would lead to the assumption that violence does not stem from a lack of access to the political system, but from a perception of "illegitimacy" in terms of the rules of the game, irrespective of how democratic they might appear to be. This is particularly the case when fundamental identity values appear to be threatened. It follows that authoritarianism might be more capable of dealing with this type of dissent through repression. Others have argued that the absence of democracy in itself is the primary generator of political violence because authoritarian regimes do not allow for the free expression of political demands and this leaves disaffected groups no other choice than to resort to violence to promote their views. A third school of thought argues that such clear-cut distinctions based on theoretical assumptions about the nature of democracy and the nature of authoritarianism are not possible. Instead, the argument goes, we should concentrate on the degree of political violence that occurs. Thus, on the one hand, democracies may experience more episodes of political violence, but usually they are of reduced intensity and are eventually eliminated, particularly if the political system remains open and abides by the procedures of democracy. On the other hand, authoritarian regimes may experience fewer episodes of political violence through "pre-emption by repression," but when such violence occurs it is usually on a very large scale, bordering on insurrection.

Empirical evidence is mixed and largely depends on the definitions of democracy, authoritarianism, and political violence that one uses. What is interesting, however, is that in the current post-9/11 world the second school of thought seems to have prevailed among policymakers and security experts. This has led to the largely unquestioned belief among some observers that the absence of democracy in the Middle East and North Africa is the cause of terror. The obvious outcome of such an understanding about the nature of political violence and terrorism is the assumption that if democracy were to triumph across the region, then such violence would disappear.

This is certainly the logic behind two major diplomatic initiatives that the Bush administration launched following a comprehensive review of American foreign policy in the Middle East and North Africa: the Middle East Partnership Initiative (MEPI) and the Broader Middle East and North Africa Partnership Initiative (BMENA) undertaken under the auspices of the G8. Both are based on the assumption that democratization in the region will reduce and, possibly, eliminate the threat of political violence.[29] This approach—sincerity and credibility notwithstanding—is laudable in itself because it offers the opportunity for the United States to radically alter its long-standing policies toward the area in favor of the establishment of accountable governments. However, the objective of defeating political violence through democratization does not take into account the complexity of local national politics, the diverse nature of Islamist radicalism, and

the international nature of political violence stemming from the region. The linkage between democratization and political violence might in fact be much more tenuous than what both MEPI and BMENA entail.

The degree of political violence that some of the countries in the region have known is, with the exception of Algeria, not necessarily linked to the issue of democratic governance and needs to be examined through the specific aspects of national politics, given the enormous political, social, and economic differences that characterize these countries. A broad overview of the countries in the region is helpful in highlighting how the issue of democratic governance might not be so central in understanding political violence. As mentioned earlier, Algeria is the only exception to the general pattern in the region. In the Algerian case, the cancellation of the electoral results in January 1992—which had swept the Islamist movement to victory—and the imprisonment of thousands of members of the party had a very clear impact on the decision of the Islamist group to choose armed struggle in order to have the party reinstated to power. The brutal civil war that followed spun out of control with the emergence of mindless Islamist violence and the setting up of governmental death squads, but it should not be forgotten that the cancellation of the elections is what triggered the civil war. Even in this rather clear-cut case, however, it should be noted that the FIS was involved in violence for a relatively short period of time and that the party participated in peace talks with other Algerian political entities in order to arrive at a negotiated solution to the war as early as 1995. The Algerian military, however, dismissed this attempt and did not even participate in the talks. The type of Islamist extremist violence that began to emerge after 1995 and that was carried out by groups such as the *Groupes Islamisques Armés* (GIA) is more in line with *salafism* and would hardly be appeased by the reintroduction of democratic governance.

The violence that swept through Egypt during the 1990s was quite different from the type of widespread political violence that characterized Algeria during the same period. It was in fact the product of a *salafi* ideology that certain small terrorist groups (*Jamaat al-Islamiyya* and Egyptian Islamic Jihad) subscribed to, and was not necessarily a reaction to the authoritarian Mubarak's regime, but had much more to do with the wider problem of the legitimacy of the ruler to govern without making specific references to God's authority. The absence of democratic procedures to determine the direction of the country was not the primary motivator for choosing violence, as a democratically elected leader, even one belonging to the Islamist camp, would have faced such a violent challenge to his legitimacy to rule. It is doubtful that these armed groups would have welcomed democratic rule, which in their ideology is equated with a form of government that bestows authority upon the people rather than to God, making such a government illegitimate. Specific references to this issue are

made in the writings of the radical ideologue, Sayyid Qutb, to whom these groups look for ideological inspiration.[30] It should be noted that some of the imprisoned leaders of both groups called for a cessation of hostilities and admitted that the armed struggle was not the "appropriate" means to make political demands,[31] while other leaders such as Ayman al-Zawahiri have become involved in transnational terrorism.[32] The same can be said for the very small violent minority groups that are active in Jordan and Morocco. The opening up of the political system to pluralism leading to the election of a leadership enjoying a popular mandate would not solve the problem of legitimacy and authority to rule, which is what these extremist groups are concerned about. The countries in the Arabian Peninsula face the same type of problem.

In addition to this general point about extremist violent groups, it should be noted that countries in the region do not have the same authoritarian intensity and, while some scholars dismiss the idea of partial or semidemocracies,[33] the degree of liberalism that is present seems to positively correlate with the increase of violent actions by extremist groups. This follows quite precisely from the assertion that more "liberalized" states are more easily targeted due to their relative openness. This would explain why Morocco and Egypt, which are considered to be less authoritarian than Tunisia and Syria, have experienced more political violence over the last decade.

In this context, it should be emphasized that the very popular and more mainstream radical Islamist movements in most countries of the region do not subscribe any longer, and some never did, to the idea of overthrowing the current regimes through armed struggle. Most of the current Islamist leadership across the region has come to terms with the need for electoral democracy in order to get to power and transform society, having witnessed the catastrophic effects of the use of violence on the fabric of society. Through a combination of social activism and political demands for reform, such groups seem to have made the strategic decision to pressure their own governments to open up without resorting to the use of violence, which they routinely condemn.[34] This is the case, for example, of the two largest Islamist movements in Morocco—the Party of Justice and Development (PJD) and the Justice and Spirituality Group. It is also the case for the Muslim Brotherhood in both Egypt and Syria. In Syria, the Brotherhood attempted to remove Hafez Assad from power through an open armed rebellion in the early 1980s, but the uprising failed. Furthermore, such large groups have a very diverse supporting constituency, which includes the disenfranchised youth, as well as a relatively wealthy middle class, and they need to reconcile the diverging interests that arise.[35] This "catch-all" characteristic makes these movements more moderate, as multiple influences have to be collated.

However, the formal subscription of these movements to the procedures of democracy does not make them necessarily less radical in terms of the policies they would wish to implement once in power, particularly in terms of economic redistribution, foreign policy, and social behavior. This is an important aspect of the story of radical Islamism because participation in the construction of a democratic society is not synonymous with the abandoning of their "revolutionary" goals. It is, in fact, the fear that the electorate would mandate the implementation of such policies that prevents all the regimes and their international allies (if they have any) from undertaking the necessary reforms.

The nature of radical Islamism is very complex, and if we are to understand the reasons why certain groups decide that only armed actions will deliver their political objectives, we have to be aware of the enormous differences that motivate Islamist groups to act. This has important repercussions on the relationship between democracy and political violence.

A number of clusters of "Islamisms" can be identified in the current period. First of all, there are those Islamist groups that combine their political and social actions with what they perceive to be a national liberation struggle. This is the case of the Palestinian Hamas and the Lebanese Hizbollah.[36] Their armed struggle has not had much to do with issues of democratic legitimacy of the political space they operate in, and is instead the product of military occupation from outsiders.[37] What is almost paradoxical about these two movements is that they operate on a rather democratic national political stage. Both Lebanon and the Palestinian Authority have systems that permit political pluralism and ensure a certain protection for individual rights and freedoms. The violence that stems from both Hamas and Hizbollah is not linked to the perception that violence is the only option to force the national arena open to their demands. The national space is in fact accessible to them, as the presence of Hizbollah Ministers in the Lebanese government and the Hamas victory in the January 2006 Palestinian elections illustrate. Their "violent extremism" is inextricably linked to what they regard as Israeli expansionism and colonialism, and the end of violence in this context is entirely independent from the democratization of Lebanon and Palestine.

The second cluster of Islamism that can be identified is the one that makes references to the *salafi* tradition. Groups belonging to this cluster, as mentioned above, are not interested in "democratic politics" and would question the legitimacy of any ruler, even if it came to power through free and fair elections. To a large extent, the members belonging to these groups are not motivated to act through violence because their respective national political systems do not offer the means to express their demands, but are motivated by a wider sense of injustice that characterizes their outlook on the society they belong to. If national governments in the region were held accountable to their citizens, they would implement some of

the policies that these groups approve of, but the fundamental problems of "divine authority and sanctioning" would remain. What would also remain is the possibility that such elected governments would implement polices that the electorate mandates, but are contrary to the perception of true Islam that these groups are attached to. This would once again drive them to fight, in their eyes, an illegitimate government.

The third cluster of Islamism, to which the majority of movements belong to, can be labeled "the Brothers' Islamism" and does not condone the use violence to replace the current regimes (at least, not any more). These groups have not abandoned their radical demands and policies, but by rejecting the use of violence they have made it clear to both supporters and rivals alike that they have already bought into the possibility and necessity of democracy in their respective countries. Those militants who follow such a path are unlikely to be attracted by more extremist groups, particularly if we take into account that the attempts to overthrow regimes in the past failed miserably and only brought increased repression on the movement itself.

The varied nature of Islamism seems to indicate that the absence of democracy is not the primary motivator for extremism. Most violent groups would probably remain committed to the armed struggle even in the event of an opening up of the political system because of the problematic nature of the legitimacy to rule and the confrontational nature of the international situation between the West and the world of Islam. Radical Islamist groups that made the choice of nonviolence seem simply to be biding their time until the system collapses from within, and are certain that they already control society and need only to wait for the political system to formally acknowledge that. Finally, the two MENA regional movements that are truly committed to large-scale violence direct it against an external enemy rather than using it to contest the legitimacy of their own national political systems.

There is a third aspect to violent Islamist extremism that must be examined: its international manifestations. French scholar Olivier Roy emphasizes that "it is the neo-fundamentalist international networks"[38] which constitute a threat when they espouse violence in order to re-Islamize Muslim societies and when they espouse the Huntingtonian belief of a clash of civilizations based on irreconcilable cultural differences. The presence and activism of transnational Islamist terrorism based on such "cultural" premises is also unlikely to be the product of "national authoritarianism" and therefore it is unlikely that its disappearance will be achieved by democratizing the national political space. The ideological underpinnings of radical international Islamism is linked to the *salafi* ideology that would question democracy as the method through which leaders should be selected. Moreover, transnational extremist groups have the objective of recreating the Caliphate, which inevitably bypasses the national

political stage. These groups largely attract people who are not necessarily disaffected by the absence of democracy in their respective countries, but are motivated by their belief that they are witnessing a cosmic struggle between injustice (the West and its policies) and justice.[39] The democratization of the national political space would not diminish the appeal of such an outlook in the presence of Western activities that go beyond the mere support for local authoritarian regimes to include perceived military, cultural, and economic dominance and expansionism.

## DEMOCRATIZATION AND THE INTERNATIONAL COMMUNITY

The literature on transitions to democracy has traditionally marginalized international factors from its explanations for the collapse of authoritarianism and the initiation of a democratic transition. Such an approach focusing exclusively on domestic explanatory factors has recently been challenged and, currently, it has become accepted that processes of democratization cannot be understood without making reference to the surrounding international environment.[40] In particular, the focus is on the most important political actors in the system which have placed democracy promotion at the top of their foreign policy agenda. This is the case of both the United States and the European Union (both as a single entity and in its constituent members). It is assumed that such a prodemocracy international environment is particularly beneficial for those domestic actors who are pursuing the objective of democratization because they will increase the amount of resources (in terms of finances, diplomatic support, and legitimacy) available to them in their struggle to overcome those who resist democratization. Thus, the very positive role of the European Union in bringing about change in Eastern Europe is often highlighted,[41] as is the role of the United States in contributing to the democratization of Latin America.

However, such a positive role of the international community needs to be reassessed in light of the policies implemented in the Middle East and North Africa.[42] In this region of the world, the international activism of both the United States and the European Union has been aimed at stopping processes of democratization when the outcome of it is perceived to be unfavorable to the stability of the international system and detrimental to their own interests. Starting with the transition to democracy in Algeria between 1988 and 1992, it is quite easy to demonstrate that the priority of ensuring a move away from authoritarianism in the country shifted quite considerably once it became clear to the international actors concerned—and particularly France—that the main beneficiary was going to be an Islamist party that was committed to radical policy changes. The rise of political Islam across the region had been identified by the late 1980s as the new menace that would affect the stability of the

international system[43] and both the EU and the United States began to undertake policies that would ensure the survival of the current friendly authoritarian regimes in the region, while at the same time, isolating the unfriendly authoritarian ones without pushing for their demise. The strategy of support for authoritarian regimes rested on diplomatic, military, and economic pillars. From a diplomatic point of view, the international community provided inclusion in international forums (for instance the Euro–Mediterranean strategy put in place by the EU) and ensured that these regimes would not suffer the political consequences of their authoritarianism by having sanctions placed on them due to their human rights abuses. From a military point of view, most of the authoritarian allies were gradually brought into the military structure of the United States and key European countries through joint maneuvers, training of officers, sales of weaponry, and access to military expertise. From an economic point of view, some countries—such as Algeria—were granted the rescheduling of debt, so that the government would have the necessary resources to fight the insurgency, while others signed free trade agreements with the EU (Morocco and Tunisia) and the Unied States (Morocco) that would permit the ruling elite to reap enormous economic benefits from the "crony" liberalization of trade. Egypt was virtually bankrolled by the United States as a reward for its role in Gulf War I, as was Jordan for the role it played in trying to resolve the conflict between Israelis and Palestinians. All these benefits increased the amount of resources available to the regimes, which were then used to withstand the domestic pressures for democratization, allowing the ruling elite to reshape and renew the domestic constituencies upon which they could rely for political support.

The evidence clearly points to the "anti-democracy" role that the international community played in the region for fear that the democratization process would reward parties that planned to reverse many of the policies of the regime they would be replacing. This policy of support for authoritarian but friendly regimes has not changed much after 9/11 despite the rhetoric emanating both from Washington and Brussels. The belief, which probably corresponds to the reality, that Islamist parties would sweep to power if free and fair elections were held does not allow the international community to decisively shift its support away from authoritarian rulers in favor of other domestic constituencies. There have been some attempts to put pressure on certain regimes like Egypt to become more accountable, but this has yielded very few results. The search for a liberal secular alternative to both the current regimes and to the Islamist parties has also failed to be successful because, at the moment, such an alternative simply is unavailable. The polarization of the political discourse between Islamists and regimes in power is what characterizes the region at this very moment, and the "third party" that Western powers would like to

see emerge is not a viable option. Its potential representatives are usually intellectuals that have very little connection to the reality of the masses in terms of lifestyle and beliefs and whose discourse does not deal with the most important issues that ordinary citizens are preoccupied with.

While openly or indirectly supporting friendly authoritarian regimes, the United States in particular has targeted unfriendly authoritarian regimes both diplomatically and militarily. One of the most often cited reasons for "targeting" regimes such as Syria, Iran, and Iraq is the absence of democracy in these countries, which in turn is the reason given for making them bear the responsibility of regional instability through the supporting of terrorism, through their anti-Israeli rhetoric and through the attempts to acquire sophisticated weaponry. It follows that very harsh measures ranging from economic sanctions to military invasion have led to surprising outcomes. The belief that by "forcing" such countries open to democracy, they would adopt more conciliatory international policies seems misguided. Evidence shows that diplomatic isolation and economic sanctions have paradoxically strengthened the authoritarian and conservative elites of both Syria and Iran, whose populations have rallied around the leadership once the country fell under the scrutiny and the pressure of the "international community." The military invasion of Iraq, far from smoothing the road to Jerusalem and to democracy in the Middle East, has become the symbol of the cosmic struggle between the West and Islam, drawing wider support for *salafi* Islamism, a cause that enjoyed only limited appeal across the region.

When all this is accounted for, the U.S.-sponsored initiatives and the EU-led Euro–Mediterranean partnership to promote democracy in the region lack, at best, credibility; at worst, they are hypocritical and specifically designed to continue the status quo.

## A NEW INTERNATIONAL APPROACH TO DEMOCRATIZATION IN THE REGION

The promotion of democratic governance in the region by Western powers should certainly be an integral part of a strategy aiming at reducing national and international tensions and therefore reducing the appeal of violent political activity emanating from the region. The successful democratization of the Middle East and North Africa would be an important stabilizing factor, as the new regimes in power would enjoy electoral legitimacy and would be accountable to the electorate. The democratic process, by virtue of its pluralism, ensures that all sectors of society would have the possibility to influence public policymaking, which would be removed from the currently unaccountable leaderships. The democratization of the Middle East and North Africa, however, can only be successful if it meets the expectations of the local population and "respects" the choices of the

electorate. When the end goal of democracy is subsumed to other strategic interests, it loses value and appeal.

The inability of the United States and Europe to accept Islamist parties and movements thus far as potential democratic actors has fundamentally undermined the international efforts to encourage democracy. Thus, despite the rhetoric, material support has been granted to those friendly authoritarian regimes who are engaged in satisfying the economic and security interests of the West (broadly defined) in exchange for token liberalizing gestures that have created façade democracies through the region. The supposed post-9/11 policy changes with respect to how the theme of democracy in the region should be approached are, at closer scrutiny, quite disappointing and have not yet altered the suspicions of the West *vis-à-vis* Islamist parties. This leads to a lack of credibility and further emboldens those who "speak out" against the hypocrisy of the West. Unless there is a real shift away from the preconceived notions that Islamist parties are bad for democracy, and there is a realization that a "third force"—which would be secular and liberal—is unlikely to emerge in the short term, the persistence of authoritarianism will be continually facilitated. Accepting Islamist parties as "partners" would likely entail a willingness to sacrifice certain interests in the short term and would entail accepting that new regimes would not be as close to the West as they are now. So far, such willingness does not exist. In addition, the attempt to reshape the "governance" map of the region through economic, diplomatic, and military pressure exercised against unfriendly regimes, in the absence of similar strategies adopted against "friends," will continue to backfire. This is turn will only strengthen the extremist fringes pointing to double standards and their discourse will become increasingly compelling.

What is even more worrying is that there seems very little given to the very real possibility that the issue of democratization in the region might be quite separate from the issue of political violence.

Thus, the main problem for international strategies aimed at reducing political violence is that there might not necessarily be a strong link between democratization and terrorism. For instance, many current authoritarian regimes do not face violent extremist threats to their existence. The more popular opposition movement, the Islamists, seem to be quite content at the moment to be the dominant force in society and simply wait for the regime to fold and collapse. The main enemy for the West seems to be transnational terrorism, which derives legitimacy from a number of perceived Western "sins" separate from their support for authoritarian rulers. Democratization in this context is certainly a positive outcome in itself because it can help to ensure a degree of legitimacy that current rulers do not enjoy, but might not be the panacea that some expect it to be. In order to reduce the appeal of political violence, it might be necessary for the United

States and the European Union to take into account other issues that are probably closer to explaining the violence emanating from the region.

First of all, a reduction in political violence might stem from an equitable solution to the Palestinian issue. In this respect, it would be necessary to come to terms with the fact that the Oslo peace process is dead and buried. Palestinians do not believe in it any longer because of the lack of progress on key issues such as settlements, right of return for refugees, and the status of East Jerusalem. In this context, new actors have managed to come to the fore precisely by rejecting the structure of the agreement. This does not imply that Hamas is against peace *per se* and that its ideological goals cannot be pragmatically toned down. Much research in effect suggests quite the opposite,[44] but in order for Hamas to be able to renounce violence, Israel needs to do more in terms of concessions and only the international community, specifically the United States, can force them to do that. As long as the United States is perceived in the region not to be an honest broker, but a backer of Israel, the plight of the Palestinians will be a mobilizing factor not only for local groups such as Hamas and Islamic Jihad, but also a rallying cry for transnational terrorist groups pointing out that Israel enjoys the backing of the West in its attempt to put down the "Arab World."

A second policy shift that Western countries should make has to do with military and economic pressure on what they consider unfriendly regimes in the region. While economic and diplomatic sanctions can be a useful policy tool to send a signal to unfriendly authoritarian regimes that they need to modify their behavior and open up their political system if they are to fully participate in the international game and reap the benefits of constructive engagement, this cannot be done in the absence of a general policy that applies to all countries that are undemocratic. Western countries should adopt a policy of "equal treatment for equal dictators" because the continuation of a regional policy based on double standards can be easily used to highlight the hypocrisy of Western states and feeds into the belief that the real goal of the powerful West is to crush those states that stand up to its dominance and not the creation of more democratic societies.

A third policy shift has to do with the war in Iraq, which, far from contributing to the stability of the area, is widely perceived as the new episode in the struggle between the crusading West and the world of Islam, and it constitutes a powerful recruiting tool for the international neofundamentalist movement. Opposition to the military incursion into Iraq by the vast majority of political actors in the region, be they secular or Islamist, had stemmed from the knowledge that such an undertaking would be detrimental to the cause of democracy and to the cause of civilizational dialogue. The current reality of the conflict bears witness to the fears that were expressed before the intervention. Military intervention should not

be the default option for United States and some of its allies, because the legacy of its interventionism has profound negative repercussions on a region and on a public opinion that are already unfavorable to U.S. policies for both historical and present reasons. Devising a schedule for speedy withdrawal and giving up on the presence of military bases might be the signal that the United States is prepared to sacrifice short-term interests in favor of long-term stability, but this is unlikely to happen.

If we add to this the credibility gap in promoting democracy that the West generally suffers from, it emerges quite clearly that, in isolation, democratization in the region might not solve the problem of political violence. The "war on terror" might be very long indeed.

# CHAPTER 5

## AUTHORITARIAN AND CORRUPT GOVERNMENTS

Lydia Khalil

Egypt, governed for over a quarter of a century by a perpetually renewable emergency law, is one of the most bureaucratically inefficient, unresponsive, and corrupt governments in the world. Its apathetic and weary citizenry toil within a stagnant economy and restrictive society. Recent attempts at government sponsored political reform were merely stopgap measures against the impetus for real reform called for by the opposition.

Nigeria, under military rule for most of its history after independence, is seething with ethnic tension fueled by a fight over the control of its vast natural resources. Freedom of religion and expression are constitutionally guaranteed but not regularly practiced. Election tampering is commonplace, rendering results inconsequential.

Touted as a key ally in the war on terror, Uzbekistan also has the dubious distinction of being included in Freedom House's 2005 "Worst of the Worst: The World's Most Repressive Societies" list. The culmination of Uzbekistan's repression came in May, 2005 during which hundreds of protesters were injured or killed in Andijon by military troops. The Uzbek government maintains that it was merely conducting an antiterrorism operation.

Pakistan has come under the increasing influence of militant Islamists who criticize the government's corruption and association with the United States. The Pakistani government, where security services wield total control, has an uneasy relationship with militant forces and tolerate the presence of dangerous Taliban holdouts inside their country. The absence of

an independent legislature and viable economy prospects allow Islamic extremism to flourish.[1]

All of these states have two things in common. One, they are authoritarian in structure and corrupt in practice, deteriorating the legitimacy of their governments; and two, they all have "terrorist problems" or contribute to the widening international terrorist threat. These two common threads, authoritarianism and terrorism, are connected in a network of various cause and effect linkages. The cause and effect linkages between authoritarianism and terrorism can be broadly divided in three ways.

1. Authoritarian and corrupt governments are a *causus belli* for terrorist organizations. In other words, they are a reason, although not the only reason, for why terrorist organizations exist.

2. Authoritarian and corrupt governments enable terrorists. They can do this knowingly by sponsoring or tolerating terrorist groups, or unknowingly through ineffective and illegitimate governance.

3. They also inhibit an effective response against terrorism. Authoritarian governments are at their core weak governments. Weak governments are insecure, tend to overreact to internal threats, and are ineffective partners in the international fight against terrorism.

Research conducted by Freedom House found a direct correlation between terrorism and levels of freedom in societies. In studying the 5-year period between 1999 and 2003, Freedom House researchers found that 70 percent of all deaths from terrorism were caused by terrorists and terrorist groups originating in "Not Free" societies. In contrast, only 8 percent of all terrorist fatalities were generated by terrorists with origins in "Free" societies.[2]

This chapter will examine in more detail the multifaceted connections between authoritarian governance and terrorism. But first, one must start with some basic definitions and assumptions on what it means to be an authoritarian government.

According to the *Encyclopedia Britannica*, authoritarianism is the "principle of unqualified submission to authority, as opposed to individual freedom of thought and action. As a political system, authoritarianism is antidemocratic, in that political power is concentrated in a leader or small elite not constitutionally responsible to those governed. It differs from totalitarianism, in that authoritarian governments usually lack a guiding ideology, tolerate some pluralism in social organization, lack the power to mobilize the whole population in pursuit of national goals, and exercise their power within relatively predictable limits."[3]

In theory, authoritarian governments can be benevolent. But no matter how benign their intentions, authoritarian governments usually succumb to the accumulation of power for power's sake. As James Madison famously phrased, "The essence of government is power; and power, lodged as it must be in human hands, will ever be liable to abuse."[4] Authoritarian governments, no matter what their intention, quickly lose touch with their citizenry.

Authoritarian governments may or may not have been brought to power by the people, but once in power they tend to disregard the will of the people. The elite who govern arrogantly presume they know what is right or wrong for their country. They govern without input, leading to systematic resentment and dysfunction between state and citizen. Anyone who expresses a different view on the best interests or direction of the country is not only ignored but is believed to be plotting against the government or ruling party. Dissenting voices are dealt with harshly and often violently.

Authoritarian governments routinely stifle civil liberties in order to maintain their hold on power and keep society in check. There is little to no recourse for the average citizen against abuses by the government. As such, authoritarian governments lack legitimacy among their population and in the eyes of the international community.

Unchecked and uncontrolled, authoritarian governments are free to use whatever repressive means are necessary to stay in power. In authoritarian states, brutal enforcement of the regime trumps the rule of law. Any challenge to the status quo is perceived as a direct threat, therefore authoritarian governments will engage in reform only when necessary to stay in power, and only on their own terms. Recent reform activity in the Middle East, for example, has been limited and adaptive, enacted not necessarily to expand public participation in governance, but to ensure the regime's survival.[5]

More often than not, authoritarian governments are also corrupt governments. Resources, privileges, and advantages are reserved for a select group of the people or ruling elite. Corruption encumbers the fair distribution of social services and adds another layer to the resentment caused by the lack of political participation. This corruption further erodes the government's legitimacy in the eyes of its citizens.

## AUTHORITARIANISM AS A *CAUSUS BELLI*

As we expound upon the definition of authoritarianism, it is easy to see why authoritarian governments are resented by citizens who are not part of the elite few which the system sustains. But why and how does this resentment leads to terrorism?

Terrorism manifests itself when resentment of the authoritarian state reaches a breaking point in an individual, often after many attempts to change it non violently. Because of its very structure, the state cannot be changed politically, thus leaving terrorist, and other subversive activity as the only option. There is no other way to affect change other than asymmetric, violent action. The country of Uzbekistan is a prime example. According to an International Crisis Group report on Uzbekistan, President Karimov has consolidated "immense power to the regime but [closes] off avenues of advancement for most people ... the independent local NGO sector in Uzbekistan is on the verge of being wiped out, and even apolitical NGOs—associations of librarians and beekeepers—have been shut down. Of 273 NGOs registered in the province of Ferghana, over 100 closed between July and January, 2005."[6]

Such repressive pressure has deepened dissatisfaction and increased social unrest, culminating in the Andijon massacre. In May, 2005 supporters of 23 local businessmen accused of being members of *Akramiya*, an Islamic extremist group, stormed the prison where they were being held. Uzbek security forces moved in to suppress the protesters and in the process fired upon anyone in the vicinity. The entire violent incident occurred because those who tried to defend the accused had no political recourse and had to resort to violent action.

Citizens turn to terrorism instead of peaceful opposition politics in an effort to change their system, either because political efforts did not work in the past, or because they believe it could never work as the authoritarian government's hold over the country is so strong. Often, there is simply no room in an authoritarian structure for political participation. Such action would either be entirely ineffective to effect change or it would invite suspicion, or worse, repression by political authorities.

In Egypt, recent attempts at political reform generally failed to generate political freedom but invited further repression by the authorities. Ayman Nour, a leading political figure who tried to run in the presidential election, was not only harassed by the authorities but jailed under dubious charges that he forged signatures in support of his election bid. There were numerous accounts of peaceful demonstrators being harassed and beaten by the police merely for attempting to congregate.[7]

The failure of peaceful attempts at political change has fueled popular frustration and strengthened violent Islamist groups. Essam al Arian, spokesman for Egypt's Muslim Brotherhood—a group that was part of the political coalition for change—stated, "If you support absolute power and prevent people from expressing their grievances, its like giving permission for them to take their grievances (to extremist groups.)"[8]

To prove this point, new groups like *Tawhid wal Jihad*, one of the main groups implicated in the April attacks in Egypt's Sinai resort areas, are gaining strength among certain segments in Egypt, especially within the long neglected Bedouin tribal areas. Their rise is fueled by deep-seated grievances toward the government that have not been allowed any other outlet. Tribal groups resent Cairo's alternating interference and neglect and harsh security measures against their members.[9]

Taking up arms and engaging in acts of terrorism are not easy decisions for most. An individual engages in terrorism against an authoritarian state because they have become so disaffected and disillusioned that they have lost all hope for political change through other means. Radicalization is a gradual process. Many activists start out seeking an accommodation or understanding with those at the helm of the authoritarian system. Many times they start out seeking moderate changes. But their efforts are often for naught and they are heavily punished for their efforts.

Osama bin Laden is the most prominent example of this dynamic. Since its founding, Saudi Arabia has been controlled by the al Saud royal family through a strict system of Wahhabi Islam. No other body or individual has the ability to affect the government in any significant way. Unevenly distributed wealth, its importance as the world's leading oil producer, and limited freedoms is a combustible mixture affecting Saudi society.

After years of petitioning the Saudi Arabian government to change its corrupt policies and reverse its alliance with the United States, Osama bin Laden openly declared jihad on the Saudi government and America in 1996. He wrote, "I, myself, have offered my advice to the rulers two decades ago through grand scholars but nothing has changed. I have also addressed the problem directly with the deputy interior minister ... but I got no response there as well ... The Saudi interior minister made it very clear that if the reform activists do not accept the king's legislation and policies, then the only dialogue the Saudi Arabian government will have with them will be with the sword and rifle."[10]

Terrorism, with its secretive, violent, and sensationalist character, is a perfect anecdote to the difficulties of more peaceful political methods. Its secretive nature allows its proponents to operate in a repressive society. The unexpected timing of terrorist attacks jars an authoritarian government's perception of its own power, control, and awareness of its own society.

Security is destabilizes to the point where the authoritarian government's only legitimate claim, the ability to provide security for its society, is denied. It also serves to motivate support among the population for the

terrorists because the perception of the government's invincibility is shattered. Once people see the government can be challenged and threatened, terrorist tactics are justified by their results.

To be sure, terrorists are motivated by other factors besides repression or lack of political representation under authoritarian governments. The chaos of a failed state and lack of economic opportunity are alternative or additional motivators. Terrorists can be motivated by religious and ideological factors that could just as easily manifest themselves under democratic societies. But autocratic or authoritarian governments are the political systems most likely to breed terrorism.

A recent study by Alan Krueger and David Laitin concluded that, contrary to common one thesis, lack of economic opportunity could not alone explain the emergence of terrorism. After analyzing U.S. State Department databases on terrorism attacks, they found no evidence to suggest poorer countries generate more terrorism.[11] Alberto Abadie, professor of public policy at Harvard University, expanded upon their research when he analyzed reports by the World Markets Research Center's Global Terrorism Index, which evaluates the level of terrorist risk of 186 countries around the world. His findings corroborated Krueger and Laitin's analysis, but also revealed that incidents of terrorism relate to a country's level of political freedom. Abadie concluded that democracies enjoyed the lowest levels of terrorism and that autocratic regimes suffer higher levels of terrorism than democracies.[12]

## AUTHORITARIAN GOVERNMENTS ENABLING TERRORISTS

### Unknowingly

Authoritarian governments are not only a cause for terrorism, but they also knowingly and unknowingly enable terrorist violence in their own societies and spread it regionally and internationally. Terrorist organizations tend to mimic the authoritarian structure and tactics of the governments that inspired their formation, the very governments they are trying to fight against. Like authoritarian governments, terrorist organizations believe that the end justifies the means. As Kenneth Roth observes, "Their political or social vision justifies the deliberate taking of civilian lives in violation of the most basic human rights."[13] Terrorist violence can be characterized as another form of repression. Just as societies under authoritarian governments are under the mercy of the capricious use of violence by their governments, so too do terrorist organizations inflict the same sense of uncertainty.

Because terrorists and would-be terrorists have lived under an authoritarian mode of organization and structure, they absorb this way of

thinking into their mindsets, philosophies, and administration. Citizens who want change in a freer system usually can accomplish this through non-violent political methods. That option is not available to those living under an authoritarian system, thus they adopt the violent, strong-arm tactics of the governments they have lived under.

Moreover, research finds that the more repressive the state of origin, the more brutal the terrorist. According to a Freedom House report, "terrorists from dictatorial and repressive societies that brutalize their inhabitants are themselves significantly more brutal than terrorists born and acculturated in democratic societies . . . If we exclude 9/11's fatalities, terrorists from closed societies are over twice as lethal as their counterparts from less repressive states."[14]

Terrorist groups—although they may enjoy the support of a wide subset of the population because they are challenging the government when no one else is—practice the same hubris of authoritarian governments. They claim to speak for the masses and inflict violence onto their societies and sometimes the international community, to accomplish what they believe is best for the people.

Authoritarian governments can also enable terrorists by serving as a uniter of disparate groups, making the violent opposition that much stronger. Anger and frustration against the government can serve as the motivating factor for otherwise unrelated or even competing groups to come together to fight against the government.

We have seen terrorist or insurgent groups with contradictory ideologies come together to fight an authoritarian government, even if one group believes that the other is almost as bad as the authoritarian government in power; the operative phrase being, almost as bad. The repression and severe retaliation by authoritarian governments against groups that are a threat to their rule pushes groups to form alliances of convenience.

Authoritarian societies also tend to be corrupt societies. Corruption goes hand in hand with criminality, and criminal networks facilitate the logistics of terrorist operations. Black market networks used by both criminals and terrorists allow terrorist groups to obtain weapons, channel funds, communicate and plan outside the government's purview.[15]

Many countries in Southeast Asia, such as Indonesia and Malaysia, are havens for terrorist financing activities. They have lax banking regulations, corrupt bureaucracies, lagging law enforcement, and porous borders.[16] The Southeast Asian financial sector has a notorious reputation for money laundering, and the region has long been a center for transnational criminal activity. International terrorist organizations such as al Qaeda and Jemaah Islamiyah (JI) have exploited these facts in order to distribute and transfer funding and supplies throughout the region and internationally.

For example, Jamal Ahmed al Fadl, a former al Qaeda member, testified that bin Laden frequently used Islamic banks in Malaysia to move money. Malaysia is known to be one of the world's preeminent Islamic banking centers, with deep ties to Middle Eastern businesses, banks, and charities. Al Qaeda first began channeling funds through Southeast Asia in the early 1990s. Bin Laden's brother-in-law was responsible for the Islamic International Relief Organization in the Philippines, a fund that was used to funnel arms and money. JI established companies and received contracts and business from its supporters; they then returned the proceeds back into the organization through a special fund called *Infaq Fisbilillah*.[17]

### Knowingly

Authoritarian governments also knowingly enable terrorist groups either by sponsoring them or tolerating them on some level. Insecure governments realize the threat terrorist organizations pose to their rule and ability to stay in power. Some governments believe that by accommodating terrorist groups in a limited way they can influence their behavior or co-opt their members.

The Pakistani government, knowing full well it has little control over vast swaths of territory in its own state, has tried to seek an accommodation with Pashtun militants and the foreign fighters they harbor through the "Shakai Agreement" in April, 2004. This agreement allows foreign fighters to remain in Pakistan if they renounce terrorism and turn in their weapons. The accommodation did little good, inviting instead further attacks on government interests.[18]

Rumors of "special relationships" between Pakistani militants and members of Pakistan's Interservices Intelligence (ISI), the country's intelligence and security service, are rife. Despite Pakistan's public commitment to the war on terror, international counterterrorism officials are finding increasing evidence to suggest that Pakistani militants and Taliban members continue to receive assistance from elements of Pakistan's intelligence services. ISI has hosted many terrorist training camps on Pakistani soil and supports such groups as Hizb-ul-Mujahideen, the Harkat-ul-Mujahideen, the Harkat-ul-Jehadi-Islami, the Tehreek-e-Jehadi-Islami, the Lashkar-e-Tayyiba, and the Jaish-e-Mohammad. These groups wage holy war on India, Pakistan's main rival, but they are also a destabilizing element for Pakistan itself.[19]

Pakistan is not the only authoritarian government to tolerate, or even encourage the actions of a terrorist group that may be destabilizing to a rival neighbor. The most recent example is Iran's sponsorship of Hizbollah, a Lebanese political party cum militia responsible for spreading terrorist violence inside Lebanon and into Israel.

When Hizbollah first formed in the 1980s it was a weak, disheveled Shia militia overshadowed by the more powerful Amal movement that supported American and Israeli policy in Lebanon.[20] Now, Hizbollah is powerful enough to spark a regional war, thanks to support from such state sponsors as Iran and Syria. As Daniel Byman notes, "Iran hoped to export its Islamic revolution to Lebanon, and both Syria and Iran sought to use the Shiites as a proxy force against Israel. With support from Damascus, Tehran helped organize, arm, train, inspire, and unite various Shiite groups into the movement that became known as Hizbollah"[21]

## AUTHORITARIAN GOVERNMENTS INHIBITING EFFECTIVE RESPONSE AGAINST TERRORISM

The methods used by authoritarian governments to deter terrorist violence can actually contribute to it. Since authoritarian governments have little restriction on their means and methods, they can take swift, unchecked action against terrorist groups. While this may seem good for counterterrorism efforts, it usually leads to irresponsible and disproportionate behavior by the security services.[22]

Terrorism is a complex phenomenon, but authoritarian governments address their security problems only by flexing more of their power. Authoritarian governments, although they may project strength, are very insecure and easily overreact to internal challenges. Shows of force after a terrorist incident can  end up having the opposite effect. In an effort to demonstrate their hold on power after a challenge, they demonstrate their weakness. An authoritarian government's hold on power does not come from any legitimacy but from force and coercion. When they demonstrate that force is their only answer to addressing their terrorist threat—instead of, say, enacting political reforms—they erode their legitimacy further. Terrorist attacks are an attempt to demonstrate this weakness.

Egypt's counterterrorism policies clearly demonstrate this dynamic. Georgetown professor Samir Shehata writes that "Political reform and democratization are directly related to the problem of terrorism in Egypt. In order to effectively reduce terrorism, the government must open up more political space rather than further restrict it. Genuine political reform, resulting in better governance, the enhanced rule of law and increasing transparency will prove much more effective over the medium to long term in reducing political violence than restrictive legislation, coercion and a narrow focus on security. Greater political freedom will not only result in better governance . . . it will create an Egypt where no one feels the need to resort to political violence because everyone has the opportunity to effect peaceful political change."[23]

Authoritarian governments are not encumbered by human rights regulations or considerations when responding to security threats or challenges to their power. When an attack occurs, the typical response is an indiscriminant and severe crackdown against suspicious groups and sympathizers. For terrorist organizations, this can serve as a boon to their cause. Terrorists hope to elicit an overreaction to emphasize their point against the government and generate greater animosity from the general population, as the general population is greatly affected by authoritarian government crackdowns. Civil liberties of ordinary citizens are further eroded in the name of security. They could also very well be mistakenly caught up in indiscriminant security sweeps.

Government overreaction justifies the terrorists' cause and can serve as a recruiting tool for more supporters and fighters. While a severe security response after an attack occurs is a decent short-term solution, in the long term it only serves to broaden and accelerate the resistance against authoritarianism. They inspire others to join the terrorists' ranks and they broaden the wider circle of sympathizers who shelter and indirectly support terrorist organizations.

Government security crackdowns in Nigeria's Niger Delta region have prompted legislators to challenge the powerful executive government's strategy. The Movement for the Emancipation of the Niger Delta and the Niger Delta People's Volunteer Force have waged a violent campaign for greater local control of oil wealth, and is responsible for a spate of kidnappings of oil workers for ransom. Indiscriminant security crackdowns of their region have only led to an increase in violent activity and greater support for the militant groups. As Nigerian legislator Anthony Aziegbemi has observed, "Outright criminals . . . have to be separated from the normal and appropriate agitation of people of the Niger Delta for more developmental projects. Those people have to be dealt with separately."[24]

The case of Nigeria represents a complex problem throughout the African continent. In their analysis of West Africa's security challenges, James Forest and Matt Sousa note that "Authoritarian regimes are often correlated with a history of conflict, political violence, and endemic insecurity. In many of these cases, the government of a resource-rich nation aligned itself with foreign companies and governments willing to pay handsomely for these resources, even at the expense of those citizens who have entrusted these government leaders with their well-being. The wealth derived from these natural resources has thus fueled corrupt, authoritarian regimes in several countries of the region, whose citizens come to view their national institutions as 'prizes' to be won and exploited, rather than as forums for national government."[25] In essence, as noted African scholar George Ayittey once observed, "What keeps Africans poor is their powerlessness to rid themselves of predatory governments or force

existing ones to adopt the right policies in a peaceful way."[26] As a result, many groups are able to rationalize the use of violence—including terrorism—as a means for confronting these authoritarian regimes, and can draw on local support for their efforts.

As the circle of support grows around terrorist organizations, the circle of cooperation for the government shrinks. Any government fighting terrorists needs the support of its citizens, but the antiterrorism policies of authoritarian governments serve to alienate the population further, rendering the counterterrorism policies counterproductive. Although repressive security crackdowns may yield arrests and stifle the actions of one particular organization, repression's long-term result is the generation of replacements.

Brutal and indiscriminant tactics also serve to further radicalize those who were already dabbling in violent opposition. Killings, jail time, and reprisals against a terrorist's family—all common responses of authoritarian governments against terrorists—radicalize individuals further and strengthen the resolve of terrorist organizations.

One prominent example of this is Ayman al-Zawahiri. He had always been religiously conservative and politically aware. As a teenager he joined the Muslim Brotherhood, which was an outlawed organization in Egypt due to its antiregime activities. When his challenges to the regime became too much, he was thrown in jail and mingled with more radical militant Islamic groups. It was in an Egyptian jail that he joined the more violent Egyptian Jihad, eventually rising to head the organization.[27]

It did not take long for Zawahiri to link up with bin Laden, a citizen of a neighboring autocratic regime, and expand their spite of origin to the whole international system led by the United States that they believed supported the existence of such regimes. Zawahiri was radicalized to a point where he has publicly denounced the Muslim Brotherhood, the source of inspiration for many militant salafists, for participating in state sponsored elections.[28]

The argument that authoritarian governments enable terrorists and are in and of themselves a cause for terrorist formations is a controversial one. Even the notion that the particular *form* of government is as significant as the *actions* of the government is not an automatic assumption. Some analysts would even argue the opposite point, that democracies, instead of autocracies, are more conducive to terrorist activity. The argument is that it is easier for terrorist organizations to organize in democracies, and that terrorism is more likely to be used against the state as an agent for change.

Many experts cite Iraq as an example. During Saddam's repression, terrorism was nonexistent due to the highly repressive nature of the society and the severe consequences associated with challenging the regime.

Since the American-led military invasion unseated him from power and set in motion Iraq's democratic transition, terrorism has mutated into a full-blown insurgency and is now on the verge of civil war. Juan Cole has argued that it is democratic openings coupled with foreign military occupation that has led to increased instances of terrorism, not authoritarian regimes.[29]

While American military occupation of Iraq is certainly a factor in terrorist insurgency waged in Iraq, there is another factor related to its political transition and lack of political opportunity for many of its citizens. Not all Iraqis have benefited from the democratic opening, and believe that Iraq under occupation today is more authoritarian than under Saddam.

It turns out that the picture is more complicated than this. Interestingly, Abadie's research also reveals that it was countries with transitioning levels of political freedom that experienced the most terrorism. Iraq falls into this category. Abadie's analysis is consistent with the earlier work of Mansfield and Snyder. Their widely accepted theory supports the democratic peace thesis that established democracies do not fight each other and are involved in less violent conflict. But it also added an interesting twist that it was *democratizing* states that were most prone to violence.[30]

According to Abadie, ". . . intermediate levels of political freedom are often experienced during political transitions. It is when governments are weak that conditions are favorable for the appearance of terrorism. This is consistent with the observed increase in terrorism in countries transitioning from an authoritarian regime to a democracy, like currently in Iraq, and previously in Russia and Spain."[31]

Not long ago, it was thought that authoritarian governments would serve as bulwarks against terrorism. As long as the government was secular and pro-Western, U.S. policymakers believed that these regimes served international and regional security interests. They kept religious extremism and communism in check. However, since September 11th, this practice has been called into question. As Thomas Carothers observes, "The fact that the 9/11 hijackers came from Saudi Arabia and Egypt provoked many American observers to ask whether such regimes are instead breeding grounds for terrorism.... In the two years since, the U.S. policy establishment has come to believe that promoting democracy in the Middle East should be a component of the war on terrorism—part of a broader effort to go beyond the active pursuit of terrorist groups to address the underlying roots of terrorism."[32]

Saudi Arabia has come under intense scrutiny and criticism since the September 11th attacks 5 years ago and has launched an international public relations campaign to restore its image. Despite its public relations

efforts, Saudi Arabia remains both a source and target of (Islamic) terror-ists. Saudi Arabia and Egypt are not the poorest countries in the world; in fact Saudi Arabia has many extremely wealthy citizens. And although they are not the most efficient states, nor are they failed states. The 9/11 hi-jackers were in fact upper- to middle class and well educated. Their prob-lem was not economic depravation; rather, it was political depravation. They lacked the ability and the opportunity to advance their political and social goals through the political system.

The countries that make up our world today are a composite of established democracies, democratizing states, and autocratic govern-ments. Authoritarian states are incompatible with the democratic trend sweeping the international system. When you have a democratic trend and holdout autocratic states, it is a potent mixture that fuels terrorist activity.

The Middle East, an area of special concern to counterterrorism ana-lysts, is particularly unique because in this era of globalization, it had become increasingly unfree. As Fareed Zakaria notes, "The region was breeding terror because it had developed deep dysfunctions caused by decades of repression and an almost total lack of political, economic, and social modernization."[33] In the age of globalization citizens of these autocratic states are no longer isolated in today's world, and the rela-tive disparity between their freedom and others in the world generates resentment.

Unfortunately, it is not just the problem of these particular govern-ments. Terrorism stemming from local grievances translates into interna-tional terrorism. We can no longer ignore the domestic character of states whose actions foment terrorism. Bluntly stated, authoritarian states are contributing to the international terrorist threats. Terrorists are originat-ing from these countries and while their grievances may be local in nature, their anger is easily redirected toward powerful countries, namely in the west, who terrorists believe allow the authoritarian states to continue.

Bin Laden and those he inspires identify the United States and the Western world as the core enablers of authoritarianism. Their own domestic societies may not be authoritarian, but they are the backbone of the international system that acquiesces to and sustains authoritarian governments for their own geopolitical interests. Although al Qaeda encompasses this definition, its goals and methods clearly go above and beyond this traditional characterization of terrorism. Al Qaeda does not have finite political ends. Rather, it seeks to impose an alternative worldview to the one founded, led, and spread by the United States and the Western world. Al Qaeda is unlike any other terrorist group—so much so that it is not necessarily accurate to label al Qaeda as merely a terrorist organization. It is much bigger than that. It is a wider movement, formed

as a response to America's primacy and a desire to establish an Islamic alternative.

Richard Betts states in his analysis "The Soft Underbelly of American Primacy: The Tactical Advantages of Terror," that

> American global primacy is one of the causes of this war. It animates both the terrorists' purposes and their choice of tactics. To groups like al Qaida, the United States is the enemy because American military power dominates their world, supports corrupt governments in their countries, and backs Israelis against Muslims; American cultural power insults their religion and pollutes their societies; and American economic power makes all these intrusions and desecrations possible.[34]

We can no longer accept that authoritarian states are a bulwark against terrorism. We can no longer reluctantly accept the presence of authoritarian governments because they say they will cooperate in the international terrorist effort. Authoritarian states are "bad citizens;" they do not and cannot help the international effort against international terrorism. On the contrary, authoritarian and repressive governments are themselves a cause of terrorism. Authoritarian states may have the tactical capability and even the will to cooperate, but their assistance is tainted and their long-term usefulness is doubtful. As Edward Marks observes, "Weak states, even when desirous of doing so, are unable to undertake effective efforts to deter, disrupt and respond to terrorist attacks."[35]

Instead, the United States and the international community must put these authoritarian, corrupt, and illegitimate governments that foment terrorism in a negative spotlight. This will allow us to put the focus back to states. Terrorism is an asymmetric threat that states are little equipped to fight, but by returning the focus back to states, this will make our arsenal more effective. Diplomacy and state-to-state relations are more effective against fighting the core causes of terrorism than dispatching Special Forces and intelligence personnel on a wild goose chase through hostile territories.

Numerous studies now indicate that stable democracies generate fewer and less lethal terrorists than autocracies. "In order to successfully wage a war of ideas against a such a lethal enemy, the human benefits of greater political, civil and economic freedom must be consistently encouraged . . . Even if the war on terror scores significant intelligence, security and military achievements, long term success can be best secured if it is accompanied by democratic reform and liberalization of the world's most repressive and politically closed regimes."[36] Mobilizing the international

community against authoritarian regimes in the name of effective long-term counterterrorism efforts is needed to put a check on authoritarian governments that breed this threat.

# CHAPTER 6

## THE FAILED STATE

Matthew H. Wahlert

Many political scientists and security analysts have turned to an examination of the failed state phenomenon in their research on counterterrorism. Furthermore, the Bush administration—in recognition of the serious nature of the problem—dealt with the issue in the *National Security Strategy of 2002* and the *National Security Strategy of 2006,* both of which specifically pointed to the importance of addressing both failed and failing states as a part of U.S. national security.[1] Failed states have become an important research agenda for academics as well as a topic of discussion for security specialists. This chapter will attempt to serve as an introduction to many of the issues concerning state failure as they relate to the broader effort to fight terrorism.

In common parlance and everyday usage, the idea of a state entails a government's ability to maintain a monopoly of power over recognizable borders. As a result, a failed state would consist of a government unable to maintain their monopoly over force. That is, other actors—nonstate actors, often in the form of terrorists and criminal organizations—enjoy the ability to project force in competition to the state. In short, the failed state argument maintains that the inability of a state to control its own territory creates a vacuum of power from which the nonstate actor can usurp state power and enjoy a freedom of action within that state. Indeed, one may point to Osama bin Laden and al Qaeda as a clear example of the role of failed states during an era of terrorism. Bin Laden utilized the freedom of activity inherent to Sudan and, later, Afghanistan in order to create a global terror organization. Despite efforts from many countries, including the United States, bin Laden remained unmolested in other sovereign states. Any attempt to kill or capture bin Laden would have involved (and did involve) a violation of Sudan's sovereignty, in the case of a Saudi attempt to assassinate bin Laden, or Afghanistan's sovereignty,

as the United States did during the Clinton administration after the U.S. Embassy bombings in Africa. More importantly, the ability of bin Laden to fade into the countryside and continuously evade capture or elimination and move about without concern for government law enforcement officials points to the haven provided by failed states for terrorists and other criminals.

## HISTORICAL LESSONS

Although the failed state may have been a recent image of political scientists, the reality of failed states as important variables in a state's security is really not a new development. In the United States, during the presidential administrations of William Howard Taft (1908–1912) and Woodrow Wilson (1912–1920), Mexico was a state in turmoil—and, perhaps, embodied many of the characteristics of a failing state. Mexico's erstwhile corrupt dictator Porfirio Diaz had been overthrown in 1910 by the populist Francisco Madero. Although Madero offered a policy with a number of democratic reforms, he soon wore out his welcome with American business interests. With the encouragement of the United States, Madero was soon overthrown by Victoriano Huerta. Huerta represented a more pro-U.S. and pro-business perspective than Diaz. However, Huerta's government murdered Madero and in doing so forced the United States to withhold recognition of the Huerta regime for image reasons—the United States did not want to be closely aligned with such a violent regime. A power struggle inside Mexico ensued, lasting for several years and, ultimately, impacting the national security of the United States. In 1914, a leading opposition figure, Venustiano Carranza seized control of Mexico. Wilson, upset over Carranza's failure to accept American advice in the creation of a new Mexican government, considered supporting another potential leader—Pancho Villa. Villa was a former aide and lieutenant to Carranza who had created his own army. By late 1915, Wilson finally decided on preliminary recognition for the Carranza regime. However, Villa now became angry at what he perceived as a betrayal by the United States, and a series of attacks followed. In January 1916, Villa seized 16 American miners from a train in northern Mexico and murdered them. Two months later, Villa and his army raided Columbus, New Mexico and killed 17 more Americans. The United States, under General John J. Pershing and with the permission of Carranza, entered Mexico in pursuit of Villa. Villa, of course, was never captured. However, U.S. forces and Mexican forces loyal to Carranza clashed twice. The situation stood perilously close to war. Wilson's withdraw of American troops and a formal recognition of Carranza eased tensions.

The story of Pancho Villa illustrates the importance of failed states. A failing state—or at least a chaotic state—on the immediate southern

border certainly had broader national security implications. In the long term, the results may have been even more problematic. Indeed, Germany recognized the strain in Mexican–U.S. relations and, on the eve of World War I, attempted to push Mexico into a war with the United States with the promise of regaining territory lost during the Mexican–American War in an offer made in what is now simply called the Zimmerman telegram. Although it may be impossible to prove or disprove, one could argue that the experience of Pancho Villa and Carranza were part of the impetus for the so-called Zimmerman Telegram and Germany's attempt to widen World War I. In this case, the failing state had security implications well beyond the direct results of Villa's attacks. But also, the story of Villa indicates the importance of maintaining a state's ability to deal with challenges to its authority.

In fact, another lesson of state strength was learned even earlier in the early history of the United States. After the War for Independence with Great Britain, the Articles of Confederation were established to serve as a road map for governance, but they created a very weak and decentralized form of government. Subsequently, war veteran Daniel Shays (and others)—behaving as a nonstate actor—challenged the government's foreclosure and sale of farms during the summer of 1786, eventually taking up arms in what became known as Shays Rebellion. The lack of a strong central government and the inability of the Articles to create a counterforce to Shays eventually led to the hiring of a state militia by wealthy businessmen. The Rebellion was defeated in January 1787, but at the same time, elites learned a valuable lesson about the ability of nonstate actors to challenge the government's monopoly on the use of force. A direct result of these events was the push for a stronger government. In fact, while a 1786 meeting in Annapolis to discuss the Articles drew only five state delegates, after Shays Rebellion the 1787 Constitutional Convention boasted participation of 55 delegates from all states except Rhode Island.

While Shays Rebellion serves as an analogy for the weak and ineffective centralized government which resulted from the Articles of Confederation, the Whiskey Rebellion of 1794 illustrates how a stronger centralized government can deal effectively with threats to the state's monopoly on the use of force. In 1794, farmers in western Pennsylvania refused to pay new excise taxes on whiskey—often used as a means of currency in the region. George Washington responded by calling on the militias of three states and personally marching an army of approximately 15,000—a force larger than he had ever commanded in the Revolutionary War—in order to meet the threat. Needless to say, the Whiskey Rebellion was quickly quashed. Thus, both events ultimately illustrate the importance of a state maintaining a monopoly over the use of force. Whether 1794 or 1914, the most important lesson from these examples is that a state's national security relies to a considerable extent on its power to govern its people,

as well as the power of its neighbors to govern their own people effectively.

In 1904, President Theodore Roosevelt realized the importance of what we would later call failed and failing states, when he issued the Roosevelt Corollary to the Monroe Doctrine. The Monroe Doctrine closed the Americas off from European colonization in 1823. Roosevelt reasoned that European aggression in the region of the Americas could come due to a state's instability—very close to what we would currently define as a failing state. Hence, Roosevelt proclaimed that the United States could interfere with neighbors unable to maintain their own sovereignty. The only modern difference is that globalization has made all states virtual neighbors.

## CONTEMPORARY CHALLENGES

The discussion over failed states results in a number of theoretical and policy questions, however, that must be addressed in order to more fully understand the role of such states. The most obvious question is how do we measure a failed state? Certainly, every government has a section of territory where the state lacks a monopoly on power. Particular areas of the United States feature rival power centers in the form of gangs or other criminal organizations. In fact, police are often reluctant to enter such areas—does that make the United States a failed state? In addition, the United States clearly lacks control over its southern borders. Again, should we consider that lack of control as defining a failed state? To be sure, the United States would not, under even the strictest measures, be considered a failing or failed state. The point is, however, that the obvious examples of a failed state are somewhat easy to point out. At some level, moreover, the action becomes somewhat subjective and open to a great deal of discussion. Portions of Colombia are under the exclusive control of the narco-terrorist group FARC; large portions of Afghanistan—especially outside of Kabul—remain in the control of warlords; the Baluchistan portion of Pakistan certainly lacks a government monopoly of power; and many other germane examples exist worldwide. So, we are left with the difficult question of appropriately defining a failed state. Another important question would be how exactly to handle the failed state. Does the danger of the failed state call for the United States to be a world guarantor of states? What can be done as part of the effort to fight terrorism in order to address the failed states of the world? Finally, how significant a variable is the failed state when examining the roots of terrorism?

The international system has, for hundreds of years, consisted of states interacting as unitary actors in a way to maximize their relative power within the international system. Although some may claim that the above realist interpretation is open to debate, and may offer alternative

explanations of global politics, most would agree that historically the state was (and still remains) the primary actor within the international system. In times past, the paths of states may have never crossed. Hence, a failed or weak state in Asia may have had very little impact in Europe. To borrow a phrase from the former U.S. Speaker of the House Tip O'Neill—"all politics is local." In essence, the strength or ability of a state to govern— say El Salvador—mattered little to another—for example, Greece, the two states having little in common in terms of culture, history, and policy interaction, and lacking any significant rivalry within the international system. Globalization, however, has changed the distant relationship between all states. For example, a nonstate actor dedicated to regime change in Greece may take refuge in El Salvador and direct both rhetorical and physical attacks toward the Greek leadership. Greece would be forced to rely on El Salvador's ability to enforce laws and, ultimately, protect the Greek regime from attacks emanating from inside El Salvador. As this hypothetical narrative illustrates, the strength of one state—especially because of globalization—now matters to other states. Hence, states unable to maintain a monopoly on power or the use of force within its own borders are perceived to be less likely to address other vital issues, such as poverty, disease and, especially, terrorism.

## DEFINITIONS

At this point, it is appropriate to make several comments with regard to definitions—in order to more clearly identify failed versus failing states. Specifically, a failed state is the end point of failing states.[2] Typically, a weak state may be failing—for example, Sri Lanka, embroiled in the third decade of its struggle against the Tamil Tigers, or Indonesia, unable to fully control areas of Aceh and Papua—but not pass the threshold to a collapsed state.[3] A failed state is one that is unable to perform its duties on several levels—when, as Robert Rotberg observes, "violence cascades into an all-out internal war, when standards of living massively deteriorate, when the infrastructure of ordinary life decays, and when the greed of rulers overwhelms their responsibilities to better their people and their surroundings."[4] In more direct terms, a recent State Failure Task Force defined state failure as "instances in which central state authority collapses for several years."[5] The number of completely collapsed states is historically small (see Table 6.1), but the number of collapsing states is somewhat more troublesome. As a result, the Task Force purposely extended its definition of state failure to encompass a more inclusive list of "civil conflicts, political crises, and massive human-rights violations that are typically associated with state breakdown."[6] From 1955 to 1998, according to the Task Force report, 251 events and 136 cases of state failure can be identified.[7]

**Table 6.1   State Failures/Near State Failures, 1955–1998**

| State | Year |
|---|---|
| Afghanistan | 1992–1995 |
| Argentina | 1975–1976 |
| Bangladesh | 1974–1975 |
| Bosnia-Hercegovinia | 1992–1996 |
| Burundi | 1992–1996 |
| Chad | 1978–1983 |
| Congo | 1960 |
| Congo | 1997–till date |
| Cyprus | 1964 |
| Dominican Republic | 1965–1966 |
| Guinea-Bissau | 1998 |
| Iran | 1978–1981 |
| Lebanon | 1975–1990 |
| Liberia | 1990–1996 |
| Nigeria | 1966 |
| Rwanda | 1994 |
| Sierra Leone | 1997–till date |
| Somalia | 1990–till date |
| Tajikistan | 1992 |
| USSR | 1991 |
| Yugoslavia | 1991 |

Milliken and Krause have also studied the evolving definition of state failure, and offer a thesis addressing the prescient issue of what exactly composes a "failed state." They advance the argument that the state cannot be merely classified as a static entity, but instead as an ever-changing work in progress. As such, part of the contemporary analysis of states must necessarily include the discussion of failed and/or collapsed states. Furthermore, state failure and its measurement utilize two distinct contexts—a state may "institutionally" fail or "functionally fail."[8] As a result, state failure refers to "dashed expectations" of a state or of what the citizens expect the state to accomplish. In addition, the failure remains more subjective. Thus, the numbers of states that have recently collapsed institutionally remain relatively low—the former Yugoslavia, Georgia, Haiti, Colombia, and Afghanistan. Instead of state collapse, Milliken and Krause suggest a better measure —functional failure—which offers a more useful policy tool.[9]

## POLICY IMPLICATIONS

Robert Cooper, former European Union diplomat and advisor to British Prime Minister Tony Blair, argues the threat posed by failed states is so

great that it offers a clear rationalization for a new form of colonialism—aimed at interventions in failed or failing states.[10] As renowned political scientist Francis Fukuyama noted, "weak or failed states are close to the root of many of the world's most serious problems, from poverty and AIDS to drug trafficking and terrorism."[11] Chester Crocker, a former U.S. Assistant Secretary of State, has observed that "state failure affects a broad range of U.S. interests . . . It contributes to regional insecurity, weapons proliferation, narcotics trafficking, and terrorism."[12] Within the context of new world geopolitics, the balance of power system has become outdated and not useful in formulating policy, and attention must be paid to the concept of failed states. Cooper contends that the system is best summarized as one consisting of interdependence among state actors. It is the interdependence factor that moves politics past the local level and to the system level. Hence, failed states do matter and impact other states throughout the international system.[13]

Thus, the context of world politics and the careful stability inherent to an anarchical system become threatened very clearly with the phenomenon of "failed states." To be sure, a failed state is representative of chaos—a chaos removing the state from the global political and/or economic community. Once removed from the economic benefits inherent to the interdependent structure of the contemporary global system, a "failed state" turns to narcotics, terrorism, and other criminal activities in order to compensate for its disconnection from the global community. In both failed and failing states, a number of nonstate actors fill the void left by the state to provide products of government, and prey on the state of chaos in order to increase their own power and wealth. As noted earlier in this chapter, these issues are reflected in the current U.S. national security strategy doctrines and actions.

The relation between terrorism and state failure is a particularly important dimension of the current global security environment. Bin Laden's use of Sudan as a base for militant Islam allowed for the necessary space and freedom to grow organizationally and provides an excellent illustration of the impact of a failed or failing states in a far away region on the rest of the world. Although not a failed state at the time, Sudan certainly fit many of the definitions for a failing state. Thus, bin Laden's organization was able to expand in terms of scope and operations. Indeed, without Sudan as a base of operations, bin Laden's Afghani mujahideen would have extended all over the Arab world—and made a less concentrated threat. According to one analysis, "over time, their [Afghani mujahideen] strength would have waned and they would have had difficulty communicating and coordinating their efforts . . . without Sudan, bin Laden could have not incubated the networks that have caused such devastation."[14]

In 1991, after bin Laden arrived in Sudan, a group trained by bin Laden launched the first attacks in a renewed Algerian conflict, and fighters were trained for use in Kashmir. Dr. Hassan al-Turabi—a Sudanese adherent of the militant Islamic movement, bin Laden, and Egyptian Ayman al-Zawahiri all constructed close relationships. Eventually, al-Zawahiri would manage the international finances of bin Laden and Turabi as they engaged in a series of terrorist attacks. In 1994 alone, bin Laden and his colleagues, trained 5,000 mujahideen in Sudan's terror training camps. And at the same time, bin Laden worked to gain organizational legitimacy by providing financial help and assistance in rebuilding Sudanese infrastructure: a highway from Khartoum to Port Sudan; a repaving of a 500-km highway from Sudan to Shendi and Atbara; construction on the Rusayris hydroelectric dam; a million dollar capitalization effort for the Shamali Bank; a 1993 loan of $8 million to finance imports; $1 million in contributions to the Pan Arab Islamic Conference (PAIC); a $2 million expense in resettling Afghan mujahideen from Pakistan to Sudan; and the construction ("at his own expense") of 23 terrorist camps.

The terror partnership of Turabi and bin Laden produced a litany of attacks. Agents were trained to assassinate Qaddafi; Hamas operatives were trained—as early as 1995—for suicide bombings in Israel; Egyptian militants used Sudan as a base of operations to attack the Mubarak regime; and the Sudanese counsel in Beirut was involved with the assassination of a Lebanese politician as well as an attempted bombing of the Egyptian Embassy. This list also includes a 1993 attempted attack on U.S. troops in Yemen en route to Somalia. The Sudanese government supplied weapons to Somali warlord General Muhammad Aidid and bin Laden provided reinforcements with the movement of 3,000 mujahideen to assist Aidid—at a cost of $3 million. The PAIC, through Turabi and bin Laden, agreed in 1993 to supply fighters to Bosnia. In 1996, the PAIC authorized a plan to assassinate Egyptian President Hosni Mubarak, and at least five attempts were made to fulfill the obligation. Mujahideen were sent to fight in Chechnya and Tajikistan, while al Qaeda operatives in Sudan trained members of the Filipino Moro Front, and a jihad office was opened in Baku, Azerbaijan.[15] Only in 1996 did cooperation between bin Laden and Sudan begin to wane. Bin Laden moved to Afghanistan, the policy of a Sudanese "open door" immigration policy for all Arabs ended, and Egyptian militants were ordered out of the country. Bin Laden's network, however, had grown to a point of self-sufficiency and stood primed to utilize its next host state—Afghanistan.

Not only did bin Laden construct a network of terror during this period, but he also created the necessary organizations to finance his efforts.[16] In fact, bin Laden acquired a significant business empire while in Sudan. He

organized an international trading company; owned—with the government of Sudan—a construction company; held title to the Al-Themar Agricultural Company, which employed 4,000 and harvested a 1-million-acre farm; gained exclusive monopoly over major Sudanese exports, including gum arabic, corn, sunflower, and sesame; claimed a fruit and vegetable concern called Blessed Fruits, Inc.; sold sweets and honeys through his Al-Ikhals enterprise; owned a trucking company named Al-Qudrut; and also, owned both a leather tannery and furniture making company. Finally, bin Laden provided $50 million funding for the Al-Shamad Islamic Bank.

In addition to the economic consolidation of the bin Laden network, Sudan also allowed for a political consolidation of al Qaeda.[17] Turabi organized the Islamic People's Congress in 1995, and it was at this meeting that Osama bin Laden and al Qaeda aligned with Imad Mugniyeh and Hizbollah.[18] As a result, the historic disagreement of Sunni versus Shiite Islam took a back seat to the more international struggle against Israel and the United States. Iran began to ship explosives to al Qaeda and bin Laden's "terrorist corporation" formed links with Egypt's Islamic Group, Egyptian Jihad, the Armed Islamic Group of Algeria, the Libyan Fighting Group, the Yemeni Saif Islamic Jannubi, and the Syrian Jamaat e-Jihal al-Suri. Hassan al-Turabi and Osama bin Laden held many of the same beliefs at a time when Sudan was perilously close to being a failed state. President Bashir was ultimately forced to reign in both Turabi, who is currently in prison, and bin Laden, who moved with his entourage to Afghanistan.[19]

Why, then, does a state begin to fail? Can we see any warning signs or trace the failing or failed state to a moment when intervention would be helpful? A number of varied explanations for state failure offer somewhat of a glimpse into the broad complexity of the issues involved. Fukuyama suggests that the end of the cold war led to increased incidents of the failed state, and left "a band of failed or weak states stretching from the Balkans through the Caucasus, the Middle East, Central Asia, and South Asia."[20] At the same time, international organizations like the World Bank and International Monetary Fund pushed for less government involvement in the economy. Fukuyama notes that this "Washington consensus" was an effort to reform the economy but, ultimately, it spilled over into the overall structure of the state. In addition, the reforms came at a critical time when many states were emerging from authoritarian rule. Hence, the Washington consensus placed very little emphasis on overall institutional development and state building. The already existing poor institutional framework—with the added pressure of the Washington consensus—resulted in an overall reduction of state strength.[21]

Crocker takes a longer and more general view in defining the process of state failure.[22] First, the process of state failure is one of a complex and

lengthy process of state devolution. Furthermore, a variety of inputs result in the concept of a failed state: (1) rulers may corrupt the vehicles of governance; (2) corrupt elites may act with criminal networks in order to claim the material resources of a state; (3) specific regions may feature the general lack of governmental authority and, often, illegal trade results; (4) a transition from authoritarian government results in the state's loss of monopoly on power; and finally, (5) large sections of the state feature the loss of power.[23] Hence, a cycle of state failure is quite often easy to view. This raises at least three difficult questions: whether powerful states should intervene, when in the process they should intervene, and how such an intervention should be conducted.

Also of note in an examination of state failure is the impact of external support. That is, according to Crocker, "states with shallow domestic legitimacy tend to fail when they lose foreign support . . ."[24] He notes that part of the equation of failed states, is the number of transitions to democracy during the 1990s. Specifically, a number of these transitions would simply fail. Some may result in the reemergence of an autocratic leader, some may simply become very weak, failing states, and others "will descend into chaotic warlord struggles."[25] In fact, Crocker argues "In much of the transitional world—those at-risk societies concentrated in Africa, the Middle East, and southwestern Asia—there is a footrace underway between legitimate governmental institutions and legal business enterprises, on the one hand, and criminal networks, often linked to warlords or political factions associated with security agencies, on the other."[26]

Milliken and Krause maintain that legitimization is a process of function within a state—charged with providing "security, representation, and welfare."[27] In the race toward legitimization versus state failure, the legitimate networks must outdistance and outperform the networks of corruption. As Crocker observes, "Those who lead the cells and networks that hollow out failing states focus with a laser like intensity on exploiting opportunity and creating facts on the ground. Whether loosely arrayed in symbiotic relations or more closely coordinated by a central brain, they find space to operate in the vacuums left by a declining or transitional state—and they eat what they kill."[28]

Susan Woodward has also examined the impact of failed states upon the international system. In short, a failed state represents the undermining of a key assumption in international politics—the primacy of the state actor. Furthermore, Woodward points to the fact that globalization is already challenging the power of the state. Yet, ironically, globalization "requires states that function—governments capable of giving sovereign guarantees, exercising sovereign power and responsibility, and controlling their sovereign borders."[29] Milliken and Krause considered the concept of "economic globalization" a primary influence in the fall

of the state. In fact, economic globalization tends to accentuate the societal cleavages in conjunction with inefficient and uneven distribution of government resources.[30] Woodward suggests "there is a powerful association between internal disintegration, fragmentation, massive civil violence, and the rise of warlordism, on the one hand, and states' lack of strategic significance for major powers and the uncontrolled proliferation of conventional arms since the end of the Cold War, on the other."[31] Indeed, the lack of state power effectively eliminates a key limiting mechanism on internal politics.[32] The nonstate actor emerges from or makes a home in the remains of a state in order to operate unmolested from any form of legal authority. Certainly, the model of drug trade in areas of Colombia, Afghanistan, and Myanmar—in addition to relative lawlessness in Liberia, Southern Sudan, and most of Somalia—illustrate the ability of nonstate actors to freely operate in failed states or regions.

Crocker argues that the U.S.-led war on terrorism is incomplete, as it is only targeting the current manifestations of terror. Hence, the long-term terror implications are not addressed. To wit, primary among the unaddressed concerns are the role of failed states. In addition, the rhetoric of the *War on Terror* is necessarily misleading, because an enemy does not exist—*enemies* exist. Terrorism, according to Crocker, is merely a "tool."[33] Indeed, the work in Afghanistan and Iraq, as well as the targeting of al Qaeda, are simply the "first steps" toward global security.[34] To be sure, Washington also must concentrate on "sustaining regional security, leading coalitions and institutions to help failing and threatened states, and winning the struggle after wars and regimes change."[35] Furthermore, Crocker contends

> State failure directly affects a broad range of U.S. interests, including the promotion of human rights, good governance, the rule of law, religious tolerance, environmental preservation, and opportunities for U.S. investors and exporters . . . unless the United States and its principal partners engage proactively to prevent and contain state failure, rogue regime may seize power in additional failed or failing states, raising the specter of fresh adversaries that seek WMD and harbor terrorists. Moreover, the United States must learn to rebuild states after overturning their regimes, or the whole enterprise will backfire.[36]

In explaining what needs to be done in order to prevent the rise of "failed states," Crocker points to the fact that the number of sovereign states in 1945 was 51, while almost 200 exist today.[37] In addition, although the failed state is typically a poor state, the economy does not provide a complete answer.[38] A look at civilizations also comes up short in attacking "failed states." That said, Crocker argues (with relevant empirical data) that "weak democracies" and "reforming autocracies" are "highly

prone to state failure."[39] In the end, national boundaries as well as ethnic cleavages are not the sole sources of the problem of "state failure." Instead, Crocker looks at "ethnic imbalance between a dominant majority and a large minority" and "contested natural resources and separatist movements supported by well-heeled expatriate communities" as important antecedents to a failed state.[40]

Be that as it may, Woodward provides several convincing arguments as to why the United States should be concerned over the existence of failed states. First, she notes, the constraints of the cold war era—the threat of nuclear attack—are largely nonexistent in the contemporary era of global politics. The cold war's competition of superpowers acted as a limiting factor on worldwide behavior, yet no other natural limiting factor of behavior has emerged to replace the cold war equilibrium. That is, should the Soviet Union or United States have gone too far with a foreign policy directive, both risked a war with the other and the corresponding threat of escalation to the point where the virtual existence of the planet was threatened. In addition, the cold war led to the use of foreign aid to "purchase" a state's friendship and loyalty. In contemporary global relationships, aid packages—which Woodward notes are essential for some states to maintain authority—are more often tied to neoliberal "policies of liberalization, privatization, budgetary cuts and devolution, and overall fiscal conservatism."[41] Thus, the end result includes "increasing regional inequalities and grievances, social polarization and abandonment, and a power vacuum that open the door to movements for regional autonomy or secession, to alternative elites who aspire to total power through ethnic and nationalist appeals, and to vicious cycles of public protests, police repression by weak governments, communal violence, and local insurgencies."[42]

A second argument Woodward provides to justify the need to intervene in failing states involves the end results of failed states. She argues that, "what seems to matter about failed states are the consequences," including political violence, refugee problems, and mass humanitarian emergencies. As a result, international actors contemplate action only when the state has failed. Thus, Woodward argues that the response is more humanitarian than political—which, by definition, suggests a quick end to emergency conditions and not the political negotiation required for long-term solutions. She believes that "violence [is] being caused by ethnic hatred [and we must] begin to treat such differences and presumed hatreds as essences rather than as contingencies produced by alterable conditions. This is especially the case if interveners organize in terms of "enemies" and "victims" and thus take sides; by doing so they harden lines of conflict rather than reinforce instances of cooperation and the capacity for it."[43]

The breakdown of governance, which produces a power vacuum, is also a key difficulty in dealing with failing states. Instead of traditional

forms of governing power, authority in such a state is claimed by others based upon their possession of some territory and some weapons by individuals who are taking advantage of fear in order to capitalize upon the insecurities inherent to such a breakdown of state power. Furthermore, such arrangements are reciprocal by nature—the "legitimacy" must be returned by some form of government services. In the failed state, the reciprocal service is often looting and/or criminal activity, which leads to further state failure. Woodward posits that "ethnic, religious, linguistic, or clan differences" within a society are significantly exacerbated by the failure of a state's governance and economic functions. These dividing lines often become magnified by the influx of resources internationally from groups or individuals sharing loyalties and offering sympathy to a particular cause.[44]

## CONCLUSION

How does this discussion of failed and failing states directly impact concerns over terrorism? Much has already been said and alluded to in this effort, focusing on the ability of nonstate actors—for the purposes of this chapter, terrorist groups—to usurp some of the space inherent to statehood in order to operate freely. Rotberg characterizes globalization as the intervening variable between "failed states" and terrorism. That is, the past strategy of isolating failed states simply has become immaterial in the era of globalization. The realities of international relations demand effectual states, and the continuation of failed states endangers security at a global level. He further argues that failed states grow to be both "reservoirs" as well as "exporters of terror." Essentially, the literature suggests a failed state is marked by levels of rising corruption at the hands of leaders who use the rule of force to establish legitimacy. All the while, government services become benefits enjoyed by only a select few. Legitimacy is finally attacked by the masses within a final stage of state failure. At that point, reinforced societal cleavages—ethnic, religious, linguistic, and more—become more pronounced. Finally, the inequities of history become fresh memories in the minds of mass society, and historical grievances become part of the contemporary political agenda of settlement by force. A state, at that point, becomes perilously close to state failure—which becomes a threat to world security. Rotberg's solution involves four elements: (1) improve economic conditions, (2) reintroduce the rule of law, (3) reestablish political institutions, and (4) offer a new chance for civil society.[45]

Rotberg's premise gains in expediency when seen through the perspective provided by Takeyh and Gvosdev. In their recent essay, these researchers speak both of the role of failed states as well as smaller failures within states (cities, geographical areas, etc).[46] The importance of

investigating sovereign states and governments facing potential failure is paramount, as both are linked to the reality that a group like al Qaeda is much different from the IRA or the PKK, which have "limited, irredentist claims." Conversely, al Qaeda is "not confined territorially or ideologically to a particular region." Al Qaeda is more advanced and boasts its own "infrastructure" and is "self-sufficient." As a result, al Qaeda—and future organizations based similarly on global geographical realities—look for failed states into which to move their organization. Indeed, the state's sovereignty becomes host of (and used by) nonstate actors, including terror organizations, to achieve their own goals.

The failed state theory is evident in many instances of terror organizations around the world. Key, too, are geographic areas or cities or villages that can be classified as "failed" because of the lack of coherent central government control. A good example is the Bosnian village of Bocinja Donja—a village which is widely described as lawless and a haven for radical Islamic movements. In addition, Italy (among other states) remains quite concerned of the security threat posed by Albania and its links to both criminal networks and Osama bin Laden. In fact, the Port of Durres, Albania has played a prominent role as a center of transit for smuggling and for Osama bin Laden-related activities.

In short, Takeyh and Gvosdev argue, terror groups "have gained control over territory in a failed state through a Faustian bargain with authorities, usually by offering its services to the failed state during times of conflict." Other factors also contribute to the usefulness of failed states as bases for terror groups. First, failed states lack the infrastructure of any semblance of law enforcement. In addition, a failed state also offers a population of ready-made recruits—as Takeyh and Gvosdev observe, "failed states create pools of recruits and supporters for terrorist groups who can use their resources and organizations to step into the vacuum left by the collapse of civil society."[47] Finally, the levels of poverty and corruption typically associated with failed states makes the viability of bribes more compelling—again, allowing terrorist or criminal organizations the freedom to behave in any manner they wish.

What has been offered in this chapter obviously does not offer a complete answer to the basic questions of how to define a failed versus failing state, the role of failed states in terrorism, the importance or the method for intervention, or any other of a number of relevant policy questions. These and other related questions are addressed amply throughout the political science and security studies literature.[48] Instead, the chapter is meant to offer an analysis of the current debate over state strength and state failure, and how these concepts apply to concerns of national security with regard to counterterrorism efforts. Obviously, not every failed state will produce an Osama bin Laden. What also should be obvious, however, is that failed states do matter—not only for humanitarian

reasons, but also for basic issues of national security. The concept of a strong state is one as old as the republic itself, and concern over stability in other states has a historical precedent. What remains clear is that the shrinking of the world—through globalization—should offer pause for consideration on how to deal with the failing or failed state.

48. A number of datasets are available to those interested in exploring the ideas of state failure and state strength. One of the most often used datasets is Freedom House. Freedom House measures states in terms of freedoms and civil liberties with historical data for comparative purposes (www.freedomhouse.org). Transparency International publishes a Corruption Perception index that offers quantitative measures of a state's level of corruption—available at www.transparency.org. The World Bank, located at www.worldbank.org, publishes a number of measures to use in investigating state failure, as well. The International Country Risk Guide, produced by an independent firm accessible at www.prsgroup.com, also measures corruption, the effectiveness of law, and the quality of bureaucracy. Phase III of the State Failure Task Force Report—cited in this chapter—offers an analysis of a 5-year study attempting to quantify variables of state failure. Hence, a great deal of raw quantitative data exists from which to study and draw further conclusions.

# Chapter 7

## BORDERS AND STATE INSECURITY

Michelle L. Spencer

Sovereignty and identity have been a source of conflict since the existence of man; however, our current view of statehood—which tied together both concepts—was formalized by the Treaty of Westphalia in 1648. Little has affected these ideals (held by democratic nations as unalienable)—even two world wars—until the advent of globalization and the growth of terrorism from a domestic problem into a global threat.

The leaders of the states comprising the international community are now faced with many existential questions: Has the concept of the nation-state been replaced by a supra-state structure as represented by the European Union? Can we protect our societies from the constant threat of terrorism? What role does border security play in countering the global threat of terrorism? Can free trade coexist with a secure state? Further thought on these philosophical questions raises others regarding the current state of international relations. Are the threats we face today the challenges of tomorrow? Is the potential for terrorist acquisition and use of WMD the greatest challenge for the international community today?

This chapter will not attempt to answer all of the above questions but will consider how we got here, the factors related to borders that frame the current threats and our ability to address them, the primary threats that must be addressed by the international community, and the role border security can or cannot play in addressing those challenges.

### BORDER SECURITY: A SOLUTION OR A PROBLEM?

The concept of border security is a complex one with many challenges. It includes a range of operational aspects, such as monitoring people and cargo at legal points of entry and monitoring the spaces in between whether by land or sea. Management of a nation's border requires

customs, port security, border guards, transportation security officials, and law enforcement. All of these agencies have to work together to create a seamless web of governance and control which no single individual or piece of cargo can slip through. That is the challenge of securing a border; terrorists must find only one weakness in the system to exploit—one customs officer in need of a little extra cash, or the one border post overcome with traffic on a given day. The border is only as secure as the integrity of those protecting it. Must borders be protected 100 percent to be considered secure? Total security is inconsistent with democratic values and free trade. Given that the odds are against keeping every determined terrorist out while maintaining the required level of trade for a bountiful economy, nations are caught between the proverbial rock and a hard place. Regardless of how tempting it is to consider the futility of the border security mission, the border is the first line of defense against terrorism and the last line of a nation's territorial integrity.

## THE ROLE OF GLOBALIZATION AND OTHER FACTORS

Many definitions of globalization exist. According to a source enabled by this phenomenon—the online editable encyclopedia, *Wikipedia*—globalization is "an umbrella term for a complex series of economic, social, technological, cultural and political changes seen as increasing interdependence, integration and interaction between people and companies in disparate locations. . . . The concept has been referred to as the shrinking of time and space."[1] If time and space are smaller, how is it that our problems seem bigger? Globalization has become the whipping boy of the modern age. It causes great turmoil, but brings with it economic opportunity. In relation to border security, there is a tendency to relax security in order to reap globalization's economic benefits. However, global jihad groups are making democracies pay a price for choosing facilitation of trade over security, and the issue is coming to a head in the United States, the European Union, and for almost every country who favors freedom. The question is how democracies strike the balance.

While globalization plays a significant role in how countries manage their borders, it is not the defining factor. In addition to globalization, four interrelated factors contribute to a country's ability to secure its borders. The factors include history, geography, demographics, and political stability, though no single factor is dominant. Some change, some are permanent, and some evolve, but all are interrelated. Two additional factors exist, but vary from state to state: political will and capability. A country can have both, one or the other, or none. Without both the capacity to monitor and protect national borders and the willingness to use the tools at hand, borders and the national sovereignty they represent will remain at risk.

*History*. The history of a nation is its collective memory and the experience of its citizenry woven together like a tapestry. It provides the foundation for a national perspective on sovereignty, the political inclination of a state, a country's role in the international community as well as relations with its neighbors. The history of borders is one of the most varied and interesting aspects of international relations, as most boundaries have not been drawn on the basis of ethnicity or national unity, but rather to divide loyalties and disengage identification of distinct ethnic groups from territory. Most borders in conflict areas today were drawn by the victors of wars of yesteryear, in the creation of empires or simply in discussion between "gentlemen." Joseph Stalin was perhaps the most notorious for forcefully uprooting entire ethnic groups and replanting them thousands of miles from their homes. Generations lived in homelands disconnected from ancestry. Stalin believed this would prevent any desire for secession, but he could have never imagined the ramifications for independence 60 years later.

*Geography*. Geography is the factor that does not change. Borders may move, but neighboring states are like relatives—you do not get to choose them. The geography of a border can benefit national security—for example in the case of a high cliff or impassable mountain range—but it can also aid foes if a country is required to monitor miles of unmarked desert or open plain. Maritime geography, too, can have an impact. Italy faces daily incursions by small Albanian vessels sailing across the Adriatic, many smuggling illicit goods into the EU. Small boats can avoid major ports, even exchanging goods without ever docking. Indonesia, a country with thousands of islands, faces enormous border security challenges. Given the difficult nature of monitoring every inch of shoreline or mile of land, countries are forced to prioritize, focusing on most likely points of entry. For democratic nations, 100 percent coverage of the border is an idealistic but ultimately unattainable goal.

One can argue that even the most stable of democratic republics in a bad neighborhood can have great difficulty managing its borders. The nature of democracy requires nations to trust in shared security goals with neighbors. When this trust breaks down due to instability or conflict in one country, surrounding nations can suffer. Terrorist groups have continually taken advantage of unrest in a country or region to move personnel or material alongside throngs of refugees, combatants, and civilians.

The porous nature of the Afghanistan–Pakistan border is clearly an important factor in the survival of the Taliban. President Karzai has repeatedly reprimanded his Pakistani counterpart on his unwillingness to prevent Taliban supporters from receiving aid and shelter in Pakistan and crossing the border at will. Pakistani President Pervez Musharraf has claimed that his government is doing what it can to root out insurgents and police the 1,400-mile unmarked border that follows through deserts

and mountains.[2] Iraq faces a similar situation given its geographic neighborhood. Open borders cannot be blamed for every ill suffered by Iraq, but the greatest asset of the insurgency is its ability to build, regenerate, and supply itself from Syria and Iran.[3] The geography of Afghanistan and Iraq present significant challenges to border security. The governments of the two countries must make hard choices concerning resources and manpower and must obtain the political will to use their capabilities effectively.

*Demographics*. The demographic nature of a country is the most diverse variable. No two countries have identical demographics. Ethnic composition, median age of a population, and relations between ethnic groups are all defining aspects of a government's ability to maintain stability and control its borders. Demographics encompass both social and economic indicators and can change over time. They include such indicators as ethnic homogeneity, refugees, and displaced persons.

The ethnic homogeneity of a population can have a positive effect on political stability, but once challenged by immigrant groups—as is occurring in the Netherlands, France, and Germany—it can alter the political landscape when ethnic groups are unwilling or unable to assimilate. Ethnic identification is often stronger than a national one, especially in states that encourage multiculturalism over integration.

Another challenge is displaced populations, immigrants, refugees, and economic migrants. These can place a significant strain on national resources and political life. Often these transitory populations can provide terrorists a place of shelter, sometimes unknowingly. As a recent 2003 Library of Congress Report concludes, "Foreign communities resident in a given country may form networks that often control legal commerce, but they may also protect well-established trafficking networks that channel illegal commodities between the host country and the home country abroad."[4] The linkage between legal and illegal commerce aids the terrorist in that the communities are less likely to be highly scrutinized by a government, given the difficulty of doing so.

The fact that populations are not confined within nor identify themselves solely by statehood or borders is a concept that is played upon by al Qaeda and its affiliates in global jihad groups. As Muslim populations around the world were caught up in wars of ethnic cleansing or territorial disputes, jihadis heeded the call of imams (spiritual leaders of Islam) to fight alongside their brethren. Thousands fought in Afghanistan in 1979–1989 and again in 2001; Bosnia during the 1990s; Chechnya since 1994; and Iraq since 2003. Significant support provided to conflict areas, both financial and logistical, plays an important role in cross-border crime and terrorist acts.

The ethnic composition of the Balkans has worked in opposition to political stability in the region. Only the authoritarian regimes of the

Austro–Hungarian Empire and communism under Joseph Tito were able to rein in highly independent and often rebellious ethnic minorities. Tito was able to capitalize on the strengths of the ethnic groups, and during his lifetime Yugoslavia etched out a peaceful coexistence. Upon his departure from the political scene, less visionary politicians chose divisive tactics to inflame long-held ethnic rivalries. This type of irresponsible governance imposed a great deal of hardship on the region, from civil war and ethnic cleansing to poverty and estrangement. Now the states of the former Yugoslav union are picking up the pieces of their shattered lives and trying to build a political process where none existed. The stability of the region depends upon the ethnic groups' ability to work in unison, cooperating and compromising within the democratic process.

*Political Stability*. The final element, political stability, is also complex as it is affected by the preceding three factors. Political stability is intangible. It is a combination of elements including the ability of a government to satisfy the basic needs of the people; creation and maintenance of a conducive environment for economic well-being; and the ability to instill and maintain the rule of law. A solid legal foundation includes legislation that is regularly reviewed in light of constantly changing threats. Most important is the political will to enforce the legislation from arrest to prosecution. As one security analyst recently noted, "While state collapse, civil conflict and widespread lawlessness are long-term problems in some countries, they are more often transitional phases."[5] It is in this period when countries are most susceptible to terrorist exploitation.

Authoritarian regimes tend to view border security as a control mechanism for their own population. The Berlin Wall and the "Iron Curtain" were constructed to prevent emigration. Of greatest concern was the departure of the educated middle class from East Germany during the 1960s.[6] The fragile democracies in Iraq and Afghanistan are facing a similar dilemma now—as insurgency and political instability threaten civil society, many elites choose to leave with their families rather than face the daily mortal risk.

## TEST CASES: POST-COMMUNIST STATES

Lack of democratic experience has left many post-authoritarian governments unprepared to manage their newfound freedom and responsibility in light of current threats. Nations often desire freedom, but creating and maintaining effective bureaucratic structures democratically is another matter. Effective institutions are the key. Post-authoritarian societies are rife with corruption and social inequalities, if only during transition to democracy or stable political environment. These factors affect not only the civil society of a nation, but also the formation and maintenance of government.

Successor states of the Soviet Union have been at a particular disadvantage due to the nature of border control under Soviet rule. After 1957, national border units were abolished at the republic level and border control was administered by the KGB from Moscow.[7] Thus, upon breakup of the union few of the post-Soviet countries had experience with monitoring their own borders. Starting from scratch has its advantages, in that some of the problems faced by entrenched bureaucracies do not exist; however, just because border control is a newer government responsibility does not mean that fewer agencies want the responsibility. As Soviet control faded into the sunset, political battles raged over which agency or ministry would gain control. Few post-communist countries have followed the same model. While most nations have demilitarized their borders at the insistence of Western powers, many agencies have been given nominal responsibility with little budgetary or physical capability to back it up.

A second element of the communist legacy is the fact that most borders were guarded by intelligence rather than security forces or law enforcement. The goal was to keep the population in and spies out. Changing this ingrained bureaucratic ideal is a slow process. In many countries, border guards are not held in high regard, partially due to the suspicion remaining from the legacy mission of those manning the border. Creating a security force that gains the trust of the population and plays an integral role in national security must be a primary goal of post-communist states. Without trust and cooperation of the population, effective border security will be an unattainable goal. Two case studies—the Balkans and the Black Sea—demonstrate the range of internal and external challenges that newly democratic states face in securing their borders.

The Balkans and the Black Sea regions are the gateways tying North Africa and Asia to Europe and the Western Hemisphere. Trade routes through these regions have been utilized by merchants and militaries through the ages. Throughout the 1990s, instability and armed conflict in the Balkans made that region a significant destination for arms and illegal goods from the Black Sea region. Though regional violence has subsided, smuggling routes remain active and connect the Balkans to the Black Sea and Western Europe. Illegal arms trafficking routes through Ukraine and Moldova, for example, were used by both Bosnians and Croats during the UN arms embargo. They were also used to facilitate the influx of weapons into Macedonia during that country's 2001 unrest.[8] These routes have also been used to transport WMD-related materials, and there is concern that such trafficking may continue. The German Federal Intelligence Agency believes that the Balkans has become one of the most popular destinations and transshipment points for WMD and WMD-related materials coming from Ukraine and Moldova.[9] The Balkans has also served as a source of WMD materials. Instability in Albania during 1997 led to the looting of chemical and radioactive agents from Albanian army depots, and Albania

has been used as a transshipment point for WMD-related materials traf-
ficked into Italy and Slovenia.[10] All of these factors drive the importance
of these regions to European security. This in turn impacts U.S. security
interests in the region.

### Albania: The Balkan Wild Child

More than four decades of paranoid Marxism left Albania the poor-
est country in Europe, with few natural resources or economic infras-
tructure on which to build. The civilian riots of 1997 caused by a col-
lapse of government-supported pyramid schemes completely destroyed
or severely damaged most government institutions, from the navy to gov-
ernment buildings in the capital. Of the 119 border posts that existed in
1997, 113 were looted and vandalized, leaving only shells of buildings
remaining.[11]

Since 1997, Albanians have begun to build an institutionalized democ-
racy. A new constitution was written and adopted on November 28, 1998.
Judicial and legislative reforms are slow but continuing. Many interna-
tional organizations are active in assisting Albania's growth and revival.
However, because of the collapse of the communist-supported light in-
dustry and ensuing mass unemployment, Albanians have been forced to
look for new ways to survive economically. The dire economic conditions
have fostered corruption and organized crime.

Corruption in Albania is endemic and systemic. Border guards are paid
less that $200 per month, and according to one Albanian official are highly
susceptible to bribery.[12]

> [C]ontrol of Albania's mountainous borders is a purely civilian task under
> the Ministry of Public Order, but control is very poor. Typically, a pair of bor-
> der guards patrols a 15 mile stretch of mountainous terrain on foot. They
> seldom have vehicles (and even more seldom have fuel), and lack advanced
> equipment such as ground motion sensors or night vision goggles ... With
> arrangements for "turning a blind eye" at formal crossing points, which are
> institutionalized in some cases by pre-payment of bribes, corruption com-
> pounds the problem. Anecdotal evidence suggests that despite the almost
> open nature of the green borders, the overwhelming majority of contraband
> coming into the country still moves through formal border crossings with the
> assistance of some corrupt border guards and customs officers.[13]

In this environment, terrorist groups can exploit opportunities with little
risk or cost to their operations. Combating this corruption and facilitation
of movement must be a primary goal of border security.

Many Albanians have left their homeland, moving to other areas in
the Balkans and beyond. Some are simply looking for a better life, while

others seek to expand decades-long criminal enterprises. Ethnic Albanians are popping up on virtually every European intelligence agency's radar. Albanians are now the fastest growing ethnic criminal presence in Europe.[14] The Albanians, Russians, and other aspiring criminal groups are providing logistical and financial support to terror groups simply by controlling the smuggling routes, money laundering operations, and transit options from most points of entry into Europe, including maritime routes through the Adriatic, Mediterranean, and Black Sea. Political instability, together with corrupt officials, porous borders, and inherent smuggling routes, make areas such as the Balkans, Central Asia, and Sub-Saharan Africa an "inviting operational environment" for terrorists and criminals.[15] What is unclear is how far the criminal element will furnish its support. The question facing the international community is whether a criminal group could gain access to WMD and be willing to sell the capability to a terrorist group.

Trafficking in weapons has played a significant role in destabilizing the Balkans.[16] Communist Albania was a producer of Chinese-style AK-47s. Millions were manufactured during the reign of communist leader Envar Hoxha. Given his paranoid fear of invasion, Hoxha armed his population and maintained state-run arsenals containing untold amounts of ammunition and weapons. During the 1997 unrest, 1,300 state arsenals were looted. The vast majority of these weapons were never recovered, but made their way to other conflicts. For example, weapons from Albania played a direct role in the destabilization of Kosovo and Macedonia, where according to one report, "they joined weapons that had traveled to the Balkans from hotspots such as Georgia's Abkhazia region. Many are still there, in people's homes and hidden caches, others ended up in the hands of ethnic Albanian crime groups in Europe, but at least half have since been retrafficked, and have turned up on the Lebanese black market and in the hands of jihadists in Chechnya."[17]

At home, Albanians struggle against institutional indifference. Generational bureaucratic rivalries persist, while new ones arise and states try to conform to Western standards of governance. This tension often produces lengthy battles over roles and responsibilities. The resulting uncertainty and fluctuations in agency responsibilities leave many individuals to wonder about their role and how it might change day to day. In Albania, for example, customs agents have no arrest authority, but they are responsible for inspecting cargo and pedestrian traffic at the border. Border police have arrest authority, but cannot inspect—and the two agencies do not work hand in hand, even though many are colocated at major border crossings. This is not an uncommon experience, even in Western countries.

In Albania, the border is guarded by police forces within the Ministry of Public Order. As borders were demilitarized, power was transferred from

the military to the police, but the budget and manpower did not always follow. As in many countries, included the United States, the Albanian border is manned primarily at official points of entry, while the vast areas in between go unobserved.

The border between Albania and its neighbors Macedonia, Kosovo, and Montenegro is extremely porous. During the 1999 Kosovo crisis and the 2001 Macedonia tensions, the Balkans saw most of the light arms and ammunition used by the ethnic Albanians come across the Albanian border, often in small numbers on pack animals or small carts. The cross-border movement is facilitated by the large number of ethnic Albanians that live at or near the border areas in Macedonia and Kosovo. Sympathies and relations remain strong between the neighbors, unimpeded by international borders. Albanian demography continues to play a direct role in the government's ability to secure its borders.

### Bulgaria: The Black Sea Linchpin

Bulgaria is at the heart of the Black Sea region that connects Europe to the Middle East and former Soviet Union. Centuries-old trade routes now dotted by oil and gas pipelines transect the area. Since the beginning of the twenty-first century, the probability of WMD proliferation and terrorist attacks in the Black Sea region has increased due to many of the factors discussed earlier—history, geography, demography, and political stability. With the exception of Bulgaria, every country in the region has either a disputed or undemarcated border.[18] Pockets of instability in Transnistria and the Caucasus make defending the border against such threats very difficult. The borders between Bulgaria and Turkey remain weak, and Turkish intelligence believes that the terrorists behind several of the attacks in Istanbul have established bases and weapon smuggling routes in Bulgaria.[19]

The Black Sea region is located on a significant illegal trade route that runs from Central Asia to Europe. Heroin from Afghanistan, Pakistan, and Iran is shipped through Turkey, where it can then be smuggled in several directions. The most common destination for heroin from Turkey is Bulgaria. In 2003 alone, 662 kg of heroin was seized at Bulgaria's borders with Turkey. Turkish heroin thought to have transited Bulgaria has been seized in large quantities as far north as Rotterdam and in Albania and Macedonia.[20] It is estimated that 80 percent of the heroin in the EU is smuggled through Bulgaria.[21] As Bulgaria joins the EU's Schengen regime in 2007, terrorists and smugglers alike will be forced to exploit new or expanded routes. For example, a ship sailing the Black Sea from a Georgian port such as Poti to the Bulgarian port of Varna would provide maritime access to EU markets without facing the more strictly monitored EU land borders.[22]

Throughout the Black Sea region, corruption is pervasive and often seen as part of the price of doing business. According to the Transparency International Corruption Perceptions Index, the Black Sea region as a whole is one of the most corrupt regions of the world. Out of 133 countries studied, with the ranking of 1 indicating the least corrupt country, only Bulgaria ranked above 60.[23] Corruption is rampant in the region, in part because low salaries make customs officials susceptible to (and dependent on) bribes to maintain a basic standard of living. Combined with corruption and poorly defined borders, Bulgaria's location at the center of prominent east-west and north-south trade routes makes it a major transshipment corridor for several types of illegal goods. Drugs, weapons, and humans are the predominant cargo on smuggling routes in the area.

Most experts agree that the greatest threat to the international community is the possibility of terrorists gaining access to weapons of mass destruction. One survey found that 47 percent agreed that the greatest threat to U.S. national security was a state or terrorist acquisition and use of nuclear weapons or WMD.[24] Preventing the transit of WMD materials from source countries, many in the former Soviet Union, is a primary objective of U.S. foreign policy and national security programs. While much of the plutonium and uranium required to build a nuclear bomb that was resident in the former Soviet Union has been secured, significant amounts of spent fuel and other materials that could be used in creating a radiological dispersal device remain in unsecured areas around the globe. The U.S. government states that it will take another 13 years to secure the remaining material, an unacceptable amount of time for most analysts.[25]

According the International Atomic Energy Agency, in the last 12 years there have been 20 reported incidents of WMD trafficking in Bulgaria. These have ranged from stealing from mines and research laboratories in Bulgaria to material coming from Turkey.[26] In September 1994, Bulgarian police arrested 6 people with 19 containers of radioactive material, including 100 g of plutonium. The material had been stolen from Bulgarian laboratories, and law enforcement officials suspect that a Russian mafia group was attempting to smuggle the material into Western Europe. In May 1999, Bulgarian customs agents detained a Turkish citizen attempting to smuggle 10 g of highly enriched uranium into Turkey. In October 2000, two suspects were arrested in Turkey for trying to sell 150 g of uranium smuggled from Bulgaria.[27] The sheer volume of interdictions raises concerns about the possibility of those not discovered. Bulgaria has received significant assistance from the United States, Germany, and the European Union to address its porous borders and to secure its nuclear facilities.

Some experts might question the use of Albania and Bulgaria as primary examples of border security challenges today. Bulgaria is a recently inducted member of NATO and an EU hopeful, and will eventually take part in the EU's Schengen border system. Albania is hopeful, but unlikely

to reach either of its stated goals for NATO or EU membership in this decade.

However, one case in particular illustrates how Spain, Austria, Belgium, Hungary, and Serbia can face the same challenges when trying to interrupt terrorists' mobility. Moroccan-born Abdelmajid Bouchar is under arrest in Spain for suspicion of involvement in the March 11, 2004 Madrid train bombings. The suspect fled from a Madrid suburban apartment 3 weeks after the train bombings, as police closed in to make arrests there. His tale highlights border vulnerabilities across Europe. The capture of Bouchar in July 2005 surprised Serbian police. They had thought he was just another Middle Easterner traveling illegally through the country until an Interpol fingerprint check revealed his identity. According to official reports, Bouchar had traveled to Brussels from Madrid, where he expected to obtain forged documents. However, his contacts there were either under arrest or fleeing police. He moved on and spent time in Austrian and Hungarian jails, but was freed. No one in either country checked his fingerprints. Serbian police investigators believe that he was seeking haven either in Bosnia or Kosovo and perhaps safe passage to the Middle East.[28]

## A WAY FORWARD

The role of every agency involved in protecting their nation's border has changed. Even for customs officials, whose focus had always been (and still is in some countries) on revenue collection, responsibilities have shifted. As the U.S. Commissioner of Customs and Border Protection Robert Bonner stated, "On the morning of September 11th, 2001 . . . the priority mission of U.S. Customs had changed from the interdiction of illicit drugs and regulation of trade to a national security mission."[29]

If the goal has changed, how then should border security be defined? Department of Homeland Security Secretary Michael Chertoff defined border security in terms of a nation's ability to stem the tide of illegal immigrants. Border security, according to Chertoff, is "a very high likelihood that we will intercept, apprehend, and remove people illegally crossing between points of entry. . . . It doesn't mean 100 percent, but it means getting pretty close."[30] For most governments, including the United States, it is untenable to define security in such strict terms. Most border forces have a difficult enough time maintaining constant coverage of pedestrian and cargo traffic at legal points of entry. Protection of "blue" and "green" borders—the spaces in between official points of entry on sea and land—are secondary concerns. The sheer volume of legal entry can overwhelm a country's ability to monitor the space in between, as is the case in the United States, whose land border alone spans almost 7,500 miles.

There are at least three elemental aspects to border security. First and foremost, all borders must be agreed upon and institutionalized. Treaties or agreements must be signed and entered into force. Second, borders need clear demarcation by those states sharing the border. Many nations have lacked the funding to adequately demarcate their national boundaries.[31] Third, personnel must be skilled, motivated, and in sufficient numbers to monitor the border.

Improving awareness, knowledge, and skills of those responsible for the protection of the border is essential. Two important cases against jihadist operatives illustrate this point. The first is the case of Ahmed Ressam, known as the "millennium bomber." On December 14, 1999, a U.S. Customs inspector interviewed a man arriving on a ferry from Victoria, Canada. Ressam was asked a series of routine questions regarding his citizenship, home of record, and travel intentions. Sensing that Ressam was reluctant and uncomfortable about answering her questions, the officer asked if his vehicle could be searched. Ressam panicked and tried unsuccessfully to flee, and agents subsequently discovered bomb-making materials in the trunk of his car.[32] The second case is that of Abu Musab al-Zarqawi. Zarqawi was pinpointed after Jordanian intelligence officers captured one of Zarqawi's mid-level operatives near the Iraqi border.[33] The operative had worked as a customs clearance officer at a large border post between Amman and Baghdad. Although the role of luck cannot be discounted, both of these cases underscore the importance of integrity, training, and motivation of border personnel.

The ability to train and maintain knowledgeable border staff must be a primary goal. Maintenance of the personnel includes teaching anti-corruption strategies. Low pay and social inequities of border forces is the hallmark of a state lacking true control of its borders. Also, the uncertainty of governance on a personal level leads to job dissatisfaction and apathy, and greatly increases susceptibility to corruption. Given the varying levels of income between nations and bureaucratic levels within a country, corruption is unlikely to be wiped out, because the person at the border will always make a comparably modest salary. However, strategies exist to manage corruption at the local level and to mitigate the effects at the national and regional levels. One strategy is to link criminal acts to terror plots and jihadists goals. At the very least this will remind individuals of the linkage between terrorism and petty criminals.

In new democracies, given the lack of experience in border control, police and Ministry of Interior forces often are ineffective in managing border security. With training and assistance, this can be dramatically improved, however, one option that should receive strong consideration is a support function for the military. Assistance in intelligence collection,

analysis, and dissemination would greatly enhance the ability of border forces to detect and deter illegal activity. Given bureaucratic stovepipes, information rarely flows from the military to the border police units, even when they share space at a border post.

In countries like Albania, for example, there is a pronounced need to establish a basic computer network between border enforcement agencies at the ports of entry, border police outposts, customs agencies, responsible military assets, and their respective headquarters located in the capital. In addition to these institutional linkages, information networks between government agencies and international sources are required. Even a EU-aspirant country like Bulgaria, with its future linkage to the Schengen Information System, must still create new lines of communication between agencies and organizations within the Bulgarian government. Often, countries—including the United States—are much more effective at sharing information with their international counterparts than they are with their interagency partners. In the National Counterterrorism Center in Washington, intelligence agencies sit side by side at computer terminals that are linked with their respective agencies, not with their NCTC colleagues.[34] It is up to each agency representative to share information— hardly a productive process when intelligence is being collected and analyzed from thousands of sources worldwide.

### CONCLUSION

Border security is not a panacea. It will not win the war on terror. There is no single model that can be instituted worldwide to secure every border under any circumstance. Methods and means of border security are governed by national security interests and, thus, are different for each country. The role of border security in countering terrorism is limited to the abilities of a state, which are complicated by a country's history, geography, demographics, and political stability. There are many things border security cannot do. It cannot stop knowledge, funding, or violent ideology from spreading.

It can, however, be a part of the solution. Security can only be effective in layers. Terrorists must be forced to clear hurdle after hurdle, country after country. It is this type of international cooperation that will gradually, but forcefully increase the opportunity costs for terrorist groups. The United States and the international community should assist partner countries in improving their capabilities. Best practices and standardization should be shared and encouraged. This is not altruism. The better borders are secured across the globe, the greater the cost to terrorists to move themselves and material, and to garner support across a border. While terrorists seem to have the upper hand, they live in fear of the

border security official asking too many of the right questions at the wrong time.

# CRIMINAL AND ECONOMIC DIMENSIONS

# CHAPTER 8

## COMBATING THE INTERNATIONAL PROLIFERATION OF SMALL ARMS AND LIGHT WEAPONS

Christopher Carr

The problems associated with the proliferation of small arms and light weapons (SALW) appear at once to be insignificant and insurmountable.[1] The very phrase "small arms" appears to relegate them to a minor role in conflicts, but their very numbers—by some measure in the hundreds of millions—appear to place them beyond control or management. However, both of these perceptions are flawed. SALW pose a far more real threat to more people than do the vaunted weapons of mass destruction (WMD) and they can—and in some cases are—being controlled and managed. Nevertheless, in the war on terrorism SALW are considered to be the loose change of a conflict in which explosives and the threat of WMD pose the principal threats. What is missing from this assumption is the reality that SALW, in sufficient numbers and in the context of weak states, can create an architecture of insecurity which fosters the very circumstances which protect and sustain the culture of terrorism. In Yemen, in the North-West Frontier Province of Pakistan, in the slums of urban Jamaica, and in the Caucasus mountains, the proliferation of small arms has allowed armed groups to challenge the primacy of the state and to create conditions of instability which provide aid and comfort to criminal and terrorist communities. In such places, the traffickers in drugs, humans, and weapons cohabit with the warlords, militia leaders, and political opportunists in an environment which precludes good governance and judicial oversight.

The impact of arms upon host societies has to be placed in context. In the United States there are an estimated 220 million firearms in private

hands, but while they might have an impact on crime and law enforcement, the mere presence of such arms does not challenge the authority of the state.[2] But a few thousand weapons injected into chronically unstable environs, such as Papua New Guinea or the pastoral communities of East Africa, can alter the very nature of these societies. In the latter cases, modern arms can destroy—within less than a generation—the delicate membranes of tradition and hierarchy. Similarly, where the state is weak, such as in Pakistan's tribal areas or in the Central American states, the proliferation of arms can elevate criminal networks and tribal militias from their social setting up to the level of a threat to national security. There are very few strong states that can, like the United States, countenance and manage the proliferation of arms within the general population. For the most part, those states where arms have become embedded within the society, rather than in inventories and armories of the state, have been weakened and in some cases fractured by the competing authority of unmanaged armed groups.

The proliferation of SALW since 1945 has many origins. In the highlands of Papua New Guinea and elsewhere in Southeast Asia, there are still deposits of arms that are left over from the Second World War.[3] Military detritus from the Vietnam conflict still emerges from Indochina and flows through Burma into Bangladesh and beyond. Bequests from departing colonial regimes in Africa and South Asia continue to provide usable weaponry for local militaries, militias, criminal gangs, and poachers. But the bulk of the weapons available today are legacies from a minor chord of cold war competition. In their proxy wars against each other, the West and East used the inexpensive medium of small arms transfers as a low-risk and low-cost instrument to support allies and undermine opponents. The fact that the Soviet Kalashnikov rifle is more common throughout the world than the American M16 rifle is one indicator that the Soviet Union supported insurgents (whose principal weapons were small arms) fighting against central governments, while the United States was, for the most part, the sponsor of states (whose needs were for larger weapon systems). These residual elements of the cold war remain in evidence today in Somalia, Mozambique, Afghanistan, Pakistan, Nicaragua, and numerous other former proxy battlefields.

Gray- and black-market arms trafficking has also helped in the proliferation of SALW. The gray market, which is characterized by the active involvement of national agencies, was particularly affected by the end of the cold war. Former socialist states, thrust overnight into the free marketplace, found that they had few manufactured goods that were competitive with those of the West. But military equipment manufactured in the former Warsaw Pact countries was inexpensive and robust and was particularly attractive to the governments of poorer states, pariah administrations, and nonstate actors such as the militias that emerged in many parts

of Sub-Saharan Africa. Ukraine, Romania, Poland, and the Czech and Slovak republics all exported arms in large quantities during the 1990s, and they often felt unconstrained by international law. Perhaps the most egregious of these new gray-market traffickers was Bulgaria.[4] In the last decade after the end of the cold war, Bulgarians were found by UN investigators (amongst others) to be shipping arms in a profligate manner into conflict zones throughout Africa and elsewhere. It was only after external actors, most particularly the states of Western Europe, linked accession to the North Atlantic Treaty Organization (NATO) and the European Union (EU) to arms trafficking by Bulgaria did the authorities in Sofia begin to exert control over uncontrolled arms trading.

Black-market trafficking in arms is certainly a global phenomenon, and there are individuals, groups, and commercial concerns that specialize in such activities. However, for the most part, illegal trafficking in arms is conducted as part of a basket of illicit and illegal activities by criminal groups or entrepreneurs who contract specialists to perform the key elements of the trade. These specialists are comprised of brokers or middlemen, who acquire the arms and bring together sellers and buyers; documentation experts, who provide such items as end-user certificates, which are required to verify the legality of the transaction; and transportation facilitators, who provide the means whereby arms are shipped from place of origin to place of destination. The clandestine nature of such activities attracts former members of national intelligence communities, veterans of armed forces and ex-law enforcement officials, many of whom were made redundant by the demise of the cold war. Each specialty requires its own type of acumen and, as with all illegal trafficking, the level of mutual suspicion between all parties is considerable.

The middleman or broker in illegal arms trafficking most often attempts to remain aloof from the physical transferring of the weaponry. This distancing by brokers from the arms themselves has meant that it has been difficult to enact laws and regulations that can inhibit the actions of such individuals. Even when such laws exist, as they have since 1996 in the United States, they are almost never applied or enforced.[5] The actions of the middleman are often nothing more than a series of communications, sometimes obscured by code or oblique references, which are designed to coordinate the efforts of the suppliers with the wishes of the recipients. Although such efforts at coordination can be fraught with their own perils (for example, during the French–Algerian conflict, the French authorities created a special unit to track and kill arms traffickers), most of the problems that the middlemen face are akin to those of any entrepreneur or executive.[6] The only significant additional problem relates to the fact that should any party to the deal renege upon a commitment, it would not be possible to resort to the courts to achieve redress. Implicit in most black-market arms deals, therefore, is a threat that, should the agreement

be breached, penalties—in the form of violence or intimidation—will be applied. However, the threat of an injured reputation is often enough to deter brokers themselves from overt acts of theft or fraud from the parties to the transaction.

The document expert must provide the paper camouflage that allows the weapons to be bought and shipped by the traffickers. The end-use certificate (EUC) is a document which confirms that the arms will be received by a legal authority, most often by agents of a national government. This document may be in the form of a crude memorandum, signed by a designated authority, such as the official responsible for procurement for a country's armed services. It also may be a comprehensive document bearing multiple signatures and official seals that are designed to preclude counterfeiting. Counterfeit or forged EUCs are used when it is believed that no genuine EUC can be procured to justify the transfer. They are also used when the traffickers are unwilling to pay the price for genuine but fraudulent documents that are provided by corrupt officials who are willing to provide an EUC with a false destination for the arms being trafficked. Such genuine but fraudulent EUCs may cost the traffickers fees equivalent to $50,000 or more, depending upon the size of the transaction.[7] The document provider may also supply bills of lading and other papers that are needed to ship hazardous cargoes by road, sea, and air.

Arms and munitions require particular handling when being transported between countries. While black-market arms may be disguised within general mixed cargoes, they are often shipped by carriers who specialize in moving dangerous goods between destinations that may have marginal facilities. These requirements, in addition to the illegal nature of the transfer, restrict the type of provider to small maritime and air shippers who have the equipment and personnel that can transcend problems associated with clandestine transportation of arms. Traditionally the Baltic fleet of the Danish maritime industry has provided much of the seaborne support for the black-market arms shippers, with their onboard cranes and shallow drafts allowing them access to unimproved ports in Africa, Latin America, and Asia.[8]

Transportation of small arms by air is plausible and, in the cases of landlocked conflict zones, mandatory. The collective weight of an SALW cargo, together with the volatility of ammunition and explosives, ensures that fees for transporting such cargoes are concomitantly high. Nevertheless, arms have been moved into and around Africa by aircraft almost continuously since the 1970s and increasingly since the end of the cold war. Fleets of former Soviet cargo aircraft, most prominently those of Ukrainian origin, have provided support for arms traffickers moving product into West and Central African conflict areas.[9] These activities have been the subject of numerous investigations, including several by the United Nations, with

the conclusion that the practice of uncontrolled aerial commerce is difficult to suppress and impossible to monitor. Most African airspace is not covered by radar, communications facilities are rudimentary, and the licensing of companies and aircraft is rife with fraud and deception. Companies change names and aircraft receive new identification numbers with great frequency, while airworthiness certificates are either bought from corrupt administrators or forged. In the Congo, a collection of aircraft, many with serious mechanical and electrical deficiencies, were used to provide arms to the militias who controlled the extractive mining regions, and on the return journeys these aircraft carried sacks of coltan and other minerals which enhanced the wealth of those who sponsored the militias.[10]

The black-market international traffickers are important because they will provide arms for nonstate actors, to states that are under sanction or embargo, and into areas where hostilities are taking place. But in terms of numbers and impact on the proliferation of SALW, the movement of arms within and between zones of conflict is a more significant phenomenon. The manner in which arms migrate from one battlespace to another may be less dramatic than clandestine shipments between continents, but the infective nature of such movements is a key element in the evolution of regional insecurity architectures. The migration of small arms is worthy of study and concern, since it is an important indicator of incipient unrest and civil conflict. The free market in arms that exists in parts of South and Southeast Asia and in Africa and Latin America is as subject to the laws of supply and demand as other commodity markets, but as the arms move they have a tendency to create ripples of instability and insecurity. In Kenya and Uganda, for example, combatants involved in the civil conflicts in Southern Sudan and Somalia often sold their weapons in border bazaars from whence they gravitated into the hands of cattle raiders, urban criminals in Nairobi, and bands of *shifta* robbers.[11] The end result of this stealthy proliferation was to place significant areas of their national territories beyond the direct control of the governments in Kampala and Nairobi. The secondary effect was to provide enough insecurity to cloak the activities of terrorists and uncontrolled militias such as the Lord's Resistance Army.

Ironically, when peace breaks out in one area where small arms have proliferated to a high degree, this change in circumstances poses a real threat to contiguous and regional states. In West Africa, for example, arms from the Liberian conflict migrated into Sierra Leone and then into Cote d'Ivoire and into the Niger Delta Region of Nigeria. In Central Africa, arms from Rwanda passed into the Democratic Republic of Congo.[12] In South Asia during the 1990s, weapons from Afghanistan moved into the border areas of Pakistan and then into the city of Karachi. Weak governments were further weakened, as the arms allowed political and social divisions to develop into armed confrontations and then into endemic

chaos. The chaos, perhaps best exemplified by conditions that have existed in Somalia since 1991, has served to create its own culture and economy that requires dysfunction and instability in order to continue.[13] The lords of chaos in Somalia traffic in drugs, manufacture counterfeit goods, and conduct acts of piracy because the state (and agents of external intervention) have been unable to withstand the challenge provided by counterforces that were primarily armed with SALW. Similarly, the blowback from United States and Pakistani support for the *mujahideen* against the Soviet military in Afghanistan resulted in a *de facto* fragmentation of the state of Pakistan into enclaves that continue to sustain organized criminal communities and radical religious and political factions.[14]

When the supply and demand for arms has matured within zones of insecurity, the trade in weapons becomes more organized and formal. Permanent bazaars, such as the Bakaraaha in Mogadishu and Dhamar in Yemen, provide a continual and reliable source of supply. In the case of Yemen, the arms bazaars not only provide weapons for the local tribes but also are the basis for an export trade that supplies arms for the traders in the Horn of Africa. In Latin America, the arms traders that are based in the Iguacu Triangle area that conjoins Brazil, Argentina, and Paraguay (also referred to as the Tri-Border Area) provide the weapons to the *favela* gangs in Sao Paulo and Rio de Janeiro.[15] In Cambodia, the notorious Teuk Thia arms market has been the source of weapons that transit Thailand and Burma, pass through Cox's Bazaar in southern Bangladesh and either remain in Bangladesh to arm political factions in that country or are further moved into the Indian hill areas such as Nagaland, where they fuel numerous long-term insurgencies.[16] Although most of these permanent arms bazaars are illegal, they are protected by custom, economic utility, and corruption. In Yemen, where the "Kalashnikov culture" is entrenched, the arms markets serve as real and symbolic examples of tribal autonomy and antistatist sentiment.[17]

Another major source of proliferation of SALW are the inventories of militaries and police forces. In most parts of the developing world, law enforcement and military personnel are inadequately compensated and often remain unpaid for long periods of time. Selling arms and ammunition from official stocks helps to supplement the income of the soldiers and police officers, but the sale of these arms also places instruments of intimidation into the hands of forces that pose the greatest threat to law and order. In certain cases, as occurred in Uganda in 1979, the chaos of civil conflict allows whole arsenals to be stolen. Here, after the disintegration of the Idi Amin regime in Uganda, the military installation at Moroto was abandoned and local pastoralists acquired the weapons. This single act was the precursor to a local arms race which significantly altered the delicate balance of power among a variety of tribes and clans.[18] In other cases, such as in the first Chechen war, a corrupt and

disintegrating military supplied arms to insurgents, who in turn used them against the Russian military.[19] In other cases, such as in Jamaica, Liberia, and Pakistan, politicians armed their supporters and then were unable to control the resultant deterioration into communal violence.

There is one further source of arms that requires our attention, and in terms of control this last category poses a distinct set of problems. In many areas of the world, from the tribal areas of Pakistan to the townships of South Africa and to garage manufacturers in the United Kingdom, locally manufactured weapons—often crude but nonetheless effective— provide an alternative to those individuals who cannot afford (or do not have access to) factory-made weapons. In some cases, as with guns from the village of Darra adam Khel in Pakistan, these cottage industry arms have merely supplemented guns that are already available.[20] In the case of the United Kingdom, where most personal firearms are now forbidden, deactivated arms (which are legal) were reactivated by criminal gunsmiths, and these weapons played a significant role in armed violence in Great Britain.[21] This indicates that even strict control regimes can be subverted by creative and technologically proficient individuals. Nevertheless, for arms to pose a real threat to most societies, they must be proliferated by type and in numbers which counter the monopoly of armed force that is usually enjoyed by established militaries and law enforcement branches. Cottage industry weapons have not, on their own, provided the numbers and types of arms that might successfully challenge such a monopoly.

Controlling the proliferation of SALW requires a combination of political will, instruments of enforcement, and usable intelligence. Each element must be present in order to achieve the desired objective, whether this be control or disarmament. Most of the components require bilateral or multilateral approaches in order to succeed, and all require some level of interagency coordination within states. Lack of coordination and cooperation between states and agencies is the single greatest facilitator in the proliferation of SALW. Arms traffickers exploit any confusion over laws, sovereignty, and jurisdiction to their own advantage, and without comprehensive international agreements on such matters as EUCs there is ample opportunity for the traffickers to escape detection and apprehension. Mitigating against the achievement of such comprehensive agreements is a degree of ambivalence that exists in certain supplier and recipient states. In countries where corrupt practices are endemic, the gray- and black-market trade in arms provides an attractive supplement to the incomes of venal officials. Some supplier states are also unwilling to relinquish their reputations as "reliable" sources of clandestine arms. Others, most notably the United States, have domestic and foreign policy reasons for opposing any multilateral agenda whose objectives includes the ultimate aim of disarmament. When taken as a group, these states have the

capacity to undermine any movement toward a system of international laws that might regulate the proliferation of SALW.

In 2001, the United Nations convened a *Conference on the Illicit Trade of Small Arms and Light Weapons in All its Aspects*. Although a Program of Action emerged from this meeting, the outcome of the conference was generally considered to be a failure. The 2001 conference was designed to capitalize on the success of the campaign to ban landmines, which came into force in 1997. Certain states, including the United States, Russia, and China, were not signatories to the landmine convention, but they had committed themselves to adopting unilateral moratoria on the production of such devices. The 2001 conference on SALW was designed by its sponsors to achieve the adoption of legally binding international legal statutes to mirror those of the landmine agreement, but the conference never moved beyond the stage of voluntary reporting and actions. The United States, through the office of then Undersecretary of State for Arms Control and International Security John Bolton, forcefully objected to a number of items that were in the proposed Program of Action.[22] Among these objections were the perceptions that the United Nations would be given authority to restrict legitimate government-to-government SALW transfers; that moves to prohibit the civilian possession of arms would contravene rights enshrined in national laws (in the case of the United States, the Second Amendment to the Constitution); and that restricting the flow of arms to government-to-government transactions would preclude arming dissident groups whose causes were just and whose needs for such weaponry—perhaps in the face of genocidal assaults by government forces—were manifest. Given these objections, the conference of 2001 deteriorated into a series of discussions on nonbinding proposals for monitoring and identifying egregious trafficking behavior. A follow-up conference was scheduled for the summer of 2006, but with the United States again reluctant to accept legally binding stipulations, most observers were not sanguine about the possibility of success.

Of course, the United Nations does oversee legally binding agreements through its embargo and sanctions program. Using its own staff, supplemented by experts, the United Nations monitors and reports on embargoes against state actors (for example, in 2006 the states of Liberia, Ivory Coast, and Somalia were under arms transfer bans) and nonstate actors. The monitoring groups often identify traffickers who violate these embargoes by name—for example, Victor Bout, a major transportation specialist, has been named in at least three UN investigations as a trafficker and has been the target of an Interpol warrant since 2002—but they have little power except that of embarrassing these individuals by publicizing their criminal behavior.[23] In the case of Somalia, embargoed since 1992, the UN monitoring group has cataloged the evolution of a black-market economy in which the principal actors include warlords, international criminals,

and religious extremists. Some of the UN investigations have led to indictments of foreign nationals in their home countries (for example, the Dutch government has tried several individuals for violating arms embargoes in Afghanistan, Iraq, and Liberia), but most of the UN reports have simply illustrated the inadequacies of the global approach to SALW control. The one relatively successful attempt to monitor and regulate the flow of conventional arms—the Wassenaar Arrangement of 1995—was oriented more toward the export of major weapons systems to rogue states, and was still based upon voluntary compliance by its 34 signatories.[24]

Regional attempts to control SALW proliferation might provide greater success than the global approach, but efforts such as the Nairobi Protocol and the EU Code of Conduct remain untested. The Nairobi Protocol, signed by the representatives of 11 East African states in 2004 (but not by Somalia), was a reaction to the palpable impact that arms trafficking had upon the signatory states, and therefore the impetus was not based upon philosophical commitments but upon practical requirements. The protocol covered the activities of brokers, the necessity for information sharing, and the need for officials who flouted laws to be made accountable.[25] The EU Code of Conduct, adopted in 1998, is a politically binding requirement that makes each state responsible for assessing the risk that arms might be used against allies, that weapons technology might be diverted, that arms might go to terrorists, that recipient states might reexport the arms in a profligate manner, and that any arms exports might place unreasonable economic pressures on the recipient state.[26] In respect of SALW transfers, the EU has also proposed that arms and ammunition be clearly marked and that their origins be traceable; that controls over brokers be made a high priority; and that the standardization of EUCs and the verification of their authenticity be addressed.

Some bilateral arrangements have provided evidence that two countries challenged by the effects of SALW proliferation can engage in mutually beneficial activities. Perhaps the most obvious of these arrangements is the "Operation Rachel" continuum that has existed between South Africa and Mozambique since 1995.[27] The origin of Operation Rachel concept was in the large number of weapons from Mozambique that were moving across the border into South Africa and which were threatening the cohesion of the post-*apartheid* society in that country. Mozambique, debilitated by two decades of liberation and civil wars, was unable to police its borders, and millions of Mozambicans had only their weapons to trade for food and other essential items. The South African Police Service (SAPS) proposed that its personnel collaborate with Mozambican security forces in identifying arms caches adjacent to their mutual border and destroying the weapons in place when they were found. Using local informants, who identified locations with global positioning system (GPS) receivers, the joint patrols had some success in containing the arms

moving into South Africa, and an annual operation was instituted. In 1999, as Operation Rachel sweeps moved further away from the South African border, SAPS could no longer unilaterally support the program with manpower and finances, so other organizations—including the Belgian government—helped to underwrite the program. By the 2005 operation, more than 25,000 units of SALW had been destroyed, together with more than 1.6 million rounds of ammunition. With perhaps more than a million weapons still remaining in private hands in Mozambique, this 10-year total might not appear significant, but as an example of long-term bilateral cooperation between two states, Operation Rachel provides a useful template.

As an adjunct to Operations Rachel in Mozambique, another local program was instituted in that country. This program employed an approach that has been attempted, with varying degrees of success, from Australia to Albania to the inner areas of U.S. cities. The approach, sometimes called "buyback" programs, offers remuneration or benefits for anyone who surrenders arms for destruction. In the case of Mozambique, arms were exchanged for bicycles, sewing machines, and other useful items.[28] The Australian buyback program offered generous prices for arms that were surrendered by their owners. In Albania, a program managed and supported by the United Nations was slightly different and more ambitious, and was based upon community needs being linked to the success of a disarmament program. In the Gramsh district of Albania, the United Nations Development Program (UNDP) partnered with local Albanian authorities to rid the region of thousands of small arms that remained in private hands after the looting of Albanian military installations in 1997. In exchange for the more than 6,000 weapons that were eventually collected, the UNDP underwrote improvements in infrastructure throughout the Gramsh district, including road improvement, communications upgrading, and equipping police units.[29] As a pilot project, the Gramsh experiment was limited in scope and expectation, but it did appear to address one of the problems inherent in "buyback" programs based upon remuneration of individuals. In that approach, the "buybacks" encourage inflation in the value of arms and often result in the destruction of weapons that are clearly no longer functioning.[30] A wealthy country such as Australia might be able to bear the fiscal burden of paying market prices for firearms, but that option is not available to most states.

Even if multilateral agreements were achieved and regional and bilateral arrangements were honored, the need for useful data and intelligence would still require exceptional effort. Most states do not place a high priority on gathering information on SALW transfers, and the burden of this task has largely fallen upon nongovernmental organizations (NGOs) with pedigrees or links to the anti-landmine campaign. Indeed, were it not for interested NGOs, the failure of the United Nations' 2001 conference might

have sounded the death knell for the SALW antiproliferation campaign. Groups such as the International Network on Small Arms (IANSA), Saferworld, and Oxfam and Human Rights Watch have provided a clearinghouse for information on SALW trafficking and the impact of small arms on the global community. Field data have been collected by the "Small Arms Survey" group at Geneva's Graduate Institute of International Studies, the Institute for Strategic Studies in South Africa, the Norwegian Initiative on Small Arms Transfer, and by the Monterey Institute of International Studies, to name but a handful. A small cadre of men and women have gathered information—often while hostilities have been ongoing—on small arms trafficking into West Africa, the Balkans, the Caucasus region, East Africa, and the Great Lakes Region, and South and Southeast Asia. Even if the final objective has been advocacy toward an international control regime for SALW, much of the research has proven a fitting substitute for nonexistent governmental data.

Perhaps even more useful than the data gathered by international NGOs has been provided by local organizations residing in areas that are most heavily impacted by SALW proliferation. These groups, often subject to intimidation and always underfunded, are best exemplified by "Viva Rio" and "Children and Youth in Organized Armed Violence" (COAV) in Brazil, and by the Working Group for Weapons Reduction in Cambodia. The Brazilian organizations have been responsible for raising national and international awareness of the problem of firearms in the hands of criminal groups in Brazil, and particularly in the *favelas* of Rio de Janeiro and Sao Paulo, and this awareness led to a national referendum on restricting gun ownership in Brazil. Held in 2005, this referendum was, however, defeated by a substantial margin. Weighing against the reality of 38,000 gun deaths per year in Brazil was the belief that the forces of law and order in that country were unable to protect citizens from the predations of criminal gangs, and that self-protection made personal firearms ownership necessary.[31] This paradox, in which guns create insecurity but gun ownership is necessary to provide protection against armed predators, provides the rationale for an unrestricted arms market in such diverse communities as Somalia, Yemen, Pakistan, and even in some U.S. cities.

Although NGOs are very useful in terms of gathering and analyzing data on SALW proliferation, they cannot (and should not) be used as a substitute for traditional intelligence activities. However, as stated above, SALW proliferation is not a priority amongst the national intelligence agencies of developed states, and only becomes a matter of public concern when—as in the case of British merchants shipping arms into Sierra Leone, or French arms being found in Rwanda—the activities of arms traffickers initiate a scandal. Indeed, it may be that the potential for political scandal, in which the label of "Merchants of Death" is often attached to those identified as traffickers, provides the greatest degree of incentive for

governments to maintain awareness and oversight over SALW transfers. It should also provide a cautionary constraint upon those intelligence professionals who believe that cohabiting with arms traffickers is just another way of gaining access to necessary information. Arms traffickers have a penchant for using their contacts in national intelligence communities to further their commercial aims, and this can create a web of interdependence that, if made public, would tarnish the reputation of the communities and undermine the basis for claiming any moral high ground.

Even in a climate of ambivalence, inertia, corruption, and mixed motives, certain actions can be taken to further understand and impede the proliferation of SALW. Since the black market in arms has the fewest defenders and apologists, it is logical to attack that sector first, with an expectation that any success might be used to provide ways in which the grey market might be curbed. The EU approach—in which the origins of arms can be traced by stampings and markings—is useful, but such identifiers can always be counterfeited.[32] Proposals for chemically degenerating primers and powder in ammunition are also interesting, but this would place a burden upon poor states which would have to renew their legal stocks of ammunition as they deteriorate. The regularization of EUCs, together with other documentation that must be provided by arms traffickers, is probably a better initiative and one which could be instituted inexpensively and quickly.

The Wazan affair, which was the subject of a formal investigative commission in South Africa in 1995, contained most of the elements which continue to facilitate black- and grey-market transactions.[33] One such element was the use of a crudely forged EUC that was provided by a broker, Eli Wazan, to support a shipment of arms from South Africa to Lebanon, but whose real destination was a Yugoslavia that was then embroiled in a civil war. Wazan himself had been paid $50,000 by his principals to provide a genuine but fraudulent EUC, to be acquired from an official of a foreign country. Wazan took the money, forged the EUC, and passed it to officials who were either part of the deceit or who did not adequately inspect the document. Since the EUC, nominally from a Lebanese government agency, could not be compared with any genuine article because there was no regularization of such documents, those who passed the document as genuine were able to plead ignorance of the deception. If EUCs were to assume the properties of a standardized international document, such as are found in the international transportation industry, then any confusion as to their validity might be mitigated. Ideally, modern technologies could be used to produce one standard, counterfeit-proof document, to be used by all arms-importing countries. If this was not possible, then examples of standard EUCs used by all states could be lodged in a database and accessed electronically, together with the signatures of the officials designated to authenticate the request in recipient states.

Arms brokers have traditionally felt immune from penalties associated with their trafficking activities. Even where laws exist to control their practices, they are so seldom applied that they are flouted by the brokers. The simple solution is to create antibrokering laws where they do not exist, and to enforce them where they do. A number of well-publicized prosecutions of major brokers might have a chilling effect upon those who feel that because they are not intimate with the arms that they traffic, they are immune from responsibility. Similarly, those who transport arms into zones of conflict should be prosecuted for their transgression of international law, and their ships and aircraft should be confiscated. In order to monitor and gain evidence against these shippers, the radar coverage of areas such as Central Africa needs to be increased, possibly through the use of airborne radars such as the AWACS system. Traffickers in systems that are demonstrably destabilizing and destructive, such as shoulder-launched antiaircraft missiles, should suffer particularly harsh penalties.

All efforts to control SALW require that the threat posed by an uncontrolled market in small arms is on par with that posed by terrorism or the proliferation of weapons of mass destruction. The populations of Somalia, Karachi, Port Moresby, or Cambodia do not need to be convinced of that assertion, but those that are not directly impacted on a daily basis by the implications of an armed society may be less willing to elevate SALW proliferation to the table of high security concerns. However, the litany of those states that have devolved into the status of weak or unmanageable societies as the result of uncontrolled weaponization mirrors very closely those states that harbor or sustain the terrorists, human traffickers, and drug lords whose actions and product undermine the societies of the developed world. The arms that have undermined the authority of states in Central America have encouraged mass migration from that region to the United States. The small arms that have restricted the mandate of the central government in Yemen have provided safe havens for terrorists with international agendas. The weapons in the hands of Afghan warlords protect a poppy harvest whose end products have social and economic ramifications from Indonesia to Ireland. The proliferation of small arms and light weapons raises complex issues of culture, policy, and enforcement, but its darkest ramifications should not be disavowed because the task of control is too difficult or the threat posed by weaponized societies is too tangential.

**NOTES**

1. Small arms and light weapons are defined as those arms that are classified as individual weapons or are crew-served but portable. Individual weapons include handguns, rifles, combat shotguns, submachine guns, light machine guns, grenade launchers, and hand-thrown grenades. Certain other weapons,

such as rocket-propelled grenade launchers (RPGs) can also be included in this category. Crew-served weapons include medium and heavy machine guns, automatic grenade launchers, and heavy antitank systems. Shoulder-fired antiaircraft systems, sometimes called Man-Portable Air Defense Systems (MANPADS) are also included in the definition of SALW, as are portable directional mines of the "Claymore" variety.

# CHAPTER 9

## TERRORISM FINANCE: GLOBAL RESPONSES TO THE TERRORISM MONEY TRAIL

Paul J. Smith

In the weeks following the September 11, 2001, terrorist attacks in the United States, media reports focused on the ease with which the hijackers had lived in the United States while simultaneously plotting their imminent suicide attacks. Much attention was focused on the method of finance, and particularly the fact that the hijackers had moved more than $325,000 into roughly 35 American bank accounts "without any of the banks' issuing reports of suspicious activity to federal regulators."[1] Several news articles highlighted the ease with which several of the hijackers had opened bank accounts in southern Florida. Another story noted that "the coordination [of the terrorist operation] was so thorough that each of the four hijacking teams had its own ATM card."[2] Investigators would later reveal that two key hijackers, Mohamed Atta and Marwan al-Shehhi, received wire transfers from an al Qaeda operative based in the United Arab Emirates. F.B.I. officials said they believe that the transfers were sent by Mustafa Ahmed al-Hisawi, who had been identified as a "financial manager for Osama bin Laden."[3] Several years later, the National Commission on Terrorism Attacks upon the United States ("The 9/11 Commission") would finally conclude that "the 9/11 plotters spent somewhere between $400,000 and $500,000 to plan and conduct their attack."[4]

In subsequent weeks and months following the 9/11 attacks, as Congressional hearings began in earnest, there was little surprise that one issue that captivated lawmakers' attention was the role and importance of money in sustaining the 9/11 operation. Representative Michael

Oxley, Chairman of the Committee on Financial Services, perhaps captured this sentiment best when he delivered the following statement in October 2001: "The terrorists used American freedoms and American dollars against us. They executed their plans with access to our financial system, including credit cards, ATMs, local checking accounts, and wiring money overseas. The best way for our Committee to commemorate the victims' lives is to take every step possible to ensure that the gates to the financial services system in this country are locked to terrorists."[5] Similar sentiments were expressed by other members of Congress. Senator Richard Shelby, a key expert on financial and money laundering matters, would note four years later that "money is the life blood of terrorism, and the Middle East is ground zero for much of the money raised and moved in support of terrorist activities."[6]

Similarly, the link between money and terrorism was highlighted by Juan Zarate, a senior U.S. Treasury Department official, in his testimony before the House Committee on Financial Services, when he stated that "the axiom now accepted around the world is that we must concentrate our national and collective power on breaking the financial ties that bind terrorist networks."[7] Clearly, since the September 11, 2001, attacks in the United States, attention has focused worldwide on the phenomenon of terrorist financing. Increasingly, the conventional wisdom posits that one of the keys to countering the terrorism threat is to target terrorist groups' financial underpinnings. Moreover, this emerging conventional wisdom is reflected in an unprecedented global effort by governments around the world—but especially the United States government—to monitor, track, and document all forms of financial transactions, in the event that terrorism-support funds may be clandestinely pulsing through the international financial system.

However, subsequent investigations and hearings would later reveal that terrorism finance is a complex enterprise, involving various evolving methodologies. Testifying before the U.S. Senate, Dennis Lormel—an expert on money laundering—stated that terrorism finance should not be seen as a one-dimensional phenomenon, but rather as a complex multidimensional enterprise involving both the funds as well as technical and administrative support.[8] Moreover, another challenge for those who subscribe to the emerging conventional wisdom that money provides the elemental underpinning of terrorism is the fact that terrorism, as a form of political violence, is extremely cheap. Recent attacks in Indonesia, Spain, and the United Kingdom attest to the fact that the execution of a terrorist act often requires very little money at all. In fact, an individual terrorist could simply rely on his or her own funding by means of a personal salary, as was the case in the London subway bombing attacks. Nevertheless, this strategic shortcoming has not arrested or impeded a massive global

effort to implement a financial surveillance system of unprecedented scale.

## HOW TERRORISTS ACQUIRE MONEY

Like most organizational activities, terrorism requires money to sustain itself. Despite their antisocial predisposition and destructive tendencies, terrorists must still pay their bills, particularly if they wish to avoid unwanted attention. Throughout history, terrorists have relied on multiple pathways to acquire money and thus finance their activities. Some of these have been legal (or semilegal), and others clearly illegal. What is clear, however, is that terrorists rely on overwhelmingly diverse means of acquiring money, which suggests that curtailing terrorism from a financial dimension is probably a much more daunting challenge than many policymakers may be willing to admit.

### Fundraising and Solicitation

Similar to a parent–teacher organization (PTO) or a local civic club, terrorist groups may turn to classic fund-raising techniques to acquire working capital. The Sri Lankan-based Liberation Tigers of Tamil Eelam (LTTE) is particularly notorious for conducting fund-raising activities in Western countries among diaspora Tamil communities. These activities range from pledge drives, contribution cans located next to cash registers in convenience stores, and direct door-to-door solicitation. In Canada, these fund-raising activities are estimated to raise between $7 million to $22 million a year in direct and indirect support for the Tamil guerrillas who are seeking an independent homeland in Sri Lanka.[9]

Like the LTTE, the Lebanese-based group Hizbollah[10] also relies on Lebanese expatriates (and others) who send money back home. In Charlotte, North Carolina, Hizbollah is famous for holding "regular parlor meetings" in members' homes, where Hizbollah propaganda videos are shown, followed by the passing around of a collection basket.[11] Similar patterns can be seen with numerous other terrorist groups.

### Charities and Wealthy Individuals

Charities may also act as a significant source of funding for terrorist organizations. The role of charities and financial contributions by individuals is particularly important for Middle Eastern terrorist groups, such as al Qaeda. According to one terrorism analyst," [D]angerous Middle Eastern terrorists like al Qaeda, Hizbollah and Hamas traditionally have relied largely on donations from wealthy Arab contributors, sometimes

funneled through Islamic charities."[12] According to the *9/11 Commission Report*, al Qaeda collected money from charities in two key ways, first by relying on "al Qaeda sympathizers in specific foreign branch offices of large, international charities,"[13] and by controlling certain charities, such as the al Wafa organization. The 9/11 Commission found that "charities were a source of money and also provided significant cover, which enabled operatives to travel undetected under the guise of working for a humanitarian organization."[14]

One key problem for officials investigating charities is that legitimate humanitarian money is often mixed with money that is either earmarked for terrorism, or is siphoned off by terrorist organizations. For example, it is widely known that the LTTE siphons "off donations to non-governmental organizations (NGOs), aid organizations and other benevolent entities that finance Tamil social service and development programs in Sri Lanka."[15] Another case of fund siphoning was highlighted recently by the U.S. tax authority, the Internal Revenue Service, which compelled the executive director of Chicago-based Benevolence International Foundation, Inc. (BIF) to plead guilty to a racketeering conspiracy for his role in diverting funds "in order to provide financial assistance to persons engaged in violent activities overseas," including fighters based in Chechnya and Bosnia.[16]

In addition to charities, terrorist organizations may benefit from direct donations from wealthy individuals who share sympathies with the terrorists' political objectives. According to the 9/11 Commission's final report, al Qaeda derived the bulk of its financing not from Osama bin Laden's purported vast wealth, but rather from his reliance on a key network of wealthy donors. The report noted that "Al Qaeda appears to have relied on a core group of financial facilitators who raised money from a variety of donors and other fund-raisers, primarily in the Gulf countries and particularly in Saudi Arabia."[17] The phenomenon of individual contributions to terrorist organizations has been a particular challenge for Saudi Arabia. Although the Saudi Arabian government has cracked down on many charities, it has had less success with controlling individuals who have a penchant for financing violent extremism. According to Anthony Cordesman, individuals in Saudi Arabia and other Middle Eastern and Islamic countries will continue to provide financial support for extremist groups because "regional governments can only do so much to limit such funding."[18] He cites a report from the U.S. investment firm Merrill Lynch suggesting that this may become an even greater problem in the future: "Merrill Lynch's estimates that the capital controlled by wealthy individuals in the Middle East rose by 29 percent during 2003–2004, to a level of approximately $1 trillion . . . [this raises] serious questions about how much governments can do. Much of this capital is in private accounts outside the region, terrorist operations are only moderately expensive, and

Merrill Lynch projects a further 9 percent annual rise in such holdings from 2004 to 2009."[19]

### Legitimate Businesses

Some terrorist organizations run their own business enterprises. Al Qaeda, under Osama Bin Laden's leadership, was famous for its entrepreneurial tendencies. Al Qaeda reportedly owned a fishing business in Mombassa, Kenya, various trading companies in Sudan, and a ceramic manufacturing company in Yemen.[20] Nevertheless, despite al Qaeda's apparent knack for capitalist enterprise, it is not clear that these businesses substantially improved or sustained al Qaeda's finances. According to the *9/11 Commission Report*, al Qaeda's business pursuits had only a marginal impact on the organization's finances; according to CIA estimates, most of the $30 million that al Qaeda needed to sustain itself every year was raised almost entirely through donations.[21]

Other terrorist organizations running their own businesses have arguably had greater success, although not necessarily on the financial front. For example, one of the key members of the Indonesian-based Jemaah Islamiya (JI) ran a company, Infocus Technology, that was able to facilitate the granting of an immigration visa into the United States for Zacarias Moussaoui, the alleged twentieth September 11 hijacker.[22] Another JI-affiliated company, Green Laboratory Medicine—whose director was Yazid Sufaat, a JI member—was used as a front to purchase 21 tons of ammonium nitrate for use in terrorist attacks in Singapore.[23] The trading company Konsojaya, established in 1994, "ostensibly exported Malaysian palm oil to Afghanistan and imported honey from Sudan and Yemen."[24] But the company played a more sinister role, particularly as a "front for moving money and purchasing chemicals and equipment for bomb-making" for the 9/11-prototype plot known as *Oplan Bojinka*, which sought to destroy 11 U.S. airliners as they crossed the Pacific Ocean (among other objectives).[25]

### Illicit Activities: Narcotics

In addition to legal or semilegal activities, terrorist groups may also resort to criminal activity as a means of raising funds. On March 1, 2006, for example, the United States Court for the District of Columbia issued a superseding indictment against more than 40 individuals, primarily Colombian nationals, for violating various federal laws regarding narcotics trafficking and conspiracy. According to the indictment, "it was a part and an object of the conspiracy that All Defendants, and others known and unknown to the Grand Jury, would and did import into the United States . . . five kilograms and more of mixtures and substances containing a

detectable amount of cocaine."[26] Many of the individuals named in the indictment are members of the *Fuerzas Armadas Revolucionarias de Colombia* (Revolutionary Armed Forces of Colombia or FARC), which was created in 1964 "as a left wing guerilla group dedicated to the violent overthrow of the Government of Colombia."[27]

The indictment further states that "FARC has evolved into the world's largest supplier of cocaine and cocaine paste."[28] Moreover, the group is directly responsible for half of the world's supply of cocaine and "more than approximately 60% of the cocaine sent to the United States."[29] FARC has been designated by the U.S. Secretary of State as a foreign terrorist organization. Initially, FARC's involvement in cocaine trafficking related to "taxes" that it imposed on non-FARC drug traffickers operating within the territory it controlled; however, beginning in the 1990s, FARC took on a more direct role in the cocaine trade by transforming itself "into a broker between the cocaine paste producing campesinos and the cocaine transportation organizations that distributed the cocaine to the United States and elsewhere."[30] Having achieved a monopoly in cocaine paste purchases, FARC was then able to set the price of cocaine paste purchased from the campesinos.[31] The case of FARC and Colombian drug trafficking provides a direct example of a terrorist organization turning to narcotics to raise funds; narcotics has provided the organization with a sizable funding source of convenience and consistency.

Other examples linking terrorists to the narcotics trade also exist around the world. In Turkey, the separatist Kurdistan Workers' Party (or PKK) has long been associated with the drug trade. Since 1985, over 300 PKK members have been arrested for drug offenses, and over half of these arrests occurred in Germany. The PKK link to narcotics is natural, given "Turkey's position as a pivotal transit route for Southwest Asian opiates flowing into Europe."[32] In Central Asia, the Islamic Movement of Uzbekistan (IMU) and other groups in that region have also been strongly linked to the drug trade. According to Michael Sheehan, former U.S. State Department Coordinator for Counterterrorism, "Terrorist groups in Central Asia have been profiting from the drug smuggling and using it to finance their purchase of weapons and other activities."[33] In Thailand, the Office of the Narcotics Control Board (ONCB) has accused various narcotics syndicates of "helping to finance the insurgency in the southern border provinces"[34] although some other officials have disputed this claim. Specifically, the ONCB alleged that "of the 17 drug gangs known to be operating in the southern provinces along the Thai–Malay border, two of the largest international syndicates were thought to be assisting southern militants and vice versa."[35]

In Europe, drug trafficking has been strongly linked to terrorist organizations. The terrorists involved in the Madrid train attack were part of a major drug smuggling syndicate linking Morocco, Spain, Belgium,

and the Netherlands.[36] There is evidence that proceeds from illegal drug sales directly funded the terrorist operations. According to one report published in *U.S. News & World Report*, "Moroccan terrorists used drug sales to fund not only the 2004 Madrid attack but also the 2003 attacks in Casablanca, killing 45, and attempted bombings of U.S. and British ships in Gibraltar in 2002."[37] Another study published by *Jane's Intelligence Review* also supports this claim: "Trading in hashish and ecstasy paid for cars, safe houses and explosives."[38] Moreover, many of the terrorist operatives involved in the Madrid operation also had records of involvement with illicit drugs.[39]

### Other Criminal Activities

Terrorist organizations have also turned to other forms of crime to raise money, including credit card fraud, kidnapping, and extortion. Historically, terrorism has often been associated with crime, and thus this phenomenon is not new. In Germany, for instance, the now defunct Red Army Faction raised money "the old fashioned way" by robbing banks.[40] Contemporary terrorists have shown similar traits in terms of their criminal ingenuity and scope. In one recent case, cigarette smuggling was the preferred means of accessing capital. In March 2006, prosecutors in the United States unsealed an indictment charging 19 people (including U.S. and Canadian citizens) with smuggling cigarettes and other contraband (including counterfeit Viagra). A portion of the profits were diverted to the designated terrorist organization Hizbollah.[41] Typically, a cigarette smuggling enterprise simply involves purchasing cigarettes in states where the tax is low (such as North Carolina), then transporting them on an interstate freeway north to states that impose a much higher tax. The cigarettes are then sold on the black market without having any tax imposed. With such huge profits, some police argue that "cigarette trafficking now has begun to rival drug trafficking as a funding choice for terrorist groups."[42]

In another case, Mohammad Youssef Hammoud, a citizen of Lebanon, entered the United States with fraudulent documents in 1992. After being detained by U.S. immigration authorities, Hammoud applied for asylum and during this period he moved to Charlotte, North Carolina, where he had brothers and cousins. Ultimately, Hammoud gained U.S. resident alien status by marrying a U.S. citizen. Sometime in the mid-1990s, Hammoud, his wife, and one brother became involved in a cigarette smuggling operation that involved smuggling cigarettes from North Carolina (a state that imposed a minimal tax of .50 cents on cigarette packs) to Michigan (which imposed a tax of $7.50 per carton). Taxes were not paid in Michigan, and consequently that state lost approximately $3 million in potential tax revenues. More importantly, some portion of these illicit profits were funneled to Hizbollah. Moreover, the court determined that

Hammoud and his coconspirators had engaged in sophisticated money laundering schemes by setting up fictitious entities and shell corporations which could then be used to launder the proceeds of the cigarette smuggling. Eventually, Hammoud and his brother were convicted of numerous crimes, including cigarette smuggling, racketeering, and money laundering, and Hammoud was eventually sentenced to 155 years in prison.[43]

Apart from more sophisticated criminal schemes, many contemporary terrorists are actively involved in petty crimes, with the purpose of raising funds. In some cases, the leadership of the organization, such as Jemaah Islamiya, will actively encourage the practice. Within certain militant Islamist movements in Southeast Asia, there exists a tradition known as *fa'i*—using money from crime to support religious causes.[44] Abu Bakar Ba'asyir, one of the cofounders of Jemaah Islamiya, reportedly told a student who had asked about the appropriateness of conducting computer hacking and online fraud, "You Can take their blood, then why not take their property?"[45] In other cases, criminal activity is turned to out of necessity. In December 1999, a U.S. Customs Agent intercepted Ahmed Ressam as he was attempting to enter the United States for the purposes of bombing the Los Angeles International Airport. Ressam had built his life as a terrorist not by living on lavish support from al Qaeda or any other organization, but rather by engaging in petty crime and welfare fraud in Canada. Among other things, he sold fake passports, social security numbers, and driver's licenses. He was also arrested four times and convicted twice. During the period from 1994 to 1999, Ahmed Ressam committed crimes ranging from "shoplifting, pickpocketing, purse snatching and stealing tourists' suitcases."[46] In 1998, he was convicted of stealing laptop computers from parked cars, and served a 2-week sentence.[47] What the Ressam case reveals is the fact that many contemporary terrorists engage in criminal activities—in a manner similar to classic organized crime syndicates—to raise money, support themselves, or purchase key weapons or other materials that are needed to conduct terrorist attacks.[48]

Kidnapping provides yet another criminal pathway to substantial capital inflows for terrorists. Kidnapping has emerged as a major internal security threat in many developing countries around the world, although in most cases it is an outgrowth of criminal (not terrorist) activities. However, there are examples where crime and terrorism converge. In Colombia, for instance, local criminals kidnap individuals and after receiving a ransom, simply transfer the hostage to the FARC, which then extorts additional money from families and businesses, and thus earns substantial profits for itself.[49] In Southeast Asia, one of the most brazen kidnapping events occurred on April 23, 2000, when operatives from the Philippine-based Abu Sayyaf Group (ASG)—a semiterrorist, semicriminal organization—kidnapped more than 21 tourists from Malaysia, Germany, South Africa, Lebanon, Finland, and the Philippines at the Malaysian diving resort of

Sipadan.[50] With their hostages in tow, the ASG operatives raced back into Philippines waters (via their two speedboats) and ultimately reached their jungle hideouts. Subsequently, they made exorbitant financial demands for release of the hostages, including demands of U.S. $1 million per hostage. Eventually, the drama became more bizarre when Libya offered to pay $25 million in exchange for most of the hostages. Such kidnappings are not rare in the Philippines, and have been repeated often since 2000. In many cases, a complex nexus exists between criminal gangs and terrorist groups, often to the point of tactical cooperation.

Crime and terrorism have traditionally been viewed as distinct activities. Organized crime gangs typically engage in crime so as to gain illicit profits; terrorists engage in "criminal acts"—murder, destruction of property, etc.—so as to bring about some sort of political change. The traditional view has been that these are distinct phenomena. However, the case of Ahmed Ressam and other contemporary examples suggest that crime and terrorism may be more related than once assumed, particularly in an era of globalization and declining (direct) state support for terrorism. One analyst has argued that "criminal and terrorist groups regularly engage in strategic alliances to provide goods or services"[51] and moreover, "terrorist and criminal groups converge in territory inadequately controlled by state forces . . . to advance mutual interests and areas of potential cooperation."[52] Traditionally, it was assumed that criminal organizations eschewed terrorists, not because of any moral qualms, but because "it was bad for business; cooperation with political radicals would turn unwanted attention onto [the criminal] group."[53] Now that there is evidence to the contrary, the implications are that both terrorist and criminal groups may become more independent of state control. Thus, pressuring states to sever all financial support to terrorists may have been an effective strategy in the past (hence the recent laudatory praise of Libya), but the fact remains that many terrorist organizations have alternative ways in which to assure their financial security. The increasing convergence between crime and terrorism suggests that terrorist groups may become more private—in other words, operate to a great extent outside the constraints and controls that could have been imposed by governments and the international system.

## HOW TERRORISTS TRANSFER OR STORE THEIR MONEY

On February 18, 2004, U.S. Internal Revenue Service (IRS) agents raided the Ashland Oregon offices of Al Haramain Islamic Foundation, a Saudi Arabian charity linked to al Qaeda and other terrorist organizations. IRS agents acted on suspicion that Al Haramain officials had filed false tax returns by omitting certain income and by mischaracterizing how their money was being spent.[54] Moreover, the group was accused of

laundering $150,000 in donations to help al Qaeda fighters in Chechnya.[55] The Oregon raids revealed a key element of the U.S. strategy against terrorist financing—cracking down on charities and other organizations that funnel money to terrorist groups. In the case of Al Haramain, U.S. officials had linked this organization to a range of terrorist attacks, including the 1998 U.S. embassy attacks in Kenya and Tanzania, as well as the Bali nightclub bombings in October 2002.

However, what is also significant about Al Haramain was the fact that the organization not only allegedly provided a source for funding, it also provided a global conduit through which funds could be discreetly disbursed across the world. In one case, the charity was accused of wiring a $1-million-dollar payment in 1999 to militant fighters in Chechnya.[56] For this and other reasons, the group was forced to shut its offices in various former Soviet Union states, as well as Somalia and Bosnia, particularly after U.S. officials "asserted those offices used charitable donations to finance terrorist activities."[57] Officials describe the practice of diverting legitimate funds to terrorism activities as "reverse money laundering." Reverse money laundering—unlike classic money laundering—involves the transmitting of clean money into associations or activities that are illegal in nature. An alternative definition describes reverse money laundering as an activity "where illicit funds are covertly transferred to individuals to finance terrorist operations."[58] Contributing money to a charity that promotes terrorism would thus be considered money laundering. This is important for al Qaeda since, according to a report by a Council on Foreign Relations task force, "Al-Qaeda moves its funds through the global financial system, the Islamic banking system, and the underground hawala system, among other money transfer mechanisms. It uses its global network of businesses and charities as a cover for moving funds."[59] A similar case of "charity abuse" occurred in the southern Philippines, where Mohammed Jamal Khalifa—Osama bin Laden's brother-in-law—had set up local branches of Islamic charities, such as the International Islamic Relief Organization (IIRO).[60] According to one analyst, "The IIRO branch [in the Philippines] was misused without its knowledge for the routing of funds to the ASG and Al-Qaeda cells located throughout the country and region."[61]

Charities may use formal banking sectors, or if they face pressure, they may revert to using informal value transfer systems (IVTS), which provide another pathway for terrorists to transfer funds globally (particularly as formal transfer systems receive increased government scrutiny and surveillance). Such systems include the *hawala* system, the peso-exchange system, the *fei-chien* system, among others. These systems work by transferring value (as opposed to physical or electronic currency) throughout the world. For example, an IVTS dealer in country X contacts another dealer in country Y and instructs him to deduct a certain amount (the

amount of the money to be transferred). This obviously creates a debt for the dealer in country Y; such debts are reconciled either by opposite financial flows, or through other means (such as false invoicing). At some point in the future, the books must be reconciled between the two dealers. The problem for government regulators is that global IVTS systems have been developed, not for terrorism financing, but rather to address the banking needs of millions of poor—often migrant—workers throughout the world. In many parts of the world, these informal value-transfer systems "represent the only financial system available."[62] According to Walter Perkel, an estimated $100 billion to $300 billion pass through the IVTS every year. The problem is that such systems, while originally created for purposes unrelated to terrorism, can be exploited by transnational terrorist organizations.

Another way to transmit money is to use the services of an unlicensed or unregistered money transmitter. Indeed, as scrutiny of the formal banking sectors grows every year, terrorist organizations, their supporters, or members of classic criminal organizations may seek to transmit funds globally via informal channels, such as through unregistered money transmission businesses. As with the IVTS, unlicensed money transmitters often service immigrant—and often illegal immigrant—communities. In other words, they target groups who cannot afford traditional fees charged by banks and who wish to avoid government scrutiny for a variety of reasons (tax evasion, illegal immigrant status, etc.). Nevertheless, these money transmitting businesses are viewed by the U.S. government, and increasingly other governments, as a potential problem in terms of money laundering. According to one U.S. Homeland Security Department official, "These unlicensed [money service] businesses operate outside of the traditional banking system and governmental oversight, and have been long recognized by law enforcement as vulnerable for exploitation by terrorists and other criminals."[63] Recent legal changes, such as *18 U.S.C. 1960, Prohibition of Unlicensed Money Transmitting Business,* enacted through the USA PATRIOT Act, are providing U.S. investigators with greater authority to investigate such businesses.[64]

A more fundamental means of transmitting money across international borders is to simply have someone smuggle it in cash. In Southeast Asia, Jemaah Islamiya relies on small-scale couriers who arrive with bags of cash. Personal couriers, often Indonesian migrants working in Malaysia who are not actual members of JI, helped transfer more than $15,000 in cash which was used in the first Bali bombing of October 2002.[65] Indonesian police have confirmed that JI regularly uses cash couriers to smuggle cash into Indonesia to fund its operations.[66] In the United States, bulk cash smuggling is traditionally associated with narcotics trafficking. As the United States has implemented stricter banking standards—resulting from requirements of the Bank Secrecy Act of 1970—narcotics traffickers

have found it more difficult to achieve the initial "placement" stage (depositing cash; transforming cash into an electronic or bankable form) of money laundering. As a result, a vibrant cash smuggling industry has grown, particularly along the U.S.–Mexican border. According to a U.S. Treasury Department official, "Cash associated with drugs typically flows out of the U.S. across the southwest border into Mexico, retracing the route that the drugs took entering the United States. Drugs and illicit proceeds also cross our northern and other borders."[67]

Finally, a new and emerging form of cross-border cash or value transfer is facilitated by the Internet, particularly the rise of "e-cash" or "e-gold" transactions. According to a U.S. Department of Homeland Security (DHS) official, "Internet payment services such as PayPal, Bid-Pay, e-gold and e-Dinar represent new methods to transfer funds globally. For example in 2004, PayPal executed 339.9 million payments totaling $18.9 billion in value."[68] E-cash is ideal for clandestine transmission of money across borders. It is particularly useful to achieve the "layering" stage of money laundering (sending money to a number of accounts in different jurisdictions so as to create layers between the money and its source). Many of these transactions can be conducted without the need for identifying information of the sender or receiver. And, according to this DHS official, "some Internet payment conveyances keep few or no records. Others with substantial record keeping may reside safely beyond the reach of U.S. law enforcement."[69] U.S. officials fear that these new and emerging technologies provide a significant window through which illicit cash can be transmitted across multiple jurisdictions, and moreover, that these technologies and methods "are not addressed by the currency and monetary instrument reporting requirements as presently structured."[70]

## DOMESTIC AND INTERNATIONAL LEGAL REGIMES AGAINST TERRORISM FINANCE

As global attention focuses on terrorism and terrorism financing, governments around the world have pushed for new regulations—both international and domestic—to address the perceived legal gaps that terrorists may exploit. Indeed, multiple jurisdictions around the world—often under U.S. guidance or pressure—are transforming their financial systems in a manner as to make them inhospitable to terrorism financing. According to Gerald Feierstein of the U.S. State Department, "A number of countries have either adopted new legislation to shut down terrorist financing, or are in the process or doing so."[71] The U.S. Treasury Department's Office of Technical Assistance (OTA), which provides policy advice and technical assistance (regarding management of public finances) to governments seeking such assistance, has expanded its financial enforcement program substantially.

