- 102050                   *LC\_CTYPE*       Determine the locale for the interpretation of sequences of bytes of text data as  
102051                   characters (for example, single-byte as opposed to multi-byte characters in  
102052                   arguments).
- 102053                   *LC\_MESSAGES*     Determine the locale that should be used to affect the format and contents of  
102054                   diagnostic messages written to standard error.  
102055
- 102056                   *LOGNAME*       Determine the login name of the user.
- 102057                   *TZ*             Determine the timezone used to interpret the *date-time* option-argument. If *TZ* is  
102058                   unset or null, an unspecified default timezone shall be used.
- 102059 **ASYNCHRONOUS EVENTS**
- 102060                   Default.
- 102061 **STDOUT**
- 102062                   None.
- 102063 **STDERR**
- 102064                   The standard error shall be used only for diagnostic messages.
- 102065 **OUTPUT FILES**
- 102066                   None.
- 102067 **EXTENDED DESCRIPTION**
- 102068                   None.

102069 **EXIT STATUS**

102070 The following exit values shall be returned:

102071 0 Successful completion.

102072 >0 An error occurred.

102073 **CONSEQUENCES OF ERRORS**

102074 In addition to the default behavior, the *qalter* utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch *job\_identifier* does not exist on the server. Whether or not the *qalter* utility attempts to locate the batch job on other batch servers is implementation-defined.

102078 **APPLICATION USAGE**

102079 None.

102080 **EXAMPLES**

102081 None.

102082 **RATIONALE**

102083 The *qalter* utility allows users to change the attributes of a batch job.

102084 As a means of altering a queued job, the *qalter* utility is superior to deleting and requeuing the batch job insofar as an altered job retains its place in the queue with some traditional selection algorithms. In addition, the *qalter* utility is both shorter and simpler than a sequence of *qdel* and *qsub* utilities.

102088 The result of an attempt on the part of a user to alter a batch job in a RUNNING state is implementation-defined because a batch job in the RUNNING state will already have opened its output files and otherwise performed any actions indicated by the options in effect at the time the batch job began execution.

102092 The options processed by the *qalter* utility are identical to those of the *qsub* utility, with a few exceptions: **-V**, **-v**, and **-q**. The **-V** and **-v** are inappropriate for the *qalter* utility, since they capture potentially transient environment information from the submitting process. The **-q** option would specify a new queue, which would largely negate the previously stated advantage of using *qalter*; furthermore, the *qmove* utility provides a superior means of moving jobs.

102097 Each of the following paragraphs provides the rationale for a *qalter* option.

102098 Additional rationale concerning these options can be found in the rationale for the *qsub* utility.

102099 The **-a** option allows users to alter the date and time at which a batch job becomes eligible to run.

102101 The **-A** option allows users to change the account that will be charged for the resources consumed by the batch job. Support for the **-A** option is mandatory for conforming implementations of *qalter*, even though support of accounting is optional for servers. Whether or not to support accounting is left to the implementor of the server, but mandatory support of the **-A** option assures users of a consistent interface and allows them to control accounting on servers that support accounting.

102107 The **-c** option allows users to alter the checkpointing interval of a batch job. A checkpointing system, which is not defined by POSIX.1-2008, allows recovery of a batch job at the most recent checkpoint in the event of a crash. Checkpointing is typically used for jobs that consume expensive computing time or must meet a critical schedule. Users should be allowed to make the tradeoff between the overhead of checkpointing and the risk to the timely completion of the batch job; therefore, this volume of POSIX.1-2008 provides the checkpointing interval option. Support for checkpointing is optional for servers.

- 102114 The **-e** option allows users to alter the name and location of the standard error stream written by  
102115 a batch job. However, the path of the standard error stream is meaningless if the value of the  
102116 *Join\_Path* attribute of the batch job is TRUE.
- 102117 The **-h** option allows users to set the hold type in the *Hold\_Types* attribute of a batch job. The  
102118 *qhold* and *qrls* utilities add or remove hold types to the *Hold\_Types* attribute, respectively. The **-h**  
102119 option has been modified to allow for implementation-defined hold types.
- 102120 The **-j** option allows users to alter the decision to join (merge) the standard error stream of the  
102121 batch job with the standard output stream of the batch job.
- 102122 The **-l** option allows users to change the resource limits imposed on a batch job.
- 102123 The **-m** option allows users to modify the list of points in the life of a batch job at which the  
102124 designated users will receive mail notification.
- 102125 The **-M** option allows users to alter the list of users who will receive notification about events in  
102126 the life of a batch job.
- 102127 The **-N** option allows users to change the name of a batch job.
- 102128 The **-o** option allows users to alter the name and path to which the standard output stream of  
102129 the batch job will be written.
- 102130 The **-P** option allows users to modify the priority of a batch job. Support for priority is optional  
102131 for batch servers.
- 102132 The **-r** option allows users to alter the rerunability status of a batch job.
- 102133 The **-S** option allows users to change the name and location of the shell image that will be  
102134 invoked to interpret the script of the batch job. This option has been modified to allow a list of  
102135 shell name and locations associated with different hosts.
- 102136 The **-u** option allows users to change the user identifier under which the batch job will execute.
- 102137 The *job\_identifier* operand syntax is provided so that the user can differentiate between the  
102138 originating and destination (or executing) batch server. These may or may not be the same. The  
102139 *.server\_name* portion identifies the originating batch server, while the *@server* portion identifies  
102140 the destination batch server.
- 102141 Historically, the *qalter* utility has been a component of the Network Queuing System (NQS), the  
102142 existing practice from which this utility has been derived.
- 102143 **FUTURE DIRECTIONS**
- 102144 The *qalter* utility may be removed in a future version.
- 102145 **SEE ALSO**

- 102148 **CHANGE HISTORY**
- 102149 Derived from IEEE Std 1003.2d-1994.
- 102150 **Issue 6**
- 102151 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.
- 102152 IEEE PASC Interpretation 1003.2 #182 is applied, clarifying the description of the **-a** option.

102153 **Issue 7**

102154 The *qalter* utility is marked obsolescent.

102155 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

102156 **NAME**

102157 qdel — delete batch jobs

102158 **SYNOPSIS**102159 OB BE `qdel job_identifier...`102160 **DESCRIPTION**

102161 A batch job is deleted by sending a request to the batch server that manages the batch job. A  
 102162 batch job that has been deleted is no longer subject to management by batch services.

102163 The *qdel* utility is a user-accessible client of batch services that requests the deletion of one or  
 102164 more batch jobs.

102165 The *qdel* utility shall request a batch server to delete those batch jobs for which a batch  
 102166 *job\_identifier* is presented to the utility.

102167 The *qdel* utility shall delete batch jobs in the order in which their batch *job\_identifiers* are  
 102168 presented to the utility.

102169 If the *qdel* utility fails to process any batch *job\_identifier* successfully, the utility shall proceed to  
 102170 process the remaining batch *job\_identifiers*, if any.

102171 The *qdel* utility shall delete each batch job by sending a *Delete Job Request* to the batch server that  
 102172 manages the batch job.

102173 The *qdel* utility shall not exit until the batch job corresponding to each successfully processed  
 102174 batch *job\_identifier* has been deleted.

102175 **OPTIONS**

102176 None.

102177 **OPERANDS**

102178 The *qdel* utility shall accept one or more operands that conform to the syntax for a batch  
 102179 *job\_identifier* (see [Section 3.3.1](#), on page 2397).

102180 **STDIN**

102181 Not used.

102182 **INPUT FILES**

102183 None.

102184 **ENVIRONMENT VARIABLES**102185 The following environment variables shall affect the execution of *qdel*:

102186 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 102187 (See [XBD Section 8.2](#) (on page 174) the precedence of internationalization variables  
 102188 used to determine the values of locale categories.)

102189 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 102190 internationalization variables.

102191 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 102192 characters (for example, single-byte as opposed to multi-byte characters in  
 102193 arguments).

102194 *LC\_MESSAGES*

102195 Determine the locale that should be used to affect the format and contents of  
 102196 diagnostic messages written to standard error.

- 102197 *LOGNAME* Determine the login name of the user.
- 102198 **ASYNCHRONOUS EVENTS**
- 102199 Default.
- 102200 **STDOUT**
- 102201 An implementation of the *qdel* utility may write informative messages to standard output.
- 102202 **STDERR**
- 102203 The standard error shall be used only for diagnostic messages.
- 102204 **OUTPUT FILES**
- 102205 None.
- 102206 **EXTENDED DESCRIPTION**
- 102207 None.
- 102208 **EXIT STATUS**
- 102209 The following exit values shall be returned:
- 102210 0 Successful completion.
- 102211 >0 An error occurred.
- 102212 **CONSEQUENCES OF ERRORS**
- 102213 In addition to the default behavior, the *qdel* utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch *job\_identifier* does not exist on the server. Whether or not the *qdel* utility waits to output the diagnostic message while attempting to locate the job on other servers is implementation-defined.
- 102214
- 102215
- 102216
- 102217
- 102218 **APPLICATION USAGE**
- 102219 None.
- 102220 **EXAMPLES**
- 102221 None.
- 102222 **RATIONALE**
- 102223 The *qdel* utility allows users and administrators to delete jobs.
- 102224 The *qdel* utility provides functionality that is not otherwise available. For example, the *kill* utility of the operating system does not suffice. First, to use the *kill* utility, the user might have to log in on a remote node, because the *kill* utility does not operate across the network. Second, unlike *qdel*, *kill* cannot remove jobs from queues. Lastly, the arguments of the *qdel* utility are job identifiers rather than process identifiers, and so this utility can be passed the output of the *qselect* utility, thus providing users with a means of deleting a list of jobs.
- 102225
- 102226
- 102227
- 102228
- 102229
- 102230 Because a set of jobs can be selected using the *qselect* utility, the *qdel* utility has not been complicated with options that provide for selection of jobs. Instead, the batch jobs to be deleted are identified individually by their job identifiers.
- 102231
- 102232
- 102233 Historically, the *qdel* utility has been a component of NQS, the existing practice on which it is based. However, the *qdel* utility defined in this volume of POSIX.1-2008 does not provide an option for specifying a signal number to send to the batch job prior to the killing of the process; that capability has been subsumed by the *qsig* utility.
- 102234
- 102235
- 102236
- 102237 A discussion was held about the delays of networking and the possibility that the batch server may never respond, due to a down router, down batch server, or other network mishap. The DESCRIPTION records this under the words “fails to process any job identifier”. In the broad sense, the network problem is also an error, which causes the failure to process the batch job
- 102238
- 102239
- 102240

- 102241 identifier.
- 102242 **FUTURE DIRECTIONS**
- 102243 The *qdel* utility may be removed in a future version.
- 102244 **SEE ALSO**
- 102245 [Chapter 3](#) (on page 2375), *kill*, *qselect*, *qsig*
- 102246 XBD [Chapter 8](#) (on page 173)
- 102247 **CHANGE HISTORY**
- 102248 Derived from IEEE Std 1003.2d-1994.
- 102249 **Issue 6**
- 102250 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.
- 102251 **Issue 7**
- 102252 The *qdel* utility is marked obsolescent.
- 102253 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

102254 **NAME**

102255 qhold — hold batch jobs

102256 **SYNOPSIS**102257 OB BE `qhold [-h hold_list] job_identifier...`102258 **DESCRIPTION**

102259 A hold is placed on a batch job by a request to the batch server that manages the batch job. A  
 102260 batch job that has one or more holds is not eligible for execution. The *qhold* utility is a user-  
 102261 accessible client of batch services that requests one or more types of hold to be placed on one or  
 102262 more batch jobs.

102263 The *qhold* utility shall place holds on those batch jobs for which a batch *job\_identifier* is presented  
 102264 to the utility.

102265 The *qhold* utility shall place holds on batch jobs in the order in which their batch *job\_identifiers*  
 102266 are presented to the utility. If the *qhold* utility fails to process any batch *job\_identifier* successfully,  
 102267 the utility shall proceed to process the remaining batch *job\_identifiers*, if any.

102268 The *qhold* utility shall place holds on each batch job by sending a *Hold Job Request* to the batch  
 102269 server that manages the batch job.

102270 The *qhold* utility shall not exit until holds have been placed on the batch job corresponding to  
 102271 each successfully processed batch *job\_identifier*.

102272 **OPTIONS**

102273 The *qhold* utility shall conform to XBD [Section 12.2](#) (on page 215).

102274 The following option shall be supported by the implementation:

102275 `-h hold_list` Define the types of holds to be placed on the batch job.

102276 The *qhold* `-h` option shall accept a value for the *hold\_list* option-argument that is a  
 102277 string of alphanumeric characters in the portable character set (see XBD [Section](#)  
 102278 [6.1](#), on page 125).

102279 The *qhold* utility shall accept a value for the *hold\_list* option-argument that is a  
 102280 string of one or more of the characters 'u', 's', or 'o', or the single character  
 102281 'n'.

102282 For each unique character in the *hold\_list* option-argument, the *qhold* utility shall  
 102283 add a value to the *Hold\_Types* attribute of the batch job as follows, each  
 102284 representing a different hold type:

102285 u USER

102286 s SYSTEM

102287 o OPERATOR

102288 If any of these characters are duplicated in the *hold\_list* option-argument, the  
 102289 duplicates shall be ignored.

102290 An existing *Hold\_Types* attribute can be cleared by the following hold type:

102291 n NO\_HOLD

102292 The *qhold* utility shall consider it an error if any hold type other than 'n' is  
 102293 combined with hold type 'n'.

102294 Strictly conforming applications shall not repeat any of the characters 'u', 's',

102295 'o', or 'n' within the *hold\_list* option-argument. The *qhold* utility shall permit the  
 102296 repetition of characters, but shall not assign additional meaning to the repeated  
 102297 characters.

102298 An implementation may define other hold types. The conformance document for  
 102299 an implementation shall describe any additional hold types, how they are  
 102300 specified, their internal behavior, and how they affect the behavior of the utility.

102301 If the **-h** option is not presented to the *qhold* utility, the implementation shall set  
 102302 the *Hold\_Types* attribute to USER.

#### 102303 OPERANDS

102304 The *qhold* utility shall accept one or more operands that conform to the syntax for a batch  
 102305 *job\_identifier* (see [Section 3.3.1](#), on page 2397).

#### 102306 STDIN

102307 Not used.

#### 102308 INPUT FILES

102309 None.

#### 102310 ENVIRONMENT VARIABLES

102311 The following environment variables shall affect the execution of *qhold*:

102312 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 102313 (See [XBD Section 8.2](#) (on page 174) the precedence of internationalization variables  
 102314 used to determine the values of locale categories.)

102315 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 102316 internationalization variables.

102317 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 102318 characters (for example, single-byte as opposed to multi-byte characters in  
 102319 arguments).

#### 102320 *LC\_MESSAGES*

102321 Determine the locale that should be used to affect the format and contents of  
 102322 diagnostic messages written to standard error.

102323 *LOGNAME* Determine the login name of the user.

#### 102324 ASYNCHRONOUS EVENTS

102325 Default.

#### 102326 STDOUT

102327 None.

#### 102328 STDERR

102329 The standard error shall be used only for diagnostic messages.

#### 102330 OUTPUT FILES

102331 None.

#### 102332 EXTENDED DESCRIPTION

102333 None.

#### 102334 EXIT STATUS

102335 The following exit values shall be returned:

102336 0 Successful completion.

102337 >0 An error occurred.

#### 102338 CONSEQUENCES OF ERRORS

102339 In addition to the default behavior, the *qhold* utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch *job\_identifier* does not exist on the server. Whether or not the *qhold* utility waits to output the diagnostic message while attempting to locate the job on other servers is implementation-defined.

#### 102344 APPLICATION USAGE

102345 None.

#### 102346 EXAMPLES

102347 None.

#### 102348 RATIONALE

102349 The *qhold* utility allows users to place a hold on one or more jobs. A hold makes a batch job ineligible for execution.

102351 The *qhold* utility has options that allow the user to specify the type of hold. Should the user wish to place a hold on a set of jobs that meet a selection criteria, such a list of jobs can be acquired using the *qselect* utility.

102354 The **-h** option allows the user to specify the type of hold that is to be placed on the job. This option allows for USER, SYSTEM, OPERATOR, and implementation-defined hold types. The USER and OPERATOR holds are distinct. The batch server that manages the batch job will verify that the user is authorized to set the specified hold for the batch job.

102358 Mail is not required on hold because the administrator has the tools and libraries to build this option if he or she wishes.

102360 Historically, the *qhold* utility has been a part of some existing batch systems, although it has not traditionally been a part of the NQS.

#### 102362 FUTURE DIRECTIONS

102363 The *qhold* utility may be removed in a future version.

#### 102364 SEE ALSO

102365 [Chapter 3](#) (on page 2375), *qselect*

102366 XBD [Section 6.1](#) (on page 125), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

#### 102367 CHANGE HISTORY

102368 Derived from IEEE Std 1003.2d-1994.

#### 102369 Issue 6

102370 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

#### 102371 Issue 7

102372 The *qhold* utility is marked obsolescent.

102373 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

102374 **NAME**

102375 qmove — move batch jobs

102376 **SYNOPSIS**102377 OB BE `qmove destination job_identifier...`102378 **DESCRIPTION**

102379 To move a batch job is to remove the batch job from the batch queue in which it resides and  
 102380 instantiate the batch job in another batch queue. A batch job is moved by a request to the batch  
 102381 server that manages the batch job. The *qmove* utility is a user-accessible batch client that requests  
 102382 the movement of one or more batch jobs.

102383 The *qmove* utility shall move those batch jobs, and only those batch jobs, for which a batch  
 102384 *job\_identifier* is presented to the utility.

102385 The *qmove* utility shall move batch jobs in the order in which the corresponding batch  
 102386 *job\_identifiers* are presented to the utility.

102387 If the *qmove* utility fails to process a batch *job\_identifier* successfully, the utility shall proceed to  
 102388 process the remaining batch *job\_identifiers*, if any.

102389 The *qmove* utility shall move batch jobs by sending a *Move Job Request* to the batch server that  
 102390 manages each batch job. The *qmove* utility shall not exit before the batch jobs corresponding to all  
 102391 successfully processed batch *job\_identifiers* have been moved.

102392 **OPTIONS**

102393 None.

102394 **OPERANDS**

102395 The *qmove* utility shall accept one operand that conforms to the syntax for a destination (see  
 102396 [Section 3.3.2](#), on page 2398).

102397 The *qmove* utility shall accept one or more operands that conform to the syntax for a batch  
 102398 *job\_identifier* (see [Section 3.3.1](#), on page 2397).

102399 **STDIN**

102400 Not used.

102401 **INPUT FILES**

102402 None.

102403 **ENVIRONMENT VARIABLES**102404 The following environment variables shall affect the execution of *qmove*:

102405 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 102406 (See [XBD Section 8.2](#) (on page 174) the precedence of internationalization variables  
 102407 used to determine the values of locale categories.)

102408 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 102409 internationalization variables.

102410 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 102411 characters (for example, single-byte as opposed to multi-byte characters in  
 102412 arguments).

102413 *LC\_MESSAGES*

102414 Determine the locale that should be used to affect the format and contents of  
 102415 diagnostic messages written to standard error.

- 102416 *LOGNAME* Determine the login name of the user.
- 102417 **ASYNCHRONOUS EVENTS**
- 102418 Default.
- 102419 **STDOUT**
- 102420 None.
- 102421 **STDERR**
- 102422 The standard error shall be used only for diagnostic messages.
- 102423 **OUTPUT FILES**
- 102424 None.
- 102425 **EXTENDED DESCRIPTION**
- 102426 None.
- 102427 **EXIT STATUS**
- 102428 The following exit values shall be returned:
- 102429 0 Successful completion.
- 102430 >0 An error occurred.
- 102431 **CONSEQUENCES OF ERRORS**
- 102432 In addition to the default behavior, the *qmove* utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch *job\_identifier* does not exist on the server. Whether or not the *qmove* utility waits to output the diagnostic message while attempting to locate the job on other servers is implementation-defined.
- 102433
- 102434
- 102435
- 102436
- 102437 **APPLICATION USAGE**
- 102438 None.
- 102439 **EXAMPLES**
- 102440 None.
- 102441 **RATIONALE**
- 102442 The *qmove* utility allows users to move jobs between queues.
- 102443 The alternative to using the *qmove* utility—deleting the batch job and requeuing it—entails considerably more typing.
- 102444
- 102445 Since the means of selecting jobs based on attributes has been encapsulated in the *qselect* utility, the only option of the *qmove* utility concerns authorization. The **-u** option provides the user with the convenience of changing the user identifier under which the batch job will execute.
- 102446
- 102447
- 102448 Minimalism and consistency have taken precedence over convenience; the **-u** option has been deleted because the equivalent capability exists with the **-u** option of the *qalter* utility.
- 102449
- 102450 **FUTURE DIRECTIONS**
- 102451 The *qmove* utility may be removed in a future version.
- 102452 **SEE ALSO**
- 102453 [Chapter 3](#) (on page 2375), *qalter*, *qselect*
- 102454 [XBD Chapter 8](#) (on page 173)

102455 **CHANGE HISTORY**

102456 Derived from IEEE Std 1003.2d-1994.

102457 **Issue 6**

102458 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

102459 **Issue 7**

102460 The *qmove* utility is marked obsolescent.

102461 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

102462 **NAME**

102463 qmsg — send message to batch jobs

102464 **SYNOPSIS**102465 OB BE `qmsg [-EO] message_string job_identifier...`102466 **DESCRIPTION**

102467 To send a message to a batch job is to request that a server write a message string into one or  
 102468 more output files of the batch job. A message is sent to a batch job by a request to the batch  
 102469 server that manages the batch job. The *qmsg* utility is a user-accessible batch client that requests  
 102470 the sending of messages to one or more batch jobs.

102471 The *qmsg* utility shall write messages into the files of batch jobs by sending a *Job Message Request*  
 102472 to the batch server that manages the batch job. The *qmsg* utility shall not directly write the  
 102473 message into the files of the batch job.

102474 The *qmsg* utility shall send a *Job Message Request* for those batch jobs, and only those batch jobs,  
 102475 for which a batch *job\_identifier* is presented to the utility.

102476 The *qmsg* utility shall send *Job Message Requests* for batch jobs in the order in which their batch  
 102477 *job\_identifiers* are presented to the utility.

102478 If the *qmsg* utility fails to process any batch *job\_identifier* successfully, the utility shall proceed to  
 102479 process the remaining batch *job\_identifiers*, if any.

102480 The *qmsg* utility shall not exit before a *Job Message Request* has been sent to the server that  
 102481 manages the batch job that corresponds to each successfully processed batch *job\_identifier*.

102482 **OPTIONS**102483 The *qmsg* utility shall conform to XBD [Section 12.2](#) (on page 215).

102484 The following options shall be supported by the implementation:

102485 **-E** Specify that the message is written to the standard error of each batch job.102486 The *qmsg* utility shall write the message into the standard error of the batch job.102487 **-O** Specify that the message is written to the standard output of each batch job.102488 The *qmsg* utility shall write the message into the standard output of the batch job.

102489 If neither the **-O** nor the **-E** option is presented to the *qmsg* utility, the utility shall write the  
 102490 message into an implementation-defined file. The conformance document for the  
 102491 implementation shall describe the name and location of the implementation-defined file. If both  
 102492 the **-O** and the **-E** options are presented to the *qmsg* utility, then the utility shall write the  
 102493 messages to both standard output and standard error.

102494 **OPERANDS**102495 The *qmsg* utility shall accept a minimum of two operands, *message\_string* and one or more batch  
102496 *job\_identifiers*.

102497 The *message\_string* operand shall be the string to be written to one or more output files of the  
 102498 batch job followed by a <newline>. If the string contains <blank> characters, then the  
 102499 application shall ensure that the string is quoted. The *message\_string* shall be encoded in the  
 102500 portable character set (see XBD [Section 6.1](#), on page 125).

102501 All remaining operands are batch *job\_identifiers* that conform to the syntax for a batch  
 102502 *job\_identifier* (see [Section 3.3.1](#), on page 2397).

102503 **STDIN**

102504 Not used.

102505 **INPUT FILES**

102506 None.

102507 **ENVIRONMENT VARIABLES**102508 The following environment variables shall affect the execution of *qmsg*:

102509 *LANG* Provide a default value for the internationalization variables that are unset or null.  
102510 (See XBD Section 8.2 (on page 174) the precedence of internationalization variables  
102511 used to determine the values of locale categories.)

102512 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
102513 internationalization variables.

102514 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
102515 characters (for example, single-byte as opposed to multi-byte characters in  
102516 arguments).

102517 *LC\_MESSAGES*

102518 Determine the locale that should be used to affect the format and contents of  
102519 diagnostic messages written to standard error.

102520 *LOGNAME* Determine the login name of the user.102521 **ASYNCHRONOUS EVENTS**

102522 Default.

102523 **STDOUT**

102524 None.

102525 **STDERR**

102526 The standard error shall be used only for diagnostic messages.

102527 **OUTPUT FILES**

102528 None.

102529 **EXTENDED DESCRIPTION**

102530 None.

102531 **EXIT STATUS**

102532 The following exit values shall be returned:

102533 0 Successful completion.

102534 &gt;0 An error occurred.

102535 **CONSEQUENCES OF ERRORS**

102536 In addition to the default behavior, the *qmsg* utility shall not be required to write a diagnostic  
102537 message to standard error when the error reply received from a batch server indicates that the  
102538 batch *job\_identifier* does not exist on the server. Whether or not the *qmsg* utility waits to output  
102539 the diagnostic message while attempting to locate the job on other servers is implementation-  
102540 defined.

**102541 APPLICATION USAGE**

102542 None.

**102543 EXAMPLES**

102544 None.

**102545 RATIONALE**

102546 The *qmsg* utility allows users to write messages into the output files of running jobs. Users,  
102547 including operators and administrators, have a number of occasions when they want to place  
102548 messages in the output files of a batch job. For example, if a disk that is being used by a batch job  
102549 is showing errors, the operator might note this in the standard error stream of the batch job.

102550 The options of the *qmsg* utility provide users with the means of placing the message in the  
102551 output stream of their choice. The default output stream for the message—if the user does not  
102552 designate an output stream—is implementation-defined, since many implementations will  
102553 provide, as an extension to this volume of POSIX.1-2008, a log file that shows the history of  
102554 utility execution.

102555 If users wish to send a message to a set of jobs that meet a selection criteria, the *qselect* utility can  
102556 be used to acquire the appropriate list of job identifiers.

102557 The **-E** option allows users to place the message in the standard error stream of the batch job.

102558 The **-O** option allows users to place the message in the standard output stream of the batch job.

102559 Historically, the *qmsg* utility is an existing practice in the offerings of one or more implementors  
102560 of an NQS-derived batch system. The utility has been found to be useful enough that it deserves  
102561 to be included in this volume of POSIX.1-2008.

**102562 FUTURE DIRECTIONS**

102563 The *qmsg* utility may be removed in a future version.

**102564 SEE ALSO**

102565 [Chapter 3](#) (on page 2375), *qselect*

102566 XBD [Section 6.1](#) (on page 125), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

**102567 CHANGE HISTORY**

102568 Derived from IEEE Std 1003.2d-1994.

**102569 Issue 6**

102570 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

**102571 Issue 7**

102572 The *qmsg* utility is marked obsolescent.

102573 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

102574 **NAME**

102575 qrerun — rerun batch jobs

102576 **SYNOPSIS**102577 OB BE `qrerun job_identifier...`102578 **DESCRIPTION**

102579 To rerun a batch job is to terminate the session leader of the batch job, delete any associated  
 102580 checkpoint files, and return the batch job to the batch queued state. A batch job is rerun by a  
 102581 request to the batch server that manages the batch job. The *qrerun* utility is a user-accessible  
 102582 batch client that requests the rerunning of one or more batch jobs.

102583 The *qrerun* utility shall rerun those batch jobs for which a batch *job\_identifier* is presented to the  
 102584 utility.

102585 The *qrerun* utility shall rerun batch jobs in the order in which their batch *job\_identifiers* are  
 102586 presented to the utility.

102587 If the *qrerun* utility fails to process any batch *job\_identifier* successfully, the utility shall proceed to  
 102588 process the remaining batch *job\_identifiers*, if any.

102589 The *qrerun* utility shall rerun batch jobs by sending a *Rerun Job Request* to the batch server that  
 102590 manages each batch job.

102591 For each successfully processed batch *job\_identifier*, the *qrerun* utility shall have rerun the  
 102592 corresponding batch job at the time the utility exits.

102593 **OPTIONS**

102594 None.

102595 **OPERANDS**

102596 The *qrerun* utility shall accept one or more operands that conform to the syntax for a batch  
 102597 *job\_identifier* (see [Section 3.3.1](#), on page 2397).

102598 **STDIN**

102599 Not used.

102600 **INPUT FILES**

102601 None.

102602 **ENVIRONMENT VARIABLES**102603 The following environment variables shall affect the execution of *qrerun*:

102604 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 102605 (See [XBD Section 8.2](#) (on page 174) the precedence of internationalization variables  
 102606 used to determine the values of locale categories.)

102607 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 102608 internationalization variables.

102609 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 102610 characters (for example, single-byte as opposed to multi-byte characters in  
 102611 arguments).

102612 *LC\_MESSAGES*

102613 Determine the locale that should be used to affect the format and contents of  
 102614 diagnostic messages written to standard error.

- 102615 *LOGNAME* Determine the login name of the user.
- 102616 **ASYNCHRONOUS EVENTS**
- 102617 Default.
- 102618 **STDOUT**
- 102619 None.
- 102620 **STDERR**
- 102621 The standard error shall be used only for diagnostic messages.
- 102622 **OUTPUT FILES**
- 102623 None.
- 102624 **EXTENDED DESCRIPTION**
- 102625 None.
- 102626 **EXIT STATUS**
- 102627 The following exit values shall be returned:
- 102628 0 Successful completion.
- 102629 >0 An error occurred.
- 102630 **CONSEQUENCES OF ERRORS**
- 102631 In addition to the default behavior, the *qrerun* utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch *job\_identifier* does not exist on the server. Whether or not the *qrerun* utility waits to output the diagnostic message while attempting to locate the job on other servers is implementation-defined.
- 102632
- 102633
- 102634
- 102635
- 102636 **APPLICATION USAGE**
- 102637 None.
- 102638 **EXAMPLES**
- 102639 None.
- 102640 **RATIONALE**
- 102641 The *qrerun* utility allows users to cause jobs in the running state to exit and rerun.
- 102642 The *qrerun* utility is a new utility, *vis-a-vis* existing practice, that has been defined in this volume of POSIX.1-2008 to correct user-perceived deficiencies in the existing practice.
- 102643
- 102644 **FUTURE DIRECTIONS**
- 102645 The *qrerun* utility may be removed in a future version.
- 102646 **SEE ALSO**

- 102648 [XBD Chapter 8](#) (on page 173)
- 102649 **CHANGE HISTORY**
- 102650 Derived from IEEE Std 1003.2d-1994.
- 102651 **Issue 6**
- 102652 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

102653 **Issue 7**

102654 The *qrerun* utility is marked obsolescent.

102655 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

102656 **NAME**

102657 qrln — release batch jobs

102658 **SYNOPSIS**102659 OB BE `qrln [-h hold_list] job_identifier...`102660 **DESCRIPTION**

102661 A batch job might have one or more holds, which prevent the batch job from executing. A batch  
 102662 job from which all the holds have been removed becomes eligible for execution and is said to  
 102663 have been released. A batch job hold is removed by sending a request to the batch server that  
 102664 manages the batch job. The *qrln* utility is a user-accessible client of batch services that requests  
 102665 holds be removed from one or more batch jobs.

102666 The *qrln* utility shall remove one or more holds from those batch jobs for which a batch  
 102667 *job\_identifier* is presented to the utility.

102668 The *qrln* utility shall remove holds from batch jobs in the order in which their batch *job\_identifiers*  
 102669 are presented to the utility.

102670 If the *qrln* utility fails to process a batch *job\_identifier* successfully, the utility shall proceed to  
 102671 process the remaining batch *job\_identifiers*, if any.

102672 The *qrln* utility shall remove holds on each batch job by sending a *Release Job Request* to the batch  
 102673 server that manages the batch job.

102674 The *qrln* utility shall not exit until the holds have been removed from the batch job  
 102675 corresponding to each successfully processed batch *job\_identifier*.

102676 **OPTIONS**

102677 The *qrln* utility shall conform to XBD [Section 12.2](#) (on page 215).

102678 The following option shall be supported by the implementation:

102679 **-h *hold\_list*** Define the types of holds to be removed from the batch job.

102680 The *qrln* **-h** option shall accept a value for the *hold\_list* option-argument that is a  
 102681 string of alphanumeric characters in the portable character set (see XBD [Section](#)  
 102682 [6.1](#), on page 125).

102683 The *qrln* utility shall accept a value for the *hold\_list* option-argument that is a string  
 102684 of one or more of the characters 'u', 's', or 'o', or the single character 'n'.

102685 For each unique character in the *hold\_list* option-argument, the *qrln* utility shall add  
 102686 a value to the *Hold\_Types* attribute of the batch job as follows, each representing a  
 102687 different hold type:

102688 u USER

102689 s SYSTEM

102690 o OPERATOR

102691 If any of these characters are duplicated in the *hold\_list* option-argument, the  
 102692 duplicates shall be ignored.

102693 An existing *Hold\_Types* attribute can be cleared by the following hold type:

102694 n NO\_HOLD

102695 The *qrln* utility shall consider it an error if any hold type other than 'n' is  
 102696 combined with hold type 'n'.

102697 Strictly conforming applications shall not repeat any of the characters 'u', 's',  
 102698 'o', or 'n' within the *hold\_list* option-argument. The *qrls* utility shall permit the  
 102699 repetition of characters, but shall not assign additional meaning to the repeated  
 102700 characters.

102701 An implementation may define other hold types. The conformance document for  
 102702 an implementation shall describe any additional hold types, how they are  
 102703 specified, their internal behavior, and how they affect the behavior of the utility.

102704 If the **-h** option is not presented to the *qrls* utility, the implementation shall remove  
 102705 the USER hold in the *Hold\_Types* attribute.

#### 102706 OPERANDS

102707 The *qrls* utility shall accept one or more operands that conform to the syntax for a batch  
 102708 *job\_identifier* (see [Section 3.3.1](#), on page 2397).

#### 102709 STDIN

102710 Not used.

#### 102711 INPUT FILES

102712 None.

#### 102713 ENVIRONMENT VARIABLES

102714 The following environment variables shall affect the execution of *qrls*:

102715 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 102716 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 102717 used to determine the values of locale categories.)

102718 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 102719 internationalization variables.

102720 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 102721 characters (for example, single-byte as opposed to multi-byte characters in  
 102722 arguments).

#### 102723 *LC\_MESSAGES*

102724 Determine the locale that should be used to affect the format and contents of  
 102725 diagnostic messages written to standard error.

102726 *LOGNAME* Determine the login name of the user.

#### 102727 ASYNCHRONOUS EVENTS

102728 Default.

#### 102729 STDOUT

102730 None.

#### 102731 STDERR

102732 The standard error shall be used only for diagnostic messages.

#### 102733 OUTPUT FILES

102734 None.

#### 102735 EXTENDED DESCRIPTION

102736 None.

**102737 EXIT STATUS**

102738 The following exit values shall be returned:

102739 0 Successful completion.

102740 >0 An error occurred.

**102741 CONSEQUENCES OF ERRORS**

102742 In addition to the default behavior, the *qrsl* utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch *job\_identifier* does not exist on the server. Whether or not the *qrsl* utility waits to output the diagnostic message while attempting to locate the job on other servers is implementation-defined.

**102747 APPLICATION USAGE**

102748 None.

**102749 EXAMPLES**

102750 None.

**102751 RATIONALE**

102752 The *qrsl* utility allows users, operators, and administrators to remove holds from jobs.

102753 The *qrsl* utility does not support any job selection options or wildcard arguments. Users may acquire a list of jobs selected by attributes using the *qselect* utility. For example, a user could select all of their held jobs.

102756 The **-h** option allows the user to specify the type of hold that is to be removed. This option allows for USER, SYSTEM, OPERATOR, and implementation-defined hold types. The batch server that manages the batch job will verify whether the user is authorized to remove the specified hold for the batch job. If more than one type of hold has been placed on the batch job, a user may wish to remove only some of them.

102761 Mail is not required on release because the administrator has the tools and libraries to build this option if required.

102763 The *qrsl* utility is a new utility *vis-a-vis* existing practice; it has been defined in this volume of POSIX.1-2008 as the natural complement to the *qhold* utility.

**102765 FUTURE DIRECTIONS**

102766 The *qrsl* utility may be removed in a future version.

**102767 SEE ALSO**

102768 [Chapter 3](#) (on page 2375), *qhold*, *qselect*

102769 [XBD Section 6.1](#) (on page 125), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

**102770 CHANGE HISTORY**

102771 Derived from IEEE Std 1003.2d-1994.

**102772 Issue 6**

102773 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

**102774 Issue 7**

102775 The *qrsl* utility is marked obsolescent.

102776 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

102777 **NAME**

102778 qselect — select batch jobs

102779 **SYNOPSIS**

```
102780 OB BE qselect [-a [op]date_time] [-A account_string] [-c [op]interval]
102781 [-h hold_list] [-l resource_list] [-N name] [-p [op]priority]
102782 [-q destination] [-r y|n] [-s states] [-u user_list]
```

102783 **DESCRIPTION**

102784 To select a set of batch jobs is to return the batch *job\_identifiers* for each batch job that meets a list  
 102785 of selection criteria. A set of batch jobs is selected by a request to a batch server. The *qselect* utility  
 102786 is a user-accessible batch client that requests the selection of batch jobs.

102787 Upon successful completion, the *qselect* utility shall have returned a list of zero or more batch  
 102788 *job\_identifiers* that meet the criteria specified by the options and option-arguments presented to  
 102789 the utility.

102790 The *qselect* utility shall select batch jobs by sending a *Select Jobs Request* to a batch server. The  
 102791 *qselect* utility shall not exit until the server replies to each request generated.

102792 For each option presented to the *qselect* utility, the utility shall restrict the set of selected batch  
 102793 jobs as described in the OPTIONS section.

102794 The *qselect* utility shall not restrict selection of batch jobs except by authorization and as required  
 102795 by the options presented to the utility.

102796 When an option is specified with a mandatory or optional *op* component to the option-  
 102797 argument, then *op* shall specify a relation between the value of a certain batch job attribute and  
 102798 the *value* component of the option-argument. If an *op* is allowable on an option, then the  
 102799 description of the option letter indicates the *op* as either mandatory or optional. Acceptable  
 102800 strings for the *op* component, and the relation the string indicates, are shown in the following  
 102801 list:

102802 .eq. The value represented by the attribute of the batch job is equal to the value represented  
 102803 by the option-argument.

102804 .ge. The value represented by the attribute of the batch job is greater than or equal to the  
 102805 value represented by the option-argument.

102806 .gt. The value represented by the attribute of the batch job is greater than the value  
 102807 represented by the option-argument.

102808 .lt. The value represented by the attribute of the batch job is less than the value represented  
 102809 by the option-argument.

102810 .le. The value represented by the attribute of the batch job is less than or equal to the value  
 102811 represented by the option-argument.

102812 .ne. The value represented by the attribute of the batch job is not equal to the value  
 102813 represented by the option-argument.

102814 **OPTIONS**

102815 The *qselect* utility shall conform to XBD [Section 12.2](#) (on page 215).

102816 The following options shall be supported by the implementation:

102817 **-a** [op]date\_time

102818 Restrict selection to a specific time, or a range of times.

102819 The *qselect* utility shall select only batch jobs for which the value of the

- 102820 *Execution\_Time* attribute is related to the Epoch equivalent of the local time  
 102821 expressed by the value of the *date\_time* component of the option-argument in the  
 102822 manner indicated by the value of the *op* component of the option-argument.
- 102823 The *qselect* utility shall accept a *date\_time* component of the option-argument that  
 102824 conforms to the syntax of the *time* operand of the *touch* utility.
- 102825 If the *op* component of the option-argument is not presented to the *qselect* utility,  
 102826 the utility shall select batch jobs for which the *Execution\_Time* attribute is equal to  
 102827 the *date\_time* component of the option-argument.
- 102828 When comparing times, the *qselect* utility shall use the following definitions for the  
 102829 *op* component of the option-argument:
- 102830 *.eq.* The time represented by value of the *Execution\_Time* attribute of the batch  
 102831 job is equal to the time represented by the *date\_time* component of the  
 102832 option-argument.
  - 102833 *.ge.* The time represented by value of the *Execution\_Time* attribute of the batch  
 102834 job is after or equal to the time represented by the *date\_time* component of  
 102835 the option-argument.
  - 102836 *.gt.* The time represented by value of the *Execution\_Time* attribute of the batch  
 102837 job is after the time represented by the *date\_time* component of the option-  
 102838 argument.
  - 102839 *.lt.* The time represented by value of the *Execution\_Time* attribute of the batch  
 102840 job is before the time represented by the *date\_time* component of the  
 102841 option-argument.
  - 102842 *.le.* The time represented by value of the *Execution\_Time* attribute of the batch  
 102843 job is before or equal to the time represented by the *date\_time* component  
 102844 of the option-argument.
  - 102845 *.ne.* The time represented by value of the *Execution\_Time* attribute of the batch  
 102846 job is not equal to the time represented by the *date\_time* component of the  
 102847 option-argument.
- 102848 The *qselect* utility shall accept the defined character strings for the *op* component of  
 102849 the option-argument.
- 102850 **-A** *account\_string*  
 102851 Restrict selection to the batch jobs charging a specified account.
- 102852 The *qselect* utility shall select only batch jobs for which the value of the  
 102853 *Account\_Name* attribute of the batch job matches the value of the *account\_string*  
 102854 option-argument.
- 102855 The syntax of the *account\_string* option-argument is unspecified.
- 102856 **-c** [*op*]*interval*  
 102857 Restrict selection to batch jobs within a range of checkpoint intervals.
- 102858 The *qselect* utility shall select only batch jobs for which the value of the *Checkpoint*  
 102859 attribute relates to the value of the *interval* component of the option-argument in  
 102860 the manner indicated by the value of the *op* component of the option-argument.
- 102861 If the *op* component of the option-argument is omitted, the *qselect* utility shall select  
 102862 batch jobs for which the value of the *Checkpoint* attribute is equal to the value of the  
 102863 *interval* component of the option-argument.

102864 When comparing checkpoint intervals, the *qselect* utility shall use the following  
 102865 definitions for the *op* component of the option-argument:

102866 *.eq.* The value of the *Checkpoint* attribute of the batch job equals the value of  
 102867 the *interval* component of the option-argument.

102868 *.ge.* The value of the *Checkpoint* attribute of the batch job is greater than or  
 102869 equal to the value of the *interval* component option-argument.

102870 *.gt.* The value of the *Checkpoint* attribute of the batch job is greater than the  
 102871 value of the *interval* component option-argument.

102872 *.lt.* The value of the *Checkpoint* attribute of the batch job is less than the value  
 102873 of the *interval* component option-argument.

102874 *.le.* The value of the *Checkpoint* attribute of the batch job is less than or equal  
 102875 to the value of the *interval* component option-argument.

102876 *.ne.* The value of the *Checkpoint* attribute of the batch job does not equal the  
 102877 value of the *interval* component option-argument.

102878 The *qselect* utility shall accept the defined character strings for the *op* component of  
 102879 the option-argument.

102880 The ordering relationship for the values of the interval option-argument is defined  
 102881 to be:

102882 *'n'* *.gt.* *'s'* *.gt.* *'c=minutes'* *.ge.* *'c'*

102883 When comparing *Checkpoint* attributes with an interval having the value of the  
 102884 single character *'u'*, only equality or inequality are valid comparisons.

102885 **-h hold\_list** Restrict selection to batch jobs that have a specific type of hold.

102886 The *qselect* utility shall select only batch jobs for which the value of the *Hold\_Types*  
 102887 attribute matches the value of the *hold\_list* option-argument.

102888 The *qselect* **-h** option shall accept a value for the *hold\_list* option-argument that is a  
 102889 string of alphanumeric characters in the portable character set (see XBD [Section](#)  
 102890 [6.1](#), on page 125).

102891 The *qselect* utility shall accept a value for the *hold\_list* option-argument that is a  
 102892 string of one or more of the characters *'u'*, *'s'*, or *'o'*, or the single character  
 102893 *'n'*.

102894 Each unique character in the *hold\_list* option-argument of the *qselect* utility is  
 102895 defined as follows, each representing a different hold type:

102896 u USER  
 102897 s SYSTEM  
 102898 o OPERATOR

102899 If any of these characters are duplicated in the *hold\_list* option-argument, the  
 102900 duplicates shall be ignored.

102901 The *qselect* utility shall consider it an error if any hold type other than *'n'* is  
 102902 combined with hold type *'n'*.

102903 Strictly conforming applications shall not repeat any of the characters *'u'*, *'s'*,  
 102904 *'o'*, or *'n'* within the *hold\_list* option-argument. The *qselect* utility shall permit

- 102905 the repetition of characters, but shall not assign additional meaning to the repeated  
102906 characters.
- 102907 An implementation may define other hold types. The conformance document for  
102908 an implementation shall describe any additional hold types, how they are  
102909 specified, their internal behavior, and how they affect the behavior of the utility.
- 102910 **-I *resource\_list***  
102911 Restrict selection to batch jobs with specified resource limits and attributes.
- 102912 The *qselect* utility shall accept a *resource\_list* option-argument with the following  
102913 syntax:
- 102914 *resource\_name op value [ , , resource\_name op value , , ... ]*
- 102915 When comparing resource values, the *qselect* utility shall use the following  
102916 definitions for the *op* component of the option-argument:
- 102917 *.eq.* The value of the resource of the same name in the *Resource\_List* attribute  
102918 of the batch job equals the value of the value component of the option-  
102919 argument.
- 102920 *.ge.* The value of the resource of the same name in the *Resource\_List* attribute  
102921 of the batch job is greater than or equal to the value of the *value*  
102922 component of the option-argument.
- 102923 *.gt.* The value of the resource of the same name in the *Resource\_List* attribute  
102924 of the batch job is greater than the value of the value component of the  
102925 option-argument.
- 102926 *.lt.* The value of the resource of the same name in the *Resource\_List* attribute  
102927 of the batch job is less than the value of the value component of the  
102928 option-argument.
- 102929 *.ne.* The value of the resource of the same name in the *Resource\_List* attribute  
102930 of the batch job does not equal the value of the value component of the  
102931 option-argument.
- 102932 *.le.* The value of the resource of the same name in the *Resource\_List* attribute  
102933 of the batch job is less than or equal to the value of the *value* component of  
102934 the option-argument.
- 102935 When comparing the limit of a *Resource\_List* attribute with the *value* component of  
102936 the option-argument, if the limit, the value, or both are non-numeric, only equality  
102937 or inequality are valid comparisons.
- 102938 The *qselect* utility shall select only batch jobs for which the values of the  
102939 *resource\_names* listed in the *resource\_list* option-argument match the corresponding  
102940 limits of the *Resource\_List* attribute of the batch job.
- 102941 Limits of *resource\_names* present in the *Resource\_List* attribute of the batch job that  
102942 have no corresponding values in the *resource\_list* option-argument shall not be  
102943 considered when selecting batch jobs.
- 102944 **-N *name*** Restrict selection to batch jobs with a specified name.
- 102945 The *qselect* utility shall select only batch jobs for which the value of the *Job\_Name*  
102946 attribute matches the value of the *name* option-argument. The string specified in  
102947 the *name* option-argument shall be passed, uninterpreted, to the server. This allows  
102948 an implementation to match "wildcard" patterns against batch job names.

102949 An implementation shall describe in the conformance document the format it  
102950 supports for matching against the *Job\_Name* attribute.

102951 **-p** [*op*]*priority*

102952 Restrict selection to batch jobs of the specified priority or range of priorities.

102953 The *qselect* utility shall select only batch jobs for which the value of the *Priority*  
102954 attribute of the batch job relates to the value of the *priority* component of the  
102955 option-argument in the manner indicated by the value of the *op* component of the  
102956 option-argument.

102957 If the *op* component of the option-argument is omitted, the *qselect* utility shall select  
102958 batch jobs for which the value of the *Priority* attribute of the batch job is equal to  
102959 the value of the *priority* component of the option-argument.

102960 When comparing priority values, the *qselect* utility shall use the following  
102961 definitions for the *op* component of the option-argument:

102962 *.eq.* The value of the *Priority* attribute of the batch job equals the value of the  
102963 *priority* component of the option-argument.

102964 *.ge.* The value of the *Priority* attribute of the batch job is greater than or equal  
102965 to the value of the *priority* component option-argument.

102966 *.gt.* The value of the *Priority* attribute of the batch job is greater than the value  
102967 of the *priority* component option-argument.

102968 *.lt.* The value of the *Priority* attribute of the batch job is less than the value of  
102969 the *priority* component option-argument.

102970 *.lte.* The value of the *Priority* attribute of the batch job is less than or equal to  
102971 the value of the *priority* component option-argument.

102972 *.ne.* The value of the *Priority* attribute of the batch job does not equal the value  
102973 of the *priority* component option-argument.

102974 **-q** *destination*

102975 Restrict selection to the specified batch queue or server, or both.

102976 The *qselect* utility shall select only batch jobs that are located at the destination  
102977 indicated by the value of the *destination* option-argument.

102978 The destination defines a batch queue, a server, or a batch queue at a server.

102979 The *qselect* utility shall accept an option-argument for the **-q** option that conforms  
102980 to the syntax for a destination. If the **-q** option is not presented to the *qselect* utility,  
102981 the utility shall select batch jobs from all batch queues at the default batch server.

102982 If the option-argument describes only a batch queue, the *qselect* utility shall select  
102983 only batch jobs from the batch queue of the specified name at the default batch  
102984 server. The means by which *qselect* determines the default server is  
102985 implementation-defined.

102986 If the option-argument describes only a batch server, the *qselect* utility shall select  
102987 batch jobs from all the batch queues at that batch server.

102988 If the option-argument describes both a batch queue and a batch server, the *qselect*  
102989 utility shall select only batch jobs from the specified batch queue at the specified  
102990 server.

- 102991            **-r y | n**       Restrict selection to batch jobs with the specified rerunability status.
- 102992                            The *qselect* utility shall select only batch jobs for which the value of the *Rerunable*
- 102993                            attribute of the batch job matches the value of the option-argument.
- 102994                            The *qselect* utility shall accept a value for the option-argument that consists of
- 102995                            either the single character 'y' or the single character 'n'. The character 'y'
- 102996                            represents the value TRUE, and the character 'n' represents the value FALSE.
- 102997            **-s states**       Restrict selection to batch jobs in the specified states.
- 102998                            The *qselect* utility shall accept an option-argument that consists of any combination
- 102999                            of the characters 'e', 'q', 'r', 'w', 'h', and 't'.
- 103000                            Conforming applications shall not repeat any character in the option-argument.
- 103001                            The *qselect* utility shall permit the repetition of characters in the option-argument,
- 103002                            but shall not assign additional meaning to repeated characters.
- 103003                            The *qselect* utility shall interpret the characters in the *states* option-argument as
- 103004                            follows:
- 103005                            e    Represents the EXITING state.
- 103006                            q    Represents the QUEUED state.
- 103007                            r    Represents the RUNNING state.
- 103008                            t    Represents the TRANSITING state.
- 103009                            h    Represents the HELD state.
- 103010                            w    Represents the WAITING state.
- 103011                            For each character in the *states* option-argument, the *qselect* utility shall select batch
- 103012                            jobs in the corresponding state.
- 103013            **-u user\_list**   Restrict selection to batch jobs owned by the specified user names.
- 103014                            The *qselect* utility shall select only the batch jobs of those users specified in the
- 103015                            *user\_list* option-argument.
- 103016                            The *qselect* utility shall accept a *user\_list* option-argument that conforms to the
- 103017                            following syntax:
- 103018                            *username*[*@host*] [, , *username*[*@host*] , , . . . ]
- 103019                            The *qselect* utility shall accept only one user name that is missing a corresponding
- 103020                            host name. The *qselect* utility shall accept only one user name per named host.
- 103021   **OPERANDS**
- 103022                            None.
- 103023   **STDIN**
- 103024                            Not used.
- 103025   **INPUT FILES**
- 103026                            None.
- 103027   **ENVIRONMENT VARIABLES**
- 103028                            The following environment variables shall affect the execution of *qselect*:

|        |                               |                                                                                                                                                                                                                                                |
|--------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 103029 | <i>LANG</i>                   | Provide a default value for the internationalization variables that are unset or null. (See XBD <a href="#">Section 8.2</a> (on page 174) the precedence of internationalization variables used to determine the values of locale categories.) |
| 103030 |                               |                                                                                                                                                                                                                                                |
| 103031 |                               |                                                                                                                                                                                                                                                |
| 103032 | <i>LC_ALL</i>                 | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                       |
| 103033 |                               |                                                                                                                                                                                                                                                |
| 103034 | <i>LC_CTYPE</i>               | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).                                                                      |
| 103035 |                               |                                                                                                                                                                                                                                                |
| 103036 |                               |                                                                                                                                                                                                                                                |
| 103037 | <i>LC_MESSAGES</i>            |                                                                                                                                                                                                                                                |
| 103038 |                               | Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.                                                                                                                   |
| 103039 |                               |                                                                                                                                                                                                                                                |
| 103040 | <i>LOGNAME</i>                | Determine the login name of the user.                                                                                                                                                                                                          |
| 103041 | <i>TZ</i>                     | Determine the timezone used to interpret the <i>date-time</i> option-argument. If <i>TZ</i> is unset or null, an unspecified default timezone shall be used.                                                                                   |

| 103061 | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                                                                                                                                                |
| 103062 |                               | Default.                                                                                                                                                                                                                                       |

103063 **APPLICATION USAGE**

103064 None.

103065 **EXAMPLES**

103066 The following example shows how a user might use the *qselect* utility in conjunction with the  
 103067 *qdel* utility to delete all of his or her jobs in the queued state without affecting any jobs that are  
 103068 already running:

103069 `qdel $(qselect -s q)`

103070 or:

103071 `qselect -s q || xargs qdel`103072 **RATIONALE**

103073 The *qselect* utility allows users to acquire a list of job identifiers that match user-specified  
 103074 selection criteria. The list of identifiers returned by the *qselect* utility conforms to the syntax of  
 103075 the batch job identifier list processed by a utility such as *qmove*, *qdel*, and *qrls*. The *qselect* utility  
 103076 is thus a powerful tool for causing another batch system utility to act upon a set of jobs that  
 103077 match a list of selection criteria.

103078 The options of the *qselect* utility let the user apply a number of useful filters for selecting jobs.  
 103079 Each option further restricts the selection of jobs. Many of the selection options allow the  
 103080 specification of a relational operator. The FORTRAN-like syntax of the operator—that is,  
 103081 ".lt."—was chosen rather than the C-like "<=" meta-characters.

103082 The **-a** option allows users to restrict the selected jobs to those that have been submitted (or  
 103083 altered) to wait until a particular time. The time period is determined by the argument of this  
 103084 option, which includes both a time and an operator—it is thus possible to select jobs waiting  
 103085 until a specific time, jobs waiting until after a certain time, or those waiting for a time before the  
 103086 specified time.

103087 The **-A** option allows users to restrict the selected jobs to those that have been submitted (or  
 103088 altered) to charge a particular account.

103089 The **-c** option allows users to restrict the selected jobs to those whose checkpointing interval  
 103090 falls within the specified range.

103091 The **-l** option allows users to select those jobs whose resource limits fall within the range  
 103092 indicated by the value of the option. For example, a user could select those jobs for which the  
 103093 CPU time limit is greater than two hours.

103094 The **-N** option allows users to select jobs by job name. For instance, all the parts of a task that  
 103095 have been divided in parallel jobs might be given the same name, and thus manipulated as a  
 103096 group by means of this option.

103097 The **-q** option allows users to select jobs in a specified queue.

103098 The **-r** option allows users to select only those jobs with a specified rerun criteria. For instance, a  
 103099 user might select only those jobs that can be rerun for use with the *qrerun* utility.

103100 The **-s** option allows users to select only those jobs that are in a certain state.

103101 The **-u** option allows users to select jobs that have been submitted to execute under a particular  
 103102 account.

103103 The selection criteria provided by the options of the *qselect* utility allow users to select jobs based  
 103104 on all the appropriate attributes that can be assigned to jobs by the *qsub* utility.

103105 Historically, the *qselect* utility has not been a part of existing practice; it is an improvement that

103106 has been introduced in this volume of POSIX.1-2008.

103107 **FUTURE DIRECTIONS**

103108 The *qselect* utility may be removed in a future version.

103109 **SEE ALSO**

103110 [Chapter 3](#) (on page 2375), [qdel](#), [qrerun](#), [qrls](#), [qselect](#), [qsub](#), [touch](#)

103111 XBD [Section 6.1](#) (on page 125), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

103112 **CHANGE HISTORY**

103113 Derived from IEEE Std 1003.2d-1994.

103114 **Issue 7**

103115 The *qselect* utility is marked obsolescent.

103116 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

103117 **NAME**

103118 qsig — signal batch jobs

103119 **SYNOPSIS**103120 OB BE `qsig [-s signal] job_identifier...`103121 **DESCRIPTION**

103122 To signal a batch job is to send a signal to the session leader of the batch job. A batch job is  
 103123 signaled by sending a request to the batch server that manages the batch job. The *qsig* utility is a  
 103124 user-accessible batch client that requests the signaling of a batch job.

103125 The *qsig* utility shall signal those batch jobs for which a batch *job\_identifier* is presented to the  
 103126 utility. The *qsig* utility shall not signal any batch jobs whose batch *job\_identifiers* are not  
 103127 presented to the utility.

103128 The *qsig* utility shall signal batch jobs in the order in which the corresponding batch  
 103129 *job\_identifiers* are presented to the utility. If the *qsig* utility fails to process a batch *job\_identifier*  
 103130 successfully, the utility shall proceed to process the remaining batch *job\_identifiers*, if any.

103131 The *qsig* utility shall signal batch jobs by sending a *Signal Job Request* to the batch server that  
 103132 manages the batch job.

103133 For each successfully processed batch *job\_identifier*, the *qsig* utility shall have received a  
 103134 completion reply to each *Signal Job Request* sent to a batch server at the time the utility exits.

103135 **OPTIONS**103136 The *qsig* utility shall conform to XBD [Section 12.2](#) (on page 215).

103137 The following option shall be supported by the implementation:

103138 `-s signal` Define the signal to be sent to the batch job.

103139 The *qsig* utility shall accept a *signal* option-argument that is either a symbolic signal  
 103140 name or an unsigned integer signal number (see the POSIX.1-1990 standard,  
 103141 Section 3.3.1.1). The *qsig* utility shall accept signal names for which the SIG prefix  
 103142 has been omitted.

103143 If the *signal* option-argument is a signal name, the *qsig* utility shall send that name.

103144 If the *signal* option-argument is a number, the *qsig* utility shall send the signal  
 103145 value represented by the number.

103146 If the `-s` option is not presented to the *qsig* utility, the utility shall send the signal  
 103147 SIGTERM to each signaled batch job.

103148 **OPERANDS**

103149 The *qsig* utility shall accept one or more operands that conform to the syntax for a batch  
 103150 *job\_identifier* (see [Section 3.3.1](#), on page 2397).

103151 **STDIN**

103152 Not used.

103153 **INPUT FILES**

103154 None.

103155 **ENVIRONMENT VARIABLES**103156 The following environment variables shall affect the execution of *qsig*:

- 103157        *LANG*        Provide a default value for the internationalization variables that are unset or null.  
 103158                    (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 103159                    used to determine the values of locale categories.)
- 103160        *LC\_ALL*        If set to a non-empty string value, override the values of all the other  
 103161                    internationalization variables.
- 103162        *LC\_CTYPE*      Determine the locale for the interpretation of sequences of bytes of text data as  
 103163                    characters (for example, single-byte as opposed to multi-byte characters in  
 103164                    arguments).
- 103165        *LC\_MESSAGES*  
 103166                    Determine the locale that should be used to affect the format and contents of  
 103167                    diagnostic messages written to standard error.
- 103168        *LOGNAME*      Determine the login name of the user.
- 103169    **ASYNCHRONOUS EVENTS**
- 103170        Default.
- 103171    **STDOUT**
- 103172        An implementation of the *qsig* utility may write informative messages to standard output.
- 103173    **STDERR**
- 103174        The standard error shall be used only for diagnostic messages.
- 103175    **OUTPUT FILES**
- 103176        None.
- 103177    **EXTENDED DESCRIPTION**
- 103178        None.
- 103179    **EXIT STATUS**
- 103180        The following exit values shall be returned:
- 103181            0    Successful completion.
- 103182            >0   An error occurred.
- 103183    **CONSEQUENCES OF ERRORS**
- 103184        In addition to the default behavior, the *qsig* utility shall not be required to write a diagnostic  
 103185        message to standard error when the error reply received from a batch server indicates that the  
 103186        batch *job\_identifier* does not exist on the server. Whether or not the *qsig* utility waits to output the  
 103187        diagnostic message while attempting to locate the batch job on other servers is implementation-  
 103188        defined.
- 103189    **APPLICATION USAGE**
- 103190        None.
- 103191    **EXAMPLES**
- 103192        None.
- 103193    **RATIONALE**
- 103194        The *qsig* utility allows users to signal batch jobs.
- 103195        A user may be unable to signal a batch job with the *kill* utility of the operating system for a  
 103196        number of reasons. First, the process ID of the batch job may be unknown to the user. Second,  
 103197        the processes of the batch job may be on a remote node. However, by virtue of communication  
 103198        between batch nodes, the *qsig* utility can arrange for the signaling of a process.
- 103199        Because a batch job that is not running cannot be signaled, and because the signal may not

- 103200 terminate the batch job, the *qsig* utility is not a substitute for the *qdel* utility.
- 103201 The options of the *qsig* utility allow the user to specify the signal that is to be sent to the batch  
103202 job.
- 103203 The *-s* option allows users to specify a signal by name or by number, and thus override the  
103204 default signal. The POSIX.1-1990 standard defines signals by both name and number.
- 103205 The *qsig* utility is a new utility, *vis-a-vis* existing practice; it has been defined in this volume of  
103206 POSIX.1-2008 in response to user-perceived shortcomings in existing practice.
- 103207 **FUTURE DIRECTIONS**
- 103208 The *qsig* utility may be removed in a future version.
- 103209 **SEE ALSO**
- 103210 [Chapter 3](#) (on page 2375), *kill*, *qdel*
- 103211 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)
- 103212 **CHANGE HISTORY**
- 103213 Derived from IEEE Std 1003.2d-1994.
- 103214 **Issue 6**
- 103215 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.
- 103216 **Issue 7**
- 103217 The *qsig* utility is marked obsolescent.
- 103218 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

103219 **NAME**

103220 qstat — show status of batch jobs

103221 **SYNOPSIS**103222 OB BE qstat [-f] *job\_identifier...*103223 qstat -Q [-f] *destination...*103224 qstat -B [-f] *server\_name...*103225 **DESCRIPTION**

103226 The status of a batch job, batch queue, or batch server is obtained by a request to the server. The  
 103227 *qstat* utility is a user-accessible batch client that requests the status of one or more batch jobs,  
 103228 batch queues, or servers, and writes the status information to standard output.

103229 For each successfully processed batch *job\_identifier*, the *qstat* utility shall display information  
 103230 about the corresponding batch job.

103231 For each successfully processed destination, the *qstat* utility shall display information about the  
 103232 corresponding batch queue.

103233 For each successfully processed server name, the *qstat* utility shall display information about the  
 103234 corresponding server.

103235 The *qstat* utility shall acquire batch job status information by sending a *Job Status Request* to a  
 103236 batch server. The *qstat* utility shall acquire batch queue status information by sending a *Queue*  
 103237 *Status Request* to a batch server. The *qstat* utility shall acquire server status information by  
 103238 sending a *Server Status Request* to a batch server.

103239 **OPTIONS**103240 The *qstat* utility shall conform to XBD [Section 12.2](#) (on page 215).

103241 The following options shall be supported by the implementation:

103242 **-f** Specify that a full display is produced.

103243 The minimum contents of a full display are specified in the STDOUT section.

103244 Additional contents and format of a full display are implementation-defined.

103245 **-Q** Specify that the operand is a destination.103246 The *qstat* utility shall display information about each batch queue at each  
 103247 destination identified as an operand.103248 **-B** Specify that the operand is a server name.103249 The *qstat* utility shall display information about each server identified as an  
 103250 operand.103251 **OPERANDS**103252 If the **-Q** option is presented to the *qstat* utility, the utility shall accept one or more operands that  
 103253 conform to the syntax for a destination (see [Section 3.3.2](#), on page 2398).103254 If the **-B** option is presented to the *qstat* utility, the utility shall accept one or more *server\_name*  
 103255 operands.103256 If neither the **-B** nor the **-Q** option is presented to the *qstat* utility, the utility shall accept one or  
 103257 more operands that conform to the syntax for a batch *job\_identifier* (see [Section 3.3.1](#), on page  
 103258 2397).

103259 **STDIN**

103260 Not used.

103261 **INPUT FILES**

103262 None.

103263 **ENVIRONMENT VARIABLES**103264 The following environment variables shall affect the execution of *qstat*:103265 *HOME* Determine the pathname of the user's home directory.103266 *LANG* Provide a default value for the internationalization variables that are unset or null.  
103267 (See XBD Section 8.2 (on page 174) the precedence of internationalization variables  
103268 used to determine the values of locale categories.)103269 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
103270 internationalization variables.103271 *LC\_COLLATE*103272 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
103273 character collating elements within regular expressions.103274 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
103275 characters (for example, single-byte as opposed to multi-byte characters in  
103276 arguments).103277 *LC\_MESSAGES*103278 Determine the locale that should be used to affect the format and contents of  
103279 diagnostic messages written to standard error.103280 *LC\_NUMERIC*103281 Determine the locale for selecting the radix character used when writing floating-  
103282 point formatted output.103283 **ASYNCHRONOUS EVENTS**

103284 Default.

103285 **STDOUT**103286 If an operand presented to the *qstat* utility is a batch *job\_identifier* and the *-f* option is not  
103287 specified, the *qstat* utility shall display the following items on a single line, in the stated order,  
103288 with white space between each item, for each successfully processed operand:

- 103289 • The batch *job\_identifier*
- 103290 • The batch job name
- 103291 • The *Job\_Owner* attribute
- 103292 • The CPU time used by the batch job
- 103293 • The batch job state
- 103294 • The batch job location

103295 If an operand presented to the *qstat* utility is a batch *job\_identifier* and the *-f* option is specified,  
103296 the *qstat* utility shall display the following items for each success fully processed operand:

- 103297 • The batch *job\_identifier*
- 103298 • The batch job name

- 103299 • The *Job\_Owner* attribute
  - 103300 • The execution user ID
  - 103301 • The CPU time used by the batch job
  - 103302 • The batch job state
  - 103303 • The batch job location
  - 103304 • Additional implementation-defined information, if any, about the batch job or batch queue
- 103305 If an operand presented to the *qstat* utility is a destination, the **-Q** option is specified, and the **-f**  
 103306 option is not specified, the *qstat* utility shall display the following items on a single line, in the  
 103307 stated order, with white space between each item, for each successfully processed operand:
- 103308 • The batch queue name
  - 103309 • The maximum number of batch jobs that shall be run in the batch queue concurrently
  - 103310 • The total number of batch jobs in the batch queue
  - 103311 • The status of the batch queue
  - 103312 • For each state, the number of batch jobs in that state in the batch queue and the name of  
 103313 the state
  - 103314 • The type of batch queue (execution or routing)
- 103315 If the operands presented to the *qstat* utility are destinations, the **-Q** option is specified, and the  
 103316 **-f** option is specified, the *qstat* utility shall display the following items for each successfully  
 103317 processed operand:
- 103318 • The batch queue name
  - 103319 • The maximum number of batch jobs that shall be run in the batch queue concurrently
  - 103320 • The total number of batch jobs in the batch queue
  - 103321 • The status of the batch queue
  - 103322 • For each state, the number of batch jobs in that state in the batch queue and the name of  
 103323 the state
  - 103324 • The type of batch queue (execution or routing)
  - 103325 • Additional implementation-defined information, if any, about the batch queue
- 103326 If the operands presented to the *qstat* utility are batch server names, the **-B** option is specified,  
 103327 and the **-f** option is not specified, the *qstat* utility shall display the following items on a single  
 103328 line, in the stated order, with white space between each item, for each successfully processed  
 103329 operand:
- 103330 • The batch server name
  - 103331 • The maximum number of batch jobs that shall be run in the batch queue concurrently
  - 103332 • The total number of batch jobs managed by the batch server
  - 103333 • The status of the batch server
  - 103334 • For each state, the number of batch jobs in that state and the name of the state
- 103335 If the operands presented to the *qstat* utility are server names, the **-B** option is specified, and the  
 103336 **-f** option is specified, the *qstat* utility shall display the following items for each successfully

- 103337 processed operand:
- 103338 • The server name
  - 103339 • The maximum number of batch jobs that shall be run in the batch queue concurrently
  - 103340 • The total number of batch jobs managed by the server
  - 103341 • The status of the server
  - 103342 • For each state, the number of batch jobs in that state and the name of the state
  - 103343 • Additional implementation-defined information, if any, about the server
- 103344 **STDERR**
- 103345 The standard error shall be used only for diagnostic messages.
- 103346 **OUTPUT FILES**
- 103347 None.
- 103348 **EXTENDED DESCRIPTION**
- 103349 None.
- 103350 **EXIT STATUS**
- 103351 The following exit values shall be returned:
- 103352 0 Successful completion.
  - 103353 >0 An error occurred.
- 103354 **CONSEQUENCES OF ERRORS**
- 103355 In addition to the default behavior, the *qstat* utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch *job\_identifier* does not exist on the server. Whether or not the *qstat* utility waits to output the diagnostic message while attempting to locate the batch job on other servers is implementation-defined.
- 103356
- 103357
- 103358
- 103359
- 103360 **APPLICATION USAGE**
- 103361 None.
- 103362 **EXAMPLES**
- 103363 None.
- 103364 **RATIONALE**
- 103365 The *qstat* utility allows users to display the status of jobs and list the batch jobs in queues.
- 103366 The operands of the *qstat* utility may be either job identifiers, queues (specified as destination identifiers), or batch server names. The **-Q** and **-B** options, or absence thereof, indicate the nature of the operands.
- 103367
- 103368
- 103369 The other options of the *qstat* utility allow the user to control the amount of information displayed and the format in which it is displayed. Should a user wish to display the status of a set of jobs that match a selection criteria, the *qselect* utility may be used to acquire such a list.
- 103370
- 103371
- 103372 The **-f** option allows users to request a “full” display in an implementation-defined format.
- 103373 Historically, the *qstat* utility has been a part of the NQS and its derivatives, the existing practice on which it is based.
- 103374

103375 **FUTURE DIRECTIONS**

103376 The *qstat* utility may be removed in a future version.

103377 **SEE ALSO**

103378 [Chapter 3](#) (on page 2375), [qselect](#)

103379 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

103380 **CHANGE HISTORY**

103381 Derived from IEEE Std 1003.2d-1994.

103382 **Issue 6**

103383 IEEE PASC Interpretation 1003.2 #191 is applied, removing the following ENVIRONMENT  
103384 VARIABLES listed as affecting *qstat*: *COLUMNS*, *LINES*, *LOGNAME*, *TERM*, and *TZ*.

103385 The *LC\_TIME* entry is also removed from the ENVIRONMENT VARIABLES section.

103386 **Issue 7**

103387 The *qstat* utility is marked obsolescent.

103388 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

103389 **NAME**

103390 qsub — submit a script

103391 **SYNOPSIS**

```

103392 OB BE qsub [-a date_time] [-A account_string] [-c interval]
103393 [-C directive_prefix] [-e path_name] [-h] [-j join_list]
103394 [-k keep_list] [-m mail_options] [-M mail_list] [-N name]
103395 [-o path_name] [-p priority] [-q destination] [-r y|n]
103396 [-S path_name_list] [-u user_list] [-v variable_list] [-V]
103397 [-z] [script]

```

103398 **DESCRIPTION**

103399 To submit a script is to create a batch job that executes the script. A script is submitted by a  
 103400 request to a batch server. The *qsub* utility is a user-accessible batch client that submits a script.

103401 Upon successful completion, the *qsub* utility shall have created a batch job that will execute the  
 103402 submitted script.

103403 The *qsub* utility shall submit a script by sending a *Queue Job Request* to a batch server.

103404 The *qsub* utility shall place the value of the following environment variables in the *Variable\_List*  
 103405 attribute of the batch job: *HOME*, *LANG*, *LOGNAME*, *PATH*, *MAIL*, *SHELL*, and *TZ*. The name of  
 103406 the environment variable shall be the current name prefixed with the string *PBS\_O\_*.

103407 **Note:** If the current value of the *HOME* variable in the environment space of the *qsub* utility is  
 103408 */aa/bb/cc*, then *qsub* shall place *PBS\_O\_HOME=/aa/bb/cc* in the *Variable\_List* attribute of the  
 103409 batch job.

103410 In addition to the variables described above, the *qsub* utility shall add the following variables  
 103411 with the indicated values to the variable list:

103412 *PBS\_O\_WORKDIR* The absolute path of the current working directory of the *qsub* utility  
 103413 process.

103414 *PBS\_O\_HOST* The name of the host on which the *qsub* utility is running.

103415 **OPTIONS**

103416 The *qsub* utility shall conform to XBD [Section 12.2](#) (on page 215).

103417 The following options shall be supported by the implementation:

103418 **-a date\_time** Define the time at which a batch job becomes eligible for execution.

103419 The *qsub* utility shall accept an option-argument that conforms to the syntax of the  
 103420 *time* operand of the *touch* utility.

103421

**Table 4-19** Environment Variable Values (Utilities)

103422

| Variable Name        | Value at qsub Time        |
|----------------------|---------------------------|
| <i>PBS_O_HOME</i>    | <i>HOME</i>               |
| <i>PBS_O_HOST</i>    | Client host name          |
| <i>PBS_O_LANG</i>    | <i>LANG</i>               |
| <i>PBS_O_LOGNAME</i> | <i>LOGNAME</i>            |
| <i>PBS_O_PATH</i>    | <i>PATH</i>               |
| <i>PBS_O_MAIL</i>    | <i>MAIL</i>               |
| <i>PBS_O_SHELL</i>   | <i>SHELL</i>              |
| <i>PBS_O_TZ</i>      | <i>TZ</i>                 |
| <i>PBS_O_WORKDIR</i> | Current working directory |

103423

103424

103425

103426

103427

103428

103429

103430

103431

103432

103433

**Note:** The server that initiates execution of the batch job will add other variables to the batch job's environment; see [Section 3.2.2.1](#) (on page 2381).

103434

103435

103436

103437

The *qsub* utility shall set the *Execution\_Time* attribute of the batch job to the number of seconds since the Epoch that is equivalent to the local time expressed by the value of the *date\_time* option-argument. The Epoch is defined in XBD [Section 3.150](#) (on page 57).

103438

103439

103440

If the *-a* option is not presented to the *qsub* utility, the utility shall set the *Execution\_Time* attribute of the batch job to a time (number of seconds since the Epoch) that is earlier than the time at which the utility exits.

103441

#### *-A account\_string*

103442

103443

Define the account to which the resource consumption of the batch job should be charged.

103444

The syntax of the *account\_string* option-argument is unspecified.

103445

103446

The *qsub* utility shall set the *Account\_Name* attribute of the batch job to the value of the *account\_string* option-argument.

103447

103448

If the *-A* option is not presented to the *qsub* utility, the utility shall omit the *Account\_Name* attribute from the attributes of the batch job.

103449

#### *-c interval*

Define whether the batch job should be checkpointed, and if so, how often.

103450

103451

The *qsub* utility shall accept a value for the interval option-argument that is one of the following:

103452

103453

*n* No checkpointing shall be performed on the batch job (NO\_CHECKPOINT).

103454

103455

*s* Checkpointing shall be performed only when the batch server is shut down (CHECKPOINT\_AT\_SHUTDOWN).

103456

103457

103458

*c* Automatic periodic checkpointing shall be performed at the *Minimum\_Cpu\_Interval* attribute of the batch queue, in units of CPU minutes (CHECKPOINT\_AT\_MIN\_CPU\_INTERVAL).

103459

103460

103461

103462

*c=minutes* Automatic periodic checkpointing shall be performed every *minutes* of CPU time, or every *Minimum\_Cpu\_Interval* minutes, whichever is greater. The *minutes* argument shall conform to the syntax for unsigned integers and shall be greater than zero.

103463

The *qsub* utility shall set the *Checkpoint* attribute of the batch job to the value of the

103464 *interval* option-argument.

103465 If the `-c` option is not presented to the *qsub* utility, the utility shall set the *Checkpoint*  
 103466 attribute of the batch job to the single character 'u'  
 103467 (CHECKPOINT\_UNSPECIFIED).

103468 **-C** *directive\_prefix*  
 103469 Define the prefix that declares a directive to the *qsub* utility within the script.

103470 The *directive\_prefix* is not a batch job attribute; it affects the behavior of the *qsub*  
 103471 utility.

103472 If the `-C` option is presented to the *qsub* utility, and the value of the *directive\_prefix*  
 103473 option-argument is the null string, the utility shall not scan the script file for  
 103474 directives. If the `-C` option is not presented to the *qsub* utility, then the value of the  
 103475 *PBS\_DPREFIX* environment variable is used. If the environment variable is not  
 103476 defined, then #PBS encoded in the portable character set is the default.

103477 **-e** *path\_name*  
 103478 Define the path to be used for the standard error stream of the batch job.

103479 The *qsub* utility shall accept a *path\_name* option-argument which can be preceded  
 103480 by a host name element of the form *hostname*:

103481 If the *path\_name* option-argument constitutes an absolute pathname, the *qsub* utility  
 103482 shall set the *Error\_Path* attribute of the batch job to the value of the *path\_name*  
 103483 option-argument.

103484 If the *path\_name* option-argument constitutes a relative pathname and no host  
 103485 name element is specified, the *qsub* utility shall set the *Error\_Path* attribute of the  
 103486 batch job to the value of the absolute pathname derived by expanding the  
 103487 *path\_name* option-argument relative to the current directory of the process  
 103488 executing *qsub*.

103489 If the *path\_name* option-argument constitutes a relative pathname and a host name  
 103490 element is specified, the *qsub* utility shall set the *Error\_Path* attribute of the batch  
 103491 job to the value of the *path\_name* option-argument without expansion. The host  
 103492 name element shall be included.

103493 If the *path\_name* option-argument does not include a host name element, the *qsub*  
 103494 utility shall prefix the pathname with *hostname*:, where *hostname* is the name of the  
 103495 host upon which the *qsub* utility is being executed.

103496 If the `-e` option is not presented to the *qsub* utility, the utility shall set the  
 103497 *Error\_Path* attribute of the batch job to the host name and path of the current  
 103498 directory of the submitting process and the default filename.

103499 The default filename for standard error has the following format:  
 103500 *job\_name.esquence\_number*

103501 **-h** Specify that a USER hold is applied to the batch job.

103502 The *qsub* utility shall set the value of the *Hold\_Types* attribute of the batch job to the  
 103503 value USER.

103504 If the `-h` option is not presented to the *qsub* utility, the utility shall set the  
 103505 *Hold\_Types* attribute of the batch job to the value NO\_HOLD.

103506        -j *join\_list*    Define which streams of the batch job are to be merged. The *qsub* -j option shall  
 103507                            accept a value for the *join\_list* option-argument that is a string of alphanumeric  
 103508                            characters in the portable character set (see XBD [Section 6.1](#), on page 125).

103509                            The *qsub* utility shall accept a *join\_list* option-argument that consists of one or more  
 103510                            of the characters 'e' and 'o', or the single character 'n'.

103511                            All of the other batch job output streams specified will be merged into the output  
 103512                            stream represented by the character listed first in the *join\_list* option-argument.

103513                            For each unique character in the *join\_list* option-argument, the *qsub* utility shall  
 103514                            add a value to the *Join\_Path* attribute of the batch job as follows, each representing  
 103515                            a different batch job stream to join:

103516                            e    The standard error of the batch job (JOIN\_STD\_ERROR).

103517                            o    The standard output of the batch job (JOIN\_STD\_OUTPUT).

103518                            An existing *Join\_Path* attribute can be cleared by the following join type:

103519                            n    NO\_JOIN

103520                            If 'n' is specified, then no files are joined. The *qsub* utility shall consider it an error  
 103521                            if any join type other than 'n' is combined with join type 'n'.

103522                            Strictly conforming applications shall not repeat any of the characters 'e', 'o', or  
 103523                            'n' within the *join\_list* option-argument. The *qsub* utility shall permit the  
 103524                            repetition of characters, but shall not assign additional meaning to the repeated  
 103525                            characters.

103526                            An implementation may define other join types. The conformance document for an  
 103527                            implementation shall describe any additional batch job streams, how they are  
 103528                            specified, their internal behavior, and how they affect the behavior of the utility.

103529                            If the -j option is not presented to the *qsub* utility, the utility shall set the value of  
 103530                            the *Join\_Path* attribute of the batch job to NO\_JOIN.

103531        -k *keep\_list*    Define which output of the batch job to retain on the execution host.

103532                            The *qsub* -k option shall accept a value for the *keep\_list* option-argument that is a  
 103533                            string of alphanumeric characters in the portable character set (see XBD [Section](#)  
 103534                            [6.1](#), on page 125).

103535                            The *qsub* utility shall accept a *keep\_list* option-argument that consists of one or  
 103536                            more of the characters 'e' and 'o', or the single character 'n'.

103537                            For each unique character in the *keep\_list* option-argument, the *qsub* utility shall  
 103538                            add a value to the *Keep\_Files* attribute of the batch job as follows, each representing  
 103539                            a different batch job stream to keep:

103540                            e    The standard error of the batch job (KEEP\_STD\_ERROR).

103541                            o    The standard output of the batch job (KEEP\_STD\_OUTPUT).

103542                            If both 'e' and 'o' are specified, then both files are retained. An existing  
 103543                            *Keep\_Files* attribute can be cleared by the following keep type:

103544                            n    NO\_KEEP

103545                            If 'n' is specified, then no files are retained. The *qsub* utility shall consider it an  
 103546                            error if any keep type other than 'n' is combined with keep type 'n'.

- 103547 Strictly conforming applications shall not repeat any of the characters 'e', 'o', or  
 103548 'n' within the *keep\_list* option-argument. The *qsub* utility shall permit the  
 103549 repetition of characters, but shall not assign additional meaning to the repeated  
 103550 characters.
- 103551 An implementation may define other keep types. The conformance document for  
 103552 an implementation shall describe any additional keep types, how they are  
 103553 specified, their internal behavior, and how they affect the behavior of the utility. If  
 103554 the **-k** option is not presented to the *qsub* utility, the utility shall set the *Keep\_Files*  
 103555 attribute of the batch job to the value NO\_KEEP.
- 103556 **-m** *mail\_options*  
 103557 Define the points in the execution of the batch job at which the batch server that  
 103558 manages the batch job shall send mail about a change in the state of the batch job.
- 103559 The *qsub* **-m** option shall accept a value for the *mail\_options* option-argument that  
 103560 is a string of alphanumeric characters in the portable character set (see XBD [Section](#)  
 103561 [6.1](#), on page 125).
- 103562 The *qsub* utility shall accept a value for the *mail\_options* option-argument that is a  
 103563 string of one or more of the characters 'e', 'b', and 'a', or the single character  
 103564 'n'.
- 103565 For each unique character in the *mail\_options* option-argument, the *qsub* utility shall  
 103566 add a value to the *Mail\_Users* attribute of the batch job as follows, each  
 103567 representing a different time during the life of a batch job at which to send mail:
- 103568 e MAIL\_AT\_EXIT
  - 103569 b MAIL\_AT\_BEGINNING
  - 103570 a MAIL\_AT\_ABORT
- 103571 If any of these characters are duplicated in the *mail\_options* option-argument, the  
 103572 duplicates shall be ignored.
- 103573 An existing *Mail\_Points* attribute can be cleared by the following mail type:
- 103574 n NO\_MAIL
- 103575 If 'n' is specified, then mail is not sent. The *qsub* utility shall consider it an error if  
 103576 any mail type other than 'n' is combined with mail type 'n'.
- 103577 Strictly conforming applications shall not repeat any of the characters 'e', 'b',  
 103578 'a', or 'n' within the *mail\_options* option-argument.
- 103579 The *qsub* utility shall permit the repetition of characters, but shall not assign  
 103580 additional meaning to the repeated characters. An implementation may define  
 103581 other mail types. The conformance document for an implementation shall describe  
 103582 any additional mail types, how they are specified, their internal behavior, and how  
 103583 they affect the behavior of the utility.
- 103584 If the **-m** option is not presented to the *qsub* utility, the utility shall set the  
 103585 *Mail\_Points* attribute to the value MAIL\_AT\_ABORT.
- 103586 **-M** *mail\_list* Define the list of users to which a batch server that executes the batch job shall  
 103587 send mail, if the server sends mail about the batch job.
- 103588 The syntax of the *mail\_list* option-argument is unspecified.
- 103589 If the implementation of the *qsub* utility uses a name service to locate users, the

- 103590 utility should accept the syntax used by the name service.
- 103591 If the implementation of the *qsub* utility does not use a name service to locate users,  
103592 the implementation should accept the following syntax for user names:
- 103593 *mail\_address*[, , *mail\_address*, , . . .]
- 103594 The interpretation of *mail\_address* is implementation-defined.
- 103595 The *qsub* utility shall set the *Mail\_Users* attribute of the batch job to the value of the  
103596 *mail\_list* option-argument.
- 103597 If the **-M** option is not presented to the *qsub* utility, the utility shall place only the  
103598 user name and host name for the current process in the *Mail\_Users* attribute of the  
103599 batch job.
- 103600 **-N name** Define the name of the batch job.
- 103601 The *qsub* **-N** option shall accept a value for the *name* option-argument that is a  
103602 string of up to 15 alphanumeric characters in the portable character set (see XBD  
103603 [Section 6.1](#), on page 125) where the first character is alphabetic.
- 103604 The *qsub* utility shall set the value of the *Job\_Name* attribute of the batch job to the  
103605 value of the *name* option-argument.
- 103606 If the **-N** option is not presented to the *qsub* utility, the utility shall set the *Job\_Name*  
103607 attribute of the batch job to the name of the *script* argument from which the  
103608 directory specification if any, has been removed.
- 103609 If the **-N** option is not presented to the *qsub* utility, and the script is read from  
103610 standard input, the utility shall set the *Job\_Name* attribute of the batch job to the  
103611 value STDIN.
- 103612 **-o path\_name**
- 103613 Define the path for the standard output of the batch job.
- 103614 The *qsub* utility shall accept a *path\_name* option-argument that conforms to the  
103615 syntax of the *path\_name* element defined in the System Interfaces volume of  
103616 POSIX.1-2008, which can be preceded by a host name element of the form  
103617 *hostname*..
- 103618 If the *path\_name* option-argument constitutes an absolute pathname, the *qsub* utility  
103619 shall set the *Output\_Path* attribute of the batch job to the value of the *path\_name*  
103620 option-argument without expansion.
- 103621 If the *path\_name* option-argument constitutes a relative pathname and no host  
103622 name element is specified, the *qsub* utility shall set the *Output\_Path* attribute of the  
103623 batch job to the pathname derived by expanding the value of the *path\_name* option-  
103624 argument relative to the current directory of the process executing the *qsub*.
- 103625 If the *path\_name* option-argument constitutes a relative pathname and a host name  
103626 element is specified, the *qsub* utility shall set the *Output\_Path* attribute of the batch  
103627 job to the value of the *path\_name* option-argument without expansion.
- 103628 If the *path\_name* option-argument does not specify a host name element, the *qsub*  
103629 utility shall prefix the pathname with *hostname*., where *hostname* is the name of the  
103630 host upon which the *qsub* utility is executing.
- 103631 If the **-o** option is not presented to the *qsub* utility, the utility shall set the  
103632 *Output\_Path* attribute of the batch job to the host name and path of the current

103633 directory of the submitting process and the default filename.

103634 The default filename for standard output has the following format:

103635 *job\_name.osequence\_number*

103636 **-p priority** Define the priority the batch job should have relative to other batch jobs owned by  
103637 the batch server.

103638 The *qsub* utility shall set the *Priority* attribute of the batch job to the value of the  
103639 *priority* option-argument.

103640 If the **-p** option is not presented to the *qsub* utility, the value of the *Priority* attribute  
103641 is implementation-defined.

103642 The *qsub* utility shall accept a value for the *priority* option-argument that conforms  
103643 to the syntax for signed decimal integers, and which is not less than -1 024 and not  
103644 greater than 1 023.

103645 **-q destination**

103646 Define the destination of the batch job.

103647 The destination is not a batch job attribute; it determines the batch server, and  
103648 possibly the batch queue, to which the *qsub* utility batch queues the batch job.

103649 The *qsub* utility shall submit the script to the batch server named by the *destination*  
103650 option-argument or the server that owns the batch queue named in the *destination*  
103651 option-argument.

103652 The *qsub* utility shall accept an option-argument for the **-q** option that conforms to  
103653 the syntax for a destination (see [Section 3.3.2](#), on page 2398).

103654 If the **-q** option is not presented to the *qsub* utility, the *qsub* utility shall submit the  
103655 batch job to the default destination. The mechanism for determining the default  
103656 destination is implementation-defined.

103657 **-r y | n** Define whether the batch job is rerunnable.

103658 If the value of the option-argument is *y*, the *qsub* utility shall set the *Rerunable*  
103659 attribute of the batch job to TRUE.

103660 If the value of the option-argument is *n*, the *qsub* utility shall set the *Rerunable*  
103661 attribute of the batch job to FALSE.

103662 If the **-r** option is not presented to the *qsub* utility, the utility shall set the *Rerunable*  
103663 attribute of the batch job to TRUE.

103664 **-S path\_name\_list**

103665 Define the pathname to the shell under which the batch job is to execute.

103666 The *qsub* utility shall accept a *path\_name\_list* option-argument that conforms to the  
103667 following syntax:

103668 *pathname[@host] [, , pathname[@host] , , . . . ]*

103669 The *qsub* utility shall allow only one pathname for a given host name. The *qsub*  
103670 utility shall allow only one pathname that is missing a corresponding host name.

103671 The *qsub* utility shall add a value to the *Shell\_Path\_List* attribute of the batch job for  
103672 each entry in the *path\_name\_list* option-argument.

103673 If the **-S** option is not presented to the *qsub* utility, the utility shall set the

- 103674 *Shell\_Path\_List* attribute of the batch job to the null string.
- 103675 The conformance document for an implementation shall describe the mechanism  
103676 used to set the default shell and determine the current value of the default shell.  
103677 An implementation shall provide a means for the installation to set the default  
103678 shell to the login shell of the user under which the batch job is to execute. See  
103679 [Section 3.3.3](#) (on page 2399) for a means of removing *keyword=value* (and  
103680 *value@keyword*) pairs and other general rules for list-oriented batch job attributes.
- 103681 **-u** *user\_list* Define the user name under which the batch job is to execute.
- 103682 The *qsub* utility shall accept a *user\_list* option-argument that conforms to the  
103683 following syntax:
- 103684 `username[@host] [, , username[@host] , , . . . ]`
- 103685 The *qsub* utility shall accept only one user name that is missing a corresponding  
103686 host name. The *qsub* utility shall accept only one user name per named host.
- 103687 The *qsub* utility shall add a value to the *User\_List* attribute of the batch job for each  
103688 entry in the *user\_list* option-argument.
- 103689 If the **-u** option is not presented to the *qsub* utility, the utility shall set the *User\_List*  
103690 attribute of the batch job to the user name from which the utility is executing. See  
103691 [Section 3.3.3](#) (on page 2399) for a means of removing *keyword=value* (and  
103692 *value@keyword*) pairs and other general rules for list-oriented batch job attributes.
- 103693 **-v** *variable\_list*
- 103694 Add to the list of variables that are exported to the session leader of the batch job.
- 103695 A *variable\_list* is a set of strings of either the form *<variable>* or *<variable=value>*,  
103696 delimited by *<comma>* characters.
- 103697 If the **-v** option is presented to the *qsub* utility, the utility shall also add, to the  
103698 environment *Variable\_List* attribute of the batch job, every variable named in the  
103699 environment *variable\_list* option-argument and, optionally, values of specified  
103700 variables.
- 103701 If a value is not provided on the command line, the *qsub* utility shall set the value  
103702 of each variable in the environment *Variable\_List* attribute of the batch job to the  
103703 value of the corresponding environment variable for the process in which the  
103704 utility is executing; see [Table 4-19](#) (on page 3116).
- 103705 A conforming application shall not repeat a variable in the environment  
103706 *variable\_list* option-argument.
- 103707 The *qsub* utility shall not repeat a variable in the environment *Variable\_List* attribute  
103708 of the batch job. See [Section 3.3.3](#) (on page 2399) for a means of removing  
103709 *keyword=value* (and *value@keyword*) pairs and other general rules for list-oriented  
103710 batch job attributes.
- 103711 **-V** Specify that all of the environment variables of the process are exported to the  
103712 context of the batch job.
- 103713 The *qsub* utility shall place every environment variable in the process in which the  
103714 utility is executing in the list and shall set the value of each variable in the attribute  
103715 to the value of that variable in the process.

103716            **-z**            Specify that the utility does not write the batch *job\_identifier* of the created batch job  
103717                            to standard output.

103718                            If the **-z** option is presented to the *qsub* utility, the utility shall not write the batch  
103719                            *job\_identifier* of the created batch job to standard output.

103720                            If the **-z** option is not presented to the *qsub* utility, the utility shall write the  
103721                            identifier of the created batch job to standard output.

#### 103722 **OPERANDS**

103723            The *qsub* utility shall accept a *script* operand that indicates the path to the script of the batch job.

103724            If the *script* operand is not presented to the *qsub* utility, or if the operand is the single-character  
103725            string *'-'*, the utility shall read the script from standard input.

103726            If the script represents a partial path, the *qsub* utility shall expand the path relative to the current  
103727            directory of the process executing the utility.

#### 103728 **STDIN**

103729            The *qsub* utility reads the script of the batch job from standard input if the script operand is  
103730            omitted or is the single character *'-'*.

#### 103731 **INPUT FILES**

103732            In addition to binding the file indicated by the *script* operand to the batch job, the *qsub* utility  
103733            reads the script file and acts on directives in the script.

#### 103734 **ENVIRONMENT VARIABLES**

103735            The following environment variables shall affect the execution of *qsub*:

103736            **LANG**            Provide a default value for the internationalization variables that are unset or null.  
103737                            (See XBD Section 8.2 (on page 174) the precedence of internationalization variables  
103738                            used to determine the values of locale categories.)

103739            **LC\_ALL**        If set to a non-empty string value, override the values of all the other  
103740                            internationalization variables.

103741            **LC\_CTYPE**     Determine the locale for the interpretation of sequences of bytes of text data as  
103742                            characters (for example, single-byte as opposed to multi-byte characters in  
103743                            arguments).

#### 103744 **LC\_MESSAGES**

103745                            Determine the locale that should be used to affect the format and contents of  
103746                            diagnostic messages written to standard error.

103747            **LOGNAME**     Determine the login name of the user.

#### 103748 **PBS\_DPREFIX**

103749                            Determine the default prefix for directives within the script.

103750            **SHELL**         Determine the pathname of the preferred command language interpreter of the  
103751                            user.

103752            **TZ**             Determine the timezone used to interpret the *date-time* option-argument. If *TZ* is  
103753                            unset or null, an unspecified default timezone shall be used.

#### 103754 **ASYNCHRONOUS EVENTS**

103755            Once created, a batch job exists until it exits, aborts, or is deleted.

103756            After a batch job is created by the *qsub* utility, batch servers might route, execute, modify, or  
103757            delete the batch job.

103758 **STDOUT**

103759 The *qsub* utility writes the batch *job\_identifier* assigned to the batch job to standard output, unless  
103760 the *-z* option is specified.

103761 **STDERR**

103762 The standard error shall be used only for diagnostic messages.

103763 **OUTPUT FILES**

103764 None.

103765 **EXTENDED DESCRIPTION**103766 **Script Preservation**

103767 The *qsub* utility shall make the script available to the server executing the batch job in such a  
103768 way that the server executes the script as it exists at the time of submission.

103769 The *qsub* utility can send a copy of the script to the server with the *Queue Job Request* or store a  
103770 temporary copy of the script in a location specified to the server.

103771 **Option Specification**

103772 A script can contain directives to the *qsub* utility.

103773 The *qsub* utility shall scan the lines of the script for directives, skipping blank lines, until the first  
103774 line that begins with a string other than the directive string; if directives occur on subsequent  
103775 lines, the utility shall ignore those directives.

103776 Lines are separated by a <newline>. If the first line of the script begins with "#!" or a <colon>  
103777 (' : '), then it is skipped. The *qsub* utility shall process a line in the script as a directive if and  
103778 only if the string of characters from the first non-white-space character on the line until the first  
103779 <space> or <tab> on the line match the directive prefix. If a line in the script contains a directive  
103780 and the final characters of the line are <backslash> and <newline>, then the next line shall be  
103781 interpreted as a continuation of that directive.

103782 The *qsub* utility shall process the options and option-arguments contained on the directive prefix  
103783 line using the same syntax as if the options were input on the *qsub* utility.

103784 The *qsub* utility shall continue to process a directive prefix line until after a <newline> is  
103785 encountered. An implementation may ignore lines which, according to the syntax of the shell  
103786 that will interpret the script, are comments. An implementation shall describe in the  
103787 conformance document the format of any shell comments that it will recognize.

103788 If an option is present in both a directive and the arguments to the *qsub* utility, the utility shall  
103789 ignore the option and the corresponding option-argument, if any, in the directive.

103790 If an option that is present in the directive is not present in the arguments to the *qsub* utility, the  
103791 utility shall process the option and the option-argument, if any.

103792 In order of preference, the *qsub* utility shall select the directive prefix from one of the following  
103793 sources:

- 103794 • If the *-C* option is presented to the utility, the value of the *directive\_prefix* option-argument
- 103795 • If the environment variable *PBS\_DPREFIX* is defined, the value of that variable
- 103796 • The four-character string "#PBS" encoded in the portable character set

103797 If the *-C* option is present in the script file it shall be ignored.

**103798 EXIT STATUS**

103799 The following exit values shall be returned:

103800 0 Successful completion.

103801 >0 An error occurred.

**103802 CONSEQUENCES OF ERRORS**

103803 Default.

**103804 APPLICATION USAGE**

103805 None.

**103806 EXAMPLES**

103807 None.

**103808 RATIONALE**

103809 The *qsub* utility allows users to create a batch job that will process the script specified as the  
103810 operand of the utility.

103811 The options of the *qsub* utility allow users to control many aspects of the queuing and execution  
103812 of a batch job.

103813 The **-a** option allows users to designate the time after which the batch job will become eligible to  
103814 run. By specifying an execution time, users can take advantage of resources at off-peak hours,  
103815 synchronize jobs with chronologically predictable events, and perhaps take advantage of off-  
103816 peak pricing of computing time. For these reasons and others, a timing option is existing  
103817 practice on the part of almost every batch system, including NQS.

103818 The **-A** option allows users to specify the account that will be charged for the batch job. Support  
103819 for account is not mandatory for conforming batch servers.

103820 The **-C** option allows users to prescribe the prefix for directives within the script file. The default  
103821 prefix "**#PBS**" may be inappropriate if the script will be interpreted with an alternate shell, as  
103822 specified by the **-S** option.

103823 The **-c** option allows users to establish the checkpointing interval for their jobs. A checkpointing  
103824 system, which is not defined by this volume of POSIX.1-2008, allows recovery of a batch job at  
103825 the most recent checkpoint in the event of a crash. Checkpointing is typically used for jobs that  
103826 consume expensive computing time or must meet a critical schedule. Users should be allowed to  
103827 make the tradeoff between the overhead of checkpointing and the risk to the timely completion  
103828 of the batch job; therefore, this volume of POSIX.1-2008 provides the checkpointing interval  
103829 option. Support for checkpointing is optional for batch servers.

103830 The **-e** option allows users to redirect the standard error streams of their jobs to a non-default  
103831 path. For example, if the submitted script generally produces a great deal of useless error  
103832 output, a user might redirect the standard error output to the null device. Or, if the file system  
103833 holding the default location (the home directory of the user) has too little free space, the user  
103834 might redirect the standard error stream to a file in another file system.

103835 The **-h** option allows users to create a batch job that is held until explicitly released. The ability  
103836 to create a held job is useful when some external event must complete before the batch job can  
103837 execute. For example, the user might submit a held job and release it when the system load has  
103838 dropped.

103839 The **-j** option allows users to merge the standard error of a batch job into its standard output  
103840 stream, which has the advantage of showing the sequential relationship between output and  
103841 error messages.

103842 The **-m** option allows users to designate those points in the execution of a batch job at which  
103843 mail will be sent to the submitting user, or to the account(s) indicated by the **-M** option. By  
103844 requesting mail notification at points of interest in the life of a job, the submitting user, or other  
103845 designated users, can track the progress of a batch job.

103846 The **-N** option allows users to associate a name with the batch job. The job name in no way  
103847 affects the processing of the batch job, but rather serves as a mnemonic handle for users. For  
103848 example, the batch job name can help the user distinguish between multiple jobs listed by the  
103849 *qstat* utility.

103850 The **-o** option allows users to redirect the standard output stream. A user might, for example,  
103851 wish to redirect to the null device the standard output stream of a job that produces copious yet  
103852 superfluous output.

103853 The **-P** option allows users to designate the relative priority of a batch job for selection from a  
103854 queue.

103855 The **-q** option allows users to specify an initial queue for the batch job. If the user specifies a  
103856 routing queue, the batch server routes the batch job to another queue for execution or further  
103857 routing. If the user specifies a non-routing queue, the batch server of the queue eventually  
103858 executes the batch job.

103859 The **-r** option allows users to control whether the submitted job will be rerun if the controlling  
103860 batch node fails during execution of the batch job. The **-r** option likewise allows users to  
103861 indicate whether or not the batch job is eligible to be rerun by the *qrerun* utility. Some jobs cannot  
103862 be correctly rerun because of changes they make in the state of databases or other aspects of  
103863 their environment. This volume of POSIX.1-2008 specifies that the default, if the **-r** option is not  
103864 presented to the utility, will be that the batch job cannot be rerun, since the result of rerunning a  
103865 non-rerunnable job might be catastrophic.

103866 The **-S** option allows users to specify the program (usually a shell) that will be invoked to  
103867 process the script of the batch job. This option has been modified to allow a list of shell names  
103868 and locations associated with different hosts.

103869 The **-u** option is useful when the submitting user is authorized to use more than one account on  
103870 a given host, in which case the **-u** option allows the user to select from among those accounts.  
103871 The option-argument is a list of user-host pairs, so that the submitting user can provide different  
103872 user identifiers for different nodes in the event the batch job is routed. The **-u** option provides a  
103873 lot of flexibility to accommodate sites with complex account structures. Users that have the same  
103874 user identifier on all the hosts they are authorized to use will not need to use the **-u** option.

103875 The **-V** option allows users to export all their current environment variables, as of the time the  
103876 batch job is submitted, to the context of the processes of the batch job.

103877 The **-v** option allows users to export specific environment variables from their current process to  
103878 the processes of the batch job.

103879 The **-z** option allows users to suppress the writing of the batch job identifier to standard output.  
103880 The **-z** option is an existing NQS practice that has been standardized.

103881 Historically, the *qsub* utility has served the batch job-submission function in the NQS system, the  
103882 existing practice on which it is based. Some changes and additions have been made to the *qsub*  
103883 utility in this volume of POSIX.1-2008, *vis-a-vis* NQS, as a result of the growing pool of  
103884 experience with distributed batch systems.

103885 The set of features of the *qsub* utility as defined in this volume of POSIX.1-2008 appears to  
103886 incorporate all the common existing practice on potentially conforming platforms.

**103887 FUTURE DIRECTIONS**

103888 The *qsub* utility may be removed in a future version.

**103893 CHANGE HISTORY**

103894 Derived from IEEE Std 1003.2d-1994.

**103895 Issue 6**

103896 The `-I` option has been removed as there is no portable description of the resources that are  
103897 allowed or required by the batch job.

**103898 Issue 7**

103899 The *qsub* utility is marked obsolescent.

103900 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

103901 **NAME**

103902 read — read a line from standard input

103903 **SYNOPSIS**

103904 read [-r] var...

103905 **DESCRIPTION**103906 The *read* utility shall read a single line from standard input.

103907 By default, unless the `-r` option is specified, `<backslash>` shall act as an escape character. An  
 103908 unescaped `<backslash>` shall preserve the literal value of the following character, with the  
 103909 exception of a `<newline>`. If a `<newline>` follows the `<backslash>`, the *read* utility shall interpret  
 103910 this as line continuation. The `<backslash>` and `<newline>` shall be removed before splitting the  
 103911 input into fields. All other unescaped `<backslash>` characters shall be removed after splitting the  
 103912 input into fields.

103913 If standard input is a terminal device and the invoking shell is interactive, *read* shall prompt for a  
 103914 continuation line when it reads an input line ending with a `<backslash>` `<newline>`, unless the  
 103915 `-r` option is specified.

103916 The terminating `<newline>` (if any) shall be removed from the input and the results shall be split  
 103917 into fields as in the shell for the results of parameter expansion (see [Section 2.6.5](#), on page 2311);  
 103918 the first field shall be assigned to the first variable *var*, the second field to the second variable  
 103919 *var*, and so on. If there are fewer fields than there are *var* operands, the remaining *vars* shall be  
 103920 set to empty strings. If there are fewer *vars* than fields, the last *var* shall be set to a value  
 103921 comprising the following elements:

- 103922 • The field that corresponds to the last *var* in the normal assignment sequence described  
 103923 above
- 103924 • The delimiter(s) that follow the field corresponding to the last *var*
- 103925 • The remaining fields and their delimiters, with trailing *IFS* white space ignored

103926 The setting of variables specified by the *var* operands shall affect the current shell execution  
 103927 environment; see [Section 2.12](#) (on page 2331). If it is called in a subshell or separate utility  
 103928 execution environment, such as one of the following:

```
103929 (read foo)
103930 nohup read ...
103931 find . -exec read ... \;
```

103932 it shall not affect the shell variables in the caller's environment.

103933 **OPTIONS**103934 The *read* utility shall conform to XBD [Section 12.2](#) (on page 215).

103935 The following option is supported:

- 103936 `-r` Do not treat a `<backslash>` character in any special way. Consider each  
 103937 `<backslash>` to be part of the input line.

103938 **OPERANDS**

103939 The following operand shall be supported:

- 103940 *var* The name of an existing or nonexisting shell variable.

- 103941 **STDIN**  
 103942           The standard input shall be a text file.
- 103943 **INPUT FILES**  
 103944           None.
- 103945 **ENVIRONMENT VARIABLES**  
 103946           The following environment variables shall affect the execution of *read*:
- 103947           *IFS*           Determine the internal field separators used to delimit fields; see [Section 2.5.3](#) (on  
 103948                           page 2302).
- 103949           *LANG*          Provide a default value for the internationalization variables that are unset or null.  
 103950                           (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 103951                           variables used to determine the values of locale categories.)
- 103952           *LC\_ALL*        If set to a non-empty string value, override the values of all the other  
 103953                           internationalization variables.
- 103954           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 103955                           characters (for example, single-byte as opposed to multi-byte characters in  
 103956                           arguments).
- 103957           *LC\_MESSAGES*  
 103958                           Determine the locale that should be used to affect the format and contents of  
 103959                           diagnostic messages written to standard error.
- 103960 XSI        *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 103961           *PS2*            Provide the prompt string that an interactive shell shall write to standard error  
 103962                           when a line ending with a <backslash> <newline> is read and the *-r* option was  
 103963                           not specified.
- 103964 **ASYNCHRONOUS EVENTS**  
 103965           Default.
- 103966 **STDOUT**  
 103967           Not used.
- 103968 **STDERR**  
 103969           The standard error shall be used for diagnostic messages and prompts for continued input.
- 103970 **OUTPUT FILES**  
 103971           None.
- 103972 **EXTENDED DESCRIPTION**  
 103973           None.
- 103974 **EXIT STATUS**  
 103975           The following exit values shall be returned:
- 103976           0   Successful completion.
- 103977           >0 End-of-file was detected or an error occurred.
- 103978 **CONSEQUENCES OF ERRORS**  
 103979           Default.

**103980 APPLICATION USAGE**

103981 The `-r` option is included to enable *read* to subsume the purpose of the *line* utility, which is not  
 103982 included in POSIX.1-2008.

**103983 EXAMPLES**

103984 The following command:

```
103985 while read -r xx yy
103986 do
103987     printf "%s %s\n" "$yy" "$xx"
103988 done < input_file
```

103989 prints a file with the first field of each line moved to the end of the line.

**103990 RATIONALE**

103991 The *read* utility historically has been a shell built-in. It was separated off into its own utility to  
 103992 take advantage of the richer description of functionality introduced by this volume of  
 103993 POSIX.1-2008.

103994 Since *read* affects the current shell execution environment, it is generally provided as a shell  
 103995 regular built-in. If it is called in a subshell or separate utility execution environment, such as one  
 103996 of the following:

```
103997 (read foo)
103998 nohup read ...
103999 find . -exec read ... \;
```

104000 it does not affect the shell variables in the environment of the caller.

104001 Although the standard input is required to be a text file, and therefore will always end with a  
 104002 <newline> (unless it is an empty file), the processing of continuation lines when the `-r` option is  
 104003 not used can result in the input not ending with a <newline>. This occurs if the last line of the  
 104004 input file ends with a <backslash> <newline>. It is for this reason that “if any” is used in “The  
 104005 terminating <newline> (if any) shall be removed from the input” in the description. It is not a  
 104006 relaxation of the requirement for standard input to be a text file.

**104007 FUTURE DIRECTIONS**

104008 None.

**104009 SEE ALSO**

104010 [Chapter 2](#) (on page 2297)

104011 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

**104012 CHANGE HISTORY**

104013 First released in Issue 2.

**104014 Issue 7**

104015 Austin Group Interpretation 1003.1-2001 #194 is applied, clarifying the handling of the  
 104016 <backslash> escape character.

104017 SD5-XCU-ERN-126 is applied, clarifying that input lines end with a <newline>.

104018 The description of here-documents is removed from the *read* reference page.

104019 **NAME**

104020 renice — set nice values of running processes

104021 **SYNOPSIS**104022 renice [-g|-p|-u] -n *increment* *ID...*104023 **DESCRIPTION**

104024 The *renice* utility shall request that the nice values (see XBD [Section 3.239](#), on page 71) of one or  
 104025 more running processes be changed. By default, the applicable processes are specified by their  
 104026 process IDs. When a process group is specified (see *-g*), the request shall apply to all processes  
 104027 in the process group.

104028 The nice value shall be bounded in an implementation-defined manner. If the requested  
 104029 *increment* would raise or lower the nice value of the executed utility beyond implementation-  
 104030 defined limits, then the limit whose value was exceeded shall be used.

104031 When a user is *reniced*, the request applies to all processes whose saved set-user-ID matches the  
 104032 user ID corresponding to the user.

104033 Regardless of which options are supplied or any other factor, *renice* shall not alter the nice values  
 104034 of any process unless the user requesting such a change has appropriate privileges to do so for  
 104035 the specified process. If the user lacks appropriate privileges to perform the requested action, the  
 104036 utility shall return an error status.

104037 The saved set-user-ID of the user's process shall be checked instead of its effective user ID when  
 104038 *renice* attempts to determine the user ID of the process in order to determine whether the user  
 104039 has appropriate privileges.

104040 **OPTIONS**104041 The *renice* utility shall conform to XBD [Section 12.2](#) (on page 215), except for Guideline 9.

104042 The following options shall be supported:

104043 *-g* Interpret the following operands as unsigned decimal integer process group IDs.

104044 *-n increment* Specify how the nice value of the specified process or processes is to be adjusted.  
 104045 The *increment* option-argument is a positive or negative decimal integer that shall  
 104046 be used to modify the nice value of the specified process or processes.

104047 Positive *increment* values shall cause a lower nice value. Negative *increment* values  
 104048 may require appropriate privileges and shall cause a higher nice value.

104049 *-p* Interpret the following operands as unsigned decimal integer process IDs. The *-p*  
 104050 option is the default if no options are specified.

104051 *-u* Interpret the following operands as users. If a user exists with a user name equal to  
 104052 the operand, then the user ID of that user is used in further processing. Otherwise,  
 104053 if the operand represents an unsigned decimal integer, it shall be used as the  
 104054 numeric user ID of the user.

104055 **OPERANDS**

104056 The following operands shall be supported:

104057 *ID* A process ID, process group ID, or user name/user ID, depending on the option  
 104058 selected.

104059 **STDIN**

104060 Not used.

104061 **INPUT FILES**

104062 None.

104063 **ENVIRONMENT VARIABLES**104064 The following environment variables shall affect the execution of *renice*:

104065 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 104066 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 104067 variables used to determine the values of locale categories.)

104068 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 104069 internationalization variables.

104070 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 104071 characters (for example, single-byte as opposed to multi-byte characters in  
 104072 arguments).

104073 *LC\_MESSAGES*

104074 Determine the locale that should be used to affect the format and contents of  
 104075 diagnostic messages written to standard error.

104076 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

104077 **ASYNCHRONOUS EVENTS**

104078 Default.

104079 **STDOUT**

104080 Not used.

104081 **STDERR**

104082 The standard error shall be used only for diagnostic messages.

104083 **OUTPUT FILES**

104084 None.

104085 **EXTENDED DESCRIPTION**

104086 None.

104087 **EXIT STATUS**

104088 The following exit values shall be returned:

104089 0 Successful completion.

104090 &gt;0 An error occurred.

104091 **CONSEQUENCES OF ERRORS**

104092 Default.

104093 **APPLICATION USAGE**

104094 None.

104095 **EXAMPLES**

104096 1. Adjust the nice value so that process IDs 987 and 32 would have a lower nice value:

104097 `renice -n 5 -p 987 32`

104098 2. Adjust the nice value so that group IDs 324 and 76 would have a higher nice value, if the  
 104099 user has appropriate privileges to do so:

104100 `renice -n -4 -g 324 76`

104101 3. Adjust the nice value so that numeric user ID 8 and user **sas** would have a lower nice  
104102 value:

```
104103 renice -n 4 -u 8 sas
```

104104 Useful nice value increments on historical systems include 19 or 20 (the affected processes run  
104105 only when nothing else in the system attempts to run) and any negative number (to make  
104106 processes run faster).

#### 104107 RATIONALE

104108 The *gid*, *pid*, and *user* specifications do not fit either the definition of operand or option-  
104109 argument. However, for clarity, they have been included in the OPTIONS section, rather than  
104110 the OPERANDS section.

104111 The definition of nice value is not intended to suggest that all processes in a system have  
104112 priorities that are comparable. Scheduling policy extensions such as the realtime priorities in the  
104113 System Interfaces volume of POSIX.1-2008 make the notion of a single underlying priority for all  
104114 scheduling policies problematic. Some implementations may implement the *nice*-related features  
104115 to affect all processes on the system, others to affect just the general time-sharing activities  
104116 implied by this volume of POSIX.1-2008, and others may have no effect at all. Because of the use  
104117 of “implementation-defined” in *nice* and *renice*, a wide range of implementation strategies are  
104118 possible.

104119 Originally, this utility was written in the historical manner, using the term “nice value”. This  
104120 was always a point of concern with users because it was never intuitively obvious what this  
104121 meant. With a newer version of *renice*, which used the term “system scheduling priority”, it was  
104122 hoped that novice users could better understand what this utility was meant to do. Also, it  
104123 would be easier to document what the utility was meant to do. Unfortunately, the addition of  
104124 the POSIX realtime scheduling capabilities introduced the concepts of process and thread  
104125 scheduling priorities that were totally unaffected by the *nice/renice* utilities or the  
104126 *nice()/setpriority()* functions. Continuing to use the term “system scheduling priority” would  
104127 have incorrectly suggested that these utilities and functions were indeed affecting these realtime  
104128 priorities. It was decided to revert to the historical term “nice value” to reference this unrelated  
104129 process attribute.

104130 Although this utility has use by system administrators (and in fact appears in the system  
104131 administration portion of the BSD documentation), the standard developers considered that it  
104132 was very useful for individual end users to control their own processes.

104133 Earlier versions of this standard allowed the following forms in the SYNOPSIS:

```
104134 renice nice_value[-p] pid...[-g gid...][-p pid...][-u user...]  
104135 renice nice_value -g gid...[-g gid...]-p pid...[-u user...]  
104136 renice nice_value -u user...[-g gid...]-p pid...[-u user...]
```

104137 These forms are no longer specified by POSIX.1-2008 but may be present in some  
104138 implementations.

#### 104139 FUTURE DIRECTIONS

104140 None.

#### 104141 SEE ALSO

104142 [nice](#)

104143 XBD [Section 3.239](#) (on page 71), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

104144 **CHANGE HISTORY**

104145 First released in Issue 4.

104146 **Issue 5**

104147 In the SYNOPSIS, an ellipsis is added to the `-u` option in all three obsolescent forms.

104148 **Issue 6**

104149 This utility is marked as part of the User Portability Utilities option.

104150 The APPLICATION USAGE section is added.

104151 The obsolescent forms of the SYNOPSIS are removed.

104152 Text previously conditional on POSIX\_SAVED\_IDS is mandatory in this version. This is a FIPS  
104153 requirement.

104154 **Issue 7**

104155 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that Guideline 9 of the Utility  
104156 Syntax Guidelines does not apply.

104157 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

104158 The *renice* utility is moved from the User Portability Utilities option to the Base. User Portability  
104159 Utilities is now an option for interactive utilities.

104160 **NAME**

104161           rm — remove directory entries

104162 **SYNOPSIS**104163           rm [-fiRr] *file*...104164 **DESCRIPTION**104165           The *rm* utility shall remove the directory entry specified by each *file* argument.104166           If either of the files dot or dot-dot are specified as the basename portion of an operand (that is, the final pathname component) or if an operand resolves to the root directory, *rm* shall write a diagnostic message to standard error and do nothing more with such operands.104169           For each *file* the following steps shall be taken:

- 104170           1. If the *file* does not exist:
  - 104171           a. If the **-f** option is not specified, *rm* shall write a diagnostic message to standard error.
  - 104172           b. Go on to any remaining *files*.
- 104174           2. If *file* is of type directory, the following steps shall be taken:
  - 104175           a. If neither the **-R** option nor the **-r** option is specified, *rm* shall write a diagnostic message to standard error, do nothing more with *file*, and go on to any remaining files.
  - 104176           b. If the **-f** option is not specified, and either the permissions of *file* do not permit writing and the standard input is a terminal or the **-i** option is specified, *rm* shall write a prompt to standard error and read a line from the standard input. If the response is not affirmative, *rm* shall do nothing more with the current file and go on to any remaining files.
  - 104177           c. For each entry contained in *file*, other than dot or dot-dot, the four steps listed here (1 to 4) shall be taken with the entry as if it were a *file* operand. The *rm* utility shall not traverse directories by following symbolic links into other parts of the hierarchy, but shall remove the links themselves.
  - 104178           d. If the **-i** option is specified, *rm* shall write a prompt to standard error and read a line from the standard input. If the response is not affirmative, *rm* shall do nothing more with the current file, and go on to any remaining files.
- 104187           3. If *file* is not of type directory, the **-f** option is not specified, and either the permissions of *file* do not permit writing and the standard input is a terminal or the **-i** option is specified, *rm* shall write a prompt to the standard error and read a line from the standard input. If the response is not affirmative, *rm* shall do nothing more with the current file and go on to any remaining files.
- 104188           4. If the current file is a directory, *rm* shall perform actions equivalent to the *rmdir()* function defined in the System Interfaces volume of POSIX.1-2008 called with a pathname of the current file used as the *path* argument. If the current file is not a directory, *rm* shall perform actions equivalent to the *unlink()* function defined in the System Interfaces volume of POSIX.1-2008 called with a pathname of the current file used as the *path* argument.

104201           If this fails for any reason, *rm* shall write a diagnostic message to standard error, do nothing more with the current file, and go on to any remaining files.

104202           The *rm* utility shall be able to descend to arbitrary depths in a file hierarchy, and shall not fail

104204 due to path length limitations (unless an operand specified by the user exceeds system  
104205 limitations).

#### 104206 OPTIONS

104207 The *rm* utility shall conform to XBD [Section 12.2](#) (on page 215).

104208 The following options shall be supported:

104209 **-f** Do not prompt for confirmation. Do not write diagnostic messages or modify the  
104210 exit status in the case of nonexistent operands. Any previous occurrences of the **-i**  
104211 option shall be ignored.

104212 **-i** Prompt for confirmation as described previously. Any previous occurrences of the  
104213 **-f** option shall be ignored.

104214 **-R** Remove file hierarchies. See the DESCRIPTION.

104215 **-r** Equivalent to **-R**.

#### 104216 OPERANDS

104217 The following operand shall be supported:

104218 *file* A pathname of a directory entry to be removed.

#### 104219 STDIN

104220 The standard input shall be used to read an input line in response to each prompt specified in  
104221 the STDOUT section. Otherwise, the standard input shall not be used.

#### 104222 INPUT FILES

104223 None.

#### 104224 ENVIRONMENT VARIABLES

104225 The following environment variables shall affect the execution of *rm*:

104226 *LANG* Provide a default value for the internationalization variables that are unset or null.  
104227 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
104228 variables used to determine the values of locale categories.)

104229 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
104230 internationalization variables.

104231 *LC\_COLLATE*

104232 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
104233 character collating elements used in the extended regular expression defined for  
104234 the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

104235 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
104236 characters (for example, single-byte as opposed to multi-byte characters in  
104237 arguments) and the behavior of character classes within regular expressions used  
104238 in the extended regular expression defined for the **yesexpr** locale keyword in the  
104239 *LC\_MESSAGES* category.

104240 *LC\_MESSAGES*

104241 Determine the locale used to process affirmative responses, and the locale used to  
104242 affect the format and contents of diagnostic messages and prompts written to  
104243 standard error.

104244 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

104245 **ASYNCHRONOUS EVENTS**

104246 Default.

104247 **STDOUT**

104248 Not used.

104249 **STDERR**

104250 Prompts shall be written to standard error under the conditions specified in the DESCRIPTION  
 104251 and OPTIONS sections. The prompts shall contain the *file* pathname, but their format is  
 104252 otherwise unspecified. The standard error also shall be used for diagnostic messages.

104253 **OUTPUT FILES**

104254 None.

104255 **EXTENDED DESCRIPTION**

104256 None.

104257 **EXIT STATUS**

104258 The following exit values shall be returned:

104259 0 Each directory entry was successfully removed, unless its removal was canceled by a non-  
 104260 affirmative response to a prompt for confirmation.

104261 &gt;0 An error occurred.

104262 **CONSEQUENCES OF ERRORS**

104263 Default.

104264 **APPLICATION USAGE**

104265 The *rm* utility is forbidden to remove the names dot and dot-dot in order to avoid the  
 104266 consequences of inadvertently doing something like:

104267 `rm -r .*`

104268 Some implementations do not permit the removal of the last link to an executable binary file that  
 104269 is being executed; see the [EBUSY] error in the *unlink()* function defined in the System Interfaces  
 104270 volume of POSIX.1-2008. Thus, the *rm* utility can fail to remove such files.

104271 The `-i` option causes *rm* to prompt and read the standard input even if the standard input is not  
 104272 a terminal, but in the absence of `-i` the mode prompting is not done when the standard input is  
 104273 not a terminal.

104274 **EXAMPLES**

104275 1. The following command:

104276 `rm a.out core`104277 removes the directory entries: **a.out** and **core**.

104278 2. The following command:

104279 `rm -Rf junk`104280 removes the directory **junk** and all its contents, without prompting.104281 **RATIONALE**

104282 For absolute clarity, paragraphs (2b) and (3) in the DESCRIPTION of *rm* describing the behavior  
 104283 when prompting for confirmation, should be interpreted in the following manner:

```
104284 if ((NOT f_option) AND
104285     ((not_writable AND input_is_terminal) OR i_option))
```

104286 The exact format of the interactive prompts is unspecified. Only the general nature of the  
104287 contents of prompts are specified because implementations may desire more descriptive  
104288 prompts than those used on historical implementations. Therefore, an application not using the  
104289 `-f` option, or using the `-i` option, relies on the system to provide the most suitable dialog directly  
104290 with the user, based on the behavior specified.

104291 The `-r` option is historical practice on all known systems. The synonym `-R` option is provided  
104292 for consistency with the other utilities in this volume of POSIX.1-2008 that provide options  
104293 requesting recursive descent through the file hierarchy.

104294 The behavior of the `-f` option in historical versions of *rm* is inconsistent. In general, along with  
104295 “forcing” the unlink without prompting for permission, it always causes diagnostic messages to  
104296 be suppressed and the exit status to be unmodified for nonexistent operands and files that  
104297 cannot be unlinked. In some versions, however, the `-f` option suppresses usage messages and  
104298 system errors as well. Suppressing such messages is not a service to either shell scripts or users.

104299 It is less clear that error messages regarding files that cannot be unlinked (removed) should be  
104300 suppressed. Although this is historical practice, this volume of POSIX.1-2008 does not permit the  
104301 `-f` option to suppress such messages.

104302 When given the `-r` and `-i` options, historical versions of *rm* prompt the user twice for each  
104303 directory, once before removing its contents and once before actually attempting to delete the  
104304 directory entry that names it. This allows the user to “prune” the file hierarchy walk. Historical  
104305 versions of *rm* were inconsistent in that some did not do the former prompt for directories  
104306 named on the command line and others had obscure prompting behavior when the `-i` option  
104307 was specified and the permissions of the file did not permit writing. The POSIX Shell and  
104308 Utilities *rm* differs little from historic practice, but does require that prompts be consistent.  
104309 Historical versions of *rm* were also inconsistent in that prompts were done to both standard  
104310 output and standard error. This volume of POSIX.1-2008 requires that prompts be done to  
104311 standard error, for consistency with *cp* and *mv*, and to allow historical extensions to *rm* that  
104312 provide an option to list deleted files on standard output.

104313 The *rm* utility is required to descend to arbitrary depths so that any file hierarchy may be  
104314 deleted. This means, for example, that the *rm* utility cannot run out of file descriptors during its  
104315 descent (that is, if the number of file descriptors is limited, *rm* cannot be implemented in the  
104316 historical fashion where one file descriptor is used per directory level). Also, *rm* is not permitted  
104317 to fail because of path length restrictions, unless an operand specified by the user is longer than  
104318 `{PATH_MAX}`.

104319 The *rm* utility removes symbolic links themselves, not the files they refer to, as a consequence of  
104320 the dependence on the *unlink()* functionality, per the DESCRIPTION. When removing  
104321 hierarchies with `-r` or `-R`, the prohibition on following symbolic links has to be made explicit.

#### 104328 CHANGE HISTORY

104329 First released in Issue 2.

104330 **Issue 5**

104331 The FUTURE DIRECTIONS section is added.

104332 **Issue 6**

104333 Text is added to clarify actions relating to symbolic links as specified in the IEEE P1003.2b draft  
104334 standard.

104335 **Issue 7**

104336 Austin Group Interpretations 1003.1-2001 #019 and #091 are applied.

104337 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
104338 *LC\_MESSAGES* environment variable.

