have disrupted several serious plots since September 11, including al Qaeda plots to attack inside the United States.

- Numerous countries that were part of the problem before September 11 are now increasingly becoming part of the solution – and this transformation has occurred without destabilizing friendly regimes in key regions.

- The Administration has worked with Congress to adopt, implement, and renew key reforms like the USA PATRIOT Act that promote our security while also protecting our fundamental liberties.

Yet while America is safer, we are not yet safe. The enemy remains determined, and we face serious challenges at home and abroad.

### Challenges

- Terrorist networks today are more dispersed and less centralized. They are more reliant on smaller cells inspired by a common ideology and less directed by a central command structure.

- While the United States Government and its partners have thwarted many attacks, we have not been able to prevent them all. Terrorists have struck in many places throughout the world, from Bali to Beslan to Baghdad.

- While we have substantially improved our air, land, sea, and border security, our Homeland is not immune from attack.

- Terrorists have declared their intention to acquire and use weapons of mass destruction (WMD) to inflict even more catastrophic attacks against the United States, our allies, partners, and other interests around the world.
- Some states, such as Syria and Iran, continue to harbor terrorists at home and sponsor terrorist activity abroad.
- The ongoing fight for freedom in Iraq has been twisted by terrorist propaganda as a rallying cry.
- Increasingly sophisticated use of the Internet and media has enabled our terrorist enemies to communicate, recruit, train, rally support, proselytize, and spread their propaganda without risking personal contact.

## TODAY'S TERRORIST ENEMY

The United States and our partners continue to pursue a significantly degraded but still dangerous al Qaeda network. Yet the enemy we face today in the War on Terror is not the same enemy we faced on September 11. Our effective counterterrorist efforts, in part, have forced the terrorists to evolve and modify their ways of doing business. Our understanding of the enemy has evolved as well. Today, the principal terrorist enemy confronting the United States is a transnational movement of extremist organizations, networks, and individuals – and their state and nonstate supporters – which have in common that they exploit Islam and use terrorism for ideological ends.

This transnational movement is not monolithic. Although al Qaeda functions as the movement's vanguard and remains, along with its affiliate groups and those inspired by them, the most dangerous present manifestation of the enemy, the movement is not controlled by any single individual, group, or state. What unites the movement is a common vision, a common set of ideas about the nature and destiny of the world, and a common goal of ushering in totalitarian rule. What unites the movement is the ideology of oppression, violence, and hate.

Our terrorist enemies exploit Islam to serve a violent political vision. Fueled by a radical ideology and a false belief that the United States is the cause of most problems affecting Muslims today, our enemies seek to expel Western power and influence from the Muslim world and establish regimes that rule according to a violent and intolerant distortion of Islam. As illustrated by Taliban-ruled Afghanistan, such regimes would deny all political and religious freedoms and serve as sanctuaries for extremists to launch additional attacks against not only the United States, its allies, and partners, but the Muslim world itself. Some among the enemy, particularly al Qaeda, harbor even greater territorial and geopolitical ambitions and aim to establish a single, pan-Islamic, totalitarian regime that stretches from Spain to Southeast Asia.

This enemy movement seeks to create and exploit a division between the Muslim and non-Muslim world and within the Muslim world itself. The terrorists distort the idea of jihad into a call for violence and murder against those they regard as apostates or unbelievers, including all those who disagree with them. Most of the terrorist attacks since September 11 have occurred in Muslim countries—and most of the victims have been Muslims.

In addition to this principal enemy, a host of other groups and individuals also use terror and violence against innocent civilians to pursue their political objectives. Though their motives and goals may be different, and often include secular and more narrow territorial aims, they threaten our interests and those of our partners as they attempt to overthrow civil order and replace freedom with conflict and intolerance. Their terrorist tactics ensure that they are enemies of humanity regardless of their goals and no matter where they operate.

For our terrorist enemies, violence is not only justified, it is necessary and even glorified—judged the only means to achieve a world vision darkened by hate, fear, and oppression. They use suicide bombings, beheadings, and other atrocities against innocent people as a means to promote their creed. Our enemy's demonstrated indifference to human life and desire to inflict catastrophic damage on the United States and our friends and allies around the world have fueled their desire for weapons of mass destruction. We cannot permit the world's most dangerous terrorists and their regime sponsors to threaten us with the world's most destructive weapons.

For the enemy, there is no peaceful coexistence with those who do not subscribe to their distorted and violent view of the world. They accept no dissent and tolerate no alternative points of view. Ultimately, the terrorist enemy we face threatens global peace, international security and prosperity, the rising tide of democracy, and the right of all people to live without fear of indiscriminate violence.

## STRATEGIC VISION FOR THE WAR ON TERROR

From the beginning, the War on Terror has been both a battle of arms and a battle of ideas—a fight against the terrorists and their murderous ideology. In the short run, the fight involves the application of all instruments of national power and influence to kill or capture the terrorists, deny them safe haven and control of any nation, prevent them from gaining access to WMD, render potential terrorist targets less attractive by strengthening security, and cut off their sources of funding and other resources they need to operate and survive. In the long run, winning the War on Terror means winning the battle of ideas. Ideas can transform the

embittered and disillusioned either into murderers willing to kill innocents, or into free peoples living harmoniously in a diverse society.

The battle of ideas helps to define the strategic intent of our National Strategy for Combating Terrorism. The United States will continue to lead an expansive international effort in pursuit of a two-pronged vision:

- The defeat of violent extremism as a threat to our way of life as a free and open society; and
- The creation of a global environment inhospitable to violent extremists and all who support them.

## STRATEGY FOR WINNING THE WAR ON TERROR

### Long-Term Approach: Advancing Effective Democracy

The long-term solution for winning the War on Terror is the advancement of freedom and human dignity through effective democracy. Elections are the most visible sign of a free society and can play a critical role in advancing effective democracy. But elections alone are not enough. Effective democracies honor and uphold basic human rights, including freedom of religion, conscience, speech, assembly, association, and press. They are responsive to their citizens, submitting to the will of the people. Effective democracies exercise effective sovereignty and maintain order within their own borders, address causes of conflict peacefully, protect independent and impartial systems of justice, punish crime, embrace the rule of law, and resist corruption. Effective democracies also limit the reach of government, protecting the institutions of civil society. In effective democracies, freedom is indivisible. They are the long-term antidote to the ideology of terrorism today. This is the battle of ideas.

To wage the battle of ideas effectively, we must recognize what does and does not give rise to terrorism:

- Terrorism is not the inevitable by-product of poverty. Many of the September 11 hijackers were from middle-class backgrounds, and many terrorist leaders, like bin Laden, are from privileged upbringings.
- Terrorism is not simply a result of hostility to U.S. policy in Iraq. The United States was attacked on September 11 and many years earlier, well before we toppled the Saddam Hussein regime. Moreover, countries that did not participate in Coalition efforts in Iraq have not been spared from terror attacks.
- Terrorism is not simply a result of Israeli-Palestinian issues. Al Qaeda plotting for the September 11 attacks began in the 1990s, during an active period in the peace process.
- Terrorism is not simply a response to our efforts to prevent terror attacks. The al Qaeda network targeted the United States long before the United States targeted

al Qaeda. Indeed, the terrorists are emboldened more by perceptions of weakness than by demonstrations of resolve. Terrorists lure recruits by telling them that we are decadent, easily intimidated, and will retreat if attacked.

The terrorism we confront today springs from:

- *Political alienation*. Transnational terrorists are recruited from populations with no voice in their own government and see no legitimate way to promote change in their own country. Without a stake in the existing order, they are vulnerable to manipulation by those who advocate a perverse political vision based on violence and destruction.
- *Grievances that can be blamed on others*. The failures the terrorists feel and see are blamed both on others and on perceived injustices from the recent or sometimes distant past. The terrorists' rhetoric keeps wounds associated with this past fresh and raw, a potent motivation for revenge and terror.
- *Subcultures of conspiracy and misinformation*. Terrorists recruit more effectively from populations whose information about the world is contaminated by falsehoods and corrupted by conspiracy theories. The distortions keep alive grievances and filter out facts that would challenge popular prejudices and self-serving propaganda.
- *An ideology that justifies murder*. Terrorism ultimately depends upon the appeal of an ideology that excuses or even glorifies the deliberate killing of innocents. Islam has been twisted and made to serve an evil end, as in other times and places other religions have been similarly abused.

Defeating terrorism in the long run requires that each of these factors be addressed. Effective democracy provides a counter to each, diminishing the underlying conditions terrorists seek to exploit.

- In place of alienation, democracy offers an ownership stake in society, a chance to shape one's own future.
- In place of festering grievances, democracy offers the rule of law, the peaceful resolution of disputes, and the habits of advancing interests through compromise.
- In place of a culture of conspiracy and misinformation, democracy offers freedom of speech, independent media, and the marketplace of ideas, which can expose and discredit falsehoods, prejudices, and dishonest propaganda.
- In place of an ideology that justifies murder, democracy offers a respect for human dignity that abhors the deliberate targeting of innocent civilians.

Democracy is the antithesis of terrorist tyranny, which is why the terrorists denounce it and are willing to kill the innocent to stop it. Democracy is based on empowerment, while the terrorists' ideology is based on enslavement. Democracies expand the freedom of their citizens, while the

terrorists seek to impose a single set of narrow beliefs. Democracy sees individuals as equal in worth and dignity, having an inherent potential to create, govern themselves, and exercise basic freedoms of speech and conscience. The terrorists see individuals as objects to be exploited, and then to be ruled and oppressed.

Democracies are not immune to terrorism. In some democracies, some ethnic or religious groups are unable or unwilling to grasp the benefits of freedom otherwise available in the society. Such groups can evidence the same alienation and despair that the transnational terrorists exploit in undemocratic states. This accounts for the emergence in democratic societies of homegrown terrorists—even among second- and third-generation citizens. Even in these cases, the long-term solution remains deepening the reach of democracy so that all citizens enjoy its benefits. We will continue to guard against the emergence of homegrown terrorists within our own Homeland as well.

The strategy to counter the lies behind the terrorists' ideology and deny them future recruits must empower the very people the terrorists most want to exploit: the faithful followers of Islam. We will continue to support political reforms that empower peaceful Muslims to practice and interpret their faith. We will work to undermine the ideological underpinnings of violent Islamic extremism and gain the support of nonviolent Muslims around the world. The most vital work will be done within the Islamic world itself, and Jordan, Morocco, and Indonesia, among others, have begun to make important strides in this effort. Responsible Islamic leaders need to denounce an ideology that distorts and exploits Islam to justify the murder of innocent people and defiles a proud religion.

Many of the Muslim faith are already making this commitment at great personal risk. They realize they are a target of this ideology of terror. Everywhere we have joined in the fight against terrorism, Muslim allies have stood beside us, becoming partners in this vital cause. They know the stakes—the survival of their own liberty, the future of their own region, the justice and humanity of their own traditions—and the United States is proud to stand beside them. Not only will we continue to support the efforts of our Muslim partners overseas to reject violent extremism, we will continue to engage with and strengthen the efforts of Muslims within the United States as well. Through outreach programs and public diplomacy we will reveal the terrorists' violent extremist ideology for what it is—a form of totalitarianism following in the path of fascism and Nazism.

### Over the Short Term: Four Priorities of Action

The advance of freedom, opportunity, and human dignity through democracy is the long-term solution to the transnational terror movement of today. To create the space and time for this long-term solution

to take root, we are operating along four priorities of action in the short term.

### Prevent Attacks by Terrorist Networks

A government has no higher obligation than to protect the lives and livelihoods of its citizens. The hard core among our terrorist enemies cannot be reformed or deterred; they will be tracked down, captured, or killed. They will be cut off from the network of individuals, institutions, and other resources they depend on for support and that facilitate their activities. The network, in turn, will be deterred, disrupted, and disabled. Working with committed partners across the globe, we continue to use a broad range of tools at home and abroad to take the fight to the terrorists, deny them entry to the United States, hinder their movement across international borders, and establish protective measures to further reduce our vulnerability to attack.

- *Attack terrorists and their capacity to operate*. The United States and our partners continue to take active and effective measures against our primary terrorist enemies and certain other violent extremist groups that also pose a serious and continuing threat. We are attacking these terrorists and their capacity to operate effectively at home and abroad. Specifically, through the use of all elements of national power, we are denying or neutralizing what our terrorist enemies need to operate and survive:
  - *Leaders*, who provide the vision that followers strive to realize. They also offer the necessary direction, discipline, and motivation for accomplishing a given goal or task. Most terrorist organizations have a central figure who embodies the cause, in addition to several operational leaders and managers who provide guidance on a functional, regional, or local basis. The loss of a leader can degrade a group's cohesiveness and in some cases may trigger its collapse. Other terrorist groups adapt by promoting experienced cadre or decentralizing their command structures, making our challenge in neutralizing terrorist leaders even greater.
  - *Foot soldiers*, which include the operatives, facilitators, and trainers in a terrorist network. They are the lifeblood of a terrorist group – they make it run. Technology and globalization have enhanced the ability of groups to recruit foot soldiers to their cause, including well-educated recruits. We and our partners will not only continue to capture and kill foot soldiers, but will work to halt the influx of recruits into terrorist organizations as well. Without a continuing supply of personnel to facilitate and carry out attacks, these groups ultimately will cease to operate.
  - *Weapons,* the tools of terrorists and the means by which they murder to advance their cause. Terrorists exploit many avenues to develop and acquire weapons, including through state sponsors, theft or capture, and black market purchases. Our enemies employ existing technology – explosives, small arms, missiles, and other devices – in both conventional and unconventional ways

to terrorize and achieve mass effects. They also use nonweapon technologies as weapons, such as the airplanes on September 11. Our greatest and gravest concern, however, is WMD in the hands of terrorists. Preventing their acquisition and the dire consequences of their use is a key priority of this strategy.

○ *Funds*, which provide the fungible, easily transportable means to secure all other forms of material support necessary to the survival and operation of terrorist organizations. Our enemies raise funds through a variety of means, including soliciting contributions from supporters; operating businesses, NGOs, and charitable fronts; and engaging in criminal activity such as fraud, extortion, and kidnapping for ransom. They transfer funds through several mechanisms, including the formal banking system, wire transfers, debit or "smart" cards, cash couriers, and *hawala*s, which are alternative remittance systems based on trust. Effective disruption of funding sources and interdiction of transfer mechanisms can help our partners and us to starve terrorist networks of the material support they require.

○ *Communications*, which allow terrorists the ability to receive, store, manipulate, and exchange information. The methods by which terrorists communicate are numerous and varied. Our enemies rely on couriers and face-to-face contacts with associates and tend to use what is accessible in their local areas as well as what they can afford. They also use today's technologies with increasing acumen and sophistication. This is especially true with the Internet, which they exploit to create and disseminate propaganda, recruit new members, raise funds and other material resources, provide instruction on weapons and tactics, and plan operations. Without a communications ability, terrorist groups cannot effectively organize operations, execute attacks, or spread their ideology. We and our partners will continue to target the communication nodes of our enemy.

○ *Propaganda operations*, which are used by terrorists to justify violent action as well as inspire individuals to support or join the movement. The ability of terrorists to exploit the Internet and 24/7 worldwide media coverage allows them to bolster their prominence as well as feed a steady diet of radical ideology, twisted images, and conspiracy theories to potential recruits in all corners of the globe. Besides a global reach, these technologies allow terrorists to propagate their message quickly, often before an effective counter to terrorist messages can be coordinated and distributed. These are force multipliers for our enemy.

• *Deny terrorists entry to the United States and disrupt their travel internationally*. Denying our enemies the tools to travel internationally and across and within our borders significantly impedes their mobility and can inhibit their effectiveness. They rely on illicit networks to facilitate travel and often obtain false identification documents through theft or in-house forgery operations. We will continue to enhance the security of the American people through a layered system of protections along our borders, at our ports, on our roadways and railways, in our skies, and with our international partners. We will continue to develop and enhance security practices and technologies to reduce vulnerabilities in the dynamic transportation network, inhibit terrorists from crossing U.S. borders, and detect and prevent terrorist travel within the United States. Our efforts will

include improving all aspects of aviation security; promoting secure travel and identity documents; disrupting travel facilitation networks; improving border security and visa screening; and building international capacity and improving international information exchange to secure travel and combat terrorist travel. Our National Strategy to Combat Terrorist Travel and our National Strategy for Maritime Security will help guide our efforts.

• *Defend potential targets of attack.* Our enemies are opportunistic, exploiting vulnerabilities and seeking alternatives to those targets with increased security measures. The targeting trend since at least September 11 has been away from hardened sites, such as official government facilities with formidable security, and toward softer targets – schools, restaurants, places of worship, and nodes of public transportation – where innocent civilians gather and which are not always well secured. Specific targets vary, but they tend to be symbolic and often selected because they will produce mass casualties, economic damage, or both.

   While it is impossible to protect completely all potential targets all the time, we can deter and disrupt attacks, as well as mitigate the effects of those that do occur, through strategic security improvements at sites both at home and overseas. Among our most important defensive efforts is the protection of critical infrastructures and key resources – sectors such as energy, food and agriculture, water, telecommunications, public health, transportation, the defense industrial base, government facilities, postal and shipping, the chemical industry, emergency services, monuments and icons, information technology, dams, commercial facilities, banking and finance, and nuclear reactors, materials, and waste. These are systems and assets so vital that their destruction or incapacitation would have a debilitating effect on the security of our Nation. We will also continue to protect various assets such as historical attractions or certain high-profile events whose destruction or attack would not necessarily debilitate our national security but could damage the morale and confidence of the American people. Beyond the Homeland, we will continue to protect and defend U.S. citizens, diplomatic missions, and military facilities overseas, as well as work with our partners to strengthen their ability to protect their populations and critical infrastructures.

### *Deny WMD to Rogue States and Terrorist Allies Who Seek to Use Them*

Weapons of mass destruction in the hands of terrorists is one of the gravest threats we face. We have taken aggressive efforts to deny terrorists access to WMD-related materials, equipment, and expertise, but we will enhance these activities through an integrated effort at all levels of government and with the private sector and our foreign partners to stay ahead of this dynamic and evolving threat. In July 2006, the United States and Russia launched the Global Initiative to Combat Nuclear Terrorism to establish an international framework to enhance cooperation, build capacity, and act to combat the global threat of nuclear terrorism. This initiative will help drive international focus and action to ensure the international community is doing everything possible to prevent nuclear weapons, materials, and knowledge from reaching the hands of terrorists.

   With regard to our own efforts, our comprehensive approach for addressing WMD terrorism hinges on six objectives, and we will work across all objectives simultaneously to maximize our ability to eliminate the threat.

- *Determine terrorists' intentions, capabilities, and plans to develop or acquire WMD.* We need to understand and assess the credibility of threat reporting and provide technical assessments of terrorists' WMD capabilities.

- *Deny terrorists access to the materials, expertise, and other enabling capabilities required to develop WMD.* We have an aggressive, global approach to deny our enemies access to WMD-related materials (with a particular focus on weapons-usable fissile materials), fabrication expertise, methods of transport, sources of funds, and other capabilities that facilitate the execution of a WMD attack. In addition to building upon existing initiatives to secure materials, we are developing innovative approaches that blend classic counterproliferation, nonproliferation, and counterterrorism efforts.

- *Deter terrorists from employing WMD.* A new deterrence calculus combines the need to deter terrorists and supporters from contemplating a WMD attack and, failing that, to dissuade them from actually conducting an attack. Traditional threats may not work because terrorists show a wanton disregard for the lives of innocents and in some cases for their own lives. We require a range of deterrence strategies that are tailored to the situation and the adversary. We will make clear that terrorists and those who aid or sponsor a WMD attack would face the prospect of an overwhelming response to any use of such weapons. We will seek to dissuade attacks by improving our ability to mitigate the effects of a terrorist attack involving WMD – to limit or prevent large-scale casualties, economic disruption, or panic. Finally, we will ensure that our capacity to determine the source of any attack is well known, and that our determination to respond overwhelmingly to any attack is never in doubt.

- *Detect and disrupt terrorists' attempted movement of WMD-related materials, weapons, and personnel.* We will expand our global capability for detecting illicit materials, weapons, and personnel transiting abroad or heading for the United States or U.S. interests overseas. We will use our global partnerships, international agreements, and ongoing border security and interdiction efforts. We also will continue to work with countries to enact and enforce strict penalties for WMD trafficking and other suspect WMD-related activities.

- *Prevent and respond to a WMD-related terrorist attack.* Once the possibility of a WMD attack against the United States has been detected, we will seek to contain, interdict, and eliminate the threat. We will continue to develop requisite capabilities to eliminate the possibility of a WMD operation and to prevent a possible follow-on attack. We will prepare ourselves for possible WMD incidents by developing capabilities to manage the range of consequences that may result from such an attack against the United States or our interests around the world.

- *Define the nature and source of a terrorist-employed WMD device.* Should a WMD terrorist attack occur, the rapid identification of the source and perpetrator of an attack will enable our response efforts and may be critical in disrupting follow-on

attacks. We will develop the capability to assign responsibility for the intended or actual use of WMD via accurate attribution – the rapid fusion of technical forensic data with intelligence and law enforcement information.

### Deny Terrorists the Support and Sanctuary of Rogue States

The United States and its allies and partners in the War on Terror make no distinction between those who commit acts of terror and those who support and harbor terrorists. Any government that chooses to be an ally of terror has chosen to be an enemy of freedom, justice, and peace. The world will hold those regimes to account. To break the bonds between rogue states and our terrorist enemies, we will work to disrupt the flow of resources from states to terrorists while simultaneously working to end state sponsorship of terrorism.

- *End state sponsorship of terrorism.* State sponsors are a critical resource for our terrorist enemies, often providing funds, weapons, training, safe passage, and sanctuary. Some of these countries have developed or have the capability to develop WMD and other destabilizing technologies that could fall into the hands of terrorists. The United States currently designates five state sponsors of terrorism: Iran, Syria, Sudan, North Korea, and Cuba. We will maintain sanctions against them and promote their international isolation until they end their support for terrorists, including the provision of sanctuary. To further isolate these regimes and persuade other states not to sponsor terror, we will use a range of tools and efforts to delegitimate terrorism as an instrument of statecraft. Any act of international terrorism, whether committed by a state or individual, is reprehensible, a threat to international peace and security, and should be unequivocally and uniformly rejected. Similarly, states that harbor and assist terrorists are as guilty as the terrorists, and they will be held to account.

  Iran remains the most active state sponsor of international terrorism. Through its Islamic Revolutionary Guard Corps and Ministry of Intelligence and Security, the regime in Tehran plans terrorist operations and supports groups such as Lebanese Hizbollah, Hamas, and Palestine Islamic Jihad (PIJ). Iran also remains unwilling to account for and bring to justice senior al Qaeda members it detained in 2003. Most troubling is the potential WMD–terrorism nexus that emanates from Tehran. Syria also is a significant state sponsor of terrorism and thus a priority for concern. The regime in Damascus supports and provides haven to Hizbollah, Hamas, and PIJ. We will continue to stand with the people of Iran and Syria against the regimes that oppress them at home and sponsor terror abroad.