Today, OTA has advisors in 43 countries, including the Middle East, Asia, Africa, Central and Eastern Europe, and the former Soviet Union.[72]

Notwithstanding efforts to suppress terrorism financing after the September 11 attacks, perhaps the most significant international measure against terrorism financing was introduced in 1999, when the United Nations adopted the International Convention for the Suppression of the Financing of Terrorism, which entered into force on April 10, 2002. By June 2005, the convention had been signed by 132 countries, and 117 were full parties to the agreement.[73] The Convention created a number of obligations for states, such as the need to (1) create domestic laws that criminalize the financing of terrorist acts; (2) provide legal and law enforcement to other party States; and (3) require financial institutions to implement reporting and diligence requirements.[74]

The 1999 Convention was a powerful step within the international community to stem terrorism financing. But the impact of 9/11 made the Convention even more potent, particularly with the passage of UN Resolution 1373. Passed only weeks after the September 11 attacks, Resolution 1373 "criminalized all activities falling within the ambit of terrorist financing [and] obliged states to freeze all funds or financial assets of persons and entities that are directly or indirectly used to commit terrorist acts or that are owned and controlled by persons engaged in, or associated with, terrorism [and] obliged states to prevent their nationals (including private financial institutions) from making such funds available, in effect imposing strict client detection measures, STR procedures, and subordination to other intergovernmental institutions in order to receive the names of designated terrorist organizations or individuals; [and] imposed substantive and procedural criminal law measures at the domestic level, including an obligation to cooperate in the acquisition of evidence for criminal proceedings."[75] To implement the measures of Resolution 1373, the UN Security Council established a subsidiary organ commonly known as the Counter-Terrorism Committee. "Member states were obliged to report to the committee, within 90 days, on the steps they had taken to implement the resolution."[76]

In addition to international laws, rules, or conventions, many countries have their own domestic legal regimes that focus on terrorism financing. The United States, for instance, has a number of laws that directly target terrorist financing. Under the International Emergency Powers Act (IEEPA),[77] passed in 1977, as well as other statutes, the U.S. government has established "sanctions programs that prohibit named foreign terrorists, foreign drug kingpins, and their fronts and operatives from using their assets within U.S. jurisdiction or engaging in business or other financial activities with U.S. persons, including companies or individuals."[78] Another law passed in 1996, the Anti-Terrorism and Effective Death Penalty Act (AEDPA), gives the Secretary of State authority

to designate any group as a threat to U.S. national security, and thus makes it a crime for any person in the United States to provide funds or any material support to such a group.[79] In addition, the AEDPA prevents U.S. persons from "engaging in transactions with countries that support terrorism" and requires that financial institutions freeze financial accounts belonging to international terrorist organizations.[80]

Another way that governments around the world are cracking down on terrorism financing is to target money laundering. Increasingly, countries are enacting severe regulations against money laundering, terrorism finance, and other financial crimes. According to E. Anthony Wayne, Assistant Secretary of State for Economic and Business Affairs, "Seventeen countries promulgated or updated anti-money laundering and terrorist financing laws in 2005. The number of jurisdictions that have criminalized money laundering, to include other crimes resulting in money laundering beyond narcotics, increased from 163 in 2004 to 172 in 2005. Ten more countries criminalized terrorist financing."[81] One organization that is at the forefront of anti-money laundering efforts is the Paris-based Financial Action Task Force (FATF), an intergovernmental body that standardizes international policies to counter money laundering. Recently, it has emphasized countering terrorism financing (including recent initiatives to counter cross-border currency smuggling) as part of its overall mandate to address international money laundering.[82]

The United States has also retargeted its anti-money laundering regime toward terrorism financing. The foundation of the U.S. money laundering regime is the Bank Secrecy Act, passed in 1970, which seeks to "prevent financial institutions from being used as intermediaries for the transfer or deposit of money derived from criminal activity and to provide a paper trail for law enforcement agencies in their investigations of possible money laundering."[83] The Bank Secrecy Act requires that banks generate certain reports, such as Suspicious Activity Reports (SARs), on customers who exhibit unusual behavior (in the context of a financial transaction) or who satisfy certain financial thresholds.

Recently, data from SARs has been used in terrorism investigations or prosecutions. In one case, the Federal Bureau of Investigation, relying on data provided by SARs, began a bank and mail/wire fraud investigation "involving a purported charity raising money for needy people in a Middle Eastern country."[84] Data from SARs has also been used in prosecuting operators of unlicensed money transmitting businesses. In one case, a defendant was prosecuted for operating a multimillion dollar money transfer business that, at its peak, "was transferring more than half a million dollars to a Middle Eastern country, out of the defendant's store."[85] The scope of the Bank Secrecy Act was greatly expanded with passage of Title 3 of the USA PATRIOT Act, otherwise known as the International Money Laundering Abatement and Anti-Terrorist Financing Act of 2001.

Title 3 specifically targets money laundering, considered a $500 billion per year transnational crime, and greatly expands the scope of the Bank Secrecy Act.

As noted earlier, money laundering consists of three critical steps: placement, layering, and integration. The layering stage is the primary means through which money is transferred internationally; the ability to conduct layering transactions in a sophisticated and clandestine manner is a skill that is highly valued by transnational crime and terrorist organizations. However, it is also prohibited by U.S. law. For instance, 18 U.S.C. § 1956(a)(2) addresses international financial crime offenses and specifically makes it a crime to

> transport, transmit, or transfer [or attempt the same] a monetary instrument or funds knowing that the instrument or funds involve the proceeds of any unlawful activity (i) with the intent to promote the carrying on of specified unlawful activity, (ii) knowing that such transportation, transmission or transfer is designed to conceal or disguise the nature, location, source, ownership or control of proceeds of specified unlawful activity, or (iii) knowing that such transportation, transmission or transfer is designed to avoid a federal or state transaction reporting requirement.[86]

For prosecutors, the significant utility of the federal money laundering statutes is that they can be applied to virtually any crime that involves any financial transaction, such as financial support for international terrorism. The predicate "specified unlawful activities" that invoke the money laundering statues have been expanded to include virtually all federal white-collar crimes. As a result, "the money laundering statutes reach virtually any type of illicit proceeds which one might obtain."[87] It is thus not surprising that the United States is encouraging other countries to adopt a similar regime. Recently, for instance, U.S. officials visited Bangladesh for the purpose of encouraging that country to beef up its anti-money laundering surveillance and prosecution system.[88] As the U.S. example demonstrates, it provides a critical tool to address terrorism financing.

### CONCLUSION: LIMITATIONS TO FOCUSING ON TERRORISM FINANCE

During the past decade, and particularly since 1999, regulations and laws have been implemented throughout the world, focused primarily at terrorism financing. Even governments that once resisted global pressure to either limit terrorist financing or deter money laundering in their jurisdictions are now conforming to this trend, although sometimes reluctantly. A U.S. official recently proclaimed that the United States and other countries have "frozen more than $150 million . . . of 'terrorist assets'

in the global anti-terrorism fight since 2001."[89] With such seizures in mind, it could easily be asserted that global surveillance of monetary transactions—particularly of the illicit variety—is at an all-time high. This would suggest that terrorists are being squeezed of funds, and thus the "financial oxygen" that sustains terrorist activity is nearly depleted.

Unfortunately, however, the reality is more complicated. As noted at the beginning of this chapter, terrorism is attractive—and has always been attractive to discontented groups—because it is a particularly inexpensive form of violence (or war). For instance, suicide bombings, which have become increasingly common worldwide since 1979, are uniquely inexpensive. "The improvised explosive devices worn or carried by a suicide bomber, for example, can cost less than $150 to produce. The bombers themselves are expendable assets."[90] The more costly part of the operation is the preexisting organization that must recruit, indoctrinate, and guide the suicide bomber through the operation.

In addition, when they do require larger sums of money, terrorists are extremely versatile and creative. The 9/11 Commission recognized this fact when they stated: "Though progress apparently has been made [to attack terrorist financing], terrorists have shown considerable creativity in their methods of moving money. If al Qaeda is replaced by smaller, decentralized terrorist groups, the premise behind the government's efforts—that terrorists need a financial support network—may become outdated."[91] The Commission also noted, as described above, that many terrorist operations can simply be self-funded without sophisticated reliance on outside contributors or elaborate money-making schemes: ". . . some terrorist operations do not rely on outside sources of money and may now be self-funding, either through legitimate employment or low-level criminal activity."[92] In addition, as noted earlier, terrorists are reverting to more fundamental methods of transferring money, such as enlisting informal value-transfer systems, engaging in bulk cash smuggling, or simply transferring "value" anonymously via e-cash (or e-gold) on the Internet. Further, as money laundering regimes become more advanced in rich, developed countries (and even moderately wealthy developing countries), terrorist organizations always have the option of turning to "less governed spaces"—in other words, operating in those areas of the world outside the purview of governments and financial regulators.[93]

However, it is also clear that increasing global scrutiny of financial transactions does have an impact. Among other things, it reduces terrorists' functional space; it requires them to operate in less convenient areas of the world, areas where they may become vulnerable to law enforcement intervention or areas from which terrorist operations—particularly those aimed at developed countries—are much more difficult to execute. What should be recognized and acknowledged, however, is the fact that

terrorism is a complex, political phenomenon that cannot be simply eliminated by starving terrorists of their money. Countering terrorism in the long term will still require that governments honestly and forthrightly take on those sensitive questions or issues that provide the "political oxygen" of international terrorism.[94] Unless that reality is confronted honestly, terrorists will always find a way to fund their operations.

# CHAPTER 10

# ORGANIZED CRIMINAL NETWORKS AND TERRORISM

J.P. Larsson

In a dark corner of Room 101 in Britain's New Scotland Yard, behind more or less gruesome exhibits and a range of weapons used on the streets of London, is a glass cabinet dedicated to "terrorism." True, many of the other exhibits—from forged identification documents and currency to weapons and tools of torture—have also been used for terrorist purposes, but this small exhibit is the only one dedicated purely to terrorism. Inspector Beaton's bloodstained jacket, for example, worn by the police officer as he was shot in the line of duty protecting the Royal Family in 1974, together with other items in this dark museum—such as the exploded remains of police helmets—testifies both to the importance terrorism plays in our lives and to its links with the criminal underworld. The "tools of the trade" on display illustrate that organized criminal networks have had a long-standing flirtation with terrorism. Nail bombs and assault rifles nestle together with narcotics and blindfolds used for kidnaps and abductions.

Despite the common means and methods shared by terrorists and criminal organizations, the traditional view of law enforcement has been to treat the two as completely distinct and separate, and this has in turn led to two disparate responses by government bodies, law enforcement agencies, and academic scholarship. The way to combat both terrorism and organized crime may, however, be to treat them as very similar concepts. Indeed, as the Black Museum (as this commemoration to crime in London is called) at the Metropolitan Police in London illustrates, the two have at times converged to the point of being inseparable. At other times, of course, they are quite distinct, and provision needs to be made to understand this. The move from two separate concepts to

an inextricably linked symbiotic relationship poses a problem for law enforcement agencies, as both structures and procedures have differed depending on legal considerations.

This chapter will look briefly at these issues, by first offering a brief overview of the subject of organized crime, taken quite separate from terrorism, and then exploring some of the similarities between them, how the two interact, and what the law enforcement response is and can be. Finally, some thoughts about how both terrorism and organized crime can be countered in the twenty-first century will be offered.

## ORGANIZED CRIME

Organized crime has for a long time tickled the fantasy of the public by fictional—or semifictional—accounts of con men, gangs, mobs, and mafias. The mass media, similarly, is fond of describing the war that is being fought on our streets by organized criminals, often armed better than law enforcement officers, and the amount of money it costs society. As with any fictional accounts there are always some truths in these stories. Organized crime does exist and is big and dangerous business, estimated by some reports as having annual revenues of up to US$1,000 billion.[1] Due to the very nature of organized crime, it is of course impossible to analyze its economic impact to any degree of accuracy, but some observers put money laundering alone as the third biggest revenue-producing business in the world after foreign exchange and oil. In the United Kingdom, the Serious Organized Crime Agency (SOCA) estimated at its creation in 2006 that the economic and social costs generated by organized crime varies from around £20 billion per year—or more than £300 for every person in the country—to around £40 billion (approx. US$75 billion).

Although serious and organized crime defies definition (almost as much as terrorism), every society has some sort or "organized" crime, from the "Yakuza" groups in Japan to the Chinese "Triads" and the well-known Italian Mafias. Some organized criminal networks are so well known that their name becomes synonymous with organized crime, even when not directly referring to that group. Such is the case with the Sicilian Mafia, only one of the four largest organized criminal networks in Italy (the others being the Camorra, the 'ndrangheta, and Sacra Corona Unita), which has lent its name to a host of nonrelated organizations. It is not uncommon to hear about the "Russian Mafia" or the "Albanian Mafia," for example. While this makes it easier for the media and the public at large, it is not helpful for practitioners, as it does not differentiate between important historical and methodological differences.[2]

While definitions of organized crime may elude academics and researchers, practitioners would agree that there is a range of "types" of organized crime including drug traffickers, extortion rackets, prison gangs,

motorcycle gangs, people traffickers, arms smugglers, white-collar crime, blue-collar crime, financial or violent crime, cyber crime, pedophile networks, sexual organized crime, and, yes, terrorism (as will be explored later). There is also some consensus about *what* constitutes organized crime, and includes (but is not limited to) activities such as money laundering, trafficking and trade in a range of goods (including drugs, human beings, arms, art and cultural objects, animals, vehicles, and body parts), extortion, kidnapping and serious violence, prostitution and gambling, protection rackets, loan-sharking, counterfeiting and forgery of documents and currency, fraud as well as corruption of officials. The list could go on, and not all organized criminal networks are involved in all (or even most) of these.

The primary motivation for all this is two-fold and interlinked—financial gain and power. This is of course the same for "ordinary" criminals, but what sets them apart from organized criminals is the group structure of such networks. That is, organized criminals are not merely individual criminals who interact with other individual criminals, but they work together in a defined structure for longer than just one crime. The precise definition of organized crime may not be necessary in this chapter, especially as the academic (primarily within disciplines such as criminology and sociology) and law enforcement literature on the subject is extensive. For further reading, one of the best recent overviews of the issues, including definitions and types of organized crime, may be Alan Wright's *Organized Crime*, which also has some relevance for practitioners in the subject.

Organized crime has a corrosive effect on the communities in which it happens, because it is often linked to violence, intimidation, and corruption. It can undermine legitimate business, and generates criminal capital that is likely to be used in future enterprises. In addition to this, it knows no international boundaries and is therefore sometimes known as transnational organized crime. This may, however, be a label which does not help in understanding it, as by definition it is above local level crime. In today's shrinking world, organized criminal networks therefore do not only cross police and judiciary boundaries, but also international borders. As such networks often impact on many law enforcement jurisdictions, successfully combating them and reducing the harm they cause to society is very difficult. Both terrorism and organized crime further undermines the state structure, making them "transnational" by definition.

Organized criminal networks are becoming more sophisticated, and moving away from merely being "street gangs" or mobs to being refined corporations, making informed decisions about which countries offer environments most likely to maximize their profits while minimizing their risks. A number of political, economic, and primarily technological changes have facilitated this change. Amongst these are the obvious improvements in communications and transport technology, which also

(together with public transparency through various Freedom of Information legislations) has led to an increase in information about law enforcement methodologies and powers. Other reasons include the worldwide breakdown of totalitarian regimes and the emergence of liberal democracies, with their standards of market-oriented economies, which has led to the development of global markets, the progressive removal of border controls and free trade agreements, as well as the associated deregulation of financial systems (leading to greater ease of action by those who exploit the systems). These factors have led to a substantial increase in the economic power and political influence of organized criminal networks worldwide, which now operate globally and interact with other networks by exchanging information where mutually beneficial.

## SIMILARITIES AND DIFFERENCES BETWEEN ORGANIZED CRIMINAL NETWORKS AND TERRORIST GROUPS

There are, of course, both conceptual similarities and differences between terrorism and organized crime. In short, there are two main ways in which terrorism and organized criminal networks interact. The straightforward interaction relates to the involvement of international terrorist organizations in organized criminal behavior, and includes involvement in the international trade and trafficking of drugs, weapons (including weapons of mass destruction), explosives, and human beings, as well as a range of financial activities from funding to money laundering that could all be subsumed under the umbrella term "terrorist financing." The other main strand of interaction is where no real distinction can be seen, and activities are conducted "jointly" or using the same structures.[3] This relates mainly to the use of specialist professionals, such as accountants, bankers, forgers, and counterfeiters, as will be explored later in this chapter.

As has been highlighted elsewhere, both in this volume and others, terrorism often eludes direct definition and conceptualization, as is the case with organized crime. Observers of terrorism, however, generally belong in either of two camps; one explains terrorism as warfare and the other as a crime.[4] Depending on one's viewpoint, therefore, terrorism is either an act of war or an illegal act. To an extent, the question of motivation and reward influences in which camp a particular terrorist act or organization fits. A political (or even a socioreligious) objective, such as the fight against an oppressive regime, would—by using Carl von Clausewitz's oft-cited dictum that war is merely the continuation of politics by other means—make a violent act an act of war and terrorism therefore a type of warfare. Purely monetary motives, such as those pursued by serious and organized criminals, would make their violence criminal acts and as such punishable by law. Terrorists are normally motivated by political goals and objectives, and not purely by financial profit. When financial status and gain becomes

more important to terrorists, their "special status" as terrorists is removed and they are undoubtedly organized criminals.

If considering a linear spectrum of activity, with all-out war at one extreme and "normal" crime at the other extreme, a more likely interpretation of terrorism and organized crime is that they meet somewhere in the middle. This would facilitate an understanding as to the similarity between the two concepts, and why they are often confused.

The crux of the matter is that the response to terrorism, namely counterterrorism, depends on whether terrorism is seen as an act of war or a criminal act. For the United States, for example, the events of September 11, 2001 might have changed terrorism from being regarded as a criminal activity into an act of war. The wider issue of whether this was a knee-jerk reaction or a thought-out policy change may for the present purposes be irrelevant. Of importance, however, is the reaction this forced. While special weapons and tactics may also be used against organized criminal networks, such an armed response may appear trivial when compared to the military deployments in a *war* against terrorism. The tactics available to law enforcement agencies tackling the activities both of organized criminals and terrorists are further influenced by the motivation of the criminal/terrorist networks targeted. As explained later in this chapter, law enforcement priorities sometimes conflict, and whereas a "war on terrorism" may give access to unprecedented levels of resources, it might at the same time remove those resources from countercriminal activities, as has been the case since 2001 with the U.S. involvement in places like Afghanistan.

Motivation is often crucial in the recruitment of individuals into terrorist groups and organized criminal networks. One type of motivation comes from intense loyalty, as both types of organizations tend to recruit individuals from the same (or known) familial or ethnoreligious backgrounds. There are many reasons for this, the strongest amongst these being the need for a high level of trust throughout any clandestine organization. It is easier to ensure the integrity of the group if everyone (or at least everyone in a position of status) speaks the same language, comes from the same country or town, or belongs to the same family. Such close unity hampers law enforcement attempts to use human intelligence, by infiltrating such groups. Beyond this dimension, however, the similarities of recruitment-related motivation end, as organized criminal networks are more likely to be driven by pure financial gains and desires of power, while terrorists may often be driven by a "higher" or altruistic goal, such as the riddance of an oppressive or ideologically different government. There may be no overarching ideology that binds organized criminals together, but *trust* is nonetheless of fundamental importance. However, where there are no higher motives, infiltration using greed as a bargaining chip will be easier.

While there are somewhat "altruistic" organized criminals, their motivation is much like that of a mercenary in war: the cause is not of as much importance as the reward. Despite this, it would be too simplistic to consider motivation to be the only difference between organized criminal enterprises and terrorist networks. It is quite clear that the two enjoy a separate but mutually beneficial existence. This extends from the various links between people, activities, techniques, and methods needed as both have the need for similar resources as they operate outside of the law. Particularly in terms of counterfeit documents (for uses such as travel, identification, and shipping/transport) and in terms of money laundering and other types of financing, both organized criminals and terrorists often even use the same specialists (such as bankers, accountants, solicitors, and real estate agents), although these professionals may not be either organized criminals or terrorists, as such. While they are often criminals by virtue of what they are willing to do when they know the origin of the funds, they are not often on the sole payroll of an organized criminal network. At times such professionals may even be entirely "innocent" of crimes in that they are being used by criminals without knowing where the funds originally came from. Improvements in legislation and standards governing the "regulated sector" aim to tackle this, primarily with the use of suspicious transaction reporting to, for example, SOCA in the United Kingdom and AUSTRAC (Australian Transaction Reports and Analysis Centre) in Australia. Such regulations ensures that banks, realtors, and solicitors are obliged to report any suspicious financial activity by their customers, and in so doing also protect themselves.

Perversely, law enforcement efforts targeting the finances of terrorists, and in particular terrorist fund-raising, has forced such groups into the realm of organized crime in order to generate revenue, where criminal groups traditionally dominated. Whilst terrorists often dabble in organized crime, primarily in terms of raising funds for other activities or hiding the tracks of their acts of terrorism, it is for some groups becoming second nature at times to the extent of being their sole perceivable motivation. Where raising funds, and other criminal activities, appear to be the main goal and motivation the distinction between terrorism as a phenomenon in itself and organized crime is often inextricably blurred, as explored above.

The reverse is similarly true, where organized criminals employ terrorism to get to particular goals, especially when creating fear is of importance, when recruiting or enforcing a debt. At times, organized criminal enterprises appear to exist solely to create a state of fear and uncertainty in the societies within which they operate, and profit seems to be secondary. Whilst the motivation of using fear and "terrorism" to heighten the status and power of such groups may be entirely compatible

with criminal activities, it is nonetheless also further blurring the line between organized crime and terrorism.

There are also more formal uses of terrorism by criminal networks, seen most clearly and commonly in what is frequently called "narco-terrorism." Drug cartels (like the Mendellin and Cali cartels in South America) or traffickers (as the Afghani/Pakistani warlords) employ the methods of terrorism to run their operations which have purely criminal motivations.[5] This makes it clear that motivation is often a good rule of thumb when differentiating between them. However, even this distinction is often blurred, where the mutual benefit may be the only clear motivation. For example, there have been several instances where the same training camps have been used by both types of group (for example in the Libyan desert, in South America and across Central Asia). Another example of mutual benefit can be seen in the relationship between al Qaeda and the Taliban, both of whom derived considerable revenues from poppy cultivation in Afghanistan. Of course, as has been noted elsewhere, methods and techniques, as well as the use of professionals, does not necessitate direct contact between terrorist networks and organized criminal networks.[6] With widely accessible information on the Internet and other public media, "best practice" and intelligence sharing networks are not confined to the law enforcement community, but can be exploited by criminals, terrorists, researchers, and analysts alike.

At times, seemingly contradictory liaisons are formed, such as the praise lauded on al Qaeda by American white supremacists following September 11, 2001, or al Qaeda's approach to the Cosa Nostra of Italy to purchase counterfeit U.S. passports prior to those attacks.[7] Sometimes, of course, the benefit is not explicit and organized criminals exploit the legislation and cooperation between countries aimed at disrupting both organized crime and terrorism. The introduction of a common European currency (the Euro) has, for example, facilitated the activity of laundering bulk cash across the continent,[8] in particular in terms of buying real estate and thus placing and layering criminal proceeds.

Many terrorist groups will also use the experience they have gained through their terrorist activities to provide support for others, and in doing this they are taking on a role more closely aligned with organized crime. The Italian Economic and Financial Police assesses that al Qaeda's role in Europe is now primarily as a "service provider" for affiliated Islamic terrorist groups, principally in terms of providing stolen or counterfeit travel and identity documents, safe housing, recruitment (and training) of manpower, and fund-raising, often by a range of criminal activities.[9] Such activities are more commonly associated with organized crime than with terrorism.

At practitioners' levels, some work has been done to investigate the extent and similarities, including direct connections, between serious

organized crime and terrorism. To a large degree this is attempted in order to enable disruption and undermining of both types of groups by using the experiences and tactical capability of law enforcement agencies dealing with either. Researchers have also identified a number of similarities, where the two concepts are virtually indistinguishable, such as both being comprised of rational actors who use violence (often extreme) and intimidation (including threats of violence) to further their ends. Physical violence extends to kidnappings and assassination for both groups and both also use financial extortion and blackmail. The organizations are made up in cell-structures, with leaders and their deputies controlling various henchmen, some of whom have specialized roles within the networks, and who find it is extremely difficult to leave the group they are part of. Both types of network are knowledgeable and innovative, and often extremely flexible in terms of adapting to new working practices. Included in this is the resiliency of both types of organization, and their knowledge of law enforcement techniques, capabilities, and jurisdiction and their conscious efforts to avoid detection and disruption. In addition, both types of network work across international boundaries and a minority of them are even sponsored by states.[10]

As noted earlier, therefore, the relationship between organized crime and terrorism is often taken as implicit by observers and practitioners. It appears as a given both in academic and fictional writing, not to mention in professional knowledge, especially during the past two decades. In recent years, very little thorough analysis of the convergence between terrorism and organized crime has been attempted. Notable exceptions may be Tamara Makarenko's efforts at analyzing this crime-terror nexus, which although being academic nonetheless provides some interesting further reading for the practitioner, and research by Chris Dishman and Thomas M. Sanderson.[11]

## LAW ENFORCEMENT RESPONSE

In today's world, where terrorist groups use the tried and tested methods of organized crime and organized criminal networks do not shun tactics which would be classed as terrorism, we sometimes find it difficult to see them as separate phenomena. One problem is the old issue of definition; another, that both sides consciously employ the knowledge and experience of the other for their own gains, thus blurring the distinction further. Sometimes the difficulty of differentiating the two leads to problems of how to deal with a particular event or group; should it be the antiterror police or the organized crime police that deal with the mafia, for example? This issue becomes more fundamental in countries where the judiciary sets the legal parameters within which different agencies can deal with these "different" problems.

However, although law enforcement agencies around the world are faced with such dilemmas, the similarities and differences between terrorism and organized crime may, in fact, be used as an advantage in combating both. This argument will be highlighted at the end of this chapter, after an outline of the relationship between organized crime and terrorism, and the problems faced by law enforcement agencies in relation to this.

Law enforcement response to both terrorism and organized criminality is by definition difficult. There are many reasons for this, although there are two main difficulties, both relating to structure—the structure of law enforcement and the structure of organized criminal groups and terrorist networks. In the case of the latter (the structure of the kind of networks this chapter is concerned with, as opposed to lower-level, "normal" criminals), both organized criminal networks and terrorist groups tend to be closely knit, which serves to frustrate law enforcement efforts. The closed structure of both criminal and terrorist networks often leads to a very effective cell-structure, where communication is one-way and limited knowledge is only shared to trusted contacts, in order to minimize the risk of disruption by law enforcement agencies. Working with outsiders poses a risk, but organized criminals and terrorists use similar methods to manage such risks, for example by using intermediaries, taking the advice of referees, or working only with people who share their backgrounds. Such tried and tested methods make law enforcement opportunities of infiltration, both in terms of covert human intelligence sources and undercover officers, more difficult.

While organized criminals often tend to be oriented along such lines of similar background, primarily in terms of family, ethnicity, or linguistic background, terrorist groups often have a further criterion—namely, complete commitment to the cause, as highlighted earlier. This makes it extremely difficult for the law enforcement community to infiltrate these groups even if some sympathy for their cause can be feigned. On the other hand, infiltration in the opposite direction has, traditionally, also been the case, with organized criminal groups finding it easier to infiltrate law enforcement agencies and corrupting officials than their terrorist "cousins" can. Part of this is due to the power of money, with greed being a more dominating factor than sympathy for the cause in many circumstances, particularly for the "non-committed." In addition, vetting and security clearance checks have historically focused more on terrorist links than links to the organized criminal fraternity. It must be noted, however, that terrorists are picking up some of the tricks of the trade and learning from the experiences of the organized criminal networks in terms of corrupting officials for their own purposes. In addition, the more the distinction is blurred and terrorist networks are transformed into criminal enterprises, the potential for corruption is increased, but so are also the possibilities of law enforcement infiltration. It should be stressed here, however, that

while corruption is not essential for organized crime to exist, it has undermined much of the law enforcement effort against such crime worldwide.

The second structural difficulty that makes disruption of terrorism and organized criminal networks difficult is that law enforcement agencies in these areas have traditionally been operating in two separate "silos." This has led to a range of challenges, some of which are only recently being addressed. Between these silos there have been different mind-sets and separate processes that have led to a reluctance to share intelligence or effectively work to bridge the divide. The cultural differences between the two silos remain, which at times have had disastrous consequences where serious criminals and terrorists have not been stopped in time. The silos work in similar (albeit separate) ways, with greater attempts at trying to *understand* the terrorists and serious criminals by proactive and intelligence-led policing, whereas investigation of "normal" crimes (even murders) usually involves more reactive policing.

The different responses in combating organized crime and terrorism are also rooted in law. This has led to the need to have separate processes which, by virtue of being enshrined in law, often have very little overlap. Law enforcement agencies set up to combat organized crime have thus had a very different legal jurisdiction from those focusing on terrorism. At times this reluctance to encroach on the other's territory has led to serious failing, where both criminals and terrorists have slipped through the net.

There is some rationale behind such separation, however, from a historic perspective. The key challenge of not wanting to share sensitive intelligence stems from the fact that in many cases police officers dealing with crime have lower security clearance than their law enforcement colleagues dealing primarily with terrorism. Keeping the two apart, therefore, minimizes the potential for compromise, as the less-cleared officers dealing with crime are considered more susceptible to bribery or other forms of corruption. In addition, the very different methods employed against terrorists and against organized criminals have been possible without infringing too much on human rights.

There are, of course, instances where the two disparate law enforcement responses have traditionally converged, and relied upon the expertise of the other, and this is often seen in terms of targeting the finances of organized crime groups and terrorist groups. The lessons learned from this collaborative working may well serve as a blueprint for future cooperation. Law enforcement agencies dealing with organized criminal networks have a long and distinguished record of intelligence-led investigations. This is particularly true in terms of tracing the finances of such groups.

In terms of serious and organized criminality, policing has been successful in targeting the whole range of criminal finances, from criminal funding to the transfer and laundering of profits. It is also an area where,

traditionally, antiterrorist law enforcement has cooperated with criminal law enforcement combating serious and organized crime as mentioned earlier.

In some countries, this cooperation has led to a more concerted "joint" approach, such as the multiagency Terrorist Finance Unit in the United Kingdom, which (though housed in the Serious Organized Crime Agency) combines the law enforcement expertise from both sides of the divide, as well as from the private sector. The importance of multiagency coordination in this field cannot be underestimated, and is recognized by such multilateral institutions as the European Union and the United Nations. In some countries, new and amended legislation provides for proceeds of crime and money laundering legislation to be extended to terrorist offences, particularly in terms of freezing assets. Besides the usual means of prevention and suppression of terrorism, a recent change in Italian law, for example, rules that those asset seizure measures used in the fight against the mafia can also be applied to international terrorism,[12] as is the case with the antiterrorism acts and proceeds of crime legislation in the United Kingdom.

Serious and organized criminality and international terrorism do not respect international borders or agreements restricting or enabling the movement of goods and people between countries. Combating the financing of these two phenomena, therefore, requires collective and coordinated international action. The main problem with this has been the reluctance to share intelligence and operational resources between countries or allow foreign agents to operate within each other's country. The international law enforcement liaison officer networks, which are in many respects in their infancy although long-established in terms of time, may be a possible solution to sharing both information and to enable joint operational coordination.

In order for these liaison networks to function successfully in denying organized crime and terrorism of their much-needed money, a three-tier approach may be necessary. First, there needs to be the capability of imposing *sanctions* in a foreign country, such as cutting off the money flows to individual criminals and terrorists as well as their groups. Secondly, international *standards* are necessary to stop such illegal financing. This may relate to money laundering regulations, where countries can assist each other with "best practice" and training. Finally, the liaison officers are in an excellent position to facilitate the *technical assistance* to help countries develop the measures and infrastructure necessary to root out the financing of terrorism and organized crime. Multilateral institutions for cooperation, such as Europol and Interpol, have combined legal jurisdictions for both terrorism and organized crime, and have been instrumental in getting member countries to cooperate and share intelligence and operational capabilities.

In many countries, such law enforcement cooperation has already led to a consensus that targeting the finances of both organized criminals and terrorists may be the best way to disrupt their activities. This conclusion has been reached as the upper tiers of such networks—the leaders "mafia dons" and planners—rarely put themselves in the path of law enforcement and keep out of the limelight, merely reaping the profits of the illegal activities that their subordinates commit. Traditional law enforcement, whether reactive or proactive, has failed to reduce the harm caused by such groups, as it has targeted the lower ranks. However, by targeting the finances directly, the terrorists and organized criminals are struck where they feel the impact the most. The need for funding is the main link between the two concepts, and this is the "weakness" needed in combating both. The distinction may therefore be irrelevant for successfully disrupting their activities and reducing the harm they cause. The sooner the international law enforcement community realizes that organized criminal networks and terrorist groups use each other for financial reasons, the sooner problems of cooperation may be ironed out.

The G7 (then, now known as the G8 with the permanent addition of Russia in 1998) established the Financial Action Task Force (FATF) in 1989 as an independent body with the explicit aims of examining the trends and techniques of money laundering, and it was furthermore tasked to make recommendations on how to combat it. The recommendations were originally not binding on states, but many countries incorporated these into national legislation, thus making them obligatory. While the FATF, and its recommendations, has been criticized in some quarters (notably in the U.S. media), primarily on human rights and privacy grounds, its recommendations continue to provide an anti-money laundering framework. In 2001, the FATF mandate was expanded to include the monitoring of activities set up by the member states to prevent and combat the financing of terrorism.

Legislation aimed at targeting the finances of both terrorism and organized criminals, whether multilateral such as the FATF or domestically like the USA PATRIOT Act (or Executive Order 13224, providing for the freezing of assets) or the Proceeds of Crime Act in the U.K., all have one major failing. Both organized criminal networks (and in particular those that traffic their goods across international borders) and terrorist organizations rely heavily on informal banking systems such as the *hawala* or Black Market Peso Exchange, which are unregulated networks enabling money to move between countries without leaving any tracks.[13] Once the proceeds of crime, or financing for it, enters the legitimate banking system (by purchase of airline tickets, goods, or real estate), there is an opportunity to track it and thus target the perpetrators indirectly. It is at this point where money laundering and financial industry regulators, as described above, are of vital importance in highlighting when funds may be from

illegitimate sources, such as the proceeds of crime or money being laundered.

Joint working is also further complicated by differing priorities, especially noticeable between counterterrorism and counternarcotics work. Even in Afghanistan, which may be one of the most obvious contemporary examples of combined terrorism and organized crime, the U.S.-led efforts are hampered by such competing priorities. While the allied governments have pledged support for counternarcotics initiatives, much of the hardware needed (even down to helicopters) is controlled by the military, who needs to prioritize their counterterrorist undertakings. Cooperation regarding counternarcotics strangely finds itself stuck *between* organized crime and terrorism on the linear perspective raised above, with clashing priorities. With relation to Afghanistan, the Joint Narcotics Analysis Center (JNAC), which draws together a range of British and American military and law enforcement agencies, including intelligence agencies, may be a step in the right direction.

## CONCLUDING THOUGHTS

We have seen in this chapter that organized criminal networks permeate every section of society throughout the world. The harm they cause to society is immense, and while organized crime may not play to the media's and public's imagination as much as terrorism, it may be as significant. In addition, the two phenomena are at times so similar as to defy distinction, and this may be exploited by law enforcement agencies that have traditionally been distinct entities, singing from different hymn sheets. Increased operational cooperation and intelligence sharing may be vital to combat these banes of the modern international arena. The similarities and direct links between organized criminal networks and terrorism remain important areas for research on an academic level and as intelligence gaps that need filling on a practical level. High-level agreements to cooperate—such as the joint meetings by the G8's so-called Group of Lyon (organized crime) and Group of Rome (terrorism), which have developed a joint action plan to combat terrorism—continue to be important steps in realizing the links between organized crime and terrorism. Lower-level collaborations between law enforcement agencies themselves also continue to be important, but are sometimes hampered by bureaucracy.

Moving organized crime and terrorism away from the middle of the linear interpretative spectrum, toward dealing with both as crimes (albeit rather different than street-level crime), may not only offer scope and opportunity for further cooperation and joint working between law enforcement agencies (both within countries as well as between them), but it may also reduce the harm caused by organized criminal networks. This has been attempted historically, with ambiguous success. While it has not

solved all the problems, the decision to let the police take over from the military as the main law enforcement body in Northern Ireland during the early 1970s consciously moved many acts associated with "the Troubles" away from being war to being criminal issues. Terrorists (and insurgents who use terrorism) can sometimes muster local support, but with few exceptions organized crime usually cannot.

As with terrorism, learning to understand how organized criminals operate, and how to best disrupt their activities, can only be achieved with cooperation and intelligence sharing on a practical level, and by not heightening their stature in conceptual terms. The "organized crime" label can diminish a terror group's "legitimacy" among its support base, as was seen with the Ulster Defence Force (UDF) in Northern Ireland, after the Cook Report showed that they were primarily criminal thugs. Although terrorists rarely call themselves "terrorists," other terms are used to legitimize them and heighten their status. If describing them as mere criminals they lose this legitimizing self-justification, and if they rely on fear *sine qua non*, they also lose their impact on the societies within which they operate. However, law enforcement can of course take advantage of public fear of terrorism to heighten security and therefore more successfully target such groups and individuals. Likewise, although the public perception of organized criminal networks may be inadvertently heightened if they are considered as terrorist groups (to be feared), law enforcement efforts can also capitalize on such mislabeling. If organized criminals perceive themselves as more than just profit-seeking gangs, they are more likely to seek attention for their violent and criminal acts than traditional organized criminals (with their codes of silence, such as the Mafia's *omertá*). This presents opportunities for law enforcement agencies to target them, or at least obtain leads into their organization that can be exploited by a range of techniques including covert human intelligence.

Where there are direct crossovers between terrorists and organized criminals, such as the use of the same professionals (as highlighted above), law enforcement is presented with new opportunities that can be exploited in order to disrupt such networks. Any chain is only as strong as its weakest link, and law enforcement efforts could be focused on the points where the cell structure of both organized criminals and terrorists are undermined by relying more on outsiders. As organized criminals and terrorist networks continue to overlap, and as the distinction may inevitably blur to the point of the two being inextricably linked, law enforcement agencies around the world must be prepared to accept that jurisdictions may also need to overlap, and that working in silos may not be the most effective way of combating the most serious criminals (including terrorists) today. It remains to be seen whether law enforcement and intelligence officers on both sides of the divide can accept this challenge and

develop working methods of combating organized crime and terrorism in the twenty-first century.

# CHAPTER 11

## THE GLOBAL DRUG TRADE AND ITS NEXUS TO TERRORISM

Gregory D. Lee

Drug trafficking is a multibillion-dollar industry that is conducted worldwide. Controlled substances are frequently used as a means to fund terrorist activities. Many of the methods of operation used by international drug cartels are mimicked by transnational terrorist organizations to further their political agendas. This chapter will examine not only the global drug trade, but also its nexus to international terrorist organizations, and the traits these organizations share.

There should be no wonder why drug trafficking reaps many billions of dollars in profits. Each year, according to the United Nations Office of Drug Control, there are some 185 million illicit drug users around the world. Of that 185 million, 25 million drug users reside within the borders of the United States. Americans alone spend approximately $65 billion per year on illicit drugs[1] but the costs to society from drug consumption far exceed this amount. According to a recent White House report, illegal drugs cost the U.S. economy $98.5 billion in lost earnings, $12.9 billion in health care costs, and $32.1 billion in other costs, including social welfare costs and the cost of goods and services lost to crime.[2] Current seizures of drug proceeds by all law enforcement agencies combined are estimated at less than $1 billion per year, amounting to less than 1 percent of the illicit drug market.

For many years heroin, cocaine, and marijuana have been the top three varieties of illegal drugs abused in consumer nations. Many other drugs have emerged over the past forty years, but these three have remained the most popular. Club drugs, such as ecstasy, katamine, and gamma hydroxybutyrate (GHB), have become popular in the United States and Europe

within the past few years, and they illustrate how quickly emerging drugs can take hold of certain segments of the population.

People have used drugs in one form or another for thousands of years. The reason is simple: Drugs make them feel good and alter their sense of consciousness. Unfortunately, the same drugs that provide euphoric effects can be highly physically and/or psychologically addictive. They are illegal to possess, use, or distribute because of the destruction they cause to individual users and to society as a whole. International treaties make drug trafficking a universal crime.

## DRUG SOURCE COUNTRIES

### Colombia

Arguably the most prolific drug traffickers in the world are from South America's oldest democracy: Colombia. Unquestionably the primary source of cocaine in the world, Colombian traffickers also have expanded to the heroin trade. Colombia produces the most commonly used variety of heroin found in the United States, predominately in the Northeast.

Cocaine trafficking organizations initially relied heavily on Bolivia and Peru to supply coca leaves (an essential ingredient) for their cocaine processing laboratories; however, over the past decades they have stepped up production of their own coca bush to eliminate the need to rely on foreign production. The amount of cocaine produced annually in the jungles of Colombia is staggering. Several 300-ton seizures in recent years have had no impact on regional or world wholesale prices. The vast majority of the finished cocaine hydrochloride finds its way through well-established smuggling routes in both North America and Europe. Despite their best efforts, law enforcement authorities worldwide seize only a fraction of the cocaine produced in Colombia.

As cocaine use declined heavily in the United States during the early 1990s, shrewd Colombian traffickers expanded their market to Europe. Until then, cocaine had been relatively unseen in Western Europe while America's streets had been flooded with it. Multiton seizures of cocaine in Europe are now commonplace. Colombian heroin is one of the most potent and pure that can be found anywhere in the world. Using well-established cocaine smuggling routes, Colombian drug traffickers have successfully introduced this type of heroin into the United States. In doing so, they have expanded their drug trafficking trade and made up for lost profits due to the decline of cocaine use.

Most Colombian cocaine is now smuggled into the United States through the interior of Mexico after vessels, many of them "go-fast" boats (similar to speed boats used in racing, and equipped with additional fuel

tanks), have off-loaded their multiton cargo on its shores. Colombian traffickers for years have paid Mexican smugglers to transport huge amounts of drugs through that country and then piecemeal it into the United States by land vehicles over Southwest border crossings. Within the last 10 years, however, Mexican smuggling organizations have demanded product instead of cash for payment of their services, and they have now grown into formidable cocaine trafficking cartels in their own right. Because Mexico does not produce coca leaves to produce cocaine, the cartels must rely on Colombia for their finished product.

### Mexico

Besides having the distinction of being the main conduit of cocaine into the United States, Mexico has been a longtime source of supply for marijuana, heroin, and methamphetamine. Because of their long partnerships with Colombian drug traffickers, Mexican criminal organizations have in their own right grown into large and powerful criminal organizations. Corrupt police and government officials, including the military, have willingly aided them. Although corruption has waned in recent years, it often explains why drug traffickers have remained largely untouched by the Mexican judicial system and operate freely throughout the country. A variety of heroin known as "Black tar" is produced exclusively in Mexico and exported to the United States, where it has been popular primarily on the West Coast and in the southern border states.

Most of the marijuana grown in Mexico is also smuggled into the United States, almost exclusively by land. Because the Bureau of Immigration and Customs Enforcement (ICE) only has the resources to inspect approximately 2 percent of all incoming cargo, it is obvious why Mexico is the main conduit for a variety of drugs entering America. With increased emphasis on illegal immigration and terrorism prevention, ICE is improving its capacity to inspect cargo entering from Mexico.

At one time, outlaw motorcycle gangs controlled the U.S. methamphetamine market; however, Mexican drug organizations undercut these gangs and now produce the vast majority of methamphetamine abused in the country. Although many clandestine high capacity methamphetamine laboratories can be found throughout the United States, they are usually manned, supplied, or somehow connected to Mexican national traffickers.

### Bolivia and Peru

Bolivia and Peru supply almost 30 percent of the coca bush needed by Colombian traffickers to manufacture cocaine. Criminal organizations from both of these countries have always competed directly with Colombian cocaine traffickers, but they only control a small fraction of the total

market. Much of the coca bush produced in Peru and Bolivia is used for domestic consumption. Peruvian and Bolivian nationals have chewed the coca leaf for centuries to ward off the effects of high-altitude sickness. U.S. eradication efforts in these countries have had a direct effect on the total amount of coca leaf produced annually, but recent changes in the political leadership of Bolivia may change that.

### Golden Triangle

Thailand, Burma, and Laos comprise the Golden Triangle. Second only to Afghanistan, these countries produce an enormous number of Papaver somniferum L., or opium poppy plants, to fuel heroin laboratories in Southeast Asia. The growers are powerful enough to employ private armies to protect their fields and assets from government intervention.

Thai nationals are proud of their flour-like heroin, and they place their particular multicolored brand name logos on the plastic packaging containing the drug. Double-Uoglobe, Tiger, and Lucky are a few of the established brand names. Thais sell heroin in units that are 700 grams in weight, as opposed to traditional kilogram (2.2 pound) amounts. Only about 5 percent of heroin abused in the United States now comes from Thailand. The market share was once as high as 20 percent; however, as mentioned above, Colombian heroin has captured much of the market previously held by Thailand.

Thai nationals are the primary traffickers of heroin and marijuana that is produced in the Golden Triangle. A popular variety of marijuana grown and marketed in the area is known as Thai Sticks. The marijuana, however, could have actually been grown in Cambodia, Laos, or Vietnam. With the popularity of methamphetamine abuse in the United States, Thai nationals have recently begun exporting methamphetamine tablets to the United States after realizing huge sales success in Southeast Asia, Korea, and Japan.

### Golden Crescent Region

Afghanistan, Pakistan, and Iran make up the Southwest Asian region known as the Golden Crescent. Before the U.S. Global War on Terrorism, Afghanistan was the single largest opium-producing nation on the planet. Since the war, production has almost returned to prewar levels. Eradication efforts and crop-substitution programs have so far failed to reduce the country's opium production. About 90 percent of the opium produced in Afghanistan is smuggled into Turkey, where Turkish heroin laboratories supply addicts in Western Europe and Great Britain. Only a small percentage of opium produced in the Golden Crescent is converted into heroin for domestic consumption in Afghanistan, Pakistan, and Iran. From 5

to 20 percent of the heroin that makes its way to the United States and Western Europe is processed in this area, which is controlled by Pakistani traffickers.

Pakistani drug lords mostly live and operate in or near the semiautonomous Northwest Frontier Province of the country. Many of these drug lords are powerful tribal leaders who have close ancestral ties to Afghanistan. Like their Thai counterparts, they also are known to employ private armies to protect them from law enforcement efforts by the Pakistan government.

Afghanistan and Pakistan produce more hashish than any other country in the world. Hashish is the compressed resin of the marijuana plant that is molded into what are called plates. Because of the large hashish production, very little marijuana is left for domestic consumption and none is exported. Most of the hashish produced in the Golden Crescent is exported to Europe, Canada, and the United States.

### Canada

According to the Drug Enforcement Administration, Canada is a prominent source of pseudoephedrine, the essential ingredient of methamphetamine. Also, a relatively new variety of Canadian marijuana grown in British Colombia, known as B.C. Bud, has become extremely popular in the United States. Canadian traffickers frequently exchange equal amounts of cocaine for their premium marijuana. The tetrahydrocannabinol (THC) content of B.C. Bud makes it one of the most potent varieties of marijuana produced anywhere.

### European Continent

Weekly, millions of methylenedioxy-n-methylamphetamine (MDMA)– or Ecstasy—tablets are manufactured in Europe, primarily in Belgium, Germany, and the Netherlands. Most of these designer drugs are distributed throughout Europe and the United States through bars and rave parties. Ecstasy tablets, which are also known simply as X, are aspirin-sized tablets that come in a variety of colors. Almost all bear a logo identifying the manufacturer. Cartoon characters, automobile trademarks, windmills, and stars are just a few of the many hundreds of logos found on seized Ecstasy tablets from Europe.

Ecstasy is sold wholesale in the United States in 1,000-tablet increments known as boats. Traffickers have predominately been Caucasian, although Mexican drug traffickers have recently begun to sell large amounts of Ecstasy in an attempt to capture a portion of the market. Israeli organized crime syndicates are also heavily involved in the importation and distribution of Ecstasy in the United States and elsewhere.

### United States

The United States has long been a source country for Lysergic Acid Diethylamide (LSD) and marijuana. LSD abuse has dropped significantly since the 1960s, but while it can still be found, its dose potency has dropped off significantly from its heyday in the 1960s. The drug is almost exclusively manufactured in the San Francisco Bay area of California, but it can be found throughout the country.

A potent variety of marijuana known as sin semilla, Spanish for "without seeds," is grown in northern California. Indoor marijuana growing operations can be found anywhere in the United States, as well as open marijuana fields in national forests and on private property. Domestic marijuana growers and wholesale traffickers and smugglers tend to be Caucasian, although illegal Mexican aliens are sometimes hired by the traffickers who tend to many of their fields.

Phencyclidine (PCP) is a powerful animal tranquilizer that is marketed almost exclusively by Black traffickers to other Blacks in the United States. The chemicals are relatively easy to obtain, and the required laboratory operation is substantially less sophisticated than with other clandestinely manufactured drugs. The bulk of PCP production seems to take place in Los Angeles, and it is flown or driven to large urban areas throughout the country. There currently is no demand for PCP outside the United States.

Katamine, a popular animal tranquilizer used at rave parties, is usually diverted or stolen from legitimate sources in the United States and sold to users who frequently also abuse Ecstasy. Another substance that is gaining popularity is the clear liquid Gamma Hydroxybutyrate (GHB). It is easily manufactured with a common industrial cleaner and is frequently sold for consumption with Ecstasy at rave parties. It is also known by the names Liquid X and Great Bodily Harm. GHB is also a known "date rape drug" that sexual predators use to render their victims unconscious. Recently, Ecstasy laboratories have been found in the United States, mostly on the east coast.

## TERRORISM'S NEXUS TO DRUGS

The evidence is clear that there is a direct connection between drug trafficking organizations and terrorism. Numerous terrorist organizations have been funded for years by the profits of drug traffickers, and this is likely to continue in the foreseeable future, especially when state-sponsored support is eroded by political or military action. Drug users unwittingly contribute money to fund terrorist operations throughout the world every time they buy drugs. Terrorists use drug production and trafficking profits to meet their overhead, and to destabilize governments around the world, including the United States. The methods they use to

achieve their goals are strikingly similar to those used by drug trafficking organizations, as we shall see below.

In 2001, President George W. Bush made the following remarks during a speech about the nexus of drugs and terrorism before signing the Drug-Free Communities Act Reauthorization Bill: "It's so important for Americans to know that the traffic in drugs finances the work of terror, sustaining terrorists, that terrorists use drug profits to fund their cells to commit acts of murder. If you quit drugs, you join the fight against terror in America."[3]

Community leaders such as police chiefs, school principals, and civic group leaders can further the cause of drug demand reduction in their communities by emphasizing the nexus of drugs to terrorist organizations. Just as citizen groups successfully personalized drunk driving tragedies, they can place faces and experiences within the antidrug message. Credible role models and spokespersons, especially those who have personally been touched by drug use, can be instrumental in helping turn around public opinion on drug use and simultaneously educate the public on the use of drug profits to finance terror. Parents have always been influential with their children, and need to closely monitor their children's activities to minimize their opportunity to experiment with drug usage.

This nexus between drug traffickers and terrorists directly threatens the security of the United States and other nations. It has the potential of creating regional instability and threatening national security as well as the future of the world's youth. This linkage is especially harmful to U.S. interests around the world. Of the 28 organizations identified by the U.S. Department of State's October 2001 *Report on Foreign Terrorists Organizations*, 12 are known to traffic drugs to raise funding.[4] These groups include

- Abu Sayyaf Group (ASG). An extremist separatist group operating in the Philippines that seeks an independent Islamic state. They are known to grow marijuana for resale to generate operational funding, and have close ties to Osama bin Laden's al Qaeda terrorist organization.
- Basque Fatherland and Liberty (ETA). This organization is dedicated to a separate homeland apart from Spain. The group traffics in a variety of drugs to fund their activities.
- Hizbollah.[5] This Lebanese-based, extremely well organized and violent group is comprised of two wings, a political and guerrilla military force. Hizbollah effectively used the tactic of suicide bombing in its goal to expel Israel from southern Lebanon. The government of Iran has historically been a major financial supporter of this group, although in recent years we have seen an increased interest in drug trafficking in opium and hashish to secure funds. The group is responsible for numerous terrorist attacks against Americans and Westerners, including the bombing of the U.S. embassy in Lebanon in 1993 that killed 63 people, including 17 Americans; the truck bomb attack on a U.S. Marine Corps

barracks outside Beirut that killed 241 servicemen in 1983; and the kidnapping and killing of William Buckley, the CIA station chief in Beirut. It is also been tied to numerous other acts of terror throughout the world, primarily, but not exclusively against Israeli interests.

– Islamic Movement of Uzbekistan (IMU). Involved in international opium smuggling and heroin drug trafficking.

– Kurdistan Workers Party (PKK). Located mainly in the mountainous regions of northern Iraq and southern Turkey, this group has long used violence to achieve their goal of a separate Kurdish state. Known to traffic in Southwest Asian heroin.

– Liberation Tigers of Tamil Eelam (LTTE). Based in Sri Lanka, this group has fought for years to achieve an independent state. Members are known to act as drug couriers, primarily for Pakistan hashish.

– National Liberation Army (ELN) of Colombia. Involved in many aspects of drug trafficking except international movement.

– Palestinian Islamic Jihad (PIJ). Involved in trafficking Southwest Asian heroin and hashish to achieve a Palestinian state.

– Al Qaeda. Led by Osama bin Laden and is responsible for numerous attacks against Americans and Westerners, including an attack on the World Trade Center in 1993; a truck bombing of a U.S. military barracks in Saudi Arabia in 1996; attacks on U.S. embassies in eastern Africa in 1998; the suicide boat attack on the *USS Cole* in 2000; and the commercial airline hijackings and suicide crashes into the World Trade Center and The Pentagon in 2001. Known to traffic in Afghanistan opium and heroin.

– Revolutionary Armed Forces of Colombia (FARC). Primarily a Communist revolutionary movement for several decades, they traffic in cocaine and provide protection for Colombian drug cartels to raise funding to overthrow the established democratic government in Colombia. FARC members conduct kidnappings and extortion to raise funds. They are believed to earn at least $300 million annually in criminal and drug activities.

– Sendero Luminoso (Shining Path). Provide protection for cocaine growers and laboratories within Colombia.

– United Self-Defense Forces of Colombia (AUC). The AUC is a right-wing paramilitary organization involved in all aspects of cocaine trafficking to counter the advances of the antigovernment FARC. Estimates are that drug trafficking accounts for 40–70 percent of its annual revenues.

## AFGHANISTAN CONNECTION

Throughout the reign of the Taliban, their funding for operations was derived in large part through drug cultivators and traffickers. As mentioned above, Afghanistan is a major source of heroin in the world, and in 2000 supplied 70 percent of the world's supply of opium, which is the essential ingredient of heroin.

By taxing farmers in the cultivation, sales, and transportation of opium, the Taliban raised an estimated $40 to $50 million to further their regime. The Taliban protected Osama bin Laden's al Qaeda terrorist network while it benefited directly from the tax revenues received from opium farmers. These farmers produce opium because of a strong demand for heroin that exists throughout the world, especially in Western Europe.

The U.S. Drug Enforcement Administration (DEA) has generated multiple-source information that Osama bin Laden himself has been involved in the financing and facilitation of heroin-trafficking activities presumably to raise funding for al Qaeda operations.

In September 2002, two Pakistanis and an American were arrested after being indicted in San Diego for conspiring to trade 1,320 pounds of heroin and 5 tons of hashish for four Stinger shoulder-fired antiaircraft missiles. The three men told undercover FBI agents they intended to sell the Stinger missiles to members of the Taliban, an organization which the defendants indicated was the same as al Qaeda, according to the indictment.[6]

### Colombian Connection

As mentioned previously, there are three groups operating within the country that have been designated by the U.S. Department of State as being terrorist organizations: the *Revolutionary Armed Forces of Colombia (FARC)*, the *National Liberation Army (ELN)*, and the paramilitary group, and the *United Self-Defense Forces of Colombia* (AUC). The FARC and AUC have been heavily involved in protecting cocaine laboratories and engaging in cocaine trafficking, and receive enormous funding for their causes.

In November 2002, four AUC members negotiated with undercover DEA and FBI agents in Panama to purchase 9,000 assault rifles, submachine guns, sniper rifles, 300 pistols, rocket-propelled grenade launchers, shoulder-fired missiles, 300,000 grenades, and about 60 million rounds of ammunition in exchange for cash and cocaine.

"This multimillion-dollar cocaine-for-arms deal is yet another example of the convergence of violence and terrorism with drug trafficking," [then] Drug Enforcement Administration chief Asa Hutchison said. "We have demonstrated that drug traffickers and terrorists work out of the same jungle, they plan in the same cave and they train in the same desert." The U.S. Attorney's office in Houston, Texas described the AUC as an "umbrella organization" that consolidated local and regional paramilitary groups in Colombia.

Established in 1964, the FARC is the military wing of the Colombian Communist Party. The U.S. State Department named it as the most dangerous international terrorism group based in the Western Hemisphere. In 2002, a DEA investigation led to the indictment of three members of the 16th Front of the FARC, including their coleader, on charges of conspiracy

to transport and later distribute cocaine in the United States. This marked the first time that any members of a known terrorist organization have been indicted on drug trafficking charges.[7]

The 16th Front operates mostly out of a remote village in Eastern Colombia. The revenues generated from cocaine sales are used to purchase equipment, weapons, and supplies. The State Department estimates that the FARC receives $300 million annually from cocaine trafficking to finance their pursuit of a political agenda through terrorism.

In 2002, the government of Colombia decided to retake a previously established demilitarized zone occupied by the FARC. When the Colombian Army arrived, they discovered two major cocaine laboratories and seized 5 tons of already processed cocaine. They also destroyed a 200-foot communications tower used by the FARC to communicate with their members. The cocaine laboratory and communications tower clearly suggest that the FARC not only provides protection to established Colombian cartels in their manufacturing and distribution activities, but, according to DEA, it is also independently involved in drug trafficking in an effort to make even more money.

Since 1990, narco-terrorists in Colombia have kidnapped more than 50 U.S. citizens, and since 1995, they have murdered 12 other Americans. The AUC's leader, Carlos Castańo, admitted in a published book[8] that his paramilitary group used funds derived from cocaine trafficking activities to carry out its agenda. He has admitted that upwards of 70 percent of the AUC's funding derives from the drug trade.

### Peruvian Connection

Peru is the home of the *Shining Path* terrorist organization, a revolutionary Communist group. According to DEA, it has also historically benefited by taxing cocaine traffickers and providing them protection in order to generate income to further their political agenda against the established government.[9]

### Middle Eastern Connection

Middle Eastern drug traffickers operating in the United States and Canada, predominately from Lebanon, have been responsible for the distribution of multiton quantities of pseudoephedrine to supply methamphetamine laboratories operating in California and elsewhere. Many of these traffickers have known connections with terrorist groups operating in the Middle East.

DEA, U.S. Customs Service, Internal Revenue Service, and the Royal Canadian Mounted Police conducted a massive investigation in 2002 called Operation Mountain Express, in which over the course of three

phases, 30 tons of pseudoephedrine was seized. This amount would have produced about 37,000 pounds of methamphetamine, predominately by Mexican laboratory operators. This is significant in that in 2001, U.S. authorities reported nationwide that they had only seized 6,000 pounds of methamphetamine.[10] The vast majority of the suspects arrested were Muslims, and the monies earned through their illegal activities were sent to the Middle East and believed to be used to fund various terrorist organizations.

## SHARED TRAITS OF DRUG TRAFFICKERS AND TERRORISTS

International terrorist organizations and drug traffickers share many similar traits that may not at first be obvious. Terrorists, specifically Osama bin Laden's al Qaeda's network, and international drug dealers, plan, stage, and execute their crimes while shrouded in secrecy. Both have well-established cells around the world to achieve their goals. They heavily rely on compartmentalization for operational security, and exhibit ingenious ways of smuggling coconspirators, drugs, equipment, money, weapons, and other contraband long distances from one country to another.

By virtue of their crimes, both drug trafficking and terrorist organizations are engaged in ongoing criminal conspiracies. Counterterrorism and drug agents investigate their respective crime *as it occurs* as opposed to the traditional reactive, after-the-fact, criminal investigation. Table 11.1 below outlines the shared traits of international drug and terror organizations.

For many years DEA special agents have recognized that terrorist organizations rely on drug traffickers as a straightforward, easy source of income to finance their pursuit of a political agenda through violent means. Drug traffickers, in turn, rely on the terrorists to provide physical protection for their laboratories and drug distribution endeavors. Through protection rackets, extortion, or "taxation" of clandestine laboratory operators, growers, and drug traffickers, terrorists receive the funding necessary to carry out their violent acts and political agenda.

An important distinction between the two organizations is that all terrorists may be criminals, but not all criminals are terrorists. Criminals are motivated solely by profit and they have no intention of dying in the process like a suicide bomber does. Terrorists, on the other hand, commit violent crime to make a political statement, and often make it a point to proclaim their group's involvement. But, what distinguishes them from common criminals is that they are often willing to die for their cause, making their capture moot. Intelligence analysts need to be careful not to lump all drug and terrorist organizations into the same category since their motivation is either to reap profits or cause political change. The motivation behind their acts is always what drives these people to do what they do. They may initially appear to be terrorists to intelligence analysts and the

**Table 11.1   Comparisons of International Drug Trafficking and Terrorist Organizations**

| Drug Trafficking Organizations | Terrorist Organizations |
|---|---|
| 1. Engage in conspiracies that are investigated as they occur | 1. Engage in conspiracies that are investigated as they occur |

public at large; however lacking a political agenda, a detailed analysis will expose them to be mere criminals.

### Organizational Structures

Many terrorist organizations and large-scale international drug trafficking organizations have top-down management styles. The leaders of these organizations give the orders, expect them to be followed, and rarely delegate. They discourage innovation by their members, and will not tolerate disloyalty.

Both have individual compartmentalized "cells" of their organizations in many countries throughout the world. For operational security purposes, the members of both drug and terrorism cells are not told the

identities of the other members within the same cell. This compartmentalization provides some level of security to the organization, by preventing an arrested cell member from knowing (and disclosing to law enforcement and intelligence officers) the identities of the other members of their own and other cells operating within a particular geographic region.

Often the leader of the cell is the only person who actually knows the number and identities of its members. He may know that other cells exist elsewhere, but he has purposely been excluded from this information in case he is arrested. Both drug trafficking and terrorist organizations are organized in such a way that if one cell were to be dismantled the other cells and the organization survive.[11]

### Drug and Terrorism Source Countries

It is no coincidence that drug trafficking and terrorist organizations thrive in countries that lack a strong central government, where law enforcement officials are ineffective and highly susceptible to corruption. Endemic corruption is probably the single most contributing factor in the ability of these kings of organizations to flourish. Afghanistan, Pakistan, and Colombia are examples of countries that have both terrorist and drug traffickers operating within their borders. These organizations operate freely after establishing partnerships with corrupt military and police officials to facilitate their criminal enterprises.

### Money Laundering

Drug traffickers require a way to launder their vast ill-gotten gains to give them the appearance of legitimacy, whereas terrorists—in addition to traditional money laundering—often convert seemingly honest money from donations to so-called charitable organizations and use it to finance their operations. Both go through elaborate schemes to disguise the true source of their money or its intended purpose. Terrorist "front" organizations around the world, including in the United States, sometimes play the race or religion card to gain sympathy from the general public. Colombian drug cartels have been known to build public housing and infrastructure for members of the communities they operate in for the same purpose.

Drug dealers and terrorist organizations use others as "straw" purchasers to buy property, weapons, vehicles, and the like. A "straw" purchaser is someone who is paid to buy something, like real property, in place of the true purchaser, in order to disguise the true owner(s) and source of the money. Straw purchasers are also used to rent items such as apartments, cars, boats, and trucks that are used in day-to-day operations. They are never told the real intended purpose of the renting or purchase

in order to ensure that they cannot reveal it to law enforcement. They are usually well paid for their participation and silence.

### Communications

Drug traffickers and terrorists rely on secure communications such as encrypted e-mail and code words over unsecured telephone lines to prevent law enforcement and intelligence agencies from learning about their operations. They will often purchase off-the-shelf items at novelty spy stores that can detect radio transmitters or determine if their telephones and rooms are tapped or bugged. Some of these stores sell "voice stress analysis" machines that supposedly tell the owner if the person he is talking to on the telephone is telling the truth or is lying. Fortunately, few of these items work as advertised, but terrorists have been known to use them to thwart law enforcement efforts. However, terrorists that are state sponsored may have much more sophisticated espionage equipment at their disposal that definitely work.

Many terrorist organizations and drug dealers communicate with their coconspirators throughout the world using satellite and cellular telephones, although this trend has declined in recent years. Revelations of these telephone conversations being intercepted has caused the terrorists to be more aware of operational security. Drug traffickers use satellite and cellular telephones to check on the progress of drug or weapons shipments from one part of the world to another, as well as the health and welfare of their members. To disguise the subscriber of the telephone service, both terrorists and drug dealers have been known to utilize prepaid telephones, and then discipline themselves to only telephone coconspirators when necessary by using these phones. Drug traffickers have long used prepaid telephone calling cards, Internet connections at libraries and Internet cafes, as well as disposable cellular telephones to disguise their identities and keep their plans secret. Terrorists do not want a record of phone calls or e-mails being documented either, and many such organizations have adopted these identical techniques.

### Training Manuals

Large-scale drug trafficking organizations have provided lower-level members of their organization with detailed training manuals on how to perform their jobs and assimilate into other cultures. Documents seized by the DEA during search warrants of middle-class homes in modest neighborhoods in America revealed detailed instructions to the occupants on how not to draw attention to themselves. These occupants are hired by drug cartels to live in the residence and provide security for the multihundred kilograms of drugs stored there. Instruction manuals (which have

been seized and reviewed by DEA and other agencies) instruct the person in charge of the stash house to cut the lawn, register their children in the local schools, have backyard barbeques and be friendly with their neighbors, as well as having a cover story to explain odd working hours and the presence of trucks delivering boxes. These manuals also instruct the occupants to be conscious of surveillance by the police, and what to do in case of emergencies.

Recovered al Qaeda training manuals also instruct its members to do many of these same things. They specifically have chapters on how to perform countersurveillance operations before any planned meeting to detect and avoid police surveillance.

### Immigration Fraud and False Identity Documents

A large number of international drug traffickers operating in the United States and other consumer nations are foreign nationals. These traffickers want to show a legitimate reason for traveling to the country they are doing business in, so they fraudulently represent themselves to be tourists, professional athletes, students, asylum seekers, or businessmen. Once in the country, they overstay their visas and continue operating until they are either caught or ordered back home by top management of the drug cartel. Terrorist organizations do the same thing in order to plant their personnel into a particular country. Terrorists and drug smugglers often use forged passports of those countries not believed to be synonymous with terrorism or drugs.

International terrorists also have the dilemma of overcoming the immigration laws of the United States and other countries. The asylum card is often played with claims of religious or political persecution. Attending school and accepting a job have been successful ruses to gain a visa. However, once in the country, terrorists and drug traffickers will obtain false documentation in another name to keep law enforcement off balance. Some of the terrorists who attacked the United States on September 11, 2001, had fraudulently obtained genuine identity cards issued by the Commonwealth of Virginia.

Drug traffickers also routinely use either genuine government issued identification, issued in a false name, or obtain counterfeit IDs in order to avoid detection. Both drug dealers and terrorists have long realized that having multiple identities enhance their likelihood of evading authorities.

### Similar Smuggling Techniques

Drug smugglers sometimes transport multiton quantities of controlled substances to the United States and Europe. Terrorists have been known

to smuggle weapons and people from one country to another, often using established drug smuggling routes. In fact, many of the smuggling techniques used by terrorists are so identical to drug smugglers, the similarities suggest that they were taught by the latter.

Smugglers often use commercial shipping to transport contraband into the United States and other nations disguised as legitimate cargo. Although it is estimated that only 2 percent of all commercial shipping to the United States is inspected by Border Security personnel, terrorists and drug smugglers still want to increase their odds of success. For example, Pakistani drug smugglers will often ship a container of hashish from the port city of Karachi to a nondrug source country where the bill of laden and seal are changed. The shipment then proceeds to another part of the world where others again change the bill of laden and seal to prepare it for another destination. This layering of bills of laden and seals disguises the country of origin and may require the container to be in transit for over a year before finally arriving at its intended destination. Once the container arrives at its intended destination, the smugglers will hire a company to have it transported it to a rented storage area where they will abandon it for a period of time to see if it has attracted law enforcement attention. They will often conduct sporadic surveillance on the container to see if it has been seized by law enforcement. Only after they are reasonably certain customs authorities have not examined the container will they finally open it and distribute the contents. This technique has proven to be highly successful for drug traffickers, and works equally well for terrorist organizations. Terrorists, many of whom work in concert with drug traffickers to earn money for their activities, have been known to be in concert with drug smugglers to transport weapons, and other contraband from one part of the world to another.

## CONCLUSIONS AND RECOMMENDATIONS

International drug and terrorism organizations use sophisticated methods of operation to achieve their goals. In some cases they are combining their resources to further their criminal and murderous political activities.

So long as the demand for illegal drugs exists, there will always be organizations willing to provide them. Drug users unwittingly provide funds that are often used to finance terrorist organizations. Eliminating illegal drug use would dry up a major source of funding for terrorist organizations. Community leaders need to educate the public more on the nexus between drugs and terrorism, and make it common knowledge that drug users indirectly fund terrorist operations.

Countering terrorism depletes already limited worldwide government resources and taxes and poorly trained and ill-equipped law enforcement agencies in many drug source countries. Wealthier drug consumer nations

can help in this regard by providing necessary supplemental wages, training, and equipment to police and judicial officers to combat corruption and ensure the rule of law. The United States and Britain have provided drug law enforcement training to other countries for decades, and this training should be expanded.

A major problem in antiterrorism operations has always been self-imposed restrictions in the sharing of intelligence between concerned agencies. The sharing of intelligence between the Intelligence Community and law enforcement helps to clarify if criminal investigators and intelligence case officers are dealing with drug dealers, terrorists, or both. More needs to be done to further break down barriers between different agencies so that the free flow of intelligence can someday become routine. A major source of actionable intelligence is developed by the Department of Defense. However, due to archaic rules, DoD cannot collect or share intelligence on U.S. citizens with civilian law enforcement agencies. DoD should be *compelled*, rather than restricted, to share information about illegal activity being conducted by known or suspected U.S. citizens they happen to uncover during the normal course of intelligence collection and analysis. Restricting such information fails to connect the dots and jeopardizes the safety of all Americans.

The Drug Enforcement Administration has 79 offices in 55 countries around the globe. The ability to launch an international drug conspiracy investigation is related directly to the agency's ability to obtain actionable, human intelligence. Almost without exception, drug cases start with an informant telling a drug agent about a trafficking organization's activities.

DEA is about to join the "Intelligence Community" and it is long overdue. DEA has a large reservoir of human intelligence that surely can be beneficial to those charged with conducting terrorism investigations. This is especially true when one considers the frequent interaction between drug and terrorist organizations. DEA is committed to sharing their drug intelligence in order to be a team player within the Intelligence Community. Conversely, the Intelligence Community needs to understand the nexus between drugs and terror, and should readily provide information to DEA to enable them to dismantle these organizations.

# CHAPTER 12

## AFGHANISTAN'S TRANSFORMATION TO A NARCO-TERRORIST STATE: AN ECONOMIC PERSPECTIVE

Jonathan C. Byrom and James Walker

Following September 11, 2001, the United States formally declared war on terrorism. As the United States shifted from defending itself against terrorists to executing an offensive war against those who seek to destroy the nation, it conducted a multifront assault. One focus of the global war on terrorism has been attacking the funding of terrorist organizations. This assault on terrorism financing has exposed a complex and extensive network of money trails that has gone largely unstudied.

This chapter begins with the history of terrorism financing, examining state sponsorship and charitable organizations as well as licit and illicit activities. This analysis suggests that the global attack against terrorist financing has shifted financial reliance to illicit activities, primarily drugs. This shift will cause terror groups to find opportunities to enter the global supply chain of drugs. Unfortunately, no place offers a greater opportunity than Afghanistan where the environment is too tempting for terrorists not to carve out a piece of the action—after all, this country provides 87 percent of the world's heroin supply.[1]

Because drugs will continue to be a major funding source for terrorism, Afghanistan presents an imminent threat to U.S. national security because of its comparative advantage in the production of opium. Afghanistan's comparative advantage originates from its geography and climate, the absence of rule of law, its historical war economy, and its peculiar labor market. Regrettably, this comparative advantage is not expected to

decline anytime soon. Ineffective poppy eradication, untapped poppy productivity, lack of global attention, and Afghanistan's macroeconomic dependence on opium will ensure its continued production for years to come.

Thus, Afghanistan is on the brink of becoming a major narco-terrorist state, and the United States and its allies must be appropriately concerned about its vast terrorism financing potential. To prevent this from occurring, the world community and the new Afghan government should focus on increasing all costs of the drug business. A direct effort to increase opportunity costs of growing poppies, while decreasing opportunity costs of alternatives, is what is needed. By doing this, we can once again make it harder for terrorists to conduct their business and limit the spread of terrorism.

## TERROR FINANCING

The 9/11 terrorist attacks against the United States in 2001 brought terrorism to the forefront of American consciousness. Since this awakening, the U.S. military has prosecuted very successful combat operations in Afghanistan and Iraq, while others have disrupted numerous cells and plans at home. However, these successes have not led to winning the war on terror. In fact, the United States has found itself battling an enemy entrenched in ideology, supplied with disenfranchised recruits, and supported financially by third party groups and criminal activity. These aspects, specifically its ability to sustain itself financially, increase a terrorist's capability, range, and lethality. Unfortunately, the current counterterrorism focus does very little to combat our enemy's ability to finance itself. Without proper attention to this aspect of counterterrorism, we are surely in for a long and costly war.

President Bush vowed in his September 20, 2001 speech to the American people that "[w]e will starve terrorists of funding, turn them one against another, drive them from place to place until there is no refuge or no rest."[2] This statement recognizes that military combat operations and their kinetic elements alone are not enough to win the global war on terror. Much like fighting a fire, the key to extinguishing the flame may not be to apply water directly but to find and extinguish the source of the flame. Likewise, suppressing terrorism financing should be one of the primary objectives in this war.

Since the President's 2001 speech, the United States has conducted a limited war to detect, deter, and dismantle the financing of terrorism. Beginning with Executive Order 13224 and continuing with the USA PATRIOT Act, the United States has made it harder for terrorist groups to raise, move, and store funds. The result has been that traditional sources of funding, especially Islamic charities and rich Saudi benefactors, have declined. New legislation has increased scrutiny, which has effectively

increased the costs of doing business for terrorists and their supporters in the traditional sense. However, terror groups are resilient and have shown a great ability to adapt to these changes.

Terrorists fund their activities in four distinct ways—state sponsorship, wealthy individuals/charities, legal businesses, and illicit activities, any combination of which may be present. The level of dependency on these sources has changed over time. Although each of these funding sources has always been present, there has recently been a shift to illicit activities as the most dominant funding source, as a result of political and counter-error pressure. The following section of this chapter will briefly discuss the evolution of these financing sources.

### State Sponsors

State sponsorship was the funding source most dominant during the 1970s and 1980s. In fact, terrorism researcher Daniel Byman notes that during this time "almost every important terrorist group had some ties to at least one supportive state."[3] State support comes in both active and passive forms, and includes access to money, weapons, freedom of movement, documents, protection, infrastructure, tolerance, and training. States that have provided active support for terrorism are numerous, and include Libya, Iran, India, North Korea, Syria, and the Soviet Union. Although this type of support is highly beneficial to a terrorist organization, there are costs to both the states and the terrorists.

One cost to terror groups is that states use them to promote national agendas without leaving the distinct footprint of being directly involved. Terrorists also benefit from this relationship by enjoying the ability to commit their acts with outside funding. As international actors, however, states are subject to political, economic, and military pressures that are imposed if the terror groups reach the "tipping point" of tolerance. In response to these pressures, states begin to exercise some control over the terror group, thus upsetting this supposed symbiotic relationship.

Most often, the attempt by states to control the terror group's actions is a cost that these groups are unwilling to pay in the long term. For this reason, terror groups have had to look for new funding sources. Also, the recent collapse of the Soviet Union, a major source of terrorist funds, has also removed a rich financing source for terrorist groups and forced them to look elsewhere for money. Some terror groups' stopgap measures to fill this void have been charities and wealthy Muslim benefactors around the world, particularly in the Middle East.

### Wealthy Individuals and Charities

There is no shortage of wealthy individuals or charitable organizations in the Middle East. While the vast majority of these individuals and

groups have no connection with terrorists, many do provide active and passive support. Regrettably, these sources have provided millions of dollars to terror groups and have supported hundreds of attacks, including the horrendous attacks on 9/11.[4]

Terrorists have found many supporters among the rich. Much of this support comes willingly, but terrorists are not above religious blackmail to ensure the financial survival of their cause. Questioning the devotion of some Muslims is a powerful motivator to attract support.

Charities are also a rich financing vein. All Muslims are required by Islamic Law, based on the fifth Islamic principle of *zakat*, to give 2.5 percent of their wealth to the poor. This duty provides an enormous pool of money that has been exploited. Although the majority of charities use their donations to help the poor and needy, many charities have knowingly diverted funds to terrorist organizations. Entire charities have been created for the sole purpose of acquiring, storing, and moving money for terrorists, much like the Al Wafa organization which was run entirely by al Qaida operatives.[5]

By their very nature, charities are a terrific source of funding given their religious and legal status. Not only do they offer large amounts of money, but charities also provide shelter and legitimate cover to terrorists as they travel.[6] Prior to 9/11, authorities were very hesitant to closely examine the operations of these organizations, in fear of being accused of racial prejudice or profiling. This lack of transparency allowed charities to fund terror groups around the world. Fortunately, since 9/11, terrorists have not been able to easily use charities to finance their activities.

Through legislation like the USA PATRIOT Act and unprecedented political pressure on the Saudi Royal Family, our efforts have succeeded in reducing funding worldwide. The 2004 Congressional Research Service Report *Saudi Arabia: Terrorist Financing Issues* outlines numerous allegations of Saudi Arabian terrorist financing and the Kingdom's counterterrorism efforts in response. Since 9/11, Saudi Arabia has taken active measures to control the flow of funds within its borders and abroad.[7]

All these actions have increased transparency and scrutiny of Islamic charities and rich benefactors, thus raising the cost of business. As a result, terrorists have again adapted their funding activities, this time moving to licit and illicit activities to fund their cause.

### Legal Operations

On a limited scope, terror groups also operate legal ventures to fund and support themselves. Although these businesses do not generate massive amounts of profit that can be diverted, they do provide legitimate fronts that can help conceal terror activity. It has been reported that Osama bin Laden owned and operated a string of honey shops throughout the

Middle East and Pakistan[8] as well as boats and a fishing business in Mombasa.[9]

### Illicit Activities

The world's illicit economy is estimated at between $1 and $1.5 trillion.[10] Because of this vast source of potential funding and the pressure on questionable charities and wealthy contributors by the international community, most terror groups are turning to illicit activities as a source of funding. The U.S. Treasury Department has identified many illicit sources of funding used by terrorists. Some of these activities include the drug trade, identity theft for profit, credit car fraud, counterfeit merchandise, coupon fraud, diamond smuggling, and interstate cigarette smuggling.[11] These illegal activities provide millions of dollars a year to terrorists.

Many recent events have helped establish terrorist links to these illegal activities. In 1996, the FBI launched Operation Smoke Screen aimed at dismantling an interstate cigarette smuggling ring carried out by individuals tied to Hizbollah.[12] In New York City, a warehouse full of counterfeit t-shirts was seized, netting over 100,000 knockoff Olympic and Nike t-shirts. The warehouse was tied to Sheik Omar Abdul Rahman (aka, the Blind Sheik).[13] Additionally, terrorism analyst Douglas Farah has made a compelling case about al Qaida being involved in the diamond smuggling business in West Africa.[14]

Although all these activities net terrorists millions of dollars a year, no activity is as profitable as the global drug trade.[15] The global drug trade is estimated to be between $300 billion to $500 billion annually.[16] Imagine a well-organized terror group with international contacts, country knowledge, clandestine expertise, and transportation networks in place, which could allow them to capture a small fraction of this market share. Unfortunately, this situation already exists. Some groups have become so entrenched in every aspect of the drug trade that they are indistinguishable from the traditional criminal organizations.

The terrible fear is that with more experience and time, terrorist "groups [will] become proficient at executing large, non-bank drug-trafficking operations and begin to piggyback terrorism financing on the drug-trafficking infrastructure that [already] exists..."[17] This evolution would mean greater access to massive drug profits and therefore, more resources to plan and execute attacks.

## DRUGS AND TERRORISM

Dennis Hastert, the Speaker of the U.S. House of Representatives, observed in 2003 that "[t]he link between drug money and terrorism should make every drug user pause, every American shudder, and our

government redouble its efforts."[18] Unfortunately, this warning has largely gone unheeded. The global drug trade will become the funding source of choice for terror groups in the years to come.

Drugs have historically been a source of income for many terrorist groups, including the FARC, Hizbollah, IRA, AUC, and the ELN.[19] About half of the 28 organizations identified as terrorists by the U.S. State Department are funded by the sales of illegal drugs.[20] In Colombia, the FARC initially banned drug trafficking. It began to tax the drug trade, and eventually became so enmeshed that today it earns 50 percent of its annual operating income (roughly $150 million) from the drug trade.[21] In Europe, the IRA controls Dublin's heroin market and funds the majority of its activities from these activities.[22] In the United States, Mexican drug cartels have even relied on Hizbollah terrorists to supply them with large quantities of pseudoephedrine, a key component of methamphetamines.[23]

The link between drugs and terrorism is not a new phenomenon. Rather, this relationship is rapidly growing. Nowhere is this potential for explosive growth greater than in Afghanistan. The lucrative nature of the drug trade and the fertile environment, which Afghanistan presents, is too great a temptation for terrorists groups to ignore. Robert Charles understood this very clearly when he wrote, "[t]hough all drug traffickers are not terrorists and not all funding for terrorism comes from narcotics, the higher the revenue from narcotics, the more attractive this source will be to terrorists and the more narcotics money will flow back to terrorist groups."[24]

Drug profits give malevolent groups such as terrorist organizations the ability to buy weapons, bribe officials, blow up buildings, forge documents, travel internationally, and carry on a campaign of intimidation and terror. Similarly, the affects of drug profits have been evident in Afghanistan's recent history. Since the mid-1990s, the Taliban has relied on the opium drug trade to fund their war and keep them in power.[25] Afghan warlords have also used the poppy for the same purpose since 1980.[26]

As the opium trade in Afghanistan continues to develop, it will become too irresistible of a financial resource for criminal and terror groups alike. Afghanistan is ripe for exploitation, especially by al Qaeda, which has a long history of operating in the country. Al Qaeda's Afghanistan experience, its relationship with radical groups in the region, its common religion, a mature Afghan drug market, and a weak Afghan economy create a threat that cannot be ignored by the United States or its allies.

As terrorists begin to expand their search for alternate funding, Afghanistan will be their most attractive source. This is the frightening reality we face—an Afghanistan that has spiraled into a narco-terrorist state providing a large, steady stream of income to terrorists. The lucrative nature of poppy, coupled with Afghanistan's comparative advantage in its production, create opportunities for criminal and terrorist organizations

to exploit. This is the true danger we face in Afghanistan. The next section of this chapter will focus on building a strong case that Afghanistan has a comparative advantage in the production of opium. It will also argue that this comparative advantage is becoming stronger rather than declining.

## AFGHANISTAN'S COMPARATIVE ADVANTAGE

A comparative advantage is the ability of an entity to engage in production at a lower opportunity cost than another entity. Comparative advantage is useful in determining what should be produced and what should be acquired though trade.[27] In Afghanistan's case, the cost of not growing poppies, its opportunity cost, is simply too high. The positive and negative incentives that limit illegal drug production in other countries are generally absent in Afghanistan. These incentives include established markets, financial services, infrastructure, education, legislation, enforcement, and religious and social pressures. Given Afghanistan's current environment, there is no crop, good, or service in its production possibilities that can compete with opium. The statistics are clear—Afghanistan has a comparative advantage in the production of opium.

Recent opium production in Afghanistan since the fall of the Taliban in 2001 has been substantial. Afghanistan produced 3,400 metric tons of opium in 2002, and 3,600 metric tons in 2003, and continued to increase to 4,200 metric tons in 2004.[28] The Afghan government claims that it has begun an aggressive eradication program, but this does not seem to have had a significant impact. In 2004, Afghanistan produced 87 percent of the world's illicit opium, with all 34 provinces participating in the production.[29] By 2003, Afghanistan's opium production generated 60 percent of its Gross Domestic Product (GDP).[30] Thus, Afghanistan is effectively growing, processing, and trafficking opium with no real competitors, again illustrating its comparative advantage in the opium industry.

How does Afghanistan maintain such a dominant comparative advantage in the production of opium? What political, social, and economic conditions exist that allow it to effectively dominate the opium industry in Western Europe and Asia and threaten the South American opium trade in the West? As identified below, there are numerous microeconomic and macroeconomic variables that allow Afghanistan to maintain a comparative advantage and produce opium with a lower opportunity cost than any other country in the world.

### Geography and Climate

International studies scholar Jonathan Goodhand recently wrote about the opium economy in Afghanistan, noting that "borderlands" foster lawlessness in a country or region, and that these borderlands consist of

"shadow societies, beyond the reach of the state, often with an insur-rectionary tradition."[31] It is thus important to recognize, he argues, that Afghanistan is completely surrounded by six different countries, result-ing in numerous "social and cultural system(s) straddling" all its borders.

Goodhand also discussed how Afghanistan acts as a geographical buffer in the Central Asian region, giving it a unique geographical po-sition in the marketing and trading corridors between Europe and Asia.[32] Afghanistan is strategically positioned along historic and geographic trade routes, allowing it to easily act as a conduit for drugs to southern Asia, Russia, Europe, Turkey, and Iran.

Afghanistan is also geographically distinct due to the Hindu Kush Mountains found along its eastern borders and dominating the majority of its landscape. These mountains are treacherous and provide outstanding areas for people to disappear for a long period of time. These mountains played a major role in the defeat of the Soviets, as well as the numerous invaders before them, by allowing Afghan fighters to hide, refit, and pre-pare for combat out of the reach of technologically advanced equipment such as helicopters, tanks, and other motorized vehicles. This geographi-cal blessing also supports opium producers, allowing them to operate well beyond the reach of the law. The deep mountains provide excellent cover for opium laboratories and hideouts for traffickers. Any attempt by the national leadership to thwart the tribal and warlord leadership in these borderlands becomes difficult to enforce due to the geography.

### Rule of Law

Afghanistan's borderlands exist outside the control of the central gov-ernment. In fact, the rule of law is absent in all but the largest cities in the country. A state needs to have security and the rule of law in order to have a functioning political, economic, and social system. Without any incentives or fear of punishment, illicit activity and corruption are cer-tain to thrive. The absence of the rule of law is a contributing factor to Afghanistan's comparative advantage in the production of opium.

The production possibilities of poppy for people in these so-called "brown areas" are substantially more profitable than any other crop.[33] Since the profit-to-weight ratio of opium is unrivaled, the legal economy cannot compete. The ability of the national government to enforce its legal framework becomes impossible in areas controlled by powerful warlords, thanks to the high opportunity costs. Few countries in the world have such extreme lawlessness in warlord-controlled areas that are protected by mountains. It actually becomes more attractive for warlords and law-less regional leaders to not support a focused and determined national government because of its threat to their opium livelihood, which funds their private armies and their respective power-bases.

The establishment of President Karzai's democratic regime, the training of the Afghanistan National Army (ANA), and the establishment of a national Islamic judicial system are bold attempts by Afghanistan to establish a rule of law. The pervasive corruption throughout the Afghanistan government, though, counters the effects of this new government, because the opium economy is entangled in the livelihoods of many of the high-ranking government officials. Thus, the rule of law will likely remain conspicuously absent in Afghanistan.

### War Economy

Afghanistan is a classic example of what Loretta Napoleoni calls a "state-shell." State-shells occur when armed organizations assemble the socioeconomic infrastructure of a state without the political infrastructure.[34] Afghanistan's long history of warfare has contributed to the deterioration of the rule of law and the creation of these state-shells. This constant warfare has created alternate systems of profit, power, and protection: a war economy. Afghanistan's reliance on narcotics as a funding source evolved during the Soviet war in the 1980s with the help of Pakistan's Inter-Services Intelligence (ISI).[35]

In 1979, the Soviet Union invaded Afghanistan and fought unsuccessfully for ten years to gain control of the country. During this war, the arms and opium trades mutually supported each other, as mujahideen commanders received support from outside countries and generated revenue internally from the opium trade. In 1989, the seven mujahideen commanders in control of Afghanistan produced over 800 metric tons of opium, thus demonstrating the income generating potential of opium.[36] Following the defeat of the Soviets, the amount of foreign aid to Afghanistan declined dramatically, creating stronger incentives for the Afghan warlords to dramatically increase production of opium to 2200 metric tons per year to offset the loss in external support.[37]

This dependence on opium continued during the Taliban's rule, except in 2001, when the Afghan leadership outlawed opium production (arguably to increase the price of their stockpiled opium). As the United States financially and operationally supported the drug-producing Northern Alliance in its fight against the Taliban, they indirectly endorsed the production of opium by the warlords in charge of the Afghan Borderlands.

According to Goodhand's analysis, "Although external resources are a significant factor, the opium economy has played an important and growing role in sustaining the combat economy."[38] This war economy, supported by the absence of rule of law for the past 25 years, has helped to perpetuate and expand the opium trade. Therefore, the present comparative advantage of Afghanistan's opium industry is directly attributable to its pervasive and enduring war economy. This war economy does not look

like it will disappear in the short term, as long as warlords attempt to hold on to power, and the Afghanistan government continues to fight Taliban insurgents who probe for signs of weakness in President Karzai's regime.

### Labor

Just as Afghanistan's geography, absence of rule of law, and war economy give it a comparative advantage in the production of opium, its labor force also contributes to the efficient production of the poppy plant. First, Afghanistan already has a labor force skilled in the conversion of poppy plants into raw opium. The lancing of poppies requires precision and skilled labor, which Afghanistan already possesses. This skilled labor "can have a major impact on production. During the 1990s, a vast pool of competent workers emerged, giving Afghanistan a comparative labor advantage relative to other potential producers."[39]

In addition to the skilled labor necessary to process a poppy harvest, Afghanistan also possesses a large unskilled labor pool to cultivate the poppy plants. A UN report on the opium economy cites the comparative cost disadvantage of producing opium. The labor intensity necessary to maintain a poppy harvest is approximately ten times that of cereals, such as wheat and other staples. This cost disadvantage, though, is countered by the large number of refugees, including women and children, returning to Afghanistan.[40] Afghanistan possesses a rare combination of skilled and inexpensive unskilled workers to make the labor-intensive harvesting of poppy profitable.

Another comparative advantage that the labor system creates for opium production is the opium debt structure. This specific financing system creates a slippery slope for poor farmers. Since many of the farmers are sharecroppers, they do not have money to live throughout the year or invest in an opium crop. This situation forces them to use the salaam system, in which they receive advance payment for a fixed agricultural product in order to allow their families to subsist through the winter. Because these money advances are approximately half the market value of opium at the time of the loan, the farmers are dependent on favorable conditions to repay their loans in the currency of choice—opium. As seen in the extreme case of the poppy harvest of 2000 and 2001, the monetization of the poppy loans led to interest rates of 1,000 percent to 15,000 percent, resulting in loan amounts that farmers could not repay. This debt further entangled the majority of farmers in future opium harvests, or face losing their daughters to repay the debts.[41]

The extent of poppy farming is evident in the average debt of poppy-dependent provinces. The average accumulated debt in Afghanistan is $1,835. While in the poppy-dependent province of Helmand, the average debt is $3,010, where the farmers are forced to continue to grow poppies

for 2–6 years to pay their salaam debt.[42] This debt is significant considering Afghanistan's per capita GDP is barely $800.[43]

Afghanistan's excellent growing environment for poppies, combined with the relative value of this illegal crop, further exacerbates debt issues for subsistence farmers. In 2003, the gross revenue per hectare of poppy returned 27 times the revenue of a hectare of wheat. In 2004, the gross revenue still remained substantial (even with the increased supply of opium) at 12 times the revenue of a hectare of wheat. The wage rates for poor farmers also incentivized opium harvesting, because the typical worker would receive 5 times the market wage for rural unskilled labor.[44] The average plot of land used to grow opium by the typical poor farmer is 1/3 of a hectare, which still generates income of $4,000 per year versus the $500 per year that the same farmer would earn from other crops.[45] Thus, the profitability of opium compared to other crops makes it attractive to these poor farmers. These poor farmers efficiently provide poppies to farm-gate buyers and support the efficient opium economy in Afghanistan.

## MAINTAINING THE COMPARATIVE ADVANTAGE

### Ineffective Eradication Efforts

Afghanistan's comparative advantage in opium production does not look like it will disappear anytime soon. Many of the countries that formerly led the world in the production of opium have conducted effective eradication campaigns. For example, in 1997, Pakistan's production of opium dropped to 24 metric tons due to pressure from the United States, and $100 million in U.S. aid contributed to help fight the problem. In the 1980s, nine countries were major producers of opium in the world. In 2000, this number had dropped to two countries—Afghanistan and Myanmar (formerly known as Burma). These two countries produced 95 percent of the world's opium. Countries such as Iran, Pakistan, and Turkey have virtually eliminated their opium trade. Because the demand for heroin remains strong, this production moved to Afghanistan and further fuels its opium economy.[46]

As noted earlier, Afghanistan's opium trade has flourished as other nations have effectively eradicated their opium production. President Karzai has recently made eradication a focus of Afghanistan's national policy. This focus, though, has not led to a decline in production of opium, but rather, an increase. In 2003–2004, the cultivation of opium grew from 80,000 hectares to 131,000 hectares.[47] This growth has continued, as production of opium has spread to all 34 provinces in Afghanistan, and is not expected to decline because of the economy's dependence on opium production.[48]

### Untapped Productivity

This eradication of the drug trade in Afghanistan is also not expected to decline due to the untapped opium production possibilities. In basic microeconomics, the production possibilities curve illustrates the total production possibilities of two products in a nation's economy. For the purpose of this illustration, we will assume that the two products for Afghanistan are opium and wheat. In the case of Afghanistan, it has been producing both of these at a very inefficient point on this graph because of numerous variables such as drought and war. This inefficiency is frightening from the perspective of this paper, because of the fact that Afghanistan has a comparative advantage in the production of opium, even in its current inefficient state. As Afghanistan emerges from its state of collapse, we predict that it will become much more efficient in its production of opium, which could have a serious impact on its potential as a narco-terrorist state.

The amount of potential growth in opium production is difficult to predict in Afghanistan, but a few indicators can help us see that growth is likely. First, in 2004, poppy cultivation covered only 3 percent of the arable land in Afghanistan.[49] With 97 percent of the arable land available for the growth of poppy, the production of opium has the potential to explode.

This explosion in poppy is also possible because of the increased confidence in the supply of wheat and the stable wheat prices.[50] As long as this wheat market remains stable, farmers can diversify their risk and grow more poppy because they are confident that wheat will be available. This availability of wheat allows (and perhaps encourages) these farmers to grow the more profitable poppy crop, thus supporting the assertion that Afghanistan has substantial untapped opium productivity potential.

The incentive to produce opium will only increase as Afghanistan becomes more adept at the highly profitable transformation of raw opium into high-quality heroin. Currently, Afghan opium traders have had little involvement in this aspect of the highly lucrative Western markets. Their income from opium has only involved 7 percent of the $35B world heroin market.[51] However, this lack of vertical integration in the overall heroin market is changing in Afghanistan, as the traders and warlords become more sophisticated and greedier. In 2000, the proportions of exported poppy was approximately 1/3 exported raw, 1/3 exported as base morphine, and 1/3 exported as heroin.[52] We predict that the heroin proportion will increase dramatically, as Afghan drug lords invest in heroin laboratories for the increased profit and the ease of smuggling heroin versus raw opium. This shift toward heroin production is already evidenced by the 2002 seizure of 5,670 tons of aceditic anhydride, the chemical necessary for processing opium into heroin, which was found in Chinese rugs enroute to Afghanistan's rug bazaars.[53]

As Afghan drug lords become more sophisticated in the profitable processing of opium into heroin, the poppy farmers will likely move to fill the increased demand for opium by tapping into the 97 percent of arable land not being used for opium production. The increased cultivation of this land into poppy fields will further cement Afghanistan's comparative advantage in the production of poppy, raw opium, and heroin.

### Afghanistan's Macroeconomic Dependence on Opium

The opium economy in Afghanistan has entangled the national government in its web. President Karzai faces the daunting task of shifting his country's comparative advantage in opium to other goods, even while his economy is dependent on this opium economy. From a macroeconomic perspective, Afghanistan is dependent on opium for a number of reasons.

First, the opium economy has increased the exchange rate of currency in Afghanistan. In 2001–2002, the real exchange rate in Afghanistan increased by approximately 24 percent. While it remained static in 2002–2003, it rose again in 2003–2004 by 13 percent.[54] These increases in the exchange rate could be largely dependent on the exporting of opium, thus further tying this country's economy to the global opium trade.

Second, the opium economy has contributed to growth in Afghanistan's GDP, which has resulted in a healthy economic increase in price levels. These price level increases have reflected an increase in the wealth of all levels of society, from the poor sharecroppers to the wealthy opium traders. The price level increases have also created a perverse economic problem: if the government eradicates the opium economy, it could result "in a $1 billion shock to the rural economy."[55] A shock of this magnitude could devastate Karzai's progress in establishing a stable and democratic government in Afghanistan.

Lastly, the opium economy has increased Afghanistan's aggregate demand for goods, services, and investment from within and abroad. This increase in aggregate demand has fueled the recovery of the economy, which makes investment by foreigners more attractive.[56] Also, 1/3 of the Afghanistan GDP in 2003 came from the opium trade and contributed to a "money multiplier" of roughly 2.[57] Therefore, the opium economy has been a major conduit of the recent economic growth, which has facilitated the recovery of Afghanistan politically, economically, and socially.

Each of these macroeconomic indicators illustrate that Afghanistan is dependent on the opium economy. President Karzai faces the daunting task of shifting his country's comparative advantage in opium to other goods, even while his economy is dependent on this opium economy. This task will likely take years and possibly even decades, which supports our assertion that Afghanistan has (and will likely maintain) a comparative

advantage in the growing of poppies and the production of raw opium both at the regional and global level.

In summary, this section of the chapter argues that Afghanistan has a comparative advantage in the production of opium due to its geography, its absence of rule of law, its history of a war economy, and its favorable labor force. We have also argued that this comparative advantage will remain a problem in the future due to Afghanistan's ineffective eradication efforts, its untapped opium productivity potential, and the macroeconomic dependence on the opium economy. The next step in this analysis is to describe how Afghanistan's comparative advantage in opium makes it a threat to the United States' war on terrorism, and what should be done to counter this threat.

## COUNTERING AFGHANISTAN'S COMPARATIVE ADVANTAGE

We are facing a potential crisis in the war on terror. Afghanistan's comparative advantage in opium production threatens to create an unstoppable narco-terrorist state that will be a source of terror financing. Thus, it is vital that we explore what can be done to prevent this. The concluding section of this chapter describes what is currently being done, and then offers some final thoughts on where marginal dollars should be spent.

### Economic Overview

Afghanistan quantitatively and qualitatively has the international comparative advantage in the production of opium. The key to countering this comparative advantage is to increase the cost of participating in the opium business, while decreasing the cost of conducting legal business. In noneconomic terms, the Afghan leadership needs to make it unprofitable economically, socially, religiously, and politically for farmers to grow poppy, for farm-gate buyers to purchase poppy, for manufacturers to make opium and heroin from poppy, for shop owners to sell opium and heroin, and for bulk buyers/large scale specialist traders to ship it abroad. Furthermore, these players—and especially farmers—must have the opportunity to economically, socially, religiously, and politically profit from alternate means, if any solution is to succeed.

### Current Afghan Plan to Counter Opium Trade

The Afghan government has drafted a plan to counter the opium economy. In May 2003, the Transitional Islamic State of Afghanistan issued a *5-Year Strategy for Tackling Illicit Drug Problems in Afghanistan*. This plan presents a cogent strategy that identifies the opium problem, outlines the

specific goals and objectives to counter it, and most importantly, recommends means to coordinate, resource, and monitor all efforts.

More recently, the Karzai government published *The 1384 (2005) Counter-Narcotics Implementation Plan*, which organizes the strategy into eight pillars: building institutions, information campaigns, alternative livelihoods, interdiction and law enforcement, criminal justice, eradication, demand reduction/treatment of addicts, and regional cooperation.[58] The discussion below outlines each of the pillars and the specific impact of either raising the cost of participating in the drug business or lowering the cost of conducting legitimate business.

*Building Institutions.* The first pillar for the implementation plan involves establishing central government focus on the narcotics problem. The Counter-Narcotics Ministry will take the lead role in the fight against opium. The Counter-Narcotics Minister will head a Cabinet Sub-Committee on Counter-Narcotics and will also cochair a Counter-Narcotics Consultative Group working with the UK ambassador. Additionally, the Afghan government has formed a Counter Narcotics Trust Fund for international and national entities to support this implementation plan. The priority of spending for this trust fund will focus on implementation of alternative livelihood projects. The government has also formed Provincial Development Committees that approve and control the numerous development projects within each province.

This focus on building institutions addresses the labor comparative advantage discussed earlier in this paper. Rather than simply eradicating the opium crop, Afghanistan has wisely decided to commit resources that lower the farmer's opportunity cost of earning a living outside of growing opium. This alternative livelihood dimension also addresses the future threat of untapped opium productivity capabilities by focusing on the labor at the production level.

*Information Campaign.* The second pillar of the Implementation Plan involves educating the Afghan populace on the negative aspects of an opium economy. This pillar focuses on delegating the information campaign to religious leaders in mosques and local government officials rather than conducting a national information campaign. This system would have a greater effect given the infrastructure and technological problems that exist outside major cities.

This pillar also addresses Afghanistan's comparative labor advantage, by focusing on educating the lowest level of the opium supply chain—the farmers—and thereby lowering the opportunity costs of doing other business. The Afghan government hopes to raise the opportunity cost of participating in the opium economy by increasing awareness of the narcotics problem and consequences associated with growing and trading opium. It also desires to raise the local pressure on opium farmers and traders from communities, peers, and local and religious leadership.

*Alternative Livelihoods*. The third pillar is closely tied to the first, due to the Afghan Trust Fund's priority in supporting alternative livelihoods. The Afghan government has further focused this money and effort on the seven key opium-producing regions in Afghanistan, with priority going to regions that have voluntarily made efforts to reduce opium production. Alternate livelihoods primarily center on licit crops, but could include developing its textile market. One large obstacle in alternate livelihood development is the lack of infrastructure in Afghanistan. A robust infrastructure decreases the costs of doing business, specifically in transportation.

Additionally, the government also plans to address the opium indebtedness problem, although it is not sure yet how to do this and is seeking international help in tackling this problem.

The focus on alternative livelihoods directly addresses Afghanistan's comparative advantage in opium labor. It also indirectly attempts to change Afghanistan's pervasive war economy by creating a legitimate peacetime economy not based on maintaining regional and national balance of power.

*Law Enforcement/Interdiction*. The fourth pillar of Afghanistan's Counter-Narcotics Implementation Plan is to actively seek out narcotics producers and traders. The Afghan government, in coordination with the United Kingdom and Germany, is aggressively developing competent and aggressive law enforcement agencies that it hopes will extend influence throughout Afghanistan, even into the borderlands. The government's Implementation Plan has provided resources for the Afghan Special Narcotics Force, which is working closely with United Kingdom advisors. This unit has achieved some success by destroying 70 drug labs and disrupting 2 opium bazaars, but should have more of an impact with the additional resourcing and training that this implementation plan promises.[59] The Afghan government has also demonstrated its resolve to interdict the narcotics trade by resourcing the expansion of its Counter-Narcotics Police by 750 officers.

The Afghan government hopes this investment in its law enforcement will help establish a strong rule of law throughout the country. Rather than see Afghanistan's comparative advantage grow indefinitely, the Afghan government hopes that a strong antinarcotics police force will slow the growth in opium production and make growing, transporting, and processing opium too costly for those involved.

*Criminal Justice System*. Afghanistan hopes to establish a robust criminal justice system, including more laws, courts, and prisons. As discussed earlier in this chapter, Afghanistan is notorious for its absence of rule of law, especially in regions outside its major cities. The Afghan government hopes to dramatically transform its inept justice system so it can punish those who participate in the opium economy. The first step in its

implementation plan is to strengthen the recently formed Counter-Narcotics Criminal Justice Task Force and also establish a new drug trafficking court in Kabul. The Afghan government is also updating its legal framework to establish explicit laws dealing with narcotics. Lastly, it is updating the infamous Pul-e-Charki prison so that it has a facility to properly secure those convicted of narcotics crimes.

By establishing a justice system to punish those who violate Afghan law, the Afghan government demonstrates its commitment to reducing the country's comparative advantage in opium production. This strengthening of the rule of law demonstrates that Karzai's regime understands it must raise the legal cost of participating in the opium economy for all participants in the opium supply chain.

*Eradication*. Afghanistan's most aggressive and precarious pillar in its war on opium is eradication. The Afghan government will dramatically increase the Central Poppy Eradication Force (CPEF) with funding and personnel. It will also deploy 15 newly trained verification teams throughout the provinces and will support them with satellite imagery to better verify the eradication process.

This eradication effort is focused on reversing the trend of increasing yearly production of opium. The goal of the government is to raise the economic cost of growing opium so that farmers will grow licit crops, and opium traders will not have a product to trade and will be forced to trade legal goods.

*Demand Reduction*. The seventh pillar of Afghanistan's Counter-Narcotics Implementation Plan involves lowering the demand for opium both in Afghanistan and the world. It plans to build new drug addiction treatment centers, regional hospitals, and community-based treatment centers. Afghanistan also calls on nations worldwide to decrease the demand for heroin so that the market declines, thereby eliminating the demand for opium.

The Afghan government understands the basic principle of supply and demand. If the quantity of opium demanded declines dramatically, then the price for opium will decline, thereby eliminating the need for a supply of opium. The opportunity cost of producing opium will become much higher than producing other legal crops and goods. The reduction in the demand of opium is not practical for the Afghanistan government and requires a worldwide coordination effort.

*Regional Cooperation*. The final pillar in Afghanistan's plan is regional cooperation. Regional cooperation is directly tied to demand reduction and supply reduction. Afghanistan's implementation plan is very brief on this pillar and refers readers to the framework of the Good Neighborly Relations Regional Declaration on Counter Narcotics.

Regional cooperation is indirectly tied to reducing all of Afghanistan's comparative advantages in its opium economy. This sweeping generality

of regional cooperation does lead to a convenient segue into the final thought for this chapter.

## MARGINAL DOLLARS—WHERE SHOULD THEY BE SPENT?

The primary national security priority for the United States since 9/11 has been the elimination of terrorist threats both within its borders and outside U.S. borders. Based on the premise that Afghanistan is ripe to become a dangerous narco-terrorist state, U.S. policymakers should be very interested in ensuring that Afghanistan's opium economy does not become a large-scale terrorist financer. The next question becomes, Where should the United States spend its marginal dollars to fight this threat? More specifically, where should the United States spend its limited resources to decrease Afghanistan's potential ability to fund terror groups? We will analyze this question from the demand reduction approach and the supply reduction approach.

### Demand Reduction

Most experts in counter-narcotics agree that reducing the demand for an illegal drug is the most effective method for eliminating a market for that drug. If there is no demand, the price for the drug will decrease, thereby raising the opportunity cost of producing the drug. If drug suppliers can make more money with less risk in another livelihood, then they will grow other crops or manufacture other products.

This line of reasoning for reducing the demand for Afghan-produced opium is faulty, though, because Afghanistan is not the primary consumer of Afghan opium. The primary consumers of Afghan opium are users in Europe and Asia. Thus, Afghanistan has very little influence in the demand for opium. Instead, multilateral prevention measures are necessary to reduce worldwide demand for opium. Examples of multilateral prevention measures are education at regional levels and treaties among international organizations such as the UN, NATO, and the WTO. These treaties require economic and political incentives to foster real cooperation among nations.

### Supply Reduction

The other policy approach to preventing Afghanistan from becoming a narco-terrorist state is to reduce the supply of opium produced in Afghanistan. We believe that U.S. aid can actually have a positive impact on decreasing the opium economy and raising the opportunity cost for all its participants. Policies addressing the marginal spending of U.S. dollars are best approached through a short-term and a long-term approach.

In the short term, U.S. aid should focus on removing opium traffickers and warlords involved in the opium economy. It should not focus on eradicating poppy production because of the farmers' reliance on the crop for survival and their entanglement in the opium debt dilemma.

How can the United States best influence the demise of these higher-level opium bulk-buyers and large-scale specialist traders to achieve short-term results in preventing a narco-terrorist Afghanistan? First, the United States can financially support the Afghanistan government's efforts to establish a viable rule of law throughout the country, ensuring narcotics criminals can be legally tried, convicted, and imprisoned. The United States could further focus this spending by investing in the education of policymakers, judges, and prison officials, primarily in effective criminal justice techniques.

Second, the United States should help establish enforcement measures aimed at raising the cost of participating in the opium business. These interdiction and seizure measures should focus on stopping Afghan traffickers, terrorists, and warlords from producing and shipping opium and its derivatives. Recently, these players have been able to increase their profits by producing the final products (heroin and morphine) inside the country instead of storing and shipping poppies and the gum. These refined products have huge profit margins due to decreased transportation costs, lower seizure risks due to the smaller size, and reducing the number of individuals in the supply chain. These cost savings only increase the potential amount of money available to terrorists.

Additionally, interdiction and seizures must occur inside Afghanistan for them to be effective against terror financing. If these actions occur outside Afghanistan, the decrease in supply drives up the price Afghan traffickers receive for their product, further incentivizing everyone involved in Afghanistan to remain in the drug business.[60] This decrease in the opportunity cost is exactly what we do not want. Interdiction and seizures effectively increase the cost of doing business if conducted in Afghanistan. The key to impacting the opium trade is to cause the risk and opportunity cost of participating in the opium economy to become too high for the major players. Again, this opportunity cost does not only include economic costs, but also political, social, and religious costs.

Lastly, infrastructure development and modernization must occur nationwide. In order for alternative livelihoods to have a fighting chance against the drug trade, something must be done to lower the costs of producing, transporting, and selling these preferred goods. Highways must be built. Railheads and lines must be established. Irrigation systems must be built. Permanent and mobile markets must be created. Communication networks must be formed. Financing institutions and methods must be advanced. And new technologies must be employed to lower costs.

By increasing the costs of participating in the opium economy and lowering the costs of pursuing alternative livelihoods, the plan may succeed in moving the opium market to another country. This possibility, although not the optimal result, is definitely preferable to the current situation. In the short run, this is a success since the shift away from Afghanistan will disrupt terrorism financing. We understand that this line of reasoning is dangerous, because we cannot predict what perverse effects a transition of opium production will have in the long-run. We are confident, though, that this risk is acceptable to prevent Afghanistan from evolving into a full-blown narco-terrorist threat to the world.

## CONCLUSION

This chapter has sketched the evolution of terrorism financing and has suggested that drugs are terrorist's next major source of funding. We have argued that Afghanistan has a comparative advantage in the production of opium due to its geography and climate, its absence of rule of law, its historical war economy, and its expert, opium, sharecropping labor force. This comparative advantage does not appear that it will decrease in the near future due to ineffective eradication efforts, untapped poppy productivity, and the national macroeconomic dependence on opium. As a result, Afghanistan has the potential to become a major narco-terrorist threat to the world if it becomes a funding base for terrorists.

Therefore, the global community has the opportunity to invest in Afghanistan's 2005 Counter Narcotics Implementation Plan, where its marginal dollars can have an immediate impact in reducing the amount of money supplied to terrorists. Now is the time to make that investment. Failing to take this opportunity will cause a greater future investment in terms of dollars, soldiers, time, and other valuable assets.

# CHAPTER 13

# THE SHADOW ECONOMY AND TERRORIST INFRASTRUCTURE

Shahdad Naghshpour, Joseph J. St. Marie, and Samuel S. Stanton, Jr.

To what extent does the economy promote or deter terrorism? And more importantly, which of the government's economic policies actually assist terrorists in creating an infrastructure for financing terrorism. While terrorist organizations seek various objectives, engage in a myriad of violent acts, and have diverse social and ideological backgrounds, they share one common problem—namely, how to finance terrorism. Terror must be funded, and funded in sufficient quantity to help terrorists meet their goals. In general, terrorism is a form of political violence,[1] specifically; it is a deliberate violence against noncombatants for political purposes.[2]

The purpose of this chapter is to examine the role of the shadow economy in the global spread of terrorism. To this end, we examine the theory behind the shadow economy and the effects it can have on terrorist organizations with regard to financing. We believe that the shadow economy can provide an infrastructure for terrorist organizations to operate in, whereby financing becomes easier and detecting it becomes more difficult.

**THE SHADOW ECONOMY**

Each economy harbors an element seldom discussed save by economists, and then only in selected circles—the shadow economy. Shadow economic activities are activities that are underground, covert, or illegal. Governments have an interest in determining the size of the shadow economy.[3] First, governments need to provide accurate estimates of the size of the economy; and second, they must determine what activities

lie outside the state's regulatory structure in order to bring these activities into the regulatory structure and derive revenue. Once shadow activities are identified and mapped, the state can devise policies to shrink the shadow sector of the economy. The ability to reduce or eliminate the shadow economy becomes more important if it finances the terrorist organizations that are trying to overthrow the government. Western countries—especially the United States—are particularly concerned with this aspect of the shadow economy, since it also finances global terrorism.

A shadow economy cannot be measured unless it is defined. The definition of the shadow economy is not uniform within the economic literature. Common definitions revolve around economic activity that is not officially calculated in the GNP, while Philip Smith defines it as "market-based production of goods and services, whether legal or illegal, that escapes detection in the official estimates."[4] Some broadly define the shadow economy as "those economic activities and the income derived from them that circumvent or otherwise escape government regulation, taxation or observation."[5] German economist Friedrich Schneider, who has conducted extensive research on shadow economies worldwide, provides a definition that encompasses those activities that may be undertaken by terrorist organizations:

> The shadow economy includes unreported income from the production of legal goods and services, either from monetary or barter transactions—and so includes all economic activities that would generally be taxable were they reported to the state (tax) authorities.[6]

The presence of a shadow economy (all countries have a shadow economy) does not indicate that the country is poor or wealthy; a shadow economy and its magnitude merely indicates how much of the economic activity is outside the "official" sector. Nor does a shadow economy necessarily cause poverty. Causes of poverty seem to have little relationship to the size of the shadow economy. Research on a poverty/terrorism link has found no strong link between poorer nations and the propensity to generate terrorists.[7] Studies also indicate that members of terrorist organizations tend to come from more affluent segments of the population of their respective countries.[8] Thus, we analyze the shadow economy as an instrument that can be used by terrorist organizations for financing rather than a cause of terrorism.

Building on our definition of the shadow economy, we follow the taxonomy of the shadow economy to explain how shadow activities can support terrorist financing. Table 13.1 details the various nonobservable economic activities that comprise the shadow economy.

This classification of underground, shadow economic activities comprises two axes, the horizontal axis indicates monetary and nonmonetary

**Table 13.1    Taxonomy of Types of Underground Economic Activities**

| Type of Activity | Monetary Transactions | | Non Monetary Transactions | |
|---|---|---|---|---|
| **Illegal Activities** | Trade with stolen goods, drug dealing and manufacturing, prostitution, gambling, smuggling, fraud, etc. | | Barter of drugs, stolen goods, smuggling, etc. Produce or grow drugs for own use. Theft for own use. | |
| **Legal Activities** | **Tax Evasion** Unreported income from self-employment, wages, salaries and assets from unreported work related to legal services and goods | **Tax Avoidance** Employee discounts, fringe benefits | **Tax Evasion** Barter of legal services and goods | **Tax Avoidance** All do-it-yourself work and neighbor help |

transactions, while the vertical axis denotes the dichotomy between legal and illegal activities. For our purposes these distinctions fit well into scenarios of terrorist financing, where the power of the state to resist terrorism is at stake. To be sure, the capacity of the state to resist terrorist demands is implicit in its capacity to regulate its economy. The capacity of the state to harness its economy through various regulatory, law enforcement, or tax mechanisms can be seen in how successful the state controls legal or illegal transactions.

### Causes of the Shadow Economy

The economics literature considers the shadow economy primarily as a result of various factors, but in particular:

1. Increasing tax burden, either direct (sales, value-added-tax, income, real estate, etc.) or through increasing social security contributions' burden (increased withholding or surcharges).

2. An increase in the number and intensity of regulations in the official economy, especially in the labor markets.

3. Reductions in work hours either through layoffs or work slowdowns, early retirement, and growing unemployment both in the private and public sectors.

4. Decline in the loyalty of the populace toward the government and its regulations or a decrease in the ability of the government to control the population and its economic activities.

5. The presence of ethnic/racial conflict, civil war, and terrorist organization that are not funded by other governments. After the Cold War, these groups were forced to finance most if not all of their activities themselves, which forced them into shadow economy activities for obvious reasons.

6. In the old Soviet Bloc countries, the transition from socialism to capitalism destroyed the social safety nets, thus creating unemployment and reduced or diminished health care, social security, etc. Augmented by inflation and lack of government infrastructure to curb shadow economic activities, this has increased participation in the unofficial sector.

The influence of various types of taxation denotes how rising tax rates increase the prevalence and size of shadow economies. In a study of 14 Latin American nations, Loayza found that primary determinants of the shadow economy to be the tax burden, labor market restrictions, and the strength and efficiency of government institutions.[9] These findings indicate that the greater the tax burden, the greater the incentive to resort to the nonobservable economy for labor, as well as barter for heavily taxed goods. Thus, one major determinant of the shadow economy is the overall tax burden, which when increasing tends to increase the size of the shadow economy, as well as the incentive to avoid "official" work. As seen in the above table, this type of activity encompasses monetary transactions such as tax evasion or tax avoidance. Although there are numerous examples of revolutions, ethnic conflicts, and terrorist activities as a result of the overburden of taxes, present day terrorism seems to lack strong links between taxation and terrorist activities. Nowadays, ethnic conflict, social tension, and terrorism simply take advantage of the presence of (and the opportunities created by) the existing shadow economy of the country to sustain its activities.

The intensity of the regulatory environment also affects the shadow economy. Economists Johnson, Kaufmann, and Zoido-Lobaton recently demonstrated how labor market regulations for both citizens and foreigners affect the incentive structure to avoid engagement in shadow economy activities.[10] Furthermore, the number of laws, regulations, and license requirements has been found to limit the choices for those individuals seeking to participate in the economy. De Soto reinforces this point by asserting that increased regulation leads to increased entry costs in the official economy, thus entrepreneurs favor the unofficial economy where entry is easier.[11] While technically illegal, these shadow entrepreneurs fill a void created by an excessive regulatory state.

 Increased labor regulation reduces official employment by creating incentives for firms to hire shadow workers while cutting the hours of "official" workers. Workers who have had their work hours cut are provided with incentives to engage in shadow activities thus increasing the overall size of the nonobservable economy. Hunt agues that Volkswagen workers who were limited in the hours they worked—against their wishes—provided the labor for a home reconstruction and renovation boom.[12] This sort of activity is a type of tax evasion based upon barter of goods and services, or neighbors' help, which in each instance results in lost tax revenue and an increase in the shadow economy. In the old Soviet Bloc countries, the collapse of the system created an opportunity to avoid tax payment altogether. Simultaneously, the reduced or vanished police authority and the lucrative return on illegal activities have resulted in expansion of all kinds of illegal shadow economy activities in these countries. In general, privatization in the Soviet Bloc countries has increased the size of the shadow economy in these countries substantially.[13]

Reduced revenues can lead to either decreased public expenditures or a higher overall tax burden for the remaining taxpayers to offset the loss. In the former case, decreased public spending can lead to loss of citizen loyalty, especially for minority groups who may rely upon income transfers or government developmental aid. Sudden drop in spending can test the loyalty of even majority groups. To be sure, once a public service is provided, restricting or discontinuing the service is difficult. While reducing public spending per person may be regime-type dependent, any reduction without an accompanying increase in replacement benefits (tangible or intangible) or security will meet resentment in most societies. This is especially important where terrorist groups operate, as they can exploit the inability of the government to provide services. Indeed the rise of Hamas in the Palestinian territories can be traced to the inability of the PLO to provide such services.[14]

A higher tax burden either in developed or developing nations signifies an attempt by the government to increase its power or control over the population on one hand, while also deriving revenue on the other hand. Clearly, state capacity is tied to its ability to finance its endeavors and the ability to increase taxes to an optimum level, in order to maintain control. In segmented societies, overcontrol may prod ethnic minorities to seek autonomy or rebellion. Political violence in the form of terrorism is also an outcome of an overly extractive state. For developed nations, an increase in the tax burden leads to a larger shadow economy as incentives for productive "official" employment is lessened. In developing countries, a lack of the rule of law, poor institutions, or authoritarian leaders and corruption leads to larger shadow economies.

In both instances, the logic of the Laffer Curve is evident, where increasing taxes in a developing nation beyond the optimum level will lead to a

decreased official sector and increased shadow economy.[15] As taxes rise, an incentive to exit the official sector is created. Theoretically, when taxes reach 100 percent of income, employment in the official economy would be nil, while employment in the shadow economy would be full. Alienated groups will resort to shadow economy activity especially if—as is the case in many developing countries—they are economically disadvantaged vis-à-vis the dominant group. This may also have political repercussions for state capacity and terrorism. In developed countries, the political repercussions of an increased tax burden will primarily be felt through the polls, while in developing nations rebellion, civil war, and terrorism directed against the government are common. In either instance, an increased tax burden has implications for the shadow economy, the official economy, and politics.

The above discussion of the shadow economy revolves around those activities that are legal, involving either monetary transactions or nonmonetary transactions through tax evasion or tax avoidance. However, many activities of the shadow economy are based upon illegal monetary or nonmonetary transactions. Illegal activities involving narcotics, smuggling, and precious metals are especially of interest to terrorist groups due to the high value of the commodity. Usually, tax evasion is an individual act, part of which may or may not be diverted to support a cause, be it an ethnic conflict, civil war, or terrorism. On the other hand, narcotics, smuggling, and precious metals smuggling generates revenue, usually from beyond the borders of the base country. These activities have the added advantage—from the terrorists' point of view—of hurting or damaging the afflicted countries, while generating lucrative revenue to finance terrorist activities. Transportation and distribution of these illegal products requires a higher level of sophistication and mastery of logistics that benefit the terrorist in obtaining their weapons. Monetary transactions might include the trade of stolen goods, manufacture and distribution of illegal drugs, small-scale specialized manufacturing, prostitution, gambling, smuggling, all types of fraud, and in general, all nonviolent felonious activity.

Nonmonetary illegal transactions include barter for drugs, stolen goods, drug production for barter or personal use, as well as theft for one's personal use. These are the types of activities that make the shadow economy difficult to measure, especially if it is well established and relatively dependent upon illegal activities. While not explicitly noted in the literature, the implication is that legal activities may eventually turn into illegal activities should the tax or regulatory burden of the state increase to a significant level. This is especially true in many underdeveloped economies, where the rule of law and judicial independence are absent, while onerous regulatory regimes, and corruption are present.[16]

**THE SHADOW ECONOMY AND TERRORISM**

Once the basis of a shadow economy is understood, its general effects on creating an infrastructure for the financing of terrorist organizations becomes clear. We begin with the assumption that there are social, ethnic, or religious groups under some sort of economic or political disenfranchisement. While this situation may not always be the case, we believe that most groups as such feel economic pressures or political pressures.

We base part of our theoretical framework on the work of Albert Hirschman, who presents a theory based upon organizational behavior.[17] We see the state and groups within the state, behaving in much the same manner as Hirschman predicts individuals would in a firm. For Hirschman, the behavioral options for individuals in the firm are divided into three aspects. One may "voice" dissent by complaining about a deteriorating condition in the firm, or if the individual sees no improvement in conditions, they may exercise the option of "exit," thereby leaving the firm. Related to this, but in a separate category, is the notion of loyalty. Loyalty is a predictor of the likelihood of an individual using the "voice" or "exit" option. Graphically, we could see the relationship between the three concepts as a spectrum called loyalty. On the low end or far right side we would place "exit" while on the opposite end with high loyalty we would place "voice" (see Figure 13.1).

In practice, Hirschman notes that there are two principle determinants of when one resorts to voice or exit.[18] The first is the extent to which the person is willing to trade off the certainty of exit against the uncertainties of an improvement in the deteriorating organization. Second is the person's assessment of their ability to influence the organization. These factors drive the voice/exit determination. Implicit in Hirschman's model is the important assumption that the firm or organization is in decline. Thus, perceived or actual decline is an impetus for the person to begin making the voice/exit calculus depending on loyalty.

Clearly, exit/voice and loyalty are complex interrelationships. For the purpose of this chapter, we define loyalty as good citizenship and acceptance of the current political and economic institutions. On the other hand "exit" is an option that the dissatisfied or terrorist can exercise within the economic sphere (we assume they have already exited the political sphere). One can exit the official sector for the informal or shadow

Voice                                                                    Exit

Loyalty

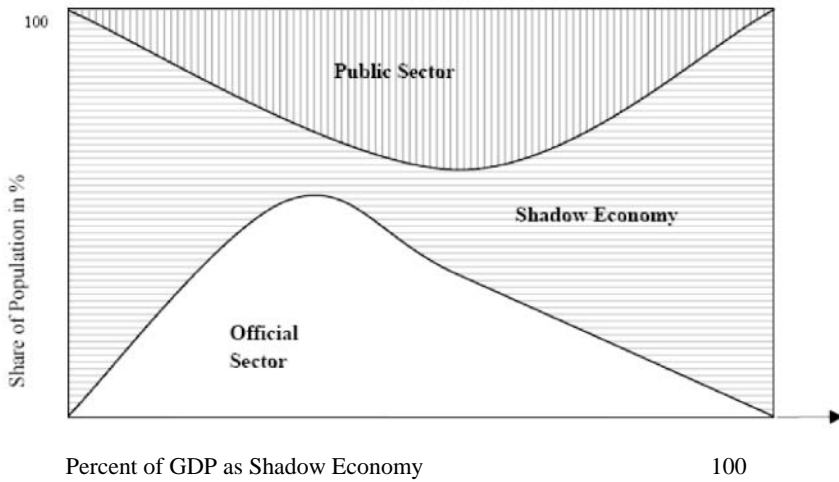
**Figure 13.1    Exit Voice Continuum**


**Figure 13.2   Stylized Model of an Increasing Shadow Economy**
*Source*: **Adopted from Dr. Dominik H. Enste. The Shadow Economy and Institutional Change in Transition Countries. Institut der deutschen Wirtschaft, Köln. 2003 page 40.**

sector either fully or in part. Any movement to the shadow sector creates an increase in the infrastructure available to the terrorist. Sympathizers may participate in both the official and shadow economies. Such sympathizers are the basis of the shadow economy's infrastructure the terrorist organization depends upon for financial and material support.

Having explained the shadow economy and its effects on the supporting infrastructure available to terrorist organizations, we now offer a central observation based upon the notion that a person or persons will exit the official economy to join, either in whole or in part, the shadow economy to support terrorist organizations. Our assertion is that an increase in the factors comprising the shadow economy increases the avenues for participation in the shadow economy by supporters of terror organizations or terrorist themselves. Furthermore, the larger the shadow economy the greater the potential for and avenues for the creation of an infrastructure for material and financial support for terrorist organizations. Finally, the poorer a region or a country the greater the need for a terrorist organization to engage in shadow economy activities, especially illegal activities because it is more difficult for the poor to finance terrorists. The latter situation is more applicable to organizations that lack foreign funding. In fact all the organizations financed by Soviet Union, Libya, and Saudi Arabia (in the case of al Qaeda) are now either out of operation or are engaged in some sort of shadow economic activity, especially of the illegal type. The basic logic of our argument follows Figure 13.2, which demonstrates

how an increasingly large public sector, or more demands by the state on resources (such as higher taxes or more onerous regulations), will create incentives for individuals to defect to the shadow economy.

As state revenue drops as a result of an increase in the shadow economy, the official sector is forced to increase taxes, etc., which will cause even further increase in the shadow economy. Eventually, the public sector will decline, as defections to the shadow economy make revenue collection impossible. If we look at this scenario on a linear continuum we can see how consolidation of state power and economic development creates conditions of economic prosperity. Economic prosperity leads to the expansion of the public sector, creates "institutional sclerosis" to use Mancur Olson's terminology,[19] and eventually defections to the shadow economy. Increasing defection and grievances lead to a potential terrorist infrastructure. It might be useful to distinguish between localized terrorism, for example, ETA in Spain or the Irish Republic Army in Ireland, and global terrorism such as al Qaeda. In the case of the former, at one time or another, the segment of the population of the country that has been affected by the tax burden or social injustice will choose the exit option through terrorism against the government. In the case of the latter, the root of the conflict is external. However, although the source(s) of disenfranchisement is different, there is no evidence to support the notion that the methods, procedures, or the financing means of terrorism differs in the two cases. Regardless of the origin of the terrorist movement, the organization can benefit from an increase in the shadow economy, which creates conditions where dissatisfied groups have an infrastructure to engage in political violence. Graphically, we superimpose this process on the shadow economy model, as seen in Figure 13.3.

Clearly, there are limitations to our analysis. The first is the direction of causality question—does the existence of shadow economy cause terrorism or does terrorism cause a shadow economy. We believe that terrorist behavior is indeed a path-dependent process, and that while the process can be halted or redirected, certain conditions in general are necessary for terrorist activities or political violence to occur. At the same time, the processes that create an increase in the shadow economy follow a similar path and logic. We theorize that instead of attempting to determine the direction of causality, conceptualizing the co-movement of both processes is analytically useful for capturing the essence of the decision either to use voice or to exit the economic system (and by extension, the political system).

Second, we acknowledge that the shadow economy is a hybrid of legal and illegal activities. The greater the share of the illegal activity in the shadow economy, the greater the harm to the society and the larger the problem for government. The problem for analysts is to determine how the ratio of each component (legal/illegal) is measured. Furthermore,

Increasing Economic Prosperity
Expansion of Public Sector
Defections to Shadow Economy
Potential for Terrorist Infrastructure Created
Increase in the Potential Terrorist Infrastructure
Terrorism Supported by Shadow Economy
Decline in State Authority
Civil War—Terrorist Ascendancy
Institutional Change

Public Sector

Shadow Economy

Official Sector

**Figure 13.3   The Consolidation of State Power/Decrease in Shadow Economy.**

it is necessary to identify the point at which, during the increase in the shadow economy (and increase in potential terrorist infrastructure), this ratio moves from majority legal to majority illegal. This legal/illegal switch may indeed occur, yet the tracking and measurement of such activities is difficult and beyond the scope of this chapter.[20] However, we believe that our analysis provided below points to interesting findings and further directions for research into the infrastructure that the states inadvertently provide to terrorists.

## HOW THE SHADOW ECONOMY CAN AFFECT POLITICAL VIOLENCE AND TERRORISM

Since political violence can take many forms, the shadow economy can also affect political violence in many ways. The shadow economy can provide terrorists or others with numerous financing opportunities in both legal and illegal realms of activity, each of which requires a unique response as part of a comprehensive strategy for combating terrorism.

### Legal

Legal monetary transactions can include tax evasion, where individuals who sympathize with (or are part of) a terrorist organization redirect some of their income while underreporting their total income, or engage in self-employment to finance the organization. Unreported income can come from legal sources, but is redirected to terrorist organizations. Diverting taxes on a large scale from government to terrorists increases the overall share of the shadow economy. Another method would involve tax avoidance, if one directed fringe benefits or such things as employee discounts toward terrorist activities/organizations. Clearly, these are not violent or illegal economic activities but they do, however, provide an infrastructure for the terrorist or terror organization to operate within. A nation with a larger legal monetary shadow economy will be able to provide a more extensive infrastructure for clandestine support, as opposed to a nation with a smaller shadow economy.

Legal activities of a nonmonetary nature can be in the form of barter of legal goods or services as well as helping neighbors. These activities avoid any form of taxation. Each form of shadow activity can add to an infrastructure that is conducive to terrorist organizations. Clearly, terrorist organizations do not operate in a vacuum and a nation with the potential for an extensive infrastructure would be an attractive home base for such organizations, whether they have domestic or international goals. A more important way of participation is through sheltering terrorists by providing housing, food, clothing, and logistical information to enable terrorists' movement through a territory. Examples of this include Vietcong sympathizers in Vietnam, Laos, and Cambodia, who enabled the insurgents to carry out numerous, extended, and prolonged attacks against South Vietnamese and American forces. A terrorist organization with access to revenue through legal or illegal activities can, and often does, reimburse the sympathizers to expand its support base. This unique aspect of the shadow economy not only applies to the terrorist activities, but to rebel groups who engage in political violence as well as social and ideologically motivated groups who seek regime change.

The existence of a large legal shadow economy would provide the necessary requirements for terror organizations. Countries with such a shadow sector are primarily developed high-income countries, where high taxation and regulatory burdens create conditions for legal shadow activities. Recent terrorist incidents, such as the London bombings and the September 11 attacks, demonstrate how terror organizations can operate in developed nations that have the potential for an extensive legal shadow infrastructure. To be sure, if nations such as the Untied Kingdom and the United States have potential shadow infrastructures for terror organizations, while also having a very small shadow economy—estimated

at 2.6 percent and 8.7 percent respectively—nations with larger shadow economies would potentially offer much greater support for terrorist organizations.

### Illegal

Illegal activities that comprise the overall shadow economy also take the form of monetary and nonmonetary transactions. Monetary transactions include: trade of stolen goods, drug production and distribution, prostitution, gambling, smuggling of all types and fraud. The single most important link in the illegal shadow economy system is the middleman. The middlemen connect the suppliers and buyers without exposing either source, even if one of the participating groups happens to be a terrorist organization. Without this lifeline, no terrorist organization can manage to finance its survival.

Trade in stolen goods or natural resources is a form of terrorist financing that has been increasingly prevalent in the post-Cold War era. Natural resources can take two forms, renewable and nonrenewable. Renewable resources such as agricultural commodities have the potential to become sources of financing for terror organizations. However, the transport and sale of commodities such as grains, sugar, or wood products requires a logistical network beyond the capabilities of many terror organizations. While on a small scale such shadow activities would provide support, they would be incapable of providing the level of income needed to support an extended organization. In major ethnic conflicts, civil wars, and sometimes in terrorists' activities, feeding and supplying the "troops" in the field becomes a decisive component. Since terrorists are denied the regular logistical capabilities, access to a shadow economy can play a vital role. Therefore, in the case of agricultural products, the terrorists do not benefit financially; however, their survival depends on their ability to obtain enough support for larger operations. Small-scale terrorist groups can carry enough currency to allow them to obtain their needs from the market. On the other hand, nonrenewable natural resources can play a much larger role in the creation of a shadow economy supporting infrastructure for terrorists.

Recent research conducted by Collier and Hoeffler conclude that the "extent of primary commodity exports is the strongest single influence on the risk of conflict" although they focus on civil war the research has implications for the study of terrorist networks.[21] A refinement by Fearon notes how commodity exports used to fund civil wars tend to be confined to oil, which has high value relative to the costs of production.[22] Moreover, access through a myriad of pipelines, etc., allows rebels or terrorists to skim from overall national production. Skimming is small compared to total production and the cost of policing production facilities and

pipelines. This sort of environment allows a shadow economy to operate with relative immunity and provide prolonged and substantial financial support for the terrorist organization.

To be sure, the logistics involved in shadow economy operations are important if nonrenewable resources are being used in an illicit manner. Trucks and other associated equipment would be needed for oil skimming, as well as a buyer. Other high volume commodities would necessitate greater logistical support. Two natural resources that entail less logistical preparation are diamonds and minerals. While mineral looting or smuggling can be a relatively simple process, requiring virtually no logistical support, diamonds are even easier to loot and smuggle. The logic is simple—the more transportable or value per pound the more likely terror organizations will attempt to use this portion of the shadow economy to finance their operations. While diamond or gold smuggling may be relatively simple compared to oil skimming, an important aspect of this sort of activity is the transaction cost involved in selling the stolen goods. In the same way that a thief pays a "premium" to the buyer of the stolen goods, so does the purveyor of looted gems or minerals. This premium is based upon a separate infrastructure that moves goods out of the country and the risk involved to those engaged in the smuggling. Since the total value of the smuggled goods is very high, capturing the smugglers has high payoff as well, justifying increased police and military tracking. Increased government policing can raise this premium to unacceptable levels, thereby closing off this avenue of terrorist financing and eliminating an element of the shadow economy infrastructure of terrorist organizations.

Within the past few years, diamond looting has been discussed as a chief form of financing for civil wars in West Africa. For example, recent studies note how the production of diamond increases the likelihood of civil war, while also accounting for the state capacity and the propensity to use this sort of financing.[23] Of particular interest for our purpose in this chapter is to understand how political leaders can alter the market or infrastructure for looting by changing modes of extraction. The shape of the shadow economy can be changed, provided leaders recognize the significance of the shadow economy and how it can be used to provide an infrastructure for terrorist organizations. These studies of diamond looting in support of civil war rebels illustrates how structural incentives of the economy can create an increased shadow economy and shadow economy elements that are amenable to a terrorist infrastructure.

The illegal narcotics trade is another area of both nonmonetary and monetary transactions that can contribute to an infrastructure for terrorist organizations. As with looting of various nonrenewable natural resources, the drug trade requires an infrastructure to be profitable for terrorist organizations.[24] The Taliban's drug dealing did not operate in a

vacuum but thrived in lawless regions where the Taliban taxed the raw opium while also funneling it to dealers outside the country, who could then place it into the global drug pipeline.[25] Not controlling the drug chain makes terrorists who trade drugs price takers, as they add little value to the finished product other than the initial commodity. While terror organizations could enter the product chain and add value at multiple stages, such options would be dependent upon the structure of the shadow economy (the illegal to legal ratio or the monetary to nonmonetary ratio). Terrorist organizations can control the flow of products—both legal and illegal—by virtue of controlling a territory or by making their passage impossible without their explicit approval and/or involvement. In doing so, terrorists can obtain both the support of the masses and the poor while financing their activities. The Taliban, for example, controlled most of Afghanistan which means they could weed out the middlemen, who are usually the greatest benefactors of the narcotics trade. The Taliban could continue to pay farmers the same or even more than middlemen; take the product from farms to central distribution centers with little more than transportation costs, and create a national monopoly. They would have become heroes in the eyes of the peasants, while making more money than (nonmonopolist) middlemen at a reduced cost, because unlike the middlemen they neither had to pay bribes nor risk loss of their inventory to confiscation. As a major producer, they would increase their leverage versus international opium refiners and could affect the overall market costs. Why the Taliban failed to grasp this opportunity is unknown.

Illegal monetary transactions can also take the form of manufacturing. While we have not seen any evidence of terrorist-owned firms, terrorist organizations can and do manufacture various goods for their cause. While these goods are primarily "the tools of the trade" such as explosives or guns, they also manufacture a select number of goods that can be sold on the shadow market. In this category, we can place the manufacture of illegal drugs that do not require a supply chain nor multiple processes. Methamphetamine is a perfect example of the type of "low-tech" drug manufacture that has a high value to weight ratio and is thus attractive to smugglers. Moreover, the feedstocks are readily available, as are instructions or "recipes."

Another facet of the illegal monetary shadow economy would be organized illegal activities, or what is commonly referred to as organized crime.[26] In general, organized crime denotes ethnically based mafia type groups who rely upon ethnic or family ties to maintain their cohesiveness. The archetypical example is Mario Puzos' *Godfather* series. Modern terrorist groups may differ in that they are more ideologically based; yet if residing in a country where there exists a sizable shadow economy, they will have the perquisite infrastructure to engage in mafia-like activities. These activities might include gambling, prostitution, fraud, or extortion.

Such illegal enterprises may not be well suited to terrorist groups who have moral or religious injunctions against these types of social vices. Although we should note that the Taliban did issue *fatwas* stating that while drug use was morally wrong, supplying drugs to *infidels* was not a moral transgression. Even if mafia-like illegal activities were to appeal to terrorist groups, movement into such areas would be detrimental to the terrorists, as they would potentially be infringing on areas of the shadow economy occupied by established groups. We can expect established mafias to vigorously defend their "turf," thus making forays into these areas less attractive to terrorist organizations. While terrorist groups may engage in these types of activities, we could expect that they would have only minimal involvement, as most areas would already be exploited by established organized crime groups.

In sum, the various illegal activities that terrorist organization may avail themselves of in the shadow economy are diverse, each with attending risks and rewards. We would envision a terrorist group to be nimble and be able to switch from one shadow economic activity to another in short order. Movement from the illegal to legal may be more difficult. Clearly, the size of a country's shadow economy creates ample opportunities that terrorists may exploit for financing their operations.

## CONCLUSION

In this chapter, we have examined the concept of the shadow economy and how it creates an infrastructure that may be exploited by terrorist for financing and other activities necessary to their operations. The irony for most nations' decision makers is that public policy decisions intended to create a better quality of life—such as a social security system which collects contributions through taxes and then provides a basic human security "safety net" for all its citizens—may actually create an infrastructure where terror organizations can operate, finance themselves, and carry out attacks on the very sociopolitical system that unwittingly supports them. A comprehensive approach to combating terrorism thus requires significant monitoring of the shadow economy.

# CHAPTER 14

## INTERNATIONAL ENERGY DEPENDENCE: FACILITATOR AND VULNERABILITY

Sumesh M. Arora and David Butler

Energy is one of the basic needs for the survival of mankind (in addition to food, clothing, shelter, and healthcare) since it is at the core of producing many of the materials of human consumption including food and clothing. At more than $3 trillion of annual global sales, the energy industry is the world's largest trading sector. The food industry is a distant second, with annual sales of US$1.7 trillion. The energy trade in the United States accounts for almost a third of the global energy sales.[1] The aggregate per capita consumption of total primary energy is highly disproportionate around the world, and it is not surprising that the highly industrialized nations around the world are also among the highest consumers of energy.

A strong correlation is apparent between the Human Development Index (HDI) published by the United Nations Development Program (UNDP) and per capita electricity consumption.[2] The graph in Figure 14.1 (derived from the UNDP data) shows that HDI and per capita electricity consumption have similar trends and indicate the apparent dependence of the HDI on electricity consumption. The least developed countries on UNDP's list consume far less electricity per capita than do high-income countries. It is suggestive from these data that in order for the developing countries to improve their human development indices, per capita energy consumption will have to increase.

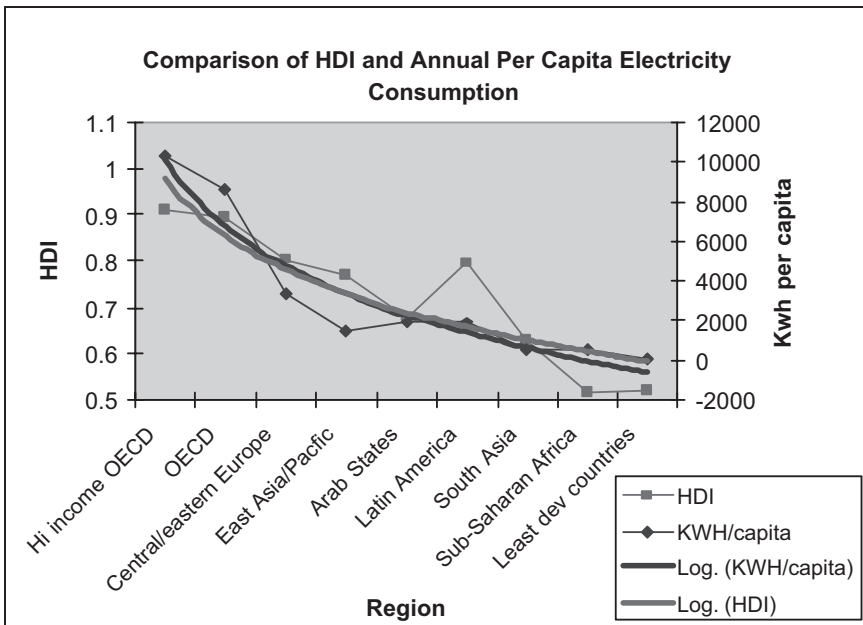
Without an affordable and reliable supply of energy, regardless of how it is generated or distributed, it is difficult to sustain any other sector of the economy or provide an adequate level of services such as health care


**Figure 14.1    Trends for human development index and per capita electricity consumption by various regions of the world**[2]

and education to a large number of people. Global energy security was listed as one of the three highest priority items on the agenda of the 2006 G8 Summit held in St. Petersburg, Russia. The other two agenda items were fighting infectious diseases and improving education levels around the world. This is the first time that Russia has served as president of the G8 and in his address, Russian President Vladimir Putin stated, "This year, we plan to urge our partners to redouble efforts to ensure global energy security. We believe that today, it is crucial to find a solution to a problem, which directly influences the social and economic development of all countries, without exception."[3] The Ministry of Industry and Energy of the Russian Federation hosted the International Conference on Energy Security in March 2006 in advance of the G8 summit. A declaration signed by the energy ministers of the participating countries states[4]

> Neither global energy security, nor the millennium development goals can be fully achieved without sustainable access to fuels for the 2.4 billion people and to electricity for the 1.6 billion people currently without such access in developing countries. They cannot be forgotten or marginalized.

For the purposes of this chapter, energy supply is synonymous with fuel supply, to include renewable resources such as solar, wind, hydropower,

geothermal, and biomass; fossil fuels such as crude oil, coal, and natural gas; and nuclear fuels.

## WHAT IS ENERGY SECURITY?

The definitions of affordable and reliable supply of energy vary from one part of the world to another based on local economic and political conditions, and form the basis for what constitutes energy security for a country. The World Bank report[5] groups countries into five groups based on their energy import and export capacity, and demand patterns measuring its market sector growth and income levels. These groups are: (1) industrialized nations that are net importers of energy; (2) largest sovereign hydrocarbon producers; (3) largest emerging markets with a fast-growing energy demand; (4) net importers of energy with medium incomes; and (5) net importers of energy with low incomes. The World Bank defines characteristics of these countries such as per capita GDP and energy consumption per capita, as well as elucidates the differences in their energy security strategies. Diversification of energy supply sources is listed as an important energy security concern for countries in groups 1 and 3, whereas meeting the population's basic energy needs is among the energy security priorities of the medium and low income energy importers in groups 4 and 5. Countries in groups 1 and 3 are the ones most susceptible to energy supply disruptions, and countries in group 2 are most vulnerable to terrorist attacks on energy production installations.

It is evident from the grouping of these countries that there is a substantial disconnect in the energy consumption and energy production patterns. Data published annually by British Petroleum show that proven reserves of oil and natural gas are distributed grossly unevenly around the globe. Crude oil distribution represents the strongest case of geographic disparity (see Figure 14.2), where the United States, with the largest oil consumption and some of the fastest growing nations (such as China and India) have the smallest known reserves.[6] Generally speaking, identified or proven reserves refer to oil and gas that have been discovered and remain in the ground, but are accessible using current technology in an expedient and economical manner. Proven reserves, however, are a function not only of geology, but also economics, technology, and politics.[7] While it is sufficient to look at the general distribution trend of the fossil reserves for the purposes of this chapter, the stating of such reserves is subject to political and economic forces, and the accuracy of these reserve estimates has come under question.[8]

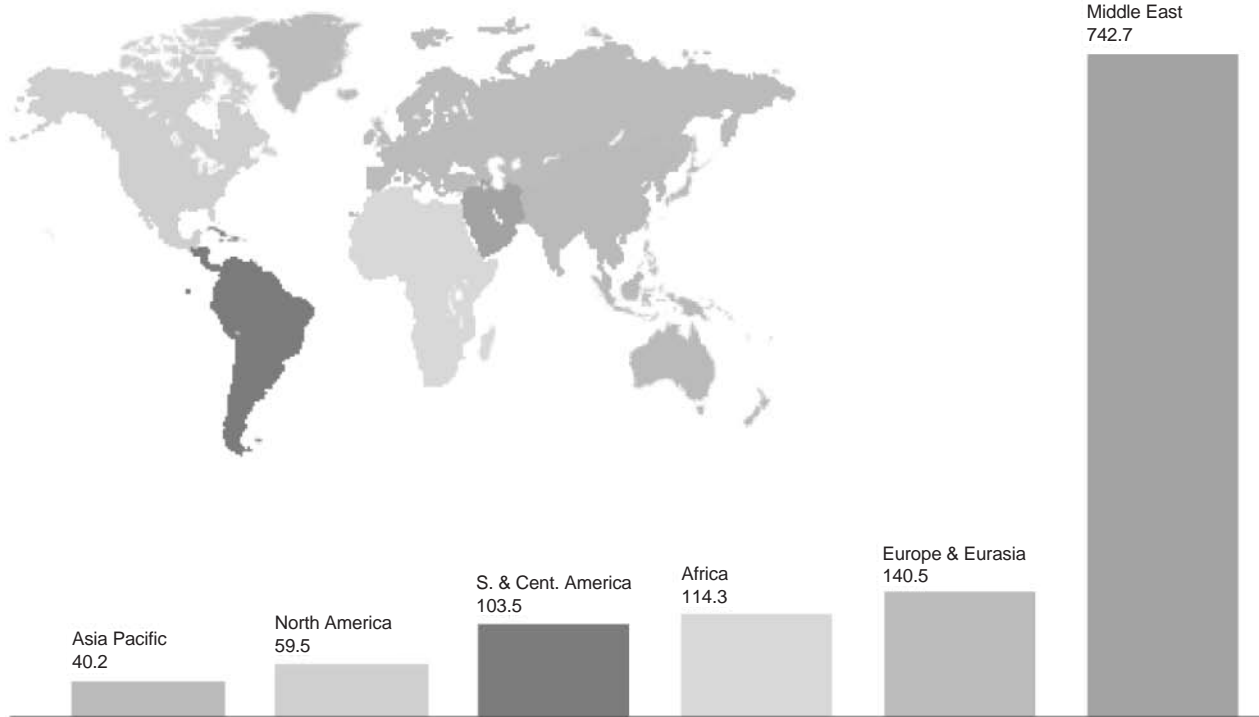
Clive Crook describes energy security as the ability of a country to absorb the rise in energy prices.[9] Affordability of energy can be viewed in terms of the percentage of disposable income that the citizens of a country have to spend on energy expenses. A report from the International Atomic


**Figure 14.2   British petroleum data for world oil reserves at the end of 2005**[5]

Energy Agency (IAEA) indicated that in 1998 Bangladeshis spent 18 percent of their per capita private consumption as energy expenditure versus only 7 percent for the German citizens.[10] Given the uneven distribution of conventional energy supplies as discussed above, countries with growing populations such as Bangladesh will have to import even more energy. Coupled with the escalating price of energy products, this will put additional strain on the purchasing power of the individuals. Higher prices can be expected to further exacerbate the percentage of energy expenditures for the poorer nations that do not have domestic reserves. And, as many scholars have noted, significant strains on a domestic population's purchasing power can lead to political unrest.

## GLOBAL ENERGY DEMAND AND PRICE VOLATILITY

According to the *World Energy Outlook: 2005* published by the International Energy Agency, the global energy demand is expected to grow by 50 percent by the year 2030. Two-thirds of this increase will come from the developing countries creating increased competition for energy sources and an increased reliance on the oil and gas reserves in the Middle East.[11] Historically the price of oil has been flat, but the increasing price volatility of crude oil over the last 35 years (presented in Figure 14.3) has been attributed in large part due to global geopolitical events.[12] At current record-setting prices of greater then US$70 per barrel on the New York Mercantile Exchange (NYMEX Future),[13] the price concern has been a mainstream discussion around the world, as evidenced by coverage provided by numerous media outlets on a regular basis. The uneven global distribution of conventional energy reserves and price volatility of fossil fuels suggest a case for exploiting indigenous energy resources in countries currently dependent on imported energy.

Oil, the most common transportation fuel, has become a liability that threatens global security in multiple ways. Like other fossil fuels, oil is a finite resource, and even though the future duration of its availability is debated, it poses a threat to global economic security since there is no established substitute for it, and the gap between supply and demand is growing. Imported oil accounts for a large share of energy budgets in most industrial countries, for example 36 percent in France, 39 percent in the United States, and 49 percent in Japan. Developing countries are even more vulnerable because their imports are larger in relation to their GDP and because the additional strain on purchasing power can exacerbate the challenges faced by an already weak central government. Growing evidence suggests that rising demand, especially from nations such as China and India, will soon permanently outpace supply, leading to a long-term rise in prices.[14]

The current run-up in oil and other fossil fuel prices is largely due to the tight balance between supply and demand. It is widely recognized that there is very little excess capacity in the current system to produce any excess oil should any disruption occur. By some current estimates, the spare production capacity of the petroleum industry to meet the daily global demand of more than 80 million barrels of oil is only 1 million barrels per day. One of the reasons for this lack of spare production capacity is the result of inadequate investments in exploration during the previous 20 years, especially by the countries with the largest oil reserves. Maugeri explains that in the early 1980s, the Oil Producing and Exporting Countries (OPEC) began to worry about overproduction, resulting from the corrections instituted during the 1970s oil crisis. The price of crude oil collapsed in 1986 and again in 1998–1999, caused by overproduction and limited growth in demand, reinforcing the "determination of producers to minimize excess capacity."[15]

A major factor in the increased demand in energy in the 2000s is the economic growth in China, where demand for oil rose by 40 percent between 2000 and 2004.[16] China and India's rapidly growing economies are increasing their demand for energy and are creating intense competition over international sources of supply. According to a report published by Laguna Research Partners, the Chinese Rim—comprised of 19 Southeast Asian countries—faces a deficit of 1.7 billion barrels of crude oil annually.[17] China's efforts to develop domestic fields have generally been disappointing, and efforts to pipe gas from Central Asia and Russia to the east coast have not yet materialized. Consequently, China is considering the vulnerability of its sea-lanes to the Middle East and beyond, and is now paying greater attention to potential petroleum resources in the East and South China Seas. Its need to diversify has promoted closer relations with countries throughout Central Asia and the Middle East,[18] as well as the oil producing countries of Africa and Latin America. It remains to be seen whether China's concerns for securing energy supplies will lead to international cooperation against terrorism or fuel the already heated competition for both oil and natural gas.[19]

With a delicate balance between oil supply and demand, any disruption in the supply can lead to price increases. The reasons for a disruption can be varied from natural events such as earthquakes or hurricanes, to politically motivated actions on the part of energy producing countries, or terrorist activities that threaten to disrupt the energy supply chain through the use of violent force. This chapter looks in greater depth at the effects of terrorism on the stability of the energy infrastructure, the rationale behind al Qaeda's strategy to attack energy targets, and the ability of countries to absorb energy supply disruptions.

The arguments presented in this chapter are that the disparity between the production and consumption of energy resources leads to geopolitical

security tensions, and that the price of fossil fuel energy resources is closely tied to geopolitical events. It is suggested that there is a critical need for countries, especially those that consume more energy than they produce, to evaluate their long-term prospects of limiting their exposure to energy derived from locations around the world that are more susceptible to terrorist attacks; or to alternatively set up protective provisions in the countries that supply the oil and increase the security for energy products transportation such as oil tankers and natural gas pipelines.

A significant volume of literature exists that discusses the new paradigm of security in general, as delineated by the terrorist attacks of September 11, 2001. However, the history of energy security can be traced back to the World War I era, when First Lord of the Admiralty Winston Churchill proclaimed "safety and certainty in oil lie in variety and variety alone." Churchill made a key decision to switch from coal to oil for powering the British Navy, in order to make it faster than the German fleet; however, this also exposed it to the uncertainties of the oil supply from Persia. The phrase "energy independence" was first articulated by President Richard Nixon four weeks after the 1973 embargo was put in place.[20] Every U.S. president throughout the last half century has had to address energy supply issues. For example, as President Ronald Reagan repealed the provisions of the Powerplant and Industrial Fuel Use Act of 1978 (PIFUA) in May of that year, he urged, "several measures to ensure our nation as a strong domestic oil and gas industry and substantial protection against supply interruptions. These measures, taken together, will result in increased energy security."[21] PIFUA was passed by Congress, effectively prohibiting the construction of oil or natural gas fired power plants in response to the shortages resulting from the oil embargo in 1973.

The phrases "energy security" and "energy independence" are often used interchangeably by people in the media, politicians, and the general population, but according to Sosa and Desnyder, energy security is discussed generally in terms of the uninterrupted energy supply, whereas energy independence generally has a strong connotation for increasing the domestic production of energy products and reducing reliance on imports.[22] It is important to realize that both terms, security and independence, have the same implication of achieving the goal of a stable energy supply that can adequately meet current and future demand at a price point that the market can reasonably afford. "Energy product value chain stability" thus encompasses both security and independence. The frequent use of the emotional terms of "security" and "independence" is a reflection on the lack of stability of the current global energy sector. As seen later in this chapter, a great deal of anxiety arises from the possible threat of terrorist attacks on the energy infrastructure.

Proceeding from the approaches described above, this discussion views global energy product value chain stability as the long-term reliable

supply of different types of energetic materials at prices complying with basic macroeconomic principles of supply and demand, with minimal damage to the environment to sustain the global economy. Further elucidating this definition, a common energy security strategy should encompass an uninterrupted supply of fossil fuels for the near term, as well as a diversification of the energy supply through the use and development of new renewable and nonrenewable energy sources and technologies, while improving the energy sector's efficiency, long-term sustainability, safety and environmental responsibility.

A research paper prepared for the 2006 G8 Summit states that the current energy economy largely depends on centralized power systems, and although it may be economically justified on the whole, "the concept makes large masses of people, depending on one power source, greatly sensitive to terrorism or sabotage." In her research paper, Tatyana Mitrova recommends the solution is to diversify the energy sources and considerably increase the share of local and individual sources in overall energy supply. The share of locally supplied energy should be increased to 40 percent of the global energy consumption by 2020 from the 25 percent level in the 1990s.[23]

## TERRORIST ATTACKS ON ENERGY INFRASTRUCTURE

In February, 2004, a message was posted to the al Qaeda-affiliated *al Qalah* (the Fortress) Web site[24] entitled "Map of Future al Qaida Operations." It stated among other things that the terrorists would make it a priority to attack oil facilities in the Middle East. According to the posting, attacking the U.S. energy base in the Persian Gulf would have three effects: Damaging the American economy; embarrassing the United States and emboldening other countries seeking to secure their own energy supplies; and forcing the United States to deploy further troops to the region to stabilize the situation. "The U.S. will reach a stage of madness after the targeting of its oil interests," the terrorists reason, "which will facilitate the creation of a new front and the drowning of the U.S. in a new quagmire that will be worse than the quagmires of Iraq and Afghanistan."[25] Later that year, in mid-December, Arab satellite channels aired an audiotape message by Osama bin Laden in which he called on his cohorts to take their holy war to the oil industry and to disrupt supplies to the United States from the Persian Gulf. Two days later a follow-up statement by the Saudi branch of al Qaeda was published, calling on "all mujahideen . . . in the Arabian Peninsula" to target "the oil resources that do not serve the nation of Islam."[26]

Attacks on a country's oil infrastructure have already become common in several parts of the world, including Colombia and Iraq. In these and other countries, religious militants and secular insurgents all recognize

the important relationship between oil and a state's regime. A country's oil infrastructure vulnerabilities include the following:[27]

– production facilities, such as petroleum fields, wells, platforms, and rigs;
– refineries and gas processing plants;
– transportation facilities, including pipelines and pumping stations, terminals and tank ships;
– oil and gas depots;
– administration buildings;
– distribution centers/petrol stations; and
– all personnel on or employed at these installations.

Of these, the blasting of oil pipelines is the most common form of attack, and has been the source of over 60 percent of disruptions to a country's oil infrastructure.[28] Attacks on oil pipelines are tactically easy, as there are long stretches of unguarded pipelines; since pipelines are relatively easy to repair, oil companies have often invested little in their protection.[29]

Overall, the possibility of terrorist attacks on energy installations today is a legitimate concern, validated by several incidents that have been reported by the news media in the recent months and years. Prugh, Flavin, and Swain[30] with the World Watch Institute suggest that the oil economy is central to the threats posed by such attacks and efforts to protect and control the infrastructure have undermined peace, democracy, and human rights in many regions of the world. Many nations with oil resources have found themselves afflicted with the "natural resource curse"—the tendency of mineral wealth to support corruption and conflict rather than growth and development. Oil has recently been linked to terrorism, most obviously in the Wahhabist schools, funded by Saudi oil revenues, which helped train the Islamic radicals of al Qaeda. In the foreword to the report compiled by the World Watch Institute, Mikhail S. Gorbachev, now serving as Chairman of Green Cross International, asserted that "the dominance of the oil industry in the Middle East has undermined the economic and political development of the region while flooding it with petrodollars that have increased economic disparities and financed the rise of terrorism." The following section briefly describes some of the specific attacks that have been carried out on energy installations and the potential for future attacks on the energy infrastructure.

### Iraq

In February 1991, Saddam Hussein put Kuwait's oilfields to the torch as his invading army was being driven out of the emirate by U.S.-led forces in Operation Desert Storm. More than 700 wells were set ablaze

in the worst attack on energy infrastructure since World War II. Saddam Hussein's act of madness and revenge in Kuwait removed 2 million barrels of oil a day from production. It took a year to extinguish all the fires in Kuwait and 3 years to rebuild the emirate's oil infrastructure. The possibility of terrorist attacks of this magnitude is limited, but even a "couple of dozen suicide bombers, operating in unison, could do immense damage against such targets, inflicting destruction costing billions of dollars."[31]

Iraq, though posting an oil production growth rate of 51 percent in 2004, the highest growth rate among oil producing nations, has suffered around 300 terrorist attacks on oil infrastructure between June 2003 and May 2005. The underinvestment in oil infrastructure and the terrorist threats make the country's oil supply very unstable. As Mitrova observed, "Oil production was falling through the first quarter of 2005 and rising again in the second and third quarters, obviously in antiphase with terrorist activity." According to most estimates, Iraq produced and exported 15 percent less oil than planned in 2005, which had a direct impact on global markets.[32]

### Russia

Two explosions occurred on the main branch and a reserve branch of the Mozdok–Tbilisi pipeline in the Russian border region of North Ossetia at around 3 A.M. local time. The electricity transmission line in Russia's southern region of Karachayevo–Cherkessiya—also near the Georgian border—was brought down by an explosion a few hours later on January 22, 2006. Speaking to the BBC, Georgia's President Mikhail Saakashvili, said there was now "huge pressure on his country's energy system, as it was experiencing its coldest weather in more than 20 years. We received numerous threats by Russian politicians and officials at different levels to punish us for basically not giving them the pipelines." He said all gas supplies to Georgia were now cut off, as was 25 percent of the electricity supply. The Russians maintained that the attacks were perpetrated by terrorist groups.[33]

### Saudi Arabia

Attacks on the Saudi oil infrastructure took place in February 2006, when suicide bombers tried to detonate their bombs within the Abqaiq complex, which is the largest facility in Saudi Arabia and processes about two-thirds of the country's export of 9.5 million barrels per day. This attack was foiled by security guards firing on the explosive-laden cars (which bore the markings of the Saudi oil company Aramco) and killing five militants.[34] In May 2004, attackers stormed the offices of a Houston-based oil company in the western Saudi oil hub of Yanbu, and subsequent

fighting killed six Westerners, a Saudi, and the militants. Later that same year, al Qaeda-linked gunmen stormed oil company compounds in Khobar, on the eastern coast, and took hostages in a siege that killed 22 people, 19 of them foreign oil workers. And, as described earlier, al Qaeda leader Osama bin Laden has called on militants to attack oil targets in the Middle East to stop the flow of oil to the West.[35]

### Maritime Security

In a recent analysis of maritime security, Luft and Korin[36] discuss how pirate attacks on ships tripled in the decade prior to 2004, and emphasize the link between piracy and terrorism. They note that today's pirates are often trained fighters aboard speedboats equipped with satellite phones and global positioning systems, and armed with automatic weapons, antitank missiles, and grenades. Many of today's pirates are maritime terrorists pursuing ideological or political agendas, rather than the stereotypical pirates seeking material wealth. This convergence of piracy and terrorism makes the energy markets especially vulnerable since most of the world's oil and gas is shipped through the world's most "piracy-infested waters." Luft and Korin state that the terrorists are aware that supply disruptions can have a devastating impact on oil prices, and describe some of the attacks and attempts on sea-based energy facilities. For example, Tamil Tiger separatists carried out a coordinated suicide attack by five boats on an oil tanker off northern Sri Lanka in October 2001, and a year later, an explosives-laden boat hit the French oil tanker MV *Limburg* off the coast of Yemen. Whereas land targets such as power plants, refineries, and pumping stations are relatively well protected, the "super-extended energy umbilical cord that extends by sea to connect the West and the Asian economies with the Middle East is more vulnerable than ever, with 60 percent of the world's oil being shipped by approximately 4,000 slow and cumbersome oil tankers." According to Luft and Korin, the consequences of even a single burning oil tanker in the aftermath of an explosion and its associated oil spill in a narrow, strategic oil passage such as the Straits of Hormuz that connects the Persian Gulf and the Arabian Sea could disrupt the global oil supply for weeks.