104339 **NAME**104340 rmdel — remove a delta from an SCCS file (**DEVELOPMENT**)104341 **SYNOPSIS**104342 XSI `rmdel -r SID file...`104343 **DESCRIPTION**

104344 The *rmdel* utility shall remove the delta specified by the *SID* from each named SCCS file. The  
 104345 delta to be removed shall be the most recent delta in its branch in the delta chain of each named  
 104346 SCCS file. In addition, the application shall ensure that the *SID* specified is not that of a version  
 104347 being edited for the purpose of making a delta; that is, if a *p-file* (see *get*) exists for the named  
 104348 SCCS file, the *SID* specified shall not appear in any entry of the *p-file*.

104349 Removal of a delta shall be restricted to:

- 104350 1. The user who made the delta
- 104351 2. The owner of the SCCS file
- 104352 3. The owner of the directory containing the SCCS file

104353 **OPTIONS**104354 The *rmdel* utility shall conform to XBD [Section 12.2](#) (on page 215).

104355 The following option shall be supported:

104356 **-r** *SID* Specify the SCCS identification string (*SID*) of the delta to be deleted.104357 **OPERANDS**

104358 The following operand shall be supported:

104359 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *rmdel*  
 104360 utility shall behave as though each file in the directory were specified as a named  
 104361 file, except that non-SCCS files (last component of the pathname does not begin  
 104362 with **s**.) and unreadable files shall be silently ignored.

104363 If exactly one *file* operand appears, and it is **'-'**, the standard input shall be read;  
 104364 each line of the standard input is taken to be the name of an SCCS file to be  
 104365 processed. Non-SCCS files and unreadable files shall be silently ignored.

104366 **STDIN**

104367 The standard input shall be a text file used only when the *file* operand is specified as **'-'**. Each  
 104368 line of the text file shall be interpreted as an SCCS pathname.

104369 **INPUT FILES**

104370 The SCCS files shall be files of unspecified format.

104371 **ENVIRONMENT VARIABLES**104372 The following environment variables shall affect the execution of *rmdel*:

104373 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 104374 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 104375 variables used to determine the values of locale categories.)

104376 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 104377 internationalization variables.

104378 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 104379 characters (for example, single-byte as opposed to multi-byte characters in  
 104380 arguments and input files).

- 104381 *LC\_MESSAGES*
- 104382 Determine the locale that should be used to affect the format and contents of  
104383 diagnostic messages written to standard error.
- 104384 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 104385 **ASYNCHRONOUS EVENTS**
- 104386 Default.
- 104387 **STDOUT**
- 104388 Not used.
- 104389 **STDERR**
- 104390 The standard error shall be used only for diagnostic messages.
- 104391 **OUTPUT FILES**
- 104392 The SCCS files shall be files of unspecified format. During processing of a *file*, a temporary *x-file*,  
104393 as described in *admin*, may be created and deleted; a locking *z-file*, as described in *get*, may be  
104394 created and deleted.
- 104395 **EXTENDED DESCRIPTION**
- 104396 None.
- 104397 **EXIT STATUS**
- 104398 The following exit values shall be returned:
- 104399 0 Successful completion.
- 104400 >0 An error occurred.
- 104401 **CONSEQUENCES OF ERRORS**
- 104402 Default.
- 104403 **APPLICATION USAGE**
- 104404 None.
- 104405 **EXAMPLES**
- 104406 None.
- 104407 **RATIONALE**
- 104408 None.
- 104409 **FUTURE DIRECTIONS**
- 104410 None.
- 104411 **SEE ALSO**
- 104412 *admin*, *delta*, *get*, *prs*
- 104413 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)
- 104414 **CHANGE HISTORY**
- 104415 First released in Issue 2.
- 104416 **Issue 6**
- 104417 The normative text is reworded to avoid use of the term “must” for application requirements.

104418 **NAME**

104419            rmdir — remove directories

104420 **SYNOPSIS**104421            rmdir [-p] *dir*...104422 **DESCRIPTION**104423            The *rmdir* utility shall remove the directory entry specified by each *dir* operand.104424            For each *dir* operand, the *rmdir* utility shall perform actions equivalent to the *rmdir()* function  
104425            called with the *dir* operand as its only argument.104426            Directories shall be processed in the order specified. If a directory and a subdirectory of that  
104427            directory are specified in a single invocation of the *rmdir* utility, the application shall specify the  
104428            subdirectory before the parent directory so that the parent directory will be empty when the  
104429            *rmdir* utility tries to remove it.104430 **OPTIONS**104431            The *rmdir* utility shall conform to XBD [Section 12.2](#) (on page 215).

104432            The following option shall be supported:

104433            **-p**            Remove all directories in a pathname. For each *dir* operand:

- 104434                            1. The directory entry it names shall be removed.
- 104435                            2. If the *dir* operand includes more than one pathname component, effects  
104436                            equivalent to the following command shall occur:

104437                            rmdir -p \$(dirname *dir*)104438 **OPERANDS**

104439            The following operand shall be supported:

104440            *dir*            A pathname of an empty directory to be removed.104441 **STDIN**

104442            Not used.

104443 **INPUT FILES**

104444            None.

104445 **ENVIRONMENT VARIABLES**104446            The following environment variables shall affect the execution of *rmdir*:104447            **LANG**            Provide a default value for the internationalization variables that are unset or null.  
104448                            (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
104449                            variables used to determine the values of locale categories.)104450            **LC\_ALL**            If set to a non-empty string value, override the values of all the other  
104451                            internationalization variables.104452            **LC\_CTYPE**        Determine the locale for the interpretation of sequences of bytes of text data as  
104453                            characters (for example, single-byte as opposed to multi-byte characters in  
104454                            arguments).104455            **LC\_MESSAGES**104456                            Determine the locale that should be used to affect the format and contents of  
104457                            diagnostic messages written to standard error.

- 104458 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 104459 **ASYNCHRONOUS EVENTS**
- 104460 Default.
- 104461 **STDOUT**
- 104462 Not used.
- 104463 **STDERR**
- 104464 The standard error shall be used only for diagnostic messages.
- 104465 **OUTPUT FILES**
- 104466 None.
- 104467 **EXTENDED DESCRIPTION**
- 104468 None.
- 104469 **EXIT STATUS**
- 104470 The following exit values shall be returned:
- 104471 0 Each directory entry specified by a *dir* operand was removed successfully.
- 104472 >0 An error occurred.
- 104473 **CONSEQUENCES OF ERRORS**
- 104474 Default.
- 104475 **APPLICATION USAGE**
- 104476 The definition of an empty directory is one that contains, at most, directory entries for dot and dot-dot.
- 104477
- 104478 **EXAMPLES**
- 104479 If a directory **a** in the current directory is empty except it contains a directory **b** and **a/b** is empty
- 104480 except it contains a directory **c**:
- 104481 `rmdir -p a/b/c`
- 104482 removes all three directories.
- 104483 **RATIONALE**
- 104484 On historical System V systems, the `-p` option also caused a message to be written to the
- 104485 standard output. The message indicated whether the whole path was removed or whether part
- 104486 of the path remained for some reason. The **STDERR** section requires this diagnostic when the
- 104487 entire path specified by a *dir* operand is not removed, but does not allow the status message
- 104488 reporting success to be written as a diagnostic.
- 104489 The *rmdir* utility on System V also included a `-s` option that suppressed the informational
- 104490 message output by the `-p` option. This option has been omitted because the informational
- 104491 message is not specified by this volume of POSIX.1-2008.
- 104492 **FUTURE DIRECTIONS**
- 104493 None.
- 104494 **SEE ALSO**
- 104495 *rm*
- 104496 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)
- 104497 XSH *remove()*, *rmdir()*, *unlink()*

104498 **CHANGE HISTORY**

104499 First released in Issue 2.

104500 **Issue 6**

104501 The normative text is reworded to avoid use of the term “must” for application requirements.

104502 **NAME**104503 sact — print current SCCS file-editing activity (**DEVELOPMENT**)104504 **SYNOPSIS**104505 XSI `sact file...`104506 **DESCRIPTION**

104507 The *sact* utility shall inform the user of any impending deltas to a named SCCS file by writing a  
 104508 list to standard output. This situation occurs when *get -e* has been executed previously without  
 104509 a subsequent execution of *delta*, *unget*, or *sccs unedit*.

104510 **OPTIONS**

104511 None.

104512 **OPERANDS**

104513 The following operand shall be supported:

104514 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *sact*  
 104515 utility shall behave as though each file in the directory were specified as a named  
 104516 file, except that non-SCCS files (last component of the pathname does not begin  
 104517 with **s**.) and unreadable files shall be silently ignored.

104518 If exactly one *file* operand appears, and it is *'-'*, the standard input shall be read;  
 104519 each line of the standard input shall be taken to be the name of an SCCS file to be  
 104520 processed. Non-SCCS files and unreadable files shall be silently ignored.

104521 **STDIN**

104522 The standard input shall be a text file used only when the *file* operand is specified as *'-'*. Each  
 104523 line of the text file shall be interpreted as an SCCS pathname.

104524 **INPUT FILES**

104525 Any SCCS files interrogated are files of an unspecified format.

104526 **ENVIRONMENT VARIABLES**104527 The following environment variables shall affect the execution of *sact*:

104528 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 104529 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 104530 variables used to determine the values of locale categories.)

104531 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 104532 internationalization variables.

104533 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 104534 characters (for example, single-byte as opposed to multi-byte characters in  
 104535 arguments and input files).

104536 *LC\_MESSAGES*

104537 Determine the locale that should be used to affect the format and contents of  
 104538 diagnostic messages written to standard error.

104539 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

104540 **ASYNCHRONOUS EVENTS**

104541 Default.

104542 **STDOUT**

104543 The output for each named file shall consist of a line in the following format:

104544 "%sΔ%sΔ%sΔ%sΔ\n", <SID>, <new SID>, <login>, <date>, <time>

104545 <SID> Specifies the SID of a delta that currently exists in the SCCS file to which changes  
104546 are made to make the new delta.

104547 <new SID> Specifies the SID for the new delta to be created.

104548 <login> Contains the login name of the user who makes the delta (that is, who executed a  
104549 *get* for editing).

104550 <date> Contains the date that *get -e* was executed, in the format used by the *prs :D:* data  
104551 keyword.

104552 <time> Contains the time that *get -e* was executed, in the format used by the *prs :T:* data  
104553 keyword.

104554 If there is more than one named file or if a directory or standard input is named, each pathname  
104555 shall be written before each of the preceding lines:

104556 "\n%s:\n", <pathname>

104557 **STDERR**

104558 The standard error shall be used only for optional informative messages concerning SCCS files  
104559 with no impending deltas, and for diagnostic messages.

104560 **OUTPUT FILES**

104561 None.

104562 **EXTENDED DESCRIPTION**

104563 None.

104564 **EXIT STATUS**

104565 The following exit values shall be returned:

104566 0 Successful completion.

104567 >0 An error occurred.

104568 **CONSEQUENCES OF ERRORS**

104569 Default.

104570 **APPLICATION USAGE**

104571 None.

104572 **EXAMPLES**

104573 None.

104574 **RATIONALE**

104575 None.

104576 **FUTURE DIRECTIONS**

104577 None.

104578 **SEE ALSO**

104579 *delta*, *get*, *sccs*, *unget*

104580 XBD Chapter 8 (on page 173)

104581 **CHANGE HISTORY**  
104582 First released in Issue 2.

104583 **NAME**104584 `sccs` — front end for the SCCS subsystem (**DEVELOPMENT**)104585 **SYNOPSIS**104586 XSI `sccs [-r] [-d path] [-p path] command [options...] [operands...]`104587 **DESCRIPTION**104588 The `sccs` utility is a front end to the SCCS programs. It also includes the capability to run set-user-id to another user to provide additional protection.  
104589104590 The `sccs` utility shall invoke the specified *command* with the specified *options* and *operands*. By  
104591 default, each of the *operands* shall be modified by prefixing it with the string "SCCS/s. ".104592 The *command* can be the name of one of the SCCS utilities in this volume of POSIX.1-2008 (*admin*,  
104593 *delta*, *get*, *prs*, *rmDEL*, *sact*, *unget*, *val*, or *what*) or one of the pseudo-utilities listed in the  
104594 EXTENDED DESCRIPTION section.104595 **OPTIONS**104596 The `sccs` utility shall conform to XBD [Section 12.2](#) (on page 215), except that *options* operands are  
104597 actually options to be passed to the utility named by *command*. When the portion of the  
104598 command:104599 `command [options ...] [operands ...]`104600 is considered, all of the pseudo-utilities used as *command* shall support the Utility Syntax  
104601 Guidelines. Any of the other SCCS utilities that can be invoked in this manner support the  
104602 Guidelines to the extent indicated by their individual OPTIONS sections.104603 The following options shall be supported preceding the *command* operand:104604 **-d *path*** A pathname of a directory to be used as a root directory for the SCCS files. The  
104605 default shall be the current directory. The **-d** option shall take precedence over the  
104606 *PROJECTDIR* variable. See **-p**.104607 **-p *path*** A pathname of a directory in which the SCCS files are located. The default shall be  
104608 the **SCCS** directory.104609 The **-p** option differs from the **-d** option in that the **-d** option-argument shall be  
104610 prefixed to the entire pathname and the **-p** option-argument shall be inserted  
104611 before the final component of the pathname. For example:104612 `sccs -d /x -p y get a/b`

104613 converts to:

104614 `get /x/a/y/s.b`

104615 This allows the creation of aliases such as:

104616 `alias syssccs="sccs -d /usr/src"`

104617 which is used as:

104618 `syssccs get cmd/who.c`104619 **-r** Invoke *command* with the real user ID of the process, not any effective user ID that  
104620 the `sccs` utility is set to. Certain commands (*admin*, **check**, **clean**, **diffs**, **info**, *rmDEL*,  
104621 and **tell**) cannot be run set-user-ID by all users, since this would allow anyone to  
104622 change the authorizations. These commands are always run as the real user.

104623 **OPERANDS**

104624 The following operands shall be supported:

104625 *command* An SCCS utility name or the name of one of the pseudo-utilities listed in the  
104626 EXTENDED DESCRIPTION section.

104627 *options* An option or option-argument to be passed to *command*.

104628 *operands* An operand to be passed to *command*.

104629 **STDIN**

104630 See the utility description for the specified *command*.

104631 **INPUT FILES**

104632 See the utility description for the specified *command*.

104633 **ENVIRONMENT VARIABLES**

104634 The following environment variables shall affect the execution of *sccs*:

104635 *LANG* Provide a default value for the internationalization variables that are unset or null.  
104636 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
104637 variables used to determine the values of locale categories.)

104638 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
104639 internationalization variables.

104640 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
104641 characters (for example, single-byte as opposed to multi-byte characters in  
104642 arguments and input files).

104643 *LC\_MESSAGES*

104644 Determine the locale that should be used to affect the format and contents of  
104645 diagnostic messages written to standard error.

104646 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

104647 *PROJECTDIR*

104648 Provide a default value for the *-d path* option. If the value of *PROJECTDIR* begins  
104649 with a <slash>, it shall be considered an absolute pathname; otherwise, the value  
104650 of *PROJECTDIR* is treated as a user name and that user's initial working directory  
104651 shall be examined for a subdirectory *src* or *source*. If such a directory is found, it  
104652 shall be used. Otherwise, the value shall be used as a relative pathname.

104653 Additional environment variable effects may be found in the utility description for the specified  
104654 *command*.

104655 **ASYNCHRONOUS EVENTS**

104656 Default.

104657 **STDOUT**

104658 See the utility description for the specified *command*.

104659 **STDERR**

104660 See the utility description for the specified *command*.

104661 **OUTPUT FILES**

104662 See the utility description for the specified *command*.

## 104663 EXTENDED DESCRIPTION

104664 The following pseudo-utilities shall be supported as *command* operands. All options referred to  
 104665 in the following list are values given in the *options* operands following *command*.

104666 **check** Equivalent to **info**, except that nothing shall be printed if nothing is being edited, and a  
 104667 non-zero exit status shall be returned if anything is being edited. The intent is to have  
 104668 this included in an “install” entry in a makefile to ensure that everything is included  
 104669 into the SCCS file before a version is installed.

104670 **clean** Remove everything from the current directory that can be recreated from SCCS files,  
 104671 but do not remove any files being edited. If the **-b** option is given, branches shall be  
 104672 ignored in the determination of whether they are being edited; this is dangerous if  
 104673 branches are kept in the same directory.

104674 **create** Create an SCCS file, taking the initial contents from the file of the same name. Any  
 104675 options to *admin* are accepted. If the creation is successful, the original files shall be  
 104676 renamed by prefixing the basenames with a comma. These renamed files should be  
 104677 removed after it has been verified that the SCCS files have been created successfully.

104678 **delget** Perform a *delta* on the named files and then *get* new versions. The new versions shall  
 104679 have ID keywords expanded and shall not be editable. Any **-m**, **-p**, **-r**, **-s**, and **-y**  
 104680 options shall be passed to *delta*, and any **-b**, **-c**, **-e**, **-i**, **-k**, **-l**, **-s**, and **-x** options shall be  
 104681 passed to *get*.

104682 **deledit** Equivalent to **delget**, except that the *get* phase shall include the **-e** option. This option is  
 104683 useful for making a checkpoint of the current editing phase. The same options shall be  
 104684 passed to *delta* as described above, and all the options listed for *get* above except **-e**  
 104685 shall be passed to **edit**.

104686 **diffs** Write a difference listing between the current version of the files checked out for editing  
 104687 and the versions in SCCS format. Any **-r**, **-c**, **-i**, **-x**, and **-t** options shall be passed to  
 104688 *get*; any **-l**, **-s**, **-e**, **-f**, **-h**, and **-b** options shall be passed to *diff*. A **-C** option shall be  
 104689 passed to *diff* as **-c**.

104690 **edit** Equivalent to *get -e*.

104691 **fix** Remove the named delta, but leave a copy of the delta with the changes that were in it.  
 104692 It is useful for fixing small compiler bugs, and so on. The application shall ensure that it  
 104693 is followed by a **-r** *SID* option. Since **fix** does not leave audit trails, it should be used  
 104694 carefully.

104695 **info** Write a listing of all files being edited. If the **-b** option is given, branches (that is, SIDs  
 104696 with two or fewer components) shall be ignored. If a **-u** *user* option is given, then only  
 104697 files being edited by the named user shall be listed. A **-U** option shall be equivalent to  
 104698 **-u**<*current user*>.

104699 **print** Write out verbose information about the named files, equivalent to *sccs prs*.

104700 **tell** Write a <newline>-separated list of the files being edited to standard output. Takes the  
 104701 **-b**, **-u**, and **-U** options like **info** and **check**.

104702 **unedit** This is the opposite of an **edit** or a *get -e*. It should be used with caution, since any  
 104703 changes made since the *get* are lost.

104704 **EXIT STATUS**

104705 The following exit values shall be returned:

104706 0 Successful completion.

104707 >0 An error occurred.

104708 **CONSEQUENCES OF ERRORS**

104709 Default.

104710 **APPLICATION USAGE**

104711 Many of the SCCS utilities take directory names as operands as well as specific filenames. The  
 104712 pseudo-utilities supported by *sccs* are not described as having this capability, but are not  
 104713 prohibited from doing so.

104714 **EXAMPLES**

104715 1. To get a file for editing, edit it and produce a new delta:

```
104716 sccs get -e file.c
```

```
104717 ex file.c
```

```
104718 sccs delta file.c
```

104719 2. To get a file from another directory:

```
104720 sccs -p /usr/src/sccs/s. get cc.c
```

104721 or:

```
104722 sccs get /usr/src/sccs/s.cc.c
```

104723 3. To make a delta of a large number of files in the current directory:

```
104724 sccs delta *.c
```

104725 4. To get a list of files being edited that are not on branches:

```
104726 sccs info -b
```

104727 5. To delta everything being edited by the current user:

```
104728 sccs delta $(sccs tell -U)
```

104729 6. In a makefile, to get source files from an SCCS file if it does not already exist:

```
104730 SRCS = <list of source files>
```

```
104731 $(SRCS) :
```

```
104732 sccs get $(REL) $@
```

104733 **RATIONALE**

104734 *sccs* and its associated utilities are part of the XSI Development Utilities option within the XSI  
 104735 option.

104736 SCCS is an abbreviation for Source Code Control System. It is a maintenance and enhancement  
 104737 tracking tool. When a file is put under SCCS, the source code control system maintains the file  
 104738 and, when changes are made, identifies and stores them in the file with the original source code  
 104739 and/or documentation. As other changes are made, they too are identified and retained in the  
 104740 file.

104741 Retrieval of the original and any set of changes is possible. Any version of the file as it develops  
 104742 can be reconstructed for inspection or additional modification. History data can be stored with  
 104743 each version, documenting why the changes were made, who made them, and when they were  
 104744 made.

104745 **FUTURE DIRECTIONS**

104746 None.

104747 **SEE ALSO**104748 *admin, delta, get, make, prs, rmdel, sact, unget, val, what*104749 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)104750 **CHANGE HISTORY**

104751 First released in Issue 4.

104752 **Issue 6**104753 In the ENVIRONMENT VARIABLES section, the *PROJECTDIR* description is updated from  
104754 “otherwise, the home directory of a user of that name is examined” to “otherwise, the value of  
104755 *PROJECTDIR* is treated as a user name and that user’s initial working directory is examined”.

104756 The normative text is reworded to avoid use of the term “must” for application requirements.

104757 **Issue 7**

104758 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

104759 **NAME**

104760 sed — stream editor

104761 **SYNOPSIS**104762 sed [-n] *script* [*file...*]104763 sed [-n] -e *script* [-e *script*]... [-f *script\_file*]... [*file...*]104764 sed [-n] [-e *script*]... -f *script\_file* [-f *script\_file*]... [*file...*]104765 **DESCRIPTION**

104766 The *sed* utility is a stream editor that shall read one or more text files, make editing changes  
 104767 according to a script of editing commands, and write the results to standard output. The script  
 104768 shall be obtained from either the *script* operand string or a combination of the option-arguments  
 104769 from the -e *script* and -f *script\_file* options.

104770 **OPTIONS**

104771 The *sed* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the order of  
 104772 presentation of the -e and -f options is significant.

104773 The following options shall be supported:

104774 -e *script* Add the editing commands specified by the *script* option-argument to the end of  
 104775 the script of editing commands. The *script* option-argument shall have the same  
 104776 properties as the *script* operand, described in the OPERANDS section.

104777 -f *script\_file* Add the editing commands in the file *script\_file* to the end of the script.

104778 -n Suppress the default output (in which each line, after it is examined for editing, is  
 104779 written to standard output). Only lines explicitly selected for output are written.

104780 Multiple -e and -f options may be specified. All commands shall be added to the script in the  
 104781 order specified, regardless of their origin.

104782 **OPERANDS**

104783 The following operands shall be supported:

104784 *file* A pathname of a file whose contents are read and edited. If multiple *file* operands  
 104785 are specified, the named files shall be read in the order specified and the  
 104786 concatenation shall be edited. If no *file* operands are specified, the standard input  
 104787 shall be used.

104788 *script* A string to be used as the script of editing commands. The application shall not  
 104789 present a *script* that violates the restrictions of a text file except that the final  
 104790 character need not be a <newline>.

104791 **STDIN**

104792 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
 104793 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 104794 the standard input shall not be used. See the INPUT FILES section.

104795 **INPUT FILES**

104796 The input files shall be text files. The *script\_files* named by the -f option shall consist of editing  
 104797 commands.

104798 **ENVIRONMENT VARIABLES**

104799 The following environment variables shall affect the execution of *sed*:

104800 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 104801 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 104802 variables used to determine the values of locale categories.)

- 104803 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
104804 internationalization variables.
- 104805 *LC\_COLLATE*  
104806 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
104807 character collating elements within regular expressions.
- 104808 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
104809 characters (for example, single-byte as opposed to multi-byte characters in  
104810 arguments and input files), and the behavior of character classes within regular  
104811 expressions.
- 104812 *LC\_MESSAGES*  
104813 Determine the locale that should be used to affect the format and contents of  
104814 diagnostic messages written to standard error.
- 104815 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 104816 **ASYNCHRONOUS EVENTS**  
104817 Default.
- 104818 **STDOUT**  
104819 The input files shall be written to standard output, with the editing commands specified in the  
104820 script applied. If the `-n` option is specified, only those input lines selected by the script shall be  
104821 written to standard output.
- 104822 **STDERR**  
104823 The standard error shall be used only for diagnostic messages.
- 104824 **OUTPUT FILES**  
104825 The output files shall be text files whose formats are dependent on the editing commands given.
- 104826 **EXTENDED DESCRIPTION**  
104827 The *script* shall consist of editing commands of the following form:  
104828 `[address[, address]] function`  
104829 where *function* represents a single-character command verb from the list in [Editing Commands](#)  
104830 [in sed](#) (on page 3155), followed by any applicable arguments.  
104831 The command can be preceded by <blank> characters and/or <semicolon> characters. The  
104832 function can be preceded by <blank> characters. These optional characters shall have no effect.  
104833 In default operation, *sed* cyclically shall append a line of input, less its terminating <newline>,  
104834 into the pattern space. Normally the pattern space will be empty, unless a **D** command  
104835 terminated the last cycle. The *sed* utility shall then apply in sequence all commands whose  
104836 addresses select that pattern space, and at the end of the script copy the pattern space to  
104837 standard output (except when `-n` is specified) and delete the pattern space. Whenever the  
104838 pattern space is written to standard output or a named file, *sed* shall immediately follow it with a  
104839 <newline>.  
104840 Some of the editing commands use a hold space to save all or part of the pattern space for  
104841 subsequent retrieval. The pattern and hold spaces shall each be able to hold at least 8 192 bytes.

### 104842 **Addresses in sed**

104843 An address is either a decimal number that counts input lines cumulatively across files, a '\$'  
104844 character that addresses the last line of input, or a context address (which consists of a BRE, as  
104845 described in [Regular Expressions in sed](#), preceded and followed by a delimiter, usually a  
104846 <slash>).

104847 An editing command with no addresses shall select every pattern space.

104848 An editing command with one address shall select each pattern space that matches the address.

104849 An editing command with two addresses shall select the inclusive range from the first pattern  
104850 space that matches the first address through the next pattern space that matches the second. (If  
104851 the second address is a number less than or equal to the line number first selected, only one line  
104852 shall be selected.) Starting at the first line following the selected range, *sed* shall look again for  
104853 the first address. Thereafter, the process shall be repeated. Omitting either or both of the address  
104854 components in the following form produces undefined results:

104855 `[address[, address]]`

### 104856 **Regular Expressions in sed**

104857 The *sed* utility shall support the BREs described in XBD [Section 9.3](#) (on page 183), with the  
104858 following additions:

- 104859 • In a context address, the construction "`\cBREC`", where *c* is any character other than  
104860 <backslash> or <newline>, shall be identical to "`/BRE/`". If the character designated by *c*  
104861 appears following a <backslash>, then it shall be considered to be that literal character,  
104862 which shall not terminate the BRE. For example, in the context address "`\xabc\xdefx`",  
104863 the second *x* stands for itself, so that the BRE is "`abcxdef`".
- 104864 • The escape sequence '`\n`' shall match a <newline> embedded in the pattern space. A  
104865 literal <newline> shall not be used in the BRE of a context address or in the substitute  
104866 function.
- 104867 • If an RE is empty (that is, no pattern is specified) *sed* shall behave as if the last RE used in  
104868 the last command applied (either as an address or as part of a substitute command) was  
104869 specified.

### 104870 **Editing Commands in sed**

104871 In the following list of editing commands, the maximum number of permissible addresses for  
104872 each function is indicated by `[0addr]`, `[1addr]`, or `[2addr]`, representing zero, one, or two  
104873 addresses.

104874 The argument *text* shall consist of one or more lines. Each embedded <newline> in the text shall  
104875 be preceded by a <backslash>. Other <backslash> characters in text shall be removed, and the  
104876 following character shall be treated literally.

104877 The **r** and **w** command verbs, and the *w* flag to the **s** command, take an *rfile* (or *wfile*) parameter,  
104878 separated from the command verb letter or flag by one or more <blank> characters;  
104879 implementations may allow zero separation as an extension.

104880 The argument *rfile* or the argument *wfile* shall terminate the editing command. Each *wfile* shall be  
104881 created before processing begins. Implementations shall support at least ten *wfile* arguments in  
104882 the script; the actual number (greater than or equal to 10) that is supported by the  
104883 implementation is unspecified. The use of the *wfile* parameter shall cause that file to be initially  
104884 created, if it does not exist, or shall replace the contents of an existing file.

104885 The **b**, **r**, **s**, **t**, **w**, **y**, and **:** command verbs shall accept additional arguments. The following  
 104886 synopses indicate which arguments shall be separated from the command verbs by a single  
 104887 <space>.

104888 The **a** and **r** commands schedule text for later output. The text specified for the **a** command, and  
 104889 the contents of the file specified for the **r** command, shall be written to standard output just  
 104890 before the next attempt to fetch a line of input when executing the **N** or **n** commands, or when  
 104891 reaching the end of the script. If written when reaching the end of the script, and the **-n** option  
 104892 was not specified, the text shall be written after copying the pattern space to standard output.  
 104893 The contents of the file specified for the **r** command shall be as of the time the output is written,  
 104894 not the time the **r** command is applied. The text shall be output in the order in which the **a** and **r**  
 104895 commands were applied to the input.

104896 Command verbs other than **{**, **a**, **b**, **c**, **i**, **r**, **t**, **w**, **:**, and **#** can be followed by a <semicolon>,  
 104897 optional <blank> characters, and another command verb. However, when the **s** command verb  
 104898 is used with the *w* flag, following it with another command in this manner produces undefined  
 104899 results.

104900 A function can be preceded by one or more **' !'** characters, in which case the function shall be  
 104901 applied if the addresses do not select the pattern space. Zero or more <blank> characters shall be  
 104902 accepted before the first **' !'** character. It is unspecified whether <blank> characters can follow a  
 104903 **' !'** character, and conforming applications shall not follow a **' !'** character with <blank>  
 104904 characters.

104905 **[2addr]{function**  
 104906 *function*  
 104907 ...  
 104908 **}** Execute a list of *sed* functions only when the pattern space is selected. The list of *sed*  
 104909 functions shall be surrounded by braces and separated by <newline> characters,  
 104910 and conform to the following rules. The braces can be preceded or followed by  
 104911 <blank> characters. The functions can be preceded by <blank> characters, but shall  
 104912 not be followed by <blank> characters. The <right-brace> shall be preceded by a  
 104913 <newline> and can be preceded or followed by <blank> characters.

104914 **[1addr]a\**  
 104915 *text* Write text to standard output as described previously.

104916 **[2addr]b [label]**  
 104917 Branch to the **:** function bearing the *label*. If *label* is not specified, branch to the end  
 104918 of the script. The implementation shall support *labels* recognized as unique up to at  
 104919 least 8 characters; the actual length (greater than or equal to 8) that shall be  
 104920 supported by the implementation is unspecified. It is unspecified whether  
 104921 exceeding a label length causes an error or a silent truncation.

104922 **[2addr]c\**  
 104923 *text* Delete the pattern space. With a 0 or 1 address or at the end of a 2-address range,  
 104924 place *text* on the output and start the next cycle.

104925 **[2addr]d** Delete the pattern space and start the next cycle.

104926 **[2addr]D** Delete the initial segment of the pattern space through the first <newline> and  
 104927 start the next cycle.

104928 **[2addr]g** Replace the contents of the pattern space by the contents of the hold space.

|        |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 104929 | [2addr]G                       | Append to the pattern space a <newline> followed by the contents of the hold space.                                                                                                                                                                                                                                                                                                                                                                                                    |
| 104930 |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 104931 | [2addr]h                       | Replace the contents of the hold space with the contents of the pattern space.                                                                                                                                                                                                                                                                                                                                                                                                         |
| 104932 | [2addr]H                       | Append to the hold space a <newline> followed by the contents of the pattern space.                                                                                                                                                                                                                                                                                                                                                                                                    |
| 104933 |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 104934 | [1addr]i\<br>text              | Write <i>text</i> to standard output.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 104935 |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 104936 | [2addr]l                       | (The letter ell.) Write the pattern space to standard output in a visually unambiguous form. The characters listed in XBD Table 5-1 (on page 121) ('\\', '\a', '\b', '\f', '\r', '\t', '\v') shall be written as the corresponding escape sequence; the '\n' in that table is not applicable. Non-printable characters not in that table shall be written as one three-digit octal number (with a preceding <backslash>) for each byte in the character (most significant byte first). |

| 104966 |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 104967 |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 104968 |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 104969 |                                | The replacement string shall be scanned from beginning to end. An <ampersand> ('&') appearing in the replacement shall be replaced by the string matching the BRE. The special meaning of '&' in this context can be suppressed by preceding it by a <backslash>. The characters "\n", where <i>n</i> is a digit, shall be replaced by the                                                                                                                                             |
| 104970 |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 104971 |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 104972 |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

104973 text matched by the corresponding back-reference expression. If the corresponding  
 104974 back-reference expression does not match, then the characters "*\n*" shall be  
 104975 replaced by the empty string. The special meaning of "*\n*" where *n* is a digit in  
 104976 this context, can be suppressed by preceding it by a `<backslash>`. For each other  
 104977 `<backslash>` encountered, the following character shall lose its special meaning (if  
 104978 any). The meaning of a `<backslash>` immediately followed by any character other  
 104979 than `' & '`, `<backslash>`, a digit, or the delimiter character used for this command, is  
 104980 unspecified.

104981 A line can be split by substituting a `<newline>` into it. The application shall escape  
 104982 the `<newline>` in the replacement by preceding it by a `<backslash>`. A substitution  
 104983 shall be considered to have been performed even if the replacement string is  
 104984 identical to the string that it replaces. Any `<backslash>` used to alter the default  
 104985 meaning of a subsequent character shall be discarded from the BRE or the  
 104986 replacement before evaluating the BRE or using the replacement.

104987 The value of *flags* shall be zero or more of:

104988 *n* Substitute for the *n*th occurrence only of the BRE found within the  
 104989 pattern space.

104990 *g* Globally substitute for all non-overlapping instances of the BRE  
 104991 rather than just the first one. If both *g* and *n* are specified, the results  
 104992 are unspecified.

104993 *p* Write the pattern space to standard output if a replacement was  
 104994 made.

104995 *w wfile* Write. Append the pattern space to *wfile* if a replacement was made.  
 104996 A conforming application shall precede the *wfile* argument with one  
 104997 or more `<blank>` characters. If the *w* flag is not the last flag value  
 104998 given in a concatenation of multiple flag values, the results are  
 104999 undefined.

105000 `[2addr]t [label]`

105001 Test. Branch to the `:` command verb bearing the *label* if any substitutions have been  
 105002 made since the most recent reading of an input line or execution of a `t`. If *label* is  
 105003 not specified, branch to the end of the script.

105004 `[2addr]w wfile`

105005 Append (write) the pattern space to *wfile*.

105006 `[2addr]x` Exchange the contents of the pattern and hold spaces.

105007 `[2addr]y/string1/string2/`

105008 Replace all occurrences of characters in *string1* with the corresponding characters  
 105009 in *string2*. If a `<backslash>` followed by an `' n '` appear in *string1* or *string2*, the two  
 105010 characters shall be handled as a single `<newline>`. If the number of characters in  
 105011 *string1* and *string2* are not equal, or if any of the characters in *string1* appear more  
 105012 than once, the results are undefined. Any character other than `<backslash>` or  
 105013 `<newline>` can be used instead of `<slash>` to delimit the strings. If the delimiter is  
 105014 not `' n '`, within *string1* and *string2*, the delimiter itself can be used as a literal  
 105015 character if it is preceded by a `<backslash>`. If a `<backslash>` character is  
 105016 immediately followed by a `<backslash>` character in *string1* or *string2*, the two  
 105017 `<backslash>` characters shall be counted as a single literal `<backslash>` character.  
 105018 The meaning of a `<backslash>` followed by any character that is not `' n '`, a  
 105019 `<backslash>`, or the delimiter character is undefined.

105020 [Oaddr]:label Do nothing. This command bears a *label* to which the **b** and **t** commands branch.

105021 [laddr]= Write the following to standard output:

105022 "%d\n", <current line number>

105023 [Oaddr] Ignore this empty command.

105024 [Oaddr]# Ignore the '#' and the remainder of the line (treat them as a comment), with the single exception that if the first two characters in the script are "#n", the default output shall be suppressed; this shall be the equivalent of specifying **-n** on the command line.

#### 105028 EXIT STATUS

105029 The following exit values shall be returned:

105030 0 Successful completion.

105031 >0 An error occurred.

#### 105032 CONSEQUENCES OF ERRORS

105033 Default.

#### 105034 APPLICATION USAGE

105035 Regular expressions match entire strings, not just individual lines, but a <newline> is matched by '\n' in a *sed* RE; a <newline> is not allowed by the general definition of regular expression in POSIX.1-2008. Also note that '\n' cannot be used to match a <newline> at the end of an arbitrary input line; <newline> characters appear in the pattern space as a result of the **N** editing command.

#### 105040 EXAMPLES

105041 This *sed* script simulates the BSD *cat -s* command, squeezing excess empty lines from standard input.

```

105043 sed -n '
105044 # Write non-empty lines.
105045 ./ {
105046     p
105047     d
105048 }
105049 # Write a single empty line, then look for more empty lines.
105050 /^$/ p
105051 # Get next line, discard the held <newline> (empty line),
105052 # and look for more empty lines.
105053 :Empty
105054 /^$/ {
105055     N
105056     s/./ /
105057     b Empty
105058 }
105059 # Write the non-empty line before going back to search
105060 # for the first in a set of empty lines.
105061     p
105062 '

```

105063 The following *sed* command is a much simpler method of squeezing empty lines, although it is not quite the same as *cat -s* since it removes any initial empty lines:

105065 `sed -n '/./,/^$/p'`

105066 **RATIONALE**

105067 This volume of POSIX.1-2008 requires implementations to support at least ten distinct *wfiles*,  
 105068 matching historical practice on many implementations. Implementations are encouraged to  
 105069 support more, but conforming applications should not exceed this limit.

105070 The exit status codes specified here are different from those in System V. System V returns 2 for  
 105071 garbled *sed* commands, but returns zero with its usage message or if the input file could not be  
 105072 opened. The standard developers considered this to be a bug.

105073 The manner in which the **l** command writes non-printable characters was changed to avoid the  
 105074 historical backspace-overstrike method, and other requirements to achieve unambiguous output  
 105075 were added. See the RATIONALE for *ed* for details of the format chosen, which is the same as  
 105076 that chosen for *sed*.

105077 This volume of POSIX.1-2008 requires implementations to provide pattern and hold spaces of at  
 105078 least 8 192 bytes, larger than the 4 000 bytes spaces used by some historical implementations, but  
 105079 less than the 20 480 bytes limit used in an early proposal. Implementations are encouraged to  
 105080 allocate dynamically larger pattern and hold spaces as needed.

105081 The requirements for acceptance of <blank> and <space> characters in command lines has been  
 105082 made more explicit than in early proposals to describe clearly the historical practice and to  
 105083 remove confusion about the phrase “protect initial blanks [*sic*] and tabs from the stripping that is  
 105084 done on every script line” that appears in much of the historical documentation of the *sed* utility  
 105085 description of text. (Not all implementations are known to have stripped <blank> characters  
 105086 from text lines, although they all have allowed leading <blank> characters preceding the address  
 105087 on a command line.)

105088 The treatment of '#' comments differs from the SVID which only allows a comment as the first  
 105089 line of the script, but matches BSD-derived implementations. The comment character is treated  
 105090 as a command, and it has the same properties in terms of being accepted with leading <blank>  
 105091 characters; the BSD implementation has historically supported this.

105092 Early proposals required that a *script\_file* have at least one non-comment line. Some historical  
 105093 implementations have behaved in unexpected ways if this were not the case. The standard  
 105094 developers considered that this was incorrect behavior and that application developers should  
 105095 not have to avoid this feature. A correct implementation of this volume of POSIX.1-2008 shall  
 105096 permit *script\_files* that consist only of comment lines.

105097 Early proposals indicated that if **-e** and **-f** options were intermixed, all **-e** options were  
 105098 processed before any **-f** options. This has been changed to process them in the order presented  
 105099 because it matches historical practice and is more intuitive.

105100 The treatment of the **p** flag to the **s** command differs between System V and BSD-based systems  
 105101 when the default output is suppressed. In the two examples:

```
105102 echo a | sed 's/a/A/p'
```

```
105103 echo a | sed -n 's/a/A/p'
```

105104 this volume of POSIX.1-2008, BSD, System V documentation, and the SVID indicate that the first  
 105105 example should write two lines with **A**, whereas the second should write one. Some System V  
 105106 systems write the **A** only once in both examples because the **p** flag is ignored if the **-n** option is  
 105107 not specified.

105108 This is a case of a diametrical difference between systems that could not be reconciled through  
 105109 the compromise of declaring the behavior to be unspecified. The SVID/BSD/System V  
 105110 documentation behavior was adopted for this volume of POSIX.1-2008 because:

- 105111 • No known documentation for any historic system describes the interaction between the **p**
- 105112 flag and the **-n** option.
- 105113 • The selected behavior is more correct as there is no technical justification for any
- 105114 interaction between the **p** flag and the **-n** option. A relationship between **-n** and the **p** flag
- 105115 might imply that they are only used together, but this ignores valid scripts that interrupt
- 105116 the cyclical nature of the processing through the use of the **D**, **d**, **q**, or branching
- 105117 commands. Such scripts rely on the **p** suffix to write the pattern space because they do not
- 105118 make use of the default output at the “bottom” of the script.
- 105119 • Because the **-n** option makes the **p** flag unnecessary, any interaction would only be useful
- 105120 if *sed* scripts were written to run both with and without the **-n** option. This is believed to
- 105121 be unlikely. It is even more unlikely that programmers have coded the **p** flag expecting it to
- 105122 be unnecessary. Because the interaction was not documented, the likelihood of a
- 105123 programmer discovering the interaction and depending on it is further decreased.
- 105124 • Finally, scripts that break under the specified behavior produce too much output instead of
- 105125 too little, which is easier to diagnose and correct.

105126 The form of the substitute command that uses the **n** suffix was limited to the first 512 matches in

105127 an early proposal. This limit has been removed because there is no reason an editor processing

105128 lines of {LINE\_MAX} length should have this restriction. The command *s/a/A/2047* should be

105129 able to substitute the 2 047th occurrence of **a** on a line.

105130 The **b**, **t**, and **:** commands are documented to ignore leading white space, but no mention is

105131 made of trailing white space. Historical implementations of *sed* assigned different locations to

105132 the labels '**x**' and "**x**". This is not useful, and leads to subtle programming errors, but it is

105133 historical practice, and changing it could theoretically break working scripts. Implementors are

105134 encouraged to provide warning messages about labels that are never used or jumps to labels

105135 that do not exist.

105136 Historically, the *sed* **!** and **}** editing commands did not permit multiple commands on a single

105137 line using a <semicolon> as a command delimiter. Implementations are permitted, but not

105138 required, to support this extension.

105139 Earlier versions of this standard allowed for implementations with bytes other than eight bits,

105140 but this has been modified in this version.

#### 105141 FUTURE DIRECTIONS

105142 None.

#### 105147 CHANGE HISTORY

105148 First released in Issue 2.

#### 105149 Issue 5

105150 The FUTURE DIRECTIONS section is added.

#### 105151 Issue 6

105152 The following new requirements on POSIX implementations derive from alignment with the

105153 Single UNIX Specification:

- 105154           • Implementations are required to support at least ten *wfile* arguments in an editing  
105155           command.
- 105156           The EXTENDED DESCRIPTION is changed to align with the IEEE P1003.2b draft standard.
- 105157           IEEE PASC Interpretation 1003.2 #190 is applied.
- 105158           IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the meaning of the  
105159           <backslash>-escape sequences in a replacement string for a BRE.
- 105160           IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/28 is applied, removing text describing  
105161           behavior on systems with bytes consisting of more than eight bits.
- 105162           IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/29 is applied, making an editorial  
105163           correction within the Editing Commands in *sed* section.
- 105164   **Issue 7**
- 105165           Austin Group Interpretations 1003.1-2001 #006, #036, and #092 are applied.
- 105166           SD5-XCU-ERN-97 and SD5-XCU-ERN-123 are applied, updating the SYNOPSIS.
- 105167           A second example is added.

105168 **NAME**

105169 sh — shell, the standard command language interpreter

105170 **SYNOPSIS**

105171 sh [-abCefhimnuvx] [-o *option*...] [+abCefhimnuvx] [+o *option*]...  
 105172 [*command\_file* [*argument*...]]

105173 sh -c [-abCefhimnuvx] [-o *option*...] [+abCefhimnuvx] [+o *option*]...  
 105174 *command\_string* [*command\_name* [*argument*...]]

105175 sh -s [-abCefhimnuvx] [-o *option*...] [+abCefhimnuvx] [+o *option*]...  
 105176 [*argument*...]

105177 **DESCRIPTION**

105178 The *sh* utility is a command language interpreter that shall execute commands read from a  
 105179 command line string, the standard input, or a specified file. The application shall ensure that the  
 105180 commands to be executed are expressed in the language described in [Chapter 2](#) (on page 2297).

105181 Pathname expansion shall not fail due to the size of a file.

105182 Shell input and output redirections have an implementation-defined offset maximum that is  
 105183 established in the open file description.

105184 **OPTIONS**

105185 The *sh* utility shall conform to XBD [Section 12.2](#) (on page 215), with an extension for support of a  
 105186 leading <plus-sign> ('+') as noted below.

105187 The **-a**, **-b**, **-C**, **-e**, **-f**, **-m**, **-n**, **-o** *option*, **-u**, **-v**, and **-x** options are described as part of the *set*  
 105188 utility in [Section 2.14](#) (on page 2334). The option letters derived from the *set* special built-in shall  
 105189 also be accepted with a leading <plus-sign> ('+') instead of a leading <hyphen> (meaning the  
 105190 reverse case of the option as described in this volume of POSIX.1-2008).

105191 The following additional options shall be supported:

105192 **-c** Read commands from the *command\_string* operand. Set the value of special  
 105193 parameter 0 (see [Section 2.5.2](#), on page 2302) from the value of the *command\_name*  
 105194 operand and the positional parameters (\$1, \$2, and so on) in sequence from the  
 105195 remaining *argument* operands. No commands shall be read from the standard  
 105196 input.

105197 **-i** Specify that the shell is *interactive*; see below. An implementation may treat  
 105198 specifying the **-i** option as an error if the real user ID of the calling process does  
 105199 not equal the effective user ID or if the real group ID does not equal the effective  
 105200 group ID.

105201 **-s** Read commands from the standard input.

105202 If there are no operands and the **-c** option is not specified, the **-s** option shall be assumed.

105203 If the **-i** option is present, or if there are no operands and the shell's standard input and  
 105204 standard error are attached to a terminal, the shell is considered to be *interactive*.

105205 **OPERANDS**

105206 The following operands shall be supported:

105207 **-** A single <hyphen> shall be treated as the first operand and then ignored. If both  
 105208 '-' and "--" are given as arguments, or if other operands precede the single  
 105209 <hyphen>, the results are undefined.

105210 *argument* The positional parameters (\$1, \$2, and so on) shall be set to *arguments*, if any.

105211 *command\_file* The pathname of a file containing commands. If the pathname contains one or  
 105212 more <slash> characters, the implementation attempts to read that file; the file  
 105213 need not be executable. If the pathname does not contain a <slash> character:

- The implementation shall attempt to read that file from the current working  
 105214 directory; the file need not be executable.
- If the file is not in the current working directory, the implementation may  
 105215 perform a search for an executable file using the value of *PATH*, as described  
 105216 in Section 2.9.1.1 (on page 2317).

105217  
 105218  
 105219 Special parameter 0 (see Section 2.5.2, on page 2302) shall be set to the value of  
 105220 *command\_file*. If *sh* is called using a synopsis form that omits *command\_file*, special  
 105221 parameter 0 shall be set to the value of the first argument passed to *sh* from its  
 105222 parent (for example, *argv*[0] for a C program), which is normally a pathname used  
 105223 to execute the *sh* utility.

105224 *command\_name*  
 105225 A string assigned to special parameter 0 when executing the commands in  
 105226 *command\_string*. If *command\_name* is not specified, special parameter 0 shall be set  
 105227 to the value of the first argument passed to *sh* from its parent (for example, *argv*[0]  
 105228 for a C program), which is normally a pathname used to execute the *sh* utility.

105229 *command\_string*  
 105230 A string that shall be interpreted by the shell as one or more commands, as if the  
 105231 string were the argument to the *system()* function defined in the System Interfaces  
 105232 volume of POSIX.1-2008. If the *command\_string* operand is an empty string, *sh* shall  
 105233 exit with a zero exit status.

105234 **STDIN**

105235 The standard input shall be used only if one of the following is true:

- The *-s* option is specified.
- The *-c* option is not specified and no operands are specified.
- The script executes one or more commands that require input from standard input (such as  
 105238 a *read* command that does not redirect its input).

105239  
 105240 See the INPUT FILES section.

105241 When the shell is using standard input and it invokes a command that also uses standard input,  
 105242 the shell shall ensure that the standard input file pointer points directly after the command it has  
 105243 read when the command begins execution. It shall not read ahead in such a manner that any  
 105244 characters intended to be read by the invoked command are consumed by the shell (whether  
 105245 interpreted by the shell or not) or that characters that are not read by the invoked command are  
 105246 not seen by the shell. When the command expecting to read standard input is started  
 105247 asynchronously by an interactive shell, it is unspecified whether characters are read by the  
 105248 command or interpreted by the shell.

105249 If the standard input to *sh* is a FIFO or terminal device and is set to non-blocking reads, then *sh*  
 105250 shall enable blocking reads on standard input. This shall remain in effect when the command  
 105251 completes.

105252 **INPUT FILES**

105253 The input file shall be a text file, except that line lengths shall be unlimited. If the input file is  
 105254 empty or consists solely of blank lines or comments, or both, *sh* shall exit with a zero exit status.

105255 **ENVIRONMENT VARIABLES**

105256 The following environment variables shall affect the execution of *sh*:

105257 *ENV* This variable, when and only when an interactive shell is invoked, shall be  
 105258 subjected to parameter expansion (see [Section 2.6.2](#), on page 2306) by the shell, and  
 105259 the resulting value shall be used as a pathname of a file containing shell  
 105260 commands to execute in the current environment. The file need not be executable.  
 105261 If the expanded value of *ENV* is not an absolute pathname, the results are  
 105262 unspecified. *ENV* shall be ignored if the real and effective user IDs or real and  
 105263 effective group IDs of the process are different.

105264 UP *FCEDIT* This variable, when expanded by the shell, shall determine the default value for  
 105265 the *-e editor* option's *editor* option-argument. If *FCEDIT* is null or unset, *ed* shall be  
 105266 used as the editor.

105267 UP *HISTFILE* Determine a pathname naming a command history file. If the *HISTFILE* variable is  
 105268 not set, the shell may attempt to access or create a file *.sh\_history* in the directory  
 105269 referred to by the *HOME* environment variable. If the shell cannot obtain both read  
 105270 and write access to, or create, the history file, it shall use an unspecified  
 105271 mechanism that allows the history to operate properly. (References to history  
 105272 "file" in this section shall be understood to mean this unspecified mechanism in  
 105273 such cases.) An implementation may choose to access this variable only when  
 105274 initializing the history file; this initialization shall occur when *fc* or *sh* first attempt  
 105275 to retrieve entries from, or add entries to, the file, as the result of commands issued  
 105276 by the user, the file named by the *ENV* variable, or implementation-defined system  
 105277 start-up files. Implementations may choose to disable the history list mechanism  
 105278 for users with appropriate privileges who do not set *HISTFILE*; the specific  
 105279 circumstances under which this occurs are implementation-defined. If more than  
 105280 one instance of the shell is using the same history file, it is unspecified how  
 105281 updates to the history file from those shells interact. As entries are deleted from the  
 105282 history file, they shall be deleted oldest first. It is unspecified when history file  
 105283 entries are physically removed from the history file.

105284 *HISTSIZ*E Determine a decimal number representing the limit to the number of previous  
 105285 commands that are accessible. If this variable is unset, an unspecified default  
 105286 greater than or equal to 128 shall be used. The maximum number of commands in  
 105287 the history list is unspecified, but shall be at least 128. An implementation may  
 105288 choose to access this variable only when initializing the history file, as described  
 105289 under *HISTFILE*. Therefore, it is unspecified whether changes made to *HISTSIZ*E  
 105290 after the history file has been initialized are effective.

105291 UP *HOME* Determine the pathname of the user's home directory. The contents of *HOME* are  
 105292 used in tilde expansion as described in [Section 2.6.1](#) (on page 2305).

105293 *IFS* A string treated as a list of characters that is used for field splitting and to split  
 105294 lines into fields with the *read* command.

105295 If *IFS* is not set, it shall behave as normal for an unset variable, except that field  
 105296 splitting by the shell and line splitting by the *read* command shall be performed as  
 105297 if the value of *IFS* is <space><tab><newline>; see [Section 2.6.5](#) (on page 2311).

105298 Implementations may ignore the value of *IFS* in the environment, or the absence of

|        |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 105299 |                     | <i>IFS</i> from the environment, at the time the shell is invoked, in which case the shell shall set <i>IFS</i> to <space><tab><newline> when it is invoked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 105300 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 105301 | <i>LANG</i>         | Provide a default value for the internationalization variables that are unset or null. (See XBD <a href="#">Section 8.2</a> (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 105302 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 105303 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 105304 | <i>LC_ALL</i>       | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 105316 | UP <i>MAIL</i>      | Determine a pathname of the user's mailbox file for purposes of incoming mail notification. If this variable is set, the shell shall inform the user if the file named by the variable is created or if its modification time has changed. Informing the user shall be accomplished by writing a string of unspecified format to standard error prior to the writing of the next primary prompt string. Such check shall be performed only after the completion of the interval defined by the <i>MAILCHECK</i> variable after the last such check. The user shall be informed only if <i>MAIL</i> is set and <i>MAILPATH</i> is not set.                                                               |
| 105317 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 105325 |                     | Establish a decimal integer value that specifies how often (in seconds) the shell shall check for the arrival of mail in the files specified by the <i>MAILPATH</i> or <i>MAIL</i> variables. The default value shall be 600 seconds. If set to zero, the shell shall check before issuing each primary prompt.                                                                                                                                                                                                                                                                                                                                                                                         |
| 105326 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 105329 | UP <i>MAILPATH</i>  | Provide a list of pathnames and optional messages separated by <colon> characters. If this variable is set, the shell shall inform the user if any of the files named by the variable are created or if any of their modification times change. (See the preceding entry for <i>MAIL</i> for descriptions of mail arrival and user informing.) Each pathname can be followed by ' <i>%</i> ' and a string that shall be subjected to parameter expansion and written to standard error when the modification time changes. If a ' <i>%</i> ' character in the pathname is preceded by a <backslash>, it shall be treated as a literal ' <i>%</i> ' in the pathname. The default message is unspecified. |

| 105335 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 105336 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 105337 |                     | The <i>MAILPATH</i> environment variable takes precedence over the <i>MAIL</i> variable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 105338 | XSI <i>NLSPATH</i>  | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 105339 | <i>PATH</i>         | Establish a string formatted as described in XBD <a href="#">Chapter 8</a> (on page 173), used to effect command interpretation; see <a href="#">Section 2.9.1.1</a> (on page 2317).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 105340 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 105341 | <i>PWD</i>          | This variable shall represent an absolute pathname of the current working directory. Assignments to this variable may be ignored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 105342 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

105343 **ASYNCHRONOUS EVENTS**

105344 Default.

105345 **STDOUT**105346 See the `STDERR` section.105347 **STDERR**

105348 Except as otherwise stated (by the descriptions of any invoked utilities or in interactive mode),  
 105349 standard error shall be used only for diagnostic messages.

105350 **OUTPUT FILES**

105351 None.

105352 **EXTENDED DESCRIPTION**

105353 UP See [Chapter 2](#). The functionality described in the rest of the EXTENDED DESCRIPTION section  
 105354 shall be provided on implementations that support the User Portability Utilities option (and the  
 105355 rest of this section is not further shaded for this option).

105356 **Command History List**

105357 When the *sh* utility is being used interactively, it shall maintain a list of commands previously  
 105358 entered from the terminal in the file named by the *HISTFILE* environment variable. The type,  
 105359 size, and internal format of this file are unspecified. Multiple *sh* processes can share access to the  
 105360 file for a user, if file access permissions allow this; see the description of the *HISTFILE*  
 105361 environment variable.

105362 **Command Line Editing**

105363 When *sh* is being used interactively from a terminal, the current command and the command  
 105364 history (see *fc*) can be edited using *vi*-mode command line editing. This mode uses commands,  
 105365 described below, similar to a subset of those described in the *vi* utility. Implementations may  
 105366 offer other command line editing modes corresponding to other editing utilities.

105367 The command *set -o vi* shall enable *vi*-mode editing and place *sh* into *vi* insert mode (see  
 105368 [Command Line Editing \(vi-mode\)](#)). This command also shall disable any other editing mode  
 105369 that the implementation may provide. The command *set +o vi* disables *vi*-mode editing.

105370 Certain block-mode terminals may be unable to support shell command line editing. If a  
 105371 terminal is unable to provide either edit mode, it need not be possible to *set -o vi* when using the  
 105372 shell on this terminal.

105373 In the following sections, the characters *erase*, *interrupt*, *kill*, and *end-of-file* are those set by the  
 105374 *stty* utility.

105375 **Command Line Editing (vi-mode)**

105376 In *vi* editing mode, there shall be a distinguished line, the edit line. All the editing operations  
 105377 which modify a line affect the edit line. The edit line is always the newest line in the command  
 105378 history buffer.

105379 With *vi*-mode enabled, *sh* can be switched between insert mode and command mode.

105380 When in insert mode, an entered character shall be inserted into the command line, except as  
 105381 noted in [vi Line Editing Insert Mode](#) (on page 3168). Upon entering *sh* and after termination of  
 105382 the previous command, *sh* shall be in insert mode.

105383 Typing an escape character shall switch *sh* into command mode (see [vi Line Editing Command](#)  
 105384 [Mode](#), on page 3168). In command mode, an entered character shall either invoke a defined

105385 operation, be used as part of a multi-character operation, or be treated as an error. A character  
 105386 that is not recognized as part of an editing command shall terminate any specific editing  
 105387 command and shall alert the terminal. Typing the *interrupt* character in command mode shall  
 105388 cause *sh* to terminate command line editing on the current command line, reissue the prompt on  
 105389 the next line of the terminal, and reset the command history (see *fc*) so that the most recently  
 105390 executed command is the previous command (that is, the command that was being edited when  
 105391 it was interrupted is not reentered into the history).

105392 In the following sections, the phrase “move the cursor to the beginning of the word” shall mean  
 105393 “move the cursor to the first character of the current word” and the phrase “move the cursor to  
 105394 the end of the word” shall mean “move the cursor to the last character of the current word”. The  
 105395 phrase “beginning of the command line” indicates the point between the end of the prompt  
 105396 string issued by the shell (or the beginning of the terminal line, if there is no prompt string) and  
 105397 the first character of the command text.

### 105398 **vi Line Editing Insert Mode**

105399 While in insert mode, any character typed shall be inserted in the current command line, unless  
 105400 it is from the following set.

105401 <newline> Execute the current command line. If the current command line is not empty, this  
 105402 line shall be entered into the command history (see *fc*).

105403 *erase* Delete the character previous to the current cursor position and move the current  
 105404 cursor position back one character. In insert mode, characters shall be erased from  
 105405 both the screen and the buffer when backspacing.

105406 *interrupt* Terminate command line editing with the same effects as described for  
 105407 interrupting command mode; see [Command Line Editing \(vi-mode\)](#) (on page  
 105408 3167).

105409 *kill* Clear all the characters from the input line.

105410 <control>-V Insert the next character input, even if the character is otherwise a special insert  
 105411 mode character.

105412 <control>-W Delete the characters from the one preceding the cursor to the preceding word  
 105413 boundary. The word boundary in this case is the closer to the cursor of either the  
 105414 beginning of the line or a character that is in neither the **blank** nor **punct** character  
 105415 classification of the current locale.

105416 *end-of-file* Interpreted as the end of input in *sh*. This interpretation shall occur only at the  
 105417 beginning of an input line. If *end-of-file* is entered other than at the beginning of the  
 105418 line, the results are unspecified.

105419 <ESC> Place *sh* into command mode.

### 105420 **vi Line Editing Command Mode**

105421 In command mode for the command line editing feature, decimal digits not beginning with 0  
 105422 that precede a command letter shall be remembered. Some commands use these decimal digits  
 105423 as a count number that affects the operation.

105424 The term *motion command* represents one of the commands:

105425 <space> 0 b F l W ^ \$ ; E f T w | , B e h t

105426 If the current line is not the edit line, any command that modifies the current line shall cause the  
 105427 content of the current line to replace the content of the edit line, and the current line shall

105428 become the edit line. This replacement cannot be undone (see the **u** and **U** commands below).  
 105429 The modification requested shall then be performed to the edit line. When the current line is the  
 105430 edit line, the modification shall be done directly to the edit line.

105431 Any command that is preceded by *count* shall take a count (the numeric value of any preceding  
 105432 decimal digits). Unless otherwise noted, this count shall cause the specified operation to repeat  
 105433 by the number of times specified by the count. Also unless otherwise noted, a *count* that is out  
 105434 of range is considered an error condition and shall alert the terminal, but neither the cursor  
 105435 position, nor the command line, shall change.

105436 The terms *word* and *bigword* are used as defined in the *vi* description. The term *save buffer*  
 105437 corresponds to the term *unnamed buffer* in *vi*.

105438 The following commands shall be recognized in command mode:

105439 <newline> Execute the current command line. If the current command line is not empty, this  
 105440 line shall be entered into the command history (see *fc*).

105441 <control>-L Redraw the current command line. Position the cursor at the same location on the  
 105442 redrawn line.

105443 # Insert the character '#' at the beginning of the current command line and treat the  
 105444 resulting edit line as a comment. This line shall be entered into the command  
 105445 history; see *fc*.

105446 = Display the possible shell word expansions (see [Section 2.6](#), on page 2305) of the  
 105447 bigword at the current command line position.

105448 **Note:** This does not modify the content of the current line, and therefore does not cause  
 105449 the current line to become the edit line.

105450 These expansions shall be displayed on subsequent terminal lines. If the bigword  
 105451 contains none of the characters '?', '\*', or '[', an <asterisk> ('\*') shall be  
 105452 implicitly assumed at the end. If any directories are matched, these expansions  
 105453 shall have a '/' character appended. After the expansion, the line shall be  
 105454 redrawn, the cursor repositioned at the current cursor position, and *sh* shall be  
 105455 placed in command mode.

105456 \ Perform pathname expansion (see [Section 2.6.6](#), on page 2311) on the current  
 105457 bigword, up to the largest set of characters that can be matched uniquely. If the  
 105458 bigword contains none of the characters '?', '\*', or '[', an <asterisk> ('\*')  
 105459 shall be implicitly assumed at the end. This maximal expansion then shall replace  
 105460 the original bigword in the command line, and the cursor shall be placed after this  
 105461 expansion. If the resulting bigword completely and uniquely matches a directory, a  
 105462 '/' character shall be inserted directly after the bigword. If some other file is  
 105463 completely matched, a single <space> shall be inserted after the bigword. After  
 105464 this operation, *sh* shall be placed in insert mode.

105465 \* Perform pathname expansion on the current bigword and insert all expansions  
 105466 into the command to replace the current bigword, with each expansion separated  
 105467 by a single <space>. If at the end of the line, the current cursor position shall be  
 105468 moved to the first column position following the expansions and *sh* shall be placed  
 105469 in insert mode. Otherwise, the current cursor position shall be the last column  
 105470 position of the first character after the expansions and *sh* shall be placed in insert  
 105471 mode. If the current bigword contains none of the characters '?', '\*', or '[',  
 105472 before the operation, an <asterisk> ('\*') shall be implicitly assumed at the end.

| 105476 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 105477 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 105478 | <b>[count]~</b>             | Convert, if the current character is a lowercase letter, to the equivalent uppercase letter and <i>vice versa</i> , as prescribed by the current locale. The current cursor position then shall be advanced by one character. If the cursor was positioned on the last character of the line, the case conversion shall occur, but the cursor shall not advance. If the '~' command is preceded by a <i>count</i> , that number of characters shall be converted, and the cursor shall be advanced to the character position after the last character converted. If the <i>count</i> is larger than the number of characters after the cursor, this shall not be considered an error; the cursor shall advance to the last character on the line. |
| 105479 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 105486 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 105487 | <b>[count].</b>             | Repeat the most recent non-motion command, even if it was executed on an earlier command line. If the previous command was preceded by a <i>count</i> , and no count is given on the '.' command, the count from the previous command shall be included as part of the repeated command. If the '.' command is preceded by a <i>count</i> , this shall override any <i>count</i> argument to the previous command. The <i>count</i> specified in the '.' command shall become the count for subsequent '.' commands issued without a count.                                                                                                                                                                                                       |

| 105494 | <b>[number]v</b>            | Invoke the <i>vi</i> editor to edit the current command line in a temporary file. When the editor exits, the commands in the temporary file shall be executed and placed in the command history. If a <i>number</i> is included, it specifies the command number in the command history to be edited, rather than the current command line.                                                                                                                                                                                                                                                                                                                                                                                                       |

| 105592 |                       | If the motion command is the character 'c', the current command line shall be cleared and insert mode shall be entered. If the motion command would move the current cursor position toward the beginning of the command line, the character under the current cursor position shall not be deleted. If the motion command would move the current cursor position toward the end of the command line, the character under the current cursor position shall be deleted. If the <i>count</i> is larger than the number of characters between the current cursor position and the end of the command line toward which the motion command would move the cursor, this shall not be considered an error; all of the remaining characters in the aforementioned range shall be deleted and insert mode shall be entered. If the motion command is invalid, the terminal shall be alerted, the cursor shall not be moved, and no text shall be deleted. |

| 105616 | <b>[count]x</b>               | Delete the character at the current cursor position and place the deleted characters in the save buffer. If the cursor was positioned on the last character of the line, the character shall be deleted and the cursor position shall be moved to the previous character (the new last character). If the <i>count</i> is larger than the number of characters after the cursor, this shall not be considered an error; all the characters from the cursor to the end of the line shall be deleted.                                                                                                                                                                                                                                                                                                                                                               |

| 105632 |                               | Delete the characters between the current cursor position and the character position that would result from the motion command. A number <i>count</i> repeats the motion command <i>count</i> times. If the motion command would move toward the beginning of the command line, the character under the current cursor position shall not be deleted. If the motion command is <b>d</b> , the entire current command line shall be cleared. If the <i>count</i> is larger than the number of characters between the current cursor position and the end of the command line toward which the motion command would move the cursor, this shall not be considered an error; all of the remaining characters in the aforementioned range shall be deleted. The deleted characters shall be placed in the save buffer.                                                |

| 105645 |                               | Yank (that is, copy) the characters from the current cursor position to the position resulting from the motion command into the save buffer. A number <i>count</i> shall be applied to the motion command. If the motion command would move toward the beginning of the command line, the character under the current cursor position shall not be included in the set of yanked characters. If the motion command is <b>y</b> , the entire current command line shall be yanked into the save buffer. The current cursor position shall be unchanged. If the <i>count</i> is larger than the number of characters between the current cursor position and the end of the command line toward which the motion command would move the cursor, this shall not be considered an error; all of the remaining characters in the aforementioned range shall be yanked. |

| 105688 |                                | Move backwards through the command history, searching for the specified pattern, beginning with the previous command line. Patterns use the pattern matching notation described in <a href="#">Section 2.13</a> (on page 2332), except that the '^' character shall have special meaning when it appears as the first character of <i>pattern</i> . In this case, the '^' is discarded and the characters after the '^' shall be matched only at the beginning of a line. Commands in the command history shall be treated as strings, not as filenames. If the pattern is not found, the current command line shall be unchanged and the terminal is alerted. If it is found in a previous line, the current command line shall be set to that line and the cursor shall be set to the first character of the new command line. |

| 105700 |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 105701 | <b>?pattern&lt;newline&gt;</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 105702 |                                | Move forwards through the command history, searching for the specified pattern, beginning with the next command line. Patterns use the pattern matching notation described in <a href="#">Section 2.13</a> (on page 2332), except that the '^' character shall have                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 105703 |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 105704 |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

105705 special meaning when it appears as the first character of *pattern*. In this case, the  
 105706 '*^*' is discarded and the characters after the '*^*' shall be matched only at the  
 105707 beginning of a line. Commands in the command history shall be treated as strings,  
 105708 not as filenames. If the pattern is not found, the current command line shall be  
 105709 unchanged and the terminal alerted. If it is found in a following line, the current  
 105710 command line shall be set to that line and the cursor shall be set to the first  
 105711 character of the new command line.

105712 If *pattern* is empty, the last non-empty pattern provided to */* or *?* shall be used. If  
 105713 there is no previous non-empty pattern, the terminal shall be alerted and the  
 105714 current command line shall remain unchanged.

105715 **n** Repeat the most recent */* or *?* command. If there is no previous */* or *?*, the terminal  
 105716 shall be alerted and the current command line shall remain unchanged.

105717 **N** Repeat the most recent */* or *?* command, reversing the direction of the search. If  
 105718 there is no previous */* or *?*, the terminal shall be alerted and the current command  
 105719 line shall remain unchanged.

#### 105720 EXIT STATUS

105721 The following exit values shall be returned:

105722 0 The script to be executed consisted solely of zero or more blank lines or comments, or  
 105723 both.

105724 1-125 A non-interactive shell detected a syntax, redirection, or variable assignment error.

105725 127 A specified *command\_file* could not be found by a non-interactive shell.

105726 Otherwise, the shell shall return the exit status of the last command it invoked or attempted to  
 105727 invoke (see also the *exit* utility in [Section 2.14](#), on page 2334).

#### 105728 CONSEQUENCES OF ERRORS

105729 See [Section 2.8.1](#) (on page 2315).

#### 105730 APPLICATION USAGE

105731 Standard input and standard error are the files that determine whether a shell is interactive  
 105732 when *-i* is not specified. For example:

105733 `sh > file`

105734 and:

105735 `sh 2> file`

105736 create interactive and non-interactive shells, respectively. Although both accept terminal input,  
 105737 the results of error conditions are different, as described in [Section 2.8.1](#) (on page 2315); in the  
 105738 second example a redirection error encountered by a special built-in utility aborts the shell.

105739 A conforming application must protect its first operand, if it starts with a *<plus-sign>*, by  
 105740 preceding it with the *"--"* argument that denotes the end of the options.

105741 Applications should note that the standard *PATH* to the shell cannot be assumed to be either  
 105742 */bin/sh* or */usr/bin/sh*, and should be determined by interrogation of the *PATH* returned by  
 105743 *getconf PATH*, ensuring that the returned pathname is an absolute pathname and not a shell  
 105744 built-in.

105745 For example, to determine the location of the standard *sh* utility:

105746 `command -v sh`

105747 On some implementations this might return:

```
105748 /usr/xpg4/bin/sh
```

105749 Furthermore, on systems that support executable scripts (the "#!" construct), it is  
 105750 recommended that applications using executable scripts install them using *getconf PATH* to  
 105751 determine the shell pathname and update the "#!" script appropriately as it is being installed  
 105752 (for example, with *sed*). For example:

```
105753 #
105754 # Installation time script to install correct POSIX shell pathname
105755 #
105756 # Get list of paths to check
105757 #
105758 Sifs=$IFS
105759 Sifs_set=${IFS+y}
105760 IFS=:
105761 set -- $(getconf PATH)
105762 if [ "$Sifs_set" = y ]
105763 then
105764     IFS=$Sifs
105765 else
105766     unset IFS
105767 fi
105768 #
105769 # Check each path for 'sh'
105770 #
105771 for i
105772 do
105773     if [ -x "${i}/sh ]
105774     then
105775         Pshell=${i}/sh
105776     fi
105777 done
105778 #
105779 # This is the list of scripts to update. They should be of the
105780 # form '${name}.source' and will be transformed to '${name}'.
105781 # Each script should begin:
105782 #
105783 # #!INSTALLSHELLPATH
105784 #
105785 scripts="a b c"
105786 #
105787 # Transform each script
105788 #
105789 for i in ${scripts}
105790 do
105791     sed -e "s|INSTALLSHELLPATH|${Pshell}|" < ${i}.source > ${i}
105792 done
```

105793 **EXAMPLES**

105794 1. Execute a shell command from a string:

```
105795 sh -c "cat myfile"
```

105796 2. Execute a shell script from a file in the current directory:

```
105797 sh my_shell_cmds
```

105798 **RATIONALE**

105799 The *sh* utility and the *set* special built-in utility share a common set of options.

105800 The name *IFS* was originally an abbreviation of “Input Field Separators”; however, this name is  
 105801 misleading as the *IFS* characters are actually used as field terminators. The KornShell ignores the  
 105802 contents of *IFS* upon entry to the script. A conforming application cannot rely on importing *IFS*.  
 105803 One justification for this, beyond security considerations, is to assist possible future shell  
 105804 compilers. Allowing *IFS* to be imported from the environment prevents many optimizations that  
 105805 might otherwise be performed via dataflow analysis of the script itself.

105806 The text in the STDIN section about non-blocking reads concerns an instance of *sh* that has been  
 105807 invoked, probably by a C-language program, with standard input that has been opened using  
 105808 the `O_NONBLOCK` flag; see `open()` in the System Interfaces volume of POSIX.1-2008. If the shell  
 105809 did not reset this flag, it would immediately terminate because no input data would be available  
 105810 yet and that would be considered the same as end-of-file.

105811 The options associated with a *restricted shell* (command name *rsh* and the `-r` option) were  
 105812 excluded because the standard developers considered that the implied level of security could  
 105813 not be achieved and they did not want to raise false expectations.

105814 On systems that support set-user-ID scripts, a historical trapdoor has been to link a script to the  
 105815 name `-i`. When it is called by a sequence such as:

```
105816 sh -
```

105817 or by:

```
105818 #! usr/bin/sh -
```

105819 the historical systems have assumed that no option letters follow. Thus, this volume of  
 105820 POSIX.1-2008 allows the single `<hyphen>` to mark the end of the options, in addition to the use  
 105821 of the regular `--` argument, because it was considered that the older practice was so  
 105822 pervasive. An alternative approach is taken by the KornShell, where real and effective  
 105823 user/group IDs must match for an interactive shell; this behavior is specifically allowed by this  
 105824 volume of POSIX.1-2008.

105825 **Note:** There are other problems with set-user-ID scripts that the two approaches described here do not  
 105826 resolve.

105827 The initialization process for the history file can be dependent on the system start-up files, in  
 105828 that they may contain commands that effectively preempt the user’s settings of *HISTFILE* and  
 105829 *HISTSZ*. For example, function definition commands are recorded in the history file, unless  
 105830 the `set -o nolog` option is set. If the system administrator includes function definitions in some  
 105831 system start-up file called before the *ENV* file, the history file is initialized before the user gets a  
 105832 chance to influence its characteristics. In some historical shells, the history file is initialized just  
 105833 after the *ENV* file has been processed. Therefore, it is implementation-defined whether changes  
 105834 made to *HISTFILE* after the history file has been initialized are effective.

105835 The default messages for the various *MAIL*-related messages are unspecified because they vary  
 105836 across implementations. Typical messages are:

105837 "you have mail\n"

105838 or:

105839 "you have new mail\n"

105840 It is important that the descriptions of command line editing refer to the same shell as that in  
105841 POSIX.1-2008 so that interactive users can also be application programmers without having to  
105842 deal with programmatic differences in their two environments. It is also essential that the utility  
105843 name *sh* be specified because this explicit utility name is too firmly rooted in historical practice  
105844 of application programs for it to change.

105845 Consideration was given to mandating a diagnostic message when attempting to set *vi*-mode on  
105846 terminals that do not support command line editing. However, it is not historical practice for the  
105847 shell to be cognizant of all terminal types and thus be able to detect inappropriate terminals in  
105848 all cases. Implementations are encouraged to supply diagnostics in this case whenever possible,  
105849 rather than leaving the user in a state where editing commands work incorrectly.

105850 In early proposals, the KornShell-derived *emacs* mode of command line editing was included,  
105851 even though the *emacs* editor itself was not. The community of *emacs* proponents was adamant  
105852 that the full *emacs* editor not be standardized because they were concerned that an attempt to  
105853 standardize this very powerful environment would encourage vendors to ship strictly  
105854 conforming versions lacking the extensibility required by the community. The author of the  
105855 original *emacs* program also expressed his desire to omit the program. Furthermore, there were a  
105856 number of historical systems that did not include *emacs*, or included it without supporting it, but  
105857 there were very few that did not include and support *vi*. The shell *emacs* command line editing  
105858 mode was finally omitted because it became apparent that the KornShell version and the editor  
105859 being distributed with the GNU system had diverged in some respects. The author of *emacs*  
105860 requested that the POSIX *emacs* mode either be deleted or have a significant number of  
105861 unspecified conditions. Although the KornShell author agreed to consider changes to bring the  
105862 shell into alignment, the standard developers decided to defer specification at that time. At the  
105863 time, it was assumed that convergence on an acceptable definition would occur for a subsequent  
105864 draft, but that has not happened, and there appears to be no impetus to do so. In any case,  
105865 implementations are free to offer additional command line editing modes based on the exact  
105866 models of editors their users are most comfortable with.

105867 Early proposals had the following list entry in [vi Line Editing Insert Mode](#) (on page 3168):

105868 \ If followed by the *erase* or *kill* character, that character shall be inserted into the input line.  
105869 Otherwise, the <backslash> itself shall be inserted into the input line.

105870 However, this is not actually a feature of *sh* command line editing insert mode, but one of some  
105871 historical terminal line drivers. Some conforming implementations continue to do this when the  
105872 *stty ixten* flag is set.

#### 105873 FUTURE DIRECTIONS

105874 None.

#### 105875 SEE ALSO

105876 [Chapter 2](#) (on page 2297), *cd*, *echo*, *exit*, *fc*, *pwd*, *invalid*, *set*, *stty*, *test*, *umask*, *vi*

**105879 CHANGE HISTORY**

105880 First released in Issue 2.

**105881 Issue 5**

105882 The FUTURE DIRECTIONS section is added.

105883 Text is added to the DESCRIPTION for the Large File Summit proposal.

**105884 Issue 6**

105885 The Open Group Corrigendum U029/2 is applied, correcting the second SYNOPSIS.

105886 The Open Group Corrigendum U027/3 is applied, correcting a typographical error.

105887 The following new requirements on POSIX implementations derive from alignment with the  
105888 Single UNIX Specification:

105889 • The option letters derived from the *set* special built-in are also accepted with a leading  
105890 <plus-sign> ('+').

105891 • Large file extensions are added:

105892 — Pathname expansion does not fail due to the size of a file.

105893 — Shell input and output redirections have an implementation-defined offset maximum  
105894 that is established in the open file description.

105895 In the ENVIRONMENT VARIABLES section, the text “user’s home directory” is updated to  
105896 “directory referred to by the *HOME* environment variable”.

105897 Descriptions for the *ENV* and *PWD* environment variables are included to align with the  
105898 IEEE P1003.2b draft standard.

105899 The normative text is reworded to avoid use of the term “must” for application requirements.

**105900 Issue 7**

105901 Austin Group Interpretation 1003.1-2001 #098 is applied, changing the definition of *IFS*.

105902 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

105903 Changes to the *pwd* utility and *PWD* environment variable have been made to match the  
105904 changes to the *getcwd()* function made for Austin Group Interpretation 1003.1-2001 #140.

105905 Minor editorial changes are made to the User Portability Utilities option shading. No normative  
105906 changes are implied.

105907 Minor changes are made to the install script example in the APPLICATION USAGE section.

105908 **NAME**

105909 sleep — suspend execution for an interval

105910 **SYNOPSIS**

105911 sleep *time*

105912 **DESCRIPTION**

105913 The *sleep* utility shall suspend execution for at least the integral number of seconds specified by  
105914 the *time* operand.

105915 **OPTIONS**

105916 None.

105917 **OPERANDS**

105918 The following operand shall be supported:

105919 *time* A non-negative decimal integer specifying the number of seconds for which to  
105920 suspend execution.

105921 **STDIN**

105922 Not used.

105923 **INPUT FILES**

105924 None.

105925 **ENVIRONMENT VARIABLES**

105926 The following environment variables shall affect the execution of *sleep*:

105927 *LANG* Provide a default value for the internationalization variables that are unset or null.  
105928 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
105929 variables used to determine the values of locale categories.)

105930 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
105931 internationalization variables.

105932 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
105933 characters (for example, single-byte as opposed to multi-byte characters in  
105934 arguments).

105935 *LC\_MESSAGES*

105936 Determine the locale that should be used to affect the format and contents of  
105937 diagnostic messages written to standard error.

105938 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

105939 **ASYNCHRONOUS EVENTS**

105940 If the *sleep* utility receives a SIGALRM signal, one of the following actions shall be taken:

- 105941 1. Terminate normally with a zero exit status.
- 105942 2. Effectively ignore the signal.
- 105943 3. Provide the default behavior for signals described in the ASYNCHRONOUS EVENTS  
105944 section of [Section 1.4](#) (on page 2288). This could include terminating with a non-zero exit  
105945 status.

105946 The *sleep* utility shall take the standard action for all other signals.

105947 **STDOUT**

105948 Not used.

105949 **STDERR**

105950 The standard error shall be used only for diagnostic messages.

105951 **OUTPUT FILES**

105952 None.

105953 **EXTENDED DESCRIPTION**

105954 None.

105955 **EXIT STATUS**

105956 The following exit values shall be returned:

105957 0 The execution was successfully suspended for at least *time* seconds, or a SIGALRM signal  
105958 was received. See the ASYNCHRONOUS EVENTS section.

105959 &gt;0 An error occurred.

105960 **CONSEQUENCES OF ERRORS**

105961 Default.

105962 **APPLICATION USAGE**

105963 None.

105964 **EXAMPLES**105965 The *sleep* utility can be used to execute a command after a certain amount of time, as in:105966 `(sleep 105; command) &`

105967 or to execute a command every so often, as in:

105968 `while true`  
105969 `do`  
105970  `command`  
105971  `sleep 37`  
105972 `done`105973 **RATIONALE**105974 The exit status is allowed to be zero when *sleep* is interrupted by the SIGALRM signal because  
105975 most implementations of this utility rely on the arrival of that signal to notify them that the  
105976 requested finishing time has been successfully attained. Such implementations thus do not  
105977 distinguish this situation from the successful completion case. Other implementations are  
105978 allowed to catch the signal and go back to sleep until the requested time expires or to provide  
105979 the normal signal termination procedures.105980 As with all other utilities that take integral operands and do not specify subranges of allowed  
105981 values, *sleep* is required by this volume of POSIX.1-2008 to deal with *time* requests of up to  
105982 2 147 483 647 seconds. This may mean that some implementations have to make multiple calls to  
105983 the delay mechanism of the underlying operating system if its argument range is less than this.105984 **FUTURE DIRECTIONS**

105985 None.

105986 **SEE ALSO**105987 *wait*

105988 XBD Chapter 8 (on page 173)

105989 XSH *alarm()*, *sleep()*

105990 **CHANGE HISTORY**

105991 First released in Issue 2.

105992 **NAME**105993 `sort` — sort, merge, or sequence check text files105994 **SYNOPSIS**105995 `sort [-m] [-o output] [-bdfinru] [-t char] [-k keydef]... [file...]`105996 `sort [-c|-C] [-bdfinru] [-t char] [-k keydef] [file]`105997 **DESCRIPTION**105998 The `sort` utility shall perform one of the following functions:

- 105999 1. Sort lines of all the named files together and write the result to the specified output.
- 106000 2. Merge lines of all the named (presorted) files together and write the result to the specified  
106001 output.
- 106002 3. Check that a single input file is correctly presorted.

106003 Comparisons shall be based on one or more sort keys extracted from each line of input (or, if no  
106004 sort keys are specified, the entire line up to, but not including, the terminating <newline>), and  
106005 shall be performed using the collating sequence of the current locale.

106006 **OPTIONS**

106007 The `sort` utility shall conform to XBD [Section 12.2](#) (on page 215), except for Guideline 9, and the  
106008 `-k keydef` option should follow the `-b`, `-d`, `-f`, `-i`, `-n`, and `-r` options. In addition, '+' may be  
106009 recognized as an option delimiter as well as '-'.

106010 The following options shall be supported:

- 106011 `-c` Check that the single input file is ordered as specified by the arguments and the  
106012 collating sequence of the current locale. Output shall not be sent to standard  
106013 output. The exit code shall indicate whether or not disorder was detected or an  
106014 error occurred. If disorder (or, with `-u`, a duplicate key) is detected, a warning  
106015 message shall be sent to standard error indicating where the disorder or duplicate  
106016 key was found.
- 106017 `-C` Same as `-c`, except that a warning message shall not be sent to standard error if  
106018 disorder or, with `-u`, a duplicate key is detected.
- 106019 `-m` Merge only; the input file shall be assumed to be already sorted.
- 106020 `-o output` Specify the name of an output file to be used instead of the standard output. This  
106021 file can be the same as one of the input *files*.
- 106022 `-u` Unique: suppress all but one in each set of lines having equal keys. If used with  
106023 the `-c` option, check that there are no lines with duplicate keys, in addition to  
106024 checking that the input file is sorted.

106025 The following options shall override the default ordering rules. When ordering options appear  
106026 independent of any key field specifications, the requested field ordering rules shall be applied  
106027 globally to all sort keys. When attached to a specific key (see `-k`), the specified ordering options  
106028 shall override all global ordering options for that key.

- 106029 `-d` Specify that only <blank> characters and alphanumeric characters, according to  
106030 the current setting of `LC_CTYPE`, shall be significant in comparisons. The behavior  
106031 is undefined for a sort key to which `-i` or `-n` also applies.
- 106032 `-f` Consider all lowercase characters that have uppercase equivalents, according to  
106033 the current setting of `LC_CTYPE`, to be the uppercase equivalent for the purposes  
106034 of comparison.

- 106035        **-i**           Ignore all characters that are non-printable, according to the current setting of  
106036            *LC\_CTYPE*. The behavior is undefined for a sort key for which **-n** also applies.
- 106037        **-n**           Restrict the sort key to an initial numeric string, consisting of optional <blank>  
106038            characters, optional minus-sign, and zero or more digits with an optional radix  
106039            character and thousands separators (as defined in the current locale), which shall  
106040            be sorted by arithmetic value. An empty digit string shall be treated as zero.  
106041            Leading zeros and signs on zeros shall not affect ordering.
- 106042        **-r**           Reverse the sense of comparisons.
- 106043        The treatment of field separators can be altered using the options:
- 106044        **-b**           Ignore leading <blank> characters when determining the starting and ending  
106045            positions of a restricted sort key. If the **-b** option is specified before the first **-k**  
106046            option, it shall be applied to all **-k** options. Otherwise, the **-b** option can be  
106047            attached independently to each **-k** *field\_start* or *field\_end* option-argument (see  
106048            below).
- 106049        **-t char**       Use *char* as the field separator character; *char* shall not be considered to be part of a  
106050            field (although it can be included in a sort key). Each occurrence of *char* shall be  
106051            significant (for example, <*char*><*char*> delimits an empty field). If **-t** is not  
106052            specified, <blank> characters shall be used as default field separators; each  
106053            maximal non-empty sequence of <blank> characters that follows a non-<blank>  
106054            shall be a field separator.
- 106055        Sort keys can be specified using the options:
- 106056        **-k keydef**      The *keydef* argument is a restricted sort key field definition. The format of this  
106057            definition is:
- 106058                    *field\_start*[*type*][,*field\_end*[*type*]]
- 106059            where *field\_start* and *field\_end* define a key field restricted to a portion of the line  
106060            (see the EXTENDED DESCRIPTION section), and *type* is a modifier from the list of  
106061            characters 'b', 'd', 'f', 'i', 'n', 'r'. The 'b' modifier shall behave like the  
106062            **-b** option, but shall apply only to the *field\_start* or *field\_end* to which it is attached.  
106063            The other modifiers shall behave like the corresponding options, but shall apply  
106064            only to the key field to which they are attached; they shall have this effect if  
106065            specified with *field\_start*, *field\_end*, or both. If any modifier is attached to a  
106066            *field\_start* or to a *field\_end*, no option shall apply to either. Implementations shall  
106067            support at least nine occurrences of the **-k** option, which shall be significant in  
106068            command line order. If no **-k** option is specified, a default sort key of the entire  
106069            line shall be used.
- 106070            When there are multiple key fields, later keys shall be compared only after all  
106071            earlier keys compare equal. Except when the **-u** option is specified, lines that  
106072            otherwise compare equal shall be ordered as if none of the options **-d**, **-f**, **-i**, **-n**, or  
106073            **-k** were present (but with **-r** still in effect, if it was specified) and with all bytes in  
106074            the lines significant to the comparison. The order in which lines that still compare  
106075            equal are written is unspecified.

## 106076 OPERANDS

106077        The following operand shall be supported:

- 106078        *file*           A pathname of a file to be sorted, merged, or checked. If no *file* operands are  
106079            specified, or if a *file* operand is '-', the standard input shall be used.

106080 **STDIN**

106081 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is *'-'*.  
 106082 See the INPUT FILES section.

106083 **INPUT FILES**

106084 The input files shall be text files, except that the *sort* utility shall add a <newline> to the end of a  
 106085 file ending with an incomplete last line.

106086 **ENVIRONMENT VARIABLES**

106087 The following environment variables shall affect the execution of *sort*:

106088 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 106089 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 106090 variables used to determine the values of locale categories.)

106091 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 106092 internationalization variables.

106093 *LC\_COLLATE*

106094 Determine the locale for ordering rules.

106095 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 106096 characters (for example, single-byte as opposed to multi-byte characters in  
 106097 arguments and input files) and the behavior of character classification for the *-b*,  
 106098 *-d*, *-f*, *-i*, and *-n* options.

106099 *LC\_MESSAGES*

106100 Determine the locale that should be used to affect the format and contents of  
 106101 diagnostic messages written to standard error.

106102 *LC\_NUMERIC*

106103 Determine the locale for the definition of the radix character and thousands  
 106104 separator for the *-n* option.

106105 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

106106 **ASYNCHRONOUS EVENTS**

106107 Default.

106108 **STDOUT**

106109 Unless the *-o* or *-c* options are in effect, the standard output shall contain the sorted input.

106110 **STDERR**

106111 The standard error shall be used for diagnostic messages. When *-c* is specified, if disorder is  
 106112 detected (or if *-u* is also specified and a duplicate key is detected), a message shall be written to  
 106113 the standard error which identifies the input line at which disorder (or a duplicate key) was  
 106114 detected. A warning message about correcting an incomplete last line of an input file may be  
 106115 generated, but need not affect the final exit status.

106116 **OUTPUT FILES**

106117 If the *-o* option is in effect, the sorted input shall be written to the file *output*.

106118 **EXTENDED DESCRIPTION**

106119 The notation:

106120 *-k field\_start[type] [, field\_end[type]]*

106121 shall define a key field that begins at *field\_start* and ends at *field\_end* inclusive, unless *field\_start*  
 106122 falls beyond the end of the line or after *field\_end*, in which case the key field is empty. A missing  
 106123 *field\_end* shall mean the last character of the line.

106124 A field comprises a maximal sequence of non-separating characters and, in the absence of option  
 106125 `-t`, any preceding field separator.

106126 The *field\_start* portion of the *keydef* option-argument shall have the form:

106127 `field_number[.first_character]`

106128 Fields and characters within fields shall be numbered starting with 1. The *field\_number* and  
 106129 *first\_character* pieces, interpreted as positive decimal integers, shall specify the first character to  
 106130 be used as part of a sort key. If *first\_character* is omitted, it shall refer to the first character of the  
 106131 field.

106132 The *field\_end* portion of the *keydef* option-argument shall have the form:

106133 `field_number[.last_character]`

106134 The *field\_number* shall be as described above for *field\_start*. The *last\_character* piece, interpreted  
 106135 as a non-negative decimal integer, shall specify the last character to be used as part of the sort  
 106136 key. If *last\_character* evaluates to zero or *last\_character* is omitted, it shall refer to the last  
 106137 character of the field specified by *field\_number*.

106138 If the `-b` option or `b` type modifier is in effect, characters within a field shall be counted from the  
 106139 first non-`<blank>` in the field. (This shall apply separately to *first\_character* and *last\_character*.)

106140 **EXIT STATUS**

106141 The following exit values shall be returned:

- 106142 0 All input files were output successfully, or `-c` was specified and the input file was correctly  
 106143 sorted.
- 106144 1 Under the `-c` option, the file was not ordered as specified, or if the `-c` and `-u` options were  
 106145 both specified, two input lines were found with equal keys.
- 106146 >1 An error occurred.

106147 **CONSEQUENCES OF ERRORS**

106148 Default.

106149 **APPLICATION USAGE**

106150 The default value for `-t`, `<blank>`, has different properties from, for example, `-t"<space>"`. If a  
 106151 line contains:

106152 `<space><space>foo`

106153 the following treatment would occur with default separation as opposed to specifically selecting  
 106154 a `<space>`:

| Field | Default                                    | <code>-t "&lt;space&gt;"</code> |
|-------|--------------------------------------------|---------------------------------|
| 1     | <code>&lt;space&gt;&lt;space&gt;foo</code> | <i>empty</i>                    |
| 2     | <i>empty</i>                               | <i>empty</i>                    |
| 3     | <i>empty</i>                               | foo                             |

106159 The leading field separator itself is included in a field when `-t` is not used. For example, this  
 106160 command returns an exit status of zero, meaning the input was already sorted:

```
106161 sort -c -k 2 <<eof
106162 y<tab>b
106163 x<space>a
106164 eof
```

106165 (assuming that a `<tab>` precedes the `<space>` in the current collating sequence). The field

106166 separator is not included in a field when it is explicitly set via `-t`. This is historical practice and  
 106167 allows usage such as:

```
106168 sort -t "|" -k 2n <<eof
106169 Atlanta|425022|Georgia
106170 Birmingham|284413|Alabama
106171 Columbia|100385|South Carolina
106172 eof
```

106173 where the second field can be correctly sorted numerically without regard to the non-numeric  
 106174 field separator.

106175 The wording in the OPTIONS section clarifies that the `-b`, `-d`, `-f`, `-i`, `-n`, and `-r` options have to  
 106176 come before the first sort key specified if they are intended to apply to all specified keys. The  
 106177 way it is described in this volume of POSIX.1-2008 matches historical practice, not historical  
 106178 documentation. The results are unspecified if these options are specified after a `-k` option.

106179 The `-f` option might not work as expected in locales where there is not a one-to-one mapping  
 106180 between an uppercase and a lowercase letter.

### 106181 EXAMPLES

106182 1. The following command sorts the contents of **infile** with the second field as the sort key:

```
106183 sort -k 2,2 infile
```

106184 2. The following command sorts, in reverse order, the contents of **infile1** and **infile2**,  
 106185 placing the output in **outfile** and using the second character of the second field as the sort  
 106186 key (assuming that the first character of the second field is the field separator):

```
106187 sort -r -o outfile -k 2.2,2.2 infile1 infile2
```

106188 3. The following command sorts the contents of **infile1** and **infile2** using the second  
 106189 non-`<blank>` of the second field as the sort key:

```
106190 sort -k 2.2b,2.2b infile1 infile2
```

106191 4. The following command prints the System V password file (user database) sorted by the  
 106192 numeric user ID (the third `<colon>`-separated field):

```
106193 sort -t : -k 3,3n /etc/passwd
```

106194 5. The following command prints the lines of the already sorted file **infile**, suppressing all  
 106195 but one occurrence of lines having the same third field:

```
106196 sort -um -k 3.1,3.0 infile
```

### 106197 RATIONALE

106198 Examples in some historical documentation state that options `-um` with one input file keep the  
 106199 first in each set of lines with equal keys. This behavior was deemed to be an implementation  
 106200 artifact and was not standardized.

106201 The `-z` option was omitted; it is not standard practice on most systems and is inconsistent with  
 106202 using `sort` to sort several files individually and then merge them together. The text concerning `-z`  
 106203 in historical documentation appeared to require implementations to determine the proper buffer  
 106204 length during the sort phase of operation, but not during the merge.

106205 The `-y` option was omitted because of non-portability. The `-M` option, present in System V, was  
 106206 omitted because of non-portability in international usage.

106207 An undocumented `-T` option exists in some implementations. It is used to specify a directory for

106208 intermediate files. Implementations are encouraged to support the use of the *TMPDIR*  
 106209 environment variable instead of adding an option to support this functionality.

106210 The **-k** option was added to satisfy two objections. First, the zero-based counting used by *sort* is  
 106211 not consistent with other utility conventions. Second, it did not meet syntax guideline  
 106212 requirements.

106213 Historical documentation indicates that “setting **-n** implies **-b**”. The description of **-n** already  
 106214 states that optional leading <blank>s are tolerated in doing the comparison. If **-b** is enabled,  
 106215 rather than implied, by **-n**, this has unusual side-effects. When a character offset is used in a  
 106216 column of numbers (for example, to sort modulo 100), that offset is measured relative to the  
 106217 most significant digit, not to the column. Based upon a recommendation from the author of the  
 106218 original *sort* utility, the **-b** implication has been omitted from this volume of POSIX.1-2008, and  
 106219 an application wishing to achieve the previously mentioned side-effects has to code the **-b** flag  
 106220 explicitly.

106221 Earlier versions of this standard allowed the **-o** option to appear after operands. Historical  
 106222 practice allowed all options to be interspersed with operands. This version of the standard  
 106223 allows implementations to accept options after operands but conforming applications should  
 106224 not use this form.

106225 Earlier versions of this standard also allowed the *-number* and *+number* options. These options  
 106226 are no longer specified by POSIX.1-2008 but may be present in some implementations.

106227 Historical implementations produced a message on standard error when **-c** was specified and  
 106228 disorder was detected, and when **-c** and **-u** were specified and a duplicate key was detected. An  
 106229 earlier version of this standard contained wording that did not make it clear that this message  
 106230 was allowed and some implementations removed this message to be sure that they conformed  
 106231 to the standard’s requirements. Confronted with this difference in behavior, interactive users  
 106232 that wanted to be sure that they got visual feedback instead of just exit code 1 could have used a  
 106233 command like:

```
106234 sort -c file || echo disorder
```

106235 whether or not the *sort* utility provided a message in this case. But, it was not easy for a user to  
 106236 find where the disorder or duplicate key occurred on implementations that do not produce a  
 106237 message, especially when some parts of the input line were not part of the key and when one or  
 106238 more of the **-b**, **-d**, **-f**, **-i**, **-n**, or **-r** options or *keydef* type modifiers were in use. POSIX.1-2008  
 106239 requires a message to be produced in this case. POSIX.1-2008 also contains the **-C** option giving  
 106240 users the ability to choose either behavior.

106241 When a disorder or duplicate is found when the **-c** option is specified, some implementations  
 106242 print a message containing the first line that is out of order or contains a duplicate key; others  
 106243 print a message specifying the line number of the offending line. This standard allows either  
 106244 type of message.

#### 106245 **FUTURE DIRECTIONS**

106246 None.

106251 **CHANGE HISTORY**

106252 First released in Issue 2.

106253 **Issue 6**

106254 IEEE PASC Interpretation 1003.2 #174 is applied, updating the DESCRIPTION of comparisons.

106255 IEEE PASC Interpretation 1003.2 #168 is applied.

106256 **Issue 7**

106257 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not apply and noting that '+' may be recognized as an option delimiter.

106259 Austin Group Interpretation 1003.1-2001 #120 is applied, clarifying the use of the -c option and introducing the -C option.

106261 XCU-ERN-81 is applied, modifying the description of the -i option.

106262 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

106263 **NAME**106264 `split` — split files into pieces106265 **SYNOPSIS**106266 `split [-l line_count] [-a suffix_length] [file[name]]`106267 `split -b n[k|m] [-a suffix_length] [file[name]]`106268 **DESCRIPTION**

106269 The *split* utility shall read an input file and write one or more output files. The default size of  
 106270 each output file shall be 1 000 lines. The size of the output files can be modified by specification  
 106271 of the `-b` or `-l` options. Each output file shall be created with a unique suffix. The suffix shall  
 106272 consist of exactly *suffix\_length* lowercase letters from the POSIX locale. The letters of the suffix  
 106273 shall be used as if they were a base-26 digit system, with the first suffix to be created consisting  
 106274 of all 'a' characters, the second with a 'b' replacing the last 'a', and so on, until a name of all  
 106275 'z' characters is created. By default, the names of the output files shall be 'x', followed by a  
 106276 two-character suffix from the character set as described above, starting with "aa", "ab", "ac",  
 106277 and so on, and continuing until the suffix "zz", for a maximum of 676 files.

106278 If the number of files required exceeds the maximum allowed by the suffix length provided,  
 106279 such that the last allowable file would be larger than the requested size, the *split* utility shall fail  
 106280 after creating the last file with a valid suffix; *split* shall not delete the files it created with valid  
 106281 suffixes. If the file limit is not exceeded, the last file created shall contain the remainder of the  
 106282 input file, and may be smaller than the requested size.

106283 **OPTIONS**106284 The *split* utility shall conform to XBD [Section 12.2](#) (on page 215).

106285 The following options shall be supported:

106286 `-a suffix_length`

106287 Use *suffix\_length* letters to form the suffix portion of the filenames of the split file. If  
 106288 `-a` is not specified, the default suffix length shall be two. If the sum of the *name*  
 106289 operand and the *suffix\_length* option-argument would create a filename exceeding  
 106290 {NAME\_MAX} bytes, an error shall result; *split* shall exit with a diagnostic message  
 106291 and no files shall be created.

106292 `-b n` Split a file into pieces *n* bytes in size.106293 `-b nk` Split a file into pieces *n*\*1 024 bytes in size.106294 `-b nm` Split a file into pieces *n*\*1 048 576 bytes in size.

106295 `-l line_count` Specify the number of lines in each resulting file piece. The *line\_count* argument is  
 106296 an unsigned decimal integer. The default is 1 000. If the input does not end with a  
 106297 <newline>, the partial line shall be included in the last output file.

106298 **OPERANDS**

106299 The following operands shall be supported:

106300 *file* The pathname of the ordinary file to be split. If no input file is given or *file* is '-',  
 106301 the standard input shall be used.

106302 *name* The prefix to be used for each of the files resulting from the split operation. If no  
 106303 *name* argument is given, 'x' shall be used as the prefix of the output files. The  
 106304 combined length of the basename of *prefix* and *suffix\_length* cannot exceed  
 106305 {NAME\_MAX} bytes. See the OPTIONS section.

106306 **STDIN**

106307 See the INPUT FILES section.

106308 **INPUT FILES**

106309 Any file can be used as input.

106310 **ENVIRONMENT VARIABLES**

106311 The following environment variables shall affect the execution of *split*:

106312 *LANG* Provide a default value for the internationalization variables that are unset or null.  
106313 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
106314 variables used to determine the values of locale categories.)

106315 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
106316 internationalization variables.

106317 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
106318 characters (for example, single-byte as opposed to multi-byte characters in  
106319 arguments and input files).

106320 *LC\_MESSAGES*

106321 Determine the locale that should be used to affect the format and contents of  
106322 diagnostic messages written to standard error.

106323 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

106324 **ASYNCHRONOUS EVENTS**

106325 Default.

106326 **STDOUT**

106327 Not used.

106328 **STDERR**

106329 The standard error shall be used only for diagnostic messages.

106330 **OUTPUT FILES**

106331 The output files contain portions of the original input file; otherwise, unchanged.

106332 **EXTENDED DESCRIPTION**

106333 None.

106334 **EXIT STATUS**

106335 The following exit values shall be returned:

106336 0 Successful completion.

106337 >0 An error occurred.

106338 **CONSEQUENCES OF ERRORS**

106339 Default.

106340 **APPLICATION USAGE**

106341 None.

106342 **EXAMPLES**106343 In the following examples **foo** is a text file that contains 5 000 lines.106344 1. Create five files, **xaa**, **xab**, **xac**, **xad**, and **xae**:106345 

```
split foo
```

106346 2. Create five files, but the suffixed portion of the created files consists of three letters, **xaaa**,  
106347 **xaab**, **xaac**, **xaad**, and **xaae**:106348 

```
split -a 3 foo
```

106349 3. Create three files with four-letter suffixes and a supplied prefix, **bar\_aaaa**, **bar\_aaab**, and  
106350 **bar\_aaac**:106351 

```
split -a 4 -l 2000 foo bar_
```

106352 4. Create as many files as are necessary to contain at most 20\*1 024 bytes, each with the  
106353 default prefix of **x** and a five-letter suffix:106354 

```
split -a 5 -b 20k foo
```

106355 **RATIONALE**106356 The **-b** option was added to provide a mechanism for splitting files other than by lines. While  
106357 most uses of the **-b** option are for transmitting files over networks, some believed it would have  
106358 additional uses.106359 The **-a** option was added to overcome the limitation of being able to create only 676 files.106360 Consideration was given to deleting this utility, using the rationale that the functionality  
106361 provided by this utility is available via the *csplit* utility (see *csplit*). Upon reconsideration of the  
106362 purpose of the User Portability Utilities option, it was decided to retain both this utility and the  
106363 *csplit* utility because users use both utilities and have historical expectations of their behavior.  
106364 Furthermore, the splitting on byte boundaries in *split* cannot be duplicated with the historical  
106365 *csplit*.106366 The text “*split* shall not delete the files it created with valid suffixes” would normally be  
106367 assumed, but since the related utility, *csplit*, does delete files under some circumstances, the  
106368 historical behavior of *split* is made explicit to avoid misinterpretation.106369 Earlier versions of this standard allowed a *-line\_count* option. This form is no longer specified by  
106370 POSIX.1-2008 but may be present in some implementations.106371 **FUTURE DIRECTIONS**

106372 None.

106373 **SEE ALSO**106374 *csplit*106375 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)106376 **CHANGE HISTORY**

106377 First released in Issue 2.

106378 **Issue 6**

106379 This utility is marked as part of the User Portability Utilities option.

106380 The APPLICATION USAGE section is added.

- 106381 The obsolescent SYNOPSIS is removed.
- 106382 **Issue 7**
- 106383 Austin Group Interpretation 1003.1-2001 #027 is applied.
- 106384 The *split* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.
- 106385
- 106386 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

106387 **NAME**

106388 strings — find printable strings in files

106389 **SYNOPSIS**106390 strings [-a] [-t *format*] [-n *number*] [*file...*]106391 **DESCRIPTION**

106392 The *strings* utility shall look for printable strings in regular files and shall write those strings to  
 106393 standard output. A printable string is any sequence of four (by default) or more printable  
 106394 characters terminated by a <newline> or NUL character. Additional implementation-defined  
 106395 strings may be written; see *localedef*.

106396 If the first argument is '--', the results are unspecified.

106397 **OPTIONS**

106398 The *strings* utility shall conform to XBD [Section 12.2](#) (on page 215), except for the unspecified  
 106399 usage of '--'.

106400 The following options shall be supported:

106401 **-a** Scan files in their entirety. If **-a** is not specified, it is implementation-defined what  
 106402 portion of each file is scanned for strings.

106403 **-n *number*** Specify the minimum string length, where the *number* argument is a positive  
 106404 decimal integer. The default shall be 4.

106405 **-t *format*** Write each string preceded by its byte offset from the start of the file. The format  
 106406 shall be dependent on the single character used as the *format* option-argument:

106407 d The offset shall be written in decimal.

106408 o The offset shall be written in octal.

106409 x The offset shall be written in hexadecimal.

106410 **OPERANDS**

106411 The following operand shall be supported:

106412 *file* A pathname of a regular file to be used as input. If no *file* operand is specified, the  
 106413 *strings* utility shall read from the standard input.

106414 **STDIN**

106415 See the INPUT FILES section.

106416 **INPUT FILES**

106417 The input files named by the utility arguments or the standard input shall be regular files of any  
 106418 format.

106419 **ENVIRONMENT VARIABLES**106420 The following environment variables shall affect the execution of *strings*:

106421 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 106422 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 106423 variables used to determine the values of locale categories.)

106424 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 106425 internationalization variables.

106426 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 106427 characters (for example, single-byte as opposed to multi-byte characters in  
 106428 arguments and input files) and to identify printable strings.

- 106429 **LC\_MESSAGES**
- 106430 Determine the locale that should be used to affect the format and contents of
- 106431 diagnostic messages written to standard error.
- 106432 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 106433 **ASYNCHRONOUS EVENTS**
- 106434 Default.
- 106435 **STDOUT**
- 106436 Strings found shall be written to the standard output, one per line.
- 106437 When the **-t** option is not specified, the format of the output shall be:
- 106438 "%s", <string>
- 106439 With the **-t o** option, the format of the output shall be:
- 106440 "%o %s", <byte offset>, <string>
- 106441 With the **-t x** option, the format of the output shall be:
- 106442 "%x %s", <byte offset>, <string>
- 106443 With the **-t d** option, the format of the output shall be:
- 106444 "%d %s", <byte offset>, <string>
- 106445 **STDERR**
- 106446 The standard error shall be used only for diagnostic messages.
- 106447 **OUTPUT FILES**
- 106448 None.
- 106449 **EXTENDED DESCRIPTION**
- 106450 None.
- 106451 **EXIT STATUS**
- 106452 The following exit values shall be returned:
- 106453 0 Successful completion.
- 106454 >0 An error occurred.
- 106455 **CONSEQUENCES OF ERRORS**
- 106456 Default.
- 106457 **APPLICATION USAGE**
- 106458 By default the data area (as opposed to the text, "bss", or header areas) of a binary executable
- 106459 file is scanned. Implementations document which areas are scanned.
- 106460 Some historical implementations do not require NUL or <newline> terminators for strings to
- 106461 permit those languages that do not use NUL as a string terminator to have their strings written.
- 106462 **EXAMPLES**
- 106463 None.
- 106464 **RATIONALE**
- 106465 Apart from rationalizing the option syntax and slight difficulties with object and executable
- 106466 binary files, *strings* is specified to match historical practice closely. The **-a** and **-n** options were
- 106467 introduced to replace the non-conforming **-** and **-number** options. These options are no longer
- 106468 specified by POSIX.1-2008 but may be present in some implementations.

- 106469 The `-o` option historically means different things on different implementations. Some use it to mean “*offset in decimal*”, while others use it as “*offset in octal*”. Instead of trying to decide which way would be least objectionable, the `-t` option was added. It was originally named `-O` to mean “*offset*”, but was changed to `-t` to be consistent with *od*.
- 106470
- 106471
- 106472
- 106473 The ISO C standard function *isprint()* is restricted to a domain of **unsigned char**. This volume of  
106474 POSIX.1-2008 requires implementations to write strings as defined by the current locale.
- 106475 **FUTURE DIRECTIONS**
- 106476 None.

- 106480 **CHANGE HISTORY**
- 106481 First released in Issue 4.
- 106482 **Issue 6**
- 106483 This utility is marked as part of the User Portability Utilities option.
- 106484 The obsolescent SYNOPSIS is removed.
- 106485 The normative text is reworded to avoid use of the term “*must*” for application requirements.
- 106486 **Issue 7**
- 106487 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first  
106488 argument is `'-'`.
- 106489 The *strings* utility is moved from the User Portability Utilities option to the Base. User  
106490 Portability Utilities is now an option for interactive utilities.
- 106491 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

106492 **NAME**106493 strip — remove unnecessary information from strippable files (**DEVELOPMENT**)106494 **SYNOPSIS**106495 SD strip *file...*106496 **DESCRIPTION**106497 XSI A strippable file is defined as a relocatable, object, or executable file. On XSI-conformant  
106498 systems, a strippable file can also be an archive of object or relocatable files.106499 The *strip* utility shall remove from strippable files named by the *file* operands any information  
106500 the implementor deems unnecessary for execution of those files. The nature of that information  
106501 is unspecified. The effect of *strip* on object and executable files shall be similar to the use of the  
106502 XSI **-s** option to *c99* or *fort77*. The effect of *strip* on an archive of object files shall be similar to the  
106503 use of the **-s** option to *c99* or *fort77* for each object file in the archive.106504 **OPTIONS**

106505 None.

106506 **OPERANDS**

106507 The following operand shall be supported:

106508 *file* A pathname referring to a strippable file.106509 **STDIN**

106510 Not used.

106511 **INPUT FILES**106512 The input files shall be in the form of strippable files successfully produced by any compiler  
106513 XSI defined by this volume of POSIX.1-2008 or produced by creating or updating an archive of such  
106514 files using the *ar* utility.106515 **ENVIRONMENT VARIABLES**106516 The following environment variables shall affect the execution of *strip*:106517 *LANG* Provide a default value for the internationalization variables that are unset or null.  
106518 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
106519 variables used to determine the values of locale categories.)106520 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
106521 internationalization variables.106522 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
106523 characters (for example, single-byte as opposed to multi-byte characters in  
106524 arguments).106525 *LC\_MESSAGES*106526 Determine the locale that should be used to affect the format and contents of  
106527 diagnostic messages written to standard error.106528 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.106529 **ASYNCHRONOUS EVENTS**

106530 Default.

106531 **STDOUT**

106532 Not used.

106533 **STDERR**

106534 The standard error shall be used only for diagnostic messages.

106535 **OUTPUT FILES**

106536 The *strip* utility shall produce strippable files of unspecified format.

106537 **EXTENDED DESCRIPTION**

106538 None.

106539 **EXIT STATUS**

106540 The following exit values shall be returned:

106541 0 Successful completion.

106542 >0 An error occurred.

106543 **CONSEQUENCES OF ERRORS**

106544 Default.

106545 **APPLICATION USAGE**

106546 None.

106547 **EXAMPLES**

106548 None.

106549 **RATIONALE**

106550 Historically, this utility has been used to remove the symbol table from a strippable file. It was  
106551 included since it is known that the amount of symbolic information can amount to several  
106552 megabytes; the ability to remove it in a portable manner was deemed important, especially for  
106553 smaller systems.

106554 The behavior of *strip* on object and executable files is said to be the same as the `-s` option to a  
106555 compiler. While the end result is essentially the same, it is not required to be identical.

106556 XSI-conformant systems support use of *strip* on archive files containing object files or relocatable  
106557 files.

106558 **FUTURE DIRECTIONS**

106559 None.

106560 **SEE ALSO**

106561 *ar*, *c99*, *fort77*

106562 XBD Chapter 8 (on page 173)

106563 **CHANGE HISTORY**

106564 First released in Issue 2.

106565 **Issue 6**

106566 This utility is marked as part of the Software Development Utilities option.

106567 **Issue 7**

106568 Austin Group Interpretation 1003.1-2001 #103 is applied.

106569 **NAME**106570 `stty` — set the options for a terminal106571 **SYNOPSIS**106572 `stty [-a|-g]`106573 `stty operand...`106574 **DESCRIPTION**

106575 The `stty` utility shall set or report on terminal I/O characteristics for the device that is its  
 106576 standard input. Without options or operands specified, it shall report the settings of certain  
 106577 characteristics, usually those that differ from implementation-defined defaults. Otherwise, it  
 106578 shall modify the terminal state according to the specified operands. Detailed information about  
 106579 the modes listed in the first five groups below are described in XBD [Chapter 11](#) (on page 199).  
 106580 Operands in the Combination Modes group (see [Combination Modes](#), on page 3204) are  
 106581 implemented using operands in the previous groups. Some combinations of operands are  
 106582 mutually-exclusive on some terminal types; the results of using such combinations are  
 106583 unspecified.

106584 Typical implementations of this utility require a communications line configured to use the  
 106585 **termios** interface defined in the System Interfaces volume of POSIX.1-2008. On systems where  
 106586 none of these lines are available, and on lines not currently configured to support the **termios**  
 106587 interface, some of the operands need not affect terminal characteristics.

106588 **OPTIONS**106589 The `stty` utility shall conform to XBD [Section 12.2](#) (on page 215).

106590 The following options shall be supported:

- 106591 **-a** Write to standard output all the current settings for the terminal.
- 106592 **-g** Write to standard output all the current settings in an unspecified form that can be  
 106593 used as arguments to another invocation of the `stty` utility on the same system. The  
 106594 form used shall not contain any characters that would require quoting to avoid  
 106595 word expansion by the shell; see [Section 2.6](#) (on page 2305).

106596 **OPERANDS**

106597 The following operands shall be supported to set the terminal characteristics.

106598 **Control Modes**

106599 **parenb** (**-parenb**) Enable (disable) parity generation and detection. This shall have the effect of  
 106600 setting (not setting) PARENB in the **termios** `c_flag` field, as defined in XBD  
 106601 [Chapter 11](#) (on page 199).

106602 **parodd** (**-parodd**) Select odd (even) parity. This shall have the effect of setting (not setting)  
 106603 PARODD in the **termios** `c_flag` field, as defined in XBD [Chapter 11](#) (on page  
 106604 199).  
 106605

106606 **cs5 cs6 cs7 cs8** Select character size, if possible. This shall have the effect of setting CS5, CS6,  
 106607 CS7, and CS8, respectively, in the **termios** `c_flag` field, as defined in XBD  
 106608 [Chapter 11](#) (on page 199).

106609 *number* Set terminal baud rate to the number given, if possible. If the baud rate is set  
 106610 to zero, the modem control lines shall no longer be asserted. This shall have  
 106611 the effect of setting the input and output **termios** baud rate values as defined  
 106612 in XBD [Chapter 11](#) (on page 199).

- 106613      **ispeed** *number*      Set terminal input baud rate to the number given, if possible. If the input baud rate is set to zero, the input baud rate shall be specified by the value of the output baud rate. This shall have the effect of setting the input **termios** baud rate values as defined in XBD [Chapter 11](#) (on page 199).
- 106614
- 106615
- 106616
- 106617      **ospeed** *number*      Set terminal output baud rate to the number given, if possible. If the output baud rate is set to zero, the modem control lines shall no longer be asserted. This shall have the effect of setting the output **termios** baud rate values as defined in XBD [Chapter 11](#) (on page 199).
- 106618
- 106619
- 106620
- 106621      **hupcl** (**-hupcl**)      Stop asserting modem control lines (do not stop asserting modem control lines) on last close. This shall have the effect of setting (not setting) HUPCL in the **termios** *c\_cflag* field, as defined in XBD [Chapter 11](#) (on page 199).
- 106622
- 106623
- 106624      **hup** (**-hup**)      Equivalent to **hupcl**(**-hupcl**).
- 106625
- 106626      **cstopb** (**-cstopb**)      Use two (one) stop bits per character. This shall have the effect of setting (not setting) CSTOPB in the **termios** *c\_cflag* field, as defined in XBD [Chapter 11](#) (on page 199).
- 106627
- 106628      **cread** (**-cread**)      Enable (disable) the receiver. This shall have the effect of setting (not setting) CREAD in the **termios** *c\_cflag* field, as defined in XBD [Chapter 11](#) (on page 199).
- 106629
- 106630
- 106631      **clocal** (**-clocal**)      Assume a line without (with) modem control. This shall have the effect of setting (not setting) CLOCAL in the **termios** *c\_cflag* field, as defined in XBD [Chapter 11](#) (on page 199).
- 106632
- 106633
- 106634      It is unspecified whether *stty* shall report an error if an attempt to set a Control Mode fails.

#### 106635      **Input Modes**

- 106636      **ignbrk** (**-ignbrk**)      Ignore (do not ignore) break on input. This shall have the effect of setting (not setting) IGNBRK in the **termios** *c\_iflag* field, as defined in XBD [Chapter 11](#) (on page 199).
- 106637
- 106638
- 106639      **brkint** (**-brkint**)      Signal (do not signal) INTR on break. This shall have the effect of setting (not setting) BRKINT in the **termios** *c\_iflag* field, as defined in XBD [Chapter 11](#) (on page 199).
- 106640
- 106641
- 106642      **ignpar** (**-ignpar**)      Ignore (do not ignore) bytes with parity errors. This shall have the effect of setting (not setting) IGNPAR in the **termios** *c\_iflag* field, as defined in XBD [Chapter 11](#) (on page 199).
- 106643
- 106644
- 106645      **parmrk** (**-parmrk**)
- 106646      Mark (do not mark) parity errors. This shall have the effect of setting (not setting) PARMRK in the **termios** *c\_iflag* field, as defined in XBD [Chapter 11](#) (on page 199).
- 106647
- 106648
- 106649      **inpck** (**-inpck**)      Enable (disable) input parity checking. This shall have the effect of setting (not setting) INPCK in the **termios** *c\_iflag* field, as defined in XBD [Chapter 11](#) (on page 199).
- 106650
- 106651
- 106652      **istrip** (**-istrip**)      Strip (do not strip) input characters to seven bits. This shall have the effect of setting (not setting) ISTRIP in the **termios** *c\_iflag* field, as defined in XBD [Chapter 11](#) (on page 199).
- 106653
- 106654

|        |                                      |                                                                                                                                                                                                                                                                                                                          |
|--------|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 106655 | <b>inlcr</b> ( <b>-inlcr</b> )       | Map (do not map) NL to CR on input. This shall have the effect of setting (not setting) INLCR in the <b>termios</b> <i>c_iflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                                                                                                    |
| 106656 |                                      |                                                                                                                                                                                                                                                                                                                          |
| 106657 |                                      |                                                                                                                                                                                                                                                                                                                          |
| 106658 | <b>igncr</b> ( <b>-igncr</b> )       | Ignore (do not ignore) CR on input. This shall have the effect of setting (not setting) IGNCR in the <b>termios</b> <i>c_iflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                                                                                                    |
| 106659 |                                      |                                                                                                                                                                                                                                                                                                                          |
| 106660 |                                      |                                                                                                                                                                                                                                                                                                                          |
| 106661 | <b>icrnl</b> ( <b>-icrnl</b> )       | Map (do not map) CR to NL on input. This shall have the effect of setting (not setting) ICRNL in the <b>termios</b> <i>c_iflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                                                                                                    |
| 106662 |                                      |                                                                                                                                                                                                                                                                                                                          |
| 106663 |                                      |                                                                                                                                                                                                                                                                                                                          |
| 106664 | <b>ixon</b> ( <b>-ixon</b> )         | Enable (disable) START/STOP output control. Output from the system is stopped when the system receives STOP and started when the system receives START. This shall have the effect of setting (not setting) IXON in the <b>termios</b> <i>c_iflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199). |

| 106735 |     |                            |                                                                                                                                                                                                                                                                                                                                     |
| 106736 |     |                            |                                                                                                                                                                                                                                                                                                                                     |
| 106737 |     | <b>echonl (-echonl)</b>    | Echo (do not echo) NL, even if <b>echo</b> is disabled. This shall have the effect of setting (not setting) ECHONL in the <b>termios</b> <i>c_lflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                                                                                          |
| 106738 |     |                            |                                                                                                                                                                                                                                                                                                                                     |
| 106739 |     |                            |                                                                                                                                                                                                                                                                                                                                     |

106740 **noflsh** (**-noflsh**) Disable (enable) flush after INTR, QUIT, SUSP. This shall have the effect of  
 106741 setting (not setting) NOFLSH in the **termios** *c\_lflag* field, as defined in XBD  
 106742 [Chapter 11](#) (on page 199).

106743 **tostop** (**-tostop**) Send SIGTTOU for background output. This shall have the effect of setting  
 106744 (not setting) TOSTOP in the **termios** *c\_lflag* field, as defined in XBD [Chapter 11](#)  
 106745 (on page 199).

### 106746 Special Control Character Assignments

106747 *<control>-character string*

106748 Set *<control>-character* to *string*. If *<control>-character* is one of the character sequences in the  
 106749 first column of the following table, the corresponding XBD [Chapter 11](#) (on page 199) control  
 106750 character from the second column shall be recognized. This has the effect of setting the  
 106751 corresponding element of the **termios** *c\_cc* array (see XBD [Chapter 13](#) (on page 219),  
 106752 **<termios.h>**).

106753 **Table 4-20** Control Character Names in *stty*

| Control Character | c_cc Subscript | Description     |
|-------------------|----------------|-----------------|
| <b>eof</b>        | VEOF           | EOF character   |
| <b>eol</b>        | VEOL           | EOL character   |
| <b>erase</b>      | VERASE         | ERASE character |
| <b>intr</b>       | VINTR          | INTR character  |
| <b>kill</b>       | VKILL          | KILL character  |
| <b>quit</b>       | VQUIT          | QUIT character  |
| <b>susp</b>       | VSUSP          | SUSP character  |
| <b>start</b>      | VSTART         | START character |
| <b>stop</b>       | VSTOP          | STOP character  |

106764 If *string* is a single character, the control character shall be set to that character. If *string* is the  
 106765 two-character sequence "**^-**" or the string *undef*, the control character shall be set to  
 106766 `_POSIX_VDISABLE`, if it is in effect for the device; if `_POSIX_VDISABLE` is not in effect for  
 106767 the device, it shall be treated as an error. In the POSIX locale, if *string* is a two-character  
 106768 sequence beginning with **<circumflex>** ('**^**'), and the second character is one of those listed  
 106769 in the "**^c**" column of the following table, the control character shall be set to the  
 106770 corresponding character value in the Value column of the table.

106771 **Table 4-21** Circumflex Control Characters in *stty*

| <b>^c</b> | Value | <b>^c</b> | Value | <b>^c</b> | Value |
|-----------|-------|-----------|-------|-----------|-------|
| a, A      | <SOH> | l, L      | <FF>  | w, W      | <ETB> |
| b, B      | <STX> | m, M      | <CR>  | x, X      | <CAN> |
| c, C      | <ETX> | n, N      | <SO>  | y, Y      | <EM>  |
| d, D      | <EOT> | o, O      | <SI>  | z, Z      | <SUB> |
| e, E      | <ENQ> | p, P      | <DLE> | [         | <ESC> |
| f, F      | <ACK> | q, Q      | <DC1> | \         | <FS>  |
| g, G      | <BEL> | r, R      | <DC2> | ]         | <GS>  |
| h, H      | <BS>  | s, S      | <DC3> | ^         | <RS>  |
| i, I      | <HT>  | t, T      | <DC4> | _         | <US>  |
| j, J      | <LF>  | u, U      | <NAK> | ?         | <DEL> |
| k, K      | <VT>  | v, V      | <SYN> |           |       |

106784 **min** *number*  
 106785 Set the value of MIN to *number*. MIN is used in non-canonical mode input processing  
 106786 (**icanon**).

106787 **time** *number*  
 106788 Set the value of TIME to *number*. TIME is used in non-canonical mode input processing  
 106789 (**icanon**).

## 106790 **Combination Modes**

106791 *saved settings*  
 106792 Set the current terminal characteristics to the saved settings produced by the **-g** option.

106793 **evenp** or **parity**  
 106794 Enable **parenb** and **cs7**; disable **parodd**.

106795 **oddp**  
 106796 Enable **parenb**, **cs7**, and **parodd**.

106797 **-parity**, **-evenp**, or **-oddp**  
 106798 Disable **parenb**, and set **cs8**.

106799 XSI **raw** (**-raw** or **cooked**)  
 106800 Enable (disable) raw input and output. Raw mode shall be equivalent to setting:  
 106801 `stty cs8 erase ^- kill ^- intr ^- \  
 106802 quit ^- eof ^- eol ^- -post -inpck`

106803 **nl** (**-nl**)  
 106804 Disable (enable) **icrnl**. In addition, **-nl** unsets **inlcr** and **igncr**.

106805 **ek** Reset ERASE and KILL characters back to system defaults.

106806 **sane**  
 106807 Reset all modes to some reasonable, unspecified, values.

## 106808 **STDIN**

106809 Although no input is read from standard input, standard input shall be used to get the current  
 106810 terminal I/O characteristics and to set new terminal I/O characteristics.

## 106811 **INPUT FILES**

106812 None.

## 106813 **ENVIRONMENT VARIABLES**

106814 The following environment variables shall affect the execution of *stty*:

106815 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 106816 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 106817 variables used to determine the values of locale categories.)