  While Iranian and Syrian terrorist activities are especially worrisome, we are pressing all state sponsors to take the steps that are required to have state sponsorship designation rescinded. Each case is unique, and our approach to each will be tailored accordingly. Moreover, we never foreclose future membership in the coalition against tyranny and terror. The designation of Iraq as a state sponsor was rescinded in 2004 as it transitioned to democracy, ceased its terrorist support, and became an ally in the War on Terror. Similarly, the United States

in June 2006 rescinded the designation of Libya, which has renounced terrorism and since September 11 has provided excellent cooperation to the United States and other members of the international community in response to the new global threats we face. Libya can serve as a model for states who wish to rejoin the community of nations by rejecting terror.

- *Disrupt the flow of resources from rogue states to terrorists*. Until we can eliminate state sponsorship of terror, we will disrupt and deny the flow of support from states to terrorists. We will continue to create and strengthen international will to interdict material support, akin to our efforts in the Proliferation Security Initiative—a global effort to stop shipments of WMD, their delivery systems, and related material. We will build international cooperation to financially isolate rogue states and their terrorist proxies. We also will continue to expose the vehicles and fronts that states use to support their terrorist surrogates.

### Deny Terrorists Control of Any Nation They Would Use as a Base and Launching Pad for Terror

Our terrorist enemies are striving to claim a strategic country as a haven for terror. From this base, they could destabilize the Middle East and strike America and other free nations with ever-increasing violence. This we can never allow. Our enemies had established a sanctuary in Afghanistan prior to Operation Enduring Freedom, and today terrorists see Iraq as the central front of their fight against the United States. This is why success in helping the Afghan and Iraqi peoples forge effective democracies is vital. We will continue to prevent terrorists from exploiting ungoverned or undergoverned areas as safe havens—secure spaces that allow our enemies to plan, organize, train, and prepare for operations. Ultimately, we will eliminate these havens altogether.

- *Eliminate physical safe havens*. Physical sanctuaries can stretch across an entire sovereign state, be limited to specific ungoverned or ill-governed areas in an otherwise functioning state, or cross national borders. In some cases the government wants to exercise greater effective sovereignty over its lands and maintain control within its borders but lacks the necessary capacity. We will strengthen the capacity of such War on Terror partners to reclaim full control of their territory through effective police, border, and other security forces as well as functioning systems of justice. To further counter terrorist exploitation of undergoverned lands, we will promote effective economic development to help ensure long-term stability and prosperity. In failing states or states emerging from conflict, the risks are significant. Spoilers can take advantage of instability to create conditions terrorists can exploit. We will continue to work with foreign partners and international organizations to help prevent conflict and respond to state failure by building foreign capacity for peace operations, reconstruction, and stabilization so that countries in transition can reach a sustainable path to peace, democracy, and prosperity. Where physical havens cross national boundaries, we will continue to work with the affected countries to help establish

effective cross-border control. Yet some countries will be reluctant to fulfill their sovereign responsibilities to combat terrorist-related activities within their borders. In addition to cooperation and sustained diplomacy, we will continue to partner with the international community to persuade states to meet their obligations to combat terrorism and deny safe haven under U.N. Security Council Resolution 1373.

Yet safe havens are not just limited to geographic territories. They also can be nonphysical or virtual, existing within legal, cyber, and financial systems.

- *Legal safe havens*. Some legal systems lack adequate procedural, substantive, and international assistance laws that enable effective investigation, prosecution, and extradition of terrorists. Such gaps offer a haven in which terrorists and their organizations can operate free from fear of prosecution. In the United States, we have developed a domestic legal system that supports effective investigation and prosecution of terrorist activities while preserving individual privacy, the First Amendment rights of association, religious freedom, free speech, and other civil rights. We will continue to work with foreign partners to build their legal capacity to investigate, prosecute, and assist in the foreign prosecution of the full range of terrorist activities—from provision of material support, to conspiracy, to operational planning, to a completed act of terrorism.
- *Cyber safe havens*. The Internet provides an inexpensive, anonymous, geographically unbounded, and largely unregulated virtual haven for terrorists. Our enemies use the Internet to develop and disseminate propaganda, recruit new members, raise and transfer funds, train members on weapons use and tactics, and plan operations. Terrorist organizations can use virtual safe havens based anywhere in the world, regardless of where their members or operatives are located. Use of the Internet, however, creates opportunities for us to exploit. To counter terrorist use of the Internet as a virtual sanctuary, we will discredit terrorist propaganda by promoting truthful and peaceful messages. We will seek ultimately to deny the Internet to the terrorists as an effective safe haven for their propaganda, proselytizing, recruitment, fund-raising, training, and operational planning.
- *Financial safe havens*. Financial systems are used by terrorist organizations as a fiscal sanctuary in which to store and transfer the funds that support their survival and operations. Terrorist organizations use a variety of financial systems, including formal banking, wire transfers, debit and other stored value cards, online value storage and value transfer systems, the informal *hawala* system, and cash couriers. Terrorist organizations may be able to take advantage of such financial systems either as the result of willful complicity by financial institutions or as the result of poor oversight and monitoring practices. Domestically, we have hardened our financial systems against terrorist abuse by promulgating effective regulations, requiring financial institutions to report suspicious transactions, and building effective public–private partnerships. We will continue to work with foreign partners to ensure they develop and implement

similar regulations, requirements, and partnerships with their financial institutions. We also will continue to use the domestic and international designation and targeted sanctions regimes provided by, among other mechanisms, Executive Order 13224, USA PATRIOT Act Section 311, and United Nations Security Council Resolution 1267 and subsequent resolutions. These tools identify and isolate those actors who form part of terrorist networks or facilitate their activities.

## INSTITUTIONALIZING OUR STRATEGY FOR LONG-TERM SUCCESS

The War on Terror will be a long war. Yet we have mobilized to win other long wars, and we can and will win this one. During the Cold War we created an array of domestic and international institutions and enduring partnerships to defeat the threat of communism. Today, we require similar transformational structures to carry forward the fight against terror and to help ensure our ultimate success:

- *Establish and maintain international standards of accountability.* States that have sovereign rights also have sovereign responsibilities, including the responsibility to combat terrorism. The international community has developed a compelling body of international obligations relating to counterterrorism. Twelve universal conventions and protocols in force against terrorism have been developed under the auspices of the United Nations as well as various U.N. Security Council Resolutions related to combating terror. These include UNSCR 1373, which imposes binding obligations on all states to suppress and prevent terrorist financing, improve their border controls, enhance information sharing and law enforcement cooperation, suppress the recruitment of terrorists, and deny them sanctuary.

    The Group of Eight (G-8) along with other multilateral and regional bodies also have been instrumental in developing landmark counterterrorism standards and best practices that have been adopted by international standard-setting organizations. But our obligations are not static. We will collaborate with our partners to update and tailor international obligations to meet the evolving nature of the terrorist enemies and threats we face. We also will work to ensure that each country is both willing and able to meet its counterterrorist responsibilities. Finally, we will not just continually monitor whether we and the community of nations are meeting these standards but will evaluate if we are achieving results both individually and collectively.

- *Strengthen coalitions and partnerships.* Since September 11, most of our important successes against al Qaeda and other terrorist organizations have been made possible through effective partnerships. Continued success depends on the actions of a powerful coalition of nations maintaining a united front against terror. Multilateral groups such as the International Maritime Organization and the International Civil Aviation Organization, as well as regional organizations such as the Asia-Pacific Economic Cooperation, the Organization of American

States, NATO, the European Union, the African Union, and the Association of Southeast Asian Nations, among others, are essential elements of this front.

We will ensure that such international cooperation is an enduring feature of the long war we will fight. We will continue to leverage the comparative advantage of these institutions and organizations – drawing on what each does best in counterterrorism, from setting standards to developing regional strategies to providing forums for training and education. Indeed, a significant part of this effort includes expanding partnership capacity. We are building the capacity of foreign partners in all areas of counterterrorism activities, including strengthening their ability to conduct law enforcement, intelligence, and military counterterrorism operations. Through the provision of training, equipment, and other assistance, the United States, along with a coalition of willing and able states and organizations, will enhance the ability of partners across the globe to attack and defeat terrorists, deny them funding and freedom of movement, secure their critical infrastructures, and deny terrorists access to WMD and safe havens. Ultimately, it will be essential for our partners to come together to facilitate appropriate international, regional, and local solutions to the challenges of terrorism.

- *Enhance government architecture and interagency collaboration*. In the aftermath of September 11, we have enhanced our counterterrorism architecture and interagency collaboration by setting clear national priorities and transforming the government to achieve those priorities. We have established the Department of Homeland Security, bringing under one authority 22 Federal entities with vital roles to play in preventing terrorist attacks within the Homeland, reducing America's vulnerability to terrorism, and minimizing the damage and facilitating the recovery from attacks that do occur. We have reorganized the Intelligence Community. The Director of National Intelligence (DNI) was created to better integrate the efforts of the Community into a more unified, coordinated, and effective whole. The DNI also launched a new Open Source Center to coordinate open source intelligence and ensure this information is integrated into Intelligence Community products.

  In addition, a National Counterterrorism Center (NCTC) was established to serve as a multiagency center analyzing and integrating all intelligence pertaining to terrorism, including threats to U.S. interests at home and abroad. NCTC also is responsible for developing, implementing, and assessing the effectiveness of strategic operational planning efforts to achieve counterterrorism objectives. We similarly established a National Counterproliferation Center to manage and coordinate planning and activities in those areas.

  The transformation extends to the Federal Bureau of Investigation, which, with the help of legislation such as the USA PATRIOT Act, is now more fully integrated with the Intelligence Community, has refocused its efforts on preventing terrorism, and has been provided important tools to pursue this mission. The CIA also has transformed to fulfill its role to provide overall direction for and coordination of overseas human intelligence operations of Intelligence Community elements. In addition, the Department of the Treasury created the Office of Terrorism and Financial Intelligence to arm ourselves for the long term with

the intelligence and tools to undercut the financial underpinnings of terrorism around the world.

The Department of Defense also is preparing to meet a wider range of asymmetric challenges by restructuring its capabilities, rearranging its global posture, and adapting its forces to be better positioned to fight the War on Terror. This includes significantly expanding Special Operations Forces, increasing the capabilities of its general purpose forces to conduct irregular warfare operations, and initiating the largest rearrangement of its global force posture since the end of World War II.

The Department of State is implementing a new framework for foreign assistance to establish more integrated and coherent strategic direction and tactical plans to meet our current and long-term challenges, including terrorism. The State Department also is repositioning its domestic and overseas staff to better promote America's policies and interests and have more direct local and regional impact. This transformational diplomacy positions State to work with partners around the world to build and sustain democratic, well-governed states that will respond to the needs of their people and conduct themselves responsibly in the international system.

We will sustain the transformation already under way in these and other departments and agencies. Moreover, we will continue to build and strengthen a unified team across the counterterrorism community, and a key component of this effort will be fostering "jointness." Where practicable, we will increase interagency and intergovernmental assignments for personnel in counterterrorism-related positions. This will help to break down organizational stovepipes and advance the exchange of ideas and practices for more effective counterterrorism efforts.

- *Foster intellectual and human capital*. To better prepare ourselves for a generational struggle against terrorism and the extremist ideologies fueling it, we will create an expert community of counterterrorism professionals. We will continue to establish more systematic programs for the development and education of current professionals in counterterrorism-related fields. We will substantively expand our existing programs with curricula that includes not only training in counterterrorism policies, plans and planning, strategies, and legal authorities, but continuing education in appropriate area studies, religious philosophies, and languages. We also will ensure that personnel throughout all levels of government and in all fields related to combating terror are invited to participate.

  Yet such development and education programs must not be restricted to current counterterrorism personnel. We will support multidisciplinary studies throughout our educational system to build a knowledgeable pool of counterterrorism recruits for the future. The recent National Security Language Initiative is an essential step forward. It will help to expand U.S. foreign language education beginning in early childhood and continuing throughout formal schooling and into the workforce. Our efforts to foster intellectual and human capital also will extend beyond our borders – to academic and nongovernmental forums with our international partners to discuss and enhance our knowledge about the critical counterterrorism challenges we confront.

- In the War on Terror, there is also a need for all elements of our Nation – from Federal, State, and local governments to the private sector to local communities and individual citizens – to help create and share responsibilities in a Culture of Preparedness. This Culture of Preparedness, which applies to all catastrophes and all hazards, natural or man-made, rests on four principles: a shared acknowledgement of the certainty of future catastrophes and that creating a prepared Nation will be a continuing challenge; the importance of initiative and accountability at all levels of society; the role of citizen and community preparedness; and finally, the roles of each level of government and the private sector in creating a prepared Nation. Built upon a foundation of partnerships, common goals, and shared responsibility, the creation of a Culture of Preparedness will be among our most profound and enduring transformations in the broader effort to protect and defend the Homeland.

## CONCLUSION

Since the September 11 attacks, America is safer, but we are not yet safe. We have done much to degrade al Qaeda and its affiliates and to undercut the perceived legitimacy of terrorism. Our Muslim partners are speaking out against those who seek to use their religion to justify violence and a totalitarian vision of the world. We have significantly expanded our counterterrorism coalition, transforming old adversaries into new and vital partners in the War on Terror. We have liberated more than 50 million Afghans and Iraqis from despotism, terrorism, and oppression, permitting the first free elections in recorded history for either nation. In addition, we have transformed our governmental institutions and framework to wage a generational struggle. There will continue to be challenges ahead, but along with our partners, we will attack terrorism and its ideology, and bring hope and freedom to the people of the world. This is how we will win the War on Terror.

# Countering Terrorism and Insurgency in the 21st Century

# Countering Terrorism and Insurgency in the 21st Century

## INTERNATIONAL PERSPECTIVES

VOLUME 2: COMBATING THE SOURCES AND FACILITATORS

Edited by James J. F. Forest

# CONTENTS

# EDITOR'S NOTE

Governments have been countering the threat of terrorism and insurgency since the establishment of the Westphalia system of nation-states. However, the rapid evolution of science and technology over the past 100 years—from the invention of dynamite to commercial air travel and the Internet—has enabled new forms of terrorist and insurgent activity. It is thus likely that further technological advances over the next 100 years will yield similar results, as today's terrorist and insurgent groups have proven to be adaptable, learning organizations. This three-volume set, *Countering Terrorism and Insurgency in the 21st Century*, seeks to encourage the development of learning organizations among national security professionals by examining what we currently know about the strategic application of hard and soft power in countering the sources and facilitators of terrorism. As a collection, the thematic essays and focused case studies represent an ambitious effort to capture existing knowledge in the field of counterterrorism and counterinsurgency, and draw lessons (from successes as well as failures) that will inform new, adaptable strategies to counter the new threats that—judging from historical trends—will no doubt emerge over the next century.

At the outset, it is necessary to address why this publication covers both terrorism and insurgency, as there is confusion about these terms among many in the academic, media, and policymaking communities. In some countries that have faced the threat of violence for many years—including Colombia, Ireland, Spain, Sri Lanka, and Turkey—societies have grappled with additional terms like "paramilitaries" and "freedom fighters," but the general view reflected throughout the chapters of this publication is that all groups or individuals (including insurgents) who engage in the act of terrorism can be considered terrorists. In essence, the act of terrorism defines its perpetrator as a terrorist, regardless of the ideological motivation behind such acts.

According to the U.S. Department of Defense, terrorism is defined as "the calculated use of violence or threat of violence to inculcate fear; intended to coerce or to intimidate governments or societies in the pursuit of goals that are generally political, religious or ideological," while

insurgency is defined as "an organized resistance movement that uses subversion, sabotage, and armed conflict to achieve its aims.... [and which] seek to overthrow the existing social order and reallocate power within the country." In teaching my classes on these topics to future U.S. Army officers at West Point, the distinction I make is that insurgents can and do use terrorism (among other forms of violence), but insurgents are but one type of violent nonstate actors who may choose to use terrorism. In other words, not all insurgents use terrorism, and not all terrorists are part of an insurgency. Further, while the use of violence by insurgents to target governments is driven by a particular ideology, terrorists use violence against a range of targets (including governments) to advance their ideology.

While such distinctions may seem academic to most readers, they are actually quite important when formulating strategic, tactical, and policy responses to the threat posed by terrorism and insurgencies. As described in Volume 1 of this publication, strategies and tactics for countering insurgency are an important aspect of our knowledge base on countering terrorism, and vice versa. In both cases, experts have emphasized that the use of force to counter an organization whose objectives resonate with a larger disaffected population yields limited (if any) success. Instead, it is argued, the ideology, political, and socioeconomic aspects of an organization— through which it derives its financial support, recruits, and sympathizers from amongst the local population—must be addressed. In other words, the use of hard power in countering terrorism (including insurgencies that employ terrorist tactics) must be complemented by elements of soft power.

The link between counterinsurgency and counterterrorism is also informed by recent analyses which suggest that the al Qaeda movement can be described as a global insurgency, seeking to replace the existing Westphalia-based system of nation-states with a global caliphate in which Islamic law reigns supreme. Recent terror attacks in Bali, Madrid, London, and Cairo, as well as disrupted terror plots in Denmark, the Netherlands, and the United Kingdom, are all seen as examples of how individuals and groups around the world have been inspired by al Qaeda's ideology to commit violence as part of a strategy to change the policy and behavior of these nation-states. In other words, it is argued, al Qaeda uses terrorism tactically and operationally to advance its global insurgent strategy. When described in these terms, the U.S.-led global effort against al Qaeda can be considered to be fighting both terrorism and insurgency. Thus, *Countering Terrorism and Insurgency in the 21st Century* addresses the many challenges that stem from both types of threats to our security.

Another source of confusion in the study of terrorism and insurgency involves disagreement over the proper spelling of certain groups (or, rather, the spelling of the transliteration from the original language into English). For example, a brief survey of the literature reveals that a certain

Lebanese militant group can be spelled Hizballah, Hezbollah, Hizbullah, Hezballah, and Hizbollah. For these volumes, we have standardized the spelling of certain common names across all the chapters, such as al Qaeda (because this is how several agencies of the U.S. government are now spelling it), Hizbollah (because this is how the group spells it on their English language Web site), and Osama bin Laden (rather than Usama). Finally, it is important to note that while many chapters discuss aspects of the "global war on terrorism (GWOT)," we recognize that this term has fallen out of favor among many in the academic and policy communities. However, there currently is a worldwide effort to reduce the capabilities of globally networked terror movements like al Qaeda, and in the absence of an equally useful short-hand reference for this effort, GWOT serves an important role.

At this point in the development of the global counterterrorism effort, it is particularly important to pause for reflection on a number of critical questions. What do we know about effectively countering terrorism and insurgencies? What are the characteristics of successful or unsuccessful counterterrorism and counterinsurgency campaigns? What do we need to learn in order to do these things more effectively? *Countering Terrorism and Insurgency in the 21st Century* addresses these and related questions, and in doing so contributes to national security policy as well as to our understanding of the common threat and how it can be defeated. Chapters of this publication address many different aspects of the unconventional warfare puzzle, examining the most important diplomatic, information, military/law enforcement, and economic/financial dimensions to regional and global cooperation in countering terrorism and insurgency, and providing specific examples of these dimensions in practice.

Authors in the first volume address issues of important strategic and tactical concern, organized around the primary instruments of power through which nations pursue their counterterrorism and counterinsurgency efforts. These instruments can generally be described as either hard power (the use of force by military and law enforcement) or soft power (including diplomacy, information, and intelligence). The second volume provides a variety of insights on how to assess and combat the sources and facilitators of political violence, including state sponsors of terror, authoritarian regimes, criminal network activity, border insecurity, and the global struggle for influence among societies. As highlighted by several authors in this volume, the community of responsibly governed democracies faces uniquely complex challenges in combating terrorism and insurgencies while maintaining civil freedoms. And contributors to the third volume offer in-depth analyses of historical events and lessons learned in counterterrorism and counterinsurgency. Each volume contains a preface and introductory chapter, describing the contributed essays and providing an intellectual background for the discussions that follow.

This project is the final installment of an ambitious trilogy published by Praeger Security International. The first of these—the three-volume *The Making of a Terrorist: Recruitment, Training and Root Causes* (published in 2005)—intends to help readers understand the nature of the threat by exploring what transforms an ordinary individual into a terrorist. This was followed by the three-volume *Homeland Security: Protecting America's Targets* (published in 2006), which explored the ongoing efforts in the United States to secure our borders and ports of entry, and to protect our public spaces and critical infrastructure from future terror attacks. The volumes of *Countering Terrorism and Insurgency in the 21st Century* complement these earlier publications by focusing our attention on the broad, worldwide effort to actively confront those who threaten or use political violence against our communities. Together, these nine volumes are meant to provide a central, authoritative resource for students, teachers, policymakers, journalists, and the general public, as well as stimulate new ideas for research and analysis.

## ACKNOWLEDGMENTS

# PREFACE

The chapters of this second volume of *Countering Terrorism and Insurgency in the 21st Century* examine the sources and facilitators of political violence. A wide variety of topics can be explored within this general category, and there is also a considerable diversity of opinion about what the terms "source of terrorism" and "facilitator of terrorism" mean. The themes chosen for this volume are meant to represent this diversity, rather than encompass the entire spectrum of possible topics. The chapters are organized into four general areas. In the first, chapters explore topics within the realm of governance and the international system. The second section examines a variety of criminal and economic dimensions. The third section addresses a few dimensions of society and technology in facilitating terrorist recruitment and operations, and defines the arena of strategic influence. And in the final section of the volume, chapters examine various aspects of the U.S. response to the global security environment. As a collection, the chapters advance our understanding of national security strategy challenges, as well as raise important questions and issues for further research.

## PART I: GOVERNMENTS AND THE INTERNATIONAL SYSTEM

The first section of the volume begins with a chapter by Dan Byman, Director of the Center for Peace and Security Studies at Georgetown University, in which he notes that state sponsorship of terrorism is a complex problem that cannot easily be solved. Despite diplomatic protests, economic sanctions, and even military pressure, Iran, Pakistan, and Syria have supported numerous terrorist groups for decades. Their persistence in the face of pressure suggests that cutting the deadly connection between states and terrorist groups is difficult at best and impossible at worst. However, careful policymakers can design better solutions and avoid many common mistakes that can make the problem of state sponsorship worse. To begin with, he observes, it is easier to stop state support for terrorism before it starts than to halt backing after it begins. Thus, one of the greatest challenges to the international community is preventing

the rise of new Talibans or other regimes that see supporting terrorism as ideologically vital. Creating a strong norm against the sponsorship of terrorism both makes states less likely to engage in it in the first place and enables the victim state to respond more easily. Diplomatically, this requires engaging both allies and other states on these issues before the support for terrorism becomes well established. In addition, it demands that the United States and other countries offer would-be sponsors alternatives to terrorism, such as giving them options at the negotiating table. Also, he concludes, creating standards is vital with regard to the problem of passive state sponsorship of terrorist organization.

The nation-state is also the focus of the next chapter by Paul Pillar, a visiting professor in the Security Studies Program of Georgetown University and long-term veteran of the U.S. intelligence community. He begins by describing various arguments in favor of democracy as a superior system of government in general. The most fundamental point in favor of democracy is that when rulers are answerable to the ruled and must compete for the people's favor to gain or retain office, they are more likely than in autocracies to govern in the people's interests and not exclusively in their own. One of the most attractive features of democratization as a counterterrorism and counterinsurgency tool is that expansion of democracy and associated political rights is a value in its own right. Far from compromising or treading upon other ends, democratization represents the advancement of an important end, in addition to whatever benefit it has in curtailing terrorism. However, this does not imply that democratization should always—or even in any one case—take precedence over other counterterrorist instruments. Like the other tools, it has major limitations—most notably, the long time required for beneficial effects to become apparent, and the very long time required to develop political cultures needed for democracy to work well. Overall, he concludes, there are significant pitfalls associated with the transition of bringing new democracies into being. Much depends not on democracy itself, but on the widespread establishment of liberal attitudes and norms required to support it.