### Port Security

Liquefied natural gas (LNG) is an important source of energy in Japan and Korea, and its use is also on the rise in the United States. Due to the remote locations of the gas fields, large amounts of gas are transported across oceans primarily by specialized LNG shipping vessels, although pipelines are used in some locations. A dozen new LNG terminals are under consideration in addition to the four existing ones in the United

States, and the infrastructure to supply the U.S. terminals with LNG is nearing completion in the Middle and the Far East. Prior to September 11, 2001, the technical dangers of LNG transportation were the main concerns. However, starting with an LNG tanker being denied entry into the Boston Harbor on September 27, 2001, the consideration of terrorist attacks on LNG loading and unloading facilities and tankers has entered into the LNG trade lexicon.[37]

**EFFECT OF TERRORISM ON THE MARKETS**

Attacks by various terrorist groups on the energy infrastructure are something that the world governments now expect and have to guard against. Al Qaeda, which is perhaps the most recognized name among such groups, posted a video on a Web site in December 2005 in which Ayman al-Zawahri made a startling appeal: "I call on mujahideen to concentrate their attacks on Muslims' stolen oil, most of the revenues of which go to the enemies of Islam while most of what they leave is seized by the thieves who rule our countries."[38] At the same time, a new range of vulnerabilities has become more evident. As described earlier, al Qaeda has repeatedly threatened to attack what Osama bin Laden calls the "hinges" of the world's economy, that is, its critical infrastructure of which energy is among the most crucial elements. The world will increasingly depend on new sources of supply from places where security systems are still being developed, such as the oil and natural gas fields offshore of West Africa and in the Caspian Sea that are vulnerabilities to threats of terrorism, political turmoil, armed conflict, and piracy.[39]

The most sobering document perhaps is the recently translated work of Abu Bakr Naji, entitled *The Management of Savagery: The Most Critical Time Through Which the Umma will Pass*, which justifies attacks on petroleum facilities and lays out a media-savvy game plan to disrupt the flow of oil. Will McCants' translation of this text makes it clear that such threats and actual attacks in the future are designed to have a negative impact on the economies of al Qaeda's "enemies."[40] The word "Umma" (also spelled as Ummah) refers to a community; people who are followers of a particular religion or prophet. It refers in particular to the Muslims as a religious community.[41] Excerpts from Naji's work containing references to energy and oil infrastructure include the following:

> The targets we must concentrate on and the reasons for that: We said that we should strike any kind of target permitted in the Sharia. However, it is necessary to focus on economic targets, particularly petroleum. One might say that we will be faced with a media campaign in which every accusation will be directed against us, beginning with (the charge that we) are working to impoverish and weaken the countries economically, and so on.[42]

Naji goes on to say that the first step in the petroleum war is for an Islamic media group, who has a specialist in political-economic studies, to undertake a study to establish the true price and value of petroleum. Naji's statements reflect his understanding that "despite frantic searching, there is no substitute for it [oil] at the present time, but this is the one commodity which is the most devalued in its prices compared to other commodities." Naji calls the use of petroleum up to the present time an "injustice and pillaging" which the Umma has suffered for decades on account of its devalued price, and it must be corrected. Naji expects the study will include an explanation of how the oil wealth has benefited "a handful of the collaborators and agents of the West among the Arab and Islamic regimes" and not been used for building the Umma.

According to Naji, the "precise economic study"—which will be distributed to political scholars and media elites in the Islamic world—will be a means to justify the attacks on the petroleum sector, and not for the sole reason that the oil is being sold to infidels, since that will "expose us to media criticism which will turn our action away from its goal." Naji lays out the strategy of giving an ultimatum to all countries buying oil from Muslim states that they must pay the price recorded in their study. The money will be collected by "committees composed of people among the merchants of the countries and the notable of the Islamic countries who are trustworthy."[43] The purchasing countries will be given an appropriate period of time to comply with the new price

> ...otherwise, the striking of petroleum plants will be carried out, especially pipelines where no humans will suffer from striking them or tankers which the infidels command and work on. Regarding the guards, if they are among forces belonging to the regimes of the collaboration and apostasy, we will deal with them as if they are traitors to their Umma who are not inviolable in our eyes. If the guards are from companies of special guards [i.e., hired security guards], we will only oppose them when they tried to kill or capture one of the mujahids to turn them over to the regimes of collaboration and apostasy.[44]

Naji goes further in stating that releasing such a report or giving an ultimatum is not likely to elicit a response from the West or the collaborating regimes:

> There will also be an attempt to ignore the threat, even though they will deal with it with highest degree of seriousness, especially if its announcement has been made by the means of a hostage-taking operation, just as we mentioned. Likewise, it is also anticipated that our limited operations, which will follow the elapse of the specified time mentioned in the statement, will not stop the pumping of the petroleum to the West. However, at least these operations will raise the price of oil, even if it is just covering the cost of the electronic security

system and the salaries of troops and guards which will be disbursed along the paths of the pipelines and the massive factories of the petroleum sectors and their many annexes. We also anticipate a rise in the price of petroleum even before the operations (take place) solely on the account of the statement and the study which are issued. In this there is good media gain since we raise the price of oil by merely issuing a statement, then we raise it again through some of the limited operations against petroleum targets which are poorly protected.[45]

It is interesting to note that Naji suggests he is only using the petroleum sector as an example for "stimulating the mind." "However, the strategy of targeting the economy of the enemy in general is a valuable strategy, both politically and militarily, and it should not be absent from the guiding movement. The leaders of the jihad have called attention to it in more than one study and in more than one statement."[46]

It is apparent from a review of the current literature that there already exists a premium on the price of a barrel of crude that may be attributed to terrorist activities. In a recent interview with National Public Radio, Lord John Brown—Chief Executive Officer of British Petroleum—stated that the price of oil was about $10 to $20 higher in 2006 than in 2005 due to political risk, even though the "physicalities" did not change much. However, he added that it was difficult to quantify specific political factors that are affecting the price of oil.[47] On the other hand, the Kuwaiti Oil Minister Ahmad al-fahd al-Sabah, speaking to reporters in India, made a direct connection between terrorism and the price of oil. He said that the New York Mercantile Exchange (NYMEX) prices include a $8–$12 per barrel "terror premium," and any price in the $45–$55 range will be a stable price for a barrel or crude oil.[48] The threat of terrorism to the energy infrastructure is not limited to specific attacks by organized groups, but fluctuations in the price of oil can also arise from the actions of nation states. For example, Nauman Barakat, Senior Vice President of Global Energy Futures at Macquarie, recently noted that "Iran is the flavor of the month in the oil markets. They are blamed for supporting Hizbollah in the fight against Israel and the Iranians are giving the UN a thumbs down as they continue to enrich uranium."[49]

## CRITICAL INFRASTRUCTURE PROTECTION

Concerns about safeguarding key infrastructures (such as energy, communications, banking, and roads) from deliberate attacks are longstanding, but since the end of the cold war the emphasis has turned to the possible impacts of terrorism. The destruction in the aftermath of the attacks on the Pentagon and the World Trade Center in New York has raised the awareness of terrorist activities to unprecedented levels. Activities to

address these concerns are sometimes called "Critical Infrastructure Protection (CIP)," a concept that is somewhat different from the one of "energy security," which focuses on politically and economically motivated supply interruptions. Research conducted by Farrell, Zerriffi, and Dowlatabadi states that different elements of the energy infrastructure are characterized by distinct vulnerabilities. Breaches of security in nuclear plants can potentially lead to large-scale human and environmental disasters, but the infrastructure is concentrated and relatively easy to guard. Petroleum and natural gas production, transportation, and refining infrastructures are often spatially concentrated, and disruptions can easily lead to shortages if supply is not restored before stockpiles are exhausted. Traditional electricity infrastructures suffer from the need for systemwide integrity, in order to ensure supply reliability, with critical facilities (such as substations) spatially concentrated. Furthermore, the current power infrastructure lends itself to insignificant storage capacity for emergency supply. The concept of CIP is still relatively new and is likely to evolve over time, possibly away from a "guards, gates, and guns" defensive approach and toward a design approach that yields systems that are inherently harder to successfully attack.[50]

In another study, James Goodno reports that the U.S. Department of Homeland Security has identified 13 elements of the nation's "critical infrastructure" as potential targets for terrorist attack: agriculture and food, public health, emergency services, government, defense industries, banking and finance, chemical plants and hazardous materials, postal and shipping services, transportation, water, telecommunications, and energy. Clearly, protecting these assets represents an enormous challenge. The Department of Homeland Security has also noted that the high complexity of the nation's infrastructure makes it vulnerable to cascading failure in the event of a strategically placed attack. A successful attack on one system can have a domino effect on other systems. For example, if the water supply is cut off, firefighters will be hard pressed to combat blazes. Government agencies and private or public entities that own, operate, or regulate utilities or other forms of infrastructure should focus their security efforts "on the inherent vulnerabilities of different assets and the potential consequences if the assets were attacked, rather than the likelihood of a particular event."[51] Based on such scenarios it is easy to see the debilitating effect that the loss of the energy infrastructure can have on the other 12 elements of the nation's critical infrastructure. As evident from the UNDP data[52] (Figure 14.1), the countries with the highest consumption of energy, and especially the ones that rely on imported energy, face the greatest economic risk from energy supply disruptions.

Critical facilities and their services can be lost due to natural disasters or intentional strikes. An intentional strike—either by terrorist groups or an organized army—against a system can be called an "interdiction." The

geographical distribution of facilities in a supply or service system may be particularly vulnerable to interdiction, and the resulting impacts of the loss of one or more facilities may be substantial. Church, Scaparra, and Middleton introduced "two new spatial optimization models called the r-interdiction median problem and the r-interdiction covering problem." Both models identify the set of facilities for a given service or supply system which, if lost, would affect service delivery the most, depending upon the type of service protocol. The researchers contend that these models can then be used to identify the most critical facility assets in a service/supply system.[53] This is but one of many recent examples of how the academic community is working to support the mission of homeland security, and critical infrastructure protection.

## WHAT NEEDS TO BE DONE

The key to energy security has always been diversification. Diversification now not only requires having oil from multiple sources, but also developing a variety of types of energy sources which takes into account the rapid evolution of the global energy trade, supply-chain vulnerabilities, terrorism, and the integration of major new economies into the world market.[54]

Former German Chancellor Gerhard Schroeder and British Prime Minister Tony Blair have both recently cautioned that dependence on oil makes the world more vulnerable to a terrorist attack. Addressing the Renewable Energy Conference in Bonn, Germany in 2004, Schroeder noted that "This one-sided dependence of the global economy on oil enormously raises our vulnerability to all forms of terrorism." "The decision to [use more] renewable energy resources is not only sensible from an economic standpoint, it's also a [decision] for greater security in the world in which we live."[55] At the same event, Blair concurred, observing that, "Increasingly, we are concerned about the security of our energy supplies. Promoting the growth of renewables and energy efficiency provides us with the means of tackling this issue as well."[56] Russian President Vladimir Putin also stated at the opening of the 2006 G8 summit that "I am convinced that our efforts towards attaining this goal should be comprehensive and must stimulate stabilization of the global energy markets, development of innovation technologies, use of renewable energy sources and protection of the environment. We believe that today, we must think very seriously about ways to bridge the gap between energy-sufficient and energy-lacking countries."[57]

Jaffe and Soligo recently noted that in the aftermath of the September 11, 2001 terrorist attacks, U.S. strategy in the Central Asian region has shifted from protecting the sovereignty of the southern post-Soviet states to ensuring their stability, in light of the dual impacts of energy

development and the rising threat of Islamic terrorism. Although U.S.-Russian cooperation has made strides, particularly concerning Russian acquiescence toward U.S. and NATO military engagement in the region, geostrategic rivalry and conflicting economic goals have hindered a joint approach to initiatives regarding the region's energy development. While both agree on the goal of maximizing Russian and Caspian gas and petroleum exports, U.S. policy is increasingly prioritizing Central Asian energy prosperity as a key factor in the region's ability to contain terrorism. Development of the region's energy resources has therefore become a critical U.S. security concern. Jaffe and Soligo contend that by failing to engage with Russia in meaningful cooperation, which could encourage Moscow to diversify its own energy export prospects, competition between the two powers is likely to reduce, rather than improve, the effectiveness of support needed by the Central Asian states to strengthen their domestic profiles or withstand the incursion of terrorism.[58]

Many observers argue that individual countries should maintain a degree of domestic energy security based on their degree of energy import dependency. In the short term, increased trade and interconnection capacity can lead to a better utilization of existing capacity. In their analysis of energy security in the European Union, Jamasb and Pollit cite recent problems between Chile and Argentina—where Argentina interrupted gas exports to Chile following a shortage of gas for domestic consumption—as a reminder of how energy supply can be vulnerable to various political factors. They state that the best insurance policies against interruptions in energy supply are effective crisis management at the EU level, to allow optimal sharing of EU reserves and responsible national reserve policies.[59] Jamasb and Pollit further claim that better energy market data and transparency are needed to increase cooperation between the EU member countries. For example, a shortage of data on ownership interests of companies, costs, subsidies, and measure of security of supply will hinder cooperation in protecting the energy interests. This is particularly true of data aggregated at the EU level and at the level of the emerging regional markets. Data collection requires continuity and commitment to achieve long-term benefits. Improving the quality of data requires joint effort and agreement on types of data needed, collection methods, and standard reporting formats. In some cases, commercial sensitivity and national confidentiality rules limit exchange of data between regulators and here the barriers for cooperation may need to be lowered through agreements and legislation.[60]

Thomas Friedman, author of the bestselling book *The World Is Flat*, proposes that a "crash program for alternative energy and conservation" could make the United States energy independent in 10 years. He argues that "if President Bush made energy independence his moon shot, in one fell swoop he would dry up revenue for terrorism, force Iran,

Russia, Venezuela, and Saudi Arabia onto the path of reform . . . strengthen the dollar, and improve his own standing in Europe by doing something huge to reduce global warming." Friedman further writes that a call for energy independence would inspire a new generation to contribute to the war on terrorism, and once again encourage them to choose professions in mathematics, science, and engineering.[61]

Calculating the cost of energy production should also include variables that may not be within the direct equation of production, but factors that nevertheless influence the price of delivered energy. Such factors are called externalities and "an externality arises when the utility of an economic agent is affected by the action of another agent, and there is no control over such actions because the variables involved have no market value."[62] Efforts to quantify externalities resulting from energy use are not only widely debated, but when performed, they often significantly exceed fiscal subsidy levels. An example of the externality of the current energy fossil-fuel-based economy is its cost to the ecosystem, including climate change, nutrient cycling, water distribution, and soil dynamics. The price of electricity generation using conventional pulverized coal technologies may go from less than 5 cents per kilowatt-hour (cents/kwh) to more than 50 cents/kwh if environmental externalities are taken into account. The price of electricity generation from renewable biomass resources is only 10 cents/kwh even after adding environmental externalities and solar photovoltaic electricity cost remains relatively unchanged at approximately 25 cents/kwh.[63] Similarly, the external costs of guarding and protecting the energy infrastructure from terrorist threats should be included when determining the final cost to the consumer of fuels and electricity. The International Center for Technology Assessment published a report in 2005 that estimates the gasoline price externalities resulting in security and protection services between $78 and $159 billion, translating to $0.21–$0.32 per gallon of gasoline consumed in the United States. Some of the factors considered as externalities were (a) filling and maintaining the Strategic Petroleum Reserve, and (b) a variety of Coast Guard services for maintaining coastal shipping lanes, clearing ice, and responding to oil spills. The largest component making up the security externality is the cost to the U.S. military for protecting the petroleum supply, and ranges from $47.6 billion to $113.1 billion in 2003 dollars.[64] Anthony Owen suggests policy recommendations to internalize the cost of fossil fuel consumption and help pave the way for renewable energy technologies to become cost competitive on a life-cycle cost basis.[65]

## CONCLUSIONS

The traditional realist point of view calls for the pursuit of the least expensive form of energy, mostly fossil-fuel-based, which is in the

best interest of each country. We have seen China take this approach most recently by forging alliances with the energy producing Middle Eastern countries as well as Central Asian nations, and there is potential for a strategic alignment between Saudi Arabia and Russia on energy matters.[66] Geopolitical events may dictate at any given time how the energy markets may operate. Senator Richard Lugar of Indiana writes that we are in a different era of energy prospecting and that the "new energy realists believe that a laissez faire energy policy based solely on market evolution is a naïve posture—especially when most of the world's oil and natural gas is not controlled by market forces."[67]

In light of the significant risk that is posed by the disruptions to a country's economy that can be caused by acts of terrorism on the energy infrastructure, it is critical to identify the weak links in the energy supply chain. It is important from a policy standpoint to motivate the private sector to invest in the appropriate technologies that can help to diversify the energy portfolio as well as safeguard the existing infrastructure. In addition, the identification of the number of energy installations susceptible to terrorist attack—on domestic soil as well as foreign soil—is also important.

It is clear that diversity of energy supply is one of the most important factors in ensuring reliable and reasonably priced sources of energy over the long term. The Honorable Alexander Karsner, Assistant Secretary for the United States Department of Energy Office of Energy Efficiency and Renewable Energy (USDOE-EERE), stated in March 2006 during his first public address that "maximizing energy efficiency and renewable energy is the domestic epicenter in the War on Terror, and it is imperative that we maximize the partnerships between the public and private sectors in new and creative ways with the sense of seriousness, national purpose and the urgency the situation merits." According to Secretary Karsner, President George Bush's Advanced Energy Initiative (AEI), which was unveiled after the now famous "addicted to oil" State of the Union Address in 2006, is much more than allocating research dollars and is "nothing less than a Vision for Victory . . . Victory over reliance on unstable regimes and ideologies that are hostile to our way of life and bent on leveraging petroleum to erode our economic well-being."[68]

The literature contains a vast amount of information about how the United States can lower its dependence on foreign oil from technical and policy standpoints and perhaps even totally eliminate the need to import energetic materials. Various schemes including achievable goals of energy efficiency, additional deep sea exploration and drilling of the OCS (outer continental shelf) and the ANWR (Artic National Wildlife Refuge), clean coal technologies, oil shale and tar sands, plug-in hybrid automobiles, flex fuel vehicles, and increased used of renewable and nuclear energy sources have been presented to make America independent.[69]

However, we must also remember that in today's global economy, simply ensuring an uninterrupted energy supply within the borders of United States is not enough to sustain the economy of our country. Canada is the largest exporter of energy to the United States, and a terrorist attack on the Canadian energy infrastructure can have devastating effects on the U.S. oil and gas supplies.[70] A prolonged electricity or fuel interruption for certain parts of China or the small island nation of Singapore would cause a disruption in American trade and commerce. The bomb blasts in Mumbai, India, in July 2006 that killed 200 train commuters escalated the fears within the information technology industry that relies on a global network of services.[71] Even though the United States is competing for the same energy supplies as China and India, causing the price of energy to escalate, it is in the best interest of these countries to work together to find long-term solutions to dependable energy supplies. Renewable energy technologies will play an increasingly important role in the future energy portfolios because of their environmental benefits and insulation from terrorist activities. Although highly controversial, President Bush's recent discussions with the Indian government to provide India with nuclear technology for the commercial power sector development[72] was also a baby step in the direction of global energy cooperation. The economies of the energy-producing countries must also be modernized and diversified to move their reliance on oil or gas revenues.[73] In December 2003, Libya's leader Muammar al-Qadhafi announced that he would terminate the country's efforts to acquire and develop weapons of mass destruction and cooperate with the international community to destroy them. According to Bhagat, Libya—considered as a "pariah state" for almost 30 years—decided to change course under multilateral economic and diplomatic pressures, and effectively leverage the country's oil and natural gas assets for economic development.[74] Several developing states with substantial energy reserves are a weak link in the energy supply chain[75] and if not developed in cooperation with the energy consumers may become safe havens for terrorist groups. Overall, as this chapter illustrates, international energy dependence can be viewed as both a facilitator and vulnerability of terrorism, and thus demands our utmost attention in formulating a comprehensive, global counterterrorism response.

# CHAPTER 15

## RED SKY IN THE MORNING: THE NEXUS BETWEEN INTERNATIONAL MARITIME PIRACY AND TRANSNATIONAL TERRORISM

Kent Baumann

*"Red sky at night, sailor's delight; red sky in the morning, sailor take warning!"*
—Old Mariner's Proverb

**THE *DEWI MADRIM***

They approached suddenly and almost invisibly from out of the darkness. Using ropes and grappling hooks, the team of approximately 12 men quickly swarmed the target ship from their own high-powered speedboat. Dressed in black with balaclavas covering their faces, they moved like spectres under the moonless sky that shadowed the oceangoing tanker. With seemingly synchronized effort and armed with automatic weapons, machetes and VHF radios, the team quickly and efficiently secured the vessel. To the normal observer, this group might have appeared to be the crack team of any modern military force. Unfortunately, for Captain Surahmat Johar and the crew of the chemical tanker, *Dewi Madrim*, these raiders were something entirely different.

These attackers surpassed the typical threat to be expected on the high seas, and it was clear to the captain and his crew that these armed assailants were not average pirates. As the ship's captain was brought to the bridge, he recalls, "Up there I realized that they were completely familiar with all the equipment. Someone was expertly steering the vessel, reading

the radar very well. I remember thinking: 'My God, he can handle the ship better than I can.' I'd thought pirates were just a bunch of petty robbers who jumped onto a ship, robbed the crew, then disappeared. But these pirates were totally beyond my imagination. They were professionals."[1]

Certainly, they were modern day pirates. On the surface, their actions had all the ear markings of typical maritime criminal activity. When the attack was over, the armed assailants had disabled the ship's radio and taken some cash as well as the ship's captain and first officer, who remained hostage for some time before being released.[2] However, there is more to the story that indicates that these individuals were not typical modern day pirates in search of illegal profit at the mercy of innocent oceangoing merchants. More alarming than the crimes of illegal boarding, robbery and hostage taking, was the fact that the pirates took total control of the ship's helm, steering the tanker and altering its course and speed for approximately one hour.[3] This attack, which took place during the early morning hours of March 26, 2003, seemed more like a test drive than a traditional act of piracy. It is difficult to ignore the similarities between this attack and the 9/11 terrorists who were interested in flying lessons—excluding landing instructions.

### INTRODUCTION—WHAT IS THIS THREAT?
### A DANGEROUS NEXUS

In a pre-9/11 world, the attack on the *Dewi Madrim* would have scarcely alerted anyone beyond the fact that yet another act of piracy had occurred on one of the world's most dangerous sea lanes, the Strait of Malacca. In a post-9/11 world, it is fair to expect that this same event should have been analyzed through the prism of a different lens. In some circles, such analysis certainly took place, but on the broader scale, the nature of this particular type of threat still may not be understood to the degree warranted.

Maritime piracy is one of the oldest "professions" known to mankind. From the moment that civilized man put to the open seas in oceangoing vessels, people understood that they could profit by taking advantage of those very people who strove to make their living on the waterways of the world. While most Americans may envision such famous characters as "Blackbeard," Henry Morgan, Captain William Kidd, or even Anne Bonny, and consider piracy a thing of the past, this particular scourge has never truly been eradicated.

In fact, contemporary piracy is proving more and more dangerous as technology and globalization continue to advance and spread. Unfortunately, while both have many positive attributes, they are also having a negative effect in that they potentially bring together two of today's most dangerous strategic threats—maritime piracy and transnational terrorism.

As Catherine Zara Raymond has observed, "It has increasingly come to the attention of researchers of maritime terrorism that there is a possibility that pirates and terrorists could join forces. Pirates could sell assets such as maritime and littoral knowledge, stolen vessels (such as tugs), and stolen documentation to conventional terrorists, who could then employ their assets to carry out a large-scale terrorist attack."[4]

Terror-piracy potentially poses the most catastrophic threat on the geostrategic stage. Given that premise, the focus of this chapter is on international maritime pirates and transnational terrorist groups. This is not to say that certain, regionally focused terrorist groups do not engage in piracy at more localized levels for specific goals with set parameters, or that these particular groups and regions do not warrant attention. Rather, transnational, ideologically focused groups pose the greatest threat when associated with international maritime pirates. With that in mind, it is important to have a generally accepted point of departure with respect to understanding both groups that make up this dangerous partnership.

## DEFINITIONS—PIRACY AND TERRORISM

The Law of the Sea Convention (LOSC) defines piracy as an "attack mounted for private ends on a ship, involving violence, illegal detention of persons or property, or theft or destruction of goods."[5] Simply put, piracy is and has always been about profit on the high seas. Historically, the level of violence associated with piracy has always been in direct correlation with what is necessary for success on behalf of the pirates. Pirates normally did not want to destroy their target. There was no profit to be gained by destroying a ship and its cargo or killing hostages who represented a potentially lucrative ransom. Therefore, pirates exacted only the violence necessary to achieve their criminal goals. A troubling departure from the past is that pirates today are becoming excessively more violent. Similar to today's terrorists, contemporary pirates are better equipped, better armed, in some cases better trained and much more ready to leave dead bodies than they are willing to leave witnesses.

A universally accepted definition of terrorism continues to elude the international community even in the wake of 9/11. That notwithstanding, three key elements are central to any bona fide act of terrorism; if the aim is political, the essence is violence or the *threat* of violence, and the targets are civilians or noncombatants, then the act is an act of terrorism.[6] Keeping these three critical elements in mind, one of the most credible, academic definitions of terrorism comes from Israeli counterterrorism expert Boaz Ganor: "Terrorism is a form of violent struggle in which violence is deliberately used against civilians in order to achieve political goals (nationalistic, socioeconomic, ideological, religious, etc.)."[7]

This nexus between terrorism and piracy is certainly more discernable and possibly more predictable when we focus on specific groups and geographic regions, as well as the unique motivations that seem to be particular to this criminal alliance. Special attention should also be paid to potential targets that would result in the greatest impact in terms of casualties, economic loss, and long-term environmental damage. Additionally, understanding the common seams and linkages that foster this dangerous association may help in developing effective strategies to counter this growing threat.

## WHO? TERRORIST GROUPS INCLINED TO ENGAGE IN PIRACY

As a recent Jane's Intelligence Report observed, "The sea is not a natural place for most terrorist groups to fight, as the environment demands specialized knowledge that terrorists usually lack."[8] Nonetheless, the historical precedence for a terrorist group to use piracy in an effort to further its political agenda was set in 1985, when Palestinian terrorists hijacked the cruise liner *Achille Lauro* in Egyptian territorial waters taking the ship's crew and passengers hostage.[9] Certainly today, there continue to be terrorist organizations that actively engage in piracy and others that are more than willing to do so if it serves as a means to their ends. According to Raymond, "Terrorist groups that are known to have a maritime capability include Polisario, the Abu Sayyaf Group (ASG), Palestinian groups, al Qaeda, the Moro Islamic Liberation Front (MILF), and the Liberation Tigers of Tamil Eelam (LTTE)."[10]

Al Qaeda's leadership may be hiding in the landlocked border regions between Afghanistan and Pakistan and planning their strategic operations from there, but they would certainly not limit themselves in imagination when it comes to tactics and methodology for carrying out even more spectacular attacks than witnessed on September 11th, 2001. While al Qaeda is not above the use of normal terrorist tactics such as assassinations and car bombings, it has proven its penchant for the spectacular—a fact that should not be underestimated. Repeated statements by Osama bin Laden and other key leaders of terrorist groups continually point to the desire to strike at the "far enemy," or the West—and in particular, the United States. More significantly, they want the strikes to be devastatingly worse than those of 9/11. Even more worrisome are Osama bin Laden's continued references to acquiring and employing weapons of mass destruction (WMD). Combine this sinister vision with the potentially catastrophic opportunities afforded by a seaborne attack, and the results could certainly be felt worldwide.

Al Qaeda has already exhibited its willingness to use seaborne attacks, to include the suicide bombing of the U.S. Aegis Class Destroyer the USS *Cole* in Yemen's Aden Harbor in 2000, as well as the 2002 suicide attack

against the French tanker *Limburg*, also off the coast of Yemen.[11] While lives were lost, neither attack was catastrophic, and both are indicators of methodological and tactical adaptability. Al Qaeda leadership and operating bases may have been degraded to a large degree over the past several years, but it continues to show that it is a resilient, agile, and flexible organization capable of regenerating itself when and where necessary. It remains one of the most dangerous terrorist organizations today. Al Qaeda's strategic reach is empowered by its ability to franchise itself globally through its ideology and vision of Osama Bin Laden.

Al Qaeda-affiliated (or affinity) groups should also be considered prime candidates for a maritime terror attack. They would explore any option allowing them to execute a terrorist strike, not only to deal a crippling blow to their enemies, but to gain the attention and prestige in the eyes of the true, hard-line Al Qaeda leadership itself. These types of attempts can be seen in the Madrid 2004 railway attacks, as well as in the more recent London subway bombings of July 2005. While certainly devastating in many respects, these "franchise efforts" were not what true al Qaeda would consider overwhelming success stories. The attacks of 9/11 set the standard, and London and Madrid fell short of that standard with respect to economic impact and numbers of casualties. With that in mind, it is not hard to imagine that some al Qaeda affinity groups will actively seek out a more imaginative option of attack that might afford them the opportunity of achieving the catastrophic success their envisioned "masters" so desire. Again, a terrorist attack through the means of piracy could potentially hold the key to a "grandiose" success.

Jemaah Islamiyah, (JI), is a militant Islamic terrorist group active in several Southeast Asian countries, whose aim is to establish an Islamic republic unifying Malaysia, Indonesia, Brunei, southern Thailand, and Mindanao in the Philippines.[12] It is, without a doubt, one of the most active and dangerous terrorist organizations today, having carried out repeated attacks in Bali and Jakarta over the last several years. While JI would appear to be a more regionally focused terrorist organization with a more localized agenda and goals, its close affiliation with al Qaeda points to a broader agenda altogether. It considers its primary targets and enemies to be the West, particularly Australia and the United States. Add together this target focus, the al Qaeda factor and the fact that the group's geographic area of operations is essentially the seaway stretching from the Strait of Malacca to the South China Sea and encompassing everything in between, one has a breeding ground not only for terror-piracy, but something that could potentially facilitate this phenomenon on a catastrophic scale. At a minimum, a regional JI terror-piracy operation could serve as a preliminary phase and part of a much larger al Qaeda global operation.[13]

The Abu Sayyaf Group, (ASG) and the Moro Islamic Liberation Front, (MILF), both separatist groups active in the Philippines, have engaged in

terrorism and have affiliation with al Qaeda. "Both the MILF and the ASG are known to have trained in camps in Afghanistan that provided training for al Qaeda recruits. It is believed that al Qaeda provides financial support for both groups to carry out their attacks."[14] The ASG, or "bearer of the sword," is a splinter group of the MILF and has engaged in numerous acts of terrorism since 1991, to include terror-piracy—such as the February 27, 2004 bombing of *M/V Superferry 14* as it left Manila Bay, resulting in over 100 deaths.[15] Their geographic area of operation provides these groups with a freedom of movement, so to speak, in terms of engaging in effective acts of piracy. This coupled with their close association with al Qaeda places them high on the list of groups capable of facilitating terrorist attacks that utilize piracy as a tactic for potentially larger scale terrorist operations.[16]

Still other regionally focused groups continue to operate extensively in the maritime terrorist arena. According to Raymond, "By far the most high-profile maritime terrorist group is the LTTE, which has been employing maritime terrorist tactics since the 1980s in their ongoing war against the Sri Lankan government."[17] And, as Luft and Korin note, "uniformed members of the Free Aceh Movement, an Indonesian separatist group that is also one of the most radical Islamist movements in the world, have been hijacking vessels and taking their crews hostage at an increasing rate."[18] The danger with regionally focused terrorist groups that have exhibited a talent for executing effective terror-piracy operations is the potential that they are ready and willing to sell their talents and spoils to a more globally focused group such as al Qaeda—groups that have a far more destructive agenda. These global terrorist organizations do not want a seat at the table; they want to destroy the table.

Finally, groups that should be acknowledged for their potential to exploit piracy to further their cause are what can be described as the "Dark Horses" of terrorism. These are groups that, for whatever reason, are not on anyone's "radar screen." Either they have not yet committed a significant act of terrorism that would attract close scrutiny by the law enforcement or intelligence community, or they have yet to resort to terrorist tactics but have the potential to do so, given the proper triggers. Groups that characterize this "Dark Horse" phenomenon include radical environmentalist organizations or apocalyptic groups (as along the lines of Aum Shinrikyu in Japan), whose ultimate goal is to bring about total global destruction.

## WHY TERRORISM AND PIRACY?

The motivations influencing various terrorists groups to engage in piracy vary from their geographic proximity to strategic waterways to their particular ideological and political goals. As discussed earlier,

groups like Jemaah Islamiya, the Tamil Tigers and the Moro Islamic Front often engage in terror-piracy simply as a result of ease. Because of their proximity to the sea, they have built-in targets either on the water or in ports. Other groups traditionally confined to land-based operations, where traditional targets are now becoming better protected or "hardened," may be finding reasons to take their operations to the seas and cooperate with experienced pirates, where they can find more vulnerable high pay-off targets.

A basic motivational factor that could drive traditional land-based terrorist organizations to engage in piracy is sheer economics. Successful acts of piracy can help fund and supply future terrorist operations. Hostage taking for ransom, as well as the theft of ocean going vessels, can prove very lucrative for raising funds. Additionally, raiding ships and port facilities can provide logistical supplies, and in some cases specialized equipment that could facilitate follow-on, maritime terrorist operations.

While groups like al Qaeda might initially engage in piracy in an effort to bolster economic or logistical support, the potential benefit of recruitment should not be overlooked. Poor economic conditions in many regions of Southeast Asia often drive individuals to crime to include piracy. Consider an individual who is bitter toward his economic plight in life, understanding that he has already made the decision to resort to crime and piracy. Also consider that this same individual comes from a region that has a significant Muslim influence, often a radical Islamic influence—this is a person who is ripe for recruitment by an organization that has mastered the art of taking advantage of poverty, humiliation, and anger and focusing these motivations for their own terrorist agenda.

The most disturbing reason that certain terrorist groups like al Qaeda are so willing to exploit pirates or utilize piracy as a tactic is in their quest for weapons of mass destruction or weapons of mass effect. Gaining control over vessels with these types of materials or weapons would be extremely difficult, but not impossible. Given enough credible intelligence and fair margin for success, there would be little hesitation on the part of terrorists to seize an oceangoing vessel containing these hazardous materials or an existing weapon in transit, desiring the deadly cargo but not the vessel itself.

Less difficult would be for terrorists to use a hijacked vessel or "phantom ship" as an attack platform. "Intelligence agencies estimate that al Qaeda and its affiliates now own dozens of phantom ships—hijacked vessels that have been repainted and renamed and operate under false documentation, manned by crews with fake passports and forged competency certificates."[19] With a phantom ship, terror-pirates could simply bring an existing weapon on board and navigate the vessel to the intended target area, unfortunately raising little or no suspicion.

Finally, a combination of the previous two scenarios outlined above is a terrorist organization hijacking a commercial vessel transporting hazardous cargo and then using the ship itself as a floating weapon. Terrorists could then navigate the vessel to a specified target area and use some type of explosive devise to detonate the ship and its potentially lethal cargo. The damages—including environmental contamination, casualties, and economic loss—would vary in degree based upon the type of hazardous cargo a ship is carrying. If this attack was carried out on a tanker carrying crude oil, the damage would be measured more in terms of environmental damage and economic loss than in terms of casualties. Worse yet, if a significant amount of explosives were employed on a ship that was transporting radiological material, the result would essentially be a floating dirty bomb—probably the easiest, yet most catastrophic scenario.

Almost as frightening would be the seizure of a supertanker transporting liquefied natural gas, (LNG). LNG is extremely volatile, and many sources have compared the potential explosion of a LNG tanker with that of the December 6, 1917 explosion that literally destroyed Halifax Harbor, Nova Scotia when the French munitions carrier *Mont Blanc* collided with the merchant ship *Imo*. The horrendous explosion resulted in over 1,900 deaths and another 900 serious injuries.[20] A successful terrorist attack utilizing an LNG tanker in close proximity to a strategic trading port would be devastating in terms of the global economy and the natural gas industry. In terms of casualties, the cost could potentially be astronomical should the attack occur somewhere off one of the coastal areas of the United States where LNG tankers routinely navigate near residential areas via narrow channels and canals.

The underlying question in these attack scenarios is whether or not today's transnational terrorist groups consider a catastrophic strike aimed at the global economy a worthwhile tactic. From the terrorist standpoint, it is difficult to fully achieve the "terror" factor without a significant number of victims. History indicates that groups like al Qaeda desire not only a global media event as the result of an attack, but also a high body count—one which exceeds that of September 11, 2001. Because of this, soft targets such as shopping malls, sports stadiums, and subways are often the preferred targets for many terrorist groups. In light of this, the maritime environment should not be excluded from the list of potential soft targets, as is evidenced by the increasing number of attacks and attempted attacks by pirates aimed against oceangoing luxury cruise liners—a potentially "high-value" target in the eyes of terrorists.

Like water, terrorism will take the path of least resistance. As soft targets on land are "hardened" against the threat of terrorism, some groups will logically seek out a vulnerability that they can more easily exploit. Ironically, the global community's counterterrorism efforts on land and in the air may in fact drive terrorists to pursue targets at sea that have yet

to be fully appreciated and anticipated, such as tankers, strategic waterways, oil platforms, etc. However, while the resulting media event of such an attack would certainly be spectacular, the immediate results in terms of the number of innocent lives lost may not achieve many terrorists' goals.

Nonetheless, terrorists may be starting to appreciate the value of such a strike with long-term economic impact. Similarly, there are those terrorists who recognize the value of combining terrorism and other forms of crime and violence, such as organized crime. The Taliban-linked narco-terrorist, Baz Mohammed—who is now awaiting trial in New York—hailed narco-terrorism as a viable dual tactic because he was able to take America's money, while at the same time kill Americans with the very drugs that he was making his money from.[21] With cases like this, it is not difficult to imagine that a terrorist organization would place great value on using pirates or an act of piracy as a means of achieving their objectives.

## HOW DO TERRORISM AND PIRACY OVERLAP?
## SIMILAR LINKAGES

Terrorism and piracy overlap in many of the same ways that terrorism and organized crime do. While the bottom line for pirates is always profit, terrorists have a much broader agenda and more complex requirements. Not only do terrorists need to sustain and equip themselves during operational planning phases, they need to raise funds in order to finance actual attacks. That being said, the "pirate profit factor" has a definite appeal to terrorist groups needing to raise vital operating funds—funds that are needed not only for financing their next attack, but for other financial considerations including recruitment, training, and even their own information campaign efforts. Additionally, while piracy in its basic form can be an effective method for raising necessary funds, it can also serve as a means for acquiring specialized equipment necessary for maritime terrorist attacks. According to Louise Shelley, "A particular feature of organized crime in the Pacific region is piracy, some of it linked to the maritime transport of high technology."[22]

The nature of their organizational structures not only facilitates but promotes overlap between terrorist groups and pirates. Similar to organized crime groups, international maritime pirates operate using flat, loosely connected networks as do most of today's transnational terrorist organizations. The very criminal nature of these networks invites overlap, and where this overlap or intersection occurs, there is the likelihood that certain terrorists will recognize the operational utility of cooperating with pirates. At the same time, if pirates sense an opportunity for profit as a result of selling expertise or aiding in an attack, there is no reason to believe that many would not turn a blind eye to terrorist intentions in order to benefit financially from the endeavor.

In addition to similar organizational structures, the increasing reliance on advanced technologies such as communications, weaponry, the Internet, and even Global Positioning Systems (GPS) satellite tracking creates another node of intersection or overlap where terrorists and pirates may come together either unintentionally or intentionally. Piracy becomes central when a given terrorist group lacks the necessary expertise or equipment that would be required to execute a maritime attack. "International organized crime groups and terrorists both employ specialists."[23] What the terrorists are unable to do for themselves they will certainly hire out for, and pirates having the requisite expertise would surely embrace the opportunity to make a profit. In fact, the pirates hired may not necessarily even be given knowledge of the overall plan or larger picture, but then again they might. As Shelley has suggested, "Those hired on a contractual basis may be knowing accomplices or may be hired through intermediaries, unaware who are the end users of their services."[24]

Equally important for both pirates and terrorists to be effective is their operating environment. Unfortunately, several commonalities exist in many regions today that facilitate these environments. Both types of groups thrive in areas characterized by lawlessness, limited effective governance, open borders, and corrupt officials (or other individuals) who can easily be corrupted due to poor economic conditions. According to Luft and Korin, "International terrorists who want to cripple the global economy need not bother attacking countries where security is tight. They can inflict the same damage by targeting the territorial waters of countries that lack the will or the resources to police their own maritime backyard."[25] The sea, by its very nature and expanse, is difficult to police against piracy. Compound this natural challenge with countries that have limited governance, limited capability to police their own territorial waters (and often territorial waters that are near or located on strategic trade routes), and the result is a list of high-value targets that offer unique opportunities for terrorists who have the capability and desire to engage in piracy.

### WHERE ARE THE TERROR-PIRACY TARGETS?

Possible attack scenarios can be almost limitless; however, the realistic potential target set for terror-piracy can be divided into two basic categories, geographic and physical targets. With nearly 95 percent of the world's trade being transported by sea, there is no shortage of target areas—although some offer better and more frequent opportunities for terrorists than others. Certainly, maritime chokepoints with high volumes of sea-going traffic are the most logical target areas. Far and away the most infamous of these is the Strait of Malacca, where in 2003 alone, 42 percent of all pirate attacks took place. Virtually every piece of written work

addressing contemporary piracy highlights the unusually high level of danger and violence found on these waters. This 500-mile corridor separating Malaysia from Indonesia sees almost one quarter of the world's trade; approximately 600 ships pass through on a daily basis. This includes one-half of all oil shipments bound for Eastern Asia as well as two-thirds of the global shipment of LNG.[26]

Unfortunately, other particularly hazardous straits include those that are geographically positioned in the Middle Eastern region where many of the terrorist groups discussed earlier operate. For example, the Strait of Hormuz, which connects the Arabian Sea and the Persian Gulf, is approximately one and a half miles wide at its most narrow point, yet sees almost 15 million barrels of oil pass through it each day.[27] Likewise, the entrance to the Red Sea, or Bab el Mandeb, is barely one-and-a-half miles wide at its narrowest point. While only about 3.3 million barrels of oil a day pass through it, the Red Sea entrance is high on the list of strategic choke points.[28]

An even more narrow passage is the Bosporus Strait linking the Mediterranean and Black Seas. Not even a mile wide at some points, it offers an especially plausible target area for terrorists wanting to launch an attack against a vessel sailing through it. Of special interest is the fact that 10 percent of the 50,000 ships navigating this particular waterway on an annual basis are tankers carrying Russian and Caspian oil.[29] Given this fact, terrorists who might otherwise confine their activities to land may be influenced to attempt an attack on a tanker sailing under a Russian flag out of sheer desire to strike a blow against Russia and its economy.

Terror-piracy is not only confined to these geographic choke points. While the Strait of Malacca certainly tops the list of high-risk areas for piracy, the South China Sea as a whole is a vast region that continues to be a threat for all manner of shipping. The sheer size of the region and number of different countries with varying degrees of capabilities for policing their territorial waters exacerbate existing security challenges vis-à-vis piracy and terrorism in the region.

Another maritime region that is rapidly becoming one of the most dangerous bodies of waters in the world is the coast of Somalia. The absolute lawlessness of Somalia and lack of any effective navy has left the gate open for piracy to flourish off its coast. As a result, not only are acts of piracy in these waters on the rise, but their growing level of audacity and violence is alarming. More and more, Somali pirates are using advanced weapons as well as high-speed attack boats launched from larger ships in order to conduct effective attacks from outside territorial waters. This increasing level of success and ease of operations may very well attract the attention of terrorist groups looking to easily raise funds, strike at the western tourist industry or even mount piracy attacks that would serve as

training operations for future larger scale operations to be conducted in other regions.

As the level of audacity and daring in piracy continues to increase, so does the expansion of the categories of physical targets that terror-pirates are willing to pursue. Pirates are now targeting any type of vessel that offers a potentially lucrative target, from cargo ships hauling humanitarian aide to smaller oceangoing recreational craft to luxury cruise liners. This is a departure from the generally acknowledged list of physical maritime piracy targets, a target set that has been traditionally confined to tankers and cargo ships, as well as recreational sailing vessels, which are particularly vulnerable when they sail through ungoverned waters.

Major ports that are vital to the global economy and represent critical infrastructure to many western nations are increasingly becoming points of concern for acts of terror-piracy. Screening and monitoring initiatives are underway to secure these potential targets, to include increasing the distances out that incoming cargo ships have to communicate their estimated arrival times to a given port. Nonetheless, it is impossible to guarantee the security of a given port; just as it is equally impossible to guarantee the safety of the population associated with its location. Sources vary in their estimations, but only about 5–10 percent of all containers that enter U.S. ports on cargo ships are inspected. This leaves a significantly weak link for terrorists to take advantage of by using a phantom ship to smuggle a dirty bomb into a major port.

Oil platforms also represent particularly vulnerable targets, and while the body count after an attack on such a platform might not be significant, the economic impact to the country owning the platform would certainly be significant, if not globally catastrophic. Second and third order effects would also include short-term as well as potentially long-term impact on the environment. To certain radical left-wing environmentalist groups, the desire to achieve these types of effects (while seemingly illogical) might be especially appealing. They may feel that they can bring about a change in the petroleum industry if they can prove a "point" by exposing vulnerabilities in the security of oil platforms.

Increasingly, tourism and the cruise line industry are providing terrorists with a unique maritime vulnerability that offers them a very different kind of opportunity to strike at a given country's economy. As Joshua Sinai describes, "For example, when terrorists belonging to the Egyptian Al-Gama'a al-Islamiyya (also known as Islamic Group) attacked cruise ships along the Nile River on four occasions from 1992 to 1994, tourists kept away from Egypt. In the Philippines, when the Abu Sayyaf Group attacks cargo vessels or abduct foreigners from a tourist resort (as it did in 2001), it impacts on the entire country's trade and economy. In Somalia, when militiamen hijack foreign ships sailing off the country's coastline,

vessels steer away from the region."[30] In addition to being able to hit a country's "pocketbook," cruise ships offer a lucrative and shocking target in terms of casualties.

When discussing oceangoing tourism, it is almost as if maritime terrorism has come full circle. Arguably, contemporary maritime terrorism had its genesis in 1985 when Palestinian terrorists hijacked the *Achille Lauro* in Egyptian territorial waters. Today, over 20 years later, the potential for new and emerging terrorist groups to exploit this oceangoing tourist industry seems not only shocking, but inviting. In the minds of certain terrorists, a statement could certainly be made if an entire cruise ship with all passengers and crew on board disappeared in a single catastrophic attack. One of al Qaeda's hallmarks is to execute a large-scale attack involving a series of near-simultaneous attacks sometimes in close proximity of each other—a trademark that al Qaeda-inspired groups attempt to copy on a consistent basis. As terrorism and piracy intersect, the target set expands to include those that may potentially provide the spectacular type of attack that certain terrorist groups are looking for—attacks that result in a high body count and/or a significant blow to the Western or even global economy.

## WHEN? TERROR-PIRACY IS ALREADY A REALITY

Unfortunately, the idea of terrorists and pirates coming together for evil is not an academic question of "if" or even "when." In fact, it is not a question at all. It is a modern day reality. Simply put, terrorism is the sum of motivation and capability. When a particular group with sufficient motivation achieves the appropriate level of capability, then the likelihood of a true terrorist attack is high or even imminent.[31] This principle can certainly be applied when contemplating the nexus of terrorism and piracy. The evidence is clear that a number of terrorist groups have already firmly stated their conviction to commit acts of violence in any way they deem fit—hence, motivation is present. Given this motivation, if the targets are vulnerable and the likelihood of success is high, these same terrorists need only to acquire the requisite maritime capabilities, and they will be able to execute their acts of violence on the high seas. The potential end results are limited only to one's imagination.

A new focus on predictive analysis is required if this threat is to be better understood and hopefully thwarted. Unfortunately, there is a significant degree of disagreement as to the seriousness and reality of this threat. The facts are clear that a precedent for terror-piracy has been set. Moreover, the potential exists for even more devastating acts of terror-piracy to occur in the future. With the proper attention and analysis of events like the hijacking of the *Dewi Madrim* or the 1998 hijacking of the Singapore merchant ship the *Petro Ranger*, intelligence may be able to uncover trends

and/or locations of potential violence that point to something more than common acts of piracy.

## POTENTIAL COUNTERMEASURES

After acknowledging the reality of this threat and analyzing terror-piracy trends, there are at least a few steps that can be taken to minimize its impact both regionally and worldwide. Some of these measures are focused at the operational level, while others are aimed at the strategic level, but a combination of the two is what is most warranted.

Operationally, countermeasures center around the protection of ships themselves. As Luft and Korin observe, "Ultimately, only a ship can guarantee its own security. Maritime security forces cannot be present everywhere at all times (and in certain regions, the security forces themselves are the problem)."[32] The initial step in helping to secure ships begins with taking a hard look at the criteria for selection and screening of crew members. Thorough background checks are crucial. Many oceangoing tankers today are crewed by as few as 15 people. With manning numbers this low, it is not hard to envision the potential for insider assistance in the seizure of a particular vessel, a fact not unheard of in past attacks. If there is safety in numbers, another step that ships might take to protect themselves would be to travel in convoys, a practice that has not been used routinely since the U-Boat scourge of World War II.[33]

Additionally, the concept of arming crew members may merit serious examination. In the wake of 9/11, the U.S. Congress has seen fit to allow airline pilots to carry weapons, and some would argue that the same rationale should be applied to merchant vessels on the high seas. However, as Charles Glass observes, "Only the Russians and the Israelis are known to keep weapons aboard."[34] However, there are definite concerns and issues that must be considered before taking such a step. Luft and Korin suggest that "Arming sailors is more complicated than simply giving them weapons. Officers must be well-trained, access to onboard weapons storage must be carefully controlled, and crews must be well vetted."[35]

Unfortunately, strategic countermeasures are more long-term in nature and in some cases may be less realistic. These measures start with insuring that current international law appropriately addresses the continually evolving nature of this pirate and terrorist threat. One such step would be to blacklist phantom ships. "If a state cannot ensure that the ships it is flagging are legitimate, then all of the ships flying its flag should be blacklisted and prevented from entering the territorial waters of other states."[36] Other strategic steps include searching for alternate routes for cargo, even to include looking for new land routes that could potentially replace current sea-trading routes.

Finally, and certainly not realistic in the short-term, is to look at alternate energy supplies. While the world remains dependant on oil, the volume of oil being transported by sea will remain significant. Likewise, as long as the world's economy and energy remain targets for terrorists, ocean-going tankers will continue to top the list of vulnerable high-value targets.

In addition to looking at countermeasures to combat terrorism at sea, the idea of consequence management must be addressed as well. If the likelihood of a significant terror-piracy attack has increased since 9/11, then measures for dealing with such an attack and its after effects need to be anticipated, planned for and rehearsed. Environmental cleaning operations should be pre-organized in the event of an attack against a major oil tanker. If one of the narrow straits is blocked as the result of an attack, alternate routes and emergency procedures should be identified and agreed upon in advance. Finally, authorities must plan for the possibility of a major disruption or interruption in the world's oil flow. According to Luft and Korin, "They should, for example, expand strategic petroleum reserves so that they are sufficient to replace many weeks of lost imports."[37]

The threat of transnational terrorism allying itself with international maritime piracy is real, and is only going to increase unless nations of the world come together in their fight against terrorism on land and on the high seas. Terrorists have proven their penchant for exploiting vulnerabilities. Security measures that go toward preventing another 9/11 are certainly warranted, but terrorists continue to adapt and improvise. Madrid, Beslan, London, Bali, and Egypt have all been targets, and they did not involve planes flying into high-rise office buildings. It is imperative that we anticipate where terrorists believe they are sensing and finding our vulnerabilities and where they believe they can achieve the most effect for their efforts. Only then can we effectively move to prevent the next catastrophic attack before it happens.

# CHAPTER 16

## UNDERSTANDING AND COUNTERING THE MOTIVES AND METHODS OF WARLORDS

Brian Hanley

With continuing development of biological, nuclear, and future technologies, warlords will be capable of waging war on a global scale more effectively.[1] Casualties from al Qaeda's attacks on the World Trade Center, Pentagon, Madrid, and London are really quite minor. It is hubris to believe that we can avoid serious acts of war against our nation forever. Thus, understanding warlords is vital in this age when they are one of the players that can carry war to our shores. This chapter will attempt to further that understanding in the context of a warlord as a violent nonstate actor (VNSA),[2] oriented toward practical usability on the ground and in policy.

What is most critical to understand is that being a warlord is a profitable business and a way of life dedicated to amassing power and perks. It is high risk, but the rewards are significant for the warlord, quite similar to the rewards of being a dictator or a high-powered CEO. Immense wealth, power, women, sex, and respect accrue to a warlord. Similarly, for his followers, the allure of power, sex, drugs, and upward social mobility is hard to resist. Why would a 18-year-old general[3] give up his command, unlimited sex, wealth, and other perks? As a result, a warlord is very difficult to control unless his source of funds is interdicted or he dies. And if he dies, there may be a clash of rivals to replace him. Consequently, structural economic change based on control of resources and reasonably fair use and distribution of their revenues may be essential if warlordism is to be overcome.

To truly understand a warlord, one must put oneself in his shoes. Seeing his career choice as rationally self-interested, his modus operandi becomes more understandable. Few stupid men last long as warlords, whether formally educated or not. Their rationality may be extremely violent, viciously cruel, and callous beyond imagination. Sometimes, combined with throwbacks like cannibalism,[4] their actions and those of their followers are mind bending. Children conducting massacres with glee, children placing bets on the sex of an unborn child before slicing open a woman's belly for the sport of it, cannibalism, and casual torture that turns life as a slave into a relative safe harbor have been modus operandi of some warlords.[5] Such deeds can blind us to the patterns behind the scenes which give such events their shape. What warlords do is quite rational, and makes sense within the correct set of assumptions.

## WHAT IS A WARLORD?

In common use, warlord covers a lot of ground. "One man's warlord may be another's freedom fighter," and some warlords the U.S. government has been allied to. A warlord, like a dictator or a king, may have positive and negative effects on the people affected by his rule. Like garage entrepreneurs in a capitalist system like the United States, warlords make moves that can leverage a nobody into great power, wealth, and visibility. A warlord has been defined as "a strongman who maintains control of an area and its resources through his ability to wage war, who does not obey a higher or central authority."[6] This is a good starting point. However, what should we make of the relationship of warlords to sponsoring powers? How are warlords used by competing nation-states in a game of global chess? How does this fit with insurgency, or with matters of doctrine on the part of the warlord? And what of the global public relations war that is often the primary battleground between the "developing world" (i.e., second/third world) and the "developed world"?

Similar to the understanding that to combat an insurgency the goodwill of the people must be cultivated, warlords also need to appeal to some segment and gain its loyalty. Warlords routinely use fear as enforcement, since a large sector of civilian populations are easily herded this way. Arguably this is the same means police agencies use to combat crime and corruption[7] by making public examples of individuals, and it works.[8] Warlords may operate in a like manner, and either interlock with insurgencies or comprise their core.

Warlords make selective use of the principle of their "citizen" bearing arms, and warlord troops seeking to terrorize often depend on the citizenry not being armed or capable of effective response. A populace capable of chasing down agents of warlords in their midst is a serious threat to warlord leadership. Such capability changes the prevailing collective

psychology from one of "ratting" on the warlord's people to one of empowerment. Keeping this in mind, we shall see how warlords differ on various scales. However, this basic trait of "armed citizen" is common within warlord's organizations just as it is with gangster organizations inside the United States.

We may differentiate warlords by a combination of sources of income, politics, tribalism, doctrinal values, methods, and the scale of their operations. The methods of warlords are also practiced by dictatorships such as Myanmar or the quasi-dictatorship of Robert Mugabe in Zimbabwe. Such nations can be considered either fully acquired as warlord fiefdoms, or well on the way. The methods of warlords are also known and practiced by criminal syndicates and gangsters. Al Capone would understand Charles Taylor and Foday Sankoh very well, and so would Monstah Kody.[9] Thus, as a practical matter, the advice of those who grew up in a rough part of town filled with gangsters may be well worth seeking when trying to understand a warlord.

## ECONOMIC FOUNDATIONS: PROXY WARLORDS AND RESOURCE WARLORDS

The foremost differentiating factor for warlords is source of income. Relative to income there are two basic types of warlord. Proxy warlords are paid by some outside power, a broadly based system of funding, or a combination, upon which they depend for support.[10] Resource warlords seize some productive asset and use their control of it for income. Figure 16.1 provides a sampling of warlords by economic support system and the type of warfare engagement they have primarily pursued. Note that not all of them have been enemies of the United States. One was an ally, and others have been aligned to various degrees.

### Proxy Warlords

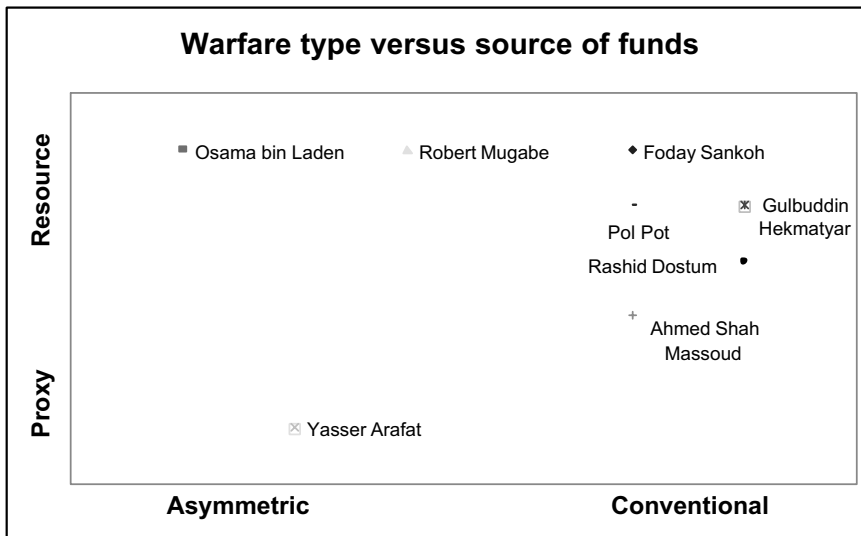
Proxy warlords are probably best exemplified today by the collection plaguing the Middle East who perform proxy war against Israel. The old cold war rivals of the United States and U.S.S.R. paid for proxy wars all over the world, maneuvering to prevent each other from dominating the globe. Proxy warlordism is still extant and fluctuating with populist fundraising (i.e. payment by nonstate agencies) probably more common than during the cold war.[11] The United States paid the Pakistani Inter-Services Intelligence (ISI) to make proxy war of this general type in Afghanistan[12] and others in Africa, while the Soviet Union and Cuba paid for warlords in South America and Africa, as well as striking economic deals with them for valuable goods such as Angolan diamonds. Iran, and until recently, Iraq, have supported proxy warlords in the Palestinian territories in


**Figure 16.1   Warlord Typologies and Examples** *Note:* **Warlords chosen for this illustration are examples, not intended to be complete. The placement of a warlord is a judgment call. In most cases information is incomplete and likely to remain so.**

various ways, as have private funds from various Persian Gulf states.[13] This difficult-to-deal-with type of warlord makes his money in rake-offs, embezzling funds and material provided for making proxy war on behalf of a nation or movement. He may also engage in some degree of confiscation or resource control, but it is not his primary means of support. He is difficult to deal with in part because it is very much not in his interest for the conflict to be resolved because his ability to amass a fortune will be curtailed. Depending on his source of support it is likely that his paymasters will end his life if he disobeys them, as a consequence of which it may be impossible for him to negotiate in good faith, regardless of what he might personally want at any time.

The motives of those who pay proxy warlords are generally rooted in religious or political doctrine for a specific goal. However, in addition to such straightforward motives, a proxy war can focus attention outward, away from domestic problems, or it may appease some vocal constituency within the sponsoring nation or group. For the purposes of maintaining a focus outward, it is useful if the enemy of the proxy warlord supporter neither loses nor wins. Thus, an endless border war with a neighbor, such as Pakistan's with India, is excellent for unifying the people, and gives justification for a succession of generals to keep control. Similarly, this same border war appeases a vocal and dangerous faction, keeping them

busy. By comparison, the outstanding convenience of proxy wars is that the paymaster nation supporting the proxy transfers most of the risks and political costs to the proxy warlord and the people of another nation. And yet, proxy wars still accrue the benefits of focusing attention outward and appeasing constituencies. Thus proxy warfare appears to be pretty much all upside with little downside for the paymasters, whether they are doctrinal supporters, or shrewd politicians. The primary downside to proxy warfare is the possibility of "blowback" which is a subject that others have covered.[14] For those strategizing the game of chess in which proxy warriors are the pieces on the board, attempting to turn proxy war support by an opponent into blowback for them is intriguing to consider.

A proxy warlord's organization tends to be more vulnerable to breakdown after his death than that of a resource warlord for several reasons. First, a proxy warlord is often not a natural tribal leader, nor part of the established structure of a society. A famous example of this is Yasir Arafat who hailed from Egypt. Such a warlord may travel from another country to get his start, or he may travel to take over an existing organization. It is possible that in the beginning, he may have ideals of some kind that lead him to fight. In any case, as a consequence of the way he begins, his organization is generally recruited from relative strangers who join the cause or group. Such an organization will need to be held together by a combination of doctrine, carrots and sticks, and will not have many natural loyalties. A smart warlord may establish an educational system that indoctrinates children or quite young recruits, but this takes time and effort for the crop to mature.[15] Alternatively, a system of education such as the madrassas established as a long-term recruitment and political base development system can be used as a source of recruits.

A proxy warlord will usually guard his connection with a foreign power carefully, for quite obvious reasons. Should he not do so, a successor can take over his position before he wants to relinquish it, an event undesirable to the proxy warlord. Consequently, it is often up to the foreign power to find a successor after his death. A proxy warlord will promote people around him that he believes will not depose him and will tend to eliminate those who make him nervous. This tendency is the Achilles heel of warlords, as it prevents them from building larger, more effective organizations with a capable officer corps since doing so is too great a risk. Consequently, those who are too smart or overly ambitious tend not to be found close to proxy war leaders. For these reasons, when such a leader dies, his organization tends to either become moribund or fall apart. Consequently, targeting a proxy warlord directly for removal is a good strategy, and warlords use this technique on each other. At the very least, iterative replacement of kingpins will stress the support pipeline both logistically and financially for the opposition.

Generally speaking, stress on a support system for war leads to greater opportunity for exposure and error, both good things for the opposition to experience. Since the proxy warlord will probably have embezzled a large amount of money and hidden it for his family, the cycle will need to occur again and new start-up costs incurred by the proxy support nations. Additionally, if the money the proxy warlord has hidden for his family can be located and confiscated by agents of the Western allied powers, (through courts or intelligence services) this can prevent his family from reaping rewards from his actions. Should it become known that families are unlikely to reap the huge rewards a warlord can provide, this may aid somewhat in curtailing the phenomenon. However, such an accomplishment is quite difficult, and perennial, akin to fighting organized crime.

A proxy warlord may not be loyal to the supporting power that backs him. Such men have their own agenda and they make use of greater powers in equal measure to the use greater powers make of them, playing their own game of chess. The example of Lenin, who was a proxy warlord backed by Field Marshal von Hindenburg and General von Ludendorff to return to Russia "like a virus" is well worth pondering. Loyalty does tend to be displayed to those more ruthless powers who will assassinate a warlord who strays off the reservation. In the case of the ISI connection to the U.S. support for Afghanistan, it appears there was probably a multilevel scheme for embezzlement that started with personnel in the ISI appropriating funds to support mujahideen in Kashmir, then more theft from such people as Gulbuddin Hekmatyar lower down the food chain. This is similar to what occurs in developing nations with large international project loans.[16] Prior to locating Ahmed Shah Massoud, CIA money was embezzled at a furious rate with marginal effect on the Soviet forces in Afghanistan. Turning this on its head, finding ways to encourage higher rates of embezzlement, through placement of intelligence operatives within warlord organizations, or arranging deals with warlords that require them to pay crippling levels of protection money to keep themselves or their families safe will stress the proxy warlord's client(s) as well. However, in the ecology that is warfare, there is the distinct possibility of evolution of response to such measures.

### Resource Warlords

This type of warlord takes control of some asset in order to milk it for money. The warlords of Congo, Angola, Sierra Leone, Liberia, and Colombia's FARC are primarily of this latter type. Some of them, such as UNITA in Angola, were once affiliated with major powers[17] but have learned to support themselves. In UNITA's case, the great powers were

the strange bedfellows of the United States and China,[18] which was justified by UNITA with the words, "take aid . . . from the devil himself."[19] A resource warlord may be associated with a tribe or ethnic group, or he may recruit his followers from scratch.

Across the top, a point resource is one that has a single location that is relatively easy to control. A diffuse resource is one that is spread over a large region. A proximate resource is close to the capital of a nation, or some other center of power. A distant resource is one that is far from the capital or center of power. The type of conflict is then listed along with the resources controlled. While considering Table 16.1, the primary thing to think about is whether it is practically and politically feasible to provide sufficient control of the resource in question as an alternative to the warlord.

On one end of this scale of those who control assets to receive money from them, one finds tribal leaders or heads of familial clans. A leader of a clan may be operating in a region where there is little or no rule of law, and so to survive, his people must bear arms. When dealing with this type of person, negotiation or attempted alliance is generally more appropriate. This type of warlord is more likely to have a conscience that can be appealed to, which can be judged by how he has treated the people in his region and how they regard him. His value system, however, is likely to be rather foreign to modern U.S. values. Outside of the United States, ethnicity, clan, and family are of the highest importance, and it is normal for families to act as one collective unit. Western society, particularly in the United States is much more fractured and oriented toward individualism and loyalties to organizations. Thus, our systems don't go over well.

There are no hard and fast rules for dealing with a tribal resource warlord. A dedicated opponent may be highly regarded, yet never entirely trustable in a negotiation. It may be the case that this person will desire to stand off unaligned to a great power for practical reasons. Should a great power decide to leave he could have serious problems, and he must think of the long-term survival of himself and his people.

The most problematic resource warlord is one who has recruited his organization from scratch, as a gangster does—or one whose ruthless control of his group's assets has overwhelmed his cultural mores. Both types of resource warlord can be difficult to counter. The context of the resource warlord's organization means that if the leader dies, a new leader, or the organization of a rival who watched from the sidelines, is likely to appear. This means that the primary way to put resource warlords out of business permanently is to take over their assets and manage those assets directly as well as see to it that civil society institutions are restarted or strengthened.

**Table 16.1   Examples of Resource Components of Conflicts**[58]

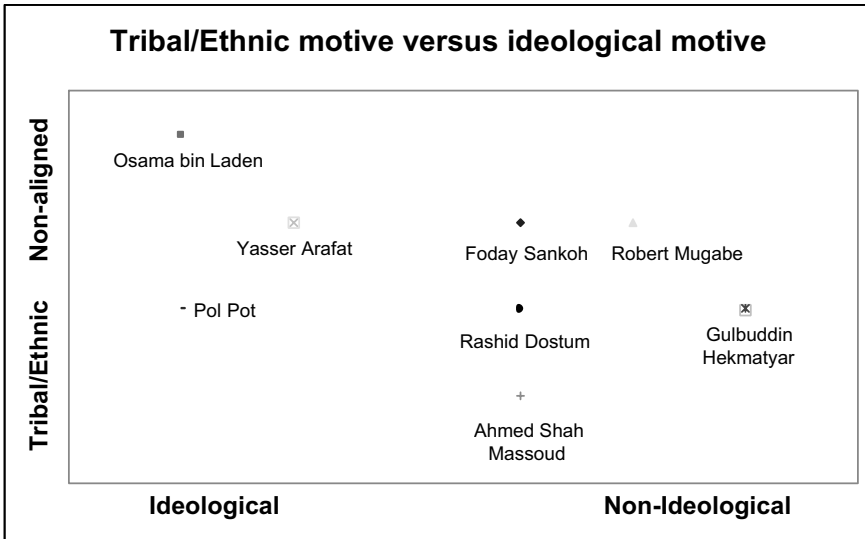
| | Point Resource (few locations/small geographic region) | | Diffuse Resource/Trade (widely distributed geographically) | |
|---|---|---|---|---|
| *Type of conflict* | *State control/ coup d'etat* | | *Rebellion/rioting* | |
| State holds strong control | Algeria | Gas | El Salvador | Coffee |
| | Angola | Oil | Guatemala | Cropland |
| | Chad | Oil | Mexico | Cropland |
| | Congo-Brazzaville | Oil | Senegal-Mauritania | Cropland |
| | Iraq-Iran | Oil | | |
| | Iraq-Kuwait | Oil | | |
| | Liberia | Iron ore, rubber | | |
| | Nicaragua | Coffee | | |
| | Rwanda | Coffee | | |
| | Sierra Leone | Rutile | | |
| *Type of conflict* | *War of secession* | | *Warlords* | |
| Weak state control at a distance | Angola-Cabinda | Oil | Afghanistan | Opium |
| | Caucasus | Oil | Angola | Diamonds |
| | D.R. Congo | Copper, cobalt, gold | Burma | Opium, timber |
| | Indonesia | Oil, copper, gold | Caucasus | Drugs, weapons |
| | Morocco-Western Sahara | Phosphate | Cambodia | Gems, timber |
| | Nigeria-Biafra | Oil | Colombia | Cocaine |
| | Papua New Guinea-Bougainville | Copper | D.R. Congo | Diamonds, gold |
| | Senegal-Casamance | Marijuana | Kurdistan | Heroin |
| | Sudan | Oil | Lebanon | Hash |
| | | | Liberia | Timber, diamonds, drugs |
| | | | Peru | Cocaine |
| | | | Philippines | Marijuana, timber |
| | | | Sierra Leone | Diamonds |
| | | | Somalia | Bananas, camels |
| | | | Tajikistan | Drugs, weapons |
| | | | Former Yugoslavia | Marijuana, timber |


**Figure 16.2    Warlords chosen are for use as examples and not intended to be complete.**

## IDEOLOGICAL/POLITICAL AGENDA AND WARLORDS

A major measure of a warlord is the degree of ideological agenda he has relative to use of his assets and methods for warfare (for example, see Figure 16.2). On the far end of this ideology scale are warlords who have relatively "pure revolutionary" motives and uses of assets. On the near end of the scale are those who appear to make war primarily as a business and to dominate others. Osama bin Laden and his al Qaeda group are on the far end of this scale. They use assets to advance their doctrine though they use warlord methods such as taking advantage of, or creating, chaos to bind a populace to them. However, one may also note that the reestablishment of the Khalifa, should it be successful, would put Osama's people either at the center of power or perhaps on the throne, so perhaps his motives are not quite as pure as they might be.

Consistency of alignment is another way to differentiate warlords. A warlord may switch sides, perhaps multiple times, as did General Rashid Dostum and Gulbuddin Hekmatyar under the Soviet, Taliban, and U.S. rule in Afghanistan.[20] Such have minimal allegiance to a nation or doctrine. On the other end of the alignment scale are those like Ahmed Shah Massoud of the Northern Alliance in Afghanistan who fought the Soviets and then the Taliban for the entire period. A leader who has loyalty to his people and fights on the same side regardless of whether he is making

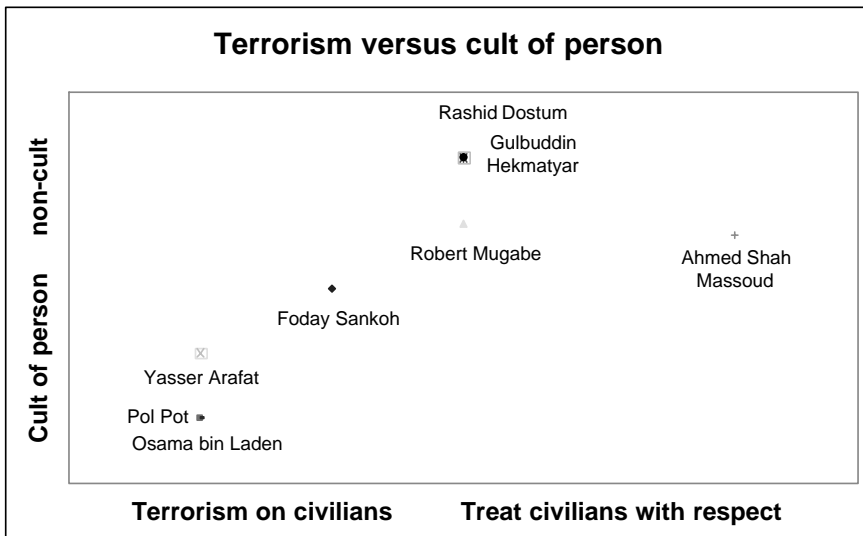
**Terrorism versus cult of person**


Figure 16.3

money at it, should be differentiated. He may make use of resources for his cause, but the resources are not his primary cause.

We can also look at the degree of terror that a warlord uses, as well as whether they create for themselves a cult of personality[21] that goes beyond ordinary leadership. To some extent we have looked already at the method of terrorism in the chart regarding methods for warfare. However, embrace of terrorist tactics is not exclusive of conventional military engagements (see Figure 16.3). Foday Sankoh is a case in point. His forces consistently drove civilians out of regions of diamond mines he sought to control by using terror conducted by semi-irregular uniformed soldiery.[22]

A related measure of a warlord is the degree to which a warlord feathers his nest and neglects the civilians of their region and even his own supporters. This is also a measure of kleptocrats, who often become the equivalent of small nation-state warlords after they have gained power. Sometimes the level of personal greed displayed is hard to fathom. Those who make funds available to such people probably deserve what they get in return. For policymakers, collusion between disbursers of funds, "Five Star Aid" agencies and their personnel[23] is something to watch carefully. The results are not necessarily desirable or intended.

These features of tribalism, cult of personality, terror tactics, and greed should be measured against the historical cultural norms of a region or ethnic group. Tribal politics in many regions provides the tribal leader

with great power, and there is significant overlap between traditional tribal politics and warlordism going back to European colonial times and prior. Tribal leaders acting in ways we in the West consider uncivilized can be part of the growing pains of certain nations.[24] (It should be noted that barbaric campaigns of terror have been part of European history and colonialism as well.) However, we evolve our culture by degrees, and by most measures, such people as Foday Sankoh, who used mass murder and chopping off hands and feet[25] to terrorize villagers into leaving the area so that he could steal diamond revenue in Sierra Leone, was violating historical cultural norms.

## CONDITIONS FOR THE GENESIS AND MAINTENANCE OF WARLORDS

Warlords thrive on chaotic circumstances and breakdowns in society. An insurgency or war can be the mechanism that creates chaos. So can disease and extremes of poverty. In such instances systems of order and restraint tend to break down. Breakdown leads to the availability of young men to conduct war, and an interest by a sufficient number of young men or children to grasp at anything that will bring opportunity into their life. Warlords are the seed crystals around which such conditions coalesce.

Warlords, like gangsters, are products of a milieu which grants opportunity to the ruthless. It is important to look carefully at what warlords represent to the common people of an area. In many cases, their success largely stems from acting as the conduit for *perceived* prosperity and order. For example, they may take it upon themselves to enforce "laws" as the IRA has done in northern Ireland, or distribute charity to families who support them. In the other cases, they make themselves the gatekeeper for *perceived opportunity* for prosperity. An example of this is the warlords of Western Africa recruiting orphans into armies with the opportunity to become an officer collecting diamond revenues. If they are the only alternative rule to a national government of kleptocrats, or simply city folk who don't care about the inhabitants, this tends to be successful. The national government or ordinary citizenry may be oppressive or threaten their survival through neglect. People do what they must to survive, even if they think it is morally wrong. Thus, poverty, oppression, and neglect are a crucible that often precedes the rise of warlords and their cousins, gangsters.

Pandemic disease can be a *very* powerful factor creating breakdown of societies. AIDS already has reshaped Africa through orphans with guns.[26] The plague hit the African continent starting in the 1980s. By 1990 WHO was concerned, spurring development of models to attempt tracking of case estimates.[27] In concert with the plague's release of tens of thousands, then millions of orphans across an already poor continent, nations have

exploded with civil wars run by resource warlords. It is estimated that there are 14 million orphans in Africa from the AIDS plague[28] creating a "resource pool" that are natural cannon fodder for warlords and warlord wannabes in that region. The number of orphans is expected to rise to 18 million by 2010.[29]

In 2006, many African nations have HIV infection rates of 30–40 percent and that rate is not trending downward yet. The effect on the economy is significant.[30] HIV, unlike other historical epidemics, attacks adults in their prime more than any other group.[31] This hollows out a society by destroying those who would ordinarily provide cultural continuity, socialization, training, and support. Poor economies are hardest hit by HIV.[32] While macroeconomic indicators do not support the obvious hypothesis that HIV/AIDS would cut per capita income, it does slow GNP growth, and there is alarm that the economy of Africa could unravel[33] as the plague persists. However, considering the events in Liberia, Sierra Leone, Somalia, and elsewhere, although economic activity still occurs, the societies of these nations have already unraveled. All of this would suggest that in addition to battling the HIV plague, to remove this foundation contextual element from the equation, good orphan care and education could be quite beneficial. Without it, the stage is set for a new warlord to step in and take advantage.

Regarding the effect of chaotic breakdown on warlords, a major problem is that a smart warlord will realize their fortunes will *not* rise if their nation's fortune rises—quite the reverse. This is true for warlords of a doctrinal stripe such as Osama bin Laden, and those who are nondoctrinal like Charles Taylor and Foday Sankoh. It can be argued that Osama bin Laden's group learned in Sudan that they have a greater chance of imposing their doctrine on a nation if it has been seriously damaged. The experience in Afghanistan made that lesson stronger as al Qaeda attained power on a foundation of rubble. It is well understood that a terrorist goal is driving the population by terror into distrusting the government's ability to protect its citizens.[34] By extension, this same principle applies to those wanting to impose a religious doctrine unsavory to most. If a warlord is smart, and realizes that under better conditions the people would either not tolerate what they offer, or would overthrow the rule of the warlord, the solution is obvious. Hence, the intelligent warlord will maintain or create the required degree of chaos while maintaining himself as the center of *relative* strength.

In a similar light, when viewing the actions of leaders who seem to be simply damaging their nation for no good end, think carefully about the strategic value of the moves the leader is making. A case in point is the actions of Robert Mugabe in Zimbabwe. His moves to damage the holdings and income of the white farming class[35] can be seen as a kind of redress for past wrongs, and as payback to supporters. However, it should also be

noted that by doing so, he has destroyed the economic base of the primary group within the country capable of acting against him and his tribal affiliates in the future. Thus, his actions, while seeming to be outlandish in conventional economic terms, bankrupting his nation, are quite intelligent in terms of power at the level of Zimbabwe as a closed system. He plays a zero-sum game, by which is meant, he assumes a limited pool of "chips" which he can either obtain or destroy in order to win. If he can simply maintain a steady position while making a rival fall, he has won. A zero-sum thinker will tend to not accept a win-win proposition if that win-win scenario will aid a potential rival.

The only check on such destructive zero-sum power grabs is threats from outside which can remove the warlord from power. Lacking such threats, a warlord is free to turn his nation or region into a smoking ruin as long as doing so leaves him on top of the heap with enough income to maintain a high ratio between his income and that of his people. This suggests that an effective way to curb the internal overreaching of such warlords could be for the international community to allow neighbors or even more distant nations to annex parts of such regions if such can bring order. This is a controversial idea, quite impractical in some circumstances. However, in the current milieu, a warlord is free to wreck his region or nation, slaughter willy-nilly, perhaps even dine on a rival,[36] take over a small nation, take a seat at the United Nations and vote, then petition the international community for loans followed by debt forgiveness. Institutional and public memories in the developed world being rather short, this is a straightforward scenario.

Statistically speaking, a warlord is probably at greater risk from influenza, the common cold, and just crossing the street, than he is from the international community. The spectacle of an unrepentant war criminal like Foday Sankoh being installed by a UN peace agreement putting him in charge of the diamond mines is beyond ironic. His child army massacred his countrymen for control of Sierra Leone's mine regions. Similarly, war criminals who served under him were hired by UNICEF to "free children" from military service.[37] Such "measures" call into question those involved, and indicate extremely selective prosecution for war crimes together with a kind of reverse racism. Foday Sankoh did finally die in 2003 at the age of 65, suffering a pulmonary embolism while in custody of the Sierra Leone war crimes tribunal[38] established in 2002. However this fact only clarifies how current international responses are ineffective as he essentially died of an affliction of old age.

## THE PROBLEM OF DEVELOPMENT BANDITRY

Development banditry is a significant problem obstructing efforts to prevent the development of conditions for warlord emergence, and to

redress such conditions in the aftermath. A development bandit is a person from the developed world whose goal is theft from the IMF, World Bank, and other aid agencies by participating in and instigating corruption to enrich themselves hugely. The problem of development banditry undermines both the legitimacy of the developed world and confidence on the part of the populace that there is actually a difference between the developed world's system and the systemic corruption normal in developing nations. It is difficult for most Americans to comprehend what it is like to live in a nation which has never experienced the rule of law, and has no "social capital"[39] to speak of upon which to base a similar economic-political system. Residents of developing nations are hopeful, and want to believe in something better. Thus the damage done by development bandits is quite serious, as they provide clear proof to local people that the developed world operates the same corrupt way as they do.

The percentage of aid money that is corrupted on its way into developing nations is unknown, although the corruption index[40] gives some guideline. Money provided by World Bank, IMF, USAID, and such large donors as the Soros Foundation, probably has a corruption level near 100 percent in many regions.[41] This even extends to gifts of aid in the form of goods as simple as blankets, meals, and generators.[42] Most of this is engaged in by locals. However, a key role is played by corrupted westerners, generally civilians.

Unfortunately, the prosecution of Stein et al. in 2006[43] is a rare event because of venue problems. This suggests that the ranks of development bandits are likely to grow until their ranks regularly experience legal retribution.[44] Paid-off officials are not going to prosecute a development bandit. Outside of the country in which the crimes took place, there is usually no jurisdiction. Doing something about it will require collaborative legislation and treaty between nations making it possible to prosecute such crimes in a western jurisdiction.[45] Additionally, allocation of resources specialized to notice, gather evidence, arrest, and prosecute such people is virtually nil today.

## PUBLIC RELATIONS WAR: ACCESS CONTROL, LANGUAGE, DENIAL, AND COUNTERATTACK

For some warlords, particularly proxy warlords, the public relations (PR) war is the primary arena of battle. For most it is a major element. The most successful will be quite skilled at manipulating the media. The methods used are absurdly simple, and can be mastered by virtually anybody with a bit of chutzpah. To start with, all a warlord must do is make a statement and it tends to get reported straight, with little or no commentary or analysis accompanying it. This is an odd, and hopefully passing, feature of Western press today, a case of ethics run amok into the field of

near madness. Journalist ethics of our time dictate that when reporting, a journalist must stay out of the story, and simply report what happens or what people say. As a consequence, journalists only feel free to slant or enter their stories when dealing with that which is highly familiar to them, that has established positions within the cultural context the journalist resides, and that are part of their personal identity politics.

Because of this, if a warlord announces that he is fighting for freedom, democracy, or the rights of "his people" very few will question it. Once in a while, after years blowing up buses full of civilians, or of hacking off hands and feet, there may be questions brought up as to his sincerity. However, since remarkably little about atrocities outside of the developed world gets reported, lazy or simply ignorant journalists need not account for what the public doesn't know when they report on such people. Even where the world knows of heinous acts, with a few photo ops, the press will run to him once more if he is a famous warlord. Fame and infamy hardly matter in today's world of media politics, they are virtually interchangeable, a fact that is probably quite dangerous to the West in this context.

By the simple ruse of refusing to speak to anyone who asks inconvenient questions, a warlord can short-circuit the Western press' questions. By another absurdly simple ruse of saying one thing to the Western press in English, and something else in their native language, a warlord can avoid being questioned by the English-only press and freely exhort his followers as he likes. There is a joke in the non-English speaking world that someone who speaks two languages is bilingual, and someone who speaks one language is American. There is much truth there, and Americans in general need to start learning what is said in languages besides English.

Two other basic techniques of the PR war used by warlords are denial and bluster. When asked about child soldiers, opium, bombs, or some other matter, they may simply deny, even if evidence is in full view. If questioned in a situation in which they cannot simply murder or terrify the unpleasant journalist, they will verbally attack, act put upon, and speak of the oppression of their people or something similar. Warlords often appear adept at pushing the political correctness buttons of Western journalists. It would appear likely they make a careful study of our foibles to manipulate them. An excellent example of PR warfare is the contretemps over cartoons depicting Mohammed choreographed by Middle Eastern dictators in concert with Islamist groups.[46] It is astounding how effective such methods are since the hypocrisy of it is profound.[47]

We have seen in Pakistan,[48] followed by Iraq,[49] an innovative strategy for dealing with the Western press that is working surprisingly well. By the simple method of kidnapping and murdering journalists and others, the insurgency in Iraq has virtually cut off news gathering from

ordinary Iraqis by Western media outlets, as well as minimizing cultural exchange. The purpose of this move is obvious. Journalists were inconveniently recording for the West that Iraqis were not unhappy enough with the U.S. occupation, presenting a more complex picture than desired. In order to win the PR war, this line of communication had to be cut off or the insurgency would definitely lose. Just as the Western press does not make news out of the strategy of refusing to talk to the press, never has the motivational strategy behind the Iraq insurgency attacking journalists been questioned. Yet, it should be as obvious that insurgent leaders must have a reason for everything they do[50] as it is that money paid for favors to a corrupt congressman by lobbyists is a bribe.

In this context, a useful lens for understanding warlords can be found in literature that discusses the methods of cult leaders from the viewpoint of people leaving a cult and conversion.[51] Reading one of the cited books could prove practically useful to those operating against a warlord since the methods and psychology are parallel. Like some cult leaders, warlords may use brainwashing techniques, a personality cult, and charisma to lead. They also like to recruit the impressionable young. Quite a few warlords, like many cult leaders, display multiple signs of sociopathic personality disorder such as

> superficial emotions and charm, having few or no friends only victims and accomplices (who often turn into victims), incapacity for empathy, complete lack of sense of responsibility for their actions, given to adult tantrums.[52]

Warlords may exemplify this with the addition of deadly force for coercion as a matter of course.

## ADDRESSING WARLORDS

Different types of warlords require different approaches for dealing with them. When dealing with a proxy warlord, it is necessary to chart his relationships to those who fund him. Charting and interdicting his sources is generally an intelligence service exercise. It will probably have links and bank accounts across the world, much of it siphoned off for his family and personal use. Part of this siphoning is practical. A warlord cannot afford to appear weak under any circumstances. The more of a financial war chest he has, the more room to move he has around the world. However, this type of warlord and his organization are more likely to break down with his death than others.

Make a map of the region controlled by a warlord in two or three levels—for example, (1) complete control, (2) partial control, and (3) frontier—in whatever way this will make sense. Map the economic resources within his territory and flag his relationship to them: coffee, cocoa,

poppies, transport routes, diamonds, etc. Determine how he controls these resources, what his revenue is from them. An equivalent map should be made of the region of control by the legitimate government, as well as those nations surrounding. For those capable of handling the complexity, and of charting with enough accuracy to be actually useful, creating a diagram of flow of goods, money, arms, and the key players can be worthwhile. The adage, "What you don't know isn't nearly as harmful as what you know that isn't so" definitely applies. There are always key players, a food chain of control and economic opportunity for all flow in the economy. But keep in mind that if one player is removed or compromised, another is likely going to take his place rapidly, perhaps within days.

Make plans for where to sell the resources on the legitimate market in cooperation with development agencies and legitimate government prior to taking action. This may require creativity at times to find legitimate buyers for goods. It is imperative that the transition not consist of just wiping out the economy for the people of the area. Simply removing the economy will tend to upset them, and at minimum result in lack of cooperation.[53] The object should be to either co-opt or take over control of resources, and shore up the economic prospects of the people of the region in order to help the legitimate government, cutting out those following the resource warlord. Note, for instance, that many miners in Africa have objectively greater *potential* for earning income (if they survive) in insurgencies like the RUF than by working for the previous owners. Risk is higher, but people have always been willing to take outsized risks for significant rewards. And people everywhere will eventually choose to die on their feet than to live on their knees.

Often, it is not practical to completely interdict a warlord's resources if the resources are too distributed. Consequently, take a divide and conquer approach. Since a military organization functions best when there is central control over payments, this is a place to target. If resources can be broken up so that benefits accrue to lesser leaders in smaller subgroups, this undermines the warlord's military power. It may then be possible to rope in those lesser leaders, one by one, and it may be possible to punish or eliminate an uncooperative new leader. Once a competitive situation is set up within the former warlord's territory, those looking to control it for the legitimate government may be able iteratively make deals with the best of the lot. This course is, of course, fraught with the "fog of war" and all the myriad problems of corruption. Any solution is likely to be incomplete to one degree or another.

Drug supported warlords are a special problem. A great deal has been tried, to little or no effect. The invisible hand of Adam Smith wins, every time, and each temporary victory brings a new player who is willing to field more effective weapons and tactics in order to conduct trade. Thus, I believe that the only way to remove the warlord's source of income is

to eliminate the "risk premium" for the high demand recreational drugs as a matter of national security. This need not be a complete capitulation, restrictions on advertising, sales to minors, and such can be maintained. Social measures that target addiction, and treatment programs paid for out of "sin taxes" will maintain balance. However, there is no other way to actually eliminate the income of warlords fueled by drugs. Restrictions act as a price support system in the form of a risk premium, which creates profits so large that men will always be found willing to take the risk.

Not uncommonly, a warlord's control region will be a *de facto* fiefdom crossing formal national boundaries. This is an excellent strategy for a warlord to take since it allows him to retreat beyond the reach of conventional militaries that respect formal borders. Cross-border retreat is not an easy problem to solve. It is advisable that the first step in a campaign consist of efforts to seal off the border, being careful not to mistake obstacles to our forces for impenetrable walls to desperate men.[54] Additionally, forces local to the region should never be counted on to actually perform as expected, even for payment. Ethnic, religious, and local economic ties will win out, and allow the warlord to escape. Guerilla warriors have often won by doing what opponents believed impossible. U.S. forces did it against the British. Ahmed Shah Massoud did it against the Soviets,[55] and Osama bin Laden against U.S. forces. The only thing that really can be done about border crossing is to document it carefully and send it up the chain of command to get the attention of higher-level decision makers or the press to force action.

When looking at the warlord's territory resource map, the areas where new and perhaps more tractable leaders will emerge that have taken over a bit of the old territory, is most likely in the region of lesser control for the warlord. Thus, a move that takes possession of the most central, highest value resource of his territory, but leaves other resources available on its periphery is likely to cause the desired fracturing of his organization. If he is not dead, starving him for resources is absolutely necessary.

Prioritize a warlord's resources by income stream value, generally going after the highest value resources first. Interdict his control and take over the resource and its payment stream for the legitimate government. This should include auditing and controls on the legitimate government to ensure it is not simply another set of kleptocrats which will destabilize the nation long term.

A note of caution regarding administration of former warlord- and dictator-controlled regions. It is common for those from the developed world to have little comprehension of how vicious and brutal it is or has been for a people who have lived under the administration of corrupt officials.[56] Corrupt officials, however, use as their stock in trade the fact that they are much easier for an outside administrating power to deal with. Corrupt officials study very carefully those who can put them in

a position of power from which to operate their "gatekeeper" shakedown system. A gatekeeper system is one in which a person obtains a position of power that allows them to collect payments in exchange for allowing some activity to occur. Those from outside should be wary of people who seem to fit into their system like a hand into a glove. Using such people will damage the reputation of an outside agency.

## CONCLUSIONS AND RECOMMENDATIONS

To effectively combat a warlord, it is crucial that his financial supply system be interdicted. This requires fundamentally different strategy when dealing with a proxy warlord who is paid and supplied by a client, versus a resource warlord who is supplied by his control of assets. *The primary method of dealing with a resource warlord is to take physical control of his resource assets and manage them on a fair and equitable way for the nation's people. This type of military-development action could be legitimized on the international scene.* Interdiction of the financial support of resource warlords is possible, but only by taking physical control of the resource. In some cases of diffuse resources, doing so can be functionally difficult or impossible, particularly for illegal commodities such as drugs. In the case of illegal drugs, a system of licensing and legal distribution could be considered, such as was put in place to end the prohibition era's violence in the United States, and it is the only known method. All other methods simply increase the risk premium on the high demand commodity, resulting in even higher profits for those willing to take the risk. This attracts ever more violent and corrupt individuals to dominate the resource.

Proxy warlords, who conduct war for a client who pays the bills, are rarely targeted for removal by the international community, intelligence services, or militaries of developed nations. Not uncommonly, proxy warlords may be negotiated with in good faith. *However, since a proxy warlord is incapable of bargaining in good faith to eliminate what he is paid for, negotiation with him is wasted effort. Consequently, it is the supporting power(s) that must be negotiated with. Due to the organization of proxy warlord organizations in particular, imprisoning or killing the warlord himself is a good strategy of negotiation with the warlord and his supporting power(s).* When a proxy warlord dies, his organization tends to either fall apart or become more peaceful. At worst, a new leader emerges, but because proxy warlords, by necessity, are usually required to carefully eliminate those too ambitious or too competent, and guard their connection to their support, underlings are unlikely to be as effective. The more often this happens, the more stressed the client-nation supporter becomes. This method is used by warlords against each other, to excellent effect, as Osama bin Laden did with Ahmed Shah Massoud leaving Osama free to conduct his attacks without fear of probable death from Massoud.

*In addition to attempting to address pandemic disease that results in breakdowns of civil society such as in Africa, programs could be instituted to deal with orphans who result. Dealing with the orphans is of higher immediate priority.* Huge numbers of orphan males in particular are extremely dangerous "feedstock" into the systems that warlords construct. Housing and educating them in Africa, as well as indoctrinating them in a civilization will remove this source of personnel. If these orphans are not taken care of and provided with real opportunity, they are nearly certain to make war in the hands of warlords.

*Formal and publicly enunciated discussion of public relations media warfare needs to become commonplace.* Public relations war is a primary form of warfare in the modern era. Bring it into the common lexicon, along with sponsoring a basic understanding in the public at large as to how it works and why. Primarily, the public and the journalistic community are able to harass the press into providing more insightful coverage of PR war events and their implications. At present, astonishingly simple-minded methods are nearly perfectly effective.

*Recognize the problem of development bandits and take steps to allow prosecution for major crimes committed in developing nations in the domicile of the funding organization.* In addition, allocate resources to gather evidence, track, and arrest such individuals. They do serious damage to the reputation of the developed world's democracies, and radically undermine efforts to improve conditions.

*As in fighting organized crime, a key to opposing warlords is not so much how draconian the threat is against them, but their perception, and that of a potential successor, that they will reliably be caught or killed.* The record is clear that only in very rare instances is a warlord going to suffer at the hands of the international community, and the treatment they receive is probably going to be as pleasant as the treatment received by major financial criminal suspects in the developed world if they receive it at all. The current politics of dealing with warlords of a destructive type needs to change radically, or else we must face up to the fact that what we do helps them, and accept their existence as national and transnational political actors.

Within the ontology of virtual nonstate actors (VNSAs),[57] warlords are a serious challenge for the developed world to counter. In this time when technologies for mass destruction are tilting in favor of asymmetric opponents, being ineffective against them is unacceptable. The strategy and tactics of warlords are fundamentally bold tactics of barbarians against the civilized. Simple techniques of brutality, lying, and going outside the bounds are quite effective against such naïve opponents as we of the developed world have collectively been. We have often been blinded by the seemingly mad brutality and outrageousness of their actions, while for many warlords rewards have been huge. The punishments and losses for the developed world to date have been miniscule, even taking into

account the recent events of al Qaeda. However, there is little reason to believe they will remain so. This chapter has attempted to take a step toward clarifying their motives and methods so that we can shape policy, strategy, and tactics that are effective. Developing sophistication and effectiveness will not be easy in an open society that values freedom, but it must be done.

# PART III

## SOCIETY, TECHNOLOGY, AND STRATEGIC INFLUENCE

# CHAPTER 17

# RESPONDING TO PSYCHOLOGICAL, SOCIAL, ECONOMIC, AND POLITICAL ROOTS OF TERRORISM

Bard E. O'Neill and Donald J. Alberts

Political terrorism is usually defined as the threat or use of physical co-ercion against noncombatants, especially civilians, to create fear in or-der to achieve various long- and short-term objectives. It is a form or method of warfare that may be conducted within and/or across the bor-ders of nation-states. The perpetrators may be individuals (so-called lone wolves), states, or insurgent organizations. This chapter focuses on the latter, since presently they are of greatest concern.[1]

Many insurgent groups—if not most—engage in terrorism, often in con-cert with other forms of violence, particularly guerrilla warfare (from hit and run attacks against the military and police to sabotage of critical in-frastructure). The long-term political aims of a group may be one or more of the following: to secede from an existing nation-state, to fundamen-tally change the political system, to remove the ruling authorities, to com-pel the government to adopt social, economic, and/or political changes or to maintain the status quo. Short-term objectives are clustered in dif-ferent combinations that vary according to time and circumstances. They include such things as publicizing the cause, boosting recruitment, dimin-ishing the appeal of rival groups, maintaining the integrity of the organi-zation, undermining the legitimacy of the government, freeing prisoners, preventing conflict resolution, being recognized as a legitimate party to peace negotiations, and exacting revenge.

Besides goals and forms of warfare, insurgent groups vary considerably with respect to strategies, physical and human environments, popular support, organizational formats and leadership, cohesion and sources of external support. As a consequence, there can be no single, all-encompassing profile of an insurgent or terrorist. This is crucial to bear in mind as we concentrate on the psychological, social, economic, and political causes (roots) of terrorism in this chapter. Simply put, different combinations of causes explain political violence and terrorism in different cases; therefore, prejudgments, presumptions, and overgeneralizations about causes can be hazardous, misleading and, at times, counterproductive. In every situation, accurately diagnosing causes of political violence depends on an open mind and solid empirical data.

The following discussion addresses possible causes of terrorism and considers remedies for mitigating them. Since information about most insurgencies is incomplete, understanding and countering them is as much an informed art as a science.

## THE ROOTS OF TERRORISM

### Psychological

Some analysts focus on individuals to ascertain the cause of terrorism. Typical of this psychoanalytic approach is the notion that terrorists are born, not made. While noting that most terrorists are not insane, psychologist Jerrold Post suggests traits and tendencies that characterize a disproportionate number of individuals who are drawn to terrorism. These traits and tendencies, which create a predisposition to violence, are rooted in unresolved childhood psychological stresses that can result in a split personality that retains the perceived good aspects of the self but projects the bad on to other people, whose evil justifies the use of violence against them. In many cases, especially those involving persons of middle- or upper-class origins, inner torments and the so-called injured self are attributable to the resentment of parents, especially authoritarian fathers, while in others they are ascribed to anger at the repression parents suffered at the hands of members of other social groups. In the former situation, feelings of inadequacy are resolved by rejecting social and political values that were dominant in the family setting and directing acts of protest and/or violence at those who play key roles in upholding such values—typically, political and business leaders, who are characterized as hypocritical and corrupt.[2] The attraction of left-wing groups to such individuals was evident in the United States, Europe, and Japan in the second half of the twentieth century, with the Weather Underground in the United States, the Red Army Faction in Germany, and the Japanese Red Army as cases in point. As for those whose parents were victimized, activism and violence are directed

at the victimizers, with secessionist (nationalist) movements—like Basque Homeland and Liberty (ETA) in Spain, the Tamil Tigers in Sri Lanka, and the Irish Republican Army (provisional wing)—being examples.

More recently, some observers have speculated that childhood experiences within the family may explain the violent anger of individuals like Osama bin Laden and the principal September 11 hijacker, Muhammad Atta. In the bin Laden situation, the injured self might be traced to the second-class status of his mother in a family where his father had multiple wives, something that bin Laden would have been aware of—and no doubt reminded of—by siblings born from other mothers. Add to this the reported indifference bin Laden's father is said to have shown toward him, and an evolving belief that everything would be resolved in the hereafter when a heroic son and religious father are rejoined, and one has the ingredients of a psychological explanation, however conjectural and heuristic, for bin Laden's behavior. As for Atta, anger and resentment may also have had to do with father–son relations—in this case, an overbearing father who ridiculed his son as another daughter because as a youngster Atta was dressed as a girl and as a teenager still bounced on his mother's knee.[3] The speculation in both these cases is that ridicule, humiliation, neglect, failure, or some combination thereof produced a lack of self-esteem that led these individuals to join groups that could provide them with a sense of worth.

As interesting as past and present psychoanalytic research into violence and terrorism may be, experts are quick to identify its limitations. First of all, there is a paucity of data for most individual cases as well as for cross-national comparative analysis. Secondly, when data is available, it often surfaces long after attacks have occurred, and may be compromised by new motivations such as prisoners wishing to ingratiate themselves with authorities. Third, even when information is available, it is normally based on interviews rather than a lengthy period of psychoanalysis. Fourth, as suggested above, it is hard to explain why some people with essentially the same background opt for terrorist violence while others choose nonviolent alternatives.[4] In an excellent survey of literature dealing with psychology and terrorism, Randy Borum sums it up this way: "Personality traits consistently have failed to explain most types of human behaviors, including violent behaviors. Certainly, they have been shown repeatedly to contribute less to an explanation than situational or contextual factors."[5] Indeed, as Mark Juergensmeyer reminds us, most studies of the psychology of terrorism focus on the way people react to social circumstances that make acts of public violence possible.[6]

A long-standing view among sociologists, organizational theorists, and psychologists posits that for those alienated by perceived injustices and made to feel insignificant and powerless by either family members or outsiders, joining groups of like-minded peers in a noble cause can provide

camaraderie, security, status, empowerment, opportunities for action and particularly self-esteem. In a word, individuals can enhance their ability to change their existential circumstances and acquire a sense of identity and belonging by fusing with others in a common cause.[7] The idea of joining groups to alleviate injustice of some sort brings us to the social, cultural, economic, and political causes of terrorism, since it is there that we find potential sources of injustice, whether perceived or real.

### Environmental Explanations

Although the analysis of social, cultural, economic, and political "causes" of violence has been around a long time, no one has fashioned a unified theory that somehow weights the causes (factors) with near mathematical precision, largely because their prevalence and significance varies in different situations.[8] Instead, there are informed propositions and hypotheses that help us explain and, at times, anticipate terrorism and political violence. In the interests of parsimony, we will use a four-fold breakdown: cultural, social, economic, and political.

Cultural causes are rooted in the salient values, attitudes, and beliefs that people manifest with respect to the cosmos, man, society, authority, and behavior. Our main focus is on those that have important implications for political terrorism. Given the tremendous diversity among cultures, it would go well beyond our purposes and competence if we tried to develop a comprehensive cross-cultural classification scheme and relate it to terrorism. A more practical approach in light of these limitations is to deal with the cultural variable on a case-by-case basis. The study of any situation involving terrorism must include a decent understanding of the major cultural and behavioral attributes of the parties to the conflict, followed by a careful analysis of the linkages between those attributes and various aspects of terrorism. Attitudes to watch out for as part of the causal mix are interpersonal and intergroup distrust and a proclivity to rely on violent means to resolve disputes.

Take, for instance, terrorist violence that has afflicted Iraq and the Balkans. To fully understand the scope and intensity of regime and insurgent terrorism in Iraq, one must examine the socialization process in tribes, which in early childhood is marked by inculcation of distrust, expectation of revenge, and acceptance—if not instigation—of violence as a way to settle disputes.[9] Likewise, the excessive use of terrorism by both sides in Kosovo was explicable in a culture where a high tolerance for violence against rival social groups and a dismissive attitude toward civil-military distinctions mixed with the high value ascribed to revenge.

It should not be inferred from the preceding examples that socialization in Western cultures has not been conducive to terrorism. History, as we know from the Crusades, Religious Wars, and the Inquisition, suggests

otherwise. In more recent times, the terror of the Holocaust was the product of one of the most civilized Western countries. Nonetheless, it would be an egregious error to allow Western sins and imperfections to blind us to cultural differences that may help us better understand terrorism in today's world.

Contemporary Western cultural values stress legal rather than violent resolution of interpersonal and intergroup conflict and the minimization of civilian casualties when force is deemed necessary. By contrast, in a place like Afghanistan, violent resolution of many issues—even trivial ones—is common, and often involves attacks and reprisals against innocent noncombatants. The point is that some cultures have a high tolerance for violence and thus are more conducive to terrorism. The slaughter of Uzbeks, Tajiks, and especially Hazaras by Pashtun-dominated Taliban (and vice versa) in Afghanistan during the 1990s illustrates the point.

Social causes of terrorism are to be found in the historical interaction and structures of classes and castes, as well as ethnic, racial, and religious groups. Social classes are marked by the differentiation of the population according to income, education, and occupation and the status that is ascribed thereto. It is well understood that classes may become alienated from—and resentful toward—one another and that this *may* lead to violent interaction. The occurrence and extent of violence depends on a number of things.

One factor that seems to preclude or moderate class antagonism is the perception that the material benefits offered by society are either fairly distributed or within reach of all classes, especially the literate ones. Such thinking underpins the common belief that a large middle class is conducive to stability. This is fine as long as most members of the middle class are either benefiting or anticipate benefiting materially. Where they are not and there is little hope that they will, the potential for trouble grows, since educated but deprived groups sometimes turn to extralegal means to remedy their situation. Sociological profiles of Islamic militants and their supporters in Egypt, for instance, reveal that they are largely underemployed lower middle class people who have come from rural areas, received some higher education, and settled in urban ghettos.[10]

While it may seem counterintuitive, the poorest class is often less inclined toward violence, even though it is the most deprived. In Latin America, for example, the urban and rural poor have long been among the most conservative segments of society. Elsewhere, the situation is often otherwise, as the effects of globalization—particularly the flow of information—reach the most deprived corners of the world; witness the recent evolution and tenacity of egalitarian insurgent groups such as the Maoist Naxalites in India, the New People's Army in the Philippines, and the Maoist Front for the Liberation of Nepal, as well as reformist ones like the Front for Emancipation of the Niger Delta in Nigeria.[11] While it is true

that some previous and current insurgent groups such as al Qaeda have been composed largely of discontented and occasionally deprived but educated elements of the upper and middle classes, the historical record shows that in many others, including Islamic ones, peasants, workers, and nomads have played a key (sometimes dominant) role, albeit usually in the rank and file. A striking example is Bedouin terrorists who, acting in the name of Islam and inspired by bin Laden, carried out bombings and suicide attacks in the northern Sinai towns of Taba in 2004, Sharm el-Sheik in 2005, and Dahab in 2006. The brother of one of the bombers singled out poverty, unemployment, and misery as the core issue and asked: "Why would he go and do this if he had a decent life?" He then added: "This life isn't worth living."[12] What all of this suggests is that given the variegated class backgrounds of terrorists, *a priori* assumptions about the social makeup of any terrorist group are no substitute for empirical analysis.

Caste members experience deprivations similar to—and in many cases worse than—those separated by classes. However, since rigid social and economic discrimination is usually institutionalized and legitimized philosophically and religiously, it has enjoyed fatalistic acceptance and thus generated less terrorism than interclass relations. Although this may change with the advent of government reform in response to increased awareness and political activism, such change will not come easily. A case in point is India, where members of the higher and middle classes have increasingly inflicted terrorist atrocities against the lowest castes in order to preserve their privileged positions. Analyses of survey and voting data by the Center for the Study of Developing Societies in New Delhi have presented clear evidence that the apathy and lack of organization of the lowest castes has been gradually giving way to political activism. Such activism has involved violent reprisals for massacres perpetrated by upper- and middle-caste terrorists. For example, the systematic killing of 33 *Dalits* (untouchables or oppressed ones) in 1999 by Ranbir Sena, a group believed to be backed by wealthy landowners, led to the slaughter of upper-caste villagers by the Maoist Communist Center (MCC), a group that had been organizing deprived laborers and peasants and warning of further massacres if the killing of *Dalits* continued. Adding to the pessimism, author Pankaj Mishra argued in July 2006 that "The potential for conflict—among castes as well as classes—also grows in urban areas, where India's cruel social and economic disparities are as evident as its new prosperity."[13]

A situation that is especially fraught with great peril is one where class differences coincide with—and reinforce—racial, ethnic, or religious divisions that alone can give rise to violence and terrorism. Indeed, recent conflict patterns suggest that the prevalence of terrorism is greater between and among primary groups than social classes.

If racial, ethnic, and religious groups are coterminous with nation-states, we can speak of national cultures and structures. Where two or more groups with distinct senses of identity exist within the borders of a nation-state, the term subnationalism is often used to characterize the group; where the differing identities are reinforced by major differences in social values, structures, and language, the term subculture is applicable. Differences between Catholics and Protestants in Northern Ireland, Hutus and Tutsis in Rwanda, and Serbs and Croats in Bosnia are best seen as subnational, since the groups manifest many similarities in social values and organization. In Kosovo, by contrast, the clashing identities of Serbs and Albanians (Kosovars) are deepened by cultural, religious, and linguistic distinctions.[14] Differentiating between subnationalism and subculturalism is not academic hair splitting, since the process of compromise and reconciliation necessary to reduce and eliminate terrorism is more difficult when groups lack shared social values and structures on which to build trust and facilitate communication. Be that as it may, as the well-publicized and extraordinarily brutal violence between the groups noted above amply demonstrates, both subnationalism and subculturalism are conducive to horrific outbreaks of terrorism.

Since, as noted above, specific subcultural traits can be contributing causes of political violence and terrorism, we need to know and comprehend the attitudes and beliefs regarding the use of coercion against both group members and outsiders, particularly occupying forces from other countries that historically have been deeply resented and thus stimulated the emergence of countless nationalist movements.[15] Attitudes and beliefs will range from pacifist ones that condemn violence (e.g., Quakers), to those that justify violence under certain conditions (e.g., most major religions), to those for whom violence is taken for granted if not expected (e.g., Comanche and Apache Indians in nineteenth-century America, and previously mentioned Takriti tribes in Iraq). This raises two closely related questions. First, do groups that are more inclined to use violence receive additional impetus from expectations that vengeance must be taken against outsiders who physically attack them and/or affront their honor? Second, if this is the case, are there social mechanisms that can mitigate revenge (e.g., apologies and agreed monetary payments to the aggrieved party)? With the answers to these questions in hand, we will be better equipped to comprehend the scope, intensity, and duration of intergroup terrorism and ways it might be blunted, if not eliminated.

Groups with a legacy of violent interaction and conflict are obviously of greatest concern when it comes to terrorism. Arabs and Israelis in the Middle East, Hutus and Tutsis in Rwanda, Tamils and Sinhalese in Sri Lanka, and Kosovars and Serbs in Yugoslavia all figure prominently here. In the case of the last two pairs, violent rivalries that had been dormant for a long time were reactivated and exploited by politicians. The savagery

and atrocities that followed suggest clearly that even where violence may be latent, it is important to carefully assess the underlying culture and history of rival groups that live next to one another. Doing so may not enable us to predict the moment, extent, or type of violence, but it may alert us that there is greater potential for it in some situations than others. The exploitation of that potential for political violence and terrorism is linked to economic and political factors.

That economic factors and trends may contribute to terrorism is, as we have discussed, well understood. Widespread poverty and misery and the perception that there is little hope of alleviating them are conducive to violence because they produce a potential pool of recruits for terrorist groups. This situation is often accentuated when a period of economic improvement is followed by precipitous decline (the so-called J curve) or where, as Ted Robert Gurr points out, there is a sense of deprivation relative to other groups or one's own expectations.[16] Whether individuals or groups that perceive themselves as deprived economically remain passive or take up arms and grow will be affected by assessments of the political opportunities available for resolving their predicament. This brings us to the political causes of terrorism.

Two general considerations stand out with respect to political opportunities. The first has to do with the responsiveness of the political authorities, the second with the emergence of a viable opposition. In terms of the first, the question is whether the authorities are willing and able to convince deprived sectors of society that they are seriously listening and intend to address their grievances. This requires some autonomous mechanisms—e.g., interest groups, parties, the media, professional associations—for nonviolent interest articulation. Functioning channels of participation can buy time for authorities. If that time is used to reduce gross economic inequities, the prospects for avoiding or reducing violence may improve. However, if participation is repressed, hope can fade and some erstwhile nonviolent political activists may look for alternatives.[17]

The search for alternatives focuses on the flip side of the political coin. The issue is whether there are activists who combine plausible—if not compelling—ideas about how to achieve a better future with organizational skills, determination, and a willingness to use violence. When such leaders, especially charismatic ones, emerge, chances are greater that some members of politically repressed and deprived classes or groups will be enticed to join terrorist groups. Once that happens, the previously mentioned psychological benefits—self worth, security, comradeship, and so on—begin to accrue and solidify.

A superb portrayal of the complex interplay of economic, political, and psychological factors that account for terrorism is provided in Jeffrey A. Nedoroscik's analysis of Islamic militants in Upper (Southern) Egypt.

Isolated politically, economically, and socially from the remainder of the country, Upper Egyptians found themselves in dire social and economic straits. Upper Egyptians are divided into three social groups: the *ashraf*, who claim descent from Mohammad, Arabs who originated in Arabia, and non-Arab *fellaheen,* whose ancestors can be traced to the time of the pharaohs. The fellaheen historically were at the bottom of the socioeconomic scale. Nevertheless, though they remained in poverty, their opportunities increased somewhat with respect to education and employment under the socialist regime of Gamal Abdel Nasser (1956–1970). But, this proved short-lived, as Nasser's death in September 1970 and the gradual dismantling of his socialist policies by his successor, Anwar as-Sadat, wiped out the few gains that had been made. The economic regression produced growing disillusionment among young and newly educated fellaheen, thus rendering them vulnerable to the appeals of Islamic militants who offered a diagnosis of the problem, a guilty party, a vision for the future, and an organization that claimed it could actualize the vision. The militant appeals stood in marked contrast to the Egyptian government's political neglect and disenfranchisement of the fellaheen. Hence, it was not hard to explain why militant Islamic groups like the Islamic Group found many recruits in Upper Egypt.[18]

### The Dynamics of Change

The Egyptian case suggests that our discussion of social, economic, and political factors is necessary but not sufficient for understanding the environmental context of insurgent terrorism. What needs to be added is an assessment of the disruptive psychological effects of the process of socioeconomic change itself. In particular, we need to look at the relationship between two things. The first is the ability of governments to meet rising material expectations stimulated by steadily growing informational awareness, elite promises, and increased education. The second is the disorientation caused by a shift from rural traditional social settings—in which one's station in life is determined by birth (ascription), benefits depend on loyalty, and behavior is restrained by religious norms—to impersonalized urban centers where social mobility is deemed possible, advancement depends on achievement, rewards are determined by merit, and behavior is increasingly influenced by secularism and materialism. For some, this presents an overwhelming challenge and they reject modernism altogether. Others who accept the challenge often compromise their old values but end up with little material compensation. Relatively young, unemployed or underemployed, restless and psychologically cut off from the old social setting, they too become threatened and rootless in the new one. Humiliated, alienated, and hopeless, they are vulnerable to insurgent recruiters that promise to return their souls, empower them,

give them meaning, and lead them either back to a traditional golden age of the past or forward to a future utopia.[19]

As the preceding discussion of social, economic, and political factors reminds us, economic deprivation is not the only cause of terrorism. Indeed, as Gurr notes, deprivation with respect to power (participation and security) and interpersonal needs (status, communality, and ideational coherence) may be more important.[20]

## RESPONDING TO THE CAUSES OF TERRORISM

In post mortems following major terrorist incidents, calls to address the root causes of terrorism rather than to rely simply on security and military measures are commonplace. This is nothing new. Students of counterinsurgency have been well aware of this truism for decades. The questions are: what and how important are the causes of violence, is there is political will to make needed changes to ameliorate the situation, and what exactly should be done on the strategic and operational levels.

While it is tempting to try to produce a universal blueprint or plan for addressing root causes of terrorism, such an undertaking would be a fool's errand and, in some instances, harmful because of situational differences, incomplete information, and our imprecise understanding of social, economic, and political change and its effects. Consequently, the best approach is a pragmatic one that emphasizes principles and guidelines based on insights gleaned from a comparative analysis of insurgencies where terrorism has been prominent. Central to this undertaking is uncovering similarities and differences among cases and their implications. Striking similarities can alert us to successes that might be emulated and failures that should be avoided. For example, since heavy-handed and indiscriminate use of force usually escalates and intensifies an insurgency, as happened in the earliest phases of the conflicts in Northern Ireland and Sri Lanka, knowledge of this should raise immediate caution flags when the use of force is contemplated.[21]

### Overarching Guidelines

Three general guidelines should frame the response to the environmental causes of terrorism. The first is to set realistic expectations. Like crime, political terrorism will not disappear anytime soon, if ever. A realistic aim would be to reduce its incidence and impact to the point where it is a marginal phenomenon. A corollary is to understand that in particularly difficult situations, such as the current ones in Iraq, Afghanistan, Sri Lanka, and India, the campaign to reduce terrorism will often be a very long one marked by periodic setbacks and uneven outcomes. Such

an understanding is more likely to produce the patience, determination, calibrated actions, and equanimity that are necessary for ultimate success.

A second guideline is to concentrate on insurgency, a larger political-military phenomenon of which terrorism is but one aspect. This permits us to better understand terrorism's connection to—and interdependency with—other factors that affect its utility and effectiveness. As important as it is, an exclusive emphasis on environmental causes of terrorism amounts to only partial analysis. At some point, it has to be integrated with assessments of insurgents with respect to their grand strategies; the effect of the physical setting; the scope and nature of popular support and the techniques for acquiring it; the structure and functioning of their organization; disunity and the exact reasons for it; and what type of external support they receive, who provides it and for what reasons.[22] Keeping this bigger picture in mind will reveal that in some scenarios there may be more important things than psychological, social, economic, and political causes. It also leads to our third guideline: the need for a comprehensive counterinsurgency strategy.

A comprehensive strategy is one that avoids the false dichotomy that argues for the use of either force or soft power. It instead calls for the use of all instruments of power—diplomacy, economics, information, military, and law enforcement—in a mutually reinforcing manner. How they will be used depends on a careful, systematic, and holistic analysis of the insurgency. Such an analysis is a prerequisite for suggesting psychological, social, economic, and political changes that may be relevant and effective in mitigating the causes of political violence.

### Countering Psychological Causes

As we have seen, psychoanalytic explanations of terrorism are of little value, in large part because of the lack of information about most active terrorists. Moreover, even if we had accurate diagnoses, addressing psychotic, mood, and personality disorders or lesser maladies would require terrorists to give up their clandestine existence for long-term therapy, a clearly impractical and unrealistic expectation. Of more interest is the previously discussed idea that many in the terrorist underworld are there because of a need for belonging, identity, and rectifying perceived injustice. To fulfill and exploit these needs, effective insurgent organizations proffer a blend of ideological and material incentives. Since the needs will not quickly disappear, the counterterrorist response should be to dissuade and deflect vulnerable individuals from joining (or, if they have joined, to entice them to leave) by offering ideological alternatives and appropriate social, economic, and political reforms.

We define ideology as an interrelated series of ideas that purport to explain the past and present and to depict, if not predict, the future. These

ideas may be religious (sacred) or secular, and are said to represent truths about society and human behavior. Because of their metaphysical or theoretical nature, ideological appeals can be attractive to those searching for interpretative analyses that not only explain what has gone wrong, but more importantly identify friend and foe clearly and provide prescriptions for setting things right. This makes it imperative to develop persuasive and compelling alternative values, arguments, and ideas to refute theories articulated by terrorist leaders on both the left and right. In some cases, they may have the added aim of eliciting active support against terrorists. But, once individuals have joined or otherwise actively supported terrorist groups for ideological reasons, it is difficult to win them back, because of the psychological and emotional investments they have made. This is especially so when religious ideas are involved.

To undercut religious appeals of terrorist groups, indigenous opinion-makers must make the case through information and education campaigns that terrorist leaders are disingenuous, selfish individuals who hypocritically violate and distort the most sacred norms of the faith for reasons of political expediency. This is exactly what the Egyptian government did when it called on mainstream Islamic preachers and renowned scholars to condemn the religious ideas of militant groups as part of its antiterrorist strategy in the 1990s. It is what the Saudi government belatedly decided to do by 2005 in response to a growing and entrenched threat by al Qaeda terrorists inside the Kingdom.

In the Saudi case, the magnitude of the effort required to counter decades of teaching hatred for infidel outsiders and their perceived domestic accomplices was addressed in a remarkable study of counterterrorism strategy by Yusuf bin-Ahmad al-Uthaymayan, published in *Riyadh Al-Jazirah* in December 2005 and January 2006. Arguing for a comprehensive strategy, he put it this way: "We have to know accurately the intellectual atmosphere, cultural sources, social grounds, institutions, and activities that nurture terrorism within the society, reproduce it, regenerate it, spread it, propagate it, and make it glamorous and "attractive" to the hearts and minds of the youths and sympathizers."[23] The real source of danger, he argues, is the sympathizers, because they are the incubators and transmitters of the terrorism virus. Studying the intellectual milieu and social framework in which they live is the basic key to the ideal method of dealing with terrorism. Since the war on terrorism is a war of thoughts, minds, souls, and convictions, Yusuf proposes nothing less than a wide range of corrective measures that should proceed along two tracks. The first is reformation of the religious message and the institutions influenced by it in order to produce moderation, tolerance, dialogue, and recognition of others. The second is to weaken the attraction of extremist ideas, especially to the youth, through social, political, cultural, and

economic reforms that touch all institutions involved in the socialization process.[24]

### Countering Environmental Causes

Crafting and implementing a reform package anywhere is contingent on a meticulous and unbiased assessment of the kind of social, economic, and political dynamics discussed earlier. This is essential for uncovering the causes of political violence and identifying obstacles that both sides face with regard to implementing their strategies and policies. From the counterterrorist perspective, a wide-ranging review can reveal critical and specific social, economic, and political problems that need to be resolved, at least partially, if the potential for terrorism is to be diminished; it can also provide insights into the feasibility of various antidotes.

The more complete the analysis, the better, since incomplete reviews run the risk of focusing on only part of the problem and ignoring the interrelatedness of social, economic, and political factors. For example, underlying the multiple insurrections faced by the Philippine government for the last 30 years or so is a pattern of deep social and economic disparities that suggest a need for land reform. However, a careful analysis of environmental causes also reveals that land reform would not be a panacea because the high population growth rate could well render the effects of land reform inadequate, if not inconsequential. This implies that the population problem must be dealt with and that other policies would be necessary to cope with the disappointments engendered when hopes associated with land reform go unfulfilled. Making this a moot point and matters worse is the reality that devising solutions to the problems associated by interconnected demographic, social, and economic realities in the near term is severely impeded by a political system that permits entrenched wealthy elites to block reforms. That this stagnation, corruption, and immobility has played into the hands of both left- and right-wing terrorist organizations in the Philippines is obvious.

To avoid undue pessimism and political paralysis when confronting daunting environmental causes of political violence, it is useful to bear in mind situations like Oman, where reform and change undermined the appeal of insurgents. During the 1960s, the human milieu in Oman was conducive to violence in the form of guerrilla warfare and scattered terrorism because ethnolinguistic differences between the jebalis (mountain people) and the coastal population were exacerbated by the relative deprivation caused by administrative neglect and unwillingness to commit resources to the mountainous regions. Under such circumstances, tribal and religious differences were exploited by a succession of militants, who escalated violence and took control of parts of the mountains in the southern

province of Dhofar and sought to link activity there to the Green Mountain in the northern part of the country. As things turned out, a coup in 1970 brought to power a new Sultan who ended the neglect by emphasizing an administrative and military presence in the mountains, as well as providing at least some health, educational, and agricultural services in the region. These reforms helped undermine popular support for the militants, led to a steadily increasing flow of defectors and resulted in a gradual diminution of political violence. This underscores the point that governments are capable of affecting socioeconomic environment in positive ways once they understand the specific problems and opportunities it presents.[25]

A comparison of the Omani situation with the negative Russian experience in Afghanistan demonstrates vividly that understanding social values and structures can preclude counterinsurgency blunders. Reforms in Oman were effective, not just because they met some material needs, but also because they did not involve substantial government intrusion into local affairs that would have threatened tribal values and structures. In Afghanistan, by contrast, ambitious land, education, and marriage reforms adopted by the ruling People's Democratic Party in the immediate wake of a coup in April 1978 played a major part in igniting violent resistance. In places like El Salvador, Guatemala, and the Philippines, such "enlightened" reforms would undoubtedly have been greeted with popular approbation; in Afghanistan, they met with scornful and violent rejection because of the threat they posed to deeply held social values and structures legitimized by tradition and religion. The lesson here is to understand the tolerance of the social system for the kinds of policy initiatives under consideration. What is suitable in some cases may be disastrous in others.[26]

No less important when it comes to responding to terrorism and guerrilla warfare is a consideration of the political culture and system. This comes as no surprise, since the resolution of social and economic problems that contribute to violence is contingent upon political decisions. As suggested previously, whatever the extant political system, leaders need to be sure that it functions well enough to keep them informed about the extent and intensity of popular demands, what groups espouse them and how strong the groups are. As the Shah of Iran belatedly found out, blocked channels of communication and expression can result in gross misconceptions and complacency about the popular mood. In essence, problems such as corruption, repression, and economic deprivation that are unknown are hard to solve.[27]

Besides the specific matter of whether social and economic demands are effectively articulated, processed, and communicated, the overall functioning of the political system itself may be a problem. A major issue here

may be demands for participation in national decision-making by various groups. The essential question is who wishes to participate and what kind of participation they have in mind. In general, the larger and more educated the groups seeking participation, the greater the problem they can pose. Smaller groups are easier to manage. The matter of what kind of participation is also important. Not all demands for participation are for Western-style formulas. In the context of Middle Eastern political culture and style, for instance, participation is more apt to mean a role in the consultative process than "one man, one vote" open elections, political parties, and so on. Where professional middle classes increasingly demand participation, careful investigation is needed to discern whether participation is seen as adaptation of local institutions or fashioning new ones. Once demands for participation are accommodated, reversing course can be especially hazardous, as we know from the years of savage terrorism that followed a fateful January 1992 decision by Algerian authorities to terminate the second stage of national elections and circumscribe political reforms that they had previously enacted in response to social, economic, and political turmoil. The reason was the fear that the Islamic Salvation Front—which surprisingly had won victories, first in municipal elections in July 1990, then in the first stage of parliamentary elections in December 1991—was poised to take over parliament. The effect of canceling the elections was to disenfranchise and disillusion nonviolent Islamic activists, with the result that many turned to virulent terrorism that still continues.[28]

Holding elections, of course, is not the final word, since they can be rigged. Where this is common and unsurprising—as in, say, some African, Middle Eastern, and Asian countries, where leaders and their sons invariably obtain over 98 percent of the votes—the consequences may be negligible. Where democratic expectations are greater, trouble may ensue. India's manipulation of the electoral process and installation of a puppet government, for example, has been cited as a major factor triggering insurgent violence among Kashmiris in the late 1980s. As Indian security expert, Praful Bidawi, put it: "There are two sides to the Kashmir problem. The first is Pakistan. The second and more important is misguided Indian domestic policy—which has led to the alienation of the Kashmir people, the brutal suppression of their rights, and popular discontent."[29]

Much more could be said about the relationship between a political system and violence, since substantial literature has been devoted to the functional requisites for stability in particular cultures. An important point that many of these studies make is the same as ours: namely, that flaws in the political system can be fundamental underlying causes of instability, which are at times translated into violent behavior. Accordingly, governments dealing with terrorism must take a close look at the political

process as part of their strategic assessment and draw the relevant conclusions from it. In some cases, the conclusion may be that what is called for is a more benign and responsive authoritarian rule that is legitimate, responsive, and acceptable to the population. In other cases, what may be called for is a radical restructuring along pluralistic lines, since that is what the people expect and desire.

## SUMMARY

Officials at all levels of government must be aware that various combinations of factors explain the presence, scope, extent, and nature of terrorism in different cases. Among these are psychological, social, economic, and political causes. Understanding their salience and interconnections requires careful and systematic analysis in every situation. This should precede the articulation and implementation of a comprehensive counterterrorist strategy. Studying a variety of other cases is also very important, since comparative analysis reveals similarities and differences that may suggest major mistakes to be avoided as well as strategies and policies that are transferable, at least partially.[30] Above all, an open and adaptable mind-set is necessary. There is no place for rigid ideological predispositions and unexamined assumptions, because when things go badly they become the handmaidens of delusion, deception, and defeat.

## NOTES

1. An excellent discussion of terrorism as a form of warfare may be found in Boaz Ganor, "Terror as a Strategy of Psychological Warfare," Herzliyya International Policy Institute for Counterterrorism, July 15, 2002 in *Foreign Broadcast Information Service—Near East—Internet Edition* (hereafter cited as *FBIS (INE)*, July 15, 2002, 8 pp. (The format and regional designations for *FBIS* citations have changed several times in the last 10 years. Today they may all be accessed at www.opensource.gov.) Insurgency is herein defined as a struggle between a nonruling group and the ruling authorities in which the nonruling group consciously uses *political resources* (e.g., organizational expertise, propaganda, and demonstrations) and *violence* to destroy, reformulate, or sustain the basis of legitimacy of one or more aspects of politics. Legitimacy and illegitimacy are terms used to determine whether existing aspects of politics are considered moral or immoral—right or wrong—by the population or selected elements thereof. Generally, the major aspects of politics may be identified as the political community, the political system, the authorities, and policies. Insurgents may consider any or all of these illegitimate. The definition of *insurgency* here is similar to that characterizing civil war in J.K. Zawodny, "Civil War," in *International Encyclopedia of the Social Science* 7 (New York: Macmillan, 1968) 499, as cited in Sam C. Sarkesian, "Revolutionary Guerrilla Warfare: An Introduction," in Sam C. Sarkesian, ed. *Revolutionary Guerrilla*

*Warfare* (Chicago: Precedent Publishing, Inc., 1975) 4. The use of violence by opponents of the government distinguishes insurgencies from sociopolitical protest movements such as Solidarity in Poland. The centrality of legitimacy in insurgencies is noted by Harry Eckstein, "On the Etiology of Internal Wars," *History and Theory* 4, no. 2 (1965): 133; Max G. Manwaring and John T. Fishel, "Insurgency and Counter-Insurgency: Toward a New Analytical Approach," *Small Wars and Insurgencies* (Winter 1992): 285–286.

2. Jerrold M. Post, "Terrorist Psycho-logic: Terrorist Behavior as a Product of Psychological Forces," in Walter Reich, ed. *Origins of Terrorism* (Baltimore, MD: Johns Hopkins University Press, 1998) 25–31. While the consensus among the experts is that most terrorists are not clinically insane, there are exceptions, which, if ignored, can lead to a host of problems. See, for example, the account of Abu Zubayda in Ron Suskind, *The One Percent Doctrine* (New York: Simon and Schuster, 2006) 169. See also, Barton Gellman, "The Shadow War, In a Surprising New Light," Review of *The One Percent Doctrine. The Washington Post*, June 20, 2006; see Jerrold M. Post, "When Hatred Is Bred in the Bone," in *The Making of a Terrorist*, ed. James Forest (Westport, CT: Praeger, 2006) 13–33; and Albert Bandura, "Training for Terrorism through Selective Moral Engagement," in *The Making of a Terrorist*, ed. James Forest (Westport, CT: Praeger, 2006) 34–50.

3. On Atta see Jim Yardley, "Portrait of a Terrorist," *The New York Times*, October 10, 2001.

4. Shortcomings and problems of the psychological approach are discussed by Walter Reich, "Understanding Terrorist Behavior: The Limits and Opportunities of Psychological Inquiry," in Reich, p. 279. Also see Marc Sageman, *Understanding Terror Networks* (Philadelphia: University of Pennsylvania Press, 2004) 81–91. An example of a nonviolent and apolitical Islamic group that attracts recruits from the same socially alienated strata as the violent groups is *Tablighi Jamaat*—"the group that propagates the faith." See Susan Sachs, "A Muslim Missionary Group Draws New Scrutiny in U.S.," *The New York Times*, July 14, 2003.

5. Randy Borum, *Psychology of Terrorism* (Tampa, FL: University of South Florida, 2004) 35; Jerrold M. Post, "When Hatred Is Bred in the Bone: Psychocultural Foundations of Contemporary Terrorism," *Political Psychology* 26, no. 4 (2005): 615–616.

6. Mark Juergensmeyer, *Terror in the Mind of God* (Berkeley: University of California Press, 2000) 8.

7. Borum, *Psychology of Terrorism*, 24–26; Post, "When Hatred Is Bred in the Bone," 623–630. The idea that groups can satisfy psychological needs is, of course, well understood. In fact, much contemporary writing on the subject repeats or elaborates on insights provided by previous thinkers, most notably Eric Hoffer, author of *The True Believer* (New York: Harper & Row Publishers, Perennial Ed., 1966) 26–32. Hoffer was not concerned with terrorism per se; rather, he focused on religious groups from times past, as well as political ones that emerged in the first half of the twentieth century: namely, communism and fascism. All represented an attempt to manage both the process of social change and its disruptive effects, regardless of the source of that change. As Hoffer saw it, disaffected individuals from all walks of life—and social classes—were susceptible to the appeals of such mass movements and included the poor, misfits, outcasts, minorities, adolescent youth, the ambitious (whether facing insurmountable obstacles or unlimited

opportunities), those in the grip of some vice or obsession, the impotent, the inordinately selfish, the bored, and the sinners. Of course, not everyone in these categories joined mass movements. Not all of the poor were frustrated or likely to do so. For instance, the abject poor on "the borderline of starvation lead purposeful lives." This is because they had immediate goals that had to be fulfilled to stay alive. The substrata of concern were the newly poor (as in the German Weimar Republic due to runaway inflation) and the free poor—those with time on their hands. And, that is the real key: individuals who have time on their hands and who do not lead, in their own minds, productive lives.

8. The differences among such terms as paradigm, model, theory, conceptual framework, and the like are discussed in Lawrence C. Mayer, *Comparative Political Inquiry* (Homewood, IL: The Dorsey Press, 1972); Abraham Kaplan, *The Conduct of Inquiry* (San Francisco, CA: Chandler Publishing Company, 1964) 298ff.

9. Report by Hazim al-Amin, "There Are the Customs on Which the Iraqi President Grew Up in His Town and Tribe," *Al-Hayah* (London), May 12, 2002, in *FBIS—Near East/South Asia (INE)*, May 13, 2002, 8 pp.

10. Hamied N. Ansari, "The Islamic Militants in Egyptian Politics," *International Journal of Middle East Studies* 16, no. 1 (March 1984): 123–144.

11. John Lancaster, "India's Raging Band of Maoists Takes Root among Rural Poor," *The New York Times*, May 13, 2006.

12. Sageman, *Understanding Terror Networks*, 73–77 and 96; Post, "When Hatred Is Bred in the Bone," 630–632. On the Bedouin see Michael Slackman, "Out of Desert Poverty, a Caldron of Rage in the Sinai, *The New York Times*, May 7, 2006.

13. Pankaj Mishra, "The Myth of the New India," *The New York Times*, July 6, 2006. Also see Celia W. Dugger, "Massacres of Low-Born Touch Off a Crisis in India," *The New York Times*, March 15, 1999; Celia W. Dugger, "India's Poorest Are Becoming Its Loudest," *The New York Times*, April 28, 1999; Associated Press, "Men Beheaded in Eastern India," *The New York Times*, March 19, 1999. As a Marxist group, the MCC would presumably portray the situation in terms of antagonistic social classes rather than castes, a distinction that has negligible practical effects. See Associated Press, "12 Killed in India Caste Massacre," *The New York Times*, April 22, 1999.

14. On Serb-Kosovar violence see Chris Hedges, "Victims Not Quite Innocent," *The New York Times*, March 28, 1999; *A Week of Terror in Drenica* (New York: Human Rights Watch, February 1999).

15. Nationalist insurrections against outsiders are a familiar part of the insurgency landscape and involve an array of secessionist groups. Nationalist appeals may also play an important part in organizations with egalitarian, traditionalist, pluralist, or preservationist goals. Robert Pape, *Dying to Win* (New York: Random House, 2005) 187–196 and 237, argues that resentment of foreign occupation is the main motivation for suicide terrorism.

16. On the J curve see James C. Davies, "Toward a Theory of Revolution," *American Sociological Review* 27, no.1 (February 1962): 6; Raymond Tanter and Manus Midlarsky, "A Theory of Revolution," *Journal of Conflict Resolution* 11, no. 3 (September 1967): 265. For a detailed elaboration of relative deprivation see Ted Robert Gurr, *Why Men Rebel* (Princeton, NJ: Princeton University Press, 1970).

17. The importance of political responsiveness in undercutting support for terrorism is underscored in Ted Robert Gurr, "Terrorism in Democracies: Its Social

and Political Bases," in Walter Reich, ed. *Origins of Terrorism* (Baltimore, MD: Johns Hopkins University Press, 1998), 97–99.

18. Jeffrey A. Nedoroscik, "Extremists Groups in Egypt," *TPV* 14, no. 2 (Summer 2002): 47–49, 62–73; Mamoun Fandy, "Egypt's Islamic Group: Regional Revenge," *Middle East Journal* 48, no. 4 (Autumn 1994): 607–625.

19. Bard E. O'Neill, *Insurgency and Terrorism* (Washington, DC: Potomac Books, Inc., 2005) 88. For a seminal study of the effects of social change in the Middle East that was strikingly prescient, insightful, and remains relevant even today, see Manfred Halpern, *The Politics of Social Change in the Middle East and North Africa* (Princeton, NJ: Princeton University Press, 1963), especially pp. 25–118. The classic general treatment of the nexus between the dysfunctional effects of sociopolitical change and the emergence and growth of mass movements is, as noted above, Hoffer, *The True Believer.*

20. Gurr, *Why Men Rebel*, 24–30. An excellent example is the global Salafi movement, especially those who have relocated from traditional core Arab societies. See Sageman, *Understanding Terror Networks*, 95 and 97.

21. The high cost of ignoring counterinsurgency lessons and knowledge from the past and failing to teach them in professional military schools is discussed in Daniel Marston, "Force Structure for High-and Low-Intensity Warfare: The Anglo-American Experience and Lessons for the Future," Discussion Paper (unpublished), prepared for the NIC-2020 Project. Also see Brigadier Nigel Aylwin-Foster, "Changing the Army for Counterinsurgency Operations," *Military Review* (November–December 2005): 2–15.

22. O'Neill, *Insurgency and Terrorism*, 15–154.

23. Yusuf's study appeared in a five-part series. In particular, see part one in "Saudi: Paper Publishes Study of Saudi Counterterrorism Strategy," in *Riyadh Al-Jazirah* (Internet version http://www.al-jazirah.com) in Arabic December 31, 2005, in *FBIS—Middle East (INE)*, December 31, 2005, 13 pp.; quote p. 2 and part two in "Saudi: Paper Publishes Study of Saudi Counterterrorism Strategy" in *Riyadh Al-Jazirah* (Internet version http://www.al-jazirah.com) in Arabic January 3, 2006, in *FBIS—Middle East (INE)*, January 3, 2006, 16 pp.

# CHAPTER 18

## SUICIDE, HOMICIDE, OR MARTYRDOM: WHAT'S IN A NAME?

Christopher L. Brown

*"What martyrdom is greater than making yourself a human bomb detonating it among the enemy? What spiritualism is greater than this spiritualism in which a person loses all feeling of his body and life for the sake of his cause and mission?"*
—Sheikh Muhammad Husayn Fadlallah, Spiritual Leader of Hizbollah

For many in the Western world there is a question of what kind of a war we are fighting. Is it the war on terror, the war against radical terrorism, the war against extremism, or some new phrase we come up with in the near future? There is also, of course, the ongoing political debate of where and how this war should actually be fought. Ironically, this debate is not just occurring in the Western world, but is also taking place within Islamist[1] circles. Unfortunately, however, the Islamists seem to understand the general nature—and therefore the extent—of this war far better than the western world.

In reality, this war is by its very nature a paradox. The enemy we face seems unlike any that the modern world has ever seen before, and yet upon closer examination there is a great deal of familiarity in the absolutist rhetoric of these enemies when compared to our previous foes.[2] So the question is, what kind of war are we facing? Although the actual answer to that question is really very simple, the implications of it are not, and until we understand its nature, we will never achieve a lasting victory.

In what he thought was to be his last act upon the Earth, as America brought the fight to al Qaeda in Afghanistan, Ayman Al-Zawahiri—arguably the real brains behind al Qaeda—wrote a book entitled "Knights

under The Prophet's Banner," which he published on numerous "jihadi" Web sites. This was meant to serve as a last bequest to what was left of al Qaeda, their allies, and future successor Islamist organizations around the world. Among the many key insights contained within the text was a single paragraph that laid out the exact nature of this war:

> He (Sayyid Qutub) [sic] affirmed that the issue of unification in Islam is important and *that the battle between Islam and its enemies is primarily an ideological one* over the issue of unification. It is also *a battle over to whom authority and power should belong* . . . to God's course and shari'ah, to man-made laws and material principles, or to those who claim to be intermediaries between the Creator and mankind.[3] (Emphasis added)

In other words, the war in which the world is currently engaged is an ideological war, or—as it is sometimes called—a war of ideas.[4] This means that although the modern military has a significant role to play in this fight, it is also not going to be the lone (or possibly even the key) vehicle of victory on the strategic level. Instead, victory will be achieved through what is termed a political warfare strategy. Of course, many readers may be somewhat confused as to what all of this discussion has to do with an examination of the tactics of the suicide bombings. The answer to that is found in the actual nature of these types of operations within both the Islamist strategy and their ideological theology.

Because these types of operations have become an increasingly pervasive tactic, in addition to their popularity among multiple Islamist organizations around the world, there must be an ideological foundation for them. Therefore, the key to a strategic counterstrategy can only come from understanding and exploiting the foundational vulnerability of the ideology of the suicide operation. Perhaps in simpler terms, once we understand the nature of the tactic we can find a means to help defeat it.

When it comes to trying to understand the Islamist ideology and tactics, it is necessary to throw the proverbial dictionary out of the window. The Islamists use their own definitions, language, and ideology as the basis for their efforts in the war of ideas. The United States has faced harsh criticism from many quarters for its position that the War on Terrorism is a black and white conflict, with clear lines of distinction between the forces of good and evil, or freedom and tyranny. However, the Islamists view it the same way, only they have completely different definitions of good, evil, freedom, and tyranny. This fundamental difference in their worldview makes the terrorist a hero or freedom fighter to their compatriots and sympathizers. Furthermore, to the Islamist the war with the United States and its allies is Tawheed[5] versus Shirk[6] —in other words, it is their view of what God has commanded and wants versus everyone and everything else; and because they are acting as the agents of the will of God,

they are free to pursue any tactic they choose, because only the will of God can stop them.

## WHY DO TERRORISTS USE SUICIDE ATTACKS?

In part, the decision to use suicide attacks can be seen as motivated by simple cost-benefit analysis, and at least four dimensions of this decision can be identified.

1. *It has worked in the past*. The Islamist community witnessed how Hizbollah[7] suicide attacks on the U.S. Marine Barracks and French paratroopers led to the withdrawal of United States and other Western forces from Lebanon, and Islamists credit these types of attack for the eventual Israeli withdrawal in 2000.
2. *Terrorists and their sponsors have avoided significant retaliation for this type of attack.* Just as Hizbollah and Iran were warned in the case of the Marine Barracks and the U.S. Embassy in Lebanon, al Qaeda received mostly verbal warnings and a purely symbolic counterattack following the U.S. Embassy bombings in Nairobi and Dar es Salaam in 1998 and the attack on the *USS Cole* in 2000.
3. *The terrorist leadership and their sympathizers know that their forces could not win a conventional war with the United States, or any other western power.* This leads to the implementation of unconventional or asymmetrical tactics.
4. *Individual attackers' reasons can vary from religious/political convictions to coercion.*

Although there has been a great deal of discussion in the popular media over the motivations, reasons, and justification for the use of suicide bombings by terrorists around the world, most of it has unfortunately failed to examine the Islamist theoideological dimension. Some, in an effort to claim academic distance, attempt to examine all suicide operations around the world as a singular phenomenon, attempting to group operations from secular groups (such as the Tamil Tigers in Sri Lanka) with the Islamists. Unfortunately, these all-inclusive theories often fail due to the same inherent logical flaw of all universal generalizations. The fact is that this approach fails to understand that each attack is a discrete event in and of itself, in which each attacker—regardless of affiliation or belief— has his/her own reasons for his/her involvement, just as each organization has its own reasons within its strategy for the use of this tactic. Now unfortunately (for any analyst) if we leave the discussion at that point, then the issue of a counterstrategy becomes moot, leaving nations, organizations, and individuals with the only choice for countering this tactic being increased physical security. As a solution, this once again ignores the theoideological factors in the motivation and justification of the individuals. In addition, from an American security standpoint, the spread of Islamist-backed suicide operations represents an actual threat to our vital (and potentially even survival) interests. For example, from 1968 to

2005, 80 percent of all suicide operations have occurred post-September 11, 2001.[8] Islamist groups claiming credit and religious justification for these suicide operations represented 31 out of the total of 35 groups who used this type of tactic.[9] Therefore, it is necessary to identify the religious justification for suicide operations.

## ISLAMIC JUSTIFICATIONS FOR SUICIDE OPERATIONS

One of the key documents used to justify these types of operations came to light in the mid-1990s under the title "The Islamic Ruling on the Permissibility of Martyrdom Operations" hereafter referred to as the "Islamic Ruling."[10] This text was written anonymously, although it is believed that one or more scholars in Saudi Arabia authored it, in support of suicide attacks in Chechnya.[11] It should be clearly understood that this is just one of many "scholarly" opinions or *fatwas* that have been issued within the international Islamic community over the past several decades in support of these types of operations.[12] However none appear to have had the same pervasive strength as the Islamic Ruling, in spite of the fact that traditionally, such anonymous documents would have been treated with a great deal of suspicion.

Within the Islamic Ruling, the author (or authors) provide a kind of three-point disclaimer, in which they write, "Not every martyrdom operation is legitimate, nor is every martyrdom operation prohibited."[13] Note the use of the term "martyrdom operation"—this is a very important distinction within Islamic circles. For example, Hizbollah's Deputy Secretary General Sheikh Naim Qassem had the following to say when he was asked during a *CBS* news interview about whether suicide operations where evil, and why the Islamic world would not denounce the use of young people killing themselves for the sake of killing innocent civilians:

> We call them martyrdom operations. We don't call them suicide operations because suicide comes out of a loss of hope in life, while martyrdom is a love of life . . . Martyrdom operations are the only power the Palestinians have against the sophisticated Israeli military machine. Balance cannot be reached unless these operations are carried out in the heartland of the enemy.[14]

The Islamic Ruling goes even further, by claiming that "the name 'suicide-operations' used by some is inaccurate, and in fact this name was chosen by the Jews to discourage people from such endeavours" [sic]. The reason why it is so important to make a distinction between suicide and "martyrdom" is that the distinctions of these two paths of death have direct implications on both this life and the next. There is, of course, a general understanding surrounding the issue of the 72 virgins. Although interestingly, some work has been done that calls into question

this reward.[15] Then again, this is not the only reward that is promised to would-be suicide bombers. For example a "martyr" is promised:

> Their souls will live in green birds that live in lamps next to Allah's throne.
> Forgiven of all of their sins with the first drop of their own blood that is spilled.
> At the time of death be shown their reward in paradise.
> Saved from judgment day.
> A crown placed on their heads with jewels more precious than life.
> Allowed to intercede on behalf of 70 family members who were going to hell.
> All the pain of their death is reduced to that of a mosquito bite.
> The best dwelling places in paradise.
> Angels spread their wings in respect over their bodies.
> Only ones who would wish to return to life from paradise would be allowed to do so, but only so they could be martyred 10 more times to increase their reward.[16]

Interestingly, the key reward that is often used in the recruitment of female suicide bombers is that of the intercession on the part of family members. After all, the rewards of 72 virgins likely has little appeal for many women. However, a promise that they can ensure the entry of their own children into paradise is an example of the twisted morality (but rational appeal) that is made in the recruitment of suicide bombers. On the more practical side of things, suicide bombers—through their "martyrdom"— often achieve less "eternal" rewards for their families and themselves. Some examples include:

> Large sums of money for their families.
> Improved social status for their families.
> Enhancing both their own and their families' reputations.
> Their families are showered with honors and gifts following their death.
> A level of personal fame in which they are "immortalized" in propaganda materials.[17]

Between these two types of rewards, recruiters claim that: "volunteers are beating down the door to join."[18] Although that is very likely an extreme overstatement of the appeal of such operations, it cannot be ignored that both the rewards in this life and the next offer an appealing menu of items for those individuals who are recruited, indoctrinated, and used in the capacity of these suicide operations.

On the opposite side of the equation if a Muslim is in fact committing suicide rather than an act of "martyrdom," his/her reward is "hell-fire."[19] However, it does not just end there, for according to Islamic scholars the

one who commits suicide will be condemned to a cycle of continually reliving that horrible moment and manner of death.[20] So, in other words, if a suicide bomber is not engaged in actual "martyrdom," but is instead killing oneself, then that person will spend eternity in hell, having their body ripped apart by explosives. This is in part because, as Dr. David Cook points out, "In Islamic history there is no equivalent to the 'noble suicide' tradition of the Bible."[21] Thus, the individual is either a glorified "martyr" or a condemned sinner. This brings us back to the issue of the Islamic Ruling, as it lays out what is required for the actions of the individual to be considered an act of "martyrdom."

The initial analysis of the Ruling centers not on what we think of as a suicide bombing operation, but more on the idea of a traditional heroic military action, such as a soldier or group of soldiers attacking a far superior force of soldiers. The author(s) concludes that such a desperate action is permissible if those engaged in it are doing any of the following by their actions:

> Seeking "martyrdom."
>
> Inflicting losses [on the enemy].
>
> Encouraging the Muslims to attack.
>
> Demoralizing the enemy, showing them that "if one man can do this, what will the totality be capable of?"[22]

It is interesting to note that in this case—meaning an armed conflict between two combatants—the issue of "martyrdom" is only one of the possible necessary conditions for such an act to be permissible. As will be discussed next, this is not the case for a so-called "martyrdom operation." However, before preceding to that, it is perhaps useful to describe what qualifies one as a "martyr"—or, as it is often transliterated in Arabic "Shaheed," which means one who dies in the name of Allah.

Literally, "martyr" means a witness. In the context of religion, this has come to mean ones who will hold on to their faith until death as a witness to the world and the object of their faithful conviction. Many theological schools of thought in almost every religion also hold a special role for the "martyr" as a witness against those who do not share their faith, or the people or organizations who created the conditions under which "martyrdom" occurred. In any case, the "martyr" is seen as serving to expand the religious community, either through bringing back those who have wavered in the faith through the "martyr's" example, or by bringing new converts into the faith. Within the Islamic Ruling, the following seven reasons articulate how a "martyr" is a Shaheed:

> (1) Because Allah and the Prophet have testified concerning his entry into Heaven.

(2) Because he is alive before his Lord.

(3) Because the angels of mercy witness the taking of his soul.

(4) Because he will be among those who testify over nations on the Day of Resurrection.

(5) Because his faith and good ending have outwardly been witnessed.

(6) Because he has a witness to his death, namely his blood.

(7) Because his soul immediately witnesses Heaven.[23]

The author(s) then goes on to provide a technical definition of a "martyr," from the four major Fiqhs, or schools of Sunni Islamic jurisprudence:

> *Hanafis*: "One who is killed by the pagans, or is found killed in the battle bearing a mark of any wound, whether external or internal—such as blood emerging from an eye or [sic] the like." [Al-'Inayah published on the margins of Fath al-Qadeer (2/142) and Hashiyat Ibn 'Abideen (2/268)]. Also, "Anyone who is killed while fighting pagans, or rebels, or brigands, by a means attributed to the enemy—whether directly or by consequence—is a shaheed [while] anyone who is killed by a means not specifically attributed to [an action of] the enemy is not considered a shaheed." [Zayla'i's Tabyeen al-Haqa'iq (1/247). See also Al-Bahr al-Ra'iq (2/211)].
>
> *Malikis*: "One who is killed while fighting warring unbelievers only, even if killed on Islamic land such as if the enemy attacked the Muslims [even if he] did not fight on account of being unaware or asleep [and even if] killed by a Muslim who mistook him for an unbeliever, or trampled by a horse, or mistakenly smitten by his own sword or arrow, or by having fallen into a well or from a cliff during the fighting." [Dardeer's Al-Sharh al-Kabeer (1/425)].
>
> *Shafi'is*: "One who is killed in fighting unbelievers, facing and not running away, for the raising of Allah's word . . . and not for any worldly motive." [Mughni al-Muhtaj (1/350) and see Fath al-Bari (6/129)].
>
> *Hanbalis*: "One who dies in a battle with the unbelievers, whether male or female, adult or not, whether killed by the unbelievers, or by his own weapon in error, or by having fallen off his mount, or having been found dead with no mark, provided he was sincere." [Kash-shaf al-Qina', 2/113. See also Al-Mughni (2/206)].[24]

Interestingly, particularly considering that this is material directly out of a justification for the use of suicide operations, one will note that only two of the fiqhs—which also happen to be the two smallest, with a combined approximate membership of 14 percent of the Sunni world—even mention the possibility of dying at one's own hands, and both make it clear that they refer to those who die while fighting who "accidentally" kill themselves. In fact, the Hanafiyyah Fiqh—which is both the largest, with over 50 percent of the Sunni Islamic community, as well as the oldest—directly contradicts the use of suicide attacks. As quoted above, "anyone who is killed by a means not specifically attributed to [an action of] the enemy is not considered a Shaheed." Therefore, an individual who kills

himself/herself through a suicide attack—particularly against unarmed civilians, as these individuals have no means to cause the death of the attacker—is committing suicide.

So, with these clear statements—which show a general historical opposition to any operation even closely resembling the modern use of suicide attacks—one might ask how the militant Islamists (who, after all, claim to be restoring traditional Islam), can claim justification for their tactics. After all, how can one justify actions that are obviously in opposition to the teachings of their own religion?

The answer is that they do what all great students of rhetoric have done throughout time; they redefine the frameworks of the question and the meaning of words—or, in laymen's terms, they punt. This should really come as no surprise, as Islamic scholars are a combination of lawyer and theologian, which means they are very skilled in the use of rhetoric. This particular feat of intellectual gymnastics is done by first defining suicide narrowly as one who kills oneself for "worldly motives" (as opposed to doing so for the cause of Allah—or, in their words, "for some religious benefit"). They then try to rationalize the suicide attack (for the cause of Allah) as being exactly like an attack—as discussed earlier—against an overwhelming enemy force. As a person doing this type of battlefield heroics has historically been viewed as a "martyr" so too does the suicide bomber receive the same distinction. In fact, the author(s) of the Islamic Ruling goes even further, saying: "We have arrived at the conclusion that martyrdom operations are permissible, and in fact the Mujahid [sic] who is killed in them is better than one who is killed fighting in the ranks."[25] Interestingly, this is not the opinion of some mujahideen who have fought on the frontlines in many of the arenas of the so-called Islamic "jihads" around the world over the last 20 years.[26] However, the author(s) of the Islamic Ruling, after having made the logical leap from one form of warfare to another, then qualify their justification of the clear violation of Islamic law with the following criteria for delineating the differences between one committing suicide and one engaged in a "martyrdom operation:"

Martyrdom operations should not be carried out unless certain conditions are met:

1. One's intention is sincere and pure—to raise the Word of Allah.
2. One is reasonably sure that the desired effect cannot be achieved by any other means which would guarantee preservation of his life.
3. One is reasonably sure that loss will be inflicted on the enemy, or they will be frightened, or the Muslims will be emboldened.
4. One should consult with war strategy experts, and especially with the amber of war, for otherwise he may upset the plan and alert the enemy to their presence.

> If the first condition is absent, the deed is worthless, but if it is satisfied while some others are lacking, then it is not the best thing, but this does not necessarily mean the Mujahid [sic] is not Shaheed [sic].

Of these criteria, the one considered most important—as it is clearly stated in this quote—is that of the intention of the attacker. Intension is the primary factor in determining whether an operation is in fact suicide or "martyrdom." This will be further addressed in the conclusions and recommendations section of this chapter.

### DA'WA

An interesting but often unnoticed (or even ignored) dimension of Da'wa (spreading Islam through the words and deeds of Muslims) involves a justification for both suicide operations and "jihad" in general. As can be seen throughout the previous discussion, the idea of raising up Allah's word, or the betterment of the Muslim community, is a continuous theme. This has carried over into the practical world, where (for example) Osama bin Laden—in an all but unnoticed statement shortly after the September 11 attack—offered the following as one of the justifications for the attack:

> Those youth who conducted the [9/11] operations did not accept any fiqh in the popular terms, but they accepted the fiqh that the prophet Muhammad brought. Those young men (. . .inaudible. . .) said in deeds, in New York and Washington, speeches that overshadowed all other speeches made everywhere else in the world. The speeches are understood by both Arabs and non-Arabs-even by Chinese. It is above all the media said. Some of them said that in Holland, at one of the centers, the number of people who accepted Islam during the days that followed the operations were more than the people who accepted Islam in the last eleven years. I heard someone on Islamic radio who owns a school in America say: "We don't have time to keep up with the demands of those who are asking about Islamic books to learn about Islam." This event made people think (about true Islam) which benefited Islam greatly.[27]

It may seem odd to most observers that someone might see the use of terrorism and suicide operations as a means of spreading a religion; however, in the worldview of many of the Islamists the sudden interest in Islam meant that people were possibly seeking to join. Hence, 9/11 was a "moral" or even "righteous" act (from the Islamists perspective) in that it resulted in some rumored trend of more people accepting Islam. This is opposed to what really likely happened, where people living in the West simply wanted to understand why 9/11 happened and how Islam was connected to it. So, rather than an increased interest related to a desire to

turn to Islam, this increased attention was mostly just curiosity, which for most people faded until the next headline.

That being said, those seeking to understand the enemy we face today ignore at our peril the potential power of the principle of Da'wa as a weapon that can be used both against us and for us. Some suggestions on how the West might be able to use Da'wa as a means to counter the Islamists will be discussed in the conclusions and recommendations section of this chapter.

## AL QAEDA

An example of how central it is to demonstrate one's true intentions, as discussed earlier, is illustrated perfectly by al Qaeda. In order to ensure that a suicide operation is a "martyrdom operation," al Qaeda operatives must submit a formal request to the group's leadership before they are allowed to participate in such an operation.[28] This, of course, only applies to actual members of al Qaeda, as opposed to those who gravitate toward the Islamist ideology and are used as nothing more than cannon fodder by various affiliated organizations.

Al-Qaeda training and ideology, in particular, is focused on preparing all members to engage in these kinds of attacks. For example, al Qaeda uses the criteria articulated by Abdullah Azzam, a cofounder of al Qaeda (and who is also reportedly involved in the founding of Hamas), in his book *Join the Caravan* (i.e., of "martyrs") to establish acceptable intentions of their members before allowing them to join in "jihad." The following are the eight specific criteria for "jihad" outlined in part one of *Join the Caravan*, a copy of which is given to each member of al Qaeda:

1. In order to prevent the disbelievers from dominating Muslims;
2. Due to the scarcity of men;
3. Fear of the Hell-Fire;
4. Fulfilling the duty of "Jihad," and responding to the Call of the Lord;
5. Following in the footsteps of the Pious Predecessors;
6. Establishing a solid foundation as a base for Islam;
7. Protecting those who are oppressed in the land; and
8. Hoping for Martyrdom and a High Station in Paradise.[29]

Azzam then goes on to outline the reasoning behind each one of these criteria, and then adds an additional eight reasons why individuals should "join the caravan" of "martyrs" in their "Jihad:"

1. "Jihad" is a shield for the Ummah's honour, and a means for lifting disgrace off them;

2. Protecting the dignity of the Ummah, and repelling the conspiracy of its enemies;
3. Preservation of the earth, and protection from corruption;
4. Security of Islamic places of worship;
5. Protection of the Ummah from punishment, disfiguration and displacement;
6. Prosperity of the Ummah, and surplus of its resources;
7. "Jihad" is the highest peak of Islam;
8. "Jihad" is the most excellent form of worship and by means of it the Muslim can reach the highest of ranks.[30]

Interestingly, from a historical perspective, al Qaeda initially did not emphasize suicide operations, but instead sought to maintain a group of highly trained guerilla fighters. This has changed, to the point where "martyrdom is assigned the highest priority . . . no other group has invested as much time or effort as al Qaida in programming its fighters for death."[31]

What caused this change were two very practical considerations, relating to the potential capture of their personnel during operations. First, there was the issue of what happened following the failed 1993 attack on the World Trade Center, in which members of that attack were captured, compromising future operations. Second, al Qaeda efforts to care for the family members of those individuals who were captured around the world—in particular, in the Arab World—represented a significant expense.[32] So, following the failed 1993 attack, Osama bin Laden reached out for technical assistance from Iran for learning how to bring down buildings, as well as training methods to prepare individuals for suicide operations.[33]

This assistance came in the form of representatives sent to Sudan from the Iranian Revolutionary Guard Corps (IRGC) and Hizbollah, including Imad Mughniyah.[34] These meetings in turn led to the movement of senior al Qaeda members to both Lebanon and Iran for training as well as assistance in reorganizing the existing training camps in Sudan.[35] This training led to a professionalizing of al Qaeda, which dramatically increased their effectiveness and capabilities. At the same time, those involved in "martyrdom operations" no longer needed to be informed of anything other than their immediate operation, and at the same time the supposed rewards of a "martyr" relieved al Qaeda of long-term financial concerns for any surviving family.

Recently, however, this continued emphasis on the use of suicide operations has begun to show signs of actually weakening al Qaeda. As mentioned previously, some veterans of previous conflicts disagree with the high status given to the suicide terrorists.[36] This type of individual criticism of tactics might be directly tied to reports that Abu Musab al-Zarqawi, the leader of al Qaeda operations in Iraq until his death in June

2006, was seeking to establish a more traditional guerilla-style army and move away from suicide operations.[37] Part of this might also be that after years of launching these attacks and seeing no sign of any near-term withdrawal of coalition forces—together with the missing social reinforcement found in the West Bank and Gaza—a greater difficulty in the recruitment of those willing to be suicide bombers has resulted. If so, this could represent a true turning point in the Iraqi theater of the global war on terror.

## CONCLUSIONS AND RECOMMENDATIONS

Our first step toward a lasting victory against terrorism will come when we recognize that we are engaged in a war of ideas or ideologies. Hence, the most powerful weapon that we might use in this war will be one that targets the theoideological basis of our enemies. After all, the use of suicide bombings is a tactic that is part of a larger strategy. Although the bombs going off in Baghdad are wounding and killing hundreds of civilians and soldiers, their real strategic targets are the television, print, and Internet media around the world. These attacks are aimed at the hearts, minds, and resolve of both sides, seeking to build their own strength while they undermine ours. It is about time that we seek a strategy that undermines this tactic at its base.

### The Suicide Bomber

*The Individual*: Appreciating that the intentions of the individual are so central in determining whether the individual is a "martyr" or has committed suicide creates an area of potential exploitation at the individual level. Through the use of effective political action, using the very justifications that are placed on "martyrdom operations," the United States could begin to create doubts in the minds of potential attackers, using classical Islamic sources and such authoritative pronouncements as:

> The Grand Mufti of Saudi Arabia: *"I am not aware of anything in the religious law regarding killing oneself in the heart of the enemy['s ranks], or what is called 'suicide.' This is not a part of Jihad, and I fear that it is merely killing oneself."*[38]

After all, if an attacker has some doubt in his/her mind as to why he/she is carrying a bomb, then the volunteer pool may just dry up a little faster, forcing terrorist groups to use coercion if they are going to continue this tactic. This in turn undermines the very credibility that they seek from the use of suicide bombers, as well as the support they receive from their respective societies.