106818 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 106819 internationalization variables.

106820 **LC\_CTYPE** This variable determines the locale for the interpretation of sequences of bytes of  
 106821 text data as characters (for example, single-byte as opposed to multi-byte  
 106822 characters in arguments) and which characters are in the class **print**.

- 106823 **LC\_MESSAGES**
- 106824 Determine the locale that should be used to affect the format and contents of
- 106825 diagnostic messages written to standard error.
- 106826 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 106827 **ASYNCHRONOUS EVENTS**
- 106828 Default.
- 106829 **STDOUT**
- 106830 If operands are specified, no output shall be produced.
- 106831 If the **-g** option is specified, *stty* shall write to standard output the current settings in a form that
- 106832 can be used as arguments to another instance of *stty* on the same system.
- 106833 If the **-a** option is specified, all of the information as described in the OPERANDS section shall
- 106834 be written to standard output. Unless otherwise specified, this information shall be written as
- 106835 <space>-separated tokens in an unspecified format, on one or more lines, with an unspecified
- 106836 number of tokens per line. Additional information may be written.
- 106837 If no options or operands are specified, an unspecified subset of the information written for the
- 106838 **-a** option shall be written.
- 106839 If speed information is written as part of the default output, or if the **-a** option is specified and if
- 106840 the terminal input speed and output speed are the same, the speed information shall be written
- 106841 as follows:
- 106842 "speed %d baud;", <speed>
- 106843 Otherwise, speeds shall be written as:
- 106844 "ispeed %d baud; ospeed %d baud;", <ispeed>, <ospeed>
- 106845 In locales other than the POSIX locale, the word **baud** may be changed to something more
- 106846 appropriate in those locales.
- 106847 If control characters are written as part of the default output, or if the **-a** option is specified,
- 106848 control characters shall be written as:
- 106849 "%s = %s;", <control-character name>, <value>
- 106850 where <value> is either the character, or some visual representation of the character if it is non-
- 106851 printable, or the string *undef* if the character is disabled.
- 106852 **STDERR**
- 106853 The standard error shall be used only for diagnostic messages.
- 106854 **OUTPUT FILES**
- 106855 None.
- 106856 **EXTENDED DESCRIPTION**
- 106857 None.
- 106858 **EXIT STATUS**
- 106859 The following exit values shall be returned:
- 106860 0 The terminal options were read or set successfully.
- 106861 >0 An error occurred.

106862 **CONSEQUENCES OF ERRORS**

106863 Default.

106864 **APPLICATION USAGE**

106865 The `-g` flag is designed to facilitate the saving and restoring of terminal state from the shell level.  
 106866 For example, a program may:

```
106867 saveterm="$ (stty -g) "           # save terminal state
106868 stty (new settings)             # set new state
106869 ...                             # ...
106870 stty $saveterm                 # restore terminal state
```

106871 Since the format is unspecified, the saved value is not portable across systems.

106872 Since the `-a` format is so loosely specified, scripts that save and restore terminal settings should  
 106873 use the `-g` option.

106874 **EXAMPLES**

106875 None.

106876 **RATIONALE**

106877 The original *stty* description was taken directly from System V and reflected the System V  
 106878 terminal driver **termio**. It has been modified to correspond to the terminal driver **termios**.

106879 Output modes are specified only for XSI-conformant systems. All implementations are expected  
 106880 to provide *stty* operands corresponding to all of the output modes they support.

106881 The *stty* utility is primarily used to tailor the user interface of the terminal, such as selecting the  
 106882 preferred ERASE and KILL characters. As an application programming utility, *stty* can be used  
 106883 within shell scripts to alter the terminal settings for the duration of the script.

106884 The **termios** section states that individual disabling of control characters is possible through the  
 106885 option `_POSIX_VDISABLE`. If enabled, two conventions currently exist for specifying this:  
 106886 System V uses `"^-"`, and BSD uses *undef*. Both are accepted by *stty* in this volume of  
 106887 POSIX.1-2008. The other BSD convention of using the letter 'u' was rejected because it conflicts  
 106888 with the actual letter 'u', which is an acceptable value for a control character.

106889 Early proposals did not specify the mapping of `"^c"` to control characters because the control  
 106890 characters were not specified in the POSIX locale character set description file requirements. The  
 106891 control character set is now specified in XBD [Chapter 3](#) (on page 33), so the historical mapping is  
 106892 specified. Note that although the mapping corresponds to control-character key assignments on  
 106893 many terminals that use the ISO/IEC 646:1991 standard (or ASCII) character encodings, the  
 106894 mapping specified here is to the control characters, not their keyboard encodings.

106895 Since **termios** supports separate speeds for input and output, two new options were added to  
 106896 specify each distinctly.

106897 Some historical implementations use standard input to get and set terminal characteristics;  
 106898 others use standard output. Since input from a login TTY is usually restricted to the owner while  
 106899 output to a TTY is frequently open to anyone, using standard input provides fewer chances of  
 106900 accidentally (or maliciously) altering the terminal settings of other users. Using standard input  
 106901 also allows *stty -a* and *stty -g* output to be redirected for later use. Therefore, usage of standard  
 106902 input is required by this volume of POSIX.1-2008.

106903 **FUTURE DIRECTIONS**

106904 None.

106905 **SEE ALSO**106906 [Chapter 2](#) (on page 2297)106907 XBD [Chapter 8](#) (on page 173), [Chapter 11](#) (on page 199), [Section 12.2](#) (on page 215), [<termios.h>](#)106908 **CHANGE HISTORY**

106909 First released in Issue 2.

106910 **Issue 5**106911 The description of **tabs** is clarified.

106912 The FUTURE DIRECTIONS section is added.

106913 **Issue 6**106914 The LEGACY items **iucl(-iucl)**, **xcase**, **olcuc(-olcuc)**, **lcase(-lcase)**, and **LCASE(-LCASE)** are removed.106916 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/37 is applied, applying IEEE PASC Interpretation 1003.2 #133, fixing an error in the OPERANDS section for the Combination Modes **nl(-nl)**.106919 **Issue 7**

106920 Austin Group Interpretation 1003.1-2001 #144 is applied, moving functionality relating to the IXANY symbol from the XSI option to the Base.

106922 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

106923 **NAME**

106924 tabs — set terminal tabs

106925 **SYNOPSIS**

106926 XSI tabs [-n|-a|-a2|-c|-c2|-c3|-f|-p|-s|-u] [-T type]

106927 tabs [-T type] n[[sep[+]n]...]

106928 **DESCRIPTION**

106929 The *tabs* utility shall display a series of characters that first clears the hardware terminal tab  
 106930 XSI settings and then initializes the tab stops at the specified positions and optionally adjusts the  
 106931 margin.

106932 The phrase “tab-stop position *N*” shall be taken to mean that, from the start of a line of output,  
 106933 tabbing to position *N* shall cause the next character output to be in the (*N*+1)th column position  
 106934 on that line. The maximum number of tab stops allowed is terminal-dependent.

106935 It need not be possible to implement *tabs* on certain terminals. If the terminal type obtained from  
 106936 the *TERM* environment variable or *-T* option represents such a terminal, an appropriate  
 106937 diagnostic message shall be written to standard error and *tabs* shall exit with a status greater  
 106938 than zero.

106939 **OPTIONS**

106940 XSI The *tabs* utility shall conform to XBD Section 12.2 (on page 215), except for various extensions:  
 106941 the options *-a2*, *-c2*, and *-c3* are multi-character.

106942 The following options shall be supported:

106943 *-n* Specify repetitive tab stops separated by a uniform number of column positions, *n*,  
 106944 where *n* is a single-digit decimal number. The default usage of *tabs* with no  
 106945 arguments shall be equivalent to *tabs -8*. When *-0* is used, the tab stops shall be  
 106946 cleared and no new ones set.

106947 XSI *-a* 1,10,16,36,72  
 106948 Assembler, applicable to some mainframes.

106949 XSI *-a2* 1,10,16,40,72  
 106950 Assembler, applicable to some mainframes.

106951 XSI *-c* 1,8,12,16,20,55  
 106952 COBOL, normal format.

106953 XSI *-c2* 1,6,10,14,49  
 106954 COBOL, compact format (columns 1 to 6 omitted).

106955 XSI *-c3* 1,6,10,14,18,22,26,30,34,38,42,46,50,54,58,62,67  
 106956 COBOL compact format (columns 1 to 6 omitted), with more tabs than *-c2*.

106957 XSI *-f* 1,7,11,15,19,23  
 106958 FORTRAN

106959 XSI *-p* 1,5,9,13,17,21,25,29,33,37,41,45,49,53,57,61  
 106960 PL/1

106961 XSI *-s* 1,10,55  
 106962 SNOBOL

106963 XSI *-u* 1,12,20,44  
 106964 Assembler, applicable to some mainframes.

106965        **-T type**        Indicate the type of terminal. If this option is not supplied and the *TERM* variable  
 106966                            is unset or null, an unspecified default terminal type shall be used. The setting of  
 106967                            *type* shall take precedence over the value in *TERM*.

#### 106968 **OPERANDS**

106969        The following operand shall be supported:

106970        *n*[[*sep*[+]*n*]...] A single command line argument that consists of one or more tab-stop values (*n*)  
 106971                            separated by a separator character (*sep*) which is either a <comma> or a <blank>  
 106972                            character. The application shall ensure that the tab-stop values are positive decimal  
 106973                            integers in strictly ascending order. If any tab-stop value (except the first one) is  
 106974                            preceded by a <plus-sign>, it is taken as an increment to be added to the previous  
 106975                            value. For example, the tab lists 1,10,20,30 and "1 10 +10 +10" are considered  
 106976                            to be identical.

#### 106977 **STDIN**

106978        Not used.

#### 106979 **INPUT FILES**

106980        None.

#### 106981 **ENVIRONMENT VARIABLES**

106982        The following environment variables shall affect the execution of *tabs*:

106983        *LANG*        Provide a default value for the internationalization variables that are unset or null.  
 106984                            (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 106985                            variables used to determine the values of locale categories.)

106986        *LC\_ALL*        If set to a non-empty string value, override the values of all the other  
 106987                            internationalization variables.

106988        *LC\_CTYPE*        Determine the locale for the interpretation of sequences of bytes of text data as  
 106989                            characters (for example, single-byte as opposed to multi-byte characters in  
 106990                            arguments).

106991        *LC\_MESSAGES*

106992                            Determine the locale that should be used to affect the format and contents of  
 106993                            diagnostic messages written to standard error.

106994 **XSI**        *NLSPATH*        Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

106995        *TERM*        Determine the terminal type. If this variable is unset or null, and if the **-T** option is  
 106996                            not specified, an unspecified default terminal type shall be used.

#### 106997 **ASYNCHRONOUS EVENTS**

106998        Default.

#### 106999 **STDOUT**

107000        If standard output is a terminal, the appropriate sequence to clear and set the tab stops may be  
 107001                            written to standard output in an unspecified format. If standard output is not a terminal,  
 107002                            undefined results occur.

#### 107003 **STDERR**

107004        The standard error shall be used only for diagnostic messages.

#### 107005 **OUTPUT FILES**

107006        None.

107007 **EXTENDED DESCRIPTION**

107008 None.

107009 **EXIT STATUS**

107010 The following exit values shall be returned:

107011 0 Successful completion.

107012 &gt;0 An error occurred.

107013 **CONSEQUENCES OF ERRORS**

107014 Default.

107015 **APPLICATION USAGE**107016 This utility makes use of the terminal's hardware tabs and the *stty tabs* option.

107017 This utility is not recommended for application use.

107018 Some integrated display units might not have escape sequences to set tab stops, but may be set  
107019 by internal system calls. On these terminals, *tabs* works if standard output is directed to the  
107020 terminal; if output is directed to another file, however, *tabs* fails.

107021 **EXAMPLES**

107022 None.

107023 **RATIONALE**

107024 Consideration was given to having the *tput* utility handle all of the functions described in *tabs*.  
107025 However, the separate *tabs* utility was retained because it seems more intuitive to use a  
107026 command named *tabs* than *tput* with a new option. The *tput* utility does not support setting or  
107027 clearing tabs, and no known historical version of *tabs* supports the capability of setting arbitrary  
107028 tab stops.

107029 The System V *tabs* interface is very complex; the version in this volume of POSIX.1-2008 has a  
107030 reduced feature list, but many of the features omitted were restored as part of the XSI option  
107031 even though the supported languages and coding styles are primarily historical.

107032 There was considerable sentiment for specifying only a means of resetting the tabs back to a  
107033 known state—presumably the “standard” of tabs every eight positions. The following features  
107034 were omitted:

- 107035 • Setting tab stops via the first line in a file, using *--file*. Since even the SVID has no  
107036 complete explanation of this feature, it is doubtful that it is in widespread use.

107037 In an early proposal, a *-t tablist* option was added for consistency with *expand*; this was later  
107038 removed when inconsistencies with the historical list of tabs were identified.

107039 Consideration was given to adding a *-p* option that would output the current tab settings so  
107040 that they could be saved and then later restored. This was not accepted because querying the tab  
107041 stops of the terminal is not a capability in historical *terminfo* or *termcap* facilities and might not be  
107042 supported on a wide range of terminals.

107043 **FUTURE DIRECTIONS**

107044 None.

107045 **SEE ALSO**107046 *expand*, *stty*, *tput*, *unexpand*

107047 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

107048 **CHANGE HISTORY**

107049 First released in Issue 2.

107050 **Issue 6**

107051 This utility is marked as part of the User Portability Utilities option.

107052 The normative text is reworded to avoid use of the term “must” for application requirements.

107053 **Issue 7**

107054 The *tabs* utility is removed from the User Portability Utilities option. User Portability Utilities is now an option for interactive utilities.

107056 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

107057 The SYNOPSIS and OPERANDS sections are updated.

107058 **NAME**

107059 tail — copy the last part of a file

107060 **SYNOPSIS**107061 tail [-f] [-c *number*|-n *number*] [*file*]107062 **DESCRIPTION**107063 The *tail* utility shall copy its input file to the standard output beginning at a designated place.107064 Copying shall begin at the point in the file indicated by the `-c number` or `-n number` options. The  
107065 option-argument *number* shall be counted in units of lines or bytes, according to the options `-n`  
107066 and `-c`. Both line and byte counts start from 1.107067 Tails relative to the end of the file may be saved in an internal buffer, and thus may be limited in  
107068 length. Such a buffer, if any, shall be no smaller than {LINE\_MAX}\*10 bytes.107069 **OPTIONS**107070 The *tail* utility shall conform to XBD [Section 12.2](#) (on page 215), except that '+' may be  
107071 recognized as an option delimiter as well as '-'.

107072 The following options shall be supported:

107073 `-c number` The application shall ensure that the *number* option-argument is a decimal integer,  
107074 optionally including a sign. The sign shall affect the location in the file, measured  
107075 in bytes, to begin the copying:

| Sign        | Copying Starts                         |
|-------------|----------------------------------------|
| +           | Relative to the beginning of the file. |
| -           | Relative to the end of the file.       |
| <i>none</i> | Relative to the end of the file.       |

107076

107077

107078

107079

107080 The application shall ensure that if the sign of the *number* option-argument is '+',  
107081 the *number* option-argument is a non-zero decimal integer.107082 The origin for counting shall be 1; that is, `-c +1` represents the first byte of the file,  
107083 `-c -1` the last.107084 `-f` If the input file is a regular file or if the *file* operand specifies a FIFO, do not  
107085 terminate after the last line of the input file has been copied, but read and copy  
107086 further bytes from the input file when they become available. If no *file* operand is  
107087 specified and standard input is a pipe or FIFO, the `-f` option shall be ignored. If the  
107088 input file is not a FIFO, pipe, or regular file, it is unspecified whether or not the `-f`  
107089 option shall be ignored.107090 `-n number` This option shall be equivalent to `-c number`, except the starting location in the file  
107091 shall be measured in lines instead of bytes. The origin for counting shall be 1; that  
107092 is, `-n +1` represents the first line of the file, `-n -1` the last.107093 If neither `-c` nor `-n` is specified, `-n 10` shall be assumed.107094 **OPERANDS**

107095 The following operand shall be supported:

107096 *file* A pathname of an input file. If no *file* operand is specified, the standard input shall  
107097 be used.

107098 **STDIN**

107099 The standard input shall be used if no *file* operand is specified, and shall be used if the *file*  
 107100 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 107101 the standard input shall not be used. See the INPUT FILES section.

107102 **INPUT FILES**

107103 If the -c option is specified, the input file can contain arbitrary data; otherwise, the input file  
 107104 shall be a text file.

107105 **ENVIRONMENT VARIABLES**

107106 The following environment variables shall affect the execution of *tail*:

107107 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 107108 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 107109 variables used to determine the values of locale categories.)

107110 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 107111 internationalization variables.

107112 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 107113 characters (for example, single-byte as opposed to multi-byte characters in  
 107114 arguments and input files).

107115 *LC\_MESSAGES*

107116 Determine the locale that should be used to affect the format and contents of  
 107117 diagnostic messages written to standard error.

107118 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

107119 **ASYNCHRONOUS EVENTS**

107120 Default.

107121 **STDOUT**

107122 The designated portion of the input file shall be written to standard output.

107123 **STDERR**

107124 The standard error shall be used only for diagnostic messages.

107125 **OUTPUT FILES**

107126 None.

107127 **EXTENDED DESCRIPTION**

107128 None.

107129 **EXIT STATUS**

107130 The following exit values shall be returned:

107131 0 Successful completion.

107132 >0 An error occurred.

107133 **CONSEQUENCES OF ERRORS**

107134 Default.

## 107135 APPLICATION USAGE

107136 The `-c` option should be used with caution when the input is a text file containing multi-byte  
107137 characters; it may produce output that does not start on a character boundary.

107138 Although the input file to *tail* can be any type, the results might not be what would be expected  
107139 on some character special device files or on file types not described by the System Interfaces  
107140 volume of POSIX.1-2008. Since this volume of POSIX.1-2008 does not specify the block size used  
107141 when doing input, *tail* need not read all of the data from devices that only perform block  
107142 transfers.

## 107143 EXAMPLES

107144 The `-f` option can be used to monitor the growth of a file that is being written by some other  
107145 process. For example, the command:

```
107146 tail -f fred
```

107147 prints the last ten lines of the file **fred**, followed by any lines that are appended to **fred** between  
107148 the time *tail* is initiated and killed. As another example, the command:

```
107149 tail -f -c 15 fred
```

107150 prints the last 15 bytes of the file **fred**, followed by any bytes that are appended to **fred** between  
107151 the time *tail* is initiated and killed.

## 107152 RATIONALE

107153 This version of *tail* was created to allow conformance to the Utility Syntax Guidelines. The  
107154 historical `-b` option was omitted because of the general non-portability of block-sized units of  
107155 text. The `-c` option historically meant “characters”, but this volume of POSIX.1-2008 indicates  
107156 that it means “bytes”. This was selected to allow reasonable implementations when multi-byte  
107157 characters are possible; it was not named `-b` to avoid confusion with the historical `-b`.

107158 The origin of counting both lines and bytes is 1, matching all widespread historical  
107159 implementations. Hence *tail -n +0* is not conforming usage because it attempts to output line  
107160 zero; but note that *tail -n 0* does conform, and outputs nothing.

107161 Earlier versions of this standard allowed the following forms in the SYNOPSIS:

```
107162 tail -[number] [b|c|l] [f] [file]
```

```
107163 tail +[number] [b|c|l] [f] [file]
```

107164 These forms are no longer specified by POSIX.1-2008, but may be present in some  
107165 implementations.

107166 The restriction on the internal buffer is a compromise between the historical System V  
107167 implementation of 4096 bytes and the BSD 32768 bytes.

107168 The `-f` option has been implemented as a loop that sleeps for 1 second and copies any bytes that  
107169 are available. This is sufficient, but if more efficient methods of determining when new data are  
107170 available are developed, implementations are encouraged to use them.

107171 Historical documentation indicates that *tail* ignores the `-f` option if the input file is a pipe (pipe  
107172 and FIFO on systems that support FIFOs). On BSD-based systems, this has been true; on System  
107173 V-based systems, this was true when input was taken from standard input, but it did not ignore  
107174 the `-f` flag if a FIFO was named as the *file* operand. Since the `-f` option is not useful on pipes and  
107175 all historical implementations ignore `-f` if no *file* operand is specified and standard input is a  
107176 pipe, this volume of POSIX.1-2008 requires this behavior. However, since the `-f` option is useful  
107177 on a FIFO, this volume of POSIX.1-2008 also requires that if a FIFO is named, the `-f` option shall  
107178 not be ignored. Earlier versions of this standard did not state any requirement for the case where  
107179 no *file* operand is specified and standard input is a FIFO. The standard has been updated to

107180 reflect current practice which is to treat this case the same as a pipe on standard input. Although  
107181 historical behavior does not ignore the `-f` option for other file types, this is unspecified so that  
107182 implementations are allowed to ignore the `-f` option if it is known that the file cannot be  
107183 extended.

107184 **FUTURE DIRECTIONS**

107185 None.

107186 **SEE ALSO**

107187 *head*

107188 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

107189 **CHANGE HISTORY**

107190 First released in Issue 2.

107191 **Issue 6**

107192 The obsolescent SYNOPSIS lines and associated text are removed.

107193 The normative text is reworded to avoid use of the term “must” for application requirements.

107194 **Issue 7**

107195 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that ‘+’ may be recognized  
107196 as an option delimiter in the OPTIONS section.

107197 Austin Group Interpretation 1003.1-2001 #092 is applied.

107198 Austin Group Interpretation 1003.1-2001 #100 is applied, adding the requirement on applications  
107199 that if the sign of the option-argument *number* is ‘+’, the *number* option-argument is a non-zero  
107200 decimal integer.

107201 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

107202 SD5-XCU-ERN-114 is applied, updating the OPTIONS section (the `-f` option).

107203 SD5-XCU-ERN-149 is applied.

107204 **NAME**

107205 talk — talk to another user

107206 **SYNOPSIS**107207 UP `talk address [terminal]`107208 **DESCRIPTION**107209 The *talk* utility is a two-way, screen-oriented communication program.107210 When first invoked, *talk* shall send a message similar to:

```
107211 Message from <unspecified string>
107212 talk: connection requested by your_address
107213 talk: respond with: talk your_address
```

107214 to the specified *address*. At this point, the recipient of the message can reply by typing:107215 `talk your_address`107216 Once communication is established, the two parties can type simultaneously, with their output  
107217 displayed in separate regions of the screen. Characters shall be processed as follows:

- 107218 • Typing the <alert> character shall alert the recipient's terminal.
- 107219 • Typing <control>-L shall cause the sender's screen regions to be refreshed.
- 107220 • Typing the erase and kill characters shall affect the sender's terminal in the manner  
107221 described by the **termios** interface in XBD [Chapter 11](#) (on page 199).
- 107222 • Typing the interrupt or end-of-file characters shall terminate the local *talk* utility. Once the  
107223 *talk* session has been terminated on one side, the other side of the *talk* session shall be  
107224 notified that the *talk* session has been terminated and shall be able to do nothing except  
107225 exit.
- 107226 • Typing characters from *LC\_CTYPE* classifications **print** or **space** shall cause those  
107227 characters to be sent to the recipient's terminal.
- 107228 • When and only when the *stty iexten* local mode is enabled, the existence and processing of  
107229 additional special control characters and multi-byte or single-byte functions shall be  
107230 implementation-defined.
- 107231 • Typing other non-printable characters shall cause implementation-defined sequences of  
107232 printable characters to be sent to the recipient's terminal.

107233 Permission to be a recipient of a *talk* message can be denied or granted by use of the *mesg* utility.  
107234 However, a user's privilege may further constrain the domain of accessibility of other users'  
107235 terminals. The *talk* utility shall fail when the user lacks appropriate privileges to perform the  
107236 requested action.

107237 Certain block-mode terminals do not have all the capabilities necessary to support the  
107238 simultaneous exchange of messages required for *talk*. When this type of exchange cannot be  
107239 supported on such terminals, the implementation may support an exchange with reduced levels  
107240 of simultaneous interaction or it may report an error describing the terminal-related deficiency.

107241 **OPTIONS**

107242 None.

107243 **OPERANDS**

107244 The following operands shall be supported:

107245 *address* The recipient of the *talk* session. One form of *address* is the *<user name>*, as returned  
 107246 by the *who* utility. Other address formats and how they are handled are  
 107247 unspecified.

107248 *terminal* If the recipient is logged in more than once, the *terminal* argument can be used to  
 107249 indicate the appropriate terminal name. If *terminal* is not specified, the *talk* message  
 107250 shall be displayed on one or more accessible terminals in use by the recipient. The  
 107251 format of *terminal* shall be the same as that returned by the *who* utility.

107252 **STDIN**

107253 Characters read from standard input shall be copied to the recipient's terminal in an unspecified  
 107254 manner. If standard input is not a terminal, *talk* shall write a diagnostic message and exit with a  
 107255 non-zero status.

107256 **INPUT FILES**

107257 None.

107258 **ENVIRONMENT VARIABLES**

107259 The following environment variables shall affect the execution of *talk*:

107260 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 107261 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 107262 variables used to determine the values of locale categories.)

107263 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 107264 internationalization variables.

107265 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 107266 characters (for example, single-byte as opposed to multi-byte characters in  
 107267 arguments and input files). If the recipient's locale does not use an *LC\_CTYPE*  
 107268 equivalent to the sender's, the results are undefined.

107269 *LC\_MESSAGES*

107270 Determine the locale that should be used to affect the format and contents of  
 107271 diagnostic messages written to standard error and informative messages written to  
 107272 standard output.

107273 *XSI* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

107274 *TERM* Determine the name of the invoker's terminal type. If this variable is unset or null,  
 107275 an unspecified default terminal type shall be used.

107276 **ASYNCHRONOUS EVENTS**

107277 When the *talk* utility receives a SIGINT signal, the utility shall terminate and exit with a zero  
 107278 status. It shall take the standard action for all other signals.

107279 **STDOUT**

107280 If standard output is a terminal, characters copied from the recipient's standard input may be  
 107281 written to standard output. Standard output also may be used for diagnostic messages. If  
 107282 standard output is not a terminal, *talk* shall exit with a non-zero status.

107283 **STDERR**

107284 None.

107285 **OUTPUT FILES**

107286 None.

107287 **EXTENDED DESCRIPTION**

107288 None.

107289 **EXIT STATUS**

107290 The following exit values shall be returned:

107291 0 Successful completion.

107292 >0 An error occurred or *talk* was invoked on a terminal incapable of supporting it.107293 **CONSEQUENCES OF ERRORS**

107294 Default.

107295 **APPLICATION USAGE**

107296 Because the handling of non-printable, non-`<space>` characters is tied to the *stty* description of  
 107297 **ixten**, implementation extensions within the terminal driver can be accessed. For example,  
 107298 some implementations provide line editing functions with certain control character sequences.

107299 **EXAMPLES**

107300 None.

107301 **RATIONALE**

107302 The *write* utility was included in this volume of POSIX.1-2008 since it can be implemented on all  
 107303 terminal types. The *talk* utility, which cannot be implemented on certain terminals, was  
 107304 considered to be a “better” communications interface. Both of these programs are in widespread  
 107305 use on historical implementations. Therefore, both utilities have been specified.

107306 All references to networking abilities (*talking* to a user on another system) were removed as  
 107307 being outside the scope of this volume of POSIX.1-2008.

107308 Historical BSD and System V versions of *talk* terminate both of the conversations when either  
 107309 user breaks out of the session. This can lead to adverse consequences if a user unwittingly  
 107310 continues to enter text that is interpreted by the shell when the other terminates the session.  
 107311 Therefore, the version of *talk* specified by this volume of POSIX.1-2008 requires both users to  
 107312 terminate their end of the session explicitly.

107313 Only messages sent to the terminal of the invoking user can be internationalized in any way:

- 107314 • The original “Message from `<unspecified string> ...`” message sent to the terminal of the  
 107315 recipient cannot be internationalized because the environment of the recipient is as yet  
 107316 inaccessible to the *talk* utility. The environment of the invoking party is irrelevant.
- 107317 • Subsequent communication between the two parties cannot be internationalized because  
 107318 the two parties may specify different languages in their environment (and non-portable  
 107319 characters cannot be mapped from one language to another).
- 107320 • Neither party can be required to communicate in a language other than C and/or the one  
 107321 specified by their environment because unavailable terminal hardware support (for  
 107322 example, fonts) may be required.

107323 The text in the STDOUT section reflects the usage of the verb “display” in this section; some *talk*  
 107324 implementations actually use standard output to write to the terminal, but this volume of  
 107325 POSIX.1-2008 does not require that to be the case.

107326 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*  
 107327 require that they all use or accept the same format.

107328 The handling of non-printable characters is partially implementation-defined because the details  
107329 of mapping them to printable sequences is not needed by the user. Historical implementations,  
107330 for security reasons, disallow the transmission of non-printable characters that may send  
107331 commands to the other terminal.

107332 **FUTURE DIRECTIONS**

107333 None.

107334 **SEE ALSO**

107337 **CHANGE HISTORY**

107338 First released in Issue 4.

107339 **Issue 6**

107340 This utility is marked as part of the User Portability Utilities option.

107341 **NAME**

107342 tee — duplicate standard input

107343 **SYNOPSIS**107344 tee [-ai] [*file...*]107345 **DESCRIPTION**107346 The *tee* utility shall copy standard input to standard output, making a copy in zero or more files.107347 The *tee* utility shall not buffer output.107348 If the **-a** option is not specified, output files shall be written (see [Section 1.1.1.4](#) (on page 2280)).107349 **OPTIONS**107350 The *tee* utility shall conform to XBD [Section 12.2](#) (on page 215).

107351 The following options shall be supported:

107352 **-a** Append the output to the files.107353 **-i** Ignore the SIGINT signal.107354 **OPERANDS**

107355 The following operands shall be supported:

107356 *file* A pathname of an output file. If a *file* operand is '-', it shall refer to a file named  
107357 -; implementations shall not treat it as meaning standard output. Processing of at  
107358 least 13 *file* operands shall be supported.107359 **STDIN**

107360 The standard input can be of any type.

107361 **INPUT FILES**

107362 None.

107363 **ENVIRONMENT VARIABLES**107364 The following environment variables shall affect the execution of *tee*:107365 *LANG* Provide a default value for the internationalization variables that are unset or null.  
107366 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
107367 variables used to determine the values of locale categories.)107368 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
107369 internationalization variables.107370 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
107371 characters (for example, single-byte as opposed to multi-byte characters in  
107372 arguments).107373 *LC\_MESSAGES*107374 Determine the locale that should be used to affect the format and contents of  
107375 diagnostic messages written to standard error.107376 *XSI NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.107377 **ASYNCHRONOUS EVENTS**107378 Default, except that if the **-i** option was specified, SIGINT shall be ignored.107379 **STDOUT**

107380 The standard output shall be a copy of the standard input.

107381 **STDERR**

107382 The standard error shall be used only for diagnostic messages.

107383 **OUTPUT FILES**

107384 If any *file* operands are specified, the standard input shall be copied to each named file.

107385 **EXTENDED DESCRIPTION**

107386 None.

107387 **EXIT STATUS**

107388 The following exit values shall be returned:

107389 0 The standard input was successfully copied to all output files.

107390 >0 An error occurred.

107391 **CONSEQUENCES OF ERRORS**

107392 If a write to any successfully opened *file* operand fails, writes to other successfully opened *file*  
107393 operands and standard output shall continue, but the exit status shall be non-zero. Otherwise,  
107394 the default actions specified in [Section 1.4](#) (on page 2288) apply.

107395 **APPLICATION USAGE**

107396 The *tee* utility is usually used in a pipeline, to make a copy of the output of some utility.

107397 The *file* operand is technically optional, but *tee* is no more useful than *cat* when none is specified.

107398 **EXAMPLES**

107399 Save an unsorted intermediate form of the data in a pipeline:

107400 `... | tee unsorted | sort > sorted`

107401 **RATIONALE**

107402 The buffering requirement means that *tee* is not allowed to use ISO C standard fully buffered or  
107403 line-buffered writes. It does not mean that *tee* has to do 1-byte reads followed by 1-byte writes.

107404 It should be noted that early versions of BSD ignore any invalid options and accept a single `'-'`  
107405 as an alternative to `-i`. They also print a message if unable to open a file:

107406 `"tee: cannot access %s\n", <pathname>`

107407 Historical implementations ignore write errors. This is explicitly not permitted by this volume of  
107408 POSIX.1-2008.

107409 Some historical implementations use `O_APPEND` when providing append mode; others use the  
107410 `lseek()` function to seek to the end-of-file after opening the file without `O_APPEND`. This volume  
107411 of POSIX.1-2008 requires functionality equivalent to using `O_APPEND`; see [Section 1.1.1.4](#) (on  
107412 page 2280).

107413 **FUTURE DIRECTIONS**

107414 None.

107419 **CHANGE HISTORY**

107420 First released in Issue 2.

107421 **Issue 6**

107422 IEEE PASC Interpretation 1003.2 #168 is applied.

107423 **Issue 7**

107424 Austin Group Interpretation 1003.1-2001 #092 is applied.

107425 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

107426 **NAME**

107427 test — evaluate expression

107428 **SYNOPSIS**107429 test [*expression*]107430 [ [*expression*] ]107431 **DESCRIPTION**

107432 The *test* utility shall evaluate the *expression* and indicate the result of the evaluation by its exit  
 107433 status. An exit status of zero indicates that the expression evaluated as true and an exit status of  
 107434 1 indicates that the expression evaluated as false.

107435 In the second form of the utility, which uses "[ ]" rather than *test*, the application shall ensure  
 107436 that the square brackets are separate arguments.

107437 **OPTIONS**

107438 The *test* utility shall not recognize the "--" argument in the manner specified by Guideline 10 in  
 107439 XBD [Section 12.2](#) (on page 215).

107440 No options shall be supported.

107441 **OPERANDS**

107442 The application shall ensure that all operators and elements of primaries are presented as  
 107443 separate arguments to the *test* utility.

107444 The following primaries can be used to construct *expression*:

107445 **-b *pathname*** True if *pathname* resolves to an existing directory entry for a block special file. False  
 107446 if *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 107447 for a file that is not a block special file.

107448 **-c *pathname*** True if *pathname* resolves to an existing directory entry for a character special file.  
 107449 False if *pathname* cannot be resolved, or if *pathname* resolves to an existing directory  
 107450 entry for a file that is not a character special file.

107451 **-d *pathname*** True if *pathname* resolves to an existing directory entry for a directory. False if  
 107452 *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 107453 for a file that is not a directory.

107454 **-e *pathname*** True if *pathname* resolves to an existing directory entry. False if *pathname* cannot be  
 107455 resolved.

107456 **-f *pathname*** True if *pathname* resolves to an existing directory entry for a regular file. False if  
 107457 *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 107458 for a file that is not a regular file.

107459 **-g *pathname*** True if *pathname* resolves to an existing directory entry for a file that has its set-  
 107460 group-ID flag set. False if *pathname* cannot be resolved, or if *pathname* resolves to an  
 107461 existing directory entry for a file that does not have its set-group-ID flag set.

107462 **-h *pathname*** True if *pathname* resolves to an existing directory entry for a symbolic link. False if  
 107463 *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 107464 for a file that is not a symbolic link. If the final component of *pathname* is a  
 107465 symbolic link, that symbolic link is not followed.

107466 **-L *pathname*** True if *pathname* resolves to an existing directory entry for a symbolic link. False if  
 107467 *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 107468 for a file that is not a symbolic link. If the final component of *pathname* is a  
 107469 symbolic link, that symbolic link is not followed.

|        |                                  |                                                                                                               |
|--------|----------------------------------|---------------------------------------------------------------------------------------------------------------|
| 107470 | <b>-n</b> <i>string</i>          | True if the length of <i>string</i> is non-zero; otherwise, false.                                            |
| 107471 | <b>-p</b> <i>pathname</i>        | True if <i>pathname</i> resolves to an existing directory entry for a FIFO. False if <i>pathname</i>          |
| 107472 |                                  | cannot be resolved, or if <i>pathname</i> resolves to an existing directory entry for a file                  |
| 107473 |                                  | that is not a FIFO.                                                                                           |
| 107474 | <b>-r</b> <i>pathname</i>        | True if <i>pathname</i> resolves to an existing directory entry for a file for which                          |
| 107475 |                                  | permission to read from the file will be granted, as defined in <a href="#">Section 1.1.1.4</a> (on           |
| 107476 |                                  | page 2280). False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to an                 |
| 107477 |                                  | existing directory entry for a file for which permission to read from the file will not                       |
| 107478 |                                  | be granted.                                                                                                   |
| 107479 | <b>-S</b> <i>pathname</i>        | True if <i>pathname</i> resolves to an existing directory entry for a socket. False if                        |
| 107480 |                                  | <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to an existing directory entry             |
| 107481 |                                  | for a file that is not a socket.                                                                              |
| 107482 | <b>-s</b> <i>pathname</i>        | True if <i>pathname</i> resolves to an existing directory entry for a file that has a size                    |
| 107483 |                                  | greater than zero. False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to an          |
| 107484 |                                  | existing directory entry for a file that does not have a size greater than zero.                              |
| 107485 | <b>-t</b> <i>file_descriptor</i> |                                                                                                               |
| 107486 |                                  | True if file descriptor number <i>file_descriptor</i> is open and is associated with a                        |
| 107487 |                                  | terminal. False if <i>file_descriptor</i> is not a valid file descriptor number, or if file                   |
| 107488 |                                  | descriptor number <i>file_descriptor</i> is not open, or if it is open but is not associated                  |
| 107489 |                                  | with a terminal.                                                                                              |
| 107490 | <b>-u</b> <i>pathname</i>        | True if <i>pathname</i> resolves to an existing directory entry for a file that has its set-                  |
| 107491 |                                  | user-ID flag set. False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to an           |
| 107492 |                                  | existing directory entry for a file that does not have its set-user-ID flag set.                              |
| 107493 | <b>-w</b> <i>pathname</i>        | True if <i>pathname</i> resolves to an existing directory entry for a file for which                          |
| 107494 |                                  | permission to write to the file will be granted, as defined in <a href="#">Section 1.1.1.4</a> (on page       |
| 107495 |                                  | 2280). False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to an existing             |
| 107496 |                                  | directory entry for a file for which permission to write to the file will not be                              |
| 107497 |                                  | granted.                                                                                                      |
| 107498 | <b>-x</b> <i>pathname</i>        | True if <i>pathname</i> resolves to an existing directory entry for a file for which                          |
| 107499 |                                  | permission to execute the file (or search it, if it is a directory) will be granted, as                       |
| 107500 |                                  | defined in <a href="#">Section 1.1.1.4</a> (on page 2280). False if <i>pathname</i> cannot be resolved, or if |
| 107501 |                                  | <i>pathname</i> resolves to an existing directory entry for a file for which permission to                    |
| 107502 |                                  | execute (or search) the file will not be granted.                                                             |
| 107503 | <b>-z</b> <i>string</i>          | True if the length of string <i>string</i> is zero; otherwise, false.                                         |
| 107504 | <i>string</i>                    | True if the string <i>string</i> is not the null string; otherwise, false.                                    |
| 107505 | <i>s1</i> = <i>s2</i>            | True if the strings <i>s1</i> and <i>s2</i> are identical; otherwise, false.                                  |
| 107506 | <i>s1</i> != <i>s2</i>           | True if the strings <i>s1</i> and <i>s2</i> are not identical; otherwise, false.                              |
| 107507 | <i>n1</i> <b>-eq</b> <i>n2</i>   | True if the integers <i>n1</i> and <i>n2</i> are algebraically equal; otherwise, false.                       |
| 107508 | <i>n1</i> <b>-ne</b> <i>n2</i>   | True if the integers <i>n1</i> and <i>n2</i> are not algebraically equal; otherwise, false.                   |
| 107509 | <i>n1</i> <b>-gt</b> <i>n2</i>   | True if the integer <i>n1</i> is algebraically greater than the integer <i>n2</i> ; otherwise, false.         |
| 107510 | <i>n1</i> <b>-ge</b> <i>n2</i>   | True if the integer <i>n1</i> is algebraically greater than or equal to the integer <i>n2</i> ;               |
| 107511 |                                  | otherwise, false.                                                                                             |

- 107512 *n1 -lt n2* True if the integer *n1* is algebraically less than the integer *n2*; otherwise, false.
- 107513 *n1 -le n2* True if the integer *n1* is algebraically less than or equal to the integer *n2*; otherwise,  
107514 false.
- 107515 OB XSI *expression1 -a expression2*  
107516 True if both *expression1* and *expression2* are true; otherwise, false. The *-a* binary  
107517 primary is left associative. It has a higher precedence than *-o*.
- 107518 OB XSI *expression1 -o expression2*  
107519 True if either *expression1* or *expression2* is true; otherwise, false. The *-o* binary  
107520 primary is left associative.
- 107521 With the exception of the *-h pathname* and *-L pathname* primaries, if a *pathname* argument is a  
107522 symbolic link, *test* shall evaluate the expression by resolving the symbolic link and using the file  
107523 referenced by the link.
- 107524 These primaries can be combined with the following operators:
- 107525 *! expression* True if *expression* is false. False if *expression* is true.
- 107526 OB XSI *( expression )* True if *expression* is true. False if *expression* is false. The parentheses can be used to  
107527 alter the normal precedence and associativity.
- 107528 The primaries with two elements of the form:
- 107529 *-primary\_operator primary\_operand*
- 107530 are known as *unary primaries*. The primaries with three elements in either of the two forms:
- 107531 *primary\_operand -primary\_operator primary\_operand*
- 107532 *primary\_operand primary\_operator primary\_operand*
- 107533 are known as *binary primaries*. Additional implementation-defined operators and  
107534 *primary\_operators* may be provided by implementations. They shall be of the form *-operator*  
107535 where the first character of *operator* is not a digit.
- 107536 The algorithm for determining the precedence of the operators and the return value that shall be  
107537 generated is based on the number of arguments presented to *test*. (However, when using the  
107538 "[...]" form, the <right-square-bracket> final argument shall not be counted in this  
107539 algorithm.)
- 107540 In the following list, \$1, \$2, \$3, and \$4 represent the arguments presented to *test*:
- 107541 0 arguments: Exit false (1).
- 107542 1 argument: Exit true (0) if \$1 is not null; otherwise, exit false.
- 107543 2 arguments:
- If \$1 is '!', exit true if \$2 is null, false if \$2 is not null.
  - If \$1 is a unary primary, exit true if the unary test is true, false if the unary test is false.
  - Otherwise, produce unspecified results.
- 107544
- 107545
- 107546
- 107547 3 arguments:
- If \$2 is a binary primary, perform the binary test of \$1 and \$3.
  - If \$1 is '!', negate the two-argument test of \$2 and \$3.
  - If \$1 is '( ' and \$3 is ') ', perform the unary test of \$2. On systems that  
107549 OB XSI do not support the XSI option, the results are unspecified if \$1 is '( '  
107550 and \$3 is ') '.
  - 107551

- 107552
- Otherwise, produce unspecified results.
- 107553 4 arguments:
- If \$1 is '!', negate the three-argument test of \$2, \$3, and \$4.
- 107554 OB XSI
- If \$1 is '(' and \$4 is ')', perform the two-argument test of \$2 and \$3.
- 107555 On systems that do not support the XSI option, the results are
- 107556 unspecified if \$1 is '(' and \$4 is ')'.  
 107557
- Otherwise, the results are unspecified.
- 107558 >4 arguments: The results are unspecified.
- 107559 OB XSI
- 107560 On XSI-conformant systems, combinations of primaries and operators shall be
- 107561 evaluated using the precedence and associativity rules described previously.
- 107562 In addition, the string comparison binary primaries '=' and '!=' shall have a higher precedence than any unary primary.
- 107563 **STDIN**
- 107564 Not used.
- 107565 **INPUT FILES**
- 107566 None.
- 107567 **ENVIRONMENT VARIABLES**
- 107568 The following environment variables shall affect the execution of *test*:
- 107569 *LANG* Provide a default value for the internationalization variables that are unset or null.
- 107570 (See XBD Section 8.2 (on page 174) for the precedence of internationalization
- 107571 variables used to determine the values of locale categories.)
- 107572 *LC\_ALL* If set to a non-empty string value, override the values of all the other
- 107573 internationalization variables.
- 107574 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
- 107575 characters (for example, single-byte as opposed to multi-byte characters in
- 107576 arguments).
- 107577 *LC\_MESSAGES*
- 107578 Determine the locale that should be used to affect the format and contents of
- 107579 diagnostic messages written to standard error.
- 107580 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 107581 **ASYNCHRONOUS EVENTS**
- 107582 Default.
- 107583 **STDOUT**
- 107584 Not used.
- 107585 **STDERR**
- 107586 The standard error shall be used only for diagnostic messages.
- 107587 **OUTPUT FILES**
- 107588 None.
- 107589 **EXTENDED DESCRIPTION**
- 107590 None.

107591 **EXIT STATUS**

107592 The following exit values shall be returned:

107593 0 *expression* evaluated to true.

107594 1 *expression* evaluated to false or *expression* was missing.

107595 >1 An error occurred.

107596 **CONSEQUENCES OF ERRORS**

107597 Default.

107598 **APPLICATION USAGE**

107599 The XSI extensions specifying the `-a` and `-o` binary primaries and the `' ( ' and ' ) '` operators  
107600 have been marked obsolescent. (Many expressions using them are ambiguously defined by the  
107601 grammar depending on the specific expressions being evaluated.) Scripts using these  
107602 expressions should be converted to the forms given below. Even though many implementations  
107603 will continue to support these obsolescent forms, scripts should be extremely careful when  
107604 dealing with user-supplied input that could be confused with these and other primaries and  
107605 operators. Unless the application developer knows all the cases that produce input to the script,  
107606 invocations like:

```
107607 test "$1" -a "$2"
```

107608 should be written as:

```
107609 test "$1" && test "$2"
```

107610 to avoid problems if a user supplied values such as \$1 set to `' ! '` and \$2 set to the null string.  
107611 That is, in cases where maximal portability is of concern, replace:

```
107612 test expr1 -a expr2
```

107613 with:

```
107614 test expr1 && test expr2
```

107615 and replace:

```
107616 test expr1 -o expr2
```

107617 with:

```
107618 test expr1 || test expr2
```

107619 but note that, in *test*, `-a` has higher precedence than `-o` while `"&&"` and `"||"` have equal  
107620 precedence in the shell.

107621 Parentheses or braces can be used in the shell command language to effect grouping.

107622 Parentheses must be escaped when using *sh*; for example:

```
107623 test \( expr1 -a expr2 \) -o expr3
```

107624 This command is not always portable even on XSI-conformant systems depending on the  
107625 expressions specified by *expr1*, *expr2*, and *expr3*. The following form can be used instead:

```
107626 ( test expr1 && test expr2 ) || test expr3
```

107627 The two commands:

```
107628 test "$1"
```

```
107629 test ! "$1"
```

107630 could not be used reliably on some historical systems. Unexpected results would occur if such a  
 107631 *string* expression were used and \$1 expanded to '!', '(', or a known unary primary. Better  
 107632 constructs are:

```
107633 test -n "$1"
107634 test -z "$1"
```

107635 respectively.

107636 Historical systems have also been unreliable given the common construct:

```
107637 test "$response" = "expected string"
```

107638 One of the following is a more reliable form:

```
107639 test "X$response" = "Xexpected string"
107640 test "expected string" = "$response"
```

107641 Note that the second form assumes that *expected string* could not be confused with any unary  
 107642 primary. If *expected string* starts with '-', '(', '!', or even '=', the first form should be used  
 107643 instead. Using the preceding rules without the XSI marked extensions, any of the three  
 107644 comparison forms is reliable, given any input. (However, note that the strings are quoted in all  
 107645 cases.)

107646 Because the string comparison binary primaries, '=' and '!=', have a higher precedence than  
 107647 any unary primary in the greater than 4 argument case, unexpected results can occur if  
 107648 arguments are not properly prepared. For example, in:

```
107649 test -d $1 -o -d $2
```

107650 If \$1 evaluates to a possible directory name of '=', the first three arguments are considered a  
 107651 string comparison, which shall cause a syntax error when the second -d is encountered. One of  
 107652 the following forms prevents this; the second is preferred:

```
107653 test \( -d "$1" \) -o \( -d "$2" \)
107654 test -d "$1" || test -d "$2"
```

107655 Also in the greater than 4 argument case:

```
107656 test "$1" = "bat" -a "$2" = "ball"
```

107657 syntax errors occur if \$1 evaluates to ' (' or '!'. One of the following forms prevents this; the  
 107658 third is preferred:

```
107659 test "X$1" = "Xbat" -a "X$2" = "Xball"
107660 test "$1" = "bat" && test "$2" = "ball"
107661 test "X$1" = "Xbat" && test "X$2" = "Xball"
```

## 107662 EXAMPLES

107663 1. Exit if there are not two or three arguments (two variations):

```
107664 if [ $# -ne 2 ] && [ $# -ne 3 ]; then exit 1; fi
107665 if [ $# -lt 2 ] || [ $# -gt 3 ]; then exit 1; fi
```

107666 2. Perform a *mkdir* if a directory does not exist:

```
107667 test ! -d tempdir && mkdir tempdir
```

107668 3. Wait for a file to become non-readable:

```
107669 while test -r thefile
107670 do
```

```

107671         sleep 30
107672     done
107673     echo ' "thefile" is no longer readable'
107674
107675     4. Perform a command if the argument is one of three strings (two variations):
107676
107677     if [ "$1" = "pear" ] || [ "$1" = "grape" ] || [ "$1" = "apple" ]
107678     then
107679         command
107680     fi
107681
107682     case "$1" in
107683         pear|grape|apple) command ;;
107684     esac

```

#### 107682 RATIONALE

107683 The KornShell-derived conditional command (double bracket [[ ]] was removed from the shell  
 107684 command language description in an early proposal. Objections were raised that the real  
 107685 problem is misuse of the *test* command (!), and putting it into the shell is the wrong way to fix  
 107686 the problem. Instead, proper documentation and a new shell reserved word (!) are sufficient.

107687 Tests that require multiple *test* operations can be done at the shell level using individual  
 107688 invocations of the *test* command and shell logicals, rather than using the error-prone *-o* flag of  
 107689 *test*.

107690 XSI-conformant systems support more than four arguments.

107691 XSI-conformant systems support the combining of primaries with the following constructs:

107692 *expression1 -a expression2*  
 107693 True if both *expression1* and *expression2* are true.

107694 *expression1 -o expression2*  
 107695 True if at least one of *expression1* and *expression2* are true.

107696 (*expression*)  
 107697 True if *expression* is true.

107698 In evaluating these more complex combined expressions, the following precedence rules are  
 107699 used:

- 107700 • The unary primaries have higher precedence than the algebraic binary primaries.
- 107701 • The unary primaries have lower precedence than the string binary primaries.
- 107702 • The unary and binary primaries have higher precedence than the unary *string* primary.
- 107703 • The ! operator has higher precedence than the *-a* operator, and the *-a* operator has higher  
 107704 precedence than the *-o* operator.
- 107705 • The *-a* and *-o* operators are left associative.
- 107706 • The parentheses can be used to alter the normal precedence and associativity.

107707 The BSD and System V versions of *-f* are not the same. The BSD definition was:

107708 *-f file* True if *file* exists and is not a directory.

107709 The SVID version (true if the file exists and is a regular file) was chosen for this volume of  
 107710 POSIX.1-2008 because its use is consistent with the *-b*, *-c*, *-d*, and *-p* operands (*file* exists and is  
 107711 a specific file type).

107712 The `-e` primary, possessing similar functionality to that provided by the C shell, was added  
 107713 because it provides the only way for a shell script to find out if a file exists without trying to  
 107714 open the file. Since implementations are allowed to add additional file types, a portable script  
 107715 cannot use:

```
107716 test -b foo -o -c foo -o -d foo -o -f foo -o -p foo
```

107717 to find out if `foo` is an existing file. On historical BSD systems, the existence of a file could be  
 107718 determined by:

```
107719 test -f foo -o -d foo
```

107720 but there was no easy way to determine that an existing file was a regular file. An early proposal  
 107721 used the KornShell `-a` primary (with the same meaning), but this was changed to `-e` because  
 107722 there were concerns about the high probability of humans confusing the `-a` primary with the `-a`  
 107723 binary operator.

107724 The following options were not included in this volume of POSIX.1-2008, although they are  
 107725 provided by some implementations. These operands should not be used by new  
 107726 implementations for other purposes:

107727 `-k file` True if *file* exists and its sticky bit is set.

107728 `-C file` True if *file* is a contiguous file.

107729 `-V file` True if *file* is a version file.

107730 The following option was not included because it was undocumented in most implementations,  
 107731 has been removed from some implementations (including System V), and the functionality is  
 107732 provided by the shell (see [Section 2.6.2](#) (on page 2306)).

107733 `-l string` The length of the string *string*.

107734 The `-b`, `-c`, `-g`, `-p`, `-u`, and `-x` operands are derived from the SVID; historical BSD does not  
 107735 provide them. The `-k` operand is derived from System V; historical BSD does not provide it.

107736 On historical BSD systems, `test -w directory` always returned false because `test` tried to open the  
 107737 directory for writing, which always fails.

107738 Some additional primaries newly invented or from the KornShell appeared in an early proposal  
 107739 as part of the conditional command (`[[ ]]`): `s1 > s2`, `s1 < s2`, `str = pattern`, `str != pattern`, `f1 -nt f2`, `f1`  
 107740 `-ot f2`, and `f1 -ef f2`. They were not carried forward into the `test` utility when the conditional  
 107741 command was removed from the shell because they have not been included in the `test` utility  
 107742 built into historical implementations of the `sh` utility.

107743 The `-t file_descriptor` primary is shown with a mandatory argument because the grammar is  
 107744 ambiguous if it can be omitted. Historical implementations have allowed it to be omitted,  
 107745 providing a default of 1.

#### 107746 FUTURE DIRECTIONS

107747 None.

#### 107748 SEE ALSO

107749 [Section 1.1.1.4](#) (on page 2280), `find`

107750 [XBD Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

107751 **CHANGE HISTORY**

107752 First released in Issue 2.

107753 **Issue 5**

107754 The FUTURE DIRECTIONS section is added.

107755 **Issue 6**

107756 The **-h** operand is added for symbolic links, and access permission requirements are clarified for  
107757 the **-r**, **-w**, and **-x** operands to align with the IEEE P1003.2b draft standard.

107758 The normative text is reworded to avoid use of the term “must” for application requirements.

107759 The **-L** and **-S** operands are added for symbolic links and sockets.

107760 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/38 is applied, adding XSI margin  
107761 marking and shading to a line in the OPERANDS section referring to the use of parentheses as  
107762 arguments to the *test* utility.

107763 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/30 is applied, rewording the existence  
107764 primaries for the *test* utility.

107765 **Issue 7**

107766 Austin Group Interpretation 1003.1-2001 #107 is applied.

107767 **NAME**

107768 time — time a simple command

107769 **SYNOPSIS**107770 time [-p] *utility* [*argument...*]107771 **DESCRIPTION**

107772 The *time* utility shall invoke the utility named by the *utility* operand with arguments supplied as  
 107773 the *argument* operands and write a message to standard error that lists timing statistics for the  
 107774 utility. The message shall include the following information:

- 107775 • The elapsed (real) time between invocation of *utility* and its termination.
- 107776 • The User CPU time, equivalent to the sum of the *tms\_utime* and *tms\_cutime* fields returned  
 107777 by the *times()* function defined in the System Interfaces volume of POSIX.1-2008 for the  
 107778 process in which *utility* is executed.
- 107779 • The System CPU time, equivalent to the sum of the *tms\_stime* and *tms\_cstime* fields  
 107780 returned by the *times()* function for the process in which *utility* is executed.

107781 The precision of the timing shall be no less than the granularity defined for the size of the clock  
 107782 tick unit on the system, but the results shall be reported in terms of standard time units (for  
 107783 example, 0.02 seconds, 00:00:00.02, 1m33.75s, 365.21 seconds), not numbers of clock ticks.

107784 When *time* is used as part of a pipeline, the times reported are unspecified, except when it is the  
 107785 sole command within a grouping command (see [Section 2.9.4.1](#), on page 2321) in that pipeline.  
 107786 For example, the commands on the left are unspecified; those on the right report on utilities **a**  
 107787 and **c**, respectively:

```
107788 time a | b | c      { time a; } | b | c
107789 a | b | time c     a | b | (time c)
```

107790 **OPTIONS**107791 The *time* utility shall conform to XBD [Section 12.2](#) (on page 215).

107792 The following option shall be supported:

107793 **-p** Write the timing output to standard error in the format shown in the STDERR  
 107794 section.

107795 **OPERANDS**

107796 The following operands shall be supported:

107797 *utility* The name of a utility that is to be invoked. If the *utility* operand names any of the  
 107798 special built-in utilities in [Section 2.14](#) (on page 2334), the results are undefined.

107799 *argument* Any string to be supplied as an argument when invoking the utility named by the  
 107800 *utility* operand.

107801 **STDIN**

107802 Not used.

107803 **INPUT FILES**

107804 None.

107805 **ENVIRONMENT VARIABLES**107806 The following environment variables shall affect the execution of *time*:

107807 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 107808 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 107809 variables used to determine the values of locale categories.)

|        |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 107810 | <i>LC_ALL</i>                 | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 107811 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 107812 | <i>LC_CTYPE</i>               | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).                                                                                                                                                                                                                                                                                                                                                                                                     |

| 107832 |                               | where each floating-point number shall be expressed in seconds. The precision used may be less than the default six digits of %f, but shall be sufficiently precise to accommodate the size of the clock tick on the system (for example, if there were 60 clock ticks per second, at least two digits shall follow the radix character). The number of digits following the radix character shall be no less than one, even if this always results in a trailing zero. The implementation may append white space and additional information following the format shown here. |

| 107847 | 127                           | The utility specified by <i>utility</i> could not be found.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 107848 | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 107849 |                               | Default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

107850 **APPLICATION USAGE**

107851 The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if  
 107852 an error occurs so that applications can distinguish “failure to find a utility” from “invoked  
 107853 utility exited with an error indication”. The value 127 was chosen because it is not commonly  
 107854 used for other meanings; most utilities use small values for “normal error conditions” and the  
 107855 values above 128 can be confused with termination due to receipt of a signal. The value 126 was  
 107856 chosen in a similar manner to indicate that the utility could be found, but not invoked. Some  
 107857 scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
 107858 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
 107859 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
 107860 any other reason.

107861 **EXAMPLES**

107862 It is frequently desirable to apply *time* to pipelines or lists of commands. This can be done by  
 107863 placing pipelines and command lists in a single file; this file can then be invoked as a utility, and  
 107864 the *time* applies to everything in the file.

107865 Alternatively, the following command can be used to apply *time* to a complex command:

```
107866 time sh -c 'complex-command-line'
```

107867 **RATIONALE**

107868 When the *time* utility was originally proposed to be included in the ISO POSIX-2:1993 standard,  
 107869 questions were raised about its suitability for inclusion on the grounds that it was not useful for  
 107870 conforming applications, specifically:

- 107871 • The underlying CPU definitions from the System Interfaces volume of POSIX.1-2008 are  
 107872 vague, so the numeric output could not be compared accurately between systems or even  
 107873 between invocations.
- 107874 • The creation of portable benchmark programs was outside the scope this volume of  
 107875 POSIX.1-2008.

107876 However, *time* does fit in the scope of user portability. Human judgement can be applied to the  
 107877 analysis of the output, and it could be very useful in hands-on debugging of applications or in  
 107878 providing subjective measures of system performance. Hence it has been included in this  
 107879 volume of POSIX.1-2008.

107880 The default output format has been left unspecified because historical implementations differ  
 107881 greatly in their style of depicting this numeric output. The `-p` option was invented to provide  
 107882 scripts with a common means of obtaining this information.

107883 In the KornShell, *time* is a shell reserved word that can be used to time an entire pipeline, rather  
 107884 than just a simple command. The POSIX definition has been worded to allow this  
 107885 implementation. Consideration was given to invalidating this approach because of the historical  
 107886 model from the C shell and System V shell. However, since the System V *time* utility historically  
 107887 has not produced accurate results in pipeline timing (because the constituent processes are not  
 107888 all owned by the same parent process, as allowed by POSIX), it did not seem worthwhile to  
 107889 break historical KornShell usage.

107890 The term *utility* is used, rather than *command*, to highlight the fact that shell compound  
 107891 commands, pipelines, special built-ins, and so on, cannot be used directly. However, *utility*  
 107892 includes user application programs and shell scripts, not just the standard utilities.

107893 **FUTURE DIRECTIONS**

107894 None.

107895 **SEE ALSO**107896 [Chapter 2](#) (on page 2297), *sh*107897 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)107898 XSH *times()*107899 **CHANGE HISTORY**

107900 First released in Issue 2.

107901 **Issue 6**

107902 This utility is marked as part of the User Portability Utilities option.

107903 **Issue 7**107904 The *time* utility is moved from the User Portability Utilities option to the Base. User Portability  
107905 Utilities is now an option for interactive utilities.

107906 SD5-XCU-ERN-115 is applied, updating the example in the DESCRIPTION.

107907 **NAME**

107908 touch — change file access and modification times

107909 **SYNOPSIS**107910 touch [-acm] [-r *ref\_file*|-t *time*|-d *date\_time*] *file*...107911 **DESCRIPTION**107912 The *touch* utility shall change the last data modification timestamps, the last data access  
107913 timestamps, or both.107914 The time used can be specified by the **-t** *time* option-argument, the corresponding *time* fields of  
107915 the file referenced by the **-r** *ref\_file* option-argument, or the **-d** *date\_time* option-argument, as  
107916 specified in the following sections. If none of these are specified, *touch* shall use the current time.107917 For each *file* operand, *touch* shall perform actions equivalent to the following functions defined  
107918 in the System Interfaces volume of POSIX.1-2008:

- 107919 1. If *file* does not exist:
  - 107920 a. The *creat()* function is called with the following arguments:
    - 107921 — The *file* operand is used as the *path* argument.
    - 107922 — The value of the bitwise-inclusive OR of S\_IRUSR, S\_IWUSR, S\_IRGRP,  
107923 S\_IWGRP, S\_IROTH, and S\_IWOTH is used as the *mode* argument.
  - 107924 b. The *futimens()* function is called with the following arguments:
    - 107925 — The file descriptor opened in step 1a.
    - 107926 — The access time and the modification time, set as described in the OPTIONS  
107927 section, are used as the first and second elements of the *times* array argument,  
107928 respectively.
- 107929 2. If *file* exists, the *utimensat()* function is called with the following arguments:
  - 107930 a. The AT\_FDCWD special value is used as the *fd* argument.
  - 107931 b. The *file* operand is used as the *path* argument.
  - 107932 c. The access time and the modification time, set as described in the OPTIONS  
107933 section, are used as the first and second elements of the *times* array argument,  
107934 respectively.
  - 107935 d. The *flag* argument is set to zero.

107936 **OPTIONS**107937 The *touch* utility shall conform to XBD [Section 12.2](#) (on page 215).

107938 The following options shall be supported:

- 107939 **-a** Change the access time of *file*. Do not change the modification time unless **-m** is  
107940 also specified.
- 107941 **-c** Do not create a specified *file* if it does not exist. Do not write any diagnostic  
107942 messages concerning this condition.
- 107943 **-d** *date\_time* Use the specified *date\_time* instead of the current time. The option-argument shall  
107944 be a string of the form:  
107945 `YYYY-MM-DDThh:mm:SS[.frac][tz]`  
107946 or:

107947 `YYYY-MM-DDThh:mm:SS[,frac][tz]`

107948 where:

- 107949 • YYYY are at least four decimal digits giving the year.
- 107950 • MM, DD, hh, mm, and SS are as with `-t time`.
- 107951 • T is the time designator, and can be replaced by a single <space>.
- 107952 • [.frac] and [,frac] are either empty, or a <period> ( '.' ) or a <comma>
- 107953 ( ',' ) respectively, followed by one or more decimal digits, specifying a
- 107954 fractional second.
- 107955 • [tz] is either empty, signifying local time, or the letter ' Z ' , signifying UTC.
- 107956 If [tz] is empty, the resulting time shall be affected by the value of the TZ
- 107957 environment variable.

107958 If the resulting time precedes the Epoch, the behavior is implementation-defined. If

107959 the time cannot be represented as the file's timestamp, *touch* shall exit immediately

107960 with an error status.

107961 **-m** Change the modification time of *file*. Do not change the access time unless **-a** is

107962 also specified.

107963 **-r ref\_file** Use the corresponding time of the file named by the pathname *ref\_file* instead of

107964 the current time.

107965 **-t time** Use the specified *time* instead of the current time. The option-argument shall be a

107966 decimal number of the form:

107967 `[[CC]YY]MMDDhhmm[.SS]`

107968 where each two digits represents the following:

107969 *MM* The month of the year [01,12].

107970 *DD* The day of the month [01,31].

107971 *hh* The hour of the day [00,23].

107972 *mm* The minute of the hour [00,59].

107973 *CC* The first two digits of the year (the century).

107974 *YY* The second two digits of the year.

107975 *SS* The second of the minute [00,60].

107976 Both *CC* and *YY* shall be optional. If neither is given, the current year shall be

107977 assumed. If *YY* is specified, but *CC* is not, *CC* shall be derived as follows:

| If YY is: | CC becomes: |
|-----------|-------------|
| [69,99]   | 19          |
| [00,68]   | 20          |

107981 **Note:** It is expected that in a future version of this standard the default century inferred

107982 from a 2-digit year will change. (This would apply to all commands accepting a

107983 2-digit year as input.)

107984 The resulting time shall be affected by the value of the *TZ* environment variable. If

107985 the resulting time value precedes the Epoch, the behavior is implementation-

107986 defined. If the time is out of range for the file's timestamp, *touch* shall exit

107987 immediately with an error status. The range of valid times past the Epoch is  
 107988 implementation-defined, but it shall extend to at least the time 0 hours, 0 minutes,  
 107989 0 seconds, January 1, 2038, Coordinated Universal Time. Some implementations  
 107990 may not be able to represent dates beyond January 18, 2038, because they use  
 107991 **signed int** as a time holder.

107992 The range for *SS* is [00,60] rather than [00,59] because of leap seconds. If *SS* is 60,  
 107993 and the resulting time, as affected by the *TZ* environment variable, does not refer  
 107994 to a leap second, the resulting time shall be one second after a time where *SS* is 59.  
 107995 If *SS* is not given a value, it is assumed to be zero.

107996 If neither the **-a** nor **-m** options were specified, *touch* shall behave as if both the **-a** and **-m**  
 107997 options were specified.

#### 107998 OPERANDS

107999 The following operands shall be supported:

108000 *file* A pathname of a file whose times shall be modified.

#### 108001 STDIN

108002 Not used.

#### 108003 INPUT FILES

108004 None.

#### 108005 ENVIRONMENT VARIABLES

108006 The following environment variables shall affect the execution of *touch*:

108007 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 108008 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 108009 variables used to determine the values of locale categories.)

108010 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 108011 internationalization variables.

108012 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 108013 characters (for example, single-byte as opposed to multi-byte characters in  
 108014 arguments).

108015 *LC\_MESSAGES*

108016 Determine the locale that should be used to affect the format and contents of  
 108017 diagnostic messages written to standard error.

108018 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

108019 *TZ* Determine the timezone to be used for interpreting the *time* option-argument. If *TZ*  
 108020 is unset or null, an unspecified default timezone shall be used.

#### 108021 ASYNCHRONOUS EVENTS

108022 Default.

#### 108023 STDOUT

108024 Not used.

#### 108025 STDERR

108026 The standard error shall be used only for diagnostic messages.

108027 **OUTPUT FILES**

108028 None.

108029 **EXTENDED DESCRIPTION**

108030 None.

108031 **EXIT STATUS**

108032 The following exit values shall be returned:

108033 0 The utility executed successfully and all requested changes were made.

108034 &gt;0 An error occurred.

108035 **CONSEQUENCES OF ERRORS**

108036 Default.

108037 **APPLICATION USAGE**

108038 The interpretation of time is taken to be *seconds since the Epoch* (see XBD Section 4.15, on page  
 108039 113). It should be noted that implementations conforming to the System Interfaces volume of  
 108040 POSIX.1-2008 do not take leap seconds into account when computing seconds since the Epoch.  
 108041 When *SS=60* is used, the resulting time always refers to 1 plus *seconds since the Epoch* for a time  
 108042 when *SS=59*.

108043 Although the *-t time* option-argument specifies values in 1969, the access time and modification  
 108044 time fields are defined in terms of seconds since the Epoch (00:00:00 on 1 January 1970 UTC).  
 108045 Therefore, depending on the value of *TZ* when *touch* is run, there is never more than a few valid  
 108046 hours in 1969 and there need not be any valid times in 1969.

108047 One ambiguous situation occurs if *-t time* is not specified, *-r ref\_file* is not specified, and the first  
 108048 operand is an eight or ten-digit decimal number. A portable script can avoid this problem by  
 108049 using:

108050 `touch -- file`

108051 or:

108052 `touch ./file`

108053 in this case.

108054 If the *T* time designator is replaced by a <space> for the *-d date\_time* option-argument, the  
 108055 <space> must be quoted to prevent the shell from splitting the argument.

108056 **EXAMPLES**

108057 Create or update a file called **dwc**; the resulting file has both the last data modification and last  
 108058 data access timestamps set to November 12, 2007 at 10:15:30 local time:

108059 `touch -d 2007-11-12T10:15:30 dwc`

108060 Create or update a file called **nick**; the resulting file has both the last data modification and last  
 108061 data access timestamps set to November 12, 2007 at 10:15:30 UTC:

108062 `touch -d 2007-11-12T10:15:30Z nick`

108063 Create or update a file called **gwc**; the resulting file has both the last data modification and last  
 108064 data access timestamps set to November 12, 2007 at 10:15:30 local time with a fractional second  
 108065 timestamp of .002 seconds:

108066 `touch -d 2007-11-12T10:15:30,002 gwc`

108067 Create or update a file called **ajosey**; the resulting file has both the last data modification and  
 108068 last data access timestamps set to November 12, 2007 at 10:15:30 UTC with a fractional second

108069 timestamp of .002 seconds:

```
108070 touch -d "2007-11-12 10:15:30.002Z" ajosey
```

108071 Create or update a file called **cathy**; the resulting file has both the last data modification and last  
108072 data access timestamps set to November 12, 2007 at 10:15:00 local time:

```
108073 touch -t 200711121015 cathy
```

108074 Create or update a file called **drepper**; the resulting file has both the last data modification and  
108075 last data access timestamps set to November 12, 2007 at 10:15:30 local time:

```
108076 touch -t 200711121015.30 drepper
```

108077 Create or update a file called **ebb9**; the resulting file has both the last data modification and last  
108078 data access timestamps set to November 12, 2007 at 10:15:30 local time:

```
108079 touch -t 0711121015.30 ebb9
```

108080 Create or update a file called **eggert**; the resulting file has the last data access timestamp set to  
108081 the corresponding time of the file named **mark** instead of the current time. If the file exists, the  
108082 last data modification time is not changed:

```
108083 touch -a -r mark eggert
```

#### 108084 RATIONALE

108085 The functionality of *touch* is described almost entirely through references to functions in the  
108086 System Interfaces volume of POSIX.1-2008. In this way, there is no duplication of effort required  
108087 for describing such side-effects as the relationship of user IDs to the user database, permissions,  
108088 and so on.

108089 There are some significant differences between the *touch* utility in this volume of POSIX.1-2008  
108090 and those in System V and BSD systems. They are upwards-compatible for historical  
108091 applications from both implementations:

- 108092 1. In System V, an ambiguity exists when a pathname that is a decimal number leads the  
108093 operands; it is treated as a time value. In BSD, no *time* value is allowed; files may only be  
108094 *touched* to the current time. The `-t time` construct solves these problems for future  
108095 conforming applications (note that the `-t` option is not historical practice).
- 108096 2. The inclusion of the century digits, *CC*, is also new. Note that a ten-digit *time* value is  
108097 treated as if *YY*, and not *CC*, were specified. The caveat about the range of dates  
108098 following the Epoch was included as recognition that some implementations are not able  
108099 to represent dates beyond 18 January 2038 because they use **signed int** as a time holder.

108100 The `-r` option was added because several comments requested this capability. This option was  
108101 named `-f` in an early proposal, but was changed because the `-f` option is used in the BSD  
108102 version of *touch* with a different meaning.

108103 At least one historical implementation of *touch* incremented the exit code if `-c` was specified and  
108104 the file did not exist. This volume of POSIX.1-2008 requires exit status zero if no errors occur.

108105 In previous version of the standard, if at least two operands are specified, and the first operand  
108106 is an eight or ten-digit decimal integer, the first operand was assumed to be a *date\_time* operand.  
108107 This usage was removed in this version of the standard since it had been marked obsolescent  
108108 previously.

108109 The `-d date_time` format is an ISO 8601:2004 standard complete representation of date and time  
108110 extended format with an optional decimal point or <comma> followed by a string of digits  
108111 following the seconds portion to specify fractions of a second. It is not necessary to recognize

108112 " [+/-] hh:mm" and " [+/-] hh" to specify timezones other than local time and UTC. The *T*  
108113 time designator in the ISO 8601:2004 standard extended format may be replaced by <space>.

108114 **FUTURE DIRECTIONS**

108115 None.

108120 **CHANGE HISTORY**

108121 First released in Issue 2.

108122 **Issue 6**

108123 The obsolescent *date\_time* operand is removed.

108124 The Open Group Corrigendum U027/1 is applied. This extends the range of valid time past the  
108125 Epoch to at least the time 0 hours, 0 minutes, 0 seconds, January 1, 2038, Coordinated Universal  
108126 Time. This is a new requirement on POSIX implementations.

108127 The range for seconds is changed from [00,61] to [00,60] to align with the ISO/IEC 9899:1999  
108128 standard, and to allow for positive leap seconds.

108129 **Issue 7**

108130 Austin Group Interpretation 1003.1-2001 #118 is applied.

108131 Austin Group Interpretation 1003.1-2001 #193 is applied, adding support for subsecond  
108132 timestamps.

108133 SD5-XCU-ERN-45 is applied, adding a new paragraph to the RATIONALE.

108134 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

108135 SD5-XCU-ERN-110 is applied, updating the OPTIONS section.

108136 Changes are made related to support for finegrained timestamps.

108137 **NAME**

108138 tput — change terminal characteristics

108139 **SYNOPSIS**108140 tput [-T *type*] *operand*...108141 **DESCRIPTION**

108142 The *tput* utility shall display terminal-dependent information. The manner in which this  
 108143 information is retrieved is unspecified. The information displayed shall clear the terminal  
 108144 screen, initialize the user's terminal, or reset the user's terminal, depending on the operand  
 108145 given. The exact consequences of displaying this information are unspecified.

108146 **OPTIONS**108147 The *tput* utility shall conform to XBD [Section 12.2](#) (on page 215).

108148 The following option shall be supported:

108149 **-T *type*** Indicate the type of terminal. If this option is not supplied and the *TERM* variable  
 108150 is unset or null, an unspecified default terminal type shall be used. The setting of  
 108151 *type* shall take precedence over the value in *TERM*.

108152 **OPERANDS**

108153 The following strings shall be supported as operands by the implementation in the POSIX locale:

108154 **clear** Display the clear-screen sequence.

108155 **init** Display the sequence that initializes the user's terminal in an implementation-  
 108156 defined manner.

108157 **reset** Display the sequence that resets the user's terminal in an implementation-defined  
 108158 manner.

108159 If a terminal does not support any of the operations described by these operands, this shall not  
 108160 be considered an error condition.

108161 **STDIN**

108162 Not used.

108163 **INPUT FILES**

108164 None.

108165 **ENVIRONMENT VARIABLES**108166 The following environment variables shall affect the execution of *tput*:

108167 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 108168 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 108169 variables used to determine the values of locale categories.)

108170 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 108171 internationalization variables.

108172 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 108173 characters (for example, single-byte as opposed to multi-byte characters in  
 108174 arguments).

108175 **LC\_MESSAGES**

108176 Determine the locale that should be used to affect the format and contents of  
 108177 diagnostic messages written to standard error.

108178 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

108179 **TERM** Determine the terminal type. If this variable is unset or null, and if the **-T** option is  
108180 not specified, an unspecified default terminal type shall be used.

108181 **ASYNCHRONOUS EVENTS**

108182 Default.

108183 **STDOUT**

108184 If standard output is a terminal device, it may be used for writing the appropriate sequence to  
108185 clear the screen or reset or initialize the terminal. If standard output is not a terminal device,  
108186 undefined results occur.

108187 **STDERR**

108188 The standard error shall be used only for diagnostic messages.

108189 **OUTPUT FILES**

108190 None.

108191 **EXTENDED DESCRIPTION**

108192 None.

108193 **EXIT STATUS**

108194 The following exit values shall be returned:

108195 0 The requested string was written successfully.

108196 1 Unspecified.

108197 2 Usage error.

108198 3 No information is available about the specified terminal type.

108199 4 The specified operand is invalid.

108200 >4 An error occurred.

108201 **CONSEQUENCES OF ERRORS**

108202 If one of the operands is not available for the terminal, *tput* continues processing the remaining  
108203 operands.

108204 **APPLICATION USAGE**

108205 The difference between resetting and initializing a terminal is left unspecified, as they vary  
108206 greatly based on hardware types. In general, resetting is a more severe action.

108207 Some terminals use control characters to perform the stated functions, and on such terminals it  
108208 might make sense to use *tput* to store the initialization strings in a file or environment variable  
108209 for later use. However, because other terminals might rely on system calls to do this work, the  
108210 standard output cannot be used in a portable manner, such as the following non-portable  
108211 constructs:

108212 ClearVar=`tput clear`  
108213 tput reset | mailx -s "Wake Up" ddg

108214 **EXAMPLES**

108215 1. Initialize the terminal according to the type of terminal in the environmental variable  
108216 *TERM*. This command can be included in a **profile** file.

108217 tput init

108218           2. Reset a 450 terminal.  
108219            tput -T 450 reset

#### 108220 **RATIONALE**

108221           The list of operands was reduced to a minimum for the following reasons:

- 108222           • The only features chosen were those that were likely to be used by human users interacting  
108223           with a terminal.
- 108224           • Specifying the full *terminfo* set was not considered desirable, but the standard developers  
108225           did not want to select among operands.
- 108226           • This volume of POSIX.1-2008 does not attempt to provide applications with sophisticated  
108227           terminal handling capabilities, as that falls outside of its assigned scope and intersects with  
108228           the responsibilities of other standards bodies.

108229           The difference between resetting and initializing a terminal is left unspecified as this varies  
108230           greatly based on hardware types. In general, resetting is a more severe action.

108231           The exit status of 1 is historically reserved for finding out if a Boolean operand is not set.  
108232           Although the operands were reduced to a minimum, the exit status of 1 should still be reserved  
108233           for the Boolean operands, for those sites that wish to support them.

#### 108234 **FUTURE DIRECTIONS**

108235           None.

#### 108236 **SEE ALSO**

108237           [stty](#), [tabs](#)

108238           XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

#### 108239 **CHANGE HISTORY**

108240           First released in Issue 4.

#### 108241 **Issue 6**

108242           This utility is marked as part of the User Portability Utilities option.

#### 108243 **Issue 7**

108244           The *tput* utility is moved from the User Portability Utilities option to the Base. User Portability  
108245           Utilities is now an option for interactive utilities.

108246 **NAME**

108247 tr — translate characters

108248 **SYNOPSIS**108249 tr [-c|-C] [-s] *string1 string2*108250 tr -s [-c|-C] *string1*108251 tr -d [-c|-C] *string1*108252 tr -ds [-c|-C] *string1 string2*108253 **DESCRIPTION**

108254 The *tr* utility shall copy the standard input to the standard output with substitution or deletion  
 108255 of selected characters. The options specified and the *string1* and *string2* operands shall control  
 108256 translations that occur while copying characters and single-character collating elements.

108257 **OPTIONS**108258 The *tr* utility shall conform to XBD [Section 12.2](#) (on page 215).

108259 The following options shall be supported:

108260 **-c** Complement the set of values specified by *string1*. See the EXTENDED  
 108261 DESCRIPTION section.

108262 **-C** Complement the set of characters specified by *string1*. See the EXTENDED  
 108263 DESCRIPTION section.

108264 **-d** Delete all occurrences of input characters that are specified by *string1*.

108265 **-s** Replace instances of repeated characters with a single character, as described in the  
 108266 EXTENDED DESCRIPTION section.

108267 **OPERANDS**

108268 The following operands shall be supported:

108269 *string1, string2*

108270 Translation control strings. Each string shall represent a set of characters to be  
 108271 converted into an array of characters used for the translation. For a detailed  
 108272 description of how the strings are interpreted, see the EXTENDED DESCRIPTION  
 108273 section.

108274 **STDIN**

108275 The standard input can be any type of file.

108276 **INPUT FILES**

108277 None.

108278 **ENVIRONMENT VARIABLES**108279 The following environment variables shall affect the execution of *tr*:

108280 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 108281 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 108282 variables used to determine the values of locale categories.)

108283 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 108284 internationalization variables.

108285 **LC\_COLLATE**

108286 Determine the locale for the behavior of range expressions and equivalence classes.

|        |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 108287 | <i>LC_CTYPE</i>             | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments) and the behavior of character classes.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 108288 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 108289 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 108303 |                             | The operands <i>string1</i> and <i>string2</i> (if specified) define two arrays of characters. The constructs in the following list can be used to specify characters or single-character collating elements. If any of the constructs result in multi-character collating elements, <i>tr</i> shall exclude, without a diagnostic, those multi-character elements from the resulting array.                                                                                                                                                                                                                                                   |

| 108307 | <i>character</i>            | Any character not described by one of the conventions below shall represent itself.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 108308 | <i>\octal</i>               | Octal sequences can be used to represent characters with specific coded values. An octal sequence shall consist of a <backslash> followed by the longest sequence of one, two, or three-octal-digit characters (01234567). The sequence shall cause the value whose encoding is represented by the one, two, or three-digit octal integer to be placed into the array. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading <backslash> for each byte.                                                                                                                                    |
| 108309 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 108319 | <i>c-c</i>                  | In the POSIX locale, this construct shall represent the range of collating elements between the range endpoints (as long as neither endpoint is an octal sequence of the form <i>\octal</i> ), inclusive, as defined by the collation sequence. The characters or collating elements in the range shall be placed in the array in ascending collation sequence. If the second endpoint precedes the starting endpoint in the collation sequence, it is unspecified whether the range of collating elements is empty, or this construct is treated as invalid. In locales other than the POSIX locale, this construct has unspecified behavior. |

| 108337 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 108338 |           | When both the <b>-d</b> and <b>-s</b> options are specified, any of the character class names shall be accepted in <i>string2</i> . Otherwise, only character class names <b>lower</b> or <b>upper</b> are valid in <i>string2</i> and then only if the corresponding character class ( <b>upper</b> and <b>lower</b> , respectively) is specified in the same relative position in <i>string1</i> . Such a specification shall be interpreted as a request for case conversion. When [:lower:] appears in <i>string1</i> and [:upper:] appears in <i>string2</i> , the arrays shall contain the characters from the <b>toupper</b> mapping in the <i>LC_CTYPE</i> category of the current locale. When [:upper:] appears in <i>string1</i> and [:lower:] appears in <i>string2</i> , the arrays shall contain the characters from the <b>tolower</b> mapping in the <i>LC_CTYPE</i> category of the current locale. The first character from each mapping pair shall be in the array for <i>string1</i> and the second character from each mapping pair shall be in the array for <i>string2</i> in the same relative position. |

| 108354 | [=equiv=] | Represents all characters or collating elements belonging to the same equivalence class as <i>equiv</i> , as defined by the current setting of the <i>LC_COLLATE</i> locale category. An equivalence class expression shall be allowed only in <i>string1</i> , or in <i>string2</i> when it is being used by the combined <b>-d</b> and <b>-s</b> options. The characters belonging to the equivalence class shall be placed in the array in an unspecified order.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 108355 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 108358 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 108359 | [x*n]     | Represents <i>n</i> repeated occurrences of the character <i>x</i> . Because this expression is used to map multiple characters to one, it is only valid when it occurs in <i>string2</i> . If <i>n</i> is omitted or is zero, it shall be interpreted as large enough to extend the <i>string2</i> -based sequence to the length of the <i>string1</i> -based sequence. If <i>n</i> has a leading zero, it shall be interpreted as an octal value. Otherwise, it shall be interpreted as a decimal value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 108360 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 108372 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 108373 |           | • If the <b>-c</b> option is specified, the complement of the values specified by <i>string1</i> shall be placed in the array in ascending order by binary value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 108374 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

108375 • Because the order in which characters specified by character class expressions or  
 108376 equivalence class expressions is undefined, such expressions should only be used if the  
 108377 intent is to map several characters into one. An exception is case conversion, as described  
 108378 previously.

108379 When the `-d` option is specified:

- 108380 • Input characters found in the array specified by *string1* shall be deleted.
- 108381 • When the `-C` option is specified with `-d`, all characters except those specified by *string1*  
 108382 shall be deleted. The contents of *string2* are ignored, unless the `-s` option is also specified.
- 108383 • When the `-c` option is specified with `-d`, all values except those specified by *string1* shall  
 108384 be deleted. The contents of *string2* shall be ignored, unless the `-s` option is also specified.
- 108385 • The same string cannot be used for both the `-d` and the `-s` option; when both options are  
 108386 specified, both *string1* (used for deletion) and *string2* (used for squeezing) shall be  
 108387 required.

108388 When the `-s` option is specified, after any deletions or translations have taken place, repeated  
 108389 sequences of the same character shall be replaced by one occurrence of the same character, if the  
 108390 character is found in the array specified by the last operand. If the last operand contains a  
 108391 character class, such as the following example:

```
108392 tr -s '[:space:]'
```

108393 the last operand's array shall contain all of the characters in that character class. However, in a  
 108394 case conversion, as described previously, such as:

```
108395 tr -s '[:upper:]' '[:lower:]'
```

108396 the last operand's array shall contain only those characters defined as the second characters in  
 108397 each of the **toupper** or **tolower** character pairs, as appropriate.

108398 An empty string used for *string1* or *string2* produces undefined results.

#### 108399 EXIT STATUS

108400 The following exit values shall be returned:

108401 0 All input was processed successfully.

108402 >0 An error occurred.

#### 108403 CONSEQUENCES OF ERRORS

108404 Default.

#### 108405 APPLICATION USAGE

108406 If necessary, *string1* and *string2* can be quoted to avoid pattern matching by the shell.

108407 If an ordinary digit (representing itself) is to follow an octal sequence, the octal sequence must  
 108408 use the full three digits to avoid ambiguity.

108409 When *string2* is shorter than *string1*, a difference results between historical System V and BSD  
 108410 systems. A BSD system pads *string2* with the last character found in *string2*. Thus, it is possible  
 108411 to do the following:

```
108412 tr 0123456789 d
```

108413 which would translate all digits to the letter 'd'. Since this area is specifically unspecified in  
 108414 this volume of POSIX.1-2008, both the BSD and System V behaviors are allowed, but a  
 108415 conforming application cannot rely on the BSD behavior. It would have to code the example in  
 108416 the following way:

108417 `tr 0123456789 '[d*]'`

108418 It should be noted that, despite similarities in appearance, the string operands used by *tr* are not  
108419 regular expressions.

108420 Unlike some historical implementations, this definition of the *tr* utility correctly processes NUL  
108421 characters in its input stream. NUL characters can be stripped by using:

108422 `tr -d '\000'`

#### 108423 EXAMPLES

108424 1. The following example creates a list of all words in **file1** one per line in **file2**, where a  
108425 word is taken to be a maximal string of letters.

108426 `tr -cs "[:alpha:]" "[\n*]" <file1 >file2`

108427 2. The next example translates all lowercase characters in **file1** to uppercase and writes the  
108428 results to standard output.

108429 `tr "[:lower:]" "[:upper:]" <file1`

108430 3. This example uses an equivalence class to identify accented variants of the base character  
108431 'e' in **file1**, which are stripped of diacritical marks and written to **file2**.

108432 `tr "[=e=]" "[e*]" <file1 >file2`

#### 108433 RATIONALE

108434 In some early proposals, an explicit option `-n` was added to disable the historical behavior of  
108435 stripping NUL characters from the input. It was considered that automatically stripping NUL  
108436 characters from the input was not correct functionality. However, the removal of `-n` in a later  
108437 proposal does not remove the requirement that *tr* correctly process NUL characters in its input  
108438 stream. NUL characters can be stripped by using `tr -d '\000'`.

108439 Historical implementations of *tr* differ widely in syntax and behavior. For example, the BSD  
108440 version has not needed the bracket characters for the repetition sequence. The *tr* utility syntax is  
108441 based more closely on the System V and XPG3 model while attempting to accommodate  
108442 historical BSD implementations. In the case of the short *string2* padding, the decision was to  
108443 unspecify the behavior and preserve System V and XPG3 scripts, which might find difficulty  
108444 with the BSD method. The assumption was made that BSD users of *tr* have to make  
108445 accommodations to meet the syntax defined here. Since it is possible to use the repetition  
108446 sequence to duplicate the desired behavior, whereas there is no simple way to achieve the  
108447 System V method, this was the correct, if not desirable, approach.

108448 The use of octal values to specify control characters, while having historical precedents, is not  
108449 portable. The introduction of escape sequences for control characters should provide the  
108450 necessary portability. It is recognized that this may cause some historical scripts to break.

108451 An early proposal included support for multi-character collating elements. It was pointed out  
108452 that, while *tr* does employ some syntactical elements from REs, the aim of *tr* is quite different;  
108453 ranges, for example, do not have a similar meaning ("any of the chars in the range matches",  
108454 *versus* "translate each character in the range to the output counterpart"). As a result, the  
108455 previously included support for multi-character collating elements has been removed. What  
108456 remains are ranges in current collation order (to support, for example, accented characters),  
108457 character classes, and equivalence classes.

108458 In XPG3 the `[:class:]` and `[=equiv=]` conventions are shown with double brackets, as in RE syntax.  
108459 However, *tr* does not implement RE principles; it just borrows part of the syntax. Consequently,  
108460 `[:class:]` and `[=equiv=]` should be regarded as syntactical elements on a par with `[x*n]`, which is

108461 not an RE bracket expression.

108462 The standard developers will consider changes to *tr* that allow it to translate characters between  
108463 different character encodings, or they will consider providing a new utility to accomplish this.

108464 On historical System V systems, a range expression requires enclosing square-brackets, such as:

```
108465 tr '[a-z]' '[A-Z]'
```

108466 However, BSD-based systems did not require the brackets, and this convention is used here to  
108467 avoid breaking large numbers of BSD scripts:

```
108468 tr a-z A-Z
```

108469 The preceding System V script will continue to work because the brackets, treated as regular  
108470 characters, are translated to themselves. However, any System V script that relied on "a-z"  
108471 representing the three characters 'a', '-', and 'z' have to be rewritten as "az-".

108472 The ISO POSIX-2:1993 standard had a `-c` option that behaved similarly to the `-C` option, but did  
108473 not supply functionality equivalent to the `-c` option specified in POSIX.1-2008. This meant that  
108474 historical practice of being able to specify `tr -cd\000-\177` (which would delete all bytes with  
108475 the top bit set) would have no effect because, in the C locale, bytes with the values octal 200 to  
108476 octal 377 are not characters.

108477 The earlier version also said that octal sequences referred to collating elements and could be  
108478 placed adjacent to each other to specify multi-byte characters. However, it was noted that this  
108479 caused ambiguities because *tr* would not be able to tell whether adjacent octal sequences were  
108480 intending to specify multi-byte characters or multiple single byte characters. POSIX.1-2008  
108481 specifies that octal sequences always refer to single byte binary values when used to specify an  
108482 endpoint of a range of collating elements.

108483 Earlier versions of this standard allowed for implementations with bytes other than eight bits,  
108484 but this has been modified in this version.

#### 108485 **FUTURE DIRECTIONS**

108486 None.

#### 108487 **SEE ALSO**

108488 *sed*

108489 XBD [Table 5-1](#) (on page 121), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

#### 108490 **CHANGE HISTORY**

108491 First released in Issue 2.

#### 108492 **Issue 6**

108493 The `-C` operand is added, and the description of the `-c` operand is changed to align with the  
108494 IEEE P1003.2b draft standard.

108495 The normative text is reworded to avoid use of the term “must” for application requirements.

108496 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/31 is applied, removing text describing  
108497 behavior on systems with bytes consisting of more than eight bits.

108498 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/32 is applied, updating an example in the  
108499 EXAMPLES section to avoid using unspecified behavior.

108500 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/33 is applied, making a correction to the  
108501 RATIONALE.

108502 **Issue 7**

108503 SD5-XCU-ERN-30 is applied.

108504 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

108505 Austin Group Interpretation 1003.1-2001 #132 is applied, adding rationale to the *\character*  
108506 construct.

108507 **NAME**

108508 true — return true value

108509 **SYNOPSIS**

108510 true

108511 **DESCRIPTION**

108512 The *true* utility shall return with exit code zero.

108513 **OPTIONS**

108514 None.

108515 **OPERANDS**

108516 None.

108517 **STDIN**

108518 Not used.

108519 **INPUT FILES**

108520 None.

108521 **ENVIRONMENT VARIABLES**

108522 None.

108523 **ASYNCHRONOUS EVENTS**

108524 Default.

108525 **STDOUT**

108526 Not used.

108527 **STDERR**

108528 Not used.

108529 **OUTPUT FILES**

108530 None.

108531 **EXTENDED DESCRIPTION**

108532 None.

108533 **EXIT STATUS**

108534 Zero.

108535 **CONSEQUENCES OF ERRORS**

108536 None.

108537 **APPLICATION USAGE**

108538 This utility is typically used in shell scripts, as shown in the EXAMPLES section. The special  
108539 built-in utility `:` is sometimes more efficient than *true*.

108540 **EXAMPLES**

108541 This command is executed forever:

```
108542 while true
108543 do
108544     command
108545 done
```

108546 **RATIONALE**

108547 The *true* utility has been retained in this volume of POSIX.1-2008, even though the shell special  
108548 built-in `:` provides similar functionality, because *true* is widely used in historical scripts and is  
108549 less cryptic to novice script readers.

108550 **FUTURE DIRECTIONS**

108551 None.

108552 **SEE ALSO**

108553 [Section 2.9](#) (on page 2316), *false*

108554 **CHANGE HISTORY**

108555 First released in Issue 2.

108556 **Issue 6**

108557 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/39 is applied, replacing the terms “None”  
108558 and “Default” from the STDERR and EXIT STATUS sections, respectively, with terms as defined  
108559 in [Section 1.4](#) (on page 2288).

108560 **NAME**

108561 tsort — topological sort

108562 **SYNOPSIS**108563 tsort [*file*]108564 **DESCRIPTION**108565 The *tsort* utility shall write to standard output a totally ordered list of items consistent with a  
108566 partial ordering of items contained in the input.108567 The application shall ensure that the input consists of pairs of items (non-empty strings)  
108568 separated by <blank> characters. Pairs of different items indicate ordering. Pairs of identical  
108569 items indicate presence, but not ordering.108570 **OPTIONS**

108571 None.

108572 **OPERANDS**

108573 The following operand shall be supported:

108574 *file* A pathname of a text file to order. If no *file* operand is given, the standard input  
108575 shall be used.108576 **STDIN**108577 The standard input shall be used if no *file* operand is specified, and shall be used if the *file*  
108578 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
108579 the standard input shall not be used. See the INPUT FILES section.108580 **INPUT FILES**

108581 The input file shall be a text file.

108582 **ENVIRONMENT VARIABLES**108583 The following environment variables shall affect the execution of *tsort*:108584 *LANG* Provide a default value for the internationalization variables that are unset or null.  
108585 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
108586 variables used to determine the values of locale categories.)108587 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
108588 internationalization variables.108589 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
108590 characters (for example, single-byte as opposed to multi-byte characters in  
108591 arguments and input files).108592 *LC\_MESSAGES*108593 Determine the locale that should be used to affect the format and contents of  
108594 diagnostic messages written to standard error.108595 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.108596 **ASYNCHRONOUS EVENTS**

108597 Default.

108598 **STDOUT**108599 The standard output shall be a text file consisting of the order list produced from the partially  
108600 ordered input.

**108601 STDERR**

108602 The standard error shall be used only for diagnostic messages.

**108603 OUTPUT FILES**

108604 None.

**108605 EXTENDED DESCRIPTION**

108606 None.

**108607 EXIT STATUS**

108608 The following exit values shall be returned:

108609 0 Successful completion.

108610 >0 An error occurred.

**108611 CONSEQUENCES OF ERRORS**

108612 Default.

**108613 APPLICATION USAGE**

108614 The *LC\_COLLATE* variable need not affect the actions of *tsort*. The output ordering is not  
108615 lexicographic, but depends on the pairs of items given as input.

**108616 EXAMPLES**

108617 The command:

```
108618 tsort <<EOF
108619 a b c c d e
108620 g g
108621 f g e f
108622 h h
108623 EOF
```

108624 produces the output:

```
108625 a
108626 b
108627 c
108628 d
108629 e
108630 f
108631 g
108632 h
```

**108633 RATIONALE**

108634 None.

**108635 FUTURE DIRECTIONS**

108636 None.

**108637 SEE ALSO**

108638 XBD [Chapter 8](#) (on page 173)

**108639 CHANGE HISTORY**

108640 First released in Issue 2.

108641 **Issue 6**

108642 The normative text is reworded to avoid use of the term “must” for application requirements.

108643 **Issue 7**

108644 Austin Group Interpretation 1003.1-2001 #092 is applied.

108645 The *tsort* utility is moved from the XSI option to the Base.

108646 **NAME**108647 `tty` — return user's terminal name108648 **SYNOPSIS**108649 `tty`108650 **DESCRIPTION**

108651 The `tty` utility shall write to the standard output the name of the terminal that is open as  
 108652 standard input. The name that is used shall be equivalent to the string that would be returned by  
 108653 the `ttyname()` function defined in the System Interfaces volume of POSIX.1-2008.

108654 **OPTIONS**108655 The `tty` utility shall conform to XBD [Section 12.2](#) (on page 215).108656 **OPERANDS**

108657 None.

108658 **STDIN**

108659 While no input is read from standard input, standard input shall be examined to determine  
 108660 whether or not it is a terminal, and, if so, to determine the name of the terminal.

108661 **INPUT FILES**

108662 None.

108663 **ENVIRONMENT VARIABLES**108664 The following environment variables shall affect the execution of `tty`:

108665 `LANG` Provide a default value for the internationalization variables that are unset or null.  
 108666 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 108667 variables used to determine the values of locale categories.)

108668 `LC_ALL` If set to a non-empty string value, override the values of all the other  
 108669 internationalization variables.

108670 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as  
 108671 characters (for example, single-byte as opposed to multi-byte characters in  
 108672 arguments).

108673 `LC_MESSAGES`

108674 Determine the locale that should be used to affect the format and contents of  
 108675 diagnostic messages written to standard error and informative messages written to  
 108676 standard output.

108677 `XSI` `NLSPATH` Determine the location of message catalogs for the processing of `LC_MESSAGES`.

108678 **ASYNCHRONOUS EVENTS**

108679 Default.

108680 **STDOUT**

108681 If standard input is a terminal device, a pathname of the terminal as specified by the `ttyname()`  
 108682 function defined in the System Interfaces volume of POSIX.1-2008 shall be written in the  
 108683 following format:

108684 `"%s\n", <terminal name>`

108685 Otherwise, a message shall be written indicating that standard input is not connected to a  
 108686 terminal. In the POSIX locale, the `tty` utility shall use the format:

108687 `"not a tty\n"`

108688 **STDERR**

108689 The standard error shall be used only for diagnostic messages.

108690 **OUTPUT FILES**

108691 None.

108692 **EXTENDED DESCRIPTION**

108693 None.

108694 **EXIT STATUS**

108695 The following exit values shall be returned:

108696 0 Standard input is a terminal.

108697 1 Standard input is not a terminal.

108698 >1 An error occurred.

108699 **CONSEQUENCES OF ERRORS**

108700 Default.

108701 **APPLICATION USAGE**

108702 This utility checks the status of the file open as standard input against that of an  
108703 implementation-defined set of files. It is possible that no match can be found, or that the match  
108704 found need not be the same file as that which was opened for standard input (although they are  
108705 the same device).

108706 **EXAMPLES**

108707 None.

108708 **RATIONALE**

108709 None.

108710 **FUTURE DIRECTIONS**

108711 None.

108712 **SEE ALSO**

108713 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

108715 **CHANGE HISTORY**

108716 First released in Issue 2.

108717 **Issue 5**

108718 The SYNOPSIS is changed to indicate two forms of the command, with the second form marked  
108719 as obsolete. This is a clarification and does not change the functionality published in previous  
108720 issues.

108721 **Issue 6**

108722 The obsolescent `-s` option is removed.

108723 **NAME**

108724            type — write a description of command type

108725 **SYNOPSIS**

108726 XSI        type name...

108727 **DESCRIPTION**108728            The *type* utility shall indicate how each argument would be interpreted if used as a command  
108729            name.108730 **OPTIONS**

108731            None.

108732 **OPERANDS**

108733            The following operand shall be supported:

108734            *name*            A name to be interpreted.108735 **STDIN**

108736            Not used.

108737 **INPUT FILES**

108738            None.

108739 **ENVIRONMENT VARIABLES**108740            The following environment variables shall affect the execution of *type*:108741            *LANG*            Provide a default value for the internationalization variables that are unset or null.  
108742                                (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
108743                                variables used to determine the values of locale categories.)108744            *LC\_ALL*        If set to a non-empty string value, override the values of all the other  
108745                                internationalization variables.108746            *LC\_CTYPE*     Determine the locale for the interpretation of sequences of bytes of text data as  
108747                                characters (for example, single-byte as opposed to multi-byte characters in  
108748                                arguments).108749            *LC\_MESSAGES*108750                                Determine the locale that should be used to affect the format and contents of  
108751                                diagnostic messages written to standard error.108752            *NLSPATH*     Determine the location of message catalogs for the processing of *LC\_MESSAGES*.108753            *PATH*            Determine the location of *name*, as described in XBD [Chapter 8](#) (on page 173).108754 **ASYNCHRONOUS EVENTS**

108755            Default.

108756 **STDOUT**108757            The standard output of *type* contains information about each operand in an unspecified format.108758            The information provided typically identifies the operand as a shell built-in, function, alias, or  
108759            keyword, and where applicable, may display the operand's pathname.108760 **STDERR**

108761            The standard error shall be used only for diagnostic messages.

108762 **OUTPUT FILES**

108763 None.

108764 **EXTENDED DESCRIPTION**

108765 None.

108766 **EXIT STATUS**

108767 The following exit values shall be returned:

108768 0 Successful completion.

108769 &gt;0 An error occurred.

108770 **CONSEQUENCES OF ERRORS**

108771 Default.

108772 **APPLICATION USAGE**

108773 Since *type* must be aware of the contents of the current shell execution environment (such as the  
108774 lists of commands, functions, and built-ins processed by *hash*), it is always provided as a shell  
108775 regular built-in. If it is called in a separate utility execution environment, such as one of the  
108776 following:

108777 `nohup type writer`108778 `find . -type f | xargs type`

108779 it might not produce accurate results.

108780 **EXAMPLES**

108781 None.

108782 **RATIONALE**

108783 None.

108784 **FUTURE DIRECTIONS**

108785 None.

108786 **SEE ALSO**108787 *command*, *hash*108788 XBD [Chapter 8](#) (on page 173)108789 **CHANGE HISTORY**

108790 First released in Issue 2.

108791 **NAME**

108792 ulimit — set or report file size limit

108793 **SYNOPSIS**108794 XSI `ulimit [-f] [blocks]`108795 **DESCRIPTION**

108796 The *ulimit* utility shall set or report the file-size writing limit imposed on files written by the  
 108797 shell and its child processes (files of any size may be read). Only a process with appropriate  
 108798 privileges can increase the limit.

108799 **OPTIONS**108800 The *ulimit* utility shall conform to XBD [Section 12.2](#) (on page 215).

108801 The following option shall be supported:

108802 **-f** Set (or report, if no *blocks* operand is present), the file size limit in blocks. The **-f**  
 108803 option shall also be the default case.

108804 **OPERANDS**

108805 The following operand shall be supported:

108806 *blocks* The number of 512-byte blocks to use as the new file size limit.108807 **STDIN**

108808 Not used.

108809 **INPUT FILES**

108810 None.

108811 **ENVIRONMENT VARIABLES**108812 The following environment variables shall affect the execution of *ulimit*:

108813 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 108814 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 108815 variables used to determine the values of locale categories.)

108816 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 108817 internationalization variables.

108818 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 108819 characters (for example, single-byte as opposed to multi-byte characters in  
 108820 arguments).

108821 **LC\_MESSAGES**

108822 Determine the locale that should be used to affect the format and contents of  
 108823 diagnostic messages written to standard error.

108824 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.108825 **ASYNCHRONOUS EVENTS**

108826 Default.

108827 **STDOUT**

108828 The standard output shall be used when no *blocks* operand is present. If the current number of  
 108829 blocks is limited, the number of blocks in the current limit shall be written in the following  
 108830 format:

108831 "%d\n", *<number of 512-byte blocks>*

108832 If there is no current limit on the number of blocks, in the POSIX locale the following format

108833 shall be used:

108834 "unlimited\n"

108835 **STDERR**

108836 The standard error shall be used only for diagnostic messages.

108837 **OUTPUT FILES**

108838 None.

108839 **EXTENDED DESCRIPTION**

108840 None.

108841 **EXIT STATUS**

108842 The following exit values shall be returned:

108843 0 Successful completion.

108844 >0 A request for a higher limit was rejected or an error occurred.

108845 **CONSEQUENCES OF ERRORS**

108846 Default.

108847 **APPLICATION USAGE**

108848 Since *ulimit* affects the current shell execution environment, it is always provided as a shell regular built-in. If it is called in a separate utility execution environment, such as one of the following:

108849

108850

```
108851 nohup ulimit -f 10000
```

```
108852 env ulimit 10000
```

108853 it does not affect the file size limit of the caller's environment.

108854 Once a limit has been decreased by a process, it cannot be increased (unless appropriate privileges are involved), even back to the original system limit.

108855

108856 **EXAMPLES**

108857 Set the file size limit to 51 200 bytes:

108858

```
108858 ulimit -f 100
```

108859 **RATIONALE**

108860 None.

108861 **FUTURE DIRECTIONS**

108862 None.

108863 **SEE ALSO**

108864 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

108865 XSH [ulimit\(\)](#)

108866 **CHANGE HISTORY**

108867 First released in Issue 2.

108868 **Issue 7**

108869 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

108870 **NAME**

108871 umask — get or set the file mode creation mask

108872 **SYNOPSIS**108873 umask [-S] [*mask*]108874 **DESCRIPTION**

108875 The *umask* utility shall set the file mode creation mask of the current shell execution environment  
 108876 (see [Section 2.12](#), on page 2331) to the value specified by the *mask* operand. This mask shall affect  
 108877 the initial value of the file permission bits of subsequently created files. If *umask* is called in a  
 108878 subshell or separate utility execution environment, such as one of the following:

```
108879 (umask 002)
108880 nohup umask ...
108881 find . -exec umask ... \;
```

108882 it shall not affect the file mode creation mask of the caller's environment.

108883 If the *mask* operand is not specified, the *umask* utility shall write to standard output the value of  
 108884 the file mode creation mask of the invoking process.

108885 **OPTIONS**108886 The *umask* utility shall conform to XBD [Section 12.2](#) (on page 215).

108887 The following option shall be supported:

108888 **-S** Produce symbolic output.

108889 The default output style is unspecified, but shall be recognized on a subsequent invocation of  
 108890 *umask* on the same system as a *mask* operand to restore the previous file mode creation mask.

108891 **OPERANDS**

108892 The following operand shall be supported:

108893 *mask* A string specifying the new file mode creation mask. The string is treated in the  
 108894 same way as the *mode* operand described in the EXTENDED DESCRIPTION  
 108895 section for *chmod*.

108896 For a *symbolic\_mode* value, the new value of the file mode creation mask shall be  
 108897 the logical complement of the file permission bits portion of the file mode specified  
 108898 by the *symbolic\_mode* string.

108899 In a *symbolic\_mode* value, the permissions *op* characters '+' and '-' shall be  
 108900 interpreted relative to the current file mode creation mask; '+' shall cause the bits  
 108901 for the indicated permissions to be cleared in the mask; '-' shall cause the bits for  
 108902 the indicated permissions to be set in the mask.

108903 The interpretation of *mode* values that specify file mode bits other than the file  
 108904 permission bits is unspecified.

108905 In the octal integer form of *mode*, the specified bits are set in the file mode creation  
 108906 mask.

108907 The file mode creation mask shall be set to the resulting numeric value.

108908 The default output of a prior invocation of *umask* on the same system with no  
 108909 operand also shall be recognized as a *mask* operand.

108910 **STDIN**

108911 Not used.

108912 **INPUT FILES**

108913 None.

108914 **ENVIRONMENT VARIABLES**108915 The following environment variables shall affect the execution of *umask*:

108916 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 108917 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 108918 variables used to determine the values of locale categories.)

108919 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 108920 internationalization variables.

108921 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 108922 characters (for example, single-byte as opposed to multi-byte characters in  
 108923 arguments).

108924 *LC\_MESSAGES*

108925 Determine the locale that should be used to affect the format and contents of  
 108926 diagnostic messages written to standard error.

108927 *XSI NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

108928 **ASYNCHRONOUS EVENTS**

108929 Default.

108930 **STDOUT**

108931 When the *mask* operand is not specified, the *umask* utility shall write a message to standard  
 108932 output that can later be used as a *umask mask* operand.

108933 If *-S* is specified, the message shall be in the following format:

108934 "u=%s,g=%s,o=%s\n", <owner permissions>, <group permissions>,  
 108935 <other permissions>

108936 where the three values shall be combinations of letters from the set {*r*, *w*, *x*}; the presence of a  
 108937 letter shall indicate that the corresponding bit is clear in the file mode creation mask.

108938 If a *mask* operand is specified, there shall be no output written to standard output.

108939 **STDERR**

108940 The standard error shall be used only for diagnostic messages.

108941 **OUTPUT FILES**

108942 None.

108943 **EXTENDED DESCRIPTION**

108944 None.

108945 **EXIT STATUS**

108946 The following exit values shall be returned:

108947 0 The file mode creation mask was successfully changed, or no *mask* operand was supplied.

108948 >0 An error occurred.

108949 **CONSEQUENCES OF ERRORS**

108950 Default.

108951 **APPLICATION USAGE**

108952 Since *umask* affects the current shell execution environment, it is generally provided as a shell  
 108953 regular built-in.

108954 In contrast to the negative permission logic provided by the file mode creation mask and the  
 108955 octal number form of the *mask* argument, the symbolic form of the *mask* argument specifies those  
 108956 permissions that are left alone.

108957 **EXAMPLES**

108958 Either of the commands:

108959 `umask a=rx,ug+w`108960 `umask 002`

108961 sets the mode mask so that subsequently created files have their S\_IWOTH bit cleared.

108962 After setting the mode mask with either of the above commands, the *umask* command can be  
 108963 used to write out the current value of the mode mask:

108964 `$ umask`108965 `0002`

108966 (The output format is unspecified, but historical implementations use the octal integer mode  
 108967 format.)

108968 `$ umask -S`108969 `u=rwx,g=rwx,o=rx`

108970 Either of these outputs can be used as the mask operand to a subsequent invocation of the *umask*  
 108971 utility.

108972 Assuming the mode mask is set as above, the command:

108973 `umask g-w`

108974 sets the mode mask so that subsequently created files have their S\_IWGRP and S\_IWOTH bits  
 108975 cleared.

108976 The command:

108977 `umask -- -w`

108978 sets the mode mask so that subsequently created files have all their write bits cleared. Note that  
 108979 *mask* operands `-r`, `-w`, `-x` or anything beginning with a <hyphen>, must be preceded by `--` to  
 108980 keep it from being interpreted as an option.

108981 **RATIONALE**

108982 Since *umask* affects the current shell execution environment, it is generally provided as a shell  
 108983 regular built-in. If it is called in a subshell or separate utility execution environment, such as one  
 108984 of the following:

108985 `(umask 002)`108986 `nohup umask ...`108987 `find . -exec umask ... \;`

108988 it does not affect the file mode creation mask of the environment of the caller.

108989 The description of the historical utility was modified to allow it to use the symbolic modes of

108990 *chmod*. The `-s` option used in early proposals was changed to `-S` because `-s` could be confused  
108991 with a *symbolic\_mode* form of mask referring to the `S_ISUID` and `S_ISGID` bits.

108992 The default output style is unspecified to permit implementors to provide migration to the new  
108993 symbolic style at the time most appropriate to their users. A `-o` flag to force octal mode output  
108994 was omitted because the octal mode may not be sufficient to specify all of the information that  
108995 may be present in the file mode creation mask when more secure file access permission checks  
108996 are implemented.

108997 It has been suggested that trusted systems developers might appreciate ameliorating the  
108998 requirement that the mode mask “affects” the file access permissions, since it seems access  
108999 control lists might replace the mode mask to some degree. The wording has been changed to say  
109000 that it affects the file permission bits, and it leaves the details of the behavior of how they affect  
109001 the file access permissions to the description in the System Interfaces volume of POSIX.1-2008.

#### 109002 **FUTURE DIRECTIONS**

109003 None.

#### 109004 **SEE ALSO**

#### 109008 **CHANGE HISTORY**

109009 First released in Issue 2.

#### 109010 **Issue 6**

109011 The following new requirements on POSIX implementations derive from alignment with the  
109012 Single UNIX Specification:

- 109013 • The octal mode is supported.

109014 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/34 is applied, making a correction to the  
109015 RATIONALE.

#### 109016 **Issue 7**

109017 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

109018 **NAME**

109019 unalias — remove alias definitions

109020 **SYNOPSIS**109021 unalias *alias-name*...

109022 unalias -a

109023 **DESCRIPTION**

109024 The *unalias* utility shall remove the definition for each alias name specified. See [Section 2.3.1](#) (on  
 109025 page 2300). The aliases shall be removed from the current shell execution environment; see  
 109026 [Section 2.12](#) (on page 2331).

109027 **OPTIONS**109028 The *unalias* utility shall conform to XBD [Section 12.2](#) (on page 215).

109029 The following option shall be supported:

109030 **-a** Remove all alias definitions from the current shell execution environment.109031 **OPERANDS**

109032 The following operand shall be supported:

109033 *alias-name* The name of an alias to be removed.109034 **STDIN**

109035 Not used.

109036 **INPUT FILES**

109037 None.

109038 **ENVIRONMENT VARIABLES**109039 The following environment variables shall affect the execution of *unalias*:

109040 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 109041 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 109042 variables used to determine the values of locale categories.)

109043 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 109044 internationalization variables.

109045 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 109046 characters (for example, single-byte as opposed to multi-byte characters in  
 109047 arguments).

109048 **LC\_MESSAGES**

109049 Determine the locale that should be used to affect the format and contents of  
 109050 diagnostic messages written to standard error.

109051 **XSI** **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.109052 **ASYNCHRONOUS EVENTS**

109053 Default.

109054 **STDOUT**

109055 Not used.

109056 **STDERR**

109057 The standard error shall be used only for diagnostic messages.

109058 **OUTPUT FILES**

109059 None.

109060 **EXTENDED DESCRIPTION**

109061 None.

109062 **EXIT STATUS**

109063 The following exit values shall be returned:

109064 0 Successful completion.

109065 >0 One of the *alias-name* operands specified did not represent a valid alias definition, or an  
109066 error occurred.109067 **CONSEQUENCES OF ERRORS**

109068 Default.

109069 **APPLICATION USAGE**109070 Since *unalias* affects the current shell execution environment, it is generally provided as a shell  
109071 regular built-in.109072 **EXAMPLES**

109073 None.

109074 **RATIONALE**109075 The *unalias* description is based on that from historical KornShell implementations. Known  
109076 differences exist between that and the C shell. The KornShell version was adopted to be  
109077 consistent with all the other KornShell features in this volume of POSIX.1-2008, such as  
109078 command line editing.109079 The **-a** option is the equivalent of the *unalias \** form of the C shell and is provided to address  
109080 security concerns about unknown aliases entering the environment of a user (or application)  
109081 through the allowable implementation-defined predefined alias route or as a result of an *ENV*  
109082 file. (Although *unalias* could be used to simplify the “secure” shell script shown in the *command*  
109083 rationale, it does not obviate the need to quote all command names. An initial call to *unalias -a*  
109084 would have to be quoted in case there was an alias for *unalias*.)109085 **FUTURE DIRECTIONS**

109086 None.

109087 **SEE ALSO**109088 [Chapter 2](#) (on page 2297), [alias](#)109089 [XBD Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)109090 **CHANGE HISTORY**

109091 First released in Issue 4.

109092 **Issue 6**

109093 This utility is marked as part of the User Portability Utilities option.

109094 **Issue 7**109095 The *unalias* utility is moved from the User Portability Utilities option to the Base. User  
109096 Portability Utilities is now an option for interactive utilities.

109097 **NAME**109098            *uname* — return system name109099 **SYNOPSIS**109100            *uname* [-amnrsv]109101 **DESCRIPTION**

109102            By default, the *uname* utility shall write the operating system name to standard output. When  
 109103            options are specified, symbols representing one or more system characteristics shall be written to  
 109104            the standard output. The format and contents of the symbols are implementation-defined. On  
 109105            systems conforming to the System Interfaces volume of POSIX.1-2008, the symbols written shall  
 109106            be those supported by the *uname()* function as defined in the System Interfaces volume of  
 109107            POSIX.1-2008.

109108 **OPTIONS**109109            The *uname* utility shall conform to XBD [Section 12.2](#) (on page 215).

109110            The following options shall be supported:

- 109111            **-a**            Behave as though all of the options **-mnrsv** were specified.
- 109112            **-m**            Write the name of the hardware type on which the system is running to standard  
 109113            output.
- 109114            **-n**            Write the name of this node within an implementation-defined communications  
 109115            network.
- 109116            **-r**            Write the current release level of the operating system implementation.
- 109117            **-s**            Write the name of the implementation of the operating system.
- 109118            **-v**            Write the current version level of this release of the operating system  
 109119            implementation.

109120            If no options are specified, the *uname* utility shall write the operating system name, as if the **-s**  
 109121            option had been specified.

109122 **OPERANDS**

109123            None.

109124 **STDIN**

109125            Not used.

109126 **INPUT FILES**

109127            None.

109128 **ENVIRONMENT VARIABLES**109129            The following environment variables shall affect the execution of *uname*:

- 109130            **LANG**            Provide a default value for the internationalization variables that are unset or null.  
 109131            (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 109132            variables used to determine the values of locale categories.)
- 109133            **LC\_ALL**            If set to a non-empty string value, override the values of all the other  
 109134            internationalization variables.
- 109135            **LC\_CTYPE**        Determine the locale for the interpretation of sequences of bytes of text data as  
 109136            characters (for example, single-byte as opposed to multi-byte characters in  
 109137            arguments).

109138 *LC\_MESSAGES*  
109139 Determine the locale that should be used to affect the format and contents of  
109140 diagnostic messages written to standard error.

109141 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

109142 **ASYNCHRONOUS EVENTS**  
109143 Default.

109144 **STDOUT**  
109145 By default, the output shall be a single line of the following form:  
109146 "%s\n", <sysname>  
109147 If the **-a** option is specified, the output shall be a single line of the following form:  
109148 "%s %s %s %s %s\n", <sysname>, <nodename>, <release>,  
109149 <version>, <machine>  
109150 Additional implementation-defined symbols may be written; all such symbols shall be written at  
109151 the end of the line of output before the <newline>.  
109152 If options are specified to select different combinations of the symbols, only those symbols shall  
109153 be written, in the order shown above for the **-a** option. If a symbol is not selected for writing, its  
109154 corresponding trailing <blank> characters also shall not be written.

109155 **STDERR**  
109156 The standard error shall be used only for diagnostic messages.

109157 **OUTPUT FILES**  
109158 None.

109159 **EXTENDED DESCRIPTION**  
109160 None.

109161 **EXIT STATUS**  
109162 The following exit values shall be returned:  
109163 0 The requested information was successfully written.  
109164 >0 An error occurred.

109165 **CONSEQUENCES OF ERRORS**  
109166 Default.

109167 **APPLICATION USAGE**  
109168 Note that any of the symbols could include embedded <space> characters, which may affect  
109169 parsing algorithms if multiple options are selected for output.  
109170 The node name is typically a name that the system uses to identify itself for inter-system  
109171 communication addressing.

109172 **EXAMPLES**  
109173 The following command:  
109174 `uname -sr`  
109175 writes the operating system name and release level, separated by one or more <blank>  
109176 characters.

109177 **RATIONALE**

109178 It was suggested that this utility cannot be used portably since the format of the symbols is  
109179 implementation-defined. The POSIX.1 working group could not achieve consensus on defining  
109180 these formats in the underlying *uname()* function, and there was no expectation that this volume  
109181 of POSIX.1-2008 would be any more successful. Some applications may still find this historical  
109182 utility of value. For example, the symbols could be used for system log entries or for comparison  
109183 with operator or user input.

109184 **FUTURE DIRECTIONS**

109185 None.

109186 **SEE ALSO**

109187 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

109188 XSH [uname\(\)](#)

109189 **CHANGE HISTORY**

109190 First released in Issue 2.

109191 **NAME**

109192 uncompress — expand compressed data

109193 **SYNOPSIS**109194 XSI uncompress [-cfv] [*file...*]109195 **DESCRIPTION**

109196 The *uncompress* utility shall restore files to their original state after they have been compressed  
 109197 using the *compress* utility. If no files are specified, the standard input shall be uncompressed to  
 109198 the standard output. If the invoking process has appropriate privileges, the ownership, modes,  
 109199 access time, and modification time of the original file shall be preserved.

109200 This utility shall support the uncompressing of any files produced by the *compress* utility on the  
 109201 same implementation. For files produced by *compress* on other systems, *uncompress* supports 9 to  
 109202 14-bit compression (see *compress*, -b); it is implementation-defined whether values of -b greater  
 109203 than 14 are supported.

109204 **OPTIONS**

109205 The *uncompress* utility shall conform to XBD Section 12.2 (on page 215), except that Guideline 1  
 109206 does apply since the utility name has ten letters.

109207 The following options shall be supported:

- 109208 -c Write to standard output; no files are changed.
- 109209 -f Do not prompt for overwriting files. Except when run in the background, if -f is  
 109210 not given the user shall be prompted as to whether an existing file should be  
 109211 overwritten. If the standard input is not a terminal and -f is not given, *uncompress*  
 109212 shall write a diagnostic message to standard error and exit with a status greater  
 109213 than zero.
- 109214 -v Write messages to standard error concerning the expansion of each file.

109215 **OPERANDS**

109216 The following operand shall be supported:

- 109217 *file* A pathname of a file. If *file* already has the .Z suffix specified, it shall be used as the  
 109218 input file and the output file shall be named **file** with the .Z suffix removed.  
 109219 Otherwise, *file* shall be used as the name of the output file and **file** with the .Z  
 109220 suffix appended shall be used as the input file.

109221 **STDIN**

109222 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'. .

109223 **INPUT FILES**

109224 Input files shall be in the format produced by the *compress* utility.

109225 **ENVIRONMENT VARIABLES**

109226 The following environment variables shall affect the execution of *uncompress*:

- 109227 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 109228 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 109229 variables used to determine the values of locale categories.)
- 109230 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 109231 internationalization variables.

- 109232 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
109233 characters (for example, single-byte as opposed to multi-byte characters in  
109234 arguments).
- 109235 **LC\_MESSAGES**  
109236 Determine the locale that should be used to affect the format and contents of  
109237 diagnostic messages written to standard error.
- 109238 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 109239 **ASYNCHRONOUS EVENTS**
- 109240 Default.
- 109241 **STDOUT**  
109242 When there are no *file* operands or the `-c` option is specified, the uncompressed output is written  
109243 to standard output.
- 109244 **STDERR**  
109245 Prompts shall be written to the standard error output under the conditions specified in the  
109246 DESCRIPTION and OPTIONS sections. The prompts shall contain the *file* pathname, but their  
109247 format is otherwise unspecified. Otherwise, the standard error output shall be used only for  
109248 diagnostic messages.
- 109249 **OUTPUT FILES**  
109250 Output files are the same as the respective input files to *compress*.
- 109251 **EXTENDED DESCRIPTION**  
109252 None.
- 109253 **EXIT STATUS**  
109254 The following exit values shall be returned:  
109255 0 Successful completion.  
109256 >0 An error occurred.
- 109257 **CONSEQUENCES OF ERRORS**  
109258 The input file remains unmodified.
- 109259 **APPLICATION USAGE**  
109260 The limit of 14 on the *compress -b bits* argument is to achieve portability to all systems (within  
109261 the restrictions imposed by the lack of an explicit published file format). Some implementations  
109262 based on 16-bit architectures cannot support 15 or 16-bit uncompression.
- 109263 **EXAMPLES**  
109264 None.
- 109265 **RATIONALE**  
109266 None.
- 109267 **FUTURE DIRECTIONS**  
109268 None.
- 109269 **SEE ALSO**  
109270 *compress, zcat*  
109271 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

109272 **CHANGE HISTORY**

109273 First released in Issue 4.

109274 **Issue 6**

109275 The normative text is reworded to avoid use of the term “must” for application requirements.

109276 **Issue 7**

109277 SD5-XCU-ERN-26 is applied, clarifying that this utility is allowed to break the Utility Syntax Guidelines by having ten letters in its name.

109279 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

109280 **NAME**

109281 unexpand — convert spaces to tabs

109282 **SYNOPSIS**109283 unexpand [-a|-t *tablist*] [*file...*]109284 **DESCRIPTION**

109285 The *unexpand* utility shall copy files or standard input to standard output, converting <blank>  
 109286 characters at the beginning of each line into the maximum number of <tab> characters followed  
 109287 by the minimum number of <space> characters needed to fill the same column positions  
 109288 originally filled by the translated <blank> characters. By default, tabstops shall be set at every  
 109289 eighth column position. Each <backspace> shall be copied to the output, and shall cause the  
 109290 column position count for tab calculations to be decremented; the count shall never be  
 109291 decremented to a value less than one.

109292 **OPTIONS**109293 The *unexpand* utility shall conform to XBD [Section 12.2](#) (on page 215).

109294 The following options shall be supported:

109295 **-a** In addition to translating <blank> characters at the beginning of each line,  
 109296 translate all sequences of two or more <blank> characters immediately preceding a  
 109297 tab stop to the maximum number of <tab> characters followed by the minimum  
 109298 number of <space> characters needed to fill the same column positions originally  
 109299 filled by the translated <blank> characters.

109300 **-t *tablist*** Specify the tab stops. The application shall ensure that the *tablist* option-argument  
 109301 is a single argument consisting of a single positive decimal integer or multiple  
 109302 positive decimal integers, separated by <blank> or <comma> characters, in  
 109303 ascending order. If a single number is given, tabs shall be set *tablist* column  
 109304 positions apart instead of the default 8. If multiple numbers are given, the tabs  
 109305 shall be set at those specific column positions.

109306 The application shall ensure that each tab-stop position *N* is an integer value  
 109307 greater than zero, and the list shall be in strictly ascending order. This is taken to  
 109308 mean that, from the start of a line of output, tabbing to position *N* shall cause the  
 109309 next character output to be in the (*N*+1)th column position on that line. When the  
 109310 **-t** option is not specified, the default shall be the equivalent of specifying **-t 8**  
 109311 (except for the interaction with **-a**, described below).

109312 No <space>-to-<tab> conversions shall occur for characters at positions beyond  
 109313 the last of those specified in a multiple tab-stop list.