The next chapter furthers this analysis of democratization's impact on countering terrorism, with a particular focus on reducing the appeal of extremist groups in North Africa and the Middle East. Authored by Francesco Cavatorta of Dublin City University, Ireland, this chapter begins by noting that "any analysis of this region today concludes that the salient trait is the complete absence of democratic governance in all the Arab countries. While this authoritarianism in the different countries varies in terms of intensity, few doubts exist about its persistence and pervasiveness." He then examines in some detail the relationship between democratization and political violence in the region and analyzes several different but interrelated aspects of such a complex relationship. First, he argues that processes of democratization in the region have largely failed due to

the controversial nature of the principal opposition to the authoritarian elites in virtually all of the countries. Second, he challenges the assumption that democratization will inevitably reduce the appeal of extremist groups, if we equate extremism with the use of violence. The relegitimization of state authority in the Middle East and North Africa through the adoption of democratic procedures is certainly a necessary first step to stem the wave of radicalism that is engulfing the region. However, he argues, it would probably only be effective in moderating those groups that have "extremist" ideas, but are already committed to pursuing their goals through nonviolent means. Finally, his chapter offers some recommendations on how the international community could help bring about not only a more democratic region, but also a more "just" international system.

The next chapter, by Lydia Khalil, a Counterterrorism analyst for the New York Police Department, furthers these discussions by examining the multifaceted connections between authoritarian governance and terrorism. She argues that no matter how benign their intentions, authoritarian governments usually succumb to the accumulation of power for power's sake. They also routinely stifle civil liberties in order to maintain their hold on power and keep society in check. Further, more often than not, authoritarian governments are also corrupt governments. Resources, privileges, and advantages are reserved for a select group of the people or ruling elite. Corruption encumbers the fair distribution of social services and adds another layer to the resentment caused by the lack of political participation. The rest of society, because they have no voice, is ignored or placated. This corruption further erodes the government's legitimacy in the eyes of its citizens. She argues that we can no longer reluctantly tolerate authoritarian governments because they say they will cooperate in the international terrorist effort. Authoritarian states are "bad citizens" that do not and cannot help the international effort against international terrorism. On the contrary, authoritarian and repressive government are themselves a cause of terrorism. Authoritarian states may have the tactical capability and even the will to cooperate, but their assistance is tainted and their long-term usefulness is doubtful. Instead, she concludes, the United States and the international community must put these authoritarian, corrupt, and illegitimate governments that foment terrorism in a negative spotlight. Mobilizing the international community against authoritarian regimes in the name of effective long-term counterterrorism efforts is needed to put a check on authoritarian governments that breed this threat.

Matthew Wahlert of Miami University follows with a chapter on the relationship between state failure and terrorism. Many political scientists and security analysts have turned to an examination of the failed state phenomenon in their research on counterterrorism. Furthermore, the Bush administration—in recognition of the serious nature of the problem—dealt with the issue in the *National Security Strategy of 2002* and

the *National Security Strategy of 2006,* both of which specifically pointed to the importance of addressing both failed and failing states as a component of our overall counterterrorism effort. A variety of factors contribute to the usefulness of failed states as bases for terror groups. First, failed states lack any semblance of law enforcement. In addition, a failed state also offers a population of ready-made recruits who are promised basic amenities (food, security, etc.) that the state is unable to provide. Finally, the levels of poverty and corruption typically associated with failed states makes the viability of bribes more compelling—again, allowing terrorist or criminal organizations the freedom to behave in any manner they wish. Overall, Wahlert provides a useful introduction to many of the issues concerning state failure as they relate to the broader effort to fight terrorism.

A state's inability to control its borders is the focus of the final chapter of this section, by Florida-based security consultant Michelle Spencer. She examines the factors related to borders that frame the current threats and our ability to address them, the primary threats that must be addressed by the international community, and the role border security can or cannot play in addressing those challenges. Her analysis suggests that border security is not a panacea and will not win the war on terror, and that there is no single model that can be instituted worldwide to secure every border under any circumstance. Indeed, methods and means of border security are governed by national security interests and, thus, are different for each country. Further, there are many things border security cannot do—for example, it cannot stop knowledge, funding, or violent ideology from spreading. Border security can, however, be a part of a comprehensive response to terrorism. Security can only be effective in layers. Terrorists must be forced to clear hurdle after hurdle, country after country. It is this type of international cooperation that will gradually, but forcefully increase the opportunity costs for terrorist groups. Thus, the United States and the international community should assist partner countries in improving their border security capabilities.

## PART II: CRIMINAL AND ECONOMIC DIMENSIONS

The second section of this volume explores the role of criminal networks and other violent nonstate entities which facilitate global terrorism. The first chapter of this section, by Chris Carr of the U.S. Air War College, addresses the international proliferation of small arms and light weapons (SALW). He begins by observing that in sufficient numbers and in the context of weak states, SALW can create an architecture of insecurity which fosters the very circumstances that protect and sustain the culture of terrorism. In Yemen, in the Northwest Frontier Province of Pakistan, in the slums of urban Jamaica, and in the Caucasus mountains, the proliferation of small arms has allowed armed groups to challenge the primacy

of the state and to create conditions of instability which provide aid and comfort to criminal and terrorist communities. In such places, the traffickers in drugs, humans, and weapons cohabit with the warlords, militia leaders, and political opportunists in an environment which precludes good governance and judicial oversight. After addressing the origins of this problem, Carr offers some suggestions for countering the proliferation of SALW, including multilateral agreements, regional and bilateral arrangements, and partnerships with nongovernmental organizations for gathering data on the locations and movements of these weapons.

Next, professor Paul Smith of the U.S. Naval War College examines the financial aspects of terrorism and counterterrorism. During the past decade, and particularly since 1999, a flurry of regulations and laws have been implemented throughout the world that focus primarily on terrorism financing. In fact, some observers might suggest that the "financial oxygen" that sustains terrorist activity is nearly depleted. Unfortunately, however, terrorists are extremely versatile and creative. They are reverting to more fundamental methods of transferring money, such as enlisting informal value transfer systems, engaging in bulk cash smuggling, or simply transferring "value" anonymously via e-cash (or e-gold) on the Internet. Further, as money laundering regimes become more advanced in rich, developed countries (and even moderately wealthy developing countries), terrorist organizations always have the option of turning to "less governed spaces"—in other words, operating in those areas of the world outside the purview of governments and financial regulators. Smith concludes that since terrorism is a complex, political phenomenon that cannot be simply eliminated by starving terrorists of their money, countering terrorism in the long term will require that governments honestly and forthrightly take on those sensitive questions or issues that provide the "political oxygen" of international terrorism. Unless that reality is confronted honestly, terrorists will always find a way to fund their operations.

His analysis is followed by a chapter from British counterterrorism expert J.P. Larsson, who examines the conceptual intersections of terrorism and organized criminal networks. Despite the common means and methods shared by terrorists and criminal organizations, the traditional view of law enforcement has been to treat the two as completely distinct and separate, and this has in turn led to two disparate responses by government bodies, law enforcement agencies, and academic scholarship. However, the way to combat both terrorism and organized crime may be to treat them as very similar concepts. Larsson begins by offering a brief overview of organized crime, taken quite separate from terrorism, and then explores some of the similarities between them, how the two interact, and what the law enforcement response is and can be. Finally, he provides some thoughts about how both terrorism and organized crime can be countered in the twenty-first century.

Organized crime is also a prominent theme of the next chapter, by Florida-based criminal justice consultant (and former DEA Supervisory Special Agent and U.S. Army soldier) Gregory D. Lee. He examines the global drug trade and its nexus to international terrorist organizations, as well as the traits these organizations share, noting that numerous terrorist organizations have been funded for years by the profits of drug traffickers, and this is likely to continue in the foreseeable future, especially when state-sponsored support is eroded by political or military action. Terrorists use drug production and trafficking profits to meet their overhead, and to destabilize governments around the world, including the United States. The methods they use to achieve their goals are strikingly similar to those used by drug trafficking organizations. He concludes by observing that the DEA is about to join the "intelligence community" and it is long overdue. The DEA has a large reservoir of human intelligence that surely can be beneficial to those charged with conducting terrorism investigations. This is especially true when one considers the frequent interaction between drug and terrorist organizations. Conversely, the intelligence community needs to understand the nexus between drugs and terror, and should readily provide information to the DEA to enable them to dismantle these organizations.

Further analysis of the intersection between terrorism and the global drug trade is provided in the next chapter, by U.S. Army officers James Walker and Jon Byrom. Their case study of Afghanistan offers unique insights into the history of terrorism financing, state sponsorship, and charitable organizations as well as licit and illicit activities, and suggests that the global attack against terrorist financing has shifted financial reliance to illicit activities, primarily drugs. Further, they argue, this shift will cause terror groups to find opportunities to enter the global supply chain of drugs. Unfortunately, no place offers a greater opportunity than Afghanistan, where the environment is too tempting for terrorists not to carve out a piece of the action—after all, because of its comparative advantage in the production of opium, this country provides 87 percent of the world's heroin supply. In fact, they argue, Afghanistan's macroeconomic dependence on opium will ensure its continued production for years to come. Overall, Afghanistan is on the brink of becoming a major narco-terrorist state, and the United States and its allies must be appropriately concerned about its vast terrorism financing potential. To prevent this from occurring, the world community and the new Afghan government should focus on increasing all costs of the drug business. From an economic perspective, a direct effort to increase opportunity costs of growing poppies, while decreasing opportunity costs of alternatives, is what is needed.

The economic dimensions of global terrorism are also addressed in the next chapter, by Shahdad Naghshpour and Joseph St. Marie of the

University of Southern Mississippi, and Samuel Stanton, Jr. of Grove City College. They examine the role of the "shadow economy" (economic activities that are underground, covert, or illegal) in the global spread of terrorism; specifically, the theory behind the shadow economy and the effects it can have on terrorist organizations with regard to financing. Their analysis indicates that the shadow economy can provide an infrastructure for terrorist organizations to operate in, whereby financing becomes easier and detecting it becomes more difficult. The irony for most nations' decision makers is that public policy decisions intended to create a better quality of life—such as a social security system which collects contributions through taxes and then provides a basic human security "safety net" for all its citizens—may actually create an infrastructure where terror organizations can operate, finance themselves, and carry out attacks against the very sociopolitical system that unwittingly supports them. A comprehensive approach to combating terrorism thus requires significant monitoring of the shadow economy.

Next, Sumesh Arora and David Butler of the University of Southern Mississippi provide an analysis of the relationship between global terrorism and a nation's dependence on energy resources outside its borders. After defining the term energy security and addressing its geopolitical nuances, the chapter examines the vulnerabilities of the global system of trade and transportation of fossil fuel energy resources (primary oil and natural gas). They note that the possibility of terrorist attacks on energy installations today is a legitimate concern, validated by several incidents that have been reported by the news media in the recent months and years. Arora and Butler then review several attacks that have been made against this system, particularly in places like Iraq, Saudi Arabia, Colombia, and Iraq, as well as threatening statements made by al Qaeda warning of attacks against oil facilities in the Middle East. Overall, they conclude, international energy dependence can be viewed as both a facilitator and vulnerability of terrorism, and thus demands our utmost attention in formulating a comprehensive, global counterterrorism response.

Another example of the intersection between global trade and terrorism involves maritime piracy, according to U.S. Army officer Kent Baumann. His chapter begins with an illustration of how contemporary piracy is proving more and more dangerous as technology and globalization continue to advance and spread. The motivations influencing various terrorist groups to engage in piracy vary from their geographic proximity to strategic waterways to their particular ideological and political goals. There are also economic reasons: successful acts of piracy can help fund and supply future terrorist operations, and hostage-taking for ransom, as well as the theft of ocean going vessels, can prove very lucrative for raising funds. Overall, he suggests, terror-piracy may pose a potentially catastrophic threat on the contemporary geostrategic stage. In particular,

transnational, ideologically focused groups pose the greatest threat when associated with international maritime pirates. Finally, his chapter concludes by proposing several short- and long-term countermeasures for combating global piracy (whether or not it is related to terrorism), and highlights the importance of consequence management in the case that global terrorism begins to take greater advantage of the maritime vulnerabilities he describes.

The final chapter of this section addresses the need to understand and counter the motives and methods of a particular type of violent nonstate actor: warlords. Here, Brian Hanley of KonnectWorld, Inc., provides a categorization of different types of warlords (including resource warlords, proxy warlords, and development bandits), and then provides recommendations for countering each type. He suggests that the primary method of dealing with a resource warlord is to take physical control of his resource assets and manage them on a fair and equitable way for the nation. This type of military-development action could be legitimized on the international scene. He recommends imprisoning or killing proxy warlords (who are supported by external entities), while negotiating with their supporting power(s). And regarding development bandits, he recommends taking steps to allow prosecution for major crimes committed in developing nations in the home country of the funding organization (where legal systems are presumed stronger). Finally, he notes, a key to opposing warlords is not so much how draconian the threat is against them, but their perception, and that of a potential successor, that they will reliably be caught or killed. Because of the prevalence of warlords in failed or failing states—the same "ungoverned spaces" where we find terrorist groups and training camps—Hanley's analysis of warlords contributes an important dimension to our understanding of countering terrorism and insurgency in the twenty-first century.

## PART III: SOCIETY, TECHNOLOGY, AND STRATEGIC INFLUENCE

The third section of this volume explores various dimensions of society that facilitate radicalization, mobilization, and other operations of insurgencies and terrorist organizations. The first chapter of this section, by National Defense University professor Bard O'Neil and former U.S. Air Force Academy professor Donald J. Alberts, offers a thoughtful analysis of the psychological, social, economic, and political roots of terrorism, and particularly the use of terror tactics by insurgent organizations, and considers remedies for mitigating them. They describe how effective insurgent organizations proffer a blend of ideological and material incentives that meet an individual's need for belonging, identity, and rectifying perceived injustice. Once individuals have joined or otherwise

actively supported terrorist groups for ideological reasons, it is difficult to win them back, because of the psychological and emotional investments they have made. This is especially true when religious ideas are involved. Moreover, their analysis highlights the need for governments to recognize the social, economic, and political problems that need to be resolved, at least partially, if the potential for terrorism is to be diminished. Particularly, they must take a close look at the political culture and system as part of their strategic assessment and draw relevant conclusions from it. Understanding the salience and interconnections of these psychological, social, economic, and political causes requires a careful and systematic analysis in every situation. This should precede the articulation and implementation of a comprehensive counterterrorist strategy.

In the next chapter, Chris Brown of the Center for Security Policy examines the means and message of Islamic extremists. He argues that because suicide bombings have become an increasingly pervasive tactic, in addition to their popularity among multiple Islamist organizations around the world, there must be an ideological foundation for them. Therefore, the key to an effective counterstrategy can only come from understanding and exploiting the foundational vulnerability of the ideology of the suicide operation. The war in which the world is currently engaged is an ideological war. Thus, he concludes, without a comprehensive strategy to engage in and win the war of ideas in ways that have cultural resonance, military operations alone will provide only a limited respite. Al Qaeda and those that share its ideology must not just be destroyed, but discredited within their own communities. This in turn will undermine their theo-ideology, which is the key to both their global reach as an organization and their ability to recruit for suicide bombings on a level that threatens America and the Western world's vital interests. Without their foundation of theo-ideology, they will fall.

The nature of Islamic extremist ideology is also addressed in the next chapter, by Magnus Norell of the Swedish Defense Research Agency. In his analysis of education for martyrdom, he notes that one does not have to work particularly hard in order to find Islamic texts that support the idea of martyrdom. At the same time, groups of frustrated young Muslim men (and some women) with a feeling of purposelessness, and disenfranchised by a Muslim world in transition, are seeking lofty goals to pin their existence on. The combination of the situation of the aspiring martyrs and individuals with the aim of channeling the frustration of these young men to their benefit can produce devastating results, particularly in the form of suicide terrorism. Further, according to Norell, the claim that those who aspire to become martyrs suffer from mental illnesses as a result of a traumatic childhood or poverty is disputed by practically all available facts. As well, bad education and substandard social conditions do not explain why a person decides to become a suicide murderer. Rather, he points to

the combination of personal frustrations, sociopolitical context, and local influences in small groups of like-minded people, where a feeling of belonging is regained. In these small groups, a mental state develops were emphasis is put on loyalty and commitment to a common cause, which ties the individuals together into a new family. When infused with an ideology that ties limited personal opportunities with an extremist interpretation of the Koran, these groups can become powerful sources of suicide bombers.

Next, Maura Conway of Dublin City University describes the role of new media—particularly the Internet—in spreading the ideological messages, strategies, and tactics of terrorism. Her chapter addresses a variety of ways in which terrorists use the Internet, including psychological warfare, publicity and propaganda, recruitment and mobilization, networking and information gathering, and planning and coordination. She notes that terrorists seek political and social change, and their objective is to influence populations in ways that support that change. To accomplish this, they engage in physical attacks and information operations, as well as the integration of these. The case of Abu Musab al-Zarqawi provides a useful example of this. Obviously, the Internet is not the only tool that a terrorist group needs in order to "succeed." However, the Net can add new dimensions to existing assets that groups can utilize to achieve their goals as well as providing new and innovative avenues for expression, fundraising, recruitment, etc. At the same time, there are also trade-offs to be made. High levels of visibility increase levels of vulnerability, both to scrutiny and security breaches. Nonetheless, the proliferation of official terrorist sites appears to indicate that the payoffs, in terms of publicity and propaganda value, are understood by many groups to be worth the risks.

Next, Randy Bowdish—a retired Navy Captain and faculty member of the U.S. Marine Corps Command and Staff College—provides a detailed look at the relationship between terrorism and the media in a liberal democracy. He argues that the media must take a more active, formal role in guarding the people against the cognitive harm and unwitting complicity toward terrorists' ends associated with news of terrorism. Long a watchdog against governmental abuse of power, the media must also stand sentinel against the tyranny of extremists who would manipulate the media and society to their own malevolent ends. Terrorism strikes at the soft underbelly of democracy by bypassing a nation's means of resistance and attacking its will to resist through the media. While censorship is one option to defend media vulnerability, it is a bad one compared to self-regulation through media codes. He acknowledges that the "cry of terror" is newsworthy and reason to "let slip the media dogs." It does not mean, however, that the news must be reported in a manner conducive to terrorists.

This discussion of terrorism and media is furthered by a case study of Al-Manar (Hizbollah's TV station), by Maura Conway of Dublin City University. She first examines the range of media products offered by Hizbollah, and then offers a brief overview of the Lebanese television scene and the establishment of Al-Manar. The third and fourth sections of the chapter describe the station's mission and financing, respectively. Section five, which describes and analyzes the station's programming, is divided into three parts: the first explores the type of programming prevalent in the station's early years; the second describes the station's contemporary format; and the third is devoted to a description of the type of viewing offered by the station to women and children. Conway also describes the station's viewership and explores the recent banning of the station in Europe and the United States. The chapter concludes with an analysis of the role of the station in the 2006 crisis in the Middle East.

And in the final chapter of this section, Christopher Jasparro of the U.S. Marine Corps Command and Staff College illustrates how analyses of sociodemographic and geographic trends can yield important insights for countering terrorism. He writes that "the application of geographic perspectives provide a means for visualizing, organizing, and assessing real world data (that can otherwise inundate essential information with a deluge of detail) thereby elucidating important spatial patterns and structures." In other words, he suggests that by knowing what areas produce the most terrorists and their supporters, combined with an understanding of where sociodemographic factors play particularly significant roles in facilitating terrorism (and how terrorist organizations exploit these factors from place to place), "we can more precisely and efficiently focus our resources and approaches instead of being constrained by 'one-size fits all' responses geared to addressing broad issues (poverty for instance) whose effectiveness is difficult, if not impossible, to measure." He also suggests that countering an ideology requires determining where a message originates from, along what paths it has diffused, and the conditions by which it resonates. More specifically, precision in reducing the effect of sociocultural and demographic "root causes" that give extreme ideologies their resonance demands that we distinguish between universal and place-specific forces of radicalization.

## PART IV: U.S. RESPONSES TO THE GLOBAL SECURITY ENVIRONMENT

The final section of this volume provides five chapters exploring various ways in which the United States is responding to the challenges of terrorism and insurgency in the twenty-first century. First, Tom Johnson and Chris Mason of the Naval Postgraduate School describe the U.S. strategy and actions in Afghanistan. They observe that today—almost six years

into America's military engagement in Afghanistan—the United States is mired in an insurgency of escalating violence and lethality which has already claimed thousands of lives. The twin insurgent movements of a resurgent Taliban (backed by al Qaeda) and the *Hizb-i-Islami* party of Gulbuddin Hekmatyar (HiG) are growing steadily in strength and influence (particularly in the east and south of the country), while the Afghan government's control over a broad swath of the country is rapidly diminishing. According to their analysis, three fundamental problems in Afghanistan have allowed for the emergence of the insurgencies: (1) the inability of the national government since 2001 to establish a politically significant presence throughout the country; (2) the failure of the international community to create a secure rural environment in the south conducive to development and reconstruction; and (3) the virtually complete lack of meaningful improvement in the lives of the great majority of the people in the southern half of the country. They also suggest that a complete change in counterinsurgency strategy is required, involving greater cultural education for all U.S. soldiers and serious changes in the Afghan National Police and conclude that abandoning Afghanistan would allow the country to once again become a refuge for terrorist groups to recruit, train, and wage war against the West.

A similar conclusion is drawn in the next chapter, by Robert Pauly and Jeff Stephens of the University of Southern Mississippi, in which they examine the current U.S. strategy in Iraq. Their discussion begins by providing an overview of the role of American military forces in nation/state-building operations in Iraq since 2003, followed by an examination of the socioeconomic, judicial, political, and security components of those operations. The chapter then offers several insights that U.S. civilian and military leaders should draw from America's efforts in Iraq to date, and concludes with an assessment of the prospects for the future. Above all, they argue, the economic and political reconstruction of Iraq is absolutely indispensable to the broader transformation of the Islamic world. The conflict in Iraq continues to present economic, military, and political roadblocks that will take years, if not decades, to overcome. However, it is essential to see the Iraqi nation/state-building project through to completion. Thus, subsequent administrations, whether Republican or Democratic, must maintain America's commitment to economic and political reform across the Greater Middle East over the long term. Failing to do so will only further embolden Islamic extremist groups, including (but by no means limited to) al Qaeda.

The next chapter of this section, by Joseph Trafton of the University of Rhode Island, highlights the need to understand the organizational, ideological, and financial aspects of al Qaeda in order to defeat this global network of terror. To date, he notes, the Bush administration has relied heavily on the military to deal with the al Qaeda threat, which is reflective

of the anachronistic way in which the administration views its contemporary adversary. And yet, despite organizational and leadership setbacks in the wake of September 11, al Qaeda continues to be a credible threat to the security of the United States. There is much to be done, particularly in the realms of "soft power" described in the previous volume of this publication. For example, he argues, little has been done by the United States or the international community to deal with the ways in which individual al Qaeda cells obtain large sums of money, for example, including the underground banking networks mentioned earlier. As well, a "strategic communications" campaign is necessary to confront the al Qaeda ideology and its influence throughout the Muslim world. Overall, he concludes, understanding the evolution of al Qaeda's organizational structure, the role ideology plays in uniting the al Qaeda network, and al Qaeda's new financial structure is critical for our success in defeating the threat posed by Osama bin Laden and those he inspires.