Also, we must remove the status of "hero" by reestablishing the stigma associated with suicide. An example of how our own ignorance might

undermine this effort can be seen in the recent move by the Bush Administration to refer to the attackers as "homicide bombers" as opposed to suicide bombers. Although this makes sense within the Western cultural framework, by concentrating on the fact that these individuals are killers and bringing the attention to the victims, however, it has the potential to legitimize these types of attacks within the Islamic/Islamist world. It effectively removes the stigma of suicide, and draws attention to the fact that these bombers are killing those whom the Islamist/potential Islamist considers the enemy.

*Family/Friends*: Highlight the damage done to the family, while creating societal pressure based on both religious/cultural norms of behavior, which will in turn place pressure on the parents/family members and friends to discourage those considering suicide operations. Such ideas as requiring that the family/tribe pay restitution for property damaged as well as reparations to the victims and their families, would create one such pressure. When the family cannot pay, these reparations should be required from the organizations and governments sponsoring these acts as well as those providing funds to the terrorist organizations.

*Organizations*: There must be an effort to undermine organizations from within. Although this seems like an obvious strategy that is likely being pursued, the sad truth is that this type of strategy involves political warfare operations, which the United States has not always been that successful in implementing because of a mix of cultural and bureaucratic considerations. For instance, a group of individuals (i.e., the leaders of the Islamist movements) who claim to be so selfless, interested in serving Allah and continuously expounding the benefits of "martyrdom," certainly invest a great deal of time and resources in their own personal safety. This paradoxical reality is perfectly illustrated by the quote at the very beginning of this chapter, in which the "spiritual leader" of Hizbollah touts the great "spiritualism" found in "martyrdom," and yet neither he nor any members of his family are becoming "martyrs."

Another example is that many of the enemies faced by the West are actually fairly thin-skinned when it comes to criticism. This is a result of the nature of the societies that they come from, and the way in which these types of organizations and groups are led. An excellent example of an attempt at effective information warfare was the May 2006 briefing in Baghdad in which outtakes of a Zarqawi video were shown demonstrating his (and his immediate followers') incompetence at basic military activities. Unfortunately, it wasn't even al Qaeda that launched a counterargument but major American media outlets and even military commanders who have been or are currently in Iraq.[39] Until we as a society understand what it means and create a strategic political warfare capability, we will never win the ideological war.

*Societies*: By encouraging the development of modern states—with varying forms of democracy and vibrant civil society in which debate and discussion occur—we could channel the anger of disenfranchised societies away from the United States, and toward changing their own nations for the better. Part of this will have to include taking each nation on a case-by-case basis, identifying truly democratic groups/movements who can assist in the peaceful transitions of governments in the region, and who will receive aid from the major democracies, while freezing out all potential negative groups such as the Muslim Brotherhood, Hamas, and the Baath Party.

### The Use of Da'wa

Although Da'wa is technically not one of the five pillars within Islam, its importance and its power cannot be denied. Ultimately, the true key to winning the long-term strategic ideological battle will have to come from within Islam itself. For too long, we have effectively ceded the entire field of Islam itself to the radicals depending on proxies of both questionable intentions and/or limited impact.

*Don't give up key real estate in the war of ideas*: By refusing to use the Islamic theology, either from ignorance or from concerns over issues of political correctness, we effectively give that battleground to the terrorists. Rather than shunning this area, we should embrace it for our own purposes—after all, the Islamists have been doing that from the beginning, as illustrated in the early discussion on the religious justifications for suicide operations.[40]

Da'wa, which means "The Call" or in other words the spreading of Islam through words and deeds, is just such a potential strategic weapon. Most Muslims, both scholars and laymen, agree that one of their required obligations is to spread Allah's message even though they may disagree over the means and methods of how it is to be done. Examples of this requirement are found in the following verses from the Qur'an:

"*Invite (all) to the Way of your Lord with wisdom and beautiful preaching; and reason with them in ways that are best and most gracious*: surely your Lord best knows those who go astray from His path, and He knows best those who follow the right way." (Qur'an 16:125) (Emphasis added)

"And it is thus that We appointed you to be the community of the middle way, so that *you might be witnesses before all mankind* and the Messenger might be a witness before you." (Qur'an 2:143) (Emphasis added)

"*Who is better in speech than one who calls (people) to Allah*, works righteousness, and says, "I am of those who bow in Islam"? The good deed and the evil deed are not alike. Repel the evil deed with one which is better: Then will he between whom and thee was hatred become as it were your friend

and intimate! *And no one will be granted such goodness except those who exercise patience and self-restraint—none but persons of the greatest good fortune."* (Qur'an 41:33-35) (Emphasis added)

In other words, Muslims are required to be the carriers of the word of God to the world through their words and their deeds. Militant Islamists thrive on exploiting the quasibrotherhood of all Muslims for recruitment, fundraising, political support, logistics, etc. In essence, tying themselves to all Muslims everywhere for their own purposes. Now what if we—meaning the West/global community—use the concept of Da'wa as a means of forcing Islam to work against the Islamists, rather than rushing to Islam's aid by countering the perception of a relatively unified Islamic community? This cannot and must not be limited to occasional statements by various leaders for the Western press in English, which they then denounce in Arabic to their own media, nor must it be limited to the various ivory towers in which academics breathe the rarified air of their own making. This must be placed on to the shoulders of the masses through the means of an overall media campaign.

### Shock Therapy for the Islamic World

The outraged reactions in Jordan following the November 2005 attacks on the Grand Hyatt, Radisson, and Days Inn hotels in Amman provide one of the key insights into perhaps the best means of conveying the message to the masses.

Most of the deaths of Iraqi civilians are being caused by the actions of the terrorists' groups/forces in Iraq; however, America continues to get the blame. It is time that we show both the real damage being done and the real cause behind that damage. This serves both strategic-ideological and tactical military purposes at the same time. After all, most of those who either have been captured, left video messages, or speak openly in support of the terrorists we are fighting cite the deaths and suffering of Muslims as the reason for their views.

Unfortunately, statements from podiums in either Washington or Baghdad will not change this perception. Instead, our arguments must be presented in a way that is undeniably pervasive and substantiated, using multiple means of distribution (i.e., print, broadcast, internet, and DVDs etc.). This effort must show in unflinching detail the death and destruction brought against innocent civilians by the terrorists, using media such as:

The afterimages of suicide/car bombings inside Iraq/Afghanistan/etc.

Those hospitalized by sectarian/terrorist violence.

Funerals of those killed by terrorists.

Actual footage of attacks in which innocents are killed

This material must be clearly attributable to the Islamists, and must also ensure that the blame for those killed or injured rests solely at the militant Islamist leadership's feet and cannot be justified, within the Islamic world, by any means.

### Responsibility without Blame

In the end, any such effort must place the responsibility on the shoulders of the Islamic community; however, it must not place blame, otherwise it risks alienating the very people that we are trying to get on our side. It must also provide a challenge or obligation to act in a positive way, while at the same time undermining the foundational justifications of those engaged in terrorism and supporting terrorism. In effect, the Ummah (or community of Muslims) must be made to feel a responsibility for the actions of their members in a way that both tactically and strategically weakens the enemy.

In the end, the answer to the question raised by the title of this chapter "Suicide Homicide, or Martyrdom: What's in a Name?" is that there is a lot. An observant reader might have noticed that outside of direct quotes and the short general discussion on martyrs, the terms jihad, martyr, martyrdom, martyrdom operations, and homicide bombing did not appear without quotes. This was an intentional effort to subtly signify that these terms required qualification. Language has power, and even subtle efforts to qualify terms can potentially carry a great deal of meaning. Hence, what is in a name comes down to what we wish to convey— do we wish to undermine our enemies or support them? After all, when those in the West refer to our enemies and the war they are fighting against us as mujahiddin or jihad, we are granting them all the positives that come from those terms within their own society.[41] This would be like Osama bin Laden calling American military personnel liberators or warriors.

Without a comprehensive strategy to engage in and win the war of ideas in ways that have cultural resonance, military operations alone will provide only a limited respite. Al-Qaeda and those that share its ideology must not just be destroyed, but discredited within their own communities. This in turn will undermine their theoideology, which is the key to both their global reach as an organization and their ability to recruit for suicide bombings on a level that threatens America and the Western world's vital interests. Without their foundation of theoideology, they will fall.

### NOTES

1. The term Islamist in this chapter denotes a radicalized and politicized version of Islam, whose proponents engage in or support the use of terrorism. This is

separate from Islam the religion. Also, it must be understood that not all Islamists are violent or militant extremists.

2. Islamist ideology was heavily influenced by multiple sources, some of which have yet to be generally recognized, including many from outside of the Islamic world such as Nationalism, Nazism, Fascism, and Communism to name a few. This is in addition to various internal movements over the entire history of Islam.

3. Ayman al-Zawahiri, "Knights under the Prophet's Banner," serialized in *Al-Sharq al Awsat* (London: December 2–10, 2001), trans. Foreign Broadcast Information Service, document FBIS-NES-2001-1202.

4. For more on this, please see the chapter by James Robbins in volume one of this book.

5. Tawheed is literally monotheism, within the Islamist/fundamentalist ideology it means that nothing can be placed in opposition to God (i.e., violations of Shari'a) or impinge upon his sovereignty (i.e., individual rights, representative government, etc.). One of the primary sources from which the modern ideas on the concept of Tawheed comes is from Kitaab At-Tawheed (The Book of Tawheed) by Sheikh Imam Muhammad Abdul-Wahhaab.

6. Shirk originally meant polytheist, but within the modern Islamist ideology, it has come to represent everything from representative democracy, Christianity, Shi'a Islam, Sufism, and capitalism.

7. The "correct" English spelling of the group's Arabic name is Hizb'Allah or Hizbu'llah, however it is more usually spelled "Hizbollah," "Hizbullah," or "Hezbollah." In order to standardize across all three volumes, the editor has chosen "Hizbollah" because that is the spelling employed in the URL designating the group's official homepage.

12. See David Cook, "Radical Islam and Martyrdom Operations: What Should the United States Do?" 22-24, for a list of 61 Islamic scholars offering support for the use of suicide operations, http://www.rice.edu/energy/publications/docs/DavidCook_martyrdom.pdf. It is also important that the reader understand that a fatwa is more than just an opinion on Islamic teachings; it is in fact also a ruling on the interpretation of Islamic law. This duel nature is often ignored or underappreciated within the West.

40. It should be noted that many of the leading ideological leaders of the Islamist movement do not come from a traditional background for having any authority within Islam. (i.e., Wahab, Bana, Qutb, Maududi, Zawahiri etc.).

41. Jim Guirard of the TrueSpeak Institute offered the following terms as substitution for some of the most common Islamic terms used in the Western world jihad (holy war or struggle) becomes hirabah (war against civilization or society), mujahiddin (holy warrior) and Shaheed (martyr) becomes mufsidoon (evil doer), and paradise (with its 72 virgins) becomes jahannam (demon filled hell).

# CHAPTER 19

# UNDERSTANDING AND COMBATING EDUCATION FOR MARTYRDOM

Magnus Norell and Eli Göndör

Terrorism in the name of Islam is on the rise. It is no longer limited to the Middle East. While the people who are targeted feel as if they have had an encounter with a mass murderer, the perpetrators see themselves as martyrs, acting in the name of God. They commit their deeds consciously and in full recognition of what the consequences are, concluding that they are justified on account of their noble goal.[1]

Recruitment into movements like al Qaeda happens on the initiative of the recruit. There are enough people willing to become martyrs for the recruiters not to be forced to actively seek them out. Many committed young Muslim men even find themselves seeking ways to become martyrs, without being able to figure out how to go about it. Their desire to participate is so strong that it can be likened with applicants for a highly esteemed education.[2] Thus, it can be assumed that the use of various forms of forceful recruitment or brainwashing is very rare, if not nonexistent.[3] A study of members of the Afghan Mujahideen (i.e., activists who fought the Soviet Union during the 1980s) concluded that the subjects, surprisingly enough, had suffered very few emotional traumas.[4] It was impossible to find any trace of any emotional trauma in their past, nor could evidence be found to suggest pathological hatred or paranoia. Based on the evidence, it was concluded that many of the Mujahideen fighters were part of a search for a higher goal, worthy of their self-sacrifice.[5]

In the Arab world, the gap is widening between the middle class and the elite. Candidates for martyrdom are found in the cities in the Middle East and North Africa, among those who seek dignity and wait

impatiently for the opportunity to be a part of the heroic adventure which, they believe, will help them escape the meaningless life they feel themselves condemned to lead. Martyrdom offers them the dignity and respect that they, tragically, lack in cities such as Teheran and Cairo, and this is true regardless of whether one is Sunni or Shia.[6]

In addition, a vast group of Muslims live as minorities in various countries throughout the West, where they struggle to find a new identity. For instance, in France (the country with the largest number of immigrated Muslims) hardly any of the French citizens with a North African background dreams of being able to return to their native land or establish an isolated Maghreb or a Muslim enclave in France. Their dream, rather, is to create a liveable zone for themselves *within* French society. They seek the opportunity to manage their own integration on their own terms and yet fight for their right to be different.[7]

Afghan Mujahideen fighters with a North African background living in France were recently surveyed,[8] and the following was discovered: Lonely people search for human contact. In environments densely populated with immigrants, especially in non-Muslim western states, the mosque is often the most accessible meeting place for people with similar backgrounds. Disillusioned with a society that has turned its back on them, combined with a feeling of broken promises of support from political groups in France, second-generation immigrants (and those newly arrived) from the Maghreb found a new community in the mosque. Islam became the tool by which dignity was restored; it gave them a feeling of spiritual calling and strengthened their moral values.[9]

Education for martyrdom, then, is something that adjusts to the prevalent mood: An education meant to accommodate the state within which Islam finds itself, by exclusivist selection from existing systems and texts within Islam, is capable of creating the results we are witnessing today.

At present, Islam is in a state that can be taken advantage of by operators with an interest in fostering martyrs. Two basic phenomena related to the state of Islam are the breakdown of structures and objectification.

## BACKGROUND

> "Therefore let those fight in the way of Allah, who sell this world's life for the hereafter; and whoever fights in the way of Allah, then be he slain or be he victorious, We shall grant him a mighty reward."
> —*The Koran*, chapter 4, "*The Women*," "*4.74*," M. H. Shakir's translation of the *Holy Qur'an*

### The Breakdown of Structures

Like other groups, Islamic societies throughout history have lived with clear hierarchies and structures. These structures are no longer uniform.

Various alternatives are available through Web sites and other institutions. The possibility of choosing different interpretations and develop interpretations of one's own, weakens the influence of formally trained religious scholars. In an attempt to preserve their status, the traditional religious scholars are appearing with greater frequency on the Internet, claiming that only they possess the ability to understand the "correct" meaning of Islam.[10]

It has become increasingly difficult for the religious elite to preserve its monopoly and retain their seniority in matters of interpretation. In 1968, it was still common for people (for example in southern Iraq) to gather around the one person who could read, while he read aloud from the newspaper. The knowledge and extensive network of contacts gave the sheikh a clear status. All over the world the number of people who know how to read has increased manifold. In Oman, the number of people with a university degree increased from 22 in 1975 to 60,000 in 1995. In Turkey, in 1950, 65 percent of men and 85 percent of women were illiterate, and in 1990 these numbers had fallen to 10 percent and 30 percent respectively. This increases both the supply and the demand for literature. Moreover, new techniques have created new ways to distribute texts. As a result, the Syrian engineer Muhammad Sharur is able to sell his 800-page long "*The Book and the Quran: A Contemporary Interpretation*" in tens of thousands of copies; this is despite the fact that the book has been banned by religious authorities. Sharur's aim is to take a closer look at the traditional interpretation of the Koran and adjust it to contemporary life. The retired officer, Nazir Ahmed, has a similar purpose with his book "*Quranic and Non-Quranic Islam*," which was published in 1997. Shortly thereafter, it was released in a second edition. Another example of a person who questions the traditional interpretations of the Koran is Nasr Abû Zayd, who holds the Ibn Rushd Chair of Humanism and Islam at the University for Humanistics in Holland. In 1995, he was forced to leave Egypt as a result of his writings.[11]

Although these developments are not universal, a clear trend can be observed, where the old hierarchies that have based their power on traditional and fixed structures are being eroded. Thus, it is becoming increasingly common that conflicting opinions are tolerated in the Muslim world. The reform movements claim independence of thought for themselves through the Internet and question the traditional structures, but the old authorities have also been able to establish themselves in the "new order," albeit not without competition.[12]

### Objectification

The objectification within Islam questions the traditional structures. Individualization and restructuring is a result of criticism directed at

previous authorities, communities, and attitudes toward the relationship between the self and the traditional surrounding. For most people, it was unlikely that practicing a religion could ever be put into question. At the end of the 20th century criticism was widespread throughout the Muslim world under the term "objectification." Objectification poses basic objective questions regarding the individual's subjective relationship to his or her faith/religion, and how faith/religion affects the individual in his or her daily life. The objectification is a conscious and active attempt to examine the meaning of Islam for the individual. He or she asks questions about his or her attitude toward Islam and what significance religion has to his or her life and identity. The phenomenon does not take into account one characteristic of Islam that certain thinkers have put great emphasis on, namely of it being something unified and impenetrable. On the contrary, it is a question of directly and clearly taking part in a discourse, which, to an increasing degree, is shaping Islamic practices in practically every social stratum. Objectification has become a tool with which to separate one's religious belief from other faiths and develop one's own thought.[13] Furthermore, objectification has ushered in an era where those who previously were perceived as the sole legitimate authority are now forced to compete with a vast number of easily accessible texts. More and more Muslims feel justified in interpreting the older (as well as the more modern) written sources of Islam themselves.[14] Several of these new interpreters claim to represent "the one and only truth" without links to the past traditions that are considered to be the cornerstones of Islam, which leads to a kind of "de-Islamization" of Islam.[15]

Thus, the questioning of past structures has opened up the stage for new actors to claim to represent "the one and only truth" and offer new ways to proceed. This development is at the base of the new phenomena, involving Islamists, neofundamentalists, and jihadists.

### Islamists, Neofundamentalists, and Jihadists

These phenomena could be described by drawing up circles where different key concepts, on the one hand, overlapped and presented certain similarities, while on the other hand also holding to quite different ideas about Islam and the role it should play in present-day life. At the root we find that Islamic political parties have failed to create a workable solution for an Islamic state. After the global Islamist revolution lost its momentum, the Islamists were confronted with the choice of either adjusting to the existing political system that is, adjust to the Western concept of the nation-state or a radicalized development toward neofundamentalism, a closed and conservative view of Islam, which was opposed to the nation-state and which stressed the *ummah*, the universal Muslim society, based on *sharia*.

Examples of Islamist movements that have slowly adjusted to the existing political system are Algerian FIS, Turkish Refah Patisi, Tunisian Nahda, and Palestinian Hamas, which has become increasingly similar to the exclusively political PLO. This can be seen as evidence that Islamic political parties increasingly have become more like regular, national parties.

Neofundamentalists are gaining ground with disenfranchised Muslim youth mainly among first- and second-generation immigrants in the West. They are small groups who reach new levels of radicalization among (for instance) al Qaeda sympathizers. They call on their adherents to reject the multicultural society, avoid integration, and instead turn to a closed sectarian community. These neofundamentalists do not identify with any state, but live with the ambition of making all societies adopt Islamic norms and fight to reestablish the *ummah*. These groups do sometimes engage in international militant *jihadism* aimed at the West, something that has previously been the Islamists' trademark. Thus, the current political radicalization of conservative Islam, embodied in the Taliban, blurred the lines between moderates, conservatives, and radicals.

The spread of radical and militant neofundamentalism has developed in parallel to two other growing trends. One of them is the spread of more or less privately funded religious schools throughout the entire Muslim world, based on the Salafi or the Wahabi strain of Islam. The second is the deterritorialization of the Muslim world through large groups of Muslim emigrants.

Liberal Islam and neofundamentalism have many things in common. In both cases, emphasis is put on the religiosity of the individual as a result of the erosion of the influence of the traditional socioreligious authorities. This, consequently, leads to a resurrection of strictly religious communities. Furthermore, it is a question of the individual's own journey through the religious and social milieus, where a lot can happen and much can change on a personal level.

The Muslim *ummah* is no longer linked to territory; rather, it should be viewed in wholly abstract terms.[16] Thus, globalization becomes more an opportunity than an obstacle for the neofundamentalists. Here, one will find individuals who, because of a feeling of individualization and/or confusion about their identity are seeking a new community that is based exclusively on religion. The neofundamentalists take advantage of this weakness and use it to rebuild the *ummah*. The problem, however, stems from the fact that the idea of the *ummah* is completely devoid of anything substantial or concrete—such as culture, territory, ethnicity, or economy upon which a society could be based. Hence, the fight to reestablish the *ummah* amounts to little more than a fantasy in a political deadlock. At the same time, some of the goals have been fulfilled by avoiding integration into the West, while still making use of the religious and social tools that the West has to offer.

The most effective way to differentiate between radical and conservative neofundamentalists is in their view of *jihad*. The traditional view is that it is a collective duty, practiced in certain circumstances. Radicals like Sayyid Qutb and Mohammed Farrag view *jihad* as a private matter, which reappears prominently in the texts of, among others, Osama bin Laden. The call to individual *jihad* complements the state of loneliness for the radical militant who has left his natural surroundings to participate in an illusory one.[17] The supporters of al Qaeda fight on many different fronts for the imaginary *ummah*.[18] Thus, the terror of al Qaeda is different from that of other terrorist groups. For example IRA, PLO, and ETA are groups that have had a clear political objective that (at least theoretically) can be achieved, and consequently, the possibility exists of their laying down their arms and coming to the negotiating table. This line of reasoning does not apply to bin Laden, because his war aim is a figment of his (and his supporters') imagination. The conflicts in the Middle East can be used in the propaganda of recruitment officers, but is in fact unrelated to the actual struggle of the Islamists. Thus, the solution of these conflicts will not reduce the availability of new recruits for *jihad*, since the fundamental motivator has much more to do with the West than with the Middle East.[19]

Islamism is a form of modern political fundamentalism, which strives to rebuild a Muslim society not only by instituting *sharia* law, but also by creating an Islamic state through political means. Although the Islamic movement is undemocratic, it does not necessarily have to be violent. Examples of Islamic movements include Jamaat-i-Islami in Pakistan, Refah Partisi in Turkey, Hizbollah in Lebanon, Nahda in Tunisia, FIS in Algeria, NIF in Sudan, IRP in Tajikistan, and a majority of movements that originated the Muslim Brotherhood in Egypt, including those in Syria, Kuwait, and Jordan. These groups have not been able to create "real" Islamic states. Moreover, the many branches of the Muslim Brotherhood took a stand for their respective countries' national interests. While they were consolidated within their respective countries, they lost their international support. Thus, a connection developed between territory and nationalism on the one hand, and deterritorialization and radical Islamism on the other.[20]

The neofundamentalists want to introduce *sharia* without having to go through government authorities, which would bring about the destruction of the nation-state. The aim is to see it through on an individual level. This stems, in part, from the problems the Muslim countries are facing and the deterritorialization of Islam, as well as its encounter with the West.[21]

The Muslim world no longer shares a territorial, cultural, or social base. The deterritorialization and the individualization is the starting point for the neofundamentalists. A Muslim, regardless of where he is, is a part of the imaginary *ummah* and therefore unconcerned with the limits of citizenship, which is based on secular legal principles, territory, and

borders.[22] Neofundamentalists are against the idea that there can be different schools, all with a claim to representing true Islam. They are neither an organization nor an exact school, but rather a trend or a mental state. They exist among defectors from the Muslim Brotherhood, Tablighi Jama'at, and Wahhabism. Included in the politically radical branch of neofundamentalism are GIA in Algeria, al Qaeda, Jayash-e-Muhammad, and Sipah-e-Sahaba in Pakistan. All of these movements see *jihad* as an individual duty, and not just as a collective one. Hizb ut-Tahir, finally, is a hybrid, since it portrays itself as a neofundamentalist party with the goal of reinstating the caliphate as a regime to rule the *ummah*. This regime needs to be instated as soon as possible for the whole *ummah*, without being limited to a specific territory.

Between neofundamentalists, the debate concerning the choice between *takfir* (excommunication) and *dawah* (missionary work) as a means to their end represents a central theme. Most hold the view that *dawah* is the right path. They reject traditional Muslim theology. They demand strict adherence to *sharia* in accordance with their own interpretation and without compromises with secular laws. Consequently, the modern notion of the nation-state is put into question. They do not care about social issues. Nor do they try to fill the social needs in the way of the Islamists. They refuse to take part in earthly science and philosophy. To them, only the notion of *haram/hallal* (forbidden/allowed) without discussion or analysis and without taking into consideration that the world has changed since the days of the Prophet, is valid. The radical neofundamentalists view the action as more important than the result. Thus, individual *jihad* becomes more important than victory. The goal is to serve God, not to achieve a certain political agenda. The results will come when God wills it.

The fundamental difference between Islamists and neofundamentalists lie in their views of state and politics. Neofundamentalists are opposed to concepts such as democracy, human rights, and freedom, while Islamists try to prove how this can all be achieved through Islam. Neofundamentalists refuse to express themselves in terms that originate in the West.[23]

The neofundamentalists feel no rush in building Islamic institutions that would risk putting the validity of *sharia* into question. For neofundamentalists, the target is salvation, not revolution. The focus is on the individual and not on society. To be able to initiate political action, one needs first to be on the right path.[24]

There is coherence in the worldview of the neofundamentalists and the Islamists. Both feel that the *ummah* is in a critical state and that Islam is under political and cultural siege from the West. The West is the enemy. The difference lies in the view of how best to correct these wrongs. The neofundamentalists see a solution either in *dawah* activities or *jihad*, but

never through political means. The Islamists, on the other hand, believe that the solution is the Islamic state.[25]

The question of what should take precedence, *jihad* or *dawah*, is what separates violent from nonviolent neofundamentalism. Adherents to Wahabism, and members of Tablighi Jama'at and Hizb ut-Tahrir do not view *jihad* as relevant for anything other than defence.[26]

To the jihadists, martyrdom is an equalizer. Regardless of social or economic status and regardless of age or education, a person is capable of becoming a martyr. Since everybody is equal in death, equality on the social and political arena during life is demanded as well.[27]

The social aspect of radical Islam is significant indeed. The encounter with likeminded people, burdened with the same feeling of alienation, failure, and isolation lay at the base of the education that needs neither brainwashing nor any form of coercive measures. Instead, the movement offers three things that these rootless individuals lack: friendship, kinship, and the affection between students and teachers. This way, a common social and emotional support group develops that aids in the creation of a new identity, sustained by the encouragement to rededicate one's life to radical Islam, the glue that holds the community together. Thus, militant radical Islam is more an answer to a human need to feel a sense of belonging than a recipe for murder, although that is in fact most commonly the result.[28] This makes for a convenient means of recruitment, by using what has always been a part of Islam to encourage disaffected youth to become martyrs.

The breakdown of earlier structures has affected large parts of the individual's natural surroundings. The clear-cut hierarchies both within the family and in society at large have been put into question to an increasing extent. Objectification has individualized the group or been a result of the former. New forms of Islam have developed as a result of the individualization of the group, and spreads in various surroundings. They differ in outlook and *modus operandi* from attempts to adjust to the Western notion of the nation-state to a complete rejection of the same. This new multitude offers new traditions of thought as a consequence of new needs. The need to find a purpose for frustrated, bored, and rootless individuals in a foreign country on the one hand, and on the other hand a purpose with a "nobler" value than what is being offered in everyday life, is a symbiosis that creates the necessary circumstances for the religious rhetoric that promulgates the glory of martyrdom.

Those who follow God are above common earthly temptations. Daily life becomes a show of strength in the face of the contemptible, where the friends of the aspiring martyr are aided in reaching a state that is beyond the profane. In light of this, it is important for the organization to keep the aspiring martyr away from worldly matters.[29]

A martyr seeks death because his ambitions and desires are impossible to attain in real life.[30] Furthermore, death through martyrdom offers redemption and the possibility of reaching the paradise that is unavailable in this world.[31]

## MARTYRDOM

Martyrdom creates equality and erases differences between social and economic classes. It is something that anyone is able to do. All men, young or old, rich or poor, educated or illiterate, can be martyrs, and since everybody is equal in death, the same is demanded in life.[32] Revolutionary martyrdom aids in hiding desperation in the face of the cruel reality of life, and at the same time, it feeds that very desperation by giving it religious underpinnings.[33]

Within Shiism, it is a natural part of one's self-image. The origin of Imamitic Shiism is found in the understanding of the status of the imam. In every generation, according to this strain of Islam, there is an Imam who is chosen and strengthened by God and guides Muslim society, religiously and spiritually. The Caliph, from this point of view, is seen as a strictly political leader, lacking in the spiritual qualities demanded of an Imam. Without an Imam, enlightened by God, and able to spread His word, there is no way of abiding by His will. The status stems from a purportedly unbroken bloodline that goes all the way back to the Prophet Muhammad.[34]

Following the death of Muhammad, the question arose of who would be best suited to take his place.[35] A group called the Mu'tazilites opposed the new caliph and criticized him for a perceived inability to do the right thing. Their much stricter interpretation of the principle of "forbidding what is wrong" and taking responsibility for making sure that people acted in a righteous manner in particular if the caliph abused his power is something that has lived on through Imamitic Shiism. Another fundamental principle, the idea that leadership should be inherited down from Ali and his descendants, rather than through *ijima* (consensus) was formulated in the sixth and seventh centuries.[36]

The story surrounding the battle at Karbala in 680 CE became central to the way Imamitic Shiism came to view itself. The disgrace suffered from not aiding Ali's son, al-Husayn, in the battle against the Umayyads developed into a call for revenge against those who had murdered members of the family of the Prophet. This later developed into the belief that the bloodline of the Imam stemmed directly from Ali.[37]

The caliphate of the Abbasids, which came into being in the 7th century, and its economic affluence in cities like Baghdad, enabled the consolidation of religious texts and religious authority. During this time, many of the things that we view today as intrinsic parts of Islam were first created.[38] New definitions replaced the old ones, and became solidified.

The historical role of the Prophet, his leadership, and the principles for appointing his rightful successor all became friction points within Islam, and made the internal splits within Islam appear more clearly.[39] This put pressure on the Shiite opposition, which became increasingly threatened, and whose leaders from time to time had to live out their days in prison. In this context, the principle of *taqiya* was developed, calling on the loyal followers of Ali to keep their faith secret in order to survive in a hostile environment.[40]

Several attempts were made to create a separate identity and differentiate Shiism from Sunni Islam. Among other things, this presented itself through attempts during the 7th century to create a holiday to mark the occasion when Muhammad, on his last pilgrimage, named Ali as his successor. Sunnis responded by creating a holiday to mark the escape of the Prophet from Mecca to Medina, the *Hijra*, accompanied by Abu Bakr, to strengthen his claim as the rightful successor.[41]

An important figure in the shaping of the ideas propounded by Shiism was Jafar al-Sadiq, who by many was considered the rightful Imam. He was the one who brought the focus to Ali's bloodline. Furthermore, Jafar accepted the political realities and never attempted to initiate a revolt against the Caliphate of the Abbasids.[42] An argument arose later on as to whom among Jafar's sons was his rightful heir. This resulted in a split within Shiism, and the resultant Ismaili sect has never gained the Twelver's (mainstream Shiism) recognition. Later, Ubayd Allah, who for the Ismaili became the embodiment of the righteous Imam, laid the foundation to the Fatimid Empire in North Africa, with Cairo as its center.[43] The Fatimid Empire later gained recognition as far away as Yemen and parts of Syria.[44] The feeling of living under relentless oppression in an unjust world in need of saving is central to Imamitic Shiism. Out of this feeling, the idea of the hidden Imam developed.

In the year 873 CE, at the young age of 29, the 11th Imam, Hasan al-Askari, died in Samarra. Confusion ensued, since no one knew whether he had an heir. This developed into the belief that he did indeed have a son, Muhammad, who was being kept hidden in order to protect him from the Abbasids and other enemies. The belief soon became widespread and during the 8th century it resulted in the Imami sect, or Twelvers, who today has the largest number of adherents of all Shia sects. The twelfth Imam was identified as the son of Hassan, Muhammad, *al-mantzur* (the longed for).[45] It should be added that there are those who are skeptical as to whether or not Hasan al-Askari even had a son.[46]

The one who is hidden is unreachable. An idea is immortal as long as it exists in the fantasies and faiths of people. And as long as the idea does not have to be tested against reality, it is impossible to question. Furthermore, it might be worth a lot of suffering in order to be able to reap the subsequent rewards. Imamitic Shiism has kept its secret and waited,

convinced that the final victory will be theirs, and that suffering is an intrinsic part of the natural state of things. Because as long as Mahdi acts only in secrecy, his followers will be forced to suffer as a confirmation of the fact that the resurrection has not yet occurred.

## A MATTER OF INTERPRETATION

> And reckon not those who are killed in Allah's way as dead; nay, they are alive (and) are provided sustenance from their Lord; Rejoicing in what Allah has given them out of His grace and they rejoice for the sake of those who, (being left) behind them, have not yet joined them, that they shall have no fear, nor shall they grieve. They rejoice on account of favor from Allah and (His) grace, and that Allah will not waste the reward of the believers. (As for) those who responded (at Ohud) to the call of Allah and the Apostle after the wound had befallen them, those among them who do good (to others) and guard (against evil) shall have a great reward.
>
> —Chapter 3, *The Family of Imran*, "3.169"-"3.172,"
> M. H. Shakir's translation of the Holy Qur'an

### Submission

Islam is Arabic for submission. In the relationship between the individual and the sacred, the individual's submission to God is required for him or her to be able to reach enlightenment. It begins with the strict balance of power between the student and the teacher.

The teaching of submission within Shiism is based on the idea that to be a good Muslim, it is required that responsibility be accepted for the betrayal at the battle of Karbala, when Husayn, according to tradition, asked his Muslim brothers for help and was let down. Within Shiism, a culture has developed where the guilty conscience of that betrayal is expressed through tragedy and lessened through martyrdom. In a culture where literature and urban myths are intimately linked to tragedy, martyrdom is viewed as a dramatic expression of tragedy. In such a social context, martyrdom is not an aberration, but a manifestation of a culture that revels in tragedy.[47]

Through a process whose goal it is to achieve the divine through submission, the individual learns to renounce the earthly and thus purify the body to disconnect it from its banality, raise it toward the sublime and, step by step, unite the soul with the spiritual, the divine. The final proof that the individual has left the banal, human state is the insight into the meaninglessness of earthly life. This way, earthly values can be disregarded and abandoned in favor of nobler values. Obsession with death leads to a mental state where death is viewed as a sensory incarnation of the ideal. The ideal has an inherent value, and living by it will bring happiness to those who believe in it.[48]

This complex state of affairs is of little use to those who strive to foster martyrs if he is unable to offer the aspiring martyrs something that would appeal to them. Since Islam is based on the Koran, the power of interpretation is a decisive factor for those with the ambition to persuade the aspiring martyrs that his intentions are righteous.

### The Status of the Koran

According to Muslim tradition, the Koran was given to Muhammad by the archangel Gabriel. It was revealed to him in Arabic and written down by him before his death in 632 CE. However, Muhammad never put all of his writings together into one cohesive text.[49] The Muslim world does not deny that the Koran has gone through an evolutionary process, however the common view among Muslims is that the process was over and done with no more than 20 years after the death of Muhammad.[50] Muhammad himself had very little to do with putting together the Koran. The gathering of texts and its final edition is said to have been done through the guidance of the third caliph, Uthman (644–656 CE). This edition, however, is viewed as a base on which the Koran came to continue its development during an additional 200 years. Findings in Yemen, among other places, has showed that some Koranic texts were put together in one book during the 6th century. However, this says nothing of the status of the texts among Muslims during that time.[51] The Koran describes in detail the believers' paradise and the purgatory of the sinners.[52] This way, the Koran is the ultimate recipe for a good and eternal earthly life, which, furthermore, guarantees an equally satisfying existence in the "final time."

The Koran, then, became a "basic document" given by God, delivered to humanity by the archangel Gabriel who appeared before Muhammad who in turn was tasked with becoming God's Prophet a concrete and physical piece of evidence of God's existence and God's will. The Koran is therefore viewed as a tool given by the almighty God to the humans in order for them, in their imperfection, to have the option of choosing a life in accordance with God's wishes. In other words, the Koran is considered to be a gift from God to humanity.

The text of the Koran could never answer all the problems with which an individual finds himself confronted in daily life. Rather, the Koran "the instruction manual" for how life is to be lead needed additional tools to be able to interpret and confirm the authenticity of the original text.

For the deeply religious and God-fearing individual, it was not enough that anyone could claim to know how to interpret the Koran to find answers to current problems. Those who intended to lead their life in accordance with the Koran, and with Muhammad as a role model,

demanded proof that the Prophet really was the source and that what they were practicing was indeed in accordance with God's will. The ones closest to the Prophet, those who had lived with him and were able to tell about how he had lived his life, were found to be suitable witnesses. When the generation of immediate eyewitnesses died, people were forced to settle with what the next generation had been told by the first and so on through history. The reliability of the information is judged by the line of transmission. It was deemed that there were reliable lines of transmission of information about the tradition, from the original eyewitnesses and on, and this was accepted as a compliment to the Koran. These eyewitness accounts of the actions of the Prophet and the ones closest to him came to be called *sunna* (holy tradition), and the way in which these traditions came to be documented and collected came to be known as *hadith*.[53] By presenting the life of the oldest of Muslim societies, the *sunna* is thought to be the most important tool for interpreting the Koran. In short, with the aid of *sunna*, the texts of the Koran become relevant and useful for later generations.[54]

There are, however, valid reasons to be skeptical of *hadith* as a historical source, in part because of the large number of contradicting accounts. For Muslims, this means that to a large degree, they are able to choose what to believe.[55] Some of the *sunnas* are tied directly to the Koran, which could arouse the suspicion that they are created for the specific purpose of strengthening the status of the Koran.

*Sunna* and *hadith* can thus be viewed as a confirmation of the unique and holy status of the Koran, but also as a tool for broadening the relevance of the Koran to new areas. Interpretation gained a large significance for the pious individual striving to lead his life in complete accordance with the Koran. But different interpretations do not necessarily produce the same result. Hence, the power of interpretation came to mean power over how other people lead their lives.

### Schools of Jurisprudence

The status of the religious authorities came, among other things, as a result of people wanting to live in accordance with the teachings of the Koran. The Koran was not read like any other book and interpreted individually. It was read aloud and commented on by a teacher with a claim of one or more links to a long line of authorities whose origin was tied to the one who had written the text and in the matter of the *hadiths*, with a bloodline that could be traced back to the Prophet himself. This way, a system developed that had less to do with transmission of knowledge and more to do with transfer of authority of knowledge. Consequently, the more disciples, the greater religious authority and respect among colleagues.[56]

Some of the most important schools of jurisprudence are:

*Hanafi* (Abu Hanafi d. 767 CE), which dominated Central Asia, Turkey, parts of
  Egypt, and India. The school allowed a greater degree of flexibility through
  personal judgment.
*Malki* (Malik ibn Anas d. 796 CE), which came to dominate North Africa and
  parts of Egypt. The school saw the people of Medina as a precedent to *sunna*.
*Shafi* (Muhammad ibn Idris al-Shafi d. 822 CE), which came to dominate
  Malaysia, Indonesia, East Africa, and parts of Egypt. It is in its foundation
  comparable to *Malki*.
*Hanbali* (Ahmad ibn Hanbal d. 855 CE) is the official school of jurisprudence in
  Saudi Arabia. They propagate for new interpretations rather than the repeti-
  tion and complimenting the interpretations of older jurists.

The schools of jurisprudence developed as local centers of studies tied
to geographical areas where Basra, Kufa, Medina, and Damascus devel-
oped their own traditions and affected others. The differences between
the schools had little to do with method or principle, and were a mat-
ter more of strictly local circumstances. Each school developed its own
*sunna*, which legitimized their own religious authorities and kept foreign
thought at arm's length.[57]
     The systematic buildup of the status of the Koran led to two basic prin-
ciples being formulated. First, the status of the Koran gained the status of
the perfect "instruction manual" given by God via the archangel Gabriel
to humanity as a sign of God's ambition to (through *sunna*) establish ev-
idence of the validity of the idea. Second, the authenticity of *sunna* came
to be established through proof of the connection between individuals in
the present time and the Prophet. Thereby, an exclusive group gained the
legitimacy to be able to decide the status of the Koran and how it could
and should be interpreted. By providing instructions for every detail of
human life, *sunna* and the authorities that interpreted it gained the power
to control the lives of its adherents into the most minute detail.
     The power of interpretation, however, is something that needs to be
protected and nurtured. To be able to argue that your interpretation is the
one and only that is true, it is crucial to be able to argue that all other
interpretations are false.

### Ijima

Ijima means agreement, and is the key to understanding the histori-
cal development of Islam from its political, theological, and legal aspects.
The thinking behind *ijima* is that what is accepted by the entire Muslim
society as right should also become a rule that applies to everyone. To
oppose *ijima* is thus tantamount to turning one's back to the orthodox

community.[58] The Koranic verse that traditionally is said to support *ijima* is "And whoever disobeys Allah and His Apostle and goes beyond His limits, He will cause him to enter fire to abide in it, and he shall have an abasing chastisement."[59] The *hadith* that supports *ijima* refers to a quote from Muhammad where he espoused the view that his congregation cannot agree on something that is not right. *Ijima* developed after the death of Muhammad as a natural consequence of relying on majority rule.[60] In short, everybody cannot be wrong at the same time. From a wider perspective, however, the idea of *ijima* became yet another tool for the enhancement of the power of the elite and its control of Muslim tradition. To oppose *ijima* was to stand outside tradition and be viewed as a dissident.[61]

The status of the Koran was built up by an elite, whose experiences and purported relation to the Prophet could be used by future elites. Through the use of *sunna*, the power could gain legitimacy and preserve its power of interpretation. The schools of jurisprudence and *ijima* became additional building blocks in the fortress of power of the elite. The schools of jurisprudence came to be defined by claims on certain geographical territories rather than differences in their teachings. *Ijima* came to offer a tool to build up the idea of an "us" and a "them." "Everyone agrees" legitimized all decisions and attitudes.

Since the status of the Koran is set and the power of interpretation is fixed, the aspiring martyrs are taught the Islamic code of ethics as an idea that calls upon the followers of Islam to try to affect the lives of those with differing opinions by force.

### The Islamic Code of Ethics

In this context, the Islamic code of ethics can be used as a means to gain the power of interpretation and foster martyrdom. The Islamic code of ethics "to forbid what is wrong" is based on the principle that there is a collective burden of responsibility. However, it is unclear who has the authority and in what situations to decide this. The principle is based on several texts from the Koran and the tradition where the Prophet is said to have called for eradicating wrongful doings by three means: by the hand, by the tongue, and by the heart. This has been the subject of lengthy discussions among religious scholars as to its exact meaning.[62]

The group that has come to be the most important in the discussions surrounding the call to forbid what is wrong was Mu'tazilla. The movement later split into several different groups of opposition, but their thinking lived on in the Hanafi and Hanbali schools of jurisprudence.[63]

The root cause of the splits into different religious groups was mainly the question of legitimacy. The question of "forbidding what is wrong" became a hotly debated issue following the death of the Prophet. The Abbasid caliphs in the sixth and seventh centuries were engaged in the debate by among other things banning alcohol and women's singing. On

the one hand, these caliphs had the power to "forbid what is wrong," but were, on the other hand, in a situation where they could easily "*do* what is wrong." One example is the caliph al-Qahir (r. 932–934 CE) who forbade alcohol and singing, and then ordered singing girls to be paid according to their musical talent, and then bought them for himself. What is interesting is how the rhetoric developed around the term, which changed the nature of the debate from an attempt at moral reform to something that had more to do with political opposition and to form the basis of a regime of one's own and retain power.[64]

In the sixth and seventh centuries, there were regents who established special task forces to make sure that no wrongdoings were committed in, for example, the marketplace. There were even those who, during the 7th century, held the view that it was the responsibility of the regime to send out "moral guardians" into society, just like they sent out tax collectors, to make sure that all wrongdoings were, indeed, banned.

One of the people reticent about allowing the authorities to decide all matters of right and wrong was Ibn Hanbal. The authorities, he felt, cannot guarantee that the wrongdoings are rectified in an adequate manner. He discussed what in terms of international law would be called the principle of proportionality. If a person is suspected of drinking alcohol and is facing punishment of death by whipping, the one who has forbidden the wrong has made an even greater wrong himself.[65]

Generally, religious scholars accept the responsibility of the regime "to forbid what is wrong." During the 10th century, the responsibility of the regime toward the public and the individual was discussed in detail. In order for the regime to enforce the law, and punish people's wrongdoings, the punishment needed to be legitimate in the eyes of the people.

Thus, there are a number of scholars who claim that it is the responsibility of the individual to oppose a regime that is acting wrongfully. One of the most prominent proponents of this idea was Malik, who claimed that it is the responsibility of every Muslim to oppose power. On the other hand, Jafar al-Sadiq claimed that there are no rewards for those who have gotten into trouble for criticizing the regime.

The authority's monopoly on deciding how wrongdoings should be forbidden cannot always be taken for granted. Maliki Ibn al-Hajj (d. 1336) points out that the fact that just because a person is neither learned nor an authority, does not necessarily mean that he is unable to "forbid what is wrong." In the matter of "forbidding what is wrong," a discussion arose of where the line should be drawn between the public and the personal sphere. When is something "my problem," and when does it become something that should be addressed by "others?" And if it is addressed and taken out into the public sphere, is there a risk that the consequences that such an action would bring to the individual is not proportional to the crime? And does that give "us," who are right, an excuse to exclude from our community a person who we feel is wrong?

In the modern Muslim state, the argument to "forbid what is wrong" has been used by regimes to institutionalize and control the society. At the same time, organizations concerned with human rights issues have been able to refer to the same principle. To interpret this code of ethics as an argument for martyrdom is indeed possible, arguing that he who dies to prevent what is wrong dies a martyr.[66]

## CONCLUSION

The Muslim world is in a transitional state, moving away from traditional structures and toward objectification. Groups of frustrated young Muslim men (and a few women) with a feeling of purposelessness are seeking loftier goals to pin their existence on.

The claim that those who aspire to become martyrs suffer from mental illnesses as a result of a traumatic childhood or poverty is disputed by practically all available facts. Bad education and substandard social conditions do not explain why a person decides to become a suicide murderer.

A break with one's homeland and family creates a sense of rootlessness. In small groups of likeminded people, the feeling of belonging is regained. In these small groups, a mental state develops where emphasis is put on loyalty and commitment to a common cause, which ties the individuals together into a new family. There are no common characteristics in all of these individuals, which would allow one to know in advance who they are. They have no commonalities when it comes to social, economic, or psychological backgrounds. What ties them together is the fact that they live in a foreign country, are gravely frustrated with the world, and that they are Muslim.

The interpretation of the Koran is the foundation. The power of interpretation of the texts of the Koran is attainable in the same way as it has been attained throughout the history of Islam. It should, by no means, be concluded that Islam is a religion more prone to violence than any other religion, or that Muslims are more violent than other people. It does, however, mean that one does not have to work particularly hard in order to find Islamic texts that support the idea of martyrdom. The combination of the situation of the aspiring martyrs and individuals with the aim of channeling the frustration of these young men to their benefit is devastating. In cases like this, it is sufficient to refer to preexisting ideas, focus on them, and channel the need of a higher purpose and a new structure toward a struggle against the tyranny of radical Islamism.

# CHAPTER 20

## TERRORISM AND NEW MEDIA: THE CYBER-BATTLESPACE

Maura Conway

This chapter has very little to offer about so-called "cyberterrorism" (i.e., acts of terrorism carried out using the Internet and/or against Internet infrastructures);[1] instead, it is centrally concerned with what David Resnick describes as "political uses of the Net"—the employment of the Internet by ordinary citizens, political activists, organized interests, governments, and others to achieve political goals that have little or nothing to do with the Internet *per se*.[2] Specifically, the focus here is on the use(s) made of the Internet by terrorist groups. What are terrorist groups attempting to do by gaining a foothold in cyberspace? A small number of researchers have addressed this question in the past 5 years.[3] Probably the best known of these analyses is a recent report by Gabriel Weimann that identifies eight major ways in which, he says, terrorists currently use the Internet: psychological warfare, publicity and propaganda, data mining, fundraising, recruitment and mobilization, networking, information sharing, and planning and coordination.[4] Similarly, research by other scholars—like Cohen, Furnell and Warren, and Thomas[5]—suggest five core terrorist uses of the Net: information provision, recruitment, financing, networking, and information gathering. This chapter offers an analysis of all of these, as well as potential responses to the increasing terrorist reliance on the Internet. Initially, however, a brief explanation as to why the Internet is viewed by terrorists as such an attractive tool is in order.

### WHY THE INTERNET?

Thomas Friedman has argued that contemporary globalization "goes farther, faster, cheaper, and deeper."[6] He might have been describing the

Internet. The Internet is a powerful tool, which is used and manipulated by actors to accomplish a wide variety of tasks. The globally networked nature of the Internet allows users to access a nearly limitless supply of information and data that can be shared across the network. People can use the Internet to educate themselves, to entertain themselves, to conduct business, to shop, or to engage in political action. There is no *a priori* reason, however, why actors should use the Internet to engage in these activities over any other potential tool that will garner the same result. As with any tool, the Internet does not exist in a vacuum; rather, actors are presented with different options and make choices based on relative advantages. If actors are to use the Internet, it must offer relative advantages over other potential tools. If no such comparative benefit exists, actors will see no utility in using the Internet, opting instead for some other, more effective, option.

There are nine key properties of the Internet that render it different from traditional media and a key instrumental power source:

– *Volume*: Far larger volumes of information can be transferred easily compared with previous modes of communication.

– *Speed*: The ability to compress data and more space for transmitting data decrease the amount of time it takes to exchange information.

– *Format*: The ability to combine text, graphics, audio, and video means that in-depth, dynamic, and visually stimulating communication is possible simultaneously.

– *Direction*: The possibilities for two-way interactive communication are greatly expanded on the Internet as a result of the greater space and speed, but also due to the enhanced relationships arising out of hypertext linkage between sites.

– *Individual Control*: The opening up of control over direction in the sending and receiving of information means that power is decentralized to the individual user, who has the choice of not only what to view, but also what to publish.

– *Anonymity*: Internet users enjoy a large measure of anonymity. There are numerous information security applications that allow customers to conceal their identity, the content of their communications, or the details of their transactions. These include free e-mail services, electronic remailers, anonymizers, and widely available encryption and steganographic tools.

– *Evasion of Government Control*: The primary way in which actors may evade government control is through operating their Web site(s) in jurisdictions with high levels of free speech protection. The various tools identified above may also be used to avoid censorship.

– *Reduced Transaction Costs*: Registering a Web site costs less than U.S.$50 and many Internet sites allow users to create Web sites at no cost at all. Free e-mail services are commonplace on the Internet, while newsgroups and message postings are likewise available at no cost.

– *Global Scope*: Perhaps most importantly, these low-cost Internet technologies allow users to transmit and share information globally almost instantaneously. The networked structure of the Internet finds the quickest and most effective route for information flows. Web sites from anywhere in the world take only seconds to load while e-mails can circle the globe in an instant.

In summary, then, Internet-based communication has the potential to be more immediate, individual, dynamic, in-depth, interactive, anonymous, unedited, cheaper, and far-reaching than is possible in conventional media. Terrorists are well aware of these properties of the Internet and this explains why they have taken to the medium with such alacrity.

## THE FIVE CORE TERRORIST USES OF THE INTERNET

### Information Provision

This refers to efforts by terrorists to engage in publicity, propaganda, and (ultimately) psychological warfare. As terrorism researcher Gus Martin has observed, "In the modern era, the truism that 'information is power' is very clearly understood by the media and governments; it is also understood by terrorists, their audiences, and their adversaries."[7] The Internet, and the advent of the World Wide Web in particular, have significantly increased the opportunities for terrorists to secure publicity. This can take the form of historical information, profiles of leaders, manifestos, etc. But terrorists can also use the Internet as a tool of psychological warfare through spreading disinformation, delivering threats, and disseminating horrific images, such as the beheading of American entrepreneur Nick Berg in Iraq and U.S. journalist Daniel Pearl in Pakistan.[8] These functions are clearly improved by the Web's enhanced volume, increased speed of data transmission, low cost, relatively uncontrolled nature, and global reach.

In the past, those characterized as "terrorists" were rarely accepted by the mass media as legitimate or authoritative sources of news in their own right. Neither were they accepted as reliable commentators upon the political situation that had given rise to the violence: As Susan Carruthers has argued, "Certainly, on the few occasions when the BBC or ITV interviewed Republican paramilitaries in the 1970s and 1980s, they were emphatically not, as a matter of policy, treated as individuals whose opinions could be accorded the same respect and due consideration as others."[9] By concentrating almost exclusively on the violent dimension of terrorism, making no attempt to contextualize its causes, media reports often leave readers, viewers, or listeners mystified as to the motivation of violent acts.[10] An unfortunate result of this is that many in the media audience take these

acts to be simply the senseless, inexplicable behavior of psychotic fundamentalists or extremist lunatics.[11]

The establishment of dedicated Web sites, on the other hand, offers terrorist groups an unprecedented level of direct control over the content of their message(s). It considerably extends their ability to shape how different target audiences perceive them and to manipulate not only their own image, but also the image of their enemies. Although for many groups, their target audience may be small, an Internet presence is nonetheless expected. Regardless of the number of hits a Web site receives, a well-designed and well-maintained Web site gives a group an aura of legitimacy, while also seeking to advance the organization's political and ideological agenda. The latter is a core function in and of itself, but clearly the site's information provision role also evidences significant overlaps with the other terrorist uses of the Internet described below, particularly recruitment.

### Recruitment

This refers to groups' efforts to recruit and mobilize sympathizers to more actively support terrorist causes or activities. The Web offers a number of ways for achieving this: it makes information gathering easier for potential recruits by offering more information, more quickly, and in multimedia format; the global reach of the Web allows groups to publicize events to more people; and by increasing the possibilities for interactive communication, new opportunities for assisting groups are offered, along with more chances for contacting the group directly. Finally, through the use of discussion forums, it is also possible for members of the public— whether supporters or detractors of a group—to engage in debate with one another. This may assist the terrorist group in adjusting their position and tactics and, potentially, increasing their levels of support and general appeal.[12]

Online recruitment by terrorist organizations is said to be widespread. Harris et al. provide the example of an Iranian site that boasts an application for suicide bombers guaranteeing that the new "martyr" will take 70 relatives with him into heaven. If the recruit is unsure about joining, or if the group is unsure about the recruit, he is directed to a chatroom where he is "virtually" vetted. If he passes muster, he will be directed to another chatroom for further vetting, and finally contacted personally by a group member. This process is said to be aimed at weeding out "undesirables" and potential infiltrators.[13] It is more typical, however, for terrorist groups to actively solicit for recruits rather than waiting for them to simply present themselves. Weimann suggests that terrorist recruiters may browse online chatrooms looking for receptive members of the public, particularly young people. Electronic bulletin boards could also serve as vehicles for reaching out to potential recruits.[14]

### Financing

This refers to efforts by terrorist groups to raise funds for their activities. Money is terrorism's lifeline; it is what Loretta Napoleoni calls "the engine of the armed struggle."[15] The immediacy and interactive nature of Internet communication, combined with its high-reach properties, opens up a huge potential for increased financial donations, as has been demonstrated by a host of nonviolent political organizations and civil society actors. Terrorists seek financing via their Web sites and by using the Internet infrastructure to engage in resource mobilization using illegal means.

Numerous terrorist groups request funds directly from Web surfers who visit their sites. Such requests may take the form of general statements underlining the organization's need for money; more often than not, however, requests are more direct, urging supporters to donate immediately and supplying either bank account details or an Internet payment option. For example, the IRA's main Web site contains a page on which visitors can make credit card donations.[16] At one point, the Ulster Loyalist Information Service—which was affiliated with the Loyalist Volunteer Force (LVF)—accepted funds via PayPal, and invited those who were "uncomfortable with making monetary donations" to donate other items, including bullet-proof vests. Another way in which groups raise funds is through the establishment of online stores and the sale of items such as books, audio and video tapes, flags, T-shirts, etc.

The Internet facilitates terrorist financing in a number of other ways besides direct solicitation via Web sites. According to Jean-Francois Ricard, one of France's top antiterrorism investigators, many Islamist terror plots are financed through credit card fraud.[17] Imam Samudra, sentenced to death for his part in the Bali bombing of 2002, has published a prison memoir of some 280 pages, which includes a paper that acts as a primer on "carding."[18] According to Dutch experts, there is strong evidence from international law enforcement agencies such as the FBI that at least some terrorist groups are financing their activities via advanced fee fraud, such as Nigerian-style scam e-mails. While to date, solid evidence for such claims has not entered the public realm,[19] there is ample evidence to support the contention that terrorist-affiliated entities and individuals have established Internet-related front businesses as a means of raising money to support their activities. For example, in December 2002, InfoCom—a Texas-based ISP—was indicted along with its individual corporate officers on 33 counts relating to its provision of communication services, in-kind support, and funds to terrorist organizations including Hamas and its affiliate the Holy Land Foundation for Relief and Development (HLFRD). InfoCom's capital was donated primarily by Nadia Elashi Marzook, wife of Hamas figurehead Mousa Abu Marzook.[20]

Terrorist organizations have a history of exploiting not just businesses, but also charities as undercover fundraising vehicles. This is particularly

popular with Islamist terrorist groups, because of the injunction that observant Muslims make regular charitable donations. In some cases, terrorist organizations have actually established charities with allegedly humanitarian purposes. Examples of such undertakings include Mercy International, Wafa al-Igatha al-Islamiya, Rabita Trust, Al Rasheed Trust, Global Relief Fund, Benevolence International Foundation, and Help the Needy. Along with advertising in sympathetic communities' press, these "charities" also advertised on Web sites and chatrooms with Islamic themes, directing interested parties to visit their Web sites.

Terrorists have also infiltrated branches of existing charities to raise funds clandestinely. Many such organizations do provide the humanitarian services that they advertise: feeding, clothing, and educating the poor and illiterate, and providing medical care for the sick. However, some organizations, in addition to pursuing their publicly stated mission of providing humanitarian aid, also pursue a covert agenda of providing material support to militant groups. These organizations' Web-based publicity materials may or may not provide hints as to their secret purposes.

### Networking

This refers to groups' efforts to flatten their organizational structures and act in a more decentralized manner through the use of the Internet, which allows dispersed actors to communicate quickly and coordinate effectively at low cost. The Internet allows not only for intragroup communication, but also intergroup connections. The Web enhances terrorists' capacities to transform their structures and build these links because of the alternative space it provides for communication and discussion and the hypertext nature of the Web, which allows for groups to link to their internal subgroups and external organizations around the globe from their central Web site.

*Transforming Organizational Structures*: For several years, RAND's John Arquilla, David Ronfeldt, and Michele Zanini have been pointing to the emergence of new forms of terrorist organizations that are attuned to the information age. They contend that: "terrorists will continue to move from hierarchical toward information-age network designs. More effort will go into building arrays of transnationally internetted groups than into building stand-alone groups."[21] This type of organizational structure is qualitatively different from traditional hierarchical designs. Terrorists are ever more likely to be organized to act in a more fully networked, decentralized, "all-channel" manner. Ideally, there is no single, central leadership, command, or headquarters. Within the network as a whole there is little or no hierarchy and there may be multiple leaders depending upon the size of the group. In other words, there is no specific heart or head that can be targeted. To realize its potential, such a network must utilize

the latest information and communications technologies. The Internet is becoming an integral component of such organizations, according to the RAND analysts.[22]

*Planning and Coordination*: As Peter Margulies observes, "Many terrorist groups share a common goal with mainstream organizations and institutions: the search for greater efficiency through the Internet."[23] Several reasons have been put forward to explain why modern IT systems, especially the Internet, are so useful for terrorists in establishing and maintaining networks. As already discussed, new technologies enable quicker, cheaper, and more secure information flows. In addition, the integration of computing with communications has substantially increased the variety and complexity of the information that can be shared.[24]

This led Michele Zanini to hypothesize that "the greater the degree of organizational networking in a terrorist group, the higher the likelihood that IT is used to support the network's decision making."[25] Zanini's hypothesis appears to be borne out by recent events. For example, many of the terrorists indicted by the United States government since 9/11 communicated via e-mail. The indictment of four members of the Armed Islamic Group (Gama'a al-Islamiyya) in Algeria alleges that computers were used "to transmit, pass and disseminate messages, communications and information between and among IG leaders and members in the United States and elsewhere around the world."[26] Similarly, six individuals indicted in Oregon in 2002 allegedly communicated via e-mail regarding their efforts to travel to Afghanistan to aid al Qaeda and the Taliban in their fight against the United States.[27]

The Internet has the ability to connect not only members of the same terrorist organizations but also members of different groups. For example, hundreds of so-called "jihadist" sites exist that express support for terrorism. According to Weimann, these sites and related forums permit terrorists in places as far-flung as Chechnya, Palestine, Indonesia, Afghanistan, Turkey, Iraq, Malaysia, the Philippines, and Lebanon to exchange not only ideas and suggestions, but also practical information about how to build bombs, establish terror cells, and ultimately perpetrate attacks.[28]

*Mitigation of Risk*: As terrorist groups come under increasing pressure from law enforcement, they have been forced to evolve and become more decentralized. This is a structure to which the Internet is perfectly suited. The Internet offers a way for like-minded people located in different communities to interact easily, which is particularly important when operatives may be isolated and required to "lie low." Denied a physical place to meet and organize, many terrorist groups are alleged to have created virtual communities through chatrooms and Web sites in order to continue spreading their propaganda, teaching, and training. Clearly, as Patrick Tibbetts argues, "information technology gives terrorist organizations global power and reach without necessarily compromising their

invisibility."[29] Timothy Thomas adds that the Internet "puts distance between those planning the attack and their targets ... [and] provides terrorists a place to plan without the risks normally associated with cell or satellite phones."[30]

### Information Gathering

This refers to the capacity of Internet users to access huge volumes of information, which was previously extremely difficult to retrieve as a result of its being stored in widely differing formats and locations. Today, there are literally hundreds of Internet tools that aid in information gathering; these include a range of search engines, millions of subject-specific e-mail distribution lists, and an almost limitless selection of esoteric chat and discussion groups. One of the major uses of the Internet by terrorist organizations is thought to be information gathering. Unlike the other uses mentioned above, terrorists' information gathering activities rely not on the operation of their own Web sites, but on the information contributed by others to "the vast digital library" that comprises the Internet.[31] There are two major issues to be addressed here. The first may be termed "data mining" and refers to terrorists using the Internet to collect and assemble information about specific targeting opportunities. The second issue is "information sharing," which refers to more general online information collection by terrorists.

*Data Mining*: In January 2003, U.S. Defense Secretary Donald Rumsfeld warned in a directive sent to military units that too much unclassified, but potentially harmful material was appearing on Department of Defense (DoD) Web sites. Rumsfeld reminded military personnel that an al Qaeda training manual recovered in Afghanistan instructs its readers that: "Using public sources openly and without resorting to illegal means, it is possible to gather at least eighty percent of information about the enemy." He went on to say, "At more than 700 gigabytes, the DoD Web-based data makes a vast, readily available source of information on DoD plans, programs and activities. One must conclude our enemies access DoD Web sites on a regular basis."[32]

In addition to information provided by and about the armed forces, the free availability of information on the Internet about the location and operation of nuclear reactors and related facilities was of particular concern to public officials after 9/11. Roy Zimmerman, director of the Nuclear Regulatory Commission's (NRC) Office of Nuclear Security and Incident Response, said the 9/11 attacks highlighted the need to safeguard sensitive information. In the days immediately after the attacks, the NRC took their Web site entirely off-line. When it was restored weeks later, it had been purged of more than 1,000 sensitive documents. Initially, the agency decided to withhold documents if "the release would provide

clear and significant benefit to a terrorist in planning an attack." Later, the NRC tightened the restriction, opting to exclude information "that could be useful or could reasonably be useful to a terrorist." According to Zimmerman, "it is currently unlikely that the information on our Web site would provide significant advantage to assist a terrorist."[33]

The measures taken by the NRC were not exceptional. According to a report produced by OMB Watch,[34] since 9/11 thousands of documents and tremendous amounts of data have been removed from U.S. government sites. The irony, however, is that much of the same information remains available on private sector Web sites.[35] Patrick Tibbetts points to the Animated Software Company's Web site, which has off-topic documents containing locations, status, security procedures, and other technical information concerning dozens of U.S. nuclear reactors,[36] while the Virtual Nuclear Tourist site contains similar information. The latter site is particularly detailed on specific security measures that may be implemented at various nuclear plants worldwide.[37] Many people view such information as a potential gold mine for terrorists. Their fears appear well founded given the capture of al Qaeda computer expert Muhammad Naeem Noor Khan in Pakistan in July 2004, which yielded a computer filled with photographs and floor diagrams of buildings in the United States that terrorists may have been planning to attack.[38]

## SHARING INFORMATION

Policymakers, law enforcement agencies, and others are also concerned about the proliferation of "how to" Web sites devoted to explaining (for example) the technical intricacies of making homemade bombs. Many such devices may be constructed using lethal combinations of otherwise innocuous materials; today, there are hundreds of freely available online manuals containing such information. As early as April 1997, the U.S. Department of Justice had concluded that the availability of this information played a significant role in facilitating terrorist and other criminal acts.[39]

As an example, Jessica Stern points to *Bacteriological Warfare: A Major Threat to North America* (1995), which is described on the Internet as a book for helping readers survive a biological weapons attack and is subtitled "What Your Family Can Do Before and After." However, it also describes the reproduction and growth of biological agents and includes a chapter entitled "Bacteria Likely to be Used by the Terrorist." The text is available for download, in various edited and condensed formats, from a number of Web sites, while hard copies of the book are available for purchase over the Internet from major online booksellers for as little as $13.[40]

More recently, an al Qaeda laptop found in Afghanistan had been used to visit the Web site of the French Anonymous Society (FAS) on several occasions. The FAS site publishes a two-volume *Sabotage Handbook* that

contains sections on planning an assassination and antisurveillance methods amongst others.[41] A much larger manual, nicknamed *The Encyclopedia of Jihad* and prepared by al Qaeda, runs to thousands of pages; distributed via the Web, it offers detailed instructions on how to establish an underground organization and execute terror attacks.[42]

This kind of information is sought out not only by sophisticated terrorist organizations but also by disaffected individuals prepared to use terrorist tactics to advance their idiosyncratic agendas. In 1999, for instance, rightwing extremist David Copeland planted nail bombs in three different areas of London: multiracial Brixton, the largely Bangladeshi community of Brick Lane, and the gay quarter in Soho. Over the course of 3 weeks, he killed three people and injured 139. At his trial, he revealed that he had learned his deadly techniques from the Internet by downloading copies of *The Terrorist's Handbook* and *How to Make Bombs: Book Two.* Both titles are still easily accessible.[43]

### THE OPEN SOURCE THREAT?

The threat posed by the easy availability of bomb-making and other "dangerous information" is a source of heated debate. Patrick Tibbetts warns against underestimating the feasibility of such threats. He points out that captured al Qaeda materials include not only information compiled on "home-grown explosives," but also indicate that this group is actively pursuing data and technical expertise necessary to pursue CBRN weapons programs. According to Ken Katzman, a terrorism analyst for the Congressional Research Service, much of the material in these captured documents was probably downloaded from the Internet.[44] As a result, many have called for laws restricting the publication of bomb-making instructions on the Internet. Others, however, have pointed out that this material is already easily accessible in bookstores and libraries.[45] In fact, much of this information has been available in print media since at least the late 1960s, with the publication of William Powell's *The Anarchist Cookbook* and other, similar titles.

Jessica Stern recently observed that "In 1982, the year of the first widely reported incident of tampering with pharmaceuticals, the Tylenol case, only a few poisoning manuals were available, and they were relatively hard to find."[46] This is doubtless true; they were hard to find, but they *were* available. As Stern concedes, how-to manuals on producing chemical and biological agents are not just available on the Internet, but are also currently advertised in paramilitary journals sold in magazine shops all over the United States.[47] According to a U.S. government report, over 50 publications describing the fabrication of explosives and destructive devices are listed in the Library of Congress and are available to any member of the public, as well as being easily available commercially.[48] Despite

assertions to the contrary,[49] the infamous *Anarchist Cookbook* (1971) is not available online, although it is easily purchased from bookstores or on-line retailers. The anonymous authors of Web sites claiming to post the *Cookbook* and similar texts often include a disclaimer that the processes described should not be carried out. This is because many of the "recipes" have a poor reputation for reliability and safety.

Perhaps the most likely "recipes" to be of use to terrorists are those re-lated to hacking tools and activities. Such information is also likely to be considerably more accurate than bomb-making information, for example; this is because the Internet is both the domain and tool of hackers. In a tes-timony before the U.S. House Armed Services Committee in 2003, Purdue University professor and information assurance expert, Eugene Spafford described how bulletin boards and discussion lists teach hacking tech-niques to anyone: "We have perhaps a virtual worldwide training camp," he testified.[50] Terrorists have been known to exploit this resource. In 1998, Khalid Ibrahim, who identified himself as an Indian national, sought clas-sified and unclassified U.S. government software and information, as well as data from India's Bhabha Atomic Research Center, from hackers com-municating via Internet Relay Chat (IRC). Using the online aliases RahulB and Rama3456, Ibrahim began frequenting online cracker hangouts in June 1998. In conversations taken from IRC logs, Ibrahim claimed to be a member of Harkat-ul-Ansar, a militant Kashmiri separatist group.[51]

Finally, it is important to keep in mind that removal of technical in-formation from public Web sites is no guarantee of safeguarding it. In essence, this effort is akin to "closing the barn door after the horse has bolted." Intelligence and technical data obtained by terrorist operatives prior to 9/11 can be archived, stored, and distributed surreptitiously re-gardless of government or private attempts to squelch its presence on the Internet today. Indeed, these materials can be loaded onto offshore or other international Web servers that cannot be affected by U.S. legislation, rendering any attempt to halt their spread outside the reach of American law enforcement.[52]

## FIGHTING BACK

In his 1996 assessment of the Internet, Charles Swett suggested that as more foreign officials, military officers, business people, and journalists got e-mail addresses, the Internet could be used as a medium for psycho-logical operations campaigns. The Internet, he said, could rapidly convey the official government perspective on a host of important issues to a wide and influential audience.[53] To date, however, most official government Web sites are limited to routine public affairs, whereas it is commonplace on the Web to see public diplomacy conducted on behalf of a host of polit-ical dissenters, including terrorists. Use of the Internet is a double-edged

sword for terrorists, however. They are not the only groups "operating" on the Internet, which can act as a valuable tool for antiterrorist forces also. The more terrorist groups use the Internet to move information, money, and recruits around the globe, the more data is available with which to trail them. Since 9/11, a number of groups have undertaken initiatives to disrupt terrorist use of the Internet, although a small number of such efforts were also undertaken previous to the attacks. Law enforcement agencies have been the chief instigators of such initiatives, but they have been joined in their endeavors by other government agencies as well as concerned individuals and various groups of hacktivists.

### The Role of Law Enforcement and Intelligence Agencies

*Intelligence Gathering*: The bulk of this chapter has been concerned with showing how the Internet can act as a significant source of instrumental power for terrorist groups. Use of the Internet can nonetheless also result in significant undesirable effects for the same groups. First, unless terrorists are extremely careful in their use of the Internet for e-mail communication, general information provision, and other activities, they may unwittingly supply law enforcement agencies with a path directly to their door. Second, by putting their positions and ideological beliefs in the public domain, terrorist groups invite opposing sides to respond to these. The ensuing war of words may backfire against the terrorists, as adherents and potential recruits are drawn away.[54] Perhaps most importantly, however, the Internet and terrorist Web sites can serve as a provider of open source intelligence for states' intelligence agencies. Although spy agencies are loathe to publicly admit it, it is generally agreed that the Web is playing an evergrowing role in the spy business.

According to the 9/11 Commission's *Staff Statement No. 11*, "open sources—the systematic collection of foreign media—has always been a bedrock source of information for intelligence. Open source remains important, including among terrorist groups that use the media and the Internet to communicate leadership guidance."[55] By the 1990s, the U.S. government's Foreign Broadcast Information Service (FBIS) had built a significant translation effort regarding terrorism-related media. Thus, many now believe that terrorists' presence on the Internet actually works against them. "A lot of what we know about al-Qaeda is gleaned from [their] Web sites," according to Steven Aftergood, a scientist at the Federation of American Scientists in Washington, DC, and director of the nonprofit organization's Project on Government Secrecy.[56] "They are a greater value as an intelligence source than if they were to disappear."[57] For example, Web sites and message boards have been known to function as a kind of early warning system. Two days before the 9/11 attacks, a message appeared on the popular Dubai-based Alsaha.com discussion forum proclaiming that

"in the next two days," "a big surprise" would come from the Saudi Arabian region of Asir. The remote province adjacent to Yemen was where most of the 19 hijackers hailed from.[58]

Innovations such as the FBIS, while useful, do not tell the whole story, however. The problem begins with the sheer volume of information floating about in cyberspace. According to the 9/11 Commission's *Staff Statement No. 9*, prior to 9/11 the FBI did not have a sufficient number of translators proficient in Arabic and other relevant languages, which by early 2001 had resulted in a significant backlog of untranslated intelligence intercepts. In addition, prior to 9/11, the FBI's investigative activities were governed by Attorney General Guidelines, first put in place in 1976 and revised in 1995, to guard against the misuse of government power. The Guidelines limited the investigative methods and techniques available to FBI agents conducting preliminary investigations of potential terrorist activities. In particular, they prohibited the use of publicly available source information, such as that found on the Internet, unless specified criteria were present.[59] These guidelines have since been modified, and terrorist Web sites are thought to be under increased surveillance since 9/11, especially by Western intelligence agencies.[60] This task remains gargantuan, however; information gleaned from the Internet must be corroborated and verified before it can be added to the intelligence mix. This requires significant input of operatives and resources.

*Technological Fixes*: Given the above, it is unsurprising that many U.S. officials and commentators are recommending that any additional funds that become available to the intelligence agencies be spent on human intelligence capabilities, rather than new technology. Others, however, are convinced that new technologies need to be developed and deployed in the fight against terrorism. They bemoan the fact that prior to 9/11, "Signals intelligence collection against terrorism, while significant, did not have sufficient funding within the NSA. The NSA's slow transformation meant it could not keep pace with advances in telecommunications."[61] Although DCS-1000—more commonly known as Carnivore—the FBI's e-mail packet-sniffer system has not been employed since 2002, Bureau officials have instead employed commercially available monitoring applications to aid in their investigations. Intelligence agencies are also said to be deploying the classic spy tactic of establishing so-called "honey pots" with a high-tech twist: in this case, setting up bogus Web sites to attract those people they are seeking to monitor.[62] Numerous other technological fixes are also in the works.

### Other Innovations

It should be clear at this stage that the events of 9/11 impacted intelligence and law enforcement agencies not only in the United States, but

also around the world. For example, in the United Kingdom, the British Security Service (MI5) took the unprecedented step of posting an appeal for information about potential terrorists on dissident Arab Web sites. The message, in Arabic, was placed on sites that the authorities knew were accessed by extremists, including "Islah.org," a Saudi Arabian opposition site, and "Qoqaz.com," a Chechen site that advocated *jihad*. The message read:

> The atrocities that took place in the U.S.A. on 11 September led to the deaths of about five thousand people, including a large number of Muslims and people of other faiths. MI5 (the British Security Service) is responsible for countering terrorism to protect all U.K. citizens of whatever faith or ethnic group. If you think you can help us to prevent future outrages, call us in confidence on 020-7930 9000.

The leaders of MI5 were hoping to elicit information from persons on the margins of extremist groups or communities who were sufficiently shocked by the events of 9/11 that they would want to contact the agency. The agency had intended to post the message on a further 15 sites known to be accessed by radicals, but many of these were shut down by the FBI in the aftermath of the attacks.[63] The events of 9/11 prompted numerous states' intelligence agencies to reappraise their online presence. Since 2001 MI5 has substantially enhanced its Web site, while in 2004 Israel's Mossad spy agency launched a Web site aimed at recruiting staff.

### Other Agencies: Sanitizing Government Sites

The U.S. government Web sites were vital repositories of information for Internet users in the days and weeks following the 9/11 attacks. The sites became important venues for those both directly and indirectly affected by the events of 9/11, members of the public wishing to donate to the relief efforts, and the various agencies' own employees, some of whom were victims of the attacks (or later of the anthrax scares).[64]

While some agencies were uploading information onto the Internet, however, others were busy erasing information from their sites. To avoid providing information that might be useful to terrorists planning further attacks, federal agencies—as well as some state and private Web page operators—took large amounts of material off the Internet in the wake of the 9/11 attacks. Some of the erasures were voluntary; others were carried out following requests from U.S. government departments. As mentioned earlier, the Nuclear Regulatory Commission, which regulates American nuclear power plants, closed down its Web site for a period following a request from the Department of Defense that it do so. Although

no other agency removed its entire site, pages were erased from the Web sites of the Department of Energy, the Interior Department's Geological Survey, the Federal Energy Regulatory Commission, the Environmental Protection Agency, the Federal Aviation Administration, the Department of Transportation's Office of Pipeline Safety, the National Archives and Records Administration, the NASA Glenn Research Center, the International Nuclear Safety Center, the Los Alamos National Laboratory, the Bureau of Transportation Statistics' Geographic Information Service, and the National Imagery and Mapping Agency.[65]

What sorts of information was removed from the sites? The Environmental Protection Agency (EPA) removed from its site thousands of chemical industry risk management plans dealing with hazardous chemical plants. Department of Transportation officials removed pipeline mapping information as well as a study describing risk profiles of various chemicals, while the Bureau of Transportation Statistics removed the National Transportation Atlas Databases and the North American Transportation Atlas, which environmentalists had used to assess the impact of transportation proposals. The Center for Disease Control and Prevention removed a *Report on Chemical Terrorism* that described industry's shortcomings in preparing for a possible terrorist attack.[66] Many of the agencies posted notices that the information had been removed because of its possible usefulness to terrorists.

### Hackers and Hacktivists

Hackers also took to the Net in the aftermath of the terror attacks, some to voice their rage, others to applaud the attackers. A group calling themselves the Dispatchers proclaimed that they would destroy Web servers and Internet access in Afghanistan and also target nations that support terrorism. The group proceeded to deface hundreds of Web sites and launch Distributed Denial of Service (DoS) attacks against targets ranging from the Iranian Ministry of the Interior to the Presidential Palace of Afghanistan. Another group, known as Young Intelligent Hackers against Terror (YIHAT) claimed, in mid-October 2001, to be negotiating with one European and one Asian government to "legalize" the group's hacking activities in those states. The group's founder, Kim Schmitz, claimed the group breached the systems of two Arabic banks with ties to Osama bin Laden, although a spokesperson for the bank denied any penetration had occurred. The group, whose stated mission is to impede the flow of money to terrorists, issued a statement on their Web site requesting that corporations make their networks available to group members for the purpose of providing the "electronic equivalent to terrorist training camps." Later, their public Web site was taken off-line, apparently in response to attacks from other hackers.[67]

Not all hacking groups were supportive of the so-called "hacking war." On September 14, 2001, the Chaos Computer Club, an organization of German hackers, called for an end to the protests and for all hackers to cease vigilante actions. They called instead for global communication to resolve the conflict: "we believe in the power of communication, a power that has always prevailed in the end and is a more positive force than hatred."[68] A well-known group of computer enthusiasts known as Cyber Angels, who promote responsible behavior, also spoke out against the hacking war. They sponsored television advertisements in the United States urging hackers to help gather information and intelligence on those who were participating in this hacktivism.[69] In any event, the predicted escalation in hack attacks[70] did not materialize. In the weeks following the attacks, Web page defacements were well publicized, but the overall number and sophistication of these remained rather low. One possible reason for the nonescalation of attacks could be that many hackers—particularly those located in the United States—were wary of being negatively associated with the events of 9/11, and curbed their activities as a result.

Since 9/11 a number of Web-based organizations have been established to monitor terrorist Web sites. One of the most well known of these is Internet Haganah,[71] self-described as "an Internet counterinsurgency." Also prominent is the Washington DC-based Search for International Terrorist Entities (SITE) Institute[72] that, like Internet Haganah, focuses on Islamic terror groups. Clients of SITE's fee-based intelligence service are said to include the FBI, Office of Homeland Security, and various media organizations. SITE's cofounder and director, Rita Katz, has commented that "It is actually to our benefit to have some of these terror sites up and running by American companies. If the servers are in the U.S., this is to our advantage when it comes to monitoring activities."[73] Aaron Weisburd, who runs Internet Haganah out of his home in Southern Illinois, says his goal is to keep the extremists moving from address to address: "The object isn't to silence them—the object is to keep them moving, keep them talking, force them to make mistakes, so we can gather as much information about them as we can, each step of the way."[74]

## CONCLUSION

Terrorism is generally conceived as physical acts of violence intended to produce fear, and conjures up images of exploding bombs and mutilated bodies. The cyberterrorist threat as portrayed in the mass media builds upon this aspect of terrorism by seeking to convince the public that cyberterrorism will ultimately result in mass casualties. There is another dimension to terrorism, however: the information dimension, which terrorists exploit every bit as much as the physical. Death and destruction are not usually the terrorists' ultimate goal; it is power and

influence. Terrorists seek political and social change, and their objective is to influence populations in ways that support that change. To accomplish this, they engage not just in physical, but also information operations, and the integration of these.

Up until very recently, cyberterrorism was presented as the sole intersection of terrorism and the Internet, even in the face of contrary evidence. The one-sided nature of the analysis only became apparent to many when, in a little over 4 weeks in April and May 2004, an Islamic extremist named Abu Musab-al Zarqawi "rocketed to worldwide fame, or infamy, by a deliberate combination of extreme violence and Internet publicity." In early April 2004, Zarqawi posted online a 30-minute audio recording that explained who he was, why he was fighting, and details of the attacks for which he and his group were responsible. Paul Eedle has described the latter as "a comprehensive branding statement":

> The Internet gave Zarqawi the means to build a brand very quickly. Suddenly the mystery man had a voice, if not a face, and a clear ideology which explained his violence . . . But what is the point of an insurgent group building a brand, establishing a public profile in this way? The answer is to magnify the impact of its violence.

Prior to the instigation of his Internet-based PR campaign, each of Zarqawi's attacks had to involve large numbers of casualties in order to get noticed amid the chaos and mounting daily death toll in Iraq. By going online, however, Zarqawi was able to both control the interpretation of his violent message and achieve greater impact with smaller operations. By the end of April 2004, his group was regularly issuing communiqués online. One of these claimed responsibility for a suicide speedboat attack on Iraq's offshore oil export terminal in the Gulf which, although the operation failed, still shook oil markets because of Zarqawi's efforts at publicizing the attack through the Internet.

In May 2004, Zarqawi took things a step further when he used the Internet's force multiplying effect to spread a new kind of terror. Here, as Paul Eedle has described, a threshold of online horror was crossed when "he personally cut off the head of an American hostage live on video, and had the footage posted on the Internet. . . . The entire purpose of the beheading was to video it, to create images that would grip the imaginations of friends and enemies alike. It worked. Zarqawi risked almost nothing in this operation; but he started a withdrawal of foreign contractors which has paralysed reconstruction in Iraq and done as much if not more to undermine U.S. plans as a bomb that killed 100 people in Najaf. And he made himself a hero to jihadis across the world."[75]

The free availability of this and other grisly "snuff movies" on the Internet today has led to a realization that the most important aspect of the

terrorism-Internet relationship is not the much vaunted "cyberterrorism," but those more mundane and everyday terrorist uses of the Net, from information provision to recruitment, which have a pedigree stretching back for many years before Zarqawi's appearance on the online scene.

The most popular contemporary terrorist Web sites draw tens of thousands of visitors each month. Obviously, the Internet is not the only tool that a terrorist group needs in order to "succeed." However, the Net can add new dimensions to existing assets that groups can utilize to achieve their goals as well as providing new and innovative avenues for expression, fundraising, recruitment, etc. At the same time, there are also trade-offs to be made. High levels of visibility increase levels of vulnerability, both to scrutiny and security breaches. Nonetheless, the proliferation of official terrorist sites appears to indicate that the payoffs, in terms of publicity and propaganda value, are understood by many groups to be worth the risks, and Zarqawi's exit from the terrorism scene emphatically does not mark the end of the evolution of the terrorism-Internet relationship.

# CHAPTER 21

## CRY TERROR AND LET SLIP THE MEDIA DOGS

Randall G. Bowdish

"And Caesar's spirit, ranging for revenge,
With Ate by his side come hot from hell,
Shall in these confines with a monarch's voice
Cry 'Havoc,' and let slip the dogs of war; . . ."

—*Julius Caesar*, William Shakespeare

Julius Caesar, legendary as a brilliant politician and military genius, was also the father of the Roman daily newssheet. His very first enactment after becoming consul was that the day-to-day proceedings of both the senate and the people should be compiled and published.[1] On the Ides of March, 44 BC, Caesar was killed by a band of conspirators bent on protecting the people from a tyrant. While historians can only guess at the newssheet headlines following his assassination, Caesar's death was undoubtedly the main news.

In one of history's great twists, Caesar's progeny, the media, has evolved into the role of watchdog against tyrants. However, while the media understands its modern societal role to "cry tyrant!" when appropriate, its role in protecting the people against cries of terror is less understood.

The focus of this chapter is the role of the media in a liberal democracy as it pertains to terrorism. The case is made that the media must take a more active, formal role in guarding the people against the cognitive harm and unwitting complicity toward terrorists' ends associated with news of terrorism. Long a watchdog against governmental abuse of power, the media must also stand sentinel against the tyranny of extremists who would manipulate the media and society to their own malevolent

ends. Decoupling "propaganda of the deed" from propaganda, proper, is critical in minimizing terrorism as a viable means to an end. As Margaret Thatcher so eloquently stated, "Democratic nations must try to find ways to starve the terrorist and the hijacker of the oxygen of publicity on which they depend." While this objective is simply stated and well understood, the mechanics of it are problematic in the extreme, given the media's role in a liberal democracy.

## FREEDOM TO INFORM AGAINST A NEED TO PROTECT

The role of the journalist in a liberal democracy is to "provide citizens with accurate and reliable information they need to function in a free society."[2] Citizens of liberal democracies depend upon timely, truthful information in order to make informed decisions about self-governance. Paradoxically, while journalists are free to inform the public on just about any topic, two boundary conditions exist that on one extreme, protect the right of people *to* information, while at the same time protecting them *from* information.

The first boundary is the right to free speech and a legal system that safeguards it.[3] It serves to protect public discourse from government censorship. In the case of the United States, free speech is protected by the First Amendment of the Bill of Rights and upheld by the judicial branch. On its own, a constitutionally mandated free speech right is not enough. For example, as pointed out in a Freedom House study,[4] "Although the Russian constitution provides for freedom of speech and of the press, authorities were still able to use the judicial system to harass and prosecute journalists for independent reporting."

Perhaps surprising to some, there are liberal democracies that do not constitutionally protect free speech, yet still enjoy it. A shining example of this exists in Australia. The Australian constitution does not address free speech. Over time, there have been attempts to include freedom of speech into the Australian constitution, but all have failed. Nonetheless, freedom of the press has been upheld and respected in Australian high court cases to such a degree that Australia was recently rated higher in press freedom than the United States.[5]

Internationally, the right to free speech was addressed in Article 19 of the United Nations' Universal Declaration of Human Rights of 1948.[6] Born of the horrors of World War II atrocities, the United Nations' declaration continues to this day to act as a beacon of hope for freedom and rights advocacy groups across the globe. However, it has no legally binding status in international law. Internationally, only 73 of 194 nations surveyed in 2005 were rated as having a truly free press.[7]

As important as free speech is to a liberal democracy, some controls are necessary. A society also requires a boundary against some types of

information. Put simply, words (and images) can hurt. The nebulous equilibrium between free speech and words that hurt were perhaps best encapsulated in Article 11 of the French National Assembly's Declaration of the Rights of Man and of the Citizen:[8]

> The free communication of ideas and opinions is one of the most precious of the rights of man. Every citizen may, accordingly, speak, write, and print with freedom, but shall be responsible for such abuses of this freedom as shall be defined by law.

From personally damaging words of obscenity, libel, defamation, and slander, to society-damaging expressions of hate and sedition, people and the government that serves them require protection under law from words that hurt. Cunningly woven words of deceit and half-truth have the power to incite otherwise rational men and women to nefarious acts of dark passion. Protection in the form of censorship against such words is considered necessary by most people as a practical measure. Laws that protect people and the government, however, also act to suppress free speech in the form of censorship. Censorship is defined as:

> Official prohibition or restriction of any type of expression believed to threaten the political, social, or moral order. It may be imposed by governmental authority, local or national, by a religious body, or occasionally by a powerful private group. It may be applied to the mail, speech, the press, the theater, dance, art, literature, photography, the cinema, radio, television, or computer networks. Censorship may be either preventive or punitive, according to whether it is exercised before or after the expression has been made public.[9]

The problem, of course, is that the line between protection of the people and their right to speak and know is often subjective and a matter of perspective. Logically, the desire to at once protect people *from* information while also protecting their right *to* information eventually breaks down as a paradox. Censorship strikes against the very ideals and safeguards that make democracies attractive and allow them to thrive in the first place. Even with the damage that dark words and images can generate, democracies must look at any and all efforts to censor, no matter how noble the pretense, with great suspicion and an eye to the potential consequences, both intended and unintended. Of course, this must be evaluated against the harm imposed by unfettered malicious speech and images. Pragmatically, a balance must be struck.

This raises a number of key questions that must be answered before a democratic media's role in reporting terrorism can be defined. Where does news of terrorism lie within the bounds of free speech and censorship? Is

the news of terrorism actually harmful to society? If so, why do the media report it? Is it bad enough to warrant forfeiting society's right to know? Who would make that determination? What alternatives exist? A rational policy regarding the media's role concerning terrorism must address these issues.

## NEWS OF TERRORISM CAN HARM

Terrorism can harm on three levels. First-order harm from terrorism results from the physical violence done against the victims. Second order harm from terrorism is the cognitive injury done through fear and anxiety producing stimuli to those that observe the physical violence. Third order damage from terrorism consists of the negative policy and societal changes wrought to cope with it.

First-order harm from terrorism is obvious, does not involve the media, and subsequently, is not the focus of this chapter. The media is instrumental, however, in the propagation of second-order effects of terrorism. A local act of violence against tens to thousands of people is vicariously shared by millions to billions of people across the globe. While the damage is greatly diminished as the violence crosses the physical to the psychological threshold through the media, the range and number of people reached increases by orders of magnitude. While this leverage is imposing, the effects are not pervasive. For example, in a survey conducted after 9/11, only a minority of Americans expressed considerable levels of fear and depression. Still, while the majority of Americans claimed that they were not psychologically disturbed by the attacks, one study reported that "almost a half reported feeling anxious or worried at least sometimes," with "just under a third feeling scared or frightened sometimes or very often."[10] The ability to have an effect on millions of people who weren't even at the scene of the terrorist act is largely a consequence of media reporting.

The major media culprit of harm from terrorism is television news, a key second-order stimulus. Television and film media are unique as communication means, in that the viewers vicariously share two of the same sensory inputs—sight and sound—as the participants and eyewitnesses. As one might expect, fear-inducing television visuals and sounds together produce more fear than more static forms of media. A study of psychological reactions to 9/11 showed that "Individuals who reported watching a great deal of TV news were more likely to report being afraid, depressed, and viewed the future risk of terrorism as high."[11] Furthermore, although newspaper coverage provided the same amount of knowledge about terrorism as TV coverage, only TV increased fear and anxiety and perceptions of risk.[12]

Threatening television images and sounds can exploit evolutionary hardwired survival mechanisms meant for coping with a clear and present

danger. Vision and hearing are the two most dominant of the five major senses when it comes to danger. Viewers see and hear the same danger stressors that initiate the "Fight, Flight, or Freeze in Fright" behavior of participants. Danger sensory input processing is instinctually biased toward action. In the fight or flight response, sensory inputs are first sent from the thalamus to the amygdala. A rough-cut evaluation of the potential threat is done in the amygdala, known as the warehouse of fear. If the amygdala determines that something might be a threat, physiological mobilization of the body begins when it signals the hypothalamus to activate the sympathetic nervous system and the adrenal-cortical system. All the while, higher-level processing in the sensory cortex continues to refine the threat, but at the cost of more time. The sensory cortex sends the signal to the hippocampus, to compare the threat to what it has in memory. The result of this more deliberate evaluation of the sensory inputs is either a confirmation or invalidation of the threat. If the sensory cortex refinements invalidate the threat, then physiological demobilization begins.

While the fight or flight response is a handy short-term instinct to have when facing a clear and present danger, chronic fear, stress, and anxiety can actually have devastating long-term effects. Even small levels of prolonged stress can cause the release of hormones that, over time, can result in a shrunken hippocampus and an enlarged and overactive amygdala. A shrunken hippocampus impairs the ability to evaluate the nature of a stressor. An enlarged amygdala causes anxiety and fear out of proportion to even small stimuli.

Millions of years of finely honed survival instinct can be problematic for the twenty-first century man inundated with electronic stimuli that have only been around for an evolutionary snap of the fingers. Swift, instinctual reactions that made the difference between life and death in the primitive world are often false alarms in the modern world. In 2005, over 14 million American adults suffered from Post-Traumatic Stress or Generalized Anxiety Disorders.[13] According to several studies, news of terrorism was a contributor.[14]

## FEAR APPEALS AND COGNITIVE DISSONANCE: THE BRIDGE TO THIRD-ORDER EFFECTS

Two psychological constructs, cognitive dissonance and fear appeals, help to describe how second-order effects transform into third-order effects. Cognitive dissonance is a psychological state of discomfort felt as a result of a discrepancy between what one already knows or believes and new information or interpretation. Within this construct, an act of terror first works to get people to pay attention to the terrorist's policy message. Terrorists seek to instill cognitive dissonance as a result of

anxiety-producing conflict between their self-professed "reasonable" demands and the "unjust" or questionable existing policy of their oppressors. Their aim is to get people to adopt their policy in order to alleviate the anxiety of cognitive dissonance. For example, al Qaeda has a stated goal of ridding Muslim states of Westerners. A constant barrage of news about the deaths of Westerners in Muslim states through acts of terror might instill cognitive dissonance regarding the value of Western presence in Muslim states. In order to resolve the dissonance, people might come to the conclusion that Western presence is not worth American lives, and seek a policy change against U.S. presence in Muslim states. In this construct, second order effects of terrorism initiate third order policy effects.

Another psychological construct, the fear appeal, also helps to explain the transition from second-order to third-order effects. A fear appeal is a persuasive message "designed to scare people by describing the terrible things that will happen to them if they do not do what the message recommends."[15] Fear appeals consist of a threat and a recommended response.

A threat is an expression of an intention to inflict pain, injury, or punishment. In the words of Thomas Schelling:[16]

> It is the *threat* of damage, or of more damage to come, that can make someone yield or comply. It is the latent violence that can influence someone's choice—violence that can still be withheld or inflicted. The threat of pain tries to structure one's motives, while brute force tries to overcome his strength. Whether it is sheer terroristic violence to induce an irrational response, or cool premeditated violence to persuade somebody that you mean it and you may do it again, it is not the pain and damage itself but its influence on somebody's behavior that matters.

According to Witte's Extended Parallel Process Model (EPPM),[17] the first thing a person does when presented with a fear appeal is to appraise the threat. If the threat is deemed irrelevant or insignificant, there is no need for further processing and the fear appeal is ignored. On the other hand, if the threat is evaluated as severe and relevant, then another appraisal of the efficacy—that is, the power or capacity of the recommendation to yield a desired outcome—of the recommended response is required.

Serious, relevant fear appeals are handled in one of two ways. An individual can choose to deal with the danger of the threat (danger control) or choose to deal with his fear of the threat (fear control). In the case of danger control, a person will concentrate on the fear appeal and look to neutralize or minimize the threat through either accepting the recommended response or by deriving an alternative response. In the case of fear control, a person will focus on how frightened he feels and attempt to reduce

it through denial, avoidance, or reactance,[18] resulting in rejection of the recommended response.

The choice between danger or fear control is a function of the message efficacy. If the recommended response is relatively easy, feasible, and effective, then a person is more likely to engage in danger control and comply with the recommended action. If the fear appeal contains a serious threat but the message is ambiguous, too difficult, or ineffective, then he/she will try to control his/her fear.

Fear appeals and cognitive dissonance contribute to third order effects of policy and societal changes through the media. News reports and disturbing images of terrorism impart various degrees of fear and anxiety in some people, while having little or no effect on others. Over time, news reports without a message may contribute to anxiety disorders in a small percentage of people, while others may control their fear through denial, avoidance, or reactance. Negative societal results of heightened fear in society may include a breakdown in trust, loss of civil rights for security, or repression against its own citizens. News reports with a high efficacy message may actually push some to seek a change in policy, in line with the terrorist's demands. On the other hand, news with low efficacy messages may incite people to go after the threat in the form of counterterrorism. Similarly, threat-induced cognitive dissonance will drive people to choose between the new information in terrorists' messages or stick with their old beliefs.

Based upon the previous discussion of fear, fear appeals, and cognitive dissonance, a hierarchy of damage (from highest to lowest) from TV and newspaper terrorism news might look like the following:

*Film and television stories with dynamic images and high efficacy messages*: Dynamic images of terror cause fear levels that initiate an efficacy check of the message. Fear appeals with high fear and high efficacy are most likely to result in message compliance.

*Film and television stories with dynamic images and low efficacy messages*: Dynamic images of terror cause high fear levels. Over time, high levels of anxiety are damaging. Additionally, new information may confuse current policy understanding, resulting in cognitive dissonance and a shift in mindset toward the terrorist's policy.

*Film and television stories with dynamic images and no message*: Same as above.

*Film and television stories with static images and high efficacy messages*: A static image is less likely to instill as much fear as a dynamic image. However, if it is enough to induce an efficacy check, then it is likely to result in message compliance

*Film and television stories with static images and lower efficacy messages*: These are likely to result in low levels of anxiety. Over time, even low levels of anxiety can be damaging to some.

*Film and television stories with static images and no message*: Same as above.

*Printed stories with images and high efficacy messages*: These are not likely to cause fear. However, viewing dynamic images of terror on TV or film with high efficacy knowledge from print may result in message acceptance.

*Printed stories with images and no message*: Not likely to cause fear, but may be subject to media cross-connections discussed earlier.

While these descriptions are purely hypothetical based upon the logic of fear appeals, empirical evidence supporting such a hierarchy would provide beneficial guidance to journalists. More practical guidance would include guidelines on what to avoid in order to minimize harm. These guidelines could be added to existing journalistic standards.

Clearly, the media plays a significant role in the second and third order effects of terrorism. In a liberal democracy, with a free and independent media, this can be problematic if the press is: (1) complicit with the terrorist cause or unwitting dupes; (2) just doing their job; or (3) professional at journalism but naive about fear appeals. One might think that a complicit media would be the worst case, but it is so transparent and obvious that people, looking for the truth, see it for what it is. Naiveté about fear appeals isn't much of a problem, either, as once it is identified as an issue it can easily be addressed through training, education, and editorial policy. Far worse is a media doing harm in the name of "the job."

## NEWSWORTHINESS AND TERRORISM

As discussed previously, the role of the media in a liberal democracy is to provide citizens with accurate and reliable information they need to make informed decisions about self-governance and function in a free society. With this role in mind, terrorism must present a significant threat to the American way of life to garner so much attention. A look at a few statistics indicates otherwise. The worst ever year for terrorist violence against Americans was 2001, with 3,166 deaths—and of those, 2,926 deaths[19] were from the 9/11 attacks. Contrast this with another measure of violence against Americans, homicides. There were 17,382 homicides in 2001. In other words, *six times* more people were murdered than killed in terrorist attacks. In 2005, only 56 U.S. citizens worldwide were killed as a result of incidents of terrorism, with 85 percent of those occurring in Iraq.[20] Given that the homicide rate[21] remained relatively the same for 2005 as it was between 1999 and 2004, then approximately 17,000 U.S. homicides[22] occurred in 2005. That means that over *300 times* more Americans were murdered than killed by terrorists in that year. Yet, the United States pursued a *war* on terrorism but only maintained a status quo policing effort against homicide, a much deadlier threat. While homicides at least make the news regularly, many more Americans die from

nonviolent traffic accidents (43,340 deaths), poisonings (28,700 deaths), or falls (18,044), which are seldom covered in consonance with the frequency of their occurrence.[23]

Both terrorism and murder are newsworthy, yet news of terrorism grabs headlines out of proportion to its harm to the citizenry. What is it about terrorism that makes it so newsworthy?

Journalists select news through an informal set of criteria established by an editorial hierarchy. While one would be hard-pressed to derive consensus from the media on newsworthy factors, as they vary by medium, institution, and individuals, Galtung and Ruge identified 12 factors,[24] well accepted and identified below, which play in the decision-making process:

– *Frequency*: The time span needed for the event to unfold itself and acquire meaning.
– *Threshold*: The level an event must pass to be recorded. Amplitude is the magnitude of the event.
– *Clarity*: One or a limited number of meanings in what is received.
– *Meaningfulness*: Some measure of ethnocentrism will be operative; there has to be cultural proximity and relevance.
– *Consonance*: The "expectation," or cognitive interpretation in terms of what one "predicts" and what one "wants." This is more commonly understood today as "cognitive dissonance"—the psychological discomfort felt as a discrepancy between what one knows/believes, and new information.
– *Unexpectedness:* Events must be unexpected or rare, within the context of meaningfulness and consonance (above), in order to receive attention.
– *Continuity*: The event has been covered and continues to be covered partly to justify its being covered in the first place, partly because of inertia in the system and partly because what was unexpected has now also become familiar.
– *Composition*: Changes in thresholds occur for new events in order to "balance" coverage.
– *Elite nations*: The actions of elite nations are more consequential than the activities of others.
– *Elite persons*: The actions of elite persons are more consequential than the activities of others.
– *Personification*: News has a tendency to present events as sentences where there is a subject, a named person or collectively consisting of people, and the event is then seen as a consequence of this person or these persons.
– *Negativity*: Negative news will be preferred to positive news.

When terrorism is looked at through the prism of newsworthiness, the symbiotic relationship between terror and the media is clear. As a story of fear, death, and destruction, terrorism meets the criteria of *negativity*. *Personification* exists in the names of terrorists, victims groups, and *elite*

*persons*. Terrorism against *elite nations*, such as European countries and the United States, is *meaningful* to their citizenry. Terrorist acts against large numbers or acts that are unexpected in their audacity (such as suicide bombers) meet *threshold*, *unexpectedness*, and *consonance* requirements. Subsequent acts of terrorism (*continuity*) are reported in the war on terror (*clarity*), but over time, higher threshold or unexpected events are required (*composition*) to make the headlines. From the perspective of a journalist, terrorism is thus quite newsworthy, and it is the job of the journalist to report it.

## ATTACK ON THE SOFT UNDERBELLY OF DEMOCRACY

It is clearly not the job of a journalist to harm the public. Through the media, terrorists are able to strike at the soft underbelly of democracy— by bypassing a democracy's means of resistance, its military, and instead assaulting its will to resist, residing in the people and the government. It is an attack inside the walls, with every newspaper, television, or radio a weapon in the homes of a nation's citizenry.

News of terrorism can be harmful to individuals and society, but nonetheless, it is a newsworthy event of worldwide significance. This places a liberal democracy on the horns of a dilemma. If controlling news of terrorism requires censoring free speech, then democracy loses one of its most precious and protective tools against tyranny and denies its citizenry of news of important events. On the other hand, unfettered news of terrorism is an attack that bypasses a nation's means of resistance and strikes indirectly into the homes of its citizenry.

This also confronts journalists with a dilemma. Terrorism is newsworthy, so it should be reported. But if terrorism is harmful to viewers, it should not be reported. What is needed is an option that negates the harmful elements of terrorism news while still allowing information of terrorism to flow without censor.

## LEASHING THE DOGS: JOURNALISM STANDARDS ON NEWS OF TERRORISM

The media in a liberal democracy has a role in protecting its nation's people from harmful news of terrorism. In order to preserve the precious gift of freedom, every effort must be made to keep government out of a censorship role. The truth of the matter is that the media can and has self-censored some harmful aspects of terrorism news. For example, in a study of editor gatekeeping, Renee and Brian Kratzer found that 16 of 20 newspapers with circulations greater than 75,000 chose on their own accord not to publish disturbing 9/11 pictures of people jumping to their deaths from the World Trade Center in New York.[25] The editors still reported the 9/11

attack, but most censored harmful images from their stories. However, the decisions were not easy ones, with a great bit of soul-searching done between an obligation to report happenings accurately against upsetting their readers.

Editors are the gatekeepers to the news. Their numbers and titles vary, with some editors acting as sole gatekeeper, while other news organizations may use many editors, management, and ownership in a gatekeeping role. Regardless, with gatekeeping already a function of editors, it makes sense that they should be at the hub of any effort to filter harmful news of terrorism. Providing editors with guidelines on terrorism news reporting will help educate those most able to do something about it.

Unfortunately, a universal set of journalistic standards does not exist. While almost all journalistic standards include a responsibility to report truthfully and accurately, surprisingly few contain much guidance helpful in minimizing the harm from terrorism news. For example, the American Society of Newspaper Editors Statement of Principles,[26] includes six articles entitled Responsibility, Freedom of the Press, Independence, Truth and Accuracy, Impartiality, and Fair Play. Only the Fair Play principle even obliquely addresses the issue of harm by exhorting an observation of "the common standards of decency." Similarly, the *Washington Post*'s closest principle against doing harm includes the goal that, "As a disseminator of the news, the paper shall observe the decencies that are obligatory upon a private gentleman.[27] "With regard to photo and graphic principles, the *Los Angeles Times* is representative of most respectable newspapers in that they disallow images that confuse, misrepresent events, are staged or altered, yet mention nothing about psychologically harmful photos. Some journalistic standards are actually harmful when applied to news of terrorism. For example, the *Orlando Sentinel* contains a principle that they will "seek to give a voice to the voiceless." Terrorists would likely argue they are driven to violence for this very reason.

The *Society of Professional Journalists* has one of the few codes that advocates a principle to minimize harm. This principle includes the following specific guidance:[28]

Journalists should:

Show compassion for those who may be affected adversely by news coverage. Use special sensitivity when dealing with children and inexperienced sources or subjects.

Be sensitive when seeking or using interviews or photographs of those affected by tragedy or grief.

Recognize that gathering and reporting information may cause harm or discomfort. Pursuit of the news is not a license for arrogance.

> Recognize that private people have a greater right to control information about themselves than do public officials and others who seek power, influence, or attention. Only an overriding public need can justify intrusion into anyone's privacy.
>
> Show good taste. Avoid pandering to lurid curiosity.
>
> Be cautious about identifying juvenile suspects or victims of sex crimes.
>
> Be judicious about naming criminal suspects before the formal filing of charges.
>
> Balance a criminal suspect's fair trial rights with the public's right to be informed.

While the principle to minimize harm acknowledges that "reporting information may cause harm or discomfort," it doesn't provide much guidance on specifics, but at least it demonstrates a commitment in the right direction.

Radio and television standards overtly contain provisions against harm. It was realized early on that television and radio personalities were very influential as "guests in one's home." Initially, the industry created its own Code of Broadcasting to deal with the harmful effects of commercialization and fraudulent, deceptive, and obscene material. However, since the industry was self-regulated, enforcement of penalties was a problem. After a period (1982–1990) with no code of professional ethics, the National Association of Broadcasters issued a "New Statement of Principles and Broadcasting," recommending caution in dealing with violence, drugs abuse, and sex.[29] Specifically, the guidance on violence consisted of the following:[30]

> Violence, physical or psychological, should only be portrayed in a responsible manner and should not be used exploitatively. Where consistent with the creative intent, programs involving violence should present the consequences of violence to its victims and perpetrators.
>
> Presentation of the details of violence should avoid the excessive, the gratuitous, and the instructional.
>
> The use of violence for its own sake and the detailed dwelling upon brutality or physical agony, by sight or by sound, should be avoided.
>
> Particular care should be exercised where children are involved in the depiction of violent behavior.

However, in keeping with First Amendment protections, this guidance remains advisory. While the National Association of Broadcasters encouraged broadcasters to write principles and policies of their own, no other recommendations were offered.

The 2000 *Radio-Television News Director's Association Code of Ethics and Professional Conduct* contains many of the same principles found in

newspaper ethics: truth, fairness, integrity, independence, and account-ability. Although it also contains a principle of public trust, it does not address harm.

## RECOMMENDATIONS

The media can maintain free speech and still prevent harm from terror-ism news by adopting a few additional guiding principles. Principles such as the National Association of Broadcaster's guidance on violence[31] and the Society of Professional Journalists direction to minimize harm provide good starting points. Yet, they are not enough. Television, which does the most damage, has the farthest to go. Even with the National Association of Broadcasters' guidance on violence, drugs, and sex, TV programming contains a lot of the very content it seeks to avoid. Confronting broad-casters with the harm of terrorism news and the potential for government regulation[32] if it is not addressed may be enough to illicit interest in a more robust set of codes. A few additional principle recommendations for both television and broadcaster codes include:

- *Avoid fear appeals*. Fear appeals consist of stories with fear-inducing graphic im-ages coupled to terrorist demands. Threatening images are bad enough on their own in that they increase fear and anxiety levels in viewers and can contribute to anxiety disorders. When fearful images are coupled to terrorists demands that are relatively easy to perform, feasible, and effective, people tend to comply with terrorist aims more so than when the images and demands are decoupled.
- *Avoid threatening images and sounds*. Threatening images and sounds induce fear and anxiety into viewers and can contribute to anxiety disorders.
- *Avoid unwitting complicity with terrorists*. Seemingly innocuous terrorist footage can contain messages for their operatives in the field.
- *Use technically correct identifiers.* Belligerents will want their adversary described in negative terms, such as bloody murderers, and themselves in positive terms, such as freedom fighters. Positive identifiers promote legitimacy.
- *Avoid promoting terrorist's objectives.* Publicizing terrorist objectives can give them legitimacy.

## CONCLUSION

The media in a liberal democracy has a critical role in protecting society from the tyranny of extremists, just as it does against the tyranny of gov-ernment. Terrorism strikes at the soft underbelly of democracy by bypass-ing a nation's means of resistance and attacking its will to resist through the media. While censorship is one option to defend media vulnerability, it is a bad one compared to self-regulation through media codes. Yes, the cry of terror is newsworthy and reason to let slip the media dogs. It does not

mean, however, that the news must be reported in a manner conducive to terrorists.

# CHAPTER 22

## TERROR TV? AN EXPLORATION OF HIZBOLLAH'S AL-MANAR TELEVISION

Maura Conway

In his introduction to *Covering Islam* (1997), Edward Said refers to the "information wars that have gone on since 1948 around the whole question of the Middle East."[1] He is particularly concerned with the way in which the Lebanese-based Shi'a group Hizbollah (Party of God) "who identify themselves and are perceived locally as resistance fighters" are "commonly referred to in the American media as terrorists."[2] In an effort to thwart such assertions, Hizbollah[3] instituted a savvy media strategy "to produce and articulate a conscious and forceful self-image"[4] of themselves not as terrorists but as resistance fighters and statesmen. The major focus of this chapter is the way in which Hizbollah have wielded their television station, al-Manar—the "Beacon" or "Lighthouse," in Arabic—as a weapon in their information war. The argument put forward here is that Hizbollah have met with high levels of success in this regard—to the extent that they may recently be seen to have become the victims of their own success, with the institution of multiple bans on transmission of al-Manar globally and the repeated targeting of the station by Israeli forces during the summer 2006 crisis. On the other hand, these difficulties may also be viewed by the organization as blessings in disguise, as they have forced the station to streamline its processes, which may, in the long term, not only ensure its continued existence, but also allow it to access a larger audience.

The first section of this chapter briefly describes the range of media products offered by Hizbollah, while section two gives a brief overview of the Lebanese television scene and the establishment of al-Manar. The

third and fourth sections detail the station's mission and financing, respectively. Section five, which describes and analyzes the station's programming, is divided into three parts: the first explores the type of programming prevalent in the station's early years, the second describes the station's contemporary format, and the third is devoted to a description of the type of viewing offered by the station to women and children. The station's viewership figures are briefly explored in section six, while section seven explores the recent banning of the station in Europe and the United States. The final section is devoted to an analysis of the role of the station in the Lebanese crisis of 2006.

## HIZBOLLAH'S RANGE OF MEDIA PRODUCTS

Autonomous communication has long been a paramount objective for Hizbollah. The group's weekly newspaper, *Al-Ahed* (The Pledge), was launched on June 13, 1984, and was followed by the weeklies, *Al Bilad*, *Al Wahda*, *El Ismailya*, and the monthly *Al Sabil*. Hizbollah's radio station, *Al-Nour* (The Light), was founded during the Amal-Hizbollah conflict in 1988, when a group of young Hizbollah fighters spontaneously began broadcasting news of the clashes. In terms of Hizbollah's Internet presence, they first went online in early 1996. Hizbollah maintains three major Web sites (all of which are available in both English and Arabic versions): http://www.moqawama.net, known as the "Islamic Resistance Support Association," which describes the group's attacks on Israeli targets; http://www.nasrollah.net, the official homepage of the group's leader Sayyed Hassan Nasrallah; and http://www.manartv.com.lb, the news and information site that is essentially the homepage of al-Manar Television.[5] There is no question, however, that the "jewel in Hizbollah's media crown"[6] is the al-Manar television station itself. Live footage of Hizbollah operations appeared for the first time in 1986, with coverage of the invasion of the Israeli-occupied Sujud Fort at the top of Jabal Safi hill in South Lebanon, and was distributed to those Lebanese television stations in operation at that time. According to Naim Qassem, Hizbollah's deputy Secretary General, "[f]ollowing the first television broadcast of this operation, the camera became an essential element in all resistance operations."[7] The establishment of al-Manar followed shortly thereafter: its first broadcast was Ayatollah Khomeini's funeral in June 1989.[8]

## THE LEBANESE TELEVISION SCENE AND THE ESTABLISHMENT OF AL-MANAR

A majority of the factions involved in the Lebanese civil war (1975–1990) established television stations during the conflict with, at one point, some

50 land-based stations in operation. After the war it was decided to regulate these, and the number of stations thus decreased to a dozen or so.[9] In terms of the provision of licenses, "the selection was made only on sectarian grounds, and all licenses were given to members of the government or their relatives, hence privileging sectarianism over professionalism."[10] Al-Manar was not amongst the stations that received permission to continue broadcasting, nor was Télé-Lumière, the station belonging to the Maronite Christian Church, but both continued to do so nonetheless. When other religiously oriented stations began to be set up, the government agreed to grant a license to both stations in order to dissuade other channels from following what Firmo-Fontan describes as "their subversive precedent."[11] Al-Manar thus became an official member of the Lebanese television community in 1996, and on April 5, 2000, the Lebanese Council of Ministers agreed to allow al-Manar Television to launch satellite transmissions.

Hizbollah denies that it controls al-Manar. However, most of the station's shareholders and staff are members of Hizbollah, which has its headquarters just around the corner from the al-Manar building in the southern suburbs of Beirut, and the station is widely viewed as Hizbollah's mouthpiece.[12] Al-Manar's Director General Abdallah Qasir insists that:

> Hizbollah has no direct organizational relationship with the station, but is rather its partner. Several members of the board of directors are party members, while others are not. Some channel workers might agree with the party through the general outlines of their political, religious and social principles. This, however, does not mean that Al-Manar is a party channel.[13]

Ibrahim Farahat, the station's Public Relations Officer, has made similar remarks.[14]

## AL-MANAR'S MISSION

On its Web site, al-Manar is described as "a Lebanese TV station . . . motivated by the ambitions of participation in building [a] better future for the Arab and Muslim generations by focusing on the tolerant values of Islam and promoting the culture of dialogue and cooperation among the followers of the Heavenly religions and human civilizations." Although at one time the station was also described on the site as the "first Arab establishment to stage an effective psychological warfare against the Zionist enemy," this particular claim has since been removed,[15] and today the station claims instead to be "the true reflection of what each and every Muslim and Arab thinks and believes in."[16] "Al-Manar is a Lebanese channel first of all," reiterates Farahat.[17] And indeed at the core of the station's programing appears to be a consistent discourse constructed around the

notion of *moqawama* (resistance) against occupation. Hizbollah's mission and identity are certainly rooted in its founders' belief that the Israeli invasion of Lebanon in 1982 could only be overcome by armed resistance. The low-intensity warfare characteristic of the 1990s and the Israeli withdrawal from South Lebanon in May 2000 notwithstanding, the notion of resistance remains central to Hizbollah's self-proclaimed mission.[18] Al-Manar thus gears its messages toward encouraging attitudes that spur action and involvement in that resistance. According to Baylouny, these messages center on:

Palestine, including American bias in the Arab-Israeli conflict;

the continuing threat posed by Israel;

the power and importance of community solidarity; and

pride in Arab culture and the achievements of the Islamic Resistance (i.e., Hizbollah's armed wing).

More generally, these messages have strong resonance not only amongst Lebanese but also in the Arab and Muslim worlds.[19]

## AL-MANAR'S FINANCING

In 2004, Jorisch put al-Manar's annual budget at US$15 million, which at that time would have been approximately half the size of al-Jazeera's budget.[20] Numerous analysts contend that al-Manar receives the bulk of its funding from Iran,[21] but the station's managers deny this, saying they fully comply with Lebanese television licensing law, which prohibits foreign funding. The station is said to receive monetary support from donors and shareholders, while the station's Director General, Qasir, claims that the channel is largely self-financed through advertising revenue and the sale of programs: "Al-Manar produces from 80 to 85% of what it broadcasts. We also receive some aid through special sponsorships of religious programs, which are sponsored by the so-called Religious Rights (*Al-Huquq al-Shar'iyah*) [sic]. We also generate considerable revenues from the dubbing and redistribution of Iranian programs."[22]

Advertising revenues are somewhat circumscribed, as al-Manar does not accept advertisements for liquor or other "un-Islamic products,"[23] which allegedly results in the station turning down some 90 percent of potential advertisers.[24] Until 2004, commercials only appeared on the land-based and not the satellite station. Among these advertisers were major American and European companies. However, this "support" of Hizbollah was brought to the attention of the U.S. Congress, which accused the companies of aiding terrorism, and the American and many European advertisers subsequently withdrew their advertisements. Currently, advertisements on al-Manar are infrequent and relatively few in number,

airing mainly at prime time. The majority of these are for local and regionally based companies and products. On the land-based station, advertisements are for local clothes, shoe, and toy stores, along with other retail stores and a Lebanese mobile phone company, while advertisements for cleaning detergents, air conditioning products, and food products are also featured. Nonveiled women appear in a number of these segments. The station also airs announcements for Hizbollah-run social service organizations and schools, computer and Koran classes, and sports clubs.[25]

## DESCRIPTION OF AL-MANAR PROGRAMMING

### The Station's Early Years

"Symbolism and the projection of messages to internal and external audiences have occupied a central place for Hizbollah throughout its evolution."[26] In his *Inside Terrorism*, Bruce Hoffman recounts how, during the crisis precipitated by the hijacking of TWA flight 847 in 1985, Hizbollah deftly manipulated the U.S. television networks: "There were graduates of media studies from American colleges at meetings at Nabih Berri's house in West Beirut while ('spin doctoring') tactics were being worked out."[27] Later, during the 1990s, Hizbollah utilized its media apparatus to wage successful campaigns against both the Israeli Defence Forces (IDF) and South Lebanese Army (SLA) when they adopted a two-pronged military strategy, combining guerrilla and psychological warfare. According to Schliefer, "Hizbollah's unique contribution to psychological operations (PSYOP) lay in the way it combined conventional and psychological warfare, creating a whole new PSYOP idiom."[28] Al-Manar was at the center of this campaign from its inception.

In terms of Hizbollah's offensive against the SLA, a campaign of psychological warfare was waged in conjunction with improved operations against SLA units. Infiltration within SLA ranks was subject to particular exploitation by the group, who capitalized on deteriorating SLA morale by regularly publicizing and distributing the names of SLA officers with promises of punishment, while at the same time televising daily broadcasts encouraging Shi'a SLA soldiers to desert and lacing these pleas with promises of financial remuneration coupled with pardons. Hizbollah even established a special information unit that highlighted SLA soldiers returning to their families.[29]

The group also waged an effective psychological warfare campaign against IDF soldiers serving in South Lebanon prior to their withdrawal in 2000. It utilized its own camera crews to record the efficiency of its attacks against IDF posts, which it then broadcast on al-Manar and, on a number of occasions, distributed to foreign media. The video-taping and dissemination of daring resistance operations served not only to boost the morale of Hizbollah's own fighters and supporters, but also undermined SLA and

IDF morale when the latter were, in a number of instances, caught on camera fleeing from advancing Hizbollah fighters. The group also regularly publicized on its television station and its Web sites the acquisition of new and upgraded weaponry in an effort to instill a degree of uncertainty into IDF units without actually having to employ the actual hardware, and broadcast messages in Hebrew to Israelis who could receive al-Manar just across the border, asking mothers of Israeli soldiers to entreat their sons to come home.[30]

The station was also watched by the group's supporters, of course, and Hizbollah was determined to prove the effectiveness of its resistance against the Israeli occupation to this constituency. Al-Manar was at this time dominated by religious programs. The pictures and names of deceased fighters were regularly screened, supported by verses from the Quran that glorified martyrdom.[31] The purpose, according to Hala Jaber, was "to indoctrinate the minds of young and old alike with the idea that those who seek martyrdom will be rewarded with more pleasure than can ever be achieved during this earthly lifetime."[32] Jaber goes on to dismiss the suggestion that social welfare services provided by the organization were dependent on those in receipt of such services and their families serving in the resistance, pointing out that Hizbollah's fighters had gained the status of national heroes, and that this was underlined in TV broadcasts, thus making the latter a much more likely tool of recruitment than welfare services.[33] In 1997, she reported, "with each broadcast the Party of God gained new momentum and a new influx of recruits."[34]

### Contemporary Programming

The initiation of the Second Palestinian Intifada on September 28, 2000, came just 4 months after Israel ended its 18-year military occupation of South Lebanon with the upshot—according to numerous analysts[35]—that al-Manar's main purpose from late 2000 onward was less the demoralization of an Israeli audience and more the assistance of the Palestinians in their struggle, along with the raising of awareness in Lebanon of the need to support the Palestinians against the Israeli government:

> The outbreak of violence in the Palestinian territories presented the new *raison d'etre* the TV station managers had been looking for—and also reflected the chronic need of Hizbollah as a radical movement to re-invent its agenda and claim to legitimacy within the domestic Lebanese political mosaic.... Early in 2001, Hizbollah's deputy chairman, Sheikh Na'im Qasim, said that: "Al-Manar is the television of the Intifada, in the same manner that it had been the medium of the resistance. It is now to be the television of this sacred cause."[36]

Prior to the outbreak of the Second Intifada, al-Manar was broadcasting for just 4 hours per day; with the upsurge in violence, however, station executives decided to increase airtime by 14 hours daily, reaching a total of 18 hours of programming per day.[37]

In terms of al-Manar's contemporary programming, live news reports, video-clips, and "resistance" songs—including some 50 specially composed for the Intifada—are slotted between quiz shows, documentaries, and calls to prayer.[38] Shows produced in-house include such programs as "Zajal Is Lebanon," a folklore show that specializes in Zajal verse—a kind of local popular lyric verse—which spotlights distinguished Lebanese Zajal bands, while *Kil Shi Ilu Shi* ("Something for Everything") is a social comedy that is composed of short sketches that comment on the contemporary political and social situation within Lebanon and the Arab world more broadly. Another home-produced show is *Habbat Misk* ("Musk Seed"), which is a satire by actor Wisam Sabbagh (Abu Shafiq) that deals with daily social, educational, and political issues. It has two segments: the first is filmed outside, and the second is broadcast live from the studio, where Sabbagh takes calls from the audience and answers their questions in a dramatic way and with commentary. Other popular Manar-produced programs include *Al-Hal Bil-Qanun* ("Legal Solution"), which is devoted to discussion of legal issues with lawyers and judges, and is presented by the lawyer Husayn Nasir and *Wijhat Nazar* ("Viewpoint"), a talk show presented by Mariam Karnib, who raises social, psychological, and educational problems that touch the core of people's everyday lives.[39]

In addition to these, al-Manar also broadcasts programs aimed at informing viewers about the nature of Israeli and American society and politics. Harb and Leenders describe Hizbollah's interest in the historical evolution of its main enemy, Israel, as particularly obsessive. The channel frequently broadcasts footage of Israeli politicians and journalists discussing the latest in Israeli politics, for example, while in-house commentators explain the workings of the Israeli parliament in voting for or against Israeli policies vis-à-vis the Palestinians. One of al-Manar's primetime game shows, *al-Muhimma* ("The Mission"), has contestants seek to virtually enter Jerusalem by answering a series of questions dealing with resistance operations, Islamic thought, the Palestinian cause, Western conspiracies, and Israeli plots, etc. In this show, the Israeli enemy is challenged through the audiovisual presentation of the merely virtual possibility of conquering Jerusalem, while knowledge about the "enemy" (and other oppressors) is celebrated and rewarded. This knowledge is also materially rechannelled into promoting the cause of armed resistance, since a quarter of the jackpot awarded to the winning candidate is sent to aid in the Palestinian Intifada.[40]

Much of the "filler" between programs is also concerned with the Israeli-Palestinian conflict, and it is via this "filler" that the basic character

of the station mainly comes through, according to Baylouny.[41] One such clip urges Palestinians to follow Hizbollah's lead by standing up to Israel, as Hizbollah guerrillas did in South Lebanon, while another points out that Arab states number 300 million people while in occupied Palestine there are only 5 million Jews, and follows up with the question: "What are you waiting for?"[42] A number of these transmissions are also in Hebrew; one of the most prominent of these messages is a video clip that sarcastically advises Israelis to leave for Europe and the United States, because those areas are safer for them than the Palestinian territories.[43] Some clips also address the American involvement in the conflict, with one clip depicting the Statue of Liberty as a skeleton, brandishing a blade dripping with blood.

### Women and Children

Television viewing is important to women in the Muslim world because of their relatively higher rates of illiteracy.[44] Al-Manar's female audience is clearly important to them, and women are very visible on the station, composing at least half of the announcers and program hosts. In fact, the channel's English-language broadcasting department has a majority of women working as reporters, presenters, and political analysts. Female presenters include Safa Muslmany, Wafa Hoteit, Btoul Ayoub, Fatima Bdeir, and Myriam Karnib, all of whom have played a leading role in the development of the channel. These all wear the *hijab* (a scarf covering the hair) and *manteau* (a floor-length coat), and thus no parts of these women's' bodies other than hands and faces are visible to viewers. However, not all the women appearing on programs—as audience members, for example—are veiled; advertisements also show unveiled women, though all of these are conservatively dressed.[45] Firmo-Fontan suggests, "the fact that women presenters wear the *manteau* and *hejab*, as opposed to the *chador*,[46] can be interpreted as an initiative on the channel's part to avoid antagonizing more liberal viewers and to appeal to all viewers of the Lebanese population."[47] Al-Manar has a wide following among Hizbollah women, who tune in to a range of soap operas (selected on moral grounds), talk shows, game shows, and news. Al-Manar's following is less obvious amongst non-Hizbollah women but, according to Firmo-Fontan, is still significant, especially in the realm of news and children's programs.[48]

The station's children's programming tends to focus on and reiterate the need for "resistance" in much the same fashion as much of the adult-oriented programming. *Asdiqa' al-Manar* ("Friends of al-Manar") is a game show set as a pretend war game, with youngsters from 10 to 15 years old fighting with pretend weapons (guns, grenades, swords, and arrows) against an enemy with a "Western" appearance (which is understood to be Israeli). The children, Shi'a and Palestinians from the camps, shout

*Allah Akhbar* (God is Great) as they cross over outdoor terrain to meet the enemy across a bridge. Another series, *Fatat al-muqawam al-Quds* ("Jerusalem Resistance Boy"), involves a young boy who wants to find his father who went missing in a war. To do so, he learns to fly planes, starting with paper airplanes and eventually graduating to lessons at a flying school. Unable to find his father, he joins Hizbollah's military wing and tries to recruit his friends into the organization also. Although religion is not mentioned in the series, the boy's mother is depicted traditionally dressed, and is shown praising him for his choices and advising her daughters to stay clear of Western influences and keep to the southern and rural areas instead.[49]

### Ratings/Audience

Al-Manar is one of the top-ranked stations in the Arab world, and often pointed to as being in the vanguard of a new and independent media. At the 2001 Cairo Television and Radio Festival, al-Manar won the most awards of all the competitors. The Lebanese Media Group, which includes al-Manar and al-Nour radio, won four and nine awards respectively.[50] Al-Manar is one of the prime sources of news in the Arab world, particularly about Palestine. The top four news stations in the region, which capture 70–80 percent of satellite viewers, are al-Manar, al-Jazeera, LBC (Lebanese Broadcasting Company), and Abu Dhabi TV. According to the Jerusalem Media Communication Center, the majority of Palestinians watch al-Jazeera, Abu Dhabi, and al-Manar, with the latter particularly widely watched in the West Bank and Gaza, where it has a number of correspondents.[51] Jorisch reports a poll in 2003 that found TV viewers in Jordan turned first to al-Manar for news of Palestine (28 percent), followed closely by al-Jazeera (27.5 percent).[52] In Lebanon, where al-Manar ranks fifth among the country's nine stations, its news bulletins are popular because they are deemed to be the most reliable and balanced on local politics.[53] Indeed al-Manar has been described as exceptional in Lebanese television because it displays "civic commitment,"[54] in the sense that it addresses the concerns of ordinary people rather than a political elite.[55] With the Israeli withdrawal from South Lebanon in 2000 and the launch of its satellite channel the same year, al-Manar took its message to a wider audience, both regionally and internationally. Some estimates put its audience in 2003–2004 at 10 million viewers worldwide.[56] It is difficult to estimate current viewership, however, as a result of the bans on transmission of al-Manar instituted in various jurisdictions since 2004.

### THE BANS ON AL-MANAR

The campaign to have al-Manar banned from transmitting via satellite began with an opinion piece that appeared in the *Los Angeles Times*

in October 2002. The article, penned by Avi Jorisch (the author of *Beacon of Hatred*), accused American companies who advertised on the station of promoting terrorism. The Pepsi Company, Proctor and Gamble, Western Union, and a number of other major U.S. and European companies were named as advertisers on al-Manar's local broadcasts (the satellite broadcast was, at that time, commercial-free).[57] Jorisch followed up with a letter to the U.S. Congress asking elected representatives to put pressure on these companies, and using the opinion piece as support. The majority of U.S. advertisers duly pulled out, and pressure to ban the transmission of the station itself increased. The Coalition Against Terrorist Media (CATM), an offshoot of the U.S.-based neo-Conservative organization Foundation for Defence of Democracy (FDD), was also founded at this time in order to generate further momentum for a ban. Representatives of FDD and CATM—including Jorisch, who came on board as the latter's Executive Director—have issued numerous statements claiming "Al-Manar runs graphic videos encouraging viewers, even children, to become suicide bombers and calls for acts of terrorism against civilians . . . Al-Manar is an operational weapon in the hands of one of the world's most dangerous terrorist organizations."[58]

Al-Manar was, at the same time, coming under pressure in Europe. While claims about incitement to suicide bombing are contested, this is not to deny that some measure of al-Manar's programming is objectionable by Western standards. The *Washington Post* has, for example, linked al-Manar to a rumor, widely spread in the Middle East, that Israel was behind the 9/11 attacks and that Jews working in the World Trade Center had been alerted not to come to work that day. Shortly after the attacks, the *Washington Post* reported that "As far as can be established, the story of 4,000 Jewish survivors originated with a September 17 (2001) report by the Beirut-based Al Manar television network . . . (which) cited 'Arab diplomatic sources' quoted in an obscure Jordanian newspaper named *Al Watan*."[59] The French move against al-Manar began after the station caused an uproar in October 2002 by broadcasting a Syrian-produced drama series entitled *al-Shattat* ("The Diaspora"), which is based on the controversial text known as the *Protocols of the Elders of Zion*, a nineteenth-century publication that depicts a Zionist conspiracy to take over the world.[60] Scenes from the multipart miniseries include a dramatization of a Rabbi slaying a young boy in order to make Passover *matzoh*.[61] Another episode includes a scene depicting a secret Jewish government allegedly plotting to drop an atomic bomb on Hiroshima, Japan. The transmission of this series caused uproar in France, where incitement to racial hatred and anti-Semitism is a criminal offence, and led France's higher audiovisual authority to instruct al-Manar to change the tone of its programming or face a ban. However, when in December 2004 a guest on a live show said that Zionists were deliberately trying to spread diseases, including AIDS, to Arabs, the authority decided to take the station to court. On January 6, 2005, France's

highest administrative court, the *Conseil d'État* (Council of State)—which had jurisdiction over the channel because it broadcast via a satellite based in France—decided that the programs al-Manar broadcast "were in a militant context, with anti-Semitic connotations" and banned transmission of the station, warning the satellite provider Eutelsat that if it failed to stop broadcasting al-Manar on its satellite within 48 hours of the decision it would be liable for payment of a fine of €5,000 (US$6,600) for every day it broadcast the station over the deadline.[62] For its part, the station said it was unfair to ban a channel on the basis of one live caller, and denies it is anti-Semitic.[63] In the event, al-Manar voluntarily stopped broadcasting several days before the ban was to take effect, a move that prevented other stations on the same satellite network from being removed from the airwaves as well, a decision that won the station praise from other networks and its international viewers.[64]

As regards the U.S. ban, which followed shortly thereafter: in George Bush's 2004 State of the Union address, he mentioned Arab media outlets he claimed were responsible for disseminating "hateful propaganda" against the United States.[65] Certainly al-Manar was included by the U.S. administration in these ranks. In December 2004, al-Manar was placed on an "exclusion list" by the U.S. State Department. This was followed up in March 2006 with al-Manar's designation as a terrorist organization by the U.S. Department of the Treasury.[66] As a result, no one associated with the broadcaster is allowed entry to the United States and any U.S. company found to be doing business with al-Manar will be subject to sanctions and possible prosecution with the result that al-Manar is prohibited from transmitting in the United States. Although they result in the same outcomes, it's worth noting that the French and U.S. bans rest on different legal foundations, with the French ban focusing on constitutional issues of expression, and the U.S. ban based on laws prohibiting the material support of terrorist organizations, which, according to Yadav, means that "At least in theory, then, the U.S. is suggesting that their own struggle against al-Manar is not based on the substance of what it says, but rather on what it does."[67] In addition to being unavailable in North America, and with access being restricted in Europe, al-Manar is also no longer available for viewing in South America, nor in Australia or much of Africa; however, it is still broadcast throughout the Middle East, parts of Europe, and North Africa by Nilesat, whose major shareholder is the government of Egypt, and Arabsat, which is owned in part by the government of Saudi Arabia.

### Responses to Ban(s)

Unsurprisingly, al-Manar officials were some of the most vociferous critics of the ban. The station responded in a statement that the U.S. action amounted to "intellectual terrorism" and an attack on press freedom.[68]

They also complained about the timing of the U.S. ban, pointing out that they had been broadcasting by satellite since 2000, and Hizbollah has been categorized as a terrorist organization by the United States since 1997, and questioning why the U.S. banning arrived on the heels of events in France, and insinuating conspiracy.[69] In Lebanon more widely, the mood was one of defiance. In response to the French ban, 50 cable operators in Beirut halted transmission of the French station TV5. The Lebanese Minister of Information declared the ban proof of censorship of any opposition to Israel, and students demonstrated in support of al-Manar. The then Lebanese Foreign Minister Mahmud Hammud commented, "We consider this to be against the freedom of expression that the entire world including the EU demands. We believe this attitude is not in harmony with the call for freedom of expression these countries advocate, and we believe there is a contradiction."[70] The banning was also criticized by organizations ranging from Hamas[71] and Palestinian Islamic Jihad[72] to Reporters Without Borders, with the latter warning against confusing anti-Israeli positions with anti-Semitism.[73] In any event, the station has also all but entirely circumvented the ban(s) by providing continuous live streaming online.

## AL-MANAR'S ROLE IN THE 2006 CRISIS

Following Israel's withdrawal from Lebanon in 2000, and believing itself relatively safe from the threat of Israeli aerial bombardment, al-Manar invested in high-specification antennas, which allowed it to extend its broadcasts further into Israel. As a result, residents of Haifa, Israel's third largest city—which is located some 30 miles from the Lebanese border—are now in the range of al-Manar's transmissions. According to Ron Schliefer, discussing the spots in Hebrew described earlier, "beyond their specific verbal messages these transmissions also seek to create in the Israeli mind a frightening connection between Al-Manar's ability to target their television sets and Hizbollah's ability to shell their homes; the implication being that the range of the one is equal to the range of the other."[74] Interestingly, al-Manar's headquarters in Haret Hreik and the above-mentioned antennas—one of which was located near Baalbek, northeast of Beirut, and another in Maroun al-Ras in southern Lebanon[75] —were some of the first targets of IDF air attacks when hostilities erupted between Israel and Hizbollah in early July 2006. Al-Manar's Beirut headquarters was first struck by the Israeli Air Force on Thursday, July 13, the second day of the crisis. The complex was bombed again on July 16, resulting in the outbreak of a fire in the station and surrounding buildings. Although the station's broadcasts continued uninterrupted during the first attack—which severely damaged the upper stories of the building— the second attack caused the station's signal to be briefly unavailable on several occasions before returning to full strength.[76] Also, on the second

day of the crisis, the first-ever Hizbollah rocket attacks on Haifa commenced.

The Israeli bombing of Hizbollah's media outlets received harsh criticism from journalistic and human rights organizations worldwide. The Committee to Protect Journalists, the International Federation of Journalists (IFJ), Human Rights Watch, and others agreed that the attacks were a violation of international law, as the station's broadcasts were not serving any direct military function (e.g., sending military communiqués).[77] Aidan White, the IFJ's General Secretary, said: "The bombing of Al-Manar is a clear demonstration that Israel has a policy of using violence to silence media it does not agree with. This action means media can become routine targets in every conflict. It is a strategy that spells catastrophe for press freedom and should never be endorsed by a government that calls itself democratic."[78] Human Rights Watch agreed, insisting "that Lebanese civilian opinion might influence how the Lebanese government responds to Hizbollah is not a sufficiently direct contribution to military action to render the media used to influence that opinion a legitimate military target. Rather, broadcasts should be met with competing broadcasts, propaganda with propaganda."[79]

Indeed the IDF—in addition to conventional attacks on media targets in Lebanon—is also said to have broadened its psychological operations over the course of the crisis. The first reports of intercepts of al-Manar's satellite transmissions were carried by Egypt's Middle East News Agency, who said that on Sunday, July 23, 2006 Israel managed "to intercept the satellite transmissions of Hizbollah's al-Manar TV channel for the third successive day, replacing it with Israeli transmissions that reportedly showed Hizbollah command sites and rocket launching pads which Israel claimed it has raided."[80] A little over a week later, al-Jazeera reported that a series of still photos with captions appeared on the screen's of al-Manar viewers for several minutes during the evening news. Al-Jazeera attributed the interruption to "Israeli-backed hackers." One of the images showed the corpse of a khaki-clad man lying face-down with accompanying Arabic text reading: "This is the photograph of a body of a member of Hizbollah's special forces. Nasrallah lies: it is not us that is hiding our losses." The al-Jazeera report is also accompanied by what appears to be a screen shot that shows a photograph of Nasrallah accompanied by the text "member of Hizbollah: watch out," which they say also appeared on TV screens.[81]

## CONCLUSION

Al-Manar has, since its inception, been a television station devoted to prioritizing the goals of Hizbollah and although these have been subject to change over time, the overarching theme of resistance has persisted throughout. From its establishment in 1991 to the Israeli withdrawal from

the south in 2000, the bulk of the station's programming was aimed at sustaining and, if possible, strengthening the Lebanese public's support for Hizbollah's campaign of resistance against the IDF in South Lebanon, while at the same time pressuring Israeli viewers to push their government for a unilateral withdrawal. The eventual withdrawal was celebrated live on air for days, but this "triumph" came tinged with distress: what was to be the station's purpose without the "hook" the resistance provided? The answer presented itself in the form of the outbreak of the so-called al-Aqsa Intifada. Al-Manar became "the secret weapon of the Palestinian intifada against Israeli occupation, the loyal supporter of armed resistance, devoting at least half its 24-hour-a-day satellite broadcasting to the battle between Palestinians and Israelis in the West Bank and Gaza."[82] In the summer of 2006, circumstances changed again, however, and al-Manar reverted to its original role as mouthpiece of the Lebanese resistance; this time around, cognizant of the role played by al-Manar in the previous conflict, the Israelis quickly sought to neutralize the station, though they had little success.

Between 1991 and 2006, other changes also occurred at the station. From a small local effort, the station grew to encompass a satellite audience of millions worldwide. This success was somewhat short-lived, however, as the station came to be banned in numerous jurisdictions around the world as a result of the anti-Semitic nature of some of its content. The bans were applauded by many, but excoriated by others. The U.S. ban was likely ill advised because by blocking al-Manar's transmission, Washington not only increased the station's notoriety and thus popularity, but also ignored political logic that upholds interests. Unfortunately for the United States and its interest in reaching out to the "Arab street," the likelihood is that the Chairman of Hizbollah's Executive Committee, Hashim Safiy-al-Din, summed up the feelings of a great many people in the Arab world when he said about the ban:

> [T]his impudent attack against our rights, with all their media, political, cultural and economic dimensions, is not a sign of strength but a sign of the U.S. weakness and powerlessness. By doing this it has proved its tyranny and oppression, which we have been talking about . . . [T]he U.S.A. is talking about democracy and freedom of speech, but at the same time it cannot tolerate a sound or an image despite all the media it has available throughout the world.[83]

On a more practical level, the goal of making al-Manar unavailable to large numbers of people worldwide was translated into an own-goal when, almost immediately on the announcement of the bans, the station commenced live online streaming. Eventually, this may mean that the station will draw more viewers via their freely available Internet service than via more costly satellite connections.

# CHAPTER 23

# SOCIOCULTURAL, ECONOMIC, AND DEMOGRAPHIC ASPECTS OF COUNTERTERRORISM

Christopher Jasparro

Sociocultural, economic, and demographic factors (henceforth referred to as sociodemographic) are among the most commonly cited suspects in debates over the "root causes" (i.e., those factors that give extremist ideologies resonance and appeal and spawn organizations willing to conduct violence on their behalf) of Islamist terrorism. The question of what the root causes of terrorism actually are, however, remains a subject of great debate.[1] It is also difficult to build strategies for addressing broad and complex sociodemographic trends. For example, youth bulges in Muslim countries are a commonly cited demographic driver of extremism. Yet, how can links between youth bulges across large swaths of the planet and a global terrorist movement be realistically addressed? Lack of precision and specificity is one reason why such analysis and consequent policy-making has been problematic.

This is partly because social science approaches used in terrorism research and analysis generally do not focus on place-specific contexts of seemingly widespread and generalized sociodemographic factors (e.g., youth bulges, poverty, and migration). For example, in an analysis of the 2002 Pew survey that questioned over 7,000 Muslin respondents in 14 countries about support for terrorism, Fair and Sheppard discovered that while some general variables applied across the sample, the actual effects of particular variables differed throughout the countries surveyed.[2] The authors thus concluded that interventions to mitigate support for terrorism should be directed toward highly defined country-specific audiences employing creative analytical application of demographic and

even psychographic data[3]—an approach to which this chapter suggests adding geographic as well.

Analyses that move beyond broad generalizations and consider the role played by particular and differing spatial factors on terrorist movements and how groups exploit physical and social spaces could potentially yield significant insights.[4] Liotta and Miksell also argue that:

> environment and geography provide both context and opportunity for the making of a terrorist. The context springs from the objective conditions that shape the strategies and tactics that are employed in terrorist operations. The opportunity consists of objective conditions that permit the organization recruitment and training of terrorists and the continuous functioning of networks of logistics and intelligence support.[5]

Simply put, "geography as the study of the globe and its interaction with the people on it, provides us with the means to understand the battlefield and predict its nature as to use the elements to advantage."[6]

The application of geographic perspectives allows for visualizing, organizing, and assessing real world data (that can otherwise inundate essential information with a deluge of detail), thereby elucidating important spatial patterns and structures.[7] In other words, by knowing what areas produce the most terrorists and their supporters, as well as where sociodemographic factors play particularly significant roles in facilitating terrorism (and how terrorist organizations exploit these factors from place to place), we can more precisely and efficiently target/tailor resources and approaches instead of being constrained by "one-size-fits-all" responses geared to addressing broad issues (poverty for instance) whose effectiveness is difficult, if not impossible, to measure.

Considering the sources of terrorism in their geographic context is especially critical for countering extremist ideologies. The potency and spread of an ideology is a function of three interrelated components: message (or story), dissemination, and resonance. All ideologies have a message to tell and stories by which to sell it. Offering counterarguments to discredit and debunk an opposing ideology is a key component of countering terrorism.[8] However, this is not enough—there are many extreme ideas floating around but they cannot attain significance unless large numbers of people are exposed to them. Thus, a second element in countering extremist ideologies requires channels of dissemination to be disrupted.

Nonetheless, in order for even a widely diffused message to mobilize significant support it must strike a chord that makes people gravitate to it. For example, in his book on the evolution of warfare, Thomas Hammes points out that today's "Fourth-generation" nonstate opponents include revolutionary leaders (and ideologies) that need people who feel disenfranchised; the fewer the disenfranchised, the fewer places there are for

movements to take root. Rupert Smith views the type of struggle we are now engaged in as part of an evolution from industrial warfare to what he calls "wars amongst the people." Success in this type of warfare requires getting clear messages through to target audiences, but it must be recognized that the message will always be filtered through the target's own (e.g., personal, national, and cultural, etc.) references.[9] This requires knowing the audience. To prevail in this type of warfare it is essential to recognize that the primary focus should be "the people" not the enemy; however, because the enemy is amongst the people, one needs to differentiate between the two.[10] It is thus important to ascertain: what people and where?

Countering an ideology therefore requires determining where a message originates from, along what paths it has spread, and how the conditions by which it resonates vary from place to place. More specifically, precision in reducing the effect of sociocultural and demographic "root causes" that give extreme ideologies their resonance calls for distinguishing between universal and place-specific drivers.

### TERRORIST GEOGRAPHY

There have been few attempts to systematically identify and analyze the geographical origins of those engaged in transnational Islamist terrorist or jihadi movements and operations and their supporters. One of the best known is Marc Sageman's study of terrorist networks, in which he identifies four clusters based upon geographical origin of 176 terrorists as well as the pattern of interaction between them.

The results of his study raise several issues of geography that need more analysis and exploration. First, at the global (macro) scale there are identifiable (but uneven) clusters and patterns in terrorist origins. For instance, al Qaeda's constituent nationalities and ethnic groups have been given responsibilities for particular regions in which familial relationships play key roles.[11] Members recruit from family, friends, and neighbors. Second, there also appears to be regional and subregional (mesoscale) variations in terrorist source areas and drivers of support.[12] Indeed, while many individuals and groups may on the surface share a common ideological bent, they have their own leaders and aims, which are often parochial and localized.[13] Third, locally specific factors such as place of recruitment and family networks are significant.

In order to further identify such clusters and patterns as well as elucidate sociodemographic factors at play, a broader dataset must ultimately be consulted. Unfortunately, ready-to-use, open-source, geographically arranged data on transnational terrorists—data that is both precise and systematically organized—is difficult to come by. Nonetheless, a fair picture can be put together by comparing various references to and

analyses of foreigners training or attending camps in so-called "jihad" theaters such as Afghanistan, Iraq, Bosnia, Kashmir, and Southeast Asia. While not all fighters in these "jihads" are or have become terrorists, it is well documented that jihadi veterans have formed the core of transnational Islamist terrorist groups across the globe. Thus it is likely that by viewing the larger set of fighters, the overall geography of Islamist terrorist operators and support can be outlined. Further refinement can be obtained by examining the geographical origins of terrorists who have participated in operations in the United States, Europe, and elsewhere.

### Afghanistan and Environs

The 1979–1989 Soviet invasion and occupation of Afghanistan saw thousands of Muslims from all over the world travel to Afghanistan and Pakistan to train and fight against the Soviets. Many (if not most) were not ideological extremists and eventually returned quietly home. However many stayed and others returned home to form the foundation of today's most radical movements. The majority of the volunteers who fought in the first Afghan war came from Pakistan, Egypt, Saudi Arabia, and Algeria.[14] Excluding Pakistanis, the most prominent group were Saudis both in terms of fighters per capita (of total national population) and nearly so in absolute terms.

In 1995, according to Pakistani press reports, there were almost 5,000 foreign *mujahideen* registered in Pakistan (of whom many presumably fought or trained in Afghanistan or Pakistan).[15] The overwhelming majority was from Egypt, Saudi Arabia, or Jordan. Egyptians and Saudis (along with Algerians) also dominate a 2000 report allegedly prepared by Osama bin Laden and published by the *Frontier Post*, which listed the nationalities of 2,359 young men who had "lost their lives in the jihad."[16] A similar pattern is seen among non-Afghans on the U.S. Department of Defense's official list of 522 detainees who passed through Combatant Review Process in 2004–2005 at Guantanamo Bay, where again foreign fighters from Saudi Arabia (as well as Yemen) are more common than from other countries.[17]

*New York Times* correspondent Carlotta Gall's 2002 report from the Northern Alliance Prison at Shiberghan in Afghanistan provides a similar picture. Of the 3,500 al Qaeda and Taliban prisoners there, over 2,000 were Afghans, but of the foreigners more than 700 were Pakistanis, with the rest hailing from Saudi Arabia, Kuwait, Yemen, Sudan, Morocco, Iraq, the Muslim republics of Russia (excluding Chechnya), and Central Asia.[18] Of senior al Qaeda leadership reported killed in the Afghan-Pakistan border area in 2005 and 2006, most have been Arabs. For example, Egyptian-born Abu Hamza Rabia, thought by some to be al Qaeda's number three, was killed in Pakistan in December 2005.[19] In the January 2006 missile strike that unsuccessfully targeted Ayman al-Zawahiri in Pakistan, several

foreign-born al Qaeda leaders are believed to have been killed. All were Arabs: Khalid Habib (aka Khalid al-Harbi), Abd al-Rahman al-Maghrebi (Moroccan), Mustafa Osman (Egyptian), Abu Obaidah al Masri (Egyptian), and Khalid Habib (Moroccan or Libyan).

A rash of suicide bombings in Afghanistan beginning in late 2005 has set off a debate over the bombers' origins. The Taliban claim that their bombers are locals. Afghan officials, however, insist (as evidenced by recent arrests that have included non-Pashtun Pakistanis[20]) they are mainly Arabs and Pakistanis who usually enter the country from Pakistan.[21] For example, in early February 2006 Afghanistan's Nimroz provincial governor, Ghulam Dastgir Azad, said nine foreigners were arrested in antiterrorist operations in Zaranj including: one Iraqi, two Kashmiris (from Pakistani administered Kashmir), one Pakistani, and five Bangladeshis.[22]

Aside from Arabs and Pakistanis, the only other foreigners that appeared in the region in significant numbers are from Central and Southeast Asia. The involvement of Central Asians in Afghanistan-Pakistan appears to be related primarily to the Islamic Movement of Uzbekistan (IMU), which some time in the late 1990s began providing fighters to the Taliban. The IMU, which has links to al Qaeda, propounds a radical jihadi ideology, operates and recruits in several Central Asian countries and receives extraregional funding; thus it can be considered a transnational group in its own right[23] (albeit at the subregional, not global level) with an area of operations that includes Afghanistan, Iran, Kyrgyzstan, Pakistan, Tajikistan, Kazakhstan, and Uzbekistan.

According to reporter Jason Burke, IMU members fighting in the fall of 2001 included Uzbeks, Tajiks, Chechens, and Uighurs.[24] By 2001, the International Crisis Group (ICG) estimated that 3,000 IMU fighters might have been in Afghanistan, with many likely to have been killed by U.S./Northern Alliance Forces or to have escaped into Tajikstan.[25] However, recent estimates now place the group's strength at less than 700.[26] Although Chechens are widely reported to have fought in Afghanistan and Pakistan, what hard open-source evidence that does exist suggests their numbers were fairly small, perhaps no more than several dozens.[27]

Although significant numbers of Southeast Asians have trained in Afghanistan and Pakistan, their exact numbers and the extent to which they engaged in actual combat operations is unclear. It is known that Indonesians, Malaysians, Filipinos, Thais, and Singaporeans trained together.[28] Indonesians, however, appear to have been by far the most numerous with Malaysians likely second. The International Crisis Group contends that over 200 Jemaah Islamiyah (JI) members trained in Afghanistan between 1985 and 1995, with an upper-end estimate of several thousand.[29] For instance, one Indonesian veteran claimed 3,000 Indonesians had fought in Afghanistan. A November 2005 statement by Indonesian intelligence officers claimed that about 5,000 Indonesian

Muslims were involved in militant activities in Afghanistan, Southern Philippines, Sri Lanka, and Libya, most of whom are now thought to be living in several large cities in Java and West Sumatra.[30] Many other outside analysts and insiders think the numbers were more likely in the hundreds.[31]

What few numbers put forward since 9/11 suggest a continuing but perhaps more limited Southeast Asian presence in Afghanistan-Pakistan. In November 2001, the Gerakan Pemuda Islam (GPI) claimed 300–350 Indonesians were in Afghanistan and Pakistan fighting with or preparing to fight with Taliban forces.[32] In September of 2003, Indonesian Gungun Rusman Gunawan (brother of Hambali) and 18 other Southeast Asians (including 13 Malaysians) were apprehended by Pakistani and U.S. agents in Karachi "for suspected militant activities."[33]

### Balkans

The outbreak of civil war in Bosnia occurred at a critical time for foreign fighters in Afghanistan. The "jihad" against the Soviets had devolved into internecine fighting, while in 1993 Pakistan began closing *mujahideen* offices and deporting illegal foreign fighters whose home countries balked at allowing them to return.[34] Reliable statistics on the numbers of foreigners fighting in Bosnia are lacking. Estimates range from several hundred to about 4,000, with 3,000–4,000 the number most commonly cited by reputable sources.[35] There is even less precision and information regarding their national and ethnic breakdowns. Most analyses suggest non-Bosnian Muslim fighters hailed mainly from Turkey, Iran, Pakistan, Sudan, Afghanistan, Jordan, Lebanon, Algeria, and Saudi Arabia. Generally most sources cite Iranians, Turks, and Arabs as the main participants.

Unlike in Afghanistan, Arabs were not the majority among foreign fighters.[36] However, most of the extreme ideologically driven fighters appear to have been Arabs.[37] They had a disproportionate effect relative to other foreign volunteers, and are accused of committing most of the terrorist actions and atrocities committed by Muslim forces.[38] The Iranian fighters, on the other hand, were largely serving under state-sponsored auspices.

For example, in 1992 seven foreign fighters from Saudi Arabia, Egypt, Morocco, Algeria, and Tunisia were reportedly wounded near Travnik.[39] A letter sent to the U.N. Special Rapporteur of the Commission on Human Rights (on the use of mercenaries) claimed that by the beginning of September 1992, 250 *mujahideen* had arrived in Bosnia from Turkey, Iran, Bahrain, and Qatar, and that in November 1992 an additional 43 (mainly Saudi) individuals fought against the Serbs at Teslic.[40] A review of other mercenaries listed in descriptions of incidents between 1992 through 1995 (in Babina Rijeka, Dervanta, Zenica, Orzen, Prijedor, Llijas, and Cakrcici)

identified by nationality the following foreign Muslim fighters: 31 Turks, 4 Jordanians, 7 Tunisians, 4 Egyptians, 4 Saudis, 1 Yemeni, 1 Syrian, and 1 Bahraini, plus two other Maghrebis and an unidentified Arab. Aside from the Turks, the only non-Arab Muslims specified were one Pakistani and a Georgian.

Some Indonesians are believed to have fought in Bosnia but their actual number is indeterminate.[41] Other than the case of Abdul Manaf Kasmuri (a former Malaysian army officer who was recruited into al Qaeda after returning to Bosnia following his service there as a peacekeeper[42]), there is little detailed evidence of Southeast Asians in Bosnia.

In 1998, foreign fighters also began entering Kosovo in order to fight alongside the Kosovo Liberation Army (KLA).[43] As in the case of Bosnia, press reports made frequent mention of Iranians, but they appear to have been there under state orders and sanction. However, most of the foreigners seem to have been Arabs. According to Fatos Klosi, then director of the Albanian intelligence service, three or four groups of foreign fighters comprised of Egyptians, Saudi Arabians, Algerians, Tunisians, and Sudanese entered Kosovo via Albania.[44] Furthermore, as of November 2001 over 30 Islamic NGOs were operating in Kosovo, primarily funded by Saudi, Kuwaiti, and Gulf States' money, a number of which are regarded by the NATO Kosovo Force (KFOR) as having external terrorist links.[45]

### Chechnya and Kashmir

The number of foreigners fighting on the side of the Chechen rebels has been variously estimated at anywhere from a few dozen to 200. An Internet tribute to "Martyrs of Chechnya" gives the stories of four foreigners killed between 1999 and 2000: three were Turks (one previously fought in Kosovo and two had trained in Afghanistan), the other a Yemeni veteran of Bosnia.[46]

Kashmir has also attracted foreign fighters, mostly Pakistani. But other nationalities have also been reported (though in lesser numbers), "Some of our Mujahideen brethren, whether Arab or (Ajam non-Arab), such as the Pakistanis and our brethren from Southeast Asia, have also helped."[47]

### Iraq

The U.S. invasion of Iraq opened up the most recent theater for transnational "jihad." Debate exists over the exact proportion of the insurgency made up by outsiders, but estimates generally range from 4 percent to 10 percent.[48] Although the exact number of foreigners is disputed, their origins have been better studied (to the extent this is possible in such an environment) than in other cases. Several different analyses and reports

give similar pictures of the origins of transnational fighters and terrorists operating in Iraq.

Iraq's Human Rights Minister, Bakhtiar Amin, reported that 350 foreign fighters were being held by the United States in 2004. He provided the following breakdown of prisoner origins: Egypt (61), Saudi Arabia (59), Jordan (40), Syria (56), Sudan (35), Yemen (10), Tunisians (10), Palestinians (8), and Lebanon (5).[49] A Saudi National Security Assessment Project concluded that 3,000 foreign fighters were present in Iraq as of late August 2005. Of these, 600 were Algerian, 550 Syrian, 500 Yemeni, 400 Egyptian, 450 Sudanese, and 350 Saudi (plus another 150 unspecified "others").[50]

Several reviews of extremist Web sites that posted tributes to foreigners "martyred" in Iraq also give similar results. An analysis by Reuven Paz of 154 foreigners killed in Iraq during February and March of 2005 (posted on Web sites associated with Abu Musab al-Zarawi's and related groups) found that at least 94 percent were Arabs. Their particular countries of origin had the following distribution: Saudi Arabia (94), Syria (16), Iraq (13), Kuwait (11), Jordan (4), Lebanon (3), Libya (2), Algeria (2), Morocco (2), Yemen (2), Tunisia (2), Palestine (1), Dubai (1), and Sudan (1).[51] A 2005 analysis conducted by *NBC News* of 400 militants killed in 2004 and 2005 revealed that they came from 21 countries, but with a disproportionate amount coming from Saudi Arabia (55 percent), Syria (13 percent), and North Africa (9 percent).[52] Another 3 percent came from Europe, the majority of whom are likely to have been North Africans or of North African descent.

### Southeast Asia

As indicated earlier Southeast Asians have been active in Afghanistan and Pakistan, but in general (except for Indonesians), they have not played a significant role in global transnational terrorist operations. Generally, Southeast Asians operate within their home countries. Of those that do operate cross-border, most do so within the region, with Indonesians the most numerous followed by Malaysians. Amongst non-Southeast Asians operating in the region, most appear to be of Arab origin.

In 1996, JI began shifting its training from Afghanistan to Moro Islamic Liberation Front (MILF) camps in Mindanao, and up to several hundred Indonesians may have participated.[53] Interrogation reports indicate the existence of classes containing both mixed Indonesians and Malaysians.[54] By August of 2003, over 200 JI members had been arrested in Southeast Asia, including nearly 90 each in Indonesia and Malaysia, and 30 in Singapore.[55] A list of 57 identified suspects detained in Malaysia since April 2001 on charges related to JI specifies three foreigners: an Indonesian, a Filipino, and a Pakistani.[56]

According to the Philippine Department of National Defense, 46 foreigners with suspected Islamist terrorist connections were arrested, detained, or "neutralized" in the country since 9/11. Among these, the following ethnic origins were reported: Saudi (5), Egyptian (2), Jordanian (5), Moroccan (2), Sudanese (3), Iraqi (10), Palestinian (3), Indonesian (12), Singaporean (1), Vietnamese (2), and Japanese (1). Of the 31 JI members and Singapore citizens detained by Singaporean authorities in 2002 and 2003, the two of non-Southeast Asians ethnic origin were of Arab and Pakistani descent.[57] The rest were mainly of local Malay or Indonesian descent. One of the few confirmed cases of foreign participation in the Southern Thai insurgency was the 2006 arrest of Indonesian Sabri Amiruddin. Of Sageman's 21 Southeast Asian subjects, the majority is from Indonesia (12), with three from Malaysia, two each from Singapore and Philippines, plus two nonethnic Southeast Asians (from Kuwait and Australia).[58]

### Western Attacks/Plots

The ethnic and geographic origins of terrorists who have crossed borders to launch attacks in western countries and of diaspora/"homegrown" terrorists reflects the wider pattern described earlier of involving many nationalities, but with Arabs and Pakistanis the most prominent. Even though there has been much recent media and scholarly attention to the "new" threat of "homegrown" Islamist terrorism, it is not new but rather a phenomenon that took root in the western world in the 1990s as, for example, when "resident and permanent Jihadist networks emerged in Spain."[59] Likewise, in the case of the 1993 World Trade Center bombing, although much attention focused upon Ramzi Yousef, an outsider from Pakistan, the core of the operational cell was comprised of men living in the greater New York City/Northern New Jersey area, and some investigators believe the original plot was homegrown.[60] A review of some specific plots is illustrative of the aforementioned patterns and trends.

Although Ramzi Yousef is widely regarded as the mastermind of the 1993 World Trade Center bombing, the cell he tapped into had its genesis in a group of Arab immigrants from the Brooklyn area originally brought together by Egyptian-born El Sayyid Nosair. Among those convicted in connection with the bombing were Mohammed Salameh (born in Palestine), Nidal Ayyad (born in Jordan), Mahmoud Abouhalima (born in Egypt), Ibrahim Elgabrowny (born in Egypt) and Abdul Rahman Yasin (U.S.-born citizen, Iraqi-American).

The core of the 2000 millennium bombing plot's North American cell were three Algerian-born Canadian and U.S. immigrants Ahmed Ressam, Abdelghani Meskini, and Mokhtar Haouri. The Hamburg cell

members who were at the heart of the 9/11 attacks leaders were Arabs who for the most part had radicalized in Hamburg, Germany, including Egyptian-born Mohammed Atta, Marwan al Shehi of the United Arab Emirates (UAE), Lebanese Ziad Jarrah, and Ramzi Binalshibh of Yemen.

The FBI's list of 26 most wanted alleged terrorists who have been indicted by Federal Grand Juries (related to terrorism charges against U.S. targets) is also dominated by Arabs. Twenty of the 26 are Arabs, with on overall ethnic-national breakdown of: 5 Saudis, 5 Egyptians, 2 Yemenis, 1 Iraqi-American, 1 Libyan, 1 Comoro, 2 Kenyans, and 2 Filipino (Moros). On the list are also 2 Palestinians and 4 Lebanese but who are not associated with Sunni-transnational terrorist groups.[61] A survey of 38 terrorist suspects arrested and charged in the United States since 9/11 yielded a breakdown of 9 American-born converts and 28 immigrants (mainly first generation), of whom 17 were Arabs and 12 Pakistani. Of the 12 named suspects arrested in the 2006 Toronto terror plot, over half were first- or second-generation immigrants from Sri Lanka (1), Somalia (2), Egypt (1), Trinidad and Tobago/West Indies (2), and Pakistan (2).

Seven of the nine primary Melbourne suspects from the Australian terror plot broken up in 2006 are of Lebanese origin, one is an immigrant from Algeria, and the other an Australian convert, while amongst the eight key Sydney suspects are a Bangladeshi immigrant, one male of Indonesian descent, a Bosnian convert, and several ethnic Lebanese.