109314 When **-t** is specified, the presence or absence of the **-a** option shall be ignored;  
 109315 conversion shall not be limited to the processing of leading <blank> characters.

109316 **OPERANDS**

109317 The following operand shall be supported:

109318 *file* A pathname of a text file to be used as input.109319 **STDIN**

109320 See the INPUT FILES section.

109321 **INPUT FILES**

109322 The input files shall be text files.

109323 **ENVIRONMENT VARIABLES**

109324 The following environment variables shall affect the execution of *unexpand*:

109325 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 109326 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 109327 variables used to determine the values of locale categories.)

109328 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 109329 internationalization variables.

109330 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 109331 characters (for example, single-byte as opposed to multi-byte characters in  
 109332 arguments and input files), the processing of <tab> and <space> characters, and  
 109333 for the determination of the width in column positions each character would  
 109334 occupy on an output device.

109335 *LC\_MESSAGES*

109336 Determine the locale that should be used to affect the format and contents of  
 109337 diagnostic messages written to standard error.

109338 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

109339 **ASYNCHRONOUS EVENTS**

109340 Default.

109341 **STDOUT**

109342 The standard output shall be equivalent to the input files with the specified <space>-to-<tab>  
 109343 conversions.

109344 **STDERR**

109345 The standard error shall be used only for diagnostic messages.

109346 **OUTPUT FILES**

109347 None.

109348 **EXTENDED DESCRIPTION**

109349 None.

109350 **EXIT STATUS**

109351 The following exit values shall be returned:

109352 0 Successful completion.

109353 >0 An error occurred.

109354 **CONSEQUENCES OF ERRORS**

109355 Default.

109356 **APPLICATION USAGE**

109357 One non-intuitive aspect of *unexpand* is its restriction to leading <space> characters when neither  
 109358 *-a* nor *-t* is specified. Users who always want to convert all <space> characters in a file can  
 109359 easily alias *unexpand* to use the *-a* or *-t 8* option.

109360 **EXAMPLES**

109361 None.

109362 **RATIONALE**

109363 On several occasions, consideration was given to adding a *-t* option to the *unexpand* utility to  
 109364 complement the *-t* in *expand* (see *expand*). The historical intent of *unexpand* was to translate  
 109365 multiple <blank> characters into tab stops, where tab stops were a multiple of eight column

109366 positions on most UNIX systems. An early proposal omitted `-t` because it seemed outside the  
109367 scope of the User Portability Utilities option; it was not described in any of the base documents.  
109368 However, hard-coding tab stops every eight columns was not suitable for the international  
109369 community and broke historical precedents for some vendors in the FORTRAN community, so  
109370 `-t` was restored in conjunction with the list of valid extension categories considered by the  
109371 standard developers. Thus, *unexpand* is now the logical converse of *expand*.

109372 **FUTURE DIRECTIONS**

109373 None.

109374 **SEE ALSO**

109375 *expand*, *tabs*

109376 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

109377 **CHANGE HISTORY**

109378 First released in Issue 4.

109379 **Issue 6**

109380 This utility is marked as part of the User Portability Utilities option.

109381 The definition of the `LC_CTYPE` environment variable is changed to align with the  
109382 IEEE P1003.2b draft standard.

109383 The normative text is reworded to avoid use of the term “must” for application requirements.

109384 **Issue 7**

109385 The *unexpand* utility is moved from the User Portability Utilities option to the Base. User  
109386 Portability Utilities is now an option for interactive utilities.

109387 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

109388 **NAME**109389 unget — undo a previous get of an SCCS file (**DEVELOPMENT**)109390 **SYNOPSIS**109391 XSI unget [-ns] [-r *SID*] *file...*109392 **DESCRIPTION**109393 The *unget* utility shall reverse the effect of a *get -e* done prior to creating the intended new delta.109394 **OPTIONS**109395 The *unget* utility shall conform to XBD [Section 12.2](#) (on page 215).

109396 The following options shall be supported:

109397 **-r** *SID* Uniquely identify which delta is no longer intended. (This would have been  
 109398 specified by *get* as the new delta.) The use of this option is necessary only if two or  
 109399 more outstanding *get* commands for editing on the same SCCS file were done by  
 109400 the same person (login name).

109401 **-s** Suppress the writing to standard output of the intended delta's *SID*.

109402 **-n** Retain the file that was obtained by *get*, which would normally be removed from  
 109403 the current directory.

109404 **OPERANDS**

109405 The following operands shall be supported:

109406 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *unget*  
 109407 utility shall behave as though each file in the directory were specified as a named  
 109408 file, except that non-SCCS files (last component of the pathname does not begin  
 109409 with **s**.) and unreadable files shall be silently ignored.

109410 If exactly one *file* operand appears, and it is *'-'*, the standard input shall be read;  
 109411 each line of the standard input shall be taken to be the name of an SCCS file to be  
 109412 processed. Non-SCCS files and unreadable files shall be silently ignored.

109413 **STDIN**

109414 The standard input shall be a text file used only when the *file* operand is specified as *'-'*. Each  
 109415 line of the text file shall be interpreted as an SCCS pathname.

109416 **INPUT FILES**

109417 Any SCCS files processed shall be files of an unspecified format.

109418 **ENVIRONMENT VARIABLES**109419 The following environment variables shall affect the execution of *unget*:

109420 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 109421 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 109422 variables used to determine the values of locale categories.)

109423 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 109424 internationalization variables.

109425 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 109426 characters (for example, single-byte as opposed to multi-byte characters in  
 109427 arguments and input files).

109428 **LC\_MESSAGES**

109429 Determine the locale that should be used to affect the format and contents of  
 109430 diagnostic messages written to standard error.

- 109431 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 109432 **ASYNCHRONOUS EVENTS**
- 109433 Default.
- 109434 **STDOUT**
- 109435 The standard output shall consist of a line for each file, in the following format:
- 109436 "%s\n", <*SID removed from file*>
- 109437 If there is more than one named file or if a directory or standard input is named, each pathname
- 109438 shall be written before each of the preceding lines:
- 109439 "\n%s:\n", <*pathname*>
- 109440 **STDERR**
- 109441 The standard error shall be used only for diagnostic messages.
- 109442 **OUTPUT FILES**
- 109443 Any SCCS files updated shall be files of an unspecified format. During processing of a *file*, a
- 109444 locking *z-file*, as described in *get*, and a *q-file* (a working copy of the *p-file*), may be created and
- 109445 deleted. The *p-file* and *g-file*, as described in *get*, shall be deleted.
- 109446 **EXTENDED DESCRIPTION**
- 109447 None.
- 109448 **EXIT STATUS**
- 109449 The following exit values shall be returned:
- 109450 0 Successful completion.
- 109451 >0 An error occurred.
- 109452 **CONSEQUENCES OF ERRORS**
- 109453 Default.
- 109454 **APPLICATION USAGE**
- 109455 None.
- 109456 **EXAMPLES**
- 109457 None.
- 109458 **RATIONALE**
- 109459 None.
- 109460 **FUTURE DIRECTIONS**
- 109461 None.
- 109462 **SEE ALSO**
- 109463 *delta*, *get*, *sact*
- 109464 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)
- 109465 **CHANGE HISTORY**
- 109466 First released in Issue 2.
- 109467 **Issue 6**
- 109468 The normative text is reworded to avoid use of the term “must” for application requirements.

109469 **Issue 7**  
109470

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

109471 **NAME**109472            **uniq** — report or filter out repeated lines in a file109473 **SYNOPSIS**109474            **uniq** [-c|-d|-u] [-f *fields*] [-s *char*] [*input\_file* [*output\_file*]]109475 **DESCRIPTION**

109476            The *uniq* utility shall read an input file comparing adjacent lines, and write one copy of each  
 109477            input line on the output. The second and succeeding copies of repeated adjacent input lines shall  
 109478            not be written. The trailing <newline> of each line in the input shall be ignored when doing  
 109479            comparisons.

109480            Repeated lines in the input shall not be detected if they are not adjacent.

109481 **OPTIONS**

109482            The *uniq* utility shall conform to XBD [Section 12.2](#) (on page 215), except that '+' may be  
 109483            recognized as an option delimiter as well as '-'.

109484            The following options shall be supported:

109485            **-c**            Precede each output line with a count of the number of times the line occurred in  
 109486            the input.

109487            **-d**            Suppress the writing of lines that are not repeated in the input.

109488            **-f *fields***    Ignore the first *fields* fields on each input line when doing comparisons, where  
 109489            *fields* is a positive decimal integer. A field is the maximal string matched by the  
 109490            basic regular expression:

109491            [[[:blank:]]]\*[^[[:blank:]]]\*

109492            If the *fields* option-argument specifies more fields than appear on an input line, a  
 109493            null string shall be used for comparison.

109494            **-s *chars***    Ignore the first *chars* characters when doing comparisons, where *chars* shall be a  
 109495            positive decimal integer. If specified in conjunction with the **-f** option, the first  
 109496            *chars* characters after the first *fields* fields shall be ignored. If the *chars* option-  
 109497            argument specifies more characters than remain on an input line, a null string shall  
 109498            be used for comparison.

109499            **-u**            Suppress the writing of lines that are repeated in the input.

109500 **OPERANDS**

109501            The following operands shall be supported:

109502            *input\_file*    A pathname of the input file. If the *input\_file* operand is not specified, or if the  
 109503            *input\_file* is '-', the standard input shall be used.

109504            *output\_file*   A pathname of the output file. If the *output\_file* operand is not specified, the  
 109505            standard output shall be used. The results are unspecified if the file named by  
 109506            *output\_file* is the file named by *input\_file*.

109507 **STDIN**109508            The standard input shall be used only if no *input\_file* operand is specified or if *input\_file* is '-'.  
109509            See the INPUT FILES section.109510 **INPUT FILES**

109511            The input file shall be a text file.

109512 **ENVIRONMENT VARIABLES**

109513 The following environment variables shall affect the execution of *uniq*:

109514 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 109515 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 109516 variables used to determine the values of locale categories.)

109517 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 109518 internationalization variables.

109519 *LC\_COLLATE*  
 109520 Determine the locale for ordering rules.

109521 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 109522 characters (for example, single-byte as opposed to multi-byte characters in  
 109523 arguments and input files) and which characters constitute a <blank> in the  
 109524 current locale.

109525 *LC\_MESSAGES*  
 109526 Determine the locale that should be used to affect the format and contents of  
 109527 diagnostic messages written to standard error.

109528 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

109529 **ASYNCHRONOUS EVENTS**

109530 Default.

109531 **STDOUT**

109532 The standard output shall be used if no *output\_file* operand is specified, and shall be used if the  
 109533 *output\_file* operand is '-' and the implementation treats the '-' as meaning standard output.  
 109534 Otherwise, the standard output shall not be used. See the OUTPUT FILES section.

109535 **STDERR**

109536 The standard error shall be used only for diagnostic messages.

109537 **OUTPUT FILES**

109538 If the -c option is specified, the output file shall be empty or each line shall be of the form:

109539 "%d %s", <number of duplicates>, <line>

109540 otherwise, the output file shall be empty or each line shall be of the form:

109541 "%s", <line>

109542 **EXTENDED DESCRIPTION**

109543 None.

109544 **EXIT STATUS**

109545 The following exit values shall be returned:

109546 0 The utility executed successfully.

109547 >0 An error occurred.

109548 **CONSEQUENCES OF ERRORS**

109549 Default.

109550 **APPLICATION USAGE**

109551 The *sort* utility can be used to cause repeated lines to be adjacent in the input file.

109552 **EXAMPLES**

109553 The following input file data (but flushed left) was used for a test series on *uniq*:

```
109554 #01 foo0 bar0 fool bar1
109555 #02 bar0 fool bar1 fool
109556 #03 foo0 bar0 fool bar1
109557 #04
109558 #05 foo0 bar0 fool bar1
109559 #06 foo0 bar0 fool bar1
109560 #07 bar0 fool bar1 foo0
```

109561 What follows is a series of test invocations of the *uniq* utility that use a mixture of *uniq* options  
 109562 against the input file data. These tests verify the meaning of *adjacent*. The *uniq* utility views the  
 109563 input data as a sequence of strings delimited by '\n'. Accordingly, for the *fields* member of  
 109564 the sequence, *uniq* interprets unique or repeated adjacent lines strictly relative to the *fields*+1th  
 109565 member.

- 109566 1. This first example tests the line counting option, comparing each line of the input file data  
 109567 starting from the second field:

```
109568 uniq -c -f 1 uniq_0I.t
109569     1 #01 foo0 bar0 fool bar1
109570     1 #02 bar0 fool bar1 fool
109571     1 #03 foo0 bar0 fool bar1
109572     1 #04
109573     2 #05 foo0 bar0 fool bar1
109574     1 #07 bar0 fool bar1 foo0
```

109575 The number '2', prefixing the fifth line of output, signifies that the *uniq* utility detected a  
 109576 pair of repeated lines. Given the input data, this can only be true when *uniq* is run using  
 109577 the *-f 1* option (which shall cause *uniq* to ignore the first field on each input line).

- 109578 2. The second example tests the option to suppress unique lines, comparing each line of the  
 109579 input file data starting from the second field:

```
109580 uniq -d -f 1 uniq_0I.t
109581 #05 foo0 bar0 fool bar1
```

- 109582 3. This test suppresses repeated lines, comparing each line of the input file data starting  
 109583 from the second field:

```
109584 uniq -u -f 1 uniq_0I.t
109585 #01 foo0 bar0 fool bar1
109586 #02 bar0 fool bar1 fool
109587 #03 foo0 bar0 fool bar1
109588 #04
109589 #07 bar0 fool bar1 foo0
```

- 109590 4. This suppresses unique lines, comparing each line of the input file data starting from the  
 109591 third character:

```
109592 uniq -d -s 2 uniq_0I.t
```

109593 In the last example, the *uniq* utility found no input matching the above criteria.

**109594 RATIONALE**

109595 Some historical implementations have limited lines to be 1 080 bytes in length, which does not  
109596 meet the implied {LINE\_MAX} limit.

109597 Earlier versions of this standard allowed the *-number* and *+number* options. These options are no  
109598 longer specified by POSIX.1-2008 but may be present in some implementations.

**109599 FUTURE DIRECTIONS**

109600 None.

**109604 CHANGE HISTORY**

109605 First released in Issue 2.

**109606 Issue 6**

109607 The obsolescent SYNOPSIS and associated text are removed.

109608 The normative text is reworded to avoid use of the term “must” for application requirements.

109609 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/40 is applied, adding *LC\_COLLATE* to the  
109610 ENVIRONMENT VARIABLES section, and changing “the application shall ensure that” in the  
109611 OUTPUT FILES section.

**109612 Issue 7**

109613 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that ‘+’ may be recognized  
109614 as an option delimiter in the OPTIONS section.

109615 Austin Group Interpretation 1003.1-2001 #092 is applied.

109616 Austin Group Interpretation 1003.1-2001 #133 is applied, clarifying the behavior of the trailing  
109617 <newline>.

109618 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

109619 SD5-XCU-ERN-141 is applied, updating the EXAMPLES section.

109620 **NAME**109621 unlink — call the *unlink()* function109622 **SYNOPSIS**109623 XSI unlink *file*109624 **DESCRIPTION**109625 The *unlink* utility shall perform the function call:109626 unlink(*file*);109627 A user may need appropriate privileges to invoke the *unlink* utility.109628 **OPTIONS**

109629 None.

109630 **OPERANDS**

109675 **SEE ALSO**109676 *link, rm*109677 XBD [Chapter 8](#) (on page 173)109678 XSH *unlink()*109679 **CHANGE HISTORY**

109680 First released in Issue 5.

109681 **NAME**

109682 uucp — system-to-system copy

109683 **SYNOPSIS**109684 UU `uucp [-cCdFjmr] [-n user] source-file... destination-file`109685 **DESCRIPTION**

109686 The *uucp* utility shall copy files named by the *source-file* argument to the *destination-file* argument.  
 109687 The files named can be on local or remote systems.

109688 The *uucp* utility cannot guarantee support for all character encodings in all circumstances. For  
 109689 example, transmission data may be restricted to 7 bits by the underlying network, 8-bit data and  
 109690 filenames need not be portable to non-internationalized systems, and so on. Under these  
 109691 circumstances, it is recommended that only characters defined in the ISO/IEC 646:1991  
 109692 standard International Reference Version (equivalent to ASCII) 7-bit range of characters be used,  
 109693 and that only characters defined in the portable filename character set be used for naming files.  
 109694 The protocol for transfer of files is unspecified by POSIX.1-2008.

109695 Typical implementations of this utility require a communications line configured to use XBD  
 109696 [Chapter 11](#) (on page 199), but other communications means may be used. On systems where  
 109697 there are no available communications means (either temporarily or permanently), this utility  
 109698 shall write an error message describing the problem and exit with a non-zero exit status.

109699 **OPTIONS**109700 The *uucp* utility shall conform to XBD [Section 12.2](#) (on page 215).

109701 The following options shall be supported:

- 109702 **-c** Do not copy local file to the spool directory for transfer to the remote machine  
 109703 (default).
- 109704 **-C** Force the copy of local files to the spool directory for transfer.
- 109705 **-d** Make all necessary directories for the file copy (default).
- 109706 **-f** Do not make intermediate directories for the file copy.
- 109707 **-j** Write the job identification string to standard output. This job identification can be  
 109708 used by *uustat* to obtain the status or terminate a job.
- 109709 **-m** Send mail to the requester when the copy is completed.
- 109710 **-n *user*** Notify *user* on the remote system that a file was sent.
- 109711 **-r** Do not start the file transfer; just queue the job.

109712 **OPERANDS**

109713 The following operands shall be supported:

109714 *destination-file, source-file*

109715 A pathname of a file to be copied to, or from, respectively. Either name can be a  
 109716 pathname on the local machine, or can have the form:

109717 *system-name!pathname*

109718 where *system-name* is taken from a list of system names that *uucp* knows about.  
 109719 The destination *system-name* can also be a list of names such as:

109720 *system-name!system-name!...!system-name!pathname*

109721 in which case, an attempt is made to send the file via the specified route to the

109722 destination. Care should be taken to ensure that intermediate nodes in the route  
109723 are willing to forward information.

109724 The shell pattern matching notation characters '?', '\*', and "[...]" appearing  
109725 in *pathname* shall be expanded on the appropriate system.

109726 Pathnames can be one of:

- 109727 1. An absolute pathname.
- 109728 2. A pathname preceded by *~user* where *user* is a login name on the specified  
109729 system and is replaced by that user's login directory. Note that if an invalid  
109730 login is specified, the default is to the public directory (called *PUBDIR*; the  
109731 actual location of *PUBDIR* is implementation-defined).
- 109732 3. A pathname preceded by *~/destination* where *destination* is appended to  
109733 *PUBDIR*.

109734 **Note:** This destination is treated as a filename unless more than one file is being  
109735 transferred by this request or the destination is already a directory. To  
109736 ensure that it is a directory, follow the destination with a '/'. For  
109737 example, *~/dan/* as the destination makes the directory **PUBDIR/dan** if it  
109738 does not exist and puts the requested files in that directory.

- 109739 4. Anything else shall be prefixed by the current directory.

109740 If the result is an erroneous pathname for the remote system, the copy shall fail. If  
109741 the *destination-file* is a directory, the last part of the *source-file* name shall be used.

109742 The read, write, and execute permissions given by *uucp* are implementation-  
109743 defined.

#### 109744 STDIN

109745 Not used.

#### 109746 INPUT FILES

109747 The files to be copied are regular files.

#### 109748 ENVIRONMENT VARIABLES

109749 The following environment variables shall affect the execution of *uucp*:

109750 *LANG* Provide a default value for the internationalization variables that are unset or null.  
109751 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
109752 variables used to determine the values of locale categories.)

109753 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
109754 internationalization variables.

109755 *LC\_COLLATE*

109756 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
109757 character collating elements within bracketed filename patterns.

109758 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
109759 characters (for example, single-byte as opposed to multi-byte characters in  
109760 arguments and input files) and the behavior of character classes within bracketed  
109761 filename patterns (for example, "[[:lower:]]\*").

109762 *LC\_MESSAGES*

109763 Determine the locale that should be used to affect the format and contents of  
109764 diagnostic messages written to standard error, and informative messages written  
109765 to standard output.

- 109766 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 109767 **ASYNCHRONOUS EVENTS**
- 109768 Default.
- 109769 **STDOUT**
- 109770 Not used.
- 109771 **STDERR**
- 109772 The standard error shall be used only for diagnostic messages.
- 109773 **OUTPUT FILES**
- 109774 The output files (which may be on other systems) are copies of the input files.
- 109775 If *-m* is used, mail files are modified.
- 109776 **EXTENDED DESCRIPTION**
- 109777 None.
- 109778 **EXIT STATUS**
- 109779 The following exit values shall be returned:
- 109780 0 Successful completion.
- 109781 >0 An error occurred.
- 109782 **CONSEQUENCES OF ERRORS**
- 109783 Default.
- 109784 **APPLICATION USAGE**
- 109785 This utility is part of the UUCP Utilities option and need not be supported by all  
109786 implementations.
- 109787 The domain of remotely accessible files can (and for obvious security reasons usually should) be  
109788 severely restricted.
- 109789 Note that the *' ! '* character in addresses has to be escaped when using *cs**h* as a command  
109790 interpreter because of its history substitution syntax. For *ksh* and *sh* the escape is not necessary,  
109791 but may be used.
- 109792 As noted above, shell metacharacters appearing in pathnames are expanded on the appropriate  
109793 system. On an internationalized system, this is done under the control of local settings of  
109794 *LC\_COLLATE* and *LC\_CTYPE*. Thus, care should be taken when using bracketed filename  
109795 patterns, as collation and typing rules may vary from one system to another. Also be aware that  
109796 certain types of expression (that is, equivalence classes, character classes, and collating symbols)  
109797 need not be supported on non-internationalized systems.
- 109798 **EXAMPLES**
- 109799 None.
- 109800 **RATIONALE**
- 109801 None.
- 109802 **FUTURE DIRECTIONS**
- 109803 None.
- 109804 **SEE ALSO**

109807 **CHANGE HISTORY**

109808 First released in Issue 2.

109809 **Issue 6**

109810 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

109811 The UN margin codes and associated shading are removed from the *-C*, *-f*, *-j*, *-n*, and *-r*  
109812 options in response to The Open Group Base Resolution bwg2001-003.

109813 **Issue 7**

109814 SD5-XCU-ERN-46 is applied, moving this utility to the UUCP Utilities Option Group.

109815 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

109816 **NAME**109817 `uudecode` — decode a binary file109818 **SYNOPSIS**109819 `uudecode [-o outfile] [file]`109820 **DESCRIPTION**

109821 The *uudecode* utility shall read a file, or standard input if no file is specified, that includes data  
 109822 created by the *uuencode* utility. The *uudecode* utility shall scan the input file, searching for data  
 109823 compatible with one of the formats specified in *uuencode*, and attempt to create or overwrite the  
 109824 file described by the data (or overridden by the `-o` option). The pathname shall be contained in  
 109825 the data or specified by the `-o` option. The file access permission bits and contents for the file to  
 109826 be produced shall be contained in that data. The mode bits of the created file (other than  
 109827 standard output) shall be set from the file access permission bits contained in the data; that is,  
 109828 other attributes of the mode, including the file mode creation mask (see *umask*), shall not affect  
 109829 the file being produced. If either of the *op* characters '+' and '-' (see *chmod*) are specified in  
 109830 symbolic mode, the initial mode on which those operations are based is unspecified.

109831 If the pathname of the file to be produced exists, and the user does not have write permission on  
 109832 that file, *uudecode* shall terminate with an error. If the pathname of the file to be produced exists,  
 109833 and the user has write permission on that file, the existing file shall be overwritten.

109834 If the input data was produced by *uuencode* on a system with a different number of bits per byte  
 109835 than on the target system, the results of *uudecode* are unspecified.

109836 **OPTIONS**109837 The *uudecode* utility shall conform to XBD [Section 12.2](#) (on page 215).

109838 The following option shall be supported by the implementation:

109839 `-o outfile` A pathname of a file that shall be used instead of any pathname contained in the  
 109840 input data. Specifying an *outfile* option-argument of `/dev/stdout` shall indicate  
 109841 standard output.

109842 **OPERANDS**

109843 The following operand shall be supported:

109844 *file* The pathname of a file containing the output of *uuencode*.109845 **STDIN**

109846 See the INPUT FILES section.

109847 **INPUT FILES**109848 The input files shall be files containing the output of *uuencode*.109849 **ENVIRONMENT VARIABLES**109850 The following environment variables shall affect the execution of *uudecode*:

109851 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 109852 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 109853 variables used to determine the values of locale categories.)

109854 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 109855 internationalization variables.

109856 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 109857 characters (for example, single-byte as opposed to multi-byte characters in  
 109858 arguments and input files).

109859 *LC\_MESSAGES*

109860 Determine the locale that should be used to affect the format and contents of

109861 diagnostic messages written to standard error.

109862 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

109863 **ASYNCHRONOUS EVENTS**

109864 Default.

109865 **STDOUT**

109866 If the file data header encoded by *uuencode* is `-` or `/dev/stdout`, or the `-o /dev/stdout` option

109867 overrides the file data, the standard output shall be in the same format as the file originally

109868 encoded by *uuencode*. Otherwise, the standard output shall not be used.

109869 **STDERR**

109870 The standard error shall be used only for diagnostic messages.

109871 **OUTPUT FILES**

109872 The output file shall be in the same format as the file originally encoded by *uuencode*.

109873 **EXTENDED DESCRIPTION**

109874 None.

109875 **EXIT STATUS**

109876 The following exit values shall be returned:

109877 0 Successful completion.

109878 >0 An error occurred.

109879 **CONSEQUENCES OF ERRORS**

109880 Default.

109881 **APPLICATION USAGE**

109882 The user who is invoking *uudecode* must have write permission on any file being created.

109883 The output of *uuencode* is essentially an encoded bit stream that is not cognizant of byte

109884 boundaries. It is possible that a 9-bit byte target machine can process input from an 8-bit source,

109885 if it is aware of the requirement, but the reverse is unlikely to be satisfying. Of course, the only

109886 data that is meaningful for such a transfer between architectures is generally character data.

109887 **EXAMPLES**

109888 None.

109889 **RATIONALE**

109890 Input files are not necessarily text files, as stated by an early proposal. Although the *uuencode*

109891 output is a text file, that output could have been wrapped within another file or mail message

109892 that is not a text file.

109893 The `-o` option is not historical practice, but was added at the request of WG15 so that the user

109894 could override the target pathname without having to edit the input data itself.

109895 In early drafts, the `[-o outfile]` option-argument allowed the use of `-` to mean standard output.

109896 The symbol `-` has only been used previously in POSIX.1-2008 as a standard input indicator. The

109897 standard developers did not wish to overload the meaning of `-` in this manner. The `/dev/stdout`

109898 concept exists on most modern systems. The `/dev/stdout` syntax does not refer to a new special

109899 file. It is just a magic cookie to specify standard output.

109900 **FUTURE DIRECTIONS**

109901 None.

109902 **SEE ALSO**109903 *chmod, umask, uuencode*109904 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)109905 **CHANGE HISTORY**

109906 First released in Issue 4.

109907 **Issue 6**

109908 This utility is marked as part of the User Portability Utilities option.

109909 The `-o outfile` option is added, as specified in the IEEE P1003.2b draft standard.

109910 The normative text is reworded to avoid use of the term “must” for application requirements.

109911 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/35 is applied, clarifying in the  
109912 DESCRIPTION that the initial mode used if either of the *op* characters is '+' or '-' is  
109913 unspecified.109914 **Issue 7**109915 The *uudecode* utility is moved from the User Portability Utilities option to the Base. User  
109916 Portability Utilities is now an option for interactive utilities.

109917 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

109918 **NAME**

109919 uuencode — encode a binary file

109920 **SYNOPSIS**109921 uuencode [-m] [*file*] *decode\_pathname*109922 **DESCRIPTION**

109923 The *uuencode* utility shall write an encoded version of the named input file, or standard input if  
 109924 no *file* is specified, to standard output. The output shall be encoded using one of the algorithms  
 109925 described in the STDOUT section and shall include the file access permission bits (in *chmod* octal  
 109926 or symbolic notation) of the input file and the *decode\_pathname*, for re-creation of the file on  
 109927 another system that conforms to this volume of POSIX.1-2008.

109928 **OPTIONS**109929 The *uuencode* utility shall conform to XBD [Section 12.2](#) (on page 215).

109930 The following option shall be supported by the implementation:

109931 **-m** Encode the output using the MIME Base64 algorithm described in STDOUT. If **-m**  
 109932 is not specified, the historical algorithm described in STDOUT shall be used.

109933 **OPERANDS**

109934 The following operands shall be supported:

109935 *decode\_pathname*

109936 The pathname of the file into which the *uudecode* utility shall place the decoded  
 109937 file. Specifying a *decode\_pathname* operand of **/dev/stdout** shall indicate that  
 109938 *uudecode* is to use standard output. If there are characters in *decode\_pathname* that  
 109939 are not in the portable filename character set the results are unspecified.

109940 *file* A pathname of the file to be encoded.109941 **STDIN**

109942 See the INPUT FILES section.

109943 **INPUT FILES**

109944 Input files can be files of any type.

109945 **ENVIRONMENT VARIABLES**109946 The following environment variables shall affect the execution of *uuencode*:

109947 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 109948 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 109949 variables used to determine the values of locale categories.)

109950 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 109951 internationalization variables.

109952 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 109953 characters (for example, single-byte as opposed to multi-byte characters in  
 109954 arguments and input files).

109955 **LC\_MESSAGES**

109956 Determine the locale that should be used to affect the format and contents of  
 109957 diagnostic messages written to standard error.

109958 **XSIX** **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

109959 **ASYNCHRONOUS EVENTS**

109960 Default.

109961 **STDOUT**109962 **uuencode Base64 Algorithm**

109963 The standard output shall be a text file (encoded in the character set of the current locale) that  
 109964 begins with the line:

109965 `"begin-base64Δ%sΔ\n", <mode>, <decode_pathname>`

109966 and ends with the line:

109967 `"====\n"`

109968 In both cases, the lines shall have no preceding or trailing &lt;blank&gt; characters.

109969 The encoding process represents 24-bit groups of input bits as output strings of four encoded  
 109970 characters. Proceeding from left to right, a 24-bit input group shall be formed by concatenating  
 109971 three 8-bit input groups. Each 24-bit input group then shall be treated as four concatenated 6-bit  
 109972 groups, each of which shall be translated into a single digit in the Base64 alphabet. When  
 109973 encoding a bit stream via the Base64 encoding, the bit stream shall be presumed to be ordered  
 109974 with the most-significant bit first. That is, the first bit in the stream shall be the high-order bit in  
 109975 the first byte, and the eighth bit shall be the low-order bit in the first byte, and so on. Each 6-bit  
 109976 group is used as an index into an array of 64 printable characters, as shown in [Table 4-22](#).

109977 **Table 4-22** uuencode Base64 Values

| Value | Encoding | Value | Encoding | Value | Encoding | Value | Encoding |
|-------|----------|-------|----------|-------|----------|-------|----------|
| 0     | A        | 17    | R        | 34    | i        | 51    | z        |
| 1     | B        | 18    | S        | 35    | j        | 52    | 0        |
| 2     | C        | 19    | T        | 36    | k        | 53    | 1        |
| 3     | D        | 20    | U        | 37    | l        | 54    | 2        |
| 4     | E        | 21    | V        | 38    | m        | 55    | 3        |
| 5     | F        | 22    | W        | 39    | n        | 56    | 4        |
| 6     | G        | 23    | X        | 40    | o        | 57    | 5        |
| 7     | H        | 24    | Y        | 41    | p        | 58    | 6        |
| 8     | I        | 25    | Z        | 42    | q        | 59    | 7        |
| 9     | J        | 26    | a        | 43    | r        | 60    | 8        |
| 10    | K        | 27    | b        | 44    | s        | 61    | 9        |
| 11    | L        | 28    | c        | 45    | t        | 62    | +        |
| 12    | M        | 29    | d        | 46    | u        | 63    | /        |
| 13    | N        | 30    | e        | 47    | v        | (pad) | =        |
| 14    | O        | 31    | f        | 48    | w        |       |          |
| 15    | P        | 32    | g        | 49    | x        |       |          |
| 16    | Q        | 33    | h        | 50    | y        |       |          |

109996 The character referenced by the index shall be placed in the output string.

109997 The output stream (encoded bytes) shall be represented in lines of no more than 76 characters  
 109998 each. All line breaks or other characters not found in the table shall be ignored by decoding  
 109999 software (see [uudecode](#)).

110000 Special processing shall be performed if fewer than 24 bits are available at the end of a message  
 110001 or encapsulated part of a message. A full encoding quantum shall always be completed at the

110002 end of a message. When fewer than 24 input bits are available in an input group, zero bits shall  
 110003 be added (on the right) to form an integral number of 6-bit groups. Output character positions  
 110004 that are not required to represent actual input data shall be set to the character '='. Since all  
 110005 Base64 input is an integral number of octets, only the following cases can arise:

- 110006 1. The final quantum of encoding input is an integral multiple of 24 bits; here, the final unit  
 110007 of encoded output shall be an integral multiple of 4 characters with no '=' padding.
- 110008 2. The final quantum of encoding input is exactly 16 bits; here, the final unit of encoded  
 110009 output shall be three characters followed by one '=' padding character.
- 110010 3. The final quantum of encoding input is exactly 8 bits; here, the final unit of encoded  
 110011 output shall be two characters followed by two '=' padding characters.

110012 A terminating "====" evaluates to nothing and denotes the end of the encoded data.

### 110013 uuencode Historical Algorithm

110014 The standard output shall be a text file (encoded in the character set of the current locale) that  
 110015 begins with the line:

```
110016 "beginΔ%sΔ%s\n" <mode>, <decode_pathname>
```

110017 and ends with the line:

```
110018 "end\n"
```

110019 In both cases, the lines shall have no preceding or trailing <blank> characters.

110020 The algorithm that shall be used for lines in between **begin** and **end** takes three octets as input  
 110021 and writes four characters of output by splitting the input at six-bit intervals into four octets,  
 110022 containing data in the lower six bits only. These octets shall be converted to characters by adding  
 110023 a value of 0x20 to each octet, so that each octet is in the range [0x20,0x5f], and then it shall be  
 110024 assumed to represent a printable character in the ISO/IEC 646:1991 standard encoded character  
 110025 set. It then shall be translated into the corresponding character codes for the codeset in use in the  
 110026 current locale. (For example, the octet 0x41, representing 'A', would be translated to 'A' in the  
 110027 current codeset, such as 0xc1 if it were EBCDIC.)

110028 Where the bits of two octets are combined, the least significant bits of the first octet shall be  
 110029 shifted left and combined with the most significant bits of the second octet shifted right. Thus  
 110030 the three octets *A*, *B*, *C* shall be converted into the four octets:

```
110031 0x20 + (( A >> 2 ) & 0x3F)
```

```
110032 0x20 + (((A << 4) | ((B >> 4) & 0xF)) & 0x3F)
```

```
110033 0x20 + (((B << 2) | ((C >> 6) & 0x3)) & 0x3F)
```

```
110034 0x20 + (( C ) & 0x3F)
```

110035 These octets then shall be translated into the local character set.

110036 Each encoded line contains a length character, equal to the number of characters to be decoded  
 110037 plus 0x20 translated to the local character set as described above, followed by the encoded  
 110038 characters. The maximum number of octets to be encoded on each line shall be 45.

### 110039 STDERR

110040 The standard error shall be used only for diagnostic messages.

110041 **OUTPUT FILES**

110042 None.

110043 **EXTENDED DESCRIPTION**

110044 None.

110045 **EXIT STATUS**

110046 The following exit values shall be returned:

110047 0 Successful completion.

110048 &gt;0 An error occurred.

110049 **CONSEQUENCES OF ERRORS**

110050 Default.

110051 **APPLICATION USAGE**110052 The file is expanded by 35 percent (each three octets become four, plus control information)  
110053 causing it to take longer to transmit.

110054 Since this utility is intended to create files to be used for data interchange between systems with  
110055 possibly different codesets, and to represent binary data as a text file, the ISO/IEC 646:1991  
110056 standard was chosen for a midpoint in the algorithm as a known reference point. The output  
110057 from *uuencode* is a text file on the local system. If the output were in the ISO/IEC 646:1991  
110058 standard codeset, it might not be a text file (at least because the <newline> characters might not  
110059 match), and the goal of creating a text file would be defeated. If this text file was then carried to  
110060 another machine with the same codeset, it would be perfectly compatible with that system's  
110061 *uudecode*. If it was transmitted over a mail system or sent to a machine with a different codeset,  
110062 it is assumed that, as for every other text file, some translation mechanism would convert it (by  
110063 the time it reached a user on the other system) into an appropriate codeset. This translation only  
110064 makes sense from the local codeset, not if the file has been put into a ISO/IEC 646:1991 standard  
110065 representation first. Similarly, files processed by *uuencode* can be placed in *pax* archives,  
110066 intermixed with other text files in the same codeset.

110067 **EXAMPLES**

110068 None.

110069 **RATIONALE**

110070 A new algorithm was added at the request of the international community to parallel work in  
110071 RFC 2045 (MIME). As with the historical *uuencode* format, the Base64 Content-Transfer-Encoding  
110072 is designed to represent arbitrary sequences of octets in a form that is not humanly readable. A  
110073 65-character subset of the ISO/IEC 646:1991 standard is used, enabling 6 bits to be represented  
110074 per printable character. (The extra 65th character, '=', is used to signify a special processing  
110075 function.)

110076 This subset has the important property that it is represented identically in all versions of the  
110077 ISO/IEC 646:1991 standard, including US ASCII, and all characters in the subset are also  
110078 represented identically in all versions of EBCDIC. The historical *uuencode* algorithm does not  
110079 share this property, which is the reason that a second algorithm was added to the ISO POSIX-2  
110080 standard.

110081 The string "====" was used for the termination instead of the end used in the original format  
110082 because the latter is a string that could be valid encoded input.

110083 In an early draft, the *-m* option was named *-b* (for Base64), but it was renamed to reflect its  
110084 relationship to the RFC 2045. A *-u* was also present to invoke the default algorithm, but since  
110085 this was not historical practice, it was omitted as being unnecessary.

- 110086 See the RATIONALE section in *uuencode* for the derivation of the `/dev/stdout` symbol.
- 110087 **FUTURE DIRECTIONS**
- 110088 None.
- 110089 **SEE ALSO**
- 110090 *chmod, mailx, uuencode*
- 110091 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)
- 110092 **CHANGE HISTORY**
- 110093 First released in Issue 4.
- 110094 **Issue 6**
- 110095 This utility is marked as part of the User Portability Utilities option.
- 110096 The Base64 algorithm and the ability to output to `/dev/stdout` are added as specified in the IEEE P1003.2b draft standard.
- 110097
- 110098 **Issue 7**
- 110099 The *uuencode* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.
- 110100
- 110101 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

110102 **NAME**

110103 uustat — uucp status enquiry and job control

110104 **SYNOPSIS**110105 UU uustat [-q|-k *jobid*|-r *jobid*]110106 uustat [-s *system*] [-u *user*]110107 **DESCRIPTION**110108 The *uustat* utility shall display the status of, or cancel, previously specified *uucp* requests, or  
110109 provide general status on *uucp* connections to other systems.110110 When no options are given, *uustat* shall write to standard output the status of all *uucp* requests  
110111 issued by the current user.110112 Typical implementations of this utility require a communications line configured to use XBD  
110113 [Chapter 11](#) (on page 199), but other communications means may be used. On systems where  
110114 there are no available communications means (either temporarily or permanently), this utility  
110115 shall write an error message describing the problem and exit with a non-zero exit status.110116 **OPTIONS**110117 The *uustat* utility shall conform to XBD [Section 12.2](#) (on page 215).

110118 The following options shall be supported:

110119 **-q** Write the jobs queued for each machine.110120 **-k *jobid*** Kill the *uucp* request whose job identification is *jobid*. The application shall ensure  
110121 that the killed *uucp* request belongs to the person invoking *uustat* unless that user  
110122 has appropriate privileges.110123 **-r *jobid*** Rejuvenate *jobid*. The files associated with *jobid* are touched so that their  
110124 modification time is set to the current time. This prevents the cleanup program  
110125 from deleting the job until the jobs modification time reaches the limit imposed by  
110126 the program.110127 **-s *system*** Write the status of all *uucp* requests for remote system *system*.110128 **-u *user*** Write the status of all *uucp* requests issued by *user*.110129 **OPERANDS**

110130 None.

110131 **STDIN**

110132 Not used.

110133 **INPUT FILES**

110134 None.

110135 **ENVIRONMENT VARIABLES**110136 The following environment variables shall affect the execution of *uustat*:110137 **LANG** Provide a default value for the internationalization variables that are unset or null.  
110138 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
110139 variables used to determine the values of locale categories.)110140 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
110141 internationalization variables.

110142            *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
110143            characters (for example, single-byte as opposed to multi-byte characters in  
110144            arguments).

110145            *LC\_MESSAGES*  
110146            Determine the locale that should be used to affect the format and contents of  
110147            diagnostic messages written to standard error, and informative messages written  
110148            to standard output.

110149            *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

110150 **ASYNCHRONOUS EVENTS**  
110151            Default.

110152 **STDOUT**  
110153            The standard output shall consist of information about each job selected, in an unspecified  
110154            format. The information shall include at least the job ID, the user ID or name, and the remote  
110155            system name.

110156 **STDERR**  
110157            The standard error shall be used only for diagnostic messages.

110158 **OUTPUT FILES**  
110159            None.

110160 **EXTENDED DESCRIPTION**  
110161            None.

110162 **EXIT STATUS**  
110163            The following exit values shall be returned:  
110164            0 Successful completion.  
110165            >0 An error occurred.

110166 **CONSEQUENCES OF ERRORS**  
110167            Default.

110168 **APPLICATION USAGE**  
110169            This utility is part of the UUCP Utilities option and need not be supported by all  
110170            implementations.

110171 **EXAMPLES**  
110172            None.

110173 **RATIONALE**  
110174            None.

110175 **FUTURE DIRECTIONS**  
110176            None.

110177 **SEE ALSO**  
110178            *uucp*  
110179            XBD [Chapter 8](#) (on page 173), [Chapter 11](#) (on page 199), [Section 12.2](#) (on page 215)

110180 **CHANGE HISTORY**  
110181            First released in Issue 2.

110182 **Issue 6**

110183 The normative text is reworded to avoid use of the term “must” for application requirements.

110184 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

110185 The UN margin code and associated shading are removed from the *-q* option in response to The  
110186 Open Group Base Resolution bwg2001-003.

110187 **Issue 7**

110188 SD5-XCU-ERN-46 is applied, moving this utility to the UUCP Utilities Option Group.

110189 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

110190 **NAME**

110191 uux — remote command execution

110192 **SYNOPSIS**110193 UU `uux [-jnp] command-string`110194 **DESCRIPTION**

110195 The *uux* utility shall gather zero or more files from various systems, execute a shell pipeline (see  
 110196 [Section 2.9](#), on page 2316) on a specified system, and then send the standard output of the  
 110197 command to a file on a specified system. Only the first command of a pipeline can have a *system-*  
 110198 *name!* prefix. All other commands in the pipeline shall be executed on the system of the first  
 110199 command.

110200 The following restrictions are applicable to the shell pipeline processed by *uux*:

110201 • In gathering files from different systems, pathname expansion shall not be performed by  
 110202 *uux*. Thus, a request such as:

110203 `uux "c99 remsys!~/*.c"`

110204 would attempt to copy the file named literally `*.c` to the local system.

110205 • The redirection operators "`>>`", "`<<`", "`>|`", and "`>&`" shall not be accepted. Any use of  
 110206 these redirection operators shall cause this utility to write an error message describing the  
 110207 problem and exit with a non-zero exit status.

110208 • The reserved word `!` cannot be used at the head of the pipeline to modify the exit status.  
 110209 (See the *command-string* operand description below.)

110210 • Alias substitution shall not be performed.

110211 A filename can be specified as for *uucp*; it can be an absolute pathname, a pathname preceded by  
 110212 *~name* (which is replaced by the corresponding login directory), a pathname specified as *~/dest*  
 110213 (*dest* is prefixed by the public directory called *PUBDIR*; the actual location of *PUBDIR* is  
 110214 implementation-defined), or a simple filename (which is prefixed by *uux* with the current  
 110215 directory). See *uucp* for the details.

110216 The execution of commands on remote systems shall take place in an execution directory known  
 110217 to the *uucp* system. All files required for the execution shall be put into this directory unless they  
 110218 already reside on that machine. Therefore, the application shall ensure that non-local filenames  
 110219 (without path or machine reference) are unique within the *uux* request.

110220 The *uux* utility shall attempt to get all files to the execution system. For files that are output files,  
 110221 the application shall ensure that the filename is escaped using parentheses.

110222 The remote system shall notify the user by mail if the requested command on the remote system  
 110223 was disallowed or the files were not accessible. This notification can be turned off by the `-n`  
 110224 option.

110225 Typical implementations of this utility require a communications line configured to use XBD  
 110226 [Chapter 11](#) (on page 199), but other communications means may be used. On systems where  
 110227 there are no available communications means (either temporarily or permanently), this utility  
 110228 shall write an error message describing the problem and exit with a non-zero exit status.

110229 The *uux* utility cannot guarantee support for all character encodings in all circumstances. For  
 110230 example, transmission data may be restricted to 7 bits by the underlying network, 8-bit data and  
 110231 filenames need not be portable to non-internationalized systems, and so on. Under these  
 110232 circumstances, it is recommended that only characters defined in the ISO/IEC 646:1991  
 110233 standard International Reference Version (equivalent to ASCII) 7-bit range of characters be used

110234 and that only characters defined in the portable filename character set be used for naming files.

#### 110235 **OPTIONS**

110236 The *uux* utility shall conform to XBD [Section 12.2](#) (on page 215).

110237 The following options shall be supported:

- 110238     **-j**           Write the job identification string to standard output. This job identification can be
- 110239                   used by *uustat* to obtain the status or terminate a job.
- 110240     **-n**           Do not notify the user if the command fails.
- 110241     **-p**           Make the standard input to *uux* the standard input to the *command-string*.

#### 110242 **OPERANDS**

110243 The following operand shall be supported:

110244     *command-string*

- 110245                   A string made up of one or more arguments that are similar to normal command
- 110246                   arguments, except that the command and any filenames can be prefixed by *system-*
- 110247                   *name!*. A null *system-name* shall be interpreted as the local system.

#### 110248 **STDIN**

110249 The standard input shall not be used unless the *'-'* or **-p** option is specified; in those cases, the

110250 standard input shall be made the standard input of the *command-string*.

#### 110251 **INPUT FILES**

110252 Input files shall be selected according to the contents of *command-string*.

#### 110253 **ENVIRONMENT VARIABLES**

110254 The following environment variables shall affect the execution of *uux*:

- 110255     **LANG**           Provide a default value for the internationalization variables that are unset or null.
- 110256                   (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization
- 110257                   variables used to determine the values of locale categories.)
- 110258     **LC\_ALL**        If set to a non-empty string value, override the values of all the other
- 110259                   internationalization variables.
- 110260     **LC\_CTYPE**     Determine the locale for the interpretation of sequences of bytes of text data as
- 110261                   characters (for example, single-byte as opposed to multi-byte characters in
- 110262                   arguments).
- 110263     **LC\_MESSAGES**   Determine the locale that should be used to affect the format and contents of
- 110264                   diagnostic messages written to standard error.
- 110265
- 110266     **NLSPATH**       Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 110267 **ASYNCHRONOUS EVENTS**

110268 Default.

#### 110269 **STDOUT**

110270 The standard output shall not be used unless the **-j** option is specified; in that case, the job

110271 identification string shall be written to standard output in the following format:

110272     "%s\n", <*jobid*>

110273 **STDERR**

110274 The standard error shall be used only for diagnostic messages.

110275 **OUTPUT FILES**

110276 Output files shall be created or written, or both, according to the contents of *command-string*.

110277 If **-n** is not used, mail files shall be modified following any command or file-access failures on  
110278 the remote system.

110279 **EXTENDED DESCRIPTION**

110280 None.

110281 **EXIT STATUS**

110282 The following exit values shall be returned:

110283 0 Successful completion.

110284 >0 An error occurred.

110285 **CONSEQUENCES OF ERRORS**

110286 Default.

110287 **APPLICATION USAGE**

110288 This utility is part of the UUCP Utilities option and need not be supported by all  
110289 implementations.

110290 Note that, for security reasons, many installations limit the list of commands executable on  
110291 behalf of an incoming request from *uux*. Many sites permit little more than the receipt of mail  
110292 via *uux*.

110293 Any characters special to the command interpreter should be quoted either by quoting the entire  
110294 *command-string* or quoting the special characters as individual arguments.

110295 As noted in *uucp*, shell pattern matching notation characters appearing in pathnames are  
110296 expanded on the appropriate local system. This is done under the control of local settings of  
110297 *LC\_COLLATE* and *LC\_CTYPE*. Thus, care should be taken when using bracketed filename  
110298 patterns, as collation and typing rules may vary from one system to another. Also be aware that  
110299 certain types of expression (that is, equivalence classes, character classes, and collating symbols)  
110300 need not be supported on non-internationalized systems.

110301 **EXAMPLES**

110302 1. The following command gets **file1** from system **a** and **file2** from system **b**, executes *diff* on  
110303 the local system, and puts the results in **file.diff** in the local *PUBDIR* directory. (*PUBDIR*  
110304 is the *uucp* public directory on the local system.)

```
110305 uux "!diff a!/usr/file1 b!/a4/file2 >!~/file.diff"
```

110306 2. The following command fails because *uux* places all files copied to a system in the same  
110307 working directory. Although the files **xyz** are from two different systems, their filenames  
110308 are the same and conflict.

```
110309 uux "!diff a!/usr1/xyz b!/usr2/xyz >!~/xyz.diff"
```

110310 3. The following command succeeds (assuming *diff* is permitted on system **a**) because the  
110311 file local to system **a** is not copied to the working directory, and hence does not conflict  
110312 with the file from system **c**.

```
110313 uux "a!diff a!/usr/xyz c!/usr/xyz >!~/xyz.diff"
```

110314 **RATIONALE**

110315 None.

110316 **FUTURE DIRECTIONS**

110317 None.

110318 **SEE ALSO**110319 [Chapter 2](#) (on page 2297), [uucp](#), [uuencode](#), [uustat](#)110320 XBD [Chapter 8](#) (on page 173), [Chapter 11](#) (on page 199), [Section 12.2](#) (on page 215)110321 **CHANGE HISTORY**

110322 First released in Issue 2.

110323 **Issue 6**

110324 The obsolescent SYNOPSIS is removed.

110325 The normative text is reworded to avoid use of the term “must” for application requirements.

110326 The UN margin code and associated shading are removed from the `-j` option in response to The  
110327 Open Group Base Resolution bwg2001-003.110328 **Issue 7**

110329 SD5-XCU-ERN-46 is applied, moving this utility to the UUCP Utilities Option Group.

110330 **NAME**110331 val — validate SCCS files (**DEVELOPMENT**)110332 **SYNOPSIS**

```
110333 XSI      val -
110334      val [-s] [-m name] [-r SID] [-y type] file...
```

110335 **DESCRIPTION**

110336 The *val* utility shall determine whether the specified *file* is an SCCS file meeting the  
 110337 characteristics specified by the options.

110338 **OPTIONS**

110339 The *val* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the usage of the *'-'*  
 110340 operand is not strictly as intended by the guidelines (that is, reading options and operands from  
 110341 standard input).

110342 The following options shall be supported:

- 110343 **-m name** Specify a *name*, which is compared with the SCCS **%M%** keyword in *file*; see *get*.
- 110344 **-r SID** Specify a *SID* (SCCS Identification String), an SCCS delta number. A check shall be  
 110345 made to determine whether the *SID* is ambiguous (for example, **-r 1** is ambiguous  
 110346 because it physically does not exist but implies 1.1, 1.2, and so on, which may exist)  
 110347 or invalid (for example, **-r 1.0** or **-r 1.1.0** are invalid because neither case can exist  
 110348 as a valid delta number). If the *SID* is valid and not ambiguous, a check shall be  
 110349 made to determine whether it actually exists.
- 110350 **-s** Silence the diagnostic message normally written to standard output for any error  
 110351 that is detected while processing each named file on a given command line.
- 110352 **-y type** Specify a *type*, which shall be compared with the SCCS **%Y%** keyword in *file*; see  
 110353 *get*.

110354 **OPERANDS**

110355 The following operands shall be supported:

- 110356 *file* A pathname of an existing SCCS file. If exactly one *file* operand appears, and it is  
 110357 *'-'*, the standard input shall be read: each line shall be independently processed  
 110358 as if it were a command line argument list. (However, the line is not subjected to  
 110359 any of the shell word expansions, such as parameter expansion or quote removal.)

110360 **STDIN**

110361 The standard input shall be a text file used only when the *file* operand is specified as *'-'*.

110362 **INPUT FILES**

110363 Any SCCS files processed shall be files of an unspecified format.

110364 **ENVIRONMENT VARIABLES**

110365 The following environment variables shall affect the execution of *val*:

- 110366 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 110367 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 110368 variables used to determine the values of locale categories.)
- 110369 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 110370 internationalization variables.

- 110371            *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).
- 110372
- 110373
- 110374            *LC\_MESSAGES*
- 110375                            Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error, and informative messages written to standard output.
- 110376
- 110377
- 110378            *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 110379 **ASYNCHRONOUS EVENTS**
- 110380            Default.
- 110381 **STDOUT**
- 110382            The standard output shall consist of informative messages about either:
- 110383                            1. Each file processed
- 110384                            2. Each command line read from standard input
- 110385            If the standard input is not used, for each *file* operand yielding a discrepancy, the output line shall have the following format:
- 110386
- 110387            "%s: %s\n", <pathname>, <unspecified string>
- 110388            If standard input is used, a line of input shall be written before each of the preceding lines for files containing discrepancies:
- 110389
- 110390            "%s:\n", <input line>
- 110391 **STDERR**
- 110392            Not used.
- 110393 **OUTPUT FILES**
- 110394            None.
- 110395 **EXTENDED DESCRIPTION**
- 110396            None.
- 110397 **EXIT STATUS**
- 110398            The 8-bit code returned by *val* shall be a disjunction of the possible errors; that is, it can be interpreted as a bit string where set bits are interpreted as follows:
- 110399
- 110400            0x80    =   Missing file argument.
- 110401            0x40    =   Unknown or duplicate option.
- 110402            0x20    =   Corrupted SCCS file.
- 110403            0x10    =   Cannot open file or file not SCCS.
- 110404            0x08    =   *SID* is invalid or ambiguous.
- 110405            0x04    =   *SID* does not exist.
- 110406            0x02    =   %Y%, -y mismatch.
- 110407            0x01    =   %M%, -m mismatch.
- 110408            Note that *val* can process two or more files on a given command line and can process multiple command lines (when reading the standard input). In these cases an aggregate code shall be returned: a logical OR of the codes generated for each command line and file processed.
- 110409
- 110410

**110411 CONSEQUENCES OF ERRORS**

110412 Default.

**110413 APPLICATION USAGE**

110414 Since the *val* exit status sets the 0x80 bit, shell applications checking "\$?" cannot tell if it  
110415 terminated due to a missing file argument or receipt of a signal.

**110416 EXAMPLES**

110417 In a directory with three SCCS files—*s.x* (of *t* type "text"), *s.y*, and *s.z* (a corrupted file)—the  
110418 following command could produce the output shown:

```
110419 val - <<EOF
110420 -y source s.x
110421 -m y s.y
110422 s.z
110423 EOF

110424 -y source s.x

110425     s.x: %Y%, -y mismatch
110426     s.z

110427     s.z: corrupted SCCS file
```

**110428 RATIONALE**

110429 None.

**110430 FUTURE DIRECTIONS**

110431 None.

110434 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

**110435 CHANGE HISTORY**

110436 First released in Issue 2.

**110437 Issue 6**

110438 The Open Group Corrigendum U025/4 is applied, correcting a typographical error in the EXIT  
110439 STATUS.

**110440 Issue 7**

110441 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

110442 **NAME**

110443 vi — screen-oriented (visual) display editor

110444 **SYNOPSIS**110445 UP `vi [-rR] [-c command] [-t tagstring] [-w size] [file...]`110446 **DESCRIPTION**110447 This utility shall be provided on systems that both support the User Portability Utilities option  
110448 and define the POSIX2\_CHAR\_TERM symbol. On other systems it is optional.110449 The *vi* (visual) utility is a screen-oriented text editor. Only the open and visual modes of the  
110450 editor are described in POSIX.1-2008; see the line editor *ex* for additional editing capabilities  
110451 used in *vi*. The user can switch back and forth between *vi* and *ex* and execute *ex* commands from  
110452 within *vi*.110453 This reference page uses the term *edit buffer* to describe the current working text. No specific  
110454 implementation is implied by this term. All editing changes are performed on the edit buffer,  
110455 and no changes to it shall affect any file until an editor command writes the file.110456 When using *vi*, the terminal screen acts as a window into the editing buffer. Changes made to  
110457 the editing buffer shall be reflected in the screen display; the position of the cursor on the screen  
110458 shall indicate the position within the editing buffer.110459 Certain terminals do not have all the capabilities necessary to support the complete *vi* definition.  
110460 When these commands cannot be supported on such terminals, this condition shall not produce  
110461 an error message such as “not an editor command” or report a syntax error. The implementation  
110462 may either accept the commands and produce results on the screen that are the result of an  
110463 unsuccessful attempt to meet the requirements of this volume of POSIX.1-2008 or report an error  
110464 describing the terminal-related deficiency.110465 **OPTIONS**110466 The *vi* utility shall conform to XBD [Section 12.2](#) (on page 215), except that '+' may be  
110467 recognized as an option delimiter as well as '-'.  
110468 The following options shall be supported:

110468 The following options shall be supported:

110469 `-c command` See the *ex* command description of the `-c` option.110470 `-r` See the *ex* command description of the `-r` option.110471 `-R` See the *ex* command description of the `-R` option.110472 `-t tagstring` See the *ex* command description of the `-t` option.110473 `-w size` See the *ex* command description of the `-w` option.110474 **OPERANDS**110475 See the OPERANDS section of the *ex* command for a description of the operands supported by  
110476 the *vi* command.110477 **STDIN**110478 If standard input is not a terminal device, the results are undefined. The standard input consists  
110479 of a series of commands and input text, as described in the EXTENDED DESCRIPTION section.110480 If a read from the standard input returns an error, or if the editor detects an end-of-file condition  
110481 from the standard input, it shall be equivalent to a SIGHUP asynchronous event.

**110482 INPUT FILES**

110483 See the INPUT FILES section of the *ex* command for a description of the input files supported by  
110484 the *vi* command.

**110485 ENVIRONMENT VARIABLES**

110486 See the ENVIRONMENT VARIABLES section of the *ex* command for the environment variables  
110487 that affect the execution of the *vi* command.

**110488 ASYNCHRONOUS EVENTS**

110489 See the ASYNCHRONOUS EVENTS section of the *ex* for the asynchronous events that affect the  
110490 execution of the *vi* command.

**110491 STDOUT**

110492 If standard output is not a terminal device, undefined results occur.

110493 Standard output may be used for writing prompts to the user, for informational messages, and  
110494 for writing lines from the file.

**110495 STDERR**

110496 If standard output is not a terminal device, undefined results occur.

110497 The standard error shall be used only for diagnostic messages.

**110498 OUTPUT FILES**

110499 See the OUTPUT FILES section of the *ex* command for a description of the output files  
110500 supported by the *vi* command.

**110501 EXTENDED DESCRIPTION**

110502 If the terminal does not have the capabilities necessary to support an unspecified portion of the  
110503 *vi* definition, implementations shall start initially in *ex* mode or open mode. Otherwise, after  
110504 initialization, *vi* shall be in command mode; text input mode can be entered by one of several  
110505 commands used to insert or change text. In text input mode, <ESC> can be used to return to  
110506 command mode; other uses of <ESC> are described later in this section; see [Terminate  
110507 Command or Input Mode](#) (on page 3319).

**110508 Initialization in *ex* and *vi***

110509 See [Initialization in \*ex\* and \*vi\*](#) (on page 2642) for a description of *ex* and *vi* initialization for the *vi*  
110510 utility.

**110511 Command Descriptions in *vi***

110512 The following symbols are used in this reference page to represent arguments to commands.

110513 *buffer* See the description of *buffer* in the EXTENDED DESCRIPTION section of the *ex* utility;  
110514 see [Command Descriptions in \*ex\*](#) (on page 2651).

110515 In open and visual mode, when a command synopsis shows both [*buffer*] and [*count*]  
110516 preceding the command name, they can be specified in either order.

110517 *count* A positive integer used as an optional argument to most commands, either to give a  
110518 repeat count or as a size. This argument is optional and shall default to 1 unless  
110519 otherwise specified.

110520 The Synopsis lines for the *vi* commands <control>-G, <control>-L, <control>-R,  
110521 <control>-], %, &, ^, D, m, M, Q, u, U, and ZZ do not have *count* as an optional  
110522 argument. Regardless, it shall not be an error to specify a *count* to these commands, and  
110523 any specified *count* shall be ignored.

110524 *motion* An optional trailing argument used by the **!**, **<**, **>**, **c**, **d**, and **y** commands, which is used  
 110525 to indicate the region of text that shall be affected by the command. The motion can be  
 110526 either one of the command characters repeated or one of several other *vi* commands  
 110527 (listed in the following table). Each of the applicable commands specifies the region of  
 110528 text matched by repeating the command; each command that can be used as a motion  
 110529 command specifies the region of text it affects.

110530 Commands that take *motion* arguments operate on either lines or characters, depending  
 110531 on the circumstances. When operating on lines, all lines that fall partially or wholly  
 110532 within the text region specified for the command shall be affected. When operating on  
 110533 characters, only the exact characters in the specified text region shall be affected. Each  
 110534 motion command specifies this individually.

110535 When commands that may be motion commands are not used as motion commands,  
 110536 they shall set the current position to the current line and column as specified.

110537 The following commands shall be valid cursor motion commands:

|        |                   |   |    |   |   |   |
|--------|-------------------|---|----|---|---|---|
| 110538 | <apostrophe>      | ( | -  | j | H |   |
| 110539 | <carriage-return> | ) | \$ | k | L |   |
| 110540 | <comma>           | [ | [  | % | l | M |
| 110541 | <control>-H       | ] | ]  | _ | n | N |
| 110542 | <control>-N       | { | ;  | t | T |   |
| 110543 | <control>-P       | } | ?  | w | W |   |
| 110544 | <grave-accent>    | ^ | b  | B |   |   |
| 110545 | <newline>         | + | e  | E |   |   |
| 110546 | <space>           |   | f  | F |   |   |
| 110547 | <zero>            | / | h  | G |   |   |

110548 Any *count* that is specified to a command that has an associated motion command shall  
 110549 be applied to the motion command. If a *count* is applied to both the command and its  
 110550 associated motion command, the effect shall be multiplicative.

110551 The following symbols are used in this section to specify locations in the edit buffer:

110552 *current character*

110553 The character that is currently indicated by the cursor.

110554 *end of a line*

110555 The point located between the last non-<newline> (if any) and the terminating  
 110556 <newline> of a line. For an empty line, this location coincides with the beginning of the  
 110557 line.

110558 *end of the edit buffer*

110559 The location corresponding to the end of the last line in the edit buffer.

110560 The following symbols are used in this section to specify command actions:

110561 *bigword* In the POSIX locale, *vi* shall recognize four kinds of *bigwords*:

- 110562 1. A maximal sequence of non-<blank> characters preceded and followed by  
 110563 <blank> characters or the beginning or end of a line or the edit buffer
- 110564 2. One or more sequential blank lines
- 110565 3. The first character in the edit buffer

- 110566 4. The last non-`<newline>` in the edit buffer
- 110567 *word* In the POSIX locale, *vi* shall recognize five kinds of words:
- 110568 1. A maximal sequence of letters, digits, and underscores, delimited at both ends
- 110569 by:
- 110570 — Characters other than letters, digits, or underscores
- 110571 — The beginning or end of a line
- 110572 — The beginning or end of the edit buffer
- 110573 2. A maximal sequence of characters other than letters, digits, underscores, or
- 110574 `<blank>` characters, delimited at both ends by:
- 110575 — A letter, digit, underscore
- 110576 — `<blank>` characters
- 110577 — The beginning or end of a line
- 110578 — The beginning or end of the edit buffer
- 110579 3. One or more sequential blank lines
- 110580 4. The first character in the edit buffer
- 110581 5. The last non-`<newline>` in the edit buffer
- 110582 *section boundary*
- 110583 A *section boundary* is one of the following:
- 110584 1. A line whose first character is a `<form-feed>`
- 110585 2. A line whose first character is an open curly brace (`' { '`)
- 110586 3. A line whose first character is a `<period>` and whose second and third characters
- 110587 match a two-character pair in the **sections** edit option (see *ed*)
- 110588 4. A line whose first character is a `<period>` and whose only other character
- 110589 matches the first character of a two-character pair in the **sections** edit option,
- 110590 where the second character of the two-character pair is a `<space>`
- 110591 5. The first line of the edit buffer
- 110592 6. The last line of the edit buffer if the last line of the edit buffer is empty or if it is a
- 110593 `]]` or `}` command; otherwise, the last non-`<newline>` of the last line of the edit
- 110594 buffer
- 110595 *paragraph boundary*
- 110596 A *paragraph boundary* is one of the following:
- 110597 1. A section boundary
- 110598 2. A line whose first character is a `<period>` and whose second and third characters
- 110599 match a two-character pair in the **paragraphs** edit option (see *ed*)
- 110600 3. A line whose first character is a `<period>` and whose only other character
- 110601 matches the first character of a two-character pair in the *paragraphs* edit option,
- 110602 where the second character of the two-character pair is a `<space>`

- 110603 4. One or more sequential blank lines
- 110604 *remembered search direction*
- 110605 See the description of *remembered search direction* in *ed*.
- 110606 *sentence boundary*
- 110607 A *sentence boundary* is one of the following:
- 110608 1. A paragraph boundary
  - 110609 2. The first non-<blank> that occurs after a paragraph boundary
  - 110610 3. The first non-<blank> that occurs after a <period> (' . '), <exclamation-mark>
  - 110611 (' ! '), or <question-mark> (' ? '), followed by two <space> characters or the end
  - 110612 of a line; any number of closing parenthesis (' ) '), closing brackets (' ] '),
  - 110613 double-quote (' " '), or single-quote (<apostrophe>) characters can appear
  - 110614 between the punctuation mark and the two <space> characters or end-of-line
- 110615 In the remainder of the description of the *vi* utility, the term “buffer line” refers to a line in the
- 110616 edit buffer and the term “display line” refers to the line or lines on the display screen used to
- 110617 display one buffer line. The term “current line” refers to a specific “buffer line”.
- 110618 If there are display lines on the screen for which there are no corresponding buffer lines because
- 110619 they correspond to lines that would be after the end of the file, they shall be displayed as a single
- 110620 <tilde> (' ~ ') character, plus the terminating <newline>.
- 110621 The last line of the screen shall be used to report errors or display informational messages. It
- 110622 shall also be used to display the input for “line-oriented commands” (*/*, *?*, *:*, and *!*). When a line-
- 110623 oriented command is executed, the editor shall enter text input mode on the last line on the
- 110624 screen, using the respective command characters as prompt characters. (In the case of the *!*
- 110625 command, the associated motion shall be entered by the user before the editor enters text input
- 110626 mode.) The line entered by the user shall be terminated by a <newline>, a
- 110627 non-<control>-V-escaped <carriage-return>, or unescaped <ESC>. It is unspecified if more
- 110628 characters than require a display width minus one column number of screen columns can be
- 110629 entered.
- 110630 If any command is executed that overwrites a portion of the screen other than the last line of the
- 110631 screen (for example, the *ex suspend* or *!* commands), other than the *ex shell* command, the user
- 110632 shall be prompted for a character before the screen is refreshed and the edit session continued.
- 110633 <tab> characters shall take up the number of columns on the screen set by the **tabstop** edit
- 110634 option (see *ed*), unless there are less than that number of columns before the display margin that
- 110635 will cause the displayed line to be folded; in this case, they shall only take up the number of
- 110636 columns up to that boundary.
- 110637 The cursor shall be placed on the current line and relative to the current column as specified by
- 110638 each command described in the following sections.
- 110639 In open mode, if the current line is not already displayed, then it shall be displayed.
- 110640 In visual mode, if the current line is not displayed, then the lines that are displayed shall be
- 110641 expanded, scrolled, or redrawn to cause an unspecified portion of the current line to be
- 110642 displayed. If the screen is redrawn, no more than the number of display lines specified by the
- 110643 value of the **window** edit option shall be displayed (unless the current line cannot be completely
- 110644 displayed in the number of display lines specified by the **window** edit option) and the current
- 110645 line shall be positioned as close to the center of the displayed lines as possible (within the
- 110646 constraints imposed by the distance of the line from the beginning or end of the edit buffer). If
- 110647 the current line is before the first line in the display and the screen is scrolled, an unspecified

110648 portion of the current line shall be placed on the first line of the display. If the current line is after  
 110649 the last line in the display and the screen is scrolled, an unspecified portion of the current line  
 110650 shall be placed on the last line of the display.

110651 In visual mode, if a line from the edit buffer (other than the current line) does not entirely fit into  
 110652 the lines at the bottom of the display that are available for its presentation, the editor may choose  
 110653 not to display any portion of the line. The lines of the display that do not contain text from the  
 110654 edit buffer for this reason shall each consist of a single '@' character.

110655 In visual mode, the editor may choose for unspecified reasons to not update lines in the display  
 110656 to correspond to the underlying edit buffer text. The lines of the display that do not correctly  
 110657 correspond to text from the edit buffer for this reason shall consist of a single '@' character (plus  
 110658 the terminating <newline>), and the <control>-R command shall cause the editor to update the  
 110659 screen to correctly represent the edit buffer.

110660 Open and visual mode commands that set the current column set it to a column position in the  
 110661 display, and not a character position in the line. In this case, however, the column position in the  
 110662 display shall be calculated for an infinite width display; for example, the column related to a  
 110663 character that is part of a line that has been folded onto additional screen lines will be offset from  
 110664 the display line column where the buffer line begins, not from the beginning of a particular  
 110665 display line.

110666 The display cursor column in the display is based on the value of the current column, as follows,  
 110667 with each rule applied in turn:

- 110668 1. If the current column is after the last display line column used by the displayed line, the  
 110669 display cursor column shall be set to the last display line column occupied by the last  
 110670 non-<newline> in the current line; otherwise, the display cursor column shall be set to the  
 110671 current column.
- 110672 2. If the character of which some portion is displayed in the display line column specified by  
 110673 the display cursor column requires more than a single display line column:
  - 110674 a. If in text input mode, the display cursor column shall be adjusted to the first  
 110675 display line column in which any portion of that character is displayed.
  - 110676 b. Otherwise, the display cursor column shall be adjusted to the last display line  
 110677 column in which any portion of that character is displayed.

110678 The current column shall not be changed by these adjustments to the display cursor column.

110679 If an error occurs during the parsing or execution of a *vi* command:

- 110680 • The terminal shall be alerted. Execution of the *vi* command shall stop, and the cursor (for  
 110681 example, the current line and column) shall not be further modified.
- 110682 • Unless otherwise specified by the following command sections, it is unspecified whether  
 110683 an informational message shall be displayed.
- 110684 • Any partially entered *vi* command shall be discarded.
- 110685 • If the *vi* command resulted from a **map** expansion, all characters from that **map** expansion  
 110686 shall be discarded, except as otherwise specified by the **map** command (see *ed*).
- 110687 • If the *vi* command resulted from the execution of a buffer, no further commands caused by  
 110688 the execution of the buffer shall be executed.

### 110689 **Page Backwards**

110690 *Synopsis:* [count] <control>-B

110691 If in open mode, the <control>-B command shall behave identically to the **z** command.  
110692 Otherwise, if the current line is the first line of the edit buffer, it shall be an error.

110693 If the **window** edit option is less than 3, display a screen where the last line of the display shall  
110694 be some portion of:

110695 *(current first line) -1*

110696 otherwise, display a screen where the first line of the display shall be some portion of:

110697 *(current first line) - count x ((window edit option) -2)*

110698 If this calculation would result in a line that is before the first line of the edit buffer, the first line  
110699 of the display shall display some portion of the first line of the edit buffer.

110700 *Current line:* If no lines from the previous display remain on the screen, set to the last line of the  
110701 display; otherwise, set to *(line - the number of new lines displayed on this screen)*.

110702 *Current column:* Set to non-<blank>.

### 110703 **Scroll Forward**

110704 *Synopsis:* [count] <control>-D

110705 If the current line is the last line of the edit buffer, it shall be an error.

110706 If no *count* is specified, *count* shall default to the *count* associated with the previous <control>-D  
110707 or <control>-U command. If there was no previous <control>-D or <control>-U command, *count*  
110708 shall default to the value of the **scroll** edit option.

110709 If in open mode, write lines starting with the line after the current line, until *count* lines or the  
110710 last line of the file have been written.

110711 *Current line:* If the current line + *count* is past the last line of the edit buffer, set to the last line of  
110712 the edit buffer; otherwise, set to the current line + *count*.

110713 *Current column:* Set to non-<blank>.

### 110714 **Scroll Forward by Line**

110715 *Synopsis:* [count] <control>-E

110716 Display the line count lines after the last line currently displayed.

110717 If the last line of the edit buffer is displayed, it shall be an error. If there is no line *count* lines  
110718 after the last line currently displayed, the last line of the display shall display some portion of  
110719 the last line of the edit buffer.

110720 *Current line:* Unchanged if the previous current character is displayed; otherwise, set to the first  
110721 line displayed.

110722 *Current column:* Unchanged.

110723       **Page Forward**

110724       *Synopsis:*     [*count*] <control>-F

110725       If in open mode, the <control>-F command shall behave identically to the **z** command.  
110726       Otherwise, if the current line is the last line of the edit buffer, it shall be an error.

110727       If the **window** edit option is less than 3, display a screen where the first line of the display shall  
110728       be some portion of:

110729       (*current last line*) +1

110730       otherwise, display a screen where the first line of the display shall be some portion of:

110731       (*current first line*) + *count* x ((*window edit option*) -2)

110732       If this calculation would result in a line that is after the last line of the edit buffer, the last line of  
110733       the display shall display some portion of the last line of the edit buffer.

110734       *Current line:* If no lines from the previous display remain on the screen, set to the first line of the  
110735       display; otherwise, set to (*line* + the number of new lines displayed on this screen).

110736       *Current column:* Set to non-<blank>.

110737       **Display Information**

110738       *Synopsis:*     <control>-G

110739       This command shall be equivalent to the *ex file* command.

110740       **Move Cursor Backwards**

110741       *Synopsis:*     [*count*] <control>-H

110742       [*count*] h

110743       the current *erase* character (see *stty*)

110744       If there are no characters before the current character on the current line, it shall be an error. If  
110745       there are less than *count* previous characters on the current line, *count* shall be adjusted to the  
110746       number of previous characters on the line.

110747       If used as a motion command:

110748           1. The text region shall be from the character before the starting cursor up to and including  
110749           the *count*th character before the starting cursor.

110750           2. Any text copied to a buffer shall be in character mode.

110751       If not used as a motion command:

110752       *Current line:* Unchanged.

110753       *Current column:* Set to (*column* - the number of columns occupied by *count* characters ending  
110754       with the previous current column).

110755 **Move Down**

110756 *Synopsis:* [count] <newline>  
 110757 [count] <control>-J  
 110758 [count] <control>-M  
 110759 [count] <control>-N  
 110760 [count] j  
 110761 [count] <carriage-return>  
 110762 [count] +

110763 If there are less than *count* lines after the current line in the edit buffer, it shall be an error.

110764 If used as a motion command:

- 110765 1. The text region shall include the starting line and the next *count* – 1 lines.
- 110766 2. Any text copied to a buffer shall be in line mode.

110767 If not used as a motion command:

110768 *Current line:* Set to *current line*+ *count*.

110769 *Current column:* Set to non-<blank> for the <carriage-return>, <control>-M, and + commands;  
 110770 otherwise, unchanged.

110771 **Clear and Redisplay**

110772 *Synopsis:* <control>-L

110773 If in open mode, clear the screen and redisplay the current line. Otherwise, clear and redisplay  
 110774 the screen.

110775 *Current line:* Unchanged.

110776 *Current column:* Unchanged.

110777 **Move Up**

110778 *Synopsis:* [count] <control>-P  
 110779 [count] k  
 110780 [count] -

110781 If there are less than *count* lines before the current line in the edit buffer, it shall be an error.

110782 If used as a motion command:

- 110783 1. The text region shall include the starting line and the previous *count* lines.
- 110784 2. Any text copied to a buffer shall be in line mode.

110785 If not used as a motion command:

110786 *Current line:* Set to *current line* – *count*.

110787 *Current column:* Set to non-<blank> for the – command; otherwise, unchanged.

### 110788 **Redraw Screen**

110789 *Synopsis:*     <control>-R

110790 If any lines have been deleted from the display screen and flagged as deleted on the terminal  
110791 using the @ convention (see the beginning of the EXTENDED DESCRIPTION section), they shall  
110792 be redisplayed to match the contents of the edit buffer.

110793 It is unspecified whether lines flagged with @ because they do not fit on the terminal display  
110794 shall be affected.

110795 *Current line:* Unchanged.

110796 *Current column:* Unchanged.

### 110797 **Scroll Backward**

110798 *Synopsis:*     [*count*] <control>-U

110799 If the current line is the first line of the edit buffer, it shall be an error.

110800 If no *count* is specified, *count* shall default to the *count* associated with the previous <control>-D  
110801 or <control>-U command. If there was no previous <control>-D or <control>-U command, *count*  
110802 shall default to the value of the **scroll** edit option.

110803 *Current line:* If *count* is greater than the current line, set to 1; otherwise, set to the current line -  
110804 *count*.

110805 *Current column:* Set to non-<blank>.

### 110806 **Scroll Backward by Line**

110807 *Synopsis:*     [*count*] <control>-Y

110808 Display the line *count* lines before the first line currently displayed.

110809 If the current line is the first line of the edit buffer, it shall be an error. If this calculation would  
110810 result in a line that is before the first line of the edit buffer, the first line of the display shall  
110811 display some portion of the first line of the edit buffer.

110812 *Current line:* Unchanged if the previous current character is displayed; otherwise, set to the first  
110813 line displayed.

110814 *Current column:* Unchanged.

### 110815 **Edit the Alternate File**

110816 *Synopsis:*     <control>-^

110817 This command shall be equivalent to the *ex edit* command, with the alternate pathname as its  
110818 argument.

110819           **Terminate Command or Input Mode**

110820           *Synopsis:*       <ESC>

110821           If a partial *vi* command (as defined by at least one, non-*count* character) has been entered,  
110822           discard the *count* and the command character(s).

110823           Otherwise, if no command characters have been entered, and the <ESC> was the result of a map  
110824           expansion, the terminal shall be alerted and the <ESC> character shall be discarded, but it shall  
110825           not be an error.

110826           Otherwise, it shall be an error.

110827           *Current line:* Unchanged.

110828           *Current column:* Unchanged.

110829           **Search for tagstring**

110830           *Synopsis:*       <control>-]

110831           If the current character is not a word or <blank>, it shall be an error.

110832           This command shall be equivalent to the *ex tag* command, with the argument to that command  
110833           defined as follows.

110834           If the current character is a <blank>:

- 110835           1. Skip all <blank> characters after the cursor up to the end of the line.
- 110836           2. If the end of the line is reached, it shall be an error.

110837           Then, the argument to the *ex tag* command shall be the current character and all subsequent  
110838           characters, up to the first non-word character or the end of the line.

110839           **Move Cursor Forward**

110840           *Synopsis:*       [*count*] <space>  
110841                       [*count*] 1 (ell)

110842           If there are less than *count* non-<newline> characters after the cursor on the current line, *count*  
110843           shall be adjusted to the number of non-<newline> characters after the cursor on the line.

110844           If used as a motion command:

- 110845           1. If the current or *count*th character after the cursor is the last non-<newline> in the line, the  
110846           text region shall be comprised of the current character up to and including the last  
110847           non-<newline> in the line. Otherwise, the text region shall be from the current character  
110848           up to, but not including, the *count*th character after the cursor.
- 110849           2. Any text copied to a buffer shall be in character mode.

110850           If not used as a motion command:

110851           If there are no non-<newline> characters after the current character on the current line, it shall be  
110852           an error.

110853           *Current line:* Unchanged.

110854           *Current column:* Set to the last column that displays any portion of the *count*th character after the  
110855           current character.

## 110856 **Replace Text with Results from Shell Command**

110857 *Synopsis:* `[count] ! motion shell-commands <newline>`

110858 If the motion command is the `!` command repeated:

- 110859 1. If the edit buffer is empty and no *count* was supplied, the command shall be the  
110860 equivalent of the *ex* `:read !` command, with the text input, and no text shall be copied to  
110861 any buffer.
- 110862 2. Otherwise:
  - 110863 a. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be  
110864 an error.
  - 110865 b. The text region shall be from the current line up to and including the next *count* -1  
110866 lines.

110867 Otherwise, the text region shall be the lines in which any character of the text region specified by  
110868 the motion command appear.

110869 Any text copied to a buffer shall be in line mode.

110870 This command shall be equivalent to the *ex* `!` command for the specified lines.

## 110871 **Move Cursor to End-of-Line**

110872 *Synopsis:* `[count] $`

110873 It shall be an error if there are less than (*count* -1) lines after the current line in the edit buffer.

110874 If used as a motion command:

- 110875 1. If *count* is 1:
  - 110876 a. It shall be an error if the line is empty.
  - 110877 b. Otherwise, the text region shall consist of all characters from the starting cursor to  
110878 the last non-`<newline>` in the line, inclusive, and any text copied to a buffer shall  
110879 be in character mode.
- 110880 2. Otherwise, if the starting cursor position is at or before the first non-`<blank>` in the line,  
110881 the text region shall consist of the current and the next *count* -1 lines, and any text saved  
110882 to a buffer shall be in line mode.
- 110883 3. Otherwise, the text region shall consist of all characters from the starting cursor to the last  
110884 non-`<newline>` in the line that is *count* -1 lines forward from the current line, and any text  
110885 copied to a buffer shall be in character mode.

110886 If not used as a motion command:

110887 *Current line:* Set to the *current line* + *count* -1.

110888 *Current column:* The current column is set to the last display line column of the last  
110889 non-`<newline>` in the line, or column position 1 if the line is empty.

110890 The current column shall be adjusted to be on the last display line column of the last  
110891 non-`<newline>` of the current line as subsequent commands change the current line, until a  
110892 command changes the current column.

110893 **Move to Matching Character**110894 *Synopsis:* %

110895 If the character at the current position is not a parenthesis, bracket, or curly brace, search  
 110896 forward in the line to the first one of those characters. If no such character is found, it shall be an  
 110897 error.

110898 The matching character shall be the parenthesis, bracket, or curly brace matching the  
 110899 parenthesis, bracket, or curly brace, respectively, that was at the current position or that was  
 110900 found on the current line.

110901 Matching shall be determined as follows, for an open parenthesis:

- 110902 1. Set a counter to 1.
- 110903 2. Search forwards until a parenthesis is found or the end of the edit buffer is reached.
- 110904 3. If the end of the edit buffer is reached, it shall be an error.
- 110905 4. If an open parenthesis is found, increment the counter by 1.
- 110906 5. If a close parenthesis is found, decrement the counter by 1.
- 110907 6. If the counter is zero, the current character is the matching character.

110908 Matching for a close parenthesis shall be equivalent, except that the search shall be backwards,  
 110909 from the starting character to the beginning of the buffer, a close parenthesis shall increment the  
 110910 counter by 1, and an open parenthesis shall decrement the counter by 1.

110911 Matching for brackets and curly braces shall be equivalent, except that searching shall be done  
 110912 for open and close brackets or open and close curly braces. It is implementation-defined whether  
 110913 other characters are searched for and matched as well.

110914 If used as a motion command:

- 110915 1. If the matching cursor was after the starting cursor in the edit buffer, and the starting  
 110916 cursor position was at or before the first non-<blank> non-<newline> in the starting line,  
 110917 and the matching cursor position was at or after the last non-<blank> non-<newline> in  
 110918 the matching line, the text region shall consist of the current line to the matching line,  
 110919 inclusive, and any text copied to a buffer shall be in line mode.
- 110920 2. If the matching cursor was before the starting cursor in the edit buffer, and the starting  
 110921 cursor position was at or after the last non-<blank> non-<newline> in the starting line,  
 110922 and the matching cursor position was at or before the first non-<blank> non-<newline> in  
 110923 the matching line, the text region shall consist of the current line to the matching line,  
 110924 inclusive, and any text copied to a buffer shall be in line mode.
- 110925 3. Otherwise, the text region shall consist of the starting character to the matching character,  
 110926 inclusive, and any text copied to a buffer shall be in character mode.

110927 If not used as a motion command:

110928 *Current line:* Set to the line where the matching character is located.

110929 *Current column:* Set to the last column where any portion of the matching character is displayed.

### 110930 **Repeat Substitution**

110931 *Synopsis:*     &

110932 Repeat the previous substitution command. This command shall be equivalent to the *ex &*  
110933 command with the current line as its addresses, and without *options, count, or flags*.

### 110934 **Return to Previous Context at Beginning of Line**

110935 *Synopsis:*     ' *character*

110936 It shall be an error if there is no line in the edit buffer marked by *character*.

110937 If used as a motion command:

- 110938     1. If the starting cursor is after the marked cursor, then the locations of the starting cursor  
110939       and the marked cursor in the edit buffer shall be logically swapped.
- 110940     2. The text region shall consist of the starting line up to and including the marked line, and  
110941       any text copied to a buffer shall be in line mode.

110942 If not used as a motion command:

110943 *Current line:* Set to the line referenced by the mark.

110944 *Current column:* Set to non-<blank>.

### 110945 **Return to Previous Context**

110946 *Synopsis:*     \ *character*

110947 It shall be an error if the marked line is no longer in the edit buffer. If the marked line no longer  
110948 contains a character in the saved numbered character position, it shall be as if the marked  
110949 position is the first non-<blank>.

110950 If used as a motion command:

- 110951     1. It shall be an error if the marked cursor references the same character in the edit buffer as  
110952       the starting cursor.
- 110953     2. If the starting cursor is after the marked cursor, then the locations of the starting cursor  
110954       and the marked cursor in the edit buffer shall be logically swapped.
- 110955     3. If the starting line is empty or the starting cursor is at or before the first non-<blank>  
110956       non-<newline> of the starting line, and the marked cursor line is empty or the marked  
110957       cursor references the first character of the marked cursor line, the text region shall consist  
110958       of all lines containing characters from the starting cursor to the line before the marked  
110959       cursor line, inclusive, and any text copied to a buffer shall be in line mode.
- 110960     4. Otherwise, if the marked cursor line is empty or the marked cursor references a character  
110961       at or before the first non-<blank> non-<newline> of the marked cursor line, the region of  
110962       text shall be from the starting cursor to the last non-<newline> of the line before the  
110963       marked cursor line, inclusive, and any text copied to a buffer shall be in character mode.
- 110964     5. Otherwise, the region of text shall be from the starting cursor (inclusive), to the marked  
110965       cursor (exclusive), and any text copied to a buffer shall be in character mode.

110966 If not used as a motion command:

110967 *Current line:* Set to the line referenced by the mark.

110968 *Current column:* Set to the last column in which any portion of the character referenced by the

110969 mark is displayed.

### 110970 **Return to Previous Section**

110971 *Synopsis:* [ *count* ] [ [

110972 Move the cursor backward through the edit buffer to the first character of the previous section  
110973 boundary, *count* times.

110974 If used as a motion command:

- 110975 1. If the starting cursor was at the first character of the starting line or the starting line was  
110976 empty, and the first character of the boundary was the first character of the boundary line,  
110977 the text region shall consist of the current line up to and including the line where the  
110978 *count*th next boundary starts, and any text copied to a buffer shall be in line mode.
- 110979 2. If the boundary was the last line of the edit buffer or the last non-<newline> of the last  
110980 line of the edit buffer, the text region shall consist of the last character in the edit buffer up  
110981 to and including the starting character, and any text saved to a buffer shall be in character  
110982 mode.
- 110983 3. Otherwise, the text region shall consist of the starting character up to but not including  
110984 the first character in the *count*th next boundary, and any text copied to a buffer shall be in  
110985 character mode.

110986 If not used as a motion command:

110987 *Current line:* Set to the line where the *count*th next boundary in the edit buffer starts.

110988 *Current column:* Set to the last column in which any portion of the first character of the *count*th  
110989 next boundary is displayed, or column position 1 if the line is empty.

### 110990 **Move to Next Section**

110991 *Synopsis:* [ *count* ] ] ]

110992 Move the cursor forward through the edit buffer to the first character of the next section  
110993 boundary, *count* times.

110994 If used as a motion command:

- 110995 1. If the starting cursor was at the first character of the starting line or the starting line was  
110996 empty, and the first character of the boundary was the first character of the boundary line,  
110997 the text region shall consist of the current line up to and including the line where the  
110998 *count*th previous boundary starts, and any text copied to a buffer shall be in line mode.
- 110999 2. If the boundary was the first line of the edit buffer, the text region shall consist of the first  
111000 character in the edit buffer up to but not including the starting character, and any text  
111001 copied to a buffer shall be in character mode.
- 111002 3. Otherwise, the text region shall consist of the first character in the *count*th previous  
111003 section boundary up to but not including the starting character, and any text copied to a  
111004 buffer shall be in character mode.

111005 If not used as a motion command:

111006 *Current line:* Set to the line where the *count*th previous boundary in the edit buffer starts.

111007 *Current column:* Set to the last column in which any portion of the first character of the *count*th  
111008 previous boundary is displayed, or column position 1 if the line is empty.

**111009 Move to First Non-<blank> Position on Current Line**

111010 *Synopsis:*     `^`

111011 If used as a motion command:

- 111012     1. If the line has no non-<blank> non-<newline> characters, or if the cursor is at the first  
111013       non-<blank> non-<newline> of the line, it shall be an error.
- 111014     2. If the cursor is before the first non-<blank> non-<newline> of the line, the text region  
111015       shall be comprised of the current character, up to, but not including, the first non-<blank>  
111016       non-<newline> of the line.
- 111017     3. If the cursor is after the first non-<blank> non-<newline> of the line, the text region shall  
111018       be from the character before the starting cursor up to and including the first non-<blank>  
111019       non-<newline> of the line.
- 111020     4. Any text copied to a buffer shall be in character mode.

111021 If not used as a motion command:

111022 *Current line:* Unchanged.

111023 *Current column:* Set to non-<blank>.

**111024 Current and Line Above**

111025 *Synopsis:*     `[count] _`

111026 If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an error.

111027 If used as a motion command:

- 111028     1. If *count* is less than 2, the text region shall be the current line.
- 111029     2. Otherwise, the text region shall include the starting line and the next *count* -1 lines.
- 111030     3. Any text copied to a buffer shall be in line mode.

111031 If not used as a motion command:

111032 *Current line:* Set to current line + *count* -1.

111033 *Current column:* Set to non-<blank>.

**111034 Move Back to Beginning of Sentence**

111035 *Synopsis:*     `[count] (`

111036 Move backward to the beginning of a sentence. This command shall be equivalent to the `[]`  
111037 command, with the exception that sentence boundaries shall be used instead of section  
111038 boundaries.

**111039 Move Forward to Beginning of Sentence**

111040 *Synopsis:*     `[count] )`

111041 Move forward to the beginning of a sentence. This command shall be equivalent to the `]`  
111042 command, with the exception that sentence boundaries shall be used instead of section  
111043 boundaries.

111044       **Move Back to Preceding Paragraph**

111045       *Synopsis:*     [*count*] {

111046       Move back to the beginning of the preceding paragraph. This command shall be equivalent to  
111047       the [[ command, with the exception that paragraph boundaries shall be used instead of section  
111048       boundaries.

111049       **Move Forward to Next Paragraph**

111050       *Synopsis:*     [*count*] }

111051       Move forward to the beginning of the next paragraph. This command shall be equivalent to the  
111052       ]] command, with the exception that paragraph boundaries shall be used instead of section  
111053       boundaries.

111054       **Move to Specific Column Position**

111055       *Synopsis:*     [*count*] |

111056       For the purposes of this command, lines that are too long for the current display and that have  
111057       been folded shall be treated as having a single, 1-based, number of columns.

111058       If there are less than *count* columns in which characters from the current line are displayed on  
111059       the screen, *count* shall be adjusted to be the last column in which any portion of the line is  
111060       displayed on the screen.

111061       If used as a motion command:

- 111062           1. If the line is empty, or the cursor character is the same as the character on the *count*th  
111063           column of the line, it shall be an error.
- 111064           2. If the cursor is before the *count*th column of the line, the text region shall be comprised of  
111065           the current character, up to but not including the character on the *count*th column of the  
111066           line.
- 111067           3. If the cursor is after the *count*th column of the line, the text region shall be from the  
111068           character before the starting cursor up to and including the character on the *count*th  
111069           column of the line.
- 111070           4. Any text copied to a buffer shall be in character mode.

111071       If not used as a motion command:

111072       *Current line:* Unchanged.

111073       *Current column:* Set to the last column in which any portion of the character that is displayed in  
111074       the *count* column of the line is displayed.

111075       **Reverse Find Character**

111076       *Synopsis:*     [*count*] ,

111077       If the last **F**, **f**, **T**, or **t** command was **F**, **f**, **T**, or **t**, this command shall be equivalent to an **f**, **F**, **t**, or  
111078       **T** command, respectively, with the specified *count* and the same search character.

111079       If there was no previous **F**, **f**, **T**, or **t** command, it shall be an error.

## 111080 Repeat

111081 *Synopsis:* [count] .

111082 Repeat the last **!**, **<**, **>**, **A**, **C**, **D**, **I**, **J**, **O**, **P**, **R**, **S**, **X**, **Y**, **a**, **c**, **d**, **i**, **o**, **p**, **r**, **s**, **x**, **y**, or **~** command. It shall  
 111083 be an error if none of these commands have been executed. Commands (other than commands  
 111084 that enter text input mode) executed as a result of map expansions, shall not change the value of  
 111085 the last repeatable command.

111086 Repeated commands with associated motion commands shall repeat the motion command as  
 111087 well; however, any specified *count* shall replace the *count*(s) that were originally specified to the  
 111088 repeated command or its associated motion command.

111089 If the motion component of the repeated command is **f**, **F**, **t**, or **T**, the repeated command shall  
 111090 not set the remembered search character for the **;** and **,** commands.

111091 If the repeated command is **p** or **P**, and the buffer associated with that command was a numeric  
 111092 buffer named with a number less than 9, the buffer associated with the repeated command shall  
 111093 be set to be the buffer named by the name of the previous buffer logically incremented by 1.

111094 If the repeated character is a text input command, the input text associated with that command  
 111095 is repeated literally:

- 111096 • Input characters are neither macro or abbreviation-expanded.
- 111097 • Input characters are not interpreted in any special way with the exception that <newline>,  
 111098 <carriage-return>, and <control>-T behave as described in [Input Mode Commands in vi](#)  
 111099 (on page 3344).

111100 *Current line:* Set as described for the repeated command.

111101 *Current column:* Set as described for the repeated command.

## 111102 Find Regular Expression

111103 *Synopsis:* /

111104 If the input line contains no non-<newline> characters, it shall be equivalent to a line containing  
 111105 only the last regular expression encountered. The enhanced regular expressions supported by *vi*  
 111106 are described in [Regular Expressions in ex](#) (on page 2675).

111107 Otherwise, the line shall be interpreted as one or more regular expressions, optionally followed  
 111108 by an address offset or a *vi z* command.

111109 If the regular expression is not the last regular expression on the line, or if a line offset or **z**  
 111110 command is specified, the regular expression shall be terminated by an unescaped **'/'**  
 111111 character, which shall not be used as part of the regular expression. If the regular expression is  
 111112 not the first regular expression on the line, it shall be preceded by zero or more <blank>  
 111113 characters, a <semicolon>, zero or more <blank> characters, and a leading **'/'** character, which  
 111114 shall not be interpreted as part of the regular expression. It shall be an error to precede any  
 111115 regular expression with any characters other than these.

111116 Each search shall begin from the character after the first character of the last match (or, if it is the  
 111117 first search, after the cursor). If the **wraps**can edit option is set, the search shall continue to the  
 111118 character before the starting cursor character; otherwise, to the end of the edit buffer. It shall be  
 111119 an error if any search fails to find a match, and an informational message to this effect shall be  
 111120 displayed.

111121 An optional address offset (see [Addressing in ex](#), on page 2644) can be specified after the last  
 111122 regular expression by including a trailing **'/'** character after the regular expression and

111123 specifying the address offset. This offset will be from the line containing the match for the last  
 111124 regular expression specified. It shall be an error if the line offset would indicate a line address  
 111125 less than 1 or greater than the last line in the edit buffer. An address offset of zero shall be  
 111126 supported. It shall be an error to follow the address offset with any other characters than  
 111127 <blank> characters.

111128 If not used as a motion command, an optional **z** command (see [Redraw Window](#), on page 3343)  
 111129 can be specified after the last regular expression by including a trailing '/' character after the  
 111130 regular expression, zero or more <blank> characters, a 'z', zero or more <blank> characters, an  
 111131 optional new **window** edit option value, zero or more <blank> characters, and a location  
 111132 character. The effect shall be as if the **z** command was executed after the / command. It shall be  
 111133 an error to follow the **z** command with any other characters than <blank> characters.

111134 The remembered search direction shall be set to forward.

111135 If used as a motion command:

- 111136 1. It shall be an error if the last match references the same character in the edit buffer as the  
 111137 starting cursor.
- 111138 2. If any address offset is specified, the last match shall be adjusted by the specified offset as  
 111139 described previously.
- 111140 3. If the starting cursor is after the last match, then the locations of the starting cursor and  
 111141 the last match in the edit buffer shall be logically swapped.
- 111142 4. If any address offset is specified, the text region shall consist of all lines containing  
 111143 characters from the starting cursor to the last match line, inclusive, and any text copied to  
 111144 a buffer shall be in line mode.
- 111145 5. Otherwise, if the starting line is empty or the starting cursor is at or before the first  
 111146 non-<blank> non-<newline> of the starting line, and the last match line is empty or the  
 111147 last match starts at the first character of the last match line, the text region shall consist of  
 111148 all lines containing characters from the starting cursor to the line before the last match  
 111149 line, inclusive, and any text copied to a buffer shall be in line mode.
- 111150 6. Otherwise, if the last match line is empty or the last match begins at a character at or  
 111151 before the first non-<blank> non-<newline> of the last match line, the region of text shall  
 111152 be from the current cursor to the last non-<newline> of the line before the last match line,  
 111153 inclusive, and any text copied to a buffer shall be in character mode.
- 111154 7. Otherwise, the region of text shall be from the current cursor (inclusive), to the first  
 111155 character of the last match (exclusive), and any text copied to a buffer shall be in character  
 111156 mode.

111157 If not used as a motion command:

111158 *Current line*: If a match is found, set to the last matched line plus the address offset, if any;  
 111159 otherwise, unchanged.

111160 *Current column*: Set to the last column on which any portion of the first character in the last  
 111161 matched string is displayed, if a match is found; otherwise, unchanged.

111162 **Move to First Character in Line**

111163 *Synopsis:*     0 (zero)

111164 Move to the first character on the current line. The character '0' shall not be interpreted as a  
111165 command if it is immediately preceded by a digit.

111166 If used as a motion command:

- 111167     1. If the cursor character is the first character in the line, it shall be an error.
- 111168     2. The text region shall be from the character before the cursor character up to and including  
111169         the first character in the line.
- 111170     3. Any text copied to a buffer shall be in character mode.

111171 If not used as a motion command:

111172 *Current line:* Unchanged.

111173 *Current column:* The last column in which any portion of the first character in the line is  
111174 displayed, or if the line is empty, unchanged.

111175 **Execute an ex Command**

111176 *Synopsis:*     :

111177 Execute one or more *ex* commands.

111178 If any portion of the screen other than the last line of the screen was overwritten by any *ex*  
111179 command (except **shell**), *vi* shall display a message indicating that it is waiting for an input from  
111180 the user, and shall then read a character. This action may also be taken for other, unspecified  
111181 reasons.

111182 If the next character entered is a ':', another *ex* command shall be accepted and executed. Any  
111183 other character shall cause the screen to be refreshed and *vi* shall return to command mode.

111184 *Current line:* As specified for the *ex* command.

111185 *Current column:* As specified for the *ex* command.

111186 **Repeat Find**

111187 *Synopsis:*     [*count*] ;

111188 This command shall be equivalent to the last **F**, **f**, **T**, or **t** command, with the specified *count*, and  
111189 with the same search character used for the last **F**, **f**, **T**, or **t** command. If there was no previous **F**,  
111190 **f**, **T**, or **t** command, it shall be an error.

111191 **Shift Left**

111192 *Synopsis:*     [*count*] < *motion*

111193 If the motion command is the < command repeated:

- 111194     1. If there are less than *count* - 1 lines after the current line in the edit buffer, it shall be an  
111195         error.
- 111196     2. The text region shall be from the current line, up to and including the next *count* - 1 lines.

111197 Shift any line in the text region specified by the *count* and motion command one shiftwidth (see  
111198 the *ex* **shiftwidth** option) toward the start of the line, as described by the *ex* < command. The  
111199 unshifted lines shall be copied to the unnamed buffer in line mode.

111200 *Current line*: If the motion was from the current cursor position toward the end of the edit buffer,  
 111201 unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region  
 111202 specified by the motion command.

111203 *Current column*: Set to non-<blank>.

### 111204 **Shift Right**

111205 *Synopsis*: [count] > motion

111206 If the motion command is the > command repeated:

- 111207 1. If there are less than *count* - 1 lines after the current line in the edit buffer, it shall be an  
 111208 error.
- 111209 2. The text region shall be from the current line, up to and including the next *count* - 1 lines.

111210 Shift any line with characters in the text region specified by the *count* and motion command one  
 111211 shiftwidth (see the *ex* **shiftwidth** option) away from the start of the line, as described by the *ex* >  
 111212 command. The unshifted lines shall be copied into the unnamed buffer in line mode.

111213 *Current line*: If the motion was from the current cursor position toward the end of the edit buffer,  
 111214 unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region  
 111215 specified by the motion command.

111216 *Current column*: Set to non-<blank>.

### 111217 **Scan Backwards for Regular Expression**

111218 *Synopsis*: ?

111219 Scan backwards; the ? command shall be equivalent to the / command (see [Find Regular](#)  
 111220 [Expression](#), on page 3326) with the following exceptions:

- 111221 1. The input prompt shall be a ' ? '.
- 111222 2. Each search shall begin from the character before the first character of the last match (or, if  
 111223 it is the first search, the character before the cursor character).
- 111224 3. The search direction shall be from the cursor toward the beginning of the edit buffer, and  
 111225 the **wrapscan** edit option shall affect whether the search wraps to the end of the edit  
 111226 buffer and continues.
- 111227 4. The remembered search direction shall be set to backward.

### 111228 **Execute**

111229 *Synopsis*: @buffer

111230 If the *buffer* is specified as @, the last buffer executed shall be used. If no previous buffer has been  
 111231 executed, it shall be an error.

111232 Behave as if the contents of the named buffer were entered as standard input. After each line of a  
 111233 line-mode buffer, and all but the last line of a character mode buffer, behave as if a <newline>  
 111234 were entered as standard input.

111235 If an error occurs during this process, an error message shall be written, and no more characters  
 111236 resulting from the execution of this command shall be processed.

111237 If a *count* is specified, behave as if that count were entered as user input before the characters  
 111238 from the @ buffer were entered.

111239 *Current line*: As specified for the individual commands.

111240 *Current column*: As specified for the individual commands.

### 111241 **Reverse Case**

111242 *Synopsis*: `[count] ~`

111243 Reverse the case of the current character and the next *count* -1 characters, such that lowercase  
111244 characters that have uppercase counterparts shall be changed to uppercase characters, and  
111245 uppercase characters that have lowercase counterparts shall be changed to lowercase characters,  
111246 as prescribed by the current locale. No other characters shall be affected by this command.

111247 If there are less than *count* -1 characters after the cursor in the edit buffer, *count* shall be adjusted  
111248 to the number of characters after the cursor in the edit buffer minus 1.

111249 For the purposes of this command, the next character after the last non-<newline> on the line  
111250 shall be the next character in the edit buffer.

111251 *Current line*: Set to the line including the (*count*-1)th character after the cursor.

111252 *Current column*: Set to the last column in which any portion of the (*count*-1)th character after the  
111253 cursor is displayed.

### 111254 **Append**

111255 *Synopsis*: `[count] a`

111256 Enter text input mode after the current cursor position. No characters already in the edit buffer  
111257 shall be affected by this command. A *count* shall cause the input text to be appended *count* -1  
111258 more times to the end of the input.

111259 *Current line/column*: As specified for the text input commands (see [Input Mode Commands in vi](#),  
111260 on page 3344).

### 111261 **Append at End-of-Line**

111262 *Synopsis*: `[count] A`

111263 This command shall be equivalent to the *vi* command:

111264 `$ [ count ] a`

111265 (see [Append](#)).

### 111266 **Move Backward to Preceding Word**

111267 *Synopsis*: `[count] b`

111268 With the exception that words are used as the delimiter instead of bigwords, this command shall  
111269 be equivalent to the **B** command.

111270 **Move Backward to Preceding Bigword**111271 *Synopsis:* [count] B

111272 If the edit buffer is empty or the cursor is on the first character of the edit buffer, it shall be an  
 111273 error. If less than *count* bigwords begin between the cursor and the start of the edit buffer, *count*  
 111274 shall be adjusted to the number of bigword beginnings between the cursor and the start of the  
 111275 edit buffer.

111276 If used as a motion command:

- 111277 1. The text region shall be from the first character of the *count*th previous bigword beginning  
 111278 up to but not including the cursor character.
- 111279 2. Any text copied to a buffer shall be in character mode.

111280 If not used as a motion command:

111281 *Current line:* Set to the line containing the *current column*.

111282 *Current column:* Set to the last column upon which any part of the first character of the *count*th  
 111283 previous bigword is displayed.

111284 **Change**111285 *Synopsis:* [buffer] [count] c motion111286 If the motion command is the **c** command repeated:

- 111287 1. The buffer text shall be in line mode.
- 111288 2. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an  
 111289 error.
- 111290 3. The text region shall be from the current line up to and including the next *count* -1 lines.

111291 Otherwise, the buffer text mode and text region shall be as specified by the motion command.

111292 The replaced text shall be copied into *buffer*, if specified, and into the unnamed buffer. If the text  
 111293 to be replaced contains characters from more than a single line, or the buffer text is in line mode,  
 111294 the replaced text shall be copied into the numeric buffers as well.

111295 If the buffer text is in line mode:

- 111296 1. Any lines that contain characters in the region shall be deleted, and the editor shall enter  
 111297 text input mode at the beginning of a new line which shall replace the first line deleted.
- 111298 2. If the **autoindent** edit option is set, **autoindent** characters equal to the **autoindent**  
 111299 characters on the first line deleted shall be inserted as if entered by the user.

111300 Otherwise, if characters from more than one line are in the region of text:

- 111301 1. The text shall be deleted.
- 111302 2. Any text remaining in the last line in the text region shall be appended to the first line in  
 111303 the region, and the last line in the region shall be deleted.
- 111304 3. The editor shall enter text input mode after the last character not deleted from the first  
 111305 line in the text region, if any; otherwise, on the first column of the first line in the region.

- 111306 Otherwise:
- 111307 1. If the glyph for ' \$ ' is smaller than the region, the end of the region shall be marked with
  - 111308 a ' \$ '.
  - 111309 2. The editor shall enter text input mode, overwriting the region of text.

111310 *Current line/column:* As specified for the text input commands (see [Input Mode Commands in vi](#),

111311 on page 3344).

### 111312 **Change to End-of-Line**

111313 *Synopsis:* `[buffer] [count] C`

111314 This command shall be equivalent to the *vi* command:

111315 `[buffer] [count] c$`

111316 See the **c** command.

### 111317 **Delete**

111318 *Synopsis:* `[buffer] [count] d motion`

111319 If the motion command is the **d** command repeated:

- 111320 1. The buffer text shall be in line mode.
- 111321 2. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an
- 111322 error.
- 111323 3. The text region shall be from the current line up to and including the next *count* -1 lines.

111324 Otherwise, the buffer text mode and text region shall be as specified by the motion command.

111325 If in open mode, and the current line is deleted, and the line remains on the display, an '@' character shall be displayed as the first glyph of that line.

111327 Delete the region of text into *buffer*, if specified, and into the unnamed buffer. If the text to be deleted contains characters from more than a single line, or the buffer text is in line mode, the deleted text shall be copied into the numeric buffers, as well.

111330 *Current line:* Set to the first text region line that appears in the edit buffer, unless that line has been deleted, in which case it shall be set to the last line in the edit buffer, or line 1 if the edit buffer is empty.

111333 *Current column:*

- 111334 1. If the line is empty, set to column position 1.
- 111335 2. Otherwise, if the buffer text is in line mode or the motion was from the cursor toward the
- 111336 end of the edit buffer:
  - 111337 a. If a character from the current line is displayed in the current column, set to the
  - 111338 last column that displays any portion of that character.
  - 111339 b. Otherwise, set to the last column in which any portion of any character in the line
  - 111340 is displayed.
- 111341 3. Otherwise, if a character is displayed in the column that began the text region, set to the
- 111342 last column that displays any portion of that character.

111343 4. Otherwise, set to the last column in which any portion of any character in the line is  
111344 displayed.

#### 111345 **Delete to End-of-Line**

111346 *Synopsis:* [buffer] D

111347 Delete the text from the current position to the end of the current line; equivalent to the *vi*  
111348 command:

111349 [buffer] d\$

#### 111350 **Move to End-of-Word**

111351 *Synopsis:* [count] e

111352 With the exception that words are used instead of bigwords as the delimiter, this command shall  
111353 be equivalent to the **E** command.

#### 111354 **Move to End-of-Bigword**

111355 *Synopsis:* [count] E

111356 If the edit buffer is empty it shall be an error. If less than *count* bigwords end between the cursor  
111357 and the end of the edit buffer, *count* shall be adjusted to the number of bigword endings between  
111358 the cursor and the end of the edit buffer.

111359 If used as a motion command:

111360 1. The text region shall be from the last character of the *count*th next bigword up to and  
111361 including the cursor character.

111362 2. Any text copied to a buffer shall be in character mode.

111363 If not used as a motion command:

111364 *Current line:* Set to the line containing the current column.

111365 *Current column:* Set to the last column upon which any part of the last character of the *count*th  
111366 next bigword is displayed.

#### 111367 **Find Character in Current Line (Forward)**

111368 *Synopsis:* [count] f *character*

111369 It shall be an error if *count* occurrences of the character do not occur after the cursor in the line.

111370 If used as a motion command:

111371 1. The text range shall be from the cursor character up to and including the *count*th  
111372 occurrence of the specified character after the cursor.

111373 2. Any text copied to a buffer shall be in character mode.

111374 If not used as a motion command:

111375 *Current line:* Unchanged.

111376 *Current column:* Set to the last column in which any portion of the *count*th occurrence of the  
111377 specified character after the cursor appears in the line.

111378 **Find Character in Current Line (Reverse)**

111379 *Synopsis:* [count] F character

111380 It shall be an error if *count* occurrences of the character do not occur before the cursor in the line.

111381 If used as a motion command:

- 111382 1. The text region shall be from the *count*th occurrence of the specified character before the
- 111383 cursor, up to, but not including the cursor character.
- 111384 2. Any text copied to a buffer shall be in character mode.

111385 If not used as a motion command:

111386 *Current line:* Unchanged.

111387 *Current column:* Set to the last column in which any portion of the *count*th occurrence of the

111388 specified character before the cursor appears in the line.

111389 **Move to Line**

111390 *Synopsis:* [count] G

111391 If *count* is not specified, it shall default to the last line of the edit buffer. If *count* is greater than

111392 the last line of the edit buffer, it shall be an error.

111393 If used as a motion command:

- 111394 1. The text region shall be from the cursor line up to and including the specified line.
- 111395 2. Any text copied to a buffer shall be in line mode.

111396 If not used as a motion command:

111397 *Current line:* Set to *count* if *count* is specified; otherwise, the last line.

111398 *Current column:* Set to non-<blank>.

111399 **Move to Top of Screen**

111400 *Synopsis:* [count] H

111401 If the beginning of the line *count* greater than the first line of which any portion appears on the

111402 display does not exist, it shall be an error.

111403 If used as a motion command:

- 111404 1. If in open mode, the text region shall be the current line.
- 111405 2. Otherwise, the text region shall be from the starting line up to and including (the first line
- 111406 of the display + *count* -1).
- 111407 3. Any text copied to a buffer shall be in line mode.

111408 If not used as a motion command:

111409 If in open mode, this command shall set the current column to non-<blank> and do nothing else.

111410 Otherwise, it shall set the current line and current column as follows.

111411 *Current line:* Set to (the first line of the display + *count* -1).

111412 *Current column:* Set to non-<blank>.

111413 **Insert Before Cursor**111414 *Synopsis:* [count] i

111415 Enter text input mode before the current cursor position. No characters already in the edit buffer  
 111416 shall be affected by this command. A *count* shall cause the input text to be appended *count* -1  
 111417 more times to the end of the input.

111418 *Current line/column:* As specified for the text input commands (see [Input Mode Commands in vi](#),  
 111419 on page 3344).

111420 **Insert at Beginning of Line**111421 *Synopsis:* [count] I111422 This command shall be equivalent to the *vi* command  $\wedge$ [count]i.111423 **Join**111424 *Synopsis:* [count] J

111425 If the current line is the last line in the edit buffer, it shall be an error.

111426 This command shall be equivalent to the *ex join* command with no addresses, and an *ex*  
 111427 command *count* value of 1 if *count* was not specified or if a *count* of 1 was specified, and an *ex*  
 111428 command *count* value of *count* -1 for any other value of *count*, except that the current line and  
 111429 column shall be set as follows.

111430 *Current line:* Unchanged.

111431 *Current column:* The last column in which any portion of the character following the last  
 111432 character in the initial line is displayed, or the last non-<newline> in the line if no characters  
 111433 were appended.

111434 **Move to Bottom of Screen**111435 *Synopsis:* [count] L

111436 If the beginning of the line *count* less than the last line of which any portion appears on the  
 111437 display does not exist, it shall be an error.

111438 If used as a motion command:

- 111439 1. If in open mode, the text region shall be the current line.
- 111440 2. Otherwise, the text region shall include all lines from the starting cursor line to (the last  
 111441 line of the display -(*count* -1)).
- 111442 3. Any text copied to a buffer shall be in line mode.

111443 If not used as a motion command:

- 111444 1. If in open mode, this command shall set the current column to non-<blank> and do  
 111445 nothing else.
- 111446 2. Otherwise, it shall set the current line and current column as follows.

111447 *Current line:* Set to (the last line of the display -(*count* -1)).111448 *Current column:* Set to non-<blank>.

111449       **Mark Position**

111450       *Synopsis:*     m letter

111451       This command shall be equivalent to the *ex mark* command with the specified character as an  
111452       argument.

111453       **Move to Middle of Screen**

111454       *Synopsis:*     M

111455       The middle line of the display shall be calculated as follows:

111456       (the top line of the display) + (((number of lines displayed) + 1) / 2) - 1

111457       If used as a motion command:

- 111458           1. If in open mode, the text region shall be the current line.
- 111459           2. Otherwise, the text region shall include all lines from the starting cursor line up to and  
111460           including the middle line of the display.
- 111461           3. Any text copied to a buffer shall be in line mode.

111462       If not used as a motion command:

111463       If in open mode, this command shall set the current column to non-<blank> and do nothing else.

111464       Otherwise, it shall set the current line and current column as follows.

111465       *Current line:* Set to the middle line of the display.

111466       *Current column:* Set to non-<blank>.

111467       **Repeat Regular Expression Find (Forward)**

111468       *Synopsis:*     n

111469       If the remembered search direction was forward, the *n* command shall be equivalent to the *vi /*  
111470       command with no characters entered by the user. Otherwise, it shall be equivalent to the *vi ?*  
111471       command with no characters entered by the user.

111472       If the *n* command is used as a motion command for the *!* command, the editor shall not enter  
111473       text input mode on the last line on the screen, and shall behave as if the user entered a single  
111474       '!' character as the text input.

111475       **Repeat Regular Expression Find (Reverse)**

111476       *Synopsis:*     N

111477       Scan for the next match of the last pattern given to */* or *?*, but in the reverse direction; this is the  
111478       reverse of *n*.

111479       If the remembered search direction was forward, the *N* command shall be equivalent to the *vi ?*  
111480       command with no characters entered by the user. Otherwise, it shall be equivalent to the *vi /*  
111481       command with no characters entered by the user. If the *N* command is used as a motion  
111482       command for the *!* command, the editor shall not enter text input mode on the last line on the  
111483       screen, and shall behave as if the user entered a single *!* character as the text input.

111484        **Insert Empty Line Below**

111485        *Synopsis:*        ○

111486        Enter text input mode in a new line appended after the current line. A *count* shall cause the input text to be appended *count* -1 more times to the end of the already added text, each time starting on a new, appended line.

111489        *Current line/column:* As specified for the text input commands (see [Input Mode Commands in vi](#), on page 3344).

111491        **Insert Empty Line Above**

111492        *Synopsis:*        ○

111493        Enter text input mode in a new line inserted before the current line. A *count* shall cause the input text to be appended *count* -1 more times to the end of the already added text, each time starting on a new, appended line.

111496        *Current line/column:* As specified for the text input commands (see [Input Mode Commands in vi](#), on page 3344).

111498        **Put from Buffer Following**

111499        *Synopsis:*        [*buffer*] p

111500        If no *buffer* is specified, the unnamed buffer shall be used.

111501        If the buffer text is in line mode, the text shall be appended below the current line, and each line of the buffer shall become a new line in the edit buffer. A *count* shall cause the buffer text to be appended *count* -1 more times to the end of the already added text, each time starting on a new, appended line.

111505        If the buffer text is in character mode, the text shall be appended into the current line after the cursor, and each line of the buffer other than the first and last shall become a new line in the edit buffer. A *count* shall cause the buffer text to be appended *count* -1 more times to the end of the already added text, each time starting after the last added character.

111509        *Current line:* If the buffer text is in line mode, set the line to line +1; otherwise, unchanged.

111510        *Current column:* If the buffer text is in line mode:

111511            1. If there is a non-<blank> in the first line of the buffer, set to the last column on which any portion of the first non-<blank> in the line is displayed.

111513            2. If there is no non-<blank> in the first line of the buffer, set to the last column on which any portion of the last non-<newline> in the first line of the buffer is displayed.

111515        If the buffer text is in character mode:

111516            1. If the text in the buffer is from more than a single line, then set to the last column on which any portion of the first character from the buffer is displayed.

111518            2. Otherwise, if the buffer is the unnamed buffer, set to the last column on which any portion of the last character from the buffer is displayed.

111520            3. Otherwise, set to the first column on which any portion of the first character from the buffer is displayed.

111521

111522 **Put from Buffer Before**

111523 *Synopsis:*     [*buffer*] P

111524 If no *buffer* is specified, the unnamed buffer shall be used.

111525 If the buffer text is in line mode, the text shall be inserted above the current line, and each line of  
111526 the buffer shall become a new line in the edit buffer. A *count* shall cause the buffer text to be  
111527 appended *count* -1 more times to the end of the already added text, each time starting on a new,  
111528 appended line.

111529 If the buffer text is in character mode, the text shall be inserted into the current line before the  
111530 cursor, and each line of the buffer other than the first and last shall become a new line in the edit  
111531 buffer. A *count* shall cause the buffer text to be appended *count* -1 more times to the end of the  
111532 already added text, each time starting after the last added character.

111533 *Current line:* Unchanged.

111534 *Current column:* If the buffer text is in line mode:

- 111535     1. If there is a non-<blank> in the first line of the buffer, set to the last column on which any  
111536       portion of that character is displayed.
- 111537     2. If there is no non-<blank> in the first line of the buffer, set to the last column on which  
111538       any portion of the last non-<newline> in the first line of the buffer is displayed.

111539 If the buffer text is in character mode:

- 111540     1. If the text in the buffer is from more than a single line, then set to the last column on  
111541       which any portion of the first character from the buffer is displayed.
- 111542     2. Otherwise, if the buffer is the unnamed buffer, set to the last column on which any  
111543       portion of the last character from the buffer is displayed.
- 111544     3. Otherwise, set to the first column on which any portion of the first character from the  
111545       buffer is displayed.

111546 **Enter ex Mode**

111547 *Synopsis:*     Q

111548 Leave visual or open mode and enter *ex* command mode.

111549 *Current line:* Unchanged.

111550 *Current column:* Unchanged.

111551 **Replace Character**

111552 *Synopsis:*     [*count*] r *character*

111553 Replace the *count* characters at and after the cursor with the specified character. If there are less  
111554 than *count* non-<newline> characters at and after the cursor on the line, it shall be an error.

111555 If character is <control>-V, any next character other than the <newline> shall be stripped of any  
111556 special meaning and used as a literal character.

111557 If character is <ESC>, no replacement shall be made and the current line and current column  
111558 shall be unchanged.

111559 If character is <carriage-return> or <newline>, *count* new lines shall be appended to the current  
111560 line. All but the last of these lines shall be empty. *count* characters at and after the cursor shall be

111561 discarded, and any remaining characters after the cursor in the current line shall be moved to the  
 111562 last of the new lines. If the **autoindent** edit option is set, they shall be preceded by the same  
 111563 number of **autoindent** characters found on the line from which the command was executed.

111564 *Current line*: Unchanged unless the replacement character is a <carriage-return> or <newline>, in  
 111565 which case it shall be set to line + *count*.

111566 *Current column*: Set to the last column position on which a portion of the last replaced character  
 111567 is displayed, or if the replacement character caused new lines to be created, set to non-<blank>.

### 111568 **Replace Characters**

111569 *Synopsis*:       R

111570 Enter text input mode at the current cursor position possibly replacing text on the current line. A  
 111571 *count* shall cause the input text to be appended *count* - 1 more times to the end of the input.

111572 *Current line/column*: As specified for the text input commands (see [Input Mode Commands in vi](#),  
 111573 on page 3344).

### 111574 **Substitute Character**

111575 *Synopsis*:       [*buffer*] [*count*] s

111576 This command shall be equivalent to the *vi* command:

111577 [*buffer*] [*count*] c<space>

### 111578 **Substitute Lines**

111579 *Synopsis*:       [*buffer*] [*count*] S

111580 This command shall be equivalent to the *vi* command:

111581 [*buffer*] [*count*] c\_

### 111582 **Move Cursor to Before Character (Forward)**

111583 *Synopsis*:       [*count*] t *character*

111584 It shall be an error if *count* occurrences of the character do not occur after the cursor in the line.

111585 If used as a motion command:

- 111586 1. The text region shall be from the cursor up to but not including the *count*th occurrence of  
 111587 the specified character after the cursor.
- 111588 2. Any text copied to a buffer shall be in character mode.

111589 If not used as a motion command:

111590 *Current line*: Unchanged.

111591 *Current column*: Set to the last column in which any portion of the character before the *count*th  
 111592 occurrence of the specified character after the cursor appears in the line.

111593 **Move Cursor to After Character (Reverse)**

111594 *Synopsis:* [count] T character

111595 It shall be an error if *count* occurrences of the character do not occur before the cursor in the line.

111596 If used as a motion command:

- 111597 1. If the character before the cursor is the specified character, it shall be an error.
- 111598 2. The text region shall be from the character before the cursor up to but not including the
- 111599 *count*th occurrence of the specified character before the cursor.
- 111600 3. Any text copied to a buffer shall be in character mode.

111601 If not used as a motion command:

111602 *Current line:* Unchanged.

111603 *Current column:* Set to the last column in which any portion of the character after the *count*th

111604 occurrence of the specified character before the cursor appears in the line.

111605 **Undo**

111606 *Synopsis:* u

111607 This command shall be equivalent to the *ex* **undo** command except that the current line and

111608 current column shall be set as follows:

111609 *Current line:* Set to the first line added or changed if any; otherwise, move to the line preceding

111610 any deleted text if one exists; otherwise, move to line 1.

111611 *Current column:* If undoing an *ex* command, set to the first non-<blank>.

111612 Otherwise, if undoing a text input command:

- 111613 1. If the command was a **C**, **c**, **O**, **o**, **R**, **S**, or **s** command, the current column shall be set to
- 111614 the value it held when the text input command was entered.
- 111615 2. Otherwise, set to the last column in which any portion of the first character after the
- 111616 deleted text is displayed, or, if no non-<newline> characters follow the text deleted from
- 111617 this line, set to the last column in which any portion of the last non-<newline> in the line
- 111618 is displayed, or 1 if the line is empty.

111619 Otherwise, if a single line was modified (that is, not added or deleted) by the **u** command:

- 111620 1. If text was added or changed, set to the last column in which any portion of the first
- 111621 character added or changed is displayed.
- 111622 2. If text was deleted, set to the last column in which any portion of the first character after
- 111623 the deleted text is displayed, or, if no non-<newline> characters follow the deleted text,
- 111624 set to the last column in which any portion of the last non-<newline> in the line is
- 111625 displayed, or 1 if the line is empty.

111626 Otherwise, set to non-<blank>.

111627        **Undo Current Line**111628        *Synopsis:*        U111629        Restore the current line to its state immediately before the most recent time that it became the  
111630        current line.111631        *Current line:* Unchanged.111632        *Current column:* Set to the first column in the line in which any portion of the first character in  
111633        the line is displayed.111634        **Move to Beginning of Word**111635        *Synopsis:*        [count] w111636        With the exception that words are used as the delimiter instead of bigwords, this command shall  
111637        be equivalent to the **W** command.111638        **Move to Beginning of Bigword**111639        *Synopsis:*        [count] W111640        If the edit buffer is empty, it shall be an error. If there are less than *count* bigwords between the  
111641        cursor and the end of the edit buffer, *count* shall be adjusted to move the cursor to the last  
111642        bigword in the edit buffer.

111643        If used as a motion command:

- 111644            1. If the associated command is **c**, *count* is 1, and the cursor is on a <blank>, the region of  
111645            text shall be the current character and no further action shall be taken.
- 111646            2. If there are less than *count* bigwords between the cursor and the end of the edit buffer,  
111647            then the command shall succeed, and the region of text shall include the last character of  
111648            the edit buffer.
- 111649            3. If there are <blank> characters or an end-of-line that precede the *count*th bigword, and the  
111650            associated command is **c**, the region of text shall be up to and including the last character  
111651            before the preceding <blank> characters or end-of-line.
- 111652            4. If there are <blank> characters or an end-of-line that precede the bigword, and the  
111653            associated command is **d** or **y**, the region of text shall be up to and including the last  
111654            <blank> before the start of the bigword or end-of-line.
- 111655            5. Any text copied to a buffer shall be in character mode.

111656        If not used as a motion command:

- 111657            1. If the cursor is on the last character of the edit buffer, it shall be an error.

111658        *Current line:* Set to the line containing the current column.111659        *Current column:* Set to the last column in which any part of the first character of the *count*th next  
111660        bigword is displayed.

### 111661 **Delete Character at Cursor**

111662 *Synopsis:*     [*buffer*] [*count*] x

111663 Delete the *count* characters at and after the current character into *buffer*, if specified, and into the  
111664 unnamed buffer.