The next chapter describes one of the most recent and forward-looking U.S. initiatives in countering terrorism in the twenty-first century: the Trans-Sahara Counterterrorism Partnership (TSCTP). Authored by Lianne Kennedy Boudali of the Combating Terrorism Center at West Point, this chapter examines how the United States is addressing the many security challenges that pervade this strategically important region of Africa, where borders are porous, economies are fragile, and while some states have stable though undemocratic governments, a few are fledgling democracies, and others have been plagued by ongoing violence and instability. In response to this regional environment, the Department of Defense has recently collaborated with the Department of State to develop the TSCTP, which supports African states' efforts to improve border security and enact counterterrorism measures, while also facilitating regional cooperation, promoting democratic governance, and improving relations with the United States. After examining the connection between security and development in Africa, and describing the details and current status of TSCTP, Kennedy concludes her chapter with a discussion of the potential benefits and risks of the initiative.

And in the final chapter of this section, terrorism consultant John Alexander argues that the current global conflict is much more complex than the uncompromising and invidious duality reflected in the Global War on Terror (GWOT), and is fraught with paradoxes. Precipitated by emotional issues juxtaposed with competing and incompatible values, the execution of counterterrorism programs become severely hampered by obvious contradictions. Further, these efforts are exacerbated by strenuous efforts by senior leaders to remain politically correct. Four theoretical approaches are most prevalent in the literature on countering terrorism. These are: enhance security (keep us safe); eliminate the terrorists (remove the cancer); attack the support infrastructure (cut their funding); and

alter the conditions that breed discontent and terrorists (drain the swamp). However, he argues, efforts to counter the conditions supporting terror must address ideological differences that drive terrorists to commit acts of extreme violence.

## CONCLUSION

Together, these chapters address an impressive breadth of issues related to the global security environment. However, there are obviously other sources and facilitators of terrorism to explore beyond what is covered in this volume. Thus, this collection will hopefully also stimulate readers to pursue further research on their own, in order to expand our collective understanding of how to counter terrorism and insurgency in the twenty-first century.

## COMBATING THE SOURCES AND FACILITATORS OF TERRORISM: AN INTRODUCTION

James J.F. Forest

In 2005, a predecessor to this publication—entitled *The Making of a Terrorist: Recruitment, Training and Root Causes*—was released as a three-volume set by Praeger. In retrospect, however, perhaps the third volume should have been give the title of "root facilitators" instead of "root causes," as this more accurately describes the role that failed states, drugs, criminal networks, political ideologies, and sociodemographic trends play in contemporary manifestations of global terrorism. Further, the national debate has shifted away from a focus on so-called "root causes of terrorism" like poverty and oppression, and instead a growing number of scholars and policymakers recognize that the *primary cause* of terrorism is a human being's decision whether or not to commit a terrorist act. A variety of factors influence that decision and facilitate the terrorist act, from ideology to weapons proliferation and criminal networks. The U.S. *National Strategy for Combating Terrorism* recognizes the need to address these and other factors as part of a comprehensive response to the terrorist threat and the global environment that enables it.

As described in the first volume of *Countering Terrorism and Insurgency in the 21st Century*, policymakers in the United States and other nations are continually seeking to apply the appropriate mix of hard and soft power in confronting the global terrorist threat. This second volume expands this discussion by highlighting various dimensions of the global security environment which require robust soft power responses—particularly in the realm of diplomacy, politics, and finance—in addressing the need to build

a nation's capacity to eradicate the terrorism-facilitating elements within its own borders.

## GOVERNMENTS AND THE INTERNATIONAL SYSTEM

A number of themes are addressed in the literature on governance and the global system of nation-states which have some relationship to terrorism and insurgency, including weak or failing states, border insecurity, authoritarian regimes, and economic issues like globalization. For example, renowned political theorist Benjamin Barber argues that the contemporary struggle against terrorism can be seen as the collision between two forces: one, an integrative modernization and aggressive economic and cultural globalization, which can be called McWorld; and the other, a fragmentary tribalism and reactionary fundamentalism, which can be called Jihad. As globalization has led to increasing interdependence, he argues, we must learn to contain and regulate the anarchy that foments both the destructiveness of terrorists and the injustices of global capital. Only the globalization of civic and democratic institutions is likely to offer a way out of the ongoing war between Jihad and McWorld, and this requires a new understanding of global democratic interdependence.[1]

However, according to Michael Mousseau, globalization and greater interdependence may also exacerbate existing tensions between various states and cultures. Indeed, his research illustrates how two distinct norms of economic integration—contracting and reciprocity—give rise to two distinct political cultures that legitimate, respectively, liberal democracy and collective authoritarianism. In liberal democracies, economic transactions are based on contracting, which requires a recognition of the equal rights of strangers, as well as religious and cultural tolerance. In contrast, economic environments where reciprocity is the norm—as is the case for many developing nations—trust and cooperation is based more on in-group beliefs and values, loyalty to in-group leaders, and distrust of outsiders. From this perspective, one begins to see how globalization has exacerbated conflicts between these two worlds—particularly when free trade between the developed and developing world hurts the local economy and worsens the conditions of the urban jobless, increasing the dependency of millions who blame the foreigners for their conditions.[2]

Other dimensions of the global economy that may facilitate terrorism include the developed world's enormous dependence upon fossil fuels (oil and gas), much of which is imported from the Middle East. According to Michael Klare, there are at least three key aspects of the relationship between energy dependence and terrorism: the intersection of European colonialism and the early years of oil production in the Middle East; the nature of U.S. ties with the leaders of oil-producing nations; and the strategic role of oil infrastructure in the war between terrorists and their

opponents. From the extremists' perspective, he notes, the extraction of Middle Eastern oil is but the latest chapter in a long drive by Western nations to overpower Islamic societies, occupy their lands, and steal their precious resources. Further, these communities are largely devoted to an ancient religious tradition that is thought to be under attack by the West, and it does not help matters that the pursuers of oil are mostly adherents to a different religious tradition that they closely associate with centuries of invasion and conquest.[3]

As John Daly observes, al Qaeda knows how important Saudi Arabian oil is to the rest of the world, and its leaders have alluded to targeting this industry as an attack against America and its allies. Any strike against the country's oil facilities and related energy industries would clearly have a crippling effect on the rest of the world. Because of the possibility of a potential attack by al Qaeda, Saudi Arabia has increased security for people employed in the oil industry, as a good number of them are foreign workers and possible targets for terrorists. Indeed, recent attacks at Yanbu (in June 2004) and Abqaiq, Saudi Arabia's largest oil complex (in February 2006) illustrate the threat to the global energy economy. Osama bin Laden has stated that it is only a matter of time before al Qaeda attacks against the oil industry cause a worldwide recession.[4] Under these circumstances, Klare argues, it will probably take the demise of petroleum as the world's leading source of energy to sever the relationship between oil and violence altogether.[5]

In addition to these and other geopolitical and economic factors, researchers have also suggested that terrorist hot spots can be identified by analyzing data on geography and political development.[6] For example, according to Peter Liotta and James Miskel, the physical landscape in which terrorists live—including environment and geography—provide both context and opportunity for terrorist group formation and mobilization, particularly in numerous locations across the Lagos–Cairo–Karachi–Jakarta arc of megacities where jobs and educational opportunities are increasingly unavailable, resulting in discontent, crime, and urban instability. Other locations of concern within this arc include the slums to which tens of millions of refugees have come from other (primarily rural) parts of the developing world. To combat the potential for these locations to serve as breeding grounds for terrorism, they argue, more focus must fall on internal public sector reform and public security improvements in states where governance is currently failing or where urban population growth is likely to induce failure at the municipal level.[7]

Research by Paul Ehrlich and Jack Liu supports the assertion that persistent demographic and socioeconomic factors can facilitate 9/11-type terrorism and make it easier to recruit terrorists. In particular, their analysis highlights the important and complex relationship between demographic variables and political instability in the developing world. For

example, increased birth rates and the age composition of populations in these countries affect resource consumption, prices, government revenues and expenditures, demand for jobs, and labor wages. Differences between developing countries and the developed world are striking—especially in terms of birth rates—and suggest that without dramatic action, the demographic and socioeconomic conditions in Islamic nations in the Middle East and South, Central, and Southeast Asia could continue to support terrorism and terrorists for many decades to come.[8] These and other studies represent the macro level of analysis, where global trends and patterns help explain the growing problem of terrorism. A more comprehensive understanding incorporates studies of the relationship between regime type and terrorism, particularly those that address issues of state sponsorship, weak or failing states, and authoritarian or repressive regimes.

### State-Level Sources and Facilitators of Terrorism

To begin with, state sponsorship is a particularly important aspect to any discussion on facilitators of terrorism. One of the most authoritative studies of this, by Daniel Byman, defines state sponsorship as "a government's intentional assistance to a terrorist group to help it use violence, bolster its political activities, or sustain [its] organization."[9] His research identifies six areas in which states provide support to terrorists—training and operations; money, arms, and logistics; diplomatic backing; organizational assistance; ideological direction; and (perhaps most importantly) sanctuary.[10] Byman argues that terrorist groups which receive significant amounts of state support are far more difficult to counter and destroy than those which do not.[11] However, it is also important to note that there are several types of state sponsorship of terrorism: "strong supporters" are states with both the desire and the capacity to support terrorist groups; "weak supporters" are those with the desire but not the capacity to offer significant support; "lukewarm supporters" are those that offer rhetorical but little actual tangible support; and "antagonistic supporters" are those that actually seek to control or even weaken the terrorist groups they appear to be supporting.

Another category Byman examines is passive support, whereby states "deliberately turn a blind eye to the activities of terrorists in their countries but do not provide direct assistance."[12] A state's tolerance of or passivity toward a terrorist group's activities, he argues, is often as important to their success as any deliberate assistance they receive. Open and active state sponsorship of terrorism is rare, and it has decreased since the end of the Cold War. Yet this lack of open support does not necessarily diminish the important role that states play in fostering or hindering terrorism. At times, the greatest contribution a state can make to a terrorist's cause is by not policing a border, turning a blind eye to fundraising, or even

tolerating terrorist efforts to build their organizations, conduct operations, and survive. Passive support for terrorism can contribute to a terrorist group's success in several ways. It often allows a group to raise money, acquire arms, plan operations, and enjoy a respite from the counterattacks of the government it opposes. Passive support may also involve spreading an ideology that assists a terrorist group in its efforts to recruit new members.[13]

Perhaps one of the most prominent examples of state sponsorship in recent history has been Afghanistan under the Taliban regime. According to Rohan Gunaratna and Arabinda Acharya, the training camps established by al Qaeda and its associates became the lifeblood for a broad array of Islamic militant groups, providing indoctrination and training for foot soldiers, go-betweens, planners, document forgers, communications specialists, scouts, technicians, bombers, and even hijackers. According to some estimates, many militant Muslims from more than 50 countries passed through the camps, spending from 2 weeks to more than 6 months learning the general and specific skills that modern terrorism requires.[14] Learning materials (manuals, notebooks, lesson plans, and reference books) recovered from guerrilla training schools in Afghanistan indicate that there were two tiers of courses, one for standardized, basic guerilla skills like cleaning and firing a rifle, using a rocket-propelled grenade, reading maps and dealing with explosives. Recruits deemed to have special skills were given additional training in either advanced infantry techniques or in specific tactics of terrorism. Military experts who reviewed these captured materials agreed that there was a high level of training on everything except in some of the more advanced terrorism skills, and that much of the instructions provided in these manuals had been borrowed from similar training materials used by the military in the United States and the former Soviet Union.[15] Thus, Afghanistan under Taliban rule played a key role in creating the global terrorist threat now faced by the West.

Direct (active of passive) state sponsorship of terrorism, however, is less common than plain negligence or inability to properly secure one's national borders—a problem faced by dozens of weak or failing states throughout the world. Indeed, as Chester Crocker recently argued.

> In much of the transitional world … there is a footrace under way between legitimate governmental institutions and legal business enterprises, on the one hand, and criminal networks, often linked to warlords or political factions associated with security agencies, on the other … When state failure sets in, the balance of power shifts ominously against ordinary civilians and in favor of armed entities operating outside the law (or with tacit approval).[16]

The challenge of state weakness is now explicitly recognized in U.S. national security circles as a strategic problem almost equal in importance

to state competitors. As the current *National Security Strategy of the United States* notes, "America is now threatened less by conquering states than we are by failing ones."[17] Weak central governments also facilitate what Forest and Sousa refer to as "zones of competing governance" within their borders, where the government's authority is routinely challenged and undermined by a variety of violent nonstate actors.[18]

Erica Chenoweth has argued that the political stability of a state is the most significant factor affecting the existence of terrorism. Her analysis indicates that politically unstable regimes—regardless of regime type—are more likely than stable regimes to provide hospitable environments for terrorist organizations to develop. The "permissive conditions" of politically unstable regimes inhibit domestic institutional mechanisms that could potentially prevent terrorist organizations from taking root in particular countries. Therefore, she argues, the international community should seek to provide multilateral, legitimate support to transitioning states in order to provide the institutional framework by which a transitioning state can develop.[19]

In essence, states in which a weak central government is unable to provide adequate human security to all segments of its population can serve as a conduit for radicalization and terrorism.[20] Such is the case with the Palestinian territories, as reflected in Matthew Levitt's research on Hamas—a group that is known not only for perpetrating suicide attacks in Israel, but for providing extensive and much-needed social services to Palestinians.[21] Because of the notion that Hamas has independent "wings," its political and charitable fronts are allowed to operate openly in many European and Middle Eastern capitals. In these cities, Islamic social welfare groups tied to Hamas are given free passes for their support of terror simply because they also provide critical humanitarian support. Hamas logistical and financial support activity is often tolerated when conducted under the rubric of charitable or humanitarian assistance. However, Levitt argues, Hamas grant making is largely determined by a cold cost-benefit analysis that links the amount of aid awarded to the extent of support that aid will buy. Individuals tied to Hamas receive more assistance than those unaffiliated with the organization, while members linked to terrorist activity receive even more.[22] The results for Hamas recruitment are striking—according to an April 2001 survey conducted by the Islamic University in Gaza, 49 percent of children aged 9–16 claimed to have participated in the *intifada*, and 73 percent claimed they hoped to become martyrs.[23] Further, the recent electoral victories by Hamas reflect the local support that the terror group now enjoys in the Palestinian Territories—support which they would not have if a strong central government, able to provide adequate human security for all Palestinians, had been established by the former ruling Fatah party.

Cases like this point to the need for robust capacity-building efforts in nations where the combination of socioeconomic, political, and ideological factors can produce an environment hospitable to terrorist recruitment. Sebastian Mallaby contends that the United States must take the lead in nation-building initiatives in order to counter the growing danger of failed states to our national security. He notes that there is a wide gap between nation builders' aspirations to create stable democratic states and what global institutions (including the World Bank and the United Nations) can deliver, and thus America should actively work to fill this gap. In a recent study by the RAND Corporation, Kim Cragin and Peter Chalk suggest specific ways in which development policies can be used to inhibit the resurgence of terrorist activities and discourage local support for political extremism. Drawing on lessons from three countries—Israel, the Philippines, and the United Kingdom—that have enacted social and economic development policies to inhibit a resurgence of terrorism within their jurisdictions, they offer six policy suggestions: (1) social and economic development policies can weaken local support for terrorist activities; (2) real policy achievements in these areas can discourage terrorist recruits; (3) inadequately funded development policies are likely to inflate expectations and renew support for terrorism; (4) the ability of these policies to inhibit terrorism depends on their implementation; (5) social and economic development policies can be used as a "stick" to discourage terrorism; and (6) these policies do not eliminate terrorism, but can reduce its presence.[24]

Finally, researchers have also focused on another aspect of regime type that is even more problematic than state sponsors or weak central governments: governmental oppression. Throughout history, as many scholars have noted, a significant amount of political violence has emerged in direct response to authoritarian, repressive, or corrupt regimes, and it is perhaps no coincidence that contemporary regimes of this type are common in the developing world—especially in the Middle East, Africa, and Southeast Asia, corresponding to the Lagos–Cairo–Karachi–Jakarta arc of instability described by Liotta and Miskel's research discussed earlier in this chapter.[25] Understanding the relationship between oppressive governments and political violence is thus an important aspect to developing comprehensive strategies for countering terrorism and insurgency.

Recent studies by Mohammed Hafez have sought to determine why some Islamic movements turn to rebellion and why previously nonviolent militants turn to violence. While an array of Islamic opposition movements have adopted a variety of strategies to affect social and political change, some have turned to violence as a direct result of institutional exclusion and indiscriminate state repression, he argues, particularly following an extended period of Islamic mobilization. Drawing on the political histories of Algeria and Egypt, he concludes that the choice between moderation and violence in Islamic movements during a

democratization process is shaped by state policies, especially the degree of system accessibility and the nature of state repression. If the democratic process grants Islamists substantive access to state institutions, the opposition will be channeled toward conventional political participation and shun violence. If, on the other hand, the state denies Islamists access and if the state applies repression indiscriminately—punishing both moderate and radical proponents of political opposition—Islamists will tend to resort to militancy.[26]

Similar studies have focused on the unique case of Saudi Arabia, a U.S. ally and (increasingly) a target of al Qaeda attacks. Anthony Cordesman recently argued that Saudi security is best protected through social, religious, and economic reforms, and not by their current security-only approach.[27] Sherifa Zuhur agrees that the future security of Saudi Arabia is contingent on its reforms, and recommends that the United States encourage the Saudi government to increase political participation, improve the intelligence services, urge responsiveness to human rights, and increase multilateral discussions relating to antiterrorism. She concludes that the benefits of enhanced security and democratization in Saudi Arabia will lead to a better relationship with the United States and allow the two countries to be more open to each other's viewpoints and insights; it will also help in the fight against global terrorism.[28]

In sum, there are many aspects to the role that governance and the international system play in contemporary terrorism, including sociodemographic trends, energy dependence, state sponsorship, weak states, and repressive regimes. In many cases, these factors contribute to a host of political grievances which are incorporated into a radical group's ideology, providing a rationale and justification (in the eyes of their members and potential recruits) for the use of violence. Beyond political grievances, however, scholars have also explored a variety of criminal and economic dimensions that facilitate the activities of terrorist networks. A majority of studies in this area have focused on money laundering, weapons proliferation, and the global drug trade.

## CRIMINAL AND ECONOMIC CONSIDERATIONS

In April 2006, an alleged ring of passport forgery that supplied documents to Pakistanis, Egyptians, and Iraqis was broken up by Colombian authorities, who claim there was a connection with al Qaeda. While U.S. authorities have remained skeptical about this, based on limited evidence of any significant Islamist militant presence in Colombia, the event nonetheless served as a reminder of the global nature of al Qaeda's financial support and logistics network.[29] Indeed, as Mark Basile notes, al Qaeda has a strong network of business savvy financiers who can disguise money and other assets. The terrorist network has also learned how to

operate through the world's financial markets, especially by moving money through underegulated markets, and has international Islamic charities in Saudi Arabia which can thwart the international attempts to eradicate the organization.[30]

Unfortunately, a growing body of research has also begun to shed light on a new, far more worrisome phenomenon involving the intersection of organized criminal networks and Islamic terror groups. For example, Thomas Sanderson notes that because the U.S.-led global war on terrorism has had some success in constricting the flow of financial support to terror groups, these organizations are moving deeper into criminal activity. He describes a "lethal cocktail" that is emerging, "consisting of one part criminal, one part terrorist, and one part weak or corrupt state." He concludes that as terror groups transform into hybrid criminal/terror entities and partner with criminal syndicates, the threat to the United States and other nations rises in complexity, demanding a highly flexible, tailored response. Law enforcement and intelligence officials will have to be more agile and adaptable in responding to the amorphous tactics adopted by terrorist groups.[31]

In a similar analysis, Tamara Makarenko proposed a model for explaining the contemporary security threat of terrorism and transnational organized crime (TOC), a model she calls the crime-terror continuum. She suggests that there are seven different relationships between terrorists and TOC, from strategic cooperation to complete integration of motivations. The continuum establishes that the traditional differences assumed between terrorist and TOC are no longer valid; rather, it has become difficult to distinguish between ideological/terrorist and criminal motivations. In fact, based on her research, Makarenko suggests that there is a point where a single entity could have both criminal and terrorist characteristics: this is called "convergence."[32] One example of this convergence, according to Pierre-Arnaud Chouvy, is seen among members of al Qaeda who are involved in Afghanistan's opium trade, particularly in the form of protecting heroin laboratories and trafficking caravans.[33] However, while there is some debate over just how deeply al Qaeda is engaged in drug trafficking, it is widely agreed that its ideological partners in the Taliban draw a great deal of revenues from this activity. In fact, Mirwais Yasini, the head of Afghanistan's Counter Narcotics Directorate, estimates that the Taliban and its allies derived more than $150 million from drugs in 2003—nearly 2 years after being driven from power by coalition forces.[34]

According to Vanda Felbab-Brown, understanding and responding to the intersection of terrorism and the global drug trade is an increasingly critical aspect of any counterterrorism strategy. Her analysis of the Taliban, the Peruvian insurgent group Sendero Luminoso, and the Colombian insurgent group FARC (Revolutionary Armed Forces of Colombia) reveals how drug cartels have used terror to protect their profits, while

the demand for (and cultivation of) drugs supports terrorism. Specifically, terrorist groups derive three sets of gains from their involvement with the illicit economy: increased *physical capabilities* (money and weapons); increased *freedom of action* (the ability to optimize tactics and strategies); and increased *political capital* (legitimacy, relationship with the local population, the willingness of the local population to withhold intelligence on the terrorist organization from the government, and the willingness to provide intelligence about government units to the terrorist organization). In essence, as long as a global drug trade exists—in which there is high consumer demand and lucrative rewards for production and trafficking—terrorist groups will continue to profit from this trade, and can be expected to commit violent acts in order to protect these profits.[35]

As described earlier in this chapter, both criminal organizations and terrorist networks are prominently found in weak or failing states. Thus it is unsurprising to find that these states play a key role in the global trade in drugs and weapons, which is facilitated by critical security vulnerabilities—porous borders, corruption, inadequate law enforcement, and an environment of extreme scarcity in which any means to make a profit is seen as better than none. The global proliferation of weapons is a particularly worrisome aspect of the contemporary global security environment. As Peter Singer recently observed, "individuals and small groups can now easily purchase and wield relatively massive amounts of power."[36] Indeed, the number of small arms throughout Africa, Central Asia, and Southeast Asia has been growing for decades, in part due to the various struggles for independence that have taken place within each of these regions. When hostilities ended, many of these weapons were left in the hands of civilians or in arms caches whose locations were forgotten or deliberately not identified so that they could be reused in any possible future conflict.[37]

In many of the weak or failing states described earlier in this chapter, small arms are the main weapons used in armed robberies, intra- and intercommunal feuds, local wars, armed insurrections, armed rebel activities, and terrorism.[38] They are also used to facilitate drug trafficking, smuggling, and other such crimes. Small arms and light weapons are used to grossly violate human rights, to facilitate the practice of bad governance, to subvert constitutions, to carry out coup d'états, and to create and maintain a general state of fear, insecurity, and instability.[39] The ensuing culture of violence and lawlessness that is spawned by the use of these weapons hinders economic, political, and social development and frustrates efforts to reconstruct societies afflicted by conflicts.[40] Interstate conflict and internal insurgencies—fueled by the spread of small arms—destroy the physical and human resources needed for an economy to grow. Armed groups systematically block or damage transit routes, disrupt natural resource development or divert it for their own use, and

attack key national industries as part of their combat strategy. Long-standing conflicts also divert human and economic resources away from agriculture, education, industry, and other constructive activities.[41]

Recognizing the severity of this challenge, the United Nations has become increasingly involved in trying to stem the flow of small arms and light weapons.[42] Recent attempts have focused mainly on border security, with some success. For example, the Nigerian Customs Service reported that it had intercepted small arms and ammunition worth more than US$30 million at border posts in a 6-month period in 2003. In a single haul in November 2003, it took in a consignment of 170,000 rounds of ammunition.[43] However, the challenges of stemming the flow of weapons is much larger than mere border security: for example, the companies and countries from which these weapons originate must be pressured to avoid exacerbating global insecurity for short-term profit. Overall, there are a variety of criminal and economic conditions which facilitate an environment conducive for terrorist recruitment, training, and operations. But while criminals are (and terrorists can be) motivated by a variety of economic concerns, many scholars have argued that the primary motivating force behind a good portion of the global terrorist threat is rooted in radical ideologies that justify (in the minds of a group's members) the use of violence in the pursuit of their vision of the future. The intersection of beliefs and ideologies, the media, and global communications technologies is thus an especially important arena for analysis and policymaking in countering terrorism and insurgency.