It would appear that recruitment for jihad in Europe is somewhat structured along national and ethnic lines.[62] Of the individuals arrested in Spain for belonging to Islamist terror networks between 1995 and 2005, there were 83 Algerians, 40 Moroccans, 21 Syrians, 12 Pakistanis, 2 Lebanese, 1 Mauritanian, and 1 Afghan.[63] According to a 2004 U.K. intelligence service list of 100 Islamist activists suspected of being involved in terrorist activities, the majority were British citizens of Pakistani descent.[64] Indeed, three of the four London subway bombers were of Pakistani decent as were the majority of the first 19 suspects identified in the 2006 U.K. airline bombing plot. In the Netherlands second-generation terrorists are predominantly of Moroccan origin who were either born in the country or moved there at a very young age.[65]

Worldwide, in case after case, the social networks in which radicalization occurs amongst diaspora populations are highly localized with friendship, community, neighborhood, family and marriage ties playing important roles.[66] Initial evidence indicates that both the Sydney and Melbourne cells fit the "bunch of guys" profile, basically a group of friends whose radical beliefs and militancy incubate, escalate, and intensify in an upward spiral over time. Most of the nine members of the Melbourne cell, for instance, were old school friends.

In addition to friendship, family and community ties are another common and recurring element in cell formation and radicalization. The

suspects in the 3/11 Madrid bombings include several sets of broth-ers and cousins.[67] Amongst the 9/11 hijackers were several cousins (Ahmed, Hamza, and Saeed al-Ghamdi) as well as sets of brothers (Salim and Nawaf al-Hamzi, Wail and Waleed al-Sheri). Other plots in which family members participated together include the 1993 WTC bombing,[68] Singapore-JI bombing plot,[69] the USS *Cole*, and Bali Nightclub bombings.[70]

Families have also been found to provide both material and moral sup-port to prospective jihadis. For example, Umer Hayat (a Pakistani immi-grant arrested in the United States in June 2005 along with his American-born son Hamid) told investigators that he provided an allowance of $100 plus paid-for airline tickets knowing his son intended to attend a ji-hadi training camp in Pakistan.[71] While Madrid 3/11 suspect Mohammed Alfalah—who may have killed himself in a suicide bombing in Iraq last May—is thought to have been provided a cell phone by his father so he could communicate his intent to die a "martyr's" death.[72] Several relatives (siblings and spouses) of London 7/21 suspects have been charged with helping suspects avoid arrest.[73]

In-laws, too, often help foster entry into terrorist circles, while alliances are often created around marriage ties.[74] The act of marriage is also com-monly used by terrorists for purposes of immigration, cover, and burrow-ing into a community.[75] Alleged members of the al Qaeda Madrid cell suspected of having assisted the 9/11 attackers (and possibly the 3/11 bombers) are thought to have used marriage to help establish themselves in Madrid.[76] Brothers-in-law Antonio Castro and Jose Emilio Trashorras are suspected of being the critical links in the 3/11 explosives procure-ment chain. Muriel Degauque, the Belgian woman suicide bomber who blew herself up while attacking American troops in Iraq on November 9, 2005, was a convert to Islam whose radical beliefs and links to terror-ist circles crystallized through her second marriage to a Moroccan-born extremist.[77] Toronto suspects Zakaria Amad and Ahmad Mustafa Ghany are thought to be brothers-in-law.

Nearly all of the Melbourne cell members were school friends prior to their suspected radicalization and terrorist activities. Khaled Cheikho is the uncle of fellow Sydney suspect Moustafa Cheikho, while Melbourne suspects Ahmad and Ezzit Raad are brothers. Many of the Toronto sus-pects were also school friends from the communities of Meadowvale and Scarborough. Members of the Sydney cell have connections to an earlier terror plot against Sydney, associated with a cell led by Willie Brigitte. These linkages appear to have been built or nurtured by a combination of familial and jihad training camp relationships. French officials claim Moustafa Cheikho and Brigitte trained together with the LeT in Pakistan, while Hasan is alleged to have helped Brigitte find a flat. Brigitte, in turn, was introduced to his wife, Melanie Brown (a good friend of Khaled

Sharrouf's sister Miriam) by Sharrouf's brother-in-law, Mamadou Ndaw, who has since been deported to Senegal on security grounds.[78]

Cells in the West have generally tended to be geographically as well as socially localized, coalescing around particular neighborhoods and/or institutions (such as mosques, schools, bookstores, prayer centers, etc.) that often serve as key nodes between local groups and wider geographic and social connections. In the United States for example, the following cities/areas (amongst others) have been persistent nodes of al Qaeda and other Sunni Islamist operations, support, and recruitment: Detroit, Boston, Brooklyn, Northern New Jersey, South Florida, Northern Virginia, Oklahoma City, Tucson, Los Angeles, and San Diego.[79] In France, the area around Lille and Roubaix has long served as fertile ground for recruitment, as has the Lyon area, with the most important recruiting grounds in France appear to be the rundown suburbs of Paris and Marseilles.[80]

Some specific examples of cell localization include: the Madrid train bombings, 1993 World Trade Center bombing and subsequent New York City landmarks plot, 2005 Sydney-Melbourne arrests, London subway bombings, and the 2006 Toronto and Miami-based plots. Many of the Madrid bombing suspects have close ties to particular cities (such as Tangiers and Tetuan in Northern Morocco) and the Madrid neighborhoods of Lavapies and Leganes,[81] while three of the four London subway bombers hailed from the Beeston neighborhood of Leeds. Thirteen of the initial 19 suspects in the 2006 U.K. airliner-bombing plot hailed from East London with nine from Walthamstow in particular. Another four came from the Buckhampshire town of High Wycombe.

Most of the Melbourne 2005 suspects were school friends prior to their suspected radicalization and terrorist activities.[82] At least four lived within walking distance of each other. About half the Sydney cell lived within walking distance of each other (and Willie Brigitte) in the Wiley Park area. Of the first 12 suspects named in the 2006 Toronto, Canada terror case, most came from two localized clusters. One was in the suburb of Scarborough, where four suspects lived. Five other unnamed suspects also attended high school together in Scarborough. Six other suspects lived in nearby Meadowvale and Mississagua, in close proximity to the Meadowvale High School and Ar-Rahman Islamic Center.[83]

### Edges

A more problematic situation is presented by the outliers of Islamist terrorism. Although there are clear concentrations of terrorist activity and support, it is widely accepted that groups like al Qaeda have a global presence, and as the preceding sections illustrate, individuals from many countries have participated in transnational terrorist and "jihadi" activities. There is considerable debate over the extent to which support for

Islamist terrorism and related ideologies has spread (or is spreading) to areas such as sub-Saharan Africa, Bangladesh, and Southern Thailand.

Certainly there are many countries and areas that share similar sociodemographic profiles with the core countries but yet do not make the same level of contribution to transnational terrorism. For instance, Kenya and Tanzania are permissive environments for terrorist operations, as yet these countries have remained relatively unpromising grounds for recruitment and support. Despite a rise in extremist Wahabbist ideology in the 1980s and 1990s the extremists seem to be losing ground mainly because they appear to have alienated their fellow local (more tolerant and mainly Sufi) Muslims. It is likely that sociodemographic vulnerabilities in countries such as these are being mitigated by other factors such as cultural differences (for example, in many ways the phenomena of Islamist terrorism may be as much or more a function of Arab and Pakistani culture than of Muslim religion), local religious interpretations, geographic proximity to "jihad lands" (Middle East and Central Asia, including the Balkans, Iraq, Chechnya, Afghanistan, and Kashmir) and centers of ideological innovation (e.g., Egypt and Saudi Arabia) or early historic diffusion (Pakistan and Indonesia), level of global connectivity (or lack thereof) and historic as well as recent geopolitical events.

However, if these countries' deep political, economic, and social problems continue to fester, particularly amongst already marginalized Muslim communities, then they may well become more promising recruiting grounds in the future.[84] Indeed, this seems to be the case in places such as Nigeria and Southern Thailand. The conflict in southern Thailand is rooted in longstanding ethnic and socioeconomic grievances. However, the influence of extreme Islamist ideology, which is not traditional, is on the rise. This suggests that deepening and unresolved sociodemographic stresses could ultimately undermine or weaken traditional checks to certain extremist ideologies.

## GEOGRAPHIC AND SOCIODEMOGRAPHIC VARIATIONS AND PATTERNS

The preceding discussion suggests that there are areas ranging from the macroscale (e.g., regions and countries) to microscale (e.g., cities, neighborhoods, and communities) that seem to produce a disproportionate share of people involved in (and one would assume, active and passive supporters of) transnational Islamist terrorist and related activities. The role sociodemographic factors play—and their level of significance—within these areas can vary from place to place. Therefore, addressing sociodemographic factors requires first identifying where the key geographic nodes (as well as emerging diffusion paths) are, and then how

sociodemographic specifically influence terrorist recruiting and support in these areas. The following section seeks to illustrate this point by examining geography as well as some specific variations and patterns between places.

### Geographic Cores

It is clear that Arabia (and the Arab diaspora) produces the most participants in transnational jihadi and terrorist activities, and is thus transnational Islamist terrorism's geographic core. Within the Arab core, Saudi Arabia, Egypt, Yemen, Morocco, and Algeria appear to be particularly prominent. There are also three important secondary cores. Of these Pakistan is arguably the most important both regionally and internationally. The other two core areas are Southeast and Central Asia, particularly Indonesia and Uzbekistan. Of course, Islamist terrorism and support for related extremist ideologies is present well beyond these cores, and may in fact be growing in some areas. These are areas where geographic cultural, political, historic, and other barriers are either limiting or at least slowing the spread of terrorist ideologies and the numbers of active domestic and transnational participants.

Other studies using different methodologies reveal a similar geographic pattern. Sageman, for example, identifies four key clusters as: Central Staff (al Qaeda and global terrorist leaders, mainly Arabs), Core Arab (Saudi Arabia, Egypt, Yemen, and Kuwait), Maghreb Arab (Morocco, Tunisia, and Algeria), and Southeast Asia. Sageman also briefly mentions the importance of microscale geographic factors when he cites local "places of recruitment" as one of the circumstances that facilitates "joining the jihad" movement.[85]

Incident and casualty figures also provide anecdotal evidence of Arabia as a geographical core for terrorism, both domestic and transnational. According to the Memorial Institute for the Prevention of Terrorism (MIPT) database, of the 38,464 fatalities from terrorist attacks between 1968 and June 2006, 17,279 (approx. 44 percent) occurred in the Middle East/Persian Gulf region. Of these, 14,268 were characterized as caused by "international" terrorist attacks, of which 4,508 (or about 32 percent) occurred in the Middle/East Persian Gulf Area.[86] In 2005, the U.S. National Counterterrorism Center reported approximately 40,000 individuals killed or wounded in terrorist attacks for the year. Based upon a combination of demographic analysis and reporting of the countries, they concluded that 10,000-15,000 of the victims were Muslims (most in Iraq), with the Middle East and South Asia bearing the brunt. Although these are aggregate figures, including victims from attacks by all groups (not just Islamist), it is nonetheless clear that the Middle East (which is predominately Arab) is also the world's main locus of terrorism in terms of victims.[87]

### General Core Sociodemographic Characteristics

If we take a macroscale look at the Arab-Pakistan core and Central and Southeast Asian secondary cores (centered upon Uzbekistan and Indonesia) some shared sociodemographic characteristics in terms of level of development, demography, corruption, and environmental sustainability are visible. All of the main core countries fall in the "medium" category of the Human Development Index (HDI), ranked between 77th (Saudi Arabia) and 141st (Sudan).[88] In terms of overall HDI rank, most of the major terrorist-producing countries fall in the bottom half (88th or lower) of the 177 countries ranked; Yemen is the only one characterized as "low" (151st) in the HDI.[89] The only Arab countries that score in the high category are the small Gulf States of Kuwait, Qatar, Bahrain, and the UAE.[90]

A more striking pattern appears in terms of Environmental Sustainability Index (ESI) scores, where (with the exception of Tunisia) every Arab country is ranked in the bottom half of the 146 countries surveyed, as are Pakistan, Uzbekistan, and the other Central Asian "stans."[91] The collection of indicators and variables that form the 2005 ESI provide among other things an alternative to GDP and the HDI for gauging a country's progress.[92] The ESI also provides a tool for measuring potential to achieve global-scale policy goals such as the Millennium Development Goals (MDGs), which explicitly commit the world community to making progress in achieving environmental sustainability within the context of a broader global agenda aimed at reducing poverty, malnutrition, and expanding education and health care.[93]

Another measure in which we see commonality is that the majority of core countries also scored in the bottom half of the Corruption Perception Index (CPI). The CPI rates perception of corruption based on a scale of 0 (highly corrupt) to 10 (highly clean). Only the small Gulf States of Oman, UAE, Qatar, and Bahrain plus Jordan scored over 5; nearly all the rest scored below 3.5.[94]

Demographically a distinct overall pattern also exists. According to a study by Population Action International (PAI), countries with a youth bulge (in which young adults composed 40 percent or more of the adult population) were more than twice as likely to experience an outbreak of civil conflict. In this study, all Arab countries (with the exception of the small Gulf States) and Central Asian countries (including Pakistan) were assessed at "high risk" in terms of youth bulge-related instability.[95] Furthermore, countries with low-availability of cropland and/or freshwater were 1.5 times more likely to experience civil conflict; of these, countries of sub-Saharan Africa and the Middle East were most at risk. Countries experiencing the overlapping demographic factors of youth bulge with rapid urbanization and/or low cropland or freshwater availability have a particularly high risk of conflict and instability. Not surprisingly, all Arab

countries (again with the exception of the small Gulf States) plus Pakistan and Uzbekistan were also categorized in the PAI report as "very high" or "high risk" for overall demographic stress.[96] The only exception amongst the core countries to these demographic profiles is Indonesia.

Although general core areas can be identified that seem to exhibit certain common sociodemographic characteristics, this should not lead to the conclusion that these factors act in common or are evenly influential and distributed within and amongst a core's regions and populations. Sociodemographic profiles of individuals also vary. Generally, most operatives seem to get involved in terror groups during their middle to late 20s,[97] although this varies somewhat by region and the profile of wider nonoperational support-base may differ substantially from that of active players.[98]

### Arab Core

While Arabia is clearly the core of Islamist transnational terrorism, there are variations in operator and support patterns within and between countries and terrorist groups. In Algeria, for instance, the return of Afghan veterans and increase in popularity of religious extremism (and the ensuing civil war) occurred against the backdrop of a severe economic downturn. According to analysis by Testas of economic factors and their relationship to violence, the economic decline of 1988–1992 did not cause political violence or Islamist extremism in Algeria, but rather fuelled and magnified social discontent, the role of religion, political grievances, and ethnic hostility.[99] This had an additional transnational dimension, as unemployment and conflict combined to create a dramatic expansion in the number of Algerians living and moving abroad since 1992, helping set the stage for later diaspora related terrorism.

Compared to Algeria and other Arab core states, Tunisia has supplied relatively few fighters to foreign jihads, transnational terrorist operations, or foreign "homegrown" diaspora cells. During the 1960s and 1970s, living standards increased similarly between Tunisia and Algeria. However Algeria's economic decline and ensuing civil war saw incomes decline in Algeria from 1985 through 1998, while rising substantially in Tunisia, which may help explain some of the differences in political stability and political violence between the two countries.[100] Indeed in terms of HDI, CPI, and ESI, Tunisia outscores all the core Arab states (with the exception of HDI, where Saudi Arabia scores better).

The influence of sociodemographic factors is not uniform and varies not only between countries but also within countries and between demographic strata and terrorist organizations. In Egypt, the Gama Islamiyya had a distinct geographical core and a bifurcated recruitment demographic.[101] Upper Egypt, from al-Minya to the southern Nubian Desert—one of Egypt's most distressed regions, with wages 30 percent

lower than the national average and infant mortality 50 percent higher—was the birthplace and heartland of Gama Islamiyya.[102] Many of its leaders were recruited from among the region's many unemployed university graduates, while the sale of cheap food was used to draw in foot soldiers and supporters from the urban poor.[103]

Terrorist operatives also vary in source and background in Saudi Arabia; however, some distinct geographic clustering seems to occur. Amongst the 12 Saudi 9/11 hijackers, particular geographic, tribal, and family nodes stand out. Nine of the 12 came from two geographical clusters and over half did not have university education. Four came from a cluster of three towns in the isolated and underdeveloped al Bahah region. All shared the same tribal affiliation and none had a university degree. Another five hailed from Asir Province, a poor region in southwestern Saudi Arabia bordering Yemen, and all had begun university studies. The remaining three—al Suqami, Majed Moqed, and Salem al Hazmi—came from various other towns and cities. Suqami had little education, Moqed was a university dropout, and al Hamzi had problems with alcohol and petty theft.[104]

Saudis recently engaged in terrorist and insurgent activities in Iraq come from various locations, but with the South, Hijaz, and Najd being the three main clusters.[105] Most are affiliated with prominent conservative tribes, but unlike the 9/11 hijackers most are middle-class, employed, and educated.[106] In Yemen as well there are varying demographic and geographic nodes of support for Islamist terrorist groups. For instance, support for al Qaeda comes from both ideologically sympathetic Islamists (including some returnees from the anti-Soviet war and training camps in Afghanistan) and from specific tribal areas. The Bakil tribes of the Marib area (in northern Yemen) are perhaps the strongest Yemeni supporters of al Qaeda.[107] However, the Bakil are not necessarily motivated by ideology, but rather by tribal, political, and economic reasons, and have shown a willingness to accept support from all quarters.[108] Thus in order to weaken Bakil support for al Qaeda, Katz has proposed a two-pronged approach. First, at the local scale, short-term aid should be provided to tribal leaders who do not cooperate with (or who act against) al Qaeda. This is to be combined with a long-term program to eliminate tribal grievances against the central government and develop the economy and educational system at the national level (thereby allowing the government to free tribal members from dependence upon shaykhs who require aid from outside actors such as al Qaeda).[109]

## DIASPORAS: PATTERNS WITHIN PATTERNS

Roy describes Muslim diaspora members and other Western country residents involved with terrorist networks as falling into one of three main categories:

Students, who came from Middle Eastern countries to study in the West; second-generation Muslims, who were either born in the West or came as infants; and converts. The students (for example, the World Trade Center pilots) are usually middle or upper class, and all were educated in technical or scientific disciplines. The second-generation Muslims emanate from the working class and disfranchised urban youths. The converts are a more complex category. Most of the individuals who gravitate towards these three categories are "new Muslims," either born-again or converts.[110]

In terms of ethnic origin, as discussed earlier, Arabs and Pakistanis appear to be the most active players in transnational Islamist terrorist activities amongst diaspora communities. Given that their new home countries do not fit into the same relatively grim macrolevel sociodemographic categories as their ancestral homelands, it could lead one to conclude that sociodemographic factors have little to do with diaspora involvement in terrorism.

However there appears to be both supply and demand drivers, some of which are sociodemographic in nature. On the supply side, the existence of large communities with skills and backgrounds amenable to the conduct of transnational terrorism (e.g., language, experience of living and working abroad, and possession of passports, etc.) are attractive to al Qaeda and like-minded organizations.[111] Meanwhile, on the demand side, disaffected communities or individuals who may be (or feel) marginalized or alienated locally, while identifying with wider narratives of grievance, may provide fertile support bases.

The social roots of Islamist violence may be strengthening due to resentment of foreigners by host populations, the difficulties of coping with modernization versus traditional culture, unemployment, and unfulfilled expectations of the second and third generation of immigrants, which has been exacerbated by financial support in Muslim countries that enabled immigrants to build and promote their own communities[112] as well as spread neofundamentalist ideology. This sort of ideology targets actual individuals in doubt of their faith and identity, and appeals to uprooted, disaffected youth in search of an identity beyond the lost cultures of their parents and thwarted expectations of a better life in the West.[113] For example, as Roane observes, in "central Montreal more than 15,000 of its 1 million citizens are of Algerian origin" [many] who say "they are being denied jobs because of their ethnicity, and immigrants of all stripes complain of harassment by the authorities."[114]

So while in absolute terms diaspora communities may be in better sociodemographic situations than their counterparts in origin countries, in relative terms they may sit in the medium zone within their host countries, where they may be subject to more corruption (or less government attention), discrimination, and hopelessness than the population at large. This

in turn provides fertile grounds for globalist religioextremist ideologies to resonate and be applied to host countries and societies. This general pattern, with place-specific differences, can be seen in the examples of France and Spain. In France, Islamist terrorist organizations and networks have, according to Jordan and Horsburgh, "captivated young second generation immigrants on the dole or immersed in a world of crime, taking advantage of the solidarity in marginal neighborhoods of Paris and other French cities."[115] Meanwhile in Spain, members of such organizations and networks have generally been first-generation immigrants from middle-class backgrounds. However, they generally were neither highly educated nor enjoyed highly paid employment.[116]

According to Kaldor, a key driver of "new wars" (of which transnational Islamist terrorism would be one form) is that local particularisms, whether in the form of ethnic identity or religious affiliation, have been supported from afar by diaspora populations, through fund-raising political contacts and weapons purchases. This is a pattern that fits with events such as 9/11 with the exception that the attackers hit the United States directly rather than indirectly supporting violence in their homelands.[117] This "exception" is actually quite significant, because it represents an example of a "reverse diaspora war" in which those disconnected from both land of origin and new home turn on their hosts even while the ideology that drives them may be funded by and exported from the old core. Evidence suggests, for example, that few children of Europe's Muslim immigrants return to wage jihad in the land of their ancestors, such as Algeria or Morocco.[118] So, while the ideology maybe transnational, the reasons for its resonance may in fact be more local.

This indeed appears to be the case with diaspora support of Islamist terrorism, and is significant because it means that on a macrolevel there may be similarities in support, but local drivers and grievances (such as socioeconomic and demographic factors) may be quite different. Thus even amongst diaspora communities there are variations in recruiting and support patterns. This is compounded by cultural, linguistic, socioeconomic and other differences between and within diaspora communities. Because of these differences, Muslims in Western Europe, for instance, "cannot be expected to share a unique public space, nor similar geopolitical visions. Therefore it is necessary to focus on one nationally defined group in one country" rather than Muslims as a single entity.[119] For example, in an analysis of Dutch Moroccan Muslim Web sites and chat rooms, Mamadouh found that "although solidarity with fellow Muslims in the Netherlands and the rest of the world is strong . . . [the label] 'Muslim' was used to refer mainly or exclusively to Arabs and the Arab world . . . or even more specifically the Moroccan community."[120] This further suggests that in many cases what appear to be macroscale universal grievances may actually be locally and particularly rooted.

Across the board however, localized concentrations of crime and marginalized immigrant communities have provided fertile ground for both radicalization and recruitment, as well as community disempowerment. Incidents such as the London subway bombings and recent arrests in Sydney and Melbourne have helped propel the thesis that many diaspora terrorists are "clean skins" or "lilywhites"—in other words, people who were unknown to police and security authorities.[121] Typical of this line of reasoning is Australian journalist Martin Chulov's contention (based on the London bombings) of the threat posed by home-grown "cleanskin" terrorists who, "Like a mutant virus with no cure, they are random, unpredictable and almost impossible to stop before they wreak their havoc."[122] This, along with the fact that many Islamist terrorists have come from middle-class backgrounds, has obscured the importance of the role low-level, localized crime plays in radicalization, recruitment, networking, logistics, and operations.

In fact, low-level criminality has played a role in nearly every successful attack (with the notable exception of 9/11) as well as in most of the more well known failed attempts by Islamist terrorists cells in the West since the early 1990s. About a quarter of Sageman's subjects (all North African Arabs in Europe and North America) were involved in petty criminal activities. Other cells in Western countries have had 20-75 percent of members with some type of criminal background. While this obviously does not mean most Islamist terrorists come from criminal backgrounds or are merely criminals, it does suggest that the sociodemographic factors conducive to criminality in certain areas amongst certain demographic groups contribute to the level of vulnerability to terrorist recruitment and support.

Low-level criminality and prisons played important roles in the lead up to several recent incidents. For example, several of the suspects involved in the 3/11 Madrid attacks have records of drug trafficking, while trading in hashish and ecstasy was critical to the operation and paid for cars, safe houses, and explosives. Key suspects also spent time in Spanish prisons.

Criminality is also common amongst Islamist terrorists in Britain. According to the British Parliament's cross-party Intelligence and Security Committee, the alleged leader of the London 7/7 bombings, Mohammed Sidique Khan, was known to police for suspected petty fraud.[123] There has also been some speculation that fellow London bomber Lindsey Germaine had been a drug dealer.[124] And at least three of the five suspects in the failed 7/21 bombing attempt had engaged in prior criminal activities such as robbery, shoplifting, gang membership, and passport fraud.[125]

In another example, four of the ten key suspects of the 2005 terrorist plot in Melbourne, Australia, had criminal pasts. Aimen Joud had prior convictions on firearms and theft charges, while Fadal Sayadi had also been convicted on a minor theft charge.[126] Several suspects have also been

accused of involvement in a stolen credit card number scheme.[127] Several members of the Sydney cell have been linked to Janel Saleh, who is currently serving time in a Lebanon prison on weapons charges.[128]

In addition to its use in raising funds for terrorist attacks, crime also appears to play a role in producing sympathy for extremist ideologies and/or driving a wedge between local communities and their governments either in the form of intimidation and extortion by extremist or just by inadequate (but sometimes oppressive) policing. For instance, Saudi businessmen and wealthy Palestinians who have reportedly made large contributions to various terrorist groups in some circumstances may have done so in response to blackmail or as a subtle form of "protection payment."[129] In Italy, Islamist extremists operating out of the Islamic Cultural Institute (ICI) in Milan set up a collection racket whereby "a 30 percent surcharge was extracted from 'fearful' local Muslim businessmen."[130] And in Kenya and Tanzania, police have limited capability to provide basic law and order services to local communities and furthermore are widely hated and feared—so much so that according to one Tanzanian Muslim NGO representative, "If we saw bad people we wouldn't go to the police."[131] Overall, as many scholars and practitioners have observed, the linkages between criminal activity and terrorism cannot be overlooked.[132]

## STRATEGY AND POLICY IMPLICATIONS

While it seems clear that socioeconomic and demographic factors contribute to the resonance of extremist ideologies as well as the growth and diffusion of passive and active support of Islamist terrorism, the manner in which particular factors play a role and their significance varies across space and from place to place. Indeed, research has not surprisingly shown that *social and economic development policies can weaken local support for terrorist activities, discourage recruiting, and can be used as a stick to discourage terrorism in certain contexts.*[133] In fact, the most popular measure cited by 2,000 Arab adults (in the United States, Egypt, Kuwait, UAE, Lebanon, and Jordan) when polled on how to win the war on terror was to "provide development aid to poor countries."[134] The ability of development polices to inhibit terrorism, however, depends upon their implementation, while inadequate policies are likely to inflate expectations and even renew support for terrorism.[135]

Implementing effective and efficient policies that address underlying socioeconomic and demographic issues and populations requires precision and understanding of local patterns. Because the type and influence of sociodemographic factors varies from place to place, there is no silver bullet strategy that can be applied broadly. While laudable, grand macroscale endeavors aimed at ending corruption, youth unemployment,

or poverty in the Muslim world are not likely to bear fruit in the near future, insufficient, watered down, unsustainable efforts or even concerted ones (but in the wrong places) are likely to have little effect or even exacerbate the problem. The need to identify underlying drivers and actors at local levels will become increasingly important as the global Islamist terrorist movement (and al Qaeda) continues to atomize and decentralize. This process is compounded by the use of the Internet, which allows small groups to form, train, and bond locally.

To attain this type of precision first requires more refined knowledge of the geographical and sociodemographic origins of both operators (supply) and supporters (demand). There is a tremendous amount of information and detail about Islamist terrorist operators and suspects available through open sources. Although the data is diffuse and of varying quality, painstaking data gathering and analysis of hundreds (if not thousands) of known suspects and operators should yield considerable specific geographic and related socioeconomic data. A much richer source, however, is available to government, intelligence, and law enforcement; there are thousands of names on watch-lists, detainee and prisoners lists, as well as rich biographic and demographic data from interrogations and suspect debriefings. The application of available data mining techniques to these datasets has the potential to yield enormous results.

In order to identify and predict key socioeconomic and demographic factors and related vulnerable populations, more resources are needed for the support side of Islamist terrorism, as opposed to active terrorist operatives.[136] However, since active terrorists are likely to hail from communities and areas where support is strong, geographic analyses of active terrorist operatives can help locate areas in which support is likely to be strong, thus helping pinpoint areas for more precise studies and policies targeted at understanding and addressing the socioeconomic and demographic support environment.

Once the above steps are taken, the next phase should be to input, map, and analyze the data using Geographic Information Systems (GIS). This would allow the multiscale mapping of clusters and diffusion pathways of terrorist recruits as well as popular support. It would also enable analysts to identify, analyze, and assess underlying socioeconomic drivers at play in current as well as emerging local hotspots and key nodes. In terms of homeland security and counterterrorism, GIS is already employed for consequence management, and is finding increased use for law enforcement intelligence evaluation and threat detection, due to its ability to consolidate diverse strands of information into a comprehensive view.[137] Extending the use of GIS from consequence management and threat detection to identify, analyze, and map sociodemographic drivers and populations vulnerable to recruitment (across scales from global-regional-national-local) requires only a small leap.

There are a number of models and methodological approaches that can be used both quantitatively and qualitatively to guide and frame GIS-based analyses such as social network analyses (e.g., Sageman) and autoregressive time-series modeling (e.g., Enders and Sandler). Of particular value, especially in delineating and predicting both active and passive support (as well as fence-sitter) populations may be techniques from medical geography and epidemiology. The adaptation of techniques such as hierarchal diffusion, distance decay, stochastic diffusion, and gravity models, as well as analysis of spatial autocorrelation, can be used to help identify key node localities, and populations as well as ideological and support diffusion paths. Techniques used to analyze "transformed space" (e.g., representing distances on roads by travel time rather than distance) have application for assessing the effect of the Internet and rapid transit on terrorist geography.

Medical geography approaches not only seek to assess key nodes and diffusion paths but also to identify barriers and countervailing factors. In opposition to networks, which pattern and support diffusion, barriers slow and shape processes and can have three effects: blocking, reflection, and slowing.[138] Reflecting barriers, for instance, channel and intensify the local impact of a diffusion process while blocking its spread to another locale.[139] For example, authoritarian crackdowns in Middle Eastern countries may have channeled and intensified diffusion of active support(ers) to diaspora communities in open Western societies, while cultural barriers may be slowing or limiting the spread in places such as East Africa. Barrier analysis combined with network and locational analysis can thus help identify which populations or communities are most vulnerable to infection (whether from a disease or extremist ideology) from those that may be somewhat inoculated by other factors. Thus appropriate countermeasures can be developed and prioritized. The aforementioned analytical tools and approaches can be used to guide the development of multiscale strategies geared at targeting and addressing underlying sociodemographic drivers in global and regional core areas and emerging hotspots, with emphasis on tailored efforts in key localities.

Once the key localities and demographic groups to be targeted are delineated, there already exist a number of tried and tested approaches that can be applied. In particular there is a need to empower communities and civil society to defeat terrorism and its underlying support from within, in a manner akin to how the "movimento antimafia" helped repress the Sicilian mafia during the 1980s and 1990s.[140] There are three related strategies that have particular promise for use at the local and community level and that if implemented in an integrated fashion, in key areas, and on a wider front, could contribute significantly to minimizing socioeconomic contributors to terrorism amongst key demographics.

### Grassroots Engagement and Community Development

Once key local areas and populations have been identified, it is important that any socioeconomic development programs be appropriate and suitable to local conditions as well as sustainable at the local level. One way to ensure this is to start with grassroots engagement though employment of bottom of pyramid (BOP) approaches. Throughout the world, BOP approaches that have involved collaboration among the poor themselves, civil organizations, governments, and private firms have proven effective in producing sustainable economic progress.[141] According to General Charles Wald, Deputy Commander of U.S. European Command, such tools are well suited to diminishing the causes of terrorism by providing investment and employment that lead to long-term quality of life improvements.[142]

### Community Policing

Community development efforts must also include a security element. Local communities often need protection from local extremists and criminals as well as from intimidation by majority populations and even corrupt police. There is also a need to identify and gather intelligence on terrorist operatives or those vulnerable to recruitment at the local level, especially in the case of so-called "homegrown terrorists."

Community policing techniques offer a way to bridge the developmental and security aspects of dealing with the socioeconomic and demographic roots of terrorism at the local level. According to Chief Deputy Joe Docobo of the Hillsborough County Sheriff's Office in Tampa, Florida, "The U.S. Department of Justice has defined community policing as a philosophy that focuses on crime and social disorder through the delivery of police services that include aspects of traditional law enforcement, as well as prevention, problem-solving, community engagement, and partnerships."[143] Many of the practices employed in community policing are natural compliments to the type of geographic analysis and BOP approaches discussed in this chapter such as: use of GIS systems, data collection, and analysis protocols for obtaining and evaluating intelligence and assessing vulnerability, not only to the threat of terrorism, but also to underlying social, economic, and demographic drivers of support.

### Rehabilitation

Empowering moderate voices—especially amongst the young—to engage in effective debate within their societies is an important action that Western governments could take in order to reduce anti-Western

sentiment amongst Arabs.[144] Some of the potentially most effective actors for combating terrorist support, ideology, and recruitment in this vein are former terrorists who can be sent back to their communities (similar to how former gang members and substance abusers have been used in gang and substance abuse prevention programs).

One of the more notable programs is found in Singapore, which has managed to rehabilitate and reintegrate in society a significant number of JI detainees. The core of Singapore's program is the Religious Rehabilitation Group (RRG). The RRG was formed as an expert group to provide religious counseling to JI detainees and family members. Amongst their key aims and activities are providing "accurate" version of religious education, empowering detainees to guide their own families (away from extremist ideologies), helping former JI members adjust to living in Singaporean society, and enabling them to play a role in national security. A second pillar of Singapore's strategy is to involve the Muslim community in public awareness and education activities designed to counter the underlying ideology of Islamist terrorism. A key component of this effort is the Asatizah Recognition Scheme, which aims to enhance the public standing of religious teachers and provide oversight and guidance to ensure responsible religious education within communities.

## CONCLUSION

Finally, expectations for socioeconomic development strategies and community-based programs in combating terrorism must be realistic. While effective and well implemented social and economic development programs can inhibit terrorism, they cannot eliminate it. In addition to socioeconomic and demographic drivers, it cannot be forgotten that powerful political and religious grievances and motivations exist. As Cragin and Chalk observe, development "is most effective when" it is integrated into a "wider political, military, and community-relations" approach.[145] However, development should not be used as a substitute for dealing with real political grievances or as a means to avoid confronting the use of religion to justify and excuse extremism and terrorism.

# PART IV

## U.S. RESPONSES TO THE GLOBAL SECURITY ENVIRONMENT

# CHAPTER 24

# TERRORISM, INSURGENCY, AND AFGHANISTAN

Thomas H. Johnson and M. Chris Mason

Over the last decade, Afghanistan and terrorism have become synonymous in the eyes of many analysts and policymakers.[1] Afghanistan, of course, was the first campaign stop—Operation Enduring Freedom (OEF)—of the Global War on Terrorism (GWOT), and has since been viewed as a hotbed for global terrorists and *jihadists*. Strictly speaking, however, regional conditions—including bad governance, poverty, oppression, corruption, and radical Islamist movements—throughout Afghanistan and its neighbors are the primary source of terrorism in this country. This is not meant to suggest that Afghan groups, such as the Taliban, are not directly responsible for terrorism in Afghanistan. Rather, it is to suggest that the Taliban are encouraged, enabled, funded, and driven by foreign sources and interests and are outsourcing their logistics and suicide missions via regional networks. To view them merely as an indigenous Afghan movement is to ignore critical aspects of their organization, support, behavior, and actions—and the aforementioned conditions in South Asia.

Today, after 27 years of continuous war, Afghanistan is struggling. President Karzai's post-Taliban government is finding it extremely difficult to extend its control and mandate outside the capital of Kabul and into the country's vast impoverished hinterland. Several forces are undermining Karzai's efforts to build a truly national government with national control, including a rising tide of narcotics production now responsible for approximately 60 percent of the country's economy, and a resurgent Taliban—backed by al Qaeda—who are mounting an increasingly virulent insurgency in the east and south of the country. Although then Secretary of Defense Donald Rumsfeld reported in May 2003 that the war on terror in

Afghanistan was in a "cleanup" or "mop up" phase,[2] today—over 5 years into American military engagement in Afghanistan—the United States is mired in an insurgency of escalating violence and lethality which has already claimed thousands of lives. The twin insurgent movements of the revitalized Taliban and the *Hizb-i-Islami* party of Gulbuddin Hekmatyar (HiG) are growing steadily in strength and influence, while Kabul's control over a broad swath of the country is rapidly diminishing. As demonstrated by the widespread anti-American riots in Kabul in May 2006, political volatility is even starting to reach urban areas. Three fundamental problems in Afghanistan have allowed for the emergence of the insurgencies:

The inability of the national government since 2001 to establish a politically significant presence throughout the country,

The failure of the international community to create a secure rural environment in the south conducive to development and reconstruction, and

The virtually complete lack of meaningful improvement in the lives of the great majority of the people in the southern half of the country.

The purpose of this chapter is to assess the insurgencies in Afghanistan and the foreign political and international terrorist elements that aid and abet them. The first section of the chapter will discuss the makeup and character of the Afghan insurgencies, examining the historical foundations of the Taliban and HiG. The second half of the chapter will provide a critical assessment of U.S. counterinsurgency efforts, and explore what lessons can be drawn which could inform U.S. counterinsurgency strategy and tactics.

## THE AFGHAN INSURGENCY AND TERRORISM

On October 7, 2001, the U.S.-led coalition began its initial air campaign against al Qaeda and Taliban forces in Afghanistan—forces deemed responsible for the September 11 attacks on the United States. According to the U.S. Defense Department, the initial U.S. air campaign "eviscerated" the Taliban's military capability within two weeks.[3] On October 18, the U.S. "official" ground campaign began when U.S. Special Forces entered northern Afghanistan and teamed up with the Northern Alliance—a loose confederation of veteran mujahideen and warlords from non-Pashtun ethnic blocs who represented the Taliban's primary resistance. By November 10, the strategic northern city of Mazar-i-Sharif fell to the Northern Alliance. In the following days, large swaths of the north were captured by the Northern Alliance, to include Kabul, which it occupied in defiance of international pressure not to enter the city. On December 6, the Taliban evacuated the southern city of Kandahar, turning over its last sanctuary to

opposition forces. Four days later, after only 62 days of conflict, the United States declared victory in Afghanistan.

However, the success of the campaign was marred by two serious mistakes, one diplomatic and one military, which would prove to be major strategic blunders in the War on Terrorism. In mid-November 2001, the Bush Administration permitted the Pakistani Air Force to fly out hundreds of Pakistanis encircled in the northern city of Konduz, an evacuation which turned into a mass extraction of senior Taliban and al Qaeda personnel, dubbed "Operation Evil Airlift" by appalled U.S. Special Forces personnel on the scene. Then, the following month, the failure to commit U.S. ground forces to block their escape route at Tora Bora permitted Osama bin Laden and several dozen of his best men to also escape encirclement near the border and flee into Pakistan.[4] The opportunity to complete the decisive destruction of the Taliban and al Qaeda before Christmas 2001 was lost.

After the withdrawal of the Taliban regime, an interim administration was quickly installed in Kabul under the terms of the UN-brokered Bonn Agreement. The temporary government was headed by an ethnic Pashtun and CIA contact, Hamid Karzai. Meanwhile, bin Laden and most of the senior al Qaeda leadership, as well as Taliban leader Mullah Mohammed Omar and the great majority of the senior Taliban cadre, are believed to have taken up residence either in Pakistan's Federally Administered Tribal Areas (FATA) or Baluchistan Province, where they began to regroup and rearm.

While scattered attacks occurred in Afghanistan during 2002, the security situation started to deteriorate significantly in 2003 in the volatile south and east of the country. With U.S. forces now bogged down and overstretched by the invasion and occupation of Iraq, the added strain of a continuing low-intensity war in Afghanistan became evident. Many key intelligence, Special Forces, and aviation assets were withdrawn from Afghanistan and sent to Iraq. Moreover, during this same period, many Pashtuns became disenchanted with Karzai's Afghan Transitional Administration (ATA), which was widely viewed as being controlled by the Panshiri Tajik faction that held the government's key ministries of defense, interior, and foreign affairs.[5] (The situation has now significantly reversed, as many Tajik leaders have been gradually sidelined.) Pashtun suspicions and mistrust of the government were further heightened by the ATA's inability to protect Pashtuns from the wave of human rights abuses perpetrated by insurgents and warlords since the fall of the Taliban. Finally, a considerable source of discontent and fuel for the insurgency involved what were widely seen as the heavy-handed tactics of U.S. military operations in Pashtun areas of the country.

Despite warnings from the State Department, such "hard-knock" operations continued to be standard procedure for several years, alienating

much of the populace. The Pentagon continued to view the situation as one of counterterrorism, not counterinsurgency, and conducted operations in the rural areas accordingly. As one U.S. Provincial Reconstruction Team (PRT) commander commented, "Black Ops [Special Operations counterterrorism forces] do more damage in my province in one night than I can undo in six months." Particularly problematic was the careless use of U.S. air power, which killed scores of civilians, and the apparent lack of sensitivity by U.S. troops to local perceptions, laws, and customs. According to reports in the Afghan press, "U.S. Special Forces, during routine sweeps of Afghan villages searching for weapons and members of resistance groups, have physically abused villagers, damaged personal property, and subjected women to body searches, a major affront on a family's honor."[6] UN officials have commented that "This doesn't help us at all . . . the people are basically pro-America. They want U.S. forces to be here. But American soldiers are not very culturally sensitive. It's hardly surprising that Afghans get angry when the Americans turn up and kick their doors in."[7]

By mid-2003, a reemergent Taliban had begun cross-border operations from Pakistan, posing a growing security threat to eastern and southern Afghanistan, with the insurgents gradually gaining political control of significant portions of the Afghan provinces of Zabol, Kandahar, Helmand, and Oruzgan. Several NGO workers were murdered by Taliban guerillas. In November 2003, 2 years after the Taliban retreat from Kabul, the United Nations started pulling staff from large areas of southern and eastern Afghanistan and closed refugee reception centers in four provinces.[8] Unable to provide a reasonable level of security for their personnel, most NGO's, including *Medicines Sans Frontieres* (Doctors without Borders), CARE, and Mercy Corps followed suit. An insurgency that the United States did not expect and did not understand was now in full swing.

## A DETERIORATING SITUATION IN AFGHANISTAN

Over 350 American Soldiers and Marines have been killed in action in Afghanistan since October 2001. While the overall level of violence in Afghanistan does not yet approach that experienced in Iraq, Afghanistan is actually the more dangerous place to be deployed in terms of fatalities per soldier-day in the combat zone. Furthermore, while the rate of U.S. casualties has stabilized somewhat in Iraq, it has increased steadily in Afghanistan since 2002 (see Table 24.1).

Most troubling of all, the last 12 months have provided ample evidence of increasingly sophisticated insurgent tactics being imported from Iraq and grafted onto classic mujahideen-style guerilla warfare. In 2006, there was a 200 percent increase in insurgent attacks, compared to 2005. Indeed, September 2006 saw the deadliest month in the country in 5

**Table 24.1   U.S. and Coalition Military Fatalities in Afghanistan By Year**

| Period | U.S. Fatalities | Other OEF Coalition Fatalities | Total Fatalities |
|---|---|---|---|
| 2006[48] | 98 | 93 | 191 |
| 2005 | 99 | 30 | 129 |
| 2004 | 52 | 6 | 58 |
| 2003 | 48 | 9 | 57 |
| 2002 | 48 | 20 | 68 |
| 2001 | 12 | 0 | 12 |
| **Total** | **357** | **158** | **515** |

years. During the first 5 months of 2006, Afghanistan has witnessed numerous attacks consisting of over 50 insurgents, as compared to just one such attack during the same time period of 2005.[9] Reports of insurgents massing in battalion-sized formations of 300–400 fighters are no longer rare. Lutfullah Mashal, the former Afghan Interior Ministry spokesman, has recently suggested that: "Taliban fighters no longer rely solely on hit-and-run tactics by small groups of guerrillas. Instead, the Taliban have been concentrating into groups of more than 100 fighters to carry out frontal assaults on government security posts."[10] Some analysts believe that the Taliban have at least 12,000 fighters controlling areas in the provinces of Oruzgan, Helmand, Zabol and Kandahar.[11]

Extremely troubling indicators—such as the relatively free movement of insurgent groups—reveal that increasingly large areas of the east and south of the country are falling under the political control of the Taliban. Said Jawad, Afghanistan's ambassador to the United States, recently stated, "We have lost a lot of the ground that we may have gained in the country, especially in the South . . . The fact that U.S. military resources have been 'diverted' to the war in Iraq is of course hurting Afghanistan."[12]

Taliban insurgents and their al Qaeda allies are undoubtedly gaining strength. There have been numerous attacks in recent months in areas other than the south and east, suggesting that the Taliban has expanded the scope of its operations and has begun to "take the war to the North." Cross-border operations from Pakistan are commonplace. The implications of the escalating violence in Afghanistan are now compounded by the fact that the United States, which has been responsible for the bulk of counterinsurgency efforts in Afghanistan since the beginning of OEF, has ceded operational control of the war to NATO forces.[13]

## THE BORDER PROBLEM

For decades, nearly all of Afghanistan's neighboring states have produced disenchanted groups of Uyghurs, Tajiks, Uzbeks, and other Islamists who have used Afghanistan for guerrilla training and an area from which to pursue their violent agendas. While such groups have played a role in Afghanistan, the most important foreign actors in Afghanistan's affairs have come from Pakistan's western border provinces, Northwest Frontier (NWFP) and Baluchistan, and especially the Federally Administered Tribal Areas (FATA). Pakistan today has become an attractive base for terrorists and extremists. The government of Pakistan, for its part, has long sought to exert influence in Afghanistan, because of its desire for "strategic depth" on its northern border in the event of any conflict with India. Successive Pakistani governments have promoted Islamic radicalism to subvert Pashtun and Baluch nationalist movements and to further their ambitions in Afghanistan and Kashmir, through groups such as Lashkar e-Tayyiba (LT), Jaish-e-Mohammed (JEM), Jamiat Ulema-i-Islam's Fazlur Rehman faction (JUI-F), Khuddam ul-Islam (KUI), and Jamaat ul-Furqan (JUF). Jihad, drugs, and gunrunning have long been the main sources of livelihood for many of the Pashtuns living near the ill-defined border. Afghan refugee camps and thousands of Islamist madrasas opened by the JUI provide a steady flow of recruits for the Taliban and other radical groups.

The minimal U.S. troop presence in the south has ensured that the rugged and porous 2,450 kilometer border between Pakistan and Afghanistan does not even constitute a speed bump to extremist groups such as the Taliban and al Qaeda seeking to expand their networks of support and increase their influence among the Pashtun tribesmen in Afghanistan. By mid-2005, in the strategically vital border province of Paktika, for example—which has a population of some 600,000 people and shares a 400 km border with Pakistan—the United States had only two companies of light infantry, and no engineers or aviation assets. Special Forces teams were drawn down. And in the summer of 2005, the fledgling Provincial Reconstruction Team (or PRT) in Paktika was dismembered due to personnel shortages, and its minimal Civil Affairs remnant (the Civil-Military Operations Center, or CMOC) was colocated with a maneuver company, a devolution that has been repeated at seven other U.S.-led PRTs, once hailed as the cornerstone of reconstruction and security.

Afghanistan's President Karzai and his new foreign minister, Rangin Dadfar Spanta, have recently blamed Pakistan's Inter-Services Intelligence Directorate (ISID) for Taliban attacks in Afghanistan. Kabul rightly claims that Pakistani security forces chase al Qaeda terrorists within Pakistan but do not make any significant effort to arrest Taliban fighters or stop them from crossing the border into Afghanistan.[14] Indeed, the coalition of

Islamist political parties, which completely dominates the border region and represents it in Parliament, the Muttahida Majlis-e-Amal (or MMA— dubbed by wags in Islamabad as the "Mullah-Musharraf Alliance") is openly pro-Taliban. This lack of cooperation by Pakistan and the open defiance of the MMA have been extremely frustrating for the United States. As Henry A. Crumpton, the American coordinator for counterterrorism, asserts:

> ...the Americans are finding the Pakistanis much more reluctant to face down the Taliban—who are brethren from the Pashtun ethnic group that dominates in Afghanistan—than they have been to confront al Qaida, who are largely outsiders. "Has Pakistan done enough? I think the answer is no....Not only al Qaida, but Taliban leadership are primarily in Pakistan, and the Pakistanis know that."[15]

In 2004, after negotiating with the Pashtun tribal Maliks (essentially spokesmen, as the Pashtun recognize no chieftains), Pakistan responded to U.S. pressure with an unprecedented deployment of a reported 70,000 troops to the Pakistan-Afghanistan border area. In Baluchistan, this force was led by the Pakistani paramilitary Frontier Corps and regular army elements from the Pakistan's 12th Corps. The Pakistani campaign in the FATA, especially in the North and South Waziristan Agencies, is being conducted by a battalion-plus Special Operations Task Force (SOTF), along with elements of the Pakistani Army's 11th Corps, aided by the indigenous local Scouts units of the Frontier Corps. While such Pakistani troop levels greatly exceed the total number of U.S and coalition forces in Afghanistan, the actual relationship between the Pakistani campaign and the U.S. GWOT is controversial and unclear, as suggested by Pakistan's Gen Tariq Majid, the Pakistani army's chief of general staff:

> We are not fighting America's war in the FATA. It is in our own interest. We're fighting this war because, unfortunately, there have been fallout effects in Pakistan from the instability in Afghanistan.[16]

Indeed, the Pakistani military activity has been aimed, for domestic political reasons, almost entirely at "foreign elements," meaning primarily former mujahideen from Middle Eastern and Central Asian countries who settled in northern Pakistan after the Soviet-Afghan War—not the Taliban or its network of supporters in the MMA.

While the perceived threat from India and fear of a two-front war has shaped Pakistan's relationship with Afghanistan, the desire for "strategic depth" is not the only driver of Pakistan's foreign policy toward Afghanistan. Afghanistan has also been influenced by Pakistan's strategy toward India-controlled Kashmir. One veteran Pakistani observer

suggests that: "the Kashmir issue became the prime mover behind Pakistan's Afghan policy and its support to the Taliban."[17] Camps in Afghanistan created for training Afghan Arabs during the anti-Soviet jihad have been recycled to train guerrilla forces for fighting in Kashmir. Pakistan has used these jihadi forces as a bargaining chip with India in an attempt to gain more autonomy and even independence from India for Kashmir.

## IRAQ AND JIHADI NETWORKS

A new source of concern is the fact that recent insurgent attacks—including the introduction of suicide bombings and the use of improvised explosive devises (IEDs)—have demonstrated an unusual level of internal coordination and a growing technological sophistication in the Afghan insurgency imported from outside the Pashtun belt. Since the summer of 2004, a variety of guerilla tactics (including assassinations and kidnappings) in Afghanistan[18] and numerous reports of knowledge transfer indicate that the insurgents are importing tactics and lethal technology from Iraq.[19] In the first 6 months of 2006, Afghan insurgents set off 32 suicide bombs, six more than in all of 2005.[20] As Griff Whitte wrote in the *Washington Post*, "despite a quarter-century of war, [suicide attacks] in Afghanistan have historically been relatively rare because of a cultural aversion to suicide."[21] According to international security analysis Esther Pan, "Suicide is not a characteristic tactic of the Afghan people . . . they have a cultural aversion to it."[22] Only five suicide attacks—none of which targeted civilians—were reported during the first $3^1/_2$ years after the Taliban were driven from power. The great majority of the suicide attacks carried out during the last $1^1/_2$ years appear to have been "outsourced" to non-Afghans, most often to Punjabis from the south of Pakistan and young foreign Islamists recruited from radical groups in the Middle East.

In summary, the wild and largely unregulated tribal areas on Pakistan's northern border play an extremely important role in the Afghan insurgency, as well as in the ongoing insurgency in Kashmir and the rising internal unrest that challenges both Pakistani security forces and governmental authority all along the frontier. They provide a steady source of recruits, a safe haven for senior leadership, and a base of operations and training for the Taliban, its al Qaeda affiliates, and (to a lesser degree) the Hekmatyar faction of *Hizb-i-Islami* (HiG).[23] Nonindigenous tactics and imported technologies indicate both al Qaeda facilitation of Jihadi networks for information-sharing and growing insurgent use of the Internet as a means of distributing lethal knowledge. The next section of this chapter will assess the Taliban and HiG insurgent groups in greater detail.

## THE ORIGINS OF THE TALIBAN

> "A host of wandering Talib-ul-ilums, who correspond with the theological students in Turkey and live free at the expense of the people . . . "
> —Winston Churchill, 1898[24]

Following the Soviet withdrawal in 1989, Afghanistan deteriorated into a brutal civil war between rival mujahideen groups positioning for power.[25] This civil war claimed thousands of lives and decimated what remained of the country's infrastructure. The civil war intensified after one of the mujahideen groups took Kabul on April 25, 1992. Shortly afterward, Beirut-style street fighting erupted in the city, especially between the Pashtun Hizb-i-Islami of Gulbuddin Hekmatyar and the Tajik Jamaat-i-Islam of Barhannudin Rabbani and Ahmed Shah Massoud. This civil war, fought with the vast surpluses of ordnance left over from the covert anti-Soviet military aid program and huge stockpiles of heavy weapons abandoned by the retreating Russians, eventually wreaked as much—if not more—havoc and destruction on the country as had the Soviet invasion and occupation. Kabul, which had remained virtually untouched during the war, was savagely bombarded with rockets, mortars, and artillery by Gulbuddin Hekmatyar. In Kandahar, fighting between Islamists—led by HiG—and traditionalist mujahideen parties resulted in the destruction of much of the traditional Kandahari societal power structures. In the rural areas, warlords, drug lords, and bandits ran amok in a state of anarchy accelerated by the unraveling of the traditional tribal leadership system.

As the mujahideen factions and warlords were fighting amongst themselves for power in Afghanistan, Pakistan's leading Islamist party, the JUI, built a network of religious boarding schools throughout northern Pakistan to extend the influence of the indigenous Deobandi School of Islamic thought, an investment that itself provides an insight into their temporal horizons. These madrasas were soon providing an important educational alternative for the numerous displaced refugees from the anti-Soviet jihad and the Afghan civil war, as well as for poor families along the frontier unable to afford the costs and fees of the secular schools. (Today there are some 5,900 madrasas in operation in NWFP and the FATA alone, with an estimated 600,000 students studying curricula neither approved nor observed by educational authorities in Pakistan.)

With the oversight of the ISID, who had grown weary of their favorite Afghan mujahideen leader—Gulbuddin Hekmatyar—the Taliban emerged from Pakistan's Northwest Frontier Province and FATA madrasas and the kinship networks inside the remaining Afghan refugee camps. The Taliban arrived on the Afghan scene in 1994 with little warning, and vowed to install a traditional Islamic government in Afghanistan and end the carnage of the fighting among the warlords. With massive

covert assistance from the Pakistani ISID, Army, and Air Force, the Taliban overthrew the largely Tajik (and northern) mujahideen regime in Kabul, capturing the capital in September 1996. The country the Taliban captured soon became a training ground for Islamic activists and other radicals from the Middle East and around Asia.

The war-weary Afghans initially welcomed the Taliban, because they believed that they would bring peace and stability to their ravaged country. The Taliban promoted itself as a new force for honesty and unity, and many Afghans—particularly fellow Pashtuns—supported the Taliban in hopes of respite from years of war, anarchy, and corruption. The Taliban went after the warlords responsible for the anarchy, and Afghans initially flocked to their movement. Soon after gaining control of Kabul, however, the Taliban instituted and employed a religious police force, the *Amr Bil Marof Wa Nai An Munkir* (Promotion of Virtue and Suppression of Vice) to brutally uphold their extreme and often bizarre interpretations of Islam (which were not previously known in Afghanistan). The Taliban philosophy, Ahmed Rashid notes,

> fitted nowhere in the Islamic spectrum of ideas and movements that had emerged in Afghanistan between 1979 and 1994.... The Taliban represented nobody but themselves and they recognized no Islam except their own.... Before the Taliban, Islamic extremism had never flourished in Afghanistan.[26]

The initial optimism of the Afghan people soon turned to fear, as the Taliban introduced a draconian interpretation of sharia law, banned women from work, and introduced sadistic punishments that included amputations and death by stoning.

Tajik resistance to the Taliban in the form of the Northern Alliance held out throughout the Taliban period and retained Afghanistan's seat in the United Nations, but were steadily pushed back by a series of military defeats into the extreme northeast province of Badakshan. Just as the Taliban assassinated Northern Alliance leader Ahmed Shah Massoud and were poised to wipe them out completely, however, the tragic events of September 11, 2001 unfolded in the United States. These events, of course, led to U.S. intervention in Afghanistan and the initiation of OEF on October 7, 2001.[27]

## THE TRIBAL BASIS OF THE TALIBAN

Western military analysts have consistently misinterpreted the Taliban as everything from a simple fundamentalist Islamic movement to a criminal gang. In reality, the Taliban is a social phenomenon with a tribal chassis. Its religious dimension—an extreme interpretation of Deobandi

**Table 24.2    Senior Taliban Leaders**

| Name | Position | Tribal Affiliation |
| --- | --- | --- |
| Mullah Muhammad Omar | Movement Leader | *Hotaki Ghilzai* |
| Mullah Berader | Deputy Movement Leader | *Ghilzai* |
| Mullah Dadullah Kakar | Senior Military Commander | *Kakar Ghurgusht* |
| Mullah Mohammad Hassan | Foreign Minister after 1997 | *Hotaki Ghilzai* |
| Nuruddin Turabi | Minister of Justice | *Hotaki Ghilzai* |
| Alla Dad Akhund | Minister of Communications | *Hotaki Ghilzai* |
| Mohamed Essa | Minister of Water and Power | *Hotaki Ghilzai* |
| Wakil Ahmed | Personal Secretary to Mullah Omar | *Kakar Ghurgusht* |
| Sadeq Akhond | Minister of Commerce | *Hotaki Ghilzai* |
| Mohammed Rabbani | Chairman of Kabul Shura | *Kakar Ghurgusht* |
| Mullah Obaidullah | Minister of Defense | *Hotaki Ghilzai* |

thought—is just the steering wheel. The Taliban consists entirely of rural Pashtuns, the great majority of them from the Ghilzai tribal group, with some support from the Kakar tribe of the Ghurghusht nation. More specifically, however, although the Taliban eventually coopted other Pashtun leaders, Mullah Omar, and most of the senior members of the Taliban from 1996-2001 were from the Hotaki tribe of the Ghilzais, as shown in Table 24.2.

The strength of the Ghilzais today is a direct result of the Soviet-Afghan War, during which they led three of the seven officially recognized Mujahideen groups who received massive covert military and financial support. This assistance fundamentally altered the balance of Pashtun power between the Ghilzais and their sworn enemies, the Durranis, who led none of the seven and who were deliberately sidelined by the CIA and ISID. This tribal "genetic meddling" quickly came home to roost in Afghanistan in the form of the Ghilzai Taliban.

The Taliban is, at its heart, all about tribal politics. It represents a tribal power grab by Ghilzais, made possible by an order of magnitude jump in military power during the Soviet-Afghan War. The Ghilzais have historically been in conflict with the Durrani confederation of tribes, who have held political power in Kabul for most of the last 300 years (President Karzai and King Zahir Shah are Durranis.) Kandahar and Helmand provinces are Durrani lands, while the Ghilzai are concentrated in Oruzgan, Zabol, Dai Kundi, and Gardez provinces and the Katawaz region of Paktika province. In keeping with their extreme Deobandi philosophy, the Taliban are vehemently opposed to any hierarchical structure within

Islamic society, which dovetails neatly into their hatred of the Durranis, who have always provided Afghanistan's kings. Thus, the first instinct of the Taliban today, as in 1994, is not to drive directly on Kabul, but rather to subjugate and coopt the Durranis, which explains why most Taliban military activity today is in Kandahar and Helmand provinces, not further north and east toward Kabul. Only when the tribal grievances have been settled and their tribal flanks are secure will the Taliban move toward the capital, as they did in 1996. It also explains why, in 1996, when the Ghilzai Taliban came to power in Kabul, they did not invite the Durrani Pashtun King, Zahir Shah, back to Afghanistan, which was one of the first orders of business of the Bonn Agreement.

The importance of the Ghilzai to the Taliban insurgency is illustrated by Figure 24.1. The shaded sections of the map of Afghanistan in Figure 24.1 represent those areas politically controlled by the Taliban as of this writing in May 2006 (with many other areas significantly contested). These areas include the northern districts of Kandahar Province, the northeastern districts of Helmand Province, most of Oruzgan and Zabol Provinces, and districts in Paktika, Ghazni, Wardak, and Logar Provinces. The inset map in Figure 24.1 represents a rough sketch of the tribal areas of the Durrani, Ghilzai, Ghurgusht, Karlanri, and Sarbani—the five large tribal confederations of Pashtuns. If one compares the inset of the tribal areas in Afghanistan with the large swath of Taliban political control, it is evident that the most intense area of the insurgency today is the area dominated by the various Ghilzai tribes.

## THE SOCIOLOGICAL BASIS OF THE TALIBAN

While the tribal politics are important, however, they do not explain how the Taliban was able to mobilize socially so effectively, even with massive Pakistani support. To do this, it drew unconsciously on a universally understood cultural phenomenon among the frontier Pashtun, one which the British and later the Pakistani governments encountered over and over again: the charismatic Mullah movement. Mullah Mohammed Omar Akhund is the archetype of this charismatic Mullah phenomenon, a cyclical pattern of insurrection that manifests itself about every 30 years in the Pashtun belt. Indeed, such leaders have often gained powers on the frontier during times of social distress.[28] These charismatic uprisings were so common, in fact, the British dubbed them "Mad Mullah movements."

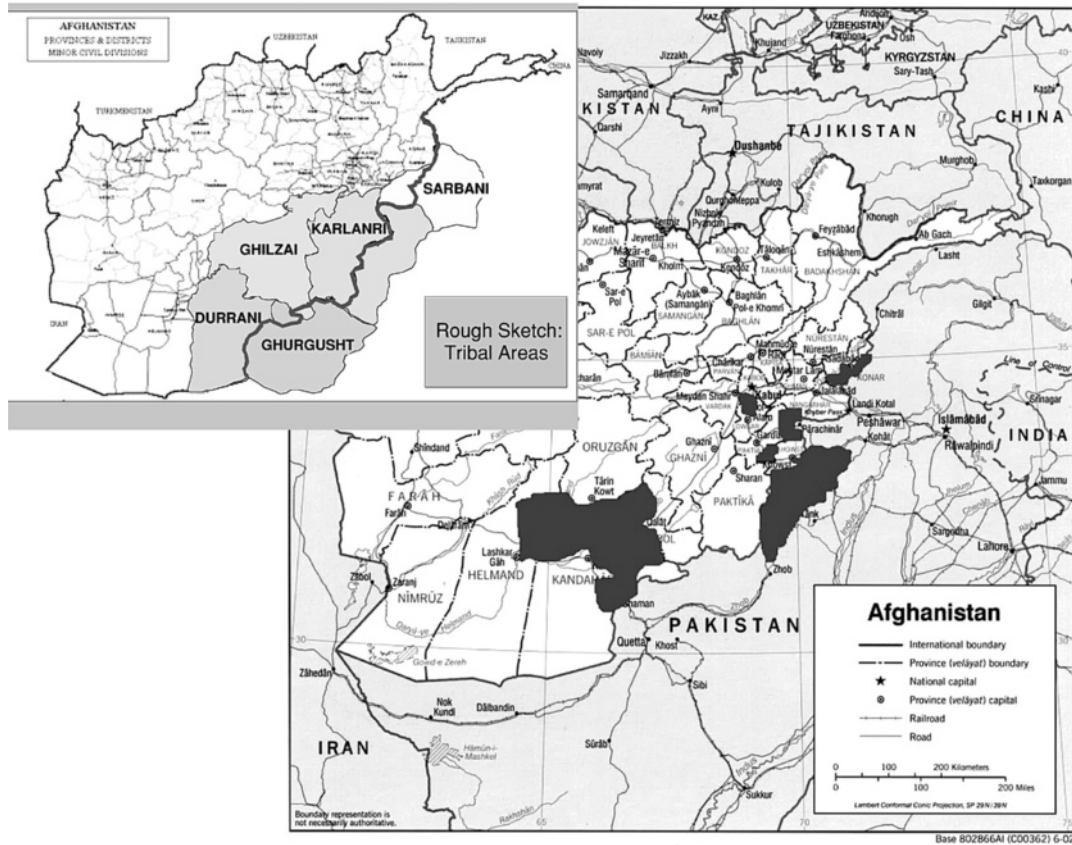
There have been many. A similar figure to Mullah Omar, Mirza Ali Khan—a Tori Khel Waziri who was known to the West as the Fakir of Ipi—led first British and then Pakistani security forces on a frustrating chase around the frontier for 30 years.[29] Protected by his Pashtun tribal supporters in the hills, much as Mullah Omar is today, he was never caught. The Mullah of Hadda, as noted by David Edwards in "Heroes of the Age,"


**Figure 24.1    Pashtun tribal areas and key insurgent strongholds, 2006**

provoked the Great Pashtun Revolt of 1897 through mysticism, parlor tricks, and promises to turn British bullets to water.[30] In "Resistance and Control in Pakistan," Akbar Ahmed focuses on the emergence of a charismatic Mullah in Waziristan who, like Mullah Omar, challenged state legitimacy.[31] Ahmed argues that the Mullah of Waziristan also used mysticism to gain legitimacy, much like Mullah Omar did 30 years later, and challenged Pakistan's attempt to modernize FATA.

Omar joined this rogues gallery of politicized insurgent Mullahs by means of a politico-religious stunt that is of enormous importance to the Taliban movement but that is considered insignificant by most Western analysts, if they are aware of it at all. In so doing, he became the epitome of the charismatic leader as described by Max Weber, who he defined as having:

> ...a certain quality of an individual personality by virtue of which he is set apart from ordinary men and treated as endowed with supernatural, super-human, or at least specifically exceptional powers or qualities. These are such as are not accessible to the ordinary person, but are regarded as of divine origin or as exemplary, and on the basis of them the individual concerned is treated as a leader ...[32]

The event in question was Omar's removal in 1994 of a sacred garment—believed by many Afghans to be the original cloak worn by the Prophet Mohammed—from its sanctuary in Kandahar, and actually wearing it while standing atop a mosque in the city. Whereas Omar had been a nonentity before this piece of religious theatre, the audacious stunt catapulted him to a level of mystical power (at least among the 90 percent of Pashtuns who are illiterate) in a manner that is almost impossible for Westerners to understand, and it resulted in his being proclaimed locally the *Amir-ul Momineen*, the Leader of the Faithful—not just of the Afghans but of all Muslims.[33]

What is known of the Taliban subsequent to this event conforms exactly to the pattern of social mobilization observed and documented as the insurgent "Mad Mullah" phenomenon. Furthermore, once in power, Ahmed Rashid notes that Taliban power was (and is) concentrated exclusively in the person of Mullah Omar, another characteristic of the phenomenon—and contrary to traditional Pashtun shura (consensus) politics. As Rashid has observed, Omar ultimately made all the decisions within the Taliban, and no one dared act without his orders.[34] Today, Mullah Omar issues statements of encouragement to his field commanders, rather than operational orders, exactly as did the Mullah of Hadda as described by David Edwards.[35] Thus, unlike most insurgencies, which are not centered in the personality of a single leader, the Taliban's center of gravity, in Clausewitzian terms, is not Taliban foot soldiers or field

commanders or even the senior clerics around Omar. It is Omar himself. Because it is, socially, a charismatic movement, if Mullah Omar dies, the Taliban, at least in its current incarnation, will wither and die, because he alone is the Leader of the Faithful. It is not a question of political or military succession: The mystical charismatic power in Islam that came from wearing the Cloak of the Prophet is not something transferable to a second in command. Unfortunately, because this entire phenomenon is so alien to Western thinking, U.S. observers and analysts have tended almost universally instead to interpret the Taliban in terms more compatible with Western logic and thought.

It is thus a strategic error, we believe, to label the Taliban as an "Islamist fundamentalist movement," or a drug gang, or any of the other revolving door euphemisms applied to it, such as "Anti-Government Militia." Understanding the Taliban enemy more precisely could enable better information and psychological operations, for example, or a more nuanced understanding of the human terrain by U.S. and NATO forces, and would suggest a realignment of reconstruction priorities based on historical models to isolate the movement and prevent its further mobilization.

## HEKMATYAR AND *HIZB-i-ISLAMI* (HiG)

On February 19, 2003, the United States designated Gulbuddin Hekmatyar a "specially designated global terrorist."[36] Hekmatyar is a prominent member of the American "most wanted terrorist list," behind only bin Laden, Mullah Omar, and (until his death in 2006) Abu Musab al-Zarqawi. Hekmatyar is a seasoned veteran of the Soviet-Afghan war and has been described as "comparably wealthy, ruthless, arrogant, inflexible, [and] a stern disciplinarian."[37]

Hekmatyar's mujahideen faction, the Hizb-i-Islami Gulbuddin, was one of the major resistance groups fighting the Soviet occupation of Afghanistan. The HiG received the largest share of the arms and funds that came into Afghanistan from Arab and Western countries to fight the Soviet occupation of Afghanistan. It was the favorite party of Pakistan's ISID during and immediately after the Soviet-Afghan war—and, as noted earlier, was responsible for much of the death and destruction that followed the collapse of communist rule in 1992. Hekmatyar has repeatedly called for a jihad[38] against the coalition forces in Afghanistan and those who cooperate with them—including the current Karzai government. Although his wanton destruction of much of Kabul by indiscriminate shelling of the city cost him any support he might still have had within Afghanistan, his call for the establishment of a pure Islamic state in Afghanistan and his condemnation of what he views as the corrupting influence of the West retains some residual appeal in northwest Pakistan. And he still has powerful friends within the ISID.

Hekmatyar is a Ghilzai Pashtun of the Kharoti tribe. His family, however, was one of thousands of Pashtun families who were forcefully relocated to northern Afghanistan as part of "detribalization" efforts early in the twentieth century, and he is thus less able to draw on traditional kinship networks within the Kharotis of the south today. During the late 1960s, while Hekmatyar was studying at the Faculty of Engineering at Kabul University, he was introduced to radical politics. After a brief period of involvement with Afghan communists, he became a disciple of Sayyid Qutb and the *Ikhwan ul-Muslimeen* (Muslim Brotherhood) movement. Ever since, he has been one of the most outspoken and extreme of all Afghan leaders. He was known, for example, to patrol the bazaars of Kabul with vials of acid, which he would throw in the face of any woman who dared to walk outdoors without a full burka covering her face. His insurgency movement is built on the *Ikhwan* model of Islamic revolution, which stresses the establishment of a pure Islamic state and utilizes a highly disciplined organizational structure built around a small cadre of educated elites over which Hekmatyar retains strict control. It is thus closer to the *foco* model of Marxist revolution than the charismatic and purely rural Taliban movement, but both are essentially insurgencies built on the personalities of their leaders rather than on sustainable mass popular support.

In 1994, with support of the ISID, Hekmatyar started training foreign volunteers to support Pakistan's new covert jihad in Indian-held Kashmir.[39] Pakistan decided to "out-source" the jihad in Kashmir; as a result, Hekmatyar became a major focus of this effort. In a move to increase its base of support, the Rabbani government in Kabul invited Hekmatyar to join the government, an offer that he accepted, briefly, twice. However, his overwhelming unpopularity backfired on Rabbani, whose government lost large tracts of popular support as a result of its association with the Butcher of Kabul, rather than gaining in strength. When it later became clear that not only was Hekmatyar not achieving Pakistan's goals in Jammu and Kashmir, but also that his lack of popular support in Afghanistan ensured that he would remain a marginalized loser in any future Afghan state, the new Pakistani government of Benazir Bhutto switched its support and helped to organize the Taliban movement. Despite having similar goals in the establishment of a pure Islamic state in Afghanistan and a common Ghilzai ethnicity, Hekmatyar was a bitter enemy during the Taliban's initial reigning years. In his educated, elitist urban worldview, the illiterate rural Mullahs of the Taliban are hillbilly bumpkins, and he regards them with a thinly veiled contempt for their lack of learning and sophistication. There are also important differences between his vision of an Islamic state and the grotesquely distorted travesty of Deobandi thought of Mullah Omar. Hekmatyar's forces fought the Taliban until they ousted him from his power base around Jalalabad, after

which he fled to Iran for a period before returning to Afghanistan in early 2002. Despite residual animosities, however, on the principle that "the enemy of my enemy is my friend"—at least temporarily—he has recently negotiated a truce with the Taliban and an agreement on limited cooperation in destroying the government of Hamid Karzai. It may not be too great of a stretch to imagine the hidden hand of the ISID behind this détente.

His forces today operate in Konduz, Nangarhar, and Nuristan provinces, and he has been linked to numerous attacks on U.S. and International Security Assistance Force (ISAF) personnel, as well as to many other attacks against Afghan government and security elements.[40] The few brief contacts that U.S. forces have had with the remote tribal groups of Nuristan since 2001 have provided strong evidence that HiG is using the virtually inaccessible valleys of that isolated region for training and logistics basing. The Nuristanis, for their part, want nothing to do with Hekmatyar's Ghilzais, and have requested a U.S. PRT be established in Nuristan province, a request that U.S. authorities have declined for reasons unknown. HiG remains a dangerous and sometimes deadly guerilla opponent in the southeast, which has impeded both Afghan government efforts to consolidate control in the region, and international efforts to rebuild and develop it, but his personal inability to inspire and mobilize mass popular support suggest his insurgency will be unable to generate critical mass. As with the Taliban, if the leader of HiG were to be liquidated, his movement, based as it is on the iron will of one man to gain power, would quickly wither and die with him, as did, for example, the *Sendero Luminoso* movement in Peru after the capture of Abimael Guzman in 1992.[41]

## POSTCONFLICT RECONSTRUCTION AND THE RISE OF THE TALIBAN PHOENIX[42]

Afghanistan today is in danger of capsizing in a perfect storm of insurgency, terrorism, narcotics,[43] and warlords. The nexus between them is growing and self-reinforcing. Five years of benign neglect by the United States after the installation of Hamid Karzai as President have brought Afghanistan back to the brink of state failure. Since 2001, Washington has badly shortchanged Afghanistan in men and resources. The deployment of U.S. and ISAF forces[44] to the stabilization of the countryside represented the lowest *per capita* commitment of peacekeeping personnel to any postconflict environment since the end of World War II. The ratios of peacekeepers to citizens in the missions in Bosnia and Kosovo, for example, were 1:48 and 1:58 respectively. For the first 3 years in Afghanistan, the comparable figure hovered near 1:2000. Today, with an increase in U.S. force levels and a major reinforcement of the NATO ISAF mission, it is roughly one peacekeeper to every 1,000 Afghans (1: 1000).

The number of security force personnel deployed after Bonn was completely inadequate to fill the security vacuum left by the retreating Taliban, a void that was quickly filled by warlords and drug lords, many of whom have since donned national police uniforms to facilitate narcotics trafficking.[45] As bad as they are, however, the numbers alone do not tell the whole story. As noted previously, the bulk of the Special Forces soldiers who best understand counterinsurgency, for example, were soon pulled out of Afghanistan to serve in Iraq and elsewhere. Aviation assets have also been drawn down to minimal levels. Because of the lack of helicopter assets, "Quick Reaction Forces" throughout much of the south are forced to respond to the scene of minor Taliban attacks in Humvees. With an average overland speed of 5–10 miles an hour (over rocky trails that have not improved), Taliban guerillas are usually long gone from their "roadblock and run" attacks before U.S. forces arrive, which emboldens the insurgents, demonstrates our inability to protect the locals, and demoralizes the police, few of whom are willing to try to hold off hardened and heavily armed Taliban veterans for several hours with poor quality weapons and the standard 30-rounds of issued ammunition.

Even more damaging to the effort to stabilize Afghanistan after the fall of the Taliban was the shockingly low level of funding committed to rebuild a country laid waste by 25 years of war. Astonishingly, President Karzai was in office nearly 3 years before total U.S. reconstruction spending in Afghanistan reached $1 billion. During the same period, the cost of military operations in Afghanistan was approximately $36 billion, perhaps one of history's most glaring illustrations of being "penny wise and pound foolish." Not counting the repaving of the Kabul-Kandahar highway, U.S. aid to Afghanistan over the last 5 years has averaged just $13 per Afghan per year. Nor, despite clear and disturbing evidence that the lack of reconstruction funds is largely responsible for the rapid spread of Taliban influence in the south since 2002, has the level of this aid to Afghanistan increased; in fact, it has decreased since 2004. The total U.S.-aid budget for the entire country in fiscal year 2006 is roughly $700 million, equal to the cost of operating the war in Iraq for only 36 hours. Total U.S. spending since 9/11 to rebuild an entire nation almost exactly the size of Texas amounts to less than half the cost of rebuilding just the levees in New Orleans damaged by Hurricane Katrina.

On the ground, frequent turnovers of personnel, lack of local funds, a cumbersome, Bagram-driven approval process for projects, the absence of eyes-on construction oversight and quality control, inadequate vetting of contractors, and endemic corruption of Afghan officials has combined to waste much of what was spent. The Provincial Reconstruction Team (PRT) effort has provided an interesting laboratory for U.S. Army Civil Affairs experimentation, but their numbers are absurdly inadequate. With an approximate overall troop-to-task ratio of one PRT (in Pashtun areas) for

every one million Pashtuns, the strategic impact of their presence is negligible. In lawless Paktika Province in 2005, for example, where no NGOs or IOs will operate, a total of eight American civil affairs enlisted reservists and two inexperienced mid-career transfer civil affairs officers were responsible for all rural development and reconstruction projects in an area the size of Vermont and New Hampshire combined, with a population of 600,000 people, where living conditions are largely unchanged since biblical times.

With a miniscule Commander's Emergency Response Program (CERP) budget, what any ten soldiers can accomplish in this environment amounts at best to a few grains of sand on the beach. In 2005, the entire province of Paktika had only a handful of buildings not made of adobe, fewer than a dozen high school graduates, and no telephones or paved roads anywhere within its borders. There were two antiquated clinics (charitably called "hospitals") and two doctors. Officially, the province has 352 elementary schools for boys, but only 40 actual school buildings. The remainder of the "schools" are simply patches of open ground in the village where the 6th-graders teach what they know to the 1st graders. Few, if any, girls attend school at all. How ten civil affairs personnel with three Humvees and a few hundred thousand dollars are supposed to change this is unclear. In fact, in the first 4 years of the Karzai government, the U.S. government had not built a single school or clinic anywhere in Paktika Province. To make matters worse, as noted previously, due to manpower shortages, the PRTs in Paktika and seven other locations have now been effectively disbanded, with their support elements redeployed to other duties. Further, the handful of Civil Affairs soldiers of the Civil Military Operations Centers (the CMOCs) have been rolled together with combat maneuver elements onto shared firebases, where they are generally the lowest priority for missions and assets. In these cases, the PRTs—originally designed as independent, freestanding civil-military affairs institutions—no longer exist as such. The stated mission of the PRT, to "extend the reach of the Afghan national government to the rural areas" is itself a gem of Kafkaesque spin, because as of 2005 there were no Afghans at all on any PRT. While there is coordination with the Afghan government at the provincial planning level, when PRTs go "outside the wire," they almost always do so alone. Hence, at the district or village level, their presence lacks any Afghan government component that might extend its reach. The failure of the minimalist peacekeeping and reconstruction efforts to ensure rural security and effect any meaningful improvement in the lives of the people in the rural south has created an angry environment of unfulfilled expectations. As much as (or more than) the Karzai government's inability to extend its authority beyond Kabul, this gap between expectation and reality is what has opened the door to the resurgence of the Taliban.

## ASSESSING THE AFGHAN INSURGENCY AND COALITION COUNTERINSURGENCY EFFORTS

The Taliban intuitively understood that the center of gravity was the satisfaction of the rural Pashtun with the results of the new government in Kabul. They knew there was a window of opportunity for Karzai to gain rural Pashtun support, and they were quick to capitalize on the failure of the Department of Defense to understand this paradigm. Indeed, the DOD saw the aftermath of the Taliban's withdrawal south of the border as a simple matter of subtractive math: "Kill the existing terrorists until the number reaches zero and the war is over." For the first 2 years of the insurgency, the DOD maintained a paradigm of "mopping up" and "hunting down" the "remaining bitter-enders."

For its part, the Taliban today is conducting a clever defensive insurgency at the operational level of war. They have deployed a sufficient number of low-level fighters to intimidate the NGOs and IGOs—who would normally carry out most of the reconstruction—into withdrawing all of their personnel from the south. By night, Taliban Mullahs travel in the rural areas, speaking to village elders. They are fond of saying, "the Americans have the wristwatches, but we have the time." The simple message they deliver in person or by "night letter" is one of intimidation: "The Americans may stay for five years, they may stay for ten, but eventually they will leave, and when they do, we will come back to this village and kill every family that has collaborated with the Americans or the Karzai government." Such a message is devastatingly effective in these areas, where transgenerational feuds and revenge are part of the fabric of society.

The combination of the lack of local protection from the Taliban's nightly visits and the absence of any tangible reason to support either the Americans or Karzai are reason enough for the villagers to either remain neutral or provide assistance to the guerillas. But as noted previously, American forces have often accelerated the alienation through culturally obtuse behavior, unnecessarily invasive and violent tactics, and a series of tragic incidents of "collateral damage," which are inevitable in wartime. U.S. forces deploying to Afghanistan still receive only minimal "cultural awareness" briefings, if any, and this training is usually the lowest priority on the checklist of requirements to be crossed off before deployment, sandwiched between the night navigation course and the grenade range. Few, if any, can speak a word of the Pashto language, and thus rely on primarily young, trilingual Tajik interpreters to communicate with Pashtun elders, itself often a source of friction.

At the strategic level of war, the Taliban is fighting a classic "war of the flea," largely (and unsurprisingly) along much the same lines used by the mujahideen 20 years ago against the Soviets, including fighting

in villages to deliberately provoke airstrikes and collateral damage.[46] In the latest in a long series of such incidents, in May 2006, U.S. airstrikes killed as many as 40 civilians in Panjway District of Kandahar Province. The United States views this as the tragic but bearable cost of a successful operation against the insurgents, without understanding that the Taliban has deliberately traded the lives of a few dozen guerilla fighters in order to cost the American forces the permanent loyalty of that village, under a code of Pashtun social behavior called *Pashtunwali* and its obligation for revenge (*Badal*), which the Army does not even begin to understand or take seriously.

Indeed, the United States continues to fight the war largely according to the Taliban "game plan." The priority of American effort is still what the Taliban wants it to be, the so-called "kill/capture mission," and the U.S. Army spends much of its time on battalion-sized or larger sweep operations. In June, 2006, the United States led approximately 10,000 coalition forces in yet another large-scale sweep operation, dubbed "Operation Mountain Thrust," in another massive demonstration of failed Vietnam-era counterinsurgency tactics designed to "flush out" Taliban guerillas, most of whom simply hide until the sweep has passed by and coalition forces have left the area before resuming their activities. This plays right into the Taliban's operational goal, which is to get American forces to do exactly what they are doing: alienating rural villages with invasive tactics, and pouring the manpower, equipment, and fiscal resources—which should be focused on improving people's lives instead—into chasing illiterate and expendable teenage boys with guns around the countryside like the proverbial dog chasing its tail and gnawing at individual flea bites.

Although few (if any) insurgencies have ever been won by killing insurgents, this still remains the primary strategy in Afghanistan. News reports of fighting in southern Afghanistan are increasingly dominated by Taliban body counts eerily reminiscent of Vietnam-era reporting. And ironically, Afghanistan is probably the country where this failed strategy of focusing on the "kill/capture mission" is least likely to work. The Taliban has a virtually infinite number of guerilla recruits growing up in the Pashtun-Afghan refugee camps in northern Pakistan and pouring out of the Deobandi madrasas along the border, and could sustain casualties of 10,000 or more guerillas a year for 20 years without any operational impact. Indeed, the Pashtun, who make up 100 percent of the Taliban, have a saying: "Kill one enemy, make ten." Thus, the death in battle of a Pashtun guerilla invokes an obligation of revenge among all his male relatives, making the killing of a Taliban guerilla an act of insurgent *multiplication*, not subtraction. The Soviets learned this lesson the hard way. They killed nearly a million Pashtuns, and the effect this level of genocide had on the number of Pashtun guerillas in the field was that it increased it.

Indeed, as an understanding of the true nature of the Taliban as a charismatic religious cult movement typical in Frontier history suggests, the Taliban center of gravity is Mullah Omar, the charismatic cult leader, not teenage boys or mid-level commanders, and no amount of killing them will shut the insurgency down. In the meantime, the United States is losing the war in Afghanistan one Pashtun village at a time, failing to rebuild the countryside, bursting into schoolyards full of children with guns bristling, kicking in village doors, searching women, driving like NASCAR racers on city streets, and putting out cross-cultural gibberish in ineffectual Information and Psyops campaigns.

## CONCLUSION

The picture we paint in this chapter is not pretty. However, without a major change in counterinsurgency strategy and significant increase in manpower, equipment (particularly aviation assets), and especially reconstruction funding, the United States may lose this war. Today, the momentum—particularly in the counterinsurgency and the counternarcotics efforts—is running the wrong way. It is still possible to win—to create a slowly developing but stable, conservative Islamic democracy in Afghanistan generally free of terrorism—but not with the current resource *status quo*, and not with the current tactics. The Taliban today has numerous advantages, including comprehensive knowledge of the local culture, language, and tribal hierarchies of which U.S. forces are completely ignorant, a virtually inexhaustible supply of recruits and money, mountainous terrain that dramatically favors the insurgent, centuries of successful experience in guerilla warfare against Western powers, patience, domination to the point of supremacy in Information Warfare, and perhaps most importantly, ready sanctuary in much of northern Pakistan.

Major changes in the way the United States is doing business are needed immediately, but even with them, the United States cannot do it alone. It needs not just the energetic support of NATO but a robust and sustained commitment from NATO to the brutal, hard, and often bloody business of counterinsurgency, a type of warfare for which NATO has had little training and almost no experience. The United Nations, nongovernmental organizations and the donor nations must do more as well. And Afghanistan's northern and Western neighbors must continue to avoid the urge to excessively meddle in Afghan affairs—and, in the case of Uzbekistan, play a more positive role in supporting U.S. efforts, or risk a future of Islamic terrorism exported from Afghanistan.

But the key to success or failure in Afghanistan lies below its southern border, in northern Pakistan. As long as insurgents are virtually free to cross the border at will, and Frontier Corps elements aid and abet their movements, the insurgency cannot be shut down in Afghanistan. As the

Soviets learned between 1979 and 1989, the border between Afghanistan and Pakistan cannot be closed from the north. President Musharraf must stop the two-faced game of appearing to be the ally of the United States in the war on terrorism, while seeking to curry political favor with its worst proponents in NWFP, Baluchistan, and the FATA. Thanks to ill-conceived policies of encouragement and appeasement, the monster of Islamic fundamentalism in the north may now be too powerful to stop, but it's not too late to try. President Musharraf must assert national control in the north and act boldly to shut down the major insurgent movements across the border before the situation there spirals completely out of his control.

For its part, the United States must begin to fight smarter and stop following the Taliban playbook. A complete change in counterinsurgency strategy is required, and all U.S. soldiers must become cultural and language warriors with months, not minutes, of training in both language and culture before deployment. Quantum improvement is required in this area; Human Rights Watch has already released a scathing report on the conduct of American military personnel and the Afghan National Police,[47] which are an almost unmitigated disaster of corruption, warlord cronyism, and incompetence.

Despite extreme poverty, a landmine-littered landscape, massive corruption, a fledgling government whose authority outside of Kabul is very limited, an ongoing insurgency, a shattered economy, booming opium production and a host of other daunting problems, Afghanistan remains geostrategically vital. The United States cannot repeat its post-Soviet invasion abandonment of the country or fob the mission off on NATO, or the results will be disastrous once again. By abandoning Afghanistan once, the United States allowed the country to become a refuge for terrorist groups to recruit, train, and wage war against the West. The effect on Afghanistan, the region, and the rest of the world was dramatic and terrifying. This time, if we leave—or lose—the results will be even worse.

# CHAPTER 25

## FIGHTING AL QAEDA: UNDERSTANDING THE ORGANIZATIONAL, IDEOLOGICAL, AND FINANCIAL ASPECTS OF A GLOBAL NETWORK OF TERROR

Joseph L. Trafton

Hours after the attacks of September 11, 2001, President George W. Bush made a public address to the nation in which he declared that, "Freedom itself was attacked this morning by a faceless coward. And freedom will be defended. Make no mistake, the United States will hunt down and punish those responsible for these cowardly acts."[1] In the months that followed, the President declared a global "war on terror," and the public watched as the United States military toppled the Taliban regime in Afghanistan, killed or sent running the remaining al Qaeda leadership, and ousted Saddam Hussein from Iraq (largely due to concerns that terrorists might acquire weapons of mass destruction from a notably anti-Western state— "The smoking gun will come in the form of a mushroom cloud," warned Secretary of State, Condoleezza Rice). This chapter explores a much less visible, yet equally important dimension of this war—the financial, ideological, and organizational structure of al Qaeda. The al Qaeda organization is the first truly global network of terror the world has ever seen, and as such it presents the first global terrorist threat. Thus, a working knowledge of how al Qaeda survives and operates is paramount for successfully prosecuting the global war on terror. This discussion will be devoted to understanding the evolution of al Qaeda's organizational structure, the

role ideology plays in uniting the al Qaeda network, and al Qaeda's new financial structure. In order to combat an adversary like al Qaeda, the adversary must first be understood.

## THE ORGANIZATION OF AL QAEDA AND WHY IT IS IMPORTANT TO UNDERSTAND IT

### Organizational Perspectives

Understanding the organization of al Qaeda is of the utmost importance in today's nebulous international environment. It dictates the ways in which we view the threat, and consequently it informs our opinions about how to best combat it. Understanding al Qaeda's organization and getting it right is more important now than ever.

To date, there is no consensus among policymakers and academics about the nature and severity of the threat to U.S. national interests posed by the al Qaeda organization. In general, attitudes about the organizational strength of al Qaeda surround three perspectives or theories. The first holds that the leadership remains intact and more needs to be done to disrupt the al Qaeda organization. Adherents to this view, called the "centralized" perspective, are not hard to come by and include top officials in the Department of Defense like Donald Rumsfeld. Increasingly, well-known personalities like Bill O'Reilly from *Fox News* have popularized this perspective, and warn that attacks like the July 7, 2005 bombings of the London underground transportation system are highly likely in the future. Those belonging to this camp conclude that continued use of the military, the CIA, and MI6 to take out the leadership is preferred to any other policy option. Therefore, even those who approve of most of the Bush Administration's military endeavors to combat terror have criticized President Bush for not having caught Osama bin Laden in Afghanistan in 2001. Further, while taking out Abu Musab al-Zarqawi—the Jordanian-born al Qaeda leader in Iraq—was a great victory, it is not seen as enough. "We must fight the terrorists abroad so that we do not have to fight them at home" remains the motto for those individuals sharing the centralized perspective of al Qaeda.

An opposite perspective holds that al Qaeda has suffered a tremendous blow since 9/11 and the Bush team has rendered it impotent. The organizational structure is far from being hierarchical, and it would be an overstatement to suggest that there is any real organization at all. Adherents to this perspective view al Qaeda only as an idea that a few petty criminals and thugs around the world use to justify their illicit behavior. This perspective of al Qaeda's organization can therefore be characterized as "decentralized and impotent." Academics belonging to the *realist* tradition of international relations theory like Kenneth Waltz and John Mearsheimer

embrace this perspective, as do many conservative political pundits like Pat Buchanan. In general, they conclude that more time ought to be spent on homeland security and less on combating al Qaeda directly, regardless of the countermeasure taken. To do the contrary is equivalent to squandering resources and diluting the relative power of the United States, something it cannot afford to do.

The third perspective is somewhat of a hybrid between the other two perspectives. The "decentralized but potent" perspective views al Qaeda as operationally strong and a viable threat to the interests of the United States and the world. On the other hand, adherents of this perspective agree that post-9/11 countermeasures have significantly disrupted the organizational integrity of al Qaeda. This perspective also notes that al Qaeda has in many respects become an idea, but unlike others, proponents do not diminish the power of ideas. The July 7 London bombings as well as the very recent plot to hijack airplanes over the Atlantic is evidence of the inspirational nature of al Qaeda's ideology. This perspective belongs predominantly to a growing group of academics who specialize in international terrorism, most notably Rohan Gunaratna, who describe al Qaeda as being the most unorganized organized terror network the world has ever seen. Like grapes on a grapevine, al Qaeda cells are at best loosely connected through modern technology to any form of central command. Individual cells operate, sustain, and finance themselves on a near-autonomous level, but their ability to threaten and cause damage to countries and innocent civilians is no less potent. In many ways, this style of organization makes al Qaeda an even more elusive threat. Counterterrorist measures should therefore adapt to reflect the nature of this organization, something that will be explored in detail in the following sections of this chapter.

### Evolution of al Qaeda's Organization

The organization of al Qaeda can best be understood as having gone through three distinct phases. The first phase begins with Osama bin Laden himself. Born in July 1957 to a wealthy Saudi family, Osama bin Laden—like many conservative Sunni Muslims—adopted his militant Islamic views while attending King Abdul Aziz University in Jeddah, Saudi Arabia.[2] Bin Laden was greatly influenced by one of his instructors, Dr. Abdullah al-Azzam, and later met with him in Afghanistan shortly after the 1979 invasion by the Soviet Union. In 1984, Azzam—the primary architect of al Qaeda—together with bin Laden established a network of recruiting and fundraising offices in the Arab world, Europe, and the United States, founded on the ideals of the Muslim Brotherhood.[3] Called Maktab al-Kihdamat (MAK), "services offices" in Arabic, this network was essentially the forerunner of al Qaeda.[4] During this time, the United

States and other allied countries—in an effort to fight the Soviet Union—covertly funneled over $3 billion through Pakistan to MAK and into the hands of the *mujahideen*, the Islamic fundamentalist faction fighting the Soviet forces on the front line.[5] At the time, neither bin Laden nor Azzam were openly known to have held aggressive intentions toward the United States, although they were both critical of the States' support for Israel. On the eve of the Soviet Union's collapse in 1988, the leadership of al Qaeda began to fracture over what to do with the newly established organization and the 20,000 supporters it had amassed. According to Azzam, al Qaeda (translated as "the base" in Arabic) should become "a rapid reaction force" to intervene wherever Muslims were perceived to be threatened.[6] On the other hand, Osama bin Laden hoped to turn al Qaeda into an activist organization, where members would return to their home countries to topple secular, pro-Western Arab leaders such as Anwar Sadat of Egypt.[7] This difference intensified, and in 1989 Azzam was assassinated (allegedly by bin Laden, due to their growing power struggle). Shortly thereafter, bin Laden gained control of MAK resources and its organizational mechanisms. More importantly, bin Laden's vision for al Qaeda as a proactive anti-Western organization was allowed to prevail.

The second phase begins with the Iraqi invasion of Kuwait in 1991 and the resulting power struggle that ensued between the United States government and bin Laden over who should oust Saddam from Kuwait. Following the conclusion of the struggle against the Soviet Union in 1989, bin Laden returned to Saudi Arabia. In part because of the great success the mujahideen had against the Red Army, Osama appealed to his family that his mujahideen forces should be deployed to expel Saddam from Kuwait. However, the Saudi family opted instead to allow 500,000 U.S. troops to conduct operations from the Saudi border, in order to deal with Saddam. From that point forth, bin Laden painted the United States as "occupiers of sacred Islamic ground" and the Saudi royal family as facilitators of that occupation.[8] Osama bin Laden abandoned his family and Saudi Arabia altogether and relocated in Sudan to begin his fight against the United States. There, bin Laden purchased land, established a construction company, an agricultural production company, and a furniture-making company, and invested $50 million in shares of a Sudanese bank, the al Shamal Islamic Bank.[9] He and his followers also began to indoctrinate and train additional al Qaeda militants. In 1996, however, bin Laden was forced to leave Sudan under pressure from the United States and Egypt. This time, he relocated back to Afghanistan, where the Taliban—long-time supporters of al Qaeda—had recently taken over the capital of Kabul. This is where bin Laden would reside until the United States response to the 9/11 attacks 5 years later.

The third phase actually begins a few years prior to the 9/11 attacks, although 9/11 provides a more recognizable marker for the last organizational shift of al Qaeda. In 1998 al Qaeda attacked the U.S.

embassies in Kenya and Tanzania, which were considered by the international community to be an attack on the United States itself. President Clinton responded in two ways: in 1998 he authorized cruise missile strikes against al Qaeda camps in Afghanistan in an attempt to take out bin Laden; and in 1999 he imposed a ban on U.S. trade with the Taliban-controlled Afghanistan and froze Taliban assets in the United States.[10] In addition, Clinton's Secretary of State Madeline Albright was instrumental in persuading the U.N. Security Council to pass Resolution 1333, effectively banning all shipments of arms and military service to the Taliban.[11] Despite these efforts, the Taliban was not defeated and Osama bin Laden was not killed. In fact, he and his al Qaeda organization were able to orchestrate the largest attack on U.S. soil since Pearl Harbor, the 9/11 attacks on the Pentagon and World Trade Center. In response, the new Bush Administration declared a "war on terror" and began by attacking the Taliban-led Afghanistan. Within 3 months, the Taliban regime was removed and replaced by a pro-U.S. government. Osama bin Laden and his coconspirator, Ayman al-Zawahiri, however, escaped the attack, apparently by traveling through the Tora Bora Mountains on their way to Pakistan. (It is believed, but not confirmed, that the two are currently in Pakistan).[12] Since the massive strike against the Taliban in 2001, the United States has been dedicated to the apprehension of all al Qaeda leadership. Despite failed efforts to locate bin Laden and al-Zawahiri, even with the help of the Pakistani government, the U.S. government and its allies have successfully arrested or killed 16 of the former top al Qaeda operatives including Mohammad Atef, Khalid Shaikh Mohammed (the September 11 planner), Abu Musab al-Suri, and most recently Abu Musab al-Zarqawi, the leader of al Qaeda in Iraq.[13] In total, since the 9/11 attacks, nearly 3,000 al Qaeda members have been arrested. All of this suggests that since 9/11 the central leadership of al Qaeda has been significantly disrupted, if not destroyed, by U.S. military operations.

### Implications for Understanding al Qaeda's Organizational Structure

Despite successful U.S. and international efforts, however, some still argue that al Qaeda leadership remains intact. It has been speculated that Iran, for example, is currently harboring three key al Qaeda leaders, including Osama bin Laden's son, Saad. If these individuals were to be able to communicate with the outside world, some feel that they would be able to coordinate future terrorist attacks by collaborating with bin Laden and al-Zawahiri.[14] In fact, evidence shows that the three al Qaeda leaders held in Iran were responsible for the May 2003 suicide attacks on a housing complex in Saudi Arabia.[15] If true, adherents of this *centralized* perspective believe that further use of the military to hunt down leaders in Iran is the only way to win the war against

al Qaeda. However, two problems exist when treating al Qaeda as an intact, hierarchically directed organization that can be destroyed militarily. First, it is extremely unlikely that bin Laden or al-Zawahiri would be able to establish avenues of communication with three individuals alleged to be in Iran without implicating the Iranian government, which would be disastrous for U.S.- Iranian relations. And second, the recent revival of the Taliban in Afghanistan only 5 years since their removal is evidence that the military option to shake up al Qaeda's network is not working.

The opposite view holds that al Qaeda's leadership has been so severely weakened that it is unlikely to be able to conduct 9/11-style terrorist attacks on U.S. soil in the future. President Bush, for example, claimed partial victory in the war on terror solely because the United States has not suffered another major terror attack since 9/11. One problem with this assertion is that it is premature. One advantage all terrorist groups share is the element of time, waiting to attack until the time is right and target countries become complacent. After all, it took 8 years for al Qaeda to attack the World Trade Center a second time. To declare success only 6 years after 9/11 is premature and perhaps exactly what al Qaeda has been waiting for.

The last perspective portrays an al Qaeda organization that is completely decentralized and new, while keeping intact its potential to threaten the interests of the United States. In a 2004 report on terrorism, the State Department noted that:

> The core of al Qaida has suffered damage to its leadership, organization and capabilities . . . at the same time, al Qaida has spread its anti-U.S., anti-Western ideology to other groups and geographical areas. It is therefore not only al Qaida itself but increasingly groups affiliated with al-Qaida, or independent ones adhering to al-Qaida's ideology that present the greatest threat of terrorist attacks against the U.S. and allied interests globally.[16]

Rohan Gunaratna, representing the academic community, echoes this view of al Qaeda's current situation. Throughout the entire lifespan of al Qaeda, the trend has been that of entropy not consolidation. Yet, attacks continue and many argue that they have indeed increased. Throughout the 1990s, for example, al Qaeda was successful in executing over ten major terrorist plots against the United States,[17] and today al Qaeda is estimated to have operating cells in over 102 countries.[18] Counterterrorist measures would be better spent focusing on local al Qaeda cells rather than treating al Qaeda as though it were a well-organized network.

## THE POWER OF IDEAS: AL QAIDA'S IDEOLOGY

Given al Qaeda's continued ability to threaten U.S. interests, Jessica Stern, an expert on terrorism at Harvard's John F. Kennedy School of

Government, asks, "What accounts for al Qaida's ongoing effectiveness in the face of an unprecedented onslaught [to kill al Qaida leadership]?"[19] Stern answers her own question by describing al Qaeda as a "protean enemy"—a highly versatile organization able to adapt to new circumstances. Rohan Gunaratna offers another, perhaps more fitting, answer to the same question: al Qaeda has "evolved into a movement of two dozen groups" in over 102 countries.[20] The portrayal of al Qaeda as a movement rather than a centrally led organization is perhaps the single scariest aspect of al Qaeda and, for many, the most intriguing; it exposes the often underestimated power of ideas in international relations. Ideas are bulletproof, and thus continuing to prioritize the military over other policy options is an anachronistic way to address the new threat.[21] Ideology is the binding force of al Qaeda, rather a central command, and the United States would do well by focusing more on the individual cells and the glue that holds them together.

There are a variety of ways to think about ideology. Ideology can be simply "a manner of thinking characteristic of an individual, group or culture," or it can be a theory that "constitutes a sociopolitical program."[22] The ideology of al Qaeda is political, if not solely political. In fact, bin Laden and Zawahiri have been described as ideologues determined to use their vision of "a new world order" to counter the spread of United States' influence.[23] The interpretation of the word *jihad* to mean a "holy war" against the infidels, for example, is deliberate in order to achieve al Qaeda's stated political ends, as is condoning killing innocent women and children, something explicitly condemned in the Koran. Also prohibited by the Koran is the use or distribution of drugs, yet al Qaeda has increasingly worked with drug traders to satisfy its budget in the wake of 9/11. All of this reveals that the priority for al Qaeda is to achieve its political ends regardless of how the Koran is manipulated. As Gunaratna notes, "In effect, contemporary Islamists such as al-Zawahiri and Osama are engaged in an unprecedented exercise in corrupting, misinterpreting, and misrepresenting the word of God to generate support for their political mission."[24]

Al Qaeda was created by bin Laden and his mentor, Azzam to combat the Soviet Union in Afghanistan. After the cold war ended, Azzam wished to turn al Qaeda into an organization responsible for training individuals to return to their home countries to free oppressed Muslims wherever Muslims were suffering. Azzam's vision for al Qaeda was localized and personal, focused on the problems inherent within individual countries. Osama's vision, on the other hand, is much more worldly, so to speak, and as has already been discussed, the variant that was allowed to survive after Azzam's early death. Osama, through al Qaeda, has "directed a call to [all] Muslims throughout the world to declare a *jihad* against the Judaeo-Christian alliance which is occupying Islamic

sacred land in Palestine and the Arab Peninsula (and now Iraq)."[25] Thus, the distinguishing characteristic about the al Qaeda ideology is its ability to unite otherwise separate and distinct Islamic terrorist groups. As noted by Gunaratna, for example, Hizbollah recruited only Lebanese; the Armed Islamic Group only Algerians; and the Egyptian Islamic *jihad* only Egyptians, whereas Osama has been dedicated to rebuilding the Umma (community of believers) and "creating a multinational organization based on the idea of uniting the vanguard of the believers, irrespective of their geographic origin."[26]

In order to garner the widest possible support, al Qaeda sympathizers have used the Internet to form what Jessica Stern labels a "virtual network" of a "leaderless resistance."[27] Al Qaeda has successfully targeted an audience of predominantly young and relatively affluent Arabs from places like the United Arab Emirates and Saudi Arabia to join the global fight against the "great Satan." According to Marc Genest, an expert on terrorism at the Naval War College in Newport, RI, for example, the latest effort to popularize al Qaeda's *jihad* using the internet has been to post video games on Web sites that depict al Qaeda sympathizers as "good guys" in the global struggle against the West. Allegedly, successful game players are provided with "real" recruitment information upon completion of the game.[28] In addition, the "Encyclopedia of Jihad" is available online, which provides instructions for creating "clandestine activity cells, with units for intelligence, supply, planning, preparation, and implementation."[29]

Young Arabs in the Middle East who are easily drawn to the momentum of the al Qaeda movement are not the only targets for al Qaeda, however. Most recently, the "virtual network" of the "leaderless resistance" has found support in somewhat unlikely places. United States prisons, especially low-level prisons, have been infiltrated by those working with al Qaeda cells to radicalize newly converted Muslim inmates. According to Warith Deen Umar, who hired most of the Muslim chaplains currently active in New York State prisons, "prisoners who are recent Muslim converts are natural recruits for Islamic organizations."[30] The reason for this is twofold; low-level prisons are relatively porous institutions in that many inmates have at least limited access to the Internet, and most are permitted religious freedoms conducive for recruitment. Further, inmates typically share one trait in common—a certain degree of animosity toward their own country. Whether inside or outside of the prison walls, many academics like Jessica Stern agree that there is increasing evidence to support the concern that the al Qaeda movement has been able generate "home grown" or "lone wolf" terrorists inside the borders of the United States and among individuals not notorious for becoming radicalized. Jose Padilla, Richard Reid, and John Walker as well as the "Lackawanna Six"—the al Qaeda sleeper cell originating out of Buffalo, New

York—are just few of the "home grown" terrorist inspired by the al Qaeda movement.[31]

While the "home grown" terrorist phenomenon inspired by the al Qaeda movement poses a unique problem insofar as they are terrorists not traditionally affiliated with al Qaeda, the real challenge to U.S. security is the ability of the movement to unite otherwise separate *foreign terrorist organizations* under the banner of al Qaeda.[32] In 1998, bin Laden created the International Islamic Front for *jihad* against the Jews and the Crusaders (IIF), which includes members from Egypt's Gama'a al Islamiya, the secretary-general of the Pakistani religious party known as the Jamiat-ul-Ulema-e-Islam (JUI), and the head of Bangladesh's *jihad* Movement, to name only a few.[33] In addition to the IIF, bin Laden has forged an alliance between al Qaeda and "franchise groups" in Iraq, Europe, Southeast Asia, and the Philippines, including Ansar al Islam, Jemaah Islamiah, Abu Sayyaf, and the Moro Islamic Liberation Front.[34]

The most alarming of all, however, and perhaps the best example of al Qaeda's ability as a movement to unite otherwise uncommon groups, is the connection between al Qaeda, a Sunni organization, and Hizbollah,[35] a Shi'a group. Hizbollah is considered by many to be the "most sophisticated terrorist group in the world," and it has become an increasing concern for the United States due to the fact that one of its major centers of operation is in the "tri-border region" in South America, second only to its home base in Lebanon.[36] Hizbollah is backed by Iran and Syria, long-time adversaries of the United States, and this tri-border region, located where Paraguay, Brazil, and Argentina meet, "has become the world's new Libya, a place where terrorists with disparate ideologies—Marxist Columbia Rebels, American white supremacists, Hamas, Hizbollah and others—meet to swap tradecraft."[37] Reports also show a growing connection between Venezuela's President Hugo Chavez and Colombian rebels, and Venezuela's Margarita Island has recently been coined a "terrorist heaven" for Islamic militant groups.[38] Most concerning of all, money raised for terrorist organizations in the United States is often funneled through Latin America via an underground banking network traditionally used by drug cartels, something that will be discussed in length in the following section of this chapter.

## FINANCING AL QAEDA

In a speech on September 24, 2001, President Bush noted that "Money is the lifeblood of terrorist operations today," and promised to "direct every resource at our command to win the war against terrorists: every avenue of diplomacy, every tool of intelligence, every instrument of law enforcement, every financial influence. We will starve the terrorists of funding."[39] To date, unfortunately, this promise has only marginally been kept. Al

Qaeda has not starved to death because it has changed its appetite, so to speak, to reflect its most current organizational structure. Viewing al Qaeda's organization as an ensemble of loosely connected grapes on a grapevine rather than a snake with a head that can be severed would lead policymakers to focus on the finances of localized cells rather than the organization as a whole. Turning the grapes into raisins one by one is a more appropriate response to the al Qaeda threat than trying to starve the entire snake or chop its head off.

There are essentially five sources that Islamic terrorists and al Qaeda specifically use to finance their activities. Having said this, many of the more traditional fundraisers are now outdated and are no longer reliable as primary sources for al Qaeda to raise the money it needs. The four traditional sources for financing terror, called the usual suspects, include individual donations from wealthy individuals, money channeled to al Qaeda through corrupt charities, Osama bin Laden's own personal wealth and investments, and legitimate nongovernmental organizations (NGOs) that have been infiltrated or exploited by al Qaeda affiliates or bin Laden himself. The fifth category of funding relates to criminal activity, as described below.

Until recently, it has been the shared common wisdom among academics and policymakers that the four traditional avenues for raising funds have been the most reliable and lucrative for many terrorist groups, including al Qaeda. According to Lee Rensselear, "Direct contributions from wealthy Arab benefactors and funds siphoned from Islamic charities are said to represent the mainstay of al Qaida's global financial network."[40] For years, this system worked quite well, in part due to the fact that the Islamic faith requires that a portion of an individual's income be allocated to charitable donations; of course, most people never actually knew what their money was being used for. Even as recently as 2002, Saudi Arabia was referred to as one of the largest culprits of "state sponsored terrorism" because of its policy of turning a blind eye to individuals and charities who "continue to donate $1–2 million a month to bin Laden through mosques and other fundraising avenues that also perform legitimate charity work."[41] In another example, the Pakistani office of the Kuwait-based Revival of Islamic Heritage Society allegedly "padded the number of orphans it claimed to care for by providing names of orphans that did not exist or who had died. Funds sent for the purpose of caring for nonexistent or dead orphans were instead diverted to al Qaida terrorists."[42] For years these wealthy individuals and charities have been the most important sources of funds for al Qaeda, but in recent days and months, al Qaeda has been forced to look elsewhere to raise its money.

The other two traditional fundraisers on the usual suspect list, Osama bin Laden and tainted NGOs, have also been major sources of revenue for al Qaeda, especially after bin Laden first relocated to Sudan. Like

individual donations and charities, however, Osama bin Laden and NGOs have been the primary targets for the United States and the international community in the post-9/11 era, due to their notoriety. For example, many of bin Laden's portfolio investments in Mauritius, Singapore, and Malaysia; his bank accounts in Hong Kong, London, and Dubai; and his real estate ventures in Europe have been discovered and frozen in part due to Presidential Executive Order 13224 issued on September 23, 2001.[43] As early as 2002, over 250 individuals and groups affiliated with al Qaeda had been designated under this Executive Order, and $36 million in terrorist-related funds in 92 separate accounts had reportedly been frozen by U.S. financial institutions.[44] Furthermore, the United Nations Security Council issued on January 16, 2002, a consolidated freeze list of some 300 individuals and entities linked to al Qaeda, Osama bin Laden, and the Taliban. In so doing, $85 million of terrorist bank funds have reportedly been frozen outside the United States since September 11, 2001.[45]

Despite these successes, it is not appropriate for the United States to become complacent, nor is it time to march around on an aircraft carrier declaring victory. Al Qaeda is like a virus, insofar as it is able to mutate and become resistant to medicines directed its way. Adapting to financial constraints imposed by the United States and the international community reflects the "protean nature" of this enemy.[46] For instance, recent trends noted by the State Department suggest that al Qaeda has been able to adapt to the new international constraints placed on its decentralized organization. One of these adaptations, according to the U.S. Department of States' "Country Reports on Global Terrorism 2005," is that more terrorist groups are aligning with international criminals to finance their objectives.[47]

Typically, terrorist networks and international criminals have eschewed becoming too intertwined.[48] Some reasons for this include a desire to avoid unnecessary attention from authorities, and because each type of organization has very different objectives; terror groups have political objectives and criminals have financial ones. Given the new circumstances, however, al Qaeda members and sympathizers have found some international crime networks particularly attractive for a couple of reasons. First, a few international criminal organizations yield massive revenues, and second, these organizations have already established networks and channels through which they can conduct business. Criminals generally cooperate with terror groups so long as their operations are not in jeopardy, and because terrorists come for cheap due to their political, as opposed to financial, goals.

Until now, many have acknowledged crime as a means for which al Qaeda cells support their day-to-day operations, but not something that can sustain the organization itself. Credit card fraud and kidnapping are just two of the ways that crime is understood to supply terror cells with

money. There are two other known criminal moneymaking avenues, however, that have the potential to generate significant revenues, beyond those needed for self-maintenance. For example, an Algerian al Qaeda cell detected in Britain in 1997 reportedly raised over $200,000 in 6 months through a variety of criminal activities, according to Rohan Gunaratna.[49]

The illegal trade of precious stones and drugs, typically confined to the international criminal community, presents the greatest danger to the national security of the United States because it allows individuals in the United States adhering to the al Qaeda ideology to raise enough money on their own to perform 9/11-type attacks without leadership and financing from abroad. The *Washington Post*, citing Western intelligence officials and other informed sources, claims that bin Laden's network "reaped millions of dollars in the past three years from the illicit sale of diamonds moved by rebels in Sierra Leone alone."[50] Another revenue source has been tanzanite, a valuable purplish-brown crystal from Northern Tanzania. According to the *Wall Street Journal*, two al Qaeda companies—Tanzanite King and Black Giant—recently exported quantities of uncut stones from Kenya to Hong Kong and made millions in profits.[51]

Despite the large sums of money that can be made through trading precious stones, the international narcotics trade is the most attractive criminal network to exploit, however, for three simple reasons. First, the demand for drugs is extremely high. Second, many countries enjoying a comparative advantage in the production of drugs share a border with the United States or have relatively easy access to the border. And third, already established networks for transferring money without a trail used by drug traders can also be exploited by terrorists. Without an avenue to transfer money, the money raised is useless. Prior to 9/11, al Qaeda relied extensively on commercial banks, shell banks, front companies, and NGOs to move funds for their global operations. Recently however, according to Rensselear, "al Qaida is relying increasingly on non-bank mechanisms to move and store funds."[52] Since 9/11, al Qaeda has been forced to depend increasingly on informal or alternative ways of manipulating and transferring funds because the formal banking systems have been targeted and regulated.

Underground banking, called the hawala, hundi, or black market peso exchange, provide a means of sending money across borders anonymously and without physical transport or electronic transfer of funds.[53] Money brokers (called *hawaladars*) in one location receive cash from a client, such as a cab driver in New York, who wants to send money to a family member or friend in another country.[54] The hawaladar alerts a corresponding broker in the other country by telephone, e-mail, or fax, who then dispenses the equivalent amount of money, less fees, to the recipient. Neither the sender nor the recipient needs to identify themselves; the transaction takes place using prearranged codes much like tracking

numbers. The client in the other country is also permitted to transmit money in the same way back into the United States at a later date. The transactions take place without any physical currency ever crossing the border. These money-transferring networks were originally conceived as a financial exchange for immigrant workers but, especially in the United States, the network has been exploited by drug traffickers and most recently terrorists.

Similarly, the black market peso exchange (BMPE) has been a tool used by Colombian drug cartels to produce revenues larger than half the countries in the world.[55] As noted by the State Department, "The black market peso exchange is documented as the largest known money laundering system in the Western Hemisphere . . . Tens of billions of dollars a year are said to move through such informal value transfer systems."[56] The way it works is a Colombian cocaine exporter sells cocaine in the United States for dollars and then sells the dollars to a Colombian black market peso broker's agent in the United States. The broker then deposits the equivalent of Colombian pesos, less fees, into the exporter's bank account in Colombia. Just as in the hawala exchange system, no currency actually crosses the U.S. and Colombian borders. The broker may then resell the dollars to a Colombian importer, who uses them to purchase U.S. goods that are then shipped back into Colombia.[57]

Unfortunately, current actions taken domestically and internationally to combat problems associated with the underground banking systems are weak at best. Since 9/11, for example, all hawaladars are supposed to register their operations with the state in which they reside, but there are absolutely no mechanisms to ensure that this takes place, nor are there severe penalties for noncompliance. Understandably, as Rensselear observes, "U.S. officials admit to having very little luck tracking movements of funds through these informal systems, which explains why efforts to break the terrorist financial chain have been decreasingly productive."[58]

### CONCLUSION

To date, the Bush Administration has relied heavily on the military to deal with the al Qaeda threat, which is reflective of the anachronistic way in which the Administration views its contemporary adversary. Despite organizational and leadership setbacks in the wake of September 11, al Qaeda continues to be a credible threat to the security of the United States.

The other policy option for the Administration to confront al Qaeda has been a financial one. Accordingly, the U.S. Department of Treasury has stated that the U.S. policy has been "starving the terrorists of funding and shutting down the institutions that support or facilitate terrorism."[59] Title III of the USA PATRIOT Act, for example, directly addresses the issue

of terrorist financing. In the most simplistic sense, Title III essentially up-grades older money laundering laws like the Bank Security Act (1970s), the Currency and Foreign Transaction Reporting Act, the Money Launder-ing Control Act (1986), the Annuzio-Wilie Anti-Money Laundering Act (1992), the Money Laundering Suppression Act (1994), and the Money Laundering and Financial Crimes Act (1998) by rewording them to ad-dress terrorist money activities rather than just criminal activities.[60] In ad-dition, the International Emergency Economic Powers Act—which in 1977 granted "special powers" to freeze foreign assets pursuant to a declaration of a national emergency with respect to a threat, "which has its source in whole or in part outside the United States to the national security of the United States"—was updated under Title III of the USA PATRIOT Act to grant similar powers to the Secretary of the Treasury to address terrorist finances specifically.[61]

Substantial funds have been frozen domestically and internationally, but "after this initial sweep [post 9/11 initiatives], the freezing of ter-rorist assets slowed down considerably."[62] The problem with Title III is that it (like the anachronistic legislation it is founded on) targets only the usual suspects of terrorist financing—namely, state-sponsored terrorist fi-nancing, donations from wealthy individuals, and contributions from Is-lamic charities. The *9/11 Commission Report* even recommended that less be expected from efforts to dry up terrorist money supplies; more ought to be devoted to confronting the terrorists directly and beefing up the intelligence community to better understand the nature of new terrorist networks.[63] The problem does not lie with our expectations, however, and efforts to combat al Qaeda financially can prove fruitful so long as how al Qaeda is organized and operates today is correctly understood. Little has been done by the United States or the international community to deal with the ways in which individual al Qaeda cells obtain large sums of money, for example, including the underground banking networks men-tioned earlier.

Fighting the al Qaeda movement itself is still another policy option not yet fully developed, and understanding that al Qaeda is glued together by its ideology is vital for success. Before leaving office, Donald Rumsfeld pi-oneered a "strategic communications" campaign aimed at tackling the al Qaeda ideology head on. As stated by Rumsfeld, "the war on terror is not only being fought on the battlefield, but in the newsrooms—in places like New York, London, Cairo and elsewhere."[64] Despite concerns that the De-partment of Defense could ignite a propaganda war that would "distort the truth" about Islam as a whole rather than target al Qaeda specifically, the campaign demonstrates that the Bush Administration is at least be-ginning to acknowledge that al Qaeda has become a movement, and in so doing the Administration is perhaps recognizing for the first time the power of ideas in international relations.

# CHAPTER 26

## IRAQ IN THE 21ST CENTURY

Robert J. Pauly, Jr., and Jeff Stephens

In March 2006, U.S. President George W. Bush released his administration's second National Security Strategy (NSS), a document that places considerable emphasis on the prospects for the political transformation of the Greater Middle East and, specifically, Iraq. Most broadly, in its opening paragraph, the NSS explicitly states that:

> It is the policy of the United States to seek and support democratic movements and institutions in every nation and culture, with the ultimate goal of ending tyranny in our world. In the world today, the fundamental character of regimes matters as much as the distribution of power among them. The goal of our statecraft is to help create a world of democratic, well-governed states that can meet the needs of their citizens and conduct themselves responsibly in the international system. This is the best way to provide enduring security for the American people.[1]

The Bush administration's emphasis on the need for economic and political reform with capitalist and liberal democratic characteristics across the Greater Middle East grew initially out of al Qaeda's devastating attacks on the World Trade Center in New York and the Pentagon on the outskirts of Washington, DC, on September 11, 2001. In short, Bush believes that creating opportunities for freedom of expression, representative democratic governance, and vibrant economic growth within the states of the Greater Middle East will reduce the support for terrorist groups such as al Qaeda, especially over the long term. The first step toward achieving that end, in the administration's view, was to remove repressive regimes controlled by the Taliban in Afghanistan and then President Saddam Hussein in Iraq through the prosecution of Operation Enduring Freedom in the fall of 2001 and Operation Iraqi Freedom (OIF)

in the spring of 2003, respectively. The second and ongoing stage of the process is to help create conditions that are favorable for the development of enduring liberal democratic institutions with domestic ethnic, cultural, and religious characteristics through the conduct of nation/state-building operations in both Afghanistan and Iraq. Regrettably, although not surprisingly, progress in each of those projects has been limited and proceeded at a rather glacial pace, most notably so because of a lack of security, particularly in the heart of Iraq—Anbar province, and the capital Baghdad—where the vast majority of that state's formerly economically and politically powerful (and now marginalized and embittered) minority Sunni community is situated.

Bush emphasized the administration's approach in his second Inaugural Address in January 2005, and reiterated it in the NSS. In the former context, for example, he explained that:

> Freedom, by its nature, must be chosen, and defended by citizens, and sustained by the rule of law and the protection of minorities. And when the soul of a nation finally speaks, the institutions that arise may reflect customs and traditions very different from our own. America will not impose our own style of government on the unwilling. Our goal instead is to help others find their own voice, attain their own freedom, and make their own way.[2]

The NSS builds on the same theme, while stressing that the task at hand—namely, reducing the influence of extremist groups that pervert the interpretation of Islam to serve their own geopolitical aims (including, but not limited to, al Qaeda)—is one that will demand an enduring commitment by the United States, its allies and the broader international community:

> Achieving this goal is the work of generations. The United States is in the early years of a long struggle, similar to what our country faced in the early years of the Cold War. The 20th century witnessed the triumph of freedom over the threats of fascism and communism. Yet a new totalitarian ideology now threatens, an ideology grounded not in secular ideology but in the perversion of a proud religion. Its content may be different from the ideologies of the last century, but its means are similar: intolerance, murder, terror, enslavement and repression. Like those who came before us, we must lay the foundations and build the institutions that our country needs to meet the challenges we face.[3]

The most daunting of those challenges to date have come in Iraq, a case that will be addressed in this chapter. The discussion begins by providing an overview of the role of American military forces in nation/state-building operations in Iraq since 2003, followed by an examination of the

socioeconomic, judicial, political, and security components of those operations. The chapter then reviews insights that U.S. civilian and military leaders and policymakers should draw from America's efforts in Iraq to date, and the chapter concludes with an assessment of the prospects for the future of that state under reconstruction.

## NATION/STATE-BUILDING OPERATIONS IN IRAQ: AN OVERVIEW

There are two interconnected reasons why nation/state-building is indispensable to the Bush administration's policy toward the Greater Middle East—and, specifically, Iraq. First, the elimination of Saddam's regime through the conduct of the second Iraq War from March to May 2003 created a power vacuum that had to be filled expeditiously in order to avoid the failure of the nascent postconflict Iraqi state. Without a sustained American commitment to the stabilization of Iraq and the cultivation of representative political institutions and a free market economy, that state will itself likely fail and become a base for terrorist groups in the future. As Robert I. Rotberg has asserted, "In the wake of September 11, the threat of terrorism has given the problem of failed nation-states an immediacy and importance that transcends its previous humanitarian dimension. . . . The existence of these kinds of countries, and the instability that they harbor, not only threatens the lives and livelihoods of their own peoples but endangers world peace."[4] Second, any strategy must begin somewhere. With respect to Bush's promised liberal democratization of the Persian Gulf and broader Middle East, the point of departure was—and remains—Iraq.[5]

As is true of most nation/state-building projects, the present U.S.-led endeavor in Iraq features interconnected socioeconomic, judicial, political, and security components. Policies associated with each of those components have been—and will continue to be—applied in distinctive (and, to some extent, overlapping) stages played out over the short, medium, and long terms. The first step in the process was (and remains) postconflict stabilization. In the case of Iraq, pursuit of that end has entailed the deployment of military forces—primarily, albeit not exclusively, those from the United States and the United Kingdom—to provide security for individuals ranging from Iraqis to humanitarian aid workers from international organizations and NGOs, in an attempt to foster political and social stability and economic prosperity, which, regrettably, has yet to occur. As evidenced by the myriad attacks carried out against proponents of (and participants in) reconstruction operations to date—including escalating attacks on coalition forces and civilians in 2004–2005 and the eruption of sectarian violence in 2006—the challenges to enduring stability in Iraq remain daunting. The Hoover Institution's Larry Diamond,

an expert on democratization who served as an advisor to the U.S.-led Coalition Provisional Authority in Baghdad in 2004, explains that the "First lesson of America's experience in Iraq is that the stabilization— not to mention the democratization—of a state that has collapsed or been toppled through violent conflict is an intrinsically difficult and protracted process that requires a huge commitment from both internal and international actors."[6] Similarly, former Ambassador James Dobbins notes that "[H]olding together ethnically divided societies is hardly a new or unfamiliar task. . . . What makes Iraq different and a particularly difficult case is that for the first time the United States has tried to put a society back together without securing the cooperation, however grudging, of the principal neighbors of the state in question."[7]

The construction of a fully democratic and independent Iraqi state is necessarily a long-term goal. The timetable for the realization of that objective is at present—and will likely remain—at least somewhat ambiguous. But as a general rule, one need only consider the length of past and contemporary nation/state-building projects across the globe. In the aftermath of World War II, for example, 4 years elapsed between the commencement of reconstruction efforts in occupied Germany and the establishment of an independent Federal Republic in May 1949. Similarly, nation/state-building efforts in the Balkans began in December 1995 in Bosnia and are still works in progress.

The socioeconomic, judicial, political, and security aspects of the reconstruction of Iraq broadly parallel many of the general characteristics of nation/state-building described in the previous section of this chapter. However, as one would expect, many of the specific details associated with the planning and implementation of those components of nation/state-building operations in Iraq reflect that state's distinctive history, geography, and natural resources, as well as its ethnic, religious, and tribal diversity. In general terms, that diversity presents problems comparable to those faced by the United States and its allies in the Balkans.

Economically, Iraq is unique in that it possesses the requisite natural resources (in the form of vast petroleum reserves) for the construction of a vibrant economy, albeit one that lacks even a measure of diversification. Yet, for that to occur, occupying forces—and, more importantly, the Iraqis themselves—must supply the security necessary to rebuild and maintain the requisite physical infrastructure to use those resources productively. Once the infrastructure is at least relatively free from the threat of sabotage by loyalists to Saddam's now-defunct regime as well as by transnational terrorist organizations and dissatisfied Sunni insurgents, Iraqi domestic and international officials and the institutions they administer can begin instituting the deeper free-market reforms required for Iraq to compete both regionally and globally.

Similarly, the political aspects of nation/state-building in Iraq can be compartmentalized in a series of stages. The first stage involves the administration of temporary governmental institutions by the military and civilian occupation forces of the United States, United Kingdom, and their coalition partners. Second, local and national transitional bodies must be developed and composed of Iraqis reflective of the ethnic and religious diversity of the domestic population, deemed reliable by the occupying forces, and accepted to whatever extent is feasible by neighboring Persian Gulf states. And third, a fully independent Iraq must be established with enduring democratic institutions.[8]

For either economic or political reconstruction to proceed in an expeditious—and ultimately successful—fashion, the long-term deployment of outside forces (most notably from America and the United Kingdom) is essential, concurrent with the continuing training and buildup of Iraqi military and police forces. Collectively, those forces have been (and will continue to be) relied upon to pursue and apprehend those insurgents determined to disrupt nation/state-building operations, and also to protect civilians attempting to carry out those operations, as well as the Iraqi general population. These are obviously daunting challenges, and ones that cannot be shouldered exclusively by the American military, particularly over the long term. As *The Atlantic Monthly*'s Robert Kaplan, who has spent extended periods imbedded with U.S. military units in Iraq over the past 2 years, notes, "On a landscape flattened by anarchy in 2004, the American military has constructed a house of cards. Fortifying this fragile structure with wood and cement now will require more aid—in massive amounts and of a type that even America's increasingly civil affairs-oriented military cannot provide."[9]

Put simply, the conduct of nation/state-building operations in Iraq requires interaction among a variety of actors, ranging from individuals, extended families, political parties, and religious groups to states, international institutions, terrorist organizations, and NGOs. The interplay of these actors will continue to manifest itself at both the domestic and international levels within and outside of the Persian Gulf region. The strongest challenges to reconstruction efforts in Iraq have grown out of two sets of domestic-level relationships, those between representatives of the U.S.-led nation/state-building coalition and the Iraqi population, and among members of Iraq's Kurdish, Shiite, and Sunni ethnic and religious groups.

The level of stability, or lack thereof, in the former set of relationships—and within the postwar state itself—is conditioned largely by the extent to which those who suffered when Saddam was in charge believe their lives have improved since the fall of the Iraqi dictator's regime. Building that trust hinges on the capacity of the nation/state builders (American civilian administrator L. Paul Bremer III between June 2003 and June

2004, and since then Ambassadors John Negroponte and Zalmay Khalizad and their staffs, along with coalition military forces, and the institutions of the nascent Iraqi government) to reduce the perpetual domestic security threats posed by al Qaeda in Iraq and followers of the late Abu Musab al-Zarqawi, Saddam loyalists, and an assortment of dissatisfied Sunnis aligned with one or both those groups or acting alone on one hand, and power struggles among Kurds, Shiites, and Sunnis on the other.

Yet, notwithstanding the aforementioned challenges, limited hope for the eventual liberal democratization of Iraq remains, even for those such as Diamond, who have been critical of nation/state-building efforts there to date. As he concludes, "After nearly three years and a bitter cost in lives and treasure, the United States now has a real chance to help Iraq move toward stabilization. It will not be quick or easy, and real democracy may be years away. But compared with the tyranny of Saddam Hussein or the chaos since the invasion, stabilization would count as considerable progress."[10]

## ROLE OF THE U.S. MILITARY IN NATION/STATE-BUILDING OPERATIONS IN IRAQ

U.S. military forces have played a significant role in nation/state-building operations in Iraq since the end of OIF in the spring of 2003. This section of the chapter examines the contributions of the military to those operations in the socioeconomic, judicial, political, and security contexts.

### Socioeconomic Context

One of the most significant challenges in the aftermath of any conflict is to restore order as expeditiously as possible in order to begin meeting the economic needs of the citizens once a given regime has fallen. Ideally, it is best to have a detailed plan at the ready to help restore and then maintain order, one that has been developed well in advance. Regrettably, in the case of Iraq, the United States did not plan adequately for the disorder that prevailed once Saddam's regime had fallen. American planners anticipated that U.S. forces would be welcomed as liberators and that, despite the collapse of the leadership of the regime, those individuals responsible for policing Iraq and providing public services would remain on the job. Instead, Iraq's institutions ceased functioning and Baghdad and the surrounding Sunni-dominated region of central Iraq were subject to mass looting that damaged the infrastructure and, more significantly, left the streets unsafe and immediately fostered negative perceptions of the United States and its coalition partners among the native population.[11]

During the planning for OIF, the Pentagon prepared to deal with a humanitarian crisis that it anticipated would grow out of the massive

flight of refugees concurrent with the conflict between U.S. and Iraqi forces. Secretary of Defense Donald Rumsfeld appointed retired Lt. Gen. Jay Garner to administer the postconflict reconstruction team, but insisted on a limited military presence in Iraq, one that (in terms of soldier-to-population ratio) was markedly smaller than those in previous American nation/state-building efforts in places such as Bosnia-Herzegovina and Kosovo. One report issued by the RAND Corporation, for instance, recommended that ideally, the soldier-to-citizen ratio in any nation/state-building project should be approximately 1: 20. Based on Iraq's population of 25 million, the United States would need a force presence of 500,000. However, the Pentagon ignored the report, as well as similar advice put forward from staffers on the Department of State's "Future of Iraq Project" and the presence has never grown above 130,000.[12]

A higher force presence would likely have been helpful in restoring order in Iraq in April and May 2003. Bremer, who replaced Garner a month after the latter's arrival in Baghdad, and headed the Coalition Provisional Authority in Iraq from June 2003 to June 2004, recommended as much repeatedly, but his requests fell on deaf ears in Washington. Yet, lack of manpower was only one of many challenges to development of the necessary foundation for a productive Iraqi economy. The state's infrastructure, for instance, was itself in a state of disrepair long before the commencement of the second Iraq War.[13] The condition of much of the equipment needed to take advantage of Iraq's most valuable resource—petroleum—is perhaps the most significant such example. As Bremer noted in describing the condition of a typical Iraqi oil refinery in his memoirs,

> The control room of the Daura oil refinery on the outskirts of Baghdad reminded me of the phony rocket ship cockpits on the *Flash Gordon* TV shows I watched as a kid: levers, steam gauges, and hand cranks. The stifling room exemplified the difficult economic challenges we faced. The manager, a soft-spoken, competent engineer named Dashar Khashab, pointed out the broken windows and the acres of rusty, cracking towers and piping. "The Americans built this in 1955," he said. "Almost nothing has been replaced . . . repaired, yes, but not replaced."[14]

Building a self-sufficient—let alone prosperous—Iraqi economy is necessarily a long-term task, one the leadership of that state will have to achieve gradually, with outside assistance as necessary. Where the U.S. military has been effective over the past 3 years in Iraq is in the use of public works projects to help build rapport with the population at the municipal level in towns and villages across the state. The problem is that, despite successes at the micro level, conditions in Iraq have not improved significantly overall since the fall of Saddam's regime.

### Judicial Context

In Iraq, as is the case across the Islamic world, the concept of justice is of critical importance in the way Muslims perceive both their own governments and those of intervening (and occupying) powers such as the United States. To most Muslims, receiving treatment they believe to be just is as important—if not more so—than building institutions deemed democratic by Western standards.[15] The challenge for American military forces and their coalition partners has been to give credence to Iraqi cultural and religious norms in their interactions with the citizenry broadly, and while meting out justice to members of Saddam Hussein's regime and those domestic and foreign fighters who have participated in the insurgency over the past 3 years.

To date, the results of U.S. attempts to engender a perception of just treatment in Iraq have been mixed. Where American forces have had the most success is in pursuing Saddam and the upper echelon of Baath Party leaders who served him. Tracking down and killing Uday and Qusay Hussein in July 2003, and capturing Saddam and turning him over to Iraqi officials for trial in a domestic court, for example, helped to create a sense that members of the regime would be forced to pay for the crimes they had committed over the previous quarter-century. For those Iraqis who had suffered under Saddam's rule, the dictator's capture was particularly satisfying. As Bremer explained in recalling the news conference he held to announce Saddam's capture, the "effect was immediate and dramatic. Iraqi journalists were on their feet, cheering wildly, as were several Western reporters, but it was the expressions of undisguised joy among the Iraqis that were most moving. I realized that those of us born and raised in freedom could never appreciate the profound psychological impact of tyranny. As long as Saddam had been somewhere *out there*, Iraqis feared that he might return."[16]

Regrettably, the pursuit, capture, and imprisonment of former Baathists and members of the insurgency have also had a negative side. Most notably, in the spring of 2004, in response to press reports of alleged abuse of Iraqi detainees by U.S. servicemen and women and private contractors at the Abu Ghraib Prison, the same site where Saddam's regime tortured and executed opponents over the years, the Department of Defense (DOD) revealed its own internal investigation confirming the abuses. While the abuses committed by U.S. forces at Abu Ghraib were clearly not on the scale of those perpetrated by the Baathists under Saddam, the fact that such abuses occurred was itself more than enough to taint the image of the American military within the Iraqi population.[17] As is also the case with terrorism, one attack is often all that is needed to create a negative perception of one ethnic or religious group within a given society.

### Political Context

One of the most challenging aspects of the nation/state-building operations that have become the rule rather than the exception in the pursuit of U.S. interests since the end of the cold war is the incorporation of the military into the political component of such operations. Ideally, the planning and implementation of a given nation/state-building project should involve effective cooperation and coordination between military and civilian agencies, most notably the DOD and Department of State (DOS). As discussed earlier in the chapter, the lack of effective coordination between those two agencies was in part to blame for Garner's failure to stabilize Iraq prior to Bremer's arrival. Both the DOD and DOS did spend significant time planning for the aftermath of the fall of the regime; they just failed to compare notes as well as they should have.

The military, on the other hand, has in practice been more effective in helping to transform Iraq politically at the local level. For instance, if one examines the situation in Iraq closely enough, there are certainly signs of progress that have been achieved primarily as a result of the actions of American servicemen and women within the context of civil-military operations at the local level. Consider, for instance, the example of Army Major James A. Gavrilis, whose 12-man special forces team established a functioning municipal democracy in Ar Rutbah, a Sunni city of 25,000 in the Anbar province of Iraq near the Syrian and Jordanian borders. Working closely with civil administrators, policemen, and tribal leaders, Gavrilis' unit orchestrated the development of representative political institutions and public services that were staffed and administered by the citizens of the town.[18] It is an example that has been replicated in locales across Iraq. Yet, until similar successes are achieved at the national level, such examples are more likely to be overlooked than lauded as indicators of the potential for a positive future for Iraqis.

### Security Context

The U.S. military "footprint" in Iraq is markedly larger than that in Afghanistan, and organized resistance to the American occupation has been considerably greater in Iraq. In short, both the challenges faced by American forces and the stakes associated with success and failure in Iraq have increased at a proportionally higher rate than in Afghanistan. Two of the most significant reasons for this are the emphasis placed on pursuing nation/state-building operations in Iraq by the Bush administration, and countering efforts by domestic insurgents and foreign fighters aligned with al Qaeda to undermine those operations. Collectively, these factors have raised the relative costs of the U.S. presence in Iraq, which has resulted in the deaths of more than 2,500 American servicemen and women there since March 2003.[19]

The extent of the troop presence in Iraq—and consistent calls by some critics of the Bush administration to increase that presence—grow out of a broader debate within the DOD over the manner in which military forces should or should not be utilized in nation/state-building projects. Generally speaking, one side of this debate does not think the military should play a central role in nation/state-building projects; its proponents suggest, instead, that U.S. forces should focus much more on traditional war-fighting tasks, which those forces carried out quite effectively in OIF. Those on the other side of the debate recognize the importance of using nation/state-building projects—and civil-military operations therein—to reduce the number of failing and failed states in the Greater Middle East and diminish the capabilities of terrorist groups in that region.

As is true of Afghanistan, the conduct of civil-military operations has resulted in a great deal of progress in terms of the development of physical infrastructure and political institutions in selected cases at the local level, but projects such as the reconstruction of schools and negotiation of power-sharing arrangements on village councils are typically overshadowed by the daily violence generated by the insurgency. Regrettably, no matter how many schools one builds or public works projects one launches, these types of endeavors simply do not generate the same extent of media coverage as the detonation of improvised explosive devices and commission of homicide bombings by insurgents with roots inside and outside of Iraq. For example, although hundreds of new schools have been opened in Iraq over the past 3 years, 26,496 insurgent attacks were carried out therein in 2004 and 34,131 in 2005.[20] Not surprisingly, the latter figures tend to draw much more public attention than the former.

## LESSONS LEARNED FROM NATION/STATE-BUILDING OPERATIONS IN IRAQ

As is true of any nation/state-building endeavor, it is essential for U.S. policymakers in both the civilian and military ranks to attempt to draw some useful insights from the case of Iraq to apply to their future tasks both within and outside of that state under reconstruction. This section of the chapter identifies such insights in four issue areas—planning, civil-military cooperation and coordination, confronting an insurgency, and public diplomacy at home and abroad.

### Planning

Planning is of critical importance to the successful execution of each component of any nation/state-building project, whether carried out by civilian or military actors or a combination of the two. When preparing for such operations, receiving input from both civilian and military organizations (most notable the DOD and DOS), and incorporating that input into

a coherent plan of action is essential. Without instructive input from area experts with the requisite background understanding of a given region or state, nation/state-building is likely to prove unnecessarily complicated. Put simply, "cookie-cutter" models are problematic when dealing with regions as diverse in terms of ethnicity, tribal affiliation, and religious interpretation as the Greater Middle East.

Consider the case of Iraq. On balance, the DOD failed to identify beforehand some of the most significant challenges U.S. forces were likely to face in the aftermath of the fall of Saddam's regime (most notably, the extent to which Iraq's police and public services would disintegrate), hurdles that were forecast by the DOS "Future of Iraq Project." That lack of preparedness resulted in the failure to put an expeditious stop to the looting that followed the fall of Baghdad in April 2003. As a result, the first impression of American forces developed by many Iraqis who had waited decades for Saddam's ouster was a negative one. As brutal as Saddam's rule had been, the streets of Baghdad were perhaps more dangerous in terms of the potential for an individual to experience random violence than was the case previously.

One of the shortcomings of the U.S. government in the years preceding the events of September 11, 2001, was a lack of coordination between agencies charged with safeguarding America's national security. Comparable shortcomings hampered planning for the postconflict stage of the second Iraq War. If the United States is to succeed in the transformation of Iraq and the Greater Middle East, let alone continue to achieve progress in the war on terrorism, cooperation and coordination between agencies, including (but not limited to) the DOD and DOS, must improve considerably.

### Civil-Military Cooperation and Coordination

While it is essential that the U.S. military play a significant role in the conduct of nation/state-building operations, it is also clear that American civilian agencies such as the DOS and U.S. Agency for International Development must contribute a great deal as well. The same is true of international organizations and NGOs. Carrying out an effective civil-military operation—whether building a school or setting up a clinic to provide medical treatment to Iraqis in a particular town or village—typically demands contributions from several if not all of the above actors. Collaboration and coordination among those actors, on the other hand, is often difficult to achieve, both at the policymaking level and in practice on the ground in a given state. Both the DOS and DOD have placed increasing emphasis on the issue area of postconflict reconstruction and nation/state-building since the events of 9/11. They must continue to focus on that issue area and encourage interaction among representatives of government agencies, the military, international organizations, NGOs, and the

academic communities to develop increasingly better strategies for the humanitarian and civil-military components of nation/state-building in the future.

### Confronting the Insurgents

The strength of any insurgent movement is contingent on the extent to which it can depend on the population of a state under occupation to support its efforts. The level of such support, in turn, depends on the impact of the occupying force on the lives of the citizens of the state involved. The more expertise members of the occupying military forces have in interacting with individuals from a culture other than their own, the more likely it is that they will be able to develop the rapport with those individuals necessary to ensure that impact is more positive than negative. The lower that level of knowledge, by contrast, the less effective an occupying force is likely to be. If a significant number of servicemen and women, for example, lack the linguistic skills to communicate with the people in the state they are occupying, it will be difficult to create a positive impression therein.

In Iraq, U.S. military forces have faced challenges in dealing with multiple domestic- and foreign-supported insurgencies, and have had to do so with minimal previous training on the culture, language, and religion of the society of that state. The multipronged insurgency has at least four principal bases of support: foreign fighters associated with al Qaeda in Iraq, whose founder—the Jordanian Abu Musab al-Zarqawi—was killed by American forces in June 2006; loyalists to Saddam's regime; Sunnis discontent with the nation/state-building process generally and, in particular, their lack of power in the new Iraqi political system; and Shiite militants loyal to the cleric Muqtadah al-Sadr. Three years after the end of OIF, both coalition military forces and the Iraqi police and security forces continue to suffer significant casualties on a daily basis in the struggle with these various insurgent groups. In addition, the insurgency has contributed to the eruption of sectarian violence between Shiites, Sunnis, and Kurds across Iraq. Above all, such violence is demonstrative of the need for greater familiarity with the interethnic and intrareligious tensions of a state such as Iraq prior to engaging in nation/state-building efforts therein.

### Public Diplomacy at Home and Abroad

One of the most daunting challenges associated with nation/state-building generally, and civil-military operations specifically, is in promoting those concepts among an American public with a limited attention span for foreign and security affairs unless directly threatened at home.

The events of 9/11 led to a greater awareness of the international system broadly, and of failing and failed states in the Greater Middle East in particular. However, it is much more difficult to transform that interest into support for concepts such as nation/state-building and civil-military operations with which the public is not familiar and unwilling to advocate if it is perceived to entail a substantial financial cost to the government and thus the taxpayers. In short, unless there is a sense within the U.S. public that the threats posed by terrorists are as significant as was the case in the immediate aftermath of al Qaeda's attacks on 9/11, and also that creating an atmosphere conducive to economic growth and democratic reforms through nation/state-building in foreign lands will reduce those threats, apathy and disinterest (if not outright opposition) toward such concepts is likely to be the prevalent sentiment among Americans. Consequently, above all else, nation/state-building and civil-military operations must be linked to security in order to achieve even a measure of support within the U.S. population.

Nation/state-building operations must also be sold to the population of the state under reconstruction—in this case, Iraq. As discussed earlier in this section of the chapter, it is essential that Americans deployed to Iraq—members of the military and civilians alike—develop a greater capacity to communicate with the local citizens in their own languages, most notably Arabic and Kurdish. Communicating in one's native language is always helpful in communicating one's ideas more clearly to a target audience. In Iraq, the message to be communicated is that economic and political reform will prove beneficial to the population. However, the message alone is not enough. It must be supported by progress on the ground, most significantly as pertains to the level of security in Iraq everyday. Regrettably, progress in that context is not likely in the short term, which makes convincing Iraqis to continue to make sacrifices considerably more difficult. Perhaps the best way to do so is by maintaining the U.S. commitment and making comparable sacrifices.

**CONCLUSION**

Above all, the economic and political reconstruction of Iraq is absolutely indispensable to the broader transformation of the Islamic world. President Bush and his advisors have emphasized this repeatedly since the elimination of Saddam's regime in April 2003 and the commencement of reconstruction operations the ensuing month. In its NSS, for instance, the administration stresses that:

> [the] terrorists today see Iraq as the central front of their fight against the United States. They want to defeat America in Iraq and force us to abandon our allies before a stable democratic government has been established that

can provide for its own security. The terrorists believe they would then have proven that the United States is a waning power and an unreliable friend. In the chaos of a broken Iraq the terrorists believe they would be able to establish a safe haven like they had in Afghanistan, only this time in the heart of a geopolitically vital region. Surrendering to the terrorists would likewise hand them a powerful recruiting tool: the perception that they are the vanguard of history.[21]

This statement is demonstrative of two underlying points. First, the transformation of Iraq continues to present economic, military, and political roadblocks that will take years, if not decades, to overcome. Second, it is essential to see the Iraqi nation/state-building project through to completion. In short, subsequent administrations, whether Republican or Democratic, must maintain America's commitment to economic and political reform across the Greater Middle East over the long term. Failing to do so will only further embolden Islamic extremist groups, including (but by no means limited to) al Qaeda.

At the core of insurgent efforts to undermine nation/state-building operations in Iraq is the fear that the United States will establish an enduring free market economy and representative government there. That outcome could eventually lead to two developments that dictatorial regimes and terrorist groups alike would abhor: an improved standard of living for members of the lower classes of society; and the creation of a political atmosphere in which individuals are free to elect and, if they choose, criticize those in power. With Iraq as a model, other countries possessing comparably autocratic characteristics to those of Saddam's former regime could be the next candidates for economic and political transformation.

Such autocratic states include Iran, which has the potential to pose significant threats to U.S. interests in the Persian Gulf in the future. There were, for example, a variety of factors behind Bush's characterization of Iran as a member of the "axis of evil" in his 2002 State of the Union address.[22] First, Tehran is in the process of acquiring and refining weapons of mass destruction (WMD) generally, and nuclear weapons in particular, along with the means to deliver them to targets throughout the Greater Middle East. Notwithstanding its status as a signatory to the Non-Proliferation Treaty, Iran is developing a series of nominal civilian reactors that could provide the fissile materials necessary to construct atomic weaponry. In addition, Washington suspects that Iran has broken its obligations under the provisions of the Chemical Weapons Convention and Biological Weapons Convention.[23] Second, while Iran has not been linked directly to the events of 9/11, it remains on the DOS's list of state sponsors of terrorism and is suspected of complicity in the June 1996 bombing of the Khobar Towers.[24] Third, Tehran continues to undermine the fleeting Israeli-Palestinian peace process by providing economic, military,

and political support to terrorist organizations such as Hamas, Hizbollah, and Islamic Jihad.[25] As Secretary of State Condoleezza Rice has asserted, "Iranian behavior puts it squarely in the 'axis of evil'—whether it is weapons of mass destruction or terrorism or any of those things. It's a complicated situation, but I think the behavior speaks for itself."[26]

American efforts to promote democratic change in Iraq scare not only the Iranians, but also the leaders of terrorist organizations. There are two reasons why. First, those groups thrive on discontent, if not outright desperation, to recruit members willing to sacrifice their lives to battle the adversaries they blame for the dearth of economic growth and political freedom prevalent across much of the Arab world. One such adversary (the United States) is perceived by many Muslims to be responsible for the majority of these shortcomings. Should Bush—or, for that matter, any other American president—manage to use a successful transformation of Iraq to start the engine of reform at the broader regional level, the pool of terrorist recruits would decrease substantially. Second, while Osama bin Laden and his ilk also seek the elimination of the present governments in control of states throughout the Middle East, they would prefer that those changes come under their auspices. That would, of course, allow them to take control and install equally repressive regimes, which they could then administer in a style similar to that of the Taliban in Afghanistan. The establishment of representative democracies, by contrast, would encourage the free expression of dissent to prevent the development of any type of autocracy, whether Islamic or secular in character.

Assuming that the democratization of the Greater Middle East is a realistic long-term objective, the Bush administration deserves credit for taking the initial step toward its achievement. However, it is also essential to recognize that the pursuit of such a revolutionary transformation will entail substantial costs and require a commitment that lasts for decades rather than years. Most significantly, those costs will grow out of the myriad challenges associated with the transformation Bush has suggested the United States should pursue.

Broadly articulated ethnic differences between groups tend to complicate reconstruction efforts at the national level, most notably as pertains to the creation and subsequent administration of economic and financial institutions in a given domestic environment. When individuals of one ethnic persuasion are appointed to leadership positions in such institutions, their counterparts from other groups understandably demand equitable treatment that, while morally just in theory, may slow the recovery process in practice. The reluctance of members of a particular ethnic group to accept advice from—and by extension, place their trust in—foreigners is equally problematic. When those foreigners represent institutions perceived to be in business simply to do the bidding to the United States, earning that trust can be exceedingly difficult within the developing world, generally, and the Greater Middle East specifically.

Challenges related to linguistic differences and intraethnic familial and tribal rivalries typically prove especially daunting at the local level. Even if, for instance, one ethnic group is represented on a transitional economic or political body at the national level, it is by no means certain that decisions taken by that entity will be accepted by the leaders of tribes or villages thousands of miles from the capital. And, in those cases where local leaders agree to help administer humanitarian aid in an area under their control, communications are not always smooth between starving civilians and the foreign soldiers or NGO workers distributing foodstuffs.

Similarly, religious impediments to the economic and financial aspects of nation/state-building manifest themselves in interactions among individuals, states, and institutions at several different levels. Inter- and intradenominational differences, for instance, are often evident locally and nationally, as well as regionally and globally. Domestically, inter- and intradenominational religious disputes have the potential to undermine both the political and economic aspects of reconstruction projects. Some international religious impediments to nation/state-building grow out of global issues (support from a small but violent minority of Muslims for transnational terrorist organizations, as evidenced by efforts to sabotage reconstruction efforts in Afghanistan and Iraq, is one such example). Others are the result of the use of NGOs to spread one faith (most often Christianity or Islam) in a state or region where the vast majority of the inhabitants already adhere to another.

Putting forward the effort to overcome these hurdles—and accepting the requisite economic, military, and political costs that accumulate along the way—will provide an opportunity to alter the broader relationship between Islam and the West in an equally favorable manner. The United States has embraced comparably daunting challenges in the past, most notably its commitment in the aftermath of World War II, to the idea of a Europe whole and free. That project is now nearly 60 years old and gradually nearing completion, with the EU and NATO both moving forward with their most recent enlargement processes in 2004. Lacking the economic, military, and political sacrifices the Americans and Western Europeans made during the cold war, the European continent, too, might still lack the freedoms the Bush administration now hopes to spread to the Greater Middle East.

# CHAPTER 27

## THE TRANS-SAHARA COUNTERTERRORISM PARTNERSHIP: AMERICA'S NEW COMMITMENT TO AFRICA

Lianne Kennedy Boudali

"Torn apart by war, disease, and poverty, and marked by vast ungoverned spaces, Africa is an emerging haven for our enemies in the Global War on Terrorism. The Trans-Sahara region . . . is becoming increasingly important as terrorists now seek out these routes for logistical support, recruiting grounds, and safe haven."

—Rear Admiral Hamlin B. Tallent, 2005[1]

"In the absence of Congressional willingness to fund a serious engagement by other parts of the government, the Pentagon has become a major player by emphasizing the prospect of terrorism, though military planners themselves recognize the inherent dangers in a purely military counter-terrorism program."

—International Crisis Group, 2005[2]

Since the terrorist attacks of September 11, 2001, the United States government has significantly enhanced its level of engagement with African governments in response to the increasingly global nature of terrorism. The Department of Defense has been in the forefront of recent efforts to raise Africa's profile in Washington, joining forces with the Department of State on a series of innovative interagency initiatives. This collaboration might come as a surprise to many Americans, who tend to view Africa as a distant continent afflicted with humanitarian disasters: tragic, surely, but not a threat to national security. In fact, there is a growing recognition in

Washington policy circles that the social and economic instability plaguing much of Africa is a strategic concern for the United States. The Department of Defense has collaborated with the Department of State to develop the Trans-Sahara Counterterrorism Partnership (TSCTP), which supports African states' efforts to improve border security and enact counterterrorism measures while also facilitating regional cooperation, promoting democratic governance, and improving relations with the United States.[3] This chapter examines the connection between security and development in Africa, describes the TSCTP program, and then ends with a discussion of the potential benefits and risks of the initiative.

## AMERICAN INTERESTS IN AFRICA

### The Link between Development and Security

Relative levels of modernization and development vary enormously among the countries of North Africa and the Sahel.[4] All the states in this region have been affected by colonization or the interference of colonial powers, and all of them have multiple ethnic groups within their territories. A few of these states are fledgling democracies, and many have stable though undemocratic governments while others have been plagued by ongoing violence and instability. The region's economies are fragile: most include a mix of state-owned industry and subsistence agriculture, underpinned with a significant amount of black market activity. Traditional trading economies that once moved gold, salt, marble, and slaves across the desert now supply illegal immigrants, arms, drugs, and cigarettes in addition to gold and precious stones. Large regions of the desert have never been under the control of a colonial power or a central government, and in some areas tribal authority still trumps state authority. This region is an excellent example of what the Pentagon has called "ungoverned space."

Illegal activities generate much more income than traditional occupations such as agriculture, and almost anything can be moved across the poorly watched borders with a four-wheel drive vehicle and a few bribes. For some individuals, criminal activity—particularly smuggling—has been a gateway to direct participation in terrorist actions. Smugglers' transportation skills, criminal network associations, and knowledge of the desert make them desirable recruits for terrorist groups. North African terrorist groups often rely on criminal associates in Europe to provide logistical support, and European-based terrorist cells may generate revenue for North African groups through credit card fraud and other kinds of petty crime.

Violent extremist groups target unemployed and underemployed young men in North and West Africa for recruitment into terrorist organizations. These extremist groups attract individuals who are angry or

frustrated with their own government for failing to provide economic opportunities. Disenfranchised youth, many of whom lack a good education or competitive job skills, are vulnerable to an ideology that offers simple solutions and promises great rewards. If the economic situation in Africa continues to stagnate, association with extremist groups will become more appealing for both financial and ideological reasons.

## INTERNATIONAL TERRORISM IN AFRICA

The level of terrorist activity in Africa is rising, and local authorities have had little success intercepting groups scattered throughout vast areas of desert terrain that is extremely difficult to monitor. North African terrorist groups have entrenched networks in Europe, and the different groups appear to cooperate quite well with each other. The growing involvement of North Africans in international terrorism has led to a recent focus on North Africa and the Sahel as a potential "safe haven" for terrorists.

In 2003, for example, 32 European tourists were taken hostage and held for several months by the *Groupe Salafist pour la Prédication et le Combat* (GSPC[5]), an Algerian Islamic militant group. They were released after the German government reportedly paid a ransom of €5 million to the terrorists. After releasing the hostages, the leader of the GSPC cell, a former Algerian paratrooper named Amari Saifi (whose *nom de guerre* is "El Para") led his band of fighters on a running gun battle that began in Mali, transited Niger, and ended in Chad.[6] Although the GSPC is nominally an Algerian nationalist organization, El Para's band of jihadists included fighters from other North African and Sahelian countries. The group had roamed through the Sahel for years before the kidnapping incident drew the attention of Western security services and provoked a strong reaction from regional militaries. The United States European Combatant Command (EUCOM), which happened to be in the midst of a series of military trainings for local armies, was able to provide logistical support to regional armies as they pursued El Para across the desert. Soldiers from Mali, Algeria, Niger, and Chad participated in the manhunt, which traversed three international borders. El Para was eventually captured by a Chadian rebel group called the Movement for Democracy and Justice in Chad,[7] which repatriated El Para to Algeria, where he remains in custody today.

Other GSPC cells have trained *mujahideen* to fight in Iraq with Abu-Musab al-Zarqawi's organization, and they have escorted al Qaeda emissaries into North Africa with the intention of unifying the various local terrorist groups under the umbrella of al Qaeda.[8] In 2004, the Moroccan security services disrupted an al Qaeda-supported plot to attack American and European ships passing through the Strait of Gibraltar. North African

terrorists have been responsible for attacks in Madrid, Casablanca, and Algiers, and they have laid the groundwork for attacks in Italy, France, and the United Kingdom.[9] The GSPC openly declared its allegiance to Al Qaeda in 2004,[10] and its cells have been discovered in Italy, France, Spain, the United Kingdom, the Netherlands, Germany, and Canada. GSPC cells in Europe are involved in fund-raising and logistics support for al Qaeda cells, including the al Qaeda in Iraq group that was headed by Abu Musab al-Zarqawi.[11] Other North African groups such as the Libyan Islamic Fighting Group and the Moroccan Islamic Combat Group also have connections to the global jihad. These groups' memberships are not limited by national origin, and the GSPC in particular is increasingly filling its ranks with non-Algerian recruits.[12]

The countries of North Africa and the Sahel have responded aggressively to the terrorist groups' activities, but the physical territory in question is so vast (and the underlying socioeconomic conditions so dire) that external assistance and coordination is necessary.

### Strategic Energy Interests

The growing amount of West African oil reaching U.S. markets has complicated the debate over how to define U.S. interests in Africa. Currently, the United States imports 18 percent of its oil from West Africa, with Nigeria and Angola being the largest exporters. By 2015 that percentage is expected to grow to 25 percent of U.S. imports.[13] In 2002, Walter Kansteiner, Assistant Secretary of State for African Affairs, said that African oil has "become a strategic interest for us."[14] European companies currently dominate the West African oil markets, but ExxonMobil and ChevronTexaco both have interests in Nigeria, Chad, and Equatorial Guinea.[15] When U.S. sanctions against Libya are lifted, American oil companies will certainly look for opportunities to partner with Ghaddafi's regime.[16]

Revenues from oil exports present both an opportunity and a challenge for African governments, as they must balance competing demands for the increased revenue. Local populations will expect to see some material benefit from record-high oil prices. For several years, Nigeria has suffered from civil violence resulting from local communities' demands for a higher share of the profits that are flowing to the central government. Corruption and cronyism have been constant barriers to effective governance throughout Africa, and profits from oil exports will likely exacerbate these problems—particularly in places like Chad, Mauritania, and Equatorial Guinea—if heads of state are unable to resist pressure from elites who expect to benefit from the oil revenue. There will also be a strong temptation on the part of many regimes to bulk up military and security services as a hedge against internal instability. Such spending may in turn alienate both local populations and members of the international donor community. In

short, Africa is facing a confluence of social, economic, and security issues that can no longer be ignored by the United States.

## THE TRANS-SAHARA COUNTERTERRORISM PARTNERSHIP (TSCTP)

The primary objectives of the *National Strategy for Combating Terror* are to preserve and promote free and open societies, defeat terrorist extremism, and create a global environment that is inhospitable to terrorists.[17] Two cornerstones of this strategy are expanding the capacity of foreign partners to combat terrorism and reducing ideological support for terrorism. For the strategy to succeed in Africa, the United States will need to help African governments provide viable social and economic opportunities to their people, thereby "disaggregating" the local conditions that lead to social unrest from the extremist ideology that facilitates terrorist activity.

The TSCTP addresses this challenge through a combination of military-to-military security assistance and development programs that aim to reduce support for violent extremism. At its most basic level, the TSCTP seeks to reduce the impact of terrorism in North Africa and the Sahel, and thereby reduce the terrorist threat to the United States. The TSCTP's military elements will increase the capacity of participating countries to identify and respond to internal security threats. Development assistance will address the social and economic issues that facilitate the spread of extremist and violent organizations and ideologies. Finally, public outreach campaigns will promote democratic institutions and values while building positive impressions of the United States. This is an ambitious program with enormous potential, but it has a great number of moving parts and a complicated budget structure. It is also a work in progress, whose success or failure rests on the ability of individuals to overcome the inherent bureaucratic hurdles described below.

The TSCTP is an extension of the earlier Pan Sahel Initiative (PSI), which began in 2003 with a 2-year budget of $7.75 million provided by the State Department.[18] The PSI allocated $6.25 million during its first year to conduct training and capacity building in Niger, Mali, Chad, and Mauritania.[19] Local military companies of approximately 100 men each were trained by U.S. Marines and Army Special Forces in basic marksmanship, planning, communications, land navigation, and patrolling.[20] Participating countries also received equipment such as night vision goggles and specially equipped sports utility vehicles. The PSI was judged to be a success by both U.S. officials and local participants, and EUCOM led the way in pushing for an expansion of the program.[21] The next iteration, the TSCTP, added Algeria, Nigeria, Morocco, Tunisia, and Senegal to the original four PSI countries, with officials leaving open the possibility that Libya could be included at a later date.

Previous training programs sponsored by the United States included the Africa Response Force, the African Crisis Initiative, Operation Focus Relief, the African Contingency Operations Training Assistance, the Coastal Security Program, and the Global Peace Operations Initiative.[22] Most of these emphasized peacekeeping operations rather than offensive capabilities. Of these, the Coastal Security Program, the African Contingency Operations Training and Assistance, and the Global Peace Operations Initiative are still in place. The TSCTP does not indicate a policy shift away from peacekeeping operations, but rather, seeks to provide a supplementary set of skills to countries with certain kinds of internal security concerns and with populations considered "at-risk" for their potential to support terrorism.

The budget for TSCTP is roughly $100 million per year, beginning in 2007 and continuing through 2013. The program budget is in fact a combination of funds requested by the Department of State, USAID, and the Department of Defense. The TSCTP is supplemented by "Section 1206," which provides the Secretaries of State and Defense with spending authority to jointly implement programs to build capacity in partner nations by providing training and equipment to foreign military forces.[23] The majority of the TSCTP budget will be spent on development initiatives such as improving health and education, building community centers, providing vocational training, supporting girls' scholarship funds, promoting transparency in governance, and providing support and training for community radio stations.[24] Embassy teams are working with EUCOM and USAID personnel to determine the package of development programs that will match the goals of the TSCTP to the needs of the host country. In many cases, USAID will have the responsibility for managing the programs in the field, which may build on existing USAID programs or adapt programs that have been successful in other countries.