111665 If the line is empty, it shall be an error. If there are less than *count* non-<newline> characters at  
111666 and after the cursor on the current line, *count* shall be adjusted to the number of non-<newline>  
111667 characters at and after the cursor.

111668 *Current line:* Unchanged.

111669 *Current column:* If the line is empty, set to column position 1. Otherwise, if there were *count* or  
111670 less non-<newline> characters at and after the cursor on the current line, set to the last column  
111671 that displays any part of the last non-<newline> of the line. Otherwise, unchanged.

### 111672 **Delete Character Before Cursor**

111673 *Synopsis:*     [*buffer*] [*count*] X

111674 Delete the *count* characters before the current character into *buffer*, if specified, and into the  
111675 unnamed buffer.

111676 If there are no characters before the current character on the current line, it shall be an error. If  
111677 there are less than *count* previous characters on the current line, *count* shall be adjusted to the  
111678 number of previous characters on the line.

111679 *Current line:* Unchanged.

111680 *Current column:* Set to (current column – the width of the deleted characters).

### 111681 **Yank**

111682 *Synopsis:*     [*buffer*] [*count*] y *motion*

111683 Copy (yank) the region of text into *buffer*, if specified, and into the unnamed buffer.

111684 If the motion command is the y command repeated:

- 111685     1. The buffer shall be in line mode.
- 111686     2. If there are less than *count* –1 lines after the current line in the edit buffer, it shall be an  
111687 error.
- 111688     3. The text region shall be from the current line up to and including the next *count* –1 lines.

111689 Otherwise, the buffer text mode and text region shall be as specified by the motion command.

111690 *Current line:* If the motion was from the current cursor position toward the end of the edit buffer,  
111691 unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region  
111692 specified by the motion command.

111693 *Current column:*

- 111694     1. If the motion was from the current cursor position toward the end of the edit buffer,  
111695 unchanged.
- 111696     2. Otherwise, if the current line is empty, set to column position 1.
- 111697     3. Otherwise, set to the last column that displays any part of the first character in the file  
111698 that is part of the text region specified by the motion command.

111699 **Yank Current Line**111700 *Synopsis:* `[buffer] [count] Y`111701 This command shall be equivalent to the *vi* command:111702 `[buffer] [count] y_`111703 **Redraw Window**111704 If in open mode, the **z** command shall have the Synopsis:111705 *Synopsis:* `[count] z`

111706 If *count* is not specified, it shall default to the **window** edit option `-1`. The **z** command shall be  
 111707 equivalent to the *ex z* command, with a type character of `=` and a *count* of *count* `-2`, except that  
 111708 the current line and current column shall be set as follows, and the **window** edit option shall not  
 111709 be affected. If the calculation for the *count* argument would result in a negative number, the  
 111710 *count* argument to the *ex z* command shall be zero. A blank line shall be written after the last line  
 111711 is written.

111712 *Current line:* Unchanged.111713 *Current column:* Unchanged.111714 If not in open mode, the **z** command shall have the following Synopsis:111715 *Synopsis:* `[line] z [count] character`

111716 If *line* is not specified, it shall default to the current line. If *line* is specified, but is greater than the  
 111717 number of lines in the edit buffer, it shall default to the number of lines in the edit buffer.

111718 If *count* is specified, the value of the **window** edit option shall be set to *count* (as described in the  
 111719 *ex window* command), and the screen shall be redrawn.

111720 *line* shall be placed as specified by the following characters:111721 `<newline>`, `<carriage-return>`

111722 Place the beginning of the line on the first line of the display.

111723 `.` Place the beginning of the line in the center of the display. The middle line of the display  
 111724 shall be calculated as described for the **M** command.

111725 `-` Place an unspecified portion of the line on the last line of the display.

111726 `+` If *line* was specified, equivalent to the `<newline>` case. If *line* was not specified, display a  
 111727 screen where the first line of the display shall be (current last line) `+1`. If there are no lines  
 111728 after the last line in the display, it shall be an error.

111729 `^` If *line* was specified, display a screen where the last line of the display shall contain an  
 111730 unspecified portion of the first line of a display that had an unspecified portion of the  
 111731 specified line on the last line of the display. If this calculation results in a line before the  
 111732 beginning of the edit buffer, display the first screen of the edit buffer.

111733 Otherwise, display a screen where the last line of the display shall contain an unspecified  
 111734 portion of (current first line `-1`). If this calculation results in a line before the beginning of  
 111735 the edit buffer, it shall be an error.

111736 *Current line*: If *line* and the '^' character were specified:

- 111737 1. If the first screen was displayed as a result of the command attempting to display lines  
 111738 before the beginning of the edit buffer: if the first screen was already displayed,  
 111739 unchanged; otherwise, set to (current first line -1).
- 111740 2. Otherwise, set to the last line of the display.

111741 If *line* and the '+' character were specified, set to the first line of the display.

111742 Otherwise, if *line* was specified, set to *line*.

111743 Otherwise, unchanged.

111744 *Current column*: Set to non-<blank>.

## 111745 **Exit**

111746 *Synopsis*: ZZ

111747 This command shall be equivalent to the *ex xit* command with no addresses, trailing !, or  
 111748 filename (see the *ex xit* command).

## 111749 **Input Mode Commands in vi**

111750 In text input mode, the current line shall consist of zero or more of the following categories, plus  
 111751 the terminating <newline>:

- 111752 1. Characters preceding the text input entry point  
 111753 Characters in this category shall not be modified during text input mode.
- 111754 2. **autoindent** characters  
 111755 **autoindent** characters shall be automatically inserted into each line that is created in text  
 111756 input mode, either as a result of entering a <newline> or <carriage-return> while in text  
 111757 input mode, or as an effect of the command itself; for example, **O** or **o** (see the *ex*  
 111758 **autoindent** command), as if entered by the user.
- 111759 It shall be possible to erase **autoindent** characters with the <control>-D command; it is  
 111760 unspecified whether they can be erased by <control>-H, <control>-U, and <control>-W  
 111761 characters. Erasing any **autoindent** character turns the glyph into erase-columns and  
 111762 deletes the character from the edit buffer, but does not change its representation on the  
 111763 screen.
- 111764 3. Text input characters  
 111765 Text input characters are the characters entered by the user. Erasing any text input  
 111766 character turns the glyph into erase-columns and deletes the character from the edit  
 111767 buffer, but does not change its representation on the screen.
- 111768 Each text input character entered by the user (that does not have a special meaning) shall  
 111769 be treated as follows:
- 111770 a. The text input character shall be appended to the last character in the edit buffer  
 111771 from the first, second, or third categories.
- 111772 b. If there are no erase-columns on the screen, the text input command was the **R**  
 111773 command, and characters in the fifth category from the original line follow the  
 111774 cursor, the next such character shall be deleted from the edit buffer. If the  
 111775 **slowopen** edit option is not set, the corresponding glyph on the screen shall

- 111776 become erase-columns.
- 111777 c. If there are erase-columns on the screen, as many columns as they occupy, or as are  
111778 necessary, shall be overwritten to display the text input character. (If only part of a  
111779 multi-column glyph is overwritten, the remainder shall be left on the screen, and  
111780 continue to be treated as erase-columns; it is unspecified whether the remainder of  
111781 the glyph is modified in any way.)
- 111782 d. If additional display line columns are needed to display the text input character:
- 111783 i. If the **slowopen** edit option is set, the text input characters shall be  
111784 displayed on subsequent display line columns, overwriting any characters  
111785 displayed in those columns.
- 111786 ii. Otherwise, any characters currently displayed on or after the column on the  
111787 display line where the text input character is to be displayed shall be  
111788 pushed ahead the number of display line columns necessary to display the  
111789 rest of the text input character.

#### 111790 4. Erase-columns

111791 Erase-columns are not logically part of the edit buffer, appearing only on the screen, and  
111792 may be overwritten on the screen by subsequent text input characters. When text input  
111793 mode ends, all erase-columns shall no longer appear on the screen.

111794 Erase-columns are initially the region of text specified by the **c** command (see [Change](#), on  
111795 page 3331); however, erasing **autoindent** or text input characters causes the glyphs of the  
111796 erased characters to be treated as erase-columns.

#### 111797 5. Characters following the text region for the **c** command, or the text input entry point for 111798 all other commands

111799 Characters in this category shall not be modified during text input mode, except as  
111800 specified in category 3.b. for the **R** text input command, or as <blank> characters deleted  
111801 when a <newline> or <carriage-return> is entered.

111802 It is unspecified whether it is an error to attempt to erase past the beginning of a line that was  
111803 created by the entry of a <newline> or <carriage-return> during text input mode. If it is not an  
111804 error, the editor shall behave as if the erasing character was entered immediately after the last  
111805 text input character entered on the previous line, and all of the non-<newline> characters on the  
111806 current line shall be treated as erase-columns.

111807 When text input mode is entered, or after a text input mode character is entered (except as  
111808 specified for the special characters below), the cursor shall be positioned as follows:

- 111809 1. On the first column that displays any part of the first erase-column, if one exists
- 111810 2. Otherwise, if the **slowopen** edit option is set, on the first display line column after the last  
111811 character in the first, second, or third categories, if one exists
- 111812 3. Otherwise, the first column that displays any part of the first character in the fifth  
111813 category, if one exists
- 111814 4. Otherwise, the display line column after the last character in the first, second, or third  
111815 categories, if one exists
- 111816 5. Otherwise, on column position 1

111817 The characters that are updated on the screen during text input mode are unspecified, other than  
111818 that the last text input character shall always be updated, and, if the **slowopen** edit option is not

111819 set, the current cursor character shall always be updated.

111820 The following specifications are for command characters entered during text input mode.

## 111821 NUL

111822 *Synopsis:* NUL

111823 If the first character of the text input is a NUL, the most recently input text shall be input as if  
 111824 entered by the user, and then text input mode shall be exited. The text shall be input literally;  
 111825 that is, characters are neither macro or abbreviation expanded, nor are any characters interpreted  
 111826 in any special manner. It is unspecified whether implementations shall support more than 256  
 111827 bytes of remembered input text.

## 111828 <control>-D

111829 *Synopsis:* <control>-D

111830 The <control>-D character shall have no special meaning when in text input mode for a line-  
 111831 oriented command (see [Command Descriptions in vi](#), on page 3310).

111832 This command need not be supported on block-mode terminals.

111833 If the cursor does not follow an **autoindent** character, or an **autoindent** character and a '0' or  
 111834 '^' character:

- 111835 1. If the cursor is in column position 1, the <control>-D character shall be discarded and no  
 111836 further action taken.
- 111837 2. Otherwise, the <control>-D character shall have no special meaning.

111838 If the last input character was a '0', the cursor shall be moved to column position 1.

111839 Otherwise, if the last input character was a '^', the cursor shall be moved to column position 1.  
 111840 In addition, the **autoindent** level for the next input line shall be derived from the same line from  
 111841 which the **autoindent** level for the current input line was derived.

111842 Otherwise, the cursor shall be moved back to the column after the previous shiftwidth (see the  
 111843 *ex* **shiftwidth** command) boundary.

111844 All of the glyphs on columns between the starting cursor position and (inclusively) the ending  
 111845 cursor position shall become erase-columns as described in [Input Mode Commands in vi](#) (on  
 111846 page 3344).

111847 *Current line:* Unchanged.

111848 *Current column:* Set to 1 if the <control>-D was preceded by a '^' or '0'; otherwise, set to  
 111849 (column -1) - ((column -2) % **shiftwidth**).

## 111850 <control>-H

111851 *Synopsis:* <control>-H

111852 If in text input mode for a line-oriented command, and there are no characters to erase, text  
 111853 input mode shall be terminated, no further action shall be done for this command, and the  
 111854 current line and column shall be unchanged.

111855 If there are characters other than **autoindent** characters that have been input on the current line  
 111856 before the cursor, the cursor shall move back one character.

111857 Otherwise, if there are **autoindent** characters on the current line before the cursor, it is

111858 implementation-defined whether the <control>-H command is an error or if the cursor moves  
111859 back one **autoindent** character.

111860 Otherwise, if the cursor is in column position 1 and there are previous lines that have been  
111861 input, it is implementation-defined whether the <control>-H command is an error or if it is  
111862 equivalent to entering <control>-H after the last input character on the previous input line.

111863 Otherwise, it shall be an error.

111864 All of the glyphs on columns between the starting cursor position and (inclusively) the ending  
111865 cursor position shall become erase-columns as described in [Input Mode Commands in vi](#) (on  
111866 page 3344).

111867 The current erase character (see *stty*) shall cause an equivalent action to the <control>-H  
111868 command, unless the previously inserted character was a <backslash>, in which case it shall be  
111869 as if the literal current erase character had been inserted instead of the <backslash>.

111870 *Current line*: Unchanged, unless previously input lines are erased, in which case it shall be set to  
111871 line -1.

111872 *Current column*: Set to the first column that displays any portion of the character backed up over.

#### 111873 <newline>

111874 *Synopsis*:     <newline>  
111875               <carriage-return>  
111876               <control>-J  
111877               <control>-M

111878 If input was part of a line-oriented command, text input mode shall be terminated and the  
111879 command shall continue execution with the input provided.

111880 Otherwise, terminate the current line. If there are no characters other than **autoindent** characters  
111881 on the line, all characters on the line shall be discarded. Otherwise, it is unspecified whether the  
111882 **autoindent** characters in the line are modified by entering these characters.

111883 Continue text input mode on a new line appended after the current line. If the **slowopen** edit  
111884 option is set, the lines on the screen below the current line shall not be pushed down, but the  
111885 first of them shall be cleared and shall appear to be overwritten. Otherwise, the lines of the  
111886 screen below the current line shall be pushed down.

111887 If the **autoindent** edit option is set, an appropriate number of **autoindent** characters shall be  
111888 added as a prefix to the line as described by the *ex* **autoindent** edit option.

111889 All columns after the cursor that are erase-columns (as described in [Input Mode Commands in vi](#),  
111890 on page 3344) shall be discarded.

111891 If the **autoindent** edit option is set, all <blank> characters immediately following the cursor shall  
111892 be discarded.

111893 All remaining characters after the cursor shall be transferred to the new line, positioned after  
111894 any **autoindent** characters.

111895 *Current line*: Set to current line +1.

111896 *Current column*: Set to the first column that displays any portion of the first character after the  
111897 **autoindent** characters on the new line, if any, or the first column position after the last  
111898 **autoindent** character, if any, or column position 1.

111899 **<control>-T**111900 *Synopsis:* <control>-T111901 The <control>-T character shall have no special meaning when in text input mode for a line-  
111902 oriented command (see [Command Descriptions in vi](#), on page 3310).

111903 This command need not be supported on block-mode terminals.

111904 Behave as if the user entered the minimum number of <blank> characters necessary to move the  
111905 cursor forward to the column position after the next **shiftwidth** (see the *ex* **shiftwidth**  
111906 command) boundary.111907 *Current line:* Unchanged.111908 *Current column:* Set to  $column + \mathbf{shiftwidth} - ((column - 1) \% \mathbf{shiftwidth})$ .111909 **<control>-U**111910 *Synopsis:* <control>-U111911 If there are characters other than **autoindent** characters that have been input on the current line  
111912 before the cursor, the cursor shall move to the first character input after the **autoindent**  
111913 characters.111914 Otherwise, if there are **autoindent** characters on the current line before the cursor, it is  
111915 implementation-defined whether the <control>-U command is an error or if the cursor moves to  
111916 the first column position on the line.111917 Otherwise, if the cursor is in column position 1 and there are previous lines that have been  
111918 input, it is implementation-defined whether the <control>-U command is an error or if it is  
111919 equivalent to entering <control>-U after the last input character on the previous input line.

111920 Otherwise, it shall be an error.

111921 All of the glyphs on columns between the starting cursor position and (inclusively) the ending  
111922 cursor position shall become erase-columns as described in [Input Mode Commands in vi](#) (on  
111923 page 3344).111924 The current *kill* character (see *stty*) shall cause an equivalent action to the <control>-U command,  
111925 unless the previously inserted character was a <backslash>, in which case it shall be as if the  
111926 literal current *kill* character had been inserted instead of the <backslash>.111927 *Current line:* Unchanged, unless previously input lines are erased, in which case it shall be set to  
111928 line -1.111929 *Current column:* Set to the first column that displays any portion of the last character backed up  
111930 over.111931 **<control>-V**111932 *Synopsis:* <control>-V

111933 &lt;control&gt;-Q

111934 Allow the entry of any subsequent character, other than <control>-J or the <newline>, as a literal  
111935 character, removing any special meaning that it may have to the editor in text input mode. If a  
111936 <control>-V or <control>-Q is entered before a <control>-J or <newline>, the <control>-V or  
111937 <control>-Q character shall be discarded, and the <control>-J or <newline> shall behave as  
111938 described in the <newline> command character during input mode.

111939 For purposes of the display only, the editor shall behave as if a '^^' character was entered, and

111940 the cursor shall be positioned as if overwriting the '^' character. When a subsequent character  
 111941 is entered, the editor shall behave as if that character was entered instead of the original  
 111942 <control>-V or <control>-Q character.

111943 *Current line:* Unchanged.

111944 *Current column:* Unchanged.

#### 111945 <control>-W

111946 *Synopsis:* <control>-W

111947 If there are characters other than **autoindent** characters that have been input on the current line  
 111948 before the cursor, the cursor shall move back over the last word preceding the cursor (including  
 111949 any <blank> characters between the end of the last word and the current cursor); the cursor shall  
 111950 not move to before the first character after the end of any **autoindent** characters.

111951 Otherwise, if there are **autoindent** characters on the current line before the cursor, it is  
 111952 implementation-defined whether the <control>-W command is an error or if the cursor moves to  
 111953 the first column position on the line.

111954 Otherwise, if the cursor is in column position 1 and there are previous lines that have been  
 111955 input, it is implementation-defined whether the <control>-W command is an error or if it is  
 111956 equivalent to entering <control>-W after the last input character on the previous input line.

111957 Otherwise, it shall be an error.

111958 All of the glyphs on columns between the starting cursor position and (inclusively) the ending  
 111959 cursor position shall become erase-columns as described in [Input Mode Commands in vi](#) (on  
 111960 page 3344).

111961 *Current line:* Unchanged, unless previously input lines are erased, in which case it shall be set to  
 111962 line -1.

111963 *Current column:* Set to the first column that displays any portion of the last character backed up  
 111964 over.

#### 111965 <ESC>

111966 *Synopsis:* <ESC>

111967 If input was part of a line-oriented command:

- 111968 1. If *interrupt* was entered, text input mode shall be terminated and the editor shall return to  
 111969 command mode. The terminal shall be alerted.
- 111970 2. If <ESC> was entered, text input mode shall be terminated and the command shall  
 111971 continue execution with the input provided.

111972 Otherwise, terminate text input mode and return to command mode.

111973 Any **autoindent** characters entered on newly created lines that have no other non-<newline>  
 111974 characters shall be deleted.

111975 Any leading **autoindent** and <blank> characters on newly created lines shall be rewritten to be  
 111976 the minimum number of <blank> characters possible.

111977 The screen shall be redisplayed as necessary to match the contents of the edit buffer.

111978 *Current line:* Unchanged.

111979 *Current column:*

- 111980 1. If there are text input characters on the current line, the column shall be set to the last  
111981 column where any portion of the last text input character is displayed.
- 111982 2. Otherwise, if a character is displayed in the current column, unchanged.
- 111983 3. Otherwise, set to column position 1.

#### 111984 **EXIT STATUS**

111985 The following exit values shall be returned:

- 111986 0 Successful completion.
- 111987 >0 An error occurred.

#### 111988 **CONSEQUENCES OF ERRORS**

111989 When any error is encountered and the standard input is not a terminal device file, *vi* shall not  
111990 write the file or return to command or text input mode, and shall terminate with a non-zero exit  
111991 status.

111992 Otherwise, when an unrecoverable error is encountered it shall be equivalent to a SIGHUP  
111993 asynchronous event.

111994 Otherwise, when an error is encountered, the editor shall behave as specified in [Command](#)  
111995 [Descriptions in vi](#) (on page 3310).

#### 111996 **APPLICATION USAGE**

111997 None.

#### 111998 **EXAMPLES**

111999 None.

#### 112000 **RATIONALE**

112001 See the RATIONALE for [ex](#) for more information on *vi*. Major portions of the *vi* utility  
112002 specification point to *ex* to avoid inadvertent divergence. While *ex* and *vi* have historically been  
112003 implemented as a single utility, this is not required by POSIX.1-2008.

112004 It is recognized that portions of *vi* would be difficult, if not impossible, to implement  
112005 satisfactorily on a block-mode terminal, or a terminal without any form of cursor addressing,  
112006 thus it is not a mandatory requirement that such features should work on all terminals. It is the  
112007 intention, however, that a *vi* implementation should provide the full set of capabilities on all  
112008 terminals capable of supporting them.

112009 Historically, *vi* exited immediately if the standard input was not a terminal. POSIX.1-2008  
112010 permits, but does not require, this behavior. An end-of-file condition is not equivalent to an end-  
112011 of-file character. A common end-of-file character, <control>-D, is historically a *vi* command.

112012 The text in the STDOUT section reflects the usage of the verb *display* in this section; some  
112013 implementations of *vi* use standard output to write to the terminal, but POSIX.1-2008 does not  
112014 require that to be the case.

112015 Historically, implementations reverted to open mode if the terminal was incapable of supporting  
112016 full visual mode. POSIX.1-2008 requires this behavior. Historically, the open mode of *vi* behaved  
112017 roughly equivalently to the visual mode, with the exception that only a single line from the edit  
112018 buffer (one “buffer line”) was kept current at any time. This line was normally displayed on the  
112019 next-to-last line of a terminal with cursor addressing (and the last line performed its normal  
112020 visual functions for line-oriented commands and messages). In addition, some few commands  
112021 behaved differently in open mode than in visual mode. POSIX.1-2008 requires conformance to  
112022 historical practice.

112023 Historically, *ex* and *vi* implementations have expected text to proceed in the usual  
 112024 European/Latin order of left to right, top to bottom. There is no requirement in POSIX.1-2008  
 112025 that this be the case. The specification was deliberately written using words like “before”,  
 112026 “after”, “first”, and “last” in order to permit implementations to support the natural text order  
 112027 of the language.

112028 Historically, lines past the end of the edit buffer were marked with single <tilde> ('~')  
 112029 characters; that is, if the one-based display was 20 lines in length, and the last line of the file was  
 112030 on line one, then lines 2-20 would contain only a single '~' character.

112031 Historically, the *vi* editor attempted to display only complete lines at the bottom of the screen (it  
 112032 did display partial lines at the top of the screen). If a line was too long to fit in its entirety at the  
 112033 bottom of the screen, the screen lines where the line would have been displayed were displayed  
 112034 as single '@' characters, instead of displaying part of the line. POSIX.1-2008 permits, but does  
 112035 not require, this behavior. Implementations are encouraged to attempt always to display a  
 112036 complete line at the bottom of the screen when doing scrolling or screen positioning by buffer  
 112037 lines.

112038 Historically, lines marked with '@' were also used to minimize output to dumb terminals over  
 112039 slow lines; that is, changes local to the cursor were updated, but changes to lines on the screen  
 112040 that were not close to the cursor were simply marked with an '@' sign instead of being updated  
 112041 to match the current text. POSIX.1-2008 permits, but does not require this feature because it is  
 112042 used ever less frequently as terminals become smarter and connections are faster.

#### 112043 Initialization in *ex* and *vi*

112044 Historically, *vi* always had a line in the edit buffer, even if the edit buffer was “empty”. For  
 112045 example:

- 112046 1. The *ex* command = executed from visual mode wrote “1” when the buffer was empty.
- 112047 2. Writes from visual mode of an empty edit buffer wrote files of a single character (a  
 112048 <newline>), while writes from *ex* mode of an empty edit buffer wrote empty files.
- 112049 3. Put and read commands into an empty edit buffer left an empty line at the top of the edit  
 112050 buffer.

112051 For consistency, POSIX.1-2008 does not permit any of these behaviors.

112052 Historically, *vi* did not always return the terminal to its original modes; for example, ICRNL was  
 112053 modified if it was not originally set. POSIX.1-2008 does not permit this behavior.

#### 112054 Command Descriptions in *vi*

112055 Motion commands are among the most complicated aspects of *vi* to describe. With some  
 112056 exceptions, the text region and buffer type effect of a motion command on a *vi* command are  
 112057 described on a case-by-case basis. The descriptions of text regions in POSIX.1-2008 are not  
 112058 intended to imply direction; that is, an inclusive region from line *n* to line *n*+5 is identical to a  
 112059 region from line *n*+5 to line *n*. This is of more than academic interest—movements to marks can  
 112060 be in either direction, and, if the **wrapsan** option is set, so can movements to search points.  
 112061 Historically, lines are always stored into buffers in text order; that is, from the start of the edit  
 112062 buffer to the end. POSIX.1-2008 requires conformance to historical practice.

112063 Historically, command counts were applied to any associated motion, and were multiplicative to  
 112064 any supplied motion count. For example, **2cw** is the same as **c2w**, and **2c3w** is the same as **c6w**.  
 112065 POSIX.1-2008 requires this behavior. Historically, *vi* commands that used bigwords, words,  
 112066 paragraphs, and sentences as objects treated groups of empty lines, or lines that contained only

112067 <blank> characters, inconsistently. Some commands treated them as a single entity, while others  
 112068 treated each line separately. For example, the **w**, **W**, and **B** commands treated groups of empty  
 112069 lines as individual words; that is, the command would move the cursor to each new empty line.  
 112070 The **e** and **E** commands treated groups of empty lines as a single word; that is, the first use  
 112071 would move past the group of lines. The **b** command would just beep at the user, or if done from  
 112072 the start of the line as a motion command, fail in unexpected ways. If the lines contained only (or  
 112073 ended with) <blank> characters, the **w** and **W** commands would just beep at the user, the **E** and  
 112074 **e** commands would treat the group as a single word, and the **B** and **b** commands would treat the  
 112075 lines as individual words. For consistency and simplicity of specification, POSIX.1-2008 requires  
 112076 that all *vi* commands treat groups of empty or blank lines as a single entity, and that movement  
 112077 through lines ending with <blank> characters be consistent with other movements.

112078 Historically, *vi* documentation indicated that any number of double-quotes were skipped after  
 112079 punctuation marks at sentence boundaries; however, implementations only skipped single-  
 112080 quotes. POSIX.1-2008 requires both to be skipped.

112081 Historically, the first and last characters in the edit buffer were word boundaries. This historical  
 112082 practice is required by POSIX.1-2008.

112083 Historically, *vi* attempted to update the minimum number of columns on the screen possible,  
 112084 which could lead to misleading information being displayed. POSIX.1-2008 makes no  
 112085 requirements other than that the current character being entered is displayed correctly, leaving  
 112086 all other decisions in this area up to the implementation.

112087 Historically, lines were arbitrarily folded between columns of any characters that required  
 112088 multiple column positions on the screen, with the exception of tabs, which terminated at the  
 112089 right-hand margin. POSIX.1-2008 permits the former and requires the latter. Implementations  
 112090 that do not arbitrarily break lines between columns of characters that occupy multiple column  
 112091 positions should not permit the cursor to rest on a column that does not contain any part of a  
 112092 character.

112093 The historical *vi* had a problem in that all movements were by buffer lines, not by display or  
 112094 screen lines. This is often the right thing to do; for example, single line movements, such as **j** or  
 112095 **k**, should work on buffer lines. Commands like **dj**, or **j.**, where **.** is a change command, only  
 112096 make sense for buffer lines. It is not, however, the right thing to do for screen motion or scrolling  
 112097 commands like <control>-D, <control>-F, and **H**. If the window is fairly small, using buffer lines  
 112098 in these cases can result in completely random motion; for example, **1<control>-D** can result in a  
 112099 completely changed screen, without any overlap. This is clearly not what the user wanted. The  
 112100 problem is even worse in the case of the **H**, **L**, and **M** commands—as they position the cursor at  
 112101 the first non-<blank> of the line, they may all refer to the same location in large lines, and will  
 112102 result in no movement at all.

112103 In addition, if the line is larger than the screen, using buffer lines can make it impossible to  
 112104 display parts of the line—there are not any commands that do not display the beginning of the  
 112105 line in historical *vi*, and if both the beginning and end of the line cannot be on the screen at the  
 112106 same time, the user suffers. Finally, the page and half-page scrolling commands historically  
 112107 moved to the first non-<blank> in the new line. If the line is approximately the same size as the  
 112108 screen, this is inadequate because the cursor before and after a <control>-D command will refer  
 112109 to the same location on the screen.

112110 Implementations of *ex* and *vi* exist that do not have these problems because the relevant  
 112111 commands (<control>-B, <control>-D, <control>-F, <control>-U, <control>-Y, <control>-E, **H**, **L**,  
 112112 and **M**) operate on display (screen) lines, not (edit) buffer lines.

112113 POSIX.1-2008 does not permit this behavior by default because the standard developers believed  
 112114 that users would find it too confusing. However, historical practice has been relaxed. For

112115 example, *ex* and *vi* historically attempted, albeit sometimes unsuccessfully, to never put part of a  
112116 line on the last lines of a screen; for example, if a line would not fit in its entirety, no part of the  
112117 line was displayed, and the screen lines corresponding to the line contained single '@' characters.  
112118 This behavior is permitted, but not required by POSIX.1-2008, so that it is possible for  
112119 implementations to support long lines in small screens more reasonably without changing the  
112120 commands to be oriented to the display (instead of oriented to the buffer). POSIX.1-2008 also  
112121 permits implementations to refuse to edit any edit buffer containing a line that will not fit on the  
112122 screen in its entirety.

112123 The display area (for example, the value of the **window** edit option) has historically been  
112124 "grown", or expanded, to display new text when local movements are done in displays where  
112125 the number of lines displayed is less than the maximum possible. Expansion has historically  
112126 been the first choice, when the target line is less than the maximum possible expansion value  
112127 away. Scrolling has historically been the next choice, done when the target line is less than half a  
112128 display away, and otherwise, the screen was redrawn. There were exceptions, however, in that *ex*  
112129 commands generally always caused the screen to be redrawn. POSIX.1-2008 does not specify a  
112130 standard behavior because there may be external issues, such as connection speed, the number  
112131 of characters necessary to redraw as opposed to scroll, or terminal capabilities that  
112132 implementations will have to accommodate.

112133 The current line in POSIX.1-2008 maps one-to-one to a buffer line in the file. The current column  
112134 does not. There are two different column values that are described by POSIX.1-2008. The first is  
112135 the current column value as set by many of the *vi* commands. This value is remembered for the  
112136 lifetime of the editor. The second column value is the actual position on the screen where the  
112137 cursor rests. The two are not always the same. For example, when the cursor is backed by a  
112138 multi-column character, the actual cursor position on the screen has historically been the last  
112139 column of the character in command mode, and the first column of the character in input mode.

112140 Commands that set the current line, but that do not set the current cursor value (for example, **j**  
112141 and **k**) attempt to get as close as possible to the remembered column position, so that the cursor  
112142 tends to restrict itself to a vertical column as the user moves around in the edit buffer.  
112143 POSIX.1-2008 requires conformance to historical practice, requiring that the display location of  
112144 the cursor on the display line be adjusted from the current column value as necessary to support  
112145 this historical behavior.

112146 Historically, only a single line (and for some terminals, a single line minus 1 column) of  
112147 characters could be entered by the user for the line-oriented commands; that is, **:**, **!**, **/**, or **?**.  
112148 POSIX.1-2008 permits, but does not require, this limitation.

112149 Historically, "soft" errors in *vi* caused the terminal to be alerted, but no error message was  
112150 displayed. As a general rule, no error message was displayed for errors in command execution  
112151 in *vi*, when the error resulted from the user attempting an invalid or impossible action, or when  
112152 a searched-for object was not found. Examples of soft errors included **h** at the left margin,  
112153 <control>-B or **[** at the beginning of the file, **2G** at the end of the file, and so on. In addition,  
112154 errors such as **%**, **]**, **)**, **N**, **n**, **f**, **F**, **t**, and **T** failing to find the searched-for object were soft as well.  
112155 Less consistently, **/** and **?** displayed an error message if the pattern was not found, **/**, **?**, **N**, and **n**  
112156 displayed an error message if no previous regular expression had been specified, and **;** did not  
112157 display an error message if no previous **f**, **F**, **t**, or **T** command had occurred. Also, behavior in  
112158 this area might reasonably be based on a runtime evaluation of the speed of a network  
112159 connection. Finally, some implementations have provided error messages for soft errors in order  
112160 to assist naive users, based on the value of a verbose edit option. POSIX.1-2008 does not list  
112161 specific errors for which an error message shall be displayed. Implementations should conform  
112162 to historical practice in the absence of any strong reason to diverge.

### 112163 Page Backwards

112164 The <control>-B and <control>-F commands historically considered it an error to attempt to  
 112165 page past the beginning or end of the file, whereas the <control>-D and <control>-U commands  
 112166 simply moved to the beginning or end of the file. For consistency, POSIX.1-2008 requires the  
 112167 latter behavior for all four commands. All four commands still consider it an error if the current  
 112168 line is at the beginning (<control>-B, <control>-U) or end (<control>-F, <control>-D) of the file.  
 112169 Historically, the <control>-B and <control>-F commands skip two lines in order to include  
 112170 overlapping lines when a single command is entered. This makes less sense in the presence of a  
 112171 *count*, as there will be, by definition, no overlapping lines. The actual calculation used by  
 112172 historical implementations of the *vi* editor for <control>-B was:

```
112173 ((current first line) - count x (window edit option)) +2
```

112174 and for <control>-F was:

```
112175 ((current first line) + count x (window edit option)) -2
```

112176 This calculation does not work well when intermixing commands with and without counts; for  
 112177 example, **3<control>-F is not equivalent to entering the <control>-F command three times,**  
 112178 **and is not reversible by entering the <control>-B command three times. For consistency with**  
 112179 **other *vi* commands that take counts, POSIX.1-2008 requires a different calculation.**

### 112180 Scroll Forward

112181 The 4BSD and System V implementations of *vi* differed on the initial value used by the **scroll**  
 112182 command. 4BSD used:

```
112183 ((window edit option) +1) /2
```

112184 while System V used the value of the **scroll** edit option. The System V version is specified by  
 112185 POSIX.1-2008 because the standard developers believed that it was more intuitive and permitted  
 112186 the user a method of setting the scroll value initially without also setting the number of lines that  
 112187 are displayed.

### 112188 Scroll Forward by Line

112189 Historically, the <control>-E and <control>-Y commands considered it an error if the last and  
 112190 first lines, respectively, were already on the screen. POSIX.1-2008 requires conformance to  
 112191 historical practice. Historically, the <control>-E and <control>-Y commands had no effect in  
 112192 open mode. For simplicity and consistency of specification, POSIX.1-2008 requires that they  
 112193 behave as usual, albeit with a single line screen.

### 112194 Clear and Redisplay

112195 The historical <control>-L command refreshed the screen exactly as it was supposed to be  
 112196 currently displayed, replacing any '@' characters for lines that had been deleted but not  
 112197 updated on the screen with refreshed '@' characters. The intent of the <control>-L command is  
 112198 to refresh when the screen has been accidentally overwritten; for example, by a **write** command  
 112199 from another user, or modem noise.

**112200 Redraw Screen**

112201 The historical <control>-R command redisplayed only when necessary to update lines that had  
112202 been deleted but not updated on the screen and that were flagged with '@' characters. There is  
112203 no requirement that the screen be in any way refreshed if no lines of this form are currently  
112204 displayed. POSIX.1-2008 permits implementations to extend this command to refresh lines on  
112205 the screen flagged with '@' characters because they are too long to be displayed in the current  
112206 framework; however, the current line and column need not be modified.

**112207 Search for tagstring**

112208 Historically, the first non-<blank> at or after the cursor was the first character, and all  
112209 subsequent characters that were word characters, up to the end of the line, were included. For  
112210 example, with the cursor on the leading <space> or on the '#' character in the text "#bar@",  
112211 the tag was "#bar". On the character 'b' it was "bar", and on the 'a' it was "ar".  
112212 POSIX.1-2008 requires this behavior.

**112213 Replace Text with Results from Shell Command**

112214 Historically, the <, >, and ! commands considered most cursor motions other than line-oriented  
112215 motions an error; for example, the command >/foo<CR> succeeded, while the command >I  
112216 failed, even though the text region described by the two commands might be identical. For  
112217 consistency, all three commands only consider entire lines and not partial lines, and the region is  
112218 defined as any line that contains a character that was specified by the motion.

**112219 Move to Matching Character**

112220 Other matching characters have been left implementation-defined in order to allow extensions  
112221 such as matching '<' and '>' for searching HTML, or #ifdef, #else, and #endif for searching C  
112222 source.

**112223 Repeat Substitution**

112224 POSIX.1-2008 requires that any c and g flags specified to the previous substitute command be  
112225 ignored; however, the r flag may still apply, if supported by the implementation.

**112226 Return to Previous (Context or Section)**

112227 The [, ], (, ), {, and } commands are all affected by "section boundaries", but in some historical  
112228 implementations not all of the commands recognize the same section boundaries. This is a bug,  
112229 not a feature, and a unique section-boundary algorithm was not described for each command.  
112230 One special case that is preserved is that the sentence command moves to the end of the last line  
112231 of the edit buffer while the other commands go to the beginning, in order to preserve the  
112232 traditional character cut semantics of the sentence command. Historically, vi section boundaries  
112233 at the beginning and end of the edit buffer were the first non-<blank> on the first and last lines  
112234 of the edit buffer if one exists; otherwise, the last character of the first and last lines of the edit  
112235 buffer if one exists. To increase consistency with other section locations, this has been simplified  
112236 by POSIX.1-2008 to the first character of the first and last lines of the edit buffer, or the first and  
112237 the last lines of the edit buffer if they are empty.

112238 Sentence boundaries were problematic in the historical vi. They were not only the boundaries as  
112239 defined for the section and paragraph commands, but they were the first non-<blank> that  
112240 occurred after those boundaries, as well. Historically, the vi section commands were  
112241 documented as taking an optional window size as a count preceding the command. This was not  
112242 implemented in historical versions, so POSIX.1-2008 requires that the count repeat the command,

112243 for consistency with other *vi* commands.

### 112244 **Repeat**

112245 Historically, mapped commands other than text input commands could not be repeated using  
112246 the **period** command. POSIX.1-2008 requires conformance to historical practice.

112247 The restrictions on the interpretation of special characters (for example, <control>-H) in the  
112248 repetition of text input mode commands is intended to match historical practice. For example,  
112249 given the input sequence:

```
112250 iab<control>-H<control>-H<control>-Hdef<escape>
```

112251 the user should be informed of an error when the sequence is first entered, but not during a  
112252 command repetition. The character <control>-T is specifically exempted from this restriction.  
112253 Historical implementations of *vi* ignored <control>-T characters that were input in the original  
112254 command during command repetition. POSIX.1-2008 prohibits this behavior.

### 112255 **Find Regular Expression**

112256 Historically, commands did not affect the line searched to or from if the motion command was a  
112257 search (*/*, *?*, **N**, **n**) and the final position was the start/end of the line. There were some special  
112258 cases and *vi* was not consistent. POSIX.1-2008 does not permit this behavior, for consistency.  
112259 Historical implementations permitted but were unable to handle searches as motion commands  
112260 that wrapped (that is, due to the edit option **wrapsan**) to the original location. POSIX.1-2008  
112261 requires that this behavior be treated as an error.

112262 Historically, the syntax `"/RE/0"` was used to force the command to cut text in line mode.  
112263 POSIX.1-2008 requires conformance to historical practice.

112264 Historically, in open mode, a **z** specified to a search command redisplayed the current line  
112265 instead of displaying the current screen with the current line highlighted. For consistency and  
112266 simplicity of specification, POSIX.1-2008 does not permit this behavior.

112267 Historically, trailing **z** commands were permitted and ignored if entered as part of a search used  
112268 as a motion command. For consistency and simplicity of specification, POSIX.1-2008 does not  
112269 permit this behavior.

### 112270 **Execute an ex Command**

112271 Historically, *vi* implementations restricted the commands that could be entered on the colon  
112272 command line (for example, **append** and **change**), and some other commands were known to  
112273 cause them to fail catastrophically. For consistency, POSIX.1-2008 does not permit these  
112274 restrictions. When executing an *ex* command by entering `:`, it is not possible to enter a <newline>  
112275 as part of the command because it is considered the end of the command. A different approach  
112276 is to enter *ex* command mode by using the *vi* **Q** command (and later resuming visual mode with  
112277 the *ex* **vi** command). In *ex* command mode, the single-line limitation does not exist. So, for  
112278 example, the following is valid:

```
112279 Q
112280 s/break here/break\
112281 here/
112282 vi
```

112283 POSIX.1-2008 requires that, if the *ex* command overwrites any part of the screen that would be  
112284 erased by a refresh, *vi* pauses for a character from the user. Historically, this character could be  
112285 any character; for example, a character input by the user before the message appeared, or even a

112286 mapped character. This is probably a bug, but implementations that have tried to be more  
112287 rigorous by requiring that the user enter a specific character, or that the user enter a character  
112288 after the message was displayed, have been forced by user indignation back into historical  
112289 behavior. POSIX.1-2008 requires conformance to historical practice.

#### 112290 **Shift Left (Right)**

112291 Refer to the Rationale for the ! and / commands. Historically, the < and > commands sometimes  
112292 moved the cursor to the first non-<blank> (for example if the command was repeated or with \_  
112293 as the motion command), and sometimes left it unchanged. POSIX.1-2008 does not permit this  
112294 inconsistency, requiring instead that the cursor always move to the first non-<blank>.  
112295 Historically, the < and > commands did not support buffer arguments, although some  
112296 implementations allow the specification of an optional buffer. This behavior is neither required  
112297 nor disallowed by POSIX.1-2008.

#### 112298 **Execute**

112299 Historically, buffers could execute other buffers, and loops, infinite and otherwise, were  
112300 possible. POSIX.1-2008 requires conformance to historical practice. The *\*buffer* syntax of *ex* is not  
112301 required in *vi*, because it is not historical practice and has been used in some *vi* implementations  
112302 to support additional scripting languages.

#### 112303 **Reverse Case**

112304 Historically, the ~ command ignored any associated *count*, and acted only on the characters in the  
112305 current line. For consistency with other *vi* commands, POSIX.1-2008 requires that an associated  
112306 *count* act on the next *count* characters, and that the command move to subsequent lines if  
112307 warranted by *count*, to make it possible to modify large pieces of text in a reasonably efficient  
112308 manner. There exist *vi* implementations that optionally require an associated motion command  
112309 for the ~ command. Implementations supporting this functionality are encouraged to base it on  
112310 the **tildedop** edit option and handle the text regions and cursor positioning identically to the  
112311 **yank** command.

#### 112312 **Append**

112313 Historically, *counts* specified to the **A**, **a**, **I**, and **i** commands repeated the input of the first line  
112314 *count* times, and did not repeat the subsequent lines of the input text. POSIX.1-2008 requires that  
112315 the entire text input be repeated *count* times.

#### 112316 **Move Backward to Preceding Word**

112317 Historically, *vi* became confused if word commands were used as motion commands in empty  
112318 files. POSIX.1-2008 requires that this be an error. Historical implementations of *vi* had a large  
112319 number of bugs in the word movement commands, and they varied greatly in behavior in the  
112320 presence of empty lines, “words” made up of a single character, and lines containing only  
112321 <blank> characters. For consistency and simplicity of specification, POSIX.1-2008 does not  
112322 permit this behavior.

**112323 Change to End-of-Line**

112324 Some historical implementations of the **C** command did not behave as described by  
112325 POSIX.1-2008 when the **\$** key was remapped because they were implemented by pushing the **\$**  
112326 key onto the input queue and reprocessing it. POSIX.1-2008 does not permit this behavior.  
112327 Historically, the **C**, **S**, and **s** commands did not copy replaced text into the numeric buffers. For  
112328 consistency and simplicity of specification, POSIX.1-2008 requires that they behave like their  
112329 respective **c** commands in all respects.

**112330 Delete**

112331 Historically, lines in open mode that were deleted were scrolled up, and an **@** glyph written over  
112332 the beginning of the line. In the case of terminals that are incapable of the necessary cursor  
112333 motions, the editor erased the deleted line from the screen. POSIX.1-2008 requires conformance  
112334 to historical practice; that is, if the terminal cannot display the **'@'** character, the line cannot  
112335 remain on the screen.

**112336 Delete to End-of-Line**

112337 Some historical implementations of the **D** command did not behave as described by  
112338 POSIX.1-2008 when the **\$** key was remapped because they were implemented by pushing the **\$**  
112339 key onto the input queue and reprocessing it. POSIX.1-2008 does not permit this behavior.

**112340 Join**

112341 An historical oddity of *vi* is that the commands **J**, **1J**, and **2J** are all equivalent. POSIX.1-2008  
112342 requires conformance to historical practice. The *vi* **J** command is specified in terms of the *ex* **join**  
112343 command with an *ex* command *count* value. The address correction for a *count* that is past the  
112344 end of the edit buffer is necessary for historical compatibility for both *ex* and *vi*.

**112345 Mark Position**

112346 Historical practice is that only lowercase letters, plus backquote and single-quote, could be used  
112347 to mark a cursor position. POSIX.1-2008 requires conformance to historical practice, but  
112348 encourages implementations to support other characters as marks as well.

**112349 Repeat Regular Expression Find (Forward and Reverse)**

112350 Historically, the **N** and **n** commands could not be used as motion components for the **c**  
112351 command. With the exception of the **cN** command, which worked if the search crossed a line  
112352 boundary, the text region would be discarded, and the user would not be in text input mode. For  
112353 consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior.

**112354 Insert Empty Line (Below and Above)**

112355 Historically, counts to the **O** and **o** commands were used as the number of physical lines to  
112356 open, if the terminal was dumb and the **slowopen** option was not set. This was intended to  
112357 minimize traffic over slow connections and repainting for dumb terminals. POSIX.1-2008 does  
112358 not permit this behavior, requiring that a *count* to the open command behave as for other text  
112359 input commands. This change to historical practice was made for consistency, and because a  
112360 superset of the functionality is provided by the **slowopen** edit option.

### 112361 **Put from Buffer (Following and Before)**

112362 Historically, *counts* to the **p** and **P** commands were ignored if the buffer was a line mode buffer,  
 112363 but were (mostly) implemented as described in POSIX.1-2008 if the buffer was a character mode  
 112364 buffer. Because implementations exist that do not have this limitation, and because pasting lines  
 112365 multiple times is generally useful, POSIX.1-2008 requires that *count* be supported for all **p** and **P**  
 112366 commands.

112367 Historical implementations of *vi* were widely known to have major problems in the **p** and **P**  
 112368 commands, particularly when unusual regions of text were copied into the edit buffer. The  
 112369 standard developers viewed these as bugs, and they are not permitted for consistency and  
 112370 simplicity of specification.

112371 Historically, a **P** or **p** command (or an *ex* **put** command executed from open or visual mode)  
 112372 executed in an empty file, left an empty line as the first line of the file. For consistency and  
 112373 simplicity of specification, POSIX.1-2008 does not permit this behavior.

### 112374 **Replace Character**

112375 Historically, the **r** command did not correctly handle the *erase* and *word erase* characters as  
 112376 arguments, nor did it handle an associated *count* greater than 1 with a <carriage-return>  
 112377 argument, for which it replaced *count* characters with a single <newline>. POSIX.1-2008 does  
 112378 not permit these inconsistencies.

112379 Historically, the **r** command permitted the <control>-V escaping of entered characters, such as  
 112380 <ESC> and the <carriage-return>; however, it required two leading <control>-V characters  
 112381 instead of one. POSIX.1-2008 requires that this be changed for consistency with the other text  
 112382 input commands of *vi*.

112383 Historically, it is an error to enter the **r** command if there are less than *count* characters at or after  
 112384 the cursor in the line. While a reasonable and unambiguous extension would be to permit the **r**  
 112385 command on empty lines, it would require that too large a *count* be adjusted to match the  
 112386 number of characters at or after the cursor for consistency, which is sufficiently different from  
 112387 historical practice to be avoided. POSIX.1-2008 requires conformance to historical practice.

### 112388 **Replace Characters**

112389 Historically, if there were **autoindent** characters in the line on which the **R** command was run,  
 112390 and **autoindent** was set, the first <newline> would be properly indented and no characters  
 112391 would be replaced by the <newline>. Each additional <newline> would replace *n* characters,  
 112392 where *n* was the number of characters that were needed to indent the rest of the line to the  
 112393 proper indentation level. This behavior is a bug and is not permitted by POSIX.1-2008.

### 112394 **Undo**

112395 Historical practice for cursor positioning after undoing commands was mixed. In most cases,  
 112396 when undoing commands that affected a single line, the cursor was moved to the start of added  
 112397 or changed text, or immediately after deleted text. However, if the user had moved from the line  
 112398 being changed, the column was either set to the first non-<blank>, returned to the origin of the  
 112399 command, or remained unchanged. When undoing commands that affected multiple lines or  
 112400 entire lines, the cursor was moved to the first character in the first line restored. As an example  
 112401 of how inconsistent this was, a search, followed by an **o** text input command, followed by an  
 112402 **undo** would return the cursor to the location where the **o** command was entered, but a **cw**  
 112403 command followed by an **o** command followed by an **undo** would return the cursor to the first  
 112404 non-<blank> of the line. POSIX.1-2008 requires the most useful of these behaviors, and discards  
 112405 the least useful, in the interest of consistency and simplicity of specification.

## 112406 **Yank**

112407 Historically, the **yank** command did not move to the end of the motion if the motion was in the  
 112408 forward direction. It moved to the end of the motion if the motion was in the backward  
 112409 direction, except for the **\_** command, or for the **G** and **'** commands when the end of the motion  
 112410 was on the current line. This was further complicated by the fact that for a number of motion  
 112411 commands, the **yank** command moved the cursor but did not update the screen; for example, a  
 112412 subsequent command would move the cursor from the end of the motion, even though the  
 112413 cursor on the screen had not reflected the cursor movement for the **yank** command.  
 112414 POSIX.1-2008 requires that all **yank** commands associated with backward motions move the  
 112415 cursor to the end of the motion for consistency, and specifically, to make **'** commands as motions  
 112416 consistent with search patterns as motions.

## 112417 **Yank Current Line**

112418 Some historical implementations of the **Y** command did not behave as described by  
 112419 POSIX.1-2008 when the **'\_'** key was remapped because they were implemented by pushing the  
 112420 **'\_'** key onto the input queue and reprocessing it. POSIX.1-2008 does not permit this behavior.

## 112421 **Redraw Window**

112422 Historically, the **z** command always redrew the screen. This is permitted but not required by  
 112423 POSIX.1-2008, because of the frequent use of the **z** command in macros such as **map n nz.** for  
 112424 screen positioning, instead of its use to change the screen size. The standard developers  
 112425 believed that expanding or scrolling the screen offered a better interface for users. The ability to  
 112426 redraw the screen is preserved if the optional new window size is specified, and in the  
 112427 **<control>-L** and **<control>-R** commands.

112428 The semantics of **z^** are confusing at best. Historical practice is that the screen before the screen  
 112429 that ended with the specified line is displayed. POSIX.1-2008 requires conformance to historical  
 112430 practice.

112431 Historically, the **z** command would not display a partial line at the top or bottom of the screen. If  
 112432 the partial line would normally have been displayed at the bottom of the screen, the command  
 112433 worked, but the partial line was replaced with **'@'** characters. If the partial line would normally  
 112434 have been displayed at the top of the screen, the command would fail. For consistency and  
 112435 simplicity of specification, POSIX.1-2008 does not permit this behavior.

112436 Historically, the **z** command with a line specification of 1 ignored the command. For consistency  
 112437 and simplicity of specification, POSIX.1-2008 does not permit this behavior.

112438 Historically, the **z** command did not set the cursor column to the first non-**<blank>** for the  
 112439 character if the first screen was to be displayed, and was already displayed. For consistency and  
 112440 simplicity of specification, POSIX.1-2008 does not permit this behavior.

## 112441 **Input Mode Commands in vi**

112442 Historical implementations of **vi** did not permit the user to erase more than a single line of input,  
 112443 or to use normal erase characters such as *line erase*, *worderase*, and *erase* to erase **autoindent**  
 112444 characters. As there exist implementations of **vi** that do not have these limitations, both  
 112445 behaviors are permitted, but only historical practice is required. In the case of these extensions,  
 112446 **vi** is required to pause at the **autoindent** and previous line boundaries.

112447 Historical implementations of **vi** updated only the portion of the screen where the current cursor  
 112448 character was displayed. For example, consider the **vi** input keystrokes:

```
112449 iabcd<escape>0C<tab>
```

112450 Historically, the <tab> would overwrite the characters "abcd" when it was displayed. Other  
 112451 implementations replace only the 'a' character with the <tab>, and then push the rest of the  
 112452 characters ahead of the cursor. Both implementations have problems. The historical  
 112453 implementation is probably visually nicer for the above example; however, for the keystrokes:

112454 iabcd<ESC>OR<tab><ESC>

112455 the historical implementation results in the string "bcd" disappearing and then magically  
 112456 reappearing when the <ESC> character is entered. POSIX.1-2008 requires the former behavior  
 112457 when overwriting erase-columns—that is, overwriting characters that are no longer logically  
 112458 part of the edit buffer—and the latter behavior otherwise.

112459 Historical implementations of *vi* discarded the <control>-D and <control>-T characters when  
 112460 they were entered at places where their command functionality was not appropriate.  
 112461 POSIX.1-2008 requires that the <control>-T functionality always be available, and that  
 112462 <control>-D be treated as any other key when not operating on **autoindent** characters.

## 112463 NUL

112464 Some historical implementations of *vi* limited the number of characters entered using the NUL  
 112465 input character to 256 bytes. POSIX.1-2008 permits this limitation; however, implementations are  
 112466 encouraged to remove this limit.

## 112467 <control>-D

112468 See also Rationale for the input mode command <newline>. The hidden assumptions in the  
 112469 <control>-D command (and in the *vi* **autoindent** specification in general) is that <space>  
 112470 characters take up a single column on the screen and that <tab> characters are comprised of an  
 112471 integral number of <space> characters.

## 112472 <newline>

112473 Implementations are permitted to rewrite **autoindent** characters in the line when <newline>,  
 112474 <carriage-return>, <control>-D, and <control>-T are entered, or when the **shift** commands are  
 112475 used, because historical implementations have both done so and found it necessary to do so. For  
 112476 example, a <control>-D when the cursor is preceded by a single <tab>, with **tabstop** set to 8, and  
 112477 **shiftwidth** set to 3, will result in the <tab> being replaced by several <space> characters.

## 112478 <control>-T

112479 See also the Rationale for the input mode command <newline>. Historically, <control>-T only  
 112480 worked if no non-<blank> characters had yet been input in the current input line. In addition,  
 112481 the characters inserted by <control>-T were treated as **autoindent** characters, and could not be  
 112482 erased using normal user erase characters. Because implementations exist that do not have  
 112483 these limitations, and as moving to a column boundary is generally useful, POSIX.1-2008  
 112484 requires that both limitations be removed.

112485 **<control>-V**

112486 Historically, *vi* used **^V**, regardless of the value of the literal-next character of the terminal.  
 112487 POSIX.1-2008 requires conformance to historical practice.

112488 The uses described for <control>-V can also be accomplished with <control>-Q, which is useful  
 112489 on terminals that use <control>-V for the down-arrow function. However, most historical  
 112490 implementations use <control>-Q for the *termios* START character, so the editor will generally  
 112491 not receive the <control>-Q unless **stty ixon** mode is set to off. (In addition, some historical  
 112492 implementations of *vi* explicitly set **ixon** mode to on, so it was difficult for the user to set it to  
 112493 off.) Any of the command characters described in POSIX.1-2008 can be made ineffective by their  
 112494 selection as *termios* control characters, using the *stty* utility or other methods described in the  
 112495 System Interfaces volume of POSIX.1-2008.

112496 **<ESC>**

112497 Historically, SIGINT alerted the terminal when used to end input mode. This behavior is  
 112498 permitted, but not required, by POSIX.1-2008.

112499 **FUTURE DIRECTIONS**

112500 None.

112501 **SEE ALSO**

112502 *ed*, *ex*, *stty*

112503 XBD [Section 12.2](#) (on page 215)

112504 **CHANGE HISTORY**

112505 First released in Issue 2.

112506 **Issue 5**

112507 The FUTURE DIRECTIONS section is added.

112508 **Issue 6**

112509 This utility is marked as part of the User Portability Utilities option.

112510 The APPLICATION USAGE section is added.

112511 The obsolescent SYNOPSIS is removed.

112512 The following new requirements on POSIX implementations derive from alignment with the  
 112513 Single UNIX Specification:

- 112514 • The **reindent** command description is added.

112515 The *vi* utility has been extensively rewritten for alignment with the IEEE P1003.2b draft  
 112516 standard.

112517 IEEE PASC Interpretations 1003.2 #57, #62, #63, #64, #78, and #188 are applied.

112518 IEEE PASC Interpretation 1003.2 #207 is applied, clarifying the description of the **R** command in  
 112519 a manner similar to the descriptions of other text input mode commands such as **i**, **o**, and **O**.

112520 The **-l** option is removed.

112521 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/41 is applied, adding [*count*] to the  
 112522 Synopsis for **[I]**.

112523 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/42 is applied, adding [*count*] to the  
 112524 Synopsis for **[J]**.

112525 **Issue 7**

112526 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that '+' may be recognized  
112527 as an option delimiter in the OPTIONS section.

112528 Austin Group Interpretation 1003.1-2001 #087 is applied, updating the Put from Buffer Before (P)  
112529 command description to address multi-line requirements.

112530 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

112531 **NAME**

112532           wait — await process completion

112533 **SYNOPSIS**112534           wait [*pid*...]112535 **DESCRIPTION**

112536           When an asynchronous list (see [Section 2.9.3.1](#), on page 2319) is started by the shell, the process  
 112537           ID of the last command in each element of the asynchronous list shall become known in the  
 112538           current shell execution environment; see [Section 2.12](#) (on page 2331).

112539           If the *wait* utility is invoked with no operands, it shall wait until all process IDs known to the  
 112540           invoking shell have terminated and exit with a zero exit status.

112541           If one or more *pid* operands are specified that represent known process IDs, the *wait* utility shall  
 112542           wait until all of them have terminated. If one or more *pid* operands are specified that represent  
 112543           unknown process IDs, *wait* shall treat them as if they were known process IDs that exited with  
 112544           exit status 127. The exit status returned by the *wait* utility shall be the exit status of the process  
 112545           requested by the last *pid* operand.

112546           The known process IDs are applicable only for invocations of *wait* in the current shell execution  
 112547           environment.

112548 **OPTIONS**

112549           None.

112550 **OPERANDS**

112551           The following operand shall be supported:

112552           *pid*           One of the following:

- 112553                           1. The unsigned decimal integer process ID of a command, for which the  
 112554                           utility is to wait for the termination.
- 112555                           2. A job control job ID (see [XBD Section 3.203](#), on page 65) that identifies a  
 112556                           background process group to be waited for. The job control job ID notation  
 112557                           is applicable only for invocations of *wait* in the current shell execution  
 112558                           environment; see [Section 2.12](#) (on page 2331). The exit status of *wait* shall be  
 112559                           determined by the last command in the pipeline.

112560           **Note:**        The job control job ID type of *pid* is only available on systems supporting  
 112561           the User Portability Utilities option.

112562 **STDIN**

112563           Not used.

112564 **INPUT FILES**

112565           None.

112566 **ENVIRONMENT VARIABLES**112567           The following environment variables shall affect the execution of *wait*:

112568           *LANG*        Provide a default value for the internationalization variables that are unset or null.  
 112569           (See [XBD Section 8.2](#) (on page 174) for the precedence of internationalization  
 112570           variables used to determine the values of locale categories.)

112571           *LC\_ALL*      If set to a non-empty string value, override the values of all the other  
 112572           internationalization variables.

- 112573 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 112574 characters (for example, single-byte as opposed to multi-byte characters in  
 112575 arguments).
- 112576 **LC\_MESSAGES**  
 112577 Determine the locale that should be used to affect the format and contents of  
 112578 diagnostic messages written to standard error.
- 112579 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 112580 **ASYNCHRONOUS EVENTS**
- 112581 Default.
- 112582 **STDOUT**
- 112583 Not used.
- 112584 **STDERR**
- 112585 The standard error shall be used only for diagnostic messages.
- 112586 **OUTPUT FILES**
- 112587 None.
- 112588 **EXTENDED DESCRIPTION**
- 112589 None.
- 112590 **EXIT STATUS**
- 112591 If one or more operands were specified, all of them have terminated or were not known by the  
 112592 invoking shell, and the status of the last operand specified is known, then the exit status of *wait*  
 112593 shall be the exit status information of the command indicated by the last operand specified. If  
 112594 the process terminated abnormally due to the receipt of a signal, the exit status shall be greater  
 112595 than 128 and shall be distinct from the exit status generated by other signals, but the exact value  
 112596 is unspecified. (See the *kill* **-I** option.) Otherwise, the *wait* utility shall exit with one of the  
 112597 following values:
- 112598 0 The *wait* utility was invoked with no operands and all process IDs known by the  
 112599 invoking shell have terminated.
- 112600 1-126 The *wait* utility detected an error.
- 112601 127 The command identified by the last *pid* operand specified is unknown.
- 112602 **CONSEQUENCES OF ERRORS**
- 112603 Default.
- 112604 **APPLICATION USAGE**
- 112605 On most implementations, *wait* is a shell built-in. If it is called in a subshell or separate utility  
 112606 execution environment, such as one of the following:
- 112607 (wait)  
 112608 nohup wait ...  
 112609 find . -exec wait ... \;
- 112610 it returns immediately because there are no known process IDs to wait for in those  
 112611 environments.
- 112612 Historical implementations of interactive shells have discarded the exit status of terminated  
 112613 background processes before each shell prompt. Therefore, the status of background processes  
 112614 was usually lost unless it terminated while *wait* was waiting for it. This could be a serious  
 112615 problem when a job that was expected to run for a long time actually terminated quickly with a  
 112616 syntax or initialization error because the exit status returned was usually zero if the requested

112617 process ID was not found. This volume of POSIX.1-2008 requires the implementation to keep the  
 112618 status of terminated jobs available until the status is requested, so that scripts like:

```
112619 j1&
112620 p1=$!
112621 j2&
112622 wait $p1
112623 echo Job 1 exited with status $?
112624 wait $!
112625 echo Job 2 exited with status $?
```

112626 work without losing status on any of the jobs. The shell is allowed to discard the status of any  
 112627 process if it determines that the application cannot get the process ID for that process from the  
 112628 shell. It is also required to remember only {CHILD\_MAX} number of processes in this way. Since  
 112629 the only way to get the process ID from the shell is by using the '!' shell parameter, the shell is  
 112630 allowed to discard the status of an asynchronous list if "\$!" was not referenced before another  
 112631 asynchronous list was started. (This means that the shell only has to keep the status of the last  
 112632 asynchronous list started if the application did not reference "\$!". If the implementation of the  
 112633 shell is smart enough to determine that a reference to "\$!" was not saved anywhere that the  
 112634 application can retrieve it later, it can use this information to trim the list of saved information.  
 112635 Note also that a successful call to *wait* with no operands discards the exit status of all  
 112636 asynchronous lists.)

112637 If the exit status of *wait* is greater than 128, there is no way for the application to know if the  
 112638 waited-for process exited with that value or was killed by a signal. Since most utilities exit with  
 112639 small values, there is seldom any ambiguity. Even in the ambiguous cases, most applications just  
 112640 need to know that the asynchronous job failed; it does not matter whether it detected an error  
 112641 and failed or was killed and did not complete its job normally.

#### 112642 EXAMPLES

112643 Although the exact value used when a process is terminated by a signal is unspecified, if it is  
 112644 known that a signal terminated a process, a script can still reliably determine which signal by  
 112645 using *kill* as shown by the following script:

```
112646 sleep 1000&
112647 pid=$!
112648 kill -kill $pid
112649 wait $pid
112650 echo $pid was terminated by a SIG$(kill -l $? ) signal.
```

112651 If the following sequence of commands is run in less than 31 seconds:

```
112652 sleep 257 | sleep 31 &
112653 jobs -l %%
```

112654 either of the following commands returns the exit status of the second *sleep* in the pipeline:

```
112655 wait <pid of sleep 31>
112656 wait %%
```

#### 112657 RATIONALE

112658 The description of *wait* does not refer to the *waitpid()* function from the System Interfaces  
 112659 volume of POSIX.1-2008 because that would needlessly overspecify this interface. However, the  
 112660 wording means that *wait* is required to wait for an explicit process when it is given an argument  
 112661 so that the status information of other processes is not consumed. Historical implementations  
 112662 use the *wait()* function defined in the System Interfaces volume of POSIX.1-2008 until *wait()*  
 112663 returns the requested process ID or finds that the requested process does not exist. Because this

112664 means that a shell script could not reliably get the status of all background children if a second  
112665 background job was ever started before the first job finished, it is recommended that the *wait*  
112666 utility use a method such as the functionality provided by the *waitpid()* function.

112667 The ability to wait for multiple *pid* operands was adopted from the KornShell.

112668 This new functionality was added because it is needed to determine the exit status of any  
112669 asynchronous list accurately. The only compatibility problem that this change creates is for a  
112670 script like

```
112671 while sleep 60 do  
112672     job& echo Job started $(date) as $! done
```

112673 which causes the shell to monitor all of the jobs started until the script terminates or runs out of  
112674 memory. This would not be a problem if the loop did not reference "\$!" or if the script would  
112675 occasionally *wait* for jobs it started.

#### 112676 FUTURE DIRECTIONS

112677 None.

#### 112682 CHANGE HISTORY

112683 First released in Issue 2.

112684 **NAME**112685 `wc` — word, line, and byte or character count112686 **SYNOPSIS**112687 `wc [-c|-m] [-lw] [file...]`112688 **DESCRIPTION**112689 The *wc* utility shall read one or more input files and, by default, write the number of <newline>  
112690 characters, words, and bytes contained in each input file to the standard output.112691 The utility also shall write a total count for all named files, if more than one input file is  
112692 specified.112693 The *wc* utility shall consider a *word* to be a non-zero-length string of characters delimited by  
112694 white space.112695 **OPTIONS**112696 The *wc* utility shall conform to XBD [Section 12.2](#) (on page 215).

112697 The following options shall be supported:

112698 `-c` Write to the standard output the number of bytes in each input file.112699 `-l` Write to the standard output the number of <newline> characters in each input  
112700 file.112701 `-m` Write to the standard output the number of characters in each input file.112702 `-w` Write to the standard output the number of words in each input file.112703 When any option is specified, *wc* shall report only the information requested by the specified  
112704 options.112705 **OPERANDS**

112706 The following operand shall be supported:

112707 *file* A pathname of an input file. If no *file* operands are specified, the standard input  
112708 shall be used.112709 **STDIN**112710 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
112711 operand is `'-'` and the implementation treats the `'-'` as meaning standard input. Otherwise,  
112712 the standard input shall not be used. See the INPUT FILES section.112713 **INPUT FILES**

112714 The input files may be of any type.

112715 **ENVIRONMENT VARIABLES**112716 The following environment variables shall affect the execution of *wc*:112717 *LANG* Provide a default value for the internationalization variables that are unset or null.  
112718 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
112719 variables used to determine the values of locale categories.)112720 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
112721 internationalization variables.112722 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
112723 characters (for example, single-byte as opposed to multi-byte characters in  
112724 arguments and input files) and which characters are defined as white-space  
112725 characters.

- 112726 *LC\_MESSAGES*
- 112727 Determine the locale that should be used to affect the format and contents of
- 112728 diagnostic messages written to standard error and informative messages written to
- 112729 standard output.
- 112730 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 112731 **ASYNCHRONOUS EVENTS**
- 112732 Default.
- 112733 **STDOUT**
- 112734 By default, the standard output shall contain an entry for each input file of the form:
- 112735 "%d %d %d %s\n", <newlines>, <words>, <bytes>, <file>
- 112736 If the **-m** option is specified, the number of characters shall replace the <bytes> field in this
- 112737 format.
- 112738 If any options are specified and the **-l** option is not specified, the number of <newline>
- 112739 characters shall not be written.
- 112740 If any options are specified and the **-w** option is not specified, the number of words shall not be
- 112741 written.
- 112742 If any options are specified and neither **-c** nor **-m** is specified, the number of bytes or characters
- 112743 shall not be written.
- 112744 If no input *file* operands are specified, no name shall be written and no <blank> characters
- 112745 preceding the pathname shall be written.
- 112746 If more than one input *file* operand is specified, an additional line shall be written, of the same
- 112747 format as the other lines, except that the word **total** (in the POSIX locale) shall be written instead
- 112748 of a pathname and the total of each column shall be written as appropriate. Such an additional
- 112749 line, if any, is written at the end of the output.
- 112750 **STDERR**
- 112751 The standard error shall be used only for diagnostic messages.
- 112752 **OUTPUT FILES**
- 112753 None.
- 112754 **EXTENDED DESCRIPTION**
- 112755 None.
- 112756 **EXIT STATUS**
- 112757 The following exit values shall be returned:
- 112758 0 Successful completion.
- 112759 >0 An error occurred.
- 112760 **CONSEQUENCES OF ERRORS**
- 112761 Default.

112762 **APPLICATION USAGE**

112763 The `-m` option is not a switch, but an option at the same level as `-c`. Thus, to produce the full  
 112764 default output with character counts instead of bytes, the command required is:

112765 `wc -mlw`

112766 **EXAMPLES**

112767 None.

112768 **RATIONALE**

112769 The output file format pseudo-*printf()* string differs from the System V version of *wc*:

112770 `"%7d%7d%7d %s\n"`

112771 which produces possibly ambiguous and unparseable results for very large files, as it assumes no  
 112772 number shall exceed six digits.

112773 Some historical implementations use only `<space>`, `<tab>`, and `<newline>` as word separators.  
 112774 The equivalent of the ISO C standard *isspace()* function is more appropriate.

112775 The `-c` option stands for “character” count, even though it counts bytes. This stems from the  
 112776 sometimes erroneous historical view that bytes and characters are the same size. Due to  
 112777 international requirements, the `-m` option (reminiscent of “multi-byte”) was added to obtain  
 112778 actual character counts.

112779 Early proposals only specified the results when input files were text files. The current  
 112780 specification more closely matches historical practice. (Bytes, words, and `<newline>` characters  
 112781 are counted separately and the results are written when an end-of-file is detected.)

112782 Historical implementations of the *wc* utility only accepted one argument to specify the options  
 112783 `-c`, `-l`, and `-w`. Some of them also had multiple occurrences of an option cause the  
 112784 corresponding count to be written multiple times and had the order of specification of the  
 112785 options affect the order of the fields on output, but did not document either of these. Because  
 112786 common usage either specifies no options or only one option, and because none of this was  
 112787 documented, the changes required by this volume of POSIX.1-2008 should not break many  
 112788 historical applications (and do not break any historical conforming applications).

112789 **FUTURE DIRECTIONS**

112790 None.

112791 **SEE ALSO**

112792 [cksum](#)

112793 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

112794 **CHANGE HISTORY**

112795 First released in Issue 2.

112796 **Issue 7**

112797 Austin Group Interpretation 1003.1-2001 #092 is applied.

112798 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

112799 **NAME**112800 what — identify SCCS files (**DEVELOPMENT**)112801 **SYNOPSIS**112802 XSI `what [-s] file...`112803 **DESCRIPTION**

112804 The *what* utility shall search the given files for all occurrences of the pattern that *get* (see *get*)  
 112805 substitutes for the %Z% keyword ("@(#)") and shall write to standard output what follows  
 112806 until the first occurrence of one of the following:

112807 " &gt; newline \ NUL

112808 **OPTIONS**112809 The *what* utility shall conform to XBD [Section 12.2](#) (on page 215).

112810 The following option shall be supported:

112811 **-s** Quit after finding the first occurrence of the pattern in each file.112812 **OPERANDS**

112813 The following operands shall be supported:

112814 *file* A pathname of a file to search.112815 **STDIN**

112816 Not used.

112817 **INPUT FILES**

112818 The input files shall be of any file type.

112819 **ENVIRONMENT VARIABLES**112820 The following environment variables shall affect the execution of *what*:

112821 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 112822 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 112823 variables used to determine the values of locale categories.)

112824 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 112825 internationalization variables.

112826 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 112827 characters (for example, single-byte as opposed to multi-byte characters in  
 112828 arguments and input files).

112829 **LC\_MESSAGES**

112830 Determine the locale that should be used to affect the format and contents of  
 112831 diagnostic messages written to standard error.

112832 **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.112833 **ASYNCHRONOUS EVENTS**

112834 Default.

112835 **STDOUT**112836 The standard output shall consist of the following for each *file* operand:

112837 "%s:\n\t%s\n", &lt;pathname&gt;, &lt;identification string&gt;

112838 **STDERR**

112839 The standard error shall be used only for diagnostic messages.

112840 **OUTPUT FILES**

112841 None.

112842 **EXTENDED DESCRIPTION**

112843 None.

112844 **EXIT STATUS**

112845 The following exit values shall be returned:

112846 0 Any matches were found.

112847 1 Otherwise.

112848 **CONSEQUENCES OF ERRORS**

112849 Default.

112850 **APPLICATION USAGE**

112851 The *what* utility is intended to be used in conjunction with the SCCS command *get*, which  
112852 automatically inserts identifying information, but it can also be used where the information is  
112853 inserted by any other means.

112854 When the string "@ (#) " is included in a library routine in a shared library, it might not be found  
112855 in an **a.out** file using that library routine.

112856 **EXAMPLES**

112857 If the C-language program in file **f.c** contains:

112858 `char ident[] = "@ (#) identification information";`

112859 and **f.c** is compiled to yield **f.o** and **a.out**, then the command:

112860 `what f.c f.o a.out`

112861 writes:

112862 `f.c:`  
112863  `identification information`

112864  `...`

112865 `f.o:`  
112866  `identification information`

112867  `...`

112868 `a.out:`  
112869  `identification information`

112870  `...`

112871 **RATIONALE**

112872 None.

112873 **FUTURE DIRECTIONS**

112874 None.

112875 **SEE ALSO**

112876 *get*

112877 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

112878 **CHANGE HISTORY**  
112879 First released in Issue 2.

112880 **NAME**112881        **who** — display who is on the system112882 **SYNOPSIS**112883 XSI        **who** [-mTu] [-abdHlprt] [*file*]112884 XSI        **who** [-mu] -s [-bHlprt] [*file*]112885        **who** -q [*file*]112886        **who** am i112887        **who** am I112888 **DESCRIPTION**112889        The *who* utility shall list various pieces of information about accessible users. The domain of  
112890 accessibility is implementation-defined.112891 XSI        Based on the options given, *who* can also list the user's name, terminal line, login time, elapsed  
112892 time since activity occurred on the line, and the process ID of the command interpreter for each  
112893 current system user.112894 **OPTIONS**112895        The *who* utility shall conform to XBD [Section 12.2](#) (on page 215).112896        The following options shall be supported. The metavariables, such as *<line>*, refer to fields  
112897 described in the STDOUT section.112898 XSI        **-a**        Process the implementation-defined database or named file with the **-b**, **-d**, **-l**, **-p**,  
112899 **-r**, **-t**, **-T** and **-u** options turned on.112900 XSI        **-b**        Write the time and date of the last system reboot. The system reboot time is the  
112901 time at which the implementation is able to commence running processes.112902 XSI        **-d**        Write a list of all processes that have expired and not been respawned by the *init*  
112903 system process. The *<exit>* field shall appear for dead processes and contain the  
112904 termination and exit values of the dead process. This can be useful in determining  
112905 why a process terminated.112906 XSI        **-H**        Write column headings above the regular output.112907 XSI        **-l**        (The letter ell.) List only those lines on which the system is waiting for someone to  
112908 login. The *<name>* field shall be **LOGIN** in such cases. Other fields shall be the  
112909 same as for user entries except that the *<state>* field does not exist.112910        **-m**        Output only information about the current terminal.112911 XSI        **-p**        List any other process that is currently active and has been previously spawned by  
112912 *init*.112913 XSI        **-q**        (Quick.) List only the names and the number of users currently logged on. When  
112914 this option is used, all other options shall be ignored.112915 XSI        **-r**        Write the current *run-level* of the *init* process.112916 XSI        **-s**        List only the *<name>*, *<line>*, and *<time>* fields. This is the default case.112917 XSI        **-t**        Indicate the last change to the system clock.112918        **-T**        Show the state of each terminal, as described in the STDOUT section.

112919           **-u**           Write “idle time” for each displayed user in addition to any other information. The  
 112920           idle time is the time since any activity occurred on the user’s terminal. The method  
 112921 XSI           of determining this is unspecified. This option shall list only those users who are  
 112922           currently logged in. The *<name>* is the user’s login name. The *<line>* is the name  
 112923           of the line as found in the directory */dev*. The *<time>* is the time that the user  
 112924           logged in. The *<activity>* is the number of hours and minutes since activity last  
 112925           occurred on that particular line. A dot indicates that the terminal has seen activity  
 112926           in the last minute and is therefore “current”. If more than twenty-four hours have  
 112927           elapsed or the line has not been used since boot time, the entry shall be marked  
 112928           *<old>*. This field is useful when trying to determine whether a person is working at  
 112929           the terminal or not. The *<pid>* is the process ID of the user’s login process.

#### 112930 OPERANDS

112931 XSI           The following operands shall be supported:

112932           **am i, am I**       In the POSIX locale, limit the output to describing the invoking user, equivalent to  
 112933           the **-m** option. The **am** and **i** or **I** must be separate arguments.

112934           *file*           Specify a pathname of a file to substitute for the implementation-defined database  
 112935           of logged-on users that *who* uses by default.

#### 112936 STDIN

112937           Not used.

#### 112938 INPUT FILES

112939           None.

#### 112940 ENVIRONMENT VARIABLES

112941           The following environment variables shall affect the execution of *who*:

112942           **LANG**           Provide a default value for the internationalization variables that are unset or null.  
 112943           (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 112944           variables used to determine the values of locale categories.)

112945           **LC\_ALL**        If set to a non-empty string value, override the values of all the other  
 112946           internationalization variables.

112947           **LC\_CTYPE**     Determine the locale for the interpretation of sequences of bytes of text data as  
 112948           characters (for example, single-byte as opposed to multi-byte characters in  
 112949           arguments).

112950           **LC\_MESSAGES**

112951           Determine the locale that should be used to affect the format and contents of  
 112952           diagnostic messages written to standard error.

112953           **LC\_TIME**       Determine the locale used for the format and contents of the date and time strings.

112954 XSI           **NLSPATH**       Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

112955           **TZ**           Determine the timezone used when writing date and time information. If **TZ** is  
 112956           unset or null, an unspecified default timezone shall be used.

#### 112957 ASYNCHRONOUS EVENTS

112958           Default.

#### 112959 STDOUT

112960           The *who* utility shall write its default format to the standard output in an implementation-  
 112961           defined format, subject only to the requirement of containing the information described above.

112962 XSI OF XSI-conformant systems shall write the default information to the standard output in the  
 112963 following general format:

112964 `<name> [<state>] <line> <time> [<activity>] [<pid>] [<comment>] [<exit>]`

112965 For the `-b` option, `<line>` shall be "system boot". The `<name>` is unspecified.

112966 The following format shall be used for the `-T` option:

112967 `"%s %c %s %s\n" <name>, <terminal state>, <terminal name>,  
 112968 <time of login>`

112969 where `<terminal state>` is one of the following characters:

112970 + The terminal allows write access to other users.

112971 - The terminal denies write access to other users.

112972 ? The terminal write-access state cannot be determined.

112973 `<space>` This entry is not associated with a terminal.

112974 In the POSIX locale, the `<time of login>` shall be equivalent in format to the output of:

112975 `date +"%b %e %H:%M"`

112976 If the `-u` option is used with `-T`, the idle time shall be added to the end of the previous format in  
 112977 an unspecified format.

#### 112978 **STDERR**

112979 The standard error shall be used only for diagnostic messages.

#### 112980 **OUTPUT FILES**

112981 None.

#### 112982 **EXTENDED DESCRIPTION**

112983 None.

#### 112984 **EXIT STATUS**

112985 The following exit values shall be returned:

112986 0 Successful completion.

112987 >0 An error occurred.

#### 112988 **CONSEQUENCES OF ERRORS**

112989 Default.

#### 112990 **APPLICATION USAGE**

112991 The name *init* used for the system process is the most commonly used on historical systems, but  
 112992 it may vary.

112993 The "domain of accessibility" referred to is a broad concept that permits interpretation either on  
 112994 a very secure basis or even to allow a network-wide implementation like the historical *rwwho*.

#### 112995 **EXAMPLES**

112996 None.

#### 112997 **RATIONALE**

112998 Due to differences between historical implementations, the base options provided were a  
 112999 compromise to allow users to work with those functions. The standard developers also  
 113000 considered removing all the options, but felt that these options offered users valuable  
 113001 functionality. Additional options to match historical systems are available on XSI-conformant

- 113002 systems.
- 113003 It is recognized that the *who* command may be of limited usefulness, especially in a multi-level  
113004 secure environment. The standard developers considered, however, that having some standard  
113005 method of determining the “accessibility” of other users would aid user portability.
- 113006 No format was specified for the default *who* output for systems not supporting the XSI option. In  
113007 such a user-oriented command, designed only for human use, this was not considered to be a  
113008 deficiency.
- 113009 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, and *write* require  
113010 that they use the same format.
- 113011 It is acceptable for an implementation to produce no output for an invocation of *who mil*.
- 113012 **FUTURE DIRECTIONS**
- 113013 None.
- 113014 **SEE ALSO**
- 113015 *mesg*
- 113016 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)
- 113017 **CHANGE HISTORY**
- 113018 First released in Issue 2.
- 113019 **Issue 6**
- 113020 This utility is marked as part of the User Portability Utilities option.
- 113021 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.
- 113022 **Issue 7**
- 113023 SD5-XCU-ERN-58 is applied, clarifying the **-b** option.
- 113024 The *who* utility is moved from the User Portability Utilities option to the Base. User Portability  
113025 Utilities is now an option for interactive utilities.
- 113026 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

113027 **NAME**

113028 write — write to another user

113029 **SYNOPSIS**113030 write *user\_name* [*terminal*]113031 **DESCRIPTION**113032 The *write* utility shall read lines from the standard input and write them to the terminal of the  
113033 specified user. When first invoked, it shall write the message:113034 **Message from** *sender-login-id* (*sending-terminal*) [*date*] . . .113035 to *user\_name*. When it has successfully completed the connection, the sender's terminal shall be  
113036 alerted twice to indicate that what the sender is typing is being written to the recipient's  
113037 terminal.

113038 If the recipient wants to reply, this can be accomplished by typing:

113039 write *sender-login-id* [*sending-terminal*]113040 upon receipt of the initial message. Whenever a line of input as delimited by an NL, EOF, or  
113041 EOL special character (see XBD [Chapter 11](#), on page 199) is accumulated while in canonical  
113042 input mode, the accumulated data shall be written on the other user's terminal. Characters shall  
113043 be processed as follows:

- 113044 • Typing <alert> shall write the <alert> character to the recipient's terminal.
- 113045 • Typing the erase and kill characters shall affect the sender's terminal in the manner  
113046 described by the **termios** interface in XBD [Chapter 11](#) (on page 199).
- 113047 • Typing the interrupt or end-of-file characters shall cause *write* to write an appropriate  
113048 message ("EOT\n" in the POSIX locale) to the recipient's terminal and exit.
- 113049 • Typing characters from *LC\_CTYPE* classifications **print** or **space** shall cause those  
113050 characters to be sent to the recipient's terminal.
- 113051 • When and only when the *stty* **ixten** local mode is enabled, the existence and processing of  
113052 additional special control characters and multi-byte or single-byte functions is  
113053 implementation-defined.
- 113054 • Typing other non-printable characters shall cause implementation-defined sequences of  
113055 printable characters to be written to the recipient's terminal.

113056 To write to a user who is logged in more than once, the *terminal* argument can be used to  
113057 indicate which terminal to write to; otherwise, the recipient's terminal is selected in an  
113058 implementation-defined manner and an informational message is written to the sender's  
113059 standard output, indicating which terminal was chosen.

113060 Permission to be a recipient of a *write* message can be denied or granted by use of the *mesg*  
113061 utility. However, a user's privilege may further constrain the domain of accessibility of other  
113062 users' terminals. The *write* utility shall fail when the user lacks appropriate privileges to perform  
113063 the requested action.

113064 **OPTIONS**

113065 None.

113066 **OPERANDS**

- 113067 The following operands shall be supported:
- 113068 *user\_name* Login name of the person to whom the message shall be written. The application  
113069 shall ensure that this operand is of the form returned by the *who* utility.
- 113070 *terminal* Terminal identification in the same format provided by the *who* utility.
- 113071 **STDIN**
- 113072 Lines to be copied to the recipient's terminal are read from standard input.
- 113073 **INPUT FILES**
- 113074 None.
- 113075 **ENVIRONMENT VARIABLES**
- 113076 The following environment variables shall affect the execution of *write*:
- 113077 *LANG* Provide a default value for the internationalization variables that are unset or null.  
113078 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
113079 variables used to determine the values of locale categories.)
- 113080 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
113081 internationalization variables.
- 113082 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
113083 characters (for example, single-byte as opposed to multi-byte characters in  
113084 arguments and input files). If the recipient's locale does not use an *LC\_CTYPE*  
113085 equivalent to the sender's, the results are undefined.
- 113086 *LC\_MESSAGES*
- 113087 Determine the locale that should be used to affect the format and contents of  
113088 diagnostic messages written to standard error and informative messages written to  
113089 standard output.
- 113090 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 113091 **ASYNCHRONOUS EVENTS**
- 113092 If an interrupt signal is received, *write* shall write an appropriate message on the recipient's  
113093 terminal and exit with a status of zero. It shall take the standard action for all other signals.
- 113094 **STDOUT**
- 113095 An informational message shall be written to standard output if a recipient is logged in more  
113096 than once.
- 113097 **STDERR**
- 113098 The standard error shall be used only for diagnostic messages.
- 113099 **OUTPUT FILES**
- 113100 The recipient's terminal is used for output.
- 113101 **EXTENDED DESCRIPTION**
- 113102 None.
- 113103 **EXIT STATUS**
- 113104 The following exit values shall be returned:
- 113105 0 Successful completion.
- 113106 >0 The addressed user is not logged on or the addressed user denies permission.

**113107 CONSEQUENCES OF ERRORS**

113108 Default.

**113109 APPLICATION USAGE**

113110 The *talk* utility is considered by some users to be a more usable utility on full-screen terminals.

**113111 EXAMPLES**

113112 None.

**113113 RATIONALE**

113114 The *write* utility was included in this volume of POSIX.1-2008 since it can be implemented on all  
113115 terminal types. The standard developers considered the *talk* utility, which cannot be  
113116 implemented on certain terminals, to be a “better” communications interface. Both of these  
113117 programs are in widespread use on historical implementations. Therefore, the standard  
113118 developers decided that both utilities should be specified.

113119 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*  
113120 require that they all use or accept the same format.

**113121 FUTURE DIRECTIONS**

113122 None.

**113123 SEE ALSO**

113124 *mesg*, *talk*, *who*

113125 XBD [Chapter 8](#) (on page 173), [Chapter 11](#) (on page 199)

**113126 CHANGE HISTORY**

113127 First released in Issue 2.

**113128 Issue 5**

113129 The FUTURE DIRECTIONS section is added.

**113130 Issue 6**

113131 This utility is marked as part of the User Portability Utilities option.

113132 The normative text is reworded to avoid use of the term “must” for application requirements.

**113133 Issue 7**

113134 The *write* utility is moved from the User Portability Utilities option to the Base. User Portability  
113135 Utilities is now an option for interactive utilities.

113136 **NAME**113137 `xargs` — construct argument lists and invoke utility113138 **SYNOPSIS**

```
113139 XSI xargs [-ptx] [-E eofstr] [-I replstr|-L number|-n number]
113140 [-s size] [utility [argument...]]
```

113141 **DESCRIPTION**

113142 The `xargs` utility shall construct a command line consisting of the *utility* and *argument* operands  
 113143 specified followed by as many arguments read in sequence from standard input as fit in length  
 113144 and number constraints specified by the options. The `xargs` utility shall then invoke the  
 113145 constructed command line and wait for its completion. This sequence shall be repeated until one  
 113146 of the following occurs:

- 113147 • An end-of-file condition is detected on standard input.
- 113148 • An argument consisting of just the logical end-of-file string (see the `-E eofstr` option) is  
 113149 found on standard input after double-quote processing, <apostrophe> processing, and  
 113150 <backslash>-escape processing (see next paragraph). All arguments up to but not  
 113151 including the argument consisting of just the logical end-of-file string shall be used as  
 113152 arguments in constructed command lines.
- 113153 • An invocation of a constructed command line returns an exit status of 255.

113154 The application shall ensure that arguments in the standard input are separated by unquoted  
 113155 <blank> characters, unescaped <blank> characters, or <newline> characters. A string of zero or  
 113156 more non-double-quote ('"') characters and non-<newline> characters can be quoted by  
 113157 enclosing them in double-quotes. A string of zero or more non-<apostrophe> ('') characters  
 113158 and non-<newline> characters can be quoted by enclosing them in <apostrophe> characters.  
 113159 Any unquoted character can be escaped by preceding it with a <backslash>. The utility named  
 113160 by *utility* shall be executed one or more times until the end-of-file is reached or the logical end-of  
 113161 file string is found. The results are unspecified if the utility named by *utility* attempts to read  
 113162 from its standard input.

113163 The generated command line length shall be the sum of the size in bytes of the utility name and  
 113164 each argument treated as strings, including a null byte terminator for each of these strings. The  
 113165 `xargs` utility shall limit the command line length such that when the command line is invoked,  
 113166 the combined argument and environment lists (see the *exec* family of functions in the System  
 113167 Interfaces volume of POSIX.1-2008) shall not exceed {ARG\_MAX}-2048 bytes. Within this  
 113168 constraint, if neither the `-n` nor the `-s` option is specified, the default command line length shall  
 113169 be at least {LINE\_MAX}.

113170 **OPTIONS**113171 The `xargs` utility shall conform to XBD [Section 12.2](#) (on page 215).

113172 The following options shall be supported:

113173 `-E eofstr` Use *eofstr* as the logical end-of-file string. If `-E` is not specified, it is unspecified  
 113174 whether the logical end-of-file string is the <underscore> character ('\_') or the  
 113175 end-of-file string capability is disabled. When *eofstr* is the null string, the logical  
 113176 end-of-file string capability shall be disabled and <underscore> characters shall be  
 113177 taken literally.

113178 XSI `-I replstr` Insert mode: *utility* is executed for each logical line from standard input.  
 113179 Arguments in the standard input shall be separated only by unescaped <newline>  
 113180 characters, not by <blank> characters. Any unquoted unescaped <blank>  
 113181 characters at the beginning of each line shall be ignored. The resulting argument  
 113182 shall be inserted in *arguments* in place of each occurrence of *replstr*. At least five

113183 arguments in *arguments* can each contain one or more instances of *replstr*. Each of  
 113184 these constructed arguments cannot grow larger than an implementation-defined  
 113185 limit greater than or equal to 255 bytes. Option *-x* shall be forced on.

113186 XSI *-L number* The *utility* shall be executed for each non-empty *number* lines of arguments from  
 113187 standard input. The last invocation of *utility* shall be with fewer lines of arguments  
 113188 if fewer than *number* remain. A line is considered to end with the first <newline>  
 113189 unless the last character of the line is a <blank>; a trailing <blank> signals  
 113190 continuation to the next non-empty line, inclusive.

113191 *-n number* Invoke *utility* using as many standard input arguments as possible, up to *number* (a  
 113192 positive decimal integer) arguments maximum. Fewer arguments shall be used if:

- 113193 • The command line length accumulated exceeds the size specified by the *-s*  
 113194 option (or {LINE\_MAX} if there is no *-s* option).
- 113195 • The last iteration has fewer than *number*, but not zero, operands remaining.

113196 *-p* Prompt mode: the user is asked whether to execute *utility* at each invocation. Trace  
 113197 mode (*-t*) is turned on to write the command instance to be executed, followed by  
 113198 a prompt to standard error. An affirmative response read from */dev/tty* shall  
 113199 execute the command; otherwise, that particular invocation of *utility* shall be  
 113200 skipped.

113201 *-s size* Invoke *utility* using as many standard input arguments as possible yielding a  
 113202 command line length less than *size* (a positive decimal integer) bytes. Fewer  
 113203 arguments shall be used if:

- 113204 • The total number of arguments exceeds that specified by the *-n* option.
- 113205 XSI • The total number of lines exceeds that specified by the *-L* option.
- 113206 • End-of-file is encountered on standard input before *size* bytes are  
 113207 accumulated.

113208 Values of *size* up to at least {LINE\_MAX} bytes shall be supported, provided that  
 113209 the constraints specified in the DESCRIPTION are met. It shall not be considered  
 113210 an error if a value larger than that supported by the implementation or exceeding  
 113211 the constraints specified in the DESCRIPTION is given; *xargs* shall use the largest  
 113212 value it supports within the constraints.

113213 *-t* Enable trace mode. Each generated command line shall be written to standard  
 113214 error just prior to invocation.

113215 *-x* Terminate if a constructed command line will not fit in the implied or specified size  
 113216 (see the *-s* option above).

## 113217 OPERANDS

113218 The following operands shall be supported:

113219 *utility* The name of the utility to be invoked, found by search path using the *PATH*  
 113220 environment variable, described in XBD Chapter 8 (on page 173). If *utility* is  
 113221 omitted, the default shall be the *echo* utility. If the *utility* operand names any of the  
 113222 special built-in utilities in Section 2.14 (on page 2334), the results are undefined.

113223 *argument* An initial option or operand for the invocation of *utility*.

113224 **STDIN**

113225 The standard input shall be a text file. The results are unspecified if an end-of-file condition is  
 113226 detected immediately following an escaped <newline>.

113227 **INPUT FILES**

113228 The file `/dev/tty` shall be used to read responses required by the `-p` option.

113229 **ENVIRONMENT VARIABLES**

113230 The following environment variables shall affect the execution of *xargs*:

113231 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 113232 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 113233 variables used to determine the values of locale categories.)

113234 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 113235 internationalization variables.

113236 *LC\_COLLATE*

113237 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 113238 character collating elements used in the extended regular expression defined for  
 113239 the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

113240 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 113241 characters (for example, single-byte as opposed to multi-byte characters in  
 113242 arguments and input files) and the behavior of character classes used in the  
 113243 extended regular expression defined for the **yesexpr** locale keyword in the  
 113244 *LC\_MESSAGES* category.

113245 *LC\_MESSAGES*

113246 Determine the locale used to process affirmative responses, and the locale used to  
 113247 affect the format and contents of diagnostic messages and prompts written to  
 113248 standard error.

113249 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

113250 *PATH* Determine the location of *utility*, as described in XBD Chapter 8 (on page 173).

113251 **ASYNCHRONOUS EVENTS**

113252 Default.

113253 **STDOUT**

113254 Not used.

113255 **STDERR**

113256 The standard error shall be used for diagnostic messages and the `-t` and `-p` options. If the `-t`  
 113257 option is specified, the *utility* and its constructed argument list shall be written to standard error,  
 113258 as it will be invoked, prior to invocation. If `-p` is specified, a prompt of the following format  
 113259 shall be written (in the POSIX locale):

113260 " ? . . . "

113261 at the end of the line of the output from `-t`.

113262 **OUTPUT FILES**

113263 None.

113264 **EXTENDED DESCRIPTION**

113265 None.

113266 **EXIT STATUS**

113267 The following exit values shall be returned:

- 113268 0 All invocations of *utility* returned exit status zero.
- 113269 1-125 A command line meeting the specified requirements could not be assembled, one or  
113270 more of the invocations of *utility* returned a non-zero exit status, or some other error  
113271 occurred.
- 113272 126 The utility specified by *utility* was found but could not be invoked.
- 113273 127 The utility specified by *utility* could not be found.

113274 **CONSEQUENCES OF ERRORS**

113275 If a command line meeting the specified requirements cannot be assembled, the utility cannot be  
113276 invoked, an invocation of the utility is terminated by a signal, or an invocation of the utility exits  
113277 with exit status 255, the *xargs* utility shall write a diagnostic message and exit without  
113278 processing any remaining input.

113279 **APPLICATION USAGE**

113280 The 255 exit status allows a utility being used by *xargs* to tell *xargs* to terminate if it knows no  
113281 further invocations using the current data stream will succeed. Thus, *utility* should explicitly *exit*  
113282 with an appropriate value to avoid accidentally returning with 255.

113283 Note that since input is parsed as lines, <blank> characters separate arguments, and  
113284 <backslash>, <apostrophe>, and double-quote characters are used for quoting, if *xargs* is used to  
113285 bundle the output of commands like *find dir -print* or *ls* into commands to be executed,  
113286 unexpected results are likely if any filenames contain <blank>, <newline>, or quoting characters.  
113287 This can be solved by using *find* to call a script that converts each file found into a quoted string  
113288 that is then piped to *xargs*, but in most cases it is preferable just to have *find* do the argument  
113289 aggregation itself by using *-exec* with a '+' terminator instead of ';' . Note that the quoting  
113290 rules used by *xargs* are not the same as in the shell. They were not made consistent here because  
113291 existing applications depend on the current rules. An easy (but inefficient) method that can be  
113292 used to transform input consisting of one argument per line into a quoted form that *xargs*  
113293 interprets correctly is to precede each non-<newline> character with a <backslash>. More  
113294 efficient alternatives are shown in Example 2 and Example 5 below.

113295 On implementations with a large value for {ARG\_MAX}, *xargs* may produce command lines  
113296 longer than {LINE\_MAX}. For invocation of utilities, this is not a problem. If *xargs* is being used  
113297 to create a text file, users should explicitly set the maximum command line length with the *-s*  
113298 option.

113299 The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if  
113300 an error occurs so that applications can distinguish "failure to find a utility" from "invoked  
113301 utility exited with an error indication". The value 127 was chosen because it is not commonly  
113302 used for other meanings; most utilities use small values for "normal error conditions" and the  
113303 values above 128 can be confused with termination due to receipt of a signal. The value 126 was  
113304 chosen in a similar manner to indicate that the utility could be found, but not invoked. Some  
113305 scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
113306 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
113307 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
113308 any other reason.

## 113309 EXAMPLES

113310 1. The following command combines the output of the parenthesized commands (minus the  
113311 <apostrophe> characters) onto one line, which is then appended to the file log. It assumes  
113312 that the expansion of "\$0 \$\*" does not include any <apostrophe> or <newline>  
113313 characters.

```
113314 (logname; date; printf "'%s'\n" "$0 $*") | xargs -E "" >>log
```

113315 2. The following command invokes *diff* with successive pairs of arguments originally typed  
113316 as command line arguments. It assumes there are no embedded <newline> characters in  
113317 the elements of the original argument list.

```
113318 printf "%s\n" "$@" | sed 's/[^[:alnum:]]/\&/g' |  
113319 xargs -E "" -n 2 -x diff
```

113320 3. In the following commands, the user is asked which files in the current directory  
113321 (excluding dotfiles) are to be archived. The files are archived into **arch**; *a*, one at a time or  
113322 *b*, many at a time. The commands assume that no filenames contain <blank>, <newline>,  
113323 <backslash>, <apostrophe>, or double-quote characters.

```
113324 a. ls | xargs -E "" -p -L 1 ar -r arch
```

```
113325 b. ls | xargs -E "" -p -L 1 | xargs -E "" ar -r arch
```

113326 4. The following command invokes *command1* one or more times with multiple arguments,  
113327 stopping if an invocation of *command1* has a non-zero exit status.

```
113328 xargs -E "" sh -c 'command1 "$@" || exit 255' sh < xargs_input
```

113329 5. On XSI-conformant systems, the following command moves all files from directory **\$1** to  
113330 directory **\$2**, and echoes each move command just before doing it. It assumes no  
113331 filenames contain <newline> characters and that neither **\$1** nor **\$2** contains the sequence  
113332 "{}".

```
113333 ls -A "$1" | sed -e 's/"\/"\/\&"/g' -e 's/.*/"&"/' |  
113334 xargs -E "" -I {} -t mv "$1"/{} "$2"/{}>
```

## 113335 RATIONALE

113336 The *xargs* utility was usually found only in System V-based systems; BSD systems included an  
113337 *apply* utility that provided functionality similar to *xargs -n number*. The SVID lists *xargs* as a  
113338 software development extension. This volume of POSIX.1-2008 does not share the view that it is  
113339 used only for development, and therefore it is not optional.

113340 The classic application of the *xargs* utility is in conjunction with the *find* utility to reduce the  
113341 number of processes launched by a simplistic use of the *find -exec* combination. The *xargs* utility  
113342 is also used to enforce an upper limit on memory required to launch a process. With this basis in  
113343 mind, this volume of POSIX.1-2008 selected only the minimal features required.

113344 Although the 255 exit status is mostly an accident of historical implementations, it allows a  
113345 utility being used by *xargs* to tell *xargs* to terminate if it knows no further invocations using the  
113346 current data stream shall succeed. Any non-zero exit status from a utility falls into the 1-125  
113347 range when *xargs* exits. There is no statement of how the various non-zero utility exit status  
113348 codes are accumulated by *xargs*. The value could be the addition of all codes, their highest  
113349 value, the last one received, or a single value such as 1. Since no algorithm is arguably better  
113350 than the others, and since many of the standard utilities say little more (portably) than  
113351 "pass/fail", no new algorithm was invented.

113352 Several other *xargs* options were removed because simple alternatives already exist within this

113353 volume of POSIX.1-2008. For example, the `-i replstr` option can be just as efficiently performed  
 113354 using a shell `for` loop. Since `xargs` calls an `exec` function with each input line, the `-i` option does  
 113355 not usually exploit the grouping capabilities of `xargs`.

113356 The requirement that `xargs` never produces command lines such that invocation of `utility` is  
 113357 within 2048 bytes of hitting the POSIX `exec {ARG_MAX}` limitations is intended to guarantee  
 113358 that the invoked utility has room to modify its environment variables and command line  
 113359 arguments and still be able to invoke another utility. Note that the minimum `{ARG_MAX}`  
 113360 allowed by the System Interfaces volume of POSIX.1-2008 is 4096 bytes and the minimum value  
 113361 allowed by this volume of POSIX.1-2008 is 2048 bytes; therefore, the 2048 bytes difference seems  
 113362 reasonable. Note, however, that `xargs` may never be able to invoke a utility if the environment  
 113363 passed in to `xargs` comes close to using `{ARG_MAX}` bytes.

113364 The version of `xargs` required by this volume of POSIX.1-2008 is required to wait for the  
 113365 completion of the invoked command before invoking another command. This was done because  
 113366 historical scripts using `xargs` assumed sequential execution. Implementations wanting to provide  
 113367 parallel operation of the invoked utilities are encouraged to add an option enabling parallel  
 113368 invocation, but should still wait for termination of all of the children before `xargs` terminates  
 113369 normally.

113370 The `-e` option was omitted from the ISO POSIX-2:1993 standard in the belief that the `eofstr`  
 113371 option-argument was recognized only when it was on a line by itself and before quote and  
 113372 escape processing were performed, and that the logical end-of-file processing was only enabled  
 113373 if a `-e` option was specified. In that case, a simple `sed` script could be used to duplicate the `-e`  
 113374 functionality. Further investigation revealed that:

- 113375 • The logical end-of-file string was checked for after quote and escape processing, making a  
 113376 `sed` script that provided equivalent functionality much more difficult to write.
- 113377 • The default was to perform logical end-of-file processing with an `<underscore>` as the  
 113378 logical end-of-file string.

113379 To correct this misunderstanding, the `-E eofstr` option was adopted from the X/Open Portability  
 113380 Guide. Users should note that the description of the `-E` option matches historical documentation  
 113381 of the `-e` option (which was not adopted because it did not support the Utility Syntax  
 113382 Guidelines), by saying that if `eofstr` is the null string, logical end-of-file processing is disabled.  
 113383 Historical implementations of `xargs` actually did not disable logical end-of-file processing; they  
 113384 treated a null argument found in the input as a logical end-of-file string. (A null `string` argument  
 113385 could be generated using single or double-quotes (`' '` or `" "`). Since this behavior was not  
 113386 documented historically, it is considered to be a bug.

113387 The `-I`, `-L`, and `-n` options are mutually-exclusive. Some implementations use the last one  
 113388 specified if more than one is given on a command line; other implementations treat  
 113389 combinations of the options in different ways.

#### 113390 FUTURE DIRECTIONS

113391 None.

#### 113392 SEE ALSO

113393 [Chapter 2](#) (on page 2297), [diff](#), [echo](#), [find](#)

113394 [XBD Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

113396 **CHANGE HISTORY**

113397 First released in Issue 2.

113398 **Issue 5**

113399 A second FUTURE DIRECTION is added.

113400 **Issue 6**113401 The obsolescent `-e`, `-i`, and `-l` options are removed.113402 The following new requirements on POSIX implementations derive from alignment with the  
113403 Single UNIX Specification:

- 113404
- The `-p` option is added.
  - In the INPUT FILES section, the file `/dev/tty` is used to read responses required by the `-p` option.
  - The STDERR section is updated to describe the `-p` option.

113408 The description of the `-E` option is aligned with the ISO POSIX-2: 1993 standard.

113409 The normative text is reworded to avoid use of the term “must” for application requirements.

113410 **Issue 7**113411 Austin Group Interpretation 1003.1-2001 #123 is applied, changing the description of the `xargs -I`  
113412 option.113413 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
113414 `LC_MESSAGES` environment variable.

113415 SD5-XCU-ERN-68 is applied.

113416 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

113417 SD5-XCU-ERN-128 is applied, clarifying the DESCRIPTION of the logical end-of-file string.

113418 SD5-XCU-ERN-132 is applied, updating the EXAMPLES section.

113419 **NAME**113420 yacc — yet another compiler compiler (**DEVELOPMENT**)113421 **SYNOPSIS**113422 CD `yacc [-dltv] [-b file_prefix] [-p sym_prefix] grammar`113423 **DESCRIPTION**

113424 The *yacc* utility shall read a description of a context-free grammar in *grammar* and write C source  
 113425 code, conforming to the ISO C standard, to a code file, and optionally header information into a  
 113426 header file, in the current directory. The generated source code shall not depend on any  
 113427 undefined, unspecified, or implementation-defined behavior, except in cases where it is copied  
 113428 directly from the supplied grammar, or in cases that are documented by the implementation.  
 113429 The C code shall define a function and related routines and macros for an automaton that  
 113430 executes a parsing algorithm meeting the requirements in [Algorithms](#) (on page 3399).

113431 The form and meaning of the grammar are described in the EXTENDED DESCRIPTION section.

113432 The C source code and header file shall be produced in a form suitable as input for the C  
 113433 compiler (see [c99](#)).

113434 **OPTIONS**

113435 The *yacc* utility shall conform to XBD [Section 12.2](#) (on page 215), except for Guideline 9.

113436 The following options shall be supported:

113437 **-b** *file\_prefix* Use *file\_prefix* instead of **y** as the prefix for all output filenames. The code file  
 113438 **y.tab.c**, the header file **y.tab.h** (created when **-d** is specified), and the description  
 113439 file **y.output** (created when **-v** is specified), shall be changed to *file\_prefix.tab.c*,  
 113440 *file\_prefix.tab.h*, and *file\_prefix.output*, respectively.

113441 **-d** Write the header file; by default only the code file is written. The **#define**  
 113442 statements associate the token codes assigned by *yacc* with the user-declared token  
 113443 names. This allows source files other than **y.tab.c** to access the token codes.

113444 **-l** Produce a code file that does not contain any **#line** constructs. If this option is not  
 113445 present, it is unspecified whether the code file or header file contains **#line**  
 113446 directives. This should only be used after the grammar and the associated actions  
 113447 are fully debugged.

113448 **-p** *sym\_prefix*  
 113449 Use *sym\_prefix* instead of **yy** as the prefix for all external names produced by *yacc*.  
 113450 The names affected shall include the functions *yyparse()*, *yylex()*, and *yyerror()*,  
 113451 and the variables *yyval*, *yychar*, and *yydebug*. (In the remainder of this section, the  
 113452 six symbols cited are referenced using their default names only as a notational  
 113453 convenience.) Local names may also be affected by the **-p** option; however, the **-p**  
 113454 option shall not affect **#define** symbols generated by *yacc*.

113455 **-t** Modify conditional compilation directives to permit compilation of debugging  
 113456 code in the code file. Runtime debugging statements shall always be contained in  
 113457 the code file, but by default conditional compilation directives prevent their  
 113458 compilation.

113459 **-v** Write a file containing a description of the parser and a report of conflicts  
 113460 generated by ambiguities in the grammar.

113461 **OPERANDS**

113462 The following operand is required:

113463 *grammar* A pathname of a file containing instructions, hereafter called *grammar*, for which a  
 113464 parser is to be created. The format for the grammar is described in the EXTENDED  
 113465 DESCRIPTION section.

113466 **STDIN**

113467 Not used.

113468 **INPUT FILES**

113469 The file *grammar* shall be a text file formatted as specified in the EXTENDED DESCRIPTION  
 113470 section.

113471 **ENVIRONMENT VARIABLES**113472 The following environment variables shall affect the execution of *yacc*:

113473 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 113474 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 113475 variables used to determine the values of locale categories.)

113476 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 113477 internationalization variables.

113478 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 113479 characters (for example, single-byte as opposed to multi-byte characters in  
 113480 arguments and input files).

113481 *LC\_MESSAGES*

113482 Determine the locale that should be used to affect the format and contents of  
 113483 diagnostic messages written to standard error.

113484 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

113485 The *LANG* and *LC\_\** variables affect the execution of the *yacc* utility as stated. The *main()*  
 113486 function defined in [Yacc Library](#) (on page 3399) shall call:

```
113487 setlocale(LC_ALL, "");
```

113488 and thus the program generated by *yacc* shall also be affected by the contents of these variables  
 113489 at runtime.

113490 **ASYNCHRONOUS EVENTS**

113491 Default.

113492 **STDOUT**

113493 Not used.

113494 **STDERR**

113495 If shift/reduce or reduce/reduce conflicts are detected in *grammar*, *yacc* shall write a report of  
 113496 those conflicts to the standard error in an unspecified format.

113497 Standard error shall also be used for diagnostic messages.

113498 **OUTPUT FILES**

113499 The code file, the header file, and the description file shall be text files. All are described in the  
 113500 following sections.

113501 **Code File**

113502 This file shall contain the C source code for the *yyparse()* function. It shall contain code for the  
 113503 various semantic actions with macro substitution performed on them as described in the  
 113504 EXTENDED DESCRIPTION section. It also shall contain a copy of the **#define** statements in the  
 113505 header file. If a **%union** declaration is used, the declaration for YYSTYPE shall also be included  
 113506 in this file.

113507 **Header File**

113508 The header file shall contain **#define** statements that associate the token numbers with the token  
 113509 names. This allows source files other than the code file to access the token codes. If a **%union**  
 113510 declaration is used, the declaration for YYSTYPE and an *extern YYSTYPE yylval* declaration shall  
 113511 also be included in this file.

113512 **Description File**

113513 The description file shall be a text file containing a description of the state machine  
 113514 corresponding to the parser, using an unspecified format. Limits for internal tables (see [Limits](#),  
 113515 on page 3400) shall also be reported, in an implementation-defined manner. (Some  
 113516 implementations may use dynamic allocation techniques and have no specific limit values to  
 113517 report.)

113518 **EXTENDED DESCRIPTION**

113519 The *yacc* command accepts a language that is used to define a grammar for a target language to  
 113520 be parsed by the tables and code generated by *yacc*. The language accepted by *yacc* as a  
 113521 grammar for the target language is described below using the *yacc* input language itself.

113522 The input *grammar* includes rules describing the input structure of the target language and code  
 113523 to be invoked when these rules are recognized to provide the associated semantic action. The  
 113524 code to be executed shall appear as bodies of text that are intended to be C-language code. These  
 113525 bodies of text shall not contain C-language trigraphs. The C-language inclusions are presumed  
 113526 to form a correct function when processed by *yacc* into its output files. The code included in this  
 113527 way shall be executed during the recognition of the target language.

113528 Given a grammar, the *yacc* utility generates the files described in the OUTPUT FILES section.  
 113529 The code file can be compiled and linked using *c99*. If the declaration and programs sections of  
 113530 the grammar file did not include definitions of *main()*, *yylex()*, and *yyerror()*, the compiled  
 113531 output requires linking with externally supplied versions of those functions. Default versions of  
 113532 *main()* and *yyerror()* are supplied in the *yacc* library and can be linked in by using the **-I y**  
 113533 operand to *c99*. The *yacc* library interfaces need not support interfaces with other than the  
 113534 default **yy** symbol prefix. The application provides the lexical analyzer function, *yylex()*; the *lex*  
 113535 utility is specifically designed to generate such a routine.

113536 **Input Language**

113537 The application shall ensure that every specification file consists of three sections in order:  
 113538 *declarations*, *grammar rules*, and *programs*, separated by double <percent-sign> characters ("%").  
 113539 The declarations and programs sections can be empty. If the latter is empty, the preceding "%"  
 113540 mark separating it from the rules section can be omitted.

113541 The input is free form text following the structure of the grammar defined below.

### 113542 Lexical Structure of the Grammar

113543 The <blank>, <newline>, and <form-feed> character shall be ignored, except that the application  
113544 shall ensure that they do not appear in names or multi-character reserved symbols. Comments  
113545 shall be enclosed in `"/ * . . . */`, and can appear wherever a name is valid.

113546 Names are of arbitrary length, made up of letters, periods (`'.'`), underscores (`'_'`), and non-  
113547 initial digits. Uppercase and lowercase letters are distinct. Conforming applications shall not  
113548 use names beginning in `yy` or `YY` since the *yacc* parser uses such names. Many of the names  
113549 appear in the final output of *yacc*, and thus they should be chosen to conform with any  
113550 additional rules created by the C compiler to be used. In particular they appear in `#define`  
113551 statements.

113552 A literal shall consist of a single character enclosed in single-quote characters. All of the escape  
113553 sequences supported for character constants by the ISO C standard shall be supported by *yacc*.

113554 The relationship with the lexical analyzer is discussed in detail below.

113555 The application shall ensure that the NUL character is not used in grammar rules or literals.

### 113556 Declarations Section

113557 The declarations section is used to define the symbols used to define the target language and  
113558 their relationship with each other. In particular, much of the additional information required to  
113559 resolve ambiguities in the context-free grammar for the target language is provided here.

113560 Usually *yacc* assigns the relationship between the symbolic names it generates and their  
113561 underlying numeric value. The declarations section makes it possible to control the assignment  
113562 of these values.

113563 It is also possible to keep semantic information associated with the tokens currently on the parse  
113564 stack in a user-defined C-language **union**, if the members of the union are associated with the  
113565 various names in the grammar. The declarations section provides for this as well.

113566 The first group of declarators below all take a list of names as arguments. That list can optionally  
113567 be preceded by the name of a C union member (called a *tag* below) appearing within `'<'` and  
113568 `'>'`. (As an exception to the typographical conventions of the rest of this volume of  
113569 POSIX.1-2008, in this case `<tag>` does not represent a metavariable, but the literal angle bracket  
113570 characters surrounding a symbol.) The use of *tag* specifies that the tokens named on this line  
113571 shall be of the same C type as the union member referenced by *tag*. This is discussed in more  
113572 detail below.

113573 For lists used to define tokens, the first appearance of a given token can be followed by a  
113574 positive integer (as a string of decimal digits). If this is done, the underlying value assigned to it  
113575 for lexical purposes shall be taken to be that number.

113576 The following declares *name* to be a token:

```
113577 %token [<tag>] name [number] [name [number]]...
```

113578 If *tag* is present, the C type for all tokens on this line shall be declared to be the type referenced  
113579 by *tag*. If a positive integer, *number*, follows a *name*, that value shall be assigned to the token.

113580 The following declares *name* to be a token, and assigns precedence to it:

```
113581 %left [<tag>] name [number] [name [number]]...
```

```
113582 %right [<tag>] name [number] [name [number]]...
```

113583 One or more lines, each beginning with one of these symbols, can appear in this section. All  
113584 tokens on the same line have the same precedence level and associativity; the lines are in order

113585 of increasing precedence or binding strength. **%left** denotes that the operators on that line are  
 113586 left associative, and **%right** similarly denotes right associative operators. If *tag* is present, it shall  
 113587 declare a C type for *names* as described for **%token**.

113588 The following declares *name* to be a token, and indicates that this cannot be used associatively:

```
113589 %nonassoc [<tag>] name [number] [name [number]] . . .
```

113590 If the parser encounters associative use of this token it reports an error. If *tag* is present, it shall  
 113591 declare a C type for *names* as described for **%token**.

113592 The following declares that union member *names* are non-terminals, and thus it is required to  
 113593 have a *tag* field at its beginning:

```
113594 %type <tag> name . . .
```

113595 Because it deals with non-terminals only, assigning a token number or using a literal is also  
 113596 prohibited. If this construct is present, *yacc* shall perform type checking; if this construct is not  
 113597 present, the parse stack shall hold only the **int** type.

113598 Every name used in *grammar* not defined by a **%token**, **%left**, **%right**, or **%nonassoc** declaration  
 113599 is assumed to represent a non-terminal symbol. The *yacc* utility shall report an error for any non-  
 113600 terminal symbol that does not appear on the left side of at least one grammar rule.

113601 Once the type, precedence, or token number of a name is specified, it shall not be changed. If the  
 113602 first declaration of a token does not assign a token number, *yacc* shall assign a token number.  
 113603 Once this assignment is made, the token number shall not be changed by explicit assignment.

113604 The following declarators do not follow the previous pattern.

113605 The following declares the non-terminal *name* to be the *start symbol*, which represents the largest,  
 113606 most general structure described by the grammar rules:

```
113607 %start name
```

113608 By default, it is the left-hand side of the first grammar rule; this default can be overridden with  
 113609 this declaration.

113610 The following declares the *yacc* value stack to be a union of the various types of values desired.

```
113611 %union { body of union (in C) }
```

113612 The body of the union shall not contain unbalanced curly brace preprocessing tokens.

113613 By default, the values returned by actions (see below) and the lexical analyzer shall be of type  
 113614 **int**. The *yacc* utility keeps track of types, and it shall insert corresponding union member names  
 113615 in order to perform strict type checking of the resulting parser.

113616 Alternatively, given that at least one *<tag>* construct is used, the union can be declared in a  
 113617 header file (which shall be included in the declarations section by using a **#include** construct  
 113618 within **%{** and **%}**), and a **typedef** used to define the symbol **YYSTYPE** to represent this union.  
 113619 The effect of **%union** is to provide the declaration of **YYSTYPE** directly from the *yacc* input.

113620 C-language declarations and definitions can appear in the declarations section, enclosed by the  
 113621 following marks:

```
113622 %{ . . . %}
```

113623 These statements shall be copied into the code file, and have global scope within it so that they  
 113624 can be used in the rules and program sections. The statements shall not contain **"%}"** outside a  
 113625 comment, string literal, or multi-character constant.

113626 The application shall ensure that the declarations section is terminated by the token `%%`.

### 113627 Grammar Rules in yacc

113628 The rules section defines the context-free grammar to be accepted by the function *yacc* generates,  
113629 and associates with those rules C-language actions and additional precedence information. The  
113630 grammar is described below, and a formal definition follows.

113631 The rules section is comprised of one or more grammar rules. A grammar rule has the form:

113632 `A : BODY ;`

113633 The symbol **A** represents a non-terminal name, and **BODY** represents a sequence of zero or  
113634 more *names*, *literals*, and *semantic actions* that can then be followed by optional *precedence rules*.  
113635 Only the names and literals participate in the formation of the grammar; the semantic actions  
113636 and precedence rules are used in other ways. The `<colon>` and the `<semicolon>` are *yacc*  
113637 punctuation. If there are several successive grammar rules with the same left-hand side, the  
113638 `<vertical-line>` (`'|'`) can be used to avoid rewriting the left-hand side; in this case the  
113639 `<semicolon>` appears only after the last rule. The BODY part can be empty (or empty of names  
113640 and literals) to indicate that the non-terminal symbol matches the empty string.

113641 The *yacc* utility assigns a unique number to each rule. Rules using the vertical bar notation are  
113642 distinct rules. The number assigned to the rule appears in the description file.

113643 The elements comprising a BODY are:

113644 *name, literal* These form the rules of the grammar: *name* is either a *token* or a *non-terminal*; *literal*  
113645 stands for itself (less the lexically required quotation marks).

113646 *semantic action*

113647 With each grammar rule, the user can associate actions to be performed each time  
113648 the rule is recognized in the input process. (Note that the word “action” can also  
113649 refer to the actions of the parser—shift, reduce, and so on.)

113650 These actions can return values and can obtain the values returned by previous  
113651 actions. These values are kept in objects of type YYSTYPE (see `%union`). The  
113652 result value of the action shall be kept on the parse stack with the left-hand side of  
113653 the rule, to be accessed by other reductions as part of their right-hand side. By  
113654 using the `<tag>` information provided in the declarations section, the code  
113655 generated by *yacc* can be strictly type checked and contain arbitrary information. In  
113656 addition, the lexical analyzer can provide the same kinds of values for tokens, if  
113657 desired.

113658 An action is an arbitrary C statement and as such can do input or output, call  
113659 subprograms, and alter external variables. An action is one or more C statements  
113660 enclosed in curly braces `'{'` and `'}'`. The statements shall not contain  
113661 unbalanced curly brace preprocessing tokens.

113662 Certain pseudo-variables can be used in the action. These are macros for access to  
113663 data structures known internally to *yacc*.

113664 `$$` The value of the action can be set by assigning it to `$$`. If type  
113665 checking is enabled and the type of the value to be assigned cannot  
113666 be determined, a diagnostic message may be generated.

113667 `$number` This refers to the value returned by the component specified by the  
113668 token *number* in the right side of a rule, reading from left to right;  
113669 *number* can be zero or negative. If *number* is zero or negative, it refers

113670 to the data associated with the name on the parser's stack preceding  
 113671 the leftmost symbol of the current rule. (That is, "\$0" refers to the  
 113672 name immediately preceding the leftmost name in the current rule to  
 113673 be found on the parser's stack and "\$-1" refers to the symbol to *its*  
 113674 left.) If *number* refers to an element past the current point in the rule,  
 113675 or beyond the bottom of the stack, the result is undefined. If type  
 113676 checking is enabled and the type of the value to be assigned cannot  
 113677 be determined, a diagnostic message may be generated.

113678       \$<tag>number  
 113679       These correspond exactly to the corresponding symbols without the  
 113680 *tag* inclusion, but allow for strict type checking (and preclude  
 113681 unwanted type conversions). The effect is that the macro is expanded  
 113682 to use *tag* to select an element from the YYSTYPE union (using  
 113683 *dataname.tag*). This is particularly useful if *number* is not positive.

113684       \$<tag>\$       This imposes on the reference the type of the union member  
 113685 referenced by *tag*. This construction is applicable when a reference to  
 113686 a left context value occurs in the grammar, and provides *yacc* with a  
 113687 means for selecting a type.

113688       Actions can occur anywhere in a rule (not just at the end); an action can access  
 113689 values returned by actions to its left, and in turn the value it returns can be  
 113690 accessed by actions to its right. An action appearing in the middle of a rule shall be  
 113691 equivalent to replacing the action with a new non-terminal symbol and adding an  
 113692 empty rule with that non-terminal symbol on the left-hand side. The semantic  
 113693 action associated with the new rule shall be equivalent to the original action. The  
 113694 use of actions within rules might introduce conflicts that would not otherwise  
 113695 exist.

113696       By default, the value of a rule shall be the value of the first element in it. If the first  
 113697 element does not have a type (particularly in the case of a literal) and type  
 113698 checking is turned on by **%type**, an error message shall result.

113699       *precedence*       The keyword **%prec** can be used to change the precedence level associated with a  
 113700 particular grammar rule. Examples of this are in cases where a unary and binary  
 113701 operator have the same symbolic representation, but need to be given different  
 113702 precedences, or where the handling of an ambiguous if-else construction is  
 113703 necessary. The reserved symbol **%prec** can appear immediately after the body of  
 113704 the grammar rule and can be followed by a token name or a literal. It shall cause  
 113705 the precedence of the grammar rule to become that of the following token name or  
 113706 literal. The action for the rule as a whole can follow **%prec**.

113707       If a program section follows, the application shall ensure that the grammar rules are terminated  
 113708 by **%%**.

### 113709       **Programs Section**

113710       The *programs* section can include the definition of the lexical analyzer *yylex()*, and any other  
 113711 functions; for example, those used in the actions specified in the grammar rules. It is unspecified  
 113712 whether the programs section precedes or follows the semantic actions in the output file;  
 113713 therefore, if the application contains any macro definitions and declarations intended to apply to  
 113714 the code in the semantic actions, it shall place them within "%{ . . . %}" in the declarations  
 113715 section.

```

113716      Input Grammar
113717      The following input to yacc yields a parser for the input to yacc. This formal syntax takes
113718      precedence over the preceding text syntax description.
113719      The lexical structure is defined less precisely; Lexical Structure of the Grammar (on page 3391)
113720      defines most terms. The correspondence between the previous terms and the tokens below is as
113721      follows.
113722      IDENTIFIER      This corresponds to the concept of name, given previously. It also includes
113723                        literals as defined previously.
113724      C_IDENTIFIER    This is a name, and additionally it is known to be followed by a <colon>. A
113725                        literal cannot yield this token.
113726      NUMBER          A string of digits (a non-negative decimal integer).
113727      TYPE, LEFT, MARK, LCURL, RCURL
113728                        These correspond directly to %type, %left, %%, %{, and %}.
113729      {...}           This indicates C-language source code, with the possible inclusion of '$'
113730                        macros as discussed previously.
113731      /* Grammar for the input to yacc. */
113732      /* Basic entries. */
113733      /* The following are recognized by the lexical analyzer. */
113734      %token    IDENTIFIER      /* Includes identifiers and literals */
113735      %token    C_IDENTIFIER    /* identifier (but not literal)
113736                        followed by a :. */
113737      %token    NUMBER          /* [0-9][0-9]* */
113738      /* Reserved words : %type=>TYPE %left=>LEFT, and so on */
113739      %token    LEFT RIGHT NONASSOC TOKEN PREC TYPE START UNION
113740      %token    MARK            /* The %% mark. */
113741      %token    LCURL           /* The %{ mark. */
113742      %token    RCURL           /* The %} mark. */
113743      /* 8-bit character literals stand for themselves; */
113744      /* tokens have to be defined for multi-byte characters. */

```

113807 **Conflicts**

113808 The parser produced for an input grammar may contain states in which conflicts occur. The  
 113809 conflicts occur because the grammar is not LALR(1). An ambiguous grammar always contains at  
 113810 least one LALR(1) conflict. The *yacc* utility shall resolve all conflicts, using either default rules or  
 113811 user-specified precedence rules.

113812 Conflicts are either shift/reduce conflicts or reduce/reduce conflicts. A shift/reduce conflict is  
 113813 where, for a given state and lookahead symbol, both a shift action and a reduce action are  
 113814 possible. A reduce/reduce conflict is where, for a given state and lookahead symbol, reductions  
 113815 by two different rules are possible.

113816 The rules below describe how to specify what actions to take when a conflict occurs. Not all  
 113817 shift/reduce conflicts can be successfully resolved this way because the conflict may be due to  
 113818 something other than ambiguity, so incautious use of these facilities can cause the language  
 113819 accepted by the parser to be much different from that which was intended. The description file  
 113820 shall contain sufficient information to understand the cause of the conflict. Where ambiguity is  
 113821 the reason either the default or explicit rules should be adequate to produce a working parser.