## THE ROLE OF IDEOLOGY, THE MEDIA, AND TECHNOLOGY

As described in Volume 1, political ideologies have played a prominent role in rationalizing violence throughout the history of revolutionary movements and terrorism. According to Leonard Weinberg, both left- and right-wing ideologies have furnished small terrorist bands and their members with an exaggerated sense of their own importance, which led them to commit dramatic acts of violence in order to make their objectives known to wide audiences. Further, these ideologies have offered groups a perceived pathway to power, through which terrorism was meant to raise the level of awareness and trigger a violent uprising, from proletarian insurrection to racial holy war, by a vast pool of supporters previously too victimized to act on their own.[44]

The source of this victimization, according to many of these ideologies, is government oppression. Indeed, as described earlier in this chapter, many of today's terrorist groups have formed in response to an authoritarian or repressive regime, hence the heavy focus on democratization that is found in the current U.S. *National Strategy for Combating Terrorism.* Ultimately, as President Bush proclaimed in his 2006 State of the Union

speech, "the only way to defeat the terrorists is to defeat their dark vision of hatred and fear by offering the hopeful alternative of political freedom and peaceful change."[45] The rationale behind this approach, he argues, is that democracies "replace resentment with hope, respect the rights of their citizens and their neighbors, and join the fight against terror. Every step toward freedom in the world makes our country safer, so we will act boldly in freedom's cause."[46]

Certainly, democracy (or lack thereof) is an important element of the current global environment in which terrorism breeds. However, a strategy built on the idea that democratization will solve the terrorism problem is incomplete at best, especially since our primary adversary's ideology (i.e., that of al Qaeda) is focused on issues of justice and divine influence, not civil liberties or personal freedoms. For adherents of this ideology, the core tenets of Islam are seen to provide a more effective means for the type of justice envisioned by the likes of bin Laden, al-Zawahri, and al-Zarqawi. According to Maha Azzam, the rise of militant political Islam is rooted in the global spread of Wahhabism—an interpretation of Islam which places its doctrinal emphasis on the absolute unity of God and a return to the pure and orthodox teachings of Islam according to the Koran.[47] Islamist extremists breed on the politics and policies that are perceived by them as detrimental to Muslim interests, and which have remained unaltered for generations. A growing number among them believe they can influence this situation through a strategy of terror. Adherents of Wahhabism, with its anti-Jewish and anti-Christian overtones, have pressured their government leaders (for example, in Saudi Arabia) to maintain a puritanical and strict attitude toward any form of liberalization in either the social or political arenas, and they have been responsible for numerous acts of terrorism in pursuit of their ideological goals. Further, Wahhabism has played an essential role in the recruitment and training of members of al Qaeda because it frames the beliefs and values of the organization's leaders, including Osama bin Laden and Ayman al-Zawahri.[48]

Central to the ideology of radical Islamic fundamentalism is the concept of "jihad." According to Jarret Brachman, there are differing interpretations of this term, but it is widely used in reference to the struggle to defend religious ideals against destructive forces. For others, jihad refers to a command by God to all Muslims to fight against the aggressors who seek to corrupt Islam—embodied and globally perpetuated by the West. Jihad has served as a rallying cry for those who see themselves suffering under the draconian policies of governments; for those in a struggle with corrupt imperial overlords for the right to establish a national homeland; and for those who see themselves fighting to stave off advanced stages of cultural corruption. Muslims both volunteered and were recruited from around the world to aid Osama bin Laden and the mujahideen in Afghanistan, and were united under the call of jihad

against foreign (Soviet) aggressors.[49] Clearly, while jihad remains a contested term, it does hold deep and powerful religious significance within Islam. Therefore, Brachman argues, whoever is able to wield the reigns of its meaning will have great power in drawing new recruits into that ideological abyss.[50]

While Islamic radicalism receives a great deal of attention in the contemporary global security debate, it is just one of many religious ideologies of concern to serious scholars of terrorism studies. A recent study by J.P. Larsson helps illuminate the role of ideology in the recruitment of individuals by particularly violent religious groups. His analysis begins by explaining how many young people are "seekers" who are trying to find their own answers of how to make sense of the world around them. Religious ideologies, he argues, are often able to explain the state of the world, and in particular why believers are continuously persecuted, oppressed, or discriminated; further, they can also explain how and why violence may be condoned and necessary. Several dimensions of these ideologies are important to consider when examining terrorist recruitment: first, these ideologies are often *theologically supremacist*—meaning that all believers assume superiority over nonbelievers, who are not privy to the truth of the religion. Second, most are *exclusivist*—believers are a chosen people, or their territory is a holy land. Third, many are *absolutist*—it is not possible to be a halfhearted believer, and you are either totally within the system, or totally without it. Further, only the true believers are guaranteed salvation and victory, whereas the enemies and the unbelievers—as well as those who have taken no stance whatsoever—are condemned to some sort of eternal punishment or damnation, as well as death. Overall, religious ideologies help foster *polarizing values* in terms of right and wrong, good and evil, light and dark—values which can be co-opted by terrorist organizations to convert a "seeker" into a lethal killer.[51]

This religious-based "us-versus-them" mentality is not exclusive to militant Islamists. In fact, similar ideological elements are found among members of Christian militia groups in the United States, according to a recent study by Cindy Combs, Elizabeth Combs, and Lydia Marsh. Their analysis illuminates three important aspects of the relationship that continue to shape the training of the Christian militia today: the Biblically based theology that seeks to rationalize the preparation for violence by members of militia groups; a fervent belief in the Bill of Rights, particularly the right to bear arms and the right to generate an "unorganized militia"; and a commitment to a loose, virtually leaderless membership structure, with members trained to act alone or in small groups to "take back" the government, through force if necessary. They note how members of militia groups are often well trained in the use of arms and explosives, and some are adept at guerrilla-warfare techniques. Among their conclusions, the authors note that Christian militia groups in the United

States—while not directly responsible for the actions of their members (like Timothy McVeigh's April 1995 bombing of the Murrah Federal Building in Oklahoma City[52])—may offer social and psychological support that will enable individuals to carry out lethal acts on their own. James Aho has also highlighted the polarizing nature of extreme ideology in his research on the Christian Fundamentalist movement in the United States, in which religiously oriented extremists engage in violent activities, from cross-burning to bank robberies and targeted assassinations, while believing that they are "God's battle axe and weapons of war."[53]

Similarly polarizing values are also prominent in the Jewish extremist ideology known as Zionsim, according to Allan Brownfeld. Adherents of this ideology, nurtured within Israel's far-right religious institutions, have been responsible for several prominent acts of violence—including the assassination of Israel's Prime Minister Yitzhak Rabin on November 4, 1995, by Yigal Amir, an ultraorthodox religious zealot. Brownfeld notes that religious Zionists have adopted the notion that God demands not so much devotion to the Torah as to the land that Israel's army has conquered, and this emphasis on land—particularly the settlements in the West Bank and Gaza Strip—has underscored an extremist view toward any attempt at negotiating peace agreements with the Palestinians. He concludes by arguing that Zionist terrorism is an effort by a militant minority to impose itself upon an unwilling majority, yet because the majority has been hesitant to identify and isolate such extremists, their influence has been far out of proportion to their numbers. Operating under the cover of religion has been useful in expanding their following and muting criticism. Thus, if Israel and its neighbors are to move in the direction of a lasting peace, he argues, the majority of Israelis—particularly Israel's mainstream religious institutions—must act to neutralize those voices that have distorted Judaism's moral mandate and replaced it with worship of physical territory.[54]

In addition to issues of religion, radical militant ideologies may also seek to convince audiences of broad injustices, political or social grievances, and other secular issues which in their eyes justify the use of violence. For example, as Paul Pillar recently illustrated, a superpower's foreign policies can engender resentment on the part of certain aggrieved populations, and particularly by members of the Muslim world. U.S. policies that Muslims perceive as being on the wrong side of a conflict between Muslims and non-Muslims are resented both for the policy itself and for the U.S. motives that they are deemed to demonstrate. A second attribute that makes certain U.S. policies more likely than others to evoke resentment is that they play to other negative stereotypes or preconceptions about the United States. A third ingredient of a policy particularly suited for incurring resentment is in its potential for vivid events that by their very nature may carry emotional impact—especially people dying and suffering as a result of military action in a predominantly Muslim

country. From his analysis, it is clear that public diplomacy has an important role to play in shaping perceptions abroad of the United States and its policies.[55]

Kim Cragin and Scott Gerwehr describe such efforts using the term "strategic influence," and borrow from social and cognitive psychology studies to suggest how the environment in which public diplomacy is conducted, along with the methods used, are essential to the success of any effort. At the same time, an ineffective strategic influence campaign can be counterproductive, and may lead a population to distrust (and even grow in animosity) toward the entity conducting the campaign.[56] In his analysis of these challenges, Hassan Abbas argues that the global war of ideas and the battle for the "hearts and minds" of Muslims is only beginning. He draws on analyses of U.S. public diplomacy in Pakistan and Iran to illuminate lessons learned for consideration—for example, he notes, "closing the channels of communication and dialogue has never proved to be a productive measure."[57] His recommendations for U.S. policymakers include acknowledging past mistakes; understanding the limitations of public diplomacy; employing efficient feedback mechanisms to assess the impact of specific policies; establishing and encouraging forums for people-to-people interaction; framing important issues in more constructive ways than "you are either with us or against us"; and supporting reform of the education sector in Muslim countries, especially where madrasa networks are entrenched.[58]

The relationship between foreign policies and strategic influence (or public diplomacy) is particularly important in the areas of the world from which much of the Islamist extremist threat originates. In one of the more thoughtful analyses of this issue, West Point professor Ruth Margolies Beitler highlights how American policy toward Israel remains a particularly potent source of discontent and reverberates throughout the Arab and Muslim world. Indeed, it is commonplace in the Middle East to hear comments espousing the view that if only the United States would modify or cease its support for Israel, hatred against the United States would end. Her analysis reveals that while the United States has consistently supported Israel's existence, it has not always supported its policies, and yet the overwhelming assessment in the Muslim and Arab world is that the United States retains little objectivity when dealing with the Israeli–Palestinian issue. In reality, whether or not the United States is even-handed when it comes to the Arab World and Israel is almost insignificant, she argues—the key factor fostering resentment in the Middle East is the *perception* that the United States maintains a double standard. Thus, given the prominent role this issue has come to play in public statements of Osama bin Laden and others calling for a global jihad, it is imperative for the United States to lessen al Qaeda's appeal to discontented populations in the Middle East by ensuring a greater balance—or perception of balance—with regard to its policies toward the Arab World.[59]

In sum, U.S. foreign policies—and the perceptions of intent behind certain foreign policies—contribute to the current global conflict between liberal democracies and radical groups, some of which are resorting to violence in pursuit of their ideological objectives. A central battleground in this war of ideas (or ideologies) is the Internet. The struggle for influence taking place online between liberal democracies and extremists involves various forms of strategic communication. Members of the global salafi jihadist network use the Internet to provide motivational/ideological and operational information to potential recruits and supporters. They offer a simple, clear message to all kinds of "seekers"—join the global jihad. Further, there are multiple ways in which an individual can participate, such as providing funds, safe havens, or encouragement. The spectrum of participants can thus range from Web site designers to financiers to weapons experts and combat veterans.

Meanwhile, the United States and its allies have launched a public diplomacy effort to dissuade these same individuals from supporting the terrorists' agenda. Some observers have argued that the media—both global and local—can and should play a central role in developing and disseminating messages that effectively counter the appeal of the violent jihadist groups. As Brigitte Nacos observes, print and electronic media Sware important means to spread the terrorist "propaganda by deed" and inform, indoctrinate, and prepare some individuals for recruitment.[60] Further, she notes, terrorists learn much from other terrorists through daily news reports, video clips, and Web sites. Thus, when terrorists use the media effectively, other terrorists learn from and follow their example. In 2003, a proliferation of videotaped beheadings—which began in Iraq but spread rapidly to Saudi Arabia and other parts of the world—is but one of many examples of this phenomenon of mediated terrorism.[61] Cindy Combs agrees that the media provide a forum for knowledge transfer in the terrorist world, offering a "showcase" through which those carrying out terrorist acts can impress and threaten an audience, recruit and train new members, and support and coordinate an emerging network of followers.[62]

According to Alex Schmidt, violence polarizes and forces audiences to take part by choosing either the side of the victims or that of the terrorist. Therefore, the media provide "identification mechanisms" since "the terrorist's invitation to identification is brought home to us by the public and the private media."[63] Combs notes that a symbiotic relationship exists between terrorists (who seek attention from an audience) and news organizations (which seek dramatic stories to increase their readership and ratings).[64] Because of their unique role in the global strategic communications battlespace, the media have a unique set of opportunities and responsibilities in combating the threat of terrorism. Indeed, Combs suggests implications for better media self-regulation.[65]

But self-regulation is clearly not the answer for what has become the most important conduit for the modern-day dissemination of radicalizing messages: the Internet. As Steve Coll and Susan Glasser recently observed, the Internet is playing an increasingly prominent role in the spread of al Qaeda's ideology and the growing number of self-organized terror cells. They write that "al Qaida has become the first guerrilla movement in history to migrate from physical space to cyberspace. With laptops and DVDs, in secret hideouts and at neighborhood Internet cafes, young code-writing jihadists have sought to replicate the training, communication, planning, and preaching facilities they lost in Afghanistan with countless new locations on the Internet."[66] Uses of the Internet include training, support, and communications. Thousands of Web sites in all parts of the world reflect a growing virtual community of individuals linked indirectly through association of belief, and who celebrate al Qaeda and its ideas. In this sense of utopian ambition, the Web has become a gathering place for a rainbow coalition of jihadists.[67]

A recent study by Gabriel Weimann examined how terrorist organizations use the Internet to communicate with various audiences, including potential new recruits. Web sites are only one of the Internet's services used by modern terrorism: there are other facilities on the Net—e-mail, chat rooms, e-groups, forums, virtual message boards—that are increasingly used by terrorists. Drawing on the findings of a recent study he and his colleagues conducted for the United States Institute of Peace, Weimann notes how the Internet can be used to recruit and mobilize supporters to play a more active role in support of terrorist activities or causes. In addition to seeking converts by using the full range of Web site technologies (audio, digital, video, etc.) to enhance the presentation of their message, terrorist organizations capture information about the users who browse their Web sites. He concludes that the Internet has become a more popular apparatus for early stages of recruitment and mobilization, challenging governments, security agencies, and counterterrorism services all over the world. Moreover, it also challenges the future of the Internet, since any attempt to limit or minimize the Net's use by terrorists implies imposing restrictions on the Internet's free flow of information, free speech, and privacy.[68] Weimann also examined the terrorists' use of the Internet as virtual training camps, providing an online forum for indoctrination as well as the distribution of terrorist manuals, instructions, and data. His book examines how terrorist organizations and their supporters maintain hundreds of Web sites, exploiting the unregulated, anonymous, and easily accessible nature of the Internet for various purposes. Clearly, it is important for us to become better informed about how terrorists use the Internet, and from this knowledge find better ways to monitor and counter their activities—particularly in terms of our strategic communications and public diplomacy efforts to counter

the role that extremist ideologies play in radicalizing new agents of terrorism.[69]

Unfortunately, in an age of universal access to the means of providing information online, citizens of a liberal democracy like ours have the power to undermine these efforts, largely through ignorance and irresponsibility. This problem is particularly acute when communicating with many corners of the Muslim world, where there is no frame of reference for understanding the implications of a free and open press, or a society that enjoys the legal protection of free speech. Thus, whether the messenger is Condoleeza Rice, Howard Stern, Pat Robertson, or the 14-year-old Web blogger down the street, messages put forward online are often given equal credence in terms of representing American policy, culture, and ideas. Thus, an effective public diplomacy agenda requires a commitment to educating our own citizens for world comprehension and responsible communication, as well as motivating a grassroots campaign to develop and disseminate an effective anti-jihad message.[70]

## CONCLUSION

In sum, there are a wide variety of facilitators and sources of today's global terrorist threat. Thus, our understanding of how to respond effectively to this threat must move beyond the application of instruments of hard and soft power discussed in Volume 1 of this publication, and address the underlying conditions which enable terrorist groups to recruit and mobilize support for their use of violence. Terrorism may thrive in places where central governments are weak, or as a response to an authoritarian regime. Criminal and economic factors play an important role in facilitating and enabling terrorist group operations, and there are many different types of ideologies that fuel political violence, although the most compelling (or dangerous) are commonly grounded in religious justifications for the use of violence. The media and the Internet play a vital role in the spread of the global "join the jihad" message, and the power of these conduits for convincing mass audiences must be harnessed to put forward a compelling "anti-jihad" message to counter the appeal of the jihadists. Clearly, we must learn how to "drain the swamp," dry up the resource base, and tackle the motivations behind a group's use of terrorism to achieve its objectives. This is the goal to which the chapters of this volume now contribute.

## GOVERNMENTS AND THE INTERNATIONAL SYSTEM

# CHAPTER 2

## COMBATING STATE SPONSORS OF TERRORISM

Daniel Byman

State sponsorship of terrorism is a complex problem that cannot easily be solved.[1] Despite diplomatic protests, economic sanctions, and even military pressure, Iran, Pakistan, and Syria have supported numerous terrorist groups for decades. The Taliban persisted in its support of al Qaeda until U.S.-backed forces toppled it from power. Such persistence in the face of pressure suggests that cutting the deadly connection between states and terrorist groups is difficult at best and impossible at worst. Yet the picture is not entirely bleak. Although there are no perfect solutions, careful policymakers can design better ones and avoid many common mistakes that can make the problem of state sponsorship worse.

**WHAT INSTRUMENTS ARE AVAILABLE TO POLICYMAKERS?**

The United States and other powers usually employ several means to coerce state sponsors: political pressure, economic sanctions, and military force. As an alternative (or, more rarely, a complement), states may try to engage sponsors of terrorism. Each of these instruments has its flaws.

### Engagement

Victims of terrorism may try to engage a sponsor, offering concessions in order to reduce the likelihood of further terrorism. Regardless of the morality of "giving in to terrorists," such engagement is often based on a ruthless strategic judgment: by conceding on what a government may deem as a minor issue, it can free itself from the scourge of terrorism. Engagement may prove particularly attractive if the victim regime has few

alternatives with which to press the sponsoring state, is not the victim of state sponsorship itself, or does not see the terrorism as a serious threat.

For example, until 1986, France had a "sanctuary doctrine," essentially giving terrorists considerable freedom to operate within French borders in the hopes of minimizing international terrorism on French soil. France allowed various Palestinian groups to operate as well as the Basque separatist group ETA. France also adjusted its foreign policy to win over state sponsors and their proxies. Some groups, such as the PLO, abided by the bargain and did not conduct attacks in France. Paris was also able to maintain relations with several state sponsors of terrorism.[2]

France suffered several problems with this approach. Most important, several groups did not keep their side of the bargain and began not only attacking in France, but attacking French targets (as opposed to U.S. or Middle Eastern ones). In addition, the accommodation with groups and sponsors created both diplomatic and political problems for Paris. Relations with victim countries, such as Spain, suffered considerably. Moreover, domestic audiences in France did not support appeasement. After 1986, France slowly began to move to suppress terrorist groups, recognizing that its efforts to engage were a failure.[3]

As the French experience suggests, engagement produces several problems. Naturally, the victim state and its allies are often furious at what they see as appeasement and use considerable diplomatic pressure to stop this. Moreover, appeasement is unpopular politically. Despite government efforts to downplay terrorism, European states repeatedly had to temporarily cut ties with Iran or otherwise take confrontational steps in response to public outrage over Iranian involvement in terrorism. Engagement, of course, also indicates that the government in question will indeed be blackmailed, thus encouraging additional threats or actual attacks. Not only can this encourage the particular state sponsor, but it also sends a message to all potential sponsors that using terrorists can pay off. Engagement also does not always provide protection from all terrorists. It is far more effective with a group like the PLO, which had little interest in attacking France, than it would be with an Algerian terrorist group that saw France as an enemy. Engagement is particularly difficult if the state sponsor is driven by ideology. U.S. attempts to engage the Taliban before the 1998 embassy bombings in Kenya and Tanzania were often viewed as unwanted meddling rather than as a gentle alternative to confrontation.

Finally, engagement often requires painful policy choices that a state might not otherwise make. Partly in response to terrorism, Israel has engaged Syria over the Golan Heights, and India has engaged Pakistan over Kashmir. For both Jerusalem and New Delhi, the fact of negotiations—to say nothing of the possibility of ceding land or accepting limits to sovereignty—was a painful concession.

Despite these many problems, engagement is at times necessary as long as it is part of a broader effort that involves coercive forms of pressure. Engagement, by itself, tends to make the problem of terrorism worse. However, coercion without any promise that the pressure will relent is not really coercion in the true sense: there must be an incentive to stop the support for terrorism, and the promise of engagement is thus often necessary.

### Political Pressure

State efforts to halt support for terrorism almost always involve some form of political pressure. The U.S. state sponsor list's "name and shame" power is one means of getting state sponsors to abandon their support for terrorism. As Edmund Hull, the former acting Coordinator for Counterterrorism contended about regimes on the list, "Most of these governments are extremely uncomfortable with the stigma that comes attached to being accused of sponsoring terrorism, and they will over time seek ways to escape that stigma."[4] Another common form of pressure is an official *demarche* meant to discourage a particular act in support of a terrorist group. At times, states may attempt to make a rival regime an international pariah, shunned by its neighbors and the world. After the attempted assassination of Egyptian President Mubarak in 1995, the United States worked with Sudan's neighbors and the United Nations (UN) to isolate Khartoum, which was linked to the attackers.