Public diplomacy and public affairs messages are critical in ensuring that local populations recognize that the TSCTP programs are sponsored by the United States. To this end, the TSCTP will continue to field Military Information Support Teams (MIST) and Civil Military Support Elements (CMSE), two program elements that were created during the PSI. These teams' mission is to generate support for the United States and for moderate Islamic viewpoints while reducing sympathy and support for terrorism, boosting the regional Embassies' efforts in this area by providing additional human and financial resources.[25]

Each MIST has anywhere from two to six people, supplied by EUCOM, who work with U.S. Embassies to augment existing public diplomacy programs that articulate U.S. policy positions. MIST deployments begin with a survey to develop a theme, such as promoting democracy and tolerance or providing conflict management skills. Examples of products include billboards, T-shirts, backpacks, and basketballs printed with slogans such

as "One Family, One Nation" or "Unity and Strength." A program in Nigeria teaches nonviolent conflict resolution and provides social engagement for at-risk youth through basketball leagues.

The CMSE teams work with local governments to develop humanitarian assistance plans, and they also provide facilitation and training to foster effective civil-military coordination. Specific programs range from capacity-building seminars for local militaries to the promotion of moderate authors and textbooks for local schools. These relatively low-cost initiatives are a deliberate means of showcasing American engagement in the region, and it is hoped that such programs will build lasting goodwill toward the United States.

From EUCOM's perspective, the TSCTP overlaps neatly with its own Operation Enduring Freedom-Trans Sahara (OEF-TS), the goal of which is to enable partner nations to effectively control terrorism within their borders. Under the TSCTP umbrella, EUCOM works with the local Embassies to advise and train local military units and improve intelligence and communications capacities. EUCOM will continue to coordinate with the Embassies to organize regional military exercises, and to coordinate Foreign Military Sales, Foreign Military Finance, and International Military Education and Training initiatives. The Ambassador and his/her team works with EUCOM to adjust these programs as needed to meet the specific goals of the TSCTP, facilitating communications with the host government.

The military aspects of the TSCTP/OEF-TS include the basic infantry training described earlier, but also include more advanced counterterrorism capabilities such as improving communication systems and developing mechanisms for regional intelligence sharing. EUCOM is sponsoring regional conferences of defense ministers and military intelligence chiefs in order to build trust among them and demonstrate the advantages of cooperation. Joint military exercises are planned for most countries, and some of the units in the Sahel countries will receive equipment as part of training at the company level. EUCOM will also work to develop more effective command and control mechanisms by enhancing tactical communications capability. A key element of the military to military engagement will be promoting professionalism and deference to civilian authority while also creating positive impressions of American military personnel.

**AFRICAN STATES' RESPONSE TO THE TSCTP**

Regional governments have their own motives for participating in U.S. policy initiatives, of course, and some critics of the TSCTP have suggested that the increased amount of dollars flowing to the region have encouraged African governments to report terrorist problems where there are

none. For some countries, the TSCTP offers a means of creating a closer bi-lateral relationship with the United States, and regional militaries are keen to earn the prestige associated with joint military exercises with American troops. Underlying these complex motivations is an essential difference of opinion between the United States and the African governments over the nature of the terrorist threat in Africa. The United States is most concerned about the phenomenon of *international* terrorism, whereas most African officials are preoccupied with terrorism that poses a threat to *domestic* security.

These perspectives are not incompatible, but the differences must be taken into account if U.S. policies in the region are to be successful. Each state's needs vary enormously, and the Department of State, Department of Defense, and USAID are working closely with the host countries to de-termine the appropriate individualized package of training and capacity-building for each state. This process will be critical to the success of the TSCTP, and the final outcomes of the program will then depend on the ability of each country team to coordinate its execution with EUCOM and the host country counterparts.

Initial local response to the PSI program in Mali, Chad, and Niger was positive, and these countries' experience no doubt helped lay the ground-work for the expansion of the program. Regional governments will ob-viously be more interested in participating in a program that meets their needs—one with an appropriate balance of military operations and de-velopment initiatives. For example, there is a significant difference in the current internal security capacity of the North African states as compared to the Sahelian states. The state institutions of the Maghreb countries—including judicial, police, and military capabilities—are much more devel-oped and professionalized than those of the Sahelian states. North African and Sahelian states have therefore responded differently to United States and European policy initiatives.

For instance, Morocco's response to the TSCTP/OEF-TS has been com-plicated by the inclusion of its historical rival Algeria. Morocco has tra-ditionally been the United States' closest ally in North Africa, and some in Morocco feel that the special relationship between the two countries is threatened by the United States' recent interest in improving ties with Algeria. Additionally, the Moroccan Royal Armed Forces already possess the basic infantry skills that are the core of the OEF-TS training (more-over, some observers believe that the Moroccan military poses a greater potential threat to the survival of the current regime than do the Islamists). The Moroccan government might find greater utility in programs that would develop law enforcement capacity or support in revising the crim-inal code in such a way as to facilitate criminal prosecution of terrorist-related activity.[26]

## BUREAUCRATIC PITFALLS AND ALTERNATE APPROACHES

Within the U.S. government, there is disagreement over both the sources of the instability that decreases security and the sort of policy solutions that are most suitable to address them. Some American officials and others who have been involved in the region for some time are concerned that the TSCTP's emphasis on terrorist threats will not address the chronic problems of underdevelopment, and may in fact exacerbate anti-American sentiment by strengthening the capabilities of security services, which could then be used to quell domestic opposition to the regime in power. These critics have argued that the United States' association with these regimes will create resentment among civilian populations while doing nothing to improve the social conditions that facilitate terrorism.

Particular aspects of the TSCTP may be politically sensitive, and it will be important that the Embassies be the primary communication channel with the host country and the local media. For example, Chadian President Idriss Deby is quite unpopular at home, and the United States risks guilt by association if the TSCTP comes to be seen as a mechanism to prop up an unwanted regime (France's unwavering support for Deby has already damaged its popularity among Chadians). It would be easy for anti-American elements to leverage local media to accuse the United States of training up a personal militia that will be used to keep Deby in power, and therefore it will be important for the Embassy in N'djamena to send regular, clearly articulated media messages that explain the goals and the scope of the TSCTP. This will require coordination between EUCOM personnel and Embassy personnel to ensure that individuals do not give public statements that contradict or undermine the stated program goals.

In the end, the effectiveness of the TSCTP will depend on the ability of the Departments of State and Defense to cooperate both in Washington and on the ground in the TSCTP countries. The phrase "interagency cooperation" has often been considered an oxymoron, yet the success of the TSCTP depends on the presence of effective, truly collaborative working relationships among the participating agencies. Coordination on the ground between the various parts of the country teams and EUCOM personnel are currently often a matter of ad hoc coordination based on personal relationships. If the country teams believe that the TSCTP is a worthy initiative, they will leverage their local contacts to facilitate coordination with the host country. Conversely, if the Ambassador or other key players in the local embassy do not support the TSCTP, reluctant support (or outright opposition) would prevent its execution.

The United States' response to the growing concern over security in Africa is further complicated by the profusion of agencies within the U.S. government that have some responsibility for Africa, and the lack of standard geographic delineation of areas of operation. Until recently,

the Pentagon divided responsibility for Africa among three different regional commands—European Command, Central Command, and Pacific Command—whose geographic divisions do not match the organization of the regional desks of the Department of State. Every bureaucracy has its own culture, and it should not be surprising if "cultural differences" between the Departments of State and Defense have caused friction during the PSI and the early phases of the TSCTP. The two organizations have different processes of communication and decision making, and different definitions of success. Complicating this interagency friction is the fact that military personnel are currently staffing a number of embassy positions because the Department of State has experienced difficulty in staffing such positions.

There is reason to hope that the interagency relationships may improve in the years to come. The Department of State has developed a Regional Security Initiative (RSI), which is meant to help Embassies identify and address key counterterrorism concerns on a regional basis. The RSI should facilitate cooperation between regional partner nations and foster greater local collaboration with European and NATO allies. Additionally, on February 6th of 2007, Secretary of Defense Robert Gates announced the creation of a new geographic command for Africa that will consolidate responsibility for Africa into one organization. The idea of establishing a Combatant Command for Africa had been circulating for some time, but details about the Command's location and staffing are not yet public, and there is a risk that the TSCTP might lose momentum during transfer of command from EUCOM to the new entity.

It is far too early to judge the success of the TSCTP, but the Combined Joint Task Force Horn of Africa (CJTF-HOA) provides an interesting example of a multilateral initiative that has successfully integrated security and humanitarian goals into a single mission. The CJTF-HOA was originally conceived as a U.S. Marine Corps mission to disrupt terrorism in the Horn of Africa, defined by U.S. Central Command as Somalia, Yemen, Kenya, Sudan, Ethiopia, Eritrea, and Djibouti. CJTF-HOA began in 2002, using the USS *Mount Whitney*, anchored near Djibouti, as a base of operations.[27] In 2005, the Navy assumed operational command of the mission, and the command center was moved to permanent headquarters at Camp Lemonier in Djibouti. Camp Lemonier hosts hundreds of special operations forces and CIA personnel who conduct a range of antiterrorist activities such as the Predator strike against an al Qaeda target in Yemen in 2002.[28] However, the bulk of the American personnel stationed at Lemonier—currently numbering around 1,500—work with French, British, Dutch, Romanian, and Korean partners on humanitarian missions such as digging wells, repairing schools, clinics, and hospitals, and conducting medical and veterinary clinics.[29] CJTF-HOA has worked with USAID to coordinate both agencies' efforts with local NGOs, which

are slowly overcoming their initial mistrust of the military's intentions in the region.[30] CJTF-HOA's strong record with multilateral interdisciplinary projects is a good indicator for TSCTP's prospects for success.

The United States has not been alone in its concern for terrorism in Africa, as European nations have also been providing counterterrorism training and assistance to African countries. European countries have traditionally had close relationships with their former colonies, providing the bulk of foreign training and arms. For example, France sponsors RECAMP—Reinforcement of African Peacekeeping Capacities—a 2-year cycle of training and exercises that focuses on peacekeeping operations. RECAMP participation is rotational, and each iteration of the program focuses on a different geographic region of Africa (such as the ECOWAS countries or the SADC countries). RECAMP is similar to TSCTP in that it focuses on regional interoperability and supplies some materiel to participating countries; however, the skill sets for peacekeeping and counterterrorism operations are fundamentally different.

The United States generally participates in programs (such as RECAMP) that are sponsored by other nations or international organizations. For example, in advance of RECAMP V, the United States is funding the construction of several wells in the region. To date, none of these competing initiatives have caused conflict among the NATO members. At the same time, there could be greater effort to improve coordination of these activities to maximize their impact and reduce inefficiencies. Although European countries may be reluctant to acknowledge the growing U.S. role in Africa, it would be more efficient and effective for the NATO allies to coordinate joint security training initiatives rather than to simply participate in each other's programs. European countries (especially those with colonial-era ties) may have a closer understanding of the subtleties of the local political and cultural contexts, and in many cases, European officials have longstanding personal relationships with senior government and security personnel in North Africa and the Sahel. Everyone—including the African partner states—stands to gain from greater coordination among interested parties.

## CONCLUSION

The terrorist and criminal networks in Africa share a set of capabilities including money laundering, fund-raising, petty crime, forging documents, drug smuggling, arms trafficking, and human trafficking. Throughout the continent, a network of terrorist groups has acquired a wealth of operational knowledge and tactical experience acquired through combat in Afghanistan, Chechnya, and Iraq. This knowledge base is expanding as a new generation of *jihadi* combat veterans return to their home countries after participating in the *jihad* in Iraq and Afghanistan.

Reducing the current level of terrorist activity is in part a function of destroying existing terrorist networks and preventing their regeneration. Individual terrorists must be killed or captured, and their support networks of logisticians and financiers must be arrested and removed from society.

However, the threat of terrorism cannot be eliminated strictly through military actions and law enforcement. Each of the countries in North Africa and the Sahel suffer to varying degrees from a similar set of problems: poverty, illiteracy, unemployment, poor governance, official corruption, and urbanization. The Sahelian countries also face problems of chronic malnutrition and disease, which affect everything from agricultural production to child mortality. A lasting reduction in terrorist violence requires changes in the current social and economic environment in Africa. Without effective governance, without legitimate regimes that operate with the consent of the people, and without opportunities for education and employment, the region will continue to slide toward instability. So long as the population believes that participation in terrorist activity is either spiritually or economically beneficial, terrorist networks will continue to regenerate despite the antiterrorist efforts of local governments. Terrorist activity will be unappealing only when the cost of participation outweighs the benefits, and this requires that regional governments provide social and economic opportunities for their people.

A true measure of success for the TSCTP and future programs will be whether or not regional cooperation outlasts the program itself. Should the TSCTP be successful in improving local capacity to respond to internal *and* external threats, and should increased regional interaction be sustained once the U.S. advisors have returned home, then the program will have demonstrated the value of a coordinated regional approach to security and provided a model for future security policy for the United States, its allies, and partners.

# CHAPTER 28

# VALUES, EMOTIONS, AND THE GLOBAL WAR ON TERROR

John B. Alexander

In the Global War on Terror (GWOT), uncompromising and iron-fisted proclamations abound. In announcing the initiation of this campaign, President George W. Bush informed the world that "either you are for us or you are with the terrorists."[1] Other U.S. military and government leaders have made equally provocative statements that infer no quarter will be afforded to terrorists or those who might harbor them.

The reality of GWOT is much more complex than this invidious duality, and it is fraught with paradoxes. Precipitated by emotional issues juxtaposed with competing and incompatible values, the execution of counter-terrorism programs become severely hampered by obvious contradictions. Further, these efforts are exacerbated by strenuous efforts by senior leaders to remain politically correct.

Four theoretical approaches are most prevalent in the literature on countering terrorism. These are:

– enhance security (keep us safe);
– eliminate the terrorists (remove the cancer);
– attack the support infrastructure (cut their funding); and
– alter the conditions that breed discontent and terrorists (drain the swamp).

Each of the means to redress terrorism has advantages and significant disadvantages. Concurrently, each method engenders conflicting values within our own established way of life. Foremost in the minds of the public is ensuring personal security. Failing that, we react violently to any recent terrorist's attack, with great emphasis on the physical elimination

or apprehension of the perpetrators. If substantial loss of life or injury occurs, the public more or less demands decisive responses, if not outright retribution. The details and execution of counterterror operations thus become quite complex. When, where, how, and by whom these operations are conducted raise many ethical and legal questions. Additionally, tactical decisions often have strategic consequences, and may be at odds with our long-term national interests. Some geopolitical theoreticians call for the elimination of root causes of instability—namely, the inequitable distribution of wealth. However noble such humanitarian concepts may sound, our reality is bounded by finite resources. Thus, a well thought out, comprehensive, and unemotional plan is required.

## KEEP US SAFE

When physically threatened, our first response is to erect barriers to keep those who would do us harm away. These security barriers may be physical, procedural, legal, operational, and very importantly, psychological. Many of these barriers offer little real protection, but they have a calming effect on the public and foster a sense of normalcy during difficult circumstances. Unfortunately, logic and common sense are among the first casualties during barrier erection. This can be readily observed by the pseudo-random searches at every airport security station in America.

### Security versus Civil Liberties

The American system of jurisprudence is characterized as blind, meaning only influenced by the facts of specific cases. It is specifically designed to minimize emotion and address only issues of law. However, GWOT has severely tested that assumption and will continue to do so. In the wake of the attacks of September 11, 2001 (9/11), laws were quickly enacted that provided comprehensive authority to the Executive Branch in fighting terrorists. The USA PATRIOT Act, enacted in October 2001, called for:

– enhanced surveillance procedures;
– countering money laundering;
– border protection (with expressed concern about illegal immigration);
– removal of "obstacles to investigation of terrorism," through such actions as:
  ○ use of DNA databases
  ○ access to educational records
  ○ offering rewards;
– strengthened criminal laws against terrorism; and
– improved U.S. intelligence capabilities.[2]

A few civil libertarians voiced concerns about excessive intrusion into the privacy of U.S. citizens. However, even the name of this legislation—the USA PATRIOT Act—was intentionally intimidating. In that period of national fervor, it inferred that voting against the bill would be unpatriotic. Members of both houses of Congress passed the bill by a wide majority, the Senate having only one nay vote.[3] In fact, the emotion-laden vote was consistent with the will of the vast majority of the American people at that time, many of whom were still psychologically distraught over the attacks in New York and Washington.

Over time, the PATRIOT Act—as well as the follow-on legislation enacted in March 2006—caused many to question whether or not too much freedom has been sacrificed in the name of security. Some writers suggested that with the Act, Congress might have assisted the terrorists in accomplishing a major goal: that of disrupting our society. The intrinsic balance between civil rights, as guaranteed in the Constitution, and physical security has given rise to many critical analyses, even in military journals.[4]

As a highly evolved society, the United States has served as a beacon for emerging countries around the world. Throughout most of over two centuries of history, the evolution of our democratic principles has taken place in relative security. Oceans provided comfortable barriers that ensured our national survival was rarely in jeopardy. Under those circumstances, we placed a high priority on advancing individual rights. However, the events of 9/11 changed our perception of security.

To better understand the psychological impact of those events, it is useful to look at a model called the *hierarchy of needs*. In the 1940s and 1950s, noted psychologist Abraham Maslow created a model to describe the relativity of different needs for individuals. He suggested that the ability of an individual to evolve psychologically and function in society was based on the premise that the lower-level needs had to be fulfilled before advancing to more complex modes of behavior. Maslow's five ascending levels were physiological needs, safety, belongingness and love, esteem, and finally self-actualization. As an example of the relative hierarchy, humans who are struggling daily for basic physiological needs such as food and shelter are rarely engaged in deep contemplative dialogues about the meaning of existence. Only after lower-level needs have been met can one advance to more complex thoughts and deeds.

Prior to 9/11, few people in the United States were deeply concerned about the provision of basic physiological needs such as air, food, water, or shelter. Similarly, our collective needs for protection, security, law and order, and stability were generally met. As individuals, and as a society, people concentrated their psychological endeavors on personal relations, work groups, achievement, status, and responsibility. These efforts extended from local and national organizations to our international

relationships. This advancement in the democratic process was possible because physiological and safety needs were perceived as adequately provided.[5]

The terrorist attacks in the United States changed all that. Maslow predicted that when individuals were suddenly deprived of lower-level needs, they would immediately regress and employ behaviors designed to provide those requirements. Examples include how quickly rioting has emerged following large natural disasters. One only need look to the experiences following major hurricanes such as Hugo, Andrew, or most recently, Katrina. When the availability of food, water, or personal security was threatened, well-established law and order quickly dissipated, and near-chaotic conditions reigned.

This sudden shift in perception creates a paradox of values. Our legal and intellectual strictures are designed to function at the higher social levels, ones that were accommodated in the pre-9/11 world. However, 9/11 reintroduced emotions that were precipitated by lower-level functioning—namely, a demand for increased security. Collectively, American values in the post-9/11 world place the need for perceived personal security well above providing for individual freedoms such as a right to privacy. As a result, it is now commonplace to witness searches of personal property, greatly enhanced surveillance in public areas, and even interception of various modes of communication. The full magnitude of this paradox becomes apparent when examining the multitude of legal cases filed on behalf of people who believe their individual rights have been violated for security purposes.

The real issue is competing values based on a temporal scale that mediates the state of emotional arousal. The more recent the terrorist attack, the more the public demands security. The more distant the attack, either spatially or temporally, the more likely citizens are to favor individual freedoms.

## REMOVE THE CANCER

### The Kill/Capture Paradox

A cornerstone of counterterrorist operations has been the kill/capture policy designed to either physically eliminate the terrorists or confine them so that they are no longer a threat. The simplicity and logic of such a policy belies the conundrums it creates.

Shortly after 9/11, President Bush announced that he had a "most wanted" list. In subsequent meetings he indicated that many of the people on that list had been killed and a few were in custody. In the tenor of the times, with the value of safety foremost in the minds of Americans, termination of terrorists was not only acceptable, but also laudable. There

was no questioning of the construction of the list. There was little public concern about where or how the executions had been carried out. If terrorists died, the feeling went, Americans would be safer.

Details surrounding the killing of isolated terrorists were seen as inconsequential. More problematic, however, was when specifically identified terrorists were located in close proximity to other people. The response in such situations was mixed, and points to the inherent problems associated with this issue. In some cases, aircraft were authorized to strike the location. Even with precision-guided munitions, collateral casualties could be anticipated. In other cases, targeteers were denied authority to fire for fear of killing innocent civilians. It appears that authority to fire is more likely to be authorized if the primary target is located in a geographically remote area, and those in close proximity are believed to be supportive of the terrorist's efforts. The January 16, 2006 air strike in Damadola, Pakistan, is such an example. Intelligence indicated that al-Zawahri, the al Qaeda number two leader, would be attending dinner in the village. Only four miles from the Afghanistan border, the area is considered a rebel stronghold. In the attack, at least 17 people were killed, but al-Zawahri was not among them.[6]

Similarly, the killing of Qaed Salim Sinan al-Harethi in Yemen by a Hellfire missile launched from an armed Predator controlled from Djibouti exemplifies the complexity of the problem. Al-Harethi, a known terrorist and suspect in the bombing of the *USS Cole,* was traveling in an SUV with several other people. All were killed in the strike, as it was assumed that only other terrorists would be accompanying him. International issues abound in that al-Harethi was killed in Yemen, by an American operating from Djibouti.[7]

In these cases the value of security took precedence over isolating the individual and acting only then. It was decided that under the current circumstances collateral casualties were acceptable. There are many more equally complex decisions that have been made. Worth considering is under what conditions the use of lethal force to eliminate a terrorist might be authorized. Could such force be used in Africa, Southeast Asia, or other areas with limited governance? If relations with Mexico continued to decline, would a strike against a known al-Qaeda operative near the southern border (preparing to enter the United States), be authorized? At what point do our values regarding a need for security become sublimated to the values of justice for individuals?

The model of eliminating terrorists as a means to solve the problem is seriously flawed as it assumes that there are a fixed number to be killed. In Afghanistan, during the 1980s, the Soviets killed more than a million people. However, each day there were more mujahideen than there were the day before. The very actions taken to kill the opponents ensured that more would join the cause.

The enchantment of martyrdom is a powerful emotional incentive, one that overlords throughout history have not been able to defeat. Voluntarily sacrificing one's life is counterintuitive to the most fundamental value known to human beings, that of self-preservation. Perhaps there is a primal recognition of that significance, and these ultimate selfless acts resonate so deeply that they evoke similar response in others, thus perpetuating the ideology meant for extinction.

Speaking at a recent Joint Special Operations University symposium on the topic, Dr. Chris Mason noted that killing insurgents has never won a counterinsurgency (COIN) operation.[8] That said, COIN operations are an effective means to ensure that the designated terrorist will not commit additional acts against society.

### The Prisoner Dilemma

The issue of prisoners in counterterror operations is equally fraught with conundrums. In every previous war, the termination of hostilities was anticipated. Sometimes that was several years in the future, but repatriation was a reasonable expectation. Now, however, we are faced with the *Long War*, one that is not likely to end during the lifetime of the participants. The planning horizon of the long war is at a minimum 50 years, and that is probably a conservative estimate. How do we plan for the custody and care of those captured either on a battlefield or when involved in planning or executing terrorist acts? What can be done with detainees in an interminable conflict who openly state they will rejoin terrorist operations if released?

In its 2006 report, Amnesty International again urged the closing of the prison facilities at Guantanamo, Cuba. They consider the notion that individuals can be held indefinitely without trial as constituting torture.[9] On its face, this report is paradoxical. Except for war criminals, POWs are not subject to trial. Certainly the United States does not want to have our military personnel who are captured in combat become subject to civil or military trials.

At the most basic level, there is no clear definition about the status of people taken into custody in GWOT. A lengthy description of detainee status can be found in Thomas Ayres article, "'Six Floors' of Detainee Operations in the Post-9/11 World."[10] Questions abound regarding whether they are to be considered prisoners of war (POWs), insurgents, unlawful combatants, detainees, or criminals. Some of the issues impacting their status include:

– Where they are captured/taken into custody:
  ○ A country in which armed conflict is ongoing (Afghanistan/Iraq)
  ○ In the United States

- ○ In a country supporting U.S. efforts in GWOT
- ○ In a country not supporting U.S. efforts in GWOT (without extradition).
- – What they are doing when captured:
  - ○ Fighting on a battlefield
  - ○ In the proximity of a battlefield but not directly involved in fighting
  - ○ Involved in a terrorist attack
  - ○ Detained based on intelligence
  - ○ Civilian arrest based on warrant.
- – What they were doing prior to capture:
  - ○ Involved in planning a past terrorist attack
  - ○ Involved in planning a future terrorist attack
  - ○ Involved in activities that might be related to terrorist attacks.
- – Who took them into custody:
  - ○ U.S. military forces
  - ○ Other Federal agencies
  - ○ State of local law enforcement agencies
  - ○ Foreign military/law enforcement
  - ○ A joint U.S. foreign military/law enforcement force.
- – Nationality of the person:
  - ○ Native to the country in which they were captured
  - ○ Foreign to the country in which they were captured
  - ○ U.S. citizen is arrested in the United States
  - ○ US. citizen is captured in a foreign country.

The debate about the status and rights of persons taken into custody as part of GWOT-related operations rages on in courts both national and international, as well as in governmental legislatures. Again, it is our competing values that fuel the controversy. On one side of the argument are emotion-driven values that infer that terrorists should have few rights and must certainly not have access to our civilian court system. The opposing argument treats those in custody for terrorism as if they were common lawbreakers, with rights similar to U.S. citizens accused of crimes.

Compounding the issues concerning the rights of those in custody even further are the limitations on activities and procedures that may be used to gather intelligence from them. The law of land warfare and Geneva Conventions clearly state the rules regarding those designated as POWs. In addition to contravening torture, even humiliating or degrading treatment is prohibited. Of course, the limitations were established for conflicts between nations in which the primary combatants were uniformed troops and engaged in open warfare. U.S. soldiers were taught to resist interrogation and all military personnel were required to provide only their name,

rank, and serial number. Throughout history, POWs have been frequently subjected to harsher physical abuse. That has led to criminal charges being brought against those involved in violations of the laws of war.

Interrogation techniques have come under intense scrutiny in recent years. Great controversy abounds concerning the limits of physical and mental duress that can be applied in attempts to extract useful information. The balance between the desire to save lives through information provided by prisoners, and techniques that may be employed to obtain critical data, is a perilous one. In an abstract or ideological environment, absolute dictums are easy to make. However, in real-world situations, practicality is more difficult than we would like to admit. At one end of the spectrum is an adage to "do whatever it takes" in order to prevent loss of life among our citizens. At the other end is to make little or no effort to obtain information, and merely warehouse the prisoners.

Values become significant in determining appropriate procedures for handling prisoners. So does the emotional state of our society at various times. The United States has usually maintained the moral high ground in this area. However, as actions taken in Afghanistan and the infamous Abu Ghraib prison incidents in Iraq have come to light, that position is rightfully questioned. When the public is emotionally charged, such as immediately following an attack like 9/11, there is little sympathy for prisoners. As time passes and emotions cool, the society becomes more compassionate.

## CUT THEIR FUNDING

### Drugs versus Terror

High on the list for resolution should be the inherent conflict between GWOT and the War on Drugs (WOD), which has been conducted for a longer period of time. The WOD was formally announced in 1971, when President Nixon stated that drugs were "America's enemy number one."[11] In 1988, President Reagan created the Office of National Drug Control Policy (ONDCP). and WOD efforts intensified under the director, General Barry McCaffrey. Since that time, more than half a trillion taxpayer dollars have been spent fighting drugs in one form or another. Despite repeated press announcements concerning drug confiscations, the availability and street price for cocaine and heroin have remained about constant throughout these past three decades.[12]

Using General McCaffrey's 1999 figures for the price of cocaine, the problem becomes readily apparent. In his Congressional testimony of that year, he estimated the production cost per gram to be $3 and the street price between $150 and $200. That means that a kilo of cocaine costs about $3,000 to make, and would sell for up to $200,000. That is a profit margin

of 98.5 percent, and only because the product is illegal.[13] There is no other product in the world that has a higher return on investment. Futility in the supply side approach to solving this problem is also reflected in McCaffrey's Congressional testimony, where with pride he indicated that production of cocaine in Colombia and Peru had dropped by 3,000 metric tons (the street price for that amount would be about $600 million). Yet, despite this reported drop in production, suppliers could keep the price constant. It is worth considering what size an industry must be to absorb a cut of that magnitude without blinking. Balanced against the global income from illegal drugs, estimated at about $400 billion per year, that decline in production is statistically insignificant.

McCaffrey's remarks should be viewed from a cost-benefits standpoint. The 3,000 metric ton reduction was over a 4-year period. In 1999, the ONDCP budget was $17.7 billion.[14] Allowing for increases each year, ONDCP expended over $60 billion in the WOD over 4 years, and accomplished a $600 million decrease in available product. Even at inflated street prices, that is a one percent return on investment. By 2001, the annual ONDCP budget had risen to $19.2 billion, with constant market prices. Obviously, there is something wrong with the math.

To state "we are winning the war on drugs" is the equivalent of Saddam Hussein stating, "The mother of all battles has yet to start." The war, if there ever was one, was lost before it began. The demand for drugs in the United States has always been greater than the desire to stop the flow. In the process, we have seen whole countries corrupted, regions destabilized, and even threats made to our own national defense through the loss of trust in selected organizational units and reallocation of resources. The scope of the problem is just too big to be stopped with conventional measures.

It is easy to blame Colombia, often the butt of comedians' jokes, for supplying cocaine to the United States. The reality is that if we had suffered the same percentage of casualties as have the Colombian military, government officials, newspaper personnel, judges, and others who have opposed the narcoterrorists, there would be a massive hue and cry for armed response and a willingness to forego protection of civil rights. Imagine what we would do if the U.S. Supreme Court were physically taken over by traffickers. Few Americans remember that it happened in Colombia in 1986, when the Medellin Cartel took over the Palace of Justice, killing 90 people—including 11 Supreme Court justices. Later, in 1989, the leader of this organization (and reportedly then seventh richest man in the world) Pablo Escobar was responsible for assassinating three of five presidential candidates.[15] Before he died, Escobar was responsible for thousands of deaths in Colombia, including the bombing of an Avianca Airliner carrying 107 people.

Such violence would be unthinkable in the United States, and if it occurred we would have responded vigorously. In short, we should be sympathetic to the Southern refrain that states, "When Yankees stop shoving it up their noses, we'll stop sending it." Even some of the most conservative organizations recognized that the WOD had been lost a decade ago. William Buckley, supported by others, came to that conclusion, which was published in a February 1996 issue of the *National Review*.[16]

The issue is not one of supporting drug use. In fact, there is evidence that demand reduction and treatment are likely to be more effective than interdiction. As a minimum two significant goals will be accomplished by legalization. First and foremost, a major funding source for terrorists will be cut entirely. Secondly, there should be a steep decrease in secondary crime attributed to theft and robbery to support expensive drug habits and gang wars over distribution rights of their products.

There are many books and articles by prestigious authors that have made similar arguments. Economist David Henderson addressed the issue of support for terrorism through continuing the WOD.[17] In that article, he noted how the Revolutionary Armed Forces of Colombia (FARC) financed their terrorist campaign to overthrow the government with drug money. The respected CATO Institute has written extensively about these problems, as have many others.[18] If the terrorists' financial base is to be attacked and eliminated, it cannot be done without removing the financial incentive of illegal drugs.

Contrary to the emotional appeals from ONDCP sources, legalization is a pragmatic approach to shaping the battlefield. In fact, continuing the WOD will actually diminish the chances for success in the war on terror. It must be recognized that the fundamental disconnect is one of competing values. For politicians, it is deemed more important to be seen as antidrug than to take the actions necessary to cut drug funding to terrorists.

### DRAIN THE SWAMP

Many political theorists believe that the best method to curtail terrorism is to eliminate the root causes that breed the perpetrators. This model usually infers that epidemic poverty and material deprivation, so widespread in the third world, fosters envy and discontent over inequitable circumstances. Thus, the theory goes, if these basic living conditions can be substantially improved, then instability would decrease and potential terrorists will turn to more fruitful activities, such as earning money and supporting their families.

Extreme poverty does exist and it is useful to examine the scope of the problem. Traveling in the third world provides a glimpse of the appalling conditions under which many hundreds of millions of people live. Over 20 percent of the people in the world do not have safe drinking water, and the

problem is getting worse. Numerically, this is over 1 billion people who are deprived of the most basic resource required for human life.[19] Sanitation systems in many areas are near nonexistent. Availability of health care fluctuates widely. For instance, countries in sub-Saharan Africa have 11 percent of the population of the world, yet spend less than 1 percent of the health care dollars.[20]

Poverty and hunger are inextricably linked. Although the world produces enough food to feed everyone, more than a billion people are living on less than $1 per day, and thus do not have the resources to buy adequate food. In a vicious cycle, poverty causes lack of food, which in turn yields more poverty.[21] Other significant problems include poor (if any) secular educational systems, inadequate communications and transportation systems, and terrible working conditions.

However, to alter these conditions would require an abrupt alteration in American foreign aid policy, and one that is likely to encounter severe opposition from the public. Most Americans believe that the United States currently spends about 15 percent of the national budget on foreign aid. The reality is that it is far less than 1 percent.[22] When compared with other first world nations, the United States ranks 22nd in percentage of the gross national income contributed to foreign aid. In fact, we contribute 0.13 percent, compared with the number one country, Denmark, at 0.96 percent.[23] With the economic requirements to change the environment of instability so costly, it would require a dramatic shift in U.S. policy to accomplish the task at hand. That would probably be accompanied by substantial tax increases to pay for these programs. Americans are simply not as generous as we believe ourselves to be, and most U.S. citizens already think we are spending too much on foreign aid.

The fundamental problem with the proposed efforts to *alter the conditions that breed discontent and terrorists* is that it breaks the bank. Even if the public could be persuaded to make a large investment in the strategy, the amount of funding required is unsustainable when viewed from the perspective of five decades or longer. In fact, this proposal must incorporate some extremely unpleasant fiscal realities.

Even rudimentary analysis of financial trend data portends the makings of the perfect economic storm. According to the U.S. Treasury Department, the public debt exceeds $8 trillion and continues climbing.[24] Due to an aging population, large entitlement programs, and heavy government borrowing, bills will soon come due in excess of $53 trillion.[25] Based on Congressional Budget Office figures, the direct costs of GWOT as of mid-2006 were over $286 billion.[26] That figure, too, has continued to increase as the promised Iraqi oil funding for internal restructuring in that country failed to materialize.[27] In fact, the burgeoning national debt is our greatest strategic vulnerability. We do not have the resources necessary to adequately alter the environment of regional instability. The paradox

is that such change is necessary, and it would probably be cheaper in the long run to bear the burden now, rather than to respond to terrorist attacks that will probably continue for decades to come.

The economically based theory that disparity in resources yields terrorism is flawed. However, those who are driven by these Western-oriented values willingly accept this thesis. They simply do not understand the new social structures that are emerging or their underlying beliefs and values. Reducing the enormous economic disparity that exists between the *haves* and *have-nots* may assuage some level of civil discontent, and may even diminish the probability of U.S.-armed interventions to some degree.

However, this approach fails to account for ideologically motivated individuals and groups who actively reject our commonly held Western value system. Attempting to promote economic stability may lessen, but will not eliminate, the probability of future conflict.[28] Therefore, efforts to counter the conditions supporting terror must address ideological differences that drive terrorists to commit acts of extreme violence.

## SUMMARY

The GWOT is stressing the fabric of American society. We are a nation that desires quick fixes and simple dichotomous solutions for the most complex problems. Terrorism does not offer such solutions. The methods of countering terror that have been discussed evoke obvious paradoxes. They make us closely examine some of our most deeply held values.

Our moral compass provides a general sense of direction, not an azimuth. Analogous to the random walk of a diffusion pattern, many factors influence the direction we will take. There are spatial and temporal emotional components to terrorism that cannot be ignored. To be victorious we must insure our values are sound. We must prepare to encounter the unthinkable and predetermine what our responses will be under the most adverse circumstances. We cannot leave our servicemen and women in the untenable position of facing ambiguity and then retroactively establishing the ground rules by which they should have fought. Paradoxes, unpleasant choices, and harsh realities lie ahead. To minimize future conundrums, needed now are comprehensive plans for abhorrent exigencies. Such plans must be firmly grounded on realistic capabilities and fundamentally sound principles, and not on politically correct ideology.

# APPENDIX

# THE UNITED NATIONS GLOBAL COUNTER-TERRORISM STRATEGY

*The United Nations Global Counter-Terrorism Strategy was adopted by Member States on September 8, 2006. The strategy—in the form of a Resolution and an annexed Plan of Action—is a unique global instrument that will enhance national, regional, and international efforts to counter terrorism. This is the first time that all Member States have agreed to a common strategic approach to fight terrorism, not only sending a clear message that terrorism is unacceptable in all its forms and manifestation but also resolving to take practical steps individually and collectively to prevent and combat it. Those practical steps include a wide array of measures ranging from strengthening state capacity to counter terrorist threats to better coordinating United Nations system's counter-terrorism activities. The adoption of the strategy fulfils the commitment made by world leaders at the 2005 September Summit and builds on many of the elements proposed by the Secretary-General in his May 2, 2006 report, entitled Uniting against Terrorism: Recommendations for a Global Counter-Terrorism Strategy.*

*Following is the full text of the Resolution and the Plan of Action:*

**RESOLUTION: THE UNITED NATIONS GLOBAL COUNTER-TERRORISM STRATEGY**

The General Assembly,

*Guided* by the purposes and principles of the Charter of the United Nations and *reaffirming* its role under the Charter, including on questions related to international peace and security,

*Reiterating* its strong condemnation of terrorism in all its forms and manifestations, committed by whomever, wherever and for whatever purposes, as it constitutes one of the most serious threats to international peace and security,

*Reaffirming* the Declaration on Measures to Eliminate International Terrorism, contained in the annex to General Assembly resolution 49/60 of 9 December 1994, the Declaration to Supplement the 1994 Declaration on Measures to Eliminate International Terrorism, contained in the annex to General Assembly resolution 51/210 of 17 December 1996, and the 2005 World Summit Outcome, in particular its section oneak; terrorism,

*Recalling* all General Assembly resolutions on measures to eliminate international terrorism, including resolution 46/51 of 9 December 1991, and Security Council resolutions on threats to international peace and security caused by terrorist acts, as well as relevant resolutions of the General Assembly on the protection of human rights and fundamental freedoms while countering terrorism,

*Recalling also* that at the 2005 World Summit Outcome world leaders rededicated themselves to support all efforts to uphold the sovereign equality of all States, respect their territorial integrity and political independence, to refrain in our international relations from the threat or use of force in any manner inconsistent with the purposes and principles of the United Nations, to uphold resolution of disputes by peaceful means and in conformity with the principles of justice and international law, the right to self-determination of peoples which remain under colonial domination or foreign occupation, non-interference in the internal affairs of States, respect for human rights and fundamental freedoms, respect for the equal rights of all without distinction as to race, sex, language or religion, international cooperation in solving international problems of an economic, social, cultural or humanitarian character and the fulfillment in good faith of the obligations assumed in accordance with the Charter,

*Recalling further* the mandate contained in the 2005 World Summit Outcome that the General Assembly should develop without delay the elements identified by the Secretary-General for a counter-terrorism strategy, with a view to adopting and implementing a strategy to promote comprehensive, coordinated and consistent responses, at the national, regional and international levels, to counter terrorism, which also takes into account the conditions conducive to the spread of terrorism,

*Reaffirming* that acts, methods and practices of terrorism in all its forms and manifestations are activities aimed at the destruction of human rights, fundamental freedoms and democracy, threatening territorial integrity, security of States and destabilizing legitimately constituted Governments, and that the international community should take the necessary steps to enhance cooperation to prevent and combat terrorism,

*Reaffirming also* that terrorism cannot and should not be associated with any religion, nationality, civilization or ethnic group,

*Reaffirming further* Member States' determination to make every effort to reach an agreement on and conclude a comprehensive convention on international terrorism, including by resolving the outstanding issues related to the legal definition and scope of the acts covered by the convention, so that it can serve as an effective instrument to counter terrorism,

*Continuing* to acknowledge that the question of convening a high level conference under the auspices of the United Nations to formulate an international response to terrorism in all its forms and manifestations could be considered,

*Recognizing* that development, peace and security, and human rights are interlinked and mutually reinforcing,

*Bearing in mind* the need to address the conditions conducive to the spread of terrorism,

*Affirming* Member States' determination to continue to do all they can to resolve conflict, end foreign occupation, confront oppression, eradicate poverty, promote sustained economic growth, sustainable development, global prosperity, good governance, human rights for all and rule of law, improve intercultural understanding and ensure respect for all religions, religious values, beliefs or cultures,

1. Expresses its appreciation for the report "Uniting against terrorism: recommendations for a global counter-terrorism strategy" (doc. A/60/825), submitted by the Secretary-General to the General Assembly;

2. Adopts the present resolution and its annex as the United Nations Global Counter-Terrorism Strategy ("the Strategy");

3. Decides, without prejudice to the continuation of the discussion at its relevant committees of all their agenda items related to terrorism and counter-terrorism, to undertake the following steps for the effective follow-up of the Strategy:

   a) To launch the Strategy at a high-level segment of its sixty-first session;

   b) To examine in two years progress made in implementation of the Strategy, and to consider updating it to respond to changes, recognizing that many of the measures contained in the Strategy can be achieved immediately, some will require sustained work through the coming few years, and some should be treated as long term objectives;

   c) To invite the Secretary-General to contribute to the future deliberations of the General Assembly on the review of the implementation and updating of the Strategy;

   d) To encourage Member States, the United Nations and other appropriate international, regional and sub-regional organizations to support the implementation of the Strategy, including through mobilizing resources and expertise;

e) To further encourage non-governmental organizations and civil society to engage, as appropriate, on how to enhance efforts to implement the Strategy.

4. Decides to inscribe in the provisional agenda of its sixty-second session an item entitled "The United Nations Global Counter-Terrorism Strategy."

## ANNEX

### Plan of Action

We, the States Members of the United Nations, resolve:

1. To consistently, unequivocally and strongly condemn terrorism in all its forms and manifestations, committed by whomever, wherever and for whatever purposes, as it constitutes one of the most serious threats to international peace and security.

2. To take urgent action to prevent and combat terrorism in all its forms and manifestations and, in particular:

   a) To consider becoming parties without delay to the existing international conventions and protocols against terrorism, and implementing them, and to make every effort to reach an agreement on and conclude a comprehensive convention on international terrorism;

   b) To implement all General Assembly resolutions on measures to eliminate international terrorism, and relevant General Assembly resolutions on the protection of human rights and fundamental freedoms while countering terrorism;

   c) To implement all Security Council resolutions related to international terrorism and to cooperate fully with the counter-terrorism subsidiary bodies of the Security Council in the fulfillment of their tasks, recognizing that many States continue to require assistance in implementing these resolutions.

3. To recognize that international cooperation and any measures that we undertake to prevent and combat terrorism must comply with our obligations under international law, including the Charter of the United Nations and relevant international conventions and protocols, in particular human rights law, refugee law and international humanitarian law.

*Measures to address the conditions conducive to the spread of terrorism*

We resolve to undertake the following measures aimed at addressing the conditions conducive to the spread of terrorism, including but not limited to prolonged unresolved conflicts, dehumanization of victims of terrorism in all its forms and manifestations, lack of rule of law and violations of human rights, ethnic, national and religious discrimination, political exclusion, socio-economic marginalization, and lack of good governance, while recognizing that none of these conditions can excuse or justify acts of terrorism:

1. To continue to strengthen and make best possible use of the capacities of the United Nations in areas such as conflict prevention, negotiation, mediation, conciliation, judicial settlement, rule of law, peacekeeping and peacebuilding, in order to contribute to the successful prevention and peaceful resolution of prolonged unresolved conflicts. We recognize that the peaceful resolution of such conflicts would contribute to strengthening the global fight against terrorism.

2. To continue to arrange under the auspices of the United Nations initiatives and programs to promote dialogue, tolerance and understanding among civilizations, cultures, peoples and religions, and to promote mutual respect for and prevent the defamation of religions, religious values, beliefs and cultures. In this regard, we welcome the launching by the Secretary-General of the initiative on the Alliance of Civilizations. We also welcome similar initiatives that have been taken in other parts of the world.

3. To promote a culture of peace, justice and human development, ethnic, national and religious tolerance, and respect for all religions, religious values, beliefs or cultures by establishing and encouraging, as appropriate, education and public awareness programmes involving all sectors of society. In this regard, we encourage the United Nations Educational, Scientific and Cultural Organization to play a key role, including through inter-faith and intra-faith dialogue and dialogue among civilizations.

4. To continue to work to adopt such measures as may be necessary and appropriate and in accordance with our obligations under international law to prohibit by law incitement to commit a terrorist act or acts and prevent such conduct.

5. To reiterate our determination to ensure the timely and full realization of the development goals and objectives agreed at the major United Nations conferences and summits, including the Millennium Development Goals. We reaffirm our commitment to eradicate poverty and promote sustained economic growth, sustainable development and global prosperity for all.

6. To pursue and reinforce development and social inclusion agendas at every level as goals in themselves, recognizing that success in this area, especially on youth unemployment, could reduce marginalization and the subsequent sense of victimization that propels extremism and the recruitment of terrorists.

7. To encourage the United Nations system as a whole to scale up the cooperation and assistance it is already conducting in the fields of rule of law, human rights and good governance, to support sustained economic and social development.

8. To consider putting in place, on a voluntary basis, national systems of assistance that would promote the needs of victims of terrorism and their families and facilitate the normalization of their lives. In this regard, we encourage States to request the relevant United Nations entities to help them to develop such national systems. We will also strive to promote international solidarity in support of victims and foster the involvement of civil society in a global campaign against terrorism and for its condemnation. This could include exploring at the General Assembly the possibility of developing practical mechanisms assistance to victims.

*Measures to prevent and combat terrorism*

We resolve to undertake the following measures to prevent and combat terrorism, in particular by denying terrorists access to the means to carry out their attacks, to their targets and to the desired impact of their attacks:

1. To refrain from organizing, instigating, facilitating, participating in, financing, encouraging or tolerating terrorist activities and to take appropriate practical measures to ensure that our respective territories are not used for terrorist installations or training camps, or for the preparation or organization of terrorist acts intended to be committed against other States or their citizens.

2. To cooperate fully in the fight against terrorism, in accordance with our obligations under international law, in order to find, deny safe haven and bring to justice, on the basis of the principle of extradite or prosecute, any person who supports, facilitates, participates or attempts to participate in the financing, planning, preparation or perpetration of terrorist acts or provides safe havens.

3. To ensure the apprehension and prosecution or extradition of perpetrators of terrorist acts, in accordance with the relevant provisions of national and international law, in particular human rights law, refugee law and international humanitarian law. We will endeavour to conclude and implement to that effect mutual judicial assistance and extradition agreements, and to strengthen cooperation between law enforcement agencies.

4. To intensify cooperation, as appropriate, in exchanging timely and accurate information concerning the prevention and combating of terrorism.

5. To strengthen coordination and cooperation among States in combating crimes that might be connected with terrorism, including drug trafficking in all its aspects, illicit arms trade, in particular of small arms and light weapons, including man-portable air defence systems, money laundering and smuggling of nuclear, chemical, biological, radiological and other potentially deadly materials.

6. To consider becoming parties without delay to the United Nations Convention against Transnational Organized Crime and to the three protocols supplementing it, and implementing them.

7. To take appropriate measures, before granting asylum, for the purpose of ensuring that the asylum seeker has not engaged in terrorist activities and, after granting asylum, for the purpose of ensuring that the refugee status is not used in a manner contrary to the provisions set out in paragraph 1 of this section.

8. To encourage relevant regional and sub-regional organizations to create or strengthen counter-terrorism mechanisms or centres. Should they require cooperation and assistance to this end, we encourage the United Nations Counter-Terrorism Committee and its Executive Directorate and, where consistent with their existing mandates, the United Nations Office of Drugs and Crime and the International Criminal Police Organization, to facilitate its provision.

9. To acknowledge that the question of creating an international centre to fight terrorism could be considered, as part of the international efforts to enhance the fight against terrorism.

10. To encourage States to implement the comprehensive international standards embodied in the Financial Action Task Force's Forty Recommendations on Money Laundering and Nine Special Recommendations on Terrorist Financing, recognizing that States may require assistance in implementing them.

11. To invite the United Nations system to develop, together with Member States, a single comprehensive database on biological incidents, ensuring that it is complementary to the International Criminal Police Organization's contemplated Biocrimes Database. We also encourage the Secretary-General to update the roster of experts and laboratories, as well as the technical guidelines and procedures, available to him for the timely and efficient investigation of alleged use. In addition, we note the importance of the proposal of the Secretary-General to bring together, within the framework of the United Nations, the major biotechnology stakeholders, including industry, scientific community, civil society and governments, into a common programme aimed at ensuring that biotechnology's advances are not used for terrorist or other criminal purposes but for the public good, with due respect to the basic international norms on intellectual property rights.

12. To work with the United Nations, with due regard to confidentiality, respecting human rights and in compliance with other obligations under international law, to explore ways and means to

    a) Coordinate efforts at the international and regional level to counter terrorism in all its forms and manifestations on the Internet,

    b) Use the Internet as a tool for countering the spread of terrorism, while recognizing that States may require assistance in this regard.

13. To step-up national efforts and bilateral, sub-regional, regional and international co-operation, as appropriate, to improve border and customs controls, in order to prevent and detect the movement of terrorists and to prevent and detect the illicit traffic in, inter alia, small arms and light weapons, conventional ammunition and explosives, nuclear, chemical, biological or radiological weapons and materials, while recognizing that States may require assistance to that effect.

14. To encourage the United Nations Counter Terrorism Committee and its Executive Directorate to continue to work with States, at their request, to facilitate the adoption of legislation and administrative measures to implement the terrorist travel-related obligations, and to identify best practices in this area, drawing whenever possible on those developed by technical international organizations such as the International Civil Aviation Organization, the World Customs Organization and the International Criminal Police Organization.

15. To encourage the Committee established pursuant to Security Council resolution 1267 (1999) to continue to work to strengthen the effectiveness of the travel ban under the United Nations sanctions regime against Al-Qaida and the Taliban and associated individuals and entities, as well as to ensure, as a matter

of priority, that fair and transparent procedures exist for placing individuals and entities on its lists, for removing them and for granting humanitarian exceptions. In this regard, we encourage States to share information, including by widely distributing the International Criminal Police Organization-United Nations Special Notices concerning people subject to this sanctions regime.

16. To step up efforts and co-operation at every level, as appropriate, to improve the security on manufacturing and issuing identity and travel documents and to prevent and detect their alteration or fraudulent use, while recognizing that States may require assistance in doing so. In this regard, we invite the International Criminal Police Organization to enhance its database on stolen and lost travel documents, and we will endeavour to make full use of this tool as appropriate, in particular by sharing relevant information.

17. To invite the United Nations to improve co-ordination in planning a response to a terrorist attack using nuclear, chemical, biological or radiological weapons or materials, in particular by reviewing and improving the effectiveness of the existing inter-agency co-ordination mechanisms for assistance delivery, relief operations and victim support, so that all States can receive adequate assistance. In this regard, we invite the General Assembly and the Security Council to develop guidelines for the necessary cooperation and assistance in the event of a terrorist attack using weapons of mass destruction.

18. To step up all efforts to improve the security and protection of particularly vulnerable targets such as infrastructure and public places, as well as the response to terrorist attacks and other disasters, in particular in the area of civil protection, while recognizing that States may require assistance to that effect.

*Measures to build States' capacity to prevent and combat terrorism and to strengthen the role of the United Nations system in this regard*

We recognize that capacity-building in all States is a core element of the global counter-terrorism effort, and resolve to undertake the following measures to develop State capacity to prevent and combat terrorism and enhance coordination and coherence within the United Nations system in promoting international cooperation in countering terrorism:

1. To encourage Member States to consider making voluntary contributions to United Nations counter-terrorism cooperation and technical assistance projects, and to explore additional sources of funding in this regard. We also encourage the United Nations to consider reaching out to the private sector for contributions to capacity-building programmes, in particular in the areas of port, maritime and civil aviation security.

2. To take advantage of the framework provided by relevant international, regional and sub-regional organizations to share best practices in counter-terrorism capacity-building, and to facilitate their contributions to the international community's efforts in this area.

3. To consider establishing appropriate mechanisms to rationalize States' reporting requirements in the field of counter-terrorism and eliminate duplication of

reporting requests, taking into account and respecting the different mandates of the General Assembly, the Security Council and its subsidiary bodies that deal with counter terrorism.

4. To encourage measures, including regular informal meetings, to enhance, as appropriate, more frequent exchanges of information on cooperation and technical assistance among Member States, United Nations bodies dealing with counter terrorism, relevant specialized agencies, relevant international, regional and sub-regional organizations, and the donor community, to develop States' capacities to implement relevant United Nations resolutions.

5. To welcome the intention of the Secretary-General to institutionalize, within existing resources, the United Nations Counter-Terrorism Implementation Task Force within the Secretariat, in order to ensure overall co-ordination and coherence in the United Nations system's counter-terrorism efforts.

6. To encourage the United Nations Counter-Terrorism Committee and its Executive Directorate to continue to improve the coherence and efficiency of technical assistance delivery in the field of counter-terrorism, in particular by strengthening its dialogue with States and relevant international, regional and sub-regional organizations and working closely, including by sharing information, with all bilateral and multilateral technical assistance providers.

7. To encourage the United Nations Office on Drugs and Crime, including its Terrorism Prevention Branch, to enhance, in close consultation with the United Nations Counter-Terrorism Committee and its Executive Directorate, its provision of technical assistance to States, upon request, to facilitate the implementation of the international conventions and protocols related to the prevention and suppression of terrorism and relevant United Nations resolutions.

8. To encourage the International Monetary Fund, the World Bank, the United Nations Office on Drugs and Crime and the International Criminal Police Organization to enhance cooperation with States to help them to comply fully with international norms and obligations to combat money-laundering and financing of terrorism.

9. To encourage the International Atomic Energy Agency and the Organization for the Prohibition of Chemical Weapons to continue their efforts, within their respective mandates, in helping States to build capacity to prevent terrorists from accessing nuclear, chemical or radiological materials, to ensure security at related facilities, and to respond effectively in the event of an attack using such materials.

10. To encourage the World Health Organization to step up its technical assistance to help States improve their public health systems to prevent and prepare for biological attacks by terrorists.

11. To continue to work within the United Nations system to support the reform and modernization of border management systems, facilities and institutions, at the national, regional and international level.

12. To encourage the International Maritime Organization, the World Customs Organization and the International Civil Aviation Organization to strengthen

their co-operation, work with States to identify any national shortfalls in areas of transport security and provide assistance upon request to address them.

13. To encourage the United Nations to work with Member States and relevant international, regional and sub-regional organizations to identify and share best practices to prevent terrorist attacks on particularly vulnerable targets. We invite the International Criminal Police Organization to work with the Secretary-General so that he can submit proposals to this effect. We also recognize the importance of developing public-private partnerships in this area.

*Measures to ensure respect for human rights for all and the rule of law as the fundamental basis of the fight against terrorism*

We resolve to undertake the following measures, reaffirming that the promotion and protection of human rights for all and the rule of law is essential to all components of the Strategy, recognizing that effective counter-terrorism measures and the protection of human rights are not conflicting goals, but complementary and mutually reinforcing, and stressing the need to promote and protect the rights of victims of terrorism:

1. To reaffirm that General Assembly resolution 60/158 of 16 December 2005 provides the fundamental framework for the "Protection of human rights and fundamental freedoms while countering terrorism."

2. To reaffirm that States must ensure that any measures taken to combat terrorism comply with their obligations under international law, in particular human rights law, refugee law and international humanitarian law.

3. To consider becoming parties without delay to the core international instruments on human rights law, refugee law and international humanitarian law, and implementing them, as well as to consider accepting the competence of international and relevant regional human rights monitoring bodies.

4. To make every effort to develop and maintain an effective and rule of law-based national criminal justice system that can ensure, in accordance with our obligations under international law, that any person who participates in the financing, planning, preparation or perpetration of terrorist acts or in support of terrorist acts is brought to justice, on the basis of the principle to extradite or prosecute, with due respect for human rights and fundamental freedoms, and that such terrorist acts are established as serious criminal offences in domestic laws and regulations. We recognize that States may require assistance in developing and maintaining such effective and rule of law-based criminal justice system, and we encourage them to resort to the technical assistance delivered, inter alia, by the United Nations Office on Drugs and Crime.

5. To reaffirm the United Nations system's important role in strengthening the international legal architecture by promoting the rule of law, respect for human rights, and effective criminal justice systems, which constitute the fundamental basis of our common fight against terrorism.

6. To support the Human Rights Council, and to contribute, as it takes shape, to its work on the question of the promotion and protection of human rights for all in the fight against terrorism.

7. To support the strengthening of the operational capacity of the Office of the United Nations High Commissioner for Human Rights, with a particular emphasis on increasing field operations and presences. The Office should continue to play a lead role in examining the question of protecting human rights while countering terrorism, by making general recommendations on States' human rights obligations and providing them with assistance and advice, in particular in the area of raising awareness of international human rights law among national law-enforcement agencies, at States' request.

8. To support the role of the Special Rapporteur on the promotion and protection of human rights and fundamental freedoms while countering terrorism. The Special Rapporteur should continue to support States' efforts and offer concrete advice by corresponding with Governments, making country visits, liaising with the United Nations and regional organizations, and reporting on these issues.

# ABOUT THE EDITOR AND CONTRIBUTORS

**James J. F. Forest** is Director of Terrorism Studies and Associate Professor of Political Science at the U.S. Military Academy at West Point, where he teaches undergraduate courses on terrorism, counterterrorism, and information warfare, and also directs research initiatives for the Combating Terrorism Center. His recent publications include *Teaching Terror: Strategic and Tactical Learning in the Terrorist World* (2006); *Homeland Security: Protecting America's Targets* (2006); and *The Making of a Terrorist: Recruitment, Training and Root Causes* (2005). His research has also appeared in the *Cambridge Review of International Affairs*, the *Journal of Political Science Education*, and *Democracy and Security.* Dr. Forest received his graduate degrees from Stanford University and Boston College, and undergraduate degrees from Georgetown University and De Anza College.

**Donald J. Alberts** is a former professor at the United States Air Force Academy. He has written and lectured widely on air power, insurgency, and the Spanish civil war.

**John B. Alexander** is a retired Army officer, a Senior Fellow of the Joint Special Operations University, a Fellow of the Proteus Management Group of the U.S. Army War College, and a member of the Army Science Board. Dr. Alexander commanded Special Forces units in Vietnam and Thailand, and as a consultant he served briefly as a mentor to the Afghanistan Minister of Defense. His books include *Future War* (1999) and *Winning The War* (2003).

**Sumesh  M. Arora** is the Director of the Strategic Biomass Initiative (SBI) for the Mississippi Technology Alliance. He was named to the "Top 40 under 40" by the *Mississippi Business Journal* in 2005, and was designated by Mississippi Governor Haley Barbour to represent the state on the Governor's Ethanol Coalition in June 2006. Sumesh is currently enrolled in the International Development doctoral program at the University of Southern Mississippi and holds a Master's in materials engineering and a

Bachelor in electrical engineering from the University of Central Florida, Orlando, Florida.

**Kent Baumann** is a U.S. Army Foreign Area Officer currently assigned to the Foreign Military and Cultural Studies Office at Fort Leavenworth, Kansas, where he serves as a seminar leader in the Army's new Red Team Leader Course. Lieutenant Colonel Baumann recently served as the Deputy Director for the Program on Terrorism and Security Studies at the George C. Marshall European Center for Security Studies. He is a Russian speaker and has served extensively overseas and in Europe.

**Lianne Kennedy Boudali** is a Senior Associate in the Combating Terrorism Center at West Point, and also serves as an Assistant Professor in the Department of Social Sciences at the U.S. Military Academy. Professor Boudali holds a Masters of International Affairs from Columbia University, where she specialized in International Security Policy and Middle East Affairs. She served for 2 years as a U.S. Peace Corps Volunteer in Niger, and has also lived in Morocco. Professor Boudali's research interests include terrorism in North Africa, strategic communication in terrorism and counterterrorism, and the process of political-religious radicalization.

**Randall G. Bowdish** is a retired Navy Captain. His sea duty included tours as Commanding Officer, *USS SIMPSON* (FFG 56), Executive Officer, *USS HAWES* (FFG 53), Material Officer, Destroyer Squadron 35, Engineer Officer, *USS HAROLD E. HOLT* (FF 1073), and Damage Control Assistant on the *USS RATHBURNE* (FF 1057). He served ashore on the Joint Staff, Navy Staff, Space and Naval Warfare Systems Command, and as a faculty member at the USMC Command and Staff College. He was Federal Executive Fellow at the RAND Corporation and served as a Legislative Fellow in the Office of Congressman Ike Skelton (D-MO). Bowdish graduated from the Naval War College in 1995 and the Naval Postgraduate School in 1988, where he earned a Master of Science in Electrical Engineering. He earned a B.A. in Psychology at the University of Nebraska in 1981, and has recently returned to the university to pursue a doctorate in Political Science.

**Christopher L. Brown** is currently the Director of Education and Research at the American Security Council Foundation in Washington, DC. Prior to this he served as the Director of the Menges Hemispheric Security Program at the Center for Security Policy and Assistant Director for the Program on Transitions to Democracy at the Hudson Institute. He is an expert on terrorism with an emphasis on ideological development. His other areas of expertise are the political and security issues of China, Central Asia, Middle East, Africa, and Latin America. He has contributed to a number

of books and authored numerous articles. He is a graduate in Political Science and Philosophy from Utah State University.

**David Butler** is an Assistant Professor in the International Development doctoral program at the University of Southern Mississippi. He received his Ph.D. in geography from the University of Cincinnati, and holds a M.S. in geography and a B.A. in history from Texas A & M University. Dr. Butler's research interests lie in the areas of information technology, geopolitics, and social and political change around technologies. David also serves as the Director for the Call Center Research Laboratory at The University of Southern Mississippi. Dr. Butler's research has been featured in numerous journals, books and congressional testimony, and he has appeared on news shows on CNN and National Public Radio.

**Daniel Byman** is the Director of the Center for Peace and Security Studies at Georgetown University and an Associate Professor at Georgetown's School of Foreign Service. He is also a nonresident senior fellow at the Saban Center for Middle East Policy at the Brookings Institution, and author of *Deadly Connections: States that Sponsor Terrorism* (Cambridge University Press, 2005).

**Jonathan C. Byrom** is a cavalry officer in the United States Army, and has served in various military positions in Germany, Bosnia-Herzegovina, Fort Irwin, and Afghanistan. Major Byrom graduated from the United States Military Academy in 1995 and received his Masters of Business Administration from the Naval Postgraduate School in Monterey, California. He is currently serving as an economics instructor and International Security Seminar Executive Officer in the Social Sciences Department at the United States Military Academy.

**Christopher Carr** is an Associate Professor of International Security at the U.S. Air War College. He has written and researched on the trade in arms and on the impact of light weapons proliferation on vulnerable societies and is the author of *Security Implications of Microdisarmament* (2000). He is currently completing a manuscript on "Kalashnikov Cultures."

**Francesco Cavatorta** is a Lecturer in International Relations and Middle East Politics at Dublin City University, Ireland. Dr. Cavatorta has written extensively on processes of democratization in the Middle East and North Africa.

**Maura Conway** is a Lecturer in the School of Law and Government at Dublin City University. Previously, she was a Teaching Fellow in the School of International Relations at the University of St. Andrews,

Scotland, and was awarded her Ph.D. from the Department of Political Science at Trinity College, Dublin, Ireland. Her research interests are in the area of terrorism and new media.

**Eli Göndör** is a graduate student in Islamology at the University of Lund, Sweden. He holds a bachelor's degree in Middle Eastern Studies from the University of Stockholm, Sweden. Mr. Göndör has dual citizenship (Israeli and Swedish) and has served in the Israeli Defense Forces as a paratrooper.

**Brian Hanley** is the developer of EpiFlex, a sophisticated system for discrete modeling of novel organism epidemics, and developed the Lambda latency scale mathematical model for rapid casualty estimation in modern human populations. He has provided materials and risk assessment for Senator Richard Lugar's office and SAIC in the area of modern biological weapons scenarios. His research interests are infectious disease modeling, biodefense, and understanding terrorism/asymmetric warfare motives, organizations, and methods.

**Christopher Jasparro** is a transnational security specialist with interests in terrorism, organized crime, environmental security, and development. His prior positions include the Asia-Pacific Center for Security Studies (U.S. Pacific Command) and the Department of Geography at Framingham State College. Dr. Jasparro has also had experience in the areas of economic development and transportation planning and is a former U.S. Naval Reserve officer.

**Thomas H. Johnson** is on the faculty of the Naval Postgraduate School's National Security Affairs Department. For over two decades, Professor Johnson has conducted research on Afghanistan and South Asia. He has written extensively on Afghanistan and its politics, culture, and anthropology, and his articles have been published in journals such as *Central Asian Survey, Comparative Strategy, American Political Science Review*, the *Journal of Politics*, the *Brown Journal of World Affairs, Strategic Review, Politikon: South African Journal of Political Science, Journal of Modern African Studies*, as well as in numerous edited volumes and scholarly texts. Professor Johnson has taught at the University of Southern California, George Mason University, and the Foreign Service Institute, and frequently lectures at service academies and the National Defense University.

**Lydia Khalil** is a counterterrorism analyst for the New York Police Department and is also affiliated with Jamestown Foundation, where she is a regular contributor to *Terrorism Focus* and *Terrorism Monitor*. She previously worked in Iraq as a policy advisor for the Coalition Provisional

Authority in Baghdad. Prior to that Lydia was appointed to the White House Office of Homeland Security. Lydia has worked for the U.S. government, international organizations, private companies, and think tanks on a variety of Middle East and terrorism issues. Born in Cairo and raised in the United States, Lydia received her B.A. in International Relations from Boston College and her M.A. in International Security from Georgetown University.

**J. P. Larsson** is a practitioner on issues concerning organized crime and terrorism at the U.K. Home Office. His Ph.D. examined the logic of religious violence and terrorism, and he is the author of *Understanding Religious Violence: Thinking Outside the Box on Terrorism* (2003) and a number of other chapters, articles, and discussion materials. Religious terrorism, organized crime, and the intelligence-led policing to combat these remain close to his heart and he works professionally, consults, publishes, and teaches in these areas. He has degrees from Keele, Aberystwyth, and Lampeter universities, and still teaches courses on terrorism, religion, and war at the latter.

**Gregory D. Lee** has a combination of over 34 years of active and reserve service with the U.S. Army. He is a Reserve Chief Warrant Officer Five/Special Agent with the U.S. Army Criminal Investigation Command assigned to Headquarters, 6th Military Police Group (CID). In late 2003 he retired as a Supervisory Special Agent with the U.S. Department of Justice, Drug Enforcement Administration (DEA). In 1995 while assigned to Islamabad, Pakistan, he directly participated in the arrest of Ramzi Ahmed Yousef, the mastermind of the 1993 NYC World Trade Center bombing, collected evidence, and testified at his trial. He is the author of *Global Drug Enforcement: Practical Investigative Techniques* (2004), *Conspiracy Investigations: Terrorism, Drugs and Gangs* (2005), and *Practical Criminal Evidence* (2007).

**M. Chris Mason** is a Senior Fellow at the Center for Advanced Defense Studies in Washington, DC. He is a retired Foreign Service Officer with extensive experience in Afghanistan, most recently as the political officer on a Provincial Reconstruction Team (PRT) in Paktika Province on the Pakistani border. Mr. Mason is an expert on Afghan history and tribal culture, and lectures regularly on insurgency and counterinsurgency in Afghanistan to the four services. He recently wrote the U.S. Marine Corps' guidebook, *Afghanistan: Operational Cultural for Deploying Personnel*, published in August 2006.

**Shahdad Naghshpour** is Associate Professor of International Development at the University of Southern Mississippi. He has published

extensively on issues of income distribution and population studies. His present research includes international development.

**Magnus Norell** is a faculty member in the Center for the Study of Low Intensity Conflicts and Terrorism at the Swedish Defense Research Agency. He received his Ph.D. in Political Science from the University of Stockholm, and has degrees from the University of Uppsala (Sweden) and the Hebrew University of Jerusalem (Israel). Dr. Norell has written extensively about politics in the Middle East as well as religiously motivated terrorism. He is a well-known lecturer and is often consulted by the media on matters related to terrorism and the Middle East.

**Bard E. O'Neill** is Professor of National Security Strategy at the National War College, Washington, DC. He has written and lectured extensively on insurgency, terrorism, and the Middle East. He is the author of *Insurgency and Terrorism*, revised edition (2005), which was recently referred to as a seminal work in the *Bulletin of the Atomic Scientists*.

**Robert J. Pauly, Jr.,** is Assistant Professor of International Policy and Development and Associate Director of the International Development program at the University of Southern Mississippi in Gulfport. He focuses on the Global War on Terrorism, U.S. foreign policy toward the states of the Greater Middle East, and political and security issues in that region. His most recent books are *To Protect and Defend: U.S. Homeland Security Policy* (2006) and *U.S. Foreign Policy and the Persian Gulf: Safeguarding American Interests through Selective Multilateralism* (2005).

**Paul R. Pillar** is a Visiting Professor in the Security Studies Program of Georgetown University and is retired from a 28-year career in the U.S. Intelligence Community. His research and writing focus on counterterrorism, intelligence, and Middle Eastern issues.

**Paul J. Smith** is an Associate Professor in the National Security Decision Making Department of the Naval War College in Newport, Rhode Island.

**Michelle L. Spencer** is a senior policy analyst with over 10 years of U.S. national security policy, programmatic, and analytical experience. For the last 5 years Ms. Spencer has provided support to the International Counterproliferation Program, a cooperative effort between the Department of Defense, the Federal Bureau of Investigation, and the Department of Homeland Security. Ms. Spencer spent 2 years in the OSD Policy-Eurasia office and 2 years on the Policy Staff of the House Armed Services Committee, where she worked on various national security issues including counterterror strategies and national security policy implementation. She

has a Master's Degree in Defense and Strategic Studies from Missouri State University.

**Joseph J. St. Marie** is Assistant Professor of International Development at University of Southern Mississippi. He has publications on shadow economy, ethnic conflict, and development. His current interest is in political economy and international development.

**Samuel S. Stanton, Jr.,** is Assistant Professor of Political Science at Grove City College. His research focuses on conflict processes and ethnic conflict.

**Jeff Stephens** is a Ph.D. candidate in International Development at the University of Southern Mississippi. He has an M.B.A. from Tulane University and a B.S.B.M. from LeTourneau University. His research interests are the development of U.S. foreign policy, international security, and the development of strategic alliances from a political and business perspective. His dissertation research is on alliance theories and the balance of power between the United States and China.

**Joseph L. Trafton** is a Ph.D. candidate at the University of Denver's Graduate School of International Studies, and will graduate in June 2007. His specialties are in the areas of international security, terrorism, and terrorist financing. Currently, Joseph is a visiting professor at the University of Rhode Island and teaches graduate and undergraduate courses in international political theory, and U.S. Foreign Policy and Terrorism. In addition, Joseph's dissertation manuscript, *Terror's New Narco Economy* will soon be published as a book.

**Matthew H. Wahlert** is a doctoral student at Miami University in Oxford, Ohio. He has contributed pieces in several works on security and international relations, including *NATO: An Encyclopedia of International Security, Historical Encyclopedia of Military Communications, The Encyclopedia of World History, The Encyclopedia of Protest and Revolution, and Homeland Security: Protecting America's Targets*. His research interests include issues of terrorism, security, and warfare.

**James Walker** is the U.S. Army Fellow at the Center for International and Security Studies at the University of Maryland (CISSM). He is a career Military Police officer who has served in a variety of operational and law enforcement assignments including service in Korea, Washington DC, Johnston Island, Fort Stewart, Kuwait, and Afghanistan. Major Walker is also an associate of the Combating Terrorism Center at West Point and was recently an Assistant Professor in the Department of Social Sciences

teaching courses in Economics and Money and Banking. Major Walker holds a Bachelor of Arts degree in Criminal Justice and Psychology from Purdue University, a Master of Arts in Security Management from Webster University, and a Master of Business Administration from the Fuqua School of Business at Duke University.

# Countering Terrorism and Insurgency in the 21st Century

# COUNTERING TERRORISM AND INSURGENCY IN THE 21ST CENTURY

## INTERNATIONAL PERSPECTIVES

VOLUME 3: LESSONS FROM THE FIGHT AGAINST TERRORISM

Edited by James J. F. Forest

# CONTENTS

# EDITOR'S NOTE

Governments have been countering the threat of terrorism and insurgency since the establishment of the Westphalia system of nation-states. However, the rapid evolution of science and technology over the past 100 years—from the invention of dynamite to commercial air travel and the Internet—has enabled new forms of terrorist and insurgent activity. It is thus likely that further technological advances over the next 100 years will yield similar results, as today's terrorist and insurgent groups have proven to be adaptable, learning organizations. This three-volume set, *Countering Terrorism and Insurgency in the 21st Century*, seeks to encourage the development of learning organizations among national security professionals by examining what we currently know about the strategic application of hard and soft power in countering the sources and facilitators of terrorism. As a collection, the thematic essays and focused case studies represent an ambitious effort to capture existing knowledge in the field of counterterrorism and counterinsurgency, and draw lessons (from successes as well as failures) that will inform new, adaptable strategies to counter the new threats that—judging from historical trends—will no doubt emerge over the next century.

At the outset, it is necessary to address why this publication covers both terrorism and insurgency, as there is confusion about these terms among many in the academic, media, and policymaking communities. In some countries that have faced the threat of violence for many years—including Colombia, Ireland, Spain, Sri Lanka, and Turkey—societies have grappled with additional terms like "paramilitaries" and "freedom fighters," but the general view reflected throughout the chapters of this publication is that all groups or individuals (including insurgents) who engage in the act of terrorism can be considered terrorists. In essence, the act of terrorism defines its perpetrator as a terrorist, regardless of the ideological motivation behind such acts.

According to the U.S. Department of Defense, terrorism is defined as "the calculated use of violence or threat of violence to inculcate fear; intended to coerce or to intimidate governments or societies in the pursuit of goals that are generally political, religious or ideological," while

insurgency is defined as "an organized resistance movement that uses subversion, sabotage, and armed conflict to achieve its aims.... [and which] seek to overthrow the existing social order and reallocate power within the country." In teaching my classes on these topics to future U.S. Army officers at West Point, the distinction I make is that insurgents can and do use terrorism (among other forms of violence), but insurgents are but one type of violent nonstate actors who may choose to use terrorism. In other words, not all insurgents use terrorism, and not all terrorists are part of an insurgency. Further, while the use of violence by insurgents to target governments is driven by a particular ideology, terrorists use violence against a range of targets (including governments) to advance their ideology.

While such distinctions may seem academic to most readers, they are actually quite important when formulating strategic, tactical, and policy responses to the threat posed by terrorism and insurgencies. As described in Volume 1 of this publication, strategies and tactics for countering insurgency are an important aspect of our knowledge base on countering terrorism, and vice versa. In both cases, experts have emphasized that the use of force to counter an organization whose objectives resonate with a larger disaffected population yields limited (if any) success. Instead, it is argued, the ideology, political, and socioeconomic aspects of an organization— through which it derives its financial support, recruits, and sympathizers from amongst the local population—must be addressed. In other words, the use of hard power in countering terrorism (including insurgencies that employ terrorist tactics) must be complemented by elements of soft power.

The link between counterinsurgency and counterterrorism is also informed by recent analyses which suggest that the al Qaeda movement can be described as a global insurgency, seeking to replace the existing Westphalia-based system of nation-states with a global caliphate in which Islamic law reigns supreme. Recent terror attacks in Bali, Madrid, London, and Cairo, as well as disrupted terror plots in Denmark, the Netherlands, and the United Kingdom, are all seen as examples of how individuals and groups around the world have been inspired by al Qaeda's ideology to commit violence as part of a strategy to change the policy and behavior of these nation-states. In other words, it is argued, al Qaeda uses terrorism tactically and operationally to advance its global insurgent strategy. When described in these terms, the U.S.-led global effort against al Qaeda can be considered to be fighting both terrorism and insurgency. Thus, *Countering Terrorism and Insurgency in the 21st Century* addresses the many challenges that stem from both types of threats to our security.

Another source of confusion in the study of terrorism and insurgency involves disagreement over the proper spelling of certain groups (or, rather, the spelling of the transliteration from the original language into English). For example, a brief survey of the literature reveals that a certain

Lebanese militant group can be spelled Hizballah, Hezbollah, Hizbullah, Hezballah, and Hizbollah. For these volumes, we have standardized the spelling of certain common names across all the chapters, such as al Qaeda (because this is how several agencies of the U.S. government are now spelling it), Hizbollah (because this is how the group spells it on their English language Web site), and Osama bin Laden (rather than Usama). Finally, it is important to note that while many chapters discuss aspects of the "global war on terrorism (GWOT)," we recognize that this term has fallen out of favor among many in the academic and policy communities. However, there currently is a worldwide effort to reduce the capabilities of globally networked terror movements like al Qaeda, and in the absence of an equally useful short-hand reference for this effort, GWOT serves an important role.

At this point in the development of the global counterterrorism effort, it is particularly important to pause for reflection on a number of critical questions. What do we know about effectively countering terrorism and insurgencies? What are the characteristics of successful or unsuccessful counterterrorism and counterinsurgency campaigns? What do we need to learn in order to do these things more effectively? *Countering Terrorism and Insurgency in the 21st Century* addresses these and related questions, and in doing so contributes to national security policy as well as to our understanding of the common threat and how it can be defeated. Chapters of this publication address many different aspects of the unconventional warfare puzzle, examining the most important diplomatic, information, military/law enforcement, and economic/financial dimensions to regional and global cooperation in countering terrorism and insurgency, and providing specific examples of these dimensions in practice.

Authors in the first volume address issues of important strategic and tactical concern, organized around the primary instruments of power through which nations pursue their counterterrorism and counterinsurgency efforts. These instruments can generally be described as either hard power (the use of force by military and law enforcement) or soft power (including diplomacy, information, and intelligence). The second volume provides a variety of insights on how to assess and combat the sources and facilitators of political violence, including state sponsors of terror, authoritarian regimes, criminal network activity, border insecurity, and the global struggle for influence among societies. As highlighted by several authors in this volume, the community of responsibly governed democracies faces uniquely complex challenges in combating terrorism and insurgencies while maintaining civil freedoms. And contributors to the third volume offer in-depth analyses of historical events and lessons learned in counterterrorism and counterinsurgency. Each volume contains a preface and introductory chapter, describing the contributed essays and providing an intellectual background for the discussions that follow.

This project is the final installment of an ambitious trilogy published by Praeger Security International. The first of these—the three-volume *The Making of a Terrorist: Recruitment, Training and Root Causes* (published in 2005)—intends to help readers understand the nature of the threat by exploring what transforms an ordinary individual into a terrorist. This was followed by the three-volume *Homeland Security: Protecting America's Targets* (published in 2006), which explored the ongoing efforts in the United States to secure our borders and ports of entry, and to protect our public spaces and critical infrastructure from future terror attacks. The volumes of *Countering Terrorism and Insurgency in the 21st Century* complement these earlier publications by focusing our attention on the broad, worldwide effort to actively confront those who threaten or use political violence against our communities. Together, these nine volumes are meant to provide a central, authoritative resource for students, teachers, policymakers, journalists, and the general public, as well as stimulate new ideas for research and analysis.

## ACKNOWLEDGMENTS

# PREFACE

The chapters of the final volume of *Countering Terrorism and Insurgency in the 21st Century* provide dozens of case studies from which students and scholars can draw useful lessons and insights to further the study of critical challenges in the global security environment. Readers will undoubtedly note that some of history's prominent terrorist groups are not addressed in these chapters, such as Algeria's Armed Islamic Group and Salafist Group for Preaching and Combat, Indonesia's Jemaah Islamiyah, the Basque separatist group *Euskadi Ta Askatasuna* in Spain, and the Irish Republican Army (and its ideological cousins) in Northern Ireland. A number of books and articles have been published on these and other groups, and many are summarized in the new *Annotated Bibliography of Research on Terrorism and Counterterrorism* published by the Combating Terrorism Center at West Point (available online at: http://ctc.usma.edu). However, in order to manage the overall size of this volume, it has proven impossible to be all-inclusive. Instead, the topics selected for the volume are meant to offer a significant amount of geographic diversity: all the major regions of the world are covered in these chapters, and each country represented in this volume has had significant experience countering terrorism and insurgency.

As with the other two volumes in this book, an introductory chapter is provided in order to frame the discussions that follow. In addition to a brief review of concepts and the existing literature, this chapter also provides a discussion on the value of comparative analyses in general and specifically within the context of studying terrorism and insurgency. Next, Professor Stephen Sloan, who has studied and written about terrorism for several decades, provides his thoughts on necessary changes in counterterrorism education. He addresses the historical context of terrorism studies and why such studies had such a slow and sometimes tortuous path in finding their place as a discrete specialization within both the social and hard sciences. Based on that assessment, the chapter then examines the state of the counterterrorism art as it stands today and suggests critical questions and areas of investigation that must be addressed in order to meet both the short and longer-term evolution of the strategies and tactics

of terrorism. The discussion then focuses more specifically on the elements necessary to evolve the new educational programs that are required to assist the counterterrorism specialist in the academic, public, and corporate sectors to not only achieve the necessary corpus of knowledge, but also disseminate it to those who are on the frontline in combating terrorism. Together, these two introductory chapters frame the case studies offered in this volume and highlight their contributions to the study of countering terrorism and insurgency in the twenty-first century.

The volume is then organized around two types of case studies: examinations of discrete events and discussions of a state's multiyear struggle with terrorism and insurgency. In both sections, authors were asked to provide a brief overview of a particular terrorist event or group (including motivations, aims, organizational strength, leadership, and prominent attacks), and then address how the state responded, what successes or failures resulted, and what lessons (good or bad) we can draw from the case study that can improve our understanding (and practice) of counterterrorism in general. In their analyses of these events, authors were also asked to address topics such as intelligence gathering, surveillance, communication, hostage situations, guerilla warfare, policymaking, legal and ethical considerations, and long-term implications.

## PART I: CASE STUDIES OF TERRORIST ATTACKS AND COUNTERTERRORISM OPERATIONS

The section begins with a case study by Rick Wrona, a U.S. Army officer and a faculty member at the U.S. Military Academy at West Point, in which he analyzes the hijacking of TWA Flight 847 in June 1985. He writes that this event highlighted an atypical aspect of terrorism—instead of sowing fear among their target audience, the terrorists generally succeeded in convincing spectators to sympathize with the hijackers' cause. After providing a brief historical overview of the Lebanese civil war, the rise of Hizbollah, and the Afwaj al-Muqawamah al-Lubnaniyyah (AMAL, or "Lebanese Resistance Brigades"), as well as Palestinian Liberation Organization (PLO), and the actions taken by Israel (particularly, the prisoner exchanges that preceded the attack on Flight 847), Wrona describes the events that transpired in June 1985 and the role played by different governments, including Algeria, Israel, Iran, and Syria. Two noticeable differences separated the TWA 847 crisis from earlier hijackings, and particularly from the contemporary hijackings by Arab factions in the Middle East. First, TWA 847 received more media attention and direct media involvement than any previous hijacking. Second, the hostages' role in the media coverage of the hijacking was something not previously seen in similar events. Finally, Wrona highlights a number of lessons that can be

drawn from this event that inform counterterrorism strategy, particularly in viewing terrorist acts as combat, not as crime.

Another hijacking is the focus of the next chapter by Sean Anderson of Idaho State University and Peter Spagnolo of the Government Training Institute in Boise, Idaho. In October 1985, Palestinian fighters took control of the *Achille Lauro*, a cruise ship owned by the Italian government. Although there had been numerous aircraft hijackings during the early 1980s, the taking of a civilian passenger ship was unprecedented. Consequently, the security measures on the ship were lax: only a passport was required to buy a ticket, there were no checks of luggage, and very little observation of persons embarking other than to ensure that they were paid passengers. After describing the events that took place during this hijacking, the authors provide a brief overview of the pursuit of the culprits and the political fallout in Italy, Israel, Egypt, and the United States, and note that at the time these actual events were unfolding, disagreements over how to interpret and assess the crisis caused significant rifts and conflicts among allies both in the North Atlantic Treaty Organization (NATO) as well as in the Arab world. They conclude that it is impossible to rule out that events similar to the *Achille Lauro* hijacking will not be repeated in the twenty-first century.

Next, Daniel Baracskay of Valdosta State University provides an analysis of the February 1993 attack on the World Trade Center (WTC) in New York. He notes that this event warrants analysis for several reasons. First, it signaled a turning point in American history; where beforehand, terrorist attacks were waged primarily on foreign soil, the events of February 26, 1993 revealed that Americans no longer enjoyed immunity from this form of violence. Second, the WTC bombing indicated that foreign terrorist organizations can successfully penetrate American borders with a significant attack that embodies a political and religious plot for restitution against American presence overseas, particularly in the Middle East. Third, the attack signified the expanding nature of ad hoc terror groups that come together exclusively for violent purposes and exist as organizations that are linked together by the like-minded ideologies of their extremist members. Finally, the event in 1993 was a precursor to the September 11 attack on the two World Trade Center towers 8 years later, indicating that al Qaeda may seek to revisit targets until it succeeds in destroying them. Overall, the implications and lessons from this incident suggest that time and cooperation, both domestically and internationally, will create a more unified front to combat terrorist behavior.

Attacks on a country's major urban centers are not uncommon, as Jim Robbins—a professor at the National Defense University—observes in the next chapter. His analysis of the Chechen attack on (and takeover of) the autonomous region's capitol city, Grozny, in August 1996 reveals the challenges that urban guerilla warfare pose to a nation's government and

military leaders. In one of the few cases of an insurgency prevailing in an urban takeover, Chechen rebel forces took the city in a matter of days and were able to hold it for several years. However, he notes, the reason for the Chechens' success had less to do with their battlefield prowess than the unwillingness of the Russian government to pay the costs necessary to take the city back. Thus, Robbins concludes that the 1996 Battle of Grozny is a cautionary tale for countries involved in counterinsurgency operations under conditions of diffident leadership and weak public support at home.

This analysis is followed by a case study on the bombing of the U.S. embassies in Kenya and Tanzania in August 1998, authored by Sundara Vadlamudi of the Monterey Institute of International Studies. This event was the first major al Qaeda attack against U.S. targets that resulted in a large number of casualties. The meticulous planning, sophistication of the attack (involving near simultaneous bombings), and the number of casualties served as a significant wake-up call to the U.S. intelligence and law enforcement community. The attack brought into sharper focus the danger posed by transnational jihadists, and forced the U.S. government to readjust its counterterrorism policies. The chapter is divided into six sections. The first provides an overview of the bombing plot and lists the key individuals involved in the plot. The second section describes the immediate U.S. response to the bombing and the third section provides an overview of U.S. counterterrorism efforts against Osama bin Laden from the early 1990s until the attack in August 1998. The fourth section describes the cruise missile attacks on al Qaeda targets in Afghanistan and Sudan, launched by the United States as a response to the embassy bombings. The fifth section examines U.S. counterterrorism policies and efforts after the cruise missile attacks. And finally, the conclusion highlights some of the lessons learned from the U.S. response to the embassy bombings.

The next chapter, co-authored by Gary Ackerman of the University of Maryland and Sundara Vadlamudi, describes the history, exploits, pursuit, and capture of Ramzi Yousef, the mastermind of the 1993 attack on the World Trade Center in New York, among several other Islamist extremist terror plots. During his relatively brief career as an international terrorist, crisscrossing the globe from 1993 to 1995, Yousef succeeded in attacking one of the world's most prominent structures, plotting the assassination of several heads of state, winning over dozens of Muslim radicals, and planning what would have been one of the deadliest and most complex terrorist attacks of all time, all the while being pursued by several nations' law enforcement and intelligence agencies. Yousef has been variously described as a "mastermind" and—at least while he was active—as "the most dangerous man in the world," monikers that he egotistically appreciated; yet much about this chameleon-like villain remains a mystery. This chapter describes what is known about

Yousef's origins and his development as a terrorist, and traces his global exploits of mayhem. At the same time, the authors examine the nature and efficacy of the ultimately successful counterterrorist effort directed toward capturing a man who quickly rose to the rank of the world's most wanted terrorist. Lastly, the chapter draws lessons from the campaign against Yousef, lessons which can be applied to both current and future counterterrorism operations.

Next, Ruth Margolies Beitler of the U.S. Military Academy provides a case study of the attack on the USS *Cole*, a U.S. Navy destroyer refueling in Aden's harbor off the coast of Yemen on October 12, 2000. With 17 sailors dead and more than 38 wounded, the attack shocked the United States and its allies, and brought into sharp relief the relations between Yemen and the United States. Her chapter explores the events leading to the bombing of the USS *Cole*, the challenges of executing an investigation on foreign soil, and the ramifications of the *Cole* attack for U.S. counterterrorist policy. Regarding the latter, the investigation into the bombing of the USS *Cole* indicated clear shortcomings on a variety of levels. First, agencies within the United States must work together to increase the effectiveness of the investigations. Second, the United States must recognize the indigenous capability of a host nation, such as Yemen, and capitalize on those areas where the host nation retains a clear advantage over American investigators. Third, the U.S. government must grasp the flexible and ever-changing tactics utilized by al Qaeda. Overall, by assessing how the *Cole* investigation was handled, this chapter provides lessons for future investigations and counterterrorism cooperation.

Next, U.S. terrorism expert Robert Wesley describes the hunt for Khalid Sheik Mohammad, the tactical mastermind behind the 9/11 attacks, who was captured on March 3, 2003, in the Pakistani city of Rawalpindi. This chapter highlights the complex process that led to his detainment and the lessons underlined by this process. His capture serves to emphasize how the United States will be operating in the future to ensure continued progress in disrupting both the traditional leadership and those who replace them. Mohammad's case study allows for reflection on several counterterrorism issues likely to have an impact on the future of this global conflict. For example, governments must recognize the importance of developing strong international partnering relationships; harnessing the core competencies of joint operations, involving U.S. and host-country organizations; creating and exploiting actionable intelligence; identifying and provoking security mistakes by al Qaeda operatives; and targeting "partner organizations" of al Qaeda.

The next case study by Adam Dolnik of the University of Wollongong, Australia, describes the siege of School No. 1 in the North Ossetian town of Beslan, Russia. On September 1, 2004, a group of terrorists took more than 1,200 hostages on the first day of school in what became the

deadliest hostage crisis—and the fourth deadliest terrorist attack—in history. After a 52-hour standoff, the detonation of explosive devices inside the school triggered a chaotic rescue operation in which 31 terrorists and 331 innocent victims were killed, 176 of them children. This chapter analyzes the myths and facts of the attack, with a clear purpose of identifying the lessons learned. The central focus is devoted to the Russian response, namely, the crisis negotiation approach and management of the tactical assault. In addition, the chapter examines events that occurred before Beslan that in retrospect could have provided an intelligence picture concrete enough to prevent the attack, as well as the media management and investigation aspects of the incident. The Beslan school hostage crisis was an unprecedented terrorist attack, both in its scale and targeting. It is clear that understanding the lessons of Beslan is one of the key prerequisites of designing counterinsurgency and counterterrorism strategies for the twenty-first century.

This is followed by a chapter from Rogelio Alonso of King Juan Carlos University in which he examines the terrorist attacks of March 11, 2004, in Madrid. Although Spain had been constantly targeted by various types of terrorism since the late 1960s, violence from the ethno-nationalist Basque terrorist group *Euskadi Ta Askatasuna* (ETA, or Basque Fatherland and Freedom) being by far the most intense, never before had a terrorist attack in the country been so indiscriminate and lethal. On that day, ten bombs planted in four different trains filled with thousands of commuters on their way to Madrid were detonated between 7:37 and 7:40 A.M., killing 191 people. As it would soon emerge, the killings on March 11 were carried out by a group of Islamist terrorists, some of whom were closely linked to individuals who were also part of the al Qaeda network. The chapter examines the events that led to this terrorist attack, analyzes how and why such an atrocity was perpetrated, as well as its implications for counterterrorism in the country, and concludes with an analysis of the main counterterrorism measures implemented as a response to this tragedy.

Next, Tom Maley of Cranfeld University examines the terrorist attacks of July 7, 2005, in London, England. After describing in detail the events that took place and the subsequent police investigation, Maley examines the motivations of the bombers, concluding that Muslim disadvantage, under-achievement, and under-representation at the hands of Western influence and policies seem to have been key motivational themes; thus, they sought martyrdom operations in their quest to right these wrongs. He then describes the government's response to the attacks within the context of the UK's long-term counterterrorism strategy. Operationally, this strategy is based upon four pillars: prevention, pursuit, protection, and preparedness, known colloquially as the "Four Ps." The first two pillars were designed to reduce the threat, whereas the remaining two pillars focused upon the UK's vulnerabilities with respect to international

terrorism. Overall, Maley's analysis provides several important insights into the most likely type of self-organized and motivated terrorist attack we may see in other large Western cities, as well as how to cope with and counter the threat from local al Qaeda-inspired terrorist cells.

The final chapter of this section by Daniel Baracskay examines the April 1995 bombing of the Murrah Federal Building in Oklahoma City. He notes that this was a significant event for three principle reasons. First, the bombing established that American cities are vulnerable not only to the threats of external terrorist groups, but also to the impulses of internal extremists that are willing to use violence to advance their objectives. Second, the Oklahoma City bombing was the second large-scale assault on a public building in a 2-year period. The use of terrorism as an instrument of destruction is becoming more pervasive in the United States, if not expected. Finally, trends have shown that terror groups purposefully identify large and densely populated urban centers for targets in the United States and intentionally use violence in these cities to gain media coverage. This chapter analyzes the Oklahoma City bombing incident in detail and examines several implications and lessons that have surfaced in the decade following the event.

## PART II: CASE STUDIES OF THE LONG-TERM FIGHT AGAINST TERRORISM AND INSURGENCY

The second section of the volume explores the struggle between nation-states and terrorist groups operating within their borders. The first chapter of this section, by Tom Marks of the National Defense University, examines the response of the Sri Lankan government to the persistent threat posed by the Liberation Tigers of Tamil Eelam (LTTE). He notes that the LTTE is labeled "terrorist" by any number of governments, but in reality, it is an insurgency in intent and methodology. It has, however, gone from using terror as a tool for mass mobilization to using it as a strategy for insurgency. The success of the LTTE reveals the ability of a radical, institutionally totalitarian movement to recruit, socialize, and deploy manpower so rigidly indoctrinated that combatants prefer death by cyanide or self-destruction to capture. Having gained control of certain areas early on, LTTE was able to recruit manpower at young ages and then guide them in ways that produced entire units comprising young boys and girls who had never known alternative modes of existence. Meanwhile, this case study reveals several mistakes of strategic approach and operational implementation on the part of the government. These began with a persistent failure to assess the insurgency in terms appropriate to framing a correct response, attacking the symptoms to the near-exclusion of the causes of the violence, and misinterpreting that violence once it appeared. To focus upon the tactical acts of terror, then, was precisely the wrong approach.

Certainly repression was a necessary element of state response, but the security forces should only have been an instrument for the accomplishment of a political solution.

Next, Joanne Wright, the Pro-Vice-Chancellor at Sussex University, provides a case study of West Germany's Red Army Faction (RAF, a.k.a. the Baader Meinhof Gang). Examining the RAF, its motivating ideology, and particularly the West German government's counterterrorism policies can provide valuable lessons and insights into twenty-first-century terrorism. It can illustrate, for example, how a relatively small and seemingly irrational group can create a physical and psychological impact way out of proportion to size and threat. Perhaps even more usefully, it can illustrate that whatever sympathy terrorist groups do manage to generate among national and international audiences is largely derived from government responses to terrorism. Her chapter suggests that the RAF was able to generate some degree of success and attach some degree of credibility to its analysis of a repressive state in three areas: security force behavior, prisoners and prison conditions, and legislative changes. Overall, the West German experience highlights the need to review the impact of policies on the motivations and support of terror groups within a society.

This is followed by a chapter from David Scott Palmer of Boston University in which he examines the case of Sendero Luminoso (Shining Path) in Peru. Beginning in May 1980, the government of Peru faced the first attacks from a Maoist insurgency originating in the Andean highlands known as Shining Path, attacks that expanded dramatically over the decade. By 1990, more than 20,000 Peruvians had been killed, $10 billion of infrastructure had been damaged or destroyed, and some 9 million internal refugees and emigrants had fled their homes. This chapter offers an abbreviated account of the rise and fall of Shining Path. It discusses the conditions contributing to the initial formation and growth of the insurgency, the largely counterproductive responses by the Peruvian government and its security forces, and the key elements of the major strategic and tactical overhaul that turned the tables on the insurgents. The conclusion draws together the lessons to be learned as to how a guerrilla movement could come close to succeeding, as well as how a besieged government could overcome the threat—lessons of possible use to other governments in the formulation of their own counterinsurgency and counterterrorism policies.

A similar analysis of counterinsurgency in Latin America is provided in a chapter on the Revolutionary Armed Forces of Colombia (FARC), co-authored by Nicolás Urrutia Iriarte and Román Ortiz of Los Andes University (Bogotá). Traditionally, FARC has been considered the oldest guerilla movement in Latin America, with a history of nearly 40 years. It has also proven to be one of the more adaptable movements, as an analysis of their military tactics and financial dealings reveal. The group

had its origins in an essentially rural country with scarce social mobility and deficient political participation mechanisms. However, the long-term evolution of their attack capabilities, the multiplication of its financial resources—particularly resulting from an increase in the demand for cocaine in the new markets of Eastern Europe and the expansion of heroin production in Colombia, which provided FARC with new options to increase the volume of income from drug trafficking—and the renewed capacity to project its political message has turned FARC into a formidable threat. Their research highlights how clandestine networks for exchanging technology and military information between terrorist groups and criminal organizations have offered FARC critical channels through which they could expand their fighting capability, creating enormous challenges for the government's counterterrorism and counterintelligence efforts.

Another insurgency with a considerable history is examined in the following chapter by Thomas Sherlock of the U.S. Military Academy, which explains the origins of the Chechen crisis, assesses the costs to Russian pluralism of the Kremlin's efforts to pacify Chechnya, and suggests what the West might do to help resolve one of Russia's most important political problems. Throughout numerous brutal encounters with Russia, Chechen civilian casualties have been high and there is deep animosity throughout the region, rooted in decades of government repression. Sherlock notes that promoting democratization in Russia and working to resolve the crisis in Chechnya are important goals for the West, but it should not oscillate between condemnation and approval of Russian behavior in Chechnya, even in the face of dramatic intervening events, such as the terror attacks of 9/11, which led Washington to adopt generally supportive language regarding Kremlin policies in Chechnya. Putin and Russia's political elites fear that instability in Chechnya will spread throughout the Caucasus. Meanwhile, the recent, unexpected, and tumultuous "revolutions" on Russia's borders are viewed as threats by Russia's ruling elites, who since Putin's accession to power have been drawn in large part from the security services, and who worry that Russian influence is yet again receding in post-Soviet space. Such perceptions of vulnerability strengthen the desire to treat the problem of Chechnya as a completely "internal" matter. Sherlock concludes that while holding Russia publicly and privately accountable for atrocities committed in Chechnya by Russian and pro-Russian Chechen forces, the West should repeatedly reassure the Kremlin of its support for Russia's territorial integrity, while promoting even-handed proposals that may effectively compel Russia to negotiate with moderate elements to reach a final solution to the Chechen insurgency.

Next, Erica Chenoweth of Harvard University examines one of the most durable and evasive terrorist groups of the 1970s and 1980s in Italy—the Red Brigades. Her investigation into the history of this group illuminates the successes and failures of the Italian government in confronting the Red

Brigades, providing several observations that should inform current U.S. policy in fighting insurgency and terrorism. For example, Italian counterterrorism efforts initially failed because of shadowy complicity between elements of the state and right-wing terrorism; refusal of the government to acknowledge the destructive potential of the Red Brigades; knee-jerk reactions resulting in undemocratic policies that raised some ethical considerations; and a failure to appreciate the escalatory effects of intergroup rivalries among terrorist groups. However, according to Chenoweth, the eventual successes of Italian counterterrorism included a unification of intelligence units and a coordination of their activities; creation of special commando forces with training in hostage crises; and finally, the introduction of policies that exploited internal divisions within the Red Brigades and led to the defection of many members.

Rick Wrona follows with a case study on the Lebanese terror organization Hizbollah. After describing the origins of Hizbollah, he examines the group's ideology and its sponsorship by Iran and Syria. Today, he notes, the organization acts as a political, economic, social, and military leader in Lebanese society. Responding to such an organization is a daunting challenge for the United States and its allies in the region, most notably Israel. As a case study, Hizbollah demonstrates the lack of American consistency when dealing with organizations that resort to terrorism. America's focus on Hizbollah has been sporadic and, in many instances, poorly timed. Further, American support of the Lebanese regime in the early 1980s had the unintended consequence of turning the Shi'a population against the United States, because support of the regime equated to support of the Maronite factions controlling the government. Likewise, American support of Israel, particularly after the 1973 Yom Kippur/Ramadan War, came to be viewed by Hizbollah as both an indirect attack on the Lebanese people and direct support for Israeli regional expansion. Hizbollah's history demonstrates that integration into the political process has simply given the organization more tools by which to achieve its goals, raising questions about the role of democratization in countering terrorism. Finally, the example of Hizbollah demonstrates the power of organizations that combine national, religious, and class appeal successfully. While some terrorist organizations (most notably several European groups of the 1970s) have been unable to expand beyond a small core of radicalized supporters, Hizbollah is the textbook case of an organization that has built a constituency that guarantees the group's longevity and importance for the foreseeable future.

The next chapter by Lydia Khalil of the New York Police Department examines the Partia Karkaren Kurdistan (PKK, or the Kurdistan Workers Party). Founded by a small group of communist Kurdish students of the University of Ankara and led by Abdullah Ocalan, the PKK was originally a Marxist-Leninist-Maoist group attempting to establish socialism

in the Kurdish populated areas of the Middle East. In the late 1980s, the PKK came to focus more on promoting Kurdish nationalism and the establishment of a Kurdish nation-state. Turkey's fight against the PKK is a good example of how a military defeat of a terrorist insurgency does not automatically translate into permanent peace. Although the group is currently not operating with the full military and political force it had before Ocalan's arrest, the lack of a political settlement on Turkey's Kurdish question allowed the PKK to continue hit and run operations against Turkish forces and civilian targets. Clashes between PKK rebels and Turkish security forces have increased since the PKK called off their unilateral ceasefire in the summer of 2004. After a study of Turkey's different counterterrorism policies toward the PKK, this analysis highlights lessons learned from Turkey's successes and failures in dealing with the PKK.

This is followed by a chapter from Joshua L. Gleis of Tufts University on counterterrorism measures adopted by Israel in its fight against terrorist organizations. His description of Israeli tactics is particularly interesting. For example, narrow alleys require infantry to move house to house, blowing holes through walls in order to limit the danger to them from snipers and explosives planted in the entrances. His chapter also addresses issues of doctrine, education, preemption, targeted assassinations, and technology, including civilian antiaircraft missile systems, counterterrorism measures implemented on buses, and long-range explosives detectors. He notes that the U.S. armed forces, and particularly the Marine Corps, have joint training exercises with Israeli forces and are learning from Israel's urban warfare tactics. However, in the intelligence field there is still an extreme lack of trust toward the Israeli intelligence and security agencies. Overall, he concludes, there is much that can be learned from Israel's long experience in combating insurgency and terrorism.

Next, Brian Fishman of the Combating Terrorism Center at West Point provides a case study of Syria's struggle against the Muslim Brotherhood during the 1970s. This chapter examines the efforts of Syrian President Hafez al-Asad to defeat several armed groups operating in the streets, many of whom were associated with the Syrian Muslim Brotherhood (Brotherhood). Although the focus is on Asad's campaign against the militant Islamic opposition, it is impossible (and would be entirely improper) to separate Syria's counterinsurgency policies from Asad's efforts to build a social and political system that would enable him to dominate the Syrian state. Asad's strategy for defeating the Brotherhood contained four elements employed by all governments fighting counterinsurgencies: (1) strengthen and legitimize the government, in this case Asad himself; (2) target the insurgent's support networks domestically and internationally; (3) de-legitimize the insurgents; and (4) use violence to eliminate the insurgents and deter sympathizers. In order to understand Asad's approach to counterinsurgency, one must understand the social bases

of both the Ba'th party in Syria and the Brotherhood. The chapter begins by reviewing the rise of Asad's Alawite-dominated Ba'athist regime in Syria and the Sunni Brotherhood-associated movement that violently challenged his authority. This leads naturally into a discussion of the struggle for legitimacy between Asad and the Brotherhood. Overall, this case study is an excellent example of how counterinsurgency in an autocratic state represents the struggle of an individual or party to fend off challenges to its power and legitimacy.

Militant Islamism is also the focus of the next chapter, by Sherifa Zuhur of the U.S. Army War College, in which she provides a detailed history of Egypt's long (and recently resurgent) conflict with several Islamist groups, some of which have proved more violent than others. For much of this history, Egypt's leaders have sought to contain Islam as a political force and suppressed an array of Islamist groups. While officials disagree that their stringent counterterrorist actions could encourage further jihad, she argues, torture and imprisonment of Islamists in the 1960s produced several results in the 1970s: uncompromising radicalism and aims to immediately overthrow the state; or accommodation and commitment to a gradual Islamization of the state, this being the path of the Muslim Brotherhood. Torture and imprisonment in the late 1970s and 1980s led to further organizational development in prisons themselves, including the forming of new radical groups and the spread of "global jihad" or the quest for sanctuary somewhere outside of Egypt. She notes that in recent years, Egypt has accepted moderate Islamism in other dimensions (intellectual and social), but recent acts of religious violence (including attacks in Cairo, Sharm al-Shaykh, and Dahab) have renewed the state's efforts to counteract the rise of moderate Islamism in its political form.

In the next chapter, Vera Eccarius-Kelly of Siena College provides another case study in which a nation-state's counterterrorism policies and tactics may have contributed to the strength of a violent insurgency. Her analysis of Peru's response to the *Movimiento Revolutionario Túpac Amaru* (Revolutionary Movement of Tupac Amaru, or MRTA) reveals a repressive and corrupt national security state. This chapter examines the government's management of the media, its collusion with corrupt military and police, and its embrace of tactics of intimidation, abduction, torture, and a series of other horrific human rights offenses. She describes several of the major confrontations between the Peruvian government and the MRTA, and offers a detailed analysis of the counterterrorism policies employed during the 1996–1997 hostage crisis at the Japanese Ambassador's residence in the capital city Lima. Several significant insights can be gained from investigating the measures utilized to defeat the MRTA during both the García and Fujimori presidencies between 1985 and 2000. Overall, an evaluation of the Peruvian government's handling of the MRTA is an important case study of counterinsurgency

and counterterrorism measures in a society with fledging democratic institutions.

A similar case of a fledging democracy battling a terrorism-inclined insurgency can be found in the Philippines, as Robin Bowman of the U.S. Air Force Academy describes. Her chapter addresses the "whys"—goals, motivations, and leadership—and "hows" (including organization and tactics) behind the violent Muslim separatist movements in the Philippines, and their well-documented connections with foreign jihadists, as well as Manila's responses to its home-grown insurgencies and international terrorism. The country is considered highly vulnerable to foreign terrorist penetration and prolific domestic attacks due to its abundant Christian and Western targets, its fluid borders, weak political institutions and responses, and general lack of governmental reach into the Muslim regions. Bowman begins the chapter with a look at the formation of Moro identity, and how and why this community turned to violence and militancy in order to assert their goals of a distinct and independent Muslim homeland. She then profiles each of the violent separatist movements (particularly the Moro Islamic Liberation Front and the Abu Sayyaf Group) before describing the government's response. Overall, this chapter offers an interesting case study of political violence.

The struggle for a distinct and independent Muslim homeland is also a centerpiece of the next chapter by Johua Sinai of The Analysis Corporation in which he describes the Islamic Movement of Uzbekistan (IMU) and its struggle with the secular regime of President Karimov. Uzbekistan is the former Soviet Union's largest Muslim nation, with a population of 25.1 million people. The government believes that its counterinsurgency and counterterrorism strategies will enable it to avoid the fate of its smaller southern neighbor Tajikistan, which has been engulfed in a civil war since independence. So far, these strategies have not succeeded in rooting out Uzbekistan's extremist Islamic insurgency because its military campaign has been ineffective and solutions still need to be provided to tackle the country's internal problems, particularly the lack of full political participation in the form of free, fair, and competitive elections. Sinai notes that an effective response to the radical Islamic insurgency in Uzbekistan must be found and implemented, because this insurgency is part of a wider series of insurgencies facing the Central Asian states that pose a major threat to regional stability, democratization, and economic well-being. However, until Uzbekistan adopts a more democratic course, he argues, there will be few internal or external allies to help it defeat the IMU's insurgency.

The next chapter addresses another critical insurgency/separatist movement in this region: Kashmir. Authored by retired Indian Army officer Behram A. Sahukar, the chapter examines the origins of the Kashmir issue and the role of Pakistan in sponsoring or supporting Islamic militant groups engaged in terrorist attacks. He explains how the Soviet invasion

of Afghanistan in 1979 made Pakistan a frontline state in the United States-funded jihad against the Soviet Union, and the infusion of CIA-funded arms, equipment, and other forms of support into Pakistan legitimized the use of Islam to fight an Islamic holy war. The end of the Afghan jihad in 1989 left Pakistan flooded with surplus arms and equipment, as well as a cadre of fighters with experience in a prolonged low intensity conflict. Mujahideen who had completed their successful mission against the Soviets were diverted to Kashmir to continue their fight for Islam in Kashmir against "infidel" Hindu India. Since 1989, separatist violence in Kashmir has been backed by a radical Islamist ideology that aims to annex Kashmir to Pakistan and extend Islamic rule over India. Pakistan considers the issue of Kashmir as the "unfinished agenda of partition," and remains in occupation of one third of the Indian state. It has tried to take the rest of the state by force several times in the past and failed. However, both sides have now realized that continued hostility and acrimony is counterproductive to the peace and stability of the region. This realization led to the beginnings of a comprehensive dialogue and peace process in April 2003, and a series of confidence building measures. Unfortunately, the jihadi factor and the anti-India military in Pakistan has been a hindrance to any lasting peaceful solution to Kashmir. Sahukar concludes that unless Pakistan abandons its fixation with Kashmir and returns to a democracy, the military and the Inter Services Intelligence agency will continue to fuel a proxy war against India.

Nearby this troubled region, another insurgency has grown in strength and prominence since 1996, led by the Communist Party of Nepal (Maoist), or CPN(M), in which more than 13,000 Nepalis have lost their lives, many to insurgent torture and murder. The chapter by Tom Marks of the National Defense University describes the socio-political roots of the insurgency and the influence on the CPN(M) by other communist movements, notably *Sendero Luminoso* in Peru and Maoists in India. In Nepal, the Maoists seized territory over a period of years, enlisting a growing number of recruits until by 2003 the government estimated the movement's strength to be roughly 5,500 combatants, 8,000 militia, 4,500 cadre, 33,000 hardcore followers, and 200,000 sympathizers. Marks then describes the government's response to this "people's war" as anything but adequate. Patrols sent to the scenes of incidents were ambushed, while numerous small police stations were overrun, attacked in the dead of night in assaults initiated with homemade explosives, then overwhelmed by human wave assaults. The police then abandoned outlying stations and consolidated their forces in a defensible mass, and by early 2003, half of all police stations nationwide had been abandoned. Once the police presence was eliminated, the insurgents became the state. Marks also criticizes the Nepalese government for the lack of a political component to its counterinsurgency strategy. He concludes that counterterrorism should be

an important element, but only one element of many in a comprehensive approach, a blend of the violent and the nonviolent that addresses the roots of conflict and creates good governance.

The next chapter examines a unique form of terrorism with roots in Japan, but affiliations in other Asian countries as well. As James Smith of the U.S. Air Force Academy's Institute for National Security Studies writes, the case of Aum Shinrikyo—a Japanese "new religion" and cult that also embraced and practiced chemical and biological terrorism—and of the restrained and delayed Japanese government response provides significant lessons for those seeking to better understand and respond to terrorism, domestic religion-based terrorism, and weapons of mass destruction (WMD) terrorism. The chapter also illustrates the utility to terrorism of "sanctuary under national law," and of the acquisition of chemical and biological materials and production equipment under the sanctuary of legitimate business operations. Smith explores important issues of—and consequences from—governmental restraint and the persistent challenge of balancing civil liberties and national security. Finally, the case of Aum Shinrikyo also illustrates the utility of a culturally based analytical framework in examining terrorist groups and political violence, terrorist decisions and actions regarding WMD acquisition and use, and government response options and constraints.

The final chapter of this volume brings us back to the United States, where Eric Shibuya of the U.S. Marine Corps Command and Staff College examines the struggle with violent right-wing extremist groups. After describing several different types of groups, he identifies three trends as most significant when considering the threat these groups pose to the United States. The first is that the use of a WMD in a terrorist attack is clearly not beyond the scope of possibility for violent right-wing actors, in terms of motivation or in (growing) capability. The second trend is the increasing value of the Internet in putting the leaderless resistance form of operation into practice. The Internet has been a boon to the movement by allowing for the creation of virtual communities of interest that are more anonymous and physically disconnected, making investigation and surveillance much more difficult. The third and perhaps most significant trend is the growing statements of common cause between the violent right-wing movement and other terrorist movements. It may be an exaggeration to consider groups like al Qaeda and the Aryan Nations to be part of a single "movement," but it is certainly true that both groups find common cause in their hatred for the U.S. government. While strategic alliances may be less likely, tactical relationships may increase as both groups find areas of mutual benefit to work together. Overall, this chapter demonstrates that the threat from violent right-wing groups must be included in our national strategies for countering insurgency and terrorism in the twenty-first century.

## CONCLUSION

As a collection, these chapters demonstrate the truly global challenge of combating terrorism and insurgency. Further, there is unfortunately a wealth of additional case studies worth exploring beyond what is covered in this volume. Clearly, there is much that any country can learn from the experience of others in how to meet these challenges in new and increasingly successful ways. Thus, this collection will hopefully stimulate the reader to pursue further research on their own, in order to expand our collective understanding of countering terrorism and insurgency in the twenty-first century.

# CHAPTER 1

## AN INTRODUCTION TO THE COMPARATIVE STUDY OF COUNTERTERRORISM

James J. F. Forest

The primary goal of this volume is to distill lessons and insights from past conflicts involving terrorism or insurgency that will help inform new approaches to fighting current and future counterterrorism and counterinsurgency campaigns. Volumes 1 and 2 of *Countering Terrorism and Insurgency in the 21st Century* address important themes in a mostly international and comparative perspective. The chapters of this third volume provide a more detailed analysis of the experiences of many countries and regions, adding greater qualitative depth to the comparative perspectives offered in the other two volumes.

A comparative perspective helps us identify phenomena that, while framed by different political and social arrangements, lead to a better understanding of a complex world and our place within it. In the study of counterterrorism and counterinsurgency, we are so often bound by the constraints of national thinking that a comparative perspective becomes especially valuable, because the security challenges facing the global community of responsible nations have many common characteristics. As a collection, these chapters complement each other in highlighting important themes and issues that transcend the many differences in history, culture, and experience that occur among nations. Lessons learned in counterterrorism policies and practices in different countries can offer valuable insights to those officials responsible for setting policy.[1] Further, while it is important to review cases where governments have had success, it is also vital to examine instances where things did not go so well for the

government, or the terrorists actually succeeded in carrying out their deadly mission.

## A SAMPLING OF SUCCESSFUL COUNTERTERRORISM OPERATIONS

On January 7, 2005, a group of suspected Islamic militants were arrested in Manila, the capital of the Philippines. The group was discovered in the process of assembling bombs for what was intended to be an attack on the Christian festival of the Black Nazarene, an annual event that attracts tens of thousands of devotees. When police examined the improvised explosive devices and bomb components, including timing gadgets and cables, they realized that the death toll of the explosions, had they occurred, would have been considerable.[2] On November 9, 2005, state and federal police forces in Australia raided dozens of properties in Melbourne and Sydney, arresting 17 men and seizing large quantities of alleged precursor chemicals, laboratory equipment, instruction manuals on the production of the explosive triacetone triperoxide (TATP), and maps and photographs of potential targets. Police and political leaders declared that the operation had foiled an imminent attack of enormous magnitude.[3]

In June 2006, London police conducted a series of arrests after uncovering a plot to explode up to 12 aircraft in mid-flight between Britain and America. Authorities said that the would-be terrorists planned to carry the explosive material and detonating devices onto aircraft disguised as drinks (or other liquids that appeared innocuous on their own but could be potentially deadly when mixed) and seemingly harmless electronic devices. Subsequently, it was revealed that authorities had been monitoring the meetings, movements, travel, spending, and the aspirations of a large group of people since December 2005, and it was this surveillance effort that led to the disruption of the plot and arrest of the cell's members.[4] Clearly, as described at length in Volume 1 of this book, intelligence plays a critical role in countering terrorism. For example, in September 2006, a sting operation conducted by authorities in Odense, Denmark, resulted in the arrest of nine men charged with suspicion of plotting to carry out a bomb attack on Danish soil. Police uncovered chemicals used to make bombs, along with computers, telephones, and CD-ROMs suggesting that a radical Islamist-inspired terror attack was imminent.[5]

Similar counterterrorism investigations conducted in the United States have resulted in arrests and convictions that, in the end, help make our nation safer. For example, on September 13, 2002, the FBI arrested five U.S. citizens near Buffalo, New York (Sahim Alwan, Faysal Galab, Yahya Goba, Shafal Mosed, and Yasein Taher), charging them with "providing, attempting to provide, and conspiring to provide material support and resources to a designated foreign terrorist organization." In addition,

Mukhtar Albakri, also a U.S. citizen, was arrested in Bahrain on the same charges. All six individuals were indicted on these charges on October 21, 2002. The arrests and indictments were based on information indicating that these individuals traveled to an al Qaeda training camp in Afghanistan in 2001, where they received military training and were visited by Osama bin Laden. All six pled guilty to terrorist related charges and received prison sentences ranging between 7 and 10 years.[6]

In Portland, Oregon, six individuals (Ahmed Bilal, his brother Mohammad Bilal, Habes Al-Saoub, Patrice Ford, Jeffrey Battle, and October Lewis) were indicted on October 3, 2002, and subsequently arrested on federal charges, including conspiracy to levy war against the United States, conspiracy to provide material support and resources to a terrorist organization, conspiracy to contribute services to al Qaeda and the Taliban, and possessing firearms in furtherance of crimes of violence. With the exception of Al-Saoub, these subjects have pled guilty to terrorism related and money laundering charges and have received federal sentences ranging from 3 to 18 years. The only subject who has not been brought to justice, Al-Saoub, is believed to have been killed in Pakistan, by Pakistani military authorities.[7]

In Los Angeles, an investigation led by the FBI's Joint Terrorism Task Force discovered that Irving Rubin and Earl Krugel—active members of the Jewish Defense League (JDL), a known violent extremist Jewish Organization—were planning to attack the Islamic Muslim Public Affairs Council (IMPAC) office in Los Angeles, or possibly the California office of United States Congressman Darrell Issa. Statements made by Krugel indicated that the motivation for the attack was to serve as a "wake up call" to the Muslim Community. Rubin and Krugel were arrested for conspiring to build and place an improvised explosive device at the IMPAC office.[8]

These cases, as well as those developed by Philip Heymann and his colleagues for use at Harvard University's John F. Kennedy School of Government, offer important learning opportunities in courses on terrorism and counterterrorism.[9] But in addition to examining successful examples of counterterrorism, it is also important to explore situations in which authorities made mistakes that could have—or did—prove lethal for those people whom they intended to protect.

## EXAMINING QUESTIONABLE "SUCCESSES" IN COUNTERTERRORISM

Sometimes intelligence fails, and luck is all that prevents a terrorist attack. For example, in August 2006, German authorities disclosed a botched plot to bomb two trains. In this case, two men left suitcases stuffed with crude propane-gas bombs on trains heading for the western cities

of Hamm and Koblenz, but the explosives failed to detonate because of a "technical defect," according to the German federal prosecutor. If they had detonated as intended, the police said, they would have killed a "high number" of passengers.[10]

A more dramatic example of questionable success in countering terrorism is drawn from the recent siege of a theater in Moscow. At 9 P.M. on October 23, 2002, 41 Chechen separatists calling themselves the Islamic Suicide Squad took more than 800 Moscow theatergoers hostage.[11] This precipitated a 57-hour crisis that captured the world's attention. The Chechens were armed with small arms and machine guns. They also carried a large amount of explosives, much of which was strapped to their bodies to ward off attempts by Russian authorities to take the theater by force. They sought negotiations with Russian authorities in a quest to meet their demands for an end to the war in Chechnya, withdrawal of Russian forces, and Chechen independence. On October 26, they set a deadline of 12 hours for the Russian government to comply with their demands before they would "start shooting the captives." A second deadline (7 days) demanded "to bring an end to the war . . . or they would blow up themselves, the hostages and the theater."[12] But the Russian government was never willing to cooperate or negotiate, as evidenced by the lack of official government negotiators at any point in the process. In the early morning hours of October 27, the hostage crisis ended when Russian Federal Security Service (FSB) special forces (Spetsnaz) pumped an aerosol version of a potent, fast-acting opiate named fentanyl into the theater and then stormed it by force.[13] The gas prevented the Chechens from mounting any resistance to the assault. The fentanyl, however, had a stronger effect than expected. By the end of the incident, 129 hostages and 41 hostage-takers had died—all but two of the hostages' deaths were due to the effects of gas inhalation.

As Adam Dolnik recounts in his chapter of this volume, the Russians faced a similar hostage-taking challenge a year later at a school in Beslan, with similarly disastrous results. Naturally, the authorities in Russia have little interest in "hanging out their dirty laundry" for the rest of us to see, but in cases like these the counterterrorism community would gain tremendously from a critical, introspective analysis from the strategists, tacticians, and policymakers involved about what mistakes might have been prevented, and what other countries might do to avoid similar mistakes when faced with their own terrorist hostage crisis.

## LEARNING FROM INSTANCES IN WHICH THE TERRORISTS SUCCEEDED

Unfortunately, there are far too many instances where the terrorists succeed with their deadly mission, and evidence collected during post-attack

investigations offer important insights for the counterterrorism community. Thus, it can be argued that authorities need to provide as much detail as possible to members of the academic community (without, of course, jeopardizing their case for possibly prosecuting the perpetrators) who are responsible for teaching the next generation of national security professionals. A recent example from Indonesia is particularly instructive.[14]

In October 2005, three men walked into separate restaurants in Bali and blew themselves up, killing 15 Indonesians, 4 Australians, and a Japanese tourist. In the course of their investigation, Indonesian police discovered the step-by-step plan of the attack, a 34-page document startling in its scope and detail. Even the smallest aspects of the attack were carefully choreographed. For example, the author identifies the intended targets as "foreign tourists from America and its allies," but recognizes that the bombers would have trouble determining the native country of many tourists. "So," he notes, "we will consider all white people the enemy." A few weeks before the attacks, the three men who would carry out the operation were sent to Bali to do a "survey" of possible targets for themselves. Beforehand, they were told to learn what they could about Bali (a popular tourist island) on the Internet, and to get tourist brochures and a map. As part of their surveillance, the men were told to "pay attention to clothes worn by local tourists" and note what kind of day packs or shoulder bags they carried and whether they carried more than one. The document, titled "The Bali Project," was found on the computer of Azhari Husin, a Malaysian-born engineer educated in Australia and Britain who became a master bomb maker and was one of the most dangerous terrorists in Southeast Asia until he was killed in a shootout with the police in November 2005. His co-planner was Mohammad Noordin Top, who has narrowly escaped capture several times and remains on the run.

Documents like these serve an important purpose beyond their primary investigative purposes—they shed light on the strategic mindset and capabilities of modern terrorist groups who have embraced the tactic of suicide bombing. For example, the author describes how the group decided that discos and nightclubs offered potential targets because most of the patrons were foreigners, and there was "no security to speak of, easy to enter." But those sites were ultimately rejected, because backpacks would be suspicious at the time of night when the clubs got crowded, after 9 P.M. That led the men to consider restaurants in Kuta, one of the most popular tourist districts, as well as the seafood restaurants on the beach at Jimbaran. "Of all the places," the document says, "this may be the easiest, God willing." The team explained how the tables at Jimbaran were arranged in the sand, about a yard apart with three to seven diners at each. "Almost 80 percent of the patrons are white," they said. Others were Chinese or Japanese, they noted, using a derogatory term. The best time to attack would be around 7:30 P.M., when the restaurants were the most

crowded and a backpack would not be suspicious. There was also a fur-
ther reason for choosing the restaurants at Jimbaran: many of the patrons
were businessmen. "The death of foreign businessmen will have a greater
impact than that of young people," the document says.

The backpack bombs were to be assembled by Mr. Azhari, and the
team determined that the backpacks should not be mountaineering back-
packs, but student day packs, in order to avoid suspicion. For that reason,
Mr. Azhari constructed relatively light bombs, weighing roughly 22–26
pounds. He devised two elaborate detonating systems that the report ex-
plains in detail, including schematic diagrams of the wiring system and
drawings of a man with the wired backpack. The first system was "direct"
and connected to the explosives in the backpack. The other was on "de-
lay," for explosives in a fanny pack worn by the bombers, with a delay
time of 30 seconds; the bomber would flip the switches for that one as he
approached the restaurant. That way, if he were stopped by a guard and
could not set off the main bomb, the fanny pack would still explode.

Within the last 10 years, the number and lethality of terrorist attacks
like this has increased worldwide. In the Palestinian Territories, a young
woman by the name of Wafa Idris—a paramedic who lived in Ramallah—
entered a shopping district in Jerusalem on January 27, 2002, and deto-
nated a 22-pound bomb filled with nails and metal objects, killing an 81-
year-old man and injuring more than 100 bystanders. Idris, a member of
the Al Aqsa Martyr's Brigade, was the first known *istish-hadiyat* (female
martyr) of the Islamic fundamentalist movement in the Middle East—but
others soon followed, including Dareen Abu Aisheh, who wounded two
Israeli policeman when she detonated her bomb at a roadblock near Mac-
cabim on February 27, 2002; Aayat al-Akhras, who strolled into a super-
market in the neighborhood of Kiryat Yovel in Jerusalem and killed two
Israeli civilians and wounded 22 more on March 29, 2002; and Hanadi
Jaradat, a 29-year-old lawyer who calmly entered a highly popular restau-
rant on October 4, 2003, and killed 21 Israeli and Arab men, women, and
children.[15]

Of course, while extreme militant Muslims have been a primary source
of terrorism in the past decade (and are the main source of suicide bomb-
ings worldwide), they are by no means alone, as terror attacks from Sri
Lanka to Ireland to Colombia demonstrate. For example, on August 15,
1998, a car bomb packed with 500 lbs. of explosives detonated in the pop-
ular shopping district of Omagh, a small town in county Tyrone, Northern
Ireland (about 70 miles west of Belfast).[16] The entire front wall of SD Kells
clothes shop was blasted into the building, and the roof collapsed onto the
top floor. At the Pine Emporium, a furniture shop, the blast was such that
furniture could later be seen sticking out the windows at the back of the
building. A water main under the road was exposed by the blast, and this
began pouring gallons of water over the wreckage, washing bodies down

the hill. All in all, 28 people were killed by the blast, and hundreds more were injured.

We can learn much from studying what transpired to make these and other terrorist attacks successful in order to prevent new ones. This is the primary goal of the chapters in this volume. Counterterrorism professionals in the military, law enforcement, intelligence, diplomacy, and policymaking communities must all have a comprehensive understanding of the issues addressed in the first two volumes of this book, and must draw lessons from the application of hard and soft power (both successful and unsuccessful) reflected in the cases provided in this volume. As the world's superpower and leader of the global war on terrorism, the United States has a particular responsibility to learn from the successes and avoid the failures of other nations in countering terrorism and insurgency.

## CONCLUSION

Studying the history of terrorism—using case studies to examine a diverse array of groups including anarchists, ethnic separatists, and religious extremists—helps us recognize that the global threat is not new, but rather, presents itself in new forms, partly due to the evolution of transportation and communications technologies. It is also important to explore the organizational strategies of terrorist groups and the individual motivations of their members, as well as specific dynamics such as recruitment, training, ideology, and communication. As demonstrated by the chapters of Volume 2, we must examine various facilitators of terrorism—such as transnational financial and criminal networks—as well as the local circumstances that support terrorism, including the political, economic and social conditions that existed before political violence erupted.

Throughout history, as Yonah Alexander observes, governments challenged by terrorism have responded in different ways. Politically, one response was to seek political means of conciliation to resolve underlying issues in an effort to undermine popular support for terrorist acts. Another response was widespread repression, not only of terrorists but of innocent civilians as well. Other responses included military attacks and police raids on supposed terrorist sites, freezing the financial assets of individuals believed to be connected to the terrorists, arranging for training in counterterrorism practices, and rallying international support, to name but a few.[17]

In formulating counterterrorism strategy and tactics for the twenty-first century, it is obviously necessary to reflect on historical examples of what has worked and what has not. Unfortunately, there are many such examples to choose from, as the diverse case studies in this volume demonstrate. The chapters of this volume provide a significant amount of geographic diversity: all the major regions of the world are covered in these

chapters, and each country represented in this volume has had significant experience countering terrorism and insurgency.

New security environments and new roles and expectations require new forms of education for the counterterrorism profession. In addition to appreciating the enemy's strategies, motivations, goals, and tactics, we must develop an understanding for how complex, networked, decentralized, loosely organized groups operate. From this understanding, we can identify the political, cultural, organizational, and financial seams within those networked organizations, so that ways can be found to exploit these seams in order to degrade their operational capabilities. And equally important, we must understand the nonkinetic dimensions of today's conflicts. An insurgency is conducted in numerous locations simultaneously, including the information battlespace. Counterterrorism professionals must think in terms of influence and combined actions, as well as the impact that military and law enforcement operations will have on local perceptions. They must have a full appreciation of many forms of technology and understand what skill sets are needed for conducting strategic communications and cyber-warfare.

To some degree, the lessons contained in the chapters of this volume mirror a set of observations produced by a Rand study of counterinsurgency published in April 1962, which highlighted the need to:

- Identify and redress the political, economic, military, and other issues fueling an insurgency;
- Gain control over and protect the population, which the counterinsurgent must see as the prime center of gravity in any counterinsurgency conflict;
- Establish an immediate permanent security presence in all built-up areas cleared of enemy forces;
- Accumulate extensive, fine-grained human and other intelligence on insurgent plans, modes of operations, personnel, and support networks;
- Avoid actions that might antagonize the population; and
- Convince the population that they represent the "winning side" and intend to prevail until complete victory is secured.[18]

The salience of these observations for the current global security environment—45 years later—is striking, and hopefully not reflective of our inability to learn important lessons from our own history. Overall, a predominant theme in the literature on counterterrorism and counterinsurgency, both old and new, highlights the need to have more situational awareness and strategic understanding than the enemy. The case studies provided in this volume, combined with the chapters of the previous two volumes of *Countering Terrorism and Insurgency in the 21st Century*, thus provide a comprehensive understanding at the strategic and

policymaking level of challenges faced by the United States and its allies, and illustrate how an appropriately integrated strategy can help lead to eventual victory in what some are now calling "the long war." As we work together to combat the global terror threat, it is clear that the ways in which we do so—particularly in the realm of soft power—will largely determine our success in the long war. Throughout the world, we are relying on a highly educated force of counterterrorism professionals to succeed, guided now by lessons drawn from the chapters of this volume.

# CHAPTER 2

## EDUCATING THE NEXT GENERATION OF COUNTERTERRORISM PROFESSIONALS

Stephen Sloan

The "war against terrorism" has taken central stage in the dynamics of international politics. From global leaders to commentators in the media and the general public, the challenges created by the threat of terrorists and the impact of their acts are a major concern on the international, national, local, and personal level. While the concern may be temporarily lessened over time, following major incidents, the threat is always present, a result of the instability, political violence, and transformation of warfare as well as the profound influence of technology that marks the present "New World Disorder." Neither the threats nor the acts will dissipate, for terrorism is not only a form of protracted conflict, but a type of conflict in which its practitioners have the motivation and capability to engage in mass terrorism that was not recognized until the events of 9/11 brought the reality home to a global consciousness. Confronted with these concerns, academics, operators, and policymakers face the daunting task of understanding and —of equal importance—educating a new generation of counterterrorism professionals to not only react but take the initiative against dedicated, skillful, and creative adversaries who have declared their own "war against all." Such a task is challenging given the often slow response of academics to recognize the danger of terrorism as a modern form of political violence and warfare and their inability or unwillingness to engage in meeting a "real world" threat and to assist those who

are directly responsible to preventing, deterring, and countering acts and campaigns of terrorism. Yet concomitantly, those in the operational and policy area have also at times failed to grasp the dynamics and outcomes of modern terrorism and draw on the expertise in academia where it has existed.

This chapter will help provide a basis for the very necessary integration of knowledge on terrorism and the operational and policy dimensions of counterterrorism. It will seek to address the historical context of terrorism studies and why such studies had such a slow and at times tortuous path in finding their place as a discrete specialization within both the social and hard sciences. Based on that assessment, the chapter will then examine the state of the counterterrorism art as it stands today and suggest what critical questions and areas of investigation must be addressed to meet both the short and long-term evolution of the strategies and tactics of terrorism. The discussion will then more specifically focus on the elements necessary to evolve the new educational programs that are required to assist the counterterrorism specialist in the academic, public, and corporate sectors to not only achieve the necessary corpus of knowledge, but also disseminate it to those who are on the frontline in combating terrorism.

## THE GLACIAL PROCESS OF RECOGNIZING THE THREAT: THE POWER OF CONVENTIONAL WISDOM OVER UNCONVENTIONAL CREATIVITY

While terrorism comes from an ancient lineage, its history and evolution were never central to any particular field of study in the social sciences, much less the physical sciences. Despite the fact that its practitioners could be traced from both biblical and ancient times, terrorism did not have its own intellectual home of inquiry. Granted, there were studies on its earliest manifestations as perhaps best illustrated by the accounts of the activities of the Zealots, who practiced psychological warfare through the use of the dagger, the Assassins who hired themselves with murderous efficiency, and the Thugs—a long-enduring criminal group who used terrorism as a major instrument of coercion.[1]

But such studies often existed in isolated academic universes. In addition, the accounts of the mass brutality of groups ranging from the Romans to the Huns, the absolute kingdoms of the Middle Ages and the Inquisition underscored that while the terms "enforcement" or "state terrorism" or "terrorism from above" were not used, there were many examples of mass terrorism practiced by ancient regimes. But it would not be until the French Revolution—where the emergence of modern state terrorism had its genesis—that terrorism would become a topic of systematic inquiry. Indeed, the Reign of Terror became a very fruitful area

of study particularly in the discipline of history, where the resort to violence was closely examined within the context of revolutionary dynamics. Certainly, pioneering works such as Crane Briton's *The Anatomy of Revolution* and others provide the basis to see where violence, coercion, terrorism, and other forms of threats and actions fit within the complex and not fully understood processes of fundamental social, economic, and political change.[2]

The development of this historical tradition would further mature with the specific analysis of where violence—and even more specifically terrorism—fits in the period leading up to, during, and after the Russian Revolution. Contemporary specialists in history and political science often cite the behavior of the *Narodnya Volya* (People's Will), for example, as one important hallmark in the emergence of modern antistate terrorism. But even in these earlier studies, the specific inquiry of terrorism was an intellectual orphan subsumed under the broader topics related to revolution. The purges in post-Revolutionary Russia and the accompanying rise of modern totalitarianism in Europe did indeed place a major emphasis on understanding how the threat or action of mass violence or terrorism were utilized as instruments through which a modern state could assert its control over a population and engage in repression that could culminate in genocide.[3]

Yet, when terrorism was studied or taught within the discipline of political science—and the subdiscipline of comparative politics—it was taught under the heading of a "problem topic." In a sense, modern totalitarianism and later terrorism were intellectually quarantined, since they were not viewed to be within the mainstream of the discipline. Somehow, they were perceived to be forms of political pathology that did not fit within an idealized view of what was considered to be "normal" behavior between or among states. However, a sharper focus on terrorism, especially in the social sciences and particularly in political science, evolved with the various studies on what was either called guerilla warfare, insurgency, counterinsurgency, dark wars, unconventional war, and other terms in the late 1950s and into the 1960s.[4]

The experience of the "wars of national liberation" against the colonial powers underscored the key role of terrorism as both a tactic and a strategy in revolutionary warfare. Furthermore, the experiences—especially in what was then the Federation of Malaya as well as the "Battle for Algiers"—provided lessons to be learned both within academia and the operational world in regards to both successful and failed counterinsurgency doctrines, strategies, and policies. This focus in what would become the counterinsurgency decades would be intensified as the United States pursued its policies in Vietnam and also sought to apply them as an aspect of "surrogate warfare" during the Cold War. The role of terrorism as part of an unconventional conflict increasingly became a focus of

inquiry within the social sciences. However, terrorism was still primarily relegated to an aspect of unconventional, protracted warfare. Moreover, despite the heated debates regarding U.S. policies in Southeast Asia during the 1960s and 1970s, neither insurgency nor terrorism were recognized as a particularly legitimate discrete subject of inquiry within the conventional halls of academia.

This lack of recognition was also a manifestation of the tensions between the academic community and policymakers over Washington's policies, particularly in regards to Vietnam. Far too many scholars did not wish to be "tainted" by using their knowledge to pursue foreign policies they objected to. This marginalization of insurgency—and especially terrorism—as an area of intellectual inquiry and associated operational arts would continue well into the late 1960s and early 1970s despite the numerous skyjackings, bombings, seizures of hostages, and other forms of violence that were taking place around the world. Moreover, in the United States, international terrorism, as contrasted to terrorism as an aspect of insurgency or state repression, was not considered to be a strategic threat. Therefore, the combination of the conventional thinking within academia—which placed it on an intellectual backburner—and the reality that there was neither the funding nor accompanying public concern of the threat acted as impediments to the recognition of the importance of studying terrorism. Indeed, it was not until the mid-1970s that courses specifically for terrorism were finally offered at some universities, and even then a specialization in this still nonfield would certainly not assist those new professors who were just stating out or those seeking tenure.

The same career constraints, to a degree, also applied within a still nascent counterterrorism operational community. Until the abortive Iranian hostage rescue, those within the community mainly came from the then-financially starved special operations forces. Here, while one tour might be acceptable, a dedicated career in special ops could literally place an iron ceiling on promotion to colonel, much less flag rank. A long-term commitment to the study of terrorism or counterterrorism operations was viewed as marginal and therefore a liability in the quest for academic title or military promotion. The same applied to research and programs.

When one considers the proliferation of counterterrorism programs of very varying quality today, it is difficult to recognize that with the exception of the pioneering work of the Rand Corporation under Brian Jenkins and Bruce Hoffman and the equally groundbreaking books by such luminaries as Paul Wilkinson—who ultimately established the Center for the Study of Terrorism and Political Violence at St. Andrews—those who chose terrorism as a specialization could find neither an academic home nor like-minded colleagues for their work.[5] In a very real sense these pioneers were a small "band of brothers and sisters" that had to look beyond their institutions and organizations to find like-minded individuals who

would pursue what was viewed to be an unconventional path. The fact that terrorism was not recognized to be of strategic importance or a threat to U.S. national security—coupled with the inherent inertia and generally conservative aspects of curriculum development at all universities, as well as the bureaucratic inertia within the civilian and military bureaucracies—in large part accounted for the slow pace of the evolution of terrorism as a systematic, identified field of study. These impediments continue to slow the evolution that continues today. The fact is that conventional members of the academy, as well as the military establishment (with their focus on the Soviet threat during and at the end of the Cold War and their continuing emphasis on conventional warfare), failed to grasp a new reality—namely that while terrorism may have come from an ancient tradition, it was as Brian Jenkins succinctly and very insightfully noted "A New Mode of Conflict."[6] That is, the modernization of terrorism could be seen as a result of two profound changes, notably the introduction of commercial jet aircraft as the primary means of international travel and the maturation of television as the rapidly growing dominant medium for global communication.

As a result of these interrelated developments terrorists could literally strike at global targets in a matter of hours, and in the conduct of their operations they could ignore the arbitrary boundaries of nation-states as they seized aircraft flying at over 500 miles an hour. In effect, the terrorists were engaging in what could now be called low intensity aerospace warfare; a form of warfare that would be refined with murderous efficiency with the events of 9/11. Moreover, they could use the television and its profound visual impact to have an instantaneous and international form of "armed propaganda" or "propaganda by the deed" that would greatly exceed the wishes and capabilities of the most dedicated terrorists that preceded them. The first generation of new terrorists was transforming their operational art by engaging in what some refer to as "non-territorial terrorism—a form of terror not confined to a clearly delineated area."[7]

This first generation would be replaced by a second one, who further amplified their capabilities of spreading fear and intimidation to a global audience through the use of the Internet. Unfortunately, while the terrorists very effectively utilized technology to greatly enhance their capabilities, the lack of flexibility and imagination that characterized the academic response to the threat was mirrored in what could be called the doctrinal response of a counterterrorism community that was only beginning to understand and organize to meet a new challenge. Both the civilian bureaucracies responsible for national security and especially the military still thought and relied on a spatial approach to countering a nonterritorial, nonspatial threat and adversary. In effect, they were unwilling to "think out of the box," a term that that has been used so much that is has too often become an empty slogan. Those involved in doctrinal, policy, and

operational developments in combating terrorism stayed "in the box" because they either could not or would not let go of the restraints created by organizational, legalistic, or operational boundaries in meeting the nonterritorial nature of the threat.

Organizationally, the terrorists increasingly relied on the use of compartmentalized cells that provided them with security as well as considerable operational flexibility, and cost them the ability to coordinate their attacks—a cost that would diminish in the anonymity of cyberspace with the coming of the Internet.[8] Moreover, counterterrorism organizations and forces relied on traditional top-down hierarchies where there was not a lateral sharing of information and there were often cumbersome divisions between line and staff functions. Instead of the flat organizations that could develop cadres of counterterrorism professionals to mirror the terrorists and have the necessary flexibility, conventional organizational doctrine acted as a serious barrier to the creation of new types of organizations to meet an increasingly decentralized adversary who did not suffer from the impediments caused by administrative "stove piping." Admittedly, there were (and still remain) valid issues about having the necessary oversight and accountability, but that concern was employed at times as one of the ways of justifying and protecting existing bureaucratic turfs. The situation was excerbated by the fact that the turf battles often led to bureaucratic and legalistic boundaries. While the terrorists were transnational and transorganizational, existing governmental organizations even lacked the capacity and willingness to achieve a unity of command that is essential in combating those who are not limited in their operations by physical, legal, or bureaucratic boundaries. As in the case of academia, the governmental response to terrorism—where it existed—during this period was fragmented, as each civilian and military entity defined its mission based on achieving its own bureaucratic place under the sun.

The concept, for example, of "the lead agency" had more to do with affecting a bureaucratic compromise than achieving a unity of purpose and operational capability in combating terrorism.[9] The military's organizational emphasis on having a physically delineated bureaucratic field of operations even when confronted with the nonspatial nature of nonterritorial commands could also be readily seen in the geographically defined commands and the unfortunate continuing interservice rivalries, despite the calls for "jointness." The problem was also manifested within the intelligence community that, while it did recognize terrorism as a global issue like narcotics and organized crime, still emphasized a traditional Cold War geographic approach in meeting such threats. In addition, the agencies unfortunately did not share even the limited information they had with other community members prior to the very costly lessons that perhaps have been learned in the post-9/11 period.

In the 1970s and into the 1980s, bureaucratic warfare often took precedence over the war on terrorism, as the forces of inertia led to a situation where the United States at the federal level (and even much more so at the state and local level), failed to adjust to the truly international challenges created by nonterritorial terrorism. Moreover, especially in the area of operational doctrine, the traditional focus on placing terrorism as a subset of tactics under the general term insurgency also reinforced the spatial orientation. For example, "the hearts and minds approach" applied to a territorially based insurgency might be appropriate; but how could it be implemented when the nonterritorial terrorists operated beyond the boundaries of a particular geographical conflict arena? Whose government could be strengthened under Internal Defense and Development (IDAD) Programs and what psychological techniques could be used to win over populations when the conflict was in the fullest sense global in nature? Moreover, the "battle for hearts and minds" has now been changed with the rise of religious extremism to become "the battle for hearts and souls," creating yet another new development to challenge existing doctrine.

## FINALLY RECOGNIZING THE THREAT: THE 1990S AND BEYOND: REACTION AND THE LACK OF INTEGRATION

In assessing developments within the terrorism studies academic, policy, and operational areas since the 1970s and 1980s, one sees a pattern of responses to the threats and acts of terrorism ranging from reluctant awareness, very cautious incremental responses, a failure to recognize the growing strategic threat, and above all a failure—which has aptly been called "a failure of imagination"—to recognize the profoundly changing nature of terrorism.[10]

While there were a number of events that finally led to the recognition of the changing nature of the threat and the concomitant requirement for innovative programs, three incidents tend to stand out. The first was the initial bombing of the World Trade Center on February 26, 1993. That event should have been a wake-up call that other attacks would follow—a warning that was confirmed by a perpetrator who, when caught, stated that his accomplices would seek the complete destruction that they failed to achieve that day. But, while there was public shock and concern that (in a sense) terrorism had come home to the United States, there nevertheless was the view that any other major attack would somehow not take place in the interior of what was called "the heartland" of the country. Terrorism may have spread to the urban centers on the coasts, but the sense of insularity remained. Somehow, people believed, terrorism would remain an urban, coastal affair.

This insularity would change with the bombing of the Federal Building in Oklahoma City on April 19, 1995. The myth of insular safety was

destroyed as the shock waves of fear generated outwardly from the very center of the country. If a major bombing happened in Oklahoma City, what other Midwestern city would be safe? Ironically, while there was a forced recognition that there were no safe havens against terrorism in the United States, the recognition led to an overreaction, as officials and the public assumed the bombing was the result of Middle Eastern terrorists. It would take time for them to recognize that terrorism is not limited to various boundaries or nationalities. The perpetrators forced the public to accept the reality that American terrorists were quite capable of killing their fellow Americans. However, the bombing of the Murrah Building was not (despite claims made to the contrary) the end of American "innocence in the heartland," but the end of American insularity.

Those two bombings and other incidents did initiate a plethora of legislative action and training programs to prepare the national government and state and local communities for effectively responding to terrorist incidents. The primary focus of these was the training of first responders. As a result, such entities as the Memorial Institute for the Prevention of Terrorism (MIPT) in Oklahoma City—supported by federal funding—developed a variety of programs to enable fire and police departments, medical personnel, and others involved in disasters to respond, contain, and lessen the impact of terrorism and natural disasters. Clearly this was an important first step. But there would also be a need to develop programs where the research would, through the effort to achieve a degree of integration within academia and with the government, take the initiative in preventing and deterring incidents. There was, and still is, the need to develop the specializations required to understand, forecast, and ideally go on the academic, operational, and policy offensive in regards to short-, mid-, and long-term threats. This focus on reactive measures and the training of field personnel and emergency managers, however laudable, took precedent over the broader types of research and analysis required in both the academic and intelligence community to effectively engage in strategic assessments of future dangers and how to prevent them. The events of 9/11 would unfortunately affirm the danger of such a gap in research.[11]

It was, of course, the tragedies of 9/11 that finally mobilized the United States as the major superpower to take the initiative both within its homeland and overseas to address terrorism as a major threat to national and international security; a threat that had been recognized by a number of countries who were forced how to learn to live with terrorism. The response to the attacks on the Pentagon, the World Trade Center, and the United Airlines Flight 93 were a manifestation after a major incident to "do something now," instead of also developing an integrated strategy and approach between governmental departments, the military, and academia to acquire the capability to systematically encourage the development and refinement in the chaotically growing field of terrorism,

where instant expertise was often the rule and real knowledge the exception. There was, and more than ever now is, a vital requirement to educate and train highly qualified terrorism professionals.

Not only at the national level, but also increasingly at the state and local levels, governmental authorities have been heavily involved in establishing funding and research for programs on terrorism. The funding for the Department of Homeland Security Centers of Excellence illustrates the current focus on developing a research agenda and operationalizing preventing and responding to terrorism. As of now there are six major Centers that are initially funded for three years, each headed by a university in partnership with other institutes of higher education and outside organizations. These include The John Hopkins University, with the creation of its Center for the Study of High Consequence Event Preparedness and Response; the University of Southern California's Homeland Security Center for Risk and Economic Analysis of Terrorism Events (CREATE); Texas A&M University's Homeland Security National Center for Foreign Animal and Zoonotic Disease Defense; the University of Minnesota's Center for Homeland Security for Food Protection and Defense; the University of Maryland and its Homeland Security Center of Excellence for Behavioral and Social Research on Terrorism and Counterterrorism; and Michigan State University's Center for Advancing Microbial Research Assessment (CAMRA). While it is difficult to make generalized observations about the aims and activities of these Centers and other governmental programs and how they may impact on the present and future educations of counterterrorism professionals, a number of observations are nevertheless in order.[12]

In the first place, while the Centers' activities relate to government-sponsored research and not the development of undergraduate and graduate programs leading to a degree, it is interesting to see that the major research problems involve addressing the challenges created by terrorism that reflect concerns primarily based on current threat assessments. In a sense, these are the threats *de jour,* and while each of them are certainly important, one does not see a broader, longer-term integrated research strategy that takes into account those strategic threats that, as the Duke of Marlborough said, "May be over the horizon." Certainly, topics ranging from defense against agro-terrorism to understanding suicide bombers are important, but they are (in a sense) an expression of "conventional wisdom." What should also have been—and must in the future be—considered is promoting the understanding of future longer-term threats that may not presently be recognized. Just as the slow growth of Islamic Fundamentalism was not perceived to be important until after the fall of the Shah and the seizing of the hostages in Iran, will academics, policymakers, and operators be blindsided by other emerging threats? The understandable government sponsored "do something approach" certainly

has validity in meeting present threats, but does it continue a reactive short-term response to what is a long-term protracted conflict?

Secondly, while there certainly is a broad scope of research topics that will be carried out by each Center, that broad scope creates difficulties in developing a wide variety of programs to, in the fullest sense, educate a new generation of counterterrorism professionals. That is, there does not appear to be a central core of areas, a canon on terrorism studies that can provide a more integrated approach to fully developing the discrete field of terrorism studies and subspecializations that emerge from the canon within what could be viewed as an emerging new academic discipline.

The lack of integration is further seen with the emphasis on separate Centers of Excellence. This is not to suggest that such an approach may not be needed to focus on particular problem areas, but as in the case of bureaucracies, we may be emulating the development of intellectual-academic "stove piping," something that unfortunately has already taken place in government organizations. "Stove piping" acts as a barrier to lateral integration of effort. Moreover, such an approach may also emulate the type of turf battles that have too often characterized organizational responses to terrorism.

Thirdly, the lack of integration may also be seen in the absence of a Center whose task is to act as an overarching coordinator of research agendas and efforts. Perhaps even more troubling is the fact that at a time when there is a need to educate terrorism professionals in the state of the art, there is, in a sense, no basic uniform requirement—something that would be similar to the core courses in a college or university. Perhaps there should or will be new centers established both in and out of government to address the issues raised here—centers for the development and advancement of terrorism studies. Moreover, the specializations—with the two exceptions of the John Hopkins' program and the University of Maryland's—tend to favor technological innovation in regards to preventing or countering terrorism. Unquestionably the technological threats are there, but does this approach rely too much on scientific and technological fixes to address the at once complex and yet human intensive terrorists threats?

There may be a lesson to be learned from the experience of the intelligence community in combating terrorism. That is, it is widely understood that the United States has relied too heavily on technical intelligence (TECHINT) and not enough on human intelligence (HUMINT) in combating terrorism. Recent changes, including the newly established Director of National Intelligence, are committed to addressing this problem. In the organization of academic research on terrorism, are we running a similar risk of becoming technologically muscle-bound against an emotional and often value- or religious-driven, highly committed asymmetric adversary?

**THE ACADEMIC ARENA: SEEKING TO FIND A PLACE FOR TERRORISM RESEARCH AND TEACHING—THE QUEST FOR IDENTIFYING DISCIPLINES**

If the governmental response to addressing the challenges engaging in research on terrorism is characterized by the lack of a central direction—or an intellectual core—the problem is also manifested in academia, where there is still no agreement on where terrorism "fits" and therefore what type of organization of knowledge should be used in establishing the boundaries and direction of terrorism studies.

As noted earlier, prior to the 1970s there was a body of literature on the history of terrorism, but only as part of a broader examination of the French Revolution and the development of terrorism as an aspect of regime repression before and during the Russian Revolution. There was also a focus on the role mass terrorism played as an integral part of the rise of modern totalitarian governments. But one of the first treatments of terrorism as a potential field in itself took place within political science, especially in reference to those who were addressing a new area of investigation in reference to comparative politics and international relations. This focus could be expected, since the pioneering studies of modern terrorism primarily addressed the political purposes of terrorism in the conduct of international affairs, and especially the challenges democratic states face in reconciling the need for security with the traditions of due process and individual rights. In the 1980s, the emphasis on the political aspects of terrorism would slowly grow within the discipline of political science in the United States, as there was recognition of how such threats and acts could influence the conduct of foreign affairs and broader issues of national security.

By the same token, there were relatively early studies in the discipline of psychology that explored the motivation behind terrorism. In addition, as a result of the hostage-takings of the 1970s that culminated in the Iranian hostage crisis, there was a growing emphasis on hostage behavior. This emphasis on hostage behavior, both academically and operationally, was carried over to the field of law enforcement, where there was growing literature—and concomitantly, training courses—dealing with hostage negotiation and what (at the time) was referred to as "siege management." This emphasis was not solely the result of acts of terrorism; rather, it was necessitated by the increasingly rapid response of police forces arriving on scene before the perpetrators could escape. As a result, there were more hostage-barricade situations, ranging from domestic disputes to bank robberies to terrorist's incidents, which required skilled negotiators. At the same time, operationally, there was also an increased concern for learning how to train, equip, and deploy special weapons and tactical teams to be activated and take action as required; especially if negotiations failed. The

development of the literature in the tactical arena was also seen with the emergence of highly trained national counterterrorism forces, including the U.S. Delta Force, the British SAS, and other specialized units. But, it would take time before those involved in the discipline of law enforcement and the administration of justice, particularly in the United States, would begin to systematically address the whole spectrum of challenges created for police and other security forces at all levels—from national, to state and local.

The reason for this slow evolution was that—with the exception of various extremist groups in the 1960s (for example the Weathermen)—the long-enduring attacks by Puerto Rican separatist groups and the existence of various right-wing extremists, domestic terrorism were not viewed to be a major threat to the maintence of law and order. Moreover, law enforcement studies did not address the then-psychologically "distant" threat of international terrorism, which was still viewed to be "what happened to other people in other countries." Certainly, there were other disciplines that had emerging specialists who drew on their expertise in regards to violence as a means of beginning to understand the comparative and interdisciplinary aspects of both domestic and international terrorism, but such approaches were largely individual and not part of a large coordinated research agenda.

Within the hard sciences, there were indeed pioneering studies on (for example) early concerns over what was in the 1970s and early 1980s often called "super terrorism," before the term "weapons of mass destruction" became popular, but such studies languished in the face of the continuing resort to more conventional bombings by terrorists.[13] Nevertheless, there were particular advances in the fields of engineering, where there was a recognition of the need to "harden targets," especially those with symbolic meaning as well as those considered a part of the "critical infrastructure," whose destruction could greatly disrupt the social, economic, and political order of a community or a country. However, such studies were not part of the academic program in engineering schools.

Finally, while there certainly were a wide variety of courses at medical schools and health science centers related to threats to public health, there were virtually no courses that specifically focused on terrorism as a potentially major threat. Such events as the Aum Shinrikyo attack, where sarin gas was used, would help change the traditional orientation that did not take into account the impact on health (and indeed literally life or death) within a community. Therefore, in looking back to the early days, while historians and political scientists may have dominated terrorism studies, their efforts were often not recognized as a legitimate field within the discipline; at the most they were on the intellectual edges.

## WHERE DOES TERRORISM FIT WITHIN ACADEMIA: SHOULD THERE BE A SEARCH FOR A HOME?

It is ironic that whereas at one time terrorism studies were an academic orphan, today so many disciplines want the subject to be a member of their family. One wishes this desire was primarily the result of a genuine intellectual interest in the topic; and perhaps to a degree it is. But the realities of the long-coming recognition, especially in the United States, is based on the combination of funding and empire building as universities—like government organizations and the corporate sector—try to find their place in what tragically has now become a new market. Moreover, whereas in the past a specialization in terrorism was viewed to be an esoteric skill, now reputations, tenure grants, and promotions can be acquired from research and publication on a myriad of terrorism-related topics.

In discussing where terrorism "fits" in academia, it would be useful to assess the areas based on requirements in general undergraduate education, possible majors, or courses of study, and then focus on graduate education. There obviously is no clear fix, but there are alternatives that should be considered when creating curriculum and programs to educate the next generation of counterterrorism professionals. At the outset, more than ever the requirement for a solid liberal arts education is important to the potential counterterrorism professional. First and foremost, the ability to engage in critical thinking, as well as having an excellent ability to express oneself in written and oral form, is absolutely vital. The requirement for critical thinking is especially important given the need for the ability to identify and separate significant information from the growing mass of unimportant data, information, and misinformation that surrounds the current avalanche of material on terrorism. The ability to engage in critical thinking is also important in order to develop the imagination and accompanying creativity to discern future trends and outthink (and outcreate) those who, in their own nefarious way, have developed their own arts of destruction and carnage. The benefits and requirements of a good liberal arts education provide a fundamental contribution to the education of the would-be counterterrorism professional. Moreover, a broad-based understanding of the social and behavioral sciences coupled with the requirement for international studies would provide the foundation that could be readily applied to terrorism studies on both the undergraduate and graduate level, as well as applied in the field.

It might also be advisable to have a required undergraduate liberal arts course on terrorism that would assist the students in developing an appreciation of the changing security environment they will be working in, irrespective of their profession, with particular emphasis on a solid overview of what is, and where, terrorism would fit in their potential careers.

This course, much like other survey courses, could serve not only as an introduction to terrorism per se, but be a gateway for students who have or might become interested in terrorism studies as a rapidly expanding area of educational, professional and policy concern. Such a course could also be offered in schools of engineering, business, and other professionally oriented colleges as a means of providing a basis through which students might consider applying their newly found knowledge to an important field of specialization. Candidly, it is troublesome to see, for example, that schools of business that are training the executives of the future, or those now involved in continuing education do not require at least one basic course on security and terrorism. It is, and will increasingly be, a vital skill-set in the conduct of doing business both domestically and overseas.

As far as specific undergraduate programs on terrorism studies, there are various alternatives to be considered, developed, and implemented for the would-be professional in counterterrorism. At the outset, political science will continue to be a major focal point for the study of terrorism, not only because a number of pioneers came from the field but also as a result of the fact that ultimately there has been an agreement over the years that one of the major elements of terrorism is its political nature. Moreover, the study of terrorism as a political phenomenon may fit well into the subfields of comparative politics and international relations; the former because it provides the foundation for developing comparative analytical analysis and the latter because of the increasing significance of terrorists as major international actors. In addition, political science programs that offer courses on national security with a particular emphasis on the application of military power and the basics of intelligence could readily be adjusted to meet the unique educational challenges in these areas caused by the requirements necessary to combat terrorism.

A second, readily identifiable discipline involves programs associated with criminal justice and the administration of justice. Particularly in regards to domestic terrorism—which is still first and foremost viewed to be a criminal act—it is indeed essential that those who will be involved in law enforcement are knowledgeable about the nature of terrorism and the means to combat it through the legal system. The emphasis on this approach has of course accelerated as a result of the Murrah bombing, the attacks on the World Trade Center and the Pentagon, and the emerging recognition that other incidents and possibly campaigns of terrorism—including those from abroad—will increase in the years to come. One may also suggest that, given the increasingly international dimensions of terrorism, any new or extant program on terrorism would have to have a comparative/international scope to assist in educating those who are working with foreign countries or stationed overseas.

This requirement can be readily seen, for example, with the greatly expanded effort of the Federal Bureau of Investigation's operations

throughout the world in its new role of combating terrorism. Certainly the behavioral sciences, most notably psychology, have a key role to play and a specialization on the motivation and behavior of terrorists is necessary. While there are impressive strides being made in the systematic long-term study of individual and group behavior among terrorists and their supporters, such studies need to be intensified by addressing the psychological impact on individuals and the sociological and economic impact on the community at large. In addition, other disciplines within the social and behavioral sciences can also make major contributions ranging from understanding the historical roots and perceptions of terrorists to anthropological examinations of how terrorism and terrorists evolve and are conditioned through the complex processes of acculturation. Still other disciplines, such as economics and finance, also have their contributions to make, ranging from the cost of the impact of terrorism on the economy and the existing financial order. One may, of course, suggest that other departments could independently create ad hoc interdisciplinary entities, collaborating across their departments to advance research and educate a new generation of terrorist professionals. However, it is important to have an integrated core of areas of investigation along with those yet to exist, a canon of knowledge that can lead the way to achieving a unified field, as contrasted to the often-fragmented approach to addressing terrorism.

Achieving a meaningful degree of intellectual unity of action that can compete with what unfortunately has characterized terrorists operations will not be easy, especially since, as noted, the field of terrorism studies is certainly not (and should not be) the monopoly of any particular discipline. The comments of one particularly thoughtful authority in the field have relevance to the requirements for interdisciplinary studies on the undergraduate and graduate level:

> The field of terrorism does not neatly fit into one discipline. Terrorism is truly a multidisciplinary subject, and I believe future terrorism specialists need to know this from the very beginning. I was very grateful in my BA and MA programs and policy analysis Ph.D. program that allowed me to take courses relevant to the field of terrorism and political violence in the fields of political science, history, sociology, forensic science, political psychology, public health, peace studies, emergency management, religion and area studies. . . . I also benefited from course work in communications, which I found highly relevant since terrorism is communication.[14]

The author's points are quite well taken and one can emphasize, starting on the undergraduate level, that the importance of participating in the interdisciplinary area-studies approach is especially valuable, since there remains a paucity of terrorists "specialists" who are trained in the language and culture of a society based on extensive study and, especially in

the graduate arena, field work. The authors' concern of overspecialization in one department also has validity in that:

> What worries me is that a new generation of "terrorism specialists" will be birthed out solely of political science departments and have a concentration of Middle Eastern studies. This will create a bias in understanding. Much like the vast generation of Sovietologists who never saw the Soviet collapse and would not offer assistance in the post-Cold War world full of ethnic and asymmetric warfare/terrorism.[15]

The observer's point is also especially well taken since, as noted earlier; the focus on funding programs tends to be on current, not future threats. We need an off-the-shelf capability to constantly monitor the global threat environment based on overarching area programs and an ability to have experts immediately available before and when a new threat location becomes significant. The current reliance of an academic "surge approach" may be useful as an aspect of short-term crisis management in the academic and operational arena, but it does not provide the scope or consistency of effort needed to monitor, prevent, and respond to future threats from areas where terrorists plan and launch regional or international operations.

The importance of the interdisciplinary approach is readily apparent, but as in previous programs there will continue to be problems associated with coordination and communication between and among different disciplines. Moreover, in regards to such real concerns to the academic such as tenure, promotion, and funding, the importance of having an academic department or home cannot be dismissed. But a creative approach to integration can and should take place. As in the case of bureaucracy, academic administrators cannot afford to engage in turf battles when addressing terrorism.

At the graduate level, there certainly can and should be more narrowly based specializations in regards to combating terrorism both on the MA and Ph.D. levels as well as postdoctoral studies. Flexibility is key. For example, one may envision a 3-year intensive terrorism studies program that would include a 1-year general overview of the field followed by 2 years of specializing in the social, behavioral, or hard sciences ranging from history to public health. Perhaps one could consider developing a professional terminal degree entitled the MA or MS in Terrorism Studies (M.A.T.S., M.S.T.S.) similar in length and recognition to a Masters in Public Administration (M.P.A.) or a Masters in Fine Arts (M.F.A.).

Programs for the Ph.D. could be offered as a continuation of the specialized M.A.T.S./M.S.T.S., with a very heavy emphasis placed on original and applied research. In addition, one may suggest that—especially at the graduate level—an internship or residency should be required in the

public or private sector to begin a vital process of creating the necessary interconnectivity to the academic, bureaucratic, operational, and policy sectors. All of these programs can also benefit by the use of distance education and continuing education. The traditional campus setting would remain important, but there are so many other alternatives available to deliver the necessary knowledge.