113822 The declared precedences and associativities (see [Declarations Section](#), on page 3391) are used to  
 113823 resolve parsing conflicts as follows:

- 113824 1. A precedence and associativity is associated with each grammar rule; it is the precedence  
 113825 and associativity of the last token or literal in the body of the rule. If the **%prec** keyword  
 113826 is used, it overrides this default. Some grammar rules might not have both precedence  
 113827 and associativity.
- 113828 2. If there is a shift/reduce conflict, and both the grammar rule and the input symbol have  
 113829 precedence and associativity associated with them, then the conflict is resolved in favor of  
 113830 the action (shift or reduce) associated with the higher precedence. If the precedences are  
 113831 the same, then the associativity is used; left associative implies reduce, right associative  
 113832 implies shift, and non-associative implies an error in the string being parsed.
- 113833 3. When there is a shift/reduce conflict that cannot be resolved by rule 2, the shift is done.  
 113834 Conflicts resolved this way are counted in the diagnostic output described in [Error  
 113835 Handling](#).
- 113836 4. When there is a reduce/reduce conflict, a reduction is done by the grammar rule that  
 113837 occurs earlier in the input sequence. Conflicts resolved this way are counted in the  
 113838 diagnostic output described in [Error Handling](#).

113839 Conflicts resolved by precedence or associativity shall not be counted in the shift/reduce and  
 113840 reduce/reduce conflicts reported by *yacc* on either standard error or in the description file.

113841 **Error Handling**

113842 The token **error** shall be reserved for error handling. The name **error** can be used in grammar  
 113843 rules. It indicates places where the parser can recover from a syntax error. The default value of  
 113844 **error** shall be 256. Its value can be changed using a **%token** declaration. The lexical analyzer  
 113845 should not return the value of **error**.

113846 The parser shall detect a syntax error when it is in a state where the action associated with the  
 113847 lookahead symbol is **error**. A semantic action can cause the parser to initiate error handling by  
 113848 executing the macro YYERROR. When YYERROR is executed, the semantic action passes control  
 113849 back to the parser. YYERROR cannot be used outside of semantic actions.

113850 When the parser detects a syntax error, it normally calls *yyerror()* with the character string  
 113851 "syntax error" as its argument. The call shall not be made if the parser is still recovering

113852 from a previous error when the error is detected. The parser is considered to be recovering from  
113853 a previous error until the parser has shifted over at least three normal input symbols since the  
113854 last error was detected or a semantic action has executed the macro *yyerrok*. The parser shall not  
113855 call *yyerror()* when YYERROR is executed.

113856 The macro function YYRECOVERING shall return 1 if a syntax error has been detected and the  
113857 parser has not yet fully recovered from it. Otherwise, zero shall be returned.

113858 When a syntax error is detected by the parser, the parser shall check if a previous syntax error  
113859 has been detected. If a previous error was detected, and if no normal input symbols have been  
113860 shifted since the preceding error was detected, the parser checks if the lookahead symbol is an  
113861 endmarker (see [Interface to the Lexical Analyzer](#)). If it is, the parser shall return with a non-zero  
113862 value. Otherwise, the lookahead symbol shall be discarded and normal parsing shall resume.

113863 When YYERROR is executed or when the parser detects a syntax error and no previous error has  
113864 been detected, or at least one normal input symbol has been shifted since the previous error was  
113865 detected, the parser shall pop back one state at a time until the parse stack is empty or the  
113866 current state allows a shift over **error**. If the parser empties the parse stack, it shall return with a  
113867 non-zero value. Otherwise, it shall shift over **error** and then resume normal parsing. If the parser  
113868 reads a lookahead symbol before the error was detected, that symbol shall still be the lookahead  
113869 symbol when parsing is resumed.

113870 The macro *yyerrok* in a semantic action shall cause the parser to act as if it has fully recovered  
113871 from any previous errors. The macro *yyclearin* shall cause the parser to discard the current  
113872 lookahead token. If the current lookahead token has not yet been read, *yyclearin* shall have no  
113873 effect.

113874 The macro YYACCEPT shall cause the parser to return with the value zero. The macro  
113875 YYABORT shall cause the parser to return with a non-zero value.

### 113876 **Interface to the Lexical Analyzer**

113877 The *yylex()* function is an integer-valued function that returns a *token number* representing the  
113878 kind of token read. If there is a value associated with the token returned by *yylex()* (see the  
113879 discussion of *tag* above), it shall be assigned to the external variable *yyval*.

113880 If the parser and *yylex()* do not agree on these token numbers, reliable communication between  
113881 them cannot occur. For (single-byte character) literals, the token is simply the numeric value of  
113882 the character in the current character set. The numbers for other tokens can either be chosen by  
113883 *yacc*, or chosen by the user. In either case, the **#define** construct of C is used to allow *yylex()*  
113884 to return these numbers symbolically. The **#define** statements are put into the code file, and the  
113885 header file if that file is requested. The set of characters permitted by *yacc* in an identifier is  
113886 larger than that permitted by C. Token names found to contain such characters shall not be  
113887 included in the **#define** declarations.

113888 If the token numbers are chosen by *yacc*, the tokens other than literals shall be assigned numbers  
113889 greater than 256, although no order is implied. A token can be explicitly assigned a number by  
113890 following its first appearance in the declarations section with a number. Names and literals not  
113891 defined this way retain their default definition. All token numbers assigned by *yacc* shall be  
113892 unique and distinct from the token numbers used for literals and user-assigned tokens. If  
113893 duplicate token numbers cause conflicts in parser generation, *yacc* shall report an error;  
113894 otherwise, it is unspecified whether the token assignment is accepted or an error is reported.

113895 The end of the input is marked by a special token called the *endmarker*, which has a token  
113896 number that is zero or negative. (These values are invalid for any other token.) All lexical  
113897 analyzers shall return zero or negative as a token number upon reaching the end of their input.

113898 If the tokens up to, but excluding, the endmarker form a structure that matches the start symbol,  
113899 the parser shall accept the input. If the endmarker is seen in any other context, it shall be  
113900 considered an error.

### 113901 **Completing the Program**

113902 In addition to *yyparse()* and *yylex()*, the functions *yyerror()* and *main()* are required to make a  
113903 complete program. The application can supply *main()* and *yyerror()*, or those routines can be  
113904 obtained from the *yacc* library.

### 113905 **Yacc Library**

113906 The following functions shall appear only in the *yacc* library accessible through the `-I y` operand  
113907 to *c99*; they can therefore be redefined by a conforming application:

#### 113908 **int main(void)**

113909 This function shall call *yyparse()* and exit with an unspecified value. Other actions within  
113910 this function are unspecified.

#### 113911 **int yyerror(const char \*s)**

113912 This function shall write the NUL-terminated argument to standard error, followed by a  
113913 <newline>.

113914 The order of the `-I y` and `-I l` operands given to *c99* is significant; the application shall either  
113915 provide its own *main()* function or ensure that `-I y` precedes `-I l`.

### 113916 **Debugging the Parser**

113917 The parser generated by *yacc* shall have diagnostic facilities in it that can be optionally enabled  
113918 at either compile time or at runtime (if enabled at compile time). The compilation of the runtime  
113919 debugging code is under the control of *YYDEBUG*, a preprocessor symbol. If *YYDEBUG* has a  
113920 non-zero value, the debugging code shall be included. If its value is zero, the code shall not be  
113921 included.

113922 In parsers where the debugging code has been included, the external **int** *yydebug* can be used to  
113923 turn debugging on (with a non-zero value) and off (zero value) at runtime. The initial value of  
113924 *yydebug* shall be zero.

113925 When `-t` is specified, the code file shall be built such that, if *YYDEBUG* is not already defined at  
113926 compilation time (using the *c99* `-D YYDEBUG` option, for example), *YYDEBUG* shall be set  
113927 explicitly to 1. When `-t` is not specified, the code file shall be built such that, if *YYDEBUG* is not  
113928 already defined, it shall be set explicitly to zero.

113929 The format of the debugging output is unspecified but includes at least enough information to  
113930 determine the shift and reduce actions, and the input symbols. It also provides information  
113931 about error recovery.

### 113932 **Algorithms**

113933 The parser constructed by *yacc* implements an LALR(1) parsing algorithm as documented in the  
113934 literature. It is unspecified whether the parser is table-driven or direct-coded.

113935 A parser generated by *yacc* shall never request an input symbol from *yylex()* while in a state  
113936 where the only actions other than the error action are reductions by a single rule.

113937 The literature of parsing theory defines these concepts.

113938 **Limits**

113939 The *yacc* utility may have several internal tables. The minimum maximums for these tables are  
 113940 shown in the following table. The exact meaning of these values is implementation-defined. The  
 113941 implementation shall define the relationship between these values and between them and any  
 113942 error messages that the implementation may generate should it run out of space for any internal  
 113943 structure. An implementation may combine groups of these resources into a single pool as long  
 113944 as the total available to the user does not fall below the sum of the sizes specified by this section.

113945 **Table 4-23** Internal Limits in *yacc*

| Limit      | Minimum<br>Maximum | Description                                                                                                                                                                                                                                                        |
|------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {NTERMS}   | 126                | Number of tokens.                                                                                                                                                                                                                                                  |
| {NNONTERM} | 200                | Number of non-terminals.                                                                                                                                                                                                                                           |
| {NPROD}    | 300                | Number of rules.                                                                                                                                                                                                                                                   |
| {NSTATES}  | 600                | Number of states.                                                                                                                                                                                                                                                  |
| {MEMSIZE}  | 5 200              | Length of rules. The total length, in names (tokens and non-terminals), of all the rules of the grammar. The left-hand side is counted for each rule, even if it is not explicitly repeated, as specified in <a href="#">Grammar Rules in yacc</a> (on page 3393). |
| {ACTSIZE}  | 4 000              | Number of actions. “Actions” here (and in the description file) refer to parser actions (shift, reduce, and so on) not to semantic actions defined in <a href="#">Grammar Rules in yacc</a> (on page 3393).                                                        |

113963 **EXIT STATUS**

113964 The following exit values shall be returned:

113965 0 Successful completion.

113966 >0 An error occurred.

113967 **CONSEQUENCES OF ERRORS**

113968 If any errors are encountered, the run is aborted and *yacc* exits with a non-zero status. Partial  
 113969 code files and header files may be produced. The summary information in the description file  
 113970 shall always be produced if the `-v` flag is present.

113971 **APPLICATION USAGE**

113972 Historical implementations experience name conflicts on the names `yacc.tmp`, `yacc.acts`,  
 113973 `yacc.debug`, `y.tab.c`, `y.tab.h`, and `y.output` if more than one copy of *yacc* is running in a single  
 113974 directory at one time. The `-b` option was added to overcome this problem. The related problem  
 113975 of allowing multiple *yacc* parsers to be placed in the same file was addressed by adding a `-p`  
 113976 option to override the previously hard-coded `yy` variable prefix.

113977 The description of the `-p` option specifies the minimal set of function and variable names that  
 113978 cause conflict when multiple parsers are linked together. `YYSTYPE` does not need to be changed.  
 113979 Instead, the programmer can use `-b` to give the header files for different parsers different names,  
 113980 and then the file with the `yylex()` for a given parser can include the header for that parser.  
 113981 Names such as `yyclearerr` do not need to be changed because they are used only in the actions;  
 113982 they do not have linkage. It is possible that an implementation has other names, either internal  
 113983 ones for implementing things such as `yyclearerr`, or providing non-standard features that it wants

113984 to change with `-p`.

113985 Unary operators that are the same token as a binary operator in general need their precedence  
113986 adjusted. This is handled by the `%prec` advisory symbol associated with the particular grammar  
113987 rule defining that unary operator. (See [Grammar Rules in yacc](#) (on page 3393).) Applications are  
113988 not required to use this operator for unary operators, but the grammars that do not require it are  
113989 rare.

#### 113990 EXAMPLES

113991 Access to the *yacc* library is obtained with library search operands to *c99*. To use the *yacc* library  
113992 *main()*:

```
113993 c99 y.tab.c -l y
```

113994 Both the *lex* library and the *yacc* library contain *main()*. To access the *yacc main()*:

```
113995 c99 y.tab.c lex.yy.c -l y -l l
```

113996 This ensures that the *yacc* library is searched first, so that its *main()* is used.

113997 The historical *yacc* libraries have contained two simple functions that are normally coded by the  
113998 application programmer. These functions are similar to the following code:

```
113999 #include <locale.h>
114000 int main(void)
114001 {
114002     extern int yyparse();
114003     setlocale(LC_ALL, "");
114004     /* If the following parser is one created by lex, the
114005        application must be careful to ensure that LC_CTYPE
114006        and LC_COLLATE are set to the POSIX locale. */
114007     (void) yyparse();
114008     return (0);
114009 }
114010 #include <stdio.h>
114011 int yyerror(const char *msg)
114012 {
114013     (void) fprintf(stderr, "%s\n", msg);
114014     return (0);
114015 }
```

#### 114016 RATIONALE

114017 The references in **Referenced Documents** may be helpful in constructing the parser generator.  
114018 The referenced DeRemer and Pennello article (along with the works it references) describes a  
114019 technique to generate parsers that conform to this volume of POSIX.1-2008. Work in this area  
114020 continues to be done, so implementors should consult current literature before doing any new  
114021 implementations. The original Knuth article is the theoretical basis for this kind of parser, but the  
114022 tables it generates are impractically large for reasonable grammars and should not be used. The  
114023 “equivalent to” wording is intentional to assure that the best tables that are LALR(1) can be  
114024 generated.

114025 There has been confusion between the class of grammars, the algorithms needed to generate  
114026 parsers, and the algorithms needed to parse the languages. They are all reasonably orthogonal.  
114027 In particular, a parser generator that accepts the full range of LR(1) grammars need not generate  
114028 a table any more complex than one that accepts SLR(1) (a relatively weak class of LR grammars)

114029 for a grammar that happens to be SLR(1). Such an implementation need not recognize the case,  
114030 either; table compression can yield the SLR(1) table (or one even smaller than that) without  
114031 recognizing that the grammar is SLR(1). The speed of an LR(1) parser for any class is dependent  
114032 more upon the table representation and compression (or the code generation if a direct parser is  
114033 generated) than upon the class of grammar that the table generator handles.

114034 The speed of the parser generator is somewhat dependent upon the class of grammar it handles.  
114035 However, the original Knuth article algorithms for constructing LR parsers were judged by its  
114036 author to be impractically slow at that time. Although full LR is more complex than LALR(1), as  
114037 computer speeds and algorithms improve, the difference (in terms of acceptable wall-clock  
114038 execution time) is becoming less significant.

114039 Potential authors are cautioned that the referenced DeRemer and Pennello article previously  
114040 cited identifies a bug (an over-simplification of the computation of LALR(1) lookahead sets) in  
114041 some of the LALR(1) algorithm statements that preceded it to publication. They should take the  
114042 time to seek out that paper, as well as current relevant work, particularly Aho's.

114043 The **-b** option was added to provide a portable method for permitting *yacc* to work on multiple  
114044 separate parsers in the same directory. If a directory contains more than one *yacc* grammar, and  
114045 both grammars are constructed at the same time (by, for example, a parallel *make* program),  
114046 conflict results. While the solution is not historical practice, it corrects a known deficiency in  
114047 historical implementations. Corresponding changes were made to all sections that referenced  
114048 the filenames **y.tab.c** (now "the code file"), **y.tab.h** (now "the header file"), and **y.output** (now  
114049 "the description file").

114050 The grammar for *yacc* input is based on System V documentation. The textual description shows  
114051 there that the **' ; '** is required at the end of the rule. The grammar and the implementation do  
114052 not require this. (The use of **C\_IDENTIFIER** causes a reduce to occur in the right place.)

114053 Also, in that implementation, the constructs such as **%token** can be terminated by a  
114054 **<semicolon>**, but this is not permitted by the grammar. The keywords such as **%token** can also  
114055 appear in uppercase, which is again not discussed. In most places where **' % '** is used,  
114056 **<backslash>** can be substituted, and there are alternate spellings for some of the symbols (for  
114057 example, **%LEFT** can be **"%<"** or even **"\<"**).

114058 Historically, **<tag>** can contain any characters except **'>'**, including white space, in the  
114059 implementation. However, since the *tag* must reference an ISO C standard union member, in  
114060 practice conforming implementations need to support only the set of characters for ISO C  
114061 standard identifiers in this context.

114062 Some historical implementations are known to accept actions that are terminated by a period.  
114063 Historical implementations often allow **' \$ '** in names. A conforming implementation does not  
114064 need to support either of these behaviors.

114065 Deciding when to use **%prec** illustrates the difficulty in specifying the behavior of *yacc*. There  
114066 may be situations in which the *grammar* is not, strictly speaking, in error, and yet *yacc* cannot  
114067 interpret it unambiguously. The resolution of ambiguities in the grammar can in many instances  
114068 be resolved by providing additional information, such as using **%type** or **%union** declarations.  
114069 It is often easier and it usually yields a smaller parser to take this alternative when it is  
114070 appropriate.

114071 The size and execution time of a program produced without the runtime debugging code is  
114072 usually smaller and slightly faster in historical implementations.

114073 Statistics messages from several historical implementations include the following types of  
114074 information:

114075 *n*/512 terminals, *n*/300 non-terminals  
 114076 *n*/600 grammar rules, *n*/1500 states  
 114077 *n* shift/reduce, *n* reduce/reduce conflicts reported  
 114078 *n*/350 working sets used  
 114079 Memory: states, etc. *n*/15 000, parser *n*/15 000  
 114080 *n*/600 distinct lookahead sets  
 114081 *n* extra closures  
 114082 *n* shift entries, *n* exceptions  
 114083 *n* goto entries  
 114084 *n* entries saved by goto default  
 114085 Optimizer space used: input *n*/15 000, output *n*/15 000  
 114086 *n* table entries, *n* zero  
 114087 Maximum spread: *n*, Maximum offset: *n*

114088 The report of internal tables in the description file is left implementation-defined because all  
 114089 aspects of these limits are also implementation-defined. Some implementations may use  
 114090 dynamic allocation techniques and have no specific limit values to report.

114091 The format of the **y.output** file is not given because specification of the format was not seen to  
 114092 enhance applications portability. The listing is primarily intended to help human users  
 114093 understand and debug the parser; use of **y.output** by a conforming application script would be  
 114094 unusual. Furthermore, implementations have not produced consistent output and no popular  
 114095 format was apparent. The format selected by the implementation should be human-readable, in  
 114096 addition to the requirement that it be a text file.

114097 Standard error reports are not specifically described because they are seldom of use to  
 114098 conforming applications and there was no reason to restrict implementations.

114099 Some implementations recognize "`={"`" as equivalent to '`{`' because it appears in historical  
 114100 documentation. This construction was recognized and documented as obsolete as long ago as  
 114101 1978, in the referenced *Yacc: Yet Another Compiler-Compiler*. This volume of POSIX.1-2008 chose to  
 114102 leave it as obsolete and omit it.

114103 Multi-byte characters should be recognized by the lexical analyzer and returned as tokens. They  
 114104 should not be returned as multi-byte character literals. The token **error** that is used for error  
 114105 recovery is normally assigned the value 256 in the historical implementation. Thus, the token  
 114106 value 256, which is used in many multi-byte character sets, is not available for use as the value  
 114107 of a user-defined token.

#### 114108 **FUTURE DIRECTIONS**

114109 None.

#### 114113 **CHANGE HISTORY**

114114 First released in Issue 2.

#### 114115 **Issue 5**

114116 The FUTURE DIRECTIONS section is added.

#### 114117 **Issue 6**

114118 This utility is marked as part of the C-Language Development Utilities option.

114119 Minor changes have been added to align with the IEEE P1003.2b draft standard.

- 114120 The normative text is reworded to avoid use of the term “must” for application requirements.
- 114121 IEEE PASC Interpretation 1003.2 #177 is applied, changing the comment on **RCURL** from the }%  
114122 token to the %}.
- 114123 **Issue 7**
- 114124 Austin Group Interpretation 1003.1-2001 #190 is applied, clarifying the requirements for  
114125 generated code to conform to the ISO C standard.
- 114126 Austin Group Interpretation 1003.1-2001 #191 is applied, clarifying the handling of C-language  
114127 trigraphs and curly brace preprocessing tokens.
- 114128 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not  
114129 apply.
- 114130 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

114131 **NAME**

114132 zcat — expand and concatenate data

114133 **SYNOPSIS**114134 XSI zcat [*file...*]114135 **DESCRIPTION**

114136 The *zcat* utility shall write to standard output the uncompressed form of files that have been  
114137 compressed using the *compress* utility. It is the equivalent of *uncompress -c*. Input files are not  
114138 affected.

114139 **OPTIONS**

114140 None.

114141 **OPERANDS**

114142 The following operand shall be supported:

114143 *file* The pathname of a file previously processed by the *compress* utility. If *file* already  
114144 has the *.Z* suffix specified, it is used as submitted. Otherwise, the *.Z* suffix is  
114145 appended to the filename prior to processing.

114146 **STDIN**114147 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is *'-'*.114148 **INPUT FILES**114149 Input files shall be compressed files that are in the format produced by the *compress* utility.114150 **ENVIRONMENT VARIABLES**114151 The following environment variables shall affect the execution of *zcat*:

114152 *LANG* Provide a default value for the internationalization variables that are unset or null.  
114153 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
114154 variables used to determine the values of locale categories.)

114155 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
114156 internationalization variables.

114157 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
114158 characters (for example, single-byte as opposed to multi-byte characters in  
114159 arguments).

114160 *LC\_MESSAGES*

114161 Determine the locale that should be used to affect the format and contents of  
114162 diagnostic messages written to standard error.

114163 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

114164 **ASYNCHRONOUS EVENTS**

114165 Default.

114166 **STDOUT**

114167 The compressed files given as input shall be written on standard output in their uncompressed  
114168 form.

114169 **STDERR**

114170 The standard error shall be used only for diagnostic messages.

114171 **OUTPUT FILES**

114172 None.

114173 **EXTENDED DESCRIPTION**

114174 None.

114175 **EXIT STATUS**

114176 The following exit values shall be returned:

114177 0 Successful completion.

114178 &gt;0 An error occurred.

114179 **CONSEQUENCES OF ERRORS**

114180 Default.

114181 **APPLICATION USAGE**

114182 None.

114183 **EXAMPLES**

114184 None.

114185 **RATIONALE**

114186 None.

114187 **FUTURE DIRECTIONS**

114188 None.

# Rationale for Base Definitions

## 114206 A.1 Introduction

### 114207 A.1.1 Scope

114208 POSIX.1-2008 is one of a family of standards known as POSIX. The family of standards extends  
 114209 to many topics; POSIX.1 consists of both operating system interfaces and shell and utilities.  
 114210 POSIX.1-2008 is technically identical to The Open Group Base Specifications, Issue 7.

#### 114211 Scope of POSIX.1-2008

114212 The (paraphrased) goals of this development were to revise the single document that is ISO/IEC  
 114213 9945:2003 Parts 1 through 4, IEEE Std 1003.1, 2004 Edition, and the appropriate parts of The  
 114214 Open Group Single UNIX Specification, Version 3. This work has been undertaken by the  
 114215 Austin Group, a joint working group of IEEE, The Open Group, and ISO/IEC JTC 1/SC 22.

114216 The following are the base documents in this version:

- 114217 • IEEE Std 1003.1, 2004 Edition
- 114218 • ISO/IEC 9899:1999, Programming Languages — C, including ISO/IEC  
 114219 9899:1999/Cor.1:2001(E), ISO/IEC 9899:1999/Cor.2:2004(E), and ISO/IEC  
 114220 9899:1999/Cor.3
- 114221 • The Open Group Extended API Sets, Parts 1 through 4

114222 This version has addressed the following areas:

- 114223 • Issues raised by Austin Group defect reports, IEEE Interpretations against IEEE Std 1003.1,  
 114224 and ISO/IEC defect reports against ISO/IEC 9945

114225 The repository of interpretations can be accessed at [www.opengroup.org/austin/interps](http://www.opengroup.org/austin/interps).

- 114226 • Issues raised in corrigenda for The Open Group Technical Standards and working group  
 114227 resolutions from The Open Group

- 114228 • Issues arising from ISO TR 24715:2006, Conflicts between POSIX and the LSB

114229 This is a Type 3 informative technical report highlighting differences between the LSB 3.1  
 114230 and the 2004 Edition of this standard.

- 114231 • Changes to make the text self-consistent with the additional material merged

114232 The new material merged has come from the The Open Group Extended API Sets, Parts 1  
 114233 through 4. A list of the new interfaces is included in [Section B.1.1](#) (on page 3493).

- 114234 • Features, marked legacy or obsolescent in the base documents, have been considered for  
 114235 removal in this version

114236 See [Section B.1.1](#) (on page 3493) and [Section C.1.1](#) (on page 3637).

- 114237 • A review and reorganization of the options within the standard
- 114238 This has included marking the following options obsolescent:
- 114239 — Batch Environment Services and Utilities
- 114240 — Tracing
- 114241 — XSI STREAMS
- 114242 The UUCP Utilities option is a new option for this version.
- 114243 Functionality from the following former options is now mandatory in this version:
- 114244 AIO `_POSIX_ASYNCHRONOUS_IO` (Asynchronous Input and Output)
- 114245 BAR `_POSIX_BARRIERS` (Barriers)
- 114246 CS `_POSIX_CLOCK_SELECTION` (Clock Selection)
- 114247 MF `_POSIX_MAPPED_FILES` (Memory Mapped Files)
- 114248 MPR `_POSIX_MEMORY_PROTECTION` (Memory Protection)
- 114249 RTS `_POSIX_REALTIME_SIGNALS` (Realtime Signals Extension)
- 114250 RWL `_POSIX_READER_WRITER_LOCKS` (Read-Write Locks)
- 114251 SEM `_POSIX_SEMAPHORES` (Semaphores)
- 114252 SPI `_POSIX_SPIN_LOCKS` (Spin Locks)
- 114253 THR `_POSIX_THREADS` (Threads)
- 114254 TMO `_POSIX_TIMEOUTS` (Timeouts)
- 114255 TMR `_POSIX_TIMERS` (Timers)
- 114256 TSF `_POSIX_THREAD_SAFE_FUNCTIONS` (Thread-Safe Functions)
- 114257 • Alignment with the ISO/IEC 9899:1999 standard, including ISO/IEC
- 114258 9899:1999/Cor.2:2004(E)
- 114259 • A review of the use of fixed path filenames within the standard
- 114260 For example, the *at*, *batch*, and *crontab* utilities previously had a requirement for use of the
- 114261 directory **/usr/lib/cron**.
- 114262 The following were requirements on POSIX.1-2008:
- 114263 • Backward-compatibility
- 114264 For interfaces carried forward, it was agreed that there should be no breakage of
- 114265 functionality in the existing base documents. All strictly conforming applications will be
- 114266 conforming but not necessarily strictly conforming to the revised standard. The goal is for
- 114267 system implementations to be able to support the existing and revised standards
- 114268 simultaneously.
- 114269 • Architecture and *n*-bit-neutral
- 114270 The common standard should not make any implicit assumptions about the system
- 114271 architecture or size of data types; for example, previously some 32-bit implicit assumptions
- 114272 had crept into the standards.
- 114273 • Extensibility
- 114274 It should be possible to extend the common standard without breaking backwards-
- 114275 compatibility; for example, the name space should be reserved and structured to avoid
- 114276 duplication of names between the standard and extensions to it.

114277 **POSIX.1 and the ISO C Standard**

114278 The standard developers believed it essential for a programmer to have a single complete  
 114279 reference place, but recognized that deference to the formal standard has to be addressed for the  
 114280 duplicate interface definitions between the ISO C standard and POSIX.1-2008.

114281 Where an interface has a version in the ISO C standard, the DESCRIPTION section describes the  
 114282 relationship to the ISO C standard and markings are included as appropriate to show where the  
 114283 ISO C standard has been extended in the text.

114284 A block of text is included at the start of each affected reference page stating whether the page is  
 114285 aligned with the ISO C standard or extended. Each page has been parsed for additions beyond  
 114286 the ISO C standard (that is, including both POSIX and UNIX extensions), and these extensions  
 114287 are marked as CX extensions (for C extensions).

114288 **FIPS Requirements**

114289 The Federal Information Processing Standards (FIPS) are a series of US government  
 114290 procurement standards managed and maintained on behalf of the US Department of Commerce  
 114291 by the National Institute of Standards and Technology (NIST).

114292 The following restrictions were integrated into IEEE Std 1003.1-2001. They originally came from  
 114293 FIPS 151-2 which was withdrawn by NIST on February 25 2000.

- 114294 • The implementation supports `_POSIX_CHOWN_RESTRICTED`.
- 114295 • The limit `{NGROUPS_MAX}` is greater than or equal to 8.
- 114296 • The implementation supports the setting of the group ID of a file (when it is created) to  
 114297 that of the parent directory.
- 114298 • The implementation supports `_POSIX_SAVED_IDS`.
- 114299 • The implementation supports `_POSIX_VDISABLE`.
- 114300 • The implementation supports `_POSIX_JOB_CONTROL`.
- 114301 • The implementation supports `_POSIX_NO_TRUNC`.
- 114302 • The `read()` function returns the number of bytes read when interrupted by a signal and  
 114303 does not return `-1`.
- 114304 • The `write()` function returns the number of bytes written when interrupted by a signal and  
 114305 does not return `-1`.
- 114306 • In the environment for the login shell, the environment variables `LOGNAME` and `HOME`  
 114307 are defined and have the properties described in POSIX.1-2008.
- 114308 • The value of `{CHILD_MAX}` is greater than or equal to 25.
- 114309 • The value of `{OPEN_MAX}` is greater than or equal to 20.
- 114310 • The implementation supports the functionality associated with the symbols `CS7`, `CS8`,  
 114311 `CSTOPB`, `PARODD`, and `PARENB` defined in `<termios.h>`.

114312 **A.1.2 Conformance**114313 See [Section A.2](#) (on page 3417).114314 **A.1.3 Normative References**

114315 There is no additional rationale provided for this section.

114316 **A.1.4 Change History**

114317 There is no additional rationale provided for this section.

114318 **A.1.5 Terminology**114319 The meanings specified in POSIX.1-2008 for the words *shall*, *should*, and *may* are mandated by  
114320 ISO/IEC directives.114321 In the Rationale (Informative) volume of POSIX.1-2008, the words *shall*, *should*, and *may* are  
114322 sometimes used to illustrate similar usages in POSIX.1-2008. However, the rationale itself does  
114323 not specify anything regarding implementations or applications.114324 **conformance document**114325 As a practical matter, the conformance document is effectively part of the system  
114326 documentation. Conformance documents are distinguished by POSIX.1-2008 so that they  
114327 can be referred to distinctly.114328 **implementation-defined**114329 This definition is analogous to that of the ISO C standard and, together with “undefined”  
114330 and “unspecified”, provides a range of specification of freedom allowed to the interface  
114331 implementor.114332 **may**114333 The use of *may* has been limited as much as possible, due both to confusion stemming from  
114334 its ordinary English meaning and to objections regarding the desirability of having as few  
114335 options as possible and those as clearly specified as possible.114336 The usage of *can* and *may* were selected to contrast optional application behavior (can)  
114337 against optional implementation behavior (may).114338 **shall**114339 Declarative sentences are sometimes used in POSIX.1-2008 as if they included the word  
114340 *shall*, and facilities thus specified are no less required. For example, the two statements:114341 1. The *foo()* function shall return zero.114342 2. The *foo()* function returns zero.

114343 are meant to be exactly equivalent.

114344 **should**114345 In POSIX.1-2008, the word *should* does not usually apply to the implementation, but rather  
114346 to the application. Thus, the important words regarding implementations are *shall*, which  
114347 indicates requirements, and *may*, which indicates options.

114348 **obsolescent**

114349 The term “obsolescent” means “do not use this feature in new applications”. A feature  
114350 noted as obsolescent is supported by all implementations, but may be removed in a future  
114351 version; new applications should not use these features. The obsolescence concept is not an  
114352 ideal solution, but was used as a method of increasing consensus: many more objections  
114353 would be heard from the user community if some of these historical features were suddenly  
114354 removed without the grace period obsolescence implies. The phrase “may be removed in a  
114355 future version” implies that the result of that consideration might in fact keep those features  
114356 indefinitely if the predominance of applications do not migrate away from them quickly.

114357 **legacy**

114358 The term “legacy” was included in earlier versions of this standard but is no longer used in  
114359 the current version.

114360 **system documentation**

114361 The system documentation should normally describe the whole of the implementation,  
114362 including any extensions provided by the implementation. Such documents normally  
114363 contain information at least as detailed as the specifications in POSIX.1-2008. Few  
114364 requirements are made on the system documentation, but the term is needed to avoid a  
114365 dangling pointer where the conformance document is permitted to point to the system  
114366 documentation.

114367 **undefined**

114368 See *implementation-defined*.

114369 **unspecified**

114370 See *implementation-defined*.

114371 The definitions for “unspecified” and “undefined” appear nearly identical at first  
114372 examination, but are not. The term “unspecified” means that a conforming application may  
114373 deal with the unspecified behavior, and it should not care what the outcome is. The term  
114374 “undefined” says that a conforming application should not do it because no definition is  
114375 provided for what it does (and implicitly it would care what the outcome was if it tried it).  
114376 It is important to remember, however, that if the syntax permits the statement at all, it must  
114377 have some outcome in a real implementation.

114378 Thus, the terms “undefined” and “unspecified” apply to the way the application should  
114379 think about the feature. In terms of the implementation, it is always “defined”—there is  
114380 always some result, even if it is an error. The implementation is free to choose the behavior  
114381 it prefers.

114382 This also implies that an implementation, or another standard, could specify or define the  
114383 result in a useful fashion. The terms apply to POSIX.1-2008 specifically.

114384 The term “implementation-defined” implies requirements for documentation that are not  
114385 required for “undefined” (or “unspecified”). Where there is no need for a conforming  
114386 program to know the definition, the term “undefined” is used, even though  
114387 “implementation-defined” could also have been used in this context. There could be a  
114388 fourth term, specifying “this standard does not say what this does; it is acceptable to define  
114389 it in an implementation, but it does not need to be documented”, and undefined would  
114390 then be used very rarely for the few things for which any definition is not useful. In  
114391 particular, implementation-defined is used where it is believed that certain classes of  
114392 application will need to know such details to determine whether the application can be  
114393 successfully ported to the implementation. Such applications are not always strictly  
114394 portable, but nevertheless are common and useful; often the requirements met by the  
114395 application cannot be met without dealing with the issues implied by “implementation-  
114396 defined”. In some places the text refers to facilities supplied by the implementation that are

114397 outside the standard as implementation-supplied or implementation-provided. This is not  
 114398 intended to imply a requirement for documentation. If it were, the term “implementation-  
 114399 defined” would have been used.

114400 In many places POSIX.1-2008 is silent about the behavior of some possible construct. For  
 114401 example, a variable may be defined for a specified range of values and behaviors are  
 114402 described for those values; nothing is said about what happens if the variable has any other  
 114403 value. That kind of silence can imply an error in the standard, but it may also imply that the  
 114404 standard was intentionally silent and that any behavior is permitted. There is a natural  
 114405 tendency to infer that if the standard is silent, a behavior is prohibited. That is not the intent.  
 114406 Silence is intended to be equivalent to the term “unspecified”.

114407 The term “application” is not defined in POSIX.1-2008; it is assumed to be a part of general  
 114408 computer science terminology.

114409 Three terms used within POSIX.1-2008 overlap in meaning: “macro”, “symbolic name”, and  
 114410 “symbolic constant”.

114411 **macro**

114412 This usually describes a C preprocessor symbol, the result of the **#define** operator, with or  
 114413 without an argument. It may also be used to describe similar mechanisms in editors and  
 114414 text processors.

114415 **symbolic name**

114416 In earlier versions of this standard this was also sometimes used to refer to a C preprocessor  
 114417 symbol (without arguments), but the intention is for all such uses to have been removed. It  
 114418 is now mainly used to refer to the names for characters in character sets, but is sometimes  
 114419 used to refer to host names and even filenames.

114420 **symbolic constant**

114421 This also refers to a C preprocessor symbol, with specific associated requirements. See the  
 114422 definition in [Section 3.372](#) (on page 93).

114423 **A.1.6 Definitions and Concepts**

114424 There is no additional rationale provided for this section.

114425 **A.1.7 Portability**

114426 To aid the identification of options within POSIX.1-2008, a notation consisting of margin codes  
 114427 and shading is used. This is based on the notation used in earlier versions of The Open Group  
 114428 Base specifications.

114429 The benefit of this approach is a reduction in the number of *if* statements within the running  
 114430 text, that makes the text easier to read, and also an identification to the programmer that they  
 114431 need to ensure that their target platforms support the underlying options. For example, if  
 114432 functionality is marked with RPP in the margin, it will be available on all systems supporting  
 114433 the Robust Mutex Priority Protection option, but may not be available on some others.

## 114434 A.1.7.1 Codes

114435 This section includes codes for options defined in XBD Section 2.1.6 (on page 26), and the  
 114436 following additional codes for other purposes:

114437 CX This margin code is used to denote extensions beyond the ISO C standard. For  
 114438 interfaces that are duplicated between POSIX.1-2008 and the ISO C standard, a CX  
 114439 introduction block describes the nature of the duplication, with any extensions  
 114440 appropriately CX marked and shaded.

114441 Where an interface is added to an ISO C standard header, within the header the  
 114442 interface has an appropriate margin marker and shading (for example, CX, XSI, TSE,  
 114443 and so on) and the same marking appears on the reference page in the SYNOPSIS  
 114444 section. This enables a programmer to easily identify that the interface is extending an  
 114445 ISO C standard header.

114446 MX This margin code is used to denote IEC 60559: 1989 standard floating-point extensions.

114447 OB This margin code is used to denote obsolescent behavior and thus flag a possible future  
 114448 applications portability warning.

114449 OH The Single UNIX Specification has historically tried to reduce the number of headers an  
 114450 application has had to include when using a particular interface. Sometimes this was  
 114451 fewer than the base standard, and hence a notation is used to flag which headers are  
 114452 optional if you are using a system supporting the XSI option.

## 114453 A.1.7.2 Margin Code Notation

114454 Since some features may depend on one or more options, or require more than one option, a  
 114455 notation is used. Where a feature requires support of a single option, a single margin code will  
 114456 occur in the margin. If it depends on two options and both are required, then the codes will  
 114457 appear with a <space> separator. If either of two options are required, then a logical OR is  
 114458 denoted using the ' | ' symbol. If more than two codes are used, a special notation is used.

114459 **A.2 Conformance**

114460 The terms “profile” and “profiling” are used throughout this section.

114461 A profile of a standard or standards is a codified set of option selections, such that by being  
 114462 conformant to a profile, particular classes of users are specifically supported.

114463 **A.2.1 Implementation Conformance**

114464 These definitions allow application developers to know what to depend on in an  
 114465 implementation.

114466 There is no definition of a “strictly conforming implementation”; that would be an  
 114467 implementation that provides *only* those facilities specified by POSIX.1 with no extensions  
 114468 whatsoever. This is because no actual operating system implementation can exist without  
 114469 system administration and initialization facilities that are beyond the scope of POSIX.1.

114470 A.2.1.1 *Requirements*

114471 The word “support” is used in certain instances, rather than “provide”, in order to allow an  
114472 implementation that has no resident software development facilities, but that supports the  
114473 execution of a *Strictly Conforming POSIX.1 Application*, to be a *conforming implementation*.

114474 A.2.1.2 *Documentation*

114475 The conformance documentation is required to use the same numbering scheme as POSIX.1 for  
114476 purposes of cross-referencing. All options that an implementation chooses are reflected in  
114477 **<limits.h>** and **<unistd.h>**.

114478 Note that the use of “may” in terms of where conformance documents record where  
114479 implementations may vary, implies that it is not required to describe those features identified as  
114480 undefined or unspecified.

114481 Other aspects of systems must be evaluated by purchasers for suitability. Many systems  
114482 incorporate buffering facilities, maintaining updated data in volatile storage and transferring  
114483 such updates to non-volatile storage asynchronously. Various exception conditions, such as a  
114484 power failure or a system crash, can cause this data to be lost. The data may be associated with a  
114485 file that is still open, with one that has been closed, with a directory, or with any other internal  
114486 system data structures associated with permanent storage. This data can be lost, in whole or  
114487 part, so that only careful inspection of file contents could determine that an update did not  
114488 occur.

114489 Also, interrelated file activities, where multiple files and/or directories are updated, or where  
114490 space is allocated or released in the file system structures, can leave inconsistencies in the  
114491 relationship between data in the various files and directories, or in the file system itself. Such  
114492 inconsistencies can break applications that expect updates to occur in a specific sequence, so that  
114493 updates in one place correspond with related updates in another place.

114494 For example, if a user creates a file, places information in the file, and then records this action in  
114495 another file, a system or power failure at this point followed by restart may result in a state in  
114496 which the record of the action is permanently recorded, but the file created (or some of its  
114497 information) has been lost. The consequences of this to the user may be undesirable. For a user  
114498 on such a system, the only safe action may be to require the system administrator to have a  
114499 policy that requires, after any system or power failure, that the entire file system must be  
114500 restored from the most recent backup copy (causing all intervening work to be lost).

114501 The characteristics of each implementation will vary in this respect and may or may not meet  
114502 the requirements of a given application or user. Enforcement of such requirements is beyond the  
114503 scope of POSIX.1. It is up to the purchaser to determine what facilities are provided in an  
114504 implementation that affect the exposure to possible data or sequence loss, and also what  
114505 underlying implementation techniques and/or facilities are provided that reduce or limit such  
114506 loss or its consequences.

114507 A.2.1.3 *POSIX Conformance*

114508 This really means conformance to the base standard; however, since this document includes the  
114509 core material of the Single UNIX Specification, the standard developers decided that it was  
114510 appropriate to segment the conformance requirements into two, the former for the base  
114511 standard, and the latter for the Single UNIX Specification (denoted XSI Conformance).

114512 Within POSIX.1 there are some symbolic constants that, if defined to a certain value or range of  
114513 values, indicate that a certain option is enabled. Other symbolic constants exist in POSIX.1 for  
114514 other reasons.

114515 In this version, some features that were previously optional have been made mandatory. For  
 114516 backwards compatibility, the symbolic constants associated with the option are still required  
 114517 now with fixed allowable ranges or values. The following options from the previous version of  
 114518 this standard are now mandatory:

114519            \_POSIX\_ASYNCHRONOUS\_IO  
 114520            \_POSIX\_BARRIERS  
 114521            \_POSIX\_CLOCK\_SELECTION  
 114522            \_POSIX\_MAPPED\_FILES  
 114523            \_POSIX\_MEMORY\_PROTECTION  
 114524            \_POSIX\_READER\_WRITER\_LOCKS  
 114525            \_POSIX\_REALTIME\_SIGNALS  
 114526            \_POSIX\_SEMAPHORES  
 114527            \_POSIX\_SPIN\_LOCKS  
 114528            \_POSIX\_THREAD\_SAFE\_FUNCTIONS  
 114529            \_POSIX\_THREADS  
 114530            \_POSIX\_TIMEOUTS  
 114531            \_POSIX\_TIMERS

114532 A POSIX-conformant system may support the XSI option required by the Single UNIX  
 114533 Specification. This was intentional since the standard developers intend them to be upwards-  
 114534 compatible, so that a system conforming to the Single UNIX Specification can also conform to  
 114535 the base standard at the same time.

#### 114536 A.2.1.4 XSI Conformance

114537 This section is included to describe the conformance requirements for the base volumes of the  
 114538 Single UNIX Specification.

114539 XSI conformance can be thought of as a profile, selecting certain options from POSIX.1-2008.

#### 114540 A.2.1.5 Option Groups

114541 The concept of “Option Groups” is included to allow collections of related functions or options  
 114542 to be grouped together. This has been used as follows: the “XSI Option Groups” have been  
 114543 created to allow super-options, collections of underlying options and related functions, to be  
 114544 collectively supported by XSI-conforming systems.

114545 The standard developers considered the matter of subprofiling and decided it was better to  
 114546 include an enabling mechanism rather than detailed normative requirements. A set of  
 114547 subprofiling options was developed and included later in this volume of POSIX.1-2008 as an  
 114548 informative illustration.

#### 114549 **Subprofiling Considerations**

114550 The goal of not simultaneously fixing maximums and minimums was to allow implementations  
 114551 of the base standard or standards to support multiple profiles without conflict.

114552 The following summarizes the rules for the limit types:

| Limit Type       | Fixed Value                | Minimum Acceptable Value                   | Maximum Acceptable Value                   |
|------------------|----------------------------|--------------------------------------------|--------------------------------------------|
| Standard Profile | $X_p = X_s$<br>(No change) | $Y_p \geq Y_s$<br>(May increase the limit) | $Z_p \leq Z_s$<br>(May decrease the limit) |

114558 The intent is that ranges specified by limits in profiles be entirely contained within the  
 114559 corresponding ranges of the base standard or standards being profiled, and that the unlimited  
 114560 end of a range in a base standard must remain unlimited in any profile of that standard.

114561 Thus, the fixed `_POSIX_*` limits are constants and must not be changed by a profile. The variable  
 114562 counterparts (typically without the leading `_POSIX_`) can be changed but still remain  
 114563 semantically the same; that is, they still allow implementation values to vary as long as they  
 114564 meet the requirements for that value (be it a minimum or maximum).

114565 Where a profile does not provide a feature upon which a limit is based, the limit is not relevant.  
 114566 Applications written to that profile should be written to operate independently of the value of  
 114567 the limit.

114568 An example which has previously allowed implementations to support both the base standard  
 114569 and two other profiles in a compatible manner follows:

```
114570 Base standard (POSIX.1-1996): _POSIX_CHILD_MAX 6
114571 Base standard: CHILD_MAX minimum maximum _POSIX_CHILD_MAX
114572 FIPS profile/SUSv2 CHILD_MAX 25 (minimum maximum)
```

114573 Another example:

```
114574 Base standard (POSIX.1-1996): _POSIX_NGROUPS_MAX 0
114575 Base standard: NGROUPS_MAX minimum maximum _POSIX_NGROUP_MAX
114576 FIPS profile/SUSv2 NGROUPS_MAX 8
```

114577 A profile may lower a minimum maximum below the equivalent `_POSIX` value:

```
114578 Base standard: _POSIX_foo_MAX Z
114579 Base standard: foo_MAX _POSIX_foo_MAX
114580 profile standard : foo_MAX X (X can be less than, equal to,
114581 or greater than _POSIX_foo_MAX)
```

114582 In this case an implementation conforming to the profile may not conform to the base standard,  
 114583 but an implementation to the base standard will conform to the profile.

114584 *A.2.1.6 Options*

114585 The final subsections within *Implementation Conformance* list the core options within  
 114586 POSIX.1-2008. This includes both options for the System Interfaces volume of POSIX.1-2008 and  
 114587 the Shell and Utilities volume of POSIX.1-2008.

## 114588 A.2.2 Application Conformance

114589 These definitions guide users or adapters of applications in determining on which  
114590 implementations an application will run and how much adaptation would be required to make  
114591 it run on others. These definitions are modeled after related ones in the ISO C standard.

114592 POSIX.1 occasionally uses the expressions “portable application” or “conforming application”.  
114593 As they are used, these are synonyms for any of these terms. The differences between the classes  
114594 of application conformance relate to the requirements for other standards, the options supported  
114595 (such as the XSI option) or, in the case of the Conforming POSIX.1 Application Using Extensions,  
114596 to implementation extensions. When one of the less explicit expressions is used, it should be  
114597 apparent from the context of the discussion which of the more explicit names is appropriate

### 114598 A.2.2.1 Strictly Conforming POSIX Application

114599 This definition is analogous to that of an ISO C standard “conforming program”.

114600 The major difference between a Strictly Conforming POSIX Application and an ISO C standard  
114601 strictly conforming program is that the latter is not allowed to use features of POSIX that are not  
114602 in the ISO C standard.

### 114603 A.2.2.2 Conforming POSIX Application

114604 Examples of <National Bodies> include ANSI, BSI, and AFNOR.

### 114605 A.2.2.3 Conforming POSIX Application Using Extensions

114606 Due to possible requirements for configuration or implementation characteristics in excess of the  
114607 specifications in <limits.h> or related to the hardware (such as array size or file space), not  
114608 every Conforming POSIX Application Using Extensions will run on every conforming  
114609 implementation.

### 114610 A.2.2.4 Strictly Conforming XSI Application

114611 This is intended to be upwards-compatible with the definition of a Strictly Conforming POSIX  
114612 Application, with the addition of the facilities and functionality included in the XSI option.

### 114613 A.2.2.5 Conforming XSI Application Using Extensions

114614 Such applications may use extensions beyond the facilities defined by POSIX.1-2008 including  
114615 the XSI option, but need to document the additional requirements.

## 114616 A.2.3 Language-Dependent Services for the C Programming Language

114617 POSIX.1 is, for historical reasons, both a specification of an operating system interface, shell and  
114618 utilities, and a C binding for that specification. Efforts had been previously undertaken to  
114619 generate a language-independent specification; however, that had failed, and the fact that the  
114620 ISO C standard is the *de facto* primary language on POSIX and the UNIX system makes this a  
114621 necessary and workable situation.

**114622 A.2.4 Other Language-Related Specifications**

114623 There is no additional rationale provided for this section.

**114624 A.3 Definitions**

114625 The definitions in this section are stated so that they can be used as exact substitutes for the  
114626 terms in text. They should not contain requirements or cross-references to sections within  
114627 POSIX.1-2008; that is accomplished by using an informative note. In addition, the term should  
114628 not be included in its own definition. Where requirements or descriptions need to be addressed  
114629 but cannot be included in the definitions, due to not meeting the above criteria, these occur in  
114630 the General Concepts chapter.

114631 In this version, the definitions have been reworked extensively to meet style requirements and to  
114632 include terms from the base documents (see the Scope).

114633 Many of these definitions are necessarily circular, and some of the terms (such as “process”) are  
114634 variants of basic computing science terms that are inherently hard to define. Where some  
114635 definitions are more conceptual and contain requirements, these appear in the General Concepts  
114636 chapter. Those listed in this section appear in an alphabetical glossary format of terms.

114637 Some definitions must allow extension to cover terms or facilities that are not explicitly  
114638 mentioned in POSIX.1-2008. For example, the definition of “Extended Security Controls”  
114639 permits implementations beyond those defined in POSIX.1-2008.

114640 Some terms in the following list of notes do not appear in POSIX.1-2008; these are marked  
114641 suffixed with an asterisk (\*). Many of them have been specifically excluded from POSIX.1-2008  
114642 because they concern system administration, implementation, or other issues that are not  
114643 specific to the programming interface. Those are marked with a reason, such as  
114644 “implementation-defined”.

**114645 Appropriate Privileges**

114646 One of the fundamental security problems with many historical UNIX systems has been that the  
114647 privilege mechanism is monolithic—a user has either no privileges or *all* privileges. Thus, a  
114648 successful “trojan horse” attack on a privileged process defeats all security provisions.  
114649 Therefore, POSIX.1 allows more granular privilege mechanisms to be defined. For many  
114650 historical implementations of the UNIX system, the presence of the term “appropriate  
114651 privileges” in POSIX.1 may be understood as a synonym for “superuser” (UID 0). However,  
114652 other systems have emerged where this is not the case and each discrete controllable action has  
114653 *appropriate privileges* associated with it. Because this mechanism is implementation-defined, it  
114654 must be described in the conformance document. Although that description affects several parts  
114655 of POSIX.1 where the term “appropriate privilege” is used, because the term “implementation-  
114656 defined” only appears here, the description of the entire mechanism and its effects on these  
114657 other sections belongs in this equivalent section of the conformance document. This is especially  
114658 convenient for implementations with a single mechanism that applies in all areas, since it only  
114659 needs to be described once.

114660 **Base Character\***

114661 The term “Base Character” has been removed, as it was felt that the use of this term within  
114662 POSIX.1-2008 was common usage English.

114663 **Byte**

114664 The restriction that a byte is now exactly eight bits was a conscious decision by the standard  
114665 developers. It came about due to a combination of factors, primarily the use of the type `int8_t`  
114666 within the networking functions and the alignment with the ISO/IEC 9899:1999 standard,  
114667 where the `intN_t` types are now defined.

114668 According to the ISO/IEC 9899:1999 standard:

- 114669 • The `[u]intN_t` types must be two’s complement with no padding bits and no illegal values.
- 114670 • All types (apart from bit fields, which are not relevant here) must occupy an integral  
114671 number of bytes.
- 114672 • If a type with width  $W$  occupies  $B$  bytes with  $C$  bits per byte ( $C$  is the value of  
114673 `{CHAR_BIT}`), then it has  $P$  padding bits where  $P+W=B*C$ .
- 114674 • Therefore, for `int8_t`  $P=0$ ,  $W=8$ . Since  $B \geq 1$ ,  $C \geq 8$ , the only solution is  $B=1$ ,  $C=8$ .

114675 The standard developers also felt that this was not an undue restriction for the current state-of-  
114676 the-art for this version of the standard, but recognize that if industry trends continue, a wider  
114677 character type may be required in the future.

114678 **Character**

114679 The term “character” is used to mean a sequence of one or more bytes representing a single  
114680 graphic symbol. The deviation in the exact text of the ISO C standard definition for “byte” meets  
114681 the intent of the rationale of the ISO C standard also clears up the ambiguity raised by the term  
114682 “basic execution character set”. The octet-minimum requirement is a reflection of the  
114683 `{CHAR_BIT}` value.

114684 **Child Process**

114685 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/3 is applied, adding the `vfork()` function  
114686 to those listed.

114687 **Clock Tick**

114688 The ISO C standard defines a similar interval for use by the `clock()` function. There is no  
114689 requirement that these intervals be the same. In historical implementations these intervals are  
114690 different.

114691 **Command**

114692 The terms “command” and “utility” are related but have distinct meanings. Command is  
114693 defined as “a directive to a shell to perform a specific task”. The directive can be in the form of a  
114694 single utility name (for example, `ls`), or the directive can take the form of a compound command  
114695 (for example, `ls | grep name | pr`). A utility is a program that can be called by name  
114696 from a shell. Issuing only the name of the utility to a shell is the equivalent of a one-word  
114697 command. A utility may be invoked as a separate program that executes in a different process  
114698 than the command language interpreter, or it may be implemented as a part of the command  
114699 language interpreter. For example, the `echo` command (the directive to perform a specific task)  
114700 may be implemented such that the `echo` utility (the logic that performs the task of echoing) is in a  
114701 separate program; therefore, it is executed in a process that is different from the command

114702 language interpreter. Conversely, the logic that performs the *echo* utility could be built into the  
114703 command language interpreter; therefore, it could execute in the same process as the command  
114704 language interpreter.

114705 The terms “tool” and “application” can be thought of as being synonymous with “utility” from  
114706 the perspective of the operating system kernel. Tools, applications, and utilities historically have  
114707 run, typically, in processes above the kernel level. Tools and utilities historically have been a part  
114708 of the operating system non-kernel code and have performed system-related functions, such as  
114709 listing directory contents, checking file systems, repairing file systems, or extracting system  
114710 status information. Applications have not generally been a part of the operating system, and  
114711 they perform non-system-related functions, such as word processing, architectural design,  
114712 mechanical design, workstation publishing, or financial analysis. Utilities have most frequently  
114713 been provided by the operating system distributor, applications by third-party software  
114714 distributors, or by the users themselves. Nevertheless, POSIX.1-2008 does not differentiate  
114715 between tools, utilities, and applications when it comes to receiving services from the system, a  
114716 shell, or the standard utilities. (For example, the *xargs* utility invokes another utility; it would be  
114717 of fairly limited usefulness if the users could not run their own applications in place of the  
114718 standard utilities.) Utilities are not applications in the sense that they are not themselves subject  
114719 to the restrictions of POSIX.1-2008 or any other standard—there is no requirement for *grep*, *stty*,  
114720 or any of the utilities defined here to be any of the classes of conforming applications.

#### 114721 **Column Positions**

114722 In most 1-byte character sets, such as ASCII, the concept of column positions is identical to  
114723 character positions and to bytes. Therefore, it has been historically acceptable for some  
114724 implementations to describe line folding or tab stops or table column alignment in terms of  
114725 bytes or character positions. Other character sets pose complications, as they can have internal  
114726 representations longer than one octet and they can have display characters that have different  
114727 widths on the terminal screen or printer.

114728 In POSIX.1-2008 the term “column positions” has been defined to mean character—not byte—  
114729 positions in input files (such as “column position 7 of the FORTRAN input”). Output files  
114730 describe the column position in terms of the display width of the narrowest printable character  
114731 in the character set, adjusted to fit the characteristics of the output device. It is very possible that  
114732 *n* column positions will not be able to hold *n* characters in some character sets, unless all of those  
114733 characters are of the narrowest width. It is assumed that the implementation is aware of the  
114734 width of the various characters, deriving this information from the value of *LC\_CTYPE*, and  
114735 thus can determine how many column positions to allot for each character in those utilities  
114736 where it is important.

114737 The term “column position” was used instead of the more natural “column” because the latter is  
114738 frequently used in the different contexts of columns of figures, columns of table values, and so  
114739 on. Wherever confusion might result, these latter types of columns are referred to as “text  
114740 columns”.

#### 114741 **Controlling Terminal**

114742 The question of which of possibly several special files referring to the terminal is meant is not  
114743 addressed in POSIX.1. The filename */dev/tty* is a synonym for the controlling terminal associated  
114744 with a process.

- 114745        **Device Number\***
- 114746        The concept is handled in *stat()* as *ID of device*.
- 114747        **Direct I/O**
- 114748        Historically, direct I/O refers to the system bypassing intermediate buffering, but may be  
114749        extended to cover implementation-defined optimizations.
- 114750        **Directory**
- 114751        The format of the directory file is implementation-defined and differs radically between  
114752        System V and 4.3 BSD. However, routines (derived from 4.3 BSD) for accessing directories and  
114753        certain constraints on the format of the information returned by those routines are described in  
114754        the **<dirent.h>** header.
- 114755        **Directory Entry**
- 114756        Throughout POSIX.1-2008, the term “link” is used (about the *link()* function, for example) in  
114757        describing the objects that point to files from directories.
- 114758        **Display**
- 114759        The Shell and Utilities volume of POSIX.1-2008 assigns precise requirements for the terms  
114760        “display” and “write”. Some historical systems have chosen to implement certain utilities  
114761        without using the traditional file descriptor model. For example, the *vi* editor might employ  
114762        direct screen memory updates on a personal computer, rather than a *write()* system call. An  
114763        instance of user prompting might appear in a dialog box, rather than with standard error. When  
114764        the Shell and Utilities volume of POSIX.1-2008 uses the term “display”, the method of  
114765        outputting to the terminal is unspecified; many historical implementations use *termcap* or  
114766        *terminfo*, but this is not a requirement. The term “write” is used when the Shell and Utilities  
114767        volume of POSIX.1-2008 mandates that a file descriptor be used and that the output can be  
114768        redirected. However, it is assumed that when the writing is directly to the terminal (it has not  
114769        been redirected elsewhere), there is no practical way for a user or test suite to determine whether  
114770        a file descriptor is being used. Therefore, the use of a file descriptor is mandated only for the  
114771        redirection case and the implementation is free to use any method when the output is not  
114772        redirected. The verb *write* is used almost exclusively, with the very few exceptions of those  
114773        utilities where output redirection need not be supported: *tabs*, *talk*, *tput*, and *vi*.
- 114774        **Dot**
- 114775        The symbolic name *dot* is carefully used in POSIX.1 to distinguish the working directory  
114776        filename from a period or a decimal point.
- 114777        **Dot-Dot**
- 114778        Historical implementations permit the use of these filenames without their special meanings.  
114779        Such use precludes any meaningful use of these filenames by a Conforming POSIX.1  
114780        Application. Therefore, such use is considered an extension, the use of which makes an  
114781        implementation non-conforming; see also [Section A.4.12](#) (on page 3449).

**114782 Epoch**

114783 Historically, the origin of UNIX system time was referred to as “00:00:00 GMT, January 1, 1970”.  
114784 Greenwich Mean Time is actually not a term acknowledged by the international standards  
114785 community; therefore, this term, “Epoch”, is used to abbreviate the reference to the actual  
114786 standard, Coordinated Universal Time.

**114787 FIFO Special File**

114788 See [Pipe](#) (on page 3433).

**114789 File**

114790 It is permissible for an implementation-defined file type to be non-readable or non-writable.

**114791 File Classes**

114792 These classes correspond to the historical sets of permission bits. The classes are general to  
114793 allow implementations flexibility in expanding the access mechanism for more stringent security  
114794 environments. Note that a process is in one and only one class, so there is no ambiguity.

**114795 Filename**

114796 At the present time, the primary responsibility for truncating filenames containing multi-byte  
114797 characters must reside with the application. Some industry groups involved in  
114798 internationalization believe that in the future the responsibility must reside with the kernel. For  
114799 the moment, a clearer understanding of the implications of making the kernel responsible for  
114800 truncation of multi-byte filenames is needed.

114801 Character-level truncation was not adopted because there is no support in POSIX.1 that advises  
114802 how the kernel distinguishes between single and multi-byte characters. Until that time, it must  
114803 be incumbent upon application developers to determine where multi-byte characters must be  
114804 truncated.

**114805 File System**

114806 Historically, the meaning of this term has been overloaded with two meanings: that of the  
114807 complete file hierarchy, and that of a mountable subset of that hierarchy; that is, a mounted file  
114808 system. POSIX.1 uses the term “file system” in the second sense, except that it is limited to the  
114809 scope of a process (and root directory of a process). This usage also clarifies the domain in which  
114810 a file serial number is unique.

**114811 Graphic Character**

114812 This definition is made available for those definitions (in particular, *TZ*) which must exclude  
114813 control characters.

**114814 Group Database**

114815 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/4 is applied, removing the words “of  
114816 implementation-defined format”. See [User Database](#) (on page 3442).

**114817 Group File\***

114818 Implementation-defined; see [User Database](#) (on page 3442).

**114819 Historical Implementations\***

114820 This refers to previously existing implementations of programming interfaces and operating  
114821 systems that are related to the interface specified by POSIX.1.

**114822 Hosted Implementation\***

114823 This refers to a POSIX.1 implementation that is accomplished through interfaces from the  
114824 POSIX.1 services to some alternate form of operating system kernel services. Note that the line  
114825 between a hosted implementation and a native implementation is blurred, since most  
114826 implementations will provide some services directly from the kernel and others through some  
114827 indirect path. (For example, *fopen()* might use *open()*; or *mkfifo()* might use *mknod()*.) There is  
114828 no necessary relationship between the type of implementation and its correctness, performance,  
114829 and/or reliability.

**114830 Implementation\***

114831 This term is generally used instead of its synonym, “system”, to emphasize the consequences of  
114832 decisions to be made by system implementors. Perhaps if no options or extensions to POSIX.1  
114833 were allowed, this usage would not have occurred.

114834 The term “specific implementation” is sometimes used as a synonym for “implementation”.  
114835 This should not be interpreted too narrowly; both terms can represent a relatively broad group  
114836 of systems. For example, a hardware vendor could market a very wide selection of systems that  
114837 all used the same instruction set, with some systems desktop models and others large multi-user  
114838 minicomputers. This wide range would probably share a common POSIX.1 operating system,  
114839 allowing an application compiled for one to be used on any of the others; this is a [*specific*]  
114840 *implementation*. However, such a wide range of machines probably has some differences  
114841 between the models. Some may have different clock rates, different file systems, different  
114842 resource limits, different network connections, and so on, depending on their sizes or intended  
114843 usages. Even on two identical machines, the system administrators may configure them  
114844 differently. Each of these different systems is known by the term “a specific instance of a specific  
114845 implementation”. This term is only used in the portions of POSIX.1 dealing with runtime  
114846 queries: *sysconf()* and *pathconf()*.

**114847 Incomplete Pathname\***

114848 Absolute pathname has been adequately defined.

**114849 Job Control**

114850 In order to understand the job control facilities in POSIX.1 it is useful to understand how they  
114851 are used by a job control-cognizant shell to create the user interface effect of job control.

114852 While the job control facilities supplied by POSIX.1 can, in theory, support different types of  
114853 interactive job control interfaces supplied by different types of shells, there was historically one  
114854 particular interface that was most common when the standard was originally developed  
114855 (provided by BSD C Shell).

114856 This discussion describes that interface as a means of illustrating how the POSIX.1 job control  
114857 facilities can be used.

114858 Job control allows users to selectively stop (suspend) the execution of processes and continue  
114859 (resume) their execution at a later point. The user typically employs this facility via the

114860 interactive interface jointly supplied by the terminal I/O driver and a command interpreter  
114861 (shell).

114862 The user can launch jobs (command pipelines) in either the foreground or background. When  
114863 launched in the foreground, the shell waits for the job to complete before prompting for  
114864 additional commands. When launched in the background, the shell does not wait, but  
114865 immediately prompts for new commands.

114866 If the user launches a job in the foreground and subsequently regrets this, the user can type the  
114867 suspend character (typically set to <control>-Z), which causes the foreground job to stop and the  
114868 shell to begin prompting for new commands. The stopped job can be continued by the user (via  
114869 special shell commands) either as a foreground job or as a background job. Background jobs can  
114870 also be moved into the foreground via shell commands.

114871 If a background job attempts to access the login terminal (controlling terminal), it is stopped by  
114872 the terminal driver and the shell is notified, which, in turn, notifies the user. (Terminal access  
114873 includes *read()* and certain terminal control functions, and conditionally includes *write()*.) The  
114874 user can continue the stopped job in the foreground, thus allowing the terminal access to  
114875 succeed in an orderly fashion. After the terminal access succeeds, the user can optionally move  
114876 the job into the background via the suspend character and shell commands.

#### 114877 *Implementing Job Control Shells*

114878 The interactive interface described previously can be accomplished using the POSIX.1 job  
114879 control facilities in the following way.

114880 The key feature necessary to provide job control is a way to group processes into jobs. This  
114881 grouping is necessary in order to direct signals to a single job and also to identify which job is in  
114882 the foreground. (There is at most one job that is in the foreground on any controlling terminal at  
114883 a time.)

114884 The concept of process groups is used to provide this grouping. The shell places each job in a  
114885 separate process group via the *setpgid()* function. To do this, the *setpgid()* function is invoked by  
114886 the shell for each process in the job. It is actually useful to invoke *setpgid()* twice for each  
114887 process: once in the child process, after calling *fork()* to create the process, but before calling one  
114888 of the *exec* family of functions to begin execution of the program, and once in the parent shell  
114889 process, after calling *fork()* to create the child. The redundant invocation avoids a race condition  
114890 by ensuring that the child process is placed into the new process group before either the parent  
114891 or the child relies on this being the case. The process group ID for the job is selected by the shell  
114892 to be equal to the process ID of one of the processes in the job. Some shells choose to make one  
114893 process in the job be the parent of the other processes in the job (if any). Other shells (for  
114894 example, the C Shell) choose to make themselves the parent of all processes in the pipeline (job).  
114895 In order to support this latter case, the *setpgid()* function accepts a process group ID parameter  
114896 since the correct process group ID cannot be inherited from the shell. The shell itself is  
114897 considered to be a job and is the sole process in its own process group.

114898 The shell also controls which job is currently in the foreground. A foreground and background  
114899 job differ in two ways: the shell waits for a foreground command to complete (or stop) before  
114900 continuing to read new commands, and the terminal I/O driver inhibits terminal access by  
114901 background jobs (causing the processes to stop). Thus, the shell must work cooperatively with  
114902 the terminal I/O driver and have a common understanding of which job is currently in the  
114903 foreground. It is the user who decides which command should be currently in the foreground,  
114904 and the user informs the shell via shell commands. The shell, in turn, informs the terminal I/O  
114905 driver via the *tcsetpgrp()* function. This indicates to the terminal I/O driver the process group ID  
114906 of the foreground process group (job). When the current foreground job either stops or  
114907 terminates, the shell places itself in the foreground via *tcsetpgrp()* before prompting for  
114908 additional commands. Note that when a job is created the new process group begins as a

114909 background process group. It requires an explicit act of the shell via *tcsetpgrp()* to move a  
114910 process group (job) into the foreground.

114911 When a process in a job stops or terminates, its parent (for example, the shell) receives  
114912 synchronous notification by calling the *waitpid()* function with the WUNTRACED flag set.  
114913 Asynchronous notification is also provided when the parent establishes a signal handler for  
114914 SIGCHLD and does not specify the SA\_NOCLDSTOP flag. Usually all processes in a job stop as  
114915 a unit since the terminal I/O driver always sends job control stop signals to all processes in the  
114916 process group.

114917 To continue a stopped job, the shell sends the SIGCONT signal to the process group of the job. In  
114918 addition, if the job is being continued in the foreground, the shell invokes *tcsetpgrp()* to place the  
114919 job in the foreground before sending SIGCONT. Otherwise, the shell leaves itself in the  
114920 foreground and reads additional commands.

114921 There is additional flexibility in the POSIX.1 job control facilities that allows deviations from the  
114922 typical interface. Clearing the TOSTOP terminal flag allows background jobs to perform *write()*  
114923 functions without stopping. The same effect can be achieved on a per-process basis by having a  
114924 process set the signal action for SIGTTOU to SIG\_IGN.

114925 Note that the terms “job” and “process group” can be used interchangeably. A login session that  
114926 is not using the job control facilities can be thought of as a large collection of processes that are  
114927 all in the same job (process group). Such a login session may have a partial distinction between  
114928 foreground and background processes; that is, the shell may choose to wait for some processes  
114929 before continuing to read new commands and may not wait for other processes. However, the  
114930 terminal I/O driver will consider all these processes to be in the foreground since they are all  
114931 members of the same process group.

114932 In addition to the basic job control operations already mentioned, a job control-cognizant shell  
114933 needs to perform the following actions.

114934 When a foreground (not background) job stops, the shell must sample and remember the current  
114935 terminal settings so that it can restore them later when it continues the stopped job in the  
114936 foreground (via the *tcgetattr()* and *tcsetattr()* functions).

114937 Because a shell itself can be spawned from a shell, it must take special action to ensure that  
114938 subshells interact well with their parent shells.

114939 A subshell can be spawned to perform an interactive function (prompting the terminal for  
114940 commands) or a non-interactive function (reading commands from a file). When operating non-  
114941 interactively, the job control shell will refrain from performing the job control-specific actions  
114942 described above. It will behave as a shell that does not support job control. For example, all jobs  
114943 will be left in the same process group as the shell, which itself remains in the process group  
114944 established for it by its parent. This allows the shell and its children to be treated as a single job  
114945 by a parent shell, and they can be affected as a unit by terminal keyboard signals.

114946 An interactive subshell can be spawned from another job control-cognizant shell in either the  
114947 foreground or background. (For example, from the C Shell, the user can execute the command,  
114948 *csch &*.) Before the subshell activates job control by calling *setpgid()* to place itself in its own  
114949 process group and *tcsetpgrp()* to place its new process group in the foreground, it needs to  
114950 ensure that it has already been placed in the foreground by its parent. (Otherwise, there could  
114951 be multiple job control shells that simultaneously attempt to control mediation of the terminal.)  
114952 To determine this, the shell retrieves its own process group via *getpgrp()* and the process group  
114953 of the current foreground job via *tcgetpgrp()*. If these are not equal, the shell sends SIGTTIN  
114954 to its own process group, causing itself to stop. When continued later by its parent, the shell  
114955 repeats the process group check. When the process groups finally match, the shell is in the  
114956 foreground and it can proceed to take control. After this point, the shell ignores all the job

114957 control stop signals so that it does not inadvertently stop itself.

#### 114958 *Implementing Job Control Applications*

114959 Most applications do not need to be aware of job control signals and operations; the intuitively  
114960 correct behavior happens by default. However, sometimes an application can inadvertently  
114961 interfere with normal job control processing, or an application may choose to overtly effect job  
114962 control in cooperation with normal shell procedures.

114963 An application can inadvertently subvert job control processing by “blindly” altering the  
114964 handling of signals. A common application error is to learn how many signals the system  
114965 supports and to ignore or catch them all. Such an application makes the assumption that it does  
114966 not know what this signal is, but knows the right handling action for it. The system may  
114967 initialize the handling of job control stop signals so that they are being ignored. This allows  
114968 shells that do not support job control to inherit and propagate these settings and hence to be  
114969 immune to stop signals. A job control shell will set the handling to the default action and  
114970 propagate this, allowing processes to stop. In doing so, the job control shell is taking  
114971 responsibility for restarting the stopped applications. If an application wishes to catch the stop  
114972 signals itself, it should first determine their inherited handling states. If a stop signal is being  
114973 ignored, the application should continue to ignore it. This is directly analogous to the  
114974 recommended handling of SIGINT described in the referenced UNIX Programmer’s Manual.

114975 If an application is reading the terminal and has disabled the interpretation of special characters  
114976 (by clearing the ISIG flag), the terminal I/O driver will not send SIGTSTP when the suspend  
114977 character is typed. Such an application can simulate the effect of the suspend character by  
114978 recognizing it and sending SIGTSTP to its process group as the terminal driver would have  
114979 done. Note that the signal is sent to the process group, not just to the application itself; this  
114980 ensures that other processes in the job also stop. (Note also that other processes in the job could  
114981 be children, siblings, or even ancestors.) Applications should not assume that the suspend  
114982 character is <control>-Z (or any particular value); they should retrieve the current setting at  
114983 startup.

#### 114984 *Implementing Job Control Systems*

114985 The intent in adding 4.2 BSD-style job control functionality was to adopt the necessary 4.2 BSD  
114986 programmatic interface with only minimal changes to resolve syntactic or semantic conflicts  
114987 with System V or to close recognized security holes. The goal was to maximize the ease of  
114988 providing both conforming implementations and Conforming POSIX.1 Applications.

114989 It is only useful for a process to be affected by job control signals if it is the descendant of a job  
114990 control shell. Otherwise, there will be nothing that continues the stopped process.

114991 POSIX.1 does not specify how controlling terminal access is affected by a user logging out (that  
114992 is, by a controlling process terminating). 4.2 BSD uses the *vhangup()* function to prevent any  
114993 access to the controlling terminal through file descriptors opened prior to logout. System V does  
114994 not prevent controlling terminal access through file descriptors opened prior to logout (except  
114995 for the case of the special file, */dev/tty*). Some implementations choose to make processes  
114996 immune from job control after logout (that is, such processes are always treated as if in the  
114997 foreground); other implementations continue to enforce foreground/background checks after  
114998 logout. Therefore, a Conforming POSIX.1 Application should not attempt to access the  
114999 controlling terminal after logout since such access is unreliable. If an implementation chooses to  
115000 deny access to a controlling terminal after its controlling process exits, POSIX.1 requires a certain  
115001 type of behavior (see [Controlling Terminal](#), on page 3424).

- 115002        **Kernel\***
- 115003        See [System Call\\*](#) (on page 3440).
- 115004        **Library Routine\***
- 115005        See [System Call\\*](#) (on page 3440).
- 115006        **Logical Device\***
- 115007        Implementation-defined.
- 115008        **Map**
- 115009        The definition of map is included to clarify the usage of mapped pages in the description of the  
115010        behavior of process memory locking.
- 115011        **Memory-Resident**
- 115012        The term “memory-resident” is historically understood to mean that the so-called resident pages  
115013        are actually present in the physical memory of the computer system and are immune from  
115014        swapping, paging, copy-on-write faults, and so on. This is the actual intent of POSIX.1-2008 in  
115015        the process memory locking section for implementations where this is logical. But for some  
115016        implementations—primarily mainframes—actually locking pages into primary storage is not  
115017        advantageous to other system objectives, such as maximizing throughput. For such  
115018        implementations, memory locking is a “hint” to the implementation that the application wishes  
115019        to avoid situations that would cause long latencies in accessing memory. Furthermore, there are  
115020        other implementation-defined issues with minimizing memory access latencies that “memory  
115021        residency” does not address—such as MMU reload faults. The definition attempts to  
115022        accommodate various implementations while allowing conforming applications to specify to the  
115023        implementation that they want or need the best memory access times that the implementation  
115024        can provide.
- 115025        **Memory Object\***
- 115026        The term “memory object” usually implies shared memory. If the object is the same as a  
115027        filename in the file system name space of the implementation, it is expected that the data written  
115028        into the memory object be preserved on disk. A memory object may also apply to a physical  
115029        device on an implementation. In this case, writes to the memory object are sent to the controller  
115030        for the device and reads result in control registers being returned.
- 115031        **Mount Point\***
- 115032        The directory on which a “mounted file system” is mounted. This term, like *mount()* and  
115033        *umount()*, was not included because it was implementation-defined.
- 115034        **Mounted File System\***
- 115035        See [File System](#) (on page 3426).

115036 **Name**

115037 There are no explicit limits in POSIX.1-2008 on the sizes of names, words (see the definition of  
 115038 word in the Base Definitions volume of POSIX.1-2008), lines, or other objects. However, other  
 115039 implicit limits do apply: shell script lines produced by many of the standard utilities cannot  
 115040 exceed {LINE\_MAX} and the sum of exported variables comes under the {ARG\_MAX} limit.  
 115041 Historical shells dynamically allocate memory for names and words and parse incoming lines a  
 115042 character at a time. Lines cannot have an arbitrary {LINE\_MAX} limit because of historical  
 115043 practice, such as makefiles, where *make* removes the <newline> characters associated with the  
 115044 commands for a target and presents the shell with one very long line. The text on INPUT FILES  
 115045 in XCU Section 1.4 (on page 2288) does allow a shell to run out of memory, but it cannot have  
 115046 arbitrary programming limits.

115047 **Native Implementation\***

115048 This refers to an implementation of POSIX.1 that interfaces directly to an operating system  
 115049 kernel; see also *hosted implementation*. A similar concept is a native UNIX system, which would  
 115050 be a kernel derived from one of the original UNIX system products.

115051 **Nice Value**

115052 This definition is not intended to suggest that all processes in a system have priorities that are  
 115053 comparable. Scheduling policy extensions, such as adding realtime priorities, make the notion of  
 115054 a single underlying priority for all scheduling policies problematic. Some implementations may  
 115055 implement the features related to *nice* to affect all processes on the system, others to affect just  
 115056 the general time-sharing activities implied by POSIX.1-2008, and others may have no effect at all.  
 115057 Because of the use of “implementation-defined” in *nice* and *renice*, a wide range of  
 115058 implementation strategies is possible.

115059 **Open File Description**

115060 An “open file description”, as it is currently named, describes how a file is being accessed. What  
 115061 is currently called a “file descriptor” is actually just an identifier or “handle”; it does not  
 115062 actually describe anything.

115063 The following alternate names were discussed:

- 115064 • For “open file description”:  
 115065 “open instance”, “file access description”, “open file information”, and “file access  
 115066 information”.
- 115067 • For “file descriptor”:  
 115068 “file handle”, “file number” (cf., *fileno()*). Some historical implementations use the term  
 115069 “file table entry”.

115070 **Orphaned Process Group**

115071 Historical implementations have a concept of an orphaned process, which is a process whose  
 115072 parent process has exited. When job control is in use, it is necessary to prevent processes from  
 115073 being stopped in response to interactions with the terminal after they no longer are controlled by  
 115074 a job control-cognizant program. Because signals generated by the terminal are sent to a process  
 115075 group and not to individual processes, and because a signal may be provoked by a process that  
 115076 is not orphaned, but sent to another process that is orphaned, it is necessary to define an  
 115077 orphaned process group. The definition assumes that a process group will be manipulated as a  
 115078 group and that the job control-cognizant process controlling the group is outside of the group  
 115079 and is the parent of at least one process in the group (so that state changes may be reported via  
 115080 *waitpid()*). Therefore, a group is considered to be controlled as long as at least one process in the

- 115081 group has a parent that is outside of the process group, but within the session.
- 115082 This definition of orphaned process groups ensures that a session leader's process group is  
115083 always considered to be orphaned, and thus it is prevented from stopping in response to  
115084 terminal signals.
- 115085 **Page**
- 115086 The term "page" is defined to support the description of the behavior of memory mapping for  
115087 shared memory and memory mapped files, and the description of the behavior of process  
115088 memory locking. It is not intended to imply that shared memory/file mapping and memory  
115089 locking are applicable only to "paged" architectures. For the purposes of POSIX.1-2008,  
115090 whatever the granularity on which an architecture supports mapping or locking, this is  
115091 considered to be a "page" . If an architecture cannot support the memory mapping or locking  
115092 functions specified by POSIX.1-2008 on any granularity, then these options will not be  
115093 implemented on the architecture.
- 115094 **Passwd File\***
- 115095 Implementation-defined; see [User Database](#) (on page 3442).
- 115096 **Parent Directory**
- 115097 There may be more than one directory entry pointing to a given directory in some  
115098 implementations. The wording here identifies that exactly one of those is the parent directory. In  
115099 pathname resolution, dot-dot is identified as the way that the unique directory is identified.  
115100 (That is, the parent directory is the one to which dot-dot points.) In the case of a remote file  
115101 system, if the same file system is mounted several times, it would appear as if they were distinct  
115102 file systems (with interesting synchronization properties).
- 115103 **Pipe**
- 115104 It proved convenient to define a pipe as a special case of a FIFO, even though historically the  
115105 latter was not introduced until System III and does not exist at all in 4.3 BSD.
- 115106 **Portable Filename Character Set**
- 115107 The encoding of this character set is not specified—specifically, ASCII is not required. But the  
115108 implementation must provide a unique character code for each of the printable graphics  
115109 specified by POSIX.1; see also [Section A.4.6](#) (on page 3445).
- 115110 Situations where characters beyond the portable filename character set (or historically ASCII or  
115111 the ISO/IEC 646:1991 standard) would be used (in a context where the portable filename  
115112 character set or the ISO/IEC 646:1991 standard is required by POSIX.1) are expected to be  
115113 common. Although such a situation renders the use technically non-compliant, mutual  
115114 agreement among the users of an extended character set will make such use portable between  
115115 those users. Such a mutual agreement could be formalized as an optional extension to POSIX.1.  
115116 (Making it required would eliminate too many possible systems, as even those systems using the  
115117 ISO/IEC 646:1991 standard as a base character set extend their character sets for Western  
115118 Europe and the rest of the world in different ways.)
- 115119 Nothing in POSIX.1 is intended to preclude the use of extended characters where interchange is  
115120 not required or where mutual agreement is obtained. It has been suggested that in several places  
115121 "should" be used instead of "shall". Because (in the worst case) use of any character beyond the  
115122 portable filename character set would render the program or data not portable to all possible  
115123 systems, no extensions are permitted in this context.

**115124 Process Lifetime**

115125 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/5 is applied, adding `fork()`, `posix_spawn()`,  
115126 `posix_spawnp()`, and `vfork()` to the list of functions.

**115127 Process Termination**

115128 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/6 is applied, rewording the definition to  
115129 address the “passive exit” on termination of the last thread or the `_Exit()` function.

**115130 Regular File**

115131 POSIX.1 does not intend to preclude the addition of structuring data (for example, record  
115132 lengths) in the file, as long as such data is not visible to an application that uses the features  
115133 described in POSIX.1.

**115134 Root Directory**

115135 This definition permits the operation of `chroot()`, even though that function is not in POSIX.1; see  
115136 also [Section A.4.5](#) (on page 3444).

**115137 Root File System\***

115138 Implementation-defined.

**115139 Root of a File System\***

115140 Implementation-defined; see [Mount Point\\*](#) (on page 3431).

**115141 Signal**

115142 The definition implies a double meaning for the term. Although a signal is an event, common  
115143 usage implies that a signal is an identifier of the class of event.

**115144 Superuser\***

115145 This concept, with great historical significance to UNIX system users, has been replaced with the  
115146 notion of appropriate privileges.

**115147 Supplementary Group ID**

115148 The POSIX.1-1990 standard is inconsistent in its treatment of supplementary groups. The  
115149 definition of supplementary group ID explicitly permits the effective group ID to be included in  
115150 the set, but wording in the description of the `setuid()` and `setgid()` functions states: “Any  
115151 supplementary group IDs of the calling process remain unchanged by these function calls”. In  
115152 the case of `setgid()` this contradicts that definition. In addition, some felt that the unspecified  
115153 behavior in the definition of supplementary group IDs adds unnecessary portability problems.  
115154 The standard developers considered several solutions to this problem:

- 115155 1. Reword the description of `setgid()` to permit it to change the supplementary group IDs to  
115156 reflect the new effective group ID. A problem with this is that it adds more “may”s to the  
115157 wording and does not address the portability problems of this optional behavior.
- 115158 2. Mandate the inclusion of the effective group ID in the supplementary set (giving  
115159 {NGROUPS\_MAX} a minimum value of 1). This is the behavior of 4.4 BSD. In that  
115160 system, the effective group ID is the first element of the array of supplementary group  
115161 IDs (there is no separate copy stored, and changes to the effective group ID are made only  
115162 in the supplementary group set). By convention, the initial value of the effective group ID

- 115163 is duplicated elsewhere in the array so that the initial value is not lost when executing a  
115164 set-group-ID program.
- 115165 3. Change the definition of supplementary group ID to exclude the effective group ID and  
115166 specify that the effective group ID does not change the set of supplementary group IDs.  
115167 This is the behavior of 4.2 BSD, 4.3 BSD, and System V Release 4.
- 115168 4. Change the definition of supplementary group ID to exclude the effective group ID, and  
115169 require that *getgroups()* return the union of the effective group ID and the supplementary  
115170 group IDs.
- 115171 5. Change the definition of {NGROUPS\_MAX} to be one more than the number of  
115172 supplementary group IDs, so it continues to be the number of values returned by  
115173 *getgroups()* and existing applications continue to work. This alternative is effectively the  
115174 same as the second (and might actually have the same implementation).

115175 The standard developers decided to permit either 2 or 3. The effective group ID is orthogonal to  
115176 the set of supplementary group IDs, and it is implementation-defined whether *getgroups()*  
115177 returns this. If the effective group ID is returned with the set of supplementary group IDs, then  
115178 all changes to the effective group ID affect the supplementary group set returned by *getgroups()*.  
115179 It is permissible to eliminate duplicates from the list returned by *getgroups()*. However, if a  
115180 group ID is contained in the set of supplementary group IDs, setting the group ID to that value  
115181 and then to a different value should not remove that value from the supplementary group IDs.

115182 The definition of supplementary group IDs has been changed to not include the effective group  
115183 ID. This simplifies permanent rationale and makes the relevant functions easier to understand.  
115184 The *getgroups()* function has been modified so that it can, on an implementation-defined basis,  
115185 return the effective group ID. By making this change, functions that modify the effective group  
115186 ID do not need to discuss adding to the supplementary group list; the only view into the  
115187 supplementary group list that the application developer has is through the *getgroups()* function.

### 115188 **Symbolic Constant**

115189 Earlier versions of this standard used a variety of terms other than “macro” for many of the  
115190 constants defined in headers, and it was not clear in which of these cases they were required to  
115191 be macros or not, or to be pre-processor constants (i.e., usable in *#if*) or not. In cases where the  
115192 symbols had a reserved prefix or suffix, there was often inconsistency between whether the  
115193 prefix/suffix was reserved only for macros or for any use, and whether the term “macro” or a  
115194 different term was used in the descriptions of the symbols. There were also some unintentional  
115195 differences from the ISO C standard.

115196 One of the most commonly used terms was “symbolic constant”. This has now been designated  
115197 as the default term to be used wherever appropriate, and a formal definition of the term has  
115198 been added giving the exact requirements for symbols that are described as symbolic constants.

115199 The standard developers have performed a major rationalization of the header descriptions of  
115200 symbols with constant values according to the following policy:

- 115201 • Where symbols are from the ISO C standard, the wording from the ISO C standard (or  
115202 equivalent, in cases where the exact wording is not appropriate) is used to describe them.
- 115203 • For all other constants, the first choice is to use “symbolic constant” when the  
115204 requirements for the symbol are a reasonably close fit with those of the term.

115205 The description of the symbol can override individual requirements for symbolic  
115206 constants; e.g., to specify a non-integer type, or to add a requirement that the symbol is  
115207 usable in *#if* preprocessor directives.

115208 • When neither of the above apply, the exact requirements are stated in the description.  
 115209 (Note that macros are not required to be usable in `#if`, or even to expand to constant  
 115210 expressions, unless explicitly stated.)

115211 • In cases where there is a reserved prefix or suffix, if the symbol(s) with that prefix/suffix  
 115212 are from the ISO C standard and are required to be macros, or if the symbol is required to  
 115213 be usable in `#if`, then the prefix/suffix is reserved for use only as macros. If the symbol(s)  
 115214 are “symbolic constants” and not required to be usable in `#if`, the prefix/suffix is reserved  
 115215 for any use except in a few special cases.

115216 Where a constant is required to be a macro but is also allowed to be another type of constant  
 115217 such as an enumeration constant, on implementations which do define it as another type of  
 115218 constant the macro is typically defined as follows:

```
115219 #define macro_name macro_name
```

115220 This allows applications to use `#ifdef`, etc. to determine whether the macro is defined, but the  
 115221 macro is not usable in `#if` preprocessor directives because the preprocessor will treat the  
 115222 unexpanded word `macro_name` as having the value zero.

### 115223 Symbolic Link

115224 Earlier versions of this standard did not require symbolic links to have attributes such as  
 115225 ownership and a file serial number. This was because the 4.4 BSD implementation did not have  
 115226 them, and it was expected that other implementations may wish to do the same. However,  
 115227 experience with 4.4 BSD has shown that symbolic links implemented in this way cause problems  
 115228 for users and application developers, and later BSD systems have reverted to using `inodes`  
 115229 to implement symbolic links. Allowing `no-inode` symbolic links also caused problems in the  
 115230 standard. For example, leaving the `st_ino` value for symbolic links unspecified meant that the  
 115231 common technique of comparing the `st_dev` and `st_ino` values for two pathnames to see if they  
 115232 refer to the same file could only be used with `stat()` in conforming applications and not with  
 115233 `lstat()`. The standard now requires symbolic links to have meaningful values for the same **struct**  
 115234 **stat** fields as regular files, except for the file mode bits in `st_mode`. Historically, the file mode bits  
 115235 were unused (the contents of a symbolic link could always be read), but implementations  
 115236 differed as to whether the file mode bits (as returned in `st_mode` or reported by `ls -l`) were set  
 115237 according to the `umask` or just to a fixed value such as `0777`. Accordingly, the standard requires  
 115238 the file mode bits to be ignored by `readlink()` and when a symbolic link is followed during  
 115239 pathname resolution, but leaves the corresponding part of the value returned in `st_mode`  
 115240 unspecified.

115241 Historical implementations were followed when determining which interfaces should apply to  
 115242 symbolic links. Interfaces that historically followed symbolic links include `chmod()`, `stat()`, and  
 115243 `utime()`. Interfaces that historically did not follow symbolic links include `lstat()`, `rename()`,  
 115244 `remove()`, `rmdir()`, and `unlink()`. For `chown()` and `link()`, historical implementations differed.  
 115245 POSIX.1-2008 inherited the `lchown()` function from the Single UNIX Specification, Version 2, and  
 115246 therefore requires `chown()` to follow symbolic links. Earlier versions of this standard required  
 115247 `link()` to follow symbolic links, but with the addition of the `linkat()` function (which has a flag to  
 115248 indicate whether to follow symbolic links), both behaviors are now allowed for `link()`.

115249 When the final component of a pathname is a symbolic link, the standard requires that a trailing  
 115250 `<slash>` causes the link to be followed. This is the behavior of historical implementations. For  
 115251 example, for `/a/b` and `/a/b/`, if `/a/b` is a symbolic link to a directory, then `/a/b` refers to the  
 115252 symbolic link, and `/a/b/` refers to the directory to which the symbolic link points.

115253 Because a symbolic link and its referenced object coexist in the file system name space, confusion  
 115254 can arise in distinguishing between the link itself and the referenced object. Historically, utilities  
 115255 and system calls have adopted their own link following conventions in a somewhat *ad hoc*

115256 fashion. Rules for a uniform approach are outlined here, although historical practice has been  
 115257 adhered to as much as was possible. To promote consistent system use, user-written utilities are  
 115258 encouraged to follow these same rules.

115259 Symbolic links are handled either by operating on the link itself, or by operating on the object  
 115260 referenced by the link. In the latter case, an application or system call is said to “follow” the link.  
 115261 Symbolic links may reference other symbolic links, in which case links are dereferenced until an  
 115262 object that is not a symbolic link is found, a symbolic link that references a file that does not exist  
 115263 is found, or a loop is detected. (Current implementations do not detect loops, but have a limit on  
 115264 the number of symbolic links that they will dereference before declaring it an error.)

115265 There are four domains for which default symbolic link policy is established in a system. In  
 115266 almost all cases, there are utility options that override this default behavior. The four domains  
 115267 are as follows:

- 115268 1. Symbolic links specified to system calls that take filename arguments
- 115269 2. Symbolic links specified as command line filename arguments to utilities that are not  
 115270 performing a traversal of a file hierarchy
- 115271 3. Symbolic links referencing files not of type directory, specified to utilities that are  
 115272 performing a traversal of a file hierarchy
- 115273 4. Symbolic links referencing files of type directory, specified to utilities that are performing  
 115274 a traversal of a file hierarchy

#### 115275 *First Domain*

115276 The first domain is considered in earlier rationale.

#### 115277 *Second Domain*

115278 The reason this category is restricted to utilities that are not traversing the file hierarchy is that  
 115279 some standard utilities take an option that specifies a hierarchical traversal, but by default  
 115280 operate on the arguments themselves. Generally, users specifying the option for a file hierarchy  
 115281 traversal wish to operate on a single, physical hierarchy, and therefore symbolic links, which  
 115282 may reference files outside of the hierarchy, are ignored. For example, *chown owner file* is a  
 115283 different operation from the same command with the **-R** option specified. In this example, the  
 115284 behavior of the command *chown owner file* is described here, while the behavior of the command  
 115285 *chown -R owner file* is described in the third and fourth domains.

115286 The general rule is that the utilities in this category follow symbolic links named as arguments.

115287 Exceptions in the second domain are:

- 115288 • The *mv* and *rm* utilities do not follow symbolic links named as arguments, but respectively  
 115289 attempt to rename or delete them.
- 115290 • The *ls* utility is also an exception to this rule. For compatibility with historical systems,  
 115291 when the **-R** option is not specified, the *ls* utility follows symbolic links named as  
 115292 arguments if the **-L** option is specified or if the **-F**, **-d**, or **-l** options are not specified. (If  
 115293 the **-L** option is specified, *ls* always follows symbolic links; it is the only utility where the  
 115294 **-L** option affects its behavior even though a tree walk is not being performed.)

115295 All other standard utilities, when not traversing a file hierarchy, always follow symbolic links  
 115296 named as arguments.

115297 Historical practice is that the **-h** option is specified if standard utilities are to act upon symbolic  
 115298 links instead of upon their targets. Examples of commands that have historically had a **-h** option  
 115299 for this purpose are the *chgrp*, *chown*, *file*, and *test* utilities.

115300 *Third Domain*

115301 The third domain is symbolic links, referencing files not of type directory, specified to utilities  
 115302 that are performing a traversal of a file hierarchy. (This includes symbolic links specified as  
 115303 command line filename arguments or encountered during the traversal.)

115304 The intention of the Shell and Utilities volume of POSIX.1-2008 is that the operation that the  
 115305 utility is performing is applied to the symbolic link itself, if that operation is applicable to  
 115306 symbolic links. If the operation is not applicable to symbolic links, the symbolic link should be  
 115307 ignored. Specifically, by default, no change should be made to the file referenced by the symbolic  
 115308 link.

115309 *Fourth Domain*

115310 The fourth domain is symbolic links referencing files of type directory, specified to utilities that  
 115311 are performing a traversal of a file hierarchy. (This includes symbolic links specified as  
 115312 command line filename arguments or encountered during the traversal.)

115313 Most standard utilities do not, by default, indirect into the file hierarchy referenced by the  
 115314 symbolic link. (The Shell and Utilities volume of POSIX.1-2008 uses the informal term “physical  
 115315 walk” to describe this case. The case where the utility does indirect through the symbolic link is  
 115316 termed a “logical walk”.)

115317 There are three reasons for the default to be a physical walk:

- 115318 1. With very few exceptions, a physical walk has been the historical default on UNIX  
 115319 systems supporting symbolic links. Because some utilities (that is, *rm*) must default to a  
 115320 physical walk, regardless, changing historical practice in this regard would be confusing  
 115321 to users and needlessly incompatible.
- 115322 2. For systems where symbolic links have the historical file attributes (that is, *owner*, *group*,  
 115323 *mode*), defaulting to a logical traversal would require the addition of a new option to the  
 115324 commands to modify the attributes of the link itself. This is painful and more complex  
 115325 than the alternatives.
- 115326 3. There is a security issue with defaulting to a logical walk. Historically, the command  
 115327 *chown -R user file* has been safe for the superuser because *setuid* and *setgid* bits were lost  
 115328 when the ownership of the file was changed. If the walk were logical, changing  
 115329 ownership would no longer be safe because a user might have inserted a symbolic link  
 115330 pointing to any file in the tree. Again, this would necessitate the addition of an option to  
 115331 the commands doing hierarchy traversal to not indirect through the symbolic links, and  
 115332 historical scripts doing recursive walks would instantly become security problems. While  
 115333 this is mostly an issue for system administrators, it is preferable to not have different  
 115334 defaults for different classes of users.

115335 However, the standard developers agreed to leave it unspecified to achieve consensus.

115336 As consistently as possible, users may cause standard utilities performing a file hierarchy  
 115337 traversal to follow any symbolic links named on the command line, regardless of the type of file  
 115338 they reference, by specifying the **-H** (for half logical) option. This option is intended to make the  
 115339 command line name space look like the logical name space.

115340 As consistently as possible, users may cause standard utilities performing a file hierarchy  
 115341 traversal to follow any symbolic links named on the command line as well as any symbolic links  
 115342 encountered during the traversal, regardless of the type of file they reference, by specifying the  
 115343 **-L** (for logical) option. This option is intended to make the entire name space look like the  
 115344 logical name space.

115345 For consistency, implementors are encouraged to use the **-P** (for “physical”) flag to specify the

- 115346 physical walk in utilities that do logical walks by default for whatever reason.
- 115347 When one or more of the **-H**, **-L**, and **-P** flags can be specified, the last one specified determines  
115348 the behavior of the utility. This permits users to alias commands so that the default behavior is a  
115349 logical walk and then override that behavior on the command line.
- 115350 *Exceptions in the Third and Fourth Domains*
- 115351 The *ls* and *rm* utilities are exceptions to these rules. The *rm* utility never follows symbolic links  
115352 and does not support the **-H**, **-L**, or **-P** options. Some historical versions of *ls* always followed  
115353 symbolic links given on the command line whether the **-L** option was specified or not.  
115354 Historical versions of *ls* did not support the **-H** option. In POSIX.1-2008, unless one of the **-H** or  
115355 **-L** options is specified, the *ls* utility only follows symbolic links to directories that are given as  
115356 operands. The *ls* utility does not support the **-P** option.
- 115357 The Shell and Utilities volume of POSIX.1-2008 requires that the standard utilities *ls*, *find*, and  
115358 *pax* detect infinite loops when doing logical walks; that is, a directory, or more commonly a  
115359 symbolic link, that refers to an ancestor in the current file hierarchy. If the file system itself is  
115360 corrupted, causing the infinite loop, it may be impossible to recover. Because *find* and *ls* are often  
115361 used in system administration and security applications, they should attempt to recover and  
115362 continue as best as they can. The *pax* utility should terminate because the archive it was creating  
115363 is by definition corrupted. Other, less vital, utilities should probably simply terminate as well.  
115364 Implementations are strongly encouraged to detect infinite loops in all utilities.
- 115365 Historical practice is shown in [Table A-1](#) (on page 3440). The heading **SVID3** stands for the  
115366 Third Edition of the System V Interface Definition.
- 115367 Historically, several shells have had built-in versions of the *pwd* utility. In some of these shells,  
115368 *pwd* reported the physical path, and in others, the logical path. Implementations of the shell  
115369 corresponding to POSIX.1-2008 must report the logical path by default.
- 115370 The *cd* command is required, by default, to treat the filename dot-dot logically. Implementors are  
115371 required to support the **-P** flag in *cd* so that users can have their current environment handled  
115372 physically. In 4.3 BSD, *chgrp* during tree traversal changed the group of the symbolic link, not  
115373 the target. Symbolic links in 4.4 BSD did not have *owner*, *group*, *mode*, or other standard UNIX  
115374 system file attributes.

115375

Table A-1 Historical Practice for Symbolic Links

| Utility                | SVID3   | 4.3 BSD | 4.4 BSD | POSIX | Comments                                |
|------------------------|---------|---------|---------|-------|-----------------------------------------|
| 115376<br><i>cd</i>    |         |         |         | -L    | Treat ". ." logically.                  |
| 115377<br><i>cd</i>    |         |         |         | -P    | Treat ". ." physically.                 |
| 115378<br><i>chgrp</i> |         |         | -H      | -H    | Follow command line symlinks.           |
| 115379<br><i>chgrp</i> |         |         | -h      | -L    | Follow symlinks.                        |
| 115380<br><i>chgrp</i> | -h      |         |         | -h    | Affect the symlink.                     |
| 115381<br><i>chmod</i> |         |         |         |       | Affect the symlink.                     |
| 115382<br><i>chmod</i> |         |         | -H      |       | Follow command line symlinks.           |
| 115383<br><i>chmod</i> |         |         | -h      |       | Follow symlinks.                        |
| 115384<br><i>chown</i> |         |         | -H      | -H    | Follow command line symlinks.           |
| 115385<br><i>chown</i> |         |         | -h      | -L    | Follow symlinks.                        |
| 115386<br><i>chown</i> | -h      |         |         | -h    | Affect the symlink.                     |
| 115387<br><i>cp</i>    |         |         | -H      | -H    | Follow command line symlinks.           |
| 115388<br><i>cp</i>    |         |         | -h      | -L    | Follow symlinks.                        |
| 115389<br><i>cpio</i>  | -L      |         | -L      |       | Follow symlinks.                        |
| 115390<br><i>du</i>    |         |         | -H      | -H    | Follow command line symlinks.           |
| 115391<br><i>du</i>    |         |         | -h      | -L    | Follow symlinks.                        |
| 115392<br><i>file</i>  | -h      |         |         | -h    | Affect the symlink.                     |
| 115393<br><i>find</i>  |         |         | -H      | -H    | Follow command line symlinks.           |
| 115394<br><i>find</i>  |         |         | -h      | -L    | Follow symlinks.                        |
| 115395<br><i>find</i>  | -follow |         | -follow |       | Follow symlinks.                        |
| 115396<br><i>ln</i>    | -s      | -s      | -s      | -s    | Create a symbolic link.                 |
| 115397<br><i>ls</i>    | -L      | -L      | -L      | -L    | Follow symlinks.                        |
| 115398<br><i>ls</i>    |         |         |         | -H    | Follow command line symlinks.           |
| 115399<br><i>mv</i>    |         |         |         |       | Operates on the symlink.                |
| 115400<br><i>pax</i>   |         |         | -H      | -H    | Follow command line symlinks.           |
| 115401<br><i>pax</i>   |         |         | -h      | -L    | Follow symlinks.                        |
| 115402<br><i>pwd</i>   |         |         |         | -L    | Printed path may contain symlinks.      |
| 115403<br><i>pwd</i>   |         |         |         | -P    | Printed path will not contain symlinks. |
| 115404<br><i>rm</i>    |         |         |         |       | Operates on the symlink.                |
| 115405<br><i>tar</i>   |         |         | -H      |       | Follow command line symlinks.           |
| 115406<br><i>tar</i>   |         | -h      | -h      |       | Follow symlinks.                        |
| 115407<br><i>test</i>  | -h      |         | -h      | -h    | Affect the symlink.                     |

115409

**Synchronously-Generated Signal**

115410

Those signals that may be generated synchronously include SIGABRT, SIGBUS, SIGILL, SIGFPE, SIGPIPE, and SIGSEGV.

115411

115412

Any signal sent via the *raise()* function or a *kill()* function targeting the current process is also considered synchronous.

115413

115414

**System Call\***

115415

The distinction between a "system call" and a "library routine" is an implementation detail that may differ between implementations and has thus been excluded from POSIX.1.

115416

115417

See "Interface, Not Implementation" in the Preface.

**115418 System Console**

115419 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/7 is applied, changing from “An  
115420 implementation-defined device” to “A device”.

**115421 System Databases**

115422 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/9 is applied, rewording the definition to  
115423 reference the existing definitions for “group database” and “user database”.

**115424 System Process**

115425 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/8 is applied, rewording the definition to  
115426 remove the requirement for an implementation to define the object.

**115427 System Reboot**

115428 A “system reboot” is an event initiated by an unspecified circumstance that causes all processes  
115429 (other than special system processes) to be terminated in an implementation-defined manner,  
115430 after which any changes to the state and contents of files created or written to by a Conforming  
115431 POSIX.1 Application prior to the event are implementation-defined.

115432 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/10 is applied, changing “An  
115433 implementation-defined sequence of events” to “An unspecified sequence of events”.

**115434 Synchronized I/O Data (and File) Integrity Completion**

115435 These terms specify that for synchronized read operations, pending writes must be successfully  
115436 completed before the read operation can complete. This is motivated by two circumstances.  
115437 Firstly, when synchronizing processes can access the same file, but not share common buffers  
115438 (such as for a remote file system), this requirement permits the reading process to guarantee that  
115439 it can read data written remotely. Secondly, having data written synchronously is insufficient to  
115440 guarantee the order with respect to a subsequent write by a reading process, and thus this extra  
115441 read semantic is necessary.

**115442 Text File**

115443 The term “text file” does not prevent the inclusion of control or other non-printable characters  
115444 (other than NUL). Therefore, standard utilities that list text files as inputs or outputs are either  
115445 able to process the special characters or they explicitly describe their limitations within their  
115446 individual descriptions. The definition of “text file” has caused controversy. The only difference  
115447 between text and binary files is that text files have lines of less than {LINE\_MAX} bytes, with no  
115448 NUL characters, each terminated by a <newline>. The definition allows a file with a single  
115449 <newline>, or a totally empty file, to be called a text file. If a file ends with an incomplete line it  
115450 is not strictly a text file by this definition. The <newline> referred to in POSIX.1-2008 is not some  
115451 generic line separator, but a single character; files created on systems where they use multiple  
115452 characters for ends of lines are not portable to all conforming systems without some translation  
115453 process unspecified by POSIX.1-2008.

**Thread**

115454  
115455 POSIX.1-2008 defines a thread to be a flow of control within a process. Each thread has a  
115456 minimal amount of private state; most of the state associated with a process is shared among all  
115457 of the threads in the process. While most multi-thread extensions to POSIX have taken this  
115458 approach, others have made different decisions.

115459 **Note:** The choice to put threads within a process does not constrain implementations to implement  
115460 threads in that manner. However, all functions have to behave as though threads share the  
115461 indicated state information with the process from which they were created.

115462 Threads need to share resources in order to cooperate. Memory has to be widely shared between  
115463 threads in order for the threads to cooperate at a fine level of granularity. Threads keep data  
115464 structures and the locks protecting those data structures in shared memory. For a data structure  
115465 to be usefully shared between threads, such structures should not refer to any data that can only  
115466 be interpreted meaningfully by a single thread. Thus, any system resources that might be  
115467 referred to in data structures need to be shared between all threads. File descriptors, pathnames,  
115468 and pointers to stack variables are all things that programmers want to share between their  
115469 threads. Thus, the file descriptor table, the root directory, the current working directory, and the  
115470 address space have to be shared.

115471 Library implementations are possible as long as the effective behavior is as if system services  
115472 invoked by one thread do not suspend other threads. This may be difficult for some library  
115473 implementations on systems that do not provide asynchronous facilities.

115474 See [Section B.2.9](#) (on page 3564) for additional rationale.

**Thread ID**

115475  
115476 See [Section B.2.9.2](#) (on page 3581) for additional rationale.

**Thread-Safe Function**

115477  
115478 All functions required by POSIX.1-2008 need to be thread-safe; see [Section A.4.17](#) (on page 3452)  
115479 and [Section B.2.9.1](#) (on page 3578) for additional rationale.

**User Database**

115480  
115481 There are no references in POSIX.1-2008 to a “passwd file” or a “group file”, and there is no  
115482 requirement that the *group* or *passwd* databases be kept in files containing editable text. Many  
115483 large timesharing systems use *passwd* databases that are hashed for speed. Certain security  
115484 classifications prohibit certain information in the *passwd* database from being publicly readable.

115485 The term “encoded” is used instead of “encrypted” in order to avoid the implementation  
115486 connotations (such as reversibility or use of a particular algorithm) of the latter term.

115487 The *getgrent()*, *setgrent()*, *endgrent()*, *getpwent()*, *setpwent()*, and *endpwent()* functions are not  
115488 included as part of the base standard because they provide a linear database search capability  
115489 that is not generally useful (the *getpwuid()*, *getpwnam()*, *getgrgid()*, and *getgrnam()* functions are  
115490 provided for keyed lookup) and because in certain distributed systems, especially those with  
115491 different authentication domains, it may not be possible or desirable to provide an application  
115492 with the ability to browse the system databases indiscriminately. They are provided on XSI-  
115493 conformant systems due to their historical usage by many existing applications.

115494 A change from historical implementations is that the structures used by these functions have  
115495 fields of the types **gid\_t** and **uid\_t**, which are required to be defined in the `<sys/types.h>` header.  
115496 POSIX.1-2008 requires implementations to ensure that these types are defined by inclusion of  
115497 `<grp.h>` and `<pwd.h>`, respectively, without imposing any name space pollution or errors from  
115498 redefinition of types.

115499 POSIX.1-2008 is silent about the content of the strings containing user or group names. These  
115500 could be digit strings. POSIX.1-2008 is also silent as to whether such digit strings bear any  
115501 relationship to the corresponding (numeric) user or group ID.

115502 *Database Access*

115503 The thread-safe versions of the user and group database access functions return values in user-  
115504 supplied buffers instead of possibly using static data areas that may be overwritten by each call.

115505 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/11 is applied, removing the words “of  
115506 implementation-defined format”.

115507 **Virtual Processor\***

115508 The term “virtual processor” was chosen as a neutral term describing all kernel-level  
115509 schedulable entities, such as processes, Mach tasks, or lightweight processes. Implementing  
115510 threads using multiple processes as virtual processors, or implementing multiplexed threads  
115511 above a virtual processor layer, should be possible, provided some mechanism has also been  
115512 implemented for sharing state between processes or virtual processors. Many systems may also  
115513 wish to provide implementations of threads on systems providing “shared processes” or  
115514 “variable-weight processes”. It was felt that exposing such implementation details would  
115515 severely limit the type of systems upon which the threads interface could be supported and  
115516 prevent certain types of valid implementations. It was also determined that a virtual processor  
115517 interface was out of the scope of the Rationale (Informative) volume of POSIX.1-2008.

115518 **XSI**

115519 This is included to allow POSIX.1-2008 to be adopted as an IEEE standard and an Open Group  
115520 Technical Standard, serving both the POSIX and the Single UNIX Specification in a core set of  
115521 volumes.

115522 The term “XSI” has been used for 10 years in connection with the XPG series and the first and  
115523 second versions of the base volumes of the Single UNIX Specification. The XSI margin code was  
115524 introduced to denote the extended or more restrictive semantics beyond POSIX that are  
115525 applicable to UNIX systems.

## 115526 **A.4 General Concepts**

115527 The general concepts are similar in nature to the definitions section, with the exception that a  
115528 term defined in general concepts can contain normative requirements.

### 115529 **A.4.1 Concurrent Execution**

115530 There is no additional rationale provided for this section.

**115531 A.4.2 Directory Protection**

115532 There is no additional rationale provided for this section.

**115533 A.4.3 Extended Security Controls**

115534 Allowing an implementation to define extended security controls enables the use of  
115535 POSIX.1-2008 in environments that require different or more rigorous security than that  
115536 provided in POSIX.1. Extensions are allowed in two areas: privilege and file access permissions.  
115537 The semantics of these areas have been defined to permit extensions with reasonable, but not  
115538 exact, compatibility with all existing practices. For example, the elimination of the superuser  
115539 definition precludes identifying a process as privileged or not by virtue of its effective user ID.

**115540 A.4.4 File Access Permissions**

115541 A process should not try to anticipate the result of an attempt to access data by *a priori* use of  
115542 these rules. Rather, it should make the attempt to access data and examine the return value (and  
115543 possibly *errno* as well), or use *access()*. An implementation may include other security  
115544 mechanisms in addition to those specified in POSIX.1, and an access attempt may fail because of  
115545 those additional mechanisms, even though it would succeed according to the rules given in this  
115546 section. (For example, the user's security level might be lower than that of the object of the  
115547 access attempt.) The supplementary group IDs provide another reason for a process to not  
115548 attempt to anticipate the result of an access attempt.

115549 Since the current standard does not specify a method for opening a directory for searching, it is  
115550 unspecified whether search permission on the *fd* argument to *openat()* and related functions is  
115551 based on whether the directory was opened with search mode or on the current permissions  
115552 allowed by the directory at the time a search is performed. When there is existing practice that  
115553 supports opening directories for searching, it is expected that these functions will be modified to  
115554 specify that the search permissions will be granted based on the file access modes of the  
115555 directory's file descriptor identified by *fd*, and not on the mode of the directory at the time the  
115556 directory is searched.

**115557 A.4.5 File Hierarchy**

115558 Though the file hierarchy is commonly regarded to be a tree, POSIX.1 does not define it as such  
115559 for three reasons:

- 115560 1. Links may join branches.
- 115561 2. In some network implementations, there may be no single absolute root directory; see  
115562 *pathname resolution*.
- 115563 3. With symbolic links, the file system need not be a tree or even a directed acyclic graph.

115564 **A.4.6 Filenames**

115565 Historically, certain filenames have been reserved. This list includes **core**, **/etc/passwd**, and so  
 115566 on. Conforming applications should avoid these.

115567 Most historical implementations prohibit case folding in filenames; that is, treating uppercase  
 115568 and lowercase alphabetic characters as identical. However, some consider case folding desirable:

- 115569 • For user convenience
- 115570 • For ease-of-implementation of the POSIX.1 interface as a hosted system on some popular  
 115571 operating systems

115572 Variants, such as maintaining case distinctions in filenames, but ignoring them in comparisons,  
 115573 have been suggested. Methods of allowing escaped characters of the case opposite the default  
 115574 have been proposed.

115575 Many reasons have been expressed for not allowing case folding, including:

- 115576 • No solid evidence has been produced as to whether case-sensitivity or case-insensitivity is  
 115577 more convenient for users.
- 115578 • Making case-insensitivity a POSIX.1 implementation option would be worse than either  
 115579 having it or not having it, because:
  - 115580 — More confusion would be caused among users.
  - 115581 — Application developers would have to account for both cases in their code.
  - 115582 — POSIX.1 implementors would still have other problems with native file systems, such  
 115583 as short or otherwise constrained filenames or pathnames, and the lack of  
 115584 hierarchical directory structure.
- 115585 • Case folding is not easily defined in many European languages, both because many of  
 115586 them use characters outside the US ASCII alphabetic set, and because:
  - 115587 — In Spanish, the digraph "ll" is considered to be a single letter, the capitalized form  
 115588 of which may be either "Ll" or "LL", depending on context.
  - 115589 — In French, the capitalized form of a letter with an accent may or may not retain the  
 115590 accent, depending on the country in which it is written.
  - 115591 — In German, the sharp ess may be represented as a single character resembling a  
 115592 Greek beta ( $\beta$ ) in lowercase, but as the digraph "SS" in uppercase.
  - 115593 — In Greek, there are several lowercase forms of some letters; the one to use depends on  
 115594 its position in the word. Arabic has similar rules.
- 115595 • Many East Asian languages, including Japanese, Chinese, and Korean, do not distinguish  
 115596 case and are sometimes encoded in character sets that use more than one byte per  
 115597 character.
- 115598 • Multiple character codes may be used on the same machine simultaneously. There are  
 115599 several ISO character sets for European alphabets. In Japan, several Japanese character  
 115600 codes are commonly used together, sometimes even in filenames; this is evidently also the  
 115601 case in China. To handle case insensitivity, the kernel would have to at least be able to  
 115602 distinguish for which character sets the concept made sense.
- 115603 • The file system implementation historically deals only with bytes, not with characters,  
 115604 except for <slash> and the null byte.

- 115605 • The purpose of POSIX.1 is to standardize the common, existing definition, not to change it.
- 115606 Mandating case-insensitivity would make all historical implementations non-standard.
- 115607 • Not only the interface, but also application programs would need to change, counter to the
- 115608 purpose of having minimal changes to existing application code.
- 115609 • At least one of the original developers of the UNIX system has expressed objection in the
- 115610 strongest terms to either requiring case-insensitivity or making it an option, mostly on the
- 115611 basis that POSIX.1 should not hinder portability of application programs across related
- 115612 implementations in order to allow compatibility with unrelated operating systems.

115613 Two proposals were entertained regarding case folding in filenames:

- 115614 1. Remove all wording that previously permitted case folding.

115615 Rationale Case folding is inconsistent with portable filename character set definition  
 115616 and filename definition (all characters except <slash> and null). No known  
 115617 implementations allowing all characters except <slash> and null also do  
 115618 case folding.

- 115619 2. Change “though this practice is not recommended:” to “although this practice is strongly  
 115620 discouraged.”

115621 Rationale If case folding must be included in POSIX.1, the wording should be stronger  
 115622 to discourage the practice.

115623 The consensus selected the first proposal. Otherwise, a conforming application would have to  
 115624 assume that case folding would occur when it was not wanted, but that it would not occur when  
 115625 it was wanted.

#### 115626 **A.4.7 Filename Portability**

115627 Filenames should be constructed from the portable filename character set because the use of  
 115628 other characters can be confusing or ambiguous in certain contexts. (For example, the use of a  
 115629 <colon> ( ‘ : ’ ) in a pathname could cause ambiguity if that pathname were included in a *PATH*  
 115630 definition.)

115631 The constraint on use of the <hyphen> character as the first character of a portable filename is a  
 115632 constraint on application behavior and not on implementations, since applications might not  
 115633 work as expected when such a filename is passed as a command line argument.

#### 115634 **A.4.8 File Times Update**

115635 This section reflects the actions of historical implementations. The times are not updated  
 115636 immediately, but are only marked for update by the functions. An implementation may update  
 115637 these times immediately.

115638 The accuracy of the time update values is intentionally left unspecified so that systems can  
 115639 control the bandwidth of a possible covert channel.

115640 The wording was carefully chosen to make it clear that there is no requirement that the  
 115641 conformance document contain information that might incidentally affect file timestamps. Any  
 115642 function that performs pathname resolution might update several last data access timestamps.  
 115643 Functions such as *getpwnam()* and *getgrnam()* might update the last data access timestamp of  
 115644 some specific file or files. It is intended that these are not required to be documented in the  
 115645 conformance document, but they should appear in the system documentation.

115646 **A.4.9 Host and Network Byte Order**

115647 There is no additional rationale provided for this section.

115648 **A.4.10 Measurement of Execution Time**

115649 The methods used to measure the execution time of processes and threads, and the precision of  
 115650 these measurements, may vary considerably depending on the software architecture of the  
 115651 implementation, and on the underlying hardware. Implementations can also make tradeoffs  
 115652 between the scheduling overhead and the precision of the execution time measurements.  
 115653 POSIX.1-2008 does not impose any requirement on the accuracy of the execution time; it instead  
 115654 specifies that the measurement mechanism and its precision are implementation-defined.

115655 **A.4.11 Memory Synchronization**

115656 In older multi-processors, access to memory by the processors was strictly multiplexed. This  
 115657 meant that a processor executing program code interrogates or modifies memory in the order  
 115658 specified by the code and that all the memory operation of all the processors in the system  
 115659 appear to happen in some global order, though the operation histories of different processors are  
 115660 interleaved arbitrarily. The memory operations of such machines are said to be sequentially  
 115661 consistent. In this environment, threads can synchronize using ordinary memory operations. For  
 115662 example, a producer thread and a consumer thread can synchronize access to a circular data  
 115663 buffer as follows:

```

115664 int rdptr = 0;
115665 int wrptr = 0;
115666 data_t buf[BUFSIZE];

115667 Thread 1:
115668     while (work_to_do) {
115669         int next;
115670
115671         buf[wrptr] = produce();
115672         next = (wrptr + 1) % BUFSIZE;
115673         while (rdptr == next)
115674             ;
115675         wrptr = next;
115676     }

115677 Thread 2:
115678     while (work_to_do) {
115679         while (rdptr == wrptr)
115680             ;
115681         consume(buf[rdptr]);
115682         rdptr = (rdptr + 1) % BUFSIZE;
115683     }

```

115683 In modern multi-processors, these conditions are relaxed to achieve greater performance. If one  
 115684 processor stores values in location A and then location B, then other processors loading data  
 115685 from location B and then location A may see the new value of B but the old value of A. The  
 115686 memory operations of such machines are said to be weakly ordered. On these machines, the  
 115687 circular buffer technique shown in the example will fail because the consumer may see the new  
 115688 value of *wrptr* but the old value of the data in the buffer. In such machines, synchronization can  
 115689 only be achieved through the use of special instructions that enforce an order on memory

115690 operations. Most high-level language compilers only generate ordinary memory operations to  
115691 take advantage of the increased performance. They usually cannot determine when memory  
115692 operation order is important and generate the special ordering instructions. Instead, they rely on  
115693 the programmer to use synchronization primitives correctly to ensure that modifications to a  
115694 location in memory are ordered with respect to modifications and/or access to the same location  
115695 in other threads. Access to read-only data need not be synchronized. The resulting program is  
115696 said to be data race-free.

115697 Synchronization is still important even when accessing a single primitive variable (for example,  
115698 an integer). On machines where the integer may not be aligned to the bus data width or be  
115699 larger than the data width, a single memory load may require multiple memory cycles. This  
115700 means that it may be possible for some parts of the integer to have an old value while other  
115701 parts have a newer value. On some processor architectures this cannot happen, but portable  
115702 programs cannot rely on this.

115703 In summary, a portable multi-threaded program, or a multi-process program that shares  
115704 writable memory between processes, has to use the synchronization primitives to synchronize  
115705 data access. It cannot rely on modifications to memory being observed by other threads in the  
115706 order written in the application or even on modification of a single variable being seen  
115707 atomically.

115708 Conforming applications may only use the functions listed to synchronize threads of control  
115709 with respect to memory access. There are many other candidates for functions that might also be  
115710 used. Examples are: signal sending and reception, or pipe writing and reading. In general, any  
115711 function that allows one thread of control to wait for an action caused by another thread of  
115712 control is a candidate. POSIX.1-2008 does not require these additional functions to synchronize  
115713 memory access since this would imply the following:

- 115714 • All these functions would have to be recognized by advanced compilation systems so that  
115715 memory operations and calls to these functions are not reordered by optimization.
- 115716 • All these functions would potentially have to have memory synchronization instructions  
115717 added, depending on the particular machine.
- 115718 • The additional functions complicate the model of how memory is synchronized and make  
115719 automatic data race detection techniques impractical.

115720 Formal definitions of the memory model were rejected as unreadable by the vast majority of  
115721 programmers. In addition, most of the formal work in the literature has concentrated on the  
115722 memory as provided by the hardware as opposed to the application programmer through the  
115723 compiler and runtime system. It was believed that a simple statement intuitive to most  
115724 programmers would be most effective. POSIX.1-2008 defines functions that can be used to  
115725 synchronize access to memory, but it leaves open exactly how one relates those functions to the  
115726 semantics of each function as specified elsewhere in POSIX.1-2008. POSIX.1-2008 also does not  
115727 make a formal specification of the partial ordering in time that the functions can impose, as that  
115728 is implied in the description of the semantics of each function. It simply states that the  
115729 programmer has to ensure that modifications do not occur “simultaneously” with other access  
115730 to a memory location.

115731 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/4 is applied, adding a new paragraph  
115732 beneath the table of functions: “The *pthread\_once()* function shall synchronize memory for the  
115733 first call in each thread for a given **pthread\_once\_t** object.”.

115734 **A.4.12 Pathname Resolution**

115735 It is necessary to differentiate between the definition of pathname and the concept of pathname  
 115736 resolution with respect to the handling of trailing <slash> characters. By specifying the behavior  
 115737 here, it is not possible to provide an implementation that is conforming but extends all interfaces  
 115738 that handle pathnames to also handle strings that are not legal pathnames (because they have  
 115739 trailing <slash> characters).

115740 Pathnames that end with one or more trailing <slash> characters must refer to directory paths.  
 115741 Earlier versions of this standard were not specific about the distinction between trailing <slash>  
 115742 characters on files and directories, and both were permitted.

115743 Two types of implementation have been prevalent; those that ignored trailing <slash> characters  
 115744 on all pathnames regardless, and those that permitted them only on existing directories.

115745 An earlier version of this standard required that a pathname with a trailing <slash> character be  
 115746 treated as if it had a trailing "/" everywhere. This specification was ambiguous. In situations  
 115747 where the intent was that the application wanted to require the implementation to accept the  
 115748 pathname only if it named a directory (existing or to be created as a result of the call performing  
 115749 pathname resolution), literally adding a "." after the trailing <slash> could be interpreted to  
 115750 require use of that pathname to fail. Some of the uses that created ambiguous requirements  
 115751 included `mkdir("newdir/")` and `rmdir("existing-dir/")`. POSIX.1-2008 requires that a pathname  
 115752 with a trailing <slash> be rejected unless it refers to a file that is a directory or to a file that is to  
 115753 be created as a directory. The `rename()` function and the `mv` utility further specify that a trailing  
 115754 <slash> cannot be used on a pathname naming a file that does not exist when used as the last  
 115755 argument to `rename()` or `renameat()`, or as the last operand to `mv`.

115756 Note that this change does not break any conforming applications; since there were two different  
 115757 types of implementation, no application could have portably depended on either behavior. This  
 115758 change does however require some implementations to be altered to remain compliant.  
 115759 Substantial discussion over a three-year period has shown that the benefits to application  
 115760 developers outweighs the disadvantages for some vendors.

115761 On a historical note, some early applications automatically appended a "/" to every path.  
 115762 Rather than fix the applications, the system implementation was modified to accept this  
 115763 behavior by ignoring any trailing <slash>.

115764 Each directory has exactly one parent directory which is represented by the name **dot-dot** in the  
 115765 first directory. No other directory, regardless of linkages established by symbolic links, is  
 115766 considered the parent directory by POSIX.1-2008.

115767 There are two general categories of interfaces involving pathname resolution: those that follow  
 115768 the symbolic link, and those that do not. There are several exceptions to this rule; for example,  
 115769 `open(path,O_CREAT|O_EXCL)` will fail when `path` names a symbolic link. However, in all other  
 115770 situations, the `open()` function will follow the link.

115771 What the filename **dot-dot** refers to relative to the root directory is implementation-defined. In  
 115772 Version 7 it refers to the root directory itself; this is the behavior mentioned in POSIX.1-2008. In  
 115773 some networked systems the construction `././hostname/` is used to refer to the root directory of  
 115774 another host, and POSIX.1 permits this behavior.