By itself, however, political pressure is a weak instrument. The "punishment" of a damaged reputation, the lack of diplomatic support on other issues, or even near-complete isolation usually pales before the broader strategic objectives, domestic concerns, or ideological agenda that led to the support of terrorism in the first place.

Isolation may also prove ineffective or difficult to establish because of the supporting state's importance for a host of other issues not related to terrorism. The United States, for example, has made relations with Syria a diplomatic priority because of its importance to an Arab-Israeli peace, leading to hundreds of high-level contacts during the 1990s that undermined any efforts to isolate Damascus. Iran, a major player in a vital region, is similarly hard to shun, as many European powers and Japan see it as a major trade and investment opportunity and have felt that its critical geostrategic position made engagement a better option. Libya and Cuba, in contrast, were far easier to isolate, as they lack the strategic or economic importance of other sponsors.

Other states also have different threat perceptions, making it harder to present a unified front to a state sponsor. Iran and Hizbollah,[5] for example, pose little threat today to the interests of most western European states. As a result, U.S. calls for these countries to press Tehran often fall on deaf ears.

In addition, many states favor dialogue and engagement over political pressure, believing this is the best way to moderate a hostile regime.

Despite these many limits, political isolation offers several advantages for policymakers over other options. Most important, it is low cost: it demands few sacrifices and carries few risks. In addition, political isolation is almost always part and parcel of a larger coercive campaign involving economic and military measures. Political pressure can be seen as a first step, or a reinforcing measure, for other forms of coercion. Former Secretary of State George Shultz, for example, argued that "Diplomacy could work these problems [those related to terrorism] most effectively when force—or the threat of force —was a credible part of the equation."[6] Even if the use of massive military force is contemplated, political pressure must be used to signal the adversary as to what is desired. Moreover, obtaining multilateral support for these measures often makes them far more effective.

### Economic Pressure

Economic pressure is another common means of trying to persuade sponsors to stop supporting terrorism. States can limit trade, withdraw investment, punish foreign companies, and otherwise use economic means to convince other countries not to support terrorism. Many of the penalties linked to the U.S. list of state sponsors, for example, involve restrictions such as bans on critical technologies and U.S. foreign assistance, including U.S. opposition to support at international financial institutions like the World Bank and the International Monetary Fund. Perhaps wrongly, such pressure is often seen by the public and policymakers as a middle ground between an empty *demarche* and a full-scale invasion in terms of coercive power.

Economic pressure can be unilateral, multilateral, or, more rarely, comprehensive. Unilateral sanctions are the most common and are often initiated by the stronger, victim state. India has restricted trade with Pakistan, but few other countries have followed New Delhi's lead. The United States has long had a variety of sanctions on Iran, but it has had little success in persuading other countries to go along. Indeed, some countries have rushed in to fill the economic void created by a lack of a U.S. presence.

At times, the United States has orchestrated multilateral sanctions, working with several allies to limit investment, the sale of arms, or other forms of economic punishment. After Iran took 66 Americans hostage in 1979, for example, most Western European countries joined the United States and imposed a range of economic penalties (most of which were far stronger on paper than in practice) on the clerical regime. More rarely, near-universal sanctions have been imposed. Examples of near-universal

sanctions related to terrorism are the 1996 UN Security Council resolution that imposed limited punishments on Sudan because of its support for radical groups and the 1992–1993 sanctions placed on Libya for its noncooperation with the Pan Am 103 bombing investigation.

In theory, governments may back down in the face of economic pressure, fearing that the loss of trade or other benefits would hurt tourism, hinder economic growth, prevent a military rearmament, or otherwise harm objectives not related to terrorism. This logic suggests that the economic costs to a regime (i.e., how much money would it lose) and its vulnerability (i.e., whether it can replace the lost trade or investment) would be key concerns.[7] Such a decision is strictly a cost-benefit calculation: sanctions work when the strategic, ideological, or domestic rewards of backing a terrorist group are outweighed by the economic pain outsiders inflict.

Economic pressure may also affect elite or popular support for a regime, another theoretical potential point of leverage. A regime that fails to deliver economically might be voted out of power or lose the support of key interest groups keeping it in power. A travel ban, for example, undermines one of the prerequisites of wealth and power. Leaders and other elites are not given a place on the world stage and worse, for some, no spot on the Riviera. Some policymakers have even argued that sanctions will foster widespread popular unrest due to economic problems. The unrest, in turn, will either compel the regime to make concessions or possibly even lead to its collapse.

Sanctions, however, have several profound limits on their effectiveness. Studies of sanctions have determined that, in general, they succeeded only 17 percent of the time when imposed unilaterally and only slightly more when imposed multilaterally.[8] What explains this dismal success rate? The biggest problem for coercers is that it is difficult to use sanctions to increase the level of pain sufficiently to affect a hostile regime's decision making. Most state sponsors of terrorism are autocratic regimes and, as such, are less sensitive to the needs of their population than are democracies. The people may grumble, but the ruler can safely ignore them. Popular revolutions have never occurred in response to sanctions.[9] Indeed, one widely noted effect of sanctions is that they backfire politically, and adversary leaders are able to use them to increase their hold on power. Sanctions, by cutting off trade and other channels outside the formal state apparatus, often increase a regime's ability to channel goods to its favorites and weaken potential rivals.

Sanctions' poor success rate is also explained in part because they are often imposed unilaterally, a less effective form of pressure. Gaining multilateral support, however, is often exceptionally difficult. The United States has long tried to convince European states and Japan to back its attempts to sanction Iran with little success. As with political isolation, other states

may not forego the lost trade and investment opportunities, either because they do not share the same sense of threat as the victim state or because of the state sponsor's political and economic importance on issues not related to terrorism.[10] At other times, they may genuinely believe that sanctions would only backfire and make the supporting regime more hostile or create a humanitarian disaster.

The result is often a weak compromise: multilateral sanctions whose breadth and bite are limited. The UN-mandated sanctions on Libya and Sudan, for example, were limited in scope. For Sudan, they focused primarily on restricting travel and reducing official contact with Khartoum. Libya, too, was isolated through sanctions, and it faced additional punishments such as having its assets frozen and restrictions on Libya's purchases of oil and gas equipment.

Sanctions are particularly ineffective when a regime is motivated by ideological reasons. Ayatollah Khomeini of Iran famously scorned the importance of economics, declaring that the Islamic revolution was not about "the price of watermelons." The Taliban also cared little about the material well-being of ordinary Afghans in comparison to what they saw as their religious duty to support a range of radical groups, including al Qaeda. Limits to economic growth is a price such regimes often willingly pay. Not until Khomeini died did economic growth become a priority for the regime in Tehran, and thus only then did it become sensitive to economic punishments and incentives regarding its support for terrorism.

Unsuccessful sanctions do not always simply fail: they can backfire and make a regime more intractable. In Iran, the clerical regime has used sanctions to persuade its people that the United States is hostile to Iran and seeks to destroy the regime there. In Iraq, Saddam Hussein's regime used the comprehensive sanctions to punish parts of the population that did not support his rule. Thus, sanctions can at times increase the supporting regime's popularity, weaken the opposition to it, and raise the overall level of hostility directed at the coercer.

The humanitarian impact of sanctions is another major drawback, both due to the inherent suffering they cause among innocents and because this suffering makes it harder to sustain them. Sanctions on Iraq, for example, were roundly condemned as doing little to shake the Baath regime while devastating innocent Iraqis. Death tolls of hundreds of thousands of Iraqi civilians were widely reported, including, famously, a flawed UNICEF report that claimed that sanctions killed 500,000 Iraqi children.[11] John and Karl Mueller lambasted the humanitarian effects of sanctions as "Sanctions of Mass Destruction."[12] Even if these critics overstated the humanitarian impact of sanctions or wrongly pinned responsibility for the suffering on the United States, the sanctions proved a political disaster for Washington. Much of the world saw the United States as deliberately supporting a policy that killed hundreds of thousands of children while doing

nothing to harm Saddam's regime—a perception that tarnished America's image worldwide.

### The Use of Force

When political and economic pressure does not lead to promising results, states often use their military forces to respond to terrorism. At the most extreme levels, this may involve invading another country and trying to change its government by force. A recent example is the 2001 U.S. invasion of Afghanistan, where the United States worked with local Afghan allies to overthrow the ruling Taliban because of its support for al Qaeda. (The United States also invaded Iraq in 2003, with Iraq's support for terrorism frequently stated as a reason for the attack—a rationale that before the war was strained and afterward seems ever weaker.[13])

Far more common are limited uses of force to punish a regime for supporting terrorism and, ideally, deter it from backing future attacks. The United States bombed Libya in 1986 because of Libya's use of terrorism; in 1993, the United States struck Iraq in response to its attempted assassination of former President George H.W. Bush; and in 1998, the United States attacked Afghanistan and Sudan after al Qaeda bombed U.S. embassies in Kenya and Tanzania. The United States, of course, is not the only country that uses force in response to terrorism. Iran repeatedly struck at MEK bases in Iraq, and Egypt sought to attack Sudan in 1995 after Sudanese-based Egyptian terrorists tried to kill President Mubarak in Ethiopia. Turkey used the threat of invasion to compel Syria to end its backing of the PKK. India has long threatened military retaliation for Pakistan's support of Kashmiri groups. Most prominently, Israel has conducted military strikes at various points in its history against Egypt, Syria, Jordan, Lebanon, and Tunisia either at Palestinian targets directly or against regime targets in order to dissuade them from backing various Palestinian groups.

In these attacks, the coercing governments usually tried to focus on the terrorist group itself or on targets related to its activities—a problematic set of targets. Thus, in 1998, the United States bombed an al Qaeda camp in Afghanistan, while Israel's attack in Tunisia focused on the Palestinian Liberation Organization (PLO) headquarters there. The reasons for these limits are simple. Military strikes on terrorists based in a sympathetic country face many difficulties. In contrast to conventional militaries, terrorist groups themselves have few assets worth bombing. The "infrastructure" of supporting terrorism is often not destroyable through bombing: training camps are rudimentary, and the weapons systems involved are small and easy to replace. Terrorists themselves can easily disperse, making them difficult to strike—especially by air strikes or other "standoff" means. Even worse, terrorists often melt back into the civilian population,

increasing the likelihood of significant civilian casualties. Many terrorists are also part of a broader insurgent movement. As such, it is relatively easy for the group to replace the cadre lost in a limited military strike with other dedicated recruits.

Military force in limited quantities seldom affects a regime's ability or willingness to support terrorism and often makes the problem worse.[14] Strikes may harden the supporting regime's attitudes for several reasons. Capitulation in the aftermath of a military attack would be a grievous political blow to most governments. For the Taliban to have surrendered Osama bin Laden after the 1998 U.S. strikes on Afghanistan, for example, would demonstrate that the movement was abandoning the tradition of Pashtun hospitality for an honored guest. More generally, it would have demonstrated to a highly nationalistic people that the regime caved in the face of outside pressure. Military strikes may even increase the popularity of a group, making it more attractive as a partner. For example, many Israeli attacks on Lebanon actually increased support for Hizbollah. The devastation caused by the Israeli attacks made the group's claim that it was only defending Lebanon from an invader more credible.

Military strikes often have little support abroad. Because the terrorist attacks often inflict relatively few casualties, military force is often viewed as a disproportionate response. In addition, the military strikes are often seen as destabilizing and thus jeopardizing a host of other strategic and economic interests.

States and terrorists can also retaliate in response to military attacks, further decreasing international support for the attacks and often leading decision makers to avoid the use of force in the first place. When Israel attacked several targets in Lebanon, Hizbollah shelled Israeli settlements near the borders. The 1986 U.S. air strike on Libya led to the Pan Am 103 bombing as well as a host of smaller attacks.

## LESSONS FOR COERCERS

States can be coerced into halting or reducing their support for terrorists, but the process is arduous and lengthy. Although there are no simple steps that can guarantee that a state will cease its support for terrorism, there are several guidelines that coercing states should recognize when seeking to halt the sponsorship of terrorism or, more realistically, to reduce it.

### Understanding the Adversary

The first set of lessons involves understanding the nature of the adversary. Both support for terrorism and efforts to stop it are embedded issues, part of a regime's overall political trajectory. Revolutionary Iran and the

Taliban's Afghanistan backed other radical groups as part of their overall efforts to spread their interpretation of Islam, a goal that was apparent in their domestic as well as foreign policy. However, if it is possible to reintegrate the state so it seeks the goodwill of the international community, counterterrorism pressure is more likely to succeed. It is no coincidence that Libya began talks regarding ending its support for terrorism at the same time that it proposed giving up its weapons of mass destruction programs—both stood as obstacles to the regime's reacceptance as part of a "normal" member of the international community.

Undifferentiated pressure almost always fails. The motivations of the supporting state, the type of support provided, and the dynamic of the group it supports all will affect whether coercion succeeds or fails. Nor can pressure be divorced from the broader strategic context. What worked to turn Libya away from terrorism in the 1990s would probably have failed in the 1970s, when the regime was more ideological and faced fewer problems at home.

Efforts to halt sponsorship must recognize, and ideally capitalize on, the reasons why sponsors support terrorism. For example, Pakistan's support for militants in Kashmir is largely (though not entirely) driven by a strategic ambition to gain what Islamabad believes to be its lost territory and to weaken India. During the Kargil crisis, the U.S. threat to realign strategically with New Delhi if Pakistan did not withdraw its forces thus had a tremendous impact. Economic sanctions that increased Pakistan's economic pain for much of the 1990s, in contrast, were far less effective. The domestic importance of the Kashmir issue, moreover, made it impossible for Musharraf to completely cut off support, placing limits on any progress.

Because ideological regimes are so difficult to coerce through the imposition of standard costs or persuade by offering common benefits, it is often necessary for the revolution to wane before these regimes agree to abandon terrorism. Over time, the fervor of all revolutions decreases. Charisma is "routinized" and the petty corruption and ambitions that characterize most politics eventually overcome the initial ardor for a cause. Revolutionary behavior also is punished by other states, which try to weaken, undermine, and contain those that threat their power and position. Iran today is often described as "post-revolutionary," and Sudan is far less radical. Qaddafi too has abandoned his revolutionary pretensions. All three have reduced their support for terrorism. This process, however, takes years if not decades.

In essence, the best policy when confronting an ideological regime may be a form of containment.[15] That is to say, coercers should try to limit the spread of the revolutionary ideology by building up vulnerable states, both politically and militarily. Reducing their vulnerability to terrorism may require bolstering the victim states' intelligence services, helping

reduce government corruption, targeting regime largesse to groups or areas most susceptible to the terrorists' appeal, or otherwise reducing opportunities for radicals to exploit.

### A Way Out ... Conditionally

One reason states often support terrorism is they have few if any other options for achieving their strategic ambitions. Demanding that a state end its support for terrorism thus involves far more than the state jettisoning a small group of unsavory thugs. In reality, the coercer is asking the supporting state to abandon a strategic objective or a vital domestic concern. Pushing Syria to unconditionally end its support for Hizbollah and Palestinian rejectionists would leave Damascus with few effective means of pressing Israel on the Golan Heights and other disputes and would leave it vulnerable to charges of selling out at home. If Pakistan abandoned Kashmiri militants, its rival India would emerge far stronger.

Providing state sponsors with a diplomatic way out thus may make the path to halting sponsorship easier. The promise of negotiations can offer states another means of achieving their objective that does not require terrorism. This approach was the U.S. "answer" to the problem of Syrian terrorism: by forging a Syrian–Israeli peace, Syria would achieve its objectives at the bargaining table rather than through the use of terrorism.

Once again, however, this diplomatic "out" may easily backfire. If they are not careful, outside powers are rewarding the use of terrorism, suggesting to other states that its use pays off diplomatically. Moreover, the supporting state has an incentive to encourage terrorists to step up its activities when talks stall or when it deems the concessions insufficient, at times increasing the incidence of terrorism. Their motives are not linked to the benefits that the victim state or others can provide—often their own politics must change before progress can be made.

If a way out is offered, it must be balanced with strong coercive leverage, ensuring that the state in question does not see support for terrorism as beneficial on the whole. Engagement is at times necessary, but its costs can be considerable if it is unconditional. States must not only recognize there is a penalty for continuing to support a terrorist group, but also that support for terrorism in general is foolish and can only backfire. The U.S. handling of Libya represents an almost perfect balance of coercion and engagement. Without the constant U.S.-led campaign, Qaddafi would have not come to the bargaining table. But without the promise of relief, he would never have made concessions.

### Setting Priorities

Too often, the United States makes counterterrorism one goal of many, failing to set priorities. When pressing the Taliban in the 1990s, narcotics

trafficking, human rights, and ending the civil war often took precedence over counterterrorism. Libya is again instructive. When beginning talks with Libya, in contrast, the U.S. agenda was appropriately limited. The United States did not press Qaddafi on human rights, elections, or other internal issues despite Libya's dismal record on these scores. Washington initially even held back on Libya's offer to end its weapons of mass destruction program, recognizing that terrorism should be the top priority.

Counterterrorism, of course, should not always be the top priority. For U.S. relations with North Korea, counterproliferation is a far more important goal, and any lingering concerns about Pyongyang's involvement in terrorism should be subordinate to this objective. The key is not always to make counterterrorism a top priority, but rather to have priorities.

Even with regard to a state's consistent support for terrorism, establishing "red lines" and other priorities is essential. Mass casualty attacks, of course, are of far more concern than less deadly violence. A clear priority should be preventing a state's transfer of weapons of mass destruction (particularly any material for nuclear weapons or viral biological agents) to a terrorist group. Various WMD-armed states have so far refrained from such transfers, probably because they fear escalation from potential victims. Reinforcing such a concern among all potential proliferators is vital.

### Enemies versus Terrorists

One obvious step is to reform the process of designating state sponsors of terrorism. Currently, U.S. definitions of terrorism conflate the difference between attacks on combatants and attacks on noncombatants rather than highlight it. It is ironic that the *majority* of the states on the U.S. State Department sponsorship list have only minimal involvement in terrorism today. Cuba and North Korea had long ago ceased to support terrorist groups in any meaningful way. Sudan and Libya, both of which were at times major sponsors of terrorism, have also largely ended their support for terrorist groups. Unfortunately, by lumping them in the same category as Syria and Iran (and by excluding such egregious sponsors as Pakistan), any "name and shame" power of the list is reduced. In addition, the penalties that go with the sponsorship status remain considerable, making it hard to offer incentives for states that are moving in the right direction already.

Politics now dominates policy. Those seeking change must recognize the political risks they run as they try to create more coherent definitions and categories. Changing the listing of who is a sponsor and what constitutes terrorism, for example, would be criticized as legitimating Castro's noxious regime in Cuba or attacks on U.S. or other soldiers. Continuing the current set of definitions, however, reduces the potency of U.S.

political measures such as the state sponsorship list and gives terrorist groups few incentives to avoid attacks on true noncombatants.

Ideally, there would be more than a simplistic black or white categorization—in other words, each year states would be placed somewhere along a spectrum between "sponsor" and "non-sponsor" as an indication of progress from one to the other. In addition, the sponsorship list would be focused on terrorism, not on broader U.S. concerns about a rogue regime.

### Changing the Rules of the Game

The international community can make several changes in how it responds to state support that would make coercion more likely to succeed. One change is to end the fiction of deniability. Pakistan's links to Kashmiri militants, the Taliban's connections with al Qaeda, Iran and Syria's ties to Hizbollah, and other relations between states and major terrorist groups are usually well known and often publicized by the supporting state itself. Nevertheless, there is often a Talmudic debate over responsibility for a particular attack. For example, former National Security Advisor Samuel ("Sandy") Berger noted about the Khobar attack that, "We know it was done by the Saudi Hizbollah. We know that they were trained in Iran by Iranians. We know there was Iranian involvement. What has yet to be established is how substantial the Iranian involvement was."[16] Such hair-splitting gives a sponsor an incentive to offer sanctuary and logistical support to a group while avoiding a direct role in the final decision to strike a particular target. Instead, the burden should be on the accused state to demonstrate it has worked against the terrorist group and did not support its operations in any way, no matter how indirect.

Another fiction serving state sponsors is the respect given to sovereignty in cases where it is not exercised. Syria hid behind Lebanon, and Pakistan hid behind Afghanistan, using these ostensibly sovereign states for their own ends. Again, even though their dominance of these countries is (or was) widely recognized, they were able to exploit the narrow rules of the system to avoid responsibility for their actions.

A related change is for the international community to lower the bar on legitimate escalation on state sponsors. If states believe that only massive terrorist attacks will provoke international backing for a response, they have fewer reasons to withhold support. On the other hand, if the victim state believes that international support for a response would be forthcoming, it is far more likely to take advantage of its conventional military superiority. The October 2003 Israeli attack on Syria, which has long sponsored a range of rejectionist groups against Israel, was roundly condemned in Europe as escalation, while Syria's continued backing of violent groups was taken in stride.

### The Effectiveness of Multilateralism

When possible, pressure should be multilateral. Multilateral policies have many problems: they are cumbersome, require concessions to allies, and at times lead to a lowest common denominator effect.[17] These problems make it difficult to increase pressure on state sponsors. Despite these weaknesses, gaining the support of allies often means the difference between success and failure.

In large part, multilateral support for coercing a state sponsor limits sponsors' options, both in terms of avoiding pressure and with regard to its other objectives. In short, they have no "plan of victory" that enables them to achieve their goals. U.S. unilateral efforts for years had failed to move Tripoli. UN sanctions and international isolation of Libya after the Lockerbie and Air France bombings, however, gave Qaddafi few options for gaining much needed foreign investment or for playing the leading role he sought to play in the Arab and broader world.

### Reducing Passive Support

State sponsorship goes beyond actively arming and training terrorist groups. For some groups, particularly *jihadist* ones, state *inaction* is often vital. Governments that do not crack down on terrorist fundraising, recruitment, and transit are vital for anti-U.S. *jihadists* today. Reducing such passive support can transform the struggle against nonstate actors like al Qaeda. If al Qaeda were hounded wherever it tried to set up shop, it would be far harder for the organization to recruit, train, raise money, purchase weapons, protect its leadership, and otherwise survive and prosper. Ironically, the key to success against these nonstate actors lies in engaging or coercing their inadvertent hosts to move against them—and helping them gain the capacity to do so.

Imposing new or increasing existing costs is a time-honored tactic in diplomacy. In general, however, such threats must be part of a broader effort or else they cease to be meaningful. The United States, for example, did not make stopping support for *jihadist* causes a priority in the U.S.–Saudi relationship, giving Riyadh few additional incentives to crack down on this activity. Once this became a priority, simple embarrassment proved effective to lessen passive support. The spotlight held on Saudi Arabia after September 11 humiliated the Al Saud regime, making them scramble to at least appear cooperative.

Another key is to diminish popular support for the terrorist group, as many regimes hesitate to clamp down if the terrorists are seen as Robin Hoods. Efforts to play up the terrorist group's missteps and atrocities should be done at the popular level as well as at the governmental level. Propaganda campaigns are notoriously difficult, however, and U.S. efforts

to demonize al Qaeda have conspicuously failed. Working indirectly to diminish support may be essential. Given the deep unpopularity of the United States in Saudi Arabia, U.S. efforts to diminish al Qaeda's luster may only burnish it. It would be more effective if respected Muslim authorities would criticize the organization, as these voices have credibility with the key audiences.