It is beyond the scope of this chapter, but the issue of accreditation must also be addressed. Unfortunately, there has been a massive growth of terrorism programs without the establishment of appropriate standards and requirements. In part, this is because of the rapid emergence of the field and the lack of a body of prior knowledge and sufficient authorities to evaluate a growing field. The accreditation can ultimately take place at the university-wide association level, the respective schools and disciplines, and other agencies. Moreover, one could also model accreditation of a degree based on such certification programs as the American Society for Industrial Security's CPP Program (Certified Professional Program), which includes core courses on security and terrorism. The developing standards is absolutely essential, especially now in a period of often chaotic change, when anyone can "put up a shingle" that they are a terrorism specialist.

In addition to these civilian programs, there is (and will be) a growing need to educate a new generation of uniformed terrorism specialists in the respective military academies, as well as the staff and war colleges. While the need for present courses of studies will most certainly be required, as in all things it will be necessary to finally move beyond the verities of traditional military thinking as well as the strategies and doctrine associated with the Cold War. Innovation is required to address and understand the transformation of warfare, in which the changing nature of terrorism is but one manifestation. Positive advances are taking place in this arena. The privately funded Combating Terrorism Center (CTC) at the United States Military Academy is clearly an advance, along with the announcement that the academy's first minor's program will be on terrorism studies.[16] In addition, the Department of Defense's Counterterrorism Fellowship Program, with selected universities and overseas partners, has provided a venue in which future leaders can learn the arts and sciences, tactics and strategies of terrorism early in their careers, instead of essentially learning how to combat terrorism on the battlefield with occasional short courses in professional military studies.[17] This approach to training and education should also be utilized by the intelligence community, whose members are often on the forefront of combating terrorism. As noted earlier, there are no quick fixes in educating the next generation of counterterrorism professionals, but one thing is clear: civilian and military educators, institutions, and programs do not have the luxury of engaging in a slow, incremental process of curriculum-building to meet a very real threat. Yet, by the same token, those educators face the daunting task of

bringing rigor and standards to a field of study that may be drawn from many traditional disciplines but is as new as the next incident.

## THE NEED FOR A BODY OF KNOWLEDGE: THE QUEST FOR A CANON ON TERRORISM

In the final analysis, it is important to recognize that despite attempts at academic organization and funding, it will be very difficult to achieve the recognition of terrorism as a field of study until there is an extensive body of knowledge ranging from general theory to classic works. The development of a canon on terrorism will take time, since it is still such a recent specialization, much less a formally recognized and academically sanctioned field of study. As one authority astutely notes:

> The blunt truth is that we have failed as a community to create or identify a 'canon' of counterterrorism theory which would represent a foundation for new research and policy recommendations. While . . . the strategist can resort when in trouble to the almost eternal verities of Sun Tsu or Clausewitz, there are no essential writings which illuminate all potential challenges in the field of counterterrorism.[18]

It is not that studies do not exist. Indeed, they have vastly proliferated since the 1970s where one could have a core library of the major academic works on terrorism numbering no more than 200–300 books. The problem now, of course, is there has been a massive proliferation of books, articles, monographs, and other publications as well as databases on the Internet. There certainly are excellent sources, but quite candidly the would-be specialist is confronted with material of very uneven quality. In a real sense, the problem today, as in other areas, is that there is too much information and data, and therefore the scholar and the professional face the very demanding task of information handling and, more traditionally, engaging in a critical evaluation of source material. It would be beyond the scope of this chapter to provide a bibliography of terrorism source material. Such bibliographies are numerous and readily available.[19] Rather one can suggest areas where those who would develop a canon to guide professionals should address. In part this gap is the result of the fact that terrorism still lacks an academic home. But more specifically, there are other gaps that are a manifestation of the failure of institutions of higher education to recognize the need for an emerging specialization in one or field or in an interdisciplinary arena.

Firstly, there is an absence of overarching theories that can provide integrative conceptualizations to achieve a level of unity and direction in the field. This does not mean to suggest that there needs to be plethora of grand or general theory, but the field must acquire what could be called

its own "intellectual center of gravity." Secondly, one can readily draw on theories, especially in comparative politics, to develop the necessary foundation for the analysis of terrorists groups and movements from international politics to place such an analysis in a broader context. These, coupled with the existing and growing sophistication of political methodology, will greatly enhance the ability to refine the new field. Thirdly, there already exists a body of knowledge that can be readily built upon to further develop the canon—most notably the extensive theories and associate studies related to counterinsurgency; this especially since now terrorism is often viewed to be an aspect of global counterinsurgency. There is recognition of both continuity and change in regards to understanding the mutation of both insurgencies and terrorism. Fourthly, in developing the canon there will be a particular need for theoretical "yardsticks" that can be refined to measure and evaluate the operational effectiveness of counterterrorism operations, strategies and policy. Finally, a canon on terrorism faces the ultimate task of addressing where terrorism fits within the most fundamental areas of inquiry: the role of violence in political life, the transformation of warfare, and the concomitant transformation of terrorism. None of these are going to be easy tasks in an international arena where the classic state system is now undergoing fundamental assaults of change created by nonstate actors, the impact of the global web, and the acceleration of technological change.[20]

Faced with these challenges, a new generation of counterterrorism specialists may have a very daunting challenge, but it can also place them at the forefront of researching and, consequently, understanding the fundamental change that characterizes and challenges our human existence.

## CONCLUSION

There is, unfortunately, every reason to believe that a new generation of terrorists—even as they may pursue highly different causes—will increasingly forge their own form of academic alliances through their use of the Internet. They may not belong to particular institutions of higher education or be drawn from a particular discipline; but whether they have shared outlooks or engage in marriages of convenience, in too many instances, they are professionals without the need for core courses, master's theses or dissertations. They are engaged in developing their own areas of specialization and interdisciplinary capabilities, and the completion of their studies may end in the death of their victims as well as their own.[21] Like it or not, they have forged both a virtual and real community of the committed—committed to a protracted conflict that can and will increasingly test the resolve of their global targets. Confronted with these realities, it is absolutely essential that the United States and other governments, organizations, and regions educate, in the fullest sense, a new

generation of counterterrorism professionals, a generation that has the knowledge and commitment to not only help lead and guide those who are in the forefront of combating terrorism, but also help to educate both traditional, modernizing, and developed societies who are confronted by adversaries who are rapidly developing their own body of murderous knowledge. We can not afford the luxury of long curriculum committee meetings, drawn out bureaucratic competition, or the lack of operational unity in the face of "the men and women of violence" who, in too many instances, are rapidly completing their undergraduate and graduate education where the degree requirements lead to fear, injury, and death of so many whose only "crime" in many cases was that they were adjudged "guilty by location," guilty of being at the wrong place at the wrong time. The semester for the counterterrorism professionals must begin, since today's terrorists are now completing their advanced studies.

**NOTES**

1. Sean K. Anderson and Stephen Sloan, *Historical Dictionary of Terrorism*, 2nd ed. (Lanham and London: Scarecrow Press, 2002).

2. Crane Brinton, *The Anatomy of Revolution* (Upper Saddle River, NJ: Prentice-Hall, 1965).

3. Hannah Arendt, *The Origins of Totalitarianism* (New York: Harcourt, 1966).

4. It is beyond the scope of this chapter to provide a list of many of the excellent books on insurgency—both classics and new. Unlike books on terrorism where few have weathered the passing of time to validate them given the recent origins of the emerging field, one can readily argue over who are the best strategists, theorists, and writers on insurgency. One of the author's favorites that in many ways is just as relevant today as when it was written is: Bernard Fall, *The Two Viet-Nams: A Political and Military Analysis*, 2nd ed., revised (New York: Praeger, 1967). The authors' analysis of insurgent organizations in a territorially based conflict remains valid today and certainly can be applied to what is now called Global Insurgency. For an excellent discussion of how traditional theories and concepts of insurgency apply to modern insurgency see: David Killcullen, "Countering Global Insurgency," *Journal of Strategic Studies* (August 24, 2005): 597–617. For fine a collections of articles that address the changing face of insurgency see: Robert J. Bunker (ed.), *Networks, Terrorism and Global Insurgency* (Oxford: Routledge, 2005). The contributors include representatives of a new generation of scholars who are, and will continue to, make their names in the field.

5. Brian Jenkins' studies at the Rand Corporation and Paul Wilkinson's contribution to the field were and still are very significant. They established the foundation and encouraged other pioneers who were finding their ways in a yet to be recognized field.

6. Brian Jenkins, *International Terrorism: A New Mode of Conflict* (Los Angeles, CA: Crescent Publications, 1974).

7. Stephen Sloan, *The Anatomy of Nonterritorial Terrorism: An Analytical Essay* (Gaithersburg, MD: International Association of Chiefs of Police, 1979).

8. J. K. Zawodny, "Infrastructures of Terrorist Organizations," *Conflict Quarterly* 1 (Spring 1981), 61–70. The author drew from his experience in the Polish underground to provide one of the earliest and best accounts of, not only the way clandestine organizations operate, but also how the organizational structure influences the behavior of both leaders and followers in a combat cell.

9. William Regis Farral, *The U.S. Government Response to Terrorism: In Search of an Effective Strategy* (Boulder, CO: Westview Press, 1982). If one reads this book they will be struck by how many of the problems that confronted Washington in 1982 remain today. Moreover Washington is still "In Search of an Effective Strategy."

10. The impact of the "failure of imagination" lack of vision, bureaucratic turf battles that helped to lead to the events of 9/11 will be subject to continuous historical investigation in the years to come. The following report provides a very readable work that seeks to address what took place before and during the attacks. Certainly there are areas in the respective accounts that are subject to debate and new questions are continually raised, but the report should be required reading for potential, present and future counterterrorism professionals. Steve Strasser (ed.) with an Introduction by Craig R. Whitney, *The 9/11 Investigations: Staff Report of the 9/11 Commission* (New York: Public Affairs Reports, 2004).

11. The author served on the steering committee that was charged with establishing the goals, organization, program, and funding The Memorial Institute for the Prevention of Terrorism. Given the understandable concern and pride in how the first responders and the community reacted to the bombing along with the extraordinary assistance on the state, local and national level there was a desire to apply what was called "The Oklahoma Standard" to assist others who would face acts of terrorism.

12. U.S. Department of Homeland Security. No update listed, http://www.dhs.gov/dhspublic/interapp/editorial/editorial_0498.xml (accessed May 22, 2006).

13. Robert K. Mullen, "Mass Destruction and Terrorism," *Journal of International Affairs* 32 (1978): 63–89. Dr. Mullen wrote this very prescient study. The threat was readably recognized by those who had the imagination and talent to recognize the threat. It is ironic that after all these years weapons of mass destruction are part of the conventional wisdom on terrorism.

14. E-mail to author from Brian Houghton, Director of Research, The Memorial Institute for the Prevention of Terrorism.

15. Brian Houghton.

16. See the Combating Terrorism Center's excellent Web page for an overview of its activities and research, http://ctc.usma.edu/research.asp.

17. The Counterterrorism Fellowship Program comes from a long tradition in the United States Air Force to develop and teach courses for military personnel and their civilian equivalents in the counterterrorism field. In the early seventies, for example, the USAF pioneered the outstanding Dynamics of International Terrorism Course that is still given today at Hurlburt Airfield which is now home to the Special Operations University. An extensive discussion of the Counterterrorism Fellowship Program and the future course of terrorism studies was conducted from September 28 to October 1, 2004, in Orlando, Florida (despite the threat of a natural WMD) weather of mass destruction—a hurricane.

18.  E-mail to author from Sebestyen Gorka (May 23, 2006).

19. There are now and will increasingly be a variety of references, encyclopedia and other works that will seek to provide definitive scope and detail on the current nature of terrorism research. There are two early studies however that not only provide "the state of the art" of the time but should be used as models for future detailed surveys in the field. They are: Alex P. Schmid with a bibliography by the author and A.J. Jongman, *Political Terrorism: A Research Guide to Concepts, Theories, Data Bases and Literature* (Amsterdam: Royal Netherlands Academy of Arts and Sciences Social Science Research Center (SWIDOC) and New York: Transaction Books, 1981). A second edition of this book authored by Alex P. Schmid, Albert J. Jogman et al. was published in 1988. More recently, see the two post-9/11 terrorism research bibliographies published by the Combating Terrorism Center at West Point, http://ctc.usma.edu.

20.  For an outstanding study of the profound impact of the Internet on contemporary and future terrorism see: John Arquilla and David Ronfelt, *Networks and Netwar: The Future of Terrorism, Crime and Militancy* (Santa Monica, CA: Rand Corporation, 2001).

21. For more on this topic, please see *Teaching Terror: Strategic and Tactical Learning in the Terrorist World*, ed. James Forest (Lanham, MD: Rowman & Littlefield, 2006).

# PART I

## CASE STUDIES OF TERRORIST ATTACKS AND COUNTERTERRORISM OPERATIONS

# CHAPTER 3

# "BEGINNING OF A WAR": THE UNITED STATES AND THE HIJACKING OF TWA FLIGHT 847[1]

Richard M. Wrona, Jr.

June 14, 1985, began the most prolonged and media-intensive aircraft hijacking in the history of terrorism. Over a 16-day period, the American population was inundated with unprecedented access to the drama and coverage of unfolding events.[2] This public drama, when combined with precarious regional relationships and continuing hostage situations, led to a demonstration of American impotence in the face of a direct attack. The TWA 847 hijacking highlighted an atypical aspect of terrorism—instead of sowing fear among their target audience, the terrorists generally succeeded in convincing spectators to sympathize with the hijackers' cause.

## BACKGROUND TO THE HIJACKING

### Lebanon's Civil War

By 1985, Lebanon's civil war had been raging for close to 10 years. After the division of the Lebanese population along ethno-religious and familial lines, the country faced ongoing violence between sectarian militias. At the macro level, these militias could be identified by their religious allegiance—Maronite Christian, Sunni Muslim, Shi'a Muslim, and Druze. However, even within these sectarian groupings there were competitions for power. Most notably, the Shi'a Muslims were divided between organizations taking a more secular stand (like Afwaj al-Muqawamah al-Lubnaniyyah, or AMAL) and those taking a more religious position (Hizbollah,[3] Islamic AMAL, or "Lebanese Resistance

Brigades" and other smaller groups).[4] Additionally, the Shi'a organizations had competing state sponsors. While Syria backed AMAL (in support of Syrian efforts to subsume Lebanon into a "Greater Syria"), the Iranian Islamic regime supported Hizbollah and the other radical religious groups.

International intervention added fury and uncertainty to the boiling Lebanese cauldron. In 1976, an Arab League multinational peacekeeping force, overwhelmingly dominated by the Syrian military, entered Lebanon in an attempt to quell the civil war's sectarian violence. The Syrians used the excuse of the open-ended mandate to occupy Lebanon. Then, in June 1982, Israel invaded southern Lebanon, in order to combat escalating cross-border attacks by the Palestinian Liberation Organization (PLO). Two months later, Lebanon incurred a third introduction of foreign forces when American, French, and Italian forces (later joined by the British) of the Multinational Force (MNF) landed to evacuate Israeli-encircled Syrian and Palestinian forces. September 1982 found the peacekeepers assuming the role of peacemakers, when the MNF attempted to divide the warring Lebanese factions.

By 1985, war still raged in Lebanon. Israel had withdrawn to a security zone in the south. The Syrians roamed freely in the east. Beirut was a free-fire zone, with competing militias (Lebanese and Palestinian) raging against each other for control of sections of the city. The multinational forces had withdrawn in 1984 after suffering spectacular terrorist attacks against diplomatic and military targets. Their departure, however, did not occur before the development of a lingering antipathy resulting from their role in the conflict—particularly, a hate harbored by the Shi'a religious factions.

### The Prisoners

In addition to the direct combat with their militia rivals, kidnappings of Western citizens became a weapon in the Lebanese militias' arsenals. Beginning in 1982 with the kidnapping of David Dodge, the president of the American University of Beirut, numerous individuals with a variety of national and occupational backgrounds were kidnapped. By 1985, militias held seven American hostages, but the United States had little information as to where the hostages were or what groups detained them.

The Lebanese also faced a hostage dilemma. After its 1982 invasion, Israel soon faced an unstable situation in southern Lebanon, as the domestic population revolted against Israel's continuing occupation. Israel's answer to the increasing guerrilla activity was to implement an "Iron Fist" policy, which included the raiding of Lebanese villages in the south,

and, more importantly, the detention of large numbers of Lebanese Shi'a thought to be involved in the guerrilla actions. These detentions assumed a new dimension when, in April 1983, the Israelis moved 1,200 of the detainees to Israel.[5] Lebanese leaders protested the movement as a violation of the Geneva Convention—a position that the United States supported.[6] However, Lebanese opinion commonly held that the United States had not done enough to pressure the Israelis to abide by the convention and release the Shi'a.

The Lebanese Shi'a also faced other hostage/prisoner predicaments. The radical Lebanese Shi'a had ties to other radical Shi'a groups in the Middle East, which led to joint operations against some of the region's secular/autocratic Arab regimes. Lebanese Shi'a were involved in two particular cases of interest. On December 12, 1983, terrorists of radical Lebanese and Iraqi Shi'a factions attacked multiple targets in Kuwait. Soon after, Kuwait captured and tried 17 individuals, and delivered sentences ranging from 5 years' imprisonment to death.[7] Radical Shi'a groups made the release of these individuals, the "Dawa 17," their central demand during the hijackings and kidnappings of 1984–1985.[8] In addition to the Dawa 17, radical Lebanese Shi'a were concerned about two Lebanese Shiites incarcerated in Spain for the attempted assassinations of Saudi Arabians in 1984.[9]

TWA Flight 847's hijacking must be considered not only in the context of these prisoners, but also in the environment of prisoner exchanges that preceded the attack. While nearly every country had a public policy of refusing to negotiate with terrorists, two states that stood center-stage in the Flight 847 drama had established dangerous precedents. Israel, in the 18 months preceding the TWA flight, made prisoner exchanges an established norm when dealing with the Lebanese and Palestinian factions (see Figure 3.1.)

Likewise, Greece was perceived to be sympathetic to radical Arab regimes and movements. On two different occasions, it released individuals known or implicated in terrorist operations.[10]

| Date | Hostages Released by Israel | Israeli Hostages Returned |
|---|---|---|
| November 1983 | 4,500 (Lebanese and Palestinian) | 6 (Israeli) |
| June 1984 | 291 (Syrian), 21 (civilians—nationality not designated), 70 (Syrian bodies) | 6 (Israeli), 5 (Israeli bodies) |
| May 1985 | 1150 (Palestinian and others) | 3 Israelis |
| **Total** | **5962 (alive)/70 (dead)** | **15 (alive)/5 (dead)** |

### The Hijackings—A Target-Rich Environment

Aircraft hijackings became a regular part of the Middle East's décor during the 1970s and 1980s. A method refined by the PLO during the 1970s, by the 1980s many Arab nonstate actors accepted aircraft hijackings as an effective way to broadcast their appeals internationally. While attainment of their demands was only moderately successful, hijackers adopted the international air carrier as a podium for proclaiming their organizations' manifestos. After the operations, hijackers usually evaded prolonged imprisonment, either by escaping or as the result of ultimatums delivered to their captors.

Two important hijackings in the Middle East immediately preceded the TWA 847 incident. On June 11, a Shi'a Muslim hijacked a Royal Jordanian Airlines 727 departing Beirut Airport in an attempt to hasten the exit of Palestinian guerrillas from Beirut. Then, on June 12, a Sunni Palestinian responded to the June 11 operation by hijacking a Middle East Airlines 707.[11]

### THE HIJACKING[12]

TWA 847, a passenger aircraft carrying 145 passengers and 8 crewmembers, was bound for Rome when two young male Arabs hijacked the plane at 10:10 A.M. (local time) on June 14, 1985.[13] Armed with pistols and hand grenades that they had smuggled through the X-ray machines at Athens airport, the hijackers violently subdued the crew and passengers. First-class passengers were forced to vacate the first-class section and join the rest of the passengers in coach. The hijackers then ensured that all male passengers were seated next to windows, in order to prevent attempts by the men to retake the plane.[14] The pilot, Captain John Testrake, acceded to the hijackers' demand of diverting the flight to Beirut International Airport. Throughout the flight, passengers were forced to remain incommunicado with their heads on their knees.

Landing at Beirut International Airport proved to be no easy feat. Because of its value as a transit node and a symbolic point of the city, Lebanon's sectarian groups continually fought to gain control of the airport. When TWA 847 approached Beirut, the airport's control tower initially denied the pilot permission to land. Moreover, he found the runway barricaded by the Druze militias that were fighting the Shi'a AMAL.[15] Testrake landed after AMAL defeated the Druze and removed the barricades.

The short stay at Beirut on June 14 began the cycle of violence that led to the death of the U.S. Navy's Robert Stethem. After releasing 17 women and 2 children, the hijackers beat Stethem because of the airport's hesitation in refueling the aircraft.[16] At Beirut, the hijackers read a prepared letter to the control tower and released their first of a series of demands—Israel had to release the 766 Arab prisoners held in Atlit

prison.[17] TWA 847 then departed Beirut enroute to Algeria. Upon landing at Algiers, the terrorists increased their list of demands. In addition to Israel's release of the 766 Shi'a Muslims held at Atlit, the hijackers also demanded Spain's release of 2 Lebanese Shiites held for the attempted assassinations of two Saudi nationals, Kuwait's release of the Dawa 17, and an end to Arab oil and arms transactions with the United States.[18]

Algeria was a contentious place for the plane to land. Algerian President Chadli Bendjedid initially planned to refuse landing permission to the aircraft, but reconsidered after American appeals. American officials believed that Algeria was a far better alternative to other possible airports that the hijackers might request. In addition, Algeria had proved an effective negotiator in the past, particularly in 1979 when the Algerian government acted as the primary intermediary in the negotiations with Iran concerning American captives in Tehran.[19] Relying on Algeria proved to be beneficial. Algerian forces secured TWA 847 without incident. More importantly, the Algerians successfully gained the release of 21 additional passengers. During this initial stay in Algiers, the hijackers severely beat an American, Kurt Carlson, when the airport delayed the plane's refueling.[20] After approximately 5 hours, the hijackers demanded a departure.

TWA 847 landed a second time at Beirut in the early morning of June 15. Either because the Beirut control tower was delinquent in lighting the runway markings or because the hijackers' demand of a meeting with AMAL representatives was not satisfied promptly, the hijackers shot Petty Officer Robert Stethem and dumped his body from the plane.[21] Soon after, AMAL representatives approached the plane, and 10–12 gunmen reinforced the original hijackers. One of the reinforcements was believed to be Imad Mugniyeh, an individual implicated in the 1983 Marine barracks bombing and the kidnapping of Americans in Beirut.[22] During this second stop in Beirut, the hijackers made the strategic decision to separate the hostages. AMAL and Hizbollah captors segregated approximately 12 hostages with American government identification or "Jewish-sounding" surnames and spirited them away to different locations in the city. After only a few hours on the ground, TWA 847 was once again airborne for a second trip to Algiers.

TWA 847's second visit to Algeria was a mixed blessing. After communicating demands for the release of additional prisoners in Cyprus and Greece,[23] the hijackers (now the 2 original hijackers plus the 10–12 reinforcements from Beirut) entered into negotiations with the Algerian government and the International Red Cross. As a result of the negotiations, the Algerians secured the release of approximately 65 passengers, which included the flight's remaining women and children. The release, however, required a quid pro quo. In exchange for the release of Greek citizens (at least two fo whom were in Beirut), Greece agreed to release Ali Atwa, a

third hijacker who had been unable to board the flight in Athens.[24] After he failed to secure a seat on the flight and raised a commotion, Greek authorities detained Atwa. When the hijacking was announced, Atwa readily admitted to his planned participation, and was subsequently arrested by the Greek government. After Atwa rejoined his companions in Algiers, TWA 847 began the final leg of its air travel at 8:00 A.M. on June 16, the third day of the ordeal.

Once again, upon approaching Beirut International Airport, Captain Testrake found the runway blocked. After he communicated the necessity of landing, even at the expense of a crash landing, airport personnel moved the obstacles, and TWA 847 landed for its final time at Beirut.[25] The hijackers demanded to speak to AMAL personnel, who were soon at the airport. After meeting with the representatives of AMAL, the hijackers reemphasized their demands for the release of Shi'a prisoners in Spain and Israel. This meeting also had the effect of positioning Nabih Berri, the leader of AMAL, as the middleman in the TWA crisis. Approached by both the hijackers and the United States,[26] Berri became the public negotiator and spokesman for the hijackers' demands. He publicly assumed responsibility for the hostages' safety.

June 16 showed the weakness of Lebanon's recognized government and the powerlessness of the United States government to respond to the hijacking. After the United States conducted a demonstration of force with attack aircraft in the skies over Beirut, AMAL and its allies reinforced the airport with scores of fighters, and the Lebanese Army withdrew its 180 soldiers.[27] Hostile militias completely controlled the airport and its surrounding area, negating the slim hopes for a rescue attempt. Also on June 16, the hijackers, in coordination with Berri, removed the passengers (but not the three-person flight crew) from the aircraft, divided them into groups, and transferred them to different locations in Beirut. While the AMAL militia gained control over the majority of the passengers, Hizbollah retained control of at least four hostages. Finally, June 16 brought Nabih Berri's first press conference, the beginning of his parley with Western negotiators, and the start of his dance with the international media. Berri had been educated in France and maintained a residence in the United States. National Security Adviser Robert McFarlane, who met Berri in 1983, believed that the AMAL leader "had in his hands the ability to end the hijacking."[28]

During the press conference, Berri masterfully presented a number of points. First, by assuming responsibility for the hostages, he placed himself at the center of the situation for the remainder of the crisis. Berri became the *de facto* spokesman for an operation and an organization (Hizbollah) over which he had little control. Second, in his reiteration of the terrorists' demands, he presented himself as the fair moderator between parties.[29] Knowing the reticence of the Kuwaiti regime, he convinced the hijackers to concentrate on the prisoners detained in Israel

and Spain. In doing so, Berri fed perceptions that he could influence and moderate the hijackers' demands. Third, Berri tied the hostages' plight to the plight of the Lebanese prisoners in Israel's Atlit prison—a parallel that gained increasing public legitimacy throughout the crisis.[30] He consistently compared the remaining TWA hostages, now predominantly American men, with the Lebanese Shi'a held in Israel,

> I do not know why the policy of the U.S. differentiates between a kidnapper of a country and its people [Israel], and a hijacker of an airplane. Why should someone who defends his country be termed a terrorist, while the terrorism against our people is disregarded?[31]

After June 16, the hijacking of TWA 847 degenerated into a stand-off between competing entities with Berri acting as a churlish third party. By June 17, AMAL and Hizbollah controlled the Beirut airport, 36 hostages were held in various locations around Lebanon, 3 crew members remained on the aircraft, and the United States had few options. A military operation seemed to be impossible, as the United States had little information concerning the passengers' locations and few friends in Lebanon to aid in a rescue attempt.[32] Diplomatically, the United States also faced an impasse. Not only did it not have confirmation of the group affiliation of the hijackers (although most analysts assumed that they belonged to an organization tied to Hizbollah), but the United States did not control the foci of the hijackers' demands. On June 16, Spain had publicly announced that it would not release the two Shi'a prisoners held in its prison. On the same day, Israel had started to demonstrate its intransigence concerning the Atlit prisoners. As a result, circumstances forced the United States into a position of relying on mediators, particularly Berri, to protect the hostages and attempt to gain their freedom.

From June 17 through June 22, none of the major variables in the hijacking changed significantly. AMAL and Hizbollah moved the prisoners between locations in an effort to prevent rescue attempts. Berri shifted between stances of utmost concern for the hostages and a willingness to "wash his hands" of the hijacking.[33] The United Nations, the International Red Cross, and various European states offered to act as negotiators between the hijackers, the United States, and Israel. The Reagan Administration, facing the specter of the 1979–1980 Iranian hostage crisis, came under increasing domestic pressure to solve the situation in Lebanon.

As a result of this cumulative inertia, the United States increased its diplomatic traffic to Israel, Iran, and Syria. American messages centered on the question of the Shi'a prisoners in Atlit and the possibility of their release. Because of its public policy of "no negotiations" with terrorists, however, the United States refused to formally or publicly ask the Israelis for the prisoners' release. In communications to Iran and Syria, the United States sought assistance from those believed to be the state sponsors of

AMAL and Hizbollah. Advocates within the administration felt that the correct mix of incentives and deterrents toward these two states might gain the hostages' freedom. Unfortunately, the United States made little headway, and concern mounted that the TWA passengers faced a fate similar to the seven American hostages already in Beirut, some of whom had been held for longer than a year.

Days continued to slip by with little hope of a resolution. Even after the Israelis' release of 31 prisoners from Atlit on June 23, the hijackers refused to make a comparable release of TWA passengers. Berri approached France and Switzerland to enlist their embassies as way-stations for the hostages until the release of the remaining Shi'a prisoners, but France and other European states only agreed to shelter "released" persons. Berri unilaterally expanded the list of demands to include the withdrawal of American warships from Lebanese waters and an American guarantee against retaliation upon the conclusion of the crisis.[34] Israel and the United States publicly refused any attempts to tie TWA 847 and Atlit together as part of a hostage exchange bargain, but both states tacitly agreed to the step should the TWA hostages be released.

Soon, however, pressures outside Lebanon began to move the event toward a conclusion. Hafez al-Assad's influence and Syria's strength in Lebanon came to bear on AMAL, in an effort to (according to a CIA report) "extract Shia AMAL leader Nabih Barri . . . from a no-win situation" and to prevent Shi'a Islamists from gaining too strong a hold in Lebanon.[35] Syria's increasing pressure on Berri forced him to seek new ways to bring the situation to a hasty conclusion. Also, Israel's position shifted to one that viewed the release of the Atlit prisoners as a process interrupted by the TWA hijacking—a process that could be reinstated once the passengers were released.[36]

The hostages were released on June 30, 1985, but not without a number of missteps that delayed the process. Three days prior to the release, the United States hindered the negotiations, when it publicly demanded that the seven non-TWA American hostages held in Beirut be included in the release. Berri and Hizbollah, separately, refused to entertain such a notion. However, after Berri became satisfied that the demands concerning the Shi'a prisoners and American retaliation would be met, and after Syria agreed to accept responsibility for the hostages, the TWA passengers were consolidated in Beirut and shuttled to Damascus.[37] From Damascus, a U.S. Air Force transport plane carried them to American military facilities in Germany and to freedom. After 16 days of brinkmanship, the conclusion seemed anticlimatic, at least to everyone except the hostages.

## TWA 847 IN CONTEXT

Two noticeable differences separated the TWA 847 crisis from earlier hijackings, and particularly from the contemporary hijackings by Arab

factions in the Middle East. First, TWA 847 received more media attention and direct media involvement than any previous hijacking. Second, the hostages' role in the media coverage of the hijacking was something not previously seen in similar events. Beginning with Berri's press conference on July 16, through the final press conference by the hostages in Damascus on June 30, the international media gained unprecedented access to the event and its actors. In addition to interviews with released hostages,[38] the media publicized an interview and a press conference with hostages still held captive. The first event, on June 19, immortalized TWA 847 in media history, when journalists approached the aircraft on the Beirut tarmac to interview the captive crew. Then, on June 20, AMAL brought four hostages to the Beirut airport for a press conference. In addition to covering the hostages, the press gave unprecedented coverage to the captors. Nabih Berri became an overnight media sensation with almost-daily press conferences, interviews, and statements. AMAL gained international recognition as a result of its part in the stand-off, particularly after Berri negotiated the release of the hostages. Even the original hijackers, albeit with hooded masks, gained international recognition in a press conference conducted on June 30.

This nonstop coverage colored the Reagan administration's approach to the situation, causing it to seek the quickest resolution possible in an effort to maintain popular support of the president. While such media inundation may have proved inconsequential to the Middle East's autocracies or to Lebanon's failed state, it was all-important to an American population increasingly influenced by television coverage. As David C. Wills highlights in his excellent account of the hijacking, President Reagan's chief of staff, Donald Regan, raised the important point during the June 24 meeting of the National Security Planning Group,

> How long is the process [going to take]? We don't have the luxury of waiting. Public opinion will desert the President [and we'll face the] Carter Syndrome.[39]

## WHY TWA 847?

Why did Ali Atwa, Mohammed Ali Hammadi, and Hasan Izz-Al-Din choose TWA 847? While we can never be sure of the true intentions of the hijackers or the organization that they represented, tactical and strategic considerations made the flight an ideal target.

The flight offered a number of advantages. Athens, the flight's departure airport, was known to have lax security—a deficiency that led to many successful and recent hijackings. In 1973, the PLO's Black September attacked passengers inside the airport, and, in 1976, members of the Popular Front for the Liberation of Palestine and Germany's Baader-Meinhof Gang hijacked an Air France flight.[40] In June 1983, a Romanian

aircraft scheduled to fly the Athens-to-Rome route was hijacked to Libya. Then, in March 1985, an "Arab" fired a rocket-propelled grenade at a Royal Jordanian airliner after he breached the airport's perimeter fence.[41] In addition to this demonstrated lack of preventive measures, Greek reactive measures were weak. The Greek police were inefficient and poorly trained,[42] and according to Middle East analyst Spiros Kaminaris, Papandreou's government showed "[a] sympathy for radical Arab regimes and causes [that] was encouraged and, to some extent, exploited by Papandreou's ambition to promote Greek leadership of Third World states . . ."[43] Finally, the Greek government demonstrated on at least two occasions that it was willing to free hijackers and suspected terrorists, particularly in response to other hijackings of Greek citizens, aircraft, or ships.[44]

Strategically, the TWA 847's majority-American passenger list offered the hijackers the bargaining chips necessary to gain the freedom of their compatriots. While contemporary scholars viewed the hijacking merely as one-upmanship between the Lebanese Shi'a factions,[45] this analysis seems only accurate concerning the intervention of Nabih Berri and AMAL. Other evidence indicates that Hizbollah was primarily concerned with the Shi'a prisoners' release. First, Hizbollah and its affiliates (most notably, Islamic Jihad) made the release of Lebanese Shi'a prisoners their core demand after the Dawa 17's detention in 1983. Prior to the TWA hijacking, Islamic Jihad hijacked a Kuwaiti Airways aircraft and made demands similar to those presented by Hammadi and Izz-Al-Din.[46] Likewise, in May 1985, Islamic Jihad contacted Western news agencies with pictures of the seven American hostages held in Beirut in an effort to achieve the Dawa 17's release. On the heels of these events, TWA 847 seemed to be a more robust effort to gain the same objectives. As the United States was a patron of Israel, a patron of Kuwait, an ally of Spain, and a world superpower, the logic of forcing American pressure on these states through a hijacking of Americans appeared eminently sensible. Also, Hizbollah's decisions during the crisis indicated that Lebanese power politics was hardly the group's foremost consideration. For example, the original hijackers' demands of June 15 and 16 of only AMAL mediators, followed by a reinforcement contingent of AMAL and Hizbollah gunmen, showed little hesitancy by Hizbollah to share the spotlight with its sectarian rival.

## THE LESSONS OF 847

### Military Difficulties

From the second day of the incident until its conclusion, the lack of a military solution to the TWA hijacking frustrated the United States. In hindsight, an attempted rescue mission would have undoubtedly caused hostage fatalities and significant diplomatic problems for the United

States. Any rescue attempt first faced the problems of time and space. While much was made in the contemporary media about the deployment of Delta Force to the region,[47] the unit's deployment faced significant problems. One problem stemmed from the unit's position in the United States. Although it had the ability to react immediately to any deployment order, Delta still found itself 8–10 hours away from the Middle East. Bureaucratic inertia compounded this problem by delaying the deployment of the force until the second day of the crisis.[48] Related to this variable of proximity was the temporal window within which the United States could feasibly react. Even at the time of the hijacking, high-ranking American officials recognized that a rescue mission became impossible once the aircraft landed in Beirut for the second time (the early morning of June 15).[49] The Shi'a factions' ability to reinforce the airport and disperse the hostages to a variety of unknown locations made a successful rescue extremely unlikely.

Another problem facing military action and, particularly, a rescue attempt was the lack of agreement to such an operation by key regional actors. Even had the United States been ready to mount a rescue operation in the early hours of the crisis, Beirut was not a feasible location. The government, while friendly to the United States, did not have effective control over the airport or its surrounding area, as was demonstrated by the Lebanese Army's withdrawal from the airport on June 16. Likewise, the Algiers airport could not be the rescue location due to the Algerian government's adamant objection to any such operation.[50] While attempts had been made to force TWA 847 to land at a more hospitable location (Cyprus being the first choice as it was the staging location for Delta), the hijackers invariably controlled the aircraft's destinations.

Other problems concerning a rescue included the lack of coordination between entities that wanted to make such an attempt, and the lack of expertise of some of those actors. In addition to the United States, reports indicated that the Lebanese, the Jordanians, the Israelis, and a shadowy private entity expressed interest in staging a rescue operation.[51] Who would control such a rescue, particularly should two countries attempt simultaneous operations, became highly problematic.

Even after the hostages' release on June 30, the United States faced problems concerning the use of military force to retaliate for the hostage-taking. First, the United States faced the important question of who to retaliate against. AMAL and Hizbollah were obvious choices, but there were difficulties in distinguishing one group from another, particularly given Hizbollah's amorphous nature and the predilection of the terrorists to espouse membership in many different groups. Also, there was the question of what to retaliate against. In 1985, groups like AMAL and Hizbollah had little infrastructure for the United States to strike. Air attacks could

have been conducted against Hizbollah's training camps in the Bekaa Valley, but doing so might have caused casualties among the camp's Iranian cadre or the seven Americans still held hostage in Lebanon. More importantly, conducting attacks after the United States government's June 30 reiteration of its foreign policy calling for the "preservation of Lebanon, its government, [and] its stability and security," would have caused multiple difficulties.[52] Berri and the Syrians took the statement as a guarantee against retaliation, and military action after the statement could have caused other states and movements to question American reliability in future negotiations.

### Friends, Neutrals, and Adversaries

Given the difficulties of a military response, diplomacy became the instrument of necessity during the TWA 847 hijacking. In this arena, the United States experienced unexpected benefits and difficulties. Algerian intervention was one of the great advantages of the crisis. Former Secretary of State Henry Kissinger reportedly once said, "[I]f you want to find out what the Arab 'radicals' are thinking, go to Algiers."[53] In June 1985, the government of President Benjedid proved instrumental, particularly in gaining the freedom of so many hostages. While the Algerians were resistant to the idea of allowing American forces to attempt a rescue attempt at the Algiers airport, the Algerian performance mirrored the central role that they had played in the release of the Tehran hostages nearly 5 years earlier. Algeria was no democracy, but it certainly proved to be a valuable American friend during the crisis.

On the other hand, Israel proved to be more of an obstacle than an ally during the event. The hijackers' central demand focused not on a redress of American actions, but on the Israeli detention of Lebanese Shi'a. The Israelis had established a precedent of exchanging hostages. However, in the case of TWA 847, the Israelis demonstrated an intransigence that hindered American diplomatic efforts. At one point, according to David Wills' analysis of these events, Israeli Defense Minister Rabin told the media that "the Americans will have to crawl on all fours before we even discuss . . . releasing the detainees."[54] Israeli obstinacy, particularly during the first week of the hijacking, acted as a distraction to Reagan Administration officials who had expected and assumed far better support from the country thought to be the United States' best regional ally.

### Lessons Learned Again, and Again . . . and Again

During and after the TWA 847 crisis, the United States undertook a number of actions in response to the incident. On June 16, the administration established the Vice President's Task Force on Combatting

Terrorism.[55] Directed to provide recommendations to President Reagan concerning responses to future terrorist threats, the task force presented its report in December 1985. On June 18, in his first public statement concerning the hijacking, President Reagan issued a travel advisory against travel to Athens International Airport and issued a directive for expansion of the Department of Transportation's sky marshal program.[56] Finally, the Department of Transportation implemented a ban on American airline traffic to Beirut International Airport and restricted the Lebanese national carrier, Middle East Airlines, from landing at American airports.

In retrospect, several recommendations stemming from the Task Force's review of TWA 847's hijacking failed to be implemented, and would haunt the United States in the aftermath of the September 11 attacks. For example, their final report observed that:

- Pre-flight screening of passengers and carry-on baggage is a cornerstone of our domestic security program . . . [t]he recent terrorist acts against international aviation and maritime interests indicate a need for continual monitoring and updated security procedures.
- Currently, while several federal departments and agencies process intelligence within their own facilities, there is no consolidated center that collects and analyzes all-source information from those agencies participating in antiterrorist activities.
- An increase in human intelligence gathering is essential to penetrate terrorist groups and their support systems.[57]

In short, the recommendations put forth by the 1985 task force are remarkably similar to the recommendations provided 16 years later in response to other, far more deadly aircraft hijackings.

Another failure displayed before, during, and after the TWA hijacking was the United States' inability to recognize terrorism as a form of warfare, rather than a criminal act. Statements made by President Reagan, Secretary of State George Schultz, and other administration officials showed a desire to arrest, prosecute, and "bring to justice" the perpetrators and supporters of the hijacking.[58] Likewise, the Task Force's report to the president reflected a similar mindset. Unfortunately, this approach has not always produced a lasting justice for the atrocities committed by terrorists. For example, after his arrest in Germany in 1987 on other charges, Mohammed Ali Hammadi was tried for the hijacking of TWA 847 and the murder of Robert Stethem, and subsequently sentenced to life imprisonment. However, his "life" sentence only lasted until December 2005, when German authorities released Hammadi. He is now thought to reside somewhere in Lebanon.

## CONCLUSION

This study of TWA 847's hijacking offers specific lessons concerning antiterrorist and counterterrorist strategies. Military action, while seemingly the default response of the United States, is not the best (or a feasible) response in many circumstances. In this case, the terrorists offered little opportunity for a rescue attempt to be executed. Beirut offered too many impediments, the Algerian government would not allow any such operation in Algiers, and the hostage-takers would not allow the plane to land elsewhere. Another lesson centered on the diplomatic efforts employed during the incident. While diplomatic solutions became difficult, particularly because of strained or nonexistent relations between some parties (as in the case of American-Iranian exchanges), diplomacy was productive when the United States enlisted the aid of a third party (Algeria) that had credibility with the hijackers. Yet another lesson stemming from the incident concerned the importance of the media in the modern battle against terrorism. When countering terrorist actions, states must gain and maintain the initiative when dealing with the media. During the TWA crisis, Nabih Berri's preeminence in the media spotlight gained popular legitimacy for an incident that was an act of war, and showed the dangers of allowing terrorists to shape the media environment. Finally, TWA 847 demonstrated that states must be able to adjust their tactics and strategies in an effort to recognize terrorism for what it is—war. Whether terrorist organizations act to further their own interests or on behalf of state sponsors, their actions are a means of combat, not of crime. As such, continuing efforts to treat terrorists as criminals (even after September 11) accord the terrorists a freedom of action that hinders antiterrorist and counterterrorist efforts.

## ACKNOWLEDGMENTS

## NOTES

1. The phrase "beginning of a war" in relation to the TWA hijacking was attributed to Secretary of Defense Caspar Weinberger in David C. Wills, *The First War on Terrorism, Counter-Terrorism Policy during the Reagan Administration* (Lanham, MO: Roman and Littlefield, 2003) 137.

2. Barry Rubin, "The United States and the Middle East, 1984–1985," in Itamar Rabinovich and Haim Shaked, *Contemporary Survey, Vol. 9, 1984–1985* (Boulder, CO: Westview, 1987), http://meria.idc.ac.il/us-policy/data1984.html (accessed May 2006).

3. The "correct" English spelling of the group's Arabic name is Hizb'Allah or Hizbu'llah, however it is more usually spelled "Hizbollah," "Hizbullah," or "Hezbollah." In order to standardize across all three volumes, the editor has chosen "Hizbollah" because that is the spelling employed in the URL designating the group's official homepage.

4. AMAL is an acronym of *Afwaj al-Muqawamah al-Lubnaniyyah*, or "Lebanese Resistance Brigades." *Amal* is also the Arabic word for "hope."

8. "Dawa" (Arabic for "call") was a movement started in Najaf, Iraq, under the tutelage of senior Shi'a clerics Ayatollah Ruhollah Khomeini and Ayatollah Baqir al-Sadr. Its belief structure centered on the need for the establishment of Islamic regimes in the Middle East, even if such establishments required radical action. Dawa became the font from which many of the radical Shi'a regional movements (to include the Iranian Islamic regime and Lebanon's Hizbollah) developed. See "ITAC Intelligence Note . . ." (pp. 4, 7) for a description of the numerous hijacking and kidnapping operations that involved demands for the release of the Dawa 17.

# CHAPTER 4

# THE *ACHILLE LAURO* HIJACKING

## Sean K. Anderson and Peter N. Spagnolo

In October 1985, tension between the State of Israel and the Palestinians was nothing new. Four major wars had been fought, the Israelis had invaded and occupied southern Lebanon in 1981, and countless attacks, counterattacks, preemptive strikes, and raids had been carried out by both sides over the larger questions of Israeli existence and Palestinian rights. One of the results of the 1981 invasion was the displacement of the Palestinian Liberation Organization (PLO) from Lebanon and the relocation of its headquarters to Tunis in 1982.

On September 25, 1985, three Israeli citizens were killed on their yacht as it was anchored off the coast of Larnaca, Cyprus. Credit for this attack was claimed by Force 17, an elite unit of the PLO whose main function was the personal protection of the PLO leadership but, who also conducted terrorist strikes as well as attacks on rival Palestinian factions.

On October 1, 1985, Israel launched a long-range air strike against the PLO headquarters in Tunis, killing over 73 people and wounding about 100 others. Israel announced this attack on Tunis in a press conference held by Israeli Minister of Defense Yitzhak Rabin, Chief of Staff Moshe Levy, and Air Force Chief Amos Lapidol. During the press conference, the three Israeli leaders announced a new policy whereby terrorist targets would be attacked wherever they were located and that no terrorist would be safe. According to Israel's official account of these events:

> Mounting wave of terror against Israelis and Jews, in Israel, in the areas and abroad, culminating with the murder of three Israelis in Larnaca's harbour, led the government of Israel to seek new ways to combat terror. Since it was evident that the attacks were masterminded by the PLO and the various

organizations under its umbrella, Israel decided to attack the PLO headquarters in Tunis. In a daring, long distance aerial raid, Israeli planes bombed a PLO base in Tunis, some 4800 kilometers round-trip from Israel. 60 terrorists were killed, including some senior members of "Force 17." Arafat was not in Tunis at the time, but his headquarters was hit.[1]

Some claim that the three Israelis killed in Cyprus were Mossad agents, while the official Israeli position is that they were civilians. While many considered the aerial attack on Tunis as specifically a retribution for the Larnaca incident, the Israeli government insisted it was simply a part of their wider ongoing war on terrorism.

**EVENTS LEADING UP TO THE HIJACKING**

When the *Achille Lauro* attack occurred, at first many believed that it had been conducted in retaliation for Israel's attack on Tunis. However, the hijacking operation had been planned in advance for over 10 months, involving two previous journeys on the *Achille Lauro* by Masar Kadia,[2] who posed as a Greek shipping magnate under the name "Petros Floros," and was accompanied on at least one of these trips by the man who would lead the hijacking, Magied al Molqi. These scouting trips were intended—among other things—to assess security measures, meal times, the normal activities of passengers and crew, the relative competence and aggressiveness of specific crew members, the likely response of the ship's captain and crew, and the layout of the ship.

On September 28, 1985, accomplices smuggled four Soviet-made Kalashnikov automatic rifles, eight hand grenades, and nine detonators aboard the Tunis-to-Genoa ferry, the *Habib*, which were then carried aboard the *Achille Lauro* by the four hijackers in their uninspected baggage on October 3, 1985.[3] Masar Kadia, the previous scout who was also the handler of the four hijackers, booked a cabin separate from the others, and did not associate with them apart from one private meeting with their tactical commander, Magied al Molqi, after which he debarked in Alexandria. Later, it was learned that only Kadia and al Molqi knew of the full hijacking plan. Prior to arriving in Alexandria, after consulting with Kadia, al Molqi gave orders to the other three to unpack their weapons and prepare to seize the vessel.[4] Although the other three attackers had been kept in the dark until that moment, the original plan had apparently been to hijack the ship on the high seas.[5] Technically, such an operation would violate the PLO's declared policy since 1974, which ruled out terrorist attacks "outside the territory of Occupied Palestine."[6]

While adhering to the 1974 policy had made the PLO and its factions more respectable as "freedom fighters" in the view of the international community (apart from the United States and Israel, who still regarded them as terrorists), it also reduced the strategic effectiveness of their military struggle. The group that would seize the *Achille Lauro* had conducted seven major actions in the period 1978–1983, all of which involved attempts to take hostages, and all but one involved attempts to infiltrate Israel. Only three of the six infiltration attempts succeeded, while in only one case did the terrorists succeed in seizing hostages, but in no case did they win the release of any Arab prisoners. In April 1979, four Palestinian fighters landed on a beach near Nahariyah, Israel, on a mission to seize hostages. Three Israeli civilians were killed by the terrorists, two of whom were killed and the other two captured. The political and military payoffs of such actions were minimal: Israel was able to defend its territory and citizens effectively while the rest of the world, whose citizens were no longer in the cross-fire of the Arab-Israeli conflict, could regard it now with relative indifference.[7]

The *Achille Lauro*, a vessel owned by the Italian government, was a 23,629-ton cruise ship that was 643-feet long, capable of serving 900 passengers, having two swimming pools, a movie theater, and a discotheque. The Italians had leased the ship to the Chandris-Italy Company, which offered low-cost cruises throughout the Mediterranean. Some 748 passengers had boarded the ship at Genoa on October 3 for a 12-day Mediterranean cruise, with calls at Naples, Syracuse, Alexandria, Port Said, Ashdod (Israel), Limassol (Cyprus), and Rhodes (Greece). Cruise manager Max Fico later reported that a party of several young men kept to themselves and displayed none of the friendly behavior usual on cruises. Some passengers tried to strike up conversations with the men during a meal, but they seemed reluctant to interact with their fellow passengers and merely said they were from Argentina. When a female passenger who was fluent in Spanish tried to speak with them, none seemed to understand anything she said to them. The terrorists boarded with passports issued from Norway, Argentina, and Portugal.[8]

According to a document seized later, the four had planned to attack the Port of Ashdod upon arrival, but when a crew member saw them cleaning their weapons, they were forced to change their plans. Excerpts of this document read as follows:

> The Ashdod Port Operation: When the Zionist enemy carried out an air strike against the Palestinian HQ in Hamam al-Shatt in Tunis in October 1985, the Front reacted to this aggression by attempting a sea landing in Ashdod port . . . This operation was unsuccessful, forcing the Front's fighters to change the original plan . . . Once they were uncovered on the ship taking them. They

took over the ship known as "Achille Lauro" . . . The organization found itself fighting on several fronts, [including] directly against the American enemy. This, especially after American aircraft hijacked a civilian Egyptian aircraft that carried the comrade Abu al-Abbas, General Secretary of the Front and Member of the PLO Executive Committee, and other comrades, and forced them to land in the Sicily airport in Italy.[9]

Although there had been numerous aircraft hijackings during the early 1980s, the taking of a civilian passenger ship was unprecedented. Consequently, the security measures on the ship were lax: only a passport was required to buy a ticket, there were no checks of luggage, and very little observation of persons embarking other than to ensure they were paid passengers. Therefore the *Achille Lauro*'s distress call would receive immediate international attention. Fortunately, before the actual hijacking occurred, most of the passengers had debarked at Alexandria for a tour of the Pyramids, planning to travel overland to Port Said (the next port of call) to continue their voyage. This was on Day 5 of the planned 12-day cruise, and the next stop after Port Said was to be Ashdod, Israel, the terrorists' supposed target. The people remaining on board included the 350 members of the crew (Italian and Portuguese citizens) and 97 passengers of various nationalities.[10]

Another reason this hijacking would captivate the worldwide attention that the terrorists were seeking was the nature of their immediate victims—namely, tourists from about 20 nations, including, Belgium, Brazil, Britain, France, Holland, Italy, Spain, Switzerland, the United States, and West Germany. No Israelis were on the passenger list, however. A group of elderly Jewish Americans would eventually be singled out for "special treatment" by the hijackers, and thus receive the anxious attention from the on-looking global audience. This group included Leon and Marilyn Klinghoffer, along with eight of their closest friends—three retired couples and two older women who shared the Klinghoffer's summer homes in the same group of condominiums in Long Branch, New Jersey. The Klinghoffers were celebrating their 38th wedding anniversary, but their voyage also had some urgency behind it: Marilyn, age 58, had been diagnosed as having an incurable colon cancer and had less than a year to live. Leon Klinghoffer, a 69 year-old retired small appliance manufacturer, had suffered two strokes and was partly paralyzed and confined to a wheelchair. He had limited ability to use his hands, which were tremulous, while his speech was often slurred. Fellow hostages recalled afterwards that the hijackers seemed irritated and uneasy with his slurred speech and erratic motions.

Neither spouse expected to long survive the demise of the other, but both had decided to make the most of this twilight honeymoon voyage in

the company of their closest friends. However, the hijackers would also radio threats to kill all of the over 400 people aboard if their demands were not met or if escape were attempted, so anxiety was shared among the several nations, families, and friends who had other passengers and crew members aboard the cruise ship.

## EVENTS DURING THE HIJACKING

The passengers first realized something was amiss when the hijackers burst into the dining room toward the end of the noon meal of October 7, firing over their heads and shouting barely intelligible commands. Some passengers fled into the kitchen, pursued by one of the hijackers who beat two of the kitchen staff to the floor and then forced everyone back to the dining room. Two crew members were reportedly shot, but received only minor wounds, while another Italian sailor was slightly wounded by shrapnel from a bullet.[11] As the hijackers consolidated their control over the vessel, they took command of the ship's bridge and radio room.

After securing the passengers in the dining room, the hijackers ordered the crew to summon Captain Gerardo de Rosa, who later testified that "As soon as I got there, I faced the machine guns. First they fired some shots at the deck, shouting in Arabic. Then they told me to head for Tartus."[12] The ship then turned for the Syrian port, which was about 300 miles to the northeast. The hijackers then allowed the crew to return to running the ship, telling the captain that any attempts by him or the crew to thwart them would result in harm to the passengers held hostage.

After the initial shooting spree, the terrorists herded all passengers— except for Anna Hoerantner, a 53-year old Austrian—into the dining room, and instructed Captain de Rosa to order the crew to carry on with their normal duties but avoid all contact with the hostages. Hoerantner had been knocked down a stairwell when the hijackers had rushed into the dining room. In the confusion, she escaped and hid in a bathroom in an unoccupied cabin for the duration of the hijacking and was found hiding there 15 hours after the hijacking had ended. The terrorists told the crew that there were 20 hijackers on board; this was probably a ruse to discourage any attempts to retake the ship.

The treatment of the hostages was erratic, going from considerate one minute to brutal the next: when one passenger asked for a cup of water, the hijackers handed one to her, but when an exhausted Marilyn Klinghoffer attempted to lay down on the floor, one of them struck her with the butt of his weapon, ordering her to get up. The terrorists also tried some form of political statement by occasionally proclaiming "Reagan no good! Arafat good!"[13] and then later forced the passengers into a common area, the Arazzi Lounge. After the terrorists directed the ship into the Mediterranean and turned off the ship's transponders, the ship blended into the

busy sea lanes, and in spite of extensive tracking efforts by the United States, Egypt, Italy, Great Britain, and Israel, it disappeared for much of the next 36 hours.

To further exacerbate the confused situation, it was unclear exactly who the hijackers were and with what (if any) group they were affiliated. Early on, the terrorists claimed to be part of the Palestinian Liberation Front (PLF), and this seemed to be confirmed by the fact that the only prisoner named in the release demand was a member of the PLF. However, the PLF was no longer a single entity but had splintered into no fewer than three factions.

The original PLF had been founded in 1961 by Ahmed Jabril, who coordinated the group's efforts with Fatah in 1965. In 1967, a group from the PLF, which included Jabril, founded the Popular Front for the Liberation of Palestine (PFLP) under Dr. George Habash. Soon after the founding of the PFLP, Jabril became disillusioned with the group's emphasis on ideology, and broke away to form yet another splinter group—namely, the Popular Front for the Liberation of Palestine-General Command (PFLP-GC)—while still sharing the parent group's goal of the eradication of Israel in favor of a Palestinian state. In 1977, yet another split took place when the current PLF broke away from PFLP-GC over Jabril's support of Syria's policy in Lebanon. In late 1983, the PLF split when founder Abu Abbas decided the group was growing too subservient to Syria. He and his followers left for Tunis in order to align themselves closer with Arafat's al Fatah. The PLF faction remaining in Damascus was headed by Talat Yaqub, but was itself split when Abdal Fatah Ghanim tried unsuccessfully to seize power over the PLF in January 1984. The Yaqub faction remained in Damascus, while Ghanim and his followers established their rival PLF office in Libya. While the PLF had been recognized by Yassir Arafat in April 1977 as a member of the PLO, this recognition continued to be extended only to the faction led by Abu Abbas,[14] who was eventually made a member of the PLO Executive Committee.[15] With all of these factions and shifting loyalties and alliances, the authorities did not initially know which PLF faction they were dealing with in the hijacking of the *Achille Lauro.*

On the following day, the hijackers sought to separate Jewish and American passengers from the others. When the hijackers asked if there were any Jews present, two elderly Austrians identified themselves, whom the hijackers immediately beat and manhandled. Having seen this, the small group of Jewish Americans held their tongues. The hijackers separated the 2 Jewish Austrians—as well as the 12 Americans and 5 British women belonging to a dance troupe—from the rest of the hostages, and forced them to climb up to an upper open deck, where they were forced to sit or lie under the burning sunlight and where they were surrounded by tins of gasoline or diesel fuel. The hijackers told these hostages that they would be shot, blown apart by grenades, and burned alive if anyone attempted

to rescue them. When there was difficulty in moving Leon Klinghoffer's wheelchair up the stairs to the upper deck, the hijackers separated him from the rest, over the protests of Marilyn Klinghoffer, who was forced to leave him at the point of a gun. The hijackers took Mr. Klinghoffer's watch and cigarettes from him at that time. This was the last time that Marilyn Klinghoffer would see her husband alive. The hijackers took the passports of these 19 selected passengers and shuffled them, telling them that they would be killed one by one in the order of the shuffled deck of passports.

Meanwhile, the hijackers ordered Captain de Rosa to sail toward Syria and radioed their demands in the name of the PLF for the release of 50 Palestinian prisoners in Israel, naming only Samir al-Qantari, a PLF member arrested for the murders of an Israeli man and his five year-old daughter during a 1979 raid on the Israeli town of Nahariya on the Mediterranean coast. Once they had come into radio contact with the Syrian port authorities in Tartus, they repeated demands to talk to International Red Cross officials, and to the Ambassadors of Italy, West Germany, and Britain, whom they wanted to pressure the Israelis to comply. While they claimed to have seven Israeli captives aboard, this claim was denied by Israel.

The Voice of Lebanon, a Christian radio station in Beirut, intercepted radio communications between the hijackers and the Syrian authorities, providing the first indication that a hostage had been killed. At 2:42 P.M. [local time], the voice of a hijacker demanded: "[Where are the] negotiators? We will start killing at 1500 hours." At 3:23 P.M., the hijacker's voice then said: "What are the developments, Tartus? We will kill the second. We are losing patience." However this report was followed by another radio message from the captain in English stating that everyone aboard was "in very good health. Please, please, please don't try anything!"[16]

However, according to the later testimony of Captain de Rosa, around 3:05 P.M. he heard gunshots and when the hijackers appeared in the bridge with blood spattered over their pants and shoes, they told him that they had killed Leon Klinghoffer. The ship's bartender later testified that he witnessed the oldest hijacker shoot Klinghoffer in the forehead and in his chest. The ship's barber and one of the waiters were forced to pick up Mr. Klinghoffer in his wheelchair and to throw them both over the side of the ship. According to one of the women held hostage in the Arazzi room, the youngest hijacker had started to weep. When she asked him what was wrong, he replied that the other hijackers had killed the man in the wheelchair.

Refused landing rights in Syria, the hijackers ordered the captain to return to Port Said. Meanwhile, Yassir Arafat—who declared that he "totally dissociated himself" from this operation—sent PLO Executive Council members Abu Abbas and Hani al-Hassan to Cairo in order to help mediate the crisis. With the ship anchored 16 miles off Port Said, at

7:15 A.M. [local times] on October 9, 1985, Egyptian authorities contacted the ship and began negotiations. A boat containing some Egyptian officials, along with Abu Abbas and another unidentified man aboard, reached the *Achille Lauro*. The Egyptian and Italian authorities had agreed to grant the hijackers' demands of safe passage out of Egypt with no prosecution in exchange for their freeing all the hostages and their surrendering the ship, but only on the condition that no one had been harmed. Captain de Rosa was interviewed by Egyptian officials between 1:30 P.M. and 4:30 P.M., during which time he stated that "I am the captain. I am speaking from my office. And my officers and everyone is in good health." Based on this false assurance, the Egyptians agreed to the hijackers' demands, who in turn agreed to surrender at 4:20 P.M. They finally left the ship at 5:00 P.M., after they packed their guns and remaining weapons to take with them off the ship. The hijackers then disappeared from public view. In spite of the shipping company's and captain's wish to sail the *Achille Lauro* to its next intended destination of Ashdod, Egyptian officials insisted on it remaining in Port Said for their own investigation. The *Achille Lauro* was then steered into Port Said, arriving there at 4:00 A.M. the morning of October 10, 1985.

### AFTER THE HIJACKING: FLIGHT AND PURSUIT

Immediately after the hijackers had left the ship, Marilyn Klinghoffer ran to the infirmary where the hijackers had told her they had left Leon Klinghoffer. Not finding him there, she was told by the infirmary staff to go see the captain. When she reached the bridge, the captain informed her that her husband had been murdered by the hijackers. In fact, the cruise came to an end at Port Said, with the 15 Americans returning to the United States by a military plane on October 12, after a brief stopover in Sicily to allow witnesses to identify the hijacking suspects who by then were in custody there. The other passengers were booked return passage by either the cruise line or their respective governments.

The repeated denials by the hijackers, by Abu Abbas, and by Yassir Arafat that anyone had been killed and that Leon Klinghoffer had merely died of a heart attack before they threw his body overboard were refuted on October 15 by the discovery of Klinghoffer's body on the Syrian coast. Subsequent forensic tests confirmed not only his identity but also his violent death by gunshots to his forehead and chest. Syria's actions in recovering and delivering the body (which eventually was returned to his widow on October 20, 1985, and buried later in New Jersey) may have been intended to undermine the international credibility of Yassir Arafat, with whom Syria had serious differences over his peace policies toward Israel.[17]

Throughout the hijacking, the United States had urged all governments to deny landing rights to the hijackers, as well as any safe passage or asylum to them and, if possible, either to extradite them to the United States or at least to arrest them pending other legal actions. After the hijackers had left the *Achille Lauro* and U.S. officials demanded that local officials arrest them, President Mubarak claimed that they had already left Egypt for an undisclosed destination. In fact, U.S. intelligence knew that they were being moved around the region by Egyptian authorities until they could be flown out on an EgyptAir 737 bound for Tunis. President Reagan was briefed about this at around 5:00 P.M. (all following times are GMT) on October 10, and he ordered the U.S. Defense Department and CIA to attempt an interception of the airplane. At 7:15 P.M., four F-14 fighter planes left the *U.S.S. Saratoga* stationed off the coast of Albania. Earlier, two E-2C electronic surveillance planes (smaller versions of the AWACS aircraft) had already left the *Saratoga* in order to track the EgyptAir flight. When the EgyptAir flight carrying the four hijackers, along with Abu Abbas and his bodyguard, took off from Cairo at 9:15 P.M., U.S. intelligence quickly informed President Reagan, who was aboard Air Force One en route from Chicago to Washington, DC, at that time. At 9:37 P.M. Reagan gave final approval to intercept the plane. At 10:30 P.M. the F-14s intercepted the EgyptAir flight that had been refused permission to land at either Tunis or Athens, and ordered it to land in Sicily. At 11:45 P.M. the plane had landed at the NATO Air Base at Sigonella, just outside Catania.[18]

Respecting diplomatic protocol, President Reagan telephoned Italy's Prime Minister Bettino Craxi just minutes before the plane was due to land at Sigonella to inform him of the operation. Craxi immediately ordered the Italian police and military at Sigonella to intervene on behalf of the Palestinians. The Italian prime minister had worked during his 26-month-long tenure in office to secure good relations with the PLO and the Arab states, but would claim later that he had intervened because the unauthorized landing of the EgyptAir flight at Sigonella violated the United States-Italian accord on the use of the NATO base.

Once the EgyptAir 737 landed at Sigonella and had come to a stop, several dozen U.S. Army Delta Force soldiers exited a nearby C-141 transport plane and surrounded the civilian plane. While their orders had been to take the four hijackers, along with Abu Abbas and his bodyguard off the civilian plane, rush them into the C-141 and to take off immediately for the United States, members of the Italian carabinieri arrived and surrounded the American soldiers. A tense situation took hold on the ground, with the Italian police being joined by Italian soldiers already on the base, facing off U.S. troops for three hours. As U.S. troops parked trucks in front of, and behind, the Egyptian plane to prevent it from moving, the Italians countered by doing the same to the C-141 to prevent it from being able to move. While the Italian and American troops each held their own ground

for the next three hours, Reagan Administration officials tried in vain to persuade the Craxi government to relent and allow them to take into custody the four hijackers along with Abu Abbas and his bodyguard, Ozzuddin Badrakkan, who also was suspected of direct involvement in the hijacking conspiracy. At about 3:00 A.M. GMT President Reagan ordered the U.S. troops to "stand down" and allow the Italians to take custody of the six men.[19] The four hijackers were arrested and held in Sicily for several days, while Abu Abbas and his bodyguard again boarded the EgyptAir plane that flew them to Rome. The Craxi government refused several U.S. requests to arrest them, even stating that Abu Abbas, as a PLO official, enjoyed diplomatic immunity, and claiming a lack of evidence linking him to the hijacking. While the United States consistently demanded that Italy arrest the two men or at least prevent their departure, both were permitted to leave for Yugoslavia on October 12, in spite of U.S. claims of having evidence "based on sensitive intelligence" that Abu Abbas had actually directed the hijacking.[20] The Yugoslavians also refused to extradite or to try Abu Abbas, who later was reported to have left for South Yemen and who eventually found refuge in Iraq.

## THE POLITICAL AND LEGAL FALLOUT OF THE *ACHILLE LAURO* AFFAIR

Prime Minister Craxi's decisions that stymied U.S. attempts to seize the hijackers and Abu Abbas led to strained relations between Italy and the United States. They also triggered the resignation of Craxi's government on October 18, 1985, after the Defense Minister Giovanni Spandolini withdrew his Republican Party from the governing five-party coalition government two days earlier in protest against Craxi's actions. Craxi then led an interim government and eventually won parliamentary approval on November 8, 1985, to form a new government. However, ironically, the Craxi government—which had tried so much to appease the PLO and Arab governments in its handling of the *Achille Lauro* affair— faced another Palestinian terrorist attack upon Italian soil on December 27, 1985, when gunmen of the Abu Nidal faction murdered 18 travelers and wounded 60 others in coordinated attacks in both Rome and Vienna.

While Washington was angry at President Mubarak for his deception and refusal to hand over the hijackers, the U.S. action in intercepting the EgyptAir flight itself triggered anti-United States resentment and demonstrations in Egypt and other Arab nations. The governments of Egypt and Jordan were also irritated and embarrassed by the duplicity of Yassir Arafat for his apparent involvement in the *Achille Lauro* hijacking at the same time that his PLO was involving their governments in purported joint peace initiatives with Israel. The Tunisian government, still in shock

from the Israeli air raids earlier that month, now found itself embarrassed over the *Achille Lauro* operation that had been set in motion from its own territory, and also found itself accused by Egypt and other Arab states of caving in to U.S. pressures for having denied landing rights to the EgyptAir flight carrying the hijackers. Following the *Achille Lauro* fiasco, for which Abu Abbas and his followers were responsible, the Tunisian government ordered Abu Abbas and the PLF to leave; they then moved to Baghdad, Iraq.

On October 11, 1985, Marilyn Klinghoffer, with three other former hostages, identified the four hijackers in a police lineup in Sicily. On October 16, Israel's military intelligence chief, Maj. Gen. Ehud Barak, revealed the transcripts of intercepted radio communications between Abu Abbas and the hijackers, which indicated that he was not merely a mediatory as he and Yassir Arafat maintained, but rather was the mastermind of the operation and was giving orders to the four hijackers of the *Achille Lauro*.[21] Israeli authorities also claimed to have intelligence indicating that Arafat himself played a knowing and controlling role in these events.[22] By October 17, following much cross-examination of the four suspects along with ample testimony by Captain de Rosa and crew members, the Italian investigators in Sicily concluded that the hijackers' claim that they had originally intended to attack Ashdod—a position that seemed to crumble under interrogation—was a ruse, and that a stand-alone hijacking had been the original plan. According to this original plan, the ship would be sailed near the Syrian port of Tartus where PLF comrades ashore would take the American hostages off the ship and hold them in safe-houses until the 50 Palestinian prisoners were released.[23]

It should be noted that most American and Israeli experts continue to endorse the explanation that the PLF hijacking was a spontaneous improvised response to their having been discovered by an errant cabin steward. However, the Italian investigators concurred that the testimonies of both the accused hijackers and eye-witnesses did not confirm the account of their having been supposedly surprised and exposed, while there were serious discrepancies in the testimony claiming that the port of Ashdod was the intended target.

Ironically, the first suspect to break down and collaborate with Italian investigators was Magied al Molqi, the hijackers' leader, who had also killed Leon Klinghoffer: he confessed that the hijackers had been acting on the written orders of Abu Abbas.[24] As other hijackers broke down and began talking, naming accomplices and contacts, the judicial authorities began issuing more arrest warrants. Whereas Prime Minister Craxi had insisted that the United States lacked any proof of Abu Abbas' involvement, by October 23, 1985, the magistrates in Sicily had issued an arrest warrant for Abu Abbas. Genoa's magistrates lost little time asserting their right to try the case under Italian maritime law, since Genoa was the home

port of the *Achille Lauro*, and they shortly assumed full jurisdiction over the case.

On November 11, 1985, Luigi Carli, one of the Genoa prosecutors assigned to the case, announced that 16 arrest warrants had been issued. The four captured hijackers, including the leader Magied Youssef al Molqi (23 years old), Ahmad Marrouf al-Assadi (23 years old), Ibrahim Fatayer Abdelatif (20 years old), and Bassam al-Ashkar (17 years old) were charged with hijacking, kidnapping, murder, and various charges involving the illegal possession of firearms and explosives. Also charged and already in custody were Mohammad Khalaf and Mohammad Issa Abbas, the latter a close relative of Abu Abbas, for their roles in bringing the arms and explosives from Tunis to the hijackers in Genoa. Those charged but still at large included Abu Abbas and his bodyguard, Ozzuddin Badrakkan, both of whom had left Italy on October 12; Ibrahim Hassir, a PLO official; Abu Kitah and Mohammad al-Khadra, who had procured the arms later sent to Genoa; Ziad al-Omar, who was believed to have directed the operation both in Tunis and Genoa; and Masar Kadia (49 years old), who had scouted out the *Achille Lauro* and who later handled and accompanied the four on the cruise ship as far as Alexandria, where he disembarked.

Those in custody were convicted on November 18, 1985, on the arms and explosives charges and sentenced to jail terms ranging from four to nine years. The most severe sentence of nine years was imposed on Muhammad Issa Abbas, who had delivered Abu Abbas' instructions to the four hijackers. Although he had been arrested in late September on charges of possessing falsified passports, while remaining in custody he had revealed nothing of the planned operation to the authorities. By securing the conviction of the hijackers on these lesser charges, prosecutors could hold them in prison while they could more thoroughly prepare to try them on the more serious charges of murder and piracy.[25] Later, on November 27, 1985, the Klinghoffer family filed two lawsuits, one in the State Supreme Court in Manhattan suing the PLO for $1.5 billion, and another in Federal District Court in Manhattan suing Chandris-Italy Inc, the Port of Genoa, and Club ABC Tours Inc., for compensatory and punitive damages.[26]

In 1986, Abu Abbas was tried in absentia in Italy and convicted on charges of conspiracy in connection with the *Achille Lauro* hijacking and murder of Leon Klinghoffer; however, he would never be extradited to Italy from his safe haven in Iraq. Similarly, Italy sought to extradite Masar Kadia from Greece in 1991. On May 30, 1990, members of the Abu Abbas faction of the PLF, with Libyan support, made a seaborne attack on Tel Aviv beaches that was quashed by the Israeli Defense Forces. Four of the PLF terrorists were killed and 12 captured. This raid occurred in the eighteenth month of talks between the United States and the PLO. While Yassir Arafat disavowed any PLO connection with the raid, he also did not

publicly condemn the raid nor expel Abu Abbas from the PLO Executive Committee. This in turn prompted the United States to suspend its dialogue with the PLO. Later, in 1991, Abu Abbas resigned his membership in the PLO Executive Committee, but retained his seat on the Palestine National Council.

In 1995, an immunity accord was completed between Israel and the PLO constituting a general amnesty and granting immunity from prosecution for all PLO members for violent acts committed before September 1993. Subsequently Abu Abbas could travel freely from Iraq back and forth to the territories under control of the Palestinian Authority to take part in PLO business. On April 22, 1996, Abu Abbas—who was still wanted by the United States for his role in the *Achille Lauro* hijacking—attended the Palestine National Council meeting held in Gaza. During his presence at this meeting, Abu Abbas repeatedly stated to reporters that the *Achille Lauro* affair "was a mistake and it led to other mistakes." He claimed that his men did not know Leon Klinghoffer was Jewish or American, but that they had killed him "because he started to incite the passengers against them." By early August 1997, the PLO had agreed to settle the civil lawsuit brought against it by the Klinghoffer family. Rejecting the PLO claim that as a sovereign state it could not be sued, Federal District Judge Louis L. Stanton ordered Yassir Arafat to give a deposition.[27] Instead, the PLO moved to settle the dispute out of court and to pay the surviving Klinghoffer daughters an undisclosed sum.[28]

Following the U.S. invasion and occupation of Iraq, Abu Abbas was captured by U.S. troops on April 14, 2003. He was held as a prisoner in Iraq under U.S. custody until March 8, 2004, when he died apparently of natural causes.

### CONCLUSION: PRE-PLANNED HIJACKING OR IMPROMPTU IMPROVISATION?

In retrospect it may appear to some that the entire operation had the foreknowledge and blessing of Yassir Arafat, and was just another example of a repeated pattern of covert attacks ordered by him and carried out by proxies, whose roles could then be covered up by plausible denials, followed by an offer from Arafat and the PLO to use their good offices as mediators to solve the crisis. Whereas many Western leaders and policy experts seemed to accept at face value Arafat's denial of PLO involvement in the hijacking, and to welcome his role as a mediator, by contrast both Egypt's President Hosni Mubarak and Jordan's King Hussein regarded Arafat as being directly responsible for the hijacking and guilty of duplicity and even of personal treachery in the matter. Egypt's role in trying to resolve the *Achille Lauro* crisis cost Mubarak political goodwill with the United States. Likewise it cost King Hussein his credibility with Britain

for Jordan's recent efforts to mediate with Britain vouching for the PLO as a party earnestly seeking a peace settlement. For a while, King Hussein contemplated dissociating himself completely from the PLO and negotiating directly with Israel over the issue of the occupied territories in the West Bank[29]

The question remains: Was the takeover of the *Achille Lauro* merely a tactical blunder occasioned by the haphazard intrusion of a cabin steward upon the PLF gunmen while they were cleaning their weapons? Or was it instead a premeditated hijacking aimed at forcing the PLO's agenda back into the forefront of the world's consciousness by threatening to kill hundreds of citizens of nations other than Israel—in short, a quintessentially normal terrorist operation? While the consensus of U.S. and Israeli experts and commentators favors the view that an attack on Israeli soil was the original motive, there are problems with this hypothesis. First, previous attempts by the PLF to attack Israel using inflatable landing craft, hanggliders, and the like, had not proven very effective. Although smuggling the arms and explosives aboard the *Achille Lauro* seemed relatively easy, the next stage of smuggling them into Israel through Ashdod customs and Israeli port security would not be so easy. If the plan had been to attack the port of Ashdod from the decks of the *Achille Lauro*, in effect using the civilian cruise liner and its passengers as human shields, then there was still a terrorist threat directed indiscriminately at all the nationalities on board and not directed simply at Israel in particular. In effect, this would have been no less heinous than simply seizing the cruise ship on the high seas and using its crew and passengers as hostages. The other problem was that noted by the Italian investigators: the testimonies of the suspects on the supposed Ashdod plan were inconsistent and contradictory. At one point, suspects said a crew member had spotted them cleaning their guns, but at another point, the suspects also claimed that they had been recognized by Egyptian port authorities and had decided to seize the ship then. Some of the suspects—in particular Bassam al Ashkar—stated that they had never been surprised by any crew member, that the Ashdod attack account was in fact a fabrication, and that he had been instructed by al Molqi that they were going to seize the ship.

While preparations for the *Achille Lauro* venture had been in the works for over 10 months prior to the hijacking, the inspiration for the final form of this operation more likely may have come from a recent and very dramatic hostage situation that proved itself very successful from the viewpoint of the terrorists who perpetrated it—namely, the hijacking of TWA flight 847 on June 14, 1985.[30] Shiite gunmen in this hijacking seized 145 passengers and 8 crew members. One American serviceman among the hostages was killed and 39 American men were held hostage in Lebanon until the leader of Lebanon's Shiite AMAL militia, Nabih Berri, negotiated their release in exchange for 119 Lebanese and Palestinian prisoners

held in Israel's Atlit Prison. Berri, whose own gunmen played a principal role in the hijacking and hostage-taking incident, was portrayed in Western media as a negotiator and mediator. Thus, the *Achille Lauro* attackers may have felt that the seizure of a large number of Western hostages on a cruise liner could similarly lead to a negotiated settlement in which the PLO might wind up being hailed as a mediator and peacemaker, "saving" the hostages and conceivably gaining freedom for PLO prisoners in Israel.

There was also a Palestinian precedent for attempting such an operation—namely the "Black September" attack on the Israeli athletes at the 1972 Munich Summer Olympics, which also had been a hostage-barricade siege in which the hostage-takers demanded the release of 234 prisoners in Israel, including the surviving Japanese Red Army member who took part in the Lod Airport massacre of May 1972.[31] While the PLO denied responsibility for those attacks, it later became well-established that Black September was a PLO creation led by PLO Executive Committee member Salah Khalaf, also known as "Abu Iyad," who later even wrote about his role in the operation in his memoirs.[32]

Therefore, the problem for Arafat and the PLO was not any lack of willingness to engage in covert terrorist actions, under the cover of plausible denial, from which to reap political benefits. Nor was there any lack of motivation, since the outcome of the TWA 847 hijacking demonstrated that such an action could be successful and benefit the PLO. The problem, rather, was one of execution: to seize and hold a multideck cruise ship, full of myriad passageways, hidden service conduits and crawl spaces, with over 700 passengers and close to 350 crew members, would be a formidable task for a mere four hijackers. The success of Anna Hoerantner in evading capture illustrates this problem. This would explain why the hijackers would wait to seize the vessel until after the ship had unloaded over 600 passengers for their temporary sightseeing tour of the Pyramids. However, unlike the TWA 847 hijacking, or even the 1979 occupation of the U.S. Embassy in Tehran, the actual venue of the hijacking on the high seas remained isolated from any possibility of minute-by-minute instantaneous global press coverage. Therefore, the hijacking unfolded without creating the sort of constant coverage feeding high public emotion and outrage that had helped pressure the U.S. and Israeli government decision-makers into making concessions in the TWA 847 case, concessions that undermined their ability to maintain a steadfast and consistent position in the face of terrorist manipulation. Interestingly, there have been no noteworthy attempts by any other terrorist groups to try to replicate the *Achille Lauro* incident by hijacking another cruise liner.

Unfortunately, the only persons who could have verified whether the hijacking was intended as a PLO-sponsored stand-alone action—namely

Yassir Arafat and Abu Abbas—died without ever confirming this in spoken word or writing. The idea that Ashdod was the original intended target of the hijackers may be attractive to Western observers outside of Israel for a psychological reason: the need to believe that the Palestinian-Israeli conflict can in fact be mediated and solved through some combination of goodwill, rationality, self-interest, and skillful diplomacy. The images of Arafat's character and of PLO politics that are most consistent with the "stand-alone" hypothesis are those of a deceptive and intransigent party that in fact would be incapable of making a lasting peace. And that hypothesis clashes with the perennial optimism and faith in human progress and rationality that must underlie any hope for peace in the Middle East. Even with the 2006 Hamas political victory in the Palestinian Authority, United States and other Western diplomats—as well as well-meaning people elsewhere—continue to speak of the possibility of Hamas somehow accepting the existence of the State of Israel despite the Hamas Charter calling for the extermination of Israel, the repeated calls of Hamas leaders for destroying Israel, and the over 60 suicide-bombings sponsored by Hamas over the five-year period preceding their election. Even with so much evidence to the contrary, the United States and other Western observers wish to believe, hoping against hope, that there is still some possibility for reconciliation, compromise, and peace. Likewise, at the time of the *Achille Lauro* crisis, both the world public and Western leaders wanted to believe that Yassir Arafat and the PLO were earnestly seeking to mediate that crisis, and not simply exploiting it for political gain.

It is more perplexing to understand why Israeli analysts, who have had a much more pessimistic assessment of Arafat and the PLO leadership, endorsed the view that the hijackers originally intended to attack Ashdod and not simply hijack the ship. If the objective of an attack on Ashdod were ruled out, then the *Achille Lauro* incident would become almost completely detached from Israeli concerns, apart from the murder and mistreatment of Jewish individuals at the hands of the hijackers. After all, none of the passengers were Israeli citizens, the cruise ship was not an Israeli vessel, and the incident did not take place in Israeli territorial waters. Israel felt no need to make any concessions to the hijackers. However, for Israel, stressing the Ashdod connection helps to make it clear to nations such as Italy, France, and others, that as long as Israel remains the target of Palestinian terrorism, the nationals, ships, and territories of these other nations will not be protected from the scourge of that same terrorism no matter what separate political accommodations they make between their own nations and the PLO, and no matter how much they attempt to distance themselves from being associated with Israel.

The reader is left with two conflicting interpretations of the real purposes and motives behind the *Achille Lauro* hijacking. Nor is this a merely "theoretical" concern: at the time these actual events were unfolding, these

same disagreements over how to interpret and assess the crisis also caused great rifts and conflicts between allies both in the NATO alliance as well as in the Arab world. Neither can anyone rule out that events similar to the *Achille Lauro* hijacking will not be repeated in the twenty-first century.

# CHAPTER 5

## THE FEBRUARY 1993 ATTACK ON THE WORLD TRADE CENTER

Daniel Baracskay

Recent decades have proven that large urban centers are particularly prone to terrorist attacks. They have reputations of national and international standing, are centers of trade in a capitalist society, and have dense populations of people who live and work within their borders. Over time, New York City has matured into a globally recognized bastion of commerce, entertainment, and industry. Composed of several soaring buildings, the World Trade Center has been a familiar landmark in the city for decades. The north and south towers, each with 110 stories of office space, were the tallest and most populated of the cluster. Scores of businesses are located in close proximity to these two towers, making it a congested but profitable location. New York City's population in 1990 was approximately 7.3 million people, making it the most populated American city.[1]

The World Trade Center (WTC) bombing in 1993 warrants analysis for several reasons.[2] First, it signaled that the threat of a terrorist attack is not solely confined to foreign soil. Second, the WTC bombing indicated that foreign terrorist organizations can successfully penetrate American borders with a significant attack that embodies a political and religious plot for restitution against American presence overseas, particularly in the Middle East. Third, the attack signified the expanding nature of ad hoc terror groups that come together exclusively for violent purposes and exist as organizations that are linked together by the like-minded ideologies of their extremist members. Finally, the event in 1993 was a precursor to the September 11 attack on the two World Trade Center towers in New York City 8 years later, indicating that further efforts are essential to prevent the

ongoing prospect of similar incidents. This chapter will examine the WTC bombing of 1993 and present several lessons and implications of the event.

## EXAMINING THE WORLD TRADE CENTER ATTACK OF 1993

On February 26, 1993, a terrorist group drove a truck containing more than 1,000 pounds of explosives into the underground parking garage of the 110-story north tower of the WTC in New York City. The truck exploded at 12:17 P.M., killing six Americans and injuring hundreds more. The explosion reduced daily activities to a standstill, and created a cloud that blanketed the area with smoke and debris. The physical structure of the building was significantly damaged but did not collapse. The immediate psychological ramifications of the incident were profound. It was believed that more than 50 thousand people were in the twin towers of the WTC at the time. Evacuees from the building walked down flights of stairs in complete darkness. Smoke inhalation was rampant among the survivors.[3] The bombing was testimony that American borders were penetrable, making us vulnerable to attack by outside terrorist groups. Besides the attack on Pearl Harbor in 1941, and a small number of isolated incidents, the United States had not witnessed an aggressive display of violence of such magnitude on American soil. In fact, with the absence of a continual wave of bombings like those that had historically affected London, Paris, Rome, and numerous other cities each year, the United States lived under a "myth of invulnerability." As Jeffrey Simon observes, "since international terrorists could find an abundance of U.S. targets overseas to strike with relative ease and avoid capture, it appeared as though they would be unwilling to risk traveling to the United States to carry out their violence . . . Yet it was only a matter of time before America joined the rest of the world in encountering terrorist assaults on its soil."[4]

Victims at the scene directly experienced what millions of other American citizens viewed through the lens of journalistic reporting—a political act of aggression by a radical Islamic terrorist organization that was seeking retribution for what it perceived to be American oppression and interference in the affairs of Muslims in the Middle East. While the WTC bombing occurred inside the spatial borders of American territory, it was considered an act of international terrorism by a group that was not state-sponsored but still operated abroad. State-sponsored terrorism involves the actions of "rogue states" (e.g., Iran, Libya, and Iraq) that threaten adjacent or regional actors that pose a threat to that country's policies by using government-sponsored terrorist behaviors.[5] This pattern of behavior does not preclude an attack against democratic states, however. Terror groups have a different inclination. With the exception of Hizbollah and a few

others, terrorist groups typically do not associate themselves directly with rogue states, but present a more pervasive display of power that transverses the international arena. CIA veteran Paul Pillar refers to these entities as "ad hoc terrorists," which are basically "small cabals of extremists who do not belong to any larger, established, previously known group. Although the individuals involved may gravitate toward particular political or spiritual leaders, they do not become a group until they become one for the purpose of conducting a particular terrorist operation. After the operation, they may dissolve and disperse."[6] These groups elude capture and are discernibly more challenging to trace, since they often roam across the penetrable borders of rogue states or other nations that are considered safe havens for terrorist activities.

The terrorists of the WTC attack in 1993 subscribed to a religious fundamentalism that is quite alien to many Americans. The conventional practice of separating church from state to prevent the fusion of religion and politics in democratic regimes is manifestly absent in the proscribed doctrines of several major world religions. With over 1.2 billion adherents, Islam is the world's second largest religion after Christianity and promotes unique views on the nature of politics and religion. Students of religion and philosophy have long observed that "from its very beginnings, Islam has viewed religion and politics (church and state) as necessarily and rightfully inseparable. To Muslims, the notion of religion as separable from the totality of the human context is unimaginable, even detestable."[7] For some adherents, these religious convictions are a key motivating factor behind various forms of political violence, including terrorism. Indeed, many kinds of religious extremists, including radical Islamic fundamentalists, employ the use of terrorist activities to bridge their beliefs with reality.[8]

An extremist interpretation of Islam served as the mutually reinforcing principle that guided the WTC conspiracy. Ramzi Yousef was acknowledged as the operational mastermind of the Trade Center bombing, although the FBI has ultimately determined that the activities were part of a broader plot by al Qaeda leader Osama bin Laden.[9] Removed from Palestine and raised in Kuwait, Yousef developed a militant posture and advanced his skills at a training camp in Afghanistan. For several decades, Afghanistan has been a haven for militant rebels, including those who fought the occupation of Soviet troops from 1978 to 1988. Presidents Carter and Reagan covertly provided aid from the United States to Afghan rebels during that decade to destabilize the left-leaning and Marxist Afghani government. Simultaneously, bin Laden pledged his own money, weapons, and resources to the Afghan cause. During the late 1980s, bin Laden helped form al Qaeda and funneled his extensive family fortune into supporting a global "jihad," or holy war against the West. When the Soviets left Afghanistan in 1988, as terrorism analyst Peter

Bergen observes, al Qaeda viewed it as a "victory against the communists in Afghanistan . . . a superpower had been defeated. It was an important lesson for the Afghan Arabs and for bin Laden himself, who applied it to his next holy war—a war against the United States."[10] Al Qaeda used its relationship with the amenable Taliban regime in Afghanistan to build a coalition of supporters for its cause. Bin Laden has specifically blamed his use of terror tactics on American support for Israel and its presence in Islamic holy lands like Saudi Arabia.[11]

After his experience with al Qaeda operatives in Afghanistan, Yousef traveled to the United States in 1992 using a falsified passport. Also traveling with Yousef was his colleague, Ahmed Ajaj. Ajaj was detained by American authorities for having a phony passport and documents in his luggage on how to construct a bomb. The name Abu Barra was printed on the documents. It was the alias used by another colleague, Mohhamed Jamal Khalifa.[12] Ajaj was arrested for the incriminating evidence and Yousef informed the authorities that he had lost his passport and wanted to claim political asylum. Ajaj remained in custody, serving as a decoy to draw attention away from Yousef, who was issued a temporary passport by the Pakistani Consulate in New York, allowing him to travel freely.

Late in 1992, Yousef initiated communication with Umar Abd al-Rahman, an Egyptian cleric known as the "Blind Sheikh" who preached to his followers at the al-Farouq mosque in Brooklyn.[13] Abd al-Rahman was an unlikely culprit for the World Trade Center plot. He was 55 years of age, blind, diabetic, and moderately immobile. Those who ultimately pledged support for Abd Al-Rahman's views did not originally migrate to the United States as an independent sectarian group. Rather, they forged a link from their analogous extremist views and contacts at New York mosques.[14] Abd al-Rahman was the self-professed leader of a holy war that he waged against the United States for being an enemy of Islam. Yousef, along with other Abd al-Rahman followers and coconspirators Mohammed Salameh, Mahmud Abouhalima, and El Sayyid Nosair, constructed the explosive device that was detonated on February 26. The result of the bombing fell short of Abd al-Rahman's optimism that the force of the explosion would collapse the north tower onto the southern one, destroying both in the process.[15]

Following the incident, Yousef fled to Pakistan. Based upon information conveyed by an informant,[16] several of the conspirators were captured by authorities in the months after the attack. They were brought to trial in September 1993 and subsequently convicted in March 1994. Yousef was later arrested in Islamabad in 1995.[17] His arrest came after an informant divulged Yousef's location in exchange for a $2 million reward that had been offered for information leading to his capture. During his deportation back to America, Yousef elaborated more of his plan to the FBI agents

Table 5.1   Defendants and Outcomes of the *U.S.A. v. Eyad Ismoil et al.* Trial

| Defendant | Number of Counts Convicted | Prison Sentence and Fines Assessed |
|---|---|---|
| Ramzi Ahmed Yousef | 18 | 8 life sentences, plus 240 years; Fined $4.5 million dollars |
| Mahmud Abdouhalima | 9 | 240 years; fined $250,000 |
| Mohammad Salameh | 10 | 117 years; fined $250,000 |
| Nidal Ayyad | 9 | 117 years, fined $250,000 |
| Bilal Alkaisi* | 1 | 20 months and 2 years supervised release |
| Ahmad Mohammad Ajaj | 9 | 115 years; fined $250,000 |
| Abdul Hakim Murad | 7 | Life in prison, plus 60 years; fined $250,000 |
| Eyad Ismoil | 10 | 240 years; fined $250,000 |

*Turned states evidence to receive a lesser sentence

who accompanied him. As the plane holding Yousef and the agents passed by the WTC, Yousef allegedly stated that he would have succeeded in toppling one tower onto the other if he had been able to secure more money and explosives.[18]

Mohammed Salameh was one of the first to be arrested. Salameh had rented the truck used in the explosion, later reporting that it was stolen. He was captured at the truck company rental office when he attempted to get back his $400 deposit. The FBI also arrested Nidal Ayyad, an engineer who acquired the chemicals for the bomb, and Mahmoud Abouhalima who mixed the chemicals.[19] In the case *U.S.A. v. Eyad Ismoil et al (93-CR-180-KTD)*, a total of ten radical Islamic extremists were convicted for the incident and sentenced to prison. The table above lists the defendants, number of convictions, and sentences for those involved in the WTC bombing case.

The WTC attack of 1993 was not Yousef's only plot. He was also allegedly involved in another bombing conspiracy. Yousef and his associates plotted to slip several bombs composed of liquid explosives onto 11 U.S. commercial aircraft.[20] The liquid explosives were designed to pass easily through airport metal detectors. The modes of transportation and expected destructive capacities for executing the plot were similar to what actually transpired on 9/11. However, Yousef's plan was foiled and he was forced to flee his apartment after a chemical reaction started a fire. The computer he left behind was salvageable and tipped the FBI and other criminal investigators off to his plans. It contained information that was used to help capture Yousef later that year.[21]

The Islamic cleric Abd al-Rahman was also arrested and convicted of five counts, including seditious conspiracy, solicitation and conspiracy to murder Egyptian President Hosni Mubarak, solicitation to attack a military installation, and bombing conspiracy. He was sentenced to life in prison, plus 65 years without the possibility of parole in the case, *U.S.A. v. Omar Ahmad Ali Abdel-Rahmen et al. (93-CR-181-KTD)*. Also on trial in the case were nine coconspirators, who were sentenced to various prison terms ranging from 25 to 35 years.[22] This case addressed the information supplied by an informant to the FBI detailing plots to bomb additional landmarks in New York City—namely the United Nations building, the FBI building in New York, and the Holland and Lincoln Tunnels.

Despite the favorable outcomes that these two trials had in bringing the assailants to justice, "an unfortunate consequence of this superb investigative and prosecutorial effort was that it created an impression that the law enforcement system was well-equipped to cope with terrorism."[23] This was not the case—the trial executed justice but did not bring bin Laden or his network to the attention of either the public or policymakers.[24] Overall, 1993 was a slightly more active year for terrorist activities globally.[25] In addition to these plots by Abd al-Rahman and his associates, the FBI also foiled an Iraqi-motivated plot to assassinate former Republican President George Bush while he visited Kuwait in April of that year. These attempts were more obscured in coverage by the media, indicating that efforts by FBI and CIA agents to successfully thwart an attack emit much less public attention than when an attack does occur.[26]

## THE RESPONSE TO THE ATTACK

The World Trade Center had been attacked by foreign perpetrators and government inquiries were launched into two primary issues. The first issue probed whether the incident had state sponsorship. In such circumstances, the U.S. Department of State investigates whether the act was committed by a state or rogue terrorist group. If evidence suggests the latter, then the next step examines where the terrorists were residing prior to the incident, and whether the state that housed them covertly supported or had knowledge of their activities. Much of this analysis was predicated on foreign intelligence information gathered and supplied by the CIA. President Bill Clinton immediately charged the National Security Council (NSC) with coordinating the initial response, and the New York office of the FBI assumed control of the local investigation.[27] The NSC and its interagency Counterterrorism Security Group (CSG) both used their authority to respond to the attack with domestic and foreign counterterrorism measures.[28] In 1986, Congress had granted the FBI authority to investigate terrorist acts against Americans overseas, and in 1989 this authority was expanded to allow the FBI the authority to arrest

perpetrators abroad without the consent of the host country. House and Senate intelligence committees likewise conducted their own series of investigations. The U.S. Department of Justice's investigation sought to identify and apprehend those responsible for the incident. It attempted to isolate where the breaches in public security occurred and develop a strategy for preventing similar attacks in the future. These investigations uncovered an integrated network of terrorists who spanned the globe. The reaction times for initiating these investigations were rapid, but the process itself was long and tedious, and spanned state borders—as the capture and deportation of Yousef from Pakistan demonstrated.

The governor of the state of New York at the time of the attack, Mario Cuomo, worked closely with David N. Dinkins, the mayor of the City of New York throughout the response and recovery. As mayor, Dinkins had the primary role of reassuring the city's residential and professional inhabitants of the government's resolve, and of coordinating the efforts of local law enforcement officers with federal agents, primarily from the FBI. Dinkins was perceived throughout his short mayoral tenure (1989–1993) as being weak and unresponsive to some of the city's more plaguing problems, despite his handling of the WTC attack in 1993. The 3-day Crown Heights Riot in August of 1991 and the perceptions citizens had of the growing crime problem were contributing factors to Dinkin's defeat in the fall 1993 election, when Rudy Giuliani assumed the city's leadership for two terms, and—like his predecessor—was also forced to respond to an attack on the WTC. The destruction of the two towers 8 years later on 9/11 indicated the persistence of bin Laden and those affiliated with (or inspired by) his al Qaeda network, which produced the level of destruction envisioned for the first WTC incident.

## IMPLICATIONS AND LESSONS OF THE WTC ATTACK IN 1993

### Perceptions and Culture in World Politics

Counterterrorism measures in the United States inherently take into account the unconventional ideologies and cultures embraced by terrorist groups. This has been a growing challenge over time. Political scientist John Rourke has explored the importance that perceptions have in international politics, and argues that perceptions create a "lens" through which reality is perceived. These lenses often create distortions in the images of both ourselves and other states in the world arena. How strongly the perceptual distortion is depends upon the strength of the beholder's beliefs. Misperceptions cause a misjudgment of others' actions and plausibly increase the likelihood of a conflict.[29] Given the low levels of knowledge that most Americans have of domestic and international politics,[30] citizens consequently have a difficult time identifying either a motive

for the World Trade Center attack or an understanding of the assailants. American political culture was built upon fundamentals of democracy, which include values like freedom and independence. This has allowed the nation's borders to be porous and vulnerable to attack. Like-minded Americans find the acts of a terrorist organization morally reprehensible and inconceivable. Yet, the values embraced by terrorist groups encourage a merging of politics and religion. The two cultures find each other incomprehensible, if not disagreeable at times. This implies an innate difficulty that cannot be easily resolved.

Terrorism has become a favored tactic of several extremist religious sects, as well as groups from both the left and right of the ideological spectrum. Yet, religious doctrine itself is not to be blamed for acts of terror, but rather it is the interpretation of such doctrine. As terrorism scholar Cindy Combs has observed, "Islam is not, in any sense, a violent religion. Nor are Christianity, Judaism, or any of the other religions in whose name violence has been carried out. However, the mixture of religion and politics has quite often resulted in violence, frequently against innocent victims, which makes it . . . terrorism."[31] Combs likens the actions of extremist, self-sacrificing Islamic fundamentalists engaged in a jihad to the Brotherhood of Assassins from the Middle Ages. Though from different eras in world history, both groups promised their followers that they would be rewarded for their actions with paradise. However, Combs also observes that governments have been ineffective in preventing the proliferation of these fundamentalist groups or their use of terror to achieve their objectives. The problem has remained inherently insoluble over the years, partly because the difference in cultures and approaches has made the actions of terrorist groups difficult to predict and respond to with counterterrorism policies. Overall, the understated nature of these cross-cultural disparities, along with the inability for both sides to negotiate and bargain over perceived grievances, makes peace improbable.

### Counterterrorism Measures That Target Terrorist's Growing Financial Resources

One poignant lesson of strategic importance involves tracing the financial resources of terrorist networks.[32] These resources have expanded over time and pose a significant threat in preventing acts of terrorism. Correspondingly, this trend has also commanded the attention of counterterrorism policymakers. The terrorists who conducted the WTC bombing in 1993 drew financial support from a well-funded network of like-minded Islamic fundamentalists. Rohan Gunaratna's research finds that this expansive network—particularly with the support of bin Laden—provided the necessary funding for Yousef's terrorist activities and numerous other

Islamic fundamentalists. Yousef also received financial backing from his uncle, Khalid Sheikh Mohmmad, who lived in Qatar at the time.[33] Al-Rahman's base of support came from Egyptian groups including the Muslim Brotherhood, as well as from Algerian, Afghani, and Pakistani elements in al Qaeda.[34]

The acknowledged father of al Qaeda is Abdul Azzam, a mentor of bin Laden. Together, they founded the Maktab al Khidmat lil Mujahidin al-Arab (MAK, or Afghan Service Bureau) to increase membership, raise money, and spread their jihad globally. The MAK has expanded al Qaeda influence exponentially over time and has allowed numerous terrorist groups to extract both money and capital to support their cause. From an operational and counterterrorist policy standpoint, the United States has found that preventing the spread of al Qaeda and other terrorist organizations requires considerable thought and effort to track the financial resources of such networks. These funds have allowed al Qaeda and other groups to successfully recruit a seemingly endless number of members, and to secure weapons and supplies for its activities. For instance, U.S. intelligence tracked a money trail used to fund an assassination attempt of Egyptian President Hosni Mubarak to the National Commercial Bank (NCB) of Saudi Arabia. Millions of dollars had been transferred to al Qaeda operatives via banks in New York and London, without the banks' knowledge. U.S intelligence has additionally traced over $100 million that went to support al Qaeda's efforts to recruit loyal Islamic groups, including the Taliban.[35]

The unregulated nature of banking systems in the Middle East allows members to easily transfer funds without much governmental scrutiny. This poses a significant threat to democratic nations and has burdened U.S. counterterrorism measures with having to respond to an ever-expanding terrorist network. The Al Taqwa and Al Barakaat banking networks have both been identified by the U.S. Justice Department as financial havens for terrorists, but hundreds more like these exist. The Dubai Islamic Bank, which is controlled by the United Arab Emirates (UAE), funneled millions of dollars in laundered money from Saudi businessmen to al Qaeda operatives.[36] The 1993 WTC attack demonstrates that the multinational character of al Qaeda has often made it difficult for the CIA to trace its funding sources. These sources are extensive and span several decades. For instance, the Bank of Credit and Commerce International channeled funds to support the Afghan rebels during the Soviet Occupation. This fueled the Afghani cause and jihad that spread to the United States. But as Gunaratna notes, "intelligence and security services worldwide, including the CIA and MI6, have never before encountered a global terrorist financial network as sophisticated as Al Qaida's . . . [it] has built the most complex, robust and resilient money-generating and money-moving network yet seen."[37]

Globally interconnected relationships enable large terrorist groups like al Qaeda to generate funding from many sources. Much of al Qaeda's financial base is used for technical and logistical operations, and comes from Islamic philanthropists and foundations, notably the UAE, Kuwait, Saudi Arabia, and Qatar.[38] Many Islamic charities and NGOs pose as fronts for raising money. Other money has filtered into terrorist activities from the sale of drugs through organized crime connections.[39] The al Qaeda financial network has been analogized to a holding company, with associated Islamic terrorist groups functioning as its subsidiaries. According to numerous sources, the financial system of al Qaeda is overseen by a committee of Muslim bankers and accountants, and has supported an estimated 3,000 core Afghani and overseas members, along with 120,000 ancillary members who spread terrorism across the globe, and has an annual budget of under $50 million. Bin Laden's own family inheritance was in the range of $25–30 million, which he has used to substantially buttress the network.[40]

Prior to 9/11, efforts by the CIA to weaken the financial networks of terrorist groups were only nominally supported by other countries, particularly Canada and those in Western Europe. The attention devoted to funding sources has taken a new strategic importance in modern times as governments across the globe more readily link the growing monetary bases of terrorist groups to specific activities. The counterterrorism strategies of many of these countries have been revamped accordingly. Approximately 2,500 companies and individuals have been identified by the U.S. Office of Foreign Assets Control as entities that must have their assets blocked.[41]

### The Sprawling Nature of Interconnected Terror Networks

Counterterrorism policies have required significant adaptation in the post-Cold War era. After World War II, conflict between the United States and former Soviet Union dominated American foreign policy throughout the Cold War. The official collapse of the Soviet regime in 1991 ended what was considered a contentious bipolar era.[42] This era seems to pale in light of a perceptibly different global system. The number of rogue and nuclear-capable states has grown, as have the terrorist organizations that use such failed or rogue states for shelter. This makes the post-Cold War era much more perilous for democracies.[43] These various groups are bonded together by a shared extremist ideology, and many of them seek to infiltrate American society with terror cells.

The declaration of war against terrorist activities was enunciated by President George W. Bush on the evening of September 11. The declaration represented the cumulative effects of prior terrorist acts like the first WTC bombing in 1993, and the culmination of an incremental shift

toward a more guarded state of existence for the United States. In strategic terms, the creation of the cabinet-level Office of Homeland Security—and corresponding realignment of FBI, CIA, and Department of Defense communications and functions—demonstrates that the internal threat to our nation is not expected to recede in the foreseeable future. However, terrorist groups present a different operational challenge than was perceived during the Cold War or other points in American history. They represent a "borderless" war by groups of interconnected radical ideologues with different beliefs of political and religious idealism. Bergen argues that the end of the Cold War produced an environment conducive for the expansion of terrorist groups. His research on bin Laden and al Qaeda led him to conclude that "it was precisely the end of the Cold War, which brought more open borders, that allowed his organization to flourish . . . made possible by the changing rules of the New World Order."[44] Yet, despite the nature of this interconnected terrorist network, the end of the Cold War brought funding cuts in the U.S. budget for national security expenditures from 1990 to 1996, and led to flat budgets from 1996 to 2000.[45] This challenged the vibrancy of counterterrorism measures before 9/11.

Meanwhile, al Qaeda training camps in Afghanistan attracted an expansive coalition of followers. The WTC bombing in 1993 illustrates how terrorist groups are interconnected in nature. Yousef, the operational leader of the bombing, had trained at an al Qaeda camp in Afghanistan where he met an array of Islamic extremists. As Pillar notes, these acquaintances have allowed for "cooperation among groups—such as in procuring false documents, facilitating travel, and performing other support functions—even if they do not conduct joint terrorist operations."[46]

In order to successfully combat the sprawling and integrated nature of terrorist organizations, democratically based states must be willing to band together their own counterterrorist organizations more effectively to share information and effectively track down the vestiges of terror networks. This is not to say that such cooperation does not exist at present. The international police organization, INTERPOL, exists for just this reason—to gather information on terrorist and criminal activities, and disseminate it to countries for use in their counterterrorism measures. But such coordination and communication are increasingly complex endeavors that require significant levels of dexterity when spanning national boundaries.

One obstacle to counterterrorism measures has been the difficulty many states have had in distinguishing terrorists from viable nongovernmental organizations (NGOs) that are legitimately performing social service work. For instance, NGOs such as the Pakistani Maktab al-Khidamat exist for a valid reason, but are unwittingly used as pawns by terrorist groups that take advantage of them. Terrorists have been known to join the organization and use it as a vehicle to transport both money and materials

across their organization. The NGOs provide jobs and make activities appear legitimate when members consequently travel to other regions.[47]

Another related lesson that has been learned has been the tendency toward cross-pollination of terror networks.[48] Members communicate, recruit across organizational boundaries, transfer tactical knowledge and ideas, and share financial resources. The effect of capturing and punishing one group's members only creates a small ripple in a larger sea of the network. This has required a broader application of counterterrorism policies. Similar to the building of vast interest group coalitions and advocacy networks in the United States,[49] terrorist groups recognize the advantages of linking human and material resources together in a nonhierarchical network. The ultimate effect generates a stronger force and mechanism for inducing chaos. For example, a partnership between the Japanese Red Army and a group of anti-Israeli Palestinian Arabs led to the May 1972 terrorist attack at Lod International Airport in Tel Aviv.

Additional illustrations pointedly suggest the proliferation of terror network coalitions. Renowned terrorism expert Bruce Hoffman calls this the "internationalization of terrorism," which he traces back to the hijacking of an Israeli El Al commercial flight from Rome to Tel Aviv. The incident took place in 1968 and was instigated by the Palestinian terror group Popular Front for the Liberation of Palestine (PFLP). What differentiated the hijacking of that flight from the 11 prior incidents was that it expressed a political statement, and successfully used the media as an outlet to propagate the group's actions and goals.[50] Following this, the Red Army Faction (RAF) of West Germany and the Action Direct (AD) of France formed a cooperative coalition in the 1980s to destabilize the North Atlantic Treaty Organization (NATO) through a series of attacks that spanned across Europe.[51] A meeting in Frankfurt, Germany, in 1986 provided a forum for several hundred terrorists from around the world to share agendas and ideas to spread a revolution across the globe.[52] This cross-pollinating tendency appears to be intensifying as time progresses and via the expansion of the Internet, thus future counterterrorism policies must evolve to respond to this trend.

### Terrorists Are Well Trained and More Sophisticated

Counterterrorism measures in the United States and worldwide must address the changing nature of technology and its inherent use by terrorist organizations. The *9/11 Commission Report* found that the old Cold War intelligence community has been ill-equipped to handle the challenges of the new era. Congress failed to reorient itself to effectively respond to new threats. Advances in technology have forced counterterrorism measures to evolve incrementally, with an emphasis on new digital technologies and satellite systems rather than relying upon human intelligence or physical

troops.[53] This new age of technology has necessitated a time-consuming but essential shift in the operational and strategic cultures of governmental bureaucracies.

With the progression of time, terrorists have also employed the use of technology to advance their cause. Modern terrorists are well trained. For instance, Yousef was educated in Wales and became an engineer with excellent communication skills and fluency in the English language. Yousef's training in terrorist activities began early. He attempted to assassinate Benazir Bhutto, Pakistan's first woman prime minister, elected in 1988.[54] His training continued in the Afghani al Qaeda camps operated under the auspices of bin Laden. Yousef's communication skills and militant training later facilitated successful contact with Abd al-Rahman and other like-minded Islamists in New York City. The execution of the 1993 bombing was not an isolated aim. Yousef's terrorist plots for the United States included smuggling liquid explosives onto several passenger jets, a plan to assassinate Pope John Paul II, and a scheme to crash a plane into the CIA headquarters in Virginia.[55] In effect, according to Bergen's analysis, "the 1993 World Trade Center bombing looks increasingly like a dress rehearsal for al-Qaida's devastating attack on the Twin Towers eight years later. Several of the 1993 plotters had ties to the Alkhifa Center . . . [Yousef] appears not to have frequented the Alkhifa Center, but he had close ties to al-Qaida members."[56]

Further, technological advances in the 1990s, particularly the Internet, have made communication easier for terrorist groups. Terror groups have used the Internet and DVD technology to recruit members to their cause. Many even used Internet chatrooms to open communications with their compatriots. Intelligence research has revealed that "the men who lead these movements are generally well-educated and utilize the latest in technology in their various jihads."[57] With data and information being exchanged at faster rates, terrorists have become more sophisticated in their plots. A charismatic leader like bin Laden need not set foot on American soil to successfully motivate a following to execute an attack.

### Terror Cells Integrate Themselves Deep in Society

Terrorists have a propensity for patience. They devoutly spend years devising and preparing to execute the perfect plot. Despite the fact that the 1993 WTC attack did not produce the outcome envisioned by the perpetrators (the collapse of both the north and south towers), the event still called for increased vigilance. Al Qaeda plotters of the September 11 attack began arriving in the United States as early as 1994. They were as resolute as ever, just cognizant that more planning was necessary to execute the plot.[58]

The infiltration of terrorists is well documented. A clear example is the case of Ali A. Mohamed. Mohamed enlisted in the U.S Army in November of 1986. He was first assigned to a supply company at Fort Bragg, North Carolina, one of the most secretive military installations in the country. The base houses the John F. Kennedy Special Warfare Center, which offers courses on warfare and enemy psychology to American soldiers. Mohamed became a sergeant within one year of enlisting, and began teaching seminar courses on Middle Eastern politics, history, and culture at the base. As Bergen notes, "Fort Bragg is pretty much the last place in the world you'd expect to find a bin Laden operative. Yet Ali Mohamed, it turns out, was an indispensable player in al-Qaida . . . [he was] a chilling illustration of how easily a 'sleeper' bin Laden agent was able to penetrate one of the U.S. military's most secretive establishments and plot terrorist acts on American soil."[59]

Mohamed advanced impressively in his military career. But after an unauthorized interlude to fight in the Soviet-Afghanistan War, Mohamed received an honorable discharge from the U.S. Army in 1989. His al Qaeda roots were highly entrenched, as was his commitment to the Islamic religion. After his dismissal from the military, Mohamed continued to fight for the Afghani and al Qaeda causes. At the Alkhifa Refugee Center in Brooklyn, New York—a center where Afghan refugees displaced by the war would go for help—Mohamed developed a camaraderie with El Sayyid Nosair, one of the convicted conspirators of the 1993 WTC attack. Mohamed was providing weapons and military training in New York City to followers he had met at the Alkhifa Center. Meanwhile, Nosair was later convicted for the assassination of the Jewish leader Rabbi Meir Kahane at a Manhattan hotel in 1990.[60] Investigation of the Kahane assassination by federal agents tied Mohamed and Nosair together, after authorities found U.S. Army documents in Nosair's New Jersey apartment given to him by Mohamed. During this period, Mohamed was also traveling back and forth to Afghanistan to help train commanders of al Qaeda. The Alkhifa Center became a base of operations for bin Laden to recruit new members and coordinate activities for a New York City terror attack.[61]

This account of Mohamed's activities reveals that terror cells can easily infiltrate into democratic societies, thus complicating counterterrorism policies. Another example was Ihab Ali, an American citizen who was also an associate of bin Laden. Ali was employed at various jobs in Orlando, Florida—including Disney's Magic Kingdom, the Sheraton Hotel, a Wells Fargo Bank, and as a taxicab driver. The other portion of his double life included travel to Peshawar in 1989 to support the jihad against the Soviets, and assistance in purchasing a U.S. airplane in 1993 that was to be flown to aid al Qaeda in Sudan. He learned to fly at a flight school in Norman, Oklahoma, and later worked as a pilot for al Qaeda.[62] In sum, Ali lived as an American citizen but worked to advance al Qaeda's cause.

## CONCLUSION

The attack on the WTC in 1993 signaled a turning point in American history; where beforehand, terrorist attacks were waged primarily on foreign soil, the events of February 26, 1993, revealed that Americans no longer enjoyed immunity from this form of violence. In all, the incident clearly demonstrates Combs' observation that "terrorism is a phenomenon that is becoming a pervasive, often dominant influence in our lives. It affects the manner in which governments conduct their foreign policy . . . it influences the way we travel and the places we travel to see."[63]

The physical damage from the WTC attack of 1993 was repaired quickly, and the north tower reopened in less than a month. The psychological ramifications, particularly those of the surviving victims and their families, penetrated much deeper. The attack was committed by a group of terrorists who adhere to a religious fundamentalism that is alien to the values and beliefs of many Americans. The incident signaled the inherent disparities that prevent diplomacy and communication to exist between terror groups like al Qaeda and nations like the United States. These disparities made the 1993 and 2001 attacks imminent, and became a catalyst for the posing of critical (but not altogether answerable) questions. As this chapter has indicated, the implications and lessons from the incident are vast, but suggest that time and cooperation, both domestically and internationally, will create a more unified front to combat terrorist behavior.

# CHAPTER 6

## INSURGENT SEIZURE OF AN URBAN AREA: GROZNY, 1996

James S. Robbins

The highest form of the art for an insurgent group is to seize and hold a major urban area. Cities are natural power centers, and holding them confers control over people, infrastructure, and trade. The physical control of a city also brings with it a measure of legitimacy and allows a movement to begin to exercise power. There are a number of noteworthy historical examples of insurgent groups making a bid to seize and hold urban areas, such as the Tet uprising in Vietnam during the spring of 1968, or the takeover of Fallujah, Iraq, in the summer of 2004. In both cases, insurgent forces were able (for a time, at least) to raise their flags and begin organizing society according to their revolutionary blueprint.

While insurgencies must at some point seize and hold cities if they are to prevail in their radical programs, it is more easily attempted than accomplished. In most cases, the seizing is much easier than the holding. In the abovementioned examples, insurgent forces either were unsuccessful in the initial part of their enterprise, or soon found themselves subject to devastating counterattacks that ended their erstwhile period of rule. One of the few cases of an insurgency prevailing in an urban takeover is the August 1996 seizure of Grozny in Chechnya. Rebel forces took the city in a matter of days and were able to hold it for a period of years. However, the reason for the Chechens' success had less to do with their battlefield prowess than the unwillingness of the Russian government to pay the costs necessary to take the city back. Thus, the 1996 Battle of Grozny is a cautionary tale for countries involved in counterinsurgency operations under conditions of diffident leadership and weak public support at home.

## BACKGROUND

The Chechen relationship with Russia is one of enduring enmity, dating back to Russia's annexation of the north Caucasus in the nineteenth century. The cycle of uprising, reprisal, suppression, and bitterness was well established before the Chechen uprising in the 1990s. The most noteworthy event during this period was Soviet leader Joseph Stalin's deportation of the entire Chechen nation to internal exile during World War II. It was the most comprehensive attempt in history to eradicate the Chechen people. The Chechens were permitted to return to their homeland in the 1950s during the Khrushchev period. Among the returnees was future Soviet Air Force General Dzhokhar Dudaev, who had been born in exile. Dudaev was the first and only Soviet General of Chechen ethnicity, and would play a central role in the attempt to secure the Chechens an independent state.

The Chechens, like other nationalities in the Soviet Union, sought to make use of the opportunity afforded by the gradual collapse of Soviet authority at the end of the Cold War. Lithuania was the first Union Republic to declare (or reaffirm) its independence, on March 11, 1990. The Lithuanians were gradually followed by other former Soviet states.[1] On November 23, 1990, Dudaev presided over a Chechen National Congress that called for free elections and the formation of a Chechen parliament. Two days after the August 1991 coup attempt in Moscow, a small Chechen parliament convened and selected Dudaev as the putative country's interim leader. The following month, Dudaev stormed the local parliament and killed the Soviet Communist Party chief for Grozny, Vitali Kutsenko. His men also seized the KGB (*Komitet Gosudarstvennoy Bezopasnosti,* or Committee for State Security) headquarters as well as radio and television stations in the capital. Dudaev easily won a referendum held October 27, 1991, which Moscow denounced, and immediately declared the independent Republic of Ichkeria. Russian President Boris Yeltsin flew troops to Grozny in November and Chechen forces immobilized them at the airport. Lacking political support for war, Yeltsin withdrew the troops, and the Chechens won their first bid for independence.

The Chechen Republic of Ichkeria existed as a de facto political entity for three years, unrecognized by Russia or the international community. The situation was barely tolerable to Moscow. The Russian Federation had many such minority enclaves within its borders, and there was concern that other nationalities might try to copy the Chechen experiment. There was also some fear of Chechnya serving as a base for the spread of Muslim fundamentalism, though this tendency was less prevalent in the early years of the Chechen conflict, which was largely a nationalist movement before 1995. Chechnya was also strategically located close to the Caspian oil fields and along some planned pipeline routes. Within

Chechnya, government controls were weak and black markets and other forms of transnational criminal activity began to proliferate, spreading to Moscow and other major Russian cities. Dudaev's rule was not without problems; he faced factional infighting (sometimes violent) and generally decreasing popularity after the flush of enthusiasm for independence waned.

The Yeltsin administration attempted various overt and covert means to suppress and subvert the Dudaev government, finally opting for direct military action in December 1994. Moscow was very optimistic; Defense Minister Pavel Grachev said Grozny could be taken with a single airborne regiment in 2 hours, and Russian Security Council Secretary Oleg Lobov predicted "a small victorious war." However, Operation WAVE—the campaign against Chechnya—was ill-planned and poorly executed, and became a case study in how not to conduct military operations against a separatist uprising, particularly in urban settings. Poorly trained and ill-supplied Russian troops made slow going against determined Chechen forces, and were frustrated by civilian protestors, poor weather, and the unwillingness of some of their commanders to press the offensive. By contrast, the Chechens were highly motivated, fought on their home ground, and enjoyed strong public support.

In January 1995, Russian forces attacked the Chechen capital of Grozny and suffered a humiliating setback as the Chechen guerillas used the advantages of defense in complex urban terrain to good effect.[2] The most notable example was the experience of the 131st Independent Motorised Infantry Brigade (the Maikop Brigade), which lost 20 of 26 tanks, 102 of 120 APCs, and suffered over 1,000 combat fatalities, including commanding officer Colonel Ivan Savin. Despite these initial setbacks, the Russians were eventually able to secure Grozny by exploiting Russia's advantage in firepower and inflicting tremendous damage on the city and its half-million inhabitants. On February 26, 1995, Russia declared the city secure, and by this time was already pushing its campaign into the region's southern highlands. Other Chechen urban centers—such as Argun, Shali, and Urus Martan—fell shortly afterwards, and Chechen guerilla bands sought sanctuary in the high mountains to the south, or over the border in the Republic of Georgia.

Throughout the next year, Russia engaged in a difficult and controversial counterinsurgency with the Chechens. The Chechen guerillas fought back creatively—for example, when rebel leader Shamil Basayev seized control of a hospital in Budyonnovsk in June, 1995, taking 1,000 hostages. Salman Raduyev undertook similar attacks in Gudermes and Kizlyar. But the Russian response was the traditional one: reprisals against Chechen villages thought to be sheltering guerillas, and war of no quarter on the frontier.

**MARCH 1996: TESTING CAPABILITIES**

After the reduction of major hostilities in early 1995, Grozny had been handed over to the special troops of the Interior Ministry (MVD), which was standard Russian procedure for Phase IV operations dating back to World War II.[3] The city was occupied by between six and twelve thousand troops of various types—special armed units of the MVD, MVD contractors (*kontrakniki*), local pro-Russian Chechen militia (OMON), police, and other security forces. All varied in levels of training, equipment, motivation, and loyalty to the regime. Russia installed Doku Zavgayev, a pro-Russian Chechen, as the leader of the region, and began an aid program to bolster the loyalist regime; however, such programs were plagued by corruption, and much of the money was embezzled or diverted, doing little to ameliorate conditions inside Chechnya.

On March 6, 1996, 1,500 to 2,000 Chechen guerillas attacked Grozny from five directions. Most were from bands that had filtered back to the city from the mountains. Some were members of Zavgayev's own militia, and many others wore the militia uniform, arriving on the morning trains without raising the suspicions of Russian security forces. The attack came one day after Defense Minister Pavel Grachev paid the city a visit to discuss peace talks. "I wanted to save him the trouble of finding me," Dudaev later joked.[4] It was also the day before the Russian Security Council was to meet to talk about Chechnya. General Vyacheslav Tikhomirov, commander of Russian troops in Chechnya, said the rebels wanted to "show off their strength on the eve of the meeting."[5]

Dudaev soon appeared on rebel television with field commander Shamil Basayev and stated, "The city of Grozny will be taken. There will be no mercy for Chechen traitors."[6] (The Chechens used mobile TV transmitters that could overpower state-run TV signals, and Dudaev would regularly appear on regular television channels, interrupting scheduled programming with his special announcements.) The guerillas burned two police stations, attacked the power station and main administrative building, and attempted to seize the Interior Ministry. The railway station and main bridges were occupied to impede possible Russian movements. Fifteen Russian checkpoints were destroyed, and at the height of the raid, the insurgent forces had free movement in 80 percent of the city. As well, on March 8, Chechen rebels hijacked a Turkish Cypriot airliner and flew it to Munich as a means of publicizing their cause.[7]

The assault lasted for 2 days. Russian forces initially paused to see what the OMON (interior ministry special forces) and local police would do, but they offered no effective resistance.[8] As the Russians began their counterattack on the third day, the insurgents withdrew quietly from the city, ending the attack. Some snipers and saboteurs remained behind to harass

the Russians, and security forces were still trying to root out some of these as late as March 26.[9] Nevertheless, the main attack was over.

There were characteristically conflicting claims of damage. Russian television reported 70 government soldiers had been killed and 200 wounded. The Russian government claimed 170 rebels were killed and more than 100 were wounded, with about 100 civilians dead.[10] Dudaev claimed to have killed 91 Russian troops while losing just 8 of his own men. But regardless of the scale of damage, the Chechens had made their political point. "Chechen leader Dzhokhar Dudaev, Aslan Maskhadov and many other Chechen commanders studied in Soviet military academies, where they learned in detail about the Soviet-backed Cold War guerrilla campaigns in Algeria and Vietnam," one analyst wrote. "Many a pundit who remembers the Vietnam War will immediately notice the striking similarities between the latest Chechen attack on Grozny and the 1968 Vietcong Tet offensive."[11]

The attack also served as a dress rehearsal for future operations, according to Dudaev.[12] He called it "a little harassing operation ... a training exercise for 'a new dimension of war' that will include bolder attacks inside Russia proper."[13] Dudaev believed that the raid demonstrated that "it is no big problem for us to capture any city" including "military-industrial and political-administrative centers" in Russia and other former Soviet republics.[14] "We are prepared to fight indefinitely to add to our history of 437 years fighting against the Russian Empire," Dudaev stated. "Only independence and withdrawal of the federal troops can bring peace."[15]

Meeting while the fighting raged, the Russian Security Council adopted a plan for "peace through stabilization" in Chechnya, and sought to end fighting by March 28. Initially, this entailed increasing attacks on rebel concentrations in towns and villages, using the same encirclement techniques that had been used since the nineteenth century.[16] But a ceasefire agreement was signed on March 31. Politics were very much in play. President Yeltsin was running for reelection in a hard-fought campaign, and was not doing well in the polls. The war was a major issue, one on which he was vulnerable. The March ceasefire was portrayed as a political victory after the embarrassing attack, and Yeltsin promised an expeditious Russian troop withdrawal. On April 21, 1996, at a joint press conference with U.S. President Bill Clinton following the Moscow summit, Yeltsin declared that "there are no military operations in Chechnya."

Of course this was not true, and 3 days later the Russians scored a noteworthy success when they assassinated Dudaev by targeting a transmission from his satellite phone with an air-to-ground missile. Dudaev was in the village of Gekhi-Chu, talking to Russian negotiator Konstantin Borovoy at the time of the strike.[17] Dudaev had argued for some time that

killing him was the main objective of the Russian plan. "We have made preparations so that in case of my death, the Russians' ordeal would increase tenfold," he once said.[18] Dudaev was quickly succeeded by Zalemkhan Yanderbayev, to whom Yeltsin immediately reached out with peace feelers. The two men met in the Kremlin on May 27. Three weeks later, in the first round of elections, Yeltsin gained 35 percent of the vote, followed by Communist challenger Gennady Zyuganov with 32 percent. Yeltsin was reelected in the second round on July 3, 1996 with 53 percent of the vote, and most credited the peace offensive with helping secure his reelection. Yeltsin was set to be inaugurated on August 9.

### AUGUST 1996: THE ATTACK

In early August, there were no signs of an imminent attack in Grozny. The political climate likewise seemed pacific; Chechen leaders agreed to negotiate with Organization for Security and Cooperation in Europe (OSCE) representatives on various aspects of the current peace plan. For its part, Moscow announced that by September 1 all Federal soldiers would be withdrawn from Chechnya except for a few garrison troops. The moment seemed promising for some type of long-term settlement.

However, at a July 25 meeting Chechen commanders initiated Operation ZERO OPTION, the planned takeover of Grozny, with smaller scale attacks on Argun and Gudermes. The operation sought to change the correlation of forces in the struggle with the Russians by taking the fight unexpectedly to the symbolic center of Russian power in Chechnya. At base, the attack sought to serve as a reminder; Aslan Maskhadov, Yanderbayev's chief of staff, stated, "the actions in Grozny have a single aim—showing that the war in Chechnya is not over yet."[19] The attack was something of a gamble, as are all insurgent attacks of this nature, since they forego some insurgent strengths, such as mobility, and place the insurgency at risk of being surrounded, pinned down, and destroyed. But the Chechens may have been emboldened by their relative success in March, and perhaps felt that should events turn against them they could again withdraw to regroup and fight another day. As well, they may have felt that the risks were worth taking. A fierce, highly visible, and symbolic attack against an unmotivated enemy in an unpopular war led by a weak leader could turn the tide, or so they reasoned.

The attack was set for dawn on Tuesday, August 6, 1996. Shamil Basayev was given overall command of the ground forces, which were organized in the usual semiautonomous groupings based on family and tribal affiliations. Rebels began infiltrating the city and hiding in prepared apartments to await the attack. About 4,000 Chechen fighters faced approximately 6–7,000 Russian troops, primarily MVD with militia and police. (There were 30–40,000 Russian troops in theater.) Though they outnumbered the

Chechens, the Russians were hampered by lack of unity of command between the various types of Russian units, and no systematic information sharing or systems for coordinated action. As with the March raid, many members of the ostensibly pro-Russian Chechen government were actually in league with the rebels. One estimate had 75 percent of the Chechen police and security units being rebel sympathizers. Major Sultan Tuleyev of the Chechen Interior Ministry helped direct some of the rebel attacks, particularly those aimed at pro-Russian Chechen targets.[20]

The August attack plan did not differ significantly from the March plan. Rebel units first seized the communications apparatus and strategic choke points in the city such as bridges and rail stations. They then attacked government buildings, Russian defensive positions, and the Severny airport. They worked in small teams of 20 or less, as they had in 1995, armed with rocket launchers, small arms, and the occasional mortar. Snipers worked from predetermined positions with wide fields of fire. Supplies had been prepositioned in the city, dispersed at key points to support the attacking forces.

The Chechens achieved surprise at every level. Strategically, it was an embarrassing incident, made more so because it was successful. The attack generated a great deal of press coverage, and emphasized the growing sense of drift under Yeltsin. Tactically, surprise was complete, though it need not have been. Journalist Maria Eismont, who was in Chechnya covering the war for *Sevodnya*, stated that "only a blind man or the deaf and dumb did not know about the impending attack a week before it came. Talk about the coming offensive could be heard in offices and in markets, at home and in the barracks."[21] Chechen rebels had circulated leaflets a week before the attack asking civilians to evacuate, but these had been ignored by the Russians. A wounded Russian private told of the chaos in the early moments of the fight: "They attacked us at night. Nobody expected it. We just had no idea. They trapped us all at our posts or between buildings in groups of three or four. They would shoot from buildings and pick us off when we had no way to fight back. They had better weapons than we did and they were organized."[22]

The Chechens also won the intelligence war. Chechen rebels had effective human intelligence (HUMINT) in the city from their established networks, and creatively used off-the-shelf and stolen equipment to intercept Russian signals. They combated Russian attempts to collect signals intelligence by using a system of couriers. The smaller, flatter Chechen command hierarchy allowed intelligence to be exploited more quickly and for greater effect. Likewise, their decentralized organization allowed for better counterintelligence—it was difficult to penetrate the closely knit tribal organizations. The rebels also benefited from a long-term intelligence collection effort they had undertaken inside the city, amassing detailed information on the Russian defensive positions. They were aided by their

preexisting knowledge of the city and the sympathies of many of the non-Russian inhabitants.

The Russian defensive plan for Grozny recognized that they lacked sufficient troop strength to guard the entire city. Instead, the Russians had established checkpoints along the major roads coming into Grozny, and strong points at various locations within the city. These bunkers were intended to form knots of resistance to any rebel attacks and were designed to be strong enough to withstand attacks until reinforcements arrived. Essentially, the main effort would come through counterattacks. However, this gave the insurgents several advantages. According to guerilla band leader Vakha Ramzanov, "at most checkpoints the soldiers ignore us; they don't want a fight. Or sometimes we pay a bribe."[23] The strong points were not always mutually supporting and could be isolated and sometimes destroyed. In addition, because they were by their nature defensive positions, the Chechens were able quickly to consolidate the areas the Russians had chosen not to defend. By the end of 4 days of fighting, the Chechens had control of most of the city. A Russian military spokesman stated that Federal units were "totally surrounded in Grozny, and they are not even trying to attack the rebels, only trying to defend themselves."[24]

By seizing most of the city and establishing their own defenses, the Chechens exposed another serious contradiction in the Russian defensive plan. Chechen leaders acknowledged that the Russians would probably be able to take back the city with a concerted effort, but they doubted that the Russians would be willing to absorb the estimated 15,000 casualties in the process. The Chechens planned for the Russian counterattack by establishing harassment positions at high points around the city, and mining the main highways. Some armored reinforcements were allowed to enter the city following the same playbook as 1995, in order to be surrounded and destroyed. The Russians had not learned the lessons of the first battle of Grozny, and the Chechens were again able to cut off and kill or capture a number of Russian units. Basayev told rebel gunners to attempt to disable rather than destroy Russian vehicles when possible, in order to use them later.[25] After a few days, the Chechens were able to field four tanks and six APCs captured from Russian forces.

Russian doctrine stressed the use of firepower, either artillery, stand-off air assets such as helicopters, or bombardment by fixed wing aircraft. However, in most cases the Russians lacked accurate, timely targeting information and these attacks were rarely effective (though helicopter-fired rockets could be useful against known sniper positions). Thus, though the Russians could mass firepower, the quick-moving Chechens were not often at the receiving end. This increased the level of damage to the city and the number of civilian casualties. Furthermore, the armed formations of the MVD generally lacked the fire support capabilities enjoyed by MOD units and were unable effectively to respond to Chechen attacks.

Human factors were another asymmetric element of the battle. The Russians were in poor morale, inadequately trained and supplied, generally unmotivated, and combat ineffective. A Russian official described the troops as "hungry, lice-infested and in rags," commanded by "indifferent, tired-out people."[26] By contrast, the Chechens were well trained, well supplied, and highly motivated. "We are much more interested in continuing the war than Russia is," Dudaev had declared after the March raid. "What is left for us? Our economy has been destroyed. Our people have no homes, no bread, no jobs, nothing. We have 500,000 men aged 15 to 50 who know only one thing: how to fight."[27] Akhmed Zakayev, a Chechen ground commander, said, "It's easier for us. After a year and a half of fighting, each of us is a strategist, a commander, a general. Each person knows what he's fighting for—which I can't say for the Russians."[28] A journalist covering the attack observed that "it is not difficult to demonstrate one's fighting ability with people going quite calmly to meet their deaths. Russian soldiers have nothing to die for—neither in Grozny nor in any other settlement in Ichkeria."[29]

Initially, official statements from Russian military sources during the attack were mostly upbeat, stressing the imminent collapse of the rebel force. Journalists inside the city could be counted on to give a reality check to these claims, when they could reach the outside. But after the first few days of fighting, Russia admitted to losing 8 helicopters, 15 armored vehicles, 50 dead, and 200 wounded. In the first week, Russia admitted to 221 dead and 766 wounded troops, having only previously admitted to 1,000 casualties since December 1994.[30]

## MOSCOW REACTS

Boris Yeltsin was reinaugurated president of the Russian Federation on August 9 in Moscow, 3 days into the Chechen attack. Planned inauguration pageants had been cancelled the day after the attack began; the organizers cited financial concerns. During the inauguration ceremony, Yeltsin appeared wooden and slurred his words. He spoke for 45 seconds only, simply reciting the oath of office and then departing for a long vacation. Yeltsin lacked the fortitude to be a decisive wartime leader; one of his first official acts in response to the crisis in Grozny was to ask Prime Minister Victor Chernomyrdin to convene a commission to fix blame for the fiasco.[31]

A statement released the day after Yeltsin's inauguration vowed, "All acts of terrorism will be crushed with determination." Nevertheless, Yeltsin's office was largely silent on the developing crisis. On the second day of the battle, Doku Zavgayev, the pro-Russian Chechen leader installed by Moscow, said, "the situation in Grozny is perfectly under our full control now."[32] However, sporadic reports from reporters trapped in

Grozny told a different story. Six days into the fighting, Prime Minister Chernomyrdin threatened to declare a state of emergency "if that is what we need to do." But whether declared or not, a state of emergency had been imposed on the Russian leadership.

Yeltsin decided to hand the crisis to his national security advisor Aleksandr Lebed. Lebed was a charismatic former lieutenant general in the Soviet and Russian armies, an Afghan veteran, known for his outspoken views and sarcastic wit. He had run against Yeltsin as a peace candidate, opposing the war in Chechnya, and come in third with 15 percent of the vote. Two days later, Yeltsin named him his national security advisor, seeking to coopt the peace platform, and sacked Lebed's old rival, Defense Minister Pavel Grachev, who was made the scapegoat for the war. Grachev was replaced by Lebed's supporter General Igor N. Rodionov.

Lebed believed that the conflict in Chechnya could not be won by military means alone. "Regardless of the blood spilled in Grozny due to the Chechen opposition," he said, in the opening days of the battle, "the security council does not intend to resolve the sharpened crisis purely by means of force, even though this is how the leaders of the illegal military formations are acting."[33] Lebed was sent to Chechnya to lead negotiations, replacing hard line national security council member Oleg Lobov. Chechen spokesman Movladi Udugov saw the move as positive, and pledged that if Lebed dealt fairly with them they would help Russia preserve its interests in the Caucasus and "get out of this war while saving face."[34] For his part, Lebed felt certain that he had been sent to Chechnya by people playing "apparatchik games" who wished to see him "break his neck" in the process, but he did not shy away from the assignment.

Lebed met with Aslan Maskhadov in the village of Stariye Agagi on August 11. "We discussed the question of the possible [political] status of Chechnya and arrived at the conclusion that in order to implement any good intentions, it is first necessary to stop killing people," said Lebed. He said the two sides could reach agreement on 90 percent of the outstanding issues.[35] The solution began to take the form of an agreement along the lines of the treaty Russia had with the then-Republic of Tatarstan. Lebed also denounced nominal Chechen leader Zavgayev as a megalomaniac who had difficulties with reality. The next day, Mashkhadov negotiated an agreement with Russian ground commander Lieutenant General Konstantin Pulikovsky to separate the warring parties in Grozny. The ceasefire went into effect at noon on August 13, though it was soon being violated by both sides. One problem the Russians faced was that provisions had not been made in the agreement for the safe conduct or resupply of troops inside the city. The Chechens were more than willing to let the Russians starve in their bunkers, and some violations of the ceasefire occurred when attempts were made to bring rations to the isolated troops.

Lebed was adamant that the conflict had to end. "A country with a collapsing economy and armed forces cannot allow itself the luxury of waging a war, a democratic country cannot decide questions of nationality with rockets and shells," Lebed said on August 15. "This war should be ended and it will be." He called the war "a colossal loss for Russian prestige."[36] Lebed praised the fighting ability of the Chechens and said that the situation would be resolved not by fighting but by "humane considerations and common sense." Maskhadov, a former Soviet Colonel, said that Lebed's "guarantee is the word of honor of a Russian officer." But not all the Chechen leaders were impressed with Lebed. Shamil Basayev said, "I am glad that Lebed thinks highly of our skills ... But I don't believe in the words of any Russian. I believe it was Winston Churchill who said an agreement with Russia isn't worth the paper it was written on. So agreements mean little to me."[37]

As exchanges of gunfire became more common over the next few days and tensions began to mount, General Pulikovsky—the acting ground forces commander during the absence of the equally hawkish General Vyacheslav Tikhomirov—issued an ultimatum to the citizens of Grozny, giving them 48 hours to vacate the city before he used extreme measures. "Grozny will be cleared of the rebels," he said, "The only way out of the current situation in Grozny is the use of force." This sparked an exodus of tens of thousands of people to refugee camps.

The breakdown in policy caused many to look to Moscow for guidance, but none was forthcoming. President Yeltsin was unavailable, looking for a new dacha; Parliament was on vacation; Prime Minister Chernomyrdin had no comment.[38] Lebed was left standing, having to make difficult decisions on his own, which suggested that he had been right—that he was being set up by his adversaries. However, he was true to his belief that the war had to end. Lebed went to Grozny around August 21 and again met with Maskhadov. A new and final ceasefire went into effect at noon August 23.

Lebed expected a hero's welcome in Moscow, but Yeltsin at first snubbed Lebed on his return to the capital. Yeltsin later congratulated him over the phone for achieving this "first step" toward peace.[39] By late October, Lebed would be forced out of office by his opponents. The day the peace agreement with the Chechens was announced, the newspaper *Moskovsky Komsomolets* ran a front-page headline, "They Won."

**ANALYSIS**

The Chechen victory in August 1996 was not primarily a military victory, but rather a political victory catalyzed by military means. The attack on Grozny forced Russia to face political contradictions that made continued fighting untenable. The defeat came from the top; Yeltsin was a weak

leader of a war-weary country. The Chechens correctly diagnosed that one more dramatic, large-scale attack would set the conditions for a peace on their terms. The Russians could well have taken the city back by applying the ruthless force they had in the past, but in the summer of 1996, Russian society could not make the sacrifices necessary to win it in the same old way. A negotiated settlement and withdrawal was seen as the better option by the political leaders and most of the voters.

The Chechen rebels established facts on the ground at precisely the right time to achieve their political ends. Russian Army forces began pulling out of Chechnya that same week, and completed their withdrawal by the end of the month, as scheduled. A peace agreement was signed at Khasavyurt, Dagestan, which postponed consideration of Chechnya's political status until 2001, a de facto recognition of Chechen independence. It gave tacit recognition to the rebel Chechen government and ended Moscow's support for the opposition government. The two sides agreed to mount joint security patrols in the city, and television audiences saw Chechen guerillas and MVD troops trading cigarettes and making a show of cooperation. The Chechens began imposing sharia-based law, and taking vengeance on former collaborators with the Russian puppet government.

Chechen rebel leader Zelimkhan Yanderbayaev arrived in Grozny on September 6, the fifth anniversary of the original Chechen declaration of independence, and began organizing his government. Grozny was a shambles, the presidential palace was in ruin. There was little running water, natural gas, or electricity. But among the populace there was a feeling of expectation that perhaps this time peace would prevail. Most would agree with rebel troop commander Akhmed Zakayev, "We aren't taking over the city, we're liberating it."

During the conflict with Chechnya from 1994–1996, about 6,000 Russian soldiers, 2–3,000 Chechen fighters, and 80,000 civilians were killed. Another 240,000 persons were wounded, though estimates of total casualties ranged much higher. Chechnya's infrastructure was almost completely destroyed, its urban areas reduced to rubble, and its people impoverished spiritually as well as materially. But the Chechen rebels had again secured their independence.

In an interview in September 1996, Russian Interior Minister Anatoly Kulikov stated, "Personally, I have one concern: how to prevent the current tactical gain from becoming a future strategic loss."[40] The tactical gain he was referring to was the end of open warfare. The strategic loss he feared was the gradual establishment of sovereighty by Chechnya[41] Over time and through acquiescence—by Russia, by neighboring states, and eventually the international community—a fully independent country would be created. "The danger," he continued, "using the example of Afghanistan, is the Chechenization of the war. That is, a war for power, among Chechen groups, all hostile to Russia, against each other just like

what happened in Afghanistan after the withdrawal of Soviet troops. It is possible that the irreconcilable Chechen opposition will be consolidated around some leader. Then indefinite prolongation of the war is not out of the question at all."

This was a sound prediction, and over the next 4 years, the Chechens squandered their opportunity to establish an internationally recognized state through infighting, criminal activity, and extending their Muslim uprising to neighboring states. In so doing, they lost sight of the fact that they had won their independence by exploiting a very particular set of political circumstances. They began to overreach, failing to understand the changing dynamics within Russia. By 1999, political conditions in the Federation had changed, and Yeltsin's successor Vladimir Putin demonstrated that he was unwilling to let Chechen provocations stand. Putin was not interested in letting the separatists have their own homeland, and would make the sacrifices necessary to resubjugate Chechnya. Russian forces returned to Grozny in February 2000 and leveled the city.[42]

## ACKNOWLEDGMENTS

## NOTES

1. The Soviet Union officially recognized the secession of the Baltic States on September 6, 1991. Note that the Union Republics that comprised the Soviet Union had been guaranteed the right to secede by the Soviet constitution. Chechnya, as an independent *oblast* within the Russian Soviet Federated Socialist Republic, had no such right.

## THE U.S. EMBASSY BOMBINGS IN KENYA AND TANZANIA

Sundara Vadlamudi

The bombing of the U.S. embassies in Kenya and Tanzania was the first major al Qaeda attack against U.S. targets that resulted in a large number of casualties. The meticulous planning, sophistication of the attack (involving near simultaneous bombings), and the number of casualties served as an extreme wake-up call to the U.S. intelligence and law-enforcement community. The attack brought into sharper focus the danger posed by transnational jihadists and forced the U.S. government to readjust its counterterrorism policies. This study examines the plot to bomb the U.S. embassies, the responses by the U.S. government, and the lessons learned from those responses. The study is divided into six sections. The first section details the bombing plot and lists the key individuals involved in the plot. The second section lists the immediate U.S. response to the bombing and the third section provides an overview of U.S. counterterrorism efforts against Osama bin Laden from the early 1990s until the embassy bombings in August 1998. The fourth section describes the cruise missile attacks on al Qaeda targets in Afghanistan and Sudan, launched by the United States as a response to the embassy bombings. The fifth section examines U.S. counterterrorism policies and efforts after the cruise missile attacks. And finally, the conclusion highlights some of the lessons learned from the U.S. response to the embassy bombings.

### THE BOMBING PLOT

On August 7, 1998, two bomb-laden trucks were driven almost simultaneously into the U.S. embassies in Nairobi, Kenya, and Dar es Salaam, Tanzania, at approximately 10:35 A.M. and 10:39 A.M., respectively.

The attacks killed 213 people in Nairobi, including 12 Americans and 11 people in Dar es Salaam.[1] More than 5,000 people were injured in the attacks. The bombings, carried out by al Qaeda and Tanzim al-Jihad (Jihad Organization, also known as Egyptian Islamic Jihad) operatives, represented the first attack that was "planned, directed, and executed by al Qaida, under the direct supervision of bin Laden and his chief aides."[2] The attacks on the U.S. embassies in Kenya and Tanzania, code-named by al Qaeda as "Operation Holy Ka'ba" and "Operation al-Aqsa,"[3] respectively, were timed to occur between 10:30 and 11:00 A.M. when observant Muslims would be in the Mosque for their prayers.[4] The attacks took place 8 years to the day after U.S. troops landed in Saudi Arabia as part of an international effort in response to Saddam Hussein's invasion of Kuwait in 1990. In December 1998, bin Laden denied his involvement in the bombing, but added "I don't regret what happened there." Bin Laden said that "our job is to instigate [people against the Jews and the Americans], and by the grace of God, we did that, and certain people responded to this instigation."[5]

Al Qaeda established its presence in East Africa during the early 1990s in response to the presence of U.S. troops in Somalia, who went there to implement a U.N. program to supply food to Somali citizens. Al Qaeda viewed the U.S. troops' deployment as a step toward increasing U.S. hegemony in the region as well as targeting al Qaeda's infrastructure in neighboring Sudan.[6] At times, bin Laden and others have suggested that al Qaeda established its presence in Somalia even before the arrival of U.S. troops in order to unify the Somali militias and oppose the U.S. presence in the country.[7] It is difficult to ascertain the precise timeline of al Qaeda's entry into Somalia, but it is apparent that bin Laden has always been opposed to the U.S. presence in the Horn of Africa. After all, he explicitly stated that America must be stopped and called for cutting "the head of the snake and stop them [Americans]."[8] In 1992, Abu Ubayda al-Banshiri, al Qaeda's military commander at that time, established cells in East Africa, specifically in Nairobi, Kenya,[9] that acted as a transit point for al Qaeda operatives entering Somalia. Several al Qaeda members who went to Somalia and were involved in running the Nairobi cell participated in the embassy bombings. These operatives include Muhammad Atef (who became al Qaeda's military commander after the death of Abu Ubayda al-Banshiri), Abdullah Muhammad Abdullah (also known as Ali Salih or simply Salih), Muhammad Siddiq Odeh, and Fazul Abdullah Muhammad (also known as Harun Fazil).[10]

By late 1993, al Qaeda, then based in Sudan, initiated reconnaissance efforts to identify targets in Kenya. Ali A. Muhammad[11] cased the U.S. Embassy in Nairobi, the USAID building, the French embassy, the French Cultural Center, and other British and Israeli targets. In 1994, Ali

Muhammad went to Djibouti to conduct surveillance on several facilities, including the American and French embassies and French military installations. For some unknown reason, additional trips to Senegal to gather intelligence on French targets[12] were cancelled. It is believed that bin Laden examined the surveillance photographs of the U.S. embassy in Nairobi and pointed to the exact spot where an explosive-laden truck should enter the building.[13] The exact reason why al Qaeda did not immediately carry out attacks on U.S. targets is not known. One possible reason is that some al Qaeda members feared that such attacks would invite retaliation from the Kenyan government, which would affect the flow of al Qaeda operatives into Somalia.[14] Another possible explanation is that a combination of factors, such as al Qaeda's relocation to Afghanistan, the resulting loss of financial resources in Sudan, the death of al-Banshiri in a ferry accident in May 1996, and the time taken to rebuild the organization in Afghanistan, contributed to the delay in carrying out the attack. In any event, the U.S. withdrew its troops in March 1994, and al Qaeda's cell in Nairobi remained active as a logistics base but did not plan any attacks.[15]

In May 1996, bin Laden was forced to leave Sudan and seek refuge in Afghanistan. Shortly thereafter, in August 1996, bin Laden declared war on the United States. Later, in February 1997, Wadi al-Hajj was summoned to Afghanistan, at which point bin Laden asked al-Hajj to "militarize" the cell in Nairobi.[16] Later, in August 1997, U.S. officials investigating bin Laden's role in financing terrorist attacks on the United States, raided al-Hajj's house and confiscated his computer and several documents. Al-Hajj was then ordered to appear before a Federal jury in New York. After al-Hajj left Nairobi, Fazul Abdullah Muhammad took over the management of the Nairobi cell. Then, in February 1998, bin Laden issued the fatwa ordering Muslims worldwide to kill Americans and their allies wherever possible. The timeline of the plot and the subsequent attacks indicate that the final decision on the selection of targets and the date of attacks was probably taken around the same time that the fatwa was issued. Beginning in March, the preparations for the bombings moved forward at great speed. The attack planners rented safe houses for building the bombs, prepared false documents, and acquired delivery vehicles and explosives.[17] By the first week of August, most of the attack planners had left Kenya and Tanzania, and the remaining members included only the actual perpetrators of the attack and a couple of al Qaeda operatives who were responsible for clearing up any traces of the group's involvement in it.[18]

Al Qaeda had several reasons for attacking the U.S. embassy in Kenya. According to Muhammad al 'Awhali, Abdullah Muhammad Abdullah provided the following reasons for choosing the U.S. embassy in Nairobi,[19]

a. a large American presence at the embassy;

b. the U.S. Ambassador was a female, whose killing might generate large publicity for the attack;

c. U.S. embassy personnel were also managing some duties in Sudan;[20]

d. a number of Christian missionaries were at the embassy in Nairobi; and

e. it was an easy target.

Abdullah explained that if multiple attacks were launched against U.S. targets outside the United States, it might make it easier to launch attacks inside the United States.[21]

Al Qaeda's basic operational strategy in carrying out terrorist attacks was outlined by Abu Jandal, bin Laden's bodyguard, following his capture and interrogation. According to Abu Jandal, al Qaeda pursues a method or principle that calls for "centralization of decision and decentralization of execution." In action, this principle means that the decision to attack is made centrally but the method of attack and execution is decided by the field commanders. For example, in the *USS Cole* operation, the target was set by al Qaeda operatives on the ground. Then it was referred to a higher military central committee in al Qaeda called the Military Affairs Committee that approved the operation and provided the support and the funds for the operations.[22] Muhammad al 'Owhali said that the training at the al Qaeda camps for operating a cell divided cell into four sections: the intelligence section, the administration section, the planning and preparation section, and the execution section.[23] L'Houssaine Kherchtou, an al Qaeda operative who turned an informant and testified in the embassy bombings trial, stated that there were four parts in an operation, namely, surveillance, targeting, facilitators, and the executors.[24] Table 7.1 provides a brief list of the committees and members involved in planning and executing the 1998 attack on the U.S. embassies.

Before examining the U.S. response to the embassy bombings, it is useful to look at whether or not the United States possessed any intelligence information that could have helped to prevent the attacks. The Accountability Review Board's report on the embassy bombings, prepared by Admiral William J. Crowe, stated that there was no "credible intelligence that provided immediate or tactical warning of the August 7 bombings." The report, however, acknowledged that there were rumors of threats to diplomatic missions, including the embassies in Nairobi and Dar es Salaam, but added that the information was "discounted because of doubts about the sources." The Board's analysis termed other threat reporting as "imprecise, changing and non-specific as to dates."[25] The first clue about a possible attack came, ironically, as a result of the U.S. investigation into bin Laden's role as a terrorist financier. Officials from the CIA and the Department of State were pursuing associates of bin

**Table 7.1    Key Members of the 1998 Embassy Bombings Plot**

---

**Military Committee**: Osama bin Laden, Muhammad Atef (killed in Afghanistan), Abu Ubayda al-Banshiri (killed in ferry accident)

**Surveillance:** Ali A. Muhammad, Anas al-Liby (Anas Al-Sabai, Nazih Al-Raghie, Nazih Abdul Hamed Al-Raghie)

**Mastermind:** Abdullah Ahmed Abdullah (Abu Mohamed Al-Masri, Saleh, Ali Saleh, Abu Mariam)

**Bomb Builder:** Muhsin Musa Matwalli Atwah (Abdul Rahman, Abdul Rahman Al-Muhajir, Abdel Rahman, Mohammed K.A. Al-Namer)

**Nairobi Attack Facilitators:** Wadi al-Hajj, Fazul Abdullah Muhammad (Haroon Fazul, Fadil Abdallah Muhamad, Abdallah Mohammed Fazul), Muhammad Siddiq Odeh, Fahid Mohammed Ally Msalam (Fahid Mohammed Ali Musalaam, Fahid Muhamad Ali Salem)

**Nairobi Attack Executors:** Muhammad Rashid Daoud al 'Awhali, Jihad Muhammad Ali (Azzam)

**Dar es Salaam Attack Facilitators:** Fahid Mohammed Ally Msalam (Fahid Mohammed Ali Musalaam, Fahid Muhamad Ali Salem), Ahmed Khalfan Ghailani, Khalfan Khamis Muhammad, Sheikh Ahmed Salim Swedan (Sheikh Ahmad Salem Suweidan)

**Dar es Salaam Attack Executor:** Hamden Khalif Allah Awad

(Accessed on July 16, 2006); and FBI Executive Summary of FBI's investigation into the embassy bombings. The document can be found at http://www.pbs.org/wgbh/pages/frontline/shows/binladen/bombings/summary.html (Accessed on July 4, 2006).

Laden, and their investigations led to Wadi al-Hajj, who was managing an NGO called Help Africa People in Nairobi. Kenyan police officials and U.S. investigators raided al-Hajj's house and confiscated his computer as well as several documents.[26] The presence of an al Qaeda associate in Nairobi should have alerted investigating officials about the possibility that other al Qaeda operatives were in the country. Additionally, investigators found a letter by al-Hajj's deputy Fazul Abdul Muhammad, who expressed alarm about the deteriorating security situation of the Nairobi cell members. Muhammad warned that "there are many [r]easons that lead me to believe that the cell members in East Africa are in great danger" and added that "we are convinced one hundred percent that the Kenyan intelligence are aware about us and that indeed our security situation is extremely bad." Muhammad goes on to state that he was extremely concerned about a report in the *Daily Telegraph*, which stated that "a leading associate [of bin Laden] ... [known as] Abu Fadhl, the terrorist alias for Sidi Tayyib" was being held by Saudi authorities, and that the information provided by the captive was being passed to U.S. and British intelligence officials.[27] Muhammad wished to confirm whether the al Qaeda operative mentioned in the news article was in fact Abu al-Fadhl

al-Makki, since precautionary measures would have to be taken if such an important operative was in the custody of security officials.[28] Muhammad asked his superiors, in lieu of the dangerous security situation, "are we ready for that big clandestine battle?"[29] The discovery of the letter should have alerted U.S. officials about the presence of a larger al Qaeda cell in Nairobi. Later, in November 1997, an Egyptian named Mustafa Mahmud Sa'id Ahmad informed U.S. intelligence officials at the Nairobi embassy about a plot to target the U.S. embassy. Mr. Ahmad revealed that the plot involved the use of several vehicles and stun grenades and the detonation of a truck bomb inside the underground parking garage. The CIA, acting on Mr. Ahmad's revelations, sent two reports to the Department of State. In response, the level of security was raised for several weeks but was lowered after no attack materialized. The CIA also cautioned that the effort might be an attempt by al Qaeda to observe the defensive measures adopted by the embassy. Mr. Ahmad was later arrested in Tanzania for his role in bombing the U.S. embassy in that country.[30]

Based on the general threat information, the Department of State and the CIA issued general threat advisories on two occasions. On June 12, 1998, the Department of State issued a statement indicating that it was stepping up the security at embassies and government sites in the Middle East and South Asia following "serious" reports of a terrorist attack.[31] The announcement, which did not contain information on Africa, followed bin Laden's interview with the ABC television network in May 1998, in which he repeated his intentions to attack U.S. targets, including civilians. Curiously, a large map of East Africa was prominently displayed on the wall behind bin Laden during this interview. On July 29, the Counter Terrorism Center (CTC) at the CIA issued a general alert about a CBRN attack by bin Laden. Nairobi and Dar es-Salaam were classified as medium threat posts, but the embassy security officers were as worried about muggings and carjacking as they were about terrorism.[32] The U.S. Ambassador to Kenya, Prudence Bushnell, twice requested that the embassy to be relocated to a different place, since its current location posed great risks. Ambassador Bushnell's requests, however, were rejected by the Department of State.[33]

## INITIAL RESPONSES

Immediately after the embassy bombings, Richard Clarke, the National Coordinator for Counterterrorism, convened the Counterterrorism and Security Group to respond to the bombing. Plans were made to evacuate the injured to Europe, deploy the Navy's Fleet Anti-Terrorism Support Team (FAST)—a specialized team trained to provide force protection at sensitive locations—to provide security for the damaged embassies, and send the Department of State's Foreign Emergency Support Team (FEST)

to provide highly trained staff to assist the U.S. ambassadors in both the countries.[34] The FBI launched a massive investigation, collecting evidence from the bomb sites, interviewing suspects, and arresting people. The Kenyan and Tanzanian investigations, supervised by the New York field office, were codenamed "KENBOM" and "TANBOM" respectively.[35] In the first few days, some 400 FBI agents went to Africa from several field offices in the United States. The Washington, DC, office sent bomb experts and lab technicians; computer specialists were called from Pocatello, Idaho; and counterterrorism experts arrived from the New York office. The FBI conducted more than 1,500 interviews and collected about 8 tons of material that was shipped back to the United States for evidence analysis.[36] During the investigation in Kenya, the FBI paired agents with the local Criminal Investigative Division (CID) in order to elicit better cooperation during the investigation.[37]

On the day of the bombings, the first break into the investigation occurred in Karachi, Pakistan, when Pakistani immigration officials detained Muhammad Siddiq Odeh based on the suspicious nature of his passport. The Pakistani officials did not reveal details of the arrest for another 3 days.[38] Later, Odeh was taken into U.S. custody. Within a week, Kenyan police arrested Muhammad Rashid Da'ud al-Awhali, the alleged passenger in the truck that was used in the bombing. The original attack plan, if carried out successfully, would have resulted in the death of al-Awhali. However, he escaped the attack with some injuries.[39] The arrests of Odeh and al-Awhali provided the investigators with crucial details about the plot and the identities of the al Qaeda and Egyptian Islamic Jihad operatives involved in the attack. Within a week, the CIA was able to attribute the attacks to bin Laden, and on August 14, George Tenet, the Director of Central Intelligence (DCI), delivered his formal judgment that bin Laden and his senior Egyptian aides were responsible for the attacks.[40]

Shortly after the bombings, U.S. intelligence agencies became aware of a plot to bomb the U.S. embassy in Tirana, Albania. The CIA, in collaboration with Albanian officials, disrupted an al Qaeda forgery cell as well as the plot to attack the embassy.[41] Similarly, in the months after the embassy bombings, the CIA and the FBI, working with foreign intelligence agencies, managed to disrupt al Qaeda cells in several countries. In Uganda, the CIA and the FBI foiled a plot to attack the U.S. embassy in Kampala.[42] The disruption efforts were aided by the National Security Agency's (NSA) efforts in reviewing the communications made from al Qaeda safe-houses in Nairobi.[43] U.S. intelligence agencies also received assistance from some Muslim countries. The arrested members were involved in logistics, fundraising, and communications. U.S. intelligence agencies realized the difficulties involved in apprehending the bombing teams, which are usually mobile, and hence came to the conclusion that

these bombing teams might find it difficult to operate if the infrastructure and the support networks were disrupted. The number of apprehended members revealed the extent and depth of the organization.[44] The United States made an important breakthrough when German officials arrested Mamduh Mahmud Salim, also known as Abu Hajir, a senior aide to bin Laden.[45]

After the bombings, the Counterterrorism Security Group examined the security levels of U.S. diplomatic missions around the world and identified 40 missions that needed urgent evaluation. Seven Embassy Security Assessment Teams (ESAT) comprising officials from several agencies, including the Department of State, the Pentagon, and the CIA, traveled to these posts to make their assessments. The U.S. Congress, in the meantime, acted on a $1.8 billion request from the White House for improving the security of U.S. diplomatic posts, and appropriated $1.5 billion for improving the security of U.S. diplomatic missions worldwide. The money was used to buy "radios, surveillance cameras, and armored cars" and to increase the number of diplomatic security personnel and improve the physical security of the buildings.[46]

### U.S. RESPONSE TO AL QAEDA: PRE-EMBASSY BOMBING

Prior to examining the set of U.S. responses to the embassy bombings, it is useful to look at U.S. counterterrorism efforts against bin Laden prior to 1998, since it will help us both to evaluate the extent to which the U.S. government was focused on bin Laden and the al Qaeda network, and to better understand the response measures taken after the embassy bombings, since some policies involved building upon (or improvising) existing counterterrorism measures.

Following the first bombing of the World Trade Center in February 1993, and the subsequent discovery of a plot to target important landmarks in New York City, U.S. intelligence officials became aware of the threat posed by Osama bin Laden, although his role was identified primarily as a terrorism financier.[47] Over the years, however, U.S. intelligence officials noticed increased reporting on bin Laden, and his stay in Sudan became a contentious issue between Sudan and the United States.[48] After the United States withdrew its diplomatic staff from Sudan, citing threats and hostile surveillance of that staff, Sudanese officials attempted to mend ties with the United States. In those meetings, the sojourn of bin Laden and his supporters in Sudan figured prominently in the discussions.[49] After the assassination attempt on Mubarak in June 1995, the Counterterrorism Security Group also considered taking direct action against bin Laden, who was suspected of being involved in the attack. The retaliation plans included targeting "Veterans' Housing for Afghan War Fighters," a bank believed to contain bin Laden's money, as well as a few other options.[50]

Eventually, Saudi Arabia, Egypt, and the United States forced Sudan to evict bin Laden, who then sought refuge in Afghanistan.

In January 1996, David Cohen, chief of the CIA's Directorate of Operations, created a "virtual station"—like a CIA field station, but located in CIA's headquarters in Langley, Virginia—that was supposed to focus on terrorism financing. The focus was then shifted to Osama bin Laden based on the recommendation of Michael Scheuer, the first chief of the station, which was named "Alec station"[51] and had an initial staff of 10–15 officials.[52] The intelligence gathered by this station enabled the United States to respond immediately and aggressively after the embassy bombings.

During the summer of 1997, the CIA-funded Afghan tribal unit that was used to capture Mir Amal Kasi[53] was transferred to the bin Laden unit to help capture bin Laden. The unit was renamed as FD/TRODPINT (a CIA codename). The proposed strategy was to capture bin Laden and simultaneously work toward obtaining an indictment that would enable the United States to prosecute him or, in the absence of an indictment, send him to another country such as Egypt or Saudi Arabia to stand trial.[54] By early 1998, the Principals Committee[55] gave its "blessing" to the plan. Meanwhile, the FBI's New York field office, working with the U.S. Attorney for the Southern District of New York, was preparing to indict bin Laden on charges of conspiring to attack U.S. defense installations.[56] The court issued a sealed indictment in June 1998, which was revealed in November 1998, and the earlier indictment was superseded by another indictment issued after the embassy bombing.[57] During the spring of 1998, a CIA plan to capture and remove bin Laden from Afghanistan was cancelled due to a lack of precise intelligence and an increased risk of failure.[58]

After the CIA plan to capture bin Laden was cancelled, Richard Clarke asked the Pentagon to prepare a military option to target bin Laden. The chairman of the Joint Chiefs of Staff, General Hugh Shelton, asked CENTCOM Commander Anthony Zinni to develop a plan. The Pentagon plan was presented in the first week of July. The Pentagon's plan involved cruise missile strikes against eight terrorist camps as well bin Laden's compound in Tarnak Farms near Kandahar, Afghanistan.[59] Between 1996 and 1998, the Department of State's South Asian bureau focused attention on bin Laden, especially after his relocation to Afghanistan, but the bureau's agenda was dominated by the nuclear arms race between India and Pakistan, ending the civil war in Afghanistan, and improving human rights conditions under the Taliban's rule in Afghanistan.[60]

While looking for options to evict bin Laden from Afghanistan, the CIA approached Saudi Arabia and requested that the Saudi rulers utilize their influence on the Taliban to force bin Laden out of Afghanistan. Saudi Prince Turki bin Faysal, then head of Saudi Arabia's General

Intelligence Directorate (GID), met with Mullah Omar in June 1998; subsequently, Omar agreed to hand over bin Laden and promised to work with the Saudis in implementing the hand over.[61] Of course, that never happened.

As things stood on August 7, 1998, certain elements within the U.S. government became increasingly concerned about bin Laden's pronouncements and activities. However, the government's options were limited due to the lack of a legal indictment against bin Laden (at least until June 1998), the absence of U.S. influence over the Taliban regime, and poor intelligence on bin Laden's movements.

## OPERATION INFINITE REACH

On August 8, a day after the bombing, the CIA received intelligence that senior leaders of Islamist groups linked to bin Laden planned to meet on August 20 at the Zawhar Killi camp near Khowst in eastern Afghanistan in order to discuss the embassy bombings and plan additional attacks. George Tenet informed the Principals Committee at the White House about the planned meeting. The Principals Committee decided to target the meeting using cruise missiles. Air strikes seemed to be a likely option due to their past use in both the 1986 bombing of Libya, in response to a terrorist attack in Berlin, and the 1993 retaliatory strikes against the Iraqi intelligence headquarters after the discovery of an Iraqi plot to assassinate President Bush, Sr., during his visit to Kuwait. The Principals hoped that the missiles would hit bin Laden, but the National Security Council (NSC) recommended that the attacks be launched regardless of the meeting.[62] The Zawhar Killi camp, besides being the location of the upcoming meeting, also had historical linkages to bin Laden that made it an attractive target. Bin Laden fought his most famous battle at that location and later issued his February 1998 fatwa against "Jews and Crusaders" from there, while announcing the creation of the World Islamic Front. The camp also served as a training ground with a base headquarters and five satellite training areas.[63] An interagency group of officials prepared a list of 20 targets in Afghanistan, Sudan, and an unnamed third country.[64] The decision to attack al Qaeda's infrastructure outside Afghanistan was based on the desire of President Clinton and his foreign policy aides to launch a global response to al Qaeda's attack on U.S. targets in two different countries.[65] At a high-level meeting on August 19, it was decided to launch the attacks on the Zawhar Killi complex in Afghanistan and two Sudanese targets, the al-Shifa pharmaceutical plant and a tannery. The al-Shifa plant was included on the grounds that bin Laden was using that facility to produce nerve agents that could be used in a future attack on the United States.[66] The chairman of the Joint Chiefs of Staff (JCS), Hugh Shelton, intervened to remove the tannery from the list of targets.

On August 20, as part of Operation Infinite Reach, 75 Tomahawk missiles—each costing more than $750,000—hit the training camp complex in Afghanistan. At the same time, 13 Tomahawk missiles hit the al-Shifa facility in Khartoum, Sudan.[67] The missile attack killed between 20–30 people[68] in Afghanistan and 1 person in Sudan. But bin Laden remained unscathed, since he was not present when the cruise missiles struck the camps.[69] The cruise missiles targeted the training camp complex, which included the Zawhar Killi al-Badr base camp, support complex, and four primary training camps.[70] President Clinton issued a statement explaining that he ordered the cruise missile attack for the following four reasons: a) the groups' involvement in the embassy bombings, b) the groups' involvement in the past attacks on Americans, c) to prevent additional attacks planned by the groups, and d) because the groups were seeking to acquire chemical weapons and other dangerous weapons.[71] Since international law prohibited acts of revenge, the Clinton administration portrayed the cruise missile attacks as self-defense measures aimed at disrupting the planning and execution of future attacks.[72] Clinton administration officials cautioned that the missile attacks would not prevent further attacks, but would have certainly disrupted attacks being planned for the not-too-distant future. Secretary of State Madeleine Albright, reiterating President Clinton's remarks, stated that "while our actions are not perfect insurance, inaction would be an invitation to further horror."[73]

## POST-OPERATION INFINITE REACH ACTIONS

The U.S. response to the embassy bombings did not end with the cruise missiles attacks on Sudan and Afghanistan. The United States saw the bombings as a wake-up call that brought into clearer focus the danger posed by religious terrorists in general and by Osama bin Ladin in particular. After the cruise missile attacks, officials involved in designing and implementing counterterrorism policies discussed several options to capture bin Laden, disable elements of his network (that are spread across several countries), and cripple his financial infrastructure. The discussion below considers some elements of the U.S. strategy aimed at addressing the threat posed by the al Qaeda network, and deals primarily with the efforts undertaken by the CIA, the Department of Defense, and diplomatic efforts, chiefly led by the Department of State, since a major portion of the Clinton administration's counterterrorism efforts relied on these agencies. Other agencies, such as the FBI and the Department of Treasury, played crucial roles as well, and where appropriate they will also be discussed. However, because of space limitations, this section will not examine the responses to several threat reports that arrived immediately after the embassy bombings and throughout 1999.[74]

### Operation Infinite Resolve

After the cruise missile attacks, some officials wished to carry out a sustained campaign of missile strikes against targets in Afghanistan. JCS Chairman General Shelton issued a planning order for additional missile strikes, and President Clinton expressed his desire to carry out such attacks sooner rather than later. The Pentagon named the planned strikes Operation Infinite Resolve. But some officials advised against further attacks. Undersecretary of Defense for Policy Walter Slocombe advised Secretary Cohen that the list of targets did not seem promising and suggested defining an "articulate rationale for military action." Some officials also feared that the missile strikes might cause large civilian casualties and stressed the need to collect better intelligence on bin Laden. Department of State officials cautioned that, after the bombing campaign in Kosovo and Operation Desert Fox in Iraq, the United States might be perceived as a mad bomber if it carried out additional cruise missile strikes in Afghanistan. President Clinton also feared that the additional missile attacks might increase the list of volunteers wishing to join al Qaeda's training camps.[75]

During the fall of 1998, Richard Clarke developed a plan called "Political-Military Plan Delenda"[76] to deal with the al Qaeda network. It was a multifaceted plan that involved bringing together several agencies of the U.S. government to attack the al Qaeda network. However, this plan was never formally adopted by the Principals Committee at the White House. In the plan's military component, Clarke suggested a sustained campaign against bin Laden's bases in Afghanistan or elsewhere whenever the situation provided a set of targets. Clarke advised against solely relying on targeting terrorist leaders, thereby implying that a sustained campaign might persuade the Taliban's leaders to hand over bin Laden. Defense Secretary William Cohen and JCS Chairman Shelton did not support Clarke's idea of "rolling attacks," since the primitive terrorist training camps offered poor targets for the expensive cruise missiles. President Clinton and Sandy Berger were also concerned about the "blowback" effects that might result from such a sustained campaign.[77]

### The CIA's Role

The CIA, working with the FD/TRODPINT unit, developed plans to kidnap bin Laden as well as assist the Pentagon in launching cruise missile strikes on bin Laden whenever sufficient intelligence was available to carry out such an action. Sandy Berger ordered the Pentagon to deploy U.S. Navy ships and two cruise-missile-carrying submarines to the Arabian Sea. The submarine crew rehearsed the launching of the missiles and reduced the time gap between a presidential order and the missile

impact in Afghanistan to about 4 hours.[78] On three occasions between August 1998 and December 1999, the U.S. government seriously considered launching cruise missiles to kill bin Laden.[79] The first chance occurred in December 1998 when intelligence information suggested that bin Laden might stay in the Haji Habash house that was part of the residence of the Governor of Kandahar. The strike was called off due to fears of causing large civilian casualties as well as concerns regarding the reliability of the intelligence source.[80] Again, in February 1999, the tribal unit in Afghanistan provided information that bin Laden was at a desert hunting camp that belonged to visitors from a Gulf state believed to be UAE, a U.S. counterterrorism ally in the region. Once again, the option of using cruise missiles was discussed, but it was dropped after NSC officials considered the intelligence to be unreliable. Certain officials have hinted that the strike was called off to avoid injuring or killing members from the UAE royal family or senior officials from the UAE who were believed to be in that camp.[81] The last attempt—and possibly the one with the best opportunity to kill bin Laden—was made in May 1999, when intelligence indicated that bin Laden will be staying in or near Kandahar for a period of 5 days. CIA field officers thought that this was the best piece of intelligence on bin Laden's location. The strike was once again called off at the last minute, citing unreliable intelligence as a pretext.[82] On all three occasions, the field officers at the CIA, officers in the bin Laden unit, and working-level military officials were unhappy with the decisions not to follow through with the missile strikes.

In addition to collecting intelligence to facilitate cruise missile strikes on bin Laden, the CIA was also working with the FD/TRODPINT unit to kidnap bin Laden and bring him to trial. The effort was put on hold during the spring of 1998 but was reactivated after the embassy bombings. Following those attacks, President Clinton signed a Memorandum of Notification (MON) authorizing the CIA to let the FD/TRODPINT unit use force to capture bin Laden and his associates and also to attack bin Laden in other ways. However, this MON only allowed the tribal unit to use force in self-defense.[83] As the tribal unit expressed its desire to conduct a raid to kidnap bin Laden rather than wait and lay an ambush, the initial MON was modified to include the use of firepower. The final draft of the MON included language that seemed to indicate that it was permissible to kill bin Laden only if it was not feasible to capture him during a raid.[84] In February 1999, the CIA received White House sanction to employ troops from the Northern Alliance to hunt and capture bin Laden. However, the MON authorizing the action only allowed the use of force as a measure of self-defense during the capture operation.[85] Divisions arose between White House officials and CIA field officers and officials working at the bin Laden's unit over the ambiguity regarding the use of lethal force in attempts to capture bin Laden. CIA's field officers

felt that the White House was engaging in legal doubletalk concerning the use of lethal force, while unnecessarily criticizing the CIA for failing to capture bin Laden. The White House, on the other hand, felt that the CIA field officers were risk averse and purposefully misinterpreting the MONs to justify their inaction against bin Laden.[86]

In the fall of 1999, the CIA developed a new strategy called "The Plan." Its elements included disrupting bin Laden's operations, channeling and capturing bin Laden, conducting psychological operations to help capture bin Laden, targeting bin Laden's associates, and increasing the technical capability to conduct surveillance and gather more information.[87] The plan included a program for hiring and training better officers with counterterrorism skills, recruiting more assets, and trying to penetrate al Qaeda's ranks.[88] Meanwhile, in July 1999, Clinton authorized the CIA to develop plans, in collaboration with foreign governments, to capture bin Laden. This authorization allowed the CIA to make plans to work with the governments of Uzbekistan and Pakistan.[89] Uzbekistan provided basing rights for small aircraft, trained a commando unit to hunt bin Laden, allowed the NSC and the CIA to install monitoring equipment to intercept Taliban and al Qaeda communications, and later allowed Predator reconnaissance planes to be based on Uzbek soil.[90]

### The Pentagon's Role

After the embassy bombings, while discussing retaliation options against the al Qaeda network in Afghanistan, the Clinton administration did not consider a full-scale military invasion of Afghanistan as an option, since it was not considered feasible at that time. Key members of the Clinton administration, such as Sandy Berger and Madeleine Albright, as well as Clinton himself, did not believe that the United States could obtain domestic approval and external support for such an invasion. An option to employ Special Forces was considered and then rejected, since the operational plans presented by General Shelton involved extensive logistical planning and a long deployment time.[91] Similarly, after the effort to attack bin Laden in December 1998 using cruise missiles was dropped due to fear of extensive collateral damage, the Pentagon proposed to use the AC-130 gunship instead of cruise missiles in order to reduce the extent of collateral damage. This proposal, however, was not implemented because its implementation would have involved extensive preparations and basing rights in neighboring countries, which the United States did not possess at that time.[92]

Unfortunately, during this period, the Pentagon missed an opportunity to reorient its counterterrorism strategies. In the fall of 1998, lower level officials in the Office of the Assistant Secretary for Special Operations and Low-Intensity Conflict suggested a broad change in the national strategy

and the Pentagon's approach to counterterrorism, hinting at large-scale operations across a whole spectrum of U.S. military capabilities. The authors suggested an eight-part strategy that was more "pro-active and aggressive." The authors warned that when faced with horrific attacks in the future, the Pentagon might not have a choice or a plan to respond to the attack. For unknown reasons, the concept paper did not advance much higher in the decision-making hierarchy.[93]

### Diplomacy

Diplomacy was also a major element of U.S. counterterrorism policy, as the United States tried to build alliances in its fight against the al Qaeda network and persuade countries that were providing safe haven to al Qaeda operatives to desist from continuing such support. During bin Laden's stay in Sudan the United States—in collaboration with Egypt and Saudi Arabia—forced the Sudanese government to evict bin Laden. After bin Laden fled to Afghanistan, the United States was faced with a difficult situation, since Afghanistan was roiled by a civil war between the Taliban movement and the several factions that constituted the Northern Alliance. The United States did not have any diplomatic presence in Afghanistan. After the Taliban movement captured Kabul and assumed power, the issue became even more complicated, since the United States did not recognize the Taliban government. Only three countries, Pakistan, Saudi Arabia, and the United Arab Emirates, recognized the newly formed Taliban government. Therefore, the United States at times relied on Pakistan and Saudi Arabia to negotiate with the Taliban government, especially its reclusive leader Mullah Omar, regarding the handover of bin Laden to the United States or to any other Arab country. As described earlier, Prince Turki bin Faysal visited Mullah Omar in June 1998 to discuss the possibility of handing over bin Laden to Saudi Arabia, and Omar initially seemed favorably disposed toward the idea. However, when the Prince visited Mullah Omar again in September 1998, after the cruise missile attacks, Omar reneged on his pledge and instead railed against the Saudi Kingdom. Immediately after this event, Saudi Arabia withdrew its diplomatic personnel from Afghanistan. Similarly, the United States requested that Pakistan engage the Taliban leadership in diplomatic efforts to evict bin Laden as well as cooperate with the CIA in its efforts to capture bin Laden. Pakistan stalled, however, and at times refused to provide such assistance. Sections within the Pakistani government, especially the Inter Services Intelligence Directorate (ISI), were helping the Taliban government and did not wish to cooperate with the United States in apprehending bin Laden, who in turn was helping the Taliban government with money and supplying troops for fighting the Northern Alliance. Even within the U.S. government, there was a significant debate on defining

a policy to deal with the situation in Afghanistan. Some officials felt that the United States should help negotiate an end to the civil war and aid in the formation of a unity government. Other officials felt that the United States should label the Taliban movement as a terrorist group and funnel assistance to the Northern Alliance to help defeat the Taliban government. In addition, the Department of State's South Asia bureau was chiefly concerned with preventing hostilities between nuclear-armed India and Pakistan, so the issue of bin Laden ranked lower in its list of priorities.[94] Finally, in July 1999, Clinton declared the Taliban regime to be a state sponsor of terrorism and in October 1999, the United Nations imposed economic and travel sanctions on Afghanistan. Unfortunately, these actions did not change Mullah Omar's behavior toward bin Laden. Later in 2000, the United Nations passed *Resolution 1333,* imposing an embargo on arms shipment to Afghanistan. Pakistan, however, continued to ship arms to Afghanistan.[95]

### Terrorist Financing

On August 20, on the same day that the United States launched cruise missile attacks on targets inside Sudan and Afghanistan, President Clinton—using powers under the International Emergency Economic Powers Act—signed *Executive Order 13099,* which prohibited transactions with terrorists "who threaten the Middle East peace process," and included the names of Osama bin Muhammad bin Awad bin Ladin (a.k.a. Osama bin Laden), Islamic Army (a.k.a. Al Qaeda, Islamic Salvation Foundation, The Islamic Army for the Liberation of the Holy Places, The World Islamic Front for Jihad Against Jews and Crusaders, and The Group for the Preservation of the Holy Sites), Abu Hafs al-Masri, and Rifa'i Ahmad Taha Musa.[96] Senior Clinton administration officials described the objectives of the executive order as "identifying the network, asserting jurisdiction, denying material support, technological, financial, provision of services and fundraising, and then working with allies to take similar steps, [through which] we will seek to identify a financial trail."[97] The Clinton administration also hoped that this measure would force other countries to adopt similar anti-terrorism financing regulations.[98]

Until President Clinton signed *Executive Order 13099*, there was no systematic effort within the U.S. government to examine bin Laden's financing apparatus. This was a strange situation, since bin Laden was initially identified in U.S. investigations as a terrorist financier. Conventional wisdom within the CIA stated that terrorists carry out attacks cheaply, and hence that bin Laden did not need large amounts of money to operate his network. Also, the prevailing wisdom held that bin Laden inherited a vast fortune that was being used to finance his organization. Investigations by Clarke's team and the Department of Treasury's Office

of Foreign Assets Control (OFAC) revealed that bin Laden needed vast sums of money to operate his worldwide network, and that al Qaeda generated and moved large sums of funds through a vast financial network. The investigation revealed that bin Laden raised significant amounts of funds through generous donations from wealthy patrons in the Gulf States, circulated the money through regional banking centers, and then used Islamic NGOs operating as front organizations to deliver the funds to al Qaeda operatives.[99] Discussions with Saudi officials and bin Laden's family members revealed that his financial inheritance was not being used to finance the al Qaeda network.[100] The U.S. government received limited assistance from Saudi Arabia in regulating its banking system and sharing the information requested. The U.S. government considered using covert operations against key financial nodes that were involved in money laundering operations. U.S. officials, however, feared that such actions (if discovered) might damage confidence in the international financial system, leading to massive losses. Therefore, U.S. officials adopted a policy of "naming and shaming" organizations involved in money laundering operations.[101]

## CONCLUSION: LESSONS LEARNED

> You can't fight this enemy simply in defense. You also have to be prepared to go on the offense.
>           —Sandy Berger, National Security Advisor to President Clinton[102]

President Clinton, in his address to the nation on August 20, 1998 following the launch of cruise missiles, stated that there are certain occasions when "law enforcement and diplomatic tools are simply not enough" and that the United States "must take extraordinary steps to protect the safety of our citizens." Implying that the struggle against terrorism did not end with the cruise missile strikes, President Clinton indicated that the fight will be a "a long, ongoing struggle between freedom and fanaticism, between the rule of law and terrorism" and warned that the United States "is and will remain a target of terrorists precisely because we are leaders; because we act to advance peace, democracy and basic human values; because we're the most open society on earth."[103]

The cruise missile attacks and the counterterrorism policies outlined by Clinton administration officials revealed a shift in the U.S. counterterrorism strategy. According to Congressional Research Service analyst Raphael Perl, the cruise missile attacks represented the first time that the United States assigned such "primary and public prominence to the preemptive, as opposed to the retaliatory, nature and motive of a military strike against a terrorist organization or network." Perl's evaluation of the

Clinton administration's response to the embassy bombings is very informative and worth repeating in its entirety. Perl argued that the new counterterrorism policy was:[104]

1. more global, less defensive, and more proactive;
2. more national security oriented and less traditional law enforcement oriented;
3. more likely to use military force and other proactive measures;
4. less likely to be constrained by national boundaries when sanctuary is offered to terrorists or their infrastructure in instances where vital national security interests are at stake; and
5. generally, more unilateral when other measures fail, particularly if other nations do not make an effort to subscribe to like minded policies up front.

U.S. counterterrorism policies since the September 11, 2001 al Qaeda attacks on New York and Washington, DC, have built upon the Clinton administration's aggressive response to the embassy bombings. After 9/11, which served as a far more traumatic wake-up call, all the relevant agencies of the U.S. government that are involved in formulating and implementing counterterrorism policies have made significant progress in increasing their capabilities to address the threat from the transnational jihadists and self-starter cells inspired by al Qaeda's ideology. Despite such improvements, significant gaps remain in our understanding of the nature of the evolving threat and the means to address it. The limited scope of this chapter precludes a detailed examination of either the improvements made in U.S. counterterrorism capabilities since 9/11 or the shortcomings that still need to be addressed. However, some of the lessons learned from the U.S. responses to the embassy bombings can be identified:

– Terrorism financing: The imposition of economic sanctions on al Qaeda and its top leaders led to a better understanding of al Qaeda's financial network. The investigations into al Qaeda's financial network enabled the U.S. government to map the major nodes in the financial network that were used for collecting and routing money.
– Liaisons with local governments: The FBI made every effort to work closely with Kenyan and Tanzanian officials and actively involve them in the investigative process. This outreach effort helped the investigators gain the cooperation of local investigative agencies.
– Sharing intelligence with foreign governments: The CIA provided intelligence and worked closely with the governments of Albania and Uganda to disrupt plots to attack U.S. embassies in those countries. Similarly, the CIA worked with several foreign intelligence agencies to disrupt several al Qaeda cells.
– Importance of good actionable intelligence: The success of an aggressive strategy of targeting terrorists and their infrastructure is dependent on the ability to

collect accurate intelligence on the targets and striking the targets with limited collateral damage.

Hopefully, further lessons can be learned that will enable U.S. government agencies to interdict or forestall future terrorist attacks.

**NOTES**

1. In Kenya, the number of casualties would have been significantly higher if it were not for the guards who refused to allow the truck inside the compound. In Tanzania, due to good fortune, a water tanker stood between the bomb-carrying truck and the embassy building and absorbed a lot of the bomb's impact.

6. According to Abu Jandal, whose real name is Nasir Ahmad Abdallah al-Bahri, who served as bin Laden's bodyguard, "The impact of international developments on Somalia and the entry of the U.S. forces into it were [Osama bin Laden's] justification for the entry of al Qaida into [the country]. Al Qaida viewed the entry of the Americans into Somalia not as a move that is meant to save the Somalis from [famine], but to control Somalia and then spread U.S. hegemony over the region. This will achieve several goals. First, it will strike the growing Islamic movement in Sudan. Second, it will setup a rear U.S. base in the Gulf, since Somalia was the closest point to the Arabian Gulf." See Abu Jandal's interview, Khalid al-Hammadi, "Part 2—Al Qa'ida from Within, as narrated by Abu Jandal (Nasir al-Bahri), bin Laden's bodyguard," *Al Quds al-Arabi*, March 19, 2005: 19.

7. Abdel bari Atwan, who interviewed bin Laden in 1997, said "Bin Laden told me that he was expecting the [Americans] to come to Somalia and he sent people a month before their arrival to be prepared. And when they came actually he attacked them. But unfortunately, according to him, they ran away. And he wanted them to stay in order to fight them. He told me that the American

soldiers were cowards in comparison with the Soviet soldiers." Also Abu Jandal, bin Laden's bodyguard said "the Al-Qa'ida Organization mujahidin were already there when the United States entered because they had a program and camps and a vision to unify the country. They aspired to make of Somalia a stronghold for them close to the Arabian peninsula because the brothers in the Al Qa'ida had an aim to liberate the Arabian peninsula later on." For Atwan's comments see Peter Bergen, *The Osama Bin Laden I Know: An Oral History of al Qaeda's Leader* (New York: Free Press, 2005), pp. 137–138.

19. Bergen, *The Osama Bin Laden I Know*: 222–223. Interestingly bin Laden is also believed to have provided some rationale for attacking the embassies in Kenya and Tanzania. According to Abu Jandal, bin Laden's bodyguard, bin Laden told Abu Jandal and others that the two American embassies were big detention centers for Muslims. They were also described as the "plotting minds" of the events in Rwanda where more than "80,000 Muslims were killed." The fight between the Hutus and the Tutsis was characterized as a fight between Muslims and Christians. The American embassy was portrayed to be behind that struggle. See Khalid al-Hammadi, "Part 3—Al Qa'ida from Within, as narrated by Abu Jandal (Nasir al-Bahri), bin Laden's bodyguard," *Al Quds al-Arabi*, March 25, 2005: 19.

20. In February 1996, after evaluating the threat to U.S. diplomatic personnel in Sudan, the U.S. embassy staff was withdrawn and 2,100 Americans living in

Sudan were urged to leave. Then Ambassador Timothy Carney moved to Nairobi and monitored Sudan. See Benjamin and Simon: *Age of Sacred Terror* pp. 244–245. In 1993, Sudan was designated a State Sponsor of Terrorism.

27. Hugh Davies, "Saudis detain member of anti-American terror group," *The Daily Telegraph*, August 2, 1997. The news article stated that Sidi Tayyib was providing information about the financial methods of bin Laden. The article also mentioned that another al Qa'ida operative named Jallud is also in the custody of the Saudis. Sidi Tayyib is also known as Madani al-Tayyib. Even though the article correctly stated that Tayyib was in U.S. custody, it incorrectly assumed that Saudi Arabia was passing on the information provided by Tayyib. In fact, Saudi Arabia blocked U.S. attempts to interview Tayyib. After the embassy bombings, U.S. officials made several requests to interview Tayyib during their investigations of al Qaeda's financial network. See *9/11 Commission Report*: 122.

# CHAPTER 8

## THE CASE OF RAMZI YOUSEF

Gary A. Ackerman and Sundara Vadlamudi

Despite being replete with all sorts of colorful and dastardly characters, the annals of terrorism contain few more brazen and ambitious rogues than Ramzi Ahmad Yousef (also sometimes spelled Yusuf). During his relatively brief career as an international terrorist, crisscrossing the globe from 1993 to 1995, Yousef succeeded in attacking one of the world's most prominent structures, plotting the assassination of several heads of state, winning over dozens of Muslim radicals, and planning what would have been one of the deadliest and most complex terrorist attacks of all time, all the while being pursued by several nations' law enforcement and intelligence agencies. Yousef has been variously described as a "mastermind"[1] and—at least while he was active—as "the most dangerous man in the world,"[2] monikers that he himself no doubt appreciated; yet much about this chameleon-like and egoistical villain remains a mystery. This chapter will describe what is known about Yousef's origins and his development as a terrorist as well as trace his global exploits of mayhem. At the same time it will examine the nature and efficacy of the ultimately successful counterterrorist effort directed toward capturing a man who quickly rose to the rank of the world's most wanted terrorist. Lastly, the chapter will attempt to draw lessons from the campaign against Yousef, lessons that can be applied to both current and future counterterrorism operations.

### ORIGINS

During his operational period, Yousef utilized a slew of aliases (more than 40 in all) and was known to periodically alter his external appearance—for instance, by changing the length and color of his hair. This penchant for disguising his identity to confuse his adversaries was sufficiently successful that to this day there exist those who doubt his true

origins,[3] although most commentators believe that he was born Abdul Basit Mahmud Abdul Karim[4] on April 27, 1968, in a working-class suburb of Kuwait City.[5] His father was a Pakistani from Baluchistan who worked as an engineer for Kuwaiti Airlines and his mother was a Kuwaiti of Palestinian lineage. Although Yousef's father apparently became radicalized by Wahhabi doctrine while Yousef was still a teenager (and allegedly later joined the anti-Shi'i terrorist group Sipah-e-Sahaba in Pakistan[6]), Yousef is believed to have had a relatively standard Islamic education. Yousef showed great promise as a student, especially in mathematics and the sciences, and was conversant in Arabic, Urdu, and English. Contemporaries recalled him even then as being charismatic and seeking to lead, and several of his childhood friends later on ended up joining him in his terrorist pursuits.[7]

At the age of 18, Yousef traveled to Britain, and shortly thereafter, in August 1987, he began studying at the West Glamorgan Institute of Higher Education in Swansea, Wales. After receiving his diploma in 1989, Yousef returned to Kuwait, where he was likely swept up in the Iraqi invasion of Kuwait in August 1990. By this stage his militant attitudes were almost certainly already crystallized, and by mid-1991, he was associating and training with fellow militants in Pakistan, to which his family had moved in 1986. It was at this time that Yousef and one of his brothers married the sisters of a Pakistani militant, and Yousef bought a house in Quetta. Shortly afterwards, in late 1991, Yousef reportedly accompanied the future founder of the Abu Sayyaf terrorist group, Abdurajik Abubakar Janjalani, whom he had befriended, to the Philippines to help him train militants.[8] By the middle of 1992, Yousef was back in Pakistan, serving as an instructor at the *University of Dawa and Jihad*, a terrorist training camp, ready to embark on his campaign of violence. Physically, Yousef was a rather unimposing individual, being described as "tall with a long and skinny neck and face, ... a large, bulbous nose and flared ears."[9] Intellectually and psychologically, however, he certainly had the tools to become one of America's more lethal adversaries.

## CHRONOLOGY OF ATTACKS

The first major terrorist attack that Yousef was involved in was the 1993 bombing of the World Trade Center (WTC) in New York City.[10] In the early 1990s, a group of followers of an imprisoned extremist named al-Sayyid Nusayr began formulating plans to carry out acts of *jihad* against the United States.[11] Mahmud Abu Halima, a burly, red-bearded Egyptian who had fought in Afghanistan against the Soviets realized that the group needed an explosives expert, and sent for Yousef, whom he had presumably met a few years earlier in one of the training camps in Pakistan or Afghanistan. Yousef, using a false passport, entered the United States on

September 1, 1992, and within a short space of time took de facto control over the group's planning and activities.[12]

Soon Yousef, using the alias Rashid, had developed a plan to conduct a large-scale bombing and settled on the WTC as the target. The core group of conspirators now consisted of Yousef, Abu Halima, a simpleton named Muhammad Salama, Salama's close friend Nidal Ayyad (who was a chemical engineer and helped acquire difficult-to-obtain chemicals through the company for which he worked), and an Iraqi named Abdul Rahman Yasin. Beginning in November, Yousef and Salama had begun ordering chemicals from chemical suppliers, storing them in a public storage facility and building the bomb in a rented apartment in Jersey City. Yousef directed the production of a 1,500 pound urea-nitrate bomb, the most difficult part of which was the production of the notoriously unstable nitroglycerine that was needed as a primary explosive. Salama, a somewhat incompetent driver, involved himself and Yousef in a car accident in late January 1993, resulting in Yousef's hospitalization and nearly derailing the entire plot. After returning from the hospital, Yousef continued work on the bomb, the force of which he enhanced with various chemicals and bottled hydrogen, and the conspirators began surveilling their target.

Then, on February 26, 1993, having loaded the bomb into a rented Ford Econoline van, the conspirators drove the van into the parking garage of One World Trade Center, lit four fuses, and left. At 12:17 P.M. the bomb exploded, creating a huge crater in the parking garage and collapsing several floors. However, the blast did not succeed in bringing down either of the twin towers, as Yousef had intended.[13] Yousef later claimed that he would have made a more powerful bomb if he had not run out of money.[14] Ultimately, 6 people lost their lives and over 1,000 were injured in the blast.[15] A few hours later, Yousef departed the United States for Pakistan.

After the WTC attack, Yousef's star was on the rise amongst extremists and in July 1993 he was approached in Karachi, Pakistan, and offered $68,000 to assassinate then prime ministerial candidate Benazir Bhutto.[16] After spending a week scouting and preparing, Yousef was ready to place the bomb but was wounded when the explosive detonated unexpectedly. Despite requiring several weeks of recuperation, Yousef doggedly persisted, and plotted to kill Bhutto with a sniper rifle. Unfortunately, when the rifle was not delivered on time, Yousef was forced to abandon the plot.

Undaunted, Yousef traveled to Bangkok in early 1994 to begin assembling a new terrorist cell to attack U.S. or Israeli targets there. Yousef assembled a 1-ton bomb, but the plot was aborted when the driver of the truck with the bomb had an accident on the way to the Israeli Embassy, and Yousef was forced to flee back to Pakistan. In May 1994, he began to display rising animosity toward Shi'i Muslims and, when recruited by the Mujaheddin-e-Khalq (MEK) organization, he agreed to lead an attack in Iran. On June 20, 1994, Yousef's efforts resulted in the detonation of

a small bomb comprising high-explosive in a shrine in Mashhad, Iran, which killed 26 people and injured at least 200.[17] Yousef did not rest on his laurels; during the summer of 1994, he was involved in a series of incipient plots, prolific networking activities, and training other extremists in bomb-making in the Philippines.

It is alleged that Osama bin Laden requested that Yousef assassinate President Bill Clinton during his upcoming November 1994 visit to the Philippines.[18] While Yousef was enthusiastic, for once he demurred and decided that the security surrounding Clinton would be too great to conduct a successful attack. Thereafter, he refocused his attention toward assassinating Pope John Paul II, who was scheduled to visit the Philippines on January 15, 1995. One tactic he considered was to use a suicide bomber dressed as a Filipino priest, who would detonate an explosive when the Pope approached the "priest" to kiss him,[19] while an alternative plan consisted of the detonation of a remote-controlled device on the Pope's scheduled route.[20]

The envisaged attack on the Pope would also serve to divert attention from Yousef's single most ambitious plan, potentially even more destructive than the WTC attack, which carried the rather lyrically-sounding codename of "Bojinka."[21] From mid-1994, Yousef—together with his uncle, Khalid Shaykh Muhammad[22]—developed a plot to use 5 operatives to place timed explosives on 12 different flights that would explode on subsequent legs (mostly en route to the United States) after the attackers had disembarked during stopovers.[23] This was to be accomplished using a novel bomb devised by Yousef that could pass through airport security. While in Pakistan, Yousef recruited Abdul Hakim Murad, Wali Khan Amin Shah, and others and trained them to build his bombs. Yousef also did extensive background work on airport security and even obtained Boeing 747 blueprints to determine where to place his bombs so as to maximize their damage.

Yousef traveled to Manila in September 1994 to implement "Oplan Bojinka," and was later joined first by Murad and then by Amin Shah. Yousef wanted to test his explosive creation before the final attack, so he set off a similar device in a generator room in a shopping center in Cebu City in November, and on December 1 arranged for another device to be placed under a seat in a Manila movie theater, the detonation of which injured several patrons. On December 11, 1994, as a final test, Yousef succeeded in smuggling his device on Philippines Airlines Flight 434 from Manila to Japan, planted it under a seat, and left the plane at a stopover. During the next leg of the trip, the device exploded, killing one passenger and causing an emergency landing. At the same time, in mid-December 1994, he even came up with the idea of having his friend Murad fly a plane laden with chemical weapons or explosives and either crashing it into CIA headquarters, or spraying chemicals over the area.[24]

The Bojinka plot was nearing completion when, on January 5, 1995, roughly 2 weeks before it was to be activated,[25] a fire started while Yousef was mixing chemicals in an apartment in Manila. Yousef was forced to flee and both Yousef's friend Murad and a laptop detailing the plan were captured. The plot was aborted and Yousef returned to Pakistan, where, after considering several further terrorist plots (mainly aimed at the Philippines, with the ostensible aim of securing Murad's release), Yousef was captured before he could engage in any further violence.

## TRAINING AND ORGANIZATIONAL LINKS

Yousef did not take his terrorist career lightly; he applied his intellect and energy toward developing the skills he would later use so adroitly in his attacks. While completing his diploma in computer-aided electrical engineering, Yousef took a course in microelectronics, which probably facilitated his later bomb-making. Although he did not actually fight in the Afghan conflict, it is believed that as early as 1988, Yousef spent time there and in Pakistan learning how to make explosives.[26] He also claimed to have studied numerous chemical encyclopedias in order to become a more proficient bomb-maker.[27] This allowed Yousef to create some genuine innovations in bomb-making, including the ingenious device consisting of nitroglycerine in a contact lens case, a Casio databank wristwatch as a timer, and an ignition circuit made from a light bulb filament and a standard 9-volt battery. It was this bomb that he intended to use in the Bojinka attacks and tested successfully in the Philippines in 1994.

However, it was Yousef's networking skills that arguably contributed the most to his success as a terrorist. Neil Herman, one of the investigators tasked with tracking down Yousef proclaimed, "The real eye-opener for me, the thing that brought it all together, was the ease with which Yousef was traveling around the world. . . . That's when I realized he had to have a sizeable organization behind him."[28] While there are still questions about the extent to which Yousef acted on his own initiative or was following the guidance of others, there is no doubt that Yousef maintained strong links with several Islamist leaders in the Middle East, South Asia, and the Philippines,[29] most prominent among these being Osama bin Laden.

Yousef's links to bin Laden are circumstantial but varied. First, the camps in Pakistan and Afghanistan in which Yousef trained and taught were linked to bin Laden and al Qaeda. Second, several of Yousef's friends and contacts, including Wali Khan Amin-Shah and Ibrahim Munir[30] had strong ties to bin Laden. Third, Yousef was the nephew of Khalid Shaykh Muhammad, with whom he maintained close contact and who would later become bin Laden's chief operational strategist and the architect of

the 9/11 attacks. Fourth, during the preparations for the 1993 WTC bombing there was a trail of money leading to bin Laden,[31] and Yousef was in constant contact with several overseas parties during the course of the plot, including his uncle and perhaps even bin Laden himself. Fifth, according to police interviews with a senior member of Abu Sayyaf, Yousef introduced himself as an emissary of bin Laden in 1991.[32]

Despite some assertions to the contrary, there is no concrete evidence of Iraqi involvement in most of Yousef's activities. However, there are two, albeit tenuous, indications of possible linkages between Yousef and the Iraqis. First, it is reported that Yousef maintained close links to the MEK, on behalf of whom he may have participated in the bombing in Mashhad.[33] The MEK was supported by the Iraqi regime of Saddam Hussein at the time. Second, Abdul Rahman Yasin, one of Yousef's accomplices in the WTC bombing, was an Iraqi who fled to Baghdad after the bombing and was allowed to remain there in safety; however, this may have been more of a function of Iraq's post-1991 relations with the United States than a result of any direct links between the regime of Saddam Hussein and Yousef.

## PERSONALITY TRAITS AND MOTIVATIONS

*Yes I am a terrorist and I'm proud of it.*
            —Ramzi Yousef during sentencing at his 1997 trial[34]

A preliminary step in countering the terrorists of today and tomorrow is to understand the terrorists of yesterday and why they chose to act as they did. In short, we need to answer the questions "what kind of man is Ramzi Yousef?" and "what can we learn from his behavior that will help us catch the next Yousef?" To begin with, Yousef himself was something of an enigma in that, unlike many of his associates and coconspirators, he was not a religious zealot and did not practice Islam devoutly. For instance, he engaged in frequent womanizing while married, frequented bars and strip clubs, and did not always (or perhaps ever) fast during the month of Ramadan. Nevertheless, he harbored an intense hatred for the United States, Israel,[35] and Shi'ite Muslims. For example, he was quite ready to kill thousands of American civilians in the WTC bombing in order to punish America for supporting Israel,[36] and justified this by appealing to notions of collective punishment and the visiting upon his enemies of the same suffering he believed had been inflicted upon those he identified with, namely the Palestinians and Pakistani Sunnis. He therefore reasoned that only by sustaining a level of casualties on the scale of that inflicted by the United States on Hiroshima and Nagasaki, would the American public realize it was at war.[37]

It is unclear exactly when this intense hatred developed, but it is known that Yousef flirted with the Muslim Brotherhood while in Britain, but rejected their orientation as too moderate. Perhaps like many other impressionable and dissatisfied young Arabs, he felt simultaneously hopeless about the plight of the Palestinians and emboldened by the success of the mujahideen against the Soviets in Afghanistan. Despite the familial connections through his mother, Yousef's ostensibly strong identification with the Palestinian people might be viewed as somewhat curious, considering that he has never visited Palestinian areas, and most of his knowledge about their situation is second-hand. This leads one to entertain the notion that a search for the source of much of Yousef's hostility might prove more productive by examining the make-up of his personality.

While clearly intelligent and inventive, Yousef is hardly the humble type. Indeed, he displays all the signs of being a narcissist. A self-proclaimed genius, he has consistently displayed a great arrogance and sense of self-belief—for example, electing to defend himself during his first trial (wherein he was charged with capital offenses) despite lacking any legal training. His ambition has led him to contemplate attacks of enormous scale and impact, even though his resources were sometimes limited and he was being hunted by counterterrorism forces. At the same time, his supreme confidence has enabled him to maintain a calm demeanor in stressful or adverse situations. Examples of such behavior include his unhurried departure from the United States in the wake of the WTC bombing and his rapid resumption of terrorist activities after the interruption of the Bojinka plot when his computer was seized. He proved to be single-minded—such as when he continued with the plot to bomb the World Trade Center even though he had been hospitalized in a car accident in January 1993—and at times even a little foolhardy, for instance, when he continued his terrorist plots in the United States despite being aware that the Federal Bureau of Investigation was monitoring members of his cabal in New York and New Jersey in 1992–1993. At other times, however, he displayed evidence of pragmatic thinking, replying to a question about why he had sought to attack the United States rather than Israel by stating that Israeli targets were too well defended.

Another aspect of Yousef's character that greatly facilitated his terrorist activities was his ability to quickly surround himself with willing accomplices. A master manipulator, who could in turn be domineering and charming, Yousef displayed the capacity for at once attracting others to his cause and steering them toward doing his bidding.[38] Yet his apparent lack of concern for the well-being of his colleagues, as expressed by his willingness to risk or sacrifice their freedom and safety before his own,[39] ultimately proved to be his undoing, leading to his betrayal by one of his erstwhile protégés.

## U.S. EFFORTS TO CAPTURE RAMZI YOUSEF

Immediately after the bombing of the World Trade Center, the FBI was able to arrest key members involved in the attack, including Muhammad Salama, Nidal Ayyad, and Ibrahim El-Gabrowny. The breakthrough in the investigation came as a result of a combination of good luck and good investigative efforts. The first break came when explosive forensics experts at the bombing site found the Vehicle Identification Number (VIN) of the truck used in the bombing. Using the VIN, the FBI was able to trace the make of the vehicle and subsequently its registration information. Further investigation revealed that the truck, a Ford Econoline, was rented by Salama, who had reported the truck stolen prior to the day of the bombing. Luckily, investigators found that Salama had visited the rental agency to recover the $400 deposit money. The rental agency, acting per the FBI's request, asked Salama to come back the next day to collect his money. After luring Salama into the trap, FBI agents arrested him as he came out of the rental agency after collecting $200 of his $400 deposit money.[40] Other members of the plot, including Yousef, Muhammad Abu Halima, Abdul Rahman Yasin, and Iyad Ismoil fled the country. Soon Abu Halima was arrested in Egypt, and in July 1995, Ismoil was arrested in Jordan. The local police in Egypt and Jordan cooperated with U.S. officials and easily identified and arrested the two suspects.[41] Yousef, on the other hand, would prove far more difficult to track and apprehend.

Following the capture and interrogation of several suspects involved in the attack, the FBI was able to determine the identity of Yousef, and by mid-March of 1993 was able to single him out as a major player in the plot.[42] The U.S. government—specifically, the Joint Terrorism Task Force (JTTF) led by the FBI—launched an international manhunt to capture Ramzi Yousef. Six agents were specifically assigned "to build up the evidence against Yousef, find him, capture him, arrange an extradition, get him back to the U.S. and secure a conviction in the U.S. court."[43] The six-member team was assisted by several investigators from the Department of State, New York City Police Department, Immigration and Naturalization Service (INS), and the Port Authority.[44] The JTTF got one of its early breaks in the hunt for Yousef when it was able to get a copy of his passport and his picture. Investigators searching through Salama's house discovered legal documents related to Ahmad Ajaj and were able to determine that Yousef arrived on the same plane with Ajaj. Since Yousef used an Iraqi passport belonging to Ramzi Ahmad Yousef, investigators were able to recover a copy of his passport submitted on arrival.[45] Based on Yousef's passport, the FBI discovered that Yousef had visited the United Kingdom several times between 1986 and 1989. The FBI therefore requested that Scotland Yard and the South Wales Police Special Branch help provide a history of Yousef's stay in that country. The FBI also contacted

officials in several countries, and requested their assistance in tracing the addresses of the telephone numbers called by Yousef during his stay in the United States.[46] As the investigation began to reveal Yousef's international linkages, the FBI notified Interpol that issued an international "Red Notice," alerting all countries about Yousef. Also, on April 2, 1993, the FBI added Yousef as an eleventh member to its list of "Ten Most Wanted" fugitives.[47] In addition, the U.S. Department of State offered $2 million for any information leading to Yousef's capture, as part of its Rewards for Justice program. The reward announcement was printed on the covers of matchboxes, and they were distributed across parts of South and Central Asia.[48]

The JTTF received and followed a multitude of leads, most of which led to dead-ends. JTTF representatives visited the Baluchistan province in Pakistan several times, but were unable to achieve significant progress in the investigation there. On the Pakistani side, Rehman Malik, the Director-General of the Federal Investigation Agency (FIA), assumed supervision of the investigation. Malik, based on his investigation of Pakistani Islamists, identified Yousef's location in Quetta, Baluchistan, and sent a team of Pakistani agents and two agents from the U.S. Department of State's Diplomatic Security Service (DSS) to raid the house. Yousef, however, evaded capture and fled to Peshawar in the Northwest Frontier Province (NWFP) of Pakistan.[49] Following other leads, FIA agents, in another attempt to capture Yousef, raided the Peshawar house of Zahid al Sheikh, another of Yousef's uncles and a senior official in Mercy International, a Saudi charity for the Afghan mujahideen and Arab-Afghans. But Yousef and his uncle fled before the FIA officials raided the house.[50] While the JTTF was exploring overt options to capture Yousef and legally extradite him to the United States (or bring him back to the United States using the Rendition program),[51] the CIA also explored the possibility of covertly kidnapping Yousef and bringing him back to the United States.[52] Both efforts, however, were hampered by the lack of precise and actionable intelligence regarding Yousef's location.

So, despite such sweeping measures deployed against him, Yousef proved a difficult quarry, primarily due to the extensive nature of his network of contacts. Unlike Abu Halima or Ismoil, whose arrests were accomplished relatively easily, Yousef had numerous contacts around the world who helped him evade capture by providing him with shelter and other resources. Yousef knew veteran Arab-Afghans[53] in several countries, wealthy bankers from the Gulf countries, several sectarian militants within Pakistan, Afghan mujahideen leaders, and several recruits in Southeast Asia.[54] In fact, Yousef seemed unfazed by the efforts to capture him, and (as described earlier) even planned and carried out several attacks while on the run. As part of the investigation of the WTC bombing, the FBI found several numbers called by Yousef during his stay in the

United States, and created a database of telephone numbers that was used as late as 1998 to help track terrorists worldwide.[55] Factors that impeded the FBI's efforts to capture Yousef included a lack of human intelligence agents within the rapidly proliferating Islamist cells worldwide, a lack of strategic focus on the threat of religiously inspired terrorism, and a period of uneasy United States–Pakistan relationship as a result of Pakistan's nuclear weapons program, as well as Pakistan's displeasure with the sudden U.S. withdrawal of support to Afghanistan following the departure of Soviet troops.

Ultimately, Yousef's arrest came as the result of a lucky break, but one that was precipitated by Yousef's own arrogance and domineering demeanor. Yousef had recruited Ishtiaque Parker, a South African Muslim, to assist him in his operations. In one such attempt, Yousef involved Parker in a plot to kidnap the Philippine Ambassador to Thailand to secure Abdul Hakim Murad's release. In another plot, Yousef asked Parker to deliver suitcases packed with explosives on airplanes departing from Bangkok, Thailand, so that they would explode over U.S. cities. Parker failed to execute this mission due to heightened security measures that were implemented after the discovery of the Bojinka plot. After these plots failed, Yousef called Parker back to Pakistan and involved him in another attempt to kidnap the Philippine Ambassador to Pakistan, following which he planned to exchange the Ambassador for Murad. Yousef also ordered Parker to assist him in another plot to bomb a Shiite shrine in Islamabad, Pakistan.[56] Parker panicked, and on February 3, 1995, informed the U.S. Embassy in Pakistan that he wished to provide U.S. authorities with information on Yousef. Parker's decision to turn in Yousef was also partly based on his revulsion at Yousef's attempts to kill innocent people in his plots.[57]

Initially, DSS Agents Jeff Riner and Bill Miller interrogated Parker and became convinced that he was telling the truth. The agents informed Regional Security Officer Art Maurel, who then informed the Department of State about the new informant. The Department of State in turn passed the information to John Lipka, the Special Agent responsible for coordinating overseas liaisons in Yousef's case at FBI's Counterterrorism Section. John Lipka informed Neil Herman about the informant and a decision was made to utilize Parker to locate Yousef. On February 6, 1995, Parker informed his handlers that Yousef was in Islamabad and was planning to leave soon for Peshawar. An impromptu snatch team was hastily formed at the U.S. Embassy, and Art Maurel sought assistance from Pakistan's security agencies to capture Yousef. On February 7, officials from the U.S. Embassy and seven heavily armed Pakistani security officials, tipped off by Parker, apprehended Yousef at the Su-Case guesthouse in Islamabad's F7/2 sector. Yousef was identified by Agent Riner and was taken to the airport, where a JTTF team from the United States was waiting to take him

back to the United States. Parker received $2 million for the information that led to the capture of Ramzi Yousef.[58]

## SUCCESS AND FAILURE

Clearly, the capture of Ramzi Yousef was a significant victory for the JTTF. The long and intense manhunt provided a wealth of information on Yousef and several other terror operatives who were linked to him. At the beginning of the investigation, after realizing the extent of Yousef's connections, the JTTF forged overseas alliances to assist in the international manhunt. Similarly, FBI's Legal Attaché (Legat) in Bangkok, Thailand, proved to be quite useful for gaining the assistance of Asian security services in tracking Yousef. Another counterterrorism tool that played a role in successfully capturing Yousef was the Rewards for Justice Program. Even though Parker was not solely motivated by the reward, the $2 million prize certainly influenced his decision to turn Yousef in.

The manhunt, however, revealed at least two glaring absences in U.S. counterterrorism efforts. First, and foremost, the United States did not possess agents within the support milieus that helped Yousef evade capture and plan subsequent terror attacks. The CIA was unable to provide actionable intelligence on Yousef to facilitate his capture. The FBI's Legal Attaché scheme, though commendable, was severely understaffed. For example, the Legal Attaché for Pakistan was based in Bangkok, where he was responsible for several other countries.[59] Second, despite the international search operation, Yousef still managed to travel to several countries in Asia using false passports. The relative ease with which Yousef traveled across Asia, especially Southeast Asia, reveals the lack of coordination in circulating terrorism watch lists among countries.

## LESSONS FOR COUNTERTERRORISM

Yousef's activities and the corresponding manhunt offer several important lessons that can be applied to current and future counterterrorism efforts. To a certain extent, the planning and execution of the WTC bombing by Ramzi Yousef and his associates can be likened to the threat posed by self-radicalized cells that are inspired by al Qaeda's ideology, which conceivably makes any lessons particularly relevant in present day circumstances.

First, the search for Yousef revealed the difficulty of tracking and apprehending terrorists ensconced in widespread clandestine networks that cross several national borders. Although Yousef was a relatively independent terrorist "entrepreneur," he received support from a sizable logistical network that was largely unknown to investigators. Reliance on such a

large logistical network is a double-edged sword, since it also provides opportunities for investigators to track an individual.

Second, the United States—in order to elicit better international cooperation—must make other countries aware of the transnational nature of the terrorist threat and the risks associated with inaction in disrupting terrorist cells and operatives operating within their borders. Understandably, countries that have been directly targeted by terrorists have generally shown much greater interest in capturing or killing terrorists. However, other countries that have not been attacked by terrorists must be equally involved in counterterrorism efforts, since terrorists might be using those countries for raising funds, propaganda, and recruiting members; moreover, the absence or near absence of terrorist attacks in a country's past is not an assurance that it will never occur in the future.

Third, the security agencies, working closely with the media, researchers, and the public should develop mechanisms to ensure the functioning of an open society, while making sure that certain types of information that can be misused by terrorists are properly protected. For instance, Yousef told his captors that he learned from a CNN special report about airport screening techniques, information that he used for the Bojinka plot, including details that enabled him to devise methods to transport explosives and batteries undetected through the screening machines.[60]

Fourth, in instances of search operations, the rewards for providing information should be widely publicized in the relevant communities. In addition to financial rewards, security incentives should also be announced and widely publicized.

Fifth, Yousef was an extremely determined and innovative adversary—neither the presence of his wife and children in Pakistan, nor the fact that there was a massive counterterrorist effort arrayed against him had much effect on his willingness to plan and launch further attacks. In this case, at least, law enforcement efforts may have complicated the terrorist's operations, but did not do much to prevent further attacks by such a dedicated opponent.

Sixth, the case of Yousef indicates that even where the primary suspect is intelligent and a consummate professional, there can still be interdiction opportunities provided by less competent accomplices. While Yousef was generally extremely careful in his operations, the incompetence of cohorts like Salama or the driver of the truck in the Bangkok plot can provide law enforcement and intelligence with tangible early warning indicators, if these sometimes weak signals are detected against the pervasive background noise. Furthermore, even the very professionalism that makes a particular terrorist like Yousef so difficult to apprehend can provide distinct signals. For example, Yousef was meticulous about testing his devices

and conducting dry runs, which might have provided indicators of his activities, were counterterrorism officials paying sufficiently close attention.

Last, but not least, the case of Ramzi Yousef highlights the inevitable role played by luck in counterterrorism operations, and confirms the dictum that in the long run, fortune falls equally on all sides. On the one hand, Yousef repeatedly benefited from good luck, such as when he succeeded in passing through U.S. customs while his companion Ajaj did not, or when he escaped several accidents relatively unscathed. At the same time, counterterrorism officials benefited from the coincident good fortune of identifying the van used in the WTC bombing and Salama's return to the rental company, as well as the Manila apartment fire that scuttled the Bojinka plot, and Ishtiaque Parker's decision to turn in Yousef.

## CONCLUSION

In many respects, Ramzi Yousef was unique, an outlier, a terrorist with the independence of action, the ambition and the charisma of Carlos the Jackal, combined with an all-consuming hatred and desire to cause mass fatalities. In this light, one must draw any lessons from his exploits and capture with some degree of caution. However, in other ways, Yousef served as the harbinger of certain novel aspects of terrorism that counterterrorism officials would increasingly have to deal with at the beginning of the twenty-first century. His lust for revenge on a large scale would become the norm amongst the strain of jihadist terrorism most prominently represented by al Qaeda, while the diffuse, transnational nature of his support network and multinational contacts would continue to hamper counterterrorist efforts when these were used on a larger scale by groups like al Qaeda. Thus, while differing somewhat from the typical religious fanatic, Yousef displayed many of the operational characteristics that would come to be successfully employed by a generation of violent jihadists, especially self-starting terrorist entrepreneurs. This makes a careful study of his strengths and weaknesses—as well as the successes and failures of the counterterrorist effort against him—particularly instructive, as counterterrorism forces struggle to find answers to the multitude of current terrorist threats.

## NOTES

1. See Dwyer et al. describing the moniker applied to Yousef by the Federal Bureau of Investigation—Jim Dwyer, David Kocieniewski, Deidre Murphy, and Peg Tyre, *Two Seconds Under the World* (New York: Ballantine Books, 1994) 76.

2. Simon Reeve, *The New Jackals: Ramzi Yousef, Osama bin Laden and the Future of Terrorism* (Boston, MA: Northeastern University, 1999) 254.

3. The obscurity surrounding Yousef's identity has led to a host of alternative, if tenuous, theories about his origins, including that he was an Iraqi intelligence

agent acting at the behest of Saddam Husayn, who had taken over Abdul Basit's identity. See, e.g., Laurie Mylroie, *Study of Revenge: The First World Trade Center Attack and Saddam Hussein's War against America* (Lanham, MD: AEI, 2001).

4. This is the name Yousef gave when captured and asked to give his true name, see "Examination of Special Agent Brian Parr, U.S. Secret Service," *United States of America v Ramzi Ahmed Yousef and Eyad Ismoil*, United States District Court, Southern District of New York, S1239cr.180 (KTD), October 22, 1997, 4706.

5. Reeve, *The New Jackals*: 112.

6. Ibid.: 135.

7. Ibid.: 114. These include Abdul Hakim Murad and Eyad Ismoil, who participated in the Bojinka plot, among others.

14. Miller et al., *The Cell*: 135.

15. Soon after the bombing, the attackers sent a letter to the *New York Times* claiming responsibility on behalf of the Liberation Army: "We are, the fifth battalion in the LIBERATION ARMY, declare our responsibility for the explosion on the mentioned building. This action was done in response for the American political, economical and military support to Israel the state of terrorism and to the rest of the dictator countries in the region.

OUR DEMANDS ARE:

1. Stop all military, economical and political aids to Israel.
2. All diplomatic relations with Israel must stop.
3. Not to interfere with any of the Middle East countries interior affairs.

If our demands are not met, all of our functional groups in the army will continue to execute our missions against military and civilians targets in and out the United States. This also will include some potential Nuclear targets. For your own information, our army has more than 150 suicidal soldiers ready to go ahead. The terrorism that Israel practices (Which is supported by America) must be faced with a similar one. The dictatorship and terrorism (also supported by America) that some countries are practicing against their own people must also be faced with terrorism.

The American people must know that their civilians who got killed are not better than those who are getting killed by the American weapons in support.

The American people are responsible for the actions of their government and they must question all the crimes that their government is committing against other people. Or they—Americans—will be the targets of our operations that could diminish them.

We invite all the people from all countries and all the revolutionaries in the world to participate in this action with us to accomplish our just goals.

"If then anyone transgresses the prohibition against you transgress ye likewise against him . . ."

25. Yousef admitted as much when he was captured—*USA v Ramzi Ahmed Yousef et al.*: 4098.

26. *USA v Ramzi Ahmed Yousef et al.*: 4090

27. Ibid.

28. Miller et al., *The Cell*: 137.

29. Yousef even reportedly met with Omar Abdul Rahman, the blind sheik, who was later convicted of participating in a plot to blow up several targets in New York City.

30. Miller et al., *The Cell*: 138.

31. Investigators believe that at least some of the $20,000 Bin Laden gave to Ibrahim al-Jabrawni, ostensibly for Nusayr's legal defense, was used in making the WTC bomb. See Reeve, *The New Jackals*: 79.

32. Reeve, *The New Jackals*: 158.

33. Ibid.: 247.

34. Ibid: 242.

35. It does not appear that Yousef was anti-Semitic per se; he seemed to have no misgivings about using a Jewish lawyer in his second trial.

36. "Testimony of Brian Parr," *United States of America v Ramzi Ahmed Yousef and Eyad Ismoil*, S1293cr.180 (KTD), October 22, 1997.

37. Ibid.

38. Two pertinent examples of Yousef's powers of persuasion are 1) his success in steering the target of his U.S. attack toward the World Trade Center and away from the initial plan, prior to his joining the group of radicals, to attack several Jewish targets in New York and 2) his ability to convince his accomplices to undertake incredible risks, such as when he sent Murad back to the apartment in Manila to recover Yousef's laptop computer.

39. It is true that Yousef made certain threats with the ostensible intention of freeing both his friend Murad, who had been captured by Philippine authorities and his father, who was being held in Iran. However, these efforts were never followed up in any real sense, and it is therefore possible, based on Yousef's personality, that Yousef merely used his cohorts' incarceration to justify actions that he already wanted to undertake.

40. Miller and Stone: 102–105.

41. For information on Abu Halima's arrest see Miller and Stone, 109; For information on Ismoil's arrest see the Testimony of Brigadier General Fayez Mohamed Qablan of Jordanian Police in *USA v Ramzi Yousef et al*.: 4114–4165.

42. Simon Reeve, *The New Jackals*: 41.

43. Ibid.: 45–46. The JTTF team tasked with capturing Yousef included FBI Special Agent Frank Pelligrino, Secret Service Agent Brian Parr, and FBI Special Agent Charles Stern. The team was led by FBI Senior Supervisory Agent Neil Herman. Realizing the international nature of the manhunt Senior FBI Agent John Lipka was assigned the task of forging overseas alliances. Additionally Ralph Paul Horton, FBI's Legal Attaché in Bangkok, Thailand, was also coordinating with the Asian intelligence agencies for assistance in capturing Yousef. Ibid.: 67.

46. Reeve, *The New Jackals*: 42

47. Ibid.: 42–43.

48. Miller et al., *The Cell*: p. 119. The reward announcement was also advertised in newspapers in several countries, including Pakistan, India, Malaysia, and Philippines. More than 37,000 matchbox labels with the reward announcement were printed and dropped by plane over Baluchistan and several areas along the Pakistan-Afghanistan border. See Reeve, *The New Jackals*: 56–57.

49. Ibid.: p. 47; See also Jason Burke, *Al-Qaeda: Casting a Shadow of Terror* (London: I.B. Taurus, 2003) 99. After fleeing Quetta, Yousef is believed to have stayed in one of Osama bin Laden's guest houses in Peshawar. The exact date of the Quetta raid is not known. It can be speculated that the raid took place between March and June 1993.

50. Reeve, *The New Jackals*: 48.

51. The Rendition program is a policy tool used by the United States to return indicted terrorists to the United States to stand trial. The logistics of the rendition process are stated in Executive Order 12333, signed by President

Reagan in December 1981, and state that the CIA and its employees can "Provide specialized equipment, technical knowledge, or assistance of expert personnel for use by any department or agency" and could "Render any other assistance and cooperation to law enforcement authorities not precluded by applicable law." This executive order has been renewed by successive presidents. In June 1995, President Clinton signed Presidential Decision Directive 39, which states that "If we do not receive adequate cooperation from a state that harbors a terrorist whose extradition we are seeking, we shall take appropriate measures to induce cooperation. Return of suspects by force may be effected without the cooperation of the host government, consistent with the procedures outlined in NSD-77, which shall remain in effect." For information on Executive Order 12333 see Paul Pillar, *Terrorism and U.S. Foreign Policy* (Washington, DC: Brookings, 2001) 116–117; for information on PDD-39, see the unclassified version of the document,http://www.fas.org/irp/offdocs/pdd39.htm.

52. Reeve, *The New Jackals*: 57.

53. The Arab volunteers who went to Afghanistan to fight against the Soviet invasion of Afghanistan were called Arab-Afghans.

54. Burke, *Al-Qaeda: Casting a Shadow of Terror*: 94. Yousef's network of friends, associates, recruits, and sponsors helped him to evade the international manhunt as well as plan and carry out terrorist attacks. In Quetta, Yousef was helped by Haji Akhtar Muhammad Bareeh, a timber merchant. Also, Abu Safian, an Arab-Afghan who headed the UAE funded Red Crescent Society, helped Yousef in Quetta. As a result of the WTC bombing, Yousef became a legend in Islamist circles and it certainly helped his efforts to escape the international dragnet. See Reeve, *The New Jackals*: 46.

55. Reeve, *The New Jackals*: 39.

56. For a discussion of Yousef's attempts to secure Murad's release, see Reeve, *The New Jackals*: pp. 96–101. Combs, "The Media as a Showcase for Terrorism," in *Teaching Terror: Strategic and Tactical Learning in the Terrorist World,* ed. James J. F. Forest (Lanham, MD: Praeger, 2006) 133–154.

# CHAPTER 9

# THE ATTACK ON THE USS *COLE*

Ruth Margolies Beitler

The gaping 40-foot hole on the port side of the USS *Cole*, a U.S. Navy destroyer refueling in Aden's harbor off the coast of Yemen on October 12, 2000, underscored the fact that terrorism against American targets is not bounded by land, air, or sea. With 17 sailors dead and more than 38 wounded, the attack shocked the United States and its allies, and continued the era of dramatic strikes against American targets, including the 1993 World Trade Center bombing, the Oklahoma City Bombing in 1995, and the simultaneous attacks on the U.S. Embassies in Kenya and Tanzania in 1998. With the bombing of the USS *Cole*, Americans recognized that terrorism had become a routine component of American life whether on U.S. soil or on targets abroad. Although the United States had established an integrated, interagency counterterrorist process in the 1980s, the synchronized bombings of the embassies in Tanzania and Kenya in August 1998 served as a wake-up call that the U.S. government must pay more attention to al Qaeda's ability to adapt and threaten U.S. interests.

This chapter explores the events leading up to the bombing of the USS *Cole*, the challenges of executing an investigation on foreign soil and the ramifications of the *Cole* attack for U.S. counterterrorist policy. By assessing how the *Cole* investigation was handled, this chapter provides lessons for future investigations and counterterrorism cooperation.

**EVENTS LEADING UP TO THE *COLE* BOMBING**

Relations between the United States and the newly unified Yemen were tepid in the early 1990s due to Yemen's refusal to support the UN Security Council's mandate for Desert Strom following Saddam Hussein's invasion of Kuwait in August 1990. By the mid-1990s, relations had begun to thaw between the two countries, and the United States provided renewed

aid program to the poverty-stricken gulf state.[1] Prior to 1998, the U.S. Navy refueled many of its vessels in the small African country of Djibouti, located directly across the Gulf of Aden from Yemen. General Anthony Zinni, commander of U.S. Central Command from 1997–2000 moved refueling operations to Aden in January 1999 due to his interest in engagement with Yemen. According to Zinni, Yemen provided a strategic location on the narrow straights connecting the Red Sea to the Gulf of Aden, and was the "best of bad choices" in a region besieged by conflict.[2] U.S Ambassador to Yemen, Barbara Bodine, contends that General Zinni moved the refueling for logistical rather than political reasons since the port in Djibuti was congested, inefficient, and posed potential security threats.

Ambassador Bodine shared General Zinni's assessment that relative to other ports in the region, Yemen was manageable. Although she ended traditional port calls (where sailors disembarked and took leave in Aden), she supported refueling operations and believed that Yemen provided an adequate option for two key reasons. First, before the *Cole* attack, there were no operational threats active in Yemen. Although there had been numerous kidnappings of foreign tourists by tribes eager to pressure the Yemeni government to meet their local economic demands, for the most part, they were nonviolent, did not harm the hostages, and were confined to the desert regions in the northeast of the country. An exception occurred in 1998, when the Islamic Army of Aden kidnapped a British tour group and several hostages were killed in a rescue attempt.[3] Second, according to Ambassador Bodine, the Navy arranged to do the refueling in a matter of a few hours during daylight hours and most importantly at a "dolphin" in mid-harbor. As such, any security threat to U.S. ships seemed manageable.[4] Some analysts have debated the U.S. decision to use Yemen as a refueling port and have suggested that the United States was searching for another base in the Middle East in which to store military hardware in case of regional conflagrations, and therefore discounted any negative threat assessments.[5]

The suicide bombing of the USS *Cole* was not the first time the United States experienced a maritime threat in Yemen's waters. In January 2000, 9 months before the *Cole* assault, local operatives (possibly with al Qaeda connections) planned a suicide attack against the USS *The Sullivans* as it refueled in the port of Aden. The assault on the U.S. naval vessel fizzled due to the terrorists' poor planning. The perpetrators utilized a remote control boat laden with explosives that was meant to collide with the USS *The Sullivans*. However, due to overloading, the skiff sank immediately when pushed into the water. According to Ambassador Bodine, no one in the U.S. or Yemeni government knew about the plot until after the *Cole* bombing.[6] Some analysts have concluded that both the plan to bomb the USS *The Sullivans* and the suicide attack on the *Cole* were al Qaeda schemes. Ambassador Bodine believes that due to amateurish technology

and inadequate preparation used in the attempt on the USS *The Sullivans*, the group was most likely an affiliate that ventured out on its own without strong support from al Qaeda.

For years, al Qaeda has recognized the potential of Yemen in both recruiting operatives and for staging operations. According to one estimate, Yemenis are the third largest national group represented in al Qaeda.[7] However, Ambassador Bodine notes that although Yemenis are numerous in al Qaeda, they rarely assume leading roles in the operations. Yemen's connection to al Qaeda stems, in part, from its relationship to the jihad in Afghanistan. During the 1980s, jihadists from Yemen joined the mujahideen's struggle in Afghanistan against Soviet occupation.[8] Numerous Yemenis volunteered to fight, and analysts contend that it was in Afghanistan that Yemenis and others formed the embryonic al Qaeda movement. Osama bin Laden's father was born in Yemen, and this historical tie may have inspired bin Laden to contact Yemenis who fought in Afghanistan, in order to plan and execute attacks against Western targets. In 1992, bin Laden provided Tariq al Fadhi with financial support to bomb the Gold Mahur Hotel in Aden, with the intention of killing U.S. military personnel serving in Somalia.[9]

According to some reports, after the Soviet withdrawal from Afghanistan in 1989, returning jihadists—both Yemeni and Arab Afghans—were incorporated into Yemeni President Ali Abdullah Saleh's security apparatus.[10] The rationale behind this action was to employ them, give them a stake in the status quo, and retain the ability to surveil them.[11] Yemeni jihadis were enlisted to fight against the rebel south during the 1994 civil war. Some jihadis joined the conservative Salafi movement that espoused a literal interpretation and application of Islamic law. The Salafis in Yemen have particularly strong ties with Saudi Arabia due to their similar beliefs. A very small element of these Yemeni jihadis formed the Islamic Army of Aden (IAA), also known as the Aden-Abyan Islamic Army (AAIA), and was responsible for several bombings in Yemen as well as the 1998 kidnapping of 16 tourists.[12] The group also utilized training camps in Yemen.[13] In 1997, Yemeni sheikhs met with al Qaeda operatives, and supposedly bin Laden considered transferring his base of operations to his ancestral homeland.[14] After Yemen's government captured and executed the group's leader, Zein al-Abidine al-Midhar in October 1999, the organization's appeal diminished; however, the IAA, along with two previously unknown offshoot groups—Muhammad's Army and the Islamic Deterrence Forces—later claimed responsibility for the *Cole* bombing.

One other reason that Yemen appeals to al Qaeda as a base of operations is related to its interconnection with Saudi Arabia and the kingdom's influence on Yemen's education system. During the oil boom of the 1970s, many Yemenis found work in Saudi Arabia's oil and construction industries, and when they returned home they brought with them Salafi

teachings. Islamic schools in Yemen began to teach this more radical version of Islam.[15]

A result of Yemen's decentralized government structure that clearly appealed to al Qaeda was the almost unimpeded stream of weapons into the state. Investigators have traced weapons used in attacks against Western interests in Saudi Arabia to Yemen.[16] Due to the years of internal warfare and ensuing chaos in Yemen between 1967 and 1994, significant numbers of weapons entered the country. According to some estimates, there are three weapons for every one person in Yemen.[17]

Part of Yemen's appeal for terrorists is its forbidding geography and the tribal networks that have frequently shielded al Qaeda operatives. When al Qaeda militants fled Afghanistan after the U.S. attack on the Taliban in October 2001, many sought refuge in Yemen.[18] Although bin Laden's historical ties to Yemen partially explain why Yemenis play a large role in al Qaeda, another account holds that bin Laden is able to provide financial incentives to tribal leaders in order to secure their support of al Qaeda operatives in the country. Some tribes that shield al Qaeda members resist the authority of the government in Sanaa. They prefer to remain independent from a central authority and keep Sanaa's control out of the tribal regions. According to Mark Katz, many tribal leaders are motivated more by mercenary concerns than ideological ones when it comes to supporting al Qaeda.[19] Katz contends that some tribes support al Qaeda in order to pressure Sanaa to counter al Qaeda's influence by providing resources to their tribes as well.[20]

Al Qaeda has frequently used Yemen as a base of operations or as a point of transit in its war against the West. Investigators have linked the 1998 East Africa embassy bombings with both the *Cole* bombings and the attacks of September 11, 2001. During a meeting between U.S. President Bill Clinton and Yemeni President Saleh in April 2000, terrorism was high on the list of topics, with President Saleh requesting enhanced support from the United States to counter foreign jihadis.[21] Several members of the group that conducted the East Africa embassy bombings made lengthy visits to Yemen—including Muhammad Reshed Daoud al-Ahwali, who was a passenger in the truck delivering the bomb to the U.S. embassy in Nairobi, Kenya, on August 7, 1998.[22] Some members of the embassy bombing cell also held false Yemeni passports and had spent time in Yemen.[23]

## THE *COLE* BOMBING

U.S. naval commanders are required to file force protection plans detailing the security measures being undertaken to secure the vessel while refueling or making port calls. The *Cole*'s plan was approved at high levels in the government and the ship was placed at threat condition Bravo (the

second lowest level of four).[24] However, some reports indicate that the United States had received a warning of a terrorist threat 12 hours prior to the *Cole* bombing. According to Walter Slocombe, then Undersecretary of Defense for Policy, the warning was not specific enough for the military to take appropriate action.[25] A day after the *Cole* bombing, a defense intelligence agency analyst resigned, citing that his warnings of terrorist plots against U.S. targets in the Middle East went unheeded.[26]

Despite the failure by terrorists in Yemen to bomb the USS *The Sullivans*, the idea of conducting a maritime attack clearly appealed to al Qaeda operatives. Reportedly, a suspect later arrested for participation in the *Cole* bombing set the idea in motion to use boat bombs as early as 1996. Abd al Rahim al Nashiri allegedly received approval from bin Laden in 1998 to prepare for a maritime assault in Yemen.[27] On the morning of October 12, 2000, as the *Cole* was refueling, a small boat approached the ship. According to witnesses, two men on the small boat stood up, waved or saluted, and then detonated their explosives, leaving 17 sailors dead and inflicting $250 million worth of damage on the destroyer.

### THE INVESTIGATION

From previous al Qaeda operations, it is clear that the terror network was meticulous in its planning process, and thus expectedly sent advance teams to gather intelligence for the *Cole* operation. In Yemen, expatriates with ties to al Qaeda returned to their country of origin in order to recruit operatives for the *Cole* operation. According to a Rand study, the terrorist cell that conducted the *Cole* operation was comprised of 16 members, 11 of whom were Yemeni.[28] Yet as the RAND study concludes, the impetus for the attack did not appear to come from local militants, though several were used for logistics inside Yemen.[29] The *Cole* plot was part of a global network of terror operations that had been implemented over the past several years against Western targets.

Investigators have determined that local Yemeni groups did not have the level of technological sophistication that was evident in the *Cole* attack. Therefore, early into the investigation, terrorism experts concluded that al Qaeda directed the operation. Furthermore, the technology and long-term planning bore the fingerprints of bin Laden. The bombers used a shaped explosive charge, a clear indication of increasing sophistication.[30] Some reports claimed that Osama bin Laden used expert bombers from the Shia Lebanese group Hizbollah to build the huge bomb that incapacitated the *Cole*.[31]

A day after the *Cole* bombing, seven U.S. planes landed in Aden's airport carrying representatives from numerous U.S. government agencies charged with a variety of missions. Under the direction of the Ambassador and the Embassy, based on instructions from the Secretary of State,

the missions were: recover the ship and her crew, provide force protection, establish a joint investigation with the Yemenis, and maintain a strong bilateral relationship with the Yemeni government.[32] Included among the groups was the Foreign Emergency Support Team (FEST)—a rapid response, interagency group that is deployed when U.S. interests abroad have been attacked.[33] From its base in Aden, the team, led by a senior Department of State officer with Yemen experience, supported the Ambassador and members of her staff now working from Aden with communications equipment, interagency liaison staff, and crisis management expertise.[34]

Two agents from the FBI's Washington Field Office had established a working relationship with Yemeni investigators in the aftermath of the 1998 Mudiyah kidnappings. These agents immediately deployed to Aden along with legal attachés assigned to a number of U.S. embassies in the region. The Navy Criminal Investigative Services (NCIS), which also had a preexisting relationship with the Yemenis, deployed a small, language-competent team to Aden. FBI Head Advisory Agent John O'Neill arrived in Aden several days after the bombing and stated that he intended to deploy 150 agents to Aden. The Ambassador countered that there was only room for 50 agents at that time and suggested that the remaining agents could be staged out of Cairo until there was a clearer delineation of investigative requirements. Despite this decision, O'Neill brought the entire 150 agents into the country and sent away all regionally based legal attachés and Washington Field Office agents who had already established working relationships with the Yemeni government.[35]

According to several American investigators, some Yemeni authorities in Aden—in contravention of their government's stated policy—were uncooperative and refused to allow FBI investigators to directly interview alleged suspects in the *Cole* bombing.[36] Initially, Brigadier General Mohammad Ali Ibraheem, the commander of the naval base at Aden, claimed that the explosion came from inside the ship and did not appear deliberate.[37] The day after the explosion, however, at the request of the U.S. Ambassador, President Saleh sent his own ranking military advisor and a team of experts to the ship, who determined that the attack on the ship was clearly terrorism.[38] A week after the explosion, President Saleh publicly referred to the bombing as an act of terrorism.[39]

One crucial problem in the investigation was that the FBI decided to rotate their senior advisory agent every 30 days, hindering the development of effective continuity in the relationships among U.S. agencies and between the FBI and the Yemenis. The FBI did not develop an efficient handover from one agent to the next, leaving some agents with only a minimal grasp of the situation. Many of the agents lacked a background in counterterrorism, further impeding progress in the investigation. Although several agents were qualified for the position, many came with

the attitude that they would get through their 30-day deployment and return to their "real job."[40] This attitude filtered down to other agents, and was also recognized by the Yemenis.

In November, because of difficulties between senior members of the FBI and local Yemeni investigators, Ambassador Bodine—along with the new senior supervisory agent, Patrick Paterson, and a senior Yemeni judge—negotiated and concluded a memorandum of agreement setting the terms and parameters for both Yemeni and American investigators. Although this was a significant step in fostering a better working relationship between the FBI and Yemeni investigators, some agents remained dissatisfied with their inability to question suspects directly, a situation that was ameliorated when the FBI sent agents who were native Arabic speakers to work with the Yemenis.[41]

Some agents from the New York Field Office alleged that the Aden investigators impeded the investigation in order to sanitize records and conceal senior Yemeni officials' involvement in the plot.[42] The allegation that government personnel were somehow implicated in the attack stemmed from the previously mentioned fact that during the 1980s numerous volunteers from Yemen joined jihadists in Afghanistan to battle the Soviet occupation.[43] Clearly, there is an undisputable connection between the government and jihadist fighters, but not necessarily between the government and those involved in the *Cole* attack. During the USS *Cole* investigation, FBI Director Louis Freeh insisted upon a broad investigation that he asserted had the potential to lead to powerful officials in the President Saleh's government.[44]

The investigation into the *Cole* bombing was initially hampered by several key factors that Ambassador Bodine describes as "some inevitable, some avoidable and some unacceptable."[45] The inevitable factors included the resentment that any law enforcement perceives toward an outside entity arriving to investigate an event that took place within their jurisdiction. The resentment was amplified by Yemen's extremely unsophisticated investigative services, lacking even fingerprint powder to process crime scenes colliding with a state-of-the-art service such as the FBI. As Ambassador Bodine succinctly put it, "coming from two different planets couldn't have been more of a shock to both sides."[46] In terms of avoidable issues, the Ambassador had requested in a meeting with Director Freeh a legal attaché at the embassy months earlier, in order to increase ties with the Yemenis. Additionally, the Ambassador believed that the U.S. Navy could have stationed a representative full-time in Aden to manage the refueling program. The creation of networks and interrelationships could have facilitated the investigation during its early phases. Furthermore, Ambassador Bodine had advocated the reopening of the consulate in Aden, which would have increased networks with Adeni officials.

Information on the *Cole* bombing was difficult to obtain due, in part, to the reluctance of Yemeni officials to share intelligence with American investigators and the unwillingness of the FBI to share the results of their forensic work with the Yemenis. For Ambassador Bodine, the manner in which some senior agents handled the investigation was unacceptable, and led to some of the Yemeni reluctance to share information. She recounts that the Yemenis up to and including the President "had long advocated a more robust and formal cooperative relationship on counterterrorism and were rebuffed by the United States on a number of occasions."[47] From her perspective, the Yemenis were interested in cooperating with the U.S. investigation, but the FBI's heavy-handed and culturally insensitive approach threatened to derail the investigation—in fact, she notes, President Saleh and members of his cabinet, military, and investigative services made it very clear to his government that they would work with the Americans.[48] Yemeni officials agreed that the FBI's arrogant and culturally insensitive style hampered cooperation from the outset.[49] In fact, Ambassador Bodine denied a request for John O'Neill's return in January 2001.

There are, however, several other explanations as to why the Yemenis appeared or were reluctant to cooperate with U.S. investigators. Some members of the Yemeni security services did not like the Americans and were "probably sympathetic to the jihadi worldview, even if not supportive of their tactics."[50] Other Yemeni officials, although ambivalent about their feelings toward the United States, supported a solid relationship with the United States. When the FBI arrived with their culturally insensitive attitude, those ambivalent Yemenis were put in an awkward and embarrassing position.

Additionally, cultural misunderstandings led the FBI to perceive the Yemenis as uncooperative. For example, occasionally, when the FBI Americans asked the Yemenis for particular evidence, the Yemenis had no idea why they needed it. For example, since DNA testing is a foreign concept in a poverty-stricken developing country such as Yemen, a request for collecting fiber or hair samples was inexplicable to the Yemenis. Ambassador Bodine reiterated to her investigators that if they could explain to her why they needed particular evidence and she understood its purpose, she would then relay the significance of the request to the appropriate Yemeni official.[51]

Moreover, the issue of "pure pride" emerged as a factor in Yemen's occasional reluctance to work with the Americans. For example, Yemenis were embarrassed when the FBI requested their passport or immigration records. They had no computer records; it was all piles of handwritten paper. Thus, in some cases, Yemeni officials—in an effort to defer humiliation—dragged their feet. Ambassador Bodine worked directly with the FBI to clarify, on a case-by-case basis, whether the Yemenis were

unaccommodating because they did not have the evidence requested, because they did not understand the request due to "bureaucratic incompetence," or because they were actually being obstructionist. The distinction among these is significant, as it reflects the intent of the Yemenis.[52]

One other impediment to the investigation concerned the relationship among American agencies. Organizational cultural clashes between the FBI and the Central Intelligence Agency (CIA) are legendary, and these battles were played out in the *Cole* case as well. The CIA and FBI not only "put up firewalls, but they suffered from low-intensity warfare."[53] As the agencies retained different mandates, they guarded their intelligence. The FBI's key concern is to acquire evidence that they can use to prosecute the perpetrators of the attack. For the CIA, the crucial nature of the intelligence is to prevent another attack. In one instance, Ambassador Bodine and an FBI agent paid a visit to a Yemeni official to request a particular piece of information. When they made the inquiry, the Yemeni official revealed that he had already given the information to the Americans. When the Ambassador requested clarification as to whom the information had been given, it was revealed that her CIA station chief had received the data but did not share it with the FBI.[54]

In June 2001, the FBI announced that it had identified credible threats against its agents, and decided to remove its remaining agents from Yemen. Much to the dismay of the Department of State and the other agencies resident at the American Embassy in Sanaa, the FBI refused to share its threat intelligence with anyone "despite its legal and moral obligation to do so."[55] Ambassador Bodine asserted that since an attack would not differentiate between various players, all Americans were potentially in danger. The CIA, on the other hand, did not find evidence of any particular threat against the FBI and was rebuffed when the agency requested to see on what evidence the FBI based its position. Therefore, there was no draw down of embassy personnel or their dependents. Senior officials involved in the interagency process were also not convinced that the FBI had to leave in June. At the very least, members of the interagency believed that the FBI should have left a core group of language-qualified agents behind to continue the investigation. But despite ongoing interagency discussions, "the FBI unilaterally and without notice" removed its agents in the middle of June, taking a reluctant NCIS with them.[56] Ambassador Bodine believed that 3 months of work were lost, although she continued to pursue the investigation with the CIA station chief and others in the embassy.[57]

Following the attacks, the Yemeni government quickly rounded up several low-level suspects including Fahd al Quso and Jamal al Badawi. Badawi is alleged to have rented safe houses in Aden and to have brought the boat from Saudi Arabia that was used in the attack. Al Quso was supposed to film the attack, presumably to be used for recruitment and

motivation, though the tape was never recovered.[58] Some Yemenis were interested in closing the case quickly by trying the six Yemenis that they had in custody.[59] Ambassador Bodine disputes this and explained that the Yemenis were interested in a full investigation to prove that the attack was a Saudi, not Yemeni-based attack. The Ambassador, working with President Saleh, assured that the suspects' trials would be delayed as long as possible to allow the investigation to continue. U.S. officials wanted to complete additional investigations and connect the suspects to al Qaeda. FBI officials were concerned that the Yemeni legal system would quickly try the suspects and execute them before all the evidence was collected. Ambassador Bodine explained to the investigators that the Yemeni legal system did not work that way and that "the possibility of summary justice in the Saudi style was remote, if not impossible."[60]

In November 2000, al Quso told investigators about his dealings with a man named Khallid. He said that he traveled to Bangkok in January 2000 with one of the *Cole* suicide bombers, Ibrahim al Thawwar, and met Khallid, bringing him $36,000 in cash.[61] Both the CIA and FBI were familiar with Khallid, also known as Tawfiq Attash Khallad, since they had tracked him prior to the *Cole* bombing. According to U.S. officials, Khallad met with two of the eventual September 11 hijackers, Khalid al-Midhar and Nawaf al-Hazmi in Kuala Lumpur in January 2000.[62] This meeting was crucial in that it linked the *Cole* bombing with the September 11 plot, but this interconnection was not unearthed until after the attacks on the United States in 2001. After the *Cole* bombing, the FBI connected Khallid to that plot, asserting that he delivered a letter to the suicide bombers approving the assault on the ship. It was only after the *Cole* bombing that the CIA and FBI reassessed the dangerous threat posed by al Midhar and al Hazmi. By the time they were put on a terrorism watch list in August 2001, both men were already residing in the United States.[63]

Eventually, the United States also gathered information about the *Cole* bombing from al Qaeda prisoners captured in Afghanistan after the U.S. invasion in October 2001.[64] In September 2002, Pakistani officials arrested nine Yemenis including Ramzi bin al Shibh, who was a high-level planner in the September 11 attacks and was implicated in planning the *Cole* bombing. In November 2002, the United States—with the reticent acquiescence of the Yemeni government—assassinated Qaed Salim Sunian al-Harethi, one of the *Cole* attack's planners, using an unmanned U.S. predator drone.[65] At the end of April 2003, Pakistani officials arrested Khallad in the port city of Karachi, along with a cache of weapons and explosives.[66] Information collected in Afghanistan also led to the capture of Muhammad Hamdi al Ahdal, who was a known member of al Qaeda and was responsible for finances and operational planning for the *Cole* bombing as well as a subsequent attack in Yemen's Gulf of Hadhamut on a French ship, the *Limburg*.[67] In November 2003, Yemeni forces arrested al Ahdal outside

of the capital city of Sanaa. According to Yemeni sources, al Ahdal was one of Osama bin Laden's key al Qaeda leaders in Yemen.[68] Undoubtedly, progress on capturing some key players in the *Cole* operation was advancing.

## COUNTERTERRORISM AND LESSONS LEARNED

Aside from developing strong bilateral relationships with host nations in order to fulfill a variety of political, economic, and security purposes, resilient bilateral relationships are a crucial element in fostering effective counterterrorism links. In the late 1990s, under the direction of Ambassador Barbara Bodine, Yemen and America renewed their relationship in earnest and increased their ties in several important realms. In 1998, the United States began a modest, yet active police-training program carried out by the Department of State's Diplomatic Security Service, which included activities such as rudimentary crime scene collection and processing.[69] To further strengthen ties with Yemen, also in 1998, the United States implemented a program to remove landmines that littered Yemen as a result of conflicts spanning 30 years. Instead of bringing in a private company to remove landmines, the United States opted to assist the Yemenis in creating an indigenous capacity to do this work. Eventually, the Yemenis were able to train their own demining force.[70]

As part of the demining program, the U.S. Embassy signed a mass casualty agreement with a hospital in Aden. When the *Cole* was hit, the Yemeni deminers used the fleet of vehicles supplied by the United States to evacuate the wounded to the regional hospital. The preexisting mass casualty agreement—although anticipating an operation different than the one resulting from the *Cole* bombing—provided an important service for the United States and strengthened the goodwill and friendship between the two countries.[71]

Following the attacks in New York and Washington on September 11, Yemeni President Saleh's resolve to cooperate with the United States increased. Some analysts suspect that Yemen feared it would become a target in the global war on terror. Clearly President George W. Bush's statement that "you are either with us or against us" resonated sharply in Sanaa.[72] The Yemeni government, however, had been improving its counterterrorism capabilities prior to the attacks on the United States—for example, Yemen's police academy graduated its first class of antiterrorist police in September 2001.[73]

During President Saleh's November 2001 visit to the United States, President Bush discussed aid packages for Yemen along with Special Forces training. Additionally, the leaders discussed U.S. assistance in helping Yemen receive International Monetary Fund loans.[74] When President Saleh declared his intention to cooperate more fully with the United States

in the war on terror, teams from the 5th Special Forces Group were sent to train Yemenis in counterterrorism.[75]

President Saleh supported increased collaboration with the West in order to deter terrorists from using Yemen as a base for their operations. The suicide attack against the *Limburg* in October 2002 was costly for the Yemenis, both in terms of the environmental effects of the oil spill caused by the attack and in the loss of potential trade and investment. As such, when pressure from the United States to join the West in the global war on terror intensified, President Saleh implemented several steps to counter terrorism in Yemen. He increased cooperation with the British and American Special Forces, monitored mosques, and broadened a program dating to 1997 to deport suspected terrorists.[76] Additionally, Yemen—with assistance from the United States and others—improved its surveillance of those entering Yemen from both Afghanistan and Pakistan, which provided increased intelligence on potential terrorists. Many visitors from those countries were interrogated more intensely than they had been in the past. When people requested visas in Pakistan, consular officials allowed them to complete the paperwork, then denied their visas and shared the information with American intelligence agencies.[77]

Another effort by President Saleh's government to fight terrorism and violence has been the implementation of a plan to buy back weapons from the population; however, cultural constraints have hampered the effort.[78] Yemeni men wear the traditional curved Yemeni dagger, but this tradition fosters Western misperceptions of Yemeni extremism. Additionally, in October 2003, President Saleh implemented a controversial counterterrorism program granting amnesty to low-level militants despite their suspected links to al Qaeda.[79] President Saleh was under pressure from human rights organizations for Yemen's treatment of detainees, and Amnesty International accused the Yemeni government of torturing prisoners. In November 2003, 96 prisoners who had "repented" to an Islamic cleric were released, although they continued to be closely monitored by the government.[80] This program has caused some American officials concern, although the State Department does not believe that any suspects with direct links to terrorist attacks in Yemen have been released.[81]

Although Yemeni officials have been more aggressive in their hunt for al Qaeda operatives within Yemen, questions continue to arise as to the Yemeni government's dedication to this pursuit. In April 2003, ten suspects in the *Cole* bombing escaped from prison in Yemen, including Badawi, who was subsequently recaptured. Further, in February 2006, 23 al Qaeda operatives—13 of whom had been convicted in the USS *Cole* bombing—tunneled their way out of their cells in Sanaa. Some analysts contend that without assistance from high-ranking Yemeni officials, escapes of these magnitudes would have been virtually impossible.[82] As mentioned previously, some fighters who returned from

Afghanistan were employed by the security services, thereby enhancing the plausibility of the explanation that the escapees received inside assistance. In fact, in May 2006, 12 military officers were tried in Yemen for negligence that led to the escape of prisoners in February.[83]

Despite some key obstacles and some skepticism as to the reliability of the Yemenis, the United States worked with Yemen to establish an elite Counterterrorism Unit in 2002 and continues to provide support in that operation. Additionally, in another security cooperation program that predated the attack on the *Cole*, the United States assisted Yemen in the creation of a Coast Guard to patrol its long and treacherous coastline. Situated across the Gulf of Aden from the unstable states of Sudan, Somalia, Eritrea, Ethiopia, and Djibouti, the waters here are some of the most dangerous in the world.[84] Yet the growing problem of corruption in Yemen has led donors to cut aid programs, an essential component in funding counterterrorism operations.[85]

The investigation into the *Cole* bombing led Ambassador Bodine to several conclusions that impacted the ability of the United States to carry out effective investigations in the future. First, she is adamant that U.S. agencies need to "work with, not in spite of, the host government."[86] The United States cannot enter a country and expect to transform or ignore the host government, especially one with a 4,000-year history. American investigators need to work within a particular cultural milieu and act in a respectful manner. Second, investigators must recognize not only that the ambassador is the senior U.S. government representative in the country and technically in charge of any investigation, but also that embassy personnel have "well-honed tools" for both collaboration and cooperation. The embassy role is to facilitate the investigators' ability to do their job, utilizing its cultural knowledge and established networks. Implementing tactics that are effective in the United States might not yield positive results overseas. According to Ambassador Bodine, the FBI "never asked, but always demanded" during their investigation into the attack on the *Cole*.[87] Third, constant rotation of the FBI senior advisory agent seriously hampered the continuity and effectiveness of the investigation. This problem has since been corrected with the establishment of a permanent legal attaché office in Sanaa.

Some other key lessons learned relate to maritime force protection and a reassessment of security measures. In a U.S. Department of the Navy report released on January 19, 2001, it was found that many procedures in the ship's security plan were not followed.[88] Although one cannot say with certainty whether or not different measures might have prevented the *Cole* attack, the Navy has implemented new guidelines for protecting its vessels. The Navy has recognized that bolstered security measures are required in a region as volatile as the Middle East, and has revamped its antiterrorist and force protection plans accordingly. The Navy is also

updating its technology and access to intelligence, along with enhancing its use of the NCIS agents in ports to give the commanding officers intelligence assessments.[89]

**CONCLUSION**

The investigation into the bombing of the USS *Cole* indicated clear shortcomings on a variety of levels. First, agencies within the United States must work together to increase the effectiveness of the investigations. Issues regarding intelligence sharing between agencies such as the CIA and FBI have been addressed in earnest since September 11, and progress has been made. Second, the United States must recognize the indigenous capability of a host nation, such as Yemen, and capitalize on those areas where the host nation retains a clear advantage over American investigators. Despite the fact that Yemeni officials initially would not allow U.S. agents to interview suspects, the host nation has the distinct advantage in human intelligence.[90] Clearly, had a mutually beneficial joint investigation occurred initially, with each group exploiting its comparative advantage—U.S. technology and Yemeni human intelligence—more expedient progress could have been made. Third, the U.S. government must grasp the flexible and ever-changing tactics utilized by al Qaeda. Finally, although it is nearly impossible to anticipate new modes of attacks, the government must remain forward thinking and vigilant.

# CHAPTER 10

## CAPTURING KHALID SHEIKH MOHAMMAD

Robert N. Wesley

The fight against al Qaeda and its affiliates has produced a mixture of successes and frustrated efforts since its post-9/11 reinvigoration. One of the highest priorities of the United States' counterterrorism strategy is the capture or killing of the movement's traditional leadership. Although, as of this writing, al Qaeda's Osama bin Laden and Ayman al-Zawahiri continue to elude concerted efforts by allied intelligence and security forces, the organization's other top ranks have been in perpetual need of replenishing. Some of these achievements have been in the form of assassination strikes on difficult targets. More significantly, though, are successes where U.S. officers—working with local security services—have been able to actually capture high-ranking al Qaeda operatives alive.

One such success involved a March 3, 2003, raid in the Pakistani city of Rawalpindi. Acting on intelligence generated from a string of raids stretching over a year, scores of Pakistani paramilitaries raided an apartment building in an upscale section of Rawalpindi, awakening the mastermind of the September 11, 2001, attacks on the United States. Khalid Sheikh Mohammad (widely referred to by his initials KSM), the most important catch thus far in the fight against al Qaeda-inspired terrorism, was taken without a fight, carrying with him the details of the inner workings, history, and future operations of the network.

The most significant capture of an al Qaeda operational leader deserves to be detailed, not only for the strategic importance of the individual involved, but for delineating the complex process that led to his detainment and the lessons underlined by this process. His capture serves to emphasize how the United States will be operating in the future to ensure

continued progress in disrupting both the traditional leadership and those who replace them.

Mohammad's case study allows for reflection on several counterterrorism issues likely to have an impact on the future of this conflict. These include, *inter alia*, the importance of: developing strong international partnering relationships; harnessing the core competencies of joint operations involving United States and host-country organizations; creating and exploiting actionable intelligence; identifying and provoking security mistakes by al Qaeda operatives; and targeting "partner organizations" of al Qaeda.

### THE MASTERMIND

Although this case study will focus on the lessons learned from the counterterrorism perspective, the content of Khalid Sheikh Mohammad's background is significant enough to merit further elaboration. Mohammad was not an ordinary operative; nor was he a mediocre leader. He had a hand in so many of the most significant attacks preceding his arrest, including both World Trade Center attacks, that some counterterrorism officials gibingly referred to him as the "Forrest Gump" of al Qaeda. His insatiable appetite for the spectacular, and being the most experienced executor of attacks, elevated his detainment to the highest priority. Hence his capture on March 3, 2003, put al Qaeda's most accomplished operational leader out of business. As al Qaeda and its broader movement the Global Jihad have become more laterally structured and loosely coordinated, such capable independent-minded leaders are of the utmost importance in terms of executing complex terrorist attacks.

Mohammad is thought to have been born in 1964 or 1965 in Kuwait to parents likely from Baluchistan, an area covering parts of Pakistan and Iran.[1] Mohammad's experiences and natural attributes made him an exceptionally well-endowed operative. His mixed heritage, along with his Western education and traveling, account for his being fluent in at least Arabic, English, Urdu, and Baluchi. These languages allowed him to operate in disparate environments, freely moving about under multiple covers.

One of the common denominators of al Qaeda's core leadership is that most grew up in what can be considered religious families.[2] Mohammad is no exception, and it is believed that he joined a sect of the Muslim Brotherhood in Kuwait around age 16.[3] From this foundation, he was inculcated in violent jihad from an early age, even participating in desert training encampments. After finishing his secondary schooling, Mohammad decided to venture to the United States for a Western university education and enrolled in a small Baptist college in North Carolina in 1983.[4] After pursuing

mechanical engineering, he transferred to North Carolina Agriculture and Technology University and finished his degree in 1986.[5] His religious fervor never seems to have weakened over the years, as he was constantly engaged in jihadi activities, even while simultaneously pursuing nonrelated objectives. His radicalization was further galvanized after traveling to Afghanistan to fight the Soviets in 1987.[6]

In Afghanistan, Mohammad confided in Abdul Rasul Sayyaf, a leading Afghan resistance figure and head of the Islamic Union Party (Hizbul-Ittihad al-Islami). From 1988 to 1992, Mohammad was engaged in, among other hobbies, helping to run a nongovernmental organization (NGO) in Peshawar, Pakistan. The NGO was sponsored by his mentor Sayyaf and was involved in facilitating travel and other support to mujahideen wishing to join the Afghan jihad. During this period, Mohammad's network of associates grew significantly. After leaving the NGO, Mohammad— like many career mujahideen—spent some time fighting and supporting the Bosnia jihad. Mohammad's nephew, Ramzi Yousef, was at this time planning the first World Trade Center (WTC) bombing. The two relatives were in communication, and indeed Mohammad wired Yousef $660 for the operation.[7]

By the time of the first WTC bombing in 1993, Mohammad had moved to Qatar and taken a position as an engineer at the Qatari Ministry of Electricity and Water, following the advice of Sheikh Abdallah bin Khalid bin Hamad al-Thani, the former Qatari minister of Islamic affairs.[8] This was not a "settling-down" period for Mohammad; rather, it was a time for realigning his path of jihad. Apparently inspired by the near success of the WTC attack, Mohammad moved with its mastermind, his nephew Yousef, to the Philippines to plan further grandiose attacks.[9] While in Manila, a plan was hatched that would be the inspiration for the 9/11 attacks.

The widely known but failed Yousef-Mohammad plot to blow up 11– 12 airliners over the Pacific Ocean [a plot they referred to as "Oplan Bojinka"] was in the final planning stages when it was disrupted.[10] An explosives accident in Manila, along with investigations of other attack plans, led to the disruption of the cell and the subsequent return of Mohammad to Qatar, where he regained his government position while clandestinely globetrotting to meet with associates in Sudan, Malaysia, Brazil, and Yemen.[11]

Simultaneously, a U.S. court indicted Mohammad in January 1996 for his involvement in the first WTC bombing. U.S. authorities were also tracking Mohammad during this period and were hoping to arrest him and transport him to face trial. After learning of his residence in Qatar, U.S. officials debated where or not to snatch Mohammad by force, eventually deciding to request permission from the Qatari government. Unfortunately, however, the response from Qatar came too late, as Mohammad had already fled to Pakistan to seek refuge with brothers in the region.[12]

Later in 1996, Mohammad, needing financing and operatives, was able to meet with Osama bin Laden, where he proposed to train pilots for a plan that involved crashing airplanes into buildings on the east and west coasts of the United States. Bin Laden reportedly was not particularly interested in pursuing the plan at the time as he had recently moved from the Sudan to Afghanistan and was assumedly more concerned with reorganizing and consolidating his position in the chaotic region.[13]

The roaming Mohammad was also trying to find his jihadi nitch, and thus became enamored with jihadi training camps and supporting groups operating in the region and beyond. Mohammad moved his family to Karachi, Pakistan, in 1997. Later the same year, he tried to join Ibn al-Khattab, the famous Saudi militant leader in Chechnya, but failed to transit through Azerbaijan. During this period, Mohammad maintained his ties to al Qaeda's operatives, including Mohammad Atef and Sayf al-Adl, assisting them in various projects. These relationships flourished until bin Laden in late 1998 or early 1999 gave Mohammad the go-ahead for the "planes operation," and the September 11 plot began in earnest.[14]

As the September 11, 2001, attacks have been detailed in other publications, this study will only emphasize that Mohammad was the operational leader, the strategic guide, and the overall commander of the operation. It is also important to note that Mohammad had not sworn an official oath of allegiance, *bayat*, to bin Ladin, and thus preserved his autonomy for the coming years. Mohammad, conforming to his *modus operandi*, was also engaged in simultaneous planning for further operations, as the "planes operation" was viewed as the beginning of a protracted campaign. Following the surprising success of the operation, the hunt for Mohammad, which had been initiated in the mid-1990s, accelerated.

## CAPTURING THE FORREST GUMP OF AL QAEDA

Mohammad, like many al Qaeda operatives with previous knowledge of the attacks, expressed surprise at the magnitude of destruction of September 11. Correspondingly, the strength and determination of the U.S. response to the attacks seems to also have caught leaders such as Mohammad off guard. However, Mohammad's role in the attacks did not become clear until 2002, when interrogations—especially of al Qaeda senior leader Abu Zubaydah—revealed Mohammad to have been the primary organizer.[15]

Even though al Qaeda's operational environment was being constantly restricted after the U.S. intervention in Afghanistan and the strengthening of cooperation with the government of Pakistan, the network continued to plan future attacks and reevaluate existing plans. For example, the September 11 attacks were to be followed by a "second wave" of

attacks in the United States by operatives such as Zacarias Moussaoui.[16] The "second wave" plans seemed to have been postponed or cancelled following intense counterterrorism operations and the arrest of Moussaoui. Nonetheless, Mohammad pushed on with multiple operations.

On September 10, 2001, the same day that the Northern Alliance leader Ahmed Massoud was assassinated by al Qaeda operates in Northern Afghanistan, Khalid Sheikh Mohammad dispatched his trusted operative Mohammad Mansor Jabarah to South East Asia to lay the groundwork for multiple suicide truck bombings in the region targeting U.S., British, and Israeli interests.[17] This operation was reportedly frustrated in December 2001 after the cell in Singapore was dismantled.[18]

A week after the September 11, 2001 attacks, Mohammad is reported to have traveled from his base in Pakistan to Afghanistan to seek out bin Laden, who congratulated Mohammad and instructed him to continue operations with increasing autonomy.[19] Mohammad responded by delegating operational authorities to subordinates and sanctioning further attacks. One such move involved giving $20,000 and a fake passport to Jemaah Islamiya senior operative Riduan Isamuddin, commonly known as Hambali, with instructions to case targets in the region for further attacks.[20] Mohammad is also believed to have had a hand in the April 2002 attack on a synagogue in Jerba, Tunisia, which claimed the lives of 19 people.[21]

In the early stages of the U.S. and allied campaign against the al Qaeda organization and its networks, both sides were caught trying to come to grips with what had happened and what the future direction of the conflict would be. Al Qaeda's cadres began to seek out refuges for regrouping and continuing operations. Mohammad seems to have decided that utilizing the numerous contacts and affiliates he had collected over the years in Pakistan's cities was the wisest method of evading capture while planning future attacks.

Pakistan's cities are teaming with numerous militant groups of all varieties, and Mohammad had connections with operatives and facilitators throughout many of them. One of the most familiar cities to him was Karachi. A huge port city with a population of over 14 million, Karachi offered Mohammad easy access to people, materials, and numerous safe houses from which to evade counterterrorism initiatives. Militant groups have long had a heavy presence in the city, and support networks sympathetic to al Qaeda and Mohammad were well entrenched. The negative side of taking refuge in Karachi, however, was that it was swarming with intelligence officers and agents. Unlike the border regions of Afghanistan and Pakistan, any neighborhood in Karachi could be easily accessed within a moment's notice. Mohammad undoubtedly weighed these advantages and disadvantages, and in the end decided that Karachi was a beneficial place from which to operate.

The city of Karachi was a primary suspect for the location of Mohammad due to his previous residencies there coupled with the known presence of al Qaeda operatives in the city. However, in late 2001 and early 2002, Mohammad's location was still unclear, and indeed the priority of his capture had not yet fully matured. Later in 2002, it became known that Mohammad, Khalid bin Atish, and probably Ramzi bin al-Shibh as well had been hiding in Karachi since at least January 2002. This information was partially based on subsequent raids where it was discovered that Atish had been giving lectures in January and February 2002 to local militants, primarily from the violent sectarian group Lashkar-e-Jhangvi.[22]

Much information is not publicly known concerning Mohammad's movements or counterterrorism activities targeting him in the early months of 2002; however, it can be assumed that since both groups were in a perpetual state of operations, there was much occurring in this respect. Indeed, the Jerba synagogue bombing occurred in April of 2002, thus emphasizing Mohammad's continued relevance. Meanwhile, the U.S. and allied intelligence agencies were in need of more specific information on Mohammad's whereabouts in order to focus their resources.

The break that investigators had been searching for occurred after al-Jazeera investigative reporter Yosri Fouda received an invitation from al Qaeda to conduct an interview in June 2002. Fouda arrived in Karachi and was escorted on a series of well-orchestrated countersurveillance procedures before reaching a residence where he met two of the primary planners of the September 11, 2001 attacks: Khalid Sheikh Mohammad and Ramzi bin al-Shibh.[23]

Eager to take credit for the attacks and to voice their justifications, opinions, and goals, the two senior operatives proceeded over the next 2 days to outline the attacks and impress their ideology upon Fouda. This was the turning point in the hunt for Khalid Sheikh Mohammad.

The importance of the interview rested not in the rhetoric of the two planners, but rather in how the circumstances of the interview were exploited. The first mistake made by Mohammad was allowing the interview to take place in the same city, regardless of its size, as where he was in "long-term" hiding. Fouda was able to identify the sequence of events of his escort to the safe house and determine that he was conducting the interview in Karachi. This enabled joint Pakistani-U.S. tracking teams to focus their immediate energies on the city where they knew he had been hiding.

After finishing the interview, Fouda was not able to return with any of the audio or video tapes that had been recording the 2-day event. Mohammad and Bin al-Shibh had claimed that they needed to black out their faces by their own technical means. Fouda was promised the videotapes but never received them. After some time, Mohammad made his second mistake by allowing an audio recoding of the interview to be sent to Fouda

as documentation. This recording now allowed U.S. signals intelligence (SIGINT) technicians to develop a "voiceprint" of both al Qaeda operatives. These prints enabled U.S. agencies to monitor telecommunications transmissions for matching voice patterns with the hope of further isolating Mohammad or Bin al-Shibh's location. From this point, the manhunt began to pick up momentum.

One of the most successful ways of tracking down the location of leadership figures such as Mohammad is by producing "actionable" intelligence based on information gleaned from interrogations and clues collected in raids of individuals who could be in close proximity to the leader in question.[24] This intelligence must be exploited quickly, as al Qaeda's leaders—although making mistakes at times—tend to practice effective personal security procedures. The trail usually dries up quickly, and thus U.S. and Pakistani joint teams must work in fluid cooperation in order to harness their core competencies and maintain production of this actionable intelligence.

The period between the Fouda interview and September 2002 saw multiple low-level raids and intelligence collection activities focused on uncovering new leads in Karachi. One such raid netted Sheikh Ahmed Salim Swedan, a Kenyan national wanted for his participation in the 1998 embassy bombings. His arrest is reported to have come as the result of information retrieved from the interrogation of members of a sectarian group in Karachi, most likely from Laskar-e-Jhangvi.[25]

A series of raids conducted in September 2002 were the most considerable to date. The most significant of these began on September 9, when two foreigners and a Pakistani were arrested in a Karachi apartment. The suspects reportedly told investigators of two apartments in the Defense Housing district of Karachi that were purported to contain additional militants.[26] Investigators were also chasing down the location of a satellite phone call that was thought to have matched Mohammad's voiceprint.[27] U.S. and Pakistani teams were generating actionable intelligence that was encouragingly pointing to the location of Mohammad.

The following day on September 10, Pakistani officers raided two apartments in the Bahadurabad neighborhood. The terrorists contested the raid with automatic weapons and grenades, which led to the death of two of their comrades and the capture of five. Inside the apartments, investigators found satellite and mobile phones, laptop computers, CDs, $5,000, and other valuable materials that required immediate attention. Mohammad was apparently a frequent visitor of the raided safe houses.[28] Interrogations of suspects and individuals in and around the apartment directed the joint teams to another apartment in a run-down business district of Karachi. Pakistani Interservice Intelligence (ISI) paramilitaries raided this apartment on September 11, 2002. On the one-year anniversary of the attacks on the United States, one of the leading perpetrators was captured.[29]

Ramzi bin al-Shibh had essentially become Khalid Sheikh Mohammad's proverbial right-hand man. The former roommate of Mohammad Atta, the tactical Emir of the 9/11 attacks, bin al-Shibh, was initially meant to take part in the attacks, but could not gain the proper visa to enter the United States.[30] He thus became a primary facilitator and organizer for the 9/11 attack group. Excelling in this role, he became even closer to KSM and began taking leading positions in further operations. He even participated in refining the ideological justifications of al Qaeda's campaign.[31] Although ISI officials and U.S. intelligence officers might have been surprised to have discovered bin al-Shibh instead of KSM during the September 11, 2002 raid, they no doubt knew they had caught a substantial figure with serious implications for future operations. Indeed, KSM referred to bin al-Shibh as the "Coordinator of the Holy Tuesday Operation" in their joint interview with Fouda.

The September 11, 2002 raid not only captured bin al-Shibh, but also provided new intelligence on the activities of KSM and his associates. Authorities expected to find KSM and Khalid bin Atish at the apartment, and indeed they probably had been staying there previously, as Atish's artificial leg was found in one of the rooms.[32] Other materials indicated to investigators that some of those who were operating out of the safe house were involved in facilitating the foreign travel of al Qaeda operatives in Pakistan wishing to exit the country.[33] Also present were the usual assortment of phones, computers, documents, CDs, and money.[34]

Investigators exploited the intelligence gleaned from the previous raids to conduct yet a third raid the next day on September 12 in the Gulshan-e-Iqbal district of Karachi.[35] The raid captured seven suspects, including an Egyptian woman who reportedly told investigators that KSM had stayed in the building several times during the preceding weeks. Mohammad was clearly moving often from one safe house to another, and would receive news of the compromised refuges in very short order. However, Mohammad was still believed at this time to be in Karachi. Subsequent raids in mid-November 2002 led to the capture of eight al Qaeda suspects, although Mohammad was not among them.[36]

Joint U.S. and Pakistani teams were tracking leads generated since September all over Pakistan. In Lahore, a joint ISI and U.S. team conducted a midnight raid on the Manawan compound owned by the prominent Dr. Ahmed Javed Khawaja. The doctor was found to be harbouring al Qaeda operatives identified as Abu Yasir al-Jaziri, Assadullah Aziz, Sheikh Said al-Misri, and Abu Faraj. Khawaja was the third known Pakistani doctor to have been arrested since September 2002. Abu Faraj was reportedly also known to have been a deputy of Mohammad.[37]

The first month of 2003 brought another wave of important raids targeting Mohammad and his associates. ISI agents raided the compound of a highly visible female leader of the Jama'at-e-Islami (JeI) political party in

the Gulshan-e-Maymar neighborhood of Karachi on January 9.[38] She was the wife of the famous Pakistani field hockey player Shahid Ali Khan. In addition, the raid led to the arrest of two Arab members of al Qaeda and information that could be exploited for future operations.[39] After a gun battle the next day in Gulshan-e-Maima district, another raid netted suspected al Qaeda operatives Abu Omar and Abu Hamza.[40] Investigators also uncovered weapons, mobile phones, computers, and $25,000 in cash.[41]

On January 17, 2003, investigators identified four safe houses and captured four suspected al Qaeda operatives with links to Mohammad and the banned group Lashkar-e-Jhangvi.[42] An Australian citizen was also arrested during January and questioned regarding his links to Mohammad.[43] Investigators had started slowly identifying the network of supporters that was facilitating Mohammad's movements or who was otherwise linked to him. They were getting the kind of actionable intelligence that was necessary for breaking up a network and capturing its members.

The arduous process of pursuing leads and finding dead ends, frustrated near misses, big catches, and sleepless hours came to a climax starting in February 2003, when a combination of investigative techniques and intelligence collection methods—and possibly the reward money offered by the United States—resulted in the arrest of Mohammad Abd al-Rahman, son of the infamous Omar Abd al-Rahman imprisoned in the United States.[44] Al-Rahman was arrested on February 14 in the Pakistani city of Quetta. It is reported that al-Rahman divulged valuable details of KSM, with whom he had purportedly been hiding.[45] U.S. technicians were also able to exploit the materials that were left behind in the Quetta compound to trace previous communications to individuals with whom KSM might have sought refuge.

Khalid Sheikh Mohammad's trail was picked up again in Rawalpindi, and the ISI—with the support of the United States—employed surveillance and stalking techniques to arrest at least seven individuals associated with Mohammad. Mohammad had apparently been staying for 10 days with Ahmed Abdul Qadus, the son of an eminent microbiologist in the city with links to the Jama'at-e-Islami political group.[46] Mohammad was caught sleeping when officers raided the house in the early morning of March 3, 2003.

Arrested along with Mohammad and Qadus was Mustafa Ahmed al-Hawsawi, a trusted associate of Mohammad who had, among other activities, facilitated finances for the 9/11 operation.[47] Mohammad was quickly interrogated for more actionable intelligence and then handed over to U.S. officials to be flown out of the country for more extensive, long-term interrogations. After an arduous process, less than a year after the Fouda

interview, the mastermind of the 9/11 attacks was captured along with dozens of other highly experienced associates.

## LESSONS LEARNED

Such a robust and protracted counterterrorism project can provide insights as to how counterterrorism has been practiced in the past, and how it could be effectively practiced in the future. This chapter focuses on five of these lessons. These lessons are in many respects interdependent of one another, since the failure to accomplish one can lead to the marginal benefits of another. A successful counterterrorism campaign, as demonstrated by the KSM case study, will display a positive incorporation of these lessons.

### International Partnering Relationships

Probably the most glaring lesson that this case study of KSM illuminates is the necessity of building strong, trusting relationships between the country hosting the operations—in this case Pakistan—and the other involved parties, such as the United States. This cooperation must be comprehensive, affecting all levels of government from the policymakers to the working-level operators collecting intelligence and conducting raids.

Al Qaeda and those following a similar philosophy and terrorist strategy are a danger to all states. Most major counterterrorism operations that have involved targeting leadership have been the result of bilateral or multilateral cooperation. Mohammad would have continued to elude capture if the vested countries had pursued the hunt unilaterally. The necessity of close cooperation cannot be understated.

### Synergy and Core Competencies

Closely connected to the development of international partnering relationships is defining and exploiting the core competencies of working-level officers and agencies. Developing a synergy of strengths is crucial to breaking highly adaptive and loosely connected networks such as al Qaeda. Capturing the leadership, which is even more evasive, requires the optimizing of joint operations to develop the necessary actionable intelligence.

Pakistan exhibited strengths, or core competencies, in the area of human intelligence (HUMINT); local knowledge; human capital; national and local police capabilities; and the authority to raid, detain, and interrogate suspects. The United States brought to the team refined investigative

techniques such as surveillance and stalking; advanced analytical tools; additional HUMINT resources; and unique SIGINT capabilities, all of which complemented the core competencies of its Pakistani partner.

### Creating and Exploiting Actionable Intelligence

Mohammad did not suffer the same fate as his nephew Ramzi Yousef, who was captured as a result of one of his associates walking into the U.S. Embassy and leading U.S. and Pakistani officers to his location. Rather, Mohammad was captured as a direct result of months of the tireless joint efforts of Pakistani and U.S. intelligence and police officers who created their own "lucky breaks" by exploiting one piece of intelligence information to cause another to appear. Although joint operations are usually far from displaying perfect synergy, the competencies harnessed by the teams involved in the hunt for Khalid Sheikh Mohammad allowed for a continual production of actionable intelligence.

Terrorist groups under the strain of counterterrorism operations continuously adjust their security procedures. They also learn to compartmentalize information in order to insulate themselves when colleagues are detained and safe houses raided. Although this tradecraft is becoming highly advanced, it is permeable, and thus synergetic exploitation teams are necessary to maintain production of actionable intelligence.

### Need to Identify and Provoke Mistakes

Most terrorist leaders are well practiced in covert tradecraft, and have proven to be adept at insulating themselves from detection and capture. Intelligence collection and counterterrorism operations can place significant pressures on leaders, which in turn constricts their operational capabilities, but may not necessarily lead to capture. However, terrorists cannot solely concentrate on evading detection as they must remain relevant by interacting with their audiences and continuing operations. Terrorists can make mistakes when they engage in these necessary activities, and these mistakes can be exploited.

In this case study, Khalid Sheikh Mohammad was an operational commander who tragically decided to dabble in public relations. Mohammad exposed his location and later his voice to an exogenous source. Al Qaeda leaders have since learned of the danger of inviting journalists for interviews and thus now produce their propaganda indigenously in order to maintain full control of the information released. After unnecessarily exposing himself, U.S. and Pakistani intelligence was able to pick up his trail. Since KSM was the chief operational commander, he had to maintain active communications and access to personnel, which further

exposed him to SIGNIT activities and Karachi-focused counterterrorism operations.

Such mistakes will eventually occur when pressure is applied, but they can also happen by chance, as this case depicts. An intimate understanding of the necessary activities and objectives of terrorist leadership can allow pressure to be applied more effectively to induce more mistakes.

### Targeting Partner Organizations

The idea of targeting organizations that support or are otherwise connected to terrorist groups is not a novel concept. This case study serves to underline the fact that rolling up complex and amorphous networks such as al Qaeda requires targeting the groups that can provide an actionable intelligence "cascade" or a piece of information that leads to another, thus developing a trail that can be followed toward more significant targets.

An example of this is the tangential relationships between al Qaeda members and Lashkar-e-Jhangvi (LeJ). The two groups shared resources and facilitated movement for each other in Karachi, and indeed vital information gathered in the KSM case came from LeJ. Jama'at-e-Islami, another group in this case study with links to al Qaeda, is a bit more difficult to target due to the size of the political party and the backlash major investigations might have. However, directly targeting groups with less potential political backlash such as the LeJ, with the goal of obtaining information on al Qaeda in Karachi, can produce real results.

# CHAPTER 11

## THE SIEGE OF BESLAN'S SCHOOL NO. 1

Adam Dolnik

On September 1, 2004, a group of terrorists took more then 1,200 hostages on the first day of school in the North Ossetian town of Beslan. The deadliest hostage crisis, and at the same time the third deadliest terrorist attack in history, was about to unfold. After a 52-hour standoff, the detonation of explosive devices inside the school triggered a chaotic rescue operation, in which 31 terrorists and 331 victims were killed, 176 of them children. The Beslan school hostage crisis was an unprecedented terrorist attack, both in its scale and targeting. It is clear that understanding the lessons of Beslan is one of the key prerequisites of designing counterterrorism strategies for the twenty-first century.

Despite its global notoriety, the Beslan school tragedy still remains an incredibly misunderstood phenomenon, and many questions are yet to be satisfactorily answered. Based on exhaustive open source research in three languages, examination of thousands of pages of witness testimonies and court transcripts, analysis of available video footage, and extensive field research in Beslan, Chechnya, and Ingushetia, including the examination of evidence left behind in the school, visits to the perpetrators' home villages, reconstruction of their trip from their training camp to Beslan, and dozens of interviews with hostages, witnesses, relatives, negotiators, and investigators, this chapter will analyze the myths and facts of the attack, with the clear purpose of identifying the lessons learned. The central focus will be devoted to the Russian response—namely, the crisis negotiation approach and management of the tactical assault. In addition, the chapter will examine events that occurred before Beslan that in retrospect could have provided an intelligence picture concrete enough to prevent the

attack, as well as the media management and investigation aspects of the incident.

The greatest limitation of this chapter stems from the fact that most available accounts of the hostage crisis differ significantly in their description of virtually every aspect of the incident. This is further complicated by government secrecy, vested interests, and media censorship, as well as the fact that even eyewitness accounts are often contradictory. Some details are still being disputed, and therefore some aspects of the crisis cannot be determined with absolute certainty. For the sake of completeness, alternative interpretations of events (or author's comments on the uncertainty of certain pieces of information) are included as notes. For a complete picture, it is important to pay particular attention to these.

The first part of the chapter will provide a short chronology of the crisis. The second part will examine the alleged "intelligence failure" associated with Beslan, and will provide some details on what information was available prior to the attack. The third part will focus on the operational management of the incident, including an assessment of the negotiation efforts as well as some of the success and failures of the rescue operation. The fourth part will look at media management during the crisis, followed by an exploration of some mind-boggling questions that are yet to be answered about Beslan. And finally, the conclusion will summarize the implications and lessons learned for crafting effective counterterrorism policies in the twenty-first century.

## INCIDENT PROGRESSION

This section will provide a basic chronology of the events that unfolded in Beslan. Given the limited space of this chapter, it is impossible to include many fascinating details of the crisis. However, other excellent and highly detailed descriptive accounts exist and an interested reader is strongly encouraged to consult them for additional information.[1]

### Day 1

On September 1, 2004, just after 9 A.M., a group of terrorists arrived at School No. 1 in Beslan, Russia, and with swift action took over 1,200 people hostage, also deploying 127 homemade explosive devices around the school building. The initial response to the incident consisted of a brief shootout of armed parents with the hostage takers. An hour and a half after the takeover, soldiers and policemen finally started arriving at the scene. This is amazing considering the fact that the main police station is located a mere 200 meters from the school.[2] The initial telephone contact was reportedly handled by a local Federal Security Service of the Russian

Federation (FSB) negotiator, Vitalii Zangionov.[3] He spoke to a man who on the inside was known as Ali, but for the negotiations used the name "Sheikhu." From the very start, it was clear the terrorists were instructed by their leadership to speak only to high-level officials. According to hostages who sat close to Ali, he spoke with someone on the phone ending a conversation by saying: "I will only talk to the president." His phone rang again in 15–20 minutes. "President?" "No, his aide." Ali interrupted the talk at once.[4] In the meantime, the authorities compiled their first list of hostages and publicly announced that there were only 120 of them.

Around this time, doctor Larisa Mamitova was treating two of the hostage takers who were injured in the initial takeover. Mamitova offered her help in communicating with the authorities, and was eventually sent outside by the leader of the group, Ruslan Khuchbarov (a.k.a. "Polkovnik") with the following hand-written message:

> 8-928-738-33-374[5]
> We demand for negotiations President of the Republic Dzhosokhov, Zaizikov, president of Ingushetia, Roshal, children's doctor. If they kill any one of us, we will shoot 50 people to pieces. If they injure any one of us, we will kill 20 people. If they kill 5 of us, we will blow up everything. If they turn off the light, even for a minute, we will shoot to pieces 10 people.[6]

From early on, the terrorists selected out two groups of men and led them outside the gym. One group had the task of barricading windows, while the other was forced to kneel in the corridor with hands behind their backs facing the wall. The first group never returned. Once its job was finished, they were led to a classroom on the second floor, lined up against the wall, and shot. Their bodies were thrown out of the window.

As the incident progressed, tensions grew even higher. In the afternoon, the hostages overheard an argument between the terrorists and their leader, in which particularly the two female attackers present expressed their displeasure with holding children hostage. Around four o'clock in the afternoon one of the suicide bombers detonated, killing five or six of the men lined up in the hallway and injuring many more.[7] Those injured were later sprayed with gunfire, and their dead bodies were thrown out of the window. At this point, the number of dead hostages already reached 21.

In the meantime, negotiations continued. According to the now former President of Ossetia, Alexander Dzasohov, a deal to exchange the children for the release of 31 terrorists arrested in an earlier raid in Nazran had almost been made, but at the last moment the terrorists backed out. When Mikhail Gutseriev—the former speaker of the Russian State Duma and president of the "Rusneft'" oil company—asked the terrorists

about specific demands, Sheikhu suggested that they be handed over in writing.[8]

After 7 P.M., one of the men demanded by the terrorists for negotiations, Dr. Leonid Roshal, entered the picture. Never requested by the authorities, he flew to Beslan on his own initiative after being informed of the situation by journalists. Once he reached the school, Roshal called the terrorists expressing his readiness to enter with water and medicines, but was told that he could only enter the school with the other three men demanded earlier; if he approached alone he would be shot.

### Day 2

In the early the morning of September 2, Mamitova overheard a radio broadcast reporting that only 354 hostages were held inside the school, and that the telephone number provided by the terrorists was nonoperational. She asked to see Polkovnik and informed him of the report, also suggesting to send another note with a new telephone number. Polkovnik tore a piece of paper from a notebook and handed it over to Mamitova. "Write again," he said. "Our nerves are at a breaking point . . ."

As the day progressed, the terrorists were becoming increasingly angry and frustrated, mainly due to the repeated government claims made in the media that the number of hostages was 354, and that the hostage takers had not presented any demands. The hostage takers saw this as a deliberate attempt to obstruct negotiations and to justify the launching of an armed assault on the school. Infuriated, around noon of the second day, the terrorists called a "dry strike" and stopped giving the hostages water. From this point on, the hostages really started to suffer from the lack of food, water, and deteriorating conditions inside.

Just before 2 P.M., the terrorists' mood suddenly changed and they became visibly excited. From the top floor they announced on a megaphone that "big person" was coming in for the negotiations. This "big person" turned out to be Ruslan Aushev, Afghan war general and former Ingushetian president. Aushev and Khuchbarov held a discussion in the teachers' room,[9] and at the end of the meeting, Aushev was handed a handwritten note dated on August 30, 2004, addressed to President Putin "from Allah's slave Shamil Basayev":

> Vladimir Putin, you were not the one to start the war, but you could be the one to end it, that is if you find the courage and resolve to act like de Gaulle. We are offering you peace on a mutually beneficial basis in line with the principle "independence for security." We can guarantee that if you withdraw the troops and recognize Chechen independence, then: We will not strike any political, military or economic deals with anyone against Russia; We will not have any foreign military bases even temporary ones, we will not support

or finance groups fighting the Russian Federation, we will join the Com-
monwealth of Independent States, we will stay in the ruble zone, we could
sign the Collective Security Treaty, although we would prefer the status of a
neutral state; we can guarantee that all of Russia's Muslims will refrain from
armed methods of struggle against the Russian Federation, at least for 10–15
years, on condition that freedom of religion be respected. . . . The Chechen
nation is involved in the national liberation struggle for its Freedom and In-
dependence and for its preservation. It is not fighting to humiliate Russia or
destroy it. As a free nation, we are interested in a strong neighbor. We are
offering you peace and the choice is yours.[10]

The terrorists set a deadline for the Kremlin to respond by the morn-
ing of September 4.[11] Aushev promised to hand over the letter and asked
for the release of children.[12] Khuchbarov agreed, and the nursing mothers
were released along with one baby each, some of them having to leave
their other children behind. After leaving the school with the 26 released
hostages, Aushev immediately transmitted the text of the letter to the
Kremlin with an urgent plea for negotiations. In addition, a list of specific
demands was also handed over in writing. These demands were never
made public, but available evidence suggests that the list corresponded to
the one later provided by Basayev himself:

– We demand that the war in Chechnya be stopped immediately and that the
  withdrawal of forces be carried out;
– We insist that Putin immediately resigns from his post as president of the Rus-
  sian Federation; and
– We insist that all hostages, be it children or adults, go on hunger strike in sup-
  port of our demands.

In the evening of the second day, Aslanbek Aslakhanov, Putin's advi-
sor who was one of the negotiators demanded by the terrorist, called the
school. He was informed that he could come to Beslan to negotiate only
if he had the authority to do so granted by Putin. Aslakhanov answered
affirmatively and added "some demands are unrealistic and you know it.
Some we will fulfill. I'll talk to the president." Sheikhu replied: "If you do,
then see you tomorrow at 3 P.M., we'll hold an official meeting." Accord-
ing to his own account, Alsakhanov then spoke to President Putin, who
allegedly stated that "the children's lives must be saved at all costs. Agree
to everything. But the first two demands cannot be met."[13] This is an ex-
tremely interesting point. If Aslakhanov did indeed talk about the possi-
bility of satisfying some of the terrorists' demands, it clearly contradicts
the official claim that no demands were made. Similarly, Putin's comment
about the unacceptability of the "first two demands" confirms their ex-
istence. It is not clear, however, what the president meant by "agree to

everything"; if the first two demands—withdrawing of troops from Chechnya and his own resignation—were unacceptable, then there was nothing else to agree to but the demand that hostages go on a hunger strike. So while the statement "agree to everything but the first two demands" by itself may be interpreted as evidence of the Russian leadership's willingness to offer almost any concession in order to save the lives of the hostages, in the context of the actual list of demands it translated into agreeing to absolutely nothing.

The terrorists' desperation to speak to the authorities was evident inside the school. Polkovnik even sought out Mamitova and told her that if there were any members of parliament or other politicians that she knew, she should call them. Mamitova remembered hearing from someone in the gym that the children of the North Ossetian Parliament speaker Mamsurov were also among the hostages. Before they were summoned to the teachers' room, Ali took aside the boy, hugged him, and kissed him on the head. "Don't worry. Nothing bad is going to happen to you. We just need you to help us jumpstart the negotiations. Talk with your daddy and tell him what's going on."[14]

When Mamitova and the children finally managed to get through to Mamsurov, he replied: "The government has ordered me to leave my parental emotions at home." Visibly upset, Khuchbarov then turned on the TV, where the government media were still reporting that there were only 354 hostages, and where Dr. Roshal was claiming that kids were not in immediate danger, and that they could survive 8–9 days without water. Khuchbarov then send Mamitova and the kids back to the gym. "Go, nobody needs you."

On the evening of September 2, Ali came into the gym visibly distressed. When asked by Larisa Kudzyeva what had happened, he replied: "I don't want to lift my foot from the trigger,[15] but I'm forced to do it. They don't want to talk. The answer is no. They told me that Russia will never talk to terrorists. That the problem does not exist." When she asked what that meant, Ali replied: "I don't know what that means. They told me I have a day and a half to sort it out." Kudzyeva countered: "That can't be, maybe you didn't understand." "No, I understood. I understood everything."[16]

The authorities have a different story. According to official sources, Roshal called the terrorists in the evening of the second day and offered them free passage. The offer was allegedly bluntly refused.[17] In the evening of the second day, Aushev suggested to engage Aslan Maskhadov, the last elected president of the separatist government, for negotiations. Maskhadov had publicly condemned the attack and this gave a glimpse of hope.[18] By midnight, among the civilian segment of the local crisis staff, an agreement was allegedly drafted, containing key components oscillating around negotiations between Russian leaders

and Maskhadov, a plan for Chechen autonomy, and a gradual troop withdrawal.[19]

### Day 3

The morning of September 3 brought some optimistic news: Maskhadov had sent a message confirming that he was ready to fly to Beslan to negotiate. The local authorities responded by announcing: "Important new faces are about to enter the negotiation process, they will arrive soon." Only an hour after this announcement the storming started, leading some sources to speculate that the explosions that triggered the mayhem were no accident, and that their purpose was to deny Maskhadov the chance to come in and save the day.[20] The federal authorities in turn, categorically denied Maskhadov's willingness to come to Beslan to negotiate.[21]

The small glimpse of optimism that was present outside following the morning announcement, however, was not shared by the people inside the gym. Conditions were increasingly deteriorating, with some of the children resorting to drinking urine to survive, and at least two of the kids already reaching the verge of death. The terrorists acted increasingly aggressive, became even less responsive to hostages' anxious pleas for water, and their anger grew with their inability to quiet the hostages down.

At 1:02 P.M., following a morning agreement with the terrorists to allow the collection of bodies of the hostages killed on the first day, a lorry approached the school and suddenly, several shots were fired. Almost simultaneously, the first explosion inside the school ensued, followed by a large explosion exactly 22 seconds later. Shortly thereafter, all hell broke lose. By this point the firefight had become irreversible. At 6:13 P.M., there was one last contact with the hostage takers. "Its all your fault. Say hi to you Putin!" Around 2 A.M., more then 12 hours since the initial explosions, the last shots were fired.

### INTELLIGENCE FAILURE

Even several months before the Beslan tragedy, there were a number of indications of a heightened level of terrorist activity in the region, as well as some specific indications of an impeding attack. Ossetia itself had been the site of several recent attacks, most of which had specific links to the attackers later found in Beslan. On June 5, 2003, a woman dressed in a white overcoat killed 18 people when she detonated her explosive belt while trying to board a bus carrying Russian airmen to their base in Mozdok. Two months later, that same base became the site of another attack, when two suicide bombers drove an explosive-laden truck into the 58th Army

military hospital, killing 50 people and injuring many others.[22] At this time, the authorities in Moscow were already in possession of a suspected suicide bomber named Zarema Muzhakhoyeva. According to Muzhakohyeva's interrogation reports, she was supposed to be the original bomber during the first Mozdok attack, but lost her nerve and pretended to be ill and thus unable to participate. She was then sent to Moscow with two other women, and on July 5, 2003, she witnessed the demise of her two colleagues during the twin suicide bombings at a rock concert in Moscow's Tushino Airfield, in which 18 people died. Five days later, she herself had been arrested and accused of attempting to commit a suicide attack near the Mon-Café restaurant in the heart of Moscow. A police officer died while trying to defuse the device.

Muzhakhoyeva's interrogation following her arrest led to the apprehension of Rustam Ganiev, who was accused of recruiting and training suicide bombers for Basayev's *Riyadus-Salikhin* (RAS, a.k.a. *Riyadh-as-Saliheen,* The Reconnaissance and Sabotage Battalion of Chechen Martyrs), and whose two sisters had died in the attack on Dubrovka theater in Moscow during October 2002. Ganiev had very close links to a number of the Beslan terrorists. For instance, the one person who was arrested along with Ganiev was Mayrbek Shaybekhanov (who would however under mysterious circumstances later be freed).[23] In September 2004, Shaybekhanov was one of the terrorists holding 1,200 people hostage in the Beslan school along with his wife (who was allegedly one of the suicide bombers).[24] Another Beslan terrorist with close links to Muzhakoyeva and Ganiev was Khanpashi Kulayev, who coincidentally was also supposed to be sitting in jail at the time of the Beslan attack.[25] According to Muzhakoyeva's testimony, she and Khanpashi not only belonged to the same division, but also "practically lived together" though officially never married.[26] Similarly, one of the Beslan leaders—Vladimir Khodov—was also not unknown to authorities, having been previously wanted on charges of rape, and was also publicly sought for the February 2, 2004, bombing in the center of Vladikavkaz in which three military cadets died.[27] Although a wanted man, Khodov freely moved around and even visited his home village of Elkhotovo in Ossetia several times.

The fact that at least two of the Beslan terrorists were supposed to be in jail at the time of the attack, and that another one moved around freely in his home village despite being a wanted man, is highly disturbing. In addition, more indications of heightened terrorist violence were visible in neighboring Ingushetia, where the presence of the Beslan attackers was felt even more. On September 15, 2003, a suicide bomber detonated a 600-pound truck bomb 16 feet short of the newly constructed FSB building in Magas, killing three people.[28] One of the key organizers of the attack was Ruslan Khuchbarov—the same man whom the authorities accused of training suicide bombers for the operations in Dubrovka

and Mozdok, and who would later lead the Beslan commando team.[29] Khuchbarov was also one of the leading figures in the June 21, 2004, attack on the now former Ingushetian capitol of Nazran,[30] in which 200 attackers wearing local police uniforms set up roadblocks intercepting and killing real policemen and interior troops who raced to reinforce their colleagues. The attack followed a statement by Basayev that RAS was ready to launch a series of special operations that would be "very painful for the Putin regime and [would] take [Russia] by surprise."[31] Nearly 100 people, including several ministers, died before the fighters withdrew and disappeared in the largest Chechen operation since 1999.

Besides Khuchbarov, at least six other Beslan attackers participated in this earlier attack. In addition, 31 of the attackers who were arrested during the Nazran raid later became an object of Beslan negotiations. And finally, it has now been reliably established that among the weapons found in the possession of the terrorists in Beslan were seven Kalashnikov assault rifles and three pistols that had been stolen during the attack on Ingushetia. During the month of July, a number of additional incidents related to the Nazran raid and Beslan took place in Ingushetia. These included the death of the deputy police chief of Malgobek and the deputy head of the Malgobek crime police, who were killed in a shootout with suspected terrorists on the city's outskirts; the discovery of a large stockpile of weapons from Nazran in the woods near Sagopshi; and two shootouts near the same village, in which one militant was killed and another escaped.[32] Little did anyone know that in the forest on the hill overlooking Sagophsi and Psedakh was a training camp in which the Beslan team was preparing for the operation, and that the man who escaped from the shootout was Musa Tsechoev, whose body would later be found among the 31 corpses of Beslan terrorists.[33] Apparently, the terrorists from the camp were able to move around freely in their home villages. This is not too surprising given then fact that the small village of Psedakh officially has one policeman, who is supposed to be on duty in the village only during daylight. In practice none of the Psedakh residents consulted have ever even seen him.[34]

All of these activities in the region should have had the local authorities on high alert. And indeed, just 12 days before the Beslan attack, the Russian Ministry of Internal Affairs allegedly had sent a telegram to all regional police commanders, warning about a possible "Budyonnovsk style operation" in Northern Ossetia. This information apparently became even more specific several days later. One Beslan resident, Baliko Margiev, asked a traffic policeman just 4 days before the attack why his car was being so unusually carefully inspected, and was told that "a group of militants had penetrated Beslan."[35] In retrospect, this intelligence was accurate, as one of the terrorists was spotted by two Beslan residents in the local marketplace a week before the attack. Similarly, Beslan

residents reported several unknown men sitting on boxes in the courtyard of the school during the week leading up to the incident.[36] And finally, according to a report to Interior Minister Rashid Nurgaliev, at 5 A.M. on September 1, 2004, police in the Chechen town of Shali detained a man named Arsamikov who told them that there was a plot to seize schools in Beslan on the very same day.[37] Considering the fact that there are only four schools in Beslan, and that School Number 1 was by far the biggest and most prominent one, it is incredible that even after receiving this intelligence, the school was guarded by just one unarmed female police officer who did not even have a mobile phone.[38] Even more disturbingly, despite elevated threat levels, the local traffic police who guard major intersections near the school every day were not present on September 1. According to officials, the two officers who were supposed to have served as armed security at the school had been sent off to the Caucasus Highway, allegedly to provide extra protection for a high-ranking official who was supposed to pass through. As of this writing, nobody is able to explain who that official was supposed to be.[39] With all of these early warning signs, concrete intelligence, elevated risk levels, and thereby associated increased security measures, how is it possible that a large group of armed militants was able to travel all the way to Beslan? There are still considerable doubts and many conspiracy theories floating around in Beslan.[40] Police corruption is certainly one feasible explanation. But more importantly, the government's reactions in the wake of Beslan have directly contributed to the terrorists' goal of undermining government authority in the eyes of its own citizens.

It also does not help that the only police officer who actually stood up to the terrorists on their way to Beslan and tried to stop them received less then a hero's welcome—the fact that he was not killed was enough for the police to accuse him of being a terrorist accomplice, and torture him during an interrogation.[41] This is not a good precedent for any police officer that finds himself in a similar situation in the future. The message is: if you do something heroic such as single-handedly stand up to a group of terrorists on their way to the target, you will end up being fired from your job with lacerations on your face and crushed testicles.[42] Looking at Gurashev's fate, can anyone really expect an average police officer to go out of his way and risk his life to prevent another Beslan in the future?

## OPERATIONAL MANAGEMENT

Even more pressing and disturbing than the intelligence failure is the bleak picture surrounding the storming of the school, and the contradictory statements of various officials with regards to the negotiation efforts. This section will focus on some of the discrepancies and mistakes associated with operational management.

### Negotiations: Missed Opportunities

The negotiability or nonnegotiability of the Beslan crisis will always be an issue of much contention. It is not possible to provide a fully detailed analysis of the negotiation aspect in this short chapter, but the author has elaborated on this topic in much greater detail elsewhere.[43]

The official Russian position is that a maximum negotiation effort was undertaken but with no result. Throughout the crisis, the federal authorities kept denying the existence of any demands whatsoever on behalf of the hostage takers, implying that there was nothing more that could have been done to save the lives of the hostages but to storm the location. However, these statements are an evident manipulation of the reality. Throughout the crisis the terrorists presented a clear set of demands and were eager to speak to the authorities, but according to hostages, no one would talk to them.[44] Yes, it is true that the terrorists also kept repeating that they came to Beslan to die, that the hostages were "not needed by anyone," that "no one will leave alive." But it is beyond reasonable doubt that the terrorists' primary objective was to achieve a specific set of political concessions. Yes, their stated demands were by themselves difficult to achieve, both logistically and politically.[45] However, the fact that their proposal included multiple demands and specific conditions provided much room for discussions without necessarily giving in.[46]

Beslan was, of course, an extremely challenging situation with huge stakes, a number of executed hostages, and extremely well-prepared terrorists who seemed to be holding all the cards and who had an obvious knowledge of the hostage negotiation playbook. However, this by itself was not a sufficient reason to give up on the possibility of a negotiated settlement altogether. This is especially true when the terrorists have taken many preventive measures such as fortifying the location, placing a large number of explosive devices throughout the school, booby trapping possible entrances and monitoring them with remote control surveillance cameras,[47] deploying snipers in strategic positions, using gas masks and sentry dogs in order to prevent the use of anesthetic gas, and employing other protective measures designed to make a possible rescue attempt as costly in terms of loss of human life as possible. Under such conditions, is a full breach really the preferable option? Or even a plausible worst case alternative? Do other, less costly means of resolving the situation exist?

The terrorists' demands should have been broken up into smaller pieces, which would then be discussed in more detail. For instance, consider the demand that the president declare an end to the war in Chechnya. The negotiators should have focused on asking about the specific language and semantics of the text. Further, on day two it was clear that the number one priority of the negotiations had to be the improvement of

the conditions inside the school to improve the survivability of hostages. Clearly, the situation in which the hostages were not being given water could not have lasted much longer. The authorities should have worked step by step to offer some small concession to facilitate the improvement of the conditions inside, and then work toward the prolongation of the incident in an attempt to wear out the hostage takers, while at the same time working to get as many hostages as possible out of the school in the process. The terrorists stopped giving water to the hostages on the second day, after the officials repeated their claim that there were only 354 people held in the in the gym. Perhaps publicly admitting the actual number of hostages could have been exchanged for water for them?

In the end, it would be difficult to argue that Beslan could have been solved without the loss of life. Nevertheless, even if the incident was bound to end in bloodshed, maximum effort should have been made to get as many hostages out of the school as possible before resorting to a violent solution. Not only did the federal authorities fail in this task, they failed to even seriously try. Even more disturbingly, the official re-actions and statements on television—such as the deliberate and clearly false downplaying of the number of hostages inside—added even more fuel to the fire. As in past hostage crises in Russia, the Kremlin seems to have had only one goal in mind: to discredit the separatist leadership and to teach Basayev a lesson. Many people may applaud Putin's "courage" and argue that the "no negations with terrorists" policy should be upheld at all costs, and that the "national interest" should come before the fate of individual hostages no matter how painful the decision. It is not the issue here to debate the pros and cons of this argument. The point is to recognize that in the handling of the Beslan crisis, political realities played the main part, and that the lives of hostages inside the gym were considered only secondary to the "national interest." As a result, the *worst* possible lesson we could learn from Beslan is that it is impossible to negotiate with the "new terrorists."

### Rescue Operation

From the beginning, the response management of Beslan was highly disorganized. The incident was handled by two different command centers with little cooperation among them. The first one was the "civilian" command center manned by local politicians such as Ossetian president Dzosokhov, while the other one was a command center set up by two FSB Deputy Directors (Vladimir Pronichev and Vladimir Anisimov) several hours after the takeover.[48] There was a well-built man standing in front of the door of the federal command center, who would not let anyone in, including local officials.[49] According to Russian newspaper *Novaya Gazeta*, shortly after Russian commandos began to storm the school "the

group of FSB employees quickly packed up their equipment and left the administration building in an unknown direction."[50]

The chaotic nature of the setup was underlined by the number of agencies that were present at the site, including the elite Alfa and Vympel units, Military Intelligence troops, Interior Army, Local FSB division, Center of Special Purpose, local police, Army Secret Police, Special Purpose Detachment of Militsiya, Rapid Deployment Special Troops, and regular Russian Army.[51] All of these had their own chain of command, and mutual communication among them was limited. Two principal perimeters existed, with the external perimeter set up by the 58th Army about 3 hours into the attack, who were joined by some local policemen who took up positions on their own initiative without any specific orders or instructions. In the inner perimeter, there were a number of different operational teams and local civilians with guns. This presented a major problem, as this perimeter was too close to the school, and exchanges of sniper fire with the terrorists were common. On the second day, the terrorists even fired a rocket-propelled grenade at a car to force the armed men outside to keep their distance. In addition, the armed locals, with vivid images of the 129 dead hostages in the Moscow theater hostage crisis in mind, threatened to shoot the federal troops in their backs if they started storming the school. Throughout the incident, these local volunteers were never disarmed and neutralized, adding a high level of instability to the already bad situation. An additional mistake was the fact that the double perimeter, despite the large number of troops present, was far from secure. For instance, Russian journalist Madina Shavlokhova—who arrived several hours into the crises and was looking for the school—accidentally found herself right in the courtyard without ever running into a single police or Army barrier.[52]

In short, the entire setup of the operation was highly chaotic. There was no clear idea of who was in charge, too many bodies without sufficient communications and coordination, and armed civilians who were not instructed or controlled in any way. In other words, the operational scene was a disaster waiting to happen. Given these circumstances, it is no surprise that the origin of the explosion that triggered the storming is a subject of speculation rivaling that of the JFK assassination. No less then 14 different versions of what allegedly caused the initial explosion have been uncovered thus far. About four of them appear to be plausible, but in each case there are many other pieces of evidence that do not seem to fit. The two versions with the highest level of plausibility include an accidental detonation of the first bomb and the "sniper theory." The former is essentially the official version, which claims that one of the bombs that was attached to a basketball hoop by adhesive tape detonated accidentally, after it slipped off the hoop following the meltdown of the glue in the tape in the unbearable heat of the gym. The second explosion was then allegedly triggered deliberately by the terrorists who thought they

were being stormed. However, this version has many holes. First is the fact that it was not the bomb in the hoop that actually exploded first, but one that was hanging on a string connecting the two hoops. Second, according to hostages, the bomb exploded in the air, suggesting that it was triggered by something other then impact with the floor. Third, according to Andrei Gagloyev, the commander of the engineering troops of the 58th Army, "such explosive devices cannot be triggered by hitting the floor."[53] Fourth, the fact that the explosion took place at the very same moment that a truck pulled up to collect the bodies of the 21 men who were killed earlier suggests a likely connection between these two events.

The sniper theory received a lot of publicity after the testimony of the sole surviving terrorist, Nur-Pashi Kulayev, in which he claimed that the detonation occurred as a result of a sniper killing the terrorist whose foot was constantly on the detonation pedal preventing the circuit from closing. But in Beslan it was the story of Fatima Dudiyeva, the local policewoman who later became a hostage, which introduced the sniper theory long before Kulayev's testimony. Right before the detonation, she was sitting next to the window trying to stretch her back and her arms came upward. At that moment she "heard a sound like a stone being thrown through the window. And then there was pain." She looked at her right hand and it was bleeding out of a hole in her palm.[54] Shortly thereafter, there was an explosion. Ala Ramonova, another hostage confirms this: "Right before the first explosion, something flew into the gym with a whistling sound, and the terrorist standing on the switch clutched his side and fell over."[55] Not surprisingly, the federal commission in Moscow was extremely quick to discredit the sniper theory. Head of the commission, Alexander Torshin explained that the glass in the windows of the gym was coated with a special plastic called "lexan" that made it impossible for a sniper to see anything that was going on inside. "Besides," said Torshin "this terrorist [with the foot on the switch] was standing in a 'dead zone' where he could not have been in the line of fire. Terrorists are not idiots."[56] However, even if lexan was used to coat the glass, as early as the first day, the terrorists had broken the top parts of the windows, fearing the use of gas as in the Moscow Theater, thus effectively removing any obstacle in visibility. In addition, from the upper floors and the roof of one of the two five-story apartment buildings near the school where snipers were positioned, it is not only possible to see inside the gym through the top parts of the windows, but even the spot where the terrorist was standing is in a clear line of fire. In addition, the fact that the blast took place as the lorry pulled up to collect the bodies does suggest a level of coordination, as the distraction provided a good opportunity to strike.

Another point of controversy, besides the initiation of the storm, was its course. From the very outset, the officials were claiming that no storm was ever even considered as a possibility. For instance, from the

very beginning FSB First Deputy Director Vladimir Pronichev spoke categorically against any military scenario, claiming that as a matter of principle, the FSB did not develop plans to attack the school.[57] This, of course, is nonsense. Having a rescue operation plan in place as an option of last resort, should the hostage takers start killing hostages, is one of the basic components of any response to a situation involving hostages. Even in cases where negotiation takes absolute priority, having a rescue operation plan in place (and therefore posing a plausible threat to the hostage takers) is an indispensable part of the negotiations strategy. A rescue operation plan was certainly in place.

According to witnesses, tanks and armored vehicles pulled up to the school on the evening of the second day.[58] These were not only later used as a cover for the advancing Spetsnaz troops, but also used to fire tank shells at the school during the later stages of the rescue operation. According to testimony given by Sergeant Godovalov, the commander of one of the T-72 tanks in question, the tank fired on the school at the orders of an officer of Alpha, the elite antiterrorist unit. According to the testimony, the tank "fired four times at a spot where one of the terrorists was believed to be located, and then was moved to another area, where, again on the Alpha officer's orders, it fired three "antipersonnel rounds at three outermost windows on the school building's second floor."[59] Whether the tank fire took place while hostages were still at the gym is a point of much controversy. For instance, Andrei Gagloyev, commander of the engineering troops of the 58th Army, testified at the Kulayev trial that the tanks fired when the gym did not contain any more hostages.[60] However, First Deputy Chairman of the Parliament of North Ossetia Izrail Totoonti disagrees, claiming that he first heard the tanks fire at about 2:00 P.M. in the day. "That was before we began bringing hostages out of the school."[61] Totoonti's version is in concert with the testimonies of hostages, and a source of much anger on behalf of Beslan residents who have lost their loved ones in the siege.

Tanks were not the only equipment not exactly suitable for hostage rescue operations that were brought to Beslan. Even more controversial is the issue of the use of Shmel flamethrowers, given the fact that according to the Beslan Mothers Committee, in the case of 218 of the 331 fatalities, burns were established as the cause of death.[62] The issue of Shmels first came up after residents of Beslan found several launchers and passed them over for investigation. Originally, the authorities denied the use of these weapons, claiming that the discovered launchers belonged to the terrorists. However, two of the used launchers were discovered on the roof of an adjacent building, suggesting that the Shmels were fired from the outside. This is consistent with the testimonies of hostages who claimed that even after the initial explosions there was only a small fire inside the gym. At the same time, melting plastic was dripping on them from the

ceiling, long before any fire was visible from the inside. Eventually, an aide to the military prosecutor of the Vladikavkaz garrison, identified as Major of Justice Eminov, confirmed that Shmel flamethrowers were used, saying that they may have "possibly killed hostages or caused them bodily injuries of various degrees of severity."[63] It did not help that the fire trucks that arrived at the scene ran out of water almost immediately.

Overall, the rescue operation was a huge blunder. That is not to say that hostage rescue teams in other countries would have necessarily come out with a significantly lower death toll in such difficult circumstances.[64] But even if one considers the possibility that the security services might not have been the ones initiating the storming, the use of tanks and flamethrowers to fire at the school while it still contained hostages is mind boggling. Everything suggests that the lives of hostages were again considered secondary to the punishment and elimination of the terrorists in order to teach them a lesson. The main problem (other then the tragic deaths of so many hostages, of course) is the fact that this heavy-handedness of the Russian authorities actually played into Basayev's strategy. Basayev has learned in Budyonnovsk, Kizlyar, and Dubrovka that the Russian leadership can *always* be expected to launch a rescue operation—typically around the end of the third day of the crisis—and that these actions produce on average more than 130 deaths among the hostages. He has learned to use this fact to his advantage. Consider Basayev's claim of responsibility for Beslan in which he stated: "We came there not to kill people but to stop the war, and if it works out that way, to force the Russian leadership to kill its own civilians, if only through this to force the lying and vain world to understand what is really going on, to lay bare our wound and pain, because people don't see what is happening in Chechnya. They see it only when huge actions like this one occur on the territory of Russia itself."[65] The disturbing predictability of the Russian response clearly has played into Basayev's hands, and also provides a lesson for other countries that may face similar situations in the future. Even though our instinct may be to violently strike back at the terrorists, we should realize that by doing so we are likely to be playing right into the hands of their strategic calculus.

## MEDIA MANAGEMENT

Since media coverage can directly influence the outcome of a hostage crisis, media management is an absolutely crucial part of the response strategy. First, the media picture shapes perceptions among the general population in terms of what is going on, thereby directly impacting the perception of the most effective course of action, as well as the level of perceived urgency of that action. Second, media coverage also influences the perceptions of the hostage takers, as it serves as one of the main

sources of information for the people on the inside. In moments when the negotiations hit a roadblock, televised coverage of public statements can be used to communicate massages to the hostage takers indirectly. This is especially the case in the aforementioned hostage crises in Russia, where the hostage takers always followed the reporting on television and radio in order to gain knowledge about what was going on the outside. And third, media coverage has always been one of the most important tools in resolving hostage crises, especially ones motivated by political or ideological grievances. In such cases, the hostage takers are typically interested in conveying their point of view to the highest number of viewers possible. In such a setting, the access to media has historically been used as a valuable bargaining chip to obtain the release of hostages or some other concessions on behalf of the hostage takers. On the other hand, the media's impact on the outcome can also be a very negative one. In the past, a number of hostage crises have been complicated by irresponsible reporting such as the airing of live footage of rescue teams moving into position and therefore ruining the element of surprise, or the revealing of the identity of the hostages passing information from the inside, thereby leading to their execution. As a result, media management is one of the key issues that need to be handled with utmost attention in any hostage situation. This requires a mutual understanding of media and government interests.

From this perspective, Beslan was again a colossal failure. The information that was released to the media was manipulated, moreover, in such a blatant and obvious way that everyone in Beslan knew that this could not have been a mistake, including the terrorists. On the first day, Lev Dzugayev,[66] the spokesman of the North Ossetian President, identified the number of hostages inside the school as 150, later correcting this number to an implausible final figure of 354. This was School Number 1, the largest school in Beslan, housing nearly 1,000 students. Moreover, it was September 1, a day when many parents and family members accompany the younger children to school for a special celebration known as the Day of Knowledge. In addition, the fact that the number of hostages was over 1,200 was conveyed by the terrorists in telephone conversations with officials and to Ruslan Aushev who personally visited the gym. Aushev was even handed a videotape that featured the scenes from the gym, where it was obvious that there were at least 1,000 hostages present. The authorities immediately and stubbornly claimed the tape was blank, even when it was later shown on the NTV station. Mamitova, the doctor who on two occasions brought out the terrorist demands on a piece of paper, also conveyed the real number of hostages on both occasions. In short, it is beyond reasonable doubt that the actual number of hostages in the gym was known to every person in the region, as demonstrated by

the fact that 1,045 hospital beds in four Beslan and Vladikavkaz hospitals were being freed in preparation for the worst. And yet, the authorities continued to insist that the number of hostages was 354. This approach not only angered the local residents and undermined public confidence in the government statements; it was also directly responsible for escalating the tensions in the crisis. The terrorists knew immediately that the government was purposefully downplaying the number of hostages, and interpreted this move as public relations preparations for the aftermath of an inevitable rescue operation. Immediately after the number 354 was announced, the terrorists started to run around the gym screaming: "They say that there are 354 of you. Nobody needs you. Maybe we will just reduce you to that number!" In addition, when this number was consistently repeated even on the second day, the terrorists stopped giving the children water. Overall, the government's insistence on the unrealistically low number of hostages made a bad situation much worse.

## INVESTIGATION

The confidence in the authorities' handling of the Beslan crisis was by no means strengthened in the aftermath of the attack and the subsequent investigation. Many questions still remain unanswered. The first such question concerns the issue of the number of terrorists involved. Official figures indicate that 31 terrorists were killed, and 1 captured alive. Since the authorities claim that not a single terrorist escaped, the number of terrorists participating in the attack is officially 32. However, there is a consensus among hostages and residents of Beslan that the number of terrorists was much higher, with most estimates falling into the range between 50 and 70 attackers. And while the authorities dispute even the possibility that anyone got away, numerous pieces of evidence seem to point in this direction. First, there are specific terrorists that "disappeared" after the second day, never to be seen again even among the dead terrorists. Amongst them was Ali, one of the leaders and the main negotiator. Hostages also report the disappearance of a number of Slavic-looking terrorists, including a woman with fair hair tied in a pony tale, in black camouflage overalls, holding a sniper rifle and smoking a cigarette,[67] and a mysterious "big, red-haired man with a red face who spoke Russian without an accent, and whom the hostages were specifically forbidden to look at."[68] In addition, a number of hostages recognized three militants that are currently at large and on the most wanted list in Dagestan, including Omar Sheykhulayev, Shamil Abidov, and Gadzhi Melikov.[69] The hostages consulted when gathering research for this chapter all agreed, after being shown the pictures of these men, that Sheykhulayev was there; about half of them remember seeing Abidov, though only two pointed to Melikov.

Their absence on the list of identified terrorists has, of course, other explanations as well. Only 19 of the bodies have been actually identified,[70] while the rest are so dismembered that their faces are not recognizable, 5 of them so badly that it was not even possible to obtain fingerprints.[71] As a result, it is possible that at least some of the terrorists that are "missing" could be among these unidentifiable bodies. Nevertheless, this does not explain the fact that the federal troops reported having a shootout with Sheikhulayev and several of his men in Dagestan on January 5, 2005.[72] Similarly, Iznaur Kodzoyev—whose wife was summoned to the school on the second day to try to convince her husband to release the children—was killed not in September 2004 in Beslan, but instead, in his native village of Al'tievo in April 2005.[73]

Overall, it is more then probable that a number of terrorists did actually get away from the school, which is hardly surprising given the chaos at the scene and the fact that the terrorists were equipped with civilian clothing and other items to help them get away. The greater issue than the fact that not all terrorists were caught or killed is the failure of the authorities to acknowledge this possibility, which results in the further upsurge of conspiracy theories and in the declining faith in the government's honesty.

Overall, the investigation of Beslan has been a blunder, to the point that one even has to wonder about the sincerity of the federal attempts to achieve a productive result. The school itself was never sealed off for a forensic examination of any kind. Many items that ended up being critical pieces of evidence only entered the investigation after they were collected directly by the people in Beslan and handed to the authorities. The authorities keep releasing so many controversial and contradictory pieces of "evidence" that no one can be sure about what is true anymore. For example, the body of Vladimir Khodov (who, as described earlier, was already wanted by the Russian authorities) has clearly and unanimously been identified among the dead terrorists by the hostages and investigators alike.[74] However, a North Ossetian police spokesman claimed that Khodov had been captured alive but committed suicide the next day. "You understand," he added, "that is the official version."[75]

## CONCLUSIONS

In the aftermath of Beslan, Basayev—in his typical fashion—tried to put all the blame on Moscow by stating that he regretted that "so many children died at the hands of the Russians," but also emphasizing that he did not regret the seizure of the school itself.[76] Unlike in the aftermath of Dubrovka, however, he did not make an attempt to plead for international sympathy; on the contrary, Basayev threatened to attack "citizens of states whose leaders support Putin's Chechen policy," also proclaiming that "this world will sooner be set on fire than we refuse to fight for

our freedom and independence!"[77] In another interview conducted in January 2005, Basayev confirmed his intention to launch more "Beslan-style" operations in the future.[78] However, on July 10, 2006, Shamil Basayev was killed by an explosive-laden truck in a small Ingush village of Ekhazhevo, making the fulfillment of his threats uncertain.

What are the key lessons we can learn from Beslan? The first lesson is that we can certainly expect the resolution of future hostage incidents to be extremely challenging due the hostage takers' extensive knowledge of our operational procedures, security precautions designed to make a rescue operation as costly in terms of human life as possible, and a high level of distrust in the authorities' intentions. Another lesson is that despite all of these challenges, the room for a negotiated settlement is likely to exist, and that it may in fact be the only realistic option for solving the incident without a massive loss of life among the hostages. Whether we will succeed in this endeavor in the future will largely depend on the political sanction of the use of negotiations as the preferred means to resolve terrorist hostage situations, as well as on our ability to think outside the box and adapt to the different circumstance and requirements of situations involving ideologically inspired hostage takers. For the lack of a better option, we will need to redefine our own measures of success and increase our tolerance for casualties in terms of not giving up on negotiations based solely on the fact that hostages have died during the incident. At the same time, it is quite possible that some situations will ultimately need to be addressed by a tactical resolution. But even in such situations, the negotiation element will still be crucial, as it can be used to get the maximum number of people out of the target location before the storming.

Another key lesson of Beslan has to do with management of the scene. In hostage situations all of the elements need to be communicating with each other under a clear chain of command. Any disruptive elements such as armed outsiders need to controlled, disarmed, and moved behind a secured perimeter. Given the extreme level of emotion involved, this will require a skilled negotiation effort of its own. Further, effective consequence management will be critical to reducing the negative impact of a possible rescue operation. Quite simply, a timely response saves lives.

Perhaps the most important lesson is that while in some cases secretiveness and temporary spin-doctoring of information can have short-term benefits in helping to solve a hostage crisis, applying such a strategy in the long term will ultimately be counterproductive. When governments are caught covering up and manipulating evidence in the aftermath of a failed counterterrorism effort, it only benefits the terrorists for whom the embarrassment of a government and the undermining of its authority is a critical component of their grand strategy. The key point to realize is that we need to not only avoid feeding into this strategy, but we also

must learn to effectively counter it. Perhaps the best defense is to provide a comprehensive public investigation that will release as much detailed information as possible to dispel any doubts among the public. Examples of this effort are the *9/11 Commission Report* published by the U.S. Congress or the White Paper about the activities of the *Jeemah Islamiyah* cell in Singapore published by the city state's home ministry. Both of these reports reveal in great detail the involvement and activities of the individuals responsible, and do not hide anything with the exception of very specific sensitive information that would endanger the security of human intelligence sources. Even more importantly, they facilitate the identification of mistakes and the drawing of lessons learned, with the goal of ensuring that the same mistakes do not occur in the future. The Russian government, despite originally dismissing the idea, also finally agreed to conduct a similar open investigation into the events of Beslan. Unfortunately, the report that was prepared by the (federal) Torshin Commission differs sharply in many of the descriptions of events and conclusions form report compiled by the (local) Kesaev Commission. The inability or unwillingness to admit and identify the flaws in the response to Beslan does more than just protect the individuals responsible for these mistakes; it effectively inhibits the learning process, which means that Beslan is bound to repeat itself.

## NOTES

1. The best works on the Beslan events include: Uwe Buse, Ullrich Fichtner, Mario Kaiser, Uwe Klussmann, Walter Mayr, and Christian Neef, "Putin's Ground Zero," *Der Spiegel*, December 27, 2004: 65–101; Dunlop. John B., "Beslan: Russia's 9/11?" The American Committee for Peace in Chechnya; and The Jamestown Foundation, October 2005; C. J. Chivers, "The School: The inside story of the 2004 attack in Beslan," *Esquire* 145, Issue 6 (June 2006), available at http://www.esquire.com/features/articles/2006/060512_mfe_beslan.html; Dolnik, Adam, "Beslan and Beyond: Negotiating with the 'New' Terrorists," presented at the Processes of International Negotiation workshop titled *Negotiating with Terrorists*, International Institute for Applied Systems Analysis, Luxemburg, Austria, June 9–10, 2006. Publication forthcoming.

2. It was later reported that the late arrival of policemen on the scene was caused by the fact that the duty officer with the key to the weapons locker could not be located for a full 40 minutes.

3. Interview with Stanislav Kesaev, Vladikavkaz, July 2005.

4. Chief Beslan gunman described, *Caucasian Knot*, August 4, 2005.

5. A mobile phone number.

6. Xeroxcopy of original, author's collection.

7. According to one version, the woman was detonated remotely by Khuchbarov because of her disobedience. But, since the bomber detonated in a doorway, also killing the other suicide bomber and another terrorist in the process, it