Bolstering capacity so governments have the power to crush terrorists is a more straightforward task. This can range from technical assistance, such as helping improve databases or information systems that track terrorists and their activities to advice on intelligence reorganization and legal reform. Training can be particularly important, as many skills related to shutting down passive support—such as financial tracking—are relatively rare in government circles, particularly in the developing world. Money can also be provided to boost the size and skills of security and intelligence services.

Many regimes in the developing world, however, have only a limited capacity to absorb U.S. or other outside assistance meant to shore up their ability to fight terrorism. In Saudi Arabia, for example, the myriad new programs the Kingdom has introduced in cooperation with the United States suffer from a lack of skilled and experienced personnel. As a result, even the most dramatic turnaround in the regime's intentions to crush terrorism will produce only modest results for many years.

### Realistic Expectations

Coercing state sponsors is difficult even during the best of times, and success requires anticipating problems and recognizing the possibility of failure. Even modest progress can take years. Libya, for example, suffered unilateral sanctions, a direct military strike, and finally broad (if limited) UN-mandated sanctions before agreeing to end its support for terrorism—a process that took years. Power shifts that led to the purging of ideologues were necessary for Iran to reduce, and Sudan to end, their support for terrorism, and in Tehran's case the level of activity still remains high. In part, the significant amount of time necessary for success stems from the very nature of coercion. Most forms of coercive pressure will initially strengthen a regime, producing a rally "round the flag" effect.[18] The punishment inflicted, in contrast, may take years to sink in.

Coercing states must also be wary of limited uses of force. Often, such gestures are politically necessary, fulfilling a desire to "do something."[19] Ironically, though military force is often depicted as a strong response, its use in a limited way may signal weakness. The 1993 U.S. strike on Iraq's intelligence headquarters after the attempted assassination of former President George H. W. Bush was roundly depicted as a "pinprick"

that demonstrated only America's aversion to a strong response. Moreover, in terms of their counterterrorism effectiveness, limited strikes often make the supporting state more recalcitrant. The U.S. bombing of Libya in 1986, the 1998 attack on Afghanistan, and the various Israeli forays into Lebanon all made the target regime more enthusiastic in its backing of the terrorists. In addition, such attacks can lionize the terrorists among potential supporters, increasing their ability to raise money and recruit.

At times, states will have to settle for progress rather than for complete success. Cases such as Qaddafi's Libya are rare. Far more common are instances where outside pressure leads states to cut ties to particular groups or reduce their activities. Iran's reduced support for terrorists operating against the United States and the Gulf states, for example, is a step forward, even though Iran still has a long road to walk. Demanding an all-or-nothing standard, however, reduces supporting states' incentives to place limits on their proxies or to cut support to certain terrorist groups while retaining ties to others.

## THINKING AHEAD TO FUTURE SPONSORS

It is easier to stop state support for terrorism before it starts than to halt backing after it begins. The back and forth between the coercing state and the state supporter can generate a cycle of hostility and make it difficult for the supporter to back down and lose face, even when the stakes involved are not high. Thus, one of the greatest challenges to the international community is preventing the rise of new Talibans or other regimes that see supporting terrorism as ideologically vital. Similarly, states must be discouraged from following the path of Pakistan, which found strategic advantage by supporting terrorism.

Creating a strong norm against the sponsorship of terrorism both makes states less likely to engage in it in the first place and enables the victim state to respond more easily. Diplomatically, this requires engaging both allies and other states on these issues before the support for terrorism becomes well established. In addition, it demands that the United States and other countries offer would-be sponsors alternatives to terrorism, such as giving them options at the negotiating table.

Creating standards is vital with regard to the problem of passive sponsorship. Passive support today is a grey area in international relations, in part because the international community is reluctant to confront the difficulties of state capacity building and of demanding a higher standard for regime accountability. Passive sponsors have quite different motivations than do active sponsors, and the solutions to this problem differ in turn. Nevertheless, passive support remains vital for many terrorist groups, particularly al Qaeda and its affiliates.

Such preventive diplomacy, however, is exceptionally difficult. Often, the bloodshed and carnage terrorists inflict must be manifest before any response occurs. In addition, states inevitably have different interests and different strategies for influencing would-be sponsors of terrorism, making it difficult to forge a common approach. The problem of passive sponsorship in particular will prove difficult to solve. Nevertheless, addressing these issues in advance offers one of the few long-term hopes for reducing the problem of state sponsorship.

# Chapter 3

## THE DEMOCRATIC DEFICIT: THE NEED FOR LIBERAL DEMOCRATIZATION

Paul R. Pillar

Terrorism is a political act. It is thus unsurprising that the political environment in which potential terrorists live is important in determining whether they become real terrorists. It further follows that the political character of a state helps to explain the amount of terrorism arising within it, and that political reform of a state can reduce such terrorism. Among the most basic and relevant political characteristics of a state is the degree to which the rulers are accountable to the ruled, which is to say the degree to which it is democratic.

Besides being a political act, terrorism is an extreme and dangerous act. Angry and aggrieved people are less likely to resort to such extreme behavior if they see other, less extreme, political channels available to them. A democratic deficit is a source of terrorism insofar as it leads people strongly impelled toward political action to conclude that there are no alternative, peaceful means of political expression or of trying to influence public policy.

Even in democratic states, of course, there is often intense dissatisfaction with public policy and with the political order itself, which is one reason terrorism sometimes arises in democracies. The leftist terrorists who were active in the West during the 1970s—such as the Weather Underground in the United States or the Red Army Faction in West Germany—had just as many opportunities as their fellow citizens for peaceful expression and the use of legal means to try to influence politics and policy. They were dissatisfied and unable to change politics and society to their liking, not because of any lack of such opportunities, but instead because

their views (as well as their methods) were extreme and anathema to most citizens.

Another reason terrorism sometimes arises in democracies is that it has multiple roots and causes, and therefore does not correlate perfectly with any single cause. However important the political environment is as a determinant of terrorist behavior, it cannot always be expected to trump every other determinant. For example, the psychology and family circumstances of individual terrorists have explanatory value, as does the political system in which they live. These represent different levels of analysis, each of which contributes to the understanding of why a terrorist group emerges and why individuals join it.

Moreover, democracy (or the lack thereof) is not the only important variable at the level of the state. Most references to democracy are really references to liberal democracy, and the liberalism half of the formula may be at least as important as the democratic half as an influence on terrorism. Free political expression and avoiding the yoke of an all-pervasive state—both hallmarks of political liberalism—may be more significant than the principle of majority rule in discouraging a group from resorting to extreme and violent measures.

The degree of economic—as distinct from political—liberalism is yet another determinant of terrorist behavior. Getting into the difficult and dangerous business of terrorism can be an alternative not only to other forms of political behavior, but also to other life paths altogether. The allure of prosperous pursuits in the private sector has sidelined many legitimate politicians; it can be expected to do the same for at least some would-be terrorists.

## THEORETICAL ADVANTAGES OF DEMOCRACY

Democratic theory offers more than one argument in favor of democracy as a superior system of government in general. Corresponding multiple arguments link democracy, or its absence, to common sources of terrorism.

The most fundamental point in favor of democracy is that when rulers are answerable to the ruled and must compete for the people's favor to gain or retain office, they are more likely than in autocracies to govern in the people's interests and not exclusively in their own. The corresponding point regarding terrorism is that, other things being equal, democracies are less likely than alternative systems of government to generate perceptions of oppression or of conflicts of interest between rulers and ruled that are strong enough to motivate people to resort to terrorism. Rebellion against established authority amid such perceptions has been a recurrent feature of modern international terrorism, dating back to anarchist terrorism against the Russian empire in the late nineteenth century.

Although opposition to an authority that is perceived as not governing in the interests of the governed has continued to be a major feature of terrorist campaigns, the conflicts involved have often revolved less around the undemocratic nature of a political system than around issues of ethnic self-determination. Terrorist opposition to Israel, for example, is a campaign not against the Israeli political system—which is the most democratic in the Middle East—but against Israeli control of territories inhabited by Palestinian Arabs. The same could be said about most of the terrorism that was conducted as part of the independence campaigns against European powers in lands such as Algeria or Kenya. Some current ethnic separatist movements—although they may couch their struggles in terms overthrowing oppression—have nothing to do with democracy or its absence. The Liberation Tigers of Tamil Eelam exemplify a very undemocratic movement, ruled in dictatorial fashion by its ruthless leader Velupillai Prabhakaran, which engages in terrorism (as well as open warfare) against a Sri Lankan state that, despite its warts, is reasonably democratic. Since the days in which Russian czars were terrorist targets, the long global expansion of democracy has reduced the instances in which terrorism is used or contemplated primarily as a weapon for overthrowing an undemocratic regime.

But such instances still exist. They may be found in the Middle East, which features democracy deficits in monarchies (notably Saudi Arabia) and nominal republics (notably Egypt)—states that have been targeted by terrorists who, whatever other motives may drive them, confront regimes that largely deny them and their fellow citizens any significant say in governance. The connection between democratic deficits and terrorist threats is particularly pertinent to these and some other states in the Middle East, because the most significant potential opposition in either peaceful or terrorist forms comes from Islamists. Some of the most ardent proponents of democratization in the Middle East are Islamists, which is unsurprising because they would be among the biggest winners in any free elections in the region.[1] The more that Islamists' electoral ambitions and hopes for influencing policy are frustrated, the more one can expect to find sympathy and support for extreme and violent ways of trying to realize that hope, including the use of terrorism.

Classic arguments in favor of democracy go beyond the principle of keeping rulers accountable to the people. They also include the idea that democracy, given how it directly involves the people in public affairs, fosters more desirable traits among the people themselves than do alternative forms of government. As one theorist puts it, a justification for democracy is that it serves "as a means to producing certain states or attitudes of mind in the citizens, independence of mind, respect and tolerance for others, interest in public affairs, willingness to think about them and discuss them, and a sense of responsibility for the whole community."[2] Several

of these qualities are the antithesis of the typical terrorist mindset. Certainly, intolerance and a lack of respect for opposing opinions are central characteristics of that mindset. Disdain for free discussion—a preference for blowing up negotiating tables rather than sitting at them—is another. And within most terrorist groups, there typically is not only a lack of independent thinking but also assiduous efforts by group leaders to quash any hint of it. This condition reaches its extreme in some groups' premission indoctrination of suicide bombers.[3]

A sense of responsibility for the community is also important. An alternative way to express the point that is directly pertinent to sources of terrorism is that individuals need to have a sense that they are part of the community. This means not just a mythical or longed-for community, such as the *umma* or community of believers in Islam, which Islamists often invoke as one of their reference points. It means the political system and nation-state (and province, and town) in which the individual lives. Alienation from one's community is a thread that runs through the sources of extremism in much of the Middle East and to a lesser degree in other parts of the Muslim world. People see themselves as having little or no stake in the states and political systems in which they live. They are subjects of a political order, but do not feel a part of it. Because of this, there is little to dissuade them from turning violently against that order. To the extent that democracy—by directly, peacefully, and meaningfully involving citizens in the political process—imparts a sense of belonging to the political system, it becomes a disincentive against such violent rejection.

**EMPIRICAL PATTERNS**

The relationship between terrorism and an absence of democracy has been challenged, usually through interpretation of statistics on terrorist incidents. Comparing the U.S. government's statistics on terrorism with scorecards on political freedom reveals no such correlation.[4] Such comparisons must always be taken with a large grain of salt, given that statistics on terrorism are subject to major questions about definition and to severe skewing by large numbers of incidents or casualties associated with a few cases or conflicts. While it is possible to use these statistics to demonstrate almost anything through casual comparisons, it is virtually impossible to isolate any one variable—be it democracy or anything else—from others, or to reach statistically sound conclusions about its effect. One country, Iraq, accounts for a very large proportion of the world's terrorist incidents and casualties reflected in the most recent annual statistical compilation, but this is not a commentary on either the total absence of democracy under Saddam's dictatorship or the still quite incomplete efforts to turn Iraq into something worthy of the label of democracy. Instead, it has much

more to do with postinvasion disorder, resistance to foreign occupation, and acute ethnic and sectarian divisions.

Two more basic analytic flaws typically characterize statistically based efforts to debunk the counterterrorist value of democratization. One is confusion between where terrorism arises and where terrorist acts are carried out. Statistics about terrorist incidents reflect the latter, but the impact of democracy on the roots of terrorism concerns the former. For example, the deadliest and most spectacular international terrorist attack ever—in September 2001—took place inside a democracy, the United States. But the perpetrators of that attack came from undemocratic countries in the Middle East, and it is there that the origins of that terrorism are to be found.

The other flaw, related to the first one, is a failure to consider where terrorists' operational opportunities lie. It is easier to conduct terrorist attacks (and many other activities) in a free society than in a police state. Free societies tend to be democracies. It should be no surprise if the greater physical vulnerability of democracies to terrorist attacks—part of the price paid for enjoying a free society—offsets whatever statistical patterns might otherwise have arisen from the impact democratization has on the likelihood of individuals becoming terrorists, or of terrorist groups forming in the first place.

This last point suggests that in a narrow, short-term sense, there is something to be said for police states, as far as counterterrorism is concerned. Repression works, at least for a while and at least within a limited context. Egypt is an example. By the late 1990s, Cairo had almost eliminated what had become during the previous two decades a major terrorism problem. It did so not by democratizing or enlarging freedoms (although its partial toleration of the Muslim Brotherhood has directed into peaceful political channels opposition that otherwise may have partly assumed violent forms), but instead through harsh measures to eliminate the major terrorist groups and to cow their supporters.

Extend the frame of reference in space and time, however, and the limits of repression become more apparent. Egypt's offensive did not crush its homegrown terrorism altogether, but instead pushed some of it abroad. The faction of the Egyptian Islamic Jihad led by Ayman al-Zawahiri merged with Osama bin Laden's al Qaeda, and became part of the transnational jihadist movement whose animus is directed not only at Middle Eastern regimes but also the United States and the West. (For years, Saudi Arabia had a different sort of policy aimed at exporting its homegrown extremism, particularly by encouraging Saudi jihadists to burn their excess energy in Afghanistan.) Moreover, it is questionable how long repression will continue to work even within Egypt. Opposition that is not exported is bottled up, and what is bottled up can spill out in the future. Repression may appear to rulers as a more promising counterterrorist strategy than democratization in the short run, but the long run is a different matter.

More revealing than comparisons using annual statistics on terrorist incidents is a simpler comparison of regions. Think of the Middle East and some key characteristics come to mind: a disproportionate share of the world's petroleum, and Islam as the dominant religion. Two other characteristics are especially important: the Middle East is the origin of a disproportionate amount of the most worrisome forms of international terrorism; and it is the most undemocratic region of the world. This pattern of traits is not coincidental.

The Middle East's democratic deficit is hardly its only trait linked to terrorism. The aforementioned alienation of many citizens in the region involves their lack of a perceived stake not only in political systems but also in economies, which in the Middle East tend to be state-controlled, petroleum-centered, and providing few opportunities for advancement and an improved standard of living. Specific conflicts, notably that between Israelis and Arabs, also play a large role in terrorism originating in the Middle East. The Arab–Israeli dispute has been the direct target of much terrorism, a *cause celebre* for radicals, and—one respect in which it relates to democratization—an excuse for Arab rulers to postpone reforms in their own states.

The victory of Hamas in Palestinian legislative elections in January 2006 brought the issues of democracy and terrorism much closer together. Hamas has made extensive use of terrorism against Israel, but is also a political movement representing a major strain of Palestinian public opinion. Its winning of what was widely regarded as a free and fair vote posed difficult issues, particularly for Jerusalem and Washington, and presented in especially stark form the alternatives of peaceful and violent political expression mentioned at the outset of this chapter. Political pressures and emotions make it difficult for Israeli or American leaders to follow any policy toward Hamas other than trying to starve it out of office. And yet, the more that Palestinians (whose views Hamas represents) see that peaceful political channels are closed—even after winning a fair election—the more likely they will resort to, or at least support, violent means of expression. Negation of the Palestinian election result would probably have additional radicalizing effects elsewhere in the region, by suggesting that a proponent of democracy such as the United States is quite willing to reject democracy if it yields an electoral result that is not to its liking.

Although it is difficult to separate the effects of democracy from other variables that may affect the origins of terrorism, the respects in which the Middle East tends to differ from other regions suggest a connection. Beyond the observations about the Middle East, the empirical link between degree of democracy and extent of terrorism is not a matter of some grand statistical correlation that is applicable throughout the world. The issue is important not as the basis for a new social scientific law but rather as one consideration for how counterterrorism should enter into foreign

policy and into the postures that the United States or other outside powers should take toward individual states. Each state presents a different case. For each, a question to be posed is whether an increase in the democratic character of the state might at least marginally decrease the propensity toward extreme views and violent tactics among some of its subjects.

## THE ROLE OF DEMOCRACY IN TERRORISTS' DOCTRINE AND GOALS

Not only must each state be considered individually in order to assess the potential impact of democratization; so too must each terrorist group. Organizations that have used terrorism and appropriately bear the label "terrorist group" (including membership on the official U.S. list of Foreign Terrorist Organizations) span a very wide range of beliefs and characteristics. The effectiveness of any particular counterterrorist measure, including democratization, as a way to defuse the threat from a specific group must be analyzed with that group's individual characteristics, orientation, and situation in mind.[5]

The clearest applicability of democratization to defanging or pacifying terrorist groups is with those organizations that have good prospects of winning support and even power through democratic means. This is especially true of groups for which, despite their use of terrorism, there is reason to believe that in changed circumstances they would accept and abide by democratic norms. Hamas exemplifies such a group. Its formal refusal to recognize Israel's right to exist and its use of terrorism against Israel have defined Hamas for most outsiders, but its most consistent goal—as measured by its behavior—has been to wield political power in a Palestinian state. In pursuit of that goal, it has cultivated support among the Palestinian people not only by standing up to Israel but also by providing an array of much-needed social services. It has nurtured an image of clean and effective government at the local level, gaining a positive image which proved useful when campaigning against its political opponent Fatah and the latter's dominance of the corruption-ridden Palestinian Authority.

The internal workings of Hamas appear to be anything but democratic. Its internal governance is an opaque process involving unelected leaders either in exile or in hiding. But this is clearly a direct consequence of its working environment, in which Israel has done everything it can to impede the functioning of Hamas, including killing its leaders. In any event, numerous examples of political parties in Western democracies show there is no incompatibility between undemocratic internal procedures and a willingness to abide by democratic rules and procedures in competing against other parties.

Hamas is, in effect, the Palestinian branch of the Muslim Brotherhood, and some inkling of how it would operate in a less deadly environment

can be gleaned from the behavior of its counterparts in the neighboring states of Jordan and Egypt. In Jordan, the Brotherhood functions openly as one of several political parties, albeit one in which the legislature where it has seats can always have its power limited by the monarch. The Egyptian Muslim Brotherhood is legally banned, but its candidates run as independents or under other party labels, and it is now the largest and most organized political opposition in Egypt, both in the legislature and overall.

A further question (unanswered by these examples) about a group like Hamas concerns its willingness not only to gain power through democratic means but also to lose it through the same means. The biggest test of any process of democratization is not the first free election but rather the first subsequent election in which an incumbent party is defeated and surrenders power peacefully. Hamas, despite its sweeping victory in 2006, has given some indication of a willingness to accept less than a monopoly of power, such as through its efforts to persuade Fatah to join it in a coalition. But in the Palestinian Authority, which is a peculiar less-than-a-state entity, heavily dependent on the sufferance and support of the international community, this indicator has at most limited value.

The same question can be posed about numerous other movements that have used terrorism, particularly ones that have sought independence or self-determination. The question can be raised about the African National Congress (ANC), despite South Africa's admirable—in comparison with many other countries on the same continent—record of democracy since apartheid ended over a decade ago. The ANC, whose continued popularity so far has enabled it to stay in power through democratic means, has not yet had to deal with the prospect of being voted out of office. One can hope that when that day comes, enough postapartheid time will have passed and democratic norms will have become sufficiently engrained in the South African political culture for power to transfer as smoothly as it did in Mexico in 2000, when the Institutional Revolutionary Party (PRI)—which had governed Mexico for decades as something close to a one-party state—finally lost a presidential election.

Those questions are very long term. The more immediate issue for counterterrorism is how involving a group in a democratic process, or enhancing the scope or strength of that process, can reduce terrorism in the near- or midterm. With regard to Hamas, another instructive comparison in its own Middle Eastern neighborhood is with Lebanese Hizbollah. Hizbollah has not been defanged by participating in the political process; it retains a capable terrorist apparatus under its longtime security chief Imad Mughniyah. But its relative inactivity in terrorism over the past 10 years (apart from some assistance to Palestinian operations against Israel) contrasts starkly with its record during the previous 15 years. Part of the difference concerns specific issues and grievances—particularly the American and French presence in Lebanon, which some of Hizbollah's most spectacular

terrorist operations in the early 1980s were designed to end. The main difference, however, is the large and respected role that Hizbollah has come to play in the Lebanese political and social order. It is a political party with seats in the Lebanese parliament, a social services organization, and a broadcasting network with a large audience, as well as a security presence in south Lebanon. Leaders across the Lebanese political spectrum and in much of the rest of the Middle East accept Hizbollah as a legitimate player. Success and respect in one of the more democratic systems in the Middle East have made terrorist options appear less useful or necessary to Hizbollah. And with a lot now to lose, the downsides of resorting to terrorism appear greater.

Another instructive case is the Provisional Irish Republican Army and the form it takes as a political party, Sinn Fein. Intrinsic to the group's commitment to leave the terrorist path, under the terms of the Good Friday Agreement of 1998, is its full participation in a democratic process for governing Northern Ireland (as well as participating in national politics at Westminster and Dublin). The fits and starts of the Northern Ireland peace process, and particularly the difficulties in getting the PIRA to give up its arms, are illustrative of the problems to be expected in getting a group to make any such transition. The central fact, however, is that a major terrorist group is substituting peaceful, democratic political competition for violence, even though it has not attained its central goal (in this case, a united Ireland with no British rule).

In cases such as the ones just mentioned, the role of democracy in counterterrorism goes beyond a shaping of the political environment in which individuals decide whether or not to join a terrorist group. It provides a direct alternative route through which a group can pursue its interests. Accordingly, democracy should be a large part of any strategy for dealing with such groups.

A different sort of challenge comes from groups that are as significant as Hamas, Sinn Fein, or the ANC and that represent communities of interests but that seem unlikely to abide by democratic rules and norms. The Tamil Tigers are a prime example. This group has ferociously eliminated all alternative aspirants to leadership of the Tamil community, and it is hard to imagine it accepting any political arrangement requiring it to compete fairly with other Tamil parties or movements. Current prospects for crushing the Tigers militarily are slim, and so a negotiated settlement appears to hold the most hope for ending the terrorism and other violence in Sri Lanka. Unlike the negotiations that created frameworks within which Sinn Fein or the ANC practice peaceful politics, however, democracy may be antithetical to prospects for a negotiated peace in Sri Lanka. Over the long term, a liberal democracy that provides for political freedoms and minority rights for all Sri Lankans would be the best foundation for peace and an absence of terrorism. But in the meantime, the vicious nature of

the LTTE means the choice is more likely to be between holding out for democracy or reaching an agreement with the Tigers that would accept the group's very undemocratic rule over Tamil-inhabited portions of Sri Lanka.

Yet another different challenge comes from terrorist groups with which no settlements, democratic or otherwise, are feasible or desirable. They include the radical jihadists, including Bin Laden and his followers, whose only political objective besides the destruction of existing orders is the medieval one of reestablishing a Caliphate. The jihadists make no pretense of favoring or even accepting democracy. The most prominent jihadist who has fought in Iraq—the Jordanian Abu Musab al-Zarqawi—explicitly denounced it. In a speech attributed to Zarqawi shortly before elections for the Iraqi constituent assembly in January 2005, he declared a "fierce war" against the "evil principle of democracy and those who follow this wrong ideology."[6] With such statements, Zarqawi became the poster child for counterinsurgency efforts in Iraq, waged in the combined name of suppressing terrorism and expanding democracy. He also was the perfect illustration for the theme—which President George W. Bush has repeatedly sounded—that terrorists opposing the United States "can't stand freedom. They hate our values. They hate what America stands for."[7]

Setting aside issues of what else may drive anti-U.S. terrorism, the juxtaposition of the themes of promoting democracy and of fighting terrorists who abhor it raises a further question about the usefulness of democratization as a counterterrorist tool. If terrorists do conduct terrorist attacks because they hate democracy, wouldn't more democracy mean more hatred and more terrorism? (And might this be a reason for some of the statistical patterns referred to by those who debunk the value of democratization in combating terrorism?) An immediate response could be that this is why those who have the appalling views of an extremist like Zarqawi must be stamped out. But this places too much emphasis on specific individuals and begs the question of how many other Zarqawis—albeit less famous—are out there. Instead, the correct response is that democracy's value in countering terrorism is not a matter of placating terrorists or respecting their views. Zarqawi and others like him already are a lost cause; the only appropriate response is indeed to eliminate them. The value of democracy lies in reducing the inclination of others to become terrorists in the first place, and in reducing the sympathy and support for terrorists among larger populations, along the lines of the logic articulated at the outset of this chapter.

The idea that democracy is not a matter of appeasing terrorists or accepting their political views applies as well to terrorist groups that are, or could become, part of peace processes or negotiations. If the Good Friday Agreement in Northern Ireland takes hold, it will not be because it appeals to a democratic sense in the hearts and minds of PIRA leaders. Similarly,

if democracy in a Palestinian entity or state helps to wean Hamas from terrorist methods, it will not be because Hamas leaders have been reading John Locke or John Stuart Mill and are eager to apply the principles of a liberal democracy. The political goals of the groups, revolving around attaining power in Northern Ireland or Palestine, may have little to do with democracy as an end in itself. But evolving circumstances and properly structured incentives may make democratic competition a more attractive means than terrorism for pursuing those goals.

A final issue about terrorists' objectives and beliefs concerns the Islamists. Zarqawi couched his diatribe against democracy partly in religious terms, saying that an objectionable feature of democracy is the free choice of religion, which is contrary to his understanding of the will of God. Even recognizing that Zarqawi occupied a radical fringe of political Islam, a legitimate question concerns the compatibility between democratic principles and political Islam in general. Islam is a revealed religion that de-emphasizes division between the spiritual and temporal (including political) spheres, and emphasizes the applicability of sacred texts and Islamic law to all facets of life. There is, at the least, a tension between the concepts of God-given law and man-made law, the latter of which is central to democracy. This tension may be an additional reason for the relative paucity of democracy in the predominantly Muslim Middle East.

The question of Islam and democracy is subject to debate, however, and what matters is who within the Islamic world will win that debate. "Political Islam" is not a single ideology, but rather a label applicable to a wide range of views that claim to apply principles of Islam to politics. In many Muslim countries, a small but potentially influential element of "Islamic modernizers" has argued that democracy and liberalism are compatible with Islam. The more that debates over interpretations of Islam run in favor of the modernizers, the less support there is for the extremists. Successful implementation of democracy would be, in most milieus, the best support the modernizers could receive.

## PRINCIPLES AND PITFALLS

Democratization matters in countering terrorism, but so do the manner and circumstances in which it is implemented and the preparations for offsetting possible negative effects that could, in certain times and places, encourage more terrorism. What is understood to constitute "democracy" matters a great deal as well.

Democracy is not just majority rule. It also involves minority rights, including the right to compete freely to increase one's votes and power in the future. This point is important for undercutting extremism and terrorism, because the emotions and resentments that drive elements of a community toward terrorism are often those of a minority fearing subjugation

by a majority. That has been the case with the Catholic republican terrorism of the PIRA, and it is true of Sunni Arab violence in post-Saddam Iraq.

Democracy is also not simply understood as the existence of an electoral process. Successful democracy of the sort enjoyed by the industrialized West requires a well-developed civil society that blurs and attenuates lines of conflict by giving citizens multiple stakes in a larger community, and cross-cutting ways in which they define their interests. It also requires habits and attitudes that foster restraint, mutual respect, and the concepts of loyal opposition and alternation in power. All these attributes require time, usually much time, to develop. Moving quickly to establish elections and the other outward forms of democracy without having developed these inward attributes is apt to accentuate (rather than diminish) the fears and insecurities that breed extremism, which in turn can mean an increase in terrorism. This is taking place today in Iraq.

Elsewhere in the Middle East, the United States—motivated in large part by the goal of cutting the roots of terrorism—has initiated programs designed to encourage the long-term growth of civil society and the other attributes needed for a healthy democracy. Many of these efforts come under the Middle East Partnership Initiative (MEPI) administered by the Department of State. MEPI involves funding for a variety of programs in politics, economics, education, and the empowerment of women.[8] Political programs, for example, have included support for the development of political parties, media coverage of parliamentary sessions, and enhanced dialogue among activists and nongovernmental organizations. Although it is difficult to see effects in the short run, such efforts will help in the long term to make terrorism seem less attractive than alternative forms of political action.

These points about the attributes of democracy needed to reduce terrorism parallel well-established principles about the conditions needed for overall stability and moderation in a democracy. There is a similar parallel regarding the downside of democracy. A key finding of the voluminous research that relates different types of political systems to the outbreak of war is that, although democracies rarely fight other democracies, new democracies are among the most warlike states of all.[9] Some of the same attributes of states that encourage externally directed aggression—such as the insecurities of old elites seeking new sources of support—also make for internal extremism, with terrorism sometimes chosen as a tool by elements afraid of how they will fare in a new era. So, whatever the long-term benefits of democratization, the short term may be bumpy. That is particularly true of a state, such as Iraq today, that undergoes democratization at a forced-draft pace.

A more specific transitional problem is that political settlement of a long-running conflict—perhaps providing for democratic procedures as

part of an agreed-upon new political order—may be the occasion for terrorist groups that oppose the settlement to step up their operations in an effort to derail it. Examples include attacks by splinter groups in Northern Ireland as the peace process there moved forward. Similarly, any reviving of an Israeli–Palestinian peace process could be expected to stimulate terrorism by rejectionists determined to stop the process. In such a situation, the two Islamist Palestinian groups, Hamas and the Palestine Islamic Jihad (PIJ)—whose respective terrorist operations often have appeared to complement each other—would take different paths. Hamas, with its popular support, would see a major role for itself in a democratic process that was truly open. The PIJ, a smaller group without such broad support, would more likely be among the rejectionists happy to see a peace process fail.

The Palestinian question raises a final principle about democratization, which is the importance of consistency—even though every conflict and every terrorist group is different—in promoting democracy and respecting its results. Particularly in the Middle East, suspicions about the motives of promoters of democracy can be a significant handicap. Many in the region associate liberal democratic forms and procedures with past western domination. Any western policies that appear to place more weight on specific political outcomes than on respect for democracy itself would add to such cynicism, with a resulting encouragement of extremism elsewhere in the region.

## DEMOCRACY AS BOTH END AND MEANS

A reduction in terrorism is not the only public interest that counterterrorist tools affect. There are always trade-offs with other values and interests. Compromises must be made when the effects on other values are negative, such as with expanded investigative powers that infringe on personal privacy or with military operations that cause collateral casualties among innocent persons. One of the most attractive features of democratization as a counterterrorist tool is that expansion of democracy and associated political rights is a value in its own right. Far from compromising or treading upon other ends, democratization represents the advancement of an important end, in addition to whatever benefit it has in curtailing terrorism.

This does not imply that democratization should always, or even in any one case, take precedence over other counterterrorist instruments. Like the other tools, it has major limitations, most of which have been mentioned above. Its chief limitation is the long time required for beneficial effects to become apparent and the very long time required to develop political cultures needed for democracy to work well. What the congruence with other political ends does mean, however, is that the burden of proof ought to be less for those arguing in favor of making democratization an element

of a comprehensive counterterrorist strategy. Even if the correlations with terrorism are hard to prove, the side effects are apt to be more positive than negative. And even if, in a particular case, democratization does not curb terrorism, it will not be a wasted effort because other ends will have been served.

In sum, democracy—or rather its absence—is connected to some of the most basic roots and sources of terrorism. The effects of democratization on the incidence of terrorism vary from case to case. There are significant pitfalls, especially associated with the transition of bringing new democracies into being. Much depends not on democracy itself but on the liberal attitudes and norms required to support it. A failure to appreciate the potential contribution of democracy would be shortsighted, however, with regard to both counterterrorism and other important values.

# CHAPTER 4

# THE ROLE OF DEMOCRATIZATION IN REDUCING THE APPEAL OF EXTREMIST GROUPS IN THE MIDDLE EAST AND NORTH AFRICA

Francesco Cavatorta

The topic of democratization in the Middle East and North Africa (MENA) has preoccupied scholars and policymakers for a number of decades, and has come to the forefront of the international scene following the 9/11 attacks. Since then there has been a "reappraisal" of the political violence stemming from the region, which has been explained as the obvious outcome of the persistence of authoritarianism at a time when most other areas of the world have gone through a process of transition to democracy. Any analysis of the region today concludes that the salient trait of the MENA is the complete absence of democratic governance in all the Arab countries. While this authoritarianism in the different countries varies in terms of intensity, few doubts exist about its persistence and pervasiveness. A number of explanations have been offered to account for the lack of progress of democratic governance, ranging from Arab political culture to the authoritarian nature of Islam, from the failure of economic liberalization to the absence of particular social institutions. A number of scholars and policymakers argue quite convincingly that the principal reason for the emergence of terrorist groups in the region is precisely the absence

of democratic procedures in societies that have not changed since at least the 1970s. The closed nature of the existing political systems has been identified as the primary cause of "terror" due to the fact that political groups unable to access the system and influence public policy were driven to violence as the only means to assert their political project. Once the link between authoritarianism and political violence is established, the straightforward idea that democratization would solve the problem of political violence is also accepted. The successive policy initiatives of democracy promotion launched by both the United States and the European Union have to be understood in this context.

However,contrary to what conventional wisdom holds about the MENA, the region has not been entirely bypassed by the third wave of democratization. In fact, liberalizing trends in countries such as Tunisia and Algeria preceded the rapid political transformations of Eastern Europe and Latin America in the late 1980s and rapidly spread to most of their neighbors. In addition, and again contrary to conventional wisdom, these MENA societies have gone through a significant number of changes ranging from the introduction of market-oriented reforms to the spread of new technologies, and from the emergence of new social classes to an increase in transnational political activism. However, in spite of these early promising trends and these enormous societal changes, liberal democracy did not take hold in the region, and over the course of the 1990s authoritarianism reasserted itself fully. The role of political violence emanating from the region has to be understood in this context of authoritarian persistence and social change.

This chapter examines in some detail the relationship between democratization and political violence in the region and analyzes four different, but interrelated, aspects of such a complex relationship. First of all, this study argues that processes of democratization in the region have largely failed due to the controversial nature of the principal opposition to the authoritarian elites in virtually all of the countries. In this context it is imperative to analyze the role of Islamist groups in the democratization process, because it is in the name of Islam that many terrorist groups also operate. Secondly, this study challenges the assumption that democratization will inevitably reduce the appeal of extremist groups, if we equate extremism with the use of violence. By drawing on the literature that deals with the link between democracy and terrorism, it will be argued that democratic governance *per se* cannot defeat terrorism, particularly its international manifestations. This is because the nature of terrorism emanating from the area is not simply linked to the domestic issue of an absence of meaningful representation. The relegitimization of state authority in the Middle East and North Africa through the adoption of democratic procedures is certainly a necessary first step to stem the wave of radicalism that is engulfing the region. However, it would probably only be effective

in moderating those groups that have "extremist" ideas, but are already committed to pursuing their goals through nonviolent means. The fact that democratization and violence might not be directly linked poses a problem for the international community, which is involved—at least on paper—in promoting democracy in the region. A closer analysis of the international community, chiefly the United States and the European Union, will in fact reveal that commitment to democracy is suspect and lacks regional credibility, particularly among ordinary citizens. This further fuels a sentiment of injustice that feeds the extremist views of the radical, violent groups. Finally, this chapter will offer some recommendations on how the international community could help bring about not only a more democratic MENA region, but also a more "just" international system.

## THE FAILURE OF DEMOCRATIZATION

A cursory look at the leaders currently in power seems to confirm the assertion that the region is still stuck in its authoritarian past and that the enormous political transformations that led to the demise of many authoritarian regimes elsewhere have completely bypassed the Middle East and North Africa. Such an analysis is only superficially correct. There is very little doubt that the entire MENA is still in the grip of authoritarian rule, if we discount Iraq and the non-Arab countries of Turkey and Israel from the analysis. The authoritarian systems are different, ranging from monarchies (Jordan, Morocco, Saudi Arabia, and the Gulf States) to military juntas in disguise (Algeria) to police states (Tunisia, Egypt, Libya) to "hereditary" republics (Syria) and to Islamic Republics (Iran), but they all share the common trait of being led by the same leaders or same ruling cliques that have been in power since the end of colonialism. Thus, those who argue that nothing has changed in the Middle East and North Africa since the 1970s may seem correct.

The reality, however, is quite different—indeed, the region has not been immune to the liberalizing trends that have characterized world politics since the mid-1970s. Although Samuel Huntington[1] omits the Arab world from his study of democratization, all countries in the region—with the exception of Iraq—have experimented with some form of liberalization and/or democratization. Tunisia became the first country in the region to relax its authoritarian system when current president Ben Ali took power in 1987 after a coup that relegated former leader Bourguiba to the sidelines. The initial democratic openings that Ben Ali implemented included the signing of a political pact between all Tunisian political parties, Islamists included, which would underpin the construction of a plural political system.[2] Ben Ali quickly reverted to authoritarian rule, however, when he managed to secure complete control of the security services and some sort of popular legitimacy.[3]

Algeria was, however, the very first country in the region that did not simply stop with the liberalization of the political system but proceeded on the road to democratization, allowing for free and fair elections—both local and legislative—which saw the emergence of the Islamist FIS as the most popular political party. This experiment in Arab democracy took place between February 1989 and January 1992, when a military coup ended the electoral process after the FIS won a stunning majority in the first round of the December 1991 polls.[4] In the meantime, other countries had introduced a degree of liberal reforms. There is no doubt that, like in most other cases of transitions to democracy, most of these liberalizing reforms were introduced by the ruling elites as simply cosmetic changes that would not alter the domestic balance of power. However, once introduced, such reforms had unforeseen effects. The ruling elites quickly realized how much legitimacy to govern they actually lacked and how popular Islamist movements were among ordinary citizens. The cancellation of the Algerian elections coupled with the brutal civil war that followed buried any chance that the liberalizing trend would continue in the region. The "Algerian scenario" became the nightmare scenario for both the domestic ruling elites and the international community. It follows that many of the early reforms were rolled back, and while the ruling elites devised a new network of support among key constituents that would allow them to remain in power, the authoritarian nature of the state did not change.[5] In Morocco, the process of reforms initiated by the late King Hassan II and known as *alternance* is considered a failure, and the current King is still the supreme decision maker.[6] In Libya, Qaddafi made some cosmetic changes to the institutional setup of Libya's government, in order to give the impression of popular involvement in decision making, but power still rests with him.[7] The same can be said for both Egypt[8] and Syria.[9] Mubarak in Egypt still rules without any sort of democratic legitimacy, while in Syria power passed from father to son in what is now a "hereditary republic." The last 15 years have therefore been characterized by the "persistence of authoritarianism."[10]

The absence of democracy in the region has been explained through a number of variables over the course of the last three decades. A first group of explanations sees the centrality of Islam in the life of the majority of the citizens in the region as the main obstacle to democratization.[11] It is argued that Islam demands submission to the ruler and this leads to political "quietism," whereby citizens should remain passive and refrain from questioning the legitimacy of those who govern. This passivity is not conducive to democratic change, because democracy requires confrontation and discussion, while Islam actively discourages both. This explanation is quite weak and does not take into account the fact that Islam as a political reference can certainly lead to quietism in certain situations, but can also lead to political rebellion in other contexts. The case of the Iranian

revolution, framed in religious references and led by a cleric, and the radical zeal of many Islamist groups demonstrate that Islam as a set of beliefs can be suited to support any political system, including procedural democracy.[12]

Another set of explanations centers on the traits of Arab culture and its political manifestations.[13] The authoritarian nature of Arab culture with its emphasis on the tribal leader distributing both social and economic benefits leads to political ramifications that support authoritarianism. Thus, the leader of the state utilizes state resources to reward those who belong to his tribe or clan rather than setting up a system based on equal citizenship. Rival tribes and clans are therefore in constant conflict over the possession of the state.

Other scholars still focus their attention on the absence of an active civil society and argue that without this dimension it is virtually impossible to democratize and support democratic institutions once established.[14] The passivity of Arab civil society has however been thrown into question and does not seem to be a satisfactory explanation.[15] In addition, an active civil society is not a necessary condition for democratization, as many cases in Eastern Europe demonstrate. With the possible exception of Poland and Czechoslovakia, the other former communist countries transitioned to democracy even in the absence of an active and well-organized civil society.[16] Others have gone to the opposite extreme to argue that there is in fact too much civil society[17] in the region and that it is too Islamicized to be positive for democratization,[18] pointing to the problem of its inability to articulate political demands, which would be the natural role of parties. The problem with this approach is that it does not take into account that political parties in the region are largely discredited[19] and that some civil society actors would become parties if allowed to.

Scholars more concerned with structural explanations focus on the interrelationship between economics and politics. The *rentier state* theory[20] argues that the leaders of countries relying on external rents can afford to separate themselves from the political demands of ordinary citizens because they are able to offer services and buy off potential dissent through redistribution. The absence of taxation and the independence of the productive apparatus from the political system allow for authoritarian forms of rule. Oil and gas would constitute the core of external rents, and most countries in the region have these resources available to them while the countries that do not could still be considered semi-rentier due to the spillover effects of the regional rent.[21] While this explanation is quite popular, it fails to be entirely convincing. First of all, even when rents plummeted due to global markets, authoritarian leaders managed to remain in power. Secondly, rentier states exist also outside the Middle East, and a number of them are democracies.

Explanations focusing on institutions and political actors are more convincing than cultural or structural ones, and it is necessary to turn to these if the persistence of authoritarianism in the region and its relationship to political violence is to be understood. The failure of democratization and the ability of authoritarian leaders to remain in power despite their lack of popular legitimacy can only be convincingly explained by referring to the "nature of the opposition." An interesting aspect of the Middle East and North Africa is that all regimes in the region, despite their enormous social, economic, and ideological differences, face an opposition that frames its political discourse in religious terms. Thus, both Saudi Arabia (a *rentier* monarchy with very solid ties to the West and an orthodox conservative brand of Islam) and Syria (a socialist secular republic with a "bad" reputation in the West) face domestic political challengers that draw references for their political demands in Islam. The term Islamism "refers to the rise of movements and ideologies drawing on Islamic referents—terms, symbols and events taken from the Islamic tradition—in order to articulate a distinct political agenda."[22] The vast majority of Islamist movements across the region have been able to mobilize popular support through a combination of social activism and populist discourse, with the objective of providing a clear alternative to the regimes in place. These regimes are all accused, irrespective of their ideological nature, of being "unjust" and of having failed the communities they rule over. To a certain extent, all groups that embrace Islamism can be considered revolutionary because their fundamental objective is indeed to revolutionize the societies they live in by radically transforming the political (both domestic and international), social, economic, and cultural relationships that currently exist. The demands that such groups make on the political systems they operate in are "radical" because they generally entail the dismantling of the current structures of power. This is not a novelty *per se* in processes of democratization, where some opposition groups are indeed determined to make a clean break with the authoritarian past, while the ruling elite strives to hold on to its privileges and position. This has not impeded the ability of certain countries to successfully move away from authoritarian rule. The problem in the MENA region, however, is that a combination of domestic and international factors have conspired to make democratization virtually impossible for the moment.

The current ruling elites have been able to reshape their authoritarian stranglehold on state structures through a combination of repression and co-optation.[23] This dual strategy has been hugely successful because there is a fundamental mistrust of Islamist movements in both domestic and international circles. Radical Islamism, irrespective of its many variants, is perceived to be a danger for democracy, and opening up the political system to their participation would consign all these countries to another form of authoritarian rule, which would be even more intense than the

current one. Thus, the international community has—since at least the Algerian case—supported the repression of Islamists, decreasing the costs of repression for the regimes in power for fear that such movements, once in power, would undermine the advantageous stability of the international system.[24] If widespread abuses do not lead to international isolation, but instead to praise and access to international resources, current regimes have no incentive to truly democratize. In addition, current regimes have been able to utilize the fear of Islamism in secular sectors of their domestic societies to secure support and legitimacy for the regime. This support has been obtained largely thanks to economic rewards, particularly in rentier states where crony capitalism reigns.

Does the nature of Islamism justify such fears? It is very difficult to determine whether Islamist movements are democratic or authoritarian if they are analyzed in isolation from their environment.[25] It seems, however, that assuming *a priori* that they are not and cannot be democratic actors, by virtue of their Islamist ethos, is more the product of a purely political agenda rather than an objective examination. This is in fact the crux of the problem. Radical Islamist groups have a set of both domestic and international policy objectives that fundamentally clash with the interests of the current ruling elites and the international community, particularly the United States and the European Union. The problem therefore is not really the lack of democratic credibility these movements have (there is no empirical evidence to tell us whether or not Islamist parties elected to power through free and fair elections would abolish the system that brought them to power), but the very real political consequences that their arrival to power would entail: a challenge to the domestic, regional, and international status quo that favors selected Arab elites and Western countries.

The attitude of the international community to the problem of democracy in the Middle East and North Africa is clearly summarized by Zakaria: "the Arab rulers . . . are autocratic, corrupt, and heavy-handed. But they are still more liberal, tolerant, and pluralistic than those who would likely replace them."[26]

## POLITICAL VIOLENCE AND ABSENCE OF DEMOCRACY IN THE MIDDLE EAST AND NORTH AFRICA

The relationship between the type of political regime and the degree of political violence present in a country has always been a rather complex one.[27] Three different schools of thought can be identified in this respect.[28] One argues that democratic societies are indeed much more prone to experience political violence directed against the political system due to the "openness" of democracy itself, which by its very nature finds it very difficult to deal with groups operating in the shadows through violence.