115775 Other networked systems use the construct `//hostname` for the same purpose; that is, a double  
 115776 initial <slash> is used. There is a potential problem with existing applications that create full  
 115777 pathnames by taking a trunk and a relative pathname and making them into a single string  
 115778 separated by "/", because they can accidentally create networked pathnames when the trunk is  
 115779 "/". This practice is not prohibited because such applications can be made to conform by  
 115780 simply changing to use "//" as a separator instead of "/":

- 115781 • If the trunk is `'/'`, the full pathname will begin with `"/"` (the initial `'/'` and the  
115782 separator `"/"`). This is the same as `'/'`, which is what is desired. (This is the general  
115783 case of making a relative pathname into an absolute one by prefixing with `"/"` instead  
115784 of `'/'`.)
  - 115785 • If the trunk is `"/A"`, the result is `"/A/. . ."`; since non-leading sequences of two or more  
115786 `<slash>` characters are treated as a single `<slash>`, this is equivalent to the desired  
115787 `"/A/. . ."`.
  - 115788 • If the trunk is `"//A"`, the implementation-defined semantics will apply. (The multiple  
115789 `<slash>` rule would apply.)
- 115790 Application developers should avoid generating pathnames that start with `"/"`.  
115791 Implementations are strongly encouraged to avoid using this special interpretation since a  
115792 number of applications currently do not follow this practice and may inadvertently generate  
115793 `"/. . ."`.
- 115794 The term “root directory” is only defined in POSIX.1 relative to the process. In some  
115795 implementations, there may be no absolute root directory. The initialization of the root directory  
115796 of a process is implementation-defined.
- 115797 When the standard says: “Pathname resolution for a given pathname shall yield the same results  
115798 when used by any interface in POSIX.1-2008 as long as there are no changes to any files  
115799 evaluated during pathname resolution for the given pathname between resolutions”, this  
115800 applies to absolute pathnames or to relative pathnames from the same current working  
115801 directory. Using the same relative pathname from two different working directories may yield  
115802 different results.

#### 115803 **A.4.13 Process ID Reuse**

115804 There is no additional rationale provided for this section.

#### 115805 **A.4.14 Scheduling Policy**

115806 There is no additional rationale provided for this section.

#### 115807 **A.4.15 Seconds Since the Epoch**

115808 Coordinated Universal Time (UTC) includes leap seconds. However, in POSIX time (seconds  
115809 since the Epoch), leap seconds are ignored (not applied) to provide an easy and compatible  
115810 method of computing time differences. Broken-down POSIX time is therefore not necessarily  
115811 UTC, despite its appearance.

115812 As of December 2007, 23 leap seconds had been added to UTC since the Epoch, 1 January, 1970.  
115813 Historically, one leap second is added every 15 months on average, so this offset can be expected  
115814 to grow with time.

115815 Most systems’ notion of “time” is that of a continuously increasing value, so this value should  
115816 increase even during leap seconds. However, not only do most systems not keep track of leap  
115817 seconds, but most systems are probably not synchronized to any standard time reference.  
115818 Therefore, it is inappropriate to require that a time represented as seconds since the Epoch  
115819 precisely represent the number of seconds between the referenced time and the Epoch.

115820 It is sufficient to require that applications be allowed to treat this time as if it represented the  
115821 number of seconds between the referenced time and the Epoch. It is the responsibility of the

115822 vendor of the system, and the administrator of the system, to ensure that this value represents  
115823 the number of seconds between the referenced time and the Epoch as closely as necessary for the  
115824 application being run on that system.

115825 It is important that the interpretation of time names and seconds since the Epoch values be  
115826 consistent across conforming systems; that is, it is important that all conforming systems  
115827 interpret “536 457 599 seconds since the Epoch” as 59 seconds, 59 minutes, 23 hours 31 December  
115828 1986, regardless of the accuracy of the system’s idea of the current time. The expression is given  
115829 to ensure a consistent interpretation, not to attempt to specify the calendar. The relationship  
115830 between *tm\_yday* and the day of week, day of month, and month is in accordance with the  
115831 Gregorian calendar, and so is not specified in POSIX.1.

115832 Consistent interpretation of seconds since the Epoch can be critical to certain types of distributed  
115833 applications that rely on such timestamps to synchronize events. The accrual of leap seconds in a  
115834 time standard is not predictable. The number of leap seconds since the Epoch will likely  
115835 increase. POSIX.1 is more concerned about the synchronization of time between applications of  
115836 astronomically short duration.

115837 Note that *tm\_yday* is zero-based, not one-based, so the day number in the example above is 364.  
115838 Note also that the division is an integer division (discarding remainder) as in the C language.

115839 Note also that the meaning of *gmtime()*, *localtime()*, and *mkttime()* is specified in terms of this  
115840 expression. However, the ISO C standard computes *tm\_yday* from *tm\_mday*, *tm\_mon*, and *tm\_year*  
115841 in *mkttime()*. Because it is stated as a (bidirectional) relationship, not a function, and because the  
115842 conversion between month-day-year and day-of-year dates is presumed well known and is also  
115843 a relationship, this is not a problem.

115844 Implementations that implement **time\_t** as a signed 32-bit integer will overflow in 2038. The  
115845 data size for **time\_t** is as per the ISO C standard definition, which is implementation-defined.

115846 See also [Epoch](#) (on page 3426).

115847 The topic of whether seconds since the Epoch should account for leap seconds has been debated  
115848 on a number of occasions, and each time consensus was reached (with acknowledged dissent  
115849 each time) that the majority of users are best served by treating all days identically. (That is, the  
115850 majority of applications were judged to assume a single length—as measured in seconds since  
115851 the Epoch—for all days. Thus, leap seconds are not applied to seconds since the Epoch.) Those  
115852 applications which do care about leap seconds can determine how to handle them in whatever  
115853 way those applications feel is best. This was particularly emphasized because there was  
115854 disagreement about what the best way of handling leap seconds might be. It is a practical  
115855 impossibility to mandate that a conforming implementation must have a fixed relationship to  
115856 any particular official clock (consider isolated systems, or systems performing “reruns” by  
115857 setting the clock to some arbitrary time).

115858 Note that as a practical consequence of this, the length of a second as measured by some external  
115859 standard is not specified. This unspecified second is nominally equal to an International System  
115860 (SI) second in duration. Applications must be matched to a system that provides the particular  
115861 handling of external time in the way required by the application.

115862 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/12 is applied, making an editorial  
115863 correction to the paragraph commencing “How any changes to the value of seconds ...”.

**115864 A.4.16 Semaphore**

115865 There is no additional rationale provided for this section.

**115866 A.4.17 Thread-Safety**

115867 Where the interface of a function required by POSIX.1-2008 precludes thread-safety, an alternate  
115868 thread-safe form is provided. The names of these thread-safe forms are the same as the non-  
115869 thread-safe forms with the addition of the suffix “\_r”. The suffix “\_r” is historical, where the  
115870 ‘r’ stood for “reentrant”.

115871 In some cases, thread-safety is provided by restricting the arguments to an existing function.

115872 See also [Section B.2.9.1](#) (on page 3578).

**115873 A.4.18 Tracing**

115874 Refer to [Section B.2.11](#) (on page 3594).

**115875 A.4.19 Treatment of Error Conditions for Mathematical Functions**

115876 There is no additional rationale provided for this section.

**115877 A.4.20 Treatment of NaN Arguments for Mathematical Functions**

115878 There is no additional rationale provided for this section.

**115879 A.4.21 Utility**

115880 There is no additional rationale provided for this section.

**115881 A.4.22 Variable Assignment**

115882 There is no additional rationale provided for this section.

**115883 A.5 File Format Notation**

115884 The notation for spaces allows some flexibility for application output. Note that an empty  
115885 character position in *format* represents one or more <blank> characters on the output (not *white*  
115886 *space*, which can include <newline> characters). Therefore, another utility that reads that output  
115887 as its input must be prepared to parse the data using *scanf()*, *awk*, and so on. The ‘Δ’ character  
115888 is used when exactly one <space> is output.

115889 The treatment of integers and spaces is different from the *printf()* function in that they can be  
115890 surrounded with <blank> characters. This was done so that, given a format such as:

115891 "%d\n", <foo>

115892 the implementation could use a *printf()* call such as:

115893 `printf("%6d\n", foo);`

115894 and still conform. This notation is thus somewhat like `scanf()` in addition to `printf()`.

115895 The `printf()` function was chosen as a model because most of the standard developers were  
 115896 familiar with it. One difference from the C function `printf()` is that the `l` and `h` conversion  
 115897 specifier characters are not used. As expressed by the Shell and Utilities volume of  
 115898 POSIX.1-2008, there is no differentiation between decimal values for type **int**, type **long**, or type  
 115899 **short**. The conversion specifications `%d` or `%i` should be interpreted as an arbitrary length  
 115900 sequence of digits. Also, no distinction is made between single precision and double precision  
 115901 numbers (**float** or **double** in C). These are simply referred to as floating-point numbers.

115902 Many of the output descriptions in the Shell and Utilities volume of POSIX.1-2008 use the term  
 115903 "line", such as:

115904 `"%s", <input line>`

115905 Since the definition of *line* includes the trailing `<newline>` already, there is no need to include a  
 115906 `'\n'` in the format; a double `<newline>` would otherwise result.

## 115907 **A.6 Character Set**

### 115908 **A.6.1 Portable Character Set**

115909 The portable character set is listed in full so there is no dependency on the ISO/IEC 646:1991  
 115910 standard (or historically ASCII) encoded character set, although the set is identical to the  
 115911 characters defined in the International Reference version of the ISO/IEC 646:1991 standard.

115912 POSIX.1-2008 poses no requirement that multiple character sets or codesets be supported,  
 115913 leaving this as a marketing differentiation for implementors. Although multiple charmap files  
 115914 are supported, it is the responsibility of the implementation to provide the file(s); if only one is  
 115915 provided, only that one will be accessible using the `localedef -f` option.

115916 The statement about invariance in codesets for the portable character set is worded to avoid  
 115917 precluding implementations where multiple incompatible codesets are available (for instance,  
 115918 ASCII and EBCDIC). The standard utilities cannot be expected to produce predictable results if  
 115919 they access portable characters that vary on the same implementation.

115920 Not all character sets need include the portable character set, but each locale must include it. For  
 115921 example, a Japanese-based locale might be supported by a mixture of character sets: JIS X 0201  
 115922 Roman (a Japanese version of the ISO/IEC 646:1991 standard), JIS X 0208, and JIS X 0201  
 115923 Katakana. Not all of these character sets include the portable characters, but at least one does  
 115924 (JIS X 0201 Roman).

115925 **A.6.2 Character Encoding**

115926 Encoding mechanisms based on single shifts, such as the EUC encoding used in some Asian and  
 115927 other countries, can be supported via the current charmap mechanism. With single-shift  
 115928 encoding, each character is preceded by a shift code (SS2 or SS3). A complete EUC code,  
 115929 consisting of the portable character set (G0) and up to three additional character sets (G1, G2,  
 115930 G3), can be described using the current charmap mechanism; the encoding for each character in  
 115931 additional character sets G2 and G3 must then include their single-shift code. Other mechanisms  
 115932 to support locales based on encoding mechanisms such as locking shift are not addressed by this  
 115933 volume of POSIX.1-2008.

115934 **A.6.3 C Language Wide-Character Codes**

115935 The standard does not specify how wide characters are encoded or provide a method for  
 115936 defining wide characters in a charmap. It specifies ways of translating between wide characters  
 115937 and multi-byte characters. The standard does not prevent an extension from providing a method  
 115938 to define wide characters.

115939 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/13 is applied, adding a statement that the  
 115940 standard has no means of defining a wide-character codeset.

115941 **A.6.4 Character Set Description File**

115942 IEEE PASC Interpretation 1003.2 #196 is applied, removing three lines of text dealing with  
 115943 ranges of symbolic names using position constant values which had been erroneously included  
 115944 in the final IEEE P1003.2b draft standard.

115945 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/14 is applied, correcting the example and  
 115946 adding a statement that the standard provides no means of defining a wide-character codeset.

115947 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/15 is applied, allowing the value zero for  
 115948 the width value of **WIDTH** and **WIDTH\_DEFAULT**. This is required to cover some existing  
 115949 locales.

115950 *A.6.4.1 State-Dependent Character Encodings*

115951 A requirement was considered that would force utilities to eliminate any redundant locking  
 115952 shifts, but this was left as a quality of implementation issue.

115953 This change satisfies the following requirement from the ISO POSIX-2:1993 standard, Annex  
 115954 H.1:

115955 *The support of state-dependent (shift encoding) character sets should be addressed fully. See*  
 115956 *descriptions of these in XBD Section 6.2 (on page 128). If such character encodings are supported,*  
 115957 *it is expected that this will impact XBD Section 6.2 (on page 128), Chapter 7 (on page 135),*  
 115958 *Chapter 9 (on page 181), and the comm, cut, diff, grep, head, join, paste, and tail utilities.*

115959 The character set description file provides:

- 115960 • The capability to describe character set attributes (such as collation order or character
- 115961 classes) independent of character set encoding, and using only the characters in the
- 115962 portable character set. This makes it possible to create generic *localedef* source files for all
- 115963 codesets that share the portable character set (such as the ISO 8859 family or IBM Extended
- 115964 ASCII).

- 115965 • Standardized symbolic names for all characters in the portable character set, making it  
115966 possible to refer to any such character regardless of encoding.
- 115967 Implementations are free to choose their own symbolic names, as long as the names identified  
115968 by the Base Definitions volume of POSIX.1-2008 are also defined; this provides support for  
115969 already existing “character names”.
- 115970 The names selected for the members of the portable character set follow the  
115971 ISO/IEC 8859-1:1998 standard and the ISO/IEC 10646-1:2000 standard. However, several  
115972 commonly used UNIX system names occur as synonyms in the list:
- 115973 • The historical UNIX system names are used for control characters.
  - 115974 • The word “slash” is given in addition to “solidus”.
  - 115975 • The word “backslash” is given in addition to “reverse-solidus”.
  - 115976 • The word “hyphen” is given in addition to “hyphen-minus”.
  - 115977 • The word “period” is given in addition to “full-stop”.
  - 115978 • For digits, the word “digit” is eliminated.
  - 115979 • For letters, the words “Latin Capital Letter” and “Latin Small Letter” are eliminated.
  - 115980 • The words “left brace” and “right brace” are given in addition to “left-curly-bracket” and  
115981 “right-curly-bracket”.
  - 115982 • The names of the digits are preferred over the numbers to avoid possible confusion  
115983 between ‘0’ and ‘0’, and between ‘1’ and ‘1’ (one and the letter ell).
- 115984 The names for the control characters in XBD [Chapter 6](#) (on page 125) were taken from the  
115985 ISO/IEC 4873:1991 standard.
- 115986 The charmap file was introduced to resolve problems with the portability of, especially, *localedef*  
115987 sources. POSIX.1-2008 assumes that the portable character set is constant across all locales, but  
115988 does not prohibit implementations from supporting two incompatible codings, such as both  
115989 ASCII and EBCDIC. Such dual-support implementations should have all charmaps and *localedef*  
115990 sources encoded using one portable character set, in effect cross-compiling for the other  
115991 environment. Naturally, charmaps (and *localedef* sources) are only portable without  
115992 transformation between systems using the same encodings for the portable character set. They  
115993 can, however, be transformed between two sets using only a subset of the actual characters (the  
115994 portable character set). However, the particular coded character set used for an application or an  
115995 implementation does not necessarily imply different characteristics or collation; on the contrary,  
115996 these attributes should in many cases be identical, regardless of codeset. The charmap provides  
115997 the capability to define a common locale definition for multiple codesets (the same *localedef*  
115998 source can be used for codesets with different extended characters; the ability in the charmap to  
115999 define empty names allows for characters missing in certain codesets).
- 116000 The `<escape_char>` declaration was added at the request of the international community to ease  
116001 the creation of portable charmap files on terminals not implementing the default  
116002 `<backslash>`-escape. The `<comment_char>` declaration was added at the request of the  
116003 international community to eliminate the potential confusion between the `<number-sign>` and  
116004 the hash sign.
- 116005 The octal number notation with no leading zero required was selected to match those of *awk* and  
116006 *tr* and is consistent with that used by *localedef*. To avoid confusion between an octal constant and  
116007 the back-references used in *localedef* source, the octal, hexadecimal, and decimal constants must  
116008 contain at least two digits. As single-digit constants are relatively rare, this should not impose  
116009 any significant hardship. Provision is made for more digits to account for systems in which the

116010 byte size is larger than 8 bits. For example, a Unicode (ISO/IEC 10646-1:2000 standard) system  
116011 that has defined 16-bit bytes may require six octal, four hexadecimal, and five decimal digits.

116012 The decimal notation is supported because some newer international standards define character  
116013 values in decimal, rather than in the old column/row notation.

116014 The charmap identifies the coded character sets supported by an implementation. At least one  
116015 charmap must be provided, but no implementation is required to provide more than one.  
116016 Likewise, implementations can allow users to generate new charmaps (for instance, for a new  
116017 version of the ISO 8859 family of coded character sets), but does not have to do so. If users are  
116018 allowed to create new charmaps, the system documentation describes the rules that apply (for  
116019 instance, “only coded character sets that are supersets of the ISO/IEC 646: 1991 standard IRV, no  
116020 multi-byte characters”).

116021 This addition of the **WIDTH** specification satisfies the following requirement from the  
116022 ISO POSIX-2: 1993 standard, Annex H.1:

116023 (9) *The definition of column position relies on the implementation’s knowledge of the integral*  
116024 *width of the characters. The charmap or LC\_CTYPE locale definitions should be enhanced to*  
116025 *allow application specification of these widths.*

116026 The character “width” information was first considered for inclusion under *LC\_CTYPE* but was  
116027 moved because it is more closely associated with the information in the charmap than  
116028 information in the locale source (cultural conventions information). Concerns were raised that  
116029 formalizing this type of information is moving the locale source definition from the codeset-  
116030 independent entity that it was designed to be to a repository of codeset-specific information. A  
116031 similar issue occurred with the `<code_set_name>`, `<mb_cur_max>`, and `<mb_cur_min>`  
116032 information, which was resolved to reside in the charmap definition.

116033 The width definition was added to the IEEE P1003.2b draft standard with the intent that the  
116034 *wcswidth()* and/or *wcwidth()* functions (currently specified in the System Interfaces volume of  
116035 POSIX.1-2008) be the mechanism to retrieve the character width information.

## 116036 **A.7 Locale**

### 116037 **A.7.1 General**

116038 The description of locales is based on work performed in the UniForum Technical Committee,  
116039 Subcommittee on Internationalization. Wherever appropriate, keywords are taken from the  
116040 ISO C standard or the X/Open Portability Guide.

116041 The value used to specify a locale with environment variables is the name specified as the *name*  
116042 operand to the *localedef* utility when the locale was created. This provides a verifiable method to  
116043 create and invoke a locale.

116044 The “object” definitions need not be portable, as long as “source” definitions are. Strictly  
116045 speaking, source definitions are portable only between implementations using the same  
116046 character set(s). Such source definitions, if they use symbolic names only, easily can be ported  
116047 between systems using different codesets, as long as the characters in the portable character set  
116048 (see XBD [Section 6.1](#), on page 125) have common values between the codesets; this is frequently  
116049 the case in historical implementations. Of source, this requires that the symbolic names used for

116050 characters outside the portable character set be identical between character sets. The definition  
 116051 of symbolic names for characters is outside the scope of POSIX.1-2008, but is certainly within the  
 116052 scope of other standards organizations.

116053 Applications can select the desired locale by invoking the *setlocale()* function (or equivalent)  
 116054 with the appropriate value. If the function is invoked with an empty string, the value of the  
 116055 corresponding environment variable is used. If the environment variable is not set or is set to the  
 116056 empty string, the implementation sets the appropriate environment as defined in XBD [Chapter 8](#)  
 116057 (on page 173).

## 116058 **A.7.2 POSIX Locale**

116059 The POSIX locale is equal to the C locale. To avoid being classified as a C-language function, the  
 116060 name has been changed to the POSIX locale; the environment variable value can be either  
 116061 "POSIX" or, for historical reasons, "C".

116062 The POSIX definitions mirror the historical UNIX system behavior.

116063 The use of symbolic names for characters in the tables does not imply that the POSIX locale must  
 116064 be described using symbolic character names, but merely that it may be advantageous to do so.

## 116065 **A.7.3 Locale Definition**

116066 The decision to separate the file format from the *localedef* utility description was only partially  
 116067 editorial. Implementations may provide other interfaces than *localedef*. Requirements on "the  
 116068 utility", mostly concerning error messages, are described in this way because they are meant to  
 116069 affect the other interfaces implementations may provide as well as *localedef*.

116070 The text about POSIX2\_LOCALEDEF does not mean that internationalization is optional; only  
 116071 that the functionality of the *localedef* utility is. REs, for instance, must still be able to recognize,  
 116072 for example, character class expressions such as "[[:alpha:]]". A possible analogy is with  
 116073 an applications development environment; while all conforming implementations must be  
 116074 capable of executing applications, not all need to have the development environment installed.  
 116075 The assumption is that the capability to modify the behavior of utilities (and applications) via  
 116076 locale settings must be supported. If the *localedef* utility is not present, then the only choice is to  
 116077 select an existing (presumably implementation-documented) locale. An implementation could,  
 116078 for example, choose to support only the POSIX locale, which would in effect limit the amount of  
 116079 changes from historical implementations quite drastically. The *localedef* utility is still required,  
 116080 but would always terminate with an exit code indicating that no locale could be created.  
 116081 Supported locales must be documented using the syntax defined in this chapter. (This ensures  
 116082 that users can accurately determine what capabilities are provided. If the implementation  
 116083 decides to provide additional capabilities to the ones in this chapter, that is already provided  
 116084 for.)

116085 If the option is present (that is, locales can be created), then the *localedef* utility must be capable  
 116086 of creating locales based on the syntax and rules defined in this chapter. This does not mean that  
 116087 the implementation cannot also provide alternate means for creating locales.

116088 The octal, decimal, and hexadecimal notations are the same employed by the charmap facility  
 116089 (see XBD [Section 6.4](#), on page 129). To avoid confusion between an octal constant and a back-  
 116090 reference, the octal, hexadecimal, and decimal constants must contain at least two digits. As  
 116091 single-digit constants are relatively rare, this should not impose any significant hardship.  
 116092 Provision is made for more digits to account for systems in which the byte size is larger than 8  
 116093 bits. For example, a Unicode (see the ISO/IEC 10646-1:2000 standard) system that has defined

116094 16-bit bytes may require six octal, four hexadecimal, and five decimal digits. As with the  
 116095 charmap file, multi-byte characters are described in the locale definition file using “big-endian”  
 116096 notation for reasons of portability. There is no requirement that the internal representation in the  
 116097 computer memory be in this same order.

116098 One of the guidelines used for the development of this volume of POSIX.1-2008 is that  
 116099 characters outside the invariant part of the ISO/IEC 646:1991 standard should not be used in  
 116100 portable specifications. The <backslash> character is not in the invariant part; the <number-  
 116101 sign> is, but with multiple representations: as a <number-sign>, and as a hash sign. As far as  
 116102 general usage of these symbols, they are covered by the “grandfather clause”, but for newly  
 116103 defined interfaces, the WG15 POSIX working group has requested that POSIX provide alternate  
 116104 representations. Consequently, while the default escape character remains the <backslash> and  
 116105 the default comment character is the <number-sign>, implementations are required to recognize  
 116106 alternative representations, identified in the applicable source file via the <escape\_char> and  
 116107 <comment\_char> keywords.

#### 116108 A.7.3.1 LC\_CTYPE

116109 The *LC\_CTYPE* category is primarily used to define the encoding-independent aspects of a  
 116110 character set, such as character classification. In addition, certain encoding-dependent  
 116111 characteristics are also defined for an application via the *LC\_CTYPE* category. POSIX.1-2008 does  
 116112 not mandate that the encoding used in the locale is the same as the one used by the application  
 116113 because an implementation may decide that it is advantageous to define locales in a system-  
 116114 wide encoding rather than having multiple, logically identical locales in different encodings, and  
 116115 to convert from the application encoding to the system-wide encoding on usage. Other  
 116116 implementations could require encoding-dependent locales.

116117 In either case, the *LC\_CTYPE* attributes that are directly dependent on the encoding, such as  
 116118 <mb\_cur\_max> and the display width of characters, are not user-specifiable in a locale source  
 116119 and are consequently not defined as keywords.

116120 Implementations may define additional keywords or extend the *LC\_CTYPE* mechanism to allow  
 116121 application-defined keywords.

116122 The text “The ellipsis specification shall only be valid within a single encoded character set” is  
 116123 present because it is possible to have a locale supported by multiple character encodings, as  
 116124 explained in the rationale for XBD [Section 6.1](#) (on page 125). An example given there is of a  
 116125 possible Japanese-based locale supported by a mixture of the character sets JIS X 0201 Roman,  
 116126 JIS X 0208, and JIS X 0201 Katakana. Attempting to express a range of characters across these sets  
 116127 is not logical and the implementation is free to reject such attempts.

116128 As the *LC\_CTYPE* character classes are based on the ISO C standard character class definition,  
 116129 the category does not support multi-character elements. For instance, the German character  
 116130 <sharp-s> is traditionally classified as a lowercase letter. There is no corresponding uppercase  
 116131 letter; in proper capitalization of German text, the <sharp-s> will be replaced by "SS"; that is, by  
 116132 two characters. This kind of conversion is outside the scope of the **toupper** and **tolower**  
 116133 keywords.

116134 Where POSIX.1-2008 specifies that only certain characters can be specified, as for the keywords  
 116135 **digit** and **xdigit**, the specified characters must be from the portable character set, as shown. As  
 116136 an example, only the Arabic digits 0 through 9 are acceptable as digits.

116137 The character classes **digit**, **xdigit**, **lower**, **upper**, and **space** have a set of automatically included  
 116138 characters. These only need to be specified if the character values (that is, encoding) differs from  
 116139 the implementation default values. It is not possible to define a locale without these  
 116140 automatically included characters unless some implementation extension is used to prevent

116141 their inclusion. Such a definition would not be a proper superset of the C locale, and thus, it  
 116142 might not be possible for the standard utilities to be implemented as programs conforming to  
 116143 the ISO C standard.

116144 The definition of character class **digit** requires that only ten characters—the ones defining  
 116145 digits—can be specified; alternate digits (for example, Hindi or Kanji) cannot be specified here.  
 116146 However, the encoding may vary if an implementation supports more than one encoding.

116147 The definition of character class **xdigit** requires that the characters included in character class  
 116148 **digit** are included here also and allows for different symbols for the hexadecimal digits 10  
 116149 through 15.

116150 The inclusion of the **charclass** keyword satisfies the following requirement from the  
 116151 ISO POSIX-2: 1993 standard, Annex H.1:

116152 (3) *The LC\_CTYPE (2.5.2.1) locale definition should be enhanced to allow user-specified additional*  
 116153 *character classes, similar in concept to the ISO C standard Multibyte Support Extension (MSE)*  
 116154 *iswctype() function.*

116155 This keyword was previously included in The Open Group specifications and is now mandated  
 116156 in the Shell and Utilities volume of POSIX.1-2008.

116157 The symbolic constant {CHARCLASS\_NAME\_MAX} was also adopted from The Open Group  
 116158 specifications. Applications portability is enhanced by the use of symbolic constants.

#### 116159 A.7.3.2 LC\_COLLATE

116160 The rules governing collation depend to some extent on the use. At least five different levels of  
 116161 increasingly complex collation rules can be distinguished:

- 116162 1. *Byte/machine code order*: This is the historical collation order in the UNIX system and many  
 116163 proprietary operating systems. Collation is here performed character by character,  
 116164 without any regard to context. The primary virtue is that it usually is quite fast and also  
 116165 completely deterministic; it works well when the native machine collation sequence  
 116166 matches the user expectations.
- 116167 2. *Character order*: On this level, collation is also performed character by character, without  
 116168 regard to context. The order between characters is, however, not determined by the code  
 116169 values, but on the expectations by the user of the “correct” order between characters. In  
 116170 addition, such a (simple) collation order can specify that certain characters collate equally  
 116171 (for example, uppercase and lowercase letters).
- 116172 3. *String ordering*: On this level, entire strings are compared based on relatively  
 116173 straightforward rules. Several “passes” may be required to determine the order between  
 116174 two strings. Characters may be ignored in some passes, but not in others; the strings may  
 116175 be compared in different directions; and simple string substitutions may be performed  
 116176 before strings are compared. This level is best described as “dictionary” ordering; it is  
 116177 based on the spelling, not the pronunciation, or meaning, of the words.
- 116178 4. *Text search ordering*: This is a further refinement of the previous level, best described as  
 116179 “telephone book ordering”; some common homonyms (words spelled differently but  
 116180 with the same pronunciation) are collated together; numbers are collated as if they were  
 116181 spelled out, and so on.
- 116182 5. *Semantic-level ordering*: Words and strings are collated based on their meaning; entire  
 116183 words (such as “the”) are eliminated; the ordering is not deterministic. This usually  
 116184 requires special software and is highly dependent on the intended use.

116185 While the historical collation order formally is at level 1, for the English language it corresponds  
116186 roughly to elements at level 2. The user expects to see the output from the *ls* utility sorted very  
116187 much as it would be in a dictionary. While telephone book ordering would be an optimal goal  
116188 for standard collation, this was ruled out as the order would be language-dependent.  
116189 Furthermore, a requirement was that the order must be determined solely from the text string  
116190 and the collation rules; no external information (for example, “pronunciation dictionaries”)   
116191 could be required.

116192 As a result, the goal for the collation support is at level 3. This also matches the requirements for  
116193 the Canadian collation order, as well as other, known collation requirements for alphabetic  
116194 scripts. It specifically rules out collation based on pronunciation rules or based on semantic  
116195 analysis of the text.

116196 The syntax for the *LC\_COLLATE* category source meets the requirements for level 3 and has  
116197 been verified to produce the correct result with examples based on French, Canadian, and  
116198 Danish collation order. Because it supports multi-character collating elements, it is also capable  
116199 of supporting collation in codesets where a character is expressed using non-spacing characters  
116200 followed by the base character (such as the ISO/IEC 6937:2001 standard).

116201 The directives that can be specified in an operand to the **order\_start** keyword are based on the  
116202 requirements specified in several proposed standards and in customary use. The following is a  
116203 rephrasing of rules defined for “lexical ordering in English and French” by the Canadian  
116204 Standards Association (the text in square brackets is rephrased):

- 116205 • Once special characters [punctuation] have been removed from original strings, the  
116206 ordering is determined by scanning forwards (left to right) [disregarding case and  
116207 diacriticals].
- 116208 • In case of equivalence, special characters are once again removed from original strings and  
116209 the ordering is determined by scanning backwards (starting from the rightmost character  
116210 of the string and back), character by character [disregarding case but considering  
116211 diacriticals].
- 116212 • In case of repeated equivalence, special characters are removed again from original strings  
116213 and the ordering is determined by scanning forwards, character by character [considering  
116214 both case and diacriticals].
- 116215 • If there is still an ordering equivalence after the first three rules have been applied, then  
116216 only special characters and the position they occupy in the string are considered to  
116217 determine ordering. The string that has a special character in the lowest position comes  
116218 first. If two strings have a special character in the same position, the character [with the  
116219 lowest collation value] comes first. In case of equality, the other special characters are  
116220 considered until there is a difference or until all special characters have been exhausted.

116221 It is estimated that this part of POSIX.1-2008 covers the requirements for all European  
116222 languages, and no particular problems are anticipated with Slavic or Middle East character sets.

116223 The Far East (particularly Japanese/Chinese) collations are often based on contextual  
116224 information and pronunciation rules (the same ideogram can have different meanings and  
116225 different pronunciations). Such collation, in general, falls outside the desired goal of  
116226 POSIX.1-2008. There are, however, several other collation rules (stroke/radical or “most  
116227 common pronunciation”) that can be supported with the mechanism described here.

116228 The character order is defined by the order in which characters and elements are specified  
116229 between the **order\_start** and **order\_end** keywords. Weights assigned to the characters and  
116230 elements define the collation sequence; in the absence of weights, the character order is also the  
116231 collation sequence.

116232 The **position** keyword provides the capability to consider, in a compare, the relative position of  
 116233 characters not subject to **IGNORE**. As an example, consider the two strings "o-ring" and  
 116234 "or-ing". Assuming the <hyphen> is subject to **IGNORE** on the first pass, the two strings  
 116235 compare equal, and the position of the <hyphen> is immaterial. On second pass, all characters  
 116236 except the <hyphen> are subject to **IGNORE**, and in the normal case the two strings would  
 116237 again compare equal. By taking position into account, the first collates before the second.

116238 A.7.3.3 LC\_MONETARY

116239 The currency symbol does not appear in LC\_MONETARY because it is not defined in the C  
 116240 locale of the ISO C standard.

116241 The ISO C standard limits the size of decimal points and thousands delimiters to single-byte  
 116242 values. In locales based on multi-byte coded character sets, this cannot be enforced;  
 116243 POSIX.1-2008 does not prohibit such characters, but makes the behavior unspecified (in the text  
 116244 "In contexts where other standards ...").

116245 The grouping specification is based on, but not identical to, the ISO C standard. The -1 indicates  
 116246 that no further grouping is performed; the equivalent of {CHAR\_MAX} in the ISO C standard.

116247 The text "the value is not available in the locale" is taken from the ISO C standard and is used  
 116248 instead of the "unspecified" text in early proposals. There is no implication that omitting these  
 116249 keywords or assigning them values of " " or -1 produces unspecified results; such omissions or  
 116250 assignments eliminate the effects described for the keyword or produce zero-length strings, as  
 116251 appropriate.

116252 The locale definition is an extension of the ISO C standard *localeconv()* specification. In  
 116253 particular, rules on how **currency\_symbol** is treated are extended to also cover **int\_curr\_symbol**,  
 116254 and **p\_set\_by\_space** and **n\_sep\_by\_space** have been augmented with the value 2, which places  
 116255 a <space> between the sign and the symbol. This has been updated to match the  
 116256 ISO/IEC 9899:1999 standard requirements and is an incompatible change from UNIX 98 and the  
 116257 ISO POSIX-2 standard and the ISO POSIX-1:1996 standard requirements. The following table  
 116258 shows the result of various combinations:

116259

|                          |                        | <b>p_sep_by_space</b> |           |          |
|--------------------------|------------------------|-----------------------|-----------|----------|
|                          |                        | <b>2</b>              | <b>1</b>  | <b>0</b> |
| <b>p_cs_precedes = 1</b> | <b>p_sign_posn = 0</b> | (\$1.25)              | (\$ 1.25) | (\$1.25) |
|                          | <b>p_sign_posn = 1</b> | + \$1.25              | +\$ 1.25  | +\$1.25  |
|                          | <b>p_sign_posn = 2</b> | \$1.25 +              | \$ 1.25+  | \$1.25+  |
|                          | <b>p_sign_posn = 3</b> | + \$1.25              | +\$ 1.25  | +\$1.25  |
| <b>p_cs_precedes = 0</b> | <b>p_sign_posn = 4</b> | \$ +1.25              | \$+ 1.25  | +\$1.25  |
|                          | <b>p_sign_posn = 0</b> | (1.25 \$)             | (1.25 \$) | (1.25\$) |
|                          | <b>p_sign_posn = 1</b> | +1.25 \$              | +1.25 \$  | +1.25\$  |
|                          | <b>p_sign_posn = 2</b> | 1.25\$ +              | 1.25 \$+  | 1.25\$+  |
|                          | <b>p_sign_posn = 3</b> | 1.25+ \$              | 1.25 +\$  | 1.25+\$  |
|                          | <b>p_sign_posn = 4</b> | 1.25\$ +              | 1.25 \$+  | 1.25\$+  |

116260

116261

116262

116263

116264

116265

116266

116267

116268

116269

116270

116271 The following is an example of the interpretation of the **mon\_grouping** keyword. Assuming that  
 116272 the value to be formatted is 123 456 789 and the **mon\_thousands\_sep** is <apostrophe>, then the  
 116273 following table shows the result. The third column shows the equivalent string in the ISO C  
 116274 standard that would be used by the *localeconv()* function to accommodate this grouping.

116275  
116276  
116277  
116278  
116279  
116280

| mon_grouping | Formatted Value | ISO C String |
|--------------|-----------------|--------------|
| 3;-1         | 123456'789      | "\3\177"     |
| 3            | 123'456'789     | "\3"         |
| 3;2;-1       | 1234'56'789     | "\3\2\177"   |
| 3;2          | 12'34'56'789    | "\3\2"       |
| -1           | 123456789       | "\177"       |

116281  
116282  
116283  
116284  
116285  
116286  
116287  
116288  
116289  
116290  
116291  
116292

In these examples, the octal value of {CHAR\_MAX} is 177.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/6 adds a correction that permits the Euro currency symbol and addresses extensibility. The correction is stated using the term “should” intentionally, in order to make this a recommendation rather than a restriction on implementations. This allows for flexibility in implementations on how they handle future currency symbol additions.

IEEE Std 1003.1-2001/Cor 1-2002, tem XBD/TC1/D6/5 is applied, adding the `int_[np]*` values to the POSIX locale definition of `LC_MONETARY`.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/16 is applied, updating the descriptions of `p_sep_by_space`, `n_sep_by_space`, `int_p_sep_by_space`, and `int_n_sep_by_space` to match the description of these keywords in the ISO C standard and the System Interfaces volume of POSIX.1-2008, `localeconv()`.

116293 A.7.3.4 `LC_NUMERIC`

116294 See the rationale for `LC_MONETARY` for a description of the behavior of grouping.

116295 A.7.3.5 `LC_TIME`

116296 Although certain of the conversion specifications in the POSIX locale (such as the name of the  
116297 month) are shown with initial capital letters, this need not be the case in other locales. Programs  
116298 using these conversion specifications may need to adjust the capitalization if the output is going  
116299 to be used at the beginning of a sentence.

116300 The `LC_TIME` descriptions of `abday`, `day`, `mon`, and `abmon` imply a Gregorian style calendar  
116301 (7-day weeks, 12-month years, leap years, and so on). Formatting time strings for other types of  
116302 calendars is outside the scope of POSIX.1-2008.

116303 While the ISO 8601:2004 standard numbers the weekdays starting with Monday, historical  
116304 practice is to use the Sunday as the first day. Rather than change the order and introduce  
116305 potential confusion, the days must be specified beginning with Sunday; previous references to  
116306 “first day” have been removed. Note also that the Shell and Utilities volume of POSIX.1-2008  
116307 `date` utility supports numbering compliant with the ISO 8601:2004 standard.

116308 As specified under `date` in the Shell and Utilities volume of POSIX.1-2008 and `strftime()` in the  
116309 System Interfaces volume of POSIX.1-2008, the conversion specifications corresponding to the  
116310 optional keywords consist of a modifier followed by a traditional conversion specification (for  
116311 instance, `%Ex`). If the optional keywords are not supported by the implementation or are  
116312 unspecified for the current locale, these modified conversion specifications are treated as the  
116313 traditional conversion specifications. For example, assume the following keywords:

```
116314 alt_digits    "0th"; "1st"; "2nd"; "3rd"; "4th"; "5th"; \  
116315              "6th"; "7th"; "8th"; "9th"; "10th"  
116316 d_fmt        "The %Od day of %B in %Y"
```

116317 On July 4th 1776, the `%x` conversion specifications would result in "The 4th day of July

116318 in 1776", while on July 14th 1789 it would result in "The 14 day of July in 1789". It  
 116319 can be noted that the above example is for illustrative purposes only; the %O modifier is  
 116320 primarily intended to provide for Kanji or Hindi digits in *date* formats.

116321 The following is an example for Japan that supports the current plus last three Emperors and  
 116322 reverts to Western style numbering for years prior to the Meiji era. The example also allows for  
 116323 the custom of using a special name for the first year of an era instead of using 1. (The examples  
 116324 substitute romaji where kanji should be used.)

```
116325 era_d_fmt "%EY%mgatsu%dnichi (%a) "
```

```
116326 era "+:2:1990/01/01:+*:Heisei:%EC%Eynen";\  

116327 "+:1:1989/01/08:1989/12/31:Heisei:%ECgannen";\  

116328 "+:2:1927/01/01:1989/01/07:Shouwa:%EC%Eynen";\  

116329 "+:1:1926/12/25:1926/12/31:Shouwa:%ECgannen";\  

116330 "+:2:1913/01/01:1926/12/24:Taishou:%EC%Eynen";\  

116331 "+:1:1912/07/30:1912/12/31:Taishou:%ECgannen";\  

116332 "+:2:1869/01/01:1912/07/29:Meiji:%EC%Eynen";\  

116333 "+:1:1868/09/08:1868/12/31:Meiji:%ECgannen";\  

116334 "-:1868:1868/09/07:-*::%Ey"
```

116335 Assuming that the current date is September 21, 1991, a request to *date* or *strftime()* would yield  
 116336 the following results:

```
116337 %Ec - Heisei3nen9gatsu21nichi (Sat) 14:39:26  

116338 %EC - Heisei  

116339 %Ex - Heisei3nen9gatsu21nichi (Sat)  

116340 %Ey - 3  

116341 %EY - Heisei3nen
```

116342 Example era definitions for the Republic of China:

```
116343 era "+:2:1913/01/01:+*:ChungHwaMingGuo:%EC%EyNen";\  

116344 "+:1:1912/1/1:1912/12/31:ChungHwaMingGuo:%ECYuenNen";\  

116345 "+:1:1911/12/31:-*:MingChien:%EC%EyNen"
```

116346 Example definitions for the Christian Era:

```
116347 era "+:1:0001/01/01:+*:AD:%EC %Ey";\  

116348 "+:1:-0001/12/31:-*:BC:%Ey %EC"
```

#### 116349 A.7.3.6 LC\_MESSAGES

116350 The **yesstr** and **nostr** locale keywords and the YESSTR and NOSTR *langinfo* items were formerly  
 116351 used to match user affirmative and negative responses. In POSIX.1-2008, the **yesexpr**, **noexpr**,  
 116352 YESEXPR, and NOEXPR extended regular expressions have replaced them. Applications  
 116353 should use the general locale-based messaging facilities to issue prompting messages which  
 116354 include sample desired responses.

116355 **A.7.4 Locale Definition Grammar**

116356 There is no additional rationale provided for this section.

116357 *A.7.4.1 Locale Lexical Conventions*

116358 There is no additional rationale provided for this section.

116359 *A.7.4.2 Locale Grammar*

116360 There is no additional rationale provided for this section.

116361 **A.7.5 Locale Definition Example**

116362 The following is an example of a locale definition file that could be used as input to the *localedef*  
 116363 utility. It assumes that the utility is executed with the *-f* option, naming a charmap file with (at  
 116364 least) the following content:

```

116365 CHARMAP
116366 <space>      \x20
116367 <dollar>     \x24
116368 <A>          \101
116369 <a>          \141
116370 <A-acute>   \346
116371 <a-acute>   \365
116372 <A-grave>   \300
116373 <a-grave>   \366
116374 <b>          \142
116375 <C>          \103
116376 <c>          \143
116377 <c-cedilla> \347
116378 <d>          \x64
116379 <H>          \110
116380 <h>          \150
116381 <eszet>     \xb7
116382 <s>          \x73
116383 <z>          \x7a
116384 END CHARMAP

```

116385 It should not be taken as complete or to represent any actual locale, but only to illustrate the  
 116386 syntax.

```

116387 #
116388 LC_CTYPE
116389 lower  <a>;<b>;<c>;<c-cedilla>;<d>;...;<z>
116390 upper  A;B;C;Ç;...;Z
116391 space  \x20;\x09;\x0a;\x0b;\x0c;\x0d
116392 blank  \040;\011
116393 toupper (<a>,<A>);(b,B);(c,C);(ç,Ç);(d,D);(z,Z)
116394 END LC_CTYPE
116395 #
116396 LC_COLLATE
116397 #

```

```

116398 # The following example of collation is based on
116399 # Canadian standard Z243.4.1-1998, "Canadian Alphanumeric
116400 # Ordering Standard for Character Sets of CSA Z234.4 Standard".
116401 # (Other parts of this example locale definition file do not
116402 # purport to relate to Canada, or to any other real culture.)
116403 # The proposed standard defines a 4-weight collation, such that
116404 # in the first pass, characters are compared without regard to
116405 # case or accents; in the second pass, backwards-compare without
116406 # regard to case; in the third pass, forwards-compare without
116407 # regard to diacriticals. In the 3 first passes, non-alphabetic
116408 # characters are ignored; in the fourth pass, only special
116409 # characters are considered, such that "The string that has a
116410 # special character in the lowest position comes first. If two
116411 # strings have a special character in the same position, the
116412 # collation value of the special character determines ordering.
116413 #
116414 # Only a subset of the character set is used here; mostly to
116415 # illustrate the set-up.
116416 #
116417 collating-symbol <NULL>
116418 collating-symbol <LOW_VALUE>
116419 collating-symbol <LOWER-CASE>
116420 collating-symbol <SUBSCRIPT-LOWER>
116421 collating-symbol <SUPERSCRIPT-LOWER>

## 116535 A.8 Environment Variables

### 116536 A.8.1 Environment Variable Definition

116537 The variable *environ* is not intended to be declared in any header, but rather to be declared by  
 116538 the user for accessing the array of strings that is the environment. This is the traditional usage of  
 116539 the symbol. Putting it into a header could break some programs that use the symbol for their  
 116540 own purposes.

116541 The decision to restrict conforming systems to the use of digits, uppercase letters, and  
 116542 underscores for environment variable names allows applications to use lowercase letters in their  
 116543 environment variable names without conflicting with any conforming system.

116544 In addition to the obvious conflict with the shell syntax for positional parameter substitution,  
 116545 some historical applications (including some shells) exclude names with leading digits from the  
 116546 environment.

116547 **A.8.2 Internationalization Variables**

116548 Utilities conforming to the Shell and Utilities volume of POSIX.1-2008 and written in standard C  
116549 can access the locale variables by issuing the following call:

```
116550 setlocale(LC_ALL, "")
```

116551 If this were omitted, the ISO C standard specifies that the C locale would be used.

116552 The DESCRIPTION of *setlocale()* requires that when setting all categories of a locale, if the value  
116553 of any of the environment variable searches yields a locale that is not supported (and non-null),  
116554 the *setlocale()* function returns a null pointer and the locale of the process is unchanged.

116555 For the standard utilities, if any of the environment variables are invalid, it makes sense to  
116556 default to an implementation-defined, consistent locale environment. It is more confusing for a  
116557 user to have partial settings occur in case of a mistake. All utilities would then behave in one  
116558 language/cultural environment. Furthermore, it provides a way of forcing the whole  
116559 environment to be the implementation-defined default. Disastrous results could occur if a  
116560 pipeline of utilities partially uses the environment variables in different ways. In this case, it  
116561 would be appropriate for utilities that use *LANG* and related variables to exit with an error if  
116562 any of the variables are invalid. For example, users typing individual commands at a terminal  
116563 might want *date* to work if *LC\_MONETARY* is invalid as long as *LC\_TIME* is valid. Since these  
116564 are conflicting reasonable alternatives, POSIX.1-2008 leaves the results unspecified if the locale  
116565 environment variables would not produce a complete locale matching the specification of the  
116566 user.

116567 The locale settings of individual categories cannot be truly independent and still guarantee  
116568 correct results. For example, when collating two strings, characters must first be extracted from  
116569 each string (governed by *LC\_CTYPE*) before being mapped to collating elements (governed by  
116570 *LC\_COLLATE*) for comparison. That is, if *LC\_CTYPE* is causing parsing according to the rules of  
116571 a large, multi-byte code set (potentially returning 20000 or more distinct character codeset  
116572 values), but *LC\_COLLATE* is set to handle only an 8-bit codeset with 256 distinct characters,  
116573 meaningful results are obviously impossible.

116574 The *LC\_MESSAGES* variable affects the language of messages generated by the standard  
116575 utilities.

116576 The description of the environment variable names starting with the characters "LC\_"  
116577 acknowledges the fact that the interfaces presented may be extended as new international  
116578 functionality is required. In the ISO C standard, names preceded by "LC\_" are reserved in the  
116579 name space for future categories.

116580 To avoid name clashes, new categories and environment variables are divided into two  
116581 classifications: "implementation-independent" and "implementation-defined".

116582 Implementation-independent names will have the following format:

```
116583 LC_NAME
```

116584 where *NAME* is the name of the new category and environment variable. Capital letters must be  
116585 used for implementation-independent names.

116586 Implementation-defined names must be in lowercase letters, as below:

```
116587 LC_name
```

**116588 A.8.3 Other Environment Variables****116589 COLUMNS, LINES**

116590 The default values for the number of column positions, *COLUMNS*, and screen height, *LINES*,  
116591 are unspecified because historical implementations use different methods to determine values  
116592 corresponding to the size of the screen in which the utility is run. This size is typically known to  
116593 the implementation through the value of *TERM*, or by more elaborate methods such as  
116594 extensions to the *stty* utility or knowledge of how the user is dynamically resizing windows on a  
116595 bit-mapped display terminal. Users should not need to set these variables in the environment  
116596 unless there is a specific reason to override the default behavior of the implementation, such as  
116597 to display data in an area arbitrarily smaller than the terminal or window. Values for these  
116598 variables that are not decimal integers greater than zero are implicitly undefined values; it is  
116599 unnecessary to enumerate all of the possible values outside of the acceptable set.

**116600 LOGNAME**

116601 In most implementations, the value of such a variable is easily forged, so security-critical  
116602 applications should rely on other means of determining user identity. *LOGNAME* is required to  
116603 be constructed from the portable filename character set for reasons of interchange. No diagnostic  
116604 condition is specified for violating this rule, and no requirement for enforcement exists. The  
116605 intent of the requirement is that if extended characters are used, the “guarantee” of portability  
116606 implied by a standard is void.

**116607 PATH**

116608 Many historical implementations of the Bourne shell do not interpret a trailing <colon> to  
116609 represent the current working directory and are thus non-conforming. The C Shell and the  
116610 KornShell conform to POSIX.1-2008 on this point. The usual name of dot may also be used to  
116611 refer to the current working directory.

116612 Many implementations historically have used a default value of */bin* and */usr/bin* for the *PATH*  
116613 variable. POSIX.1-2008 does not mandate this default path be identical to that retrieved from  
116614 *getconf PATH* because it is likely that the standardized utilities may be provided in another  
116615 directory separate from the directories used by some historical applications.

**116616 SHELL**

116617 The *SHELL* variable names the preferred shell of the user; it is a guide to applications. There is  
116618 no direct requirement that that shell conform to POSIX.1-2008; that decision should rest with the  
116619 user. It is the intention of the standard developers that alternative shells be permitted, if the user  
116620 chooses to develop or acquire one. An operating system that builds its shell into the “kernel” in  
116621 such a manner that alternative shells would be impossible does not conform to the spirit of  
116622 POSIX.1-2008.

**116623 TZ**

116624 The quoted form of the timezone variable allows timezone names of the form UTC+1 (or any  
116625 name that contains the character plus ('+'), the character minus ('-'), or digits), which may be  
116626 appropriate for countries that do not have an official timezone name. It would be coded as  
116627 <UTC+1>+1<UTC+2>, which would cause *std* to have a value of UTC+1 and *dst* a value of  
116628 UTC+2, each with a length of 5 characters. This does not appear to conflict with any existing  
116629 usage. The characters '<' and '>' were chosen for quoting because they are easier to parse  
116630 visually than a quoting character that does not provide some sense of bracketing (and in a string  
116631 like this, such bracketing is helpful). They were also chosen because they do not need special  
116632 treatment when assigning to the *TZ* variable. Users are often confused by embedding quotes in a

116633 string. Because '`<`' and '`>`' are meaningful to the shell, the whole string would have to be  
116634 quoted, but that is easily explained. (Parentheses would have presented the same problems.)  
116635 Although the '`>`' symbol could have been permitted in the string by either escaping it or  
116636 doubling it, it seemed of little value to require that. This could be provided as an extension if  
116637 there was a need. Timezone names of this new form lead to a requirement that the value of  
116638 `{_POSIX_TZNAME_MAX}` change from 3 to 6.

116639 Since the *TZ* environment variable is usually inherited by all applications started by a user after  
116640 the value of the *TZ* environment variable is changed and since many applications run using the  
116641 C or POSIX locale, using characters that are not in the portable character set in the *std* and *dst*  
116642 fields could cause unexpected results.

116643 The format of the *TZ* environment variable is changed in Issue 6 to allow for the quoted form, as  
116644 defined in earlier versions of the ISO POSIX-1 standard.

116645 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/7 is applied, adding the *ctime\_r()* and  
116646 *localtime\_r()* functions to the list of functions that use the *TZ* environment variable.

## 116647 **A.9 Regular Expressions**

116648 Rather than repeating the description of REs for each utility supporting REs, the standard  
116649 developers preferred a common, comprehensive description of regular expressions in one place.  
116650 The most common behavior is described here, and exceptions or extensions to this are  
116651 documented for the respective utilities, as appropriate.

116652 The BRE corresponds to the *ed* or historical *grep* type, and the ERE corresponds to the historical  
116653 *egrep* type (now *grep -E*).

116654 The text is based on the *ed* description and substantially modified, primarily to aid developers  
116655 and others in the understanding of the capabilities and limitations of REs. Much of this was  
116656 influenced by internationalization requirements.

116657 It should be noted that the definitions in this section do not cover the *tr* utility; the *tr* syntax does  
116658 not employ REs.

116659 The specification of REs is particularly important to internationalization because pattern  
116660 matching operations are very basic operations in business and other operations. The syntax and  
116661 rules of REs are intended to be as intuitive as possible to make them easy to understand and use.  
116662 The historical rules and behavior do not provide that capability to non-English language users,  
116663 and do not provide the necessary support for commonly used characters and language  
116664 constructs. It was necessary to provide extensions to the historical RE syntax and rules to  
116665 accommodate other languages.

116666 As they are limited to bracket expressions, the rationale for these modifications is in XBD [Section](#)  
116667 [9.3.5](#) (on page 184).

### 116668 A.9.1 Regular Expression Definitions

116669 It is possible to determine what strings correspond to subexpressions by recursively applying  
 116670 the leftmost longest rule to each subexpression, but only with the proviso that the overall match  
 116671 is leftmost longest. For example, matching "`\(ac*\\)c*d[ac]*\1`" against `acdacaaa` matches  
 116672 `acdacaaa` (with `\1=a`); simply matching the longest match for "`\(ac*\\)`" would yield `\1=ac`, but  
 116673 the overall match would be smaller (`acdac`). Conceptually, the implementation must examine  
 116674 every possible match and among those that yield the leftmost longest total matches, pick the one  
 116675 that does the longest match for the leftmost subexpression, and so on. Note that this means that  
 116676 matching by subexpressions is context-dependent: a subexpression within a larger RE may  
 116677 match a different string from the one it would match as an independent RE, and two instances of  
 116678 the same subexpression within the same larger RE may match different lengths even in similar  
 116679 sequences of characters. For example, in the ERE "`(a.*b)(a.*b)`", the two identical  
 116680 subexpressions would match four and six characters, respectively, of `accbaccccb`.

116681 The definition of single character has been expanded to include also collating elements  
 116682 consisting of two or more characters; this expansion is applicable only when a bracket  
 116683 expression is included in the BRE or ERE. An example of such a collating element may be the  
 116684 Dutch *ij*, which collates as a 'y'. In some encodings, a ligature "i with j" exists as a character  
 116685 and would represent a single-character collating element. In another encoding, no such ligature  
 116686 exists, and the two-character sequence *ij* is defined as a multi-character collating element.  
 116687 Outside brackets, the *ij* is treated as a two-character RE and matches the same characters in a  
 116688 string. Historically, a bracket expression only matched a single character. The ISO POSIX-2: 1993  
 116689 standard required bracket expressions like "`^[[:lower:]]`" to match multi-character collating  
 116690 elements such as "`ij`". However, this requirement led to behavior that many users did not  
 116691 expect and that could not feasibly be mimicked in user code, and it was rarely if ever  
 116692 implemented correctly. The current standard leaves it unspecified whether a bracket expression  
 116693 matches a multi-character collating element, allowing both historical and ISO POSIX-2: 1993  
 116694 standard implementations to conform.

116695 Also, in the current standard, it is unspecified whether character class expressions like  
 116696 "`[:lower:]`" can include multi-character collating elements like "`ij`"; hence  
 116697 "`[[:lower:]]`" can match "`ij`", and "`^[[:lower:]]`" can fail to match "`ij`". Common  
 116698 practice is for a character class expression to match a collating element if it matches the collating  
 116699 element's first character.

### 116700 A.9.2 Regular Expression General Requirements

116701 The definition of which sequence is matched when several are possible is based on the leftmost-  
 116702 longest rule historically used by deterministic recognizers. This rule is easier to define and  
 116703 describe, and arguably more useful, than the first-match rule historically used by non-  
 116704 deterministic recognizers. It is thought that dependencies on the choice of rule are rare; carefully  
 116705 contrived examples are needed to demonstrate the difference.

116706 A formal expression of the leftmost-longest rule is:

116707       The search is performed as if all possible suffixes of the string were tested for a prefix  
 116708       matching the pattern; the longest suffix containing a matching prefix is chosen, and the  
 116709       longest possible matching prefix of the chosen suffix is identified as the matching  
 116710       sequence.

116711 Historically, most RE implementations only match lines, not strings. However, that is more an  
 116712 effect of the usage than of an inherent feature of REs themselves. Consequently, POSIX.1-2008  
 116713 does not regard `<newline>` characters as special; they are ordinary characters, and both a

116714 <period> and a non-matching list can match them. Those utilities (like *grep*) that do not allow  
 116715 <newline> characters to match are responsible for eliminating any <newline> from strings  
 116716 before matching against the RE. The *regcomp()* function, however, can provide support for such  
 116717 processing without violating the rules of this section.

116718 Some implementations of *egrep* have had very limited flexibility in handling complex EREs.  
 116719 POSIX.1-2008 does not attempt to define the complexity of a BRE or ERE, but does place a lower  
 116720 limit on it—any RE must be handled, as long as it can be expressed in 256 bytes or less. (Of  
 116721 course, this does not place an upper limit on the implementation.) There are historical programs  
 116722 using a non-deterministic-recognizer implementation that should have no difficulty with this  
 116723 limit. It is possible that a good approach would be to attempt to use the faster, but more limited,  
 116724 deterministic recognizer for simple expressions and to fall back on the non-deterministic  
 116725 recognizer for those expressions requiring it. Non-deterministic implementations must be  
 116726 careful to observe the rules on which match is chosen; the longest match, not the first match,  
 116727 starting at a given character is used.

116728 The term “invalid” highlights a difference between this section and some others: POSIX.1-2008  
 116729 frequently avoids mandating of errors for syntax violations because they can be used by  
 116730 implementors to trigger extensions. However, the authors of the internationalization features of  
 116731 REs wanted to mandate errors for certain conditions to identify usage problems or non-portable  
 116732 constructs. These are identified within this rationale as appropriate. The remaining syntax  
 116733 violations have been left implicitly or explicitly undefined. For example, the BRE construct  
 116734 “\{1, 2, 3\}” does not comply with the grammar. A conforming application cannot rely on it  
 116735 producing an error nor matching the literal characters “\{1, 2, 3\}”.

116736 The term “undefined” was used in favor of “unspecified” because many of the situations are  
 116737 considered errors on some implementations, and the standard developers considered that  
 116738 consistency throughout the section was preferable to mixing undefined and unspecified.

### 116739 **A.9.3 Basic Regular Expressions**

116746 There is no additional rationale provided for this section.

#### 116747 *A.9.3.4 Periods in BREs*

116748 There is no additional rationale provided for this section.

## 116749 A.9.3.5 RE Bracket Expression

116750 Range expressions are, historically, an integral part of REs. However, the requirements of  
 116751 “natural language behavior” and portability do conflict. In the POSIX locale, ranges must be  
 116752 treated according to the collating sequence and include such characters that fall within the range  
 116753 based on that collating sequence, regardless of character values. In other locales, ranges have  
 116754 unspecified behavior.

116755 Some historical implementations allow range expressions where the ending range point of one  
 116756 range is also the starting point of the next (for instance, "[a-m-o]"). This behavior should not  
 116757 be permitted, but to avoid breaking historical implementations, it is now *undefined* whether it is  
 116758 a valid expression and how it should be interpreted.

116759 Current practice in *awk* and *lex* is to accept escape sequences in bracket expressions as per XBD  
 116760 Table 5-1 (on page 121), while the normal ERE behavior is to regard such a sequence as  
 116761 consisting of two characters. Allowing the *awk/lex* behavior in EREs would change the normal  
 116762 behavior in an unacceptable way; it is expected that *awk* and *lex* will decode escape sequences in  
 116763 EREs before passing them to *regcomp()* or comparable routines. Each utility describes the escape  
 116764 sequences it accepts as an exception to the rules in this section; the list is not the same, for  
 116765 historical reasons.

116766 As noted previously, the new syntax and rules have been added to accommodate other  
 116767 languages than English. The remainder of this section describes the rationale for these  
 116768 modifications.

116769 In the POSIX locale, a regular expression that starts with a range expression matches a set of  
 116770 strings that are contiguously sorted, but this is not necessarily true in other locales. For example,  
 116771 a French locale might have the following behavior:

```
116772 $ ls
116773 alpha Alpha estimé ESTIMÉ été eurêka
116774 $ ls [a-e]*
116775 alpha Alpha estimé eurêka
```

116776 Such disagreements between matching and contiguous sorting are unavoidable because POSIX  
 116777 sorting cannot be implemented in terms of a deterministic finite-state automaton (DFA), but  
 116778 range expressions by design are implementable in terms of DFAs.

116779 Historical implementations used native character order to interpret range expressions. The  
 116780 ISO POSIX-2:1993 standard instead required collating element order (CEO): the order that  
 116781 collating elements were specified between the **order\_start** and **order\_end** keywords in the  
 116782 *LC\_COLLATE* category of the current locale. CEO had some advantages in portability over the  
 116783 native character order, but it also had some disadvantages:

- 116784 • CEO could not feasibly be mimicked in user code, leading to inconsistencies between  
 116785 POSIX matchers and matchers in popular user programs like Emacs, *ksh*, and Perl.
- 116786 • CEO caused range expressions to match accented and capitalized letters contrary to many  
 116787 users’ expectations. For example, "[a-e]" typically matched both 'É' and 'á' but  
 116788 neither 'A' nor 'é'.
- 116789 • CEO was not consistent across implementations. In practice, CEO was often less portable  
 116790 than native character order. For example, it was common for the CEOs of two  
 116791 implementation-supplied locales to disagree, even if both locales were named "da\_DK".

116792 Because of these problems, some implementations of regular expressions continued to use native  
 116793 character order. Others used the collation sequence, which is more consistent with sorting than  
 116794 either CEO or native order, but which departs further from the traditional POSIX semantics  
 116795 because it generally requires "[a-e]" to match either 'A' or 'E' but not both. As a result of

116796 this kind of implementation variation, programmers who wanted to write portable regular  
116797 expressions could not rely on the ISO POSIX-2: 1993 standard guarantees in practice.

116798 While revising the standard, lengthy consideration was given to proposals to attack this problem  
116799 by adding an API for querying the CEO to allow user-mode matchers, but none of these  
116800 proposals had implementation experience and none achieved consensus. Leaving the standard  
116801 alone was also considered, but rejected due to the problems described above.

116802 The current standard leaves unspecified the behavior of a range expression outside the POSIX  
116803 locale. This makes it clearer that conforming applications should avoid range expressions  
116804 outside the POSIX locale, and it allows implementations and compatible user-mode matchers to  
116805 interpret range expressions using native order, CEO, collation sequence, or other, more  
116806 advanced techniques. The concerns which led to this change were raised in IEEE PASC  
116807 interpretation 1003.2 #43 and others, and related to ambiguities in the specification of how  
116808 multi-character collating elements should be handled in range expressions. These ambiguities  
116809 had led to multiple interpretations of the specification, in conflicting ways, which led to varying  
116810 implementations. As noted above, efforts were made to resolve the differences, but no solution  
116811 has been found that would be specific enough to allow for portable software while not  
116812 invalidating existing implementations.

116813 The standard developers recognize that collating elements are important, such elements being  
116814 common in several European languages; for example, 'ch' or 'll' in traditional Spanish;  
116815 'aa' in several Scandinavian languages. Existing internationalized implementations have  
116816 processed, and continue to process, these elements in range expressions. Efforts are expected to  
116817 continue in the future to find a way to define the behavior of these elements precisely and  
116818 portably.

116819 The ISO POSIX-2: 1993 standard required "[b-a]" to be an invalid expression in the POSIX  
116820 locale, but this requirement has been relaxed in this version of the standard so that "[b-a]" can  
116821 instead be treated as a valid expression that does not match any string.

#### 116822 A.9.3.6 BREs Matching Multiple Characters

116823 The limit of nine back-references to subexpressions in the RE is based on the use of a single-digit  
116824 identifier; increasing this to multiple digits would break historical applications. This does not  
116825 imply that only nine subexpressions are allowed in REs. The following is a valid BRE with ten  
116826 subexpressions:

```
116827 \(\(\ (ab\)*c\)*d\)\ (ef\)*\ (gh\)\{2\}\ (ij\)*\ (kl\)*\ (mn\)*\ (op\)*\ (qr\)*
```

116828 The standard developers regarded the common historical behavior, which supported "\n\*", but  
116829 not "\n\{min,max\}", "\(\...\)\*", or "\(\...\)\{min,max\}", as a non-intentional  
116830 result of a specific implementation, and they supported both duplication and interval  
116831 expressions following subexpressions and back-references.

116832 The changes to the processing of the back-reference expression remove an unspecified or  
116833 ambiguous behavior in the Shell and Utilities volume of POSIX.1-2008, aligning it with the  
116834 requirements specified for the *regcomp()* expression, and is the result of PASC Interpretation  
116835 1003.2-92 #43 submitted for the ISO POSIX-2: 1993 standard.

## 116836 A.9.3.7 BRE Precedence

116837 There is no additional rationale provided for this section.

## 116838 A.9.3.8 BRE Expression Anchoring

116839 Often, the <dollar-sign> is viewed as matching the ending <newline> in text files. This is not  
116840 strictly true; the <newline> is typically eliminated from the strings to be matched, and the  
116841 <dollar-sign> matches the terminating null character.

116842 The ability of '^', '\$', and '\*' to be non-special in certain circumstances may be confusing to  
116843 some programmers, but this situation was changed only in a minor way from historical practice  
116844 to avoid breaking many historical scripts. Some consideration was given to making the use of  
116845 the anchoring characters undefined if not escaped and not at the beginning or end of strings.  
116846 This would cause a number of historical BREs, such as "2^10", "\$HOME", and "\$1.35", that  
116847 relied on the characters being treated literally, to become invalid.

116848 However, one relatively uncommon case was changed to allow an extension used on some  
116849 implementations. Historically, the BREs "^foo" and "\(^foo\)" did not match the same  
116850 string, despite the general rule that subexpressions and entire BREs match the same strings. To  
116851 increase consensus, POSIX.1-2008 has allowed an extension on some implementations to treat  
116852 these two cases in the same way by declaring that anchoring *may* occur at the beginning or end  
116853 of a subexpression. Therefore, portable BREs that require a literal <circumflex> at the beginning  
116854 or a <dollar-sign> at the end of a subexpression must escape them. Note that a BRE such as  
116855 "a\(^bc\)" will either match "a^bc" or nothing on different systems under the rules.

116856 ERE anchoring has been different from BRE anchoring in all historical systems. An unescaped  
116857 anchor character has never matched its literal counterpart outside a bracket expression. Some  
116858 implementations treated "foo\$bar" as a valid expression that never matched anything; others  
116859 treated it as invalid. POSIX.1-2008 mandates the former, valid unmatched behavior.

116860 Some implementations have extended the BRE syntax to add alternation. For example, the  
116861 subexpression "\ (foo\$\ |bar\ )" would match either "foo" at the end of the string or "bar"  
116862 anywhere. The extension is triggered by the use of the undefined "\|" sequence. Because the  
116863 BRE is undefined for portable scripts, the extending system is free to make other assumptions,  
116864 such that the '\$' represents the end-of-line anchor in the middle of a subexpression. If it were  
116865 not for the extension, the '\$' would match a literal <dollar-sign> under the rules.

116866 **A.9.4 Extended Regular Expressions**

116867 As with BREs, the standard developers decided to make the interpretation of escaped ordinary  
116868 characters undefined.

116869 The <right-parenthesis> is not listed as an ERE special character because it is only special in the  
116870 context of a preceding <left-parenthesis>. If found without a preceding <left-parenthesis>, the  
116871 <right-parenthesis> has no special meaning.

116872 The interval expression, "{m, n}", has been added to EREs. Historically, the interval expression  
116873 has only been supported in some ERE implementations. The standard developers estimated that  
116874 the addition of interval expressions to EREs would not decrease consensus and would also make  
116875 BREs more of a subset of EREs than in many historical implementations.

116876 It was suggested that, in addition to interval expressions, back-references ('\n') should also be  
116877 added to EREs. This was rejected by the standard developers as likely to decrease consensus.

116878 In historical implementations, multiple duplication symbols are usually interpreted from left to  
116879 right and treated as additive. As an example, "a+b" matches zero or more instances of 'a'

- 116880 followed by a 'b'. In POSIX.1-2008, multiple duplication symbols are undefined; that is, they  
116881 cannot be relied upon for conforming applications. One reason for this is to provide some scope  
116882 for future enhancements.
- 116883 The precedence of operations differs between EREs and those in *lex*; in *lex*, for historical reasons,  
116884 interval expressions have a lower precedence than concatenation.
- 116885 A.9.4.1 *EREs Matching a Single Character or Collating Element*  
116886 There is no additional rationale provided for this section.
- 116887 A.9.4.2 *ERE Ordinary Characters*  
116888 There is no additional rationale provided for this section.
- 116889 A.9.4.3 *ERE Special Characters*  
116890 There is no additional rationale provided for this section.
- 116891 A.9.4.4 *Periods in EREs*  
116892 There is no additional rationale provided for this section.
- 116893 A.9.4.5 *ERE Bracket Expression*  
116894 There is no additional rationale provided for this section.
- 116895 A.9.4.6 *EREs Matching Multiple Characters*  
116896 There is no additional rationale provided for this section.
- 116897 A.9.4.7 *ERE Alternation*  
116898 There is no additional rationale provided for this section.
- 116899 A.9.4.8 *ERE Precedence*  
116900 There is no additional rationale provided for this section.
- 116901 A.9.4.9 *ERE Expression Anchoring*  
116902 There is no additional rationale provided for this section.

116903 **A.9.5 Regular Expression Grammar**

116904 The grammars are intended to represent the range of acceptable syntaxes available to  
 116905 conforming applications. There are instances in the text where undefined constructs are  
 116906 described; as explained previously, these allow implementation extensions. There is no intended  
 116907 requirement that an implementation extension must somehow fit into the grammars shown  
 116908 here.

116909 The BRE grammar does not permit L\_ANCHOR or R\_ANCHOR inside "\ (" and "\ )" (which  
 116910 implies that '^' and '\$' are ordinary characters). This reflects the semantic limits on the  
 116911 application, as noted in XBD Section 9.3.8 (on page 187). Implementations are permitted to  
 116912 extend the language to interpret '^' and '\$' as anchors in these locations, and as such,  
 116913 conforming applications cannot use unescaped '^' and '\$' in positions inside "\ (" and "\ )"   
 116914 that might be interpreted as anchors.

116915 The ERE grammar does not permit several constructs that XBD Section 9.4.2 (on page 188) and  
 116916 Section 9.4.3 (on page 188) specify as having undefined results:

- 116917 • ORD\_CHAR preceded by <backslash>
- 116918 • ERE\_dupl\_symbol(s) appearing first in an ERE, or immediately following '|', '^', or '('
- 116919 • '{' not part of a valid ERE\_dupl\_symbol
- 116920 • '|' appearing first or last in an ERE, or immediately following '|' or '(', or  
 116921 immediately preceding ')'

116922 Implementations are permitted to extend the language to allow these. Conforming applications  
 116923 cannot use such constructs.

116924 *A.9.5.1 BRE/ERE Grammar Lexical Conventions*

116925 There is no additional rationale provided for this section.

116926 *A.9.5.2 RE and Bracket Expression Grammar*

116927 The removal of the *Back\_open\_paren Back\_close\_paren* option from the *nondupl\_RE* specification is  
 116928 the result of PASC Interpretation 1003.2-92 #43 submitted for the ISO POSIX-2:1993 standard.  
 116929 Although the grammar required support for null subexpressions, this section does not describe  
 116930 the meaning of, and historical practice did not support, this construct.

116931 *A.9.5.3 ERE Grammar*

116932 There is no additional rationale provided for this section.

## 116933 A.10 Directory Structure and Devices

### 116934 A.10.1 Directory Structure and Files

116935 A description of the historical `/usr/tmp` was omitted, removing any concept of differences in  
116936 emphasis between the `/` and `/usr` directories. The descriptions of `/bin`, `/usr/bin`, `/lib`, and `/usr/lib`  
116937 were omitted because they are not useful for applications. In an early draft, a distinction was  
116938 made between system and application directory usage, but this was not found to be useful.

116939 The directories `/` and `/dev` are included because the notion of a hierarchical directory structure is  
116940 key to other information presented elsewhere in POSIX.1-2008. In early drafts, it was argued that  
116941 special devices and temporary files could conceivably be handled without a directory structure  
116942 on some implementations. For example, the system could treat the characters `"/tmp"` as a  
116943 special token that would store files using some non-POSIX file system structure. This notion was  
116944 rejected by the standard developers, who required that all the files in this section be  
116945 implemented via POSIX file systems.

116946 The `/tmp` directory is retained in POSIX.1-2008 to accommodate historical applications that  
116947 assume its availability. Implementations are encouraged to provide suitable directory names in  
116948 the environment variable `TMPDIR` and applications are encouraged to use the contents of  
116949 `TMPDIR` for creating temporary files.

116950 The standard files `/dev/null` and `/dev/tty` are required to be both readable and writable to allow  
116951 applications to have the intended historical access to these files.

116952 The standard file `/dev/console` has been added for alignment with the Single UNIX  
116953 Specification.

### 116954 A.10.2 Output Devices and Terminal Types

116955 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/17 is applied, making it clear that the  
116956 requirements for documenting terminal support are in the system documentation.

## 116957 A.11 General Terminal Interface

116958 If the implementation does not support this interface on any device types, it should behave as if  
116959 it were being used on a device that is not a terminal device (in most cases `errno` will be set to  
116960 `[ENOTTY]` on return from functions defined by this interface). This is based on the fact that  
116961 many applications are written to run both interactively and in some non-interactive mode, and  
116962 they adapt themselves at runtime. Requiring that they all be modified to test an environment  
116963 variable to determine whether they should try to adapt is unnecessary. On a system that  
116964 provides no general terminal interface, providing all the entry points as stubs that return  
116965 `[ENOTTY]` (or an equivalent, as appropriate) has the same effect and requires no changes to the  
116966 application.

116967 Although the needs of both interface implementors and application developers were addressed  
116968 throughout POSIX.1-2008, this section pays more attention to the needs of the latter. This is  
116969 because, while many aspects of the programming interface can be hidden from the user by the  
116970 application developer, the terminal interface is usually a large part of the user interface.  
116971 Although to some extent the application developer can build missing features or work around

116972 inappropriate ones, the difficulties of doing that are greater in the terminal interface than  
 116973 elsewhere. For example, efficiency prohibits the average program from interpreting every  
 116974 character passing through it in order to simulate character erase, line kill, and so on. These  
 116975 functions should usually be done by the operating system, possibly at the interrupt level.

116976 The *tc\**() functions were introduced as a way of avoiding the problems inherent in the  
 116977 traditional *ioctl*() function and in variants of it that were proposed. For example, *tcsetattr*() is  
 116978 specified in place of the use of the TCSETA *ioctl*() command function. This allows specification  
 116979 of all the arguments in a manner consistent with the ISO C standard unlike the varying third  
 116980 argument of *ioctl*(), which is sometimes a pointer (to any of many different types) and  
 116981 sometimes an **int**.

116982 The advantages of this new method include:

- 116983 • It allows strict type checking.
- 116984 • The direction of transfer of control data is explicit.
- 116985 • Portable capabilities are clearly identified.
- 116986 • The need for a general interface routine is avoided.
- 116987 • Size of the argument is well-defined (there is only one type).

116988 The disadvantages include:

- 116989 • No historical implementation used the new method.
- 116990 • There are many small routines instead of one general-purpose one.
- 116991 • The historical parallel with *fcntl*() is broken.

116992 The issue of modem control was excluded from POSIX.1-2008 on the grounds that:

- 116993 • It was concerned with setting and control of hardware timers.
- 116994 • The appropriate timers and settings vary widely internationally.
- 116995 • Feedback from European computer manufacturers indicated that this facility was not  
 116996 consistent with European needs and that specification of such a facility was not a  
 116997 requirement for portability.

## 116998 A.11.1 Interface Characteristics

### 116999 A.11.1.1 Opening a Terminal Device File

117000 The O\_TTY\_INIT flag for *open*() has been added to POSIX.1-2008 to solve a problem  
 117001 encountered by applications written for earlier versions of this standard which need to open a  
 117002 modem or similar device and initialize all of the parameter settings. Using the  
 117003 *tcgetattr*()-*modify-tcsetattr*() method mandated by the standard could result in non-conforming  
 117004 behavior if the device had previously been used with non-conforming parameter settings, on  
 117005 implementations which do not reset the parameter settings in between the last close of the  
 117006 device by one application and the first open by another application. To avoid this problem, some  
 117007 application developers were resorting to using *memset*() to zero the **termios** structure before  
 117008 setting all of the standard parameters, but this risks non-conforming behavior on systems where  
 117009 some non-standard parameter needs a non-zero value in order for the terminal to behave in a  
 117010 conforming manner.

117011 On systems which do reset the parameter settings to defaults between uses of a terminal device,  
117012 it is expected that either `O_TTY_INIT` will have the value zero or `open(ttypath,`  
117013 `O_RDWR|O_TTY_INIT)` will do nothing additional.

117014 The standard developers considered an alternative solution of a special *fildev* argument for the  
117015 `tcgetattr()` call to obtain default parameters. However, this would not be adequate if a system  
117016 supports several different types of terminal device and the default settings need to differ  
117017 between the different types. With the `O_TTY_INIT` open flag, the implementor can determine  
117018 which device type is being opened.

117019 The standard developers also considered a special `POSIX_TTY_INIT` value for the **termios**  
117020 structure used in `tcsetattr()`, which would reset the values if used immediately after an `open()`  
117021 call. However, it was felt that this would lead to confusion amongst application developers who  
117022 wanted to reset the parameters at other points, and implementations might diverge.

#### 117023 A.11.1.2 Process Groups

117024 There is a potential race when the members of the foreground process group on a terminal leave  
117025 that process group, either by exit or by changing process groups. After the last process exits the  
117026 process group, but before the foreground process group ID of the terminal is changed (usually  
117027 by a job control shell), it would be possible for a new process to be created with its process ID  
117028 equal to the terminal's foreground process group ID. That process might then become the  
117029 process group leader and accidentally be placed into the foreground on a terminal that was not  
117030 necessarily its controlling terminal. As a result of this problem, the controlling terminal is  
117031 defined to not have a foreground process group during this time.

117032 The cases where a controlling terminal has no foreground process group occur when all  
117033 processes in the foreground process group either terminate and are waited for or join other  
117034 process groups via `setpgid()` or `setsid()`. If the process group leader terminates, this is the first  
117035 case described; if it leaves the process group via `setpgid()`, this is the second case described (a  
117036 process group leader cannot successfully call `setsid()`). When one of those cases causes a  
117037 controlling terminal to have no foreground process group, it has two visible effects on  
117038 applications. The first is the value returned by `tcgetpgrp()`. The second (which occurs only in the  
117039 case where the process group leader terminates) is the sending of signals in response to special  
117040 input characters. The intent of POSIX.1-2008 is that no process group be wrongly identified as  
117041 the foreground process group by `tcgetpgrp()` or unintentionally receive signals because of  
117042 placement into the foreground.

117043 In 4.3 BSD, the old process group ID continues to be used to identify the foreground process  
117044 group and is returned by the function equivalent to `tcgetpgrp()`. In that implementation it is  
117045 possible for a newly created process to be assigned the same value as a process ID and then form  
117046 a new process group with the same value as a process group ID. The result is that the new  
117047 process group would receive signals from this terminal for no apparent reason, and  
117048 POSIX.1-2008 precludes this by forbidding a process group from entering the foreground in this  
117049 way. It would be more direct to place part of the requirement made by the last sentence under  
117050 `fork()`, but there is no convenient way for that section to refer to the value that `tcgetpgrp()`  
117051 returns, since in this case there is no process group and thus no process group ID.

117052 One possibility for a conforming implementation is to behave similarly to 4.3 BSD, but to  
117053 prevent this reuse of the ID, probably in the implementation of `fork()`, as long as it is in use by  
117054 the terminal.

117055 Another possibility is to recognize when the last process stops using the terminal's foreground  
117056 process group ID, which is when the process group lifetime ends, and to change the terminal's  
117057 foreground process group ID to a reserved value that is never used as a process ID or process  
117058 group ID. (See the definition of *process group lifetime* in the definitions section.) The process ID

- 117059 can then be reserved until the terminal has another foreground process group.
- 117060 The 4.3 BSD implementation permits the leader (and only member) of the foreground process  
117061 group to leave the process group by calling the equivalent of *setpgid()* and to later return,  
117062 expecting to return to the foreground. There are no known application needs for this behavior,  
117063 and POSIX.1-2008 neither requires nor forbids it (except that it is forbidden for session leaders)  
117064 by leaving it unspecified.
- 117065 *A.11.1.3 The Controlling Terminal*
- 117066 POSIX.1-2008 does not specify a mechanism by which to allocate a controlling terminal. This is  
117067 normally done by a system utility (such as *getty*) and is considered an administrative feature  
117068 outside the scope of POSIX.1-2008.
- 117069 Historical implementations allocate controlling terminals on certain *open()* calls. Since *open()* is  
117070 part of POSIX.1, its behavior had to be dealt with. The traditional behavior is not required  
117071 because it is not very straightforward or flexible for either implementations or applications.  
117072 However, because of its prevalence, it was not practical to disallow this behavior either. Thus, a  
117073 mechanism was standardized to ensure portable, predictable behavior in *open()*.
- 117074 Some historical implementations deallocate a controlling terminal on the last system-wide close.  
117075 This behavior is neither required nor prohibited. Even on implementations that do provide this  
117076 behavior, applications generally cannot depend on it due to its system-wide nature.
- 117077 *A.11.1.4 Terminal Access Control*
- 117078 The access controls described in this section apply only to a process that is accessing its  
117079 controlling terminal. A process accessing a terminal that is not its controlling terminal is  
117080 effectively treated the same as a member of the foreground process group. While this may seem  
117081 unintuitive, note that these controls are for the purpose of job control, not security, and job  
117082 control relates only to the controlling terminal of a process. Normal file access permissions  
117083 handle security.
- 117084 If the process calling *read()* or *write()* is in a background process group that is orphaned, it is not  
117085 desirable to stop the process group, as it is no longer under the control of a job control shell that  
117086 could put it into the foreground again. Accordingly, calls to *read()* or *write()* functions by such  
117087 processes receive an immediate error return. This is different from 4.2 BSD, which kills orphaned  
117088 processes that receive terminal stop signals.
- 117089 The foreground/background/orphaned process group check performed by the terminal driver  
117090 must be repeatedly performed until the calling process moves into the foreground or until the  
117091 process group of the calling process becomes orphaned. That is, when the terminal driver  
117092 determines that the calling process is in the background and should receive a job control signal,  
117093 it sends the appropriate signal (SIGTTIN or SIGTTOU) to every process in the process group of  
117094 the calling process and then it allows the calling process to immediately receive the signal. The  
117095 latter is typically performed by blocking the process so that the signal is immediately noticed.  
117096 Note, however, that after the process finishes receiving the signal and control is returned to the  
117097 driver, the terminal driver must re-execute the foreground/background/orphaned process  
117098 group check. The process may still be in the background, either because it was continued in the  
117099 background by a job control shell, or because it caught the signal and did nothing.
- 117100 The terminal driver repeatedly performs the foreground/background/orphaned process group  
117101 checks whenever a process is about to access the terminal. In the case of *write()* or the control  
117102 *tc\**() functions, the check is performed at the entry of the function. In the case of *read()*, the  
117103 check is performed not only at the entry of the function, but also after blocking the process to

117104 wait for input characters (if necessary). That is, once the driver has determined that the process  
 117105 calling the `read()` function is in the foreground, it attempts to retrieve characters from the input  
 117106 queue. If the queue is empty, it blocks the process waiting for characters. When characters are  
 117107 available and control is returned to the driver, the terminal driver must return to the repeated  
 117108 foreground/background/orphaned process group check again. The process may have moved  
 117109 from the foreground to the background while it was blocked waiting for input characters.

117110 *A.11.1.5 Input Processing and Reading Data*

117111 There is no additional rationale provided for this section.

117112 *A.11.1.6 Canonical Mode Input Processing*

117113 The term “character” is intended here. ERASE should erase the last character, not the last byte.  
 117114 In the case of multi-byte characters, these two may be different.

117115 4.3 BSD has a WERASE character that erases the last “word” typed (but not any preceding  
 117116 <blank> or <tab> characters). A word is defined as a sequence of non-<blank> characters, with  
 117117 <tab> characters counted as <blank> characters. Like ERASE, WERASE does not erase beyond  
 117118 the beginning of the line. This WERASE feature has not been specified in POSIX.1 because it is  
 117119 difficult to define in the international environment. It is only useful for languages where words  
 117120 are delimited by <blank> characters. In some ideographic languages, such as Japanese and  
 117121 Chinese, words are not delimited at all. The WERASE character should presumably go back to  
 117122 the beginning of a sentence in those cases; practically, this means it would not be used much for  
 117123 those languages.

117124 It should be noted that there is a possible inherent deadlock if the application and  
 117125 implementation conflict on the value of {MAX\_CANON}. With ICANON set (if IXOFF is  
 117126 enabled) and more than {MAX\_CANON} characters transmitted without a <linefeed>,  
 117127 transmission will be stopped, the <linefeed> (or <carriage-return> when ICRLF is set) will never  
 117128 arrive, and the `read()` will never be satisfied.

117129 An application should not set IXOFF if it is using canonical mode unless it knows that (even in  
 117130 the face of a transmission error) the conditions described previously cannot be met or unless it is  
 117131 prepared to deal with the possible deadlock in some other way, such as timeouts.

117132 It should also be noted that this can be made to happen in non-canonical mode if the trigger  
 117133 value for sending IXOFF is less than VMIN and VTIME is zero.

117134 *A.11.1.7 Non-Canonical Mode Input Processing*

117135 Some points to note about MIN and TIME:

- 117136 1. The interactions of MIN and TIME are not symmetric. For example, when MIN>0 and  
 117137 TIME=0, TIME has no effect. However, in the opposite case where MIN=0 and TIME>0,  
 117138 both MIN and TIME play a role in that MIN is satisfied with the receipt of a single  
 117139 character.
- 117140 2. Also note that in case A (MIN>0, TIME>0), TIME represents an inter-character timer,  
 117141 while in case C (MIN=0, TIME>0), TIME represents a read timer.

117142 These two points highlight the dual purpose of the MIN/TIME feature. Cases A and B, where  
 117143 MIN>0, exist to handle burst-mode activity (for example, file transfer programs) where a  
 117144 program would like to process at least MIN characters at a time. In case A, the inter-character  
 117145 timer is activated by a user as a safety measure; in case B, it is turned off.

117146 Cases C and D exist to handle single-character timed transfers. These cases are readily adaptable  
117147 to screen-based applications that need to know if a character is present in the input queue before  
117148 refreshing the screen. In case C, the read is timed; in case D, it is not.

117149 Another important note is that MIN is always just a minimum. It does not denote a record  
117150 length. That is, if a program does a read of 20 bytes, MIN is 10, and 25 characters are present, 20  
117151 characters are returned to the user. In the special case of MIN=0, this still applies: if more than  
117152 one character is available, they all will be returned immediately.

117153 *A.11.1.8 Writing Data and Output Processing*

117154 There is no additional rationale provided for this section.

117155 *A.11.1.9 Special Characters*

117156 There is no additional rationale provided for this section.

117157 *A.11.1.10 Modem Disconnect*

117158 There is no additional rationale provided for this section.

117159 *A.11.1.11 Closing a Terminal Device File*

117160 POSIX.1-2008 does not specify that a *close()* on a terminal device file include the equivalent of a  
117161 call to *tcflow(fd,TCOON)*.

117162 An implementation that discards output at the time *close()* is called after reporting the return  
117163 value to the *write()* call that data was written does not conform with POSIX.1-2008. An  
117164 application has functions such as *tcdrain()*, *tcflush()*, and *tcflow()* available to obtain the detailed  
117165 behavior it requires with respect to flushing of output.

117166 At the time of the last close on a terminal device, an application relinquishes any ability to exert  
117167 flow control via *tcflow()*.

117168 **A.11.2 Parameters that Can be Set**

117169 *A.11.2.1 The termios Structure*

117170 This structure is part of an interface that, in general, retains the historic grouping of flags.  
117171 Although a more optimal structure for implementations may be possible, the degree of change  
117172 to applications would be significantly larger.

117173 *A.11.2.2 Input Modes*

117174 Some historical implementations treated a long break as multiple events, as many as one per  
117175 character time. The wording in POSIX.1 explicitly prohibits this.

117176 Although the ISTRIP flag is normally superfluous with today's terminal hardware and software,  
117177 it is historically supported. Therefore, applications may be using ISTRIP, and there is no  
117178 technical problem with supporting this flag. Also, applications may wish to receive only 7-bit  
117179 input bytes and may not be connected directly to the hardware terminal device (for example,

- 117180 when a connection traverses a network).
- 117181 Also, there is no requirement in general that the terminal device ensures that high-order bits  
117182 beyond the specified character size are cleared. ISTRIP provides this function for 7-bit  
117183 characters, which are common.
- 117184 In dealing with multi-byte characters, the consequences of a parity error in such a character, or  
117185 in an escape sequence affecting the current character set, are beyond the scope of POSIX.1 and  
117186 are best dealt with by the application processing the multi-byte characters.
- 117187 *A.11.2.3 Output Modes*
- 117188 POSIX.1 does not describe post-processing of output to a terminal or detailed control of that  
117189 from a conforming application. (That is, translation of <newline> to <carriage-return> followed  
117190 by <linefeed> or <tab> processing.) There is nothing that a conforming application should do to  
117191 its output for a terminal because that would require knowledge of the operation of the terminal.  
117192 It is the responsibility of the operating system to provide post-processing appropriate to the  
117193 output device, whether it is a terminal or some other type of device.
- 117194 Extensions to POSIX.1 to control the type of post-processing already exist and are expected to  
117195 continue into the future. The control of these features is primarily to adjust the interface between  
117196 the system and the terminal device so the output appears on the display correctly. This should  
117197 be set up before use by any application.
- 117198 In general, both the input and output modes should not be set absolutely, but rather modified  
117199 from the inherited state.
- 117200 *A.11.2.4 Control Modes*
- 117201 This section could be misread that the symbol "CSIZE" is a title in the **termios** *c\_flag* field.  
117202 Although it does serve that function, it is also a required symbol, as a literal reading of POSIX.1  
117203 (and the caveats about typography) would indicate.
- 117204 *A.11.2.5 Local Modes*
- 117205 Non-canonical mode is provided to allow fast bursts of input to be read efficiently while still  
117206 allowing single-character input.
- 117207 The ECHONL function historically has been in many implementations. Since there seems to be  
117208 no technical problem with supporting ECHONL, it is included in POSIX.1 to increase consensus.
- 117209 The alternate behavior possible when ECHOK or ECHOE are specified with ICANON is  
117210 permitted as a compromise depending on what the actual terminal hardware can do. Erasing  
117211 characters and lines is preferred, but is not always possible.
- 117212 *A.11.2.6 Special Control Characters*
- 117213 Permitting VMIN and VTIME to overlap with VEOF and VEOL was a compromise for historical  
117214 implementations. Only when backwards-compatibility of object code is a serious concern to an  
117215 implementor should an implementation continue this practice. Correct applications that work  
117216 with the overlap (at the source level) should also work if it is not present, but not the reverse.

117217 **A.12 Utility Conventions**117218 **A.12.1 Utility Argument Syntax**

117219 The standard developers considered that recent trends toward diluting the SYNOPSIS sections  
117220 of historical reference pages to the equivalent of:

117221 `command [options] [operands]`

117222 were a disservice to the reader. Therefore, considerable effort was placed into rigorous  
117223 definitions of all the command line arguments and their interrelationships. The relationships  
117224 depicted in the synopses are normative parts of POSIX.1-2008; this information is sometimes  
117225 repeated in textual form, but that is only for clarity within context.

117226 The use of “undefined” for conflicting argument usage and for repeated usage of the same  
117227 option is meant to prevent conforming applications from using conflicting arguments or  
117228 repeated options unless specifically allowed (as is the case with *ls*, which allows simultaneous,  
117229 repeated use of the `-C`, `-l`, and `-1` options). Many historical implementations will tolerate this  
117230 usage, choosing either the first or the last applicable argument. This tolerance can continue, but  
117231 conforming applications cannot rely upon it. (Other implementations may choose to print usage  
117232 messages instead.)

117233 The use of “undefined” for conflicting argument usage also allows an implementation to make  
117234 reasonable extensions to utilities where the implementor considers mutually-exclusive options  
117235 according to POSIX.1-2008 to have a sensible meaning and result.

117236 POSIX.1-2008 does not define the result of a command when an option-argument or operand is  
117237 not followed by ellipses and the application specifies more than one of that option-argument or  
117238 operand. This allows an implementation to define valid (although non-standard) behavior for  
117239 the utility when more than one such option or operand is specified.

117240 The requirements for option-arguments are summarized as follows:

|                                      | SYNOPSIS Shows:                            |                                        |
|--------------------------------------|--------------------------------------------|----------------------------------------|
|                                      | <code>-a arg</code>                        | <code>-c [arg]</code>                  |
| Conforming application uses:         | <code>-a arg</code>                        | <code>-carg</code> or <code>-c</code>  |
| System supports:                     | <code>-a arg</code> and <code>-aarg</code> | <code>-carg</code> and <code>-c</code> |
| Non-conforming applications may use: | <code>-aarg</code>                         | N/A                                    |

117246 Earlier versions of this standard included obsolescent syntax which showed some options with  
117247 (mandatory) adjacent option-arguments in the SYNOPSIS for some utilities. These have since  
117248 been removed. For all options with mandatory option-arguments, the SYNOPSIS now shows  
117249 <blank> characters between the option and the option-argument; however, historical usage has  
117250 not been consistent in this area; therefore, <blank> characters are required to be used by  
117251 conforming applications and to be handled by all implementations, but implementations are  
117252 also required to handle an adjacent option-argument in order to preserve backwards-  
117253 compatibility for old scripts. One of the justifications for selecting the multiple-argument  
117254 method was that the single-argument case is inherently ambiguous when the option-argument  
117255 can legitimately be a null string.

117256 POSIX.1-2008 explicitly states that digits are permitted as operands and option-arguments. The  
117257 lower and upper bounds for the values of the numbers used for operands and option-arguments  
117258 were derived from the ISO C standard values for {LONG\_MIN} and {LONG\_MAX}. The

117259 requirement on the standard utilities is that numbers in the specified range do not cause a  
 117260 syntax error, although the specification of a number need not be semantically correct for a  
 117261 particular operand or option-argument of a utility. For example, the specification of:

117262 `dd obs=3000000000`

117263 would yield undefined behavior for the application and could be a syntax error because the  
 117264 number 3 000 000 000 is outside of the range -2 147 483 647 to +2 147 483 647. On the other hand:

117265 `dd obs=2000000000`

117266 may cause some error, such as “blocksize too large”, rather than a syntax error.

## 117267 A.12.2 Utility Syntax Guidelines

117268 This section is based on the rules listed in the SVID. It was included for two reasons:

- 117269 1. The individual utility descriptions in XCU [Chapter 4](#) (on page 2401) needed a set of  
 117270 common (although not universal) actions on which they could anchor their descriptions  
 117271 of option and operand syntax. Most of the standard utilities actually do use these  
 117272 guidelines, and many of their historical implementations use the *getopt()* function for  
 117273 their parsing. Therefore, it was simpler to cite the rules and merely identify exceptions.
- 117274 2. Developers of conforming applications need suggested guidelines if the POSIX  
 117275 community is to avoid the chaos of historical UNIX system command syntax.

117276 It is recommended that all *future* utilities and applications use these guidelines to enhance “user  
 117277 portability”. The fact that some historical utilities could not be changed (to avoid breaking  
 117278 historical applications) should not deter this future goal.

117279 The voluntary nature of the guidelines is highlighted by repeated uses of the word *should*  
 117280 throughout. This usage should not be misinterpreted to imply that utilities that claim  
 117281 conformance in their OPTIONS sections do not always conform.

117282 Guidelines 1 and 2 encourage utility writers to use only characters from the portable character  
 117283 set because use of locale-specific characters may make the utility inaccessible from other locales.  
 117284 Use of uppercase letters is discouraged due to problems associated with porting utilities to  
 117285 systems that do not distinguish between uppercase and lowercase characters in filenames. Use  
 117286 of non-alphanumeric characters is discouraged due to the number of utilities that treat non-  
 117287 alphanumeric characters in “special” ways depending on context (such as the shell using white-  
 117288 space characters to delimit arguments, various quote characters for quoting, the <dollar-sign> to  
 117289 introduce variable expansion, etc.).

117290 In XCU [Section 2.9.1](#) (on page 2316), it is further stated that a command used in the Shell  
 117291 Command Language cannot be named with a trailing <colon>.

117292 Guideline 3 was changed to allow alphanumeric characters (letters and digits) from the  
 117293 character set to allow compatibility with historical usage. Historical practice allows the use of  
 117294 digits wherever practical, and there are no portability issues that would prohibit the use of  
 117295 digits. In fact, from an internationalization viewpoint, digits (being non-language-dependent)  
 117296 are preferable over letters (a -2 is intuitively self-explanatory to any user, while in the -f *filename*  
 117297 the letter ‘f’ is a mnemonic aid only to speakers of Latin-based languages where “filename”  
 117298 happens to translate to a word that begins with ‘f’). Since Guideline 3 still retains the word  
 117299 “single”, multi-digit options are not allowed. Instances of historical utilities that used them have  
 117300 been marked obsolescent, with the numbers being changed from option names to option-  
 117301 arguments.

117302 It was difficult to achieve a satisfactory solution to the problem of name space in option

117303 characters. When the standard developers desired to extend the historical *cc* utility to accept  
 117304 ISO C standard programs, they found that all of the portable alphabet was already in use by  
 117305 various vendors. Thus, they had to devise a new name, *c89* (now superseded by *c99*), rather than  
 117306 something like *cc -X*. There were suggestions that implementors be restricted to providing  
 117307 extensions through various means (such as using a <plus-sign> as the option delimiter or using  
 117308 option characters outside the alphanumeric set) that would reserve all of the remaining  
 117309 alphanumeric characters for future POSIX standards. These approaches were resisted because  
 117310 they lacked the historical style of UNIX systems. Furthermore, if a vendor-provided option  
 117311 should become commonly used in the industry, it would be a candidate for standardization. It  
 117312 would be desirable to standardize such a feature using historical practice for the syntax (the  
 117313 semantics can be standardized with any syntax). This would not be possible if the syntax was  
 117314 one reserved for the vendor. However, since the standardization process may lead to minor  
 117315 changes in the semantics, it may prove to be better for a vendor to use a syntax that will not be  
 117316 affected by standardization.

117317 Guideline 8 includes the concept of <comma>-separated lists in a single argument. It is up to the  
 117318 utility to parse such a list itself because *getopt()* just returns the single string. This situation was  
 117319 retained so that certain historical utilities would not violate the guidelines. Applications  
 117320 preparing for international use should be aware of an occasional problem with  
 117321 <comma>-separated lists: in some locales, the <comma> is used as the radix character. Thus, if  
 117322 an application is preparing operands for a utility that expects a <comma>-separated list, it  
 117323 should avoid generating non-integer values through one of the means that is influenced by  
 117324 setting the *LC\_NUMERIC* variable (such as *awk*, *bc*, *printf*, or *printf()*).

117325 Unless explicitly stated otherwise in the utility description, Guideline 9 requires applications to  
 117326 put options before operands, and requires utilities to accept any such usage without  
 117327 misinterpreting operands as options. For example, if an implementation of the *printf* utility  
 117328 supports a *-e* option as an extension, the command:

```
117329 printf %s -e
```

117330 must output the string "-e" without interpreting the *-e* as an option. Similarly, the command:

```
117331 ls myfile -l
```

117332 must interpret the *-l* argument as a second file operand, not as a *-l* option.

117333 Applications calling any utility with a first operand starting with '-' should usually specify *--*,  
 117334 as indicated by Guideline 10, to mark the end of the options. This is true even if the SYNOPSIS  
 117335 in the Shell and Utilities volume of POSIX.1-2008 does not specify any options; implementations  
 117336 may provide options as extensions to the Shell and Utilities volume of POSIX.1-2008. The  
 117337 standard utilities that do not support Guideline 10 indicate that fact in the OPTIONS section of  
 117338 the utility description.

117339 Guideline 7 allows any string to be an option-argument; an option-argument can begin with any  
 117340 character, can be *-* or *--*, and can be an empty string. For example, the commands *pr -h -*, *pr -h*  
 117341 *--*, *pr -h -d*, *pr -h +2*, and *pr -h ''* contain the option-arguments *-*, *--*, *-d*, *+2*, and an empty  
 117342 string, respectively. Conversely, the command *pr -h -- -d* treats *-d* as an option, not as an  
 117343 argument, because the *--* is an option-argument here, not a delimiter.

117344 Guideline 11 was modified to clarify that the order of different options should not matter  
 117345 relative to one another. However, the order of repeated options that also have option-arguments  
 117346 may be significant; therefore, such options are required to be interpreted in the order that they  
 117347 are specified. The *make* utility is an instance of a historical utility that uses repeated options in  
 117348 which the order is significant. Multiple files are specified by giving multiple instances of the *-f*  
 117349 option; for example:

```
117350 make -f common_header -f specific_rules target
```

117351 Guideline 13 does not imply that all of the standard utilities automatically accept the operand  
 117352 '–' to mean standard input or output, nor does it specify the actions of the utility upon  
 117353 encountering multiple '–' operands. It simply says that, by default, '–' operands are not used  
 117354 for other purposes in the file reading or writing (but not when using *stat()*, *unlink()*, *touch*, and  
 117355 so on) utilities. In earlier versions of this standard, all information concerning actual treatment of  
 117356 the '–' operand is found in the individual utility sections. Many implementations, however,  
 117357 treated '–' as standard input or output and many applications depended on this behavior even  
 117358 though it was not standard. This behavior is now implementation-defined. Portable applications  
 117359 should not use '–' to mean standard input or output unless it is explicitly stated to do so in the  
 117360 utility description and they should always use '. /–' if they intend to refer to a file named – in  
 117361 the current working directory.

117362 Guideline 14 is intended to prohibit implementations that would treat the command *ls -l -d* as if  
 117363 it were *ls -- -l -d* or *ls -l -- -d*.

117364 The standard permits implementations to have extensions that violate the Utility Syntax  
 117365 Guidelines so long as when the utility is used in line with the forms defined by the standard it  
 117366 follows the Utility Syntax Guidelines. Thus, *head-42file* and *ls--help* are permitted extensions.  
 117367 The intent is to allow extensions so long as the standard form is accepted and follows the  
 117368 guidelines.

117369 An area of concern was that as implementations mature, implementation-defined utilities and  
 117370 implementation-defined utility options will result. The idea was expressed that there needed to  
 117371 be a standard way, say an environment variable or some such mechanism, to identify  
 117372 implementation-defined utilities separately from standard utilities that may have the same  
 117373 name. It was decided that there already exist several ways of dealing with this situation and that  
 117374 it is outside of the scope to attempt to standardize in the area of non-standard items. A method  
 117375 that exists on some historical implementations is the use of the so-called */local/bin* or  
 117376 */usr/local/bin* directory to separate local or additional copies or versions of utilities. Another  
 117377 method that is also used is to isolate utilities into completely separate domains. Still another  
 117378 method to ensure that the desired utility is being used is to request the utility by its full  
 117379 pathname. There are many approaches to this situation; the examples given above serve to  
 117380 illustrate that there is more than one.

## 117381 **A.13 Headers**

### 117382 **A.13.1 Format of Entries**

117383 Each header reference page has a common layout of sections describing the interface. This  
 117384 layout is similar to the manual page or “man” page format shipped with most UNIX systems,  
 117385 and each header has sections describing the SYNOPSIS and DESCRIPTION. These are the two  
 117386 sections that relate to conformance.

117387 Additional sections are informative, and add considerable information for the application  
 117388 developer. APPLICATION USAGE sections provide additional caveats, issues, and  
 117389 recommendations to the developer. RATIONALE sections give additional information on the  
 117390 decisions made in defining the interface.

117391 FUTURE DIRECTIONS sections act as pointers to related work that may impact the interface in  
 117392 the future, and often cautions the developer to architect the code to account for a change in this  
 117393 area. Note that a future directions statement should not be taken as a commitment to adopt a

- 117394 feature or interface in the future.
- 117395 The CHANGE HISTORY section describes when the interface was introduced, and how it has  
117396 changed.
- 117397 Option labels and margin markings in the page can be useful in guiding the application  
117398 developer.

117399 **A.13.2 Removed Headers in Issue 7**

117400 The headers removed in Issue 7 (from the Issue 6 base document) are as follows:

117401  
117402

| Removed Headers in Issue 7       |                                 |
|----------------------------------|---------------------------------|
| <code>&lt;sys/timeb.h&gt;</code> | <code>&lt;ucontext.h&gt;</code> |

# Rationale for System Interfaces

## 117410 **B.1 Introduction**

### 117411 **B.1.1 Change History**

117412 The change history is provided as an informative section, to track changes from earlier versions  
117413 of this standard.

117414 The following sections describe changes made to the System Interfaces volume of POSIX.1-2008  
117415 since Issue 6 of the base document. The CHANGE HISTORY section for each entry details the  
117416 technical changes that have been made to that entry from Issue 5. Changes between earlier  
117417 versions of the base document and Issue 5 are not included.

#### 117418 **Changes from Issue 6 to Issue 7 (POSIX.1-2008)**

117419 The following list summarizes the major changes that were made in the System Interfaces  
117420 volume of POSIX.1-2008 from Issue 6 to Issue 7:

- 117421 • The Open Group Technical Standard, 2006, Extended API Set Part 1 is incorporated.
- 117422 • The Open Group Technical Standard, 2006, Extended API Set Part 2 is incorporated.
- 117423 • The Open Group Technical Standard, 2006, Extended API Set Part 3 is incorporated.
- 117424 • The Open Group Technical Standard, 2006, Extended API Set Part 4 is incorporated.
- 117425 • Existing functionality is aligned with ISO/IEC 9899:1999, Programming Languages — C,  
117426 ISO/IEC 9899:1999/Cor.2:2004(E)
- 117427 • Austin Group defect reports, IEEE Interpretations against IEEE Std 1003.1, and responses  
117428 to ISO/IEC defect reports against ISO/IEC 9945 are applied.
- 117429 • The Open Group corrigenda and resolutions are applied.
- 117430 • Features, marked legacy or obsolescent in the base document, have been considered for  
117431 removal in this version.
- 117432 • The options within the standard have been revised.

117433 **New Features in Issue 7**

117434 The functions first introduced in Issue 7 (over the Issue 6 base document) are as follows:

117435

117436

117437

117438

117439

117440

117441

117442

117443

117444

117445

117446

117447

117448

117449

117450

117451

117452

117453

117454

117455

117456

117457

117458

117459

117460

117461

117462

117463

117464

117465

117466

**New Functions in Issue 7**

|                     |                                      |                        |
|---------------------|--------------------------------------|------------------------|
| <i>alphasort()</i>  | <i>iswdigit_l()</i>                  | <i>strfmon_l()</i>     |
| <i>dirfd()</i>      | <i>iswgraph_l()</i>                  | <i>strncasecmp_l()</i> |
| <i>dprintf()</i>    | <i>iswlower_l()</i>                  | <i>strndup()</i>       |
| <i>duplocale()</i>  | <i>iswprint_l()</i>                  | <i>strlen()</i>        |

| <i>fchmodat()</i>   | <i>iswspace_l()</i>                  | <i>strxfrm_l()</i>     |
| <i>fchownat()</i>   | <i>iswupper_l()</i>                  | <i>symlinkat()</i>     |
| <i>fdopendir()</i>  | <i>iswxdigit_l()</i>                 | <i>tolower_l()</i>     |
| <i>fexecve()</i>    | <i>isxdigit_l()</i>                  | <i>toupper_l()</i>     |
| <i>fnmopen()</i>    | <i>linkat()</i>                      | <i>towctrans_l()</i>   |
| <i>freelocale()</i> | <i>mbsnrto wcs()</i>                 | <i>towlower_l()</i>    |
| <i>fstatat()</i>    | <i>mkdirat()</i>                     | <i>towupper_l()</i>    |
| <i>futimens()</i>   | <i>mkdtemp()</i>                     | <i>unlinkat()</i>      |
| <i>getdelim()</i>   | <i>mkfifoat()</i>                    | <i>uselocale()</i>     |
| <i>getline()</i>    | <i>mknodat()</i>                     | <i>utimensat()</i>     |
| <i>isalnum_l()</i>  | <i>newlocale()</i>                   | <i>vdprintf()</i>      |
| <i>isalpha_l()</i>  | <i>openat()</i>                      | <i>wcpcpy()</i>        |
| <i>isblank_l()</i>  | <i>open_memstream()</i>              | <i>wcpncpy()</i>       |
| <i>isctrl_l()</i>   | <i>open_wmemstream()</i>             | <i>wcscasecmp()</i>    |
| <i>isdigit_l()</i>  | <i>psiginfo()</i>                    | <i>wcscasecmp_l()</i>  |
| <i>isgraph_l()</i>  | <i>psignal()</i>                     | <i>wcscoll_l()</i>     |
| <i>islower_l()</i>  | <i>pthread_mutexattr_getrobust()</i> | <i>wcsdup()</i>        |
| <i>isprint_l()</i>  | <i>pthread_mutexattr_setrobust()</i> | <i>wcsncasecmp()</i>   |
| <i>ispunct_l()</i>  | <i>pthread_mutex_consistent()</i>    | <i>wcsncasecmp_l()</i> |
| <i>isspace_l()</i>  | <i>readlinkat()</i>                  | <i>wcsnlen()</i>       |
| <i>isupper_l()</i>  | <i>renameat()</i>                    | <i>wcsnrto mbs()</i>   |
| <i>iswalnum_l()</i> | <i>scandir()</i>                     | <i>wcsxfrm_l()</i>     |
| <i>iswalpha_l()</i> | <i>stpncpy()</i>                     | <i>wctrans_l()</i>     |
| <i>iswblank_l()</i> | <i>stpncpy()</i>                     | <i>wctype_l()</i>      |
| <i>iswcntrl_l()</i> | <i>strcasecmp_l()</i>                |                        |
| <i>iswctype_l()</i> | <i>strcoll_l()</i>                   |                        |

117467

**Newly Mandated Functions in Issue 7**

117468

The functions that were previously part of an option group but are now mandatory in Issue 7 are as follows:

117469

|        | Newly Mandated Functions in Issue 7     |                                      |                                     |
|--------|-----------------------------------------|--------------------------------------|-------------------------------------|
| 117470 |                                         |                                      |                                     |
| 117471 | <i>aio_cancel()</i>                     | <i>pthread_atfork()</i>              | <i>pthread_rwlock_tryrdlock()</i>   |
| 117472 | <i>aio_error()</i>                      | <i>pthread_attr_destroy()</i>        | <i>pthread_rwlock_trywrlock()</i>   |
| 117473 | <i>aio_fsync()</i>                      | <i>pthread_attr_getdetachstate()</i> | <i>pthread_rwlock_unlock()</i>      |
| 117474 | <i>aio_read()</i>                       | <i>pthread_attr_getguardsize()</i>   | <i>pthread_rwlock_wrlock()</i>      |

117522 **Obsolescent Functions in Issue 7**

117523 The base functions moved to obsolescent status in Issue 7 (from the Issue 6 base document) are  
 117524 as follows:

| 117525 <b>Obsolescent Base Functions in Issue 7</b> |                 |
|-----------------------------------------------------|-----------------|
| 117526 <i>asctime()</i>                             | <i>gets()</i>   |
| 117527 <i>asctime_r()</i>                           | <i>rand_r()</i> |
| 117528 <i>ctime()</i>                               | <i>tmpnam()</i> |
| 117529 <i>ctime_r()</i>                             | <i>utime()</i>  |

117530 The XSI functions moved to obsolescent status in Issue 7 (from the Issue 6 base document) are as  
 117531 follows:

| 117532 <b>Obsolescent XSI Functions in Issue 7</b> |                                 |                       |
|----------------------------------------------------|---------------------------------|-----------------------|
| 117533 <i>_longjmp()</i>                           | <i>pthread_getconcurrency()</i> | <i>sigset()</i>       |
| 117534 <i>_setjmp()</i>                            | <i>pthread_setconcurrency()</i> | <i>siginterrupt()</i> |
| 117535 <i>_tolower()</i>                           | <i>setitimer()</i>              | <i>tmpnam()</i>       |
| 117536 <i>_toupper()</i>                           | <i>setpggrp()</i>               | <i>toascii()</i>      |
| 117537 <i>ftw()</i>                                | <i>sighold()</i>                | <i>ulimit()</i>       |
| 117538 <i>getitimer()</i>                          | <i>sigignore()</i>              |                       |
| 117539 <i>gettimeofday()</i>                       | <i>sigpause()</i>               |                       |
| 117540 <i>isascii()</i>                            | <i>sigrelse()</i>               |                       |

117541 **Removed Functions and Symbols in Issue 7**

117542 The functions and symbols removed in Issue 7 (from the Issue 6 base document) are as follows:

| 117543 <b>Removed Functions and Symbols in Issue 7</b> |                                    |                      |
|--------------------------------------------------------|------------------------------------|----------------------|
| 117544 <i>bcmp()</i>                                   | <i>gethostbyaddr()</i>             | <i>rindex()</i>      |
| 117545 <i>bcopy()</i>                                  | <i>gethostbyname()</i>             | <i>scalb()</i>       |
| 117546 <i>bsd_signal()</i>                             | <i>getwd()</i>                     | <i>setcontext()</i>  |
| 117547 <i>bzero()</i>                                  | <i>h_errno</i>                     | <i>swapcontext()</i> |
| 117548 <i>ecvt()</i>                                   | <i>index()</i>                     | <i>ualarm()</i>      |
| 117549 <i>fcvt()</i>                                   | <i>makecontext()</i>               | <i>usleep()</i>      |
| 117550 <i>ftime()</i>                                  | <i>mktemp()</i>                    | <i>vfork()</i>       |
| 117551 <i>gcvt()</i>                                   | <i>pthread_attr_getstackaddr()</i> | <i>wcswcs()</i>      |
| 117552 <i>getcontext()</i>                             | <i>pthread_attr_setstackaddr()</i> |                      |

117553 **B.1.2 Relationship to Other Formal Standards**

117554 There is no additional rationale provided for this section.

117555 **B.1.3 Format of Entries**

117556 Each system interface reference page has a common layout of sections describing the interface.  
 117557 This layout is similar to the manual page or “man” page format shipped with most UNIX  
 117558 systems, and each header has sections describing the SYNOPSIS, DESCRIPTION, RETURN  
 117559 VALUE, and ERRORS. These are the four sections that relate to conformance.

117560 Additional sections are informative, and add considerable information for the application  
 117561 developer. EXAMPLES sections provide example usage. APPLICATION USAGE sections

117562 provide additional caveats, issues, and recommendations to the developer. RATIONALE  
 117563 sections give additional information on the decisions made in defining the interface.

117564 FUTURE DIRECTIONS sections act as pointers to related work that may impact the interface in  
 117565 the future, and often cautions the developer to architect the code to account for a change in this  
 117566 area. Note that a future directions statement should not be taken as a commitment to adopt a  
 117567 feature or interface in the future.

117568 The CHANGE HISTORY section describes when the interface was introduced, and how it has  
 117569 changed.

117570 Option labels and margin markings in the page can be useful in guiding the application  
 117571 developer.

## 117572 B.2 General Information

### 117573 B.2.1 Use and Implementation of Interfaces

117574 The information concerning the use of functions was adapted from a description in the ISO C  
 117575 standard. Here is an example of how an application program can protect itself from functions  
 117576 that may or may not be macros, rather than true functions:

117577 The *atoi()* function may be used in any of several ways:

- 117578 • By use of its associated header (possibly generating a macro expansion):

```
117579 #include <stdlib.h>
117580 /* ... */
117581 i = atoi(str);
```

- 117582 • By use of its associated header (assuredly generating a true function call):

```
117583 #include <stdlib.h>
117584 #undef atoi
117585 /* ... */
117586 i = atoi(str);
```

117587 or:

```
117588 #include <stdlib.h>
117589 /* ... */
117590 i = (atoi) (str);
```

- 117591 • By explicit declaration:

```
117592 extern int atoi (const char *);
117593 /* ... */
117594 i = atoi(str);
```

- 117595 • By implicit declaration:

```
117596 /* ... */
117597 i = atoi(str);
```

117598 (Assuming no function prototype is in scope. This is not allowed by the ISO C standard for  
 117599 functions with variable arguments; furthermore, parameter type conversion “widening” is

117600 subject to different rules in this case.)

117601 Note that the ISO C standard reserves names starting with ‘\_’ for the compiler. Therefore, the  
117602 compiler could, for example, implement an intrinsic, built-in function `_asm_builtin_atoi()`, which  
117603 it recognized and expanded into inline assembly code. Then, in `<stdlib.h>`, there could be the  
117604 following:

```
117605 #define atoi(X) _asm_builtin_atoi(X)
```

117606 The user’s “normal” call to `atoi()` would then be expanded inline, but the implementor would  
117607 also be required to provide a callable function named `atoi()` for use when the application  
117608 requires it; for example, if its address is to be stored in a function pointer variable.

117609 Implementors should note that since applications can **#undef** a macro in order to ensure that the  
117610 function is used, this means that it is not safe for implementations to use the names of any  
117611 standard functions in macro values, since the application could use **#undef** to ensure that no  
117612 macro exists and then use the same name for an identifier with local scope. For example,  
117613 historically it was common for a `getchar()` macro to be defined in `<stdio.h>` as:

```
117614 #define getchar() getc(stdin)
```

117615 This definition does not conform, because an application is allowed to use the identifier `getc`  
117616 with local scope, and the expansion of the `getchar()` macro would then pick up the local `getc`.  
117617 The following is conforming code, but would not compile with the above definition of `getchar()`:

```
117618 #include <stdio.h>
117619 #undef getc
```

```
117620 int main(void)
117621 {
117622     int getc;
117623     getc = getchar();
117624     return getc;
117625 }
```

117626 This does not only affect function-like macros. For example, the following definition does not  
117627 conform because there could be a local `sysconf` variable in scope when `SIGRTMIN` is expanded:

```
117628 #define SIGRTMIN ((int)sysconf(_SC_SIGRT_MIN))
```

117629 Implementors can avoid the problem by using aliases for standard functions instead of the  
117630 actual function, with names that conforming applications cannot use for local variables. For  
117631 example:

```
117632 #define SIGRTMIN ((int)__sysconf(_SC_SIGRT_MIN))
```

## 117633 B.2.2 The Compilation Environment

### 117634 B.2.2.1 POSIX.1 Symbols

117635 This and the following section address the issue of “name space pollution”. The ISO C standard  
117636 requires that the name space beyond what it reserves not be altered except by explicit action of  
117637 the application developer. This section defines the actions to add the POSIX.1 symbols for those  
117638 headers where both the ISO C standard and POSIX.1 need to define symbols, and also where the

117639 XSI option extends the base standard.

117640 When headers are used to provide symbols, there is a potential for introducing symbols that the  
 117641 application developer cannot predict. Ideally, each header should only contain one set of  
 117642 symbols, but this is not practical for historical reasons. Thus, the concept of feature test macros is  
 117643 included. Two feature test macros are explicitly defined by POSIX.1-2008; it is expected that  
 117644 future versions may add to this.

117645 **Note:** Feature test macros allow an application to announce to the implementation its desire to have  
 117646 certain symbols and prototypes exposed. They should not be confused with the version test  
 117647 macros and constants for options in `<unistd.h>` which are the implementation's way of  
 117648 announcing functionality to the application.

117649 It is further intended that these feature test macros apply only to the headers specified by  
 117650 POSIX.1-2008. Implementations are expressly permitted to make visible symbols not specified  
 117651 by POSIX.1-2008, within both POSIX.1 and other headers, under the control of feature test  
 117652 macros that are not defined by POSIX.1-2008.

### 117653 **The `_POSIX_C_SOURCE` Feature Test Macro**

117654 Since `_POSIX_SOURCE` specified by the POSIX.1-1990 standard did not have a value associated  
 117655 with it, the `_POSIX_C_SOURCE` macro replaces it, allowing an application to inform the system  
 117656 of the version of the standard to which it conforms. This symbol will allow implementations to  
 117657 support various versions of this standard simultaneously. For instance, when either  
 117658 `_POSIX_SOURCE` is defined or `_POSIX_C_SOURCE` is defined as 1, the system should make  
 117659 visible the same name space as permitted and required by the POSIX.1-1990 standard. When  
 117660 `_POSIX_C_SOURCE` is defined, the state of `_POSIX_SOURCE` is completely irrelevant.

117661 It is expected that C bindings to future POSIX standards will define new values for  
 117662 `_POSIX_C_SOURCE`, with each new value reserving the name space for that new standard, plus  
 117663 all earlier POSIX standards.

### 117664 **The `_XOPEN_SOURCE` Feature Test Macro**

117665 The feature test macro `_XOPEN_SOURCE` is provided as the announcement mechanism for the  
 117666 application that it requires functionality from the Single UNIX Specification. `_XOPEN_SOURCE`  
 117667 must be defined to the value 700 before the inclusion of any header to enable the functionality in  
 117668 the Single UNIX Specification. Its definition subsumes the use of `_POSIX_SOURCE` and  
 117669 `_POSIX_C_SOURCE`.

117670 An extract of code from a conforming application, that appears before any `#include` statements,  
 117671 is given below:

```
117672 #define _XOPEN_SOURCE 700 /* Single UNIX Specification, Version x */
117673 #include ...
```

117674 Note that the definition of `_XOPEN_SOURCE` with the value 700 makes the definition of  
 117675 `_POSIX_C_SOURCE` redundant and it can safely be omitted.

### 117676 *B.2.2.2 The Name Space*

117677 The reservation of identifiers is paraphrased from the ISO C standard. The text is included  
 117678 because it needs to be part of POSIX.1-2008, regardless of possible changes in future versions of  
 117679 the ISO C standard.

117680 These identifiers may be used by implementations, particularly for feature test macros.  
 117681 Implementations should not use feature test macro names that might be reasonably used by a  
 117682 standard.

117683 Including headers more than once is a reasonably common practice, and it should be carried  
 117684 forward from the ISO C standard. More significantly, having definitions in more than one  
 117685 header is explicitly permitted. Where the potential declaration is “benign” (the same definition  
 117686 twice) the declaration can be repeated, if that is permitted by the compiler. (This is usually true  
 117687 of macros, for example.) In those situations where a repetition is not benign (for example,  
 117688 **typedefs**), conditional compilation must be used. The situation actually occurs both within the  
 117689 ISO C standard and within POSIX.1: **time\_t** should be in `<sys/types.h>`, and the ISO C standard  
 117690 mandates that it be in `<time.h>`.

117691 The area of name space pollution *versus* additions to structures is difficult because of the macro  
 117692 structure of C. The following discussion summarizes all the various problems with and  
 117693 objections to the issue.

117694 Note the phrase “user-defined macro”. Users are not permitted to define macro names (or any  
 117695 other name) beginning with “\_`[A-Z_]`”. Thus, the conflict cannot occur for symbols reserved  
 117696 to the vendor’s name space, and the permission to add fields automatically applies, without  
 117697 qualification, to those symbols.

117698 1. Data structures (and unions) need to be defined in headers by implementations to meet  
 117699 certain requirements of POSIX.1 and the ISO C standard.

117700 2. The structures defined by POSIX.1 are typically minimal, and any practical  
 117701 implementation would wish to add fields to these structures either to hold additional  
 117702 related information or for backwards-compatibility (or both). Future standards (and *de*  
 117703 *facto* standards) would also wish to add to these structures. Issues of field alignment  
 117704 make it impractical (at least in the general case) to simply omit fields when they are not  
 117705 defined by the particular standard involved.

117706 The **dirent** structure is an example of such a minimal structure (although one could argue  
 117707 about whether the other fields need visible names). The *st\_rdev* field of most  
 117708 implementations’ **stat** structure is a common example where extension is needed and  
 117709 where a conflict could occur.

117710 3. Fields in structures are in an independent name space, so the addition of such fields  
 117711 presents no problem to the C language itself in that such names cannot interact with  
 117712 identically named user symbols because access is qualified by the specific structure name.

117713 4. There is an exception to this: macro processing is done at a lexical level. Thus, symbols  
 117714 added to a structure might be recognized as user-provided macro names at the location  
 117715 where the structure is declared. This only can occur if the user-provided name is declared  
 117716 as a macro before the header declaring the structure is included. The user’s use of the  
 117717 name after the declaration cannot interfere with the structure because the symbol is  
 117718 hidden and only accessible through access to the structure. Presumably, the user would  
 117719 not declare such a macro if there was an intention to use that field name.

117720 5. Macros from the same or a related header might use the additional fields in the structure,  
 117721 and those field names might also collide with user macros. Although this is a less  
 117722 frequent occurrence, since macros are expanded at the point of use, no constraint on the  
 117723 order of use of names can apply.

117724 6. An “obvious” solution of using names in the reserved name space and then redefining  
 117725 them as macros when they should be visible does not work because this has the effect of  
 117726 exporting the symbol into the general name space. For example, given a (hypothetical)  
 117727 system-provided header `<h.h>`, and two parts of a C program in `a.c` and `b.c`, in header  
 117728 `<h.h>`:

```
117729 struct foo {
117730     int __i;
```

```

117731     }
117732     #ifdef _FEATURE_TEST
117733     #define i __i;
117734     #endif

```

117735 **In file a.c:**

```

117736     #include h.h
117737     extern int i;
117738     ...

```

117739 **In file b.c:**

```

117740     extern int i;
117741     ...

```

117742 The symbol that the user thinks of as *i* in both files has an external name of `__i` in **a.c**; the  
 117743 same symbol *i* in **b.c** has an external name *i* (ignoring any hidden manipulations the  
 117744 compiler might perform on the names). This would cause a mysterious name resolution  
 117745 problem when **a.o** and **b.o** are linked.

117746 Simply avoiding definition then causes alignment problems in the structure.

117747 A structure of the form:

```

117748     struct foo {
117749         union {
117750             int __i;
117751         #ifdef _FEATURE_TEST
117752             int i;
117753         #endif
117754         } __ii;
117755     }

```

117756 does not work because the name of the logical field *i* is `__ii.i`, and introduction of a macro  
 117757 to restore the logical name immediately reintroduces the problem discussed previously  
 117758 (although its manifestation might be more immediate because a syntax error would result  
 117759 if a recursive macro did not cause it to fail first).

117760 7. A more workable solution would be to declare the structure:

```

117761     struct foo {
117762     #ifdef _FEATURE_TEST
117763         int i;
117764     #else
117765         int __i;
117766     #endif
117767     }

```

117768 However, if a macro (particularly one required by a standard) is to be defined that uses  
 117769 this field, two must be defined: one that uses *i*, the other that uses `__i`. If more than one  
 117770 additional field is used in a macro and they are conditional on distinct combinations of  
 117771 features, the complexity goes up as  $2^n$ .

117772 All this leaves a difficult situation: vendors must provide very complex headers to deal with  
 117773 what is conceptually simple and safe—adding a field to a structure. It is the possibility of user-  
 117774 provided macros with the same name that makes this difficult.

117775 Several alternatives were proposed that involved constraining the user's access to part of the

117776 name space available to the user (as specified by the ISO C standard). In some cases, this was  
 117777 only until all the headers had been included. There were two proposals discussed that failed to  
 117778 achieve consensus:

- 117779 1. Limiting it for the whole program.
- 117780 2. Restricting the use of identifiers containing only uppercase letters until after all system  
 117781 headers had been included. It was also pointed out that because macros might wish to  
 117782 access fields of a structure (and macro expansion occurs totally at point of use) restricting  
 117783 names in this way would not protect the macro expansion, and thus the solution was  
 117784 inadequate.

117785 It was finally decided that reservation of symbols would occur, but as constrained.

117786 The current wording also allows the addition of fields to a structure, but requires that user  
 117787 macros of the same name not interfere. This allows vendors to do one of the following:

- 117788 • Not create the situation (do not extend the structures with user-accessible names or use the  
 117789 solution in (7) above)
- 117790 • Extend their compilers to allow some way of adding names to structures and macros safely

117791 There are at least two ways that the compiler might be extended: add new preprocessor  
 117792 directives that turn off and on macro expansion for certain symbols (without changing the value  
 117793 of the macro) and a function or lexical operation that suppresses expansion of a word. The latter  
 117794 seems more flexible, particularly because it addresses the problem in macros as well as in  
 117795 declarations.

117796 The following seems to be a possible implementation extension to the C language that will do  
 117797 this: any token that during macro expansion is found to be preceded by three '#' symbols shall  
 117798 not be further expanded in exactly the same way as described for macros that expand to their  
 117799 own name as in Section 3.8.3.4 of the ISO C standard. A vendor may also wish to implement this  
 117800 as an operation that is lexically a function, which might be implemented as:

```
117801 #define __safe_name(x) ###x
```

117802 Using a function notation would insulate vendors from changes in standards until such a  
 117803 functionality is standardized (if ever). Standardization of such a function would be valuable  
 117804 because it would then permit third parties to take advantage of it portably in software they may  
 117805 supply.

117806 The symbols that are “explicitly permitted, but not required by POSIX.1-2008” include those  
 117807 classified below. (That is, the symbols classified below might, but are not required to, be present  
 117808 when `_POSIX_C_SOURCE` is defined to have the value 200809L.)

- 117809 • Symbols in `<limits.h>` and `<unistd.h>` that are defined to indicate support for options or  
 117810 limits that are constant at compile-time
- 117811 • Symbols in the name space reserved for the implementation by the ISO C standard
- 117812 • Symbols in a name space reserved for a particular type of extension (for example, type  
 117813 names ending with `_t` in `<sys/types.h>`)
- 117814 • Additional members of structures or unions whose names do not reduce the name space  
 117815 reserved for applications

117816 Since both implementations and future versions of this standard and other POSIX standards  
 117817 may use symbols in the reserved spaces described in these tables, there is a potential for name  
 117818 space clashes. To avoid future name space clashes when adding symbols, implementations  
 117819 should not use the `posix_`, `POSIX_`, or `_POSIX_` prefixes.

- 117820 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/2 is applied, deleting the entries `POSIX_`,  
 117821 `_POSIX_`, and `posix_` from the column of allowed name space prefixes for use by an  
 117822 implementation in the first table. The presence of these prefixes was contradicting later text  
 117823 which states that: “The prefixes `posix_`, `POSIX_`, and `_POSIX` are reserved for use by XCU  
 117824 Chapter 2 (on page 2297) and other POSIX standards. Implementations may add symbols to the  
 117825 headers shown in the following table, provided the identifiers ... do not use the reserved  
 117826 prefixes `posix_`, `POSIX_`, or `_POSIX`.”.
- 117827 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/3 is applied, correcting the reserved  
 117828 macro prefix from: “`PRI[a-z]`, `SCN[a-z]`” to: “`PRI[Xa-z]`, `SCN[Xa-z]`” in the second table. The  
 117829 change was needed since the ISO C standard allows implementations to define macros of the  
 117830 form `PRI` or `SCN` followed by any lowercase letter or ‘`x`’ in `<inttypes.h>`. (The  
 117831 ISO/IEC 9899:1999 standard, Subclause 7.26.4.)
- 117832 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/4 is applied, adding a new section listing  
 117833 reserved names for the `<stdint.h>` header. This change is for alignment with the ISO C standard.
- 117834 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/2 is applied, making it clear that  
 117835 implementations are permitted to have symbols with the prefix `_POSIX_` visible in any header.
- 117836 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/3 is applied, updating the table of  
 117837 allowed macro prefixes to include the prefix `FP_[A-Z]` for `<math.h>`. This text is added for  
 117838 consistency with the `<math.h>` reference page in the Base Definitions volume of POSIX.1-2008  
 117839 which permits additional implementation-defined floating-point classifications.
- 117840 Austin Group Interpretation 1003.1-2001 #048 is applied, reserving `SEEK_` in the name space.

### 117841 B.2.3 Error Numbers

- 117842 It was the consensus of the standard developers that to allow the conformance document to state  
 117843 that an error occurs and under what conditions, but to disallow a statement that it never occurs,  
 117844 does not make sense. It could be implied by the current wording that this is allowed, but to  
 117845 reduce the possibility of future interpretation requests, it is better to make an explicit statement.
- 117846 The ISO C standard requires that `errno` be an assignable lvalue. Originally, the definition in  
 117847 POSIX.1 was stricter than that in the ISO C standard, `extern int errno`, in order to support  
 117848 historical usage. In a multi-threaded environment, implementing `errno` as a global variable  
 117849 results in non-deterministic results when accessed. It is required, however, that `errno` work as a  
 117850 per-thread error reporting mechanism. In order to do this, a separate `errno` value has to be  
 117851 maintained for each thread. The following section discusses the various alternative solutions  
 117852 that were considered.
- 117853 In order to avoid this problem altogether for new functions, these functions avoid using `errno`  
 117854 and, instead, return the error number directly as the function return value; a return value of zero  
 117855 indicates that no error was detected.
- 117856 For any function that can return errors, the function return value is not used for any purpose  
 117857 other than for reporting errors. Even when the output of the function is scalar, it is passed  
 117858 through a function argument. While it might have been possible to allow some scalar outputs to  
 117859 be coded as negative function return values and mixed in with positive error status returns, this  
 117860 was rejected—using the return value for a mixed purpose was judged to be of limited use and  
 117861 error prone.
- 117862 Checking the value of `errno` alone is not sufficient to determine the existence or type of an error,  
 117863 since it is not required that a successful function call clear `errno`. The variable `errno` should only  
 117864 be examined when the return value of a function indicates that the value of `errno` is meaningful.  
 117865 In that case, the function is required to set the variable to something other than zero.

- 117866 The variable *errno* is never set to zero by any function call; to do so would contradict the ISO C  
117867 standard.
- 117868 POSIX.1 requires (in the ERRORS sections of function descriptions) certain error values to be set  
117869 in certain conditions because many existing applications depend on them. Some error numbers,  
117870 such as [EFAULT], are entirely implementation-defined and are noted as such in their  
117871 description in the ERRORS section. This section otherwise allows wide latitude to the  
117872 implementation in handling error reporting.
- 117873 Some of the ERRORS sections in POSIX.1-2008 have two subsections. The first:  
117874 “The function shall fail if:”
- 117875 could be called the “mandatory” section.
- 117876 The second:  
117877 “The function may fail if:”
- 117878 could be informally known as the “optional” section.
- 117879 Attempting to infer the quality of an implementation based on whether it detects optional error  
117880 conditions is not useful.
- 117881 Following each one-word symbolic name for an error, there is a description of the error. The  
117882 rationale for some of the symbolic names follows:
- 117883 [ECANCELED] This spelling was chosen as being more common.
- 117884 [EFAULT] Most historical implementations do not catch an error and set *errno* when an  
117885 invalid address is given to the functions *wait()*, *time()*, or *times()*. Some  
117886 implementations cannot reliably detect an invalid address. And most systems  
117887 that detect invalid addresses will do so only for a system call, not for a library  
117888 routine.
- 117889 [EFTYPE] This error code was proposed in earlier proposals as “Inappropriate operation  
117890 for file type”, meaning that the operation requested is not appropriate for the  
117891 file specified in the function call. This code was proposed, although the same  
117892 idea was covered by [ENOTTY], because the connotations of the name would  
117893 be misleading. It was pointed out that the *fcntl()* function uses the error code  
117894 [EINVAL] for this notion, and hence all instances of [EFTYPE] were changed  
117895 to this code.
- 117896 [EINTR] POSIX.1 prohibits conforming implementations from restarting interrupted  
117897 system calls of conforming applications unless the SA\_RESTART flag is  
117898 in effect for the signal. However, it does not require that [EINTR] be returned  
117899 when another legitimate value may be substituted; for example, a partial  
117900 transfer count when *read()* or *write()* are interrupted. This is only given when  
117901 the signal-catching function returns normally as opposed to returns by  
117902 mechanisms like *longjmp()* or *siglongjmp()*.
- 117903 [ELOOP] In specifying conditions under which implementations would generate this  
117904 error, the following goals were considered:
- 117905 • To ensure that actual loops are detected, including loops that result from  
117906 symbolic links across distributed file systems.
  - 117907 • To ensure that during pathname resolution an application can rely on  
117908 the ability to follow at least {SYMLOOP\_MAX} symbolic links in the  
117909 absence of a loop.

- 117910 • To allow implementations to provide the capability of traversing more
  - 117911 than {SYMLOOP\_MAX} symbolic links in the absence of a loop.
  - 117912 • To allow implementations to detect loops and generate the error prior to
  - 117913 encountering {SYMLOOP\_MAX} symbolic links.
- 117914 [ENAMETOOLONG]
- 117915 When a symbolic link is encountered during pathname resolution, the
- 117916 contents of that symbolic link are used to create a new pathname. The
- 117917 standard developers intended to allow, but not require, that implementations
- 117918 enforce the restriction of {PATH\_MAX} on the result of this pathname
- 117919 substitution.
- 117920 Implementations are allowed, but not required, to treat a pathname longer
- 117921 than {PATH\_MAX} passed into the system as an error. Implementations are
- 117922 required to return a pathname (even if it is longer than {PATH\_MAX}) when
- 117923 the user supplies a buffer with an interface that specifies the buffer size, as
- 117924 long as the user-supplied buffer is large enough to hold the entire pathname
- 117925 (see XSH *getcwd()* for an example of this type of interface). Implementations
- 117926 are required to treat a request to pass a pathname longer than {PATH\_MAX}
- 117927 from the system to a user-supplied buffer of an unspecified size (usually
- 117928 assumed to be of size {PATH\_MAX}) as an error (see XSH *realpath()* for an
- 117929 example of this type of interface).
- 117930 [ENOMEM] The term “main memory” is not used in POSIX.1 because it is
- 117931 implementation-defined.
- 117932 [ENOTSUP] This error code is to be used when an implementation chooses to implement
- 117933 the required functionality of POSIX.1-2008 but does not support optional
- 117934 facilities defined by POSIX.1-2008. The return of [ENOSYS] is to be taken to
- 117935 indicate that the function of the interface is not supported at all; the function
- 117936 will always fail with this error code.
- 117937 [ENOTTY] The symbolic name for this error is derived from a time when device control
- 117938 was done by *ioctl()* and that operation was only permitted on a terminal
- 117939 interface. The term “TTY” is derived from “teletypewriter”, the devices to
- 117940 which this error originally applied.
- 117941 [EOVERFLOW] Most of the uses of this error code are related to large file support. Typically,
- 117942 these cases occur on systems which support multiple programming
- 117943 environments with different sizes for **off\_t**, but they may also occur in
- 117944 connection with remote file systems.
- 117945 In addition, when different programming environments have different widths
- 117946 for types such as **int** and **uid\_t**, several functions may encounter a condition
- 117947 where a value in a particular environment is too wide to be represented. In
- 117948 that case, this error should be raised. For example, suppose the currently
- 117949 running process has 64-bit **int**, and file descriptor 9 223 372 036 854 775 807 is
- 117950 open and does not have the close-on-exec flag set. If the process then uses
- 117951 *execl()* to *exec* a file compiled in a programming environment with 32-bit **int**,
- 117952 the call to *execl()* can fail with *errno* set to [EOVERFLOW]. A similar failure
- 117953 can occur with *execl()* if any of the user IDs or any of the group IDs to be
- 117954 assigned to the new process image are out of range for the executed file’s
- 117955 programming environment.
- 117956 Note, however, that this condition cannot occur for functions that are
- 117957 explicitly described as always being successful, such as *getpid()*.

117958 [EPIPE] This condition normally generates the signal SIGPIPE; the error is returned if  
 117959 the generation of the signal is suppressed or the signal does not terminate the  
 117960 process.

117961 [EROFS] In historical implementations, attempting to *unlink()* or *rmdir()* a mount point  
 117962 would generate an [EBUSY] error. An implementation could be envisioned  
 117963 where such an operation could be performed without error. In this case, if  
 117964 *either* the directory entry or the actual data structures reside on a read-only file  
 117965 system, [EROFS] is the appropriate error to generate. (For example, changing  
 117966 the link count of a file on a read-only file system could not be done, as is  
 117967 required by *unlink()*, and thus an error should be reported.)

117968 Three error numbers, [EDOM], [EILSEQ], and [ERANGE], were added to this section primarily  
 117969 for consistency with the ISO C standard.

#### 117970 **Alternative Solutions for Per-Thread *errno***

117971 The usual implementation of *errno* as a single global variable does not work in a multi-threaded  
 117972 environment. In such an environment, a thread may make a POSIX.1 call and get a -1 error  
 117973 return, but before that thread can check the value of *errno*, another thread might have made a  
 117974 second POSIX.1 call that also set *errno*. This behavior is unacceptable in robust programs. There  
 117975 were a number of alternatives that were considered for handling the *errno* problem:

- 117976 • Implement *errno* as a per-thread integer variable.
- 117977 • Implement *errno* as a service that can access the per-thread error number.
- 117978 • Change all POSIX.1 calls to accept an extra status argument and avoid setting *errno*.
- 117979 • Change all POSIX.1 calls to raise a language exception.

117980 The first option offers the highest level of compatibility with existing practice but requires  
 117981 special support in the linker, compiler, and/or virtual memory system to support the new  
 117982 concept of thread private variables. When compared with current practice, the third and fourth  
 117983 options are much cleaner, more efficient, and encourage a more robust programming style, but  
 117984 they require new versions of all of the POSIX.1 functions that might detect an error. The second  
 117985 option offers compatibility with existing code that uses the **<errno.h>** header to define the  
 117986 symbol *errno*. In this option, *errno* may be a macro defined:

```
117987 #define errno (*__errno())
117988 extern int      *__errno();
```

117989 This option may be implemented as a per-thread variable whereby an *errno* field is allocated in  
 117990 the user space object representing a thread, and whereby the function *\_\_errno()* makes a system  
 117991 call to determine the location of its user space object and returns the address of the *errno* field of  
 117992 that object. Another implementation, one that avoids calling the kernel, involves allocating  
 117993 stacks in chunks. The stack allocator keeps a side table indexed by chunk number containing a  
 117994 pointer to the thread object that uses that chunk. The *\_\_errno()* function then looks at the stack  
 117995 pointer, determines the chunk number, and uses that as an index into the chunk table to find its  
 117996 thread object and thus its private value of *errno*. On most architectures, this can be done in four  
 117997 to five instructions. Some compilers may wish to implement *\_\_errno()* inline to improve  
 117998 performance.

### 117999 Disallowing Return of the [EINTR] Error Code

118000 Many blocking interfaces defined by POSIX.1-2008 may return [EINTR] if interrupted during  
 118001 their execution by a signal handler. Blocking interfaces introduced under the threads  
 118002 functionality do not have this property. Instead, they require that the interface appear to be  
 118003 atomic with respect to interruption. In particular, clients of blocking interfaces need not handle  
 118004 any possible [EINTR] return as a special case since it will never occur. If it is necessary to restart  
 118005 operations or complete incomplete operations following the execution of a signal handler, this is  
 118006 handled by the implementation, rather than by the application.

118007 Requiring applications to handle [EINTR] errors on blocking interfaces has been shown to be a  
 118008 frequent source of often unreproducible bugs, and it adds no compelling value to the available  
 118009 functionality. Thus, blocking interfaces introduced for use by multi-threaded programs do not  
 118010 use this paradigm. In particular, in none of the functions *flockfile()*, *pthread\_cond\_timedwait()*,  
 118011 *pthread\_cond\_wait()*, *pthread\_join()*, *pthread\_mutex\_lock()*, and *sigwait()* did providing [EINTR]  
 118012 returns add value, or even particularly make sense. Thus, these functions do not provide for an  
 118013 [EINTR] return, even when interrupted by a signal handler. The same arguments can be applied  
 118014 to *sem\_wait()*, *sem\_trywait()*, *sigwaitinfo()*, and *sigtimedwait()*, but implementations are  
 118015 permitted to return [EINTR] error codes for these functions for compatibility with earlier  
 118016 versions of this standard. Applications cannot rely on calls to these functions returning [EINTR]  
 118017 error codes when signals are delivered to the calling thread, but they should allow for the  
 118018 possibility.

118019 Austin Group Interpretation 1003.1-2001 #050 is applied, allowing [ENOTSUP] and  
 118020 [EOPNOTSUP] to be the same values.

#### 118021 B.2.3.1 Additional Error Numbers

118022 The ISO C standard defines the name space for implementations to add additional error  
 118023 numbers.

### 118024 B.2.4 Signal Concepts

118025 Historical implementations of signals, using the *signal()* function, have shortcomings that make  
 118026 them unreliable for many application uses. Because of this, a new signal mechanism, based very  
 118027 closely on the one of 4.2 BSD and 4.3 BSD, was added to POSIX.1.

#### 118028 Signal Names

118029 The restriction on the actual type used for **sigset\_t** is intended to guarantee that these objects can  
 118030 always be assigned, have their address taken, and be passed as parameters by value. It is not  
 118031 intended that this type be a structure including pointers to other data structures, as that could  
 118032 impact the portability of applications performing such operations. A reasonable implementation  
 118033 could be a structure containing an array of some integer type.

118034 The signals described in POSIX.1-2008 must have unique values so that they may be named as  
 118035 parameters of **case** statements in the body of a C-language **switch** clause. However,  
 118036 implementation-defined signals may have values that overlap with each other or with signals  
 118037 specified in POSIX.1-2008. An example of this is SIGABRT, which traditionally overlaps some  
 118038 other signal, such as SIGIOT.

118039 SIGKILL, SIGTERM, SIGUSR1, and SIGUSR2 are ordinarily generated only through the explicit  
 118040 use of the *kill()* function, although some implementations generate SIGKILL under  
 118041 extraordinary circumstances. SIGTERM is traditionally the default signal sent by the *kill*  
 118042 command.

118043 The signals SIGBUS, SIGEMT, SIGIOT, SIGTRAP, and SIGSYS were omitted from POSIX.1  
118044 because their behavior is implementation-defined and could not be adequately categorized.  
118045 Conforming implementations may deliver these signals, but must document the circumstances  
118046 under which they are delivered and note any restrictions concerning their delivery. The signals  
118047 SIGFPE, SIGILL, and SIGSEGV are similar in that they also generally result only from  
118048 programming errors. They were included in POSIX.1 because they do indicate three relatively  
118049 well-categorized conditions. They are all defined by the ISO C standard and thus would have to  
118050 be defined by any system with an ISO C standard binding, even if not explicitly included in  
118051 POSIX.1.

118052 There is very little that a Conforming POSIX.1 Application can do by catching, ignoring, or  
118053 masking any of the signals SIGILL, SIGTRAP, SIGIOT, SIGEMT, SIGBUS, SIGSEGV, SIGSYS, or  
118054 SIGFPE. They will generally be generated by the system only in cases of programming errors.  
118055 While it may be desirable for some robust code (for example, a library routine) to be able to  
118056 detect and recover from programming errors in other code, these signals are not nearly sufficient  
118057 for that purpose. One portable use that does exist for these signals is that a command interpreter  
118058 can recognize them as the cause of termination of a process (with *wait()*) and print an  
118059 appropriate message. The mnemonic tags for these signals are derived from their PDP-11 origin.

118060 The signals SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU, and SIGCONT are provided for job control  
118061 and are unchanged from 4.2 BSD. The signal SIGCHLD is also typically used by job control  
118062 shells to detect children that have terminated or, as in 4.2 BSD, stopped.

118063 Some implementations, including System V, have a signal named SIGCLD, which is similar to  
118064 SIGCHLD in 4.2 BSD. POSIX.1 permits implementations to have a single signal with both  
118065 names. POSIX.1 carefully specifies ways in which conforming applications can avoid the  
118066 semantic differences between the two different implementations. The name SIGCHLD was  
118067 chosen for POSIX.1 because most current application usages of it can remain unchanged in  
118068 conforming applications. SIGCLD in System V has more cases of semantics that POSIX.1 does  
118069 not specify, and thus applications using it are more likely to require changes in addition to the  
118070 name change.

118071 The signals SIGUSR1 and SIGUSR2 are commonly used by applications for notification of  
118072 exceptional behavior and are described as “reserved as application-defined” so that such use is  
118073 not prohibited. Implementations should not generate SIGUSR1 or SIGUSR2, except when  
118074 explicitly requested by *kill()*. It is recommended that libraries not use these two signals, as such  
118075 use in libraries could interfere with their use by applications calling the libraries. If such use is  
118076 unavoidable, it should be documented. It is prudent for non-portable libraries to use non-  
118077 standard signals to avoid conflicts with use of standard signals by portable libraries.

118078 There is no portable way for an application to catch or ignore non-standard signals. Some  
118079 implementations define the range of signal numbers, so applications can install signal-catching  
118080 functions for all of them. Unfortunately, implementation-defined signals often cause problems  
118081 when caught or ignored by applications that do not understand the reason for the signal. While  
118082 the desire exists for an application to be more robust by handling all possible signals (even those  
118083 only generated by *kill()*), no existing mechanism was found to be sufficiently portable to include  
118084 in POSIX.1. The value of such a mechanism, if included, would be diminished given that  
118085 SIGKILL would still not be catchable.

118086 A number of new signal numbers are reserved for applications because the two user signals  
118087 defined by POSIX.1 are insufficient for many realtime applications. A range of signal numbers is  
118088 specified, rather than an enumeration of additional reserved signal names, because different  
118089 applications and application profiles will require a different number of application signals. It is  
118090 not desirable to burden all application domains and therefore all implementations with the  
118091 maximum number of signals required by all possible applications. Note that in this context,  
118092 signal numbers are essentially different signal priorities.

118093 The relatively small number of required additional signals, `{_POSIX_RTSIG_MAX}`, was chosen  
118094 so as not to require an unreasonably large signal mask/set. While this number of signals  
118095 defined in POSIX.1 will fit in a single 32-bit word signal mask, it is recognized that most existing  
118096 implementations define many more signals than are specified in POSIX.1 and, in fact, many  
118097 implementations have already exceeded 32 signals (including the “null signal”). Support of  
118098 `{_POSIX_RTSIG_MAX}` additional signals may push some implementation over the single 32-bit  
118099 word line, but is unlikely to push any implementations that are already over that line beyond  
118100 the 64-signal line.

#### 118101 B.2.4.1 Signal Generation and Delivery

118102 The terms defined in this section are not used consistently in documentation of historical  
118103 systems. Each signal can be considered to have a lifetime beginning with generation and ending  
118104 with delivery or acceptance. The POSIX.1 definition of “delivery” does not exclude ignored  
118105 signals; this is considered a more consistent definition. This revised text in several parts of  
118106 POSIX.1-2008 clarifies the distinct semantics of asynchronous signal delivery and synchronous  
118107 signal acceptance. The previous wording attempted to categorize both under the term  
118108 “delivery”, which led to conflicts over whether the effects of asynchronous signal delivery  
118109 applied to synchronous signal acceptance.

118110 Signals generated for a process are delivered to only one thread. Thus, if more than one thread  
118111 is eligible to receive a signal, one has to be chosen. The choice of threads is left entirely up to the  
118112 implementation both to allow the widest possible range of conforming implementations and to  
118113 give implementations the freedom to deliver the signal to the “easiest possible” thread should  
118114 there be differences in ease of delivery between different threads.

118115 Note that should multiple delivery among cooperating threads be required by an application,  
118116 this can be trivially constructed out of the provided single-delivery semantics. The construction  
118117 of a `sigwait_multiple()` function that accomplishes this goal is presented with the rationale for  
118118 `sigwaitinfo()`.

118119 Implementations should deliver unblocked signals as soon after they are generated as possible.  
118120 However, it is difficult for POSIX.1 to make specific requirements about this, beyond those in  
118121 `kill()` and `sigprocmask()`. Even on systems with prompt delivery, scheduling of higher priority  
118122 processes is always likely to cause delays.

118123 In general, the interval between the generation and delivery of unblocked signals cannot be  
118124 detected by an application. Thus, references to pending signals generally apply to blocked,  
118125 pending signals. An implementation registers a signal as pending on the process when no  
118126 thread has the signal unblocked and there are no threads blocked in a `sigwait()` function for that  
118127 signal. Thereafter, the implementation delivers the signal to the first thread that unblocks the  
118128 signal or calls a `sigwait()` function on a signal set containing this signal rather than choosing the  
118129 recipient thread at the time the signal is sent.

118130 In the 4.3 BSD system, signals that are blocked and set to `SIG_IGN` are discarded immediately  
118131 upon generation. For a signal that is ignored as its default action, if the action is `SIG_DFL` and  
118132 the signal is blocked, a generated signal remains pending. In the 4.1 BSD system and in  
118133 System V Release 3 (two other implementations that support a somewhat similar signal  
118134 mechanism), all ignored blocked signals remain pending if generated. Because it is not normally  
118135 useful for an application to simultaneously ignore and block the same signal, it was unnecessary  
118136 for POSIX.1 to specify behavior that would invalidate any of the historical implementations.

118137 There is one case in some historical implementations where an unblocked, pending signal does  
118138 not remain pending until it is delivered. In the System V implementation of `signal()`, pending  
118139 signals are discarded when the action is set to `SIG_DFL` or a signal-catching routine (as well as  
118140 to `SIG_IGN`). Except in the case of setting `SIGCHLD` to `SIG_DFL`, implementations that do this

118141 do not conform completely to POSIX.1. Some earlier proposals for POSIX.1 explicitly stated this,  
 118142 but these statements were redundant due to the requirement that functions defined by POSIX.1  
 118143 not change attributes of processes defined by POSIX.1 except as explicitly stated.

118144 POSIX.1 specifically states that the order in which multiple, simultaneously pending signals are  
 118145 delivered is unspecified. This order has not been explicitly specified in historical  
 118146 implementations, but has remained quite consistent and been known to those familiar with the  
 118147 implementations. Thus, there have been cases where applications (usually system utilities) have  
 118148 been written with explicit or implicit dependencies on this order. Implementors and others  
 118149 porting existing applications may need to be aware of such dependencies.

118150 When there are multiple pending signals that are not blocked, implementations should arrange  
 118151 for the delivery of all signals at once, if possible. Some implementations stack calls to all pending  
 118152 signal-catching routines, making it appear that each signal-catcher was interrupted by the next  
 118153 signal. In this case, the implementation should ensure that this stacking of signals does not  
 118154 violate the semantics of the signal masks established by *sigaction()*. Other implementations  
 118155 process at most one signal when the operating system is entered, with remaining signals saved  
 118156 for later delivery. Although this practice is widespread, this behavior is neither standardized  
 118157 nor endorsed. In either case, implementations should attempt to deliver signals associated with  
 118158 the current state of the process (for example, SIGFPE) before other signals, if possible.

118159 In 4.2 BSD and 4.3 BSD, it is not permissible to ignore or explicitly block SIGCONT, because if  
 118160 blocking or ignoring this signal prevented it from continuing a stopped process, such a process  
 118161 could never be continued (only killed by SIGKILL). However, 4.2 BSD and 4.3 BSD do block  
 118162 SIGCONT during execution of its signal-catching function when it is caught, creating exactly  
 118163 this problem. A proposal was considered to disallow catching SIGCONT in addition to ignoring  
 118164 and blocking it, but this limitation led to objections. The consensus was to require that  
 118165 SIGCONT always continue a stopped process when generated. This removed the need to  
 118166 disallow ignoring or explicit blocking of the signal; note that SIG\_IGN and SIG\_DFL are  
 118167 equivalent for SIGCONT.

#### 118168 B.2.4.2 Realtime Signal Generation and Delivery

118169 The realtime signals functionality is required in this version of the standard for the following  
 118170 reasons:

- 118171 • The **sigevent** structure is used by other POSIX.1 functions that result in asynchronous  
 118172 event notifications to specify the notification mechanism to use and other information  
 118173 needed by the notification mechanism. POSIX.1-2008 defines only three symbolic values  
 118174 for the notification mechanism:
  - 118175 — SIGEV\_NONE is used to indicate that no notification is required when the event  
 118176 occurs. This is useful for applications that use asynchronous I/O with polling for  
 118177 completion.
  - 118178 — SIGEV\_SIGNAL indicates that a signal is generated when the event occurs.
  - 118179 — SIGEV\_THREAD provides for “callback functions” for asynchronous notifications  
 118180 done by a function call within the context of a new thread. This provides a multi-  
 118181 threaded process with a more natural means of notification than signals.

118182 The primary difficulty with previous notification approaches has been to specify the  
 118183 environment of the notification routine.

- 118184 — One approach is to limit the notification routine to call only functions permitted in a  
 118185 signal handler. While the list of permissible functions is clearly stated, this is overly  
 118186 restrictive.

- 118187 — A second approach is to define a new list of functions or classes of functions that are  
 118188 explicitly permitted or not permitted. This would give a programmer more lists to  
 118189 deal with, which would be awkward.
- 118190 — The third approach is to define completely the environment for execution of the  
 118191 notification function. A clear definition of an execution environment for notification  
 118192 is provided by executing the notification function in the environment of a newly  
 118193 created thread.
- 118194 Implementations may support additional notification mechanisms by defining new values  
 118195 for *sigev\_notify*.
- 118196 For a notification type of SIGEV\_SIGNAL, the other members of the **sigevent** structure  
 118197 defined by POSIX.1-2008 specify the realtime signal—that is, the signal number and  
 118198 application-defined value that differentiates between occurrences of signals with the same  
 118199 number—that will be generated when the event occurs. The structure is defined in  
 118200 **<signal.h>**, even though the structure is not directly used by any of the signal functions,  
 118201 because it is part of the signals interface used by the POSIX.1b “client functions”. When the  
 118202 client functions include **<signal.h>** to define the signal names, the **sigevent** structure will  
 118203 also be defined.
- 118204 An application-defined value passed to the signal handler is used to differentiate between  
 118205 different “events” instead of requiring that the application use different signal numbers for  
 118206 several reasons:
- 118207 — Realtime applications potentially handle a very large number of different events.  
 118208 Requiring that implementations support a correspondingly large number of distinct  
 118209 signal numbers will adversely impact the performance of signal delivery because the  
 118210 signal masks to be manipulated on entry and exit to the handlers will become large.
- 118211 — Event notifications are prioritized by signal number (the rationale for this is  
 118212 explained in the following paragraphs) and the use of different signal numbers to  
 118213 differentiate between the different event notifications overloads the signal number  
 118214 more than has already been done. It also requires that the application developer  
 118215 make arbitrary assignments of priority to events that are logically of equal priority.
- 118216 A union is defined for the application-defined value so that either an integer constant or a  
 118217 pointer can be portably passed to the signal-catching function. On some architectures a  
 118218 pointer cannot be cast to an **int** and *vice versa*.
- 118219 Use of a structure here with an explicit notification type discriminant rather than explicit  
 118220 parameters to realtime functions, or embedded in other realtime structures, provides for  
 118221 future extensions to POSIX.1-2008. Additional, perhaps more efficient, notification  
 118222 mechanisms can be supported for existing realtime function interfaces, such as timers and  
 118223 asynchronous I/O, by extending the **sigevent** structure appropriately. The existing  
 118224 realtime function interfaces will not have to be modified to use any such new notification  
 118225 mechanism. The revised text concerning the SIGEV\_SIGNAL value makes consistent the  
 118226 semantics of the members of the **sigevent** structure, particularly in the definitions of  
 118227 *lio\_listio()* and *aio\_fsync()*. For uniformity, other revisions cause this specification to be  
 118228 referred to rather than inaccurately duplicated in the descriptions of functions and  
 118229 structures using the **sigevent** structure. The revised wording does not relax the  
 118230 requirement that the signal number be in the range SIGRTMIN to SIGRTMAX to guarantee  
 118231 queuing and passing of the application value, since that requirement is still implied by the  
 118232 signal names.

- 118233 • POSIX.1-2008 is intentionally vague on whether “non-realtime” signal-generating  
 118234 mechanisms can result in a **siginfo\_t** being supplied to the handler on delivery. In one  
 118235 existing implementation, a **siginfo\_t** is posted on signal generation, even though the  
 118236 implementation does not support queuing of multiple occurrences of a signal. It is not the  
 118237 intent of POSIX.1-2008 to preclude this, independent of the mandate to define signals that  
 118238 do support queuing. Any interpretation that appears to preclude this is a mistake in the  
 118239 reading or writing of the standard.
- 118240 • Signals handled by realtime signal handlers might be generated by functions or conditions  
 118241 that do not allow the specification of an application-defined value and do not queue.  
 118242 POSIX.1-2008 specifies the *si\_code* member of the **siginfo\_t** structure used in existing  
 118243 practice and defines additional codes so that applications can detect whether an  
 118244 application-defined value is present or not. The code `SI_USER` for *kill()*-generated signals  
 118245 is adopted from existing practice.
- 118246 • The *sigaction()* *sa\_flags* value `SA_SIGINFO` tells the implementation that the signal-  
 118247 catching function expects two additional arguments. When the flag is not set, a single  
 118248 argument, the signal number, is passed as specified by POSIX.1-2008. Although  
 118249 POSIX.1-2008 does not explicitly allow the *info* argument to the handler function to be  
 118250 NULL, this is existing practice. This provides for compatibility with programs whose  
 118251 signal-catching functions are not prepared to accept the additional arguments.  
 118252 POSIX.1-2008 is explicitly unspecified as to whether signals actually queue when  
 118253 `SA_SIGINFO` is not set for a signal, as there appear to be no benefits to applications in  
 118254 specifying one behavior or another. One existing implementation queues a **siginfo\_t** on  
 118255 each signal generation, unless the signal is already pending, in which case the  
 118256 implementation discards the new **siginfo\_t**; that is, the queue length is never greater than  
 118257 one. This implementation only examines `SA_SIGINFO` on signal delivery, discarding the  
 118258 queued **siginfo\_t** if its delivery was not requested.
- 118259 The third argument to the signal-catching function, *context*, is left undefined by  
 118260 POSIX.1-2008, but is specified in the interface because it matches existing practice for the  
 118261 `SA_SIGINFO` flag. It was considered undesirable to require a separate implementation for  
 118262 `SA_SIGINFO` for POSIX conformance on implementations that already support the two  
 118263 additional parameters.
- 118264 • The requirement to deliver lower numbered signals in the range `SIGRTMIN` to `SIGRTMAX`  
 118265 first, when multiple unblocked signals are pending, results from several considerations:
- 118266 — A method is required to prioritize event notifications. The signal number was chosen  
 118267 instead of, for instance, associating a separate priority with each request, because an  
 118268 implementation has to check pending signals at various points and select one for  
 118269 delivery when more than one is pending. Specifying a selection order is the minimal  
 118270 additional semantic that will achieve prioritized delivery. If a separate priority were  
 118271 to be associated with queued signals, it would be necessary for an implementation to  
 118272 search all non-empty, non-blocked signal queues and select from among them the  
 118273 pending signal with the highest priority. This would significantly increase the cost of  
 118274 and decrease the determinism of signal delivery.
  - 118275 — Given the specified selection of the lowest numeric unblocked pending signal,  
 118276 preemptive priority signal delivery can be achieved using signal numbers and signal  
 118277 masks by ensuring that the *sa\_mask* for each signal number blocks all signals with a  
 118278 higher numeric value.
- 118279 For realtime applications that want to use only the newly defined realtime signal  
 118280 numbers without interference from the standard signals, this can be achieved by  
 118281 blocking all of the standard signals in the thread signal mask and in the *sa\_mask*

118282 installed by the signal action for the realtime signal handlers.

118283 POSIX.1-2008 explicitly leaves unspecified the ordering of signals outside of the range of  
118284 realtime signals and the ordering of signals within this range with respect to those outside  
118285 the range. It was believed that this would unduly constrain implementations or standards  
118286 in the future definition of new signals.

#### 118287 B.2.4.3 Signal Actions

118288 Early proposals mentioned SIGCONT as a second exception to the rule that signals are not  
118289 delivered to stopped processes until continued. Because POSIX.1-2008 now specifies that  
118290 SIGCONT causes the stopped process to continue when it is generated, delivery of SIGCONT is  
118291 not prevented because a process is stopped, even without an explicit exception to this rule.

118292 Ignoring a signal by setting the action to SIG\_IGN (or SIG\_DFL for signals whose default action  
118293 is to ignore) is not the same as installing a signal-catching function that simply returns. Invoking  
118294 such a function will interrupt certain system functions that block processes (for example, *wait()*,  
118295 *sigsuspend()*, *pause()*, *read()*, *write()*) while ignoring a signal has no such effect on the process.

118296 Historical implementations discard pending signals when the action is set to SIG\_IGN.  
118297 However, they do not always do the same when the action is set to SIG\_DFL and the default  
118298 action is to ignore the signal. POSIX.1-2008 requires this for the sake of consistency and also for  
118299 completeness, since the only signal this applies to is SIGCHLD, and POSIX.1-2008 disallows  
118300 setting its action to SIG\_IGN.

118301 Some implementations (System V, for example) assign different semantics for SIGCHLD  
118302 depending on whether the action is set to SIG\_IGN or SIG\_DFL. Since POSIX.1 requires that the  
118303 default action for SIGCHLD be to ignore the signal, applications should always set the action to  
118304 SIG\_DFL in order to avoid SIGCHLD.

118305 Whether or not an implementation allows SIG\_IGN as a SIGCHLD disposition to be inherited  
118306 across a call to one of the *exec* family of functions or *posix\_spawn()* is explicitly left as  
118307 unspecified. This change was made as a result of IEEE PASC Interpretation 1003.1 #132, and  
118308 permits the implementation to decide between the following alternatives:

- 118309 • Unconditionally leave SIGCHLD set to SIG\_IGN, in which case the implementation would  
118310 not allow applications that assume inheritance of SIG\_DFL to conform to POSIX.1-2008  
118311 without change. The implementation would, however, retain an ability to control  
118312 applications that create child processes but never call on the *wait* family of functions,  
118313 potentially filling up the process table.
- 118314 • Unconditionally reset SIGCHLD to SIG\_DFL, in which case the implementation would  
118315 allow applications that assume inheritance of SIG\_DFL to conform. The implementation  
118316 would, however, lose an ability to control applications that spawn child processes but  
118317 never reap them.
- 118318 • Provide some mechanism, not specified in POSIX.1-2008, to control inherited SIGCHLD  
118319 dispositions.

118320 Some implementations (System V, for example) will deliver a SIGCHLD signal immediately when  
118321 a process establishes a signal-catching function for SIGCHLD when that process has a child that  
118322 has already terminated. Other implementations, such as 4.3 BSD, do not generate a new  
118323 SIGCHLD signal in this way. In general, a process should not attempt to alter the signal action  
118324 for the SIGCHLD signal while it has any outstanding children. However, it is not always  
118325 possible for a process to avoid this; for example, shells sometimes start up processes in pipelines  
118326 with other processes from the pipeline as children. Processes that cannot ensure that they have  
118327 no children when altering the signal action for SIGCHLD thus need to be prepared for, but not

- 118328 depend on, generation of an immediate SIGCHLD signal.
- 118329 The default action of the stop signals (SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU) is to stop a  
118330 process that is executing. If a stop signal is delivered to a process that is already stopped, it has  
118331 no effect. In fact, if a stop signal is generated for a stopped process whose signal mask blocks the  
118332 signal, the signal will never be delivered to the process since the process must receive a  
118333 SIGCONT, which discards all pending stop signals, in order to continue executing.
- 118334 The SIGCONT signal continues a stopped process even if SIGCONT is blocked (or ignored).  
118335 However, if a signal-catching routine has been established for SIGCONT, it will not be entered  
118336 until SIGCONT is unblocked.
- 118337 If a process in an orphaned process group stops, it is no longer under the control of a job control  
118338 shell and hence would not normally ever be continued. Because of this, orphaned processes that  
118339 receive terminal-related stop signals (SIGTSTP, SIGTTIN, SIGTTOU, but not SIGSTOP) must not  
118340 be allowed to stop. The goal is to prevent stopped processes from languishing forever. (As  
118341 SIGSTOP is sent only via *kill()*, it is assumed that the process or user sending a SIGSTOP can  
118342 send a SIGCONT when desired.) Instead, the system must discard the stop signal. As an  
118343 extension, it may also deliver another signal in its place. 4.3 BSD sends a SIGKILL, which is  
118344 overly effective because SIGKILL is not catchable. Another possible choice is SIGHUP. 4.3 BSD  
118345 also does this for orphaned processes (processes whose parent has terminated) rather than for  
118346 members of orphaned process groups; this is less desirable because job control shells manage  
118347 process groups. POSIX.1 also prevents SIGTTIN and SIGTTOU signals from being generated for  
118348 processes in orphaned process groups as a direct result of activity on a terminal, preventing  
118349 infinite loops when *read()* and *write()* calls generate signals that are discarded; see [Section  
A.11.1.4](#) (on page 3481). A similar restriction on the generation of SIGTSTP was considered, but  
118350 that would be unnecessary and more difficult to implement due to its asynchronous nature.  
118351
- 118352 Although POSIX.1 requires that signal-catching functions be called with only one argument,  
118353 there is nothing to prevent conforming implementations from extending POSIX.1 to pass  
118354 additional arguments, as long as Strictly Conforming POSIX.1 Applications continue to compile  
118355 and execute correctly. Most historical implementations do, in fact, pass additional, signal-  
118356 specific arguments to certain signal-catching routines.
- 118357 There was a proposal to change the declared type of the signal handler to:
- 118358 

```
void func (int sig, ...);
```
- 118359 The usage of ellipses ("...") is ISO C standard syntax to indicate a variable number of  
118360 arguments. Its use was intended to allow the implementation to pass additional information to  
118361 the signal handler in a standard manner.
- 118362 Unfortunately, this construct would require all signal handlers to be defined with this syntax  
118363 because the ISO C standard allows implementations to use a different parameter passing  
118364 mechanism for variable parameter lists than for non-variable parameter lists. Thus, all existing  
118365 signal handlers in all existing applications would have to be changed to use the variable syntax  
118366 in order to be standard and portable. This is in conflict with the goal of Minimal Changes to  
118367 Existing Application Code.
- 118368 When terminating a process from a signal-catching function, processes should be aware of any  
118369 interpretation that their parent may make of the status returned by *wait()*, *waitid()*, or *waitpid()*.  
118370 In particular, a signal-catching function should not call *exit(0)* or *\_exit(0)* unless it wants to  
118371 indicate successful termination. A non-zero argument to *exit()* or *\_exit()* can be used to indicate  
118372 unsuccessful termination. Alternatively, the process can use *kill()* to send itself a fatal signal  
118373 (first ensuring that the signal is set to the default action and not blocked). See also the  
118374 RATIONALE section of the *\_exit()* function.
- 118375 The behavior of *unsafe* functions, as defined by this section, is undefined when they are invoked

118376 from signal-catching functions in certain circumstances. The behavior of async-signal-safe  
118377 functions, as defined by this section, is as specified by POSIX.1, regardless of invocation from a  
118378 signal-catching function. This is the only intended meaning of the statement that async-signal-  
118379 safe functions may be used in signal-catching functions without restriction. Applications must  
118380 still consider all effects of such functions on such things as data structures, files, and process  
118381 state. In particular, application developers need to consider the restrictions on interactions when  
118382 interrupting *sleep()* (see *sleep()*) and interactions among multiple handles for a file description.  
118383 The fact that any specific function is listed as async-signal-safe does not necessarily mean that  
118384 invocation of that function from a signal-catching function is recommended.

118385 In order to prevent errors arising from interrupting non-async-signal-safe function calls,  
118386 applications should protect calls to these functions either by blocking the appropriate signals or  
118387 through the use of some programmatic semaphore. POSIX.1 does not address the more general  
118388 problem of synchronizing access to shared data structures. Note in particular that even the  
118389 “safe” functions may modify the global variable *errno*; the signal-catching function may want to  
118390 save and restore its value. The same principles apply to the async-signal-safety of application  
118391 routines and asynchronous data access.

118392 Note that *longjmp()* and *siglongjmp()* are not in the list of async-signal-safe functions. This is  
118393 because the code executing after *longjmp()* or *siglongjmp()* can call any unsafe functions with the  
118394 same danger as calling those unsafe functions directly from the signal handler. Applications that  
118395 use *longjmp()* or *siglongjmp()* out of signal handlers require rigorous protection in order to be  
118396 portable. Many of the other functions that are excluded from the list are traditionally  
118397 implemented using either the C language *malloc()* or *free()* functions or the ISO C standard I/O  
118398 library, both of which traditionally use data structures in a non-async-signal-safe manner.  
118399 Because any combination of different functions using a common data structure can cause async-  
118400 signal-safety problems, POSIX.1 does not define the behavior when any unsafe function is called  
118401 in a signal handler that interrupts any unsafe function.

118402 The only realtime extension to signal actions is the addition of the additional parameters to the  
118403 signal-catching function. This extension has been explained and motivated in the previous  
118404 section. In making this extension, though, developers of POSIX.1b ran into issues relating to  
118405 function prototypes. In response to input from the POSIX.1 standard developers, members were  
118406 added to the **sigaction** structure to specify function prototypes for the newer signal-catching  
118407 function specified by POSIX.1b. These members follow changes that are being made to POSIX.1.  
118408 Note that POSIX.1-2008 explicitly states that these fields may overlap so that a union can be  
118409 defined. This enabled existing implementations of POSIX.1 to maintain binary-compatibility  
118410 when these extensions were added.

118411 The **siginfo\_t** structure was adopted for passing the application-defined value to match existing  
118412 practice, but the existing practice has no provision for an application-defined value, so this was  
118413 added. Note that POSIX normally reserves the “\_t” type designation for opaque types. The  
118414 **siginfo\_t** structure breaks with this convention to follow existing practice and thus promote  
118415 portability.

118416 POSIX.1-2008 specifies several values for the *si\_code* member of the **siginfo\_t** structure. Some  
118417 were introduced in POSIX.1b; others were XSI functionality in the Single UNIX Specification,  
118418 Version 2 and Version 3, that has now become Base functionality. Historically, an *si\_code* value of  
118419 less than or equal to zero indicated that the signal was generated by a process via the *kill()*  
118420 function, and values of *si\_code* that provided additional information for implementation-  
118421 generated signals, such as SIGFPE or SIGSEGV, were all positive. This functionality is partially  
118422 specified for XSI systems in that if *si\_code* is less than or equal to zero, the signal was generated  
118423 by a process. However, since POSIX.1b did not specify that SI\_USER (or SI\_QUEUE) had a value  
118424 less than or equal to zero, it is not true that when the signal is generated by a process, the value  
118425 of *si\_code* will always be less than or equal to zero. XSI applications should check whether *si\_code*

118426 is SI\_USER or SI\_QUEUE in addition to checking whether it is less than or equal to zero.  
 118427 Applications on systems that do not support the XSI option should just check for SI\_USER and  
 118428 SI\_QUEUE.

118429 If an implementation chooses to define additional values for *si\_code*, these values have to be  
 118430 different from the values of the non-signal-specific symbols specified by POSIX.1-2008. This will  
 118431 allow conforming applications to differentiate between signals generated by standard events  
 118432 and those generated by other implementation events in a manner compatible with existing  
 118433 practice.

118434 The unique values of *si\_code* for the POSIX.1b asynchronous events have implications for  
 118435 implementations of, for example, asynchronous I/O or message passing in user space library  
 118436 code. Such an implementation will be required to provide a hidden interface to the signal  
 118437 generation mechanism that allows the library to specify the standard values of *si\_code*.

118438 POSIX.1-2008 also specifies additional members of **siginfo\_t**, beyond those that were in  
 118439 POSIX.1b. Like the *si\_code* values mentioned above, these were XSI functionality in the Single  
 118440 UNIX Specification, Version 2 and Version 3, that has now become Base functionality. They  
 118441 provide additional information when *si\_code* has one of the values that moved from XSI to Base.

118442 Although it is not explicitly visible to applications, there are additional semantics for signal  
 118443 actions implied by queued signals and their interaction with other POSIX.1b realtime functions.  
 118444 Specifically:

- 118445 • It is not necessary to queue signals whose action is SIG\_IGN.
- 118446 • For implementations that support POSIX.1b timers, some interaction with the timer  
 118447 functions at signal delivery is implied to manage the timer overrun count.

118448 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/5 is applied, reordering the RTS shaded  
 118449 text under the third and fourth paragraphs of the SIG\_DFL description. This corrects an earlier  
 118450 editorial error in this section.

118451 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/6 is applied, adding the *abort()* function  
 118452 to the list of async-cancel-safe functions.

118453 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/4 is applied, adding the *socketmark()*  
 118454 function to the list of functions that shall be either reentrant or non-interruptible by signals and  
 118455 shall be async-signal-safe.

#### 118456 B.2.4.4 *Signal Effects on Other Functions*

118457 The most common behavior of an interrupted function after a signal-catching function returns is  
 118458 for the interrupted function to give an [EINTR] error unless the SA\_RESTART flag is in effect for  
 118459 the signal. However, there are a number of specific exceptions, including *sleep()* and certain  
 118460 situations with *read()* and *write()*.

118461 The historical implementations of many functions defined by POSIX.1-2008 are not interruptible,  
 118462 but delay delivery of signals generated during their execution until after they complete. This is  
 118463 never a problem for functions that are guaranteed to complete in a short (imperceptible to a  
 118464 human) period of time. It is normally those functions that can suspend a process indefinitely or  
 118465 for long periods of time (for example, *wait()*, *pause()*, *sigsuspend()*, *sleep()*, or *read()/write()* on a  
 118466 slow device like a terminal) that are interruptible. This permits applications to respond to  
 118467 interactive signals or to set timeouts on calls to most such functions with *alarm()*. Therefore,  
 118468 implementations should generally make such functions (including ones defined as extensions)  
 118469 interruptible.

118470 Functions not mentioned explicitly as interruptible may be so on some implementations,

118471 possibly as an extension where the function gives an [EINTR] error. There are several functions  
118472 (for example, *getpid()*, *getuid()*) that are specified as never returning an error, which can thus  
118473 never be extended in this way.

118474 If a signal-catching function returns while the SA\_RESTART flag is in effect, an interrupted  
118475 function is restarted at the point it was interrupted. Conforming applications cannot make  
118476 assumptions about the internal behavior of interrupted functions, even if the functions are  
118477 async-signal-safe. For example, suppose the *read()* function is interrupted with SA\_RESTART in  
118478 effect, the signal-catching function closes the file descriptor being read from and returns, and the  
118479 *read()* function is then restarted; in this case the application cannot assume that the *read()*  
118480 function will give an [EBADF] error, since *read()* might have checked the file descriptor for  
118481 validity before being interrupted.

## 118482 **B.2.5 Standard I/O Streams**

### 118483 *B.2.5.1 Interaction of File Descriptors and Standard I/O Streams*

118484 There is no additional rationale provided for this section.

### 118485 *B.2.5.2 Stream Orientation and Encoding Rules*

118486 There is no additional rationale provided for this section.

## 118487 **B.2.6 STREAMS**

118488 STREAMS are included into POSIX.1-2008 as part of the alignment with the Single UNIX  
118489 Specification, but marked as an option in recognition that not all systems may wish to  
118490 implement the facility. The option within POSIX.1-2008 is denoted by the XSR margin marker.  
118491 The standard developers made this option independent of the XSI option. In this version of the  
118492 standard this option is marked obsolescent.

118493 STREAMS are a method of implementing network services and other character-based  
118494 input/output mechanisms, with the STREAM being a full-duplex connection between a process  
118495 and a device. STREAMS provides direct access to protocol modules, and optional protocol  
118496 modules can be interposed between the process-end of the STREAM and the device-driver at the  
118497 device-end of the STREAM. Pipes can be implemented using the STREAMS mechanism, so they  
118498 can provide process-to-process as well as process-to-device communications.

118499 This section introduces STREAMS I/O, the message types used to control them, an overview of  
118500 the priority mechanism, and the interfaces used to access them.

### 118501 *B.2.6.1 Accessing STREAMS*

118502 There is no additional rationale provided for this section.

**118503 B.2.7 XSI Interprocess Communication**

118504 There are two forms of IPC supported as options in POSIX.1-2008. The traditional System V IPC  
118505 routines derived from the SVID—that is, the *msg\**(), *sem\**(), and *shm\**() interfaces—are  
118506 mandatory on XSI-conformant systems. Thus, all XSI-conformant systems provide the same  
118507 mechanisms for manipulating messages, shared memory, and semaphores.

118508 In addition, the POSIX Realtime Extension provides an alternate set of routines for those systems  
118509 supporting the appropriate options.

118510 The application developer is presented with a choice: the System V interfaces or the POSIX  
118511 interfaces (loosely derived from the Berkeley interfaces). The XSI profile prefers the System V  
118512 interfaces, but the POSIX interfaces may be more suitable for realtime or other performance-  
118513 sensitive applications.

**118514 B.2.7.1 IPC General Information**

118515 General information that is shared by all three mechanisms is described in this section. The  
118516 common permissions mechanism is briefly introduced, describing the mode bits, and how they  
118517 are used to determine whether or not a process has access to read or write/alter the appropriate  
118518 instance of one of the IPC mechanisms. All other relevant information is contained in the  
118519 reference pages themselves.

118520 The semaphore type of IPC allows processes to communicate through the exchange of  
118521 semaphore values. A semaphore is a positive integer. Since many applications require the use of  
118522 more than one semaphore, XSI-conformant systems have the ability to create sets or arrays of  
118523 semaphores.

118524 Calls to support semaphores include:

118525 *semctl*(), *semget*(), *semop*()

118526 Semaphore sets are created by using the *semget*() function.

118527 The message type of IPC allows processes to communicate through the exchange of data stored  
118528 in buffers. This data is transmitted between processes in discrete portions known as messages.

118529 Calls to support message queues include:

118530 *msgctl*(), *msgget*(), *msgrcv*(), *msgsnd*()

118531 The shared memory type of IPC allows two or more processes to share memory and  
118532 consequently the data contained therein. This is done by allowing processes to set up access to a  
118533 common memory address space. This sharing of memory provides a fast means of exchange of  
118534 data between processes.

118535 Calls to support shared memory include:

118536 *shmctl*(), *shmdt*(), *shmget*()

118537 The *ftok*() interface is also provided.

118538 **B.2.8 Realtime**118539 **Advisory Information**

118540 POSIX.1b contains an Informative Annex with proposed interfaces for “realtime files”. These  
118541 interfaces could determine groups of the exact parameters required to do “direct I/O” or  
118542 “extents”. These interfaces were objected to by a significant portion of the balloting group as too  
118543 complex. A conforming application had little chance of correctly navigating the large parameter  
118544 space to match its desires to the system. In addition, they only applied to a new type of file  
118545 (realtime files) and they told the implementation exactly what to do as opposed to advising the  
118546 implementation on application behavior and letting it optimize for the system the (portable)  
118547 application was running on. For example, it was not clear how a system that had a disk array  
118548 should set its parameters.

118549 There seemed to be several overall goals:

- 118550 • Optimizing sequential access
- 118551 • Optimizing caching behavior
- 118552 • Optimizing I/O data transfer
- 118553 • Preallocation

118554 The advisory interfaces, *posix\_fadvise()* and *posix\_madvise()*, satisfy the first two goals. The  
118555 POSIX\_FADV\_SEQUENTIAL and POSIX\_MADV\_SEQUENTIAL advice tells the  
118556 implementation to expect serial access. Typically the system will prefetch the next several serial  
118557 accesses in order to overlap I/O. It may also free previously accessed serial data if memory is  
118558 tight. If the application is not doing serial access it can use POSIX\_FADV\_WILLNEED and  
118559 POSIX\_MADV\_WILLNEED to accomplish I/O overlap, as required. When the application  
118560 advises POSIX\_FADV\_RANDOM or POSIX\_MADV\_RANDOM behavior, the implementation  
118561 usually tries to fetch a minimum amount of data with each request and it does not expect much  
118562 locality. POSIX\_FADV\_DONTNEED and POSIX\_MADV\_DONTNEED allow the system to free  
118563 up caching resources as the data will not be required in the near future.

118564 POSIX\_FADV\_NOREUSE tells the system that caching the specified data is not optimal. For file  
118565 I/O, the transfer should go directly to the user buffer instead of being cached internally by the  
118566 implementation. To portably perform direct disk I/O on all systems, the application must  
118567 perform its I/O transfers according to the following rules:

- 118568 1. The user buffer should be aligned according to the {POSIX\_REC\_XFER\_ALIGN}  
118569 *pathconf()* variable.
- 118570 2. The number of bytes transferred in an I/O operation should be a multiple of the  
118571 {POSIX\_ALLOC\_SIZE\_MIN} *pathconf()* variable.
- 118572 3. The offset into the file at the start of an I/O operation should be a multiple of the  
118573 {POSIX\_ALLOC\_SIZE\_MIN} *pathconf()* variable.
- 118574 4. The application should ensure that all threads which open a given file specify  
118575 POSIX\_FADV\_NOREUSE to be sure that there is no unexpected interaction between  
118576 threads using buffered I/O and threads using direct I/O to the same file.

118577 In some cases, a user buffer must be properly aligned in order to be transferred directly to/from  
118578 the device. The {POSIX\_REC\_XFER\_ALIGN} *pathconf()* variable tells the application the proper  
118579 alignment.

118580 The preallocation goal is met by the space control function, *posix\_fallocate()*. The application can  
118581 use *posix\_fallocate()* to guarantee no [ENOSPC] errors and to improve performance by prepaying  
118582 any overhead required for block allocation.

118583 Implementations may use information conveyed by a previous *posix\_fadvise()* call to influence  
 118584 the manner in which allocation is performed. For example, if an application did the following  
 118585 calls:

```
118586 fd = open("file");
118587 posix_fadvise(fd, offset, len, POSIX_FADV_SEQUENTIAL);
118588 posix_fallocate(fd, len, size);
```

118589 an implementation might allocate the file contiguously on disk.

118590 Finally, the *pathconf()* variables {POSIX\_REC\_MIN\_XFER\_SIZE},  
 118591 {POSIX\_REC\_MAX\_XFER\_SIZE}, and {POSIX\_REC\_INCR\_XFER\_SIZE} tell the application a  
 118592 range of transfer sizes that are recommended for best I/O performance.

118593 Where bounded response time is required, the vendor can supply the appropriate settings of the  
 118594 advisories to achieve a guaranteed performance level.

118595 The interfaces meet the goals while allowing applications using regular files to take advantage  
 118596 of performance optimizations. The interfaces tell the implementation expected application  
 118597 behavior which the implementation can use to optimize performance on a particular system  
 118598 with a particular dynamic load.

118599 The *posix\_memalign()* function was added to allow for the allocation of specifically aligned  
 118600 buffers; for example, for {POSIX\_REC\_XFER\_ALIGN}.

118601 The working group also considered the alternative of adding a function which would return an  
 118602 aligned pointer to memory within a user-supplied buffer. This was not considered to be the best  
 118603 method, because it potentially wastes large amounts of memory when buffers need to be aligned  
 118604 on large alignment boundaries.

## 118605 **Message Passing**

118606 This section provides the rationale for the definition of the message passing interface in  
 118607 POSIX.1-2008. This is presented in terms of the objectives, models, and requirements imposed  
 118608 upon this interface.

### 118609 • Objectives

118610 Many applications, including both realtime and database applications, require a means of  
 118611 passing arbitrary amounts of data between cooperating processes comprising the overall  
 118612 application on one or more processors. Many conventional interfaces for interprocess  
 118613 communication are insufficient for realtime applications in that efficient and deterministic  
 118614 data passing methods cannot be implemented. This has prompted the definition of  
 118615 message passing interfaces providing these facilities:

- 118616 — Open a message queue.
- 118617 — Send a message to a message queue.
- 118618 — Receive a message from a queue, either synchronously or asynchronously.
- 118619 — Alter message queue attributes for flow and resource control.

118620 It is assumed that an application may consist of multiple cooperating processes and that  
 118621 these processes may wish to communicate and coordinate their activities. The message  
 118622 passing facility described in POSIX.1-2008 allows processes to communicate through  
 118623 system-wide queues. These message queues are accessed through names that may be  
 118624 pathnames. A message queue can be opened for use by multiple sending and/or multiple  
 118625 receiving processes.

- 118626
- Background on Embedded Applications
- 118627 Interprocess communication utilizing message passing is a key facility for the construction  
118628 of deterministic, high-performance realtime applications. The facility is present in all  
118629 realtime systems and is the framework upon which the application is constructed. The  
118630 performance of the facility is usually a direct indication of the performance of the resulting  
118631 application.
- 118632 Realtime applications, especially for embedded systems, are typically designed around the  
118633 performance constraints imposed by the message passing mechanisms. Applications for  
118634 embedded systems are typically very tightly constrained. Application developers expect to  
118635 design and control the entire system. In order to minimize system costs, the writer will  
118636 attempt to use all resources to their utmost and minimize the requirement to add  
118637 additional memory or processors.
- 118638 The embedded applications usually share address spaces and only a simple message  
118639 passing mechanism is required. The application can readily access common data incurring  
118640 only mutual-exclusion overheads. The models desired are the simplest possible with the  
118641 application building higher-level facilities only when needed.
- 118642
- Requirements
- 118643 The following requirements determined the features of the message passing facilities  
118644 defined in POSIX.1-2008:
- 118645 — Naming of Message Queues
- 118646 The mechanism for gaining access to a message queue is a pathname evaluated in a  
118647 context that is allowed to be a file system name space, or it can be independent of  
118648 any file system. This is a specific attempt to allow implementations based on either  
118649 method in order to address both embedded systems and to also allow  
118650 implementation in larger systems.
- 118651 The interface of `mq_open()` is defined to allow but not require the access control and  
118652 name conflicts resulting from utilizing a file system for name resolution. All required  
118653 behavior is specified for the access control case. Yet a conforming implementation,  
118654 such as an embedded system kernel, may define that there are no distinctions  
118655 between users and may define that all processes have all access privileges.
- 118656 — Embedded System Naming
- 118657 Embedded systems need to be able to utilize independent name spaces for accessing  
118658 the various system objects. They typically do not have a file system, precluding its  
118659 utilization as a common name resolution mechanism. The modularity of an  
118660 embedded system limits the connections between separate mechanisms that can be  
118661 allowed.
- 118662 Embedded systems typically do not have any access protection. Since the system  
118663 does not support the mixing of applications from different areas, and usually does  
118664 not even have the concept of an authorization entity, access control is not useful.
- 118665 — Large System Naming
- 118666 On systems with more functionality, the name resolution must support the ability to  
118667 use the file system as the name resolution mechanism/object storage medium and to  
118668 have control over access to the objects. Utilizing the pathname space can result in  
118669 further errors when the names conflict with other objects.

- 118670 — Fixed Size of Messages
- 118671 The interfaces impose a fixed upper bound on the size of messages that can be sent to  
118672 a specific message queue. The size is set on an individual queue basis and cannot be  
118673 changed dynamically.
- 118674 The purpose of the fixed size is to increase the ability of the system to optimize the  
118675 implementation of *mq\_send()* and *mq\_receive()*. With fixed sizes of messages and  
118676 fixed numbers of messages, specific message blocks can be pre-allocated. This  
118677 eliminates a significant amount of checking for errors and boundary conditions.  
118678 Additionally, an implementation can optimize data copying to maximize  
118679 performance. Finally, with a restricted range of message sizes, an implementation is  
118680 better able to provide deterministic operations.
- 118681 — Prioritization of Messages
- 118682 Message prioritization allows the application to determine the order in which  
118683 messages are received. Prioritization of messages is a key facility that is provided by  
118684 most realtime kernels and is heavily utilized by the applications. The major purpose  
118685 of having priorities in message queues is to avoid priority inversions in the message  
118686 system, where a high-priority message is delayed behind one or more lower-priority  
118687 messages. This allows the applications to be designed so that they do not need to be  
118688 interrupted in order to change the flow of control when exceptional conditions occur.  
118689 The prioritization does add additional overhead to the message operations in those  
118690 cases it is actually used but a clever implementation can optimize for the FIFO case to  
118691 make that more efficient.
- 118692 — Asynchronous Notification
- 118693 The interface supports the ability to have a task asynchronously notified of the  
118694 availability of a message on the queue. The purpose of this facility is to allow the task  
118695 to perform other functions and yet still be notified that a message has become  
118696 available on the queue.
- 118697 To understand the requirement for this function, it is useful to understand two  
118698 models of application design: a single task performing multiple functions and  
118699 multiple tasks performing a single function. Each of these models has advantages.
- 118700 Asynchronous notification is required to build the model of a single task performing  
118701 multiple operations. This model typically results from either the expectation that  
118702 interruption is less expensive than utilizing a separate task or from the growth of the  
118703 application to include additional functions.

## 118704 Semaphores

- 118705 Semaphores are a high-performance process synchronization mechanism. Semaphores are  
118706 named by null-terminated strings of characters.
- 118707 A semaphore is created using the *sem\_init()* function or the *sem\_open()* function with the  
118708 *O\_CREAT* flag set in *oflag*.
- 118709 To use a semaphore, a process has to first initialize the semaphore or inherit an open descriptor  
118710 for the semaphore via *fork()*.
- 118711 A semaphore preserves its state when the last reference is closed. For example, if a semaphore  
118712 has a value of 13 when the last reference is closed, it will have a value of 13 when it is next  
118713 opened.
- 118714 When a semaphore is created, an initial state for the semaphore has to be provided. This value is

118715 a non-negative integer. Negative values are not possible since they indicate the presence of  
118716 blocked processes. The persistence of any of these objects across a system crash or a system  
118717 reboot is undefined. Conforming applications must not depend on any sort of persistence across  
118718 a system reboot or a system crash.

118719 • Models and Requirements

118720 A realtime system requires synchronization and communication between the processes  
118721 comprising the overall application. An efficient and reliable synchronization mechanism  
118722 has to be provided in a realtime system that will allow more than one schedulable process  
118723 mutually-exclusive access to the same resource. This synchronization mechanism has to  
118724 allow for the optimal implementation of synchronization or systems implementors will  
118725 define other, more cost-effective methods.

118726 At issue are the methods whereby multiple processes (tasks) can be designed and  
118727 implemented to work together in order to perform a single function. This requires  
118728 interprocess communication and synchronization. A semaphore mechanism is the lowest  
118729 level of synchronization that can be provided by an operating system.

118730 A semaphore is defined as an object that has an integral value and a set of blocked  
118731 processes associated with it. If the value is positive or zero, then the set of blocked  
118732 processes is empty; otherwise, the size of the set is equal to the absolute value of the  
118733 semaphore value. The value of the semaphore can be incremented or decremented by any  
118734 process with access to the semaphore and must be done as an indivisible operation. When  
118735 a semaphore value is less than or equal to zero, any process that attempts to lock it again  
118736 will block or be informed that it is not possible to perform the operation.

118737 A semaphore may be used to guard access to any resource accessible by more than one  
118738 schedulable task in the system. It is a global entity and not associated with any particular  
118739 process. As such, a method of obtaining access to the semaphore has to be provided by the  
118740 operating system. A process that wants access to a critical resource (section) has to wait on  
118741 the semaphore that guards that resource. When the semaphore is locked on behalf of a  
118742 process, it knows that it can utilize the resource without interference by any other  
118743 cooperating process in the system. When the process finishes its operation on the resource,  
118744 leaving it in a well-defined state, it posts the semaphore, indicating that some other  
118745 process may now obtain the resource associated with that semaphore.

118746 In this section, mutexes and condition variables are specified as the synchronization  
118747 mechanisms between threads.

118748 These primitives are typically used for synchronizing threads that share memory in a  
118749 single process. However, this section provides an option allowing the use of these  
118750 synchronization interfaces and objects between processes that share memory, regardless of  
118751 the method for sharing memory.

118752 Much experience with semaphores shows that there are two distinct uses of  
118753 synchronization: locking, which is typically of short duration; and waiting, which is  
118754 typically of long or unbounded duration. These distinct usages map directly onto mutexes  
118755 and condition variables, respectively.

118756 Semaphores are provided in POSIX.1-2008 primarily to provide a means of  
118757 synchronization for processes; these processes may or may not share memory. Mutexes  
118758 and condition variables are specified as synchronization mechanisms between threads;  
118759 these threads always share (some) memory. Both are synchronization paradigms that have  
118760 been in widespread use for a number of years. Each set of primitives is particularly well  
118761 matched to certain problems.

118762 With respect to binary semaphores, experience has shown that condition variables and

118763 mutexes are easier to use for many synchronization problems than binary semaphores. The  
 118764 primary reason for this is the explicit appearance of a Boolean predicate that specifies  
 118765 when the condition wait is satisfied. This Boolean predicate terminates a loop, including  
 118766 the call to *pthread\_cond\_wait()*. As a result, extra wakeups are benign since the predicate  
 118767 governs whether the thread will actually proceed past the condition wait. With stateful  
 118768 primitives, such as binary semaphores, the wakeup in itself typically means that the wait is  
 118769 satisfied. The burden of ensuring correctness for such waits is thus placed on *all* signalers  
 118770 of the semaphore rather than on an *explicitly coded* Boolean predicate located at the  
 118771 condition wait. Experience has shown that the latter creates a major improvement in safety  
 118772 and ease-of-use.

118773 Counting semaphores are well matched to dealing with producer/consumer problems,  
 118774 including those that might exist between threads of different processes, or between a signal  
 118775 handler and a thread. In the former case, there may be little or no memory shared by the  
 118776 processes; in the latter case, one is not communicating between co-equal threads, but  
 118777 between a thread and an interrupt-like entity. It is for these reasons that POSIX.1-2008  
 118778 allows semaphores to be used by threads.

118779 Mutexes and condition variables have been effectively used with and without priority  
 118780 inheritance, priority ceiling, and other attributes to synchronize threads that share  
 118781 memory. The efficiency of their implementation is comparable to or better than that of  
 118782 other synchronization primitives that are sometimes harder to use (for example, binary  
 118783 semaphores). Furthermore, there is at least one known implementation of Ada tasking that  
 118784 uses these primitives. Mutexes and condition variables together constitute an appropriate,  
 118785 sufficient, and complete set of inter-thread synchronization primitives.

118786 Efficient multi-threaded applications require high-performance synchronization  
 118787 primitives. Considerations of efficiency and generality require a small set of primitives  
 118788 upon which more sophisticated synchronization functions can be built.

118789 • Standardization Issues

118790 It is possible to implement very high-performance semaphores using test-and-set  
 118791 instructions on shared memory locations. The library routines that implement such a high-  
 118792 performance interface have to properly ensure that a *sem\_wait()* or *sem\_trywait()* operation  
 118793 that cannot be performed will issue a blocking semaphore system call or properly report  
 118794 the condition to the application. The same interface to the application program would be  
 118795 provided by a high-performance implementation.

118796 B.2.8.1 *Realtime Signals*

118797 **Realtime Signals Extension**

118798 This portion of the rationale presents models, requirements, and standardization issues relevant  
 118799 to the Realtime Signals Extension. This extension provides the capability required to support  
 118800 reliable, deterministic, asynchronous notification of events. While a new mechanism,  
 118801 unencumbered by the historical usage and semantics of POSIX.1 signals, might allow for a more  
 118802 efficient implementation, the application requirements for event notification can be met with a  
 118803 small number of extensions to signals. Therefore, a minimal set of extensions to signals to  
 118804 support the application requirements is specified.

118805 The realtime signal extensions specified in this section are used by other realtime functions  
 118806 requiring asynchronous notification:

118807 • Models

118808 The model supported is one of multiple cooperating processes, each of which handles

118809 multiple asynchronous external events. Events represent occurrences that are generated as  
 118810 the result of some activity in the system. Examples of occurrences that can constitute an  
 118811 event include:

- 118812 — Completion of an asynchronous I/O request
- 118813 — Expiration of a POSIX.1b timer
- 118814 — Arrival of an interprocess message
- 118815 — Generation of a user-defined event

118816 Processing of these events may occur synchronously via polling for event notifications or  
 118817 asynchronously via a software interrupt mechanism. Existing practice for this model is  
 118818 well established for traditional proprietary realtime operating systems, realtime  
 118819 executives, and realtime extended POSIX-like systems.

118820 A contrasting model is that of “cooperating sequential processes” where each process  
 118821 handles a single priority of events via polling. Each process blocks while waiting for  
 118822 events, and each process depends on the preemptive, priority-based process scheduling  
 118823 mechanism to arbitrate between events of different priority that need to be processed  
 118824 concurrently. Existing practice for this model is also well established for small realtime  
 118825 executives that typically execute in an unprotected physical address space, but it is just  
 118826 emerging in the context of a fuller function operating system with multiple virtual address  
 118827 spaces.

118828 It could be argued that the cooperating sequential process model, and the facilities  
 118829 supported by the POSIX Threads Extension obviate a software interrupt model. But, even  
 118830 with the cooperating sequential process model, the need has been recognized for a  
 118831 software interrupt model to handle exceptional conditions and process aborting, so the  
 118832 mechanism must be supported in any case. Furthermore, it is not the purview of  
 118833 POSIX.1-2008 to attempt to convince realtime practitioners that their current application  
 118834 models based on software interrupts are “broken” and should be replaced by the  
 118835 cooperating sequential process model. Rather, it is the charter of POSIX.1-2008 to provide  
 118836 standard extensions to mechanisms that support existing realtime practice.

118837 • Requirements

118838 This section discusses the following realtime application requirements for asynchronous  
 118839 event notification:

- 118840 — Reliable delivery of asynchronous event notification

118841 The events notification mechanism guarantees delivery of an event notification.  
 118842 Asynchronous operations (such as asynchronous I/O and timers) that complete  
 118843 significantly after they are invoked have to guarantee that delivery of the event  
 118844 notification can occur at the time of completion.

- 118845 — Prioritized handling of asynchronous event notifications

118846 The events notification mechanism supports the assigning of a user function as an  
 118847 event notification handler. Furthermore, the mechanism supports the preemption of  
 118848 an event handler function by a higher priority event notification and supports the  
 118849 selection of the highest priority pending event notification when multiple  
 118850 notifications (of different priority) are pending simultaneously.

118851 The model here is based on hardware interrupts. Asynchronous event handling  
 118852 allows the application to ensure that time-critical events are immediately processed  
 118853 when delivered, without the indeterminism of being at a random location within a  
 118854 polling loop. Use of handler priority allows the specification of how handlers are

- 118855 interrupted by other higher priority handlers.
- 118856 — Differentiation between multiple occurrences of event notifications of the same type
- 118857 The events notification mechanism passes an application-defined value to the event  
118858 handler function. This value can be used for a variety of purposes, such as enabling  
118859 the application to identify which of several possible events of the same type (for  
118860 example, timer expirations) has occurred.
- 118861 — Polled reception of asynchronous event notifications
- 118862 The events notification mechanism supports blocking and non-blocking polls for  
118863 asynchronous event notification.
- 118864 The polled mode of operation is often preferred over the interrupt mode by those  
118865 practitioners accustomed to this model. Providing support for this model facilitates  
118866 the porting of applications based on this model to POSIX.1b conforming systems.
- 118867 — Deterministic response to asynchronous event notifications
- 118868 The events notification mechanism does not preclude implementations that provide  
118869 deterministic event dispatch latency and minimizes the number of system calls  
118870 needed to use the event facilities during realtime processing.
- 118871 • Rationale for Extension
- 118872 POSIX.1 signals have many of the characteristics necessary to support the asynchronous  
118873 handling of event notifications, and the Realtime Signals Extension addresses the  
118874 following deficiencies in the POSIX.1 signal mechanism:
- 118875 — Signals do not support reliable delivery of event notification. Subsequent  
118876 occurrences of a pending signal are not guaranteed to be delivered.
- 118877 — Signals do not support prioritized delivery of event notifications. The order of signal  
118878 delivery when multiple unblocked signals are pending is undefined.
- 118879 — Signals do not support the differentiation between multiple signals of the same type.

#### 118880 B.2.8.2 *Asynchronous I/O*

118881 Many applications need to interact with the I/O subsystem in an asynchronous manner. The  
118882 asynchronous I/O mechanism provides the ability to overlap application processing and I/O  
118883 operations initiated by the application. The asynchronous I/O mechanism allows a single  
118884 process to perform I/O simultaneously to a single file multiple times or to multiple files  
118885 multiple times.

#### 118886 **Overview**

118887 Asynchronous I/O operations proceed in logical parallel with the processing done by the  
118888 application after the asynchronous I/O has been initiated. Other than this difference,  
118889 asynchronous I/O behaves similarly to normal I/O using *read()*, *write()*, *lseek()*, and *fsync()*.  
118890 The effect of issuing an asynchronous I/O request is as if a separate thread of execution were to  
118891 perform atomically the implied *lseek()* operation, if any, and then the requested I/O operation  
118892 (either *read()*, *write()*, or *fsync()*). There is no seek implied with a call to  *aio\_fsync()*. Concurrent  
118893 asynchronous operations and synchronous operations applied to the same file update the file as  
118894 if the I/O operations had proceeded serially.

118895 When asynchronous I/O completes, a signal can be delivered to the application to indicate the  
118896 completion of the I/O. This signal can be used to indicate that buffers and control blocks used  
118897 for asynchronous I/O can be reused. Signal delivery is not required for an asynchronous

118898 operation and may be turned off on a per-operation basis by the application. Signals may also be  
118899 synchronously polled using *aio\_suspend()*, *sigtimedwait()*, or *sigwaitinfo()*.

118900 Normal I/O has a return value and an error status associated with it. Asynchronous I/O  
118901 returns a value and an error status when the operation is first submitted, but that only relates to  
118902 whether the operation was successfully queued up for servicing. The I/O operation itself also  
118903 has a return status and an error value. To allow the application to retrieve the return status and  
118904 the error value, functions are provided that, given the address of an asynchronous I/O control  
118905 block, yield the return and error status associated with the operation. Until an asynchronous I/O  
118906 operation is done, its error status is [EINPROGRESS]. Thus, an application can poll for  
118907 completion of an asynchronous I/O operation by waiting for the error status to become equal to  
118908 a value other than [EINPROGRESS]. The return status of an asynchronous I/O operation is  
118909 undefined so long as the error status is equal to [EINPROGRESS].

118910 Storage for asynchronous operation return and error status may be limited. Submission of  
118911 asynchronous I/O operations may fail if this storage is exceeded. When an application retrieves  
118912 the return status of a given asynchronous operation, therefore, any system-maintained storage  
118913 used for this status and the error status may be reclaimed for use by other asynchronous  
118914 operations.

118915 Asynchronous I/O can be performed on file descriptors that have been enabled for POSIX.1b  
118916 synchronized I/O. In this case, the I/O operation still occurs asynchronously, as defined herein;  
118917 however, the asynchronous operation I/O in this case is not completed until the I/O has reached  
118918 either the state of synchronized I/O data integrity completion or synchronized I/O file integrity  
118919 completion, depending on the sort of synchronized I/O that is enabled on the file descriptor.

## 118920 Models

118921 Three models illustrate the use of asynchronous I/O: a journalization model, a data acquisition  
118922 model, and a model of the use of asynchronous I/O in supercomputing applications.

### 118923 • Journalization Model

118924 Many realtime applications perform low-priority journalizing functions. Journalizing  
118925 requires that logging records be queued for output without blocking the initiating process.

### 118926 • Data Acquisition Model

118927 A data acquisition process may also serve as a model. The process has two or more  
118928 channels delivering intermittent data that must be read within a certain time. The process  
118929 issues one asynchronous read on each channel. When one of the channels needs data  
118930 collection, the process reads the data and posts it through an asynchronous write to  
118931 secondary memory for future processing.

### 118932 • Supercomputing Model

118933 The supercomputing community has used asynchronous I/O much like that specified in  
118934 POSIX.1 for many years. This community requires the ability to perform multiple I/O  
118935 operations to multiple devices with a minimal number of entries to “the system”; each  
118936 entry to “the system” provokes a major delay in operations when compared to the normal  
118937 progress made by the application. This existing practice motivated the use of combined  
118938 *lseek()* and *read()* or *write()* calls, as well as the *lio\_listio()* call. Another common practice is  
118939 to disable signal notification for I/O completion, and simply poll for I/O completion at  
118940 some interval by which the I/O should be completed. Likewise, interfaces like *aio\_cancel()*  
118941 have been in successful commercial use for many years. Note also that an underlying  
118942 implementation of asynchronous I/O will require the ability, at least internally, to cancel  
118943 outstanding asynchronous I/O, at least when the process exits. (Consider an asynchronous  
118944 read from a terminal, when the process intends to exit immediately.)

118945 **Requirements**

118946 Asynchronous input and output for realtime implementations have these requirements:

- 118947 • The ability to queue multiple asynchronous read and write operations to a single open  
118948 instance. Both sequential and random access should be supported.
- 118949 • The ability to queue asynchronous read and write operations to multiple open instances.
- 118950 • The ability to obtain completion status information by polling and/or asynchronous event  
118951 notification.
- 118952 • Asynchronous event notification on asynchronous I/O completion is optional.
- 118953 • It has to be possible for the application to associate the event with the *aioctx* for the  
118954 operation that generated the event.
- 118955 • The ability to cancel queued requests.
- 118956 • The ability to wait upon asynchronous I/O completion in conjunction with other types of  
118957 events.
- 118958 • The ability to accept an *aio\_read()* and an *aio\_cancel()* for a device that accepts a *read()*, and  
118959 the ability to accept an *aio\_write()* and an *aio\_cancel()* for a device that accepts a *write()*.  
118960 This does not imply that the operation is asynchronous.

118961 **Standardization Issues**

118962 The following issues are addressed by the standardization of asynchronous I/O:

- 118963 • Rationale for New Interface

118964 Non-blocking I/O does not satisfy the needs of either realtime or high-performance  
118965 computing models; these models require that a process overlap program execution and  
118966 I/O processing. Realtime applications will often make use of direct I/O to or from the  
118967 address space of the process, or require synchronized (unbuffered) I/O; they also require  
118968 the ability to overlap this I/O with other computation. In addition, asynchronous I/O  
118969 allows an application to keep a device busy at all times, possibly achieving greater  
118970 throughput. Supercomputing and database architectures will often have specialized  
118971 hardware that can provide true asynchrony underlying the logical asynchrony provided  
118972 by this interface. In addition, asynchronous I/O should be supported by all types of files  
118973 and devices in the same manner.

- 118974 • Effect of Buffering

118975 If asynchronous I/O is performed on a file that is buffered prior to being actually written  
118976 to the device, it is possible that asynchronous I/O will offer no performance advantage  
118977 over normal I/O; the cycles *stolen* to perform the asynchronous I/O will be taken away  
118978 from the running process and the I/O will occur at interrupt time. This potential lack of  
118979 gain in performance in no way obviates the need for asynchronous I/O by realtime  
118980 applications, which very often will use specialized hardware support, multiple processors,  
118981 and/or unbuffered, synchronized I/O.

118982 *B.2.8.3 Memory Management*118983 All memory management and shared memory definitions are located in the `<sys/mman.h>`  
118984 header. This is for alignment with historical practice.118985 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/7 is applied, correcting the shading and  
118986 margin markers in the introduction to Section 2.8.3.1.

118987 **Memory Locking Functions**

118988 This portion of the rationale presents models, requirements, and standardization issues relevant  
118989 to process memory locking.

## 118990 • Models

118991 Realtime systems that conform to POSIX.1-2008 are expected (and desired) to be supported  
118992 on systems with demand-paged virtual memory management, non-paged swapping  
118993 memory management, and physical memory systems with no memory management  
118994 hardware. The general case, however, is the demand-paged, virtual memory system with  
118995 each POSIX process running in a virtual address space. Note that this includes  
118996 architectures where each process resides in its own virtual address space and architectures  
118997 where the address space of each process is only a portion of a larger global virtual address  
118998 space.

118999 The concept of memory locking is introduced to eliminate the indeterminacy introduced  
119000 by paging and swapping, and to support an upper bound on the time required to access  
119001 the memory mapped into the address space of a process. Ideally, this upper bound will be  
119002 the same as the time required for the processor to access “main memory”, including any  
119003 address translation and cache miss overheads. But some implementations—primarily on  
119004 mainframes—will not actually force locked pages to be loaded and held resident in main  
119005 memory. Rather, they will handle locked pages so that accesses to these pages will meet the  
119006 performance metrics for locked process memory in the implementation. Also, although it  
119007 is not, for example, the intention that this interface, as specified, be used to lock process  
119008 memory into “cache”, it is conceivable that an implementation could support a large static  
119009 RAM memory and define this as “main memory” and use a large[r] dynamic RAM as  
119010 “backing store”. These interfaces could then be interpreted as supporting the locking of  
119011 process memory into the static RAM. Support for multiple levels of backing store would  
119012 require extensions to these interfaces.

119013 Implementations may also use memory locking to guarantee a fixed translation between  
119014 virtual and physical addresses where such is beneficial to improving determinacy for  
119015 direct-to/from-process input/output. POSIX.1-2008 does not guarantee to the application  
119016 that the virtual-to-physical address translations, if such exist, are fixed, because such  
119017 behavior would not be implementable on all architectures on which implementations of  
119018 POSIX.1-2008 are expected. But POSIX.1-2008 does mandate that an implementation  
119019 define, for the benefit of potential users, whether or not locking guarantees fixed  
119020 translations.

119021 Memory locking is defined with respect to the address space of a process. Only the pages  
119022 mapped into the address space of a process may be locked by the process, and when the  
119023 pages are no longer mapped into the address space—for whatever reason—the locks  
119024 established with respect to that address space are removed. Shared memory areas warrant  
119025 special mention, as they may be mapped into more than one address space or mapped  
119026 more than once into the address space of a process; locks may be established on pages  
119027 within these areas with respect to several of these mappings. In such a case, the lock state  
119028 of the underlying physical pages is the logical OR of the lock state with respect to each of  
119029 the mappings. Only when all such locks have been removed are the shared pages  
119030 considered unlocked.

119031 In recognition of the page granularity of Memory Management Units (MMU), and in order  
119032 to support locking of ranges of address space, memory locking is defined in terms of  
119033 “page” granularity. That is, for the interfaces that support an address and size specification  
119034 for the region to be locked, the address must be on a page boundary, and all pages mapped  
119035 by the specified range are locked, if valid. This means that the length is implicitly rounded

119036 up to a multiple of the page size. The page size is implementation-defined and is available  
119037 to applications as a compile-time symbolic constant or at runtime via *sysconf()*.

119038 A “real memory” POSIX.1b implementation that has no MMU could elect not to support  
119039 these interfaces, returning [ENOSYS]. But an application could easily interpret this as  
119040 meaning that the implementation would unconditionally page or swap the application  
119041 when such is not the case. It is the intention of POSIX.1-2008 that such a system could  
119042 define these interfaces as “NO-OPs”, returning success without actually performing any  
119043 function except for mandated argument checking.

119044 • Requirements

119045 For realtime applications, memory locking is generally considered to be required as part of  
119046 application initialization. This locking is performed after an application has been loaded  
119047 (that is, *exec'd*) and the program remains locked for its entire lifetime. But to support  
119048 applications that undergo major mode changes where, in one mode, locking is required,  
119049 but in another it is not, the specified interfaces allow repeated locking and unlocking of  
119050 memory within the lifetime of a process.

119051 When a realtime application locks its address space, it should not be necessary for the  
119052 application to then “touch” all of the pages in the address space to guarantee that they are  
119053 resident or else suffer potential paging delays the first time the page is referenced. Thus,  
119054 POSIX.1-2008 requires that the pages locked by the specified interfaces be resident when  
119055 the locking functions return successfully.

119056 Many architectures support system-managed stacks that grow automatically when the  
119057 current extent of the stack is exceeded. A realtime application has a requirement to be able  
119058 to “preallocate” sufficient stack space and lock it down so that it will not suffer page faults  
119059 to grow the stack during critical realtime operation. There was no consensus on a portable  
119060 way to specify how much stack space is needed, so POSIX.1-2008 supports no specific  
119061 interface for preallocating stack space. But an application can portably lock down a specific  
119062 amount of stack space by specifying *MCL\_FUTURE* in a call to *mlockall()* and then calling  
119063 a dummy function that declares an automatic array of the desired size.

119064 Memory locking for realtime applications is also generally considered to be an “all or  
119065 nothing” proposition. That is, the entire process, or none, is locked down. But, for  
119066 applications that have well-defined sections that need to be locked and others that do not,  
119067 POSIX.1-2008 supports an optional set of interfaces to lock or unlock a range of process  
119068 addresses. Reasons for locking down a specific range include:

119069 — An asynchronous event handler function that must respond to external events in a  
119070 deterministic manner such that page faults cannot be tolerated

119071 — An input/output “buffer” area that is the target for direct-to-process I/O, and the  
119072 overhead of implicit locking and unlocking for each I/O call cannot be tolerated

119073 Finally, locking is generally viewed as an “application-wide” function. That is, the  
119074 application is globally aware of which regions are locked and which are not over time. This  
119075 is in contrast to a function that is used temporarily within a “third party” library routine  
119076 whose function is unknown to the application, and therefore must have no “side-effects”.  
119077 The specified interfaces, therefore, do not support “lock stacking” or “lock nesting” within  
119078 a process. But, for pages that are shared between processes or mapped more than once  
119079 into a process address space, “lock stacking” is essentially mandated by the requirement  
119080 that unlocking of pages that are mapped by more than one process or more than once by  
119081 the same process does not affect locks established on the other mappings.

119082 There was some support for “lock stacking” so that locking could be transparently used in  
119083 functions or opaque modules. But the consensus was not to burden all implementations

119084 with lock stacking (and reference counting), and an implementation option was proposed.  
119085 There were strong objections to the option because applications would have to support  
119086 both options in order to remain portable. The consensus was to eliminate lock stacking  
119087 altogether, primarily through overwhelming support for the System V “m[un]lock[all]”  
119088 interface on which POSIX.1-2008 is now based.

119089 Locks are not inherited across *fork()*s because some implementations implement *fork()*  
119090 by creating new address spaces for the child. In such an implementation, requiring locks to be  
119091 inherited would lead to new situations in which a fork would fail due to the inability of  
119092 the system to lock sufficient memory to lock both the parent and the child. The consensus  
119093 was that there was no benefit to such inheritance. Note that this does not mean that locks  
119094 are removed when, for instance, a thread is created in the same address space.

119095 Similarly, locks are not inherited across *exec* because some implementations implement *exec*  
119096 by unmapping all of the pages in the address space (which, by definition, removes the  
119097 locks on these pages), and maps in pages of the *exec*'d image. In such an implementation,  
119098 requiring locks to be inherited would lead to new situations in which *exec* would fail.  
119099 Reporting this failure would be very cumbersome to detect in time to report to the calling  
119100 process, and no appropriate mechanism exists for informing the *exec*'d process of its status.

119101 It was determined that, if the newly loaded application required locking, it was the  
119102 responsibility of that application to establish the locks. This is also in keeping with the  
119103 general view that it is the responsibility of the application to be aware of all locks that are  
119104 established.

119105 There was one request to allow (not mandate) locks to be inherited across *fork()*, and a  
119106 request for a flag, *MCL\_INHERIT*, that would specify inheritance of memory locks across  
119107 *execs*. Given the difficulties raised by this and the general lack of support for the feature in  
119108 POSIX.1-2008, it was not added. POSIX.1-2008 does not preclude an implementation from  
119109 providing this feature for administrative purposes, such as a “run” command that will  
119110 lock down and execute a specified application. Additionally, the rationale for the objection  
119111 equated *fork()* with creating a thread in the address space. POSIX.1-2008 does not mandate  
119112 releasing locks when creating additional threads in an existing process.

119113 • Standardization Issues

119114 One goal of POSIX.1-2008 is to define a set of primitives that provide the necessary  
119115 functionality for realtime applications, with consideration for the needs of other  
119116 application domains where such were identified, which is based to the extent possible on  
119117 existing industry practice.

119118 The Memory Locking option is required by many realtime applications to tune  
119119 performance. Such a facility is accomplished by placing constraints on the virtual memory  
119120 system to limit paging of time of the process or of critical sections of the process. This  
119121 facility should not be used by most non-realtime applications.

119122 Optional features provided in POSIX.1-2008 allow applications to lock selected address  
119123 ranges with the caveat that the process is responsible for being aware of the page  
119124 granularity of locking and the unnested nature of the locks.

## 119125 Mapped Files Functions

119126 The memory mapped files functionality provides a mechanism that allows a process to access  
119127 files by directly incorporating file data into its address space. Once a file is “mapped” into a  
119128 process address space, the data can be manipulated by instructions as memory. The use of  
119129 mapped files can significantly reduce I/O data movement since file data does not have to be  
119130 copied into process data buffers as in *read()* and *write()*. If more than one process maps a file, its  
119131 contents are shared among them. This provides a low overhead mechanism by which processes  
119132 can synchronize and communicate.

- 119133 • Historical Perspective

119134 Realtime applications have historically been implemented using a collection of cooperating  
119135 processes or tasks. In early systems, these processes ran on bare hardware (that is, without  
119136 an operating system) with no memory relocation or protection. The application paradigms  
119137 that arose from this environment involve the sharing of data between the processes.

119138 When realtime systems were implemented on top of vendor-supplied operating systems,  
119139 the paradigm or performance benefits of direct access to data by multiple processes was  
119140 still deemed necessary. As a result, operating systems that claim to support realtime  
119141 applications must support the shared memory paradigm.

119142 Additionally, a number of realtime systems provide the ability to map specific sections of  
119143 the physical address space into the address space of a process. This ability is required if an  
119144 application is to obtain direct access to memory locations that have specific properties (for  
119145 example, refresh buffers or display devices, dual ported memory locations, DMA target  
119146 locations). The use of this ability is common enough to warrant some degree of  
119147 standardization of its interface. This ability overlaps the general paradigm of shared  
119148 memory in that, in both instances, common global objects are made addressable by  
119149 individual processes or tasks.

119150 Finally, a number of systems also provide the ability to map process addresses to files. This  
119151 provides both a general means of sharing persistent objects, and using files in a manner  
119152 that optimizes memory and swapping space usage.

119153 Simple shared memory is clearly a special case of the more general file mapping capability.  
119154 In addition, there is relatively widespread agreement and implementation of the file  
119155 mapping interface. In these systems, many different types of objects can be mapped (for  
119156 example, files, memory, devices, and so on) using the same mapping interfaces. This  
119157 approach both minimizes interface proliferation and maximizes the generality of programs  
119158 using the mapping interfaces.

- 119159 • Memory Mapped Files Usage

119160 A memory object can be concurrently mapped into the address space of one or more  
119161 processes. The *mmap()* and *munmap()* functions allow a process to manipulate their  
119162 address space by mapping portions of memory objects into it and removing them from it.  
119163 When multiple processes map the same memory object, they can share access to the  
119164 underlying data. Implementations may restrict the size and alignment of mappings to be  
119165 on *page*-size boundaries. The page size, in bytes, is the value of the system-configurable  
119166 variable {PAGESIZE}, typically accessed by calling *sysconf()* with a *name* argument of  
119167 *\_SC\_PAGESIZE*. If an implementation has no restrictions on size or alignment, it may  
119168 specify a 1-byte page size.

119169 To map memory, a process first opens a memory object. The *ftruncate()* function can be  
119170 used to contract or extend the size of the memory object even when the object is currently  
119171 mapped. If the memory object is extended, the contents of the extended areas are zeros.

119172 After opening a memory object, the application maps the object into its address space  
119173 using the *mmap()* function call. Once a mapping has been established, it remains mapped  
119174 until unmapped with *munmap()*, even if the memory object is closed. The *mprotect()*  
119175 function can be used to change the memory protections initially established by *mmap()*.

119176 A *close()* of the file descriptor, while invalidating the file descriptor itself, does not unmap  
119177 any mappings established for the memory object. The address space, including all mapped  
119178 regions, is inherited on *fork()*. The entire address space is unmapped on process  
119179 termination or by successful calls to any of the *exec* family of functions.

119180 The *msync()* function is used to force mapped file data to permanent storage.

119181 • Effects on Other Functions

119182 With memory mapped files, the operation of the *open()*, *creat()*, and *unlink()* functions are  
119183 a natural result of using the file system name space to map the global names for memory  
119184 objects.

119185 The *ftruncate()* function can be used to set the length of a sharable memory object.

119186 The meaning of *stat()* fields other than the size and protection information is undefined on  
119187 implementations where memory objects are not implemented using regular files. When  
119188 regular files are used, the times reflect when the implementation updated the file image of  
119189 the data, not when a process updated the data in memory.

119190 The operations of *fdopen()*, *write()*, *read()*, and *lseek()* were made unspecified for objects  
119191 opened with *shm\_open()*, so that implementations that did not implement memory objects  
119192 as regular files would not have to support the operation of these functions on shared  
119193 memory objects.

119194 The behavior of memory objects with respect to *close()*, *dup()*, *dup2()*, *open()*, *close()*,  
119195 *fork()*, *\_exit()*, and the *exec* family of functions is the same as the behavior of the existing  
119196 practice of the *mmap()* function.

119197 A memory object can still be referenced after a close. That is, any mappings made to the  
119198 file are still in effect, and reads and writes that are made to those mappings are still valid  
119199 and are shared with other processes that have the same mapping. Likewise, the memory  
119200 object can still be used if any references remain after its name(s) have been deleted. Any  
119201 references that remain after a close must not appear to the application as file descriptors.

119202 This is existing practice for *mmap()* and *close()*. In addition, there are already mappings  
119203 present (text, data, stack) that do not have open file descriptors. The text mapping in  
119204 particular is considered a reference to the file containing the text. The desire was to treat all  
119205 mappings by the process uniformly. Also, many modern implementations use *mmap()* to  
119206 implement shared libraries, and it would not be desirable to keep file descriptors for each  
119207 of the many libraries an application can use. It was felt there were many other existing  
119208 programs that used this behavior to free a file descriptor, and thus POSIX.1-2008 could not  
119209 forbid it and still claim to be using existing practice.

119210 For implementations that implement memory objects using memory only, memory objects  
119211 will retain the memory allocated to the file after the last close and will use that same  
119212 memory on the next open. Note that closing the memory object is not the same as deleting  
119213 the name, since the memory object is still defined in the memory object name space.

119214 The locks of *fcntl()* do not block any read or write operation, including read or write access  
119215 to shared memory or mapped files. In addition, implementations that only support shared  
119216 memory objects should not be required to implement record locks. The reference to *fcntl()*  
119217 is added to make this point explicitly. The other *fcntl()* commands are useful with shared  
119218 memory objects.

119219 The size of pages that mapping hardware may be able to support may be a configurable  
119220 value, or it may change based on hardware implementations. The addition of the  
119221 `_SC_PAGESIZE` parameter to the `sysconf()` function is provided for determining the  
119222 mapping page size at runtime.

### 119223 Shared Memory Functions

119224 Implementations may support the Shared Memory Objects option independently of memory  
119225 mapped files. Shared memory objects are named regions of storage that may be independent of  
119226 the file system and can be mapped into the address space of one or more processes to allow  
119227 them to share the associated memory.

- 119228 • Requirements

119229 Shared memory is used to share data among several processes, each potentially running at  
119230 different priority levels, responding to different inputs, or performing separate tasks.  
119231 Shared memory is not just simply providing common access to data, it is providing the  
119232 fastest possible communication between the processes. With one memory write operation,  
119233 a process can pass information to as many processes as have the memory region mapped.

119234 As a result, shared memory provides a mechanism that can be used for all other  
119235 interprocess communication facilities. It may also be used by an application for  
119236 implementing more sophisticated mechanisms than semaphores and message queues.

119237 The need for a shared memory interface is obvious for virtual memory systems, where the  
119238 operating system is directly preventing processes from accessing each other's data.  
119239 However, in unprotected systems, such as those found in some embedded controllers, a  
119240 shared memory interface is needed to provide a portable mechanism to allocate a region of  
119241 memory to be shared and then to communicate the address of that region to other  
119242 processes.

119243 This, then, provides the minimum functionality that a shared memory interface must have  
119244 in order to support realtime applications: to allocate and name an object to be mapped into  
119245 memory for potential sharing (`open()` or `shm_open()`), and to make the memory object  
119246 available within the address space of a process (`mmap()`). To complete the interface, a  
119247 mechanism to release the claim of a process on a shared memory object (`munmap()`) is also  
119248 needed, as well as a mechanism for deleting the name of a sharable object that was  
119249 previously created (`unlink()` or `shm_unlink()`).

119250 After a mapping has been established, an implementation should not have to provide  
119251 services to maintain that mapping. All memory writes into that area will appear  
119252 immediately in the memory mapping of that region by any other processes.

119253 Thus, requirements include:

- 119254 — Support creation of sharable memory objects and the mapping of these objects into  
119255 the address space of a process.

- 119256 — Sharable memory objects should be accessed by global names accessible from all  
119257 processes.

- 119258 — Support the mapping of specific sections of physical address space (such as a  
119259 memory mapped device) into the address space of a process. This should not be  
119260 done by the process specifying the actual address, but again by an implementation-  
119261 defined global name (such as a special device name) dedicated to this purpose.

- 119262 — Support the mapping of discrete portions of these memory objects.

- 119263 — Support for minimum hardware configurations that contain no physical media on
- 119264 which to store shared memory contents permanently.
- 119265 — The ability to preallocate the entire shared memory region so that minimum
- 119266 hardware configurations without virtual memory support can guarantee contiguous
- 119267 space.
- 119268 — The maximizing of performance by not requiring functionality that would require
- 119269 implementation interaction above creating the shared memory area and returning
- 119270 the mapping.

119271 Note that the above requirements do not preclude:

- 119272 — The sharable memory object from being implemented using actual files on an actual
- 119273 file system.
- 119274 — The global name that is accessible from all processes being restricted to a file system
- 119275 area that is dedicated to handling shared memory.
- 119276 — An implementation not providing implementation-defined global names for the
- 119277 purpose of physical address mapping.

#### 119278 • Shared Memory Objects Usage

119279 If the Shared Memory Objects option is supported, a shared memory object may be  
 119280 created, or opened if it already exists, with the *shm\_open()* function. If the shared memory  
 119281 object is created, it has a length of zero. The *ftruncate()* function can be used to set the size  
 119282 of the shared memory object after creation. The *shm\_unlink()* function removes the name  
 119283 for a shared memory object created by *shm\_open()*.

#### 119284 • Shared Memory Overview

119285 The shared memory facility defined by POSIX.1-2008 usually results in memory locations  
 119286 being added to the address space of the process. The implementation returns the address  
 119287 of the new space to the application by means of a pointer. This works well in languages  
 119288 like C. However, in languages without pointer types it will not work. In the bindings for  
 119289 such a language, either a special COMMON section will need to be defined (which is  
 119290 unlikely), or the binding will have to allow existing structures to be mapped. The  
 119291 implementation will likely have to place restrictions on the size and alignment of such  
 119292 structures or will have to map a suitable region of the address space of the process into the  
 119293 memory object, and thus into other processes. These are issues for that particular language  
 119294 binding. For POSIX.1-2008, however, the practice will not be forbidden, merely undefined.

119295 Two potentially different name spaces are used for naming objects that may be mapped  
 119296 into process address spaces. When using memory mapped files, files may be accessed via  
 119297 *open()*. When the Shared Memory Objects option is supported, sharable memory objects  
 119298 that might not be files may be accessed via the *shm\_open()* function. These operations are  
 119299 not mutually-exclusive.

119300 Some implementations supporting the Shared Memory Objects option may choose to  
 119301 implement the shared memory object name space as part of the file system name space.  
 119302 There are several reasons for this:

- 119303 — It allows applications to prevent name conflicts by use of the directory structure.
- 119304 — It uses an existing mechanism for accessing global objects and prevents the creation
- 119305 of a new mechanism for naming global objects.

119306 In such implementations, memory objects can be implemented using regular files, if that is  
 119307 what the implementation chooses. The *shm\_open()* function can be implemented as an

119308 *open()* call in a fixed directory with the `O_CLOEXEC` flag set. The *shm\_unlink()* function  
119309 can be implemented as an *unlink()* call.

119310 On the other hand, it is also expected that small embedded systems that support the  
119311 Shared Memory Objects option may wish to implement shared memory without having  
119312 any file systems present. In this case, the implementations may choose to use a simple  
119313 string valued name space for shared memory regions. The *shm\_open()* function permits  
119314 either type of implementation.

119315 Some implementations have hardware that supports protection of mapped data from  
119316 certain classes of access and some do not. Systems that supply this functionality support  
119317 the memory protection functionality.

119318 Some implementations restrict size, alignment, and protections to be on *page-size*  
119319 boundaries. If an implementation has no restrictions on size or alignment, it may specify a  
119320 1-byte page size. Applications on implementations that do support larger pages must be  
119321 cognizant of the page size since this is the alignment and protection boundary.

119322 Simple embedded implementations may have a 1-byte page size and only support the  
119323 Shared Memory Objects option. This provides simple shared memory between processes  
119324 without requiring mapping hardware.

119325 POSIX.1-2008 specifically allows a memory object to remain referenced after a close  
119326 because that is existing practice for the *mmap()* function.

### 119327 **Typed Memory Functions**

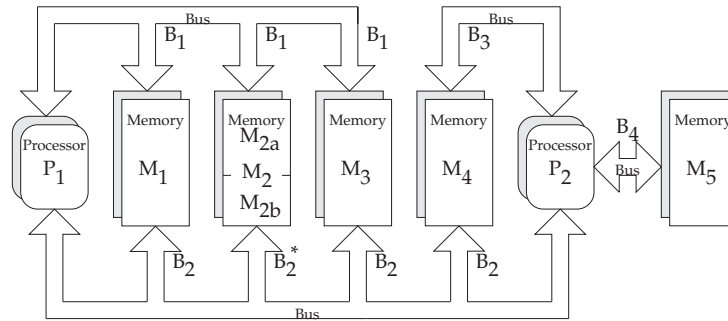

119328 Implementations may support the Typed Memory Objects option without supporting either the  
119329 Shared Memory option or memory mapped files. Types memory objects are pools of specialized  
119330 storage, different from the main memory resource normally used by a processor to hold code  
119331 and data, that can be mapped into the address space of one or more processes.

- 119332 • Model

119333 Realtime systems conforming to one of the POSIX.13 realtime profiles are expected (and  
119334 desired) to be supported on systems with more than one type or pool of memory (for  
119335 example, SRAM, DRAM, ROM, EPROM, EEPROM), where each type or pool of memory  
119336 may be accessible by one or more processors via one or more buses (ports). Memory  
119337 mapped files, shared memory objects, and the language-specific storage allocation  
119338 operators (*malloc()* for the ISO C standard, *new* for ISO Ada) fail to provide application  
119339 program interfaces versatile enough to allow applications to control their utilization of  
119340 such diverse memory resources. The typed memory interfaces *posix\_typed\_mem\_open()*,  
119341 *posix\_mem\_offset()*, *posix\_typed\_mem\_get\_info()*, *mmap()*, and *munmap()* defined herein  
119342 support the model of typed memory described below.

119343 For purposes of this model, a system comprises several processors (for example,  $P_1$  and  
119344  $P_2$ ), several physical memory pools (for example,  $M_1$ ,  $M_2$ ,  $M_{2a}$ ,  $M_{2b}$ ,  $M_3$ ,  $M_4$ , and  $M_5$ ), and  
119345 several buses or “ports” (for example,  $B_1$ ,  $B_2$ ,  $B_3$ , and  $B_4$ ) interconnecting the various  
119346 processors and memory pools in some system-specific way. Notice that some memory  
119347 pools may be contained in others (for example,  $M_{2a}$  and  $M_{2b}$  are contained in  $M_2$ ).

119348 **Figure B-1** (on page 3537) shows an example of such a model. In a system like this, an  
119349 application should be able to perform the following operations:

\* All addresses in pool M<sub>2</sub> (comprising pools M<sub>2a</sub> and M<sub>2b</sub>) accessible via port B<sub>1</sub>.  
 Addresses in pool M<sub>2b</sub> are also accessible via port B<sub>2</sub>.  
 Addresses in pool M<sub>2a</sub> are *not* accessible via port B<sub>2</sub>.

119350 **Figure B-1** Example of a System with Typed Memory

119351 — Typed Memory Allocation

119352 An application should be able to allocate memory dynamically from the desired pool  
 119353 using the desired bus, and map it into the address space of a process. For example,  
 119354 processor P<sub>1</sub> can allocate some portion of memory pool M<sub>1</sub> through port B<sub>1</sub>, treating  
 119355 all unmapped subareas of M<sub>1</sub> as a heap-storage resource from which memory may be  
 119356 allocated. This portion of memory is mapped into address space of the process, and  
 119357 subsequently deallocated when unmapped from all processes.

119358 — Using the Same Storage Region from Different Buses

119359 An application process with a mapped region of storage that is accessed from one  
 119360 bus should be able to map that same storage area at another address (subject to page  
 119361 size restrictions detailed in *mmap()*), to allow it to be accessed from another bus. For  
 119362 example, processor P<sub>1</sub> may wish to access the same region of memory pool M<sub>2b</sub> both  
 119363 through ports B<sub>1</sub> and B<sub>2</sub>.

119364 — Sharing Typed Memory Regions

119365 Several application processes running on the same or different processors may wish  
 119366 to share a particular region of a typed memory pool. Each process or processor may  
 119367 wish to access this region through different buses. For example, processor P<sub>1</sub> may  
 119368 want to share a region of memory pool M<sub>4</sub> with processor P<sub>2</sub>, and they may be  
 119369 required to use buses B<sub>2</sub> and B<sub>3</sub>, respectively, to minimize bus contention. A problem  
 119370 arises here when a process allocates and maps a portion of fragmented memory and  
 119371 then wants to share this region of memory with another process, either in the same  
 119372 processor or different processors. The solution adopted is to allow the first process to  
 119373 find out the memory map (offsets and lengths) of all the different fragments of  
 119374 memory that were mapped into its address space, by repeatedly calling  
 119375 *posix\_mem\_offset()*. Then, this process can pass the offsets and lengths obtained to  
 119376 the second process, which can then map the same memory fragments into its address  
 119377 space.

119378 — Contiguous Allocation

119379 The problem of finding the memory map of the different fragments of the memory  
 119380 pool that were mapped into logically contiguous addresses of a given process can be

119381 solved by requesting contiguous allocation. For example, a process in  $P_1$  can allocate  
 119382 10 Kbytes of physically contiguous memory from  $M_3-B_1$ , and obtain the offset (within  
 119383 pool  $M_3$ ) of this block of memory. Then, it can pass this offset (and the length) to a  
 119384 process in  $P_2$  using some interprocess communication mechanism. The second  
 119385 process can map the same block of memory by using the offset transferred and  
 119386 specifying  $M_3-B_2$ .

119387 — Unallocated Mapping

119388 Any subarea of a memory pool that is mapped to a process, either as the result of an  
 119389 allocation request or an explicit mapping, is normally unavailable for allocation.  
 119390 Special processes such as debuggers, however, may need to map large areas of a  
 119391 typed memory pool, yet leave those areas available for allocation.

119392 Typed memory allocation and mapping has to coexist with storage allocation operators  
 119393 like *malloc()*, but systems are free to choose how to implement this coexistence. For  
 119394 example, it may be system configuration-dependent if all available system memory is  
 119395 made part of one of the typed memory pools or if some part will be restricted to  
 119396 conventional allocation operators. Equally system configuration-dependent may be the  
 119397 availability of operators like *malloc()* to allocate storage from certain typed memory pools.  
 119398 It is not excluded to configure a system such that a given named pool,  $P_1$ , is in turn split  
 119399 into non-overlapping named subpools. For example,  $M_1-B_1$ ,  $M_2-B_1$ , and  $M_3-B_1$  could also be  
 119400 accessed as one common pool  $M_{123}-B_1$ . A call to *malloc()* on  $P_1$  could work on such a larger  
 119401 pool while full optimization of memory usage by  $P_1$  would require typed memory  
 119402 allocation at the subpool level.

119403 • Existing Practice

119404 OS-9 provides for the naming (numbering) and prioritization of memory types by a system  
 119405 administrator. It then provides APIs to request memory allocation of typed (colored)  
 119406 memory by number, and to generate a bus address from a mapped memory address  
 119407 (translate). When requesting colored memory, the user can specify type 0 to signify  
 119408 allocation from the first available type in priority order.

119409 HP-RT presents interfaces to map different kinds of storage regions that are visible through  
 119410 a VME bus, although it does not provide allocation operations. It also provides functions  
 119411 to perform address translation between VME addresses and virtual addresses. It represents  
 119412 a VME-bus unique solution to the general problem.

119413 The PSOS approach is similar (that is, based on a pre-established mapping of bus address  
 119414 ranges to specific memories) with a concept of segments and regions (regions dynamically  
 119415 allocated from a heap which is a special segment). Therefore, PSOS does not fully address  
 119416 the general allocation problem either. PSOS does not have a “process”-based model, but  
 119417 more of a “thread”-only-based model of multi-tasking. So mapping to a process address  
 119418 space is not an issue.

119419 QNX uses the System V approach of opening specially named devices (shared memory  
 119420 segments) and using *mmap()* to then gain access from the process. They do not address  
 119421 allocation directly, but once typed shared memory can be mapped, an “allocation  
 119422 manager” process could be written to handle requests for allocation.

119423 The System V approach also included allocation, implemented by opening yet other  
 119424 special “devices” which allocate, rather than appearing as a whole memory object.

119425 The Orkid realtime kernel interface definition has operations to manage memory “regions”  
 119426 and “pools”, which are areas of memory that may reflect the differing physical nature of  
 119427 the memory. Operations to allocate memory from these regions and pools are also  
 119428 provided.

- 119429 • Requirements
- 119430 Existing practice in SVID-derived UNIX systems relies on functionality similar to *mmap()*
- 119431 and its related interfaces to achieve mapping and allocation of typed memory. However,
- 119432 the issue of sharing typed memory (allocated or mapped) and the complication of multiple
- 119433 ports are not addressed in any consistent way by existing UNIX system practice. Part of
- 119434 this functionality is existing practice in specialized realtime operating systems. In order to
- 119435 solidify the capabilities implied by the model above, the following requirements are
- 119436 imposed on the interface:
  - 119437 — Identification of Typed Memory Pools and Ports
  - 119438 All processes (running in all processors) in the system are able to identify a particular
  - 119439 (system configured) typed memory pool accessed through a particular (system
  - 119440 configured) port by a name. That name is a member of a name space common to all
  - 119441 these processes, but need not be the same name space as that containing ordinary
  - 119442 filenames. The association between memory pools/ports and corresponding names
  - 119443 is typically established when the system is configured. The “open” operation for
  - 119444 typed memory objects should be distinct from the *open()* function, for consistency
  - 119445 with other similar services, but implementable on top of *open()*. This implies that the
  - 119446 handle for a typed memory object will be a file descriptor.
  - 119447 — Allocation and Mapping of Typed Memory
  - 119448 Once a typed memory object has been identified by a process, it is possible to both
  - 119449 map user-selected subareas of that object into process address space and to map
  - 119450 system-selected (that is, dynamically allocated) subareas of that object, with user-
  - 119451 specified length, into process address space. It is also possible to determine the
  - 119452 maximum length of memory allocation that may be requested from a given typed
  - 119453 memory object.
  - 119454 — Sharing Typed Memory
  - 119455 Two or more processes are able to share portions of typed memory, either user-
  - 119456 selected or dynamically allocated. This requirement applies also to dynamically
  - 119457 allocated regions of memory that are composed of several non-contiguous pieces.
  - 119458 — Contiguous Allocation
  - 119459 For dynamic allocation, it is the user’s option whether the system is required to
  - 119460 allocate a contiguous subarea within the typed memory object, or whether it is
  - 119461 permitted to allocate discontinuous fragments which appear contiguous in the
  - 119462 process mapping. Contiguous allocation simplifies the process of sharing allocated
  - 119463 typed memory, while discontinuous allocation allows for potentially better recovery
  - 119464 of deallocated typed memory.
  - 119465 — Accessing Typed Memory Through Different Ports
  - 119466 Once a subarea of a typed memory object has been mapped, it is possible to
  - 119467 determine the location and length corresponding to a user-selected portion of that
  - 119468 object within the memory pool. This location and length can then be used to remap
  - 119469 that portion of memory for access from another port. If the referenced portion of
  - 119470 typed memory was allocated discontinuously, the length thus determined may be
  - 119471 shorter than anticipated, and the user code must adapt to the value returned.
  - 119472 — Deallocation
  - 119473 When a previously mapped subarea of typed memory is no longer mapped by any
  - 119474 process in the system—as a result of a call or calls to *munmap()*—that subarea

119475 becomes potentially reusable for dynamic allocation; actual reuse of the subarea is a  
119476 function of the dynamic typed memory allocation policy.

119477 — Unallocated Mapping

119478 It must be possible to map user-selected subareas of a typed memory object without  
119479 marking that subarea as unavailable for allocation. This option is not the default  
119480 behavior, and requires appropriate privileges.

119481 • Scenario

119482 The following scenario will serve to clarify the use of the typed memory interfaces.

119483 Process A running on  $P_1$  (see Figure B-1, on page 3537) wants to allocate some memory  
119484 from memory pool  $M_2'$ , and it wants to share this portion of memory with process B  
119485 running on  $P_2$ . Since  $P_2$  only has access to the lower part of  $M_2'$ , both processes will use the  
119486 memory pool named  $M_{2b}$  which is the part of  $M_2$  that is accessible both from  $P_1$  and  $P_2$ . The  
119487 operations that both processes need to perform are shown below:

119488 — Allocating Typed Memory

119489 Process A calls `posix_typed_mem_open()` with the name `/typed.m2b-b1` and a `tflag` of  
119490 `POSIX_TYPED_MEM_ALLOCATE` to get a file descriptor usable for allocating from  
119491 pool  $M_{2b}$  accessed through port  $B_1$ . It then calls `mmap()` with this file descriptor  
119492 requesting a length of 4096 bytes. The system allocates two discontinuous blocks of  
119493 sizes 1024 and 3072 bytes within  $M_{2b}$ . The `mmap()` function returns a pointer to a  
119494 4096-byte array in process A's logical address space, mapping the allocated blocks  
119495 contiguously. Process A can then utilize the array, and store data in it.

119496 — Determining the Location of the Allocated Blocks

119497 Process A can determine the lengths and offsets (relative to  $M_{2b}$ ) of the two blocks  
119498 allocated, by using the following procedure: First, process A calls `posix_mem_offset()`  
119499 with the address of the first element of the array and length 4096. Upon return, the  
119500 offset and length (1024 bytes) of the first block are returned. A second call to  
119501 `posix_mem_offset()` is then made using the address of the first element of the array  
119502 plus 1024 (the length of the first block), and a new length of 4096–1024. If there were  
119503 more fragments allocated, this procedure could have been continued within a loop  
119504 until the offsets and lengths of all the blocks were obtained. Notice that this relatively  
119505 complex procedure can be avoided if contiguous allocation is requested (by opening  
119506 the typed memory object with the `tflag`  
119507 `POSIX_TYPED_MEM_ALLOCATE_CONTIG`).

119508 — Sharing Data Across Processes

119509 Process A passes the two offset values and lengths obtained from the  
119510 `posix_mem_offset()` calls to process B running on  $P_2$ , via some form of interprocess  
119511 communication. Process B can gain access to process A's data by calling  
119512 `posix_typed_mem_open()` with the name `/typed.m2b-b2` and a `tflag` of zero, then using  
119513 two `mmap()` calls on the resulting file descriptor to map the two subareas of that  
119514 typed memory object to its own address space.

119515 • Rationale for no `mem_alloc()` and `mem_free()`

119516 The standard developers had originally proposed a pair of new flags to `mmap()` which,  
119517 when applied to a typed memory object descriptor, would cause `mmap()` to allocate  
119518 dynamically from an unallocated and unmapped area of the typed memory object.  
119519 Deallocation was similarly accomplished through the use of `munmap()`. This was rejected  
119520 by the ballot group because it excessively complicated the (already rather complex)

119521 *mmap()* interface and introduced semantics useful only for typed memory, to a function  
 119522 which must also map shared memory and files. They felt that a memory allocator should  
 119523 be built on top of *mmap()* instead of being incorporated within the same interface, much as  
 119524 the ISO C standard libraries build *malloc()* on top of the virtual memory mapping  
 119525 functions *brk()* and *sbrk()*. This would eliminate the complicated semantics involved with  
 119526 unmapping only part of an allocated block of typed memory.

119527 To attempt to achieve ballot group consensus, typed memory allocation and deallocation  
 119528 was first migrated from *mmap()* and *munmap()* to a pair of complementary functions  
 119529 modeled on the ISO C standard *malloc()* and *free()*. The *mem\_alloc()* function specified  
 119530 explicitly the typed memory object (typed memory pool/access port) from which  
 119531 allocation takes place, unlike *malloc()* where the memory pool and port are unspecified.  
 119532 The *mem\_free()* function handled deallocation. These new semantics still met all of the  
 119533 requirements detailed above without modifying the behavior of *mmap()* except to allow it  
 119534 to map specified areas of typed memory objects. An implementation would have been free  
 119535 to implement *mem\_alloc()* and *mem\_free()* over *mmap()*, through *mmap()*, or independently  
 119536 but cooperating with *mmap()*.

119537 The ballot group was queried to see if this was an acceptable alternative, and while there  
 119538 was some agreement that it achieved the goal of removing the complicated semantics of  
 119539 allocation from the *mmap()* interface, several balloters realized that it just created two  
 119540 additional functions that behaved, in great part, like *mmap()*. These balloters proposed an  
 119541 alternative which has been implemented here in place of a separate *mem\_alloc()* and  
 119542 *mem\_free()*. This alternative is based on four specific suggestions:

- 119543 1. The *posix\_typed\_mem\_open()* function should provide a flag which specifies  
 119544 "allocate on *mmap()*" (otherwise, *mmap()* just maps the underlying object). This  
 119545 allows things roughly similar to */dev/zero* versus */dev/swap*. Two such flags have  
 119546 been implemented, one of which forces contiguous allocation.
- 119547 2. The *posix\_mem\_offset()* function is acceptable because it can be applied usefully to  
 119548 mapped objects in general. It should return the file descriptor of the underlying  
 119549 object.
- 119550 3. The *mem\_get\_info()* function in an earlier draft should be renamed  
 119551 *posix\_typed\_mem\_get\_info()* because it is not generally applicable to memory objects.  
 119552 It should probably return the file descriptor's allocation attribute. The renaming of  
 119553 the function has been implemented, but having it return a piece of information  
 119554 which is readily known by an application without this function has been rejected.  
 119555 Its whole purpose is to query the typed memory object for attributes that are not  
 119556 user-specified, but determined by the implementation.
- 119557 4. There should be no separate *mem\_alloc()* or *mem\_free()* functions. Instead, using  
 119558 *mmap()* on a typed memory object opened with an "allocate on *mmap()*" flag  
 119559 should be used to force allocation. These are precisely the semantics defined in the  
 119560 current draft.

119561 • Rationale for no Typed Memory Access Management

119562 The working group had originally defined an additional interface (and an additional kind  
 119563 of object: typed memory master) to establish and dissolve mappings to typed memory on  
 119564 behalf of devices or processors which were independent of the operating system and had  
 119565 no inherent capability to directly establish mappings on their own. This was to have  
 119566 provided functionality similar to device driver interfaces such as *physio()* and their  
 119567 underlying bus-specific interfaces (for example, *mballoc()*) which serve to set up and break  
 119568 down DMA pathways, and derive mapped addresses for use by hardware devices and  
 119569 processor cards.

119570 The ballot group felt that this was beyond the scope of POSIX.1 and its amendments.  
 119571 Furthermore, the removal of interrupt handling interfaces from a preceding amendment  
 119572 (the IEEE Std 1003.1d-1999) during its balloting process renders these typed memory  
 119573 access management interfaces an incomplete solution to portable device management from  
 119574 a user process; it would be possible to initiate a device transfer to/from typed memory, but  
 119575 impossible to handle the transfer-complete interrupt in a portable way.

119576 To achieve ballot group consensus, all references to typed memory access management  
 119577 capabilities were removed. The concept of portable interfaces from a device driver to both  
 119578 operating system and hardware is being addressed by the Uniform Driver Interface (UDI)  
 119579 industry forum, with formal standardization deferred until proof of concept and industry-  
 119580 wide acceptance and implementation.

#### 119581 B.2.8.4 Process Scheduling

119582 IEEE PASC Interpretation 1003.1 #96 has been applied, adding the `pthread_setschedprio()`  
 119583 function. This was added since previously there was no way for a thread to lower its own  
 119584 priority without going to the tail of the threads list for its new priority. This capability is  
 119585 necessary to bound the duration of priority inversion encountered by a thread.

119586 The following portion of the rationale presents models, requirements, and standardization  
 119587 issues relevant to process scheduling; see also [Section B.2.9.4](#) (on page 3582).

119588 In an operating system supporting multiple concurrent processes, the system determines the  
 119589 order in which processes execute to meet implementation-defined goals. For time-sharing  
 119590 systems, the goal is to enhance system throughput and promote fairness; the application is  
 119591 provided with little or no control over this sequencing function. While this is acceptable and  
 119592 desirable behavior in a time-sharing system, it is inappropriate in a realtime system; realtime  
 119593 applications must specifically control the execution sequence of their concurrent processes in  
 119594 order to meet externally defined response requirements.

119595 In POSIX.1-2008, the control over process sequencing is provided using a concept of scheduling  
 119596 policies. These policies, described in detail in this section, define the behavior of the system  
 119597 whenever processor resources are to be allocated to competing processes. Only the behavior of  
 119598 the policy is defined; conforming implementations are free to use any mechanism desired to  
 119599 achieve the described behavior.

- 119600 • Models

119601 In an operating system supporting multiple concurrent processes, the system determines  
 119602 the order in which processes execute and might force long-running processes to yield to  
 119603 other processes at certain intervals. Typically, the scheduling code is executed whenever an  
 119604 event occurs that might alter the process to be executed next.

119605 The simplest scheduling strategy is a “first-in, first-out” (FIFO) dispatcher. Whenever a  
 119606 process becomes runnable, it is placed on the end of a ready list. The process at the front of  
 119607 the ready list is executed until it exits or becomes blocked, at which point it is removed  
 119608 from the list. This scheduling technique is also known as “run-to-completion” or “run-to-  
 119609 block”.

119610 A natural extension to this scheduling technique is the assignment of a “non-migrating  
 119611 priority” to each process. This policy differs from strict FIFO scheduling in only one  
 119612 respect: whenever a process becomes runnable, it is placed at the end of the list of  
 119613 processes runnable at that priority level. When selecting a process to run, the system  
 119614 always selects the first process from the highest priority queue with a runnable process.  
 119615 Thus, when a process becomes unblocked, it will preempt a running process of lower  
 119616 priority without otherwise altering the ready list. Further, if a process elects to alter its

- 119617 priority, it is removed from the ready list and reinserted, using its new priority, according  
119618 to the policy above.
- 119619 While the above policy might be considered unfriendly in a time-sharing environment in  
119620 which multiple users require more balanced resource allocation, it could be ideal in a  
119621 realtime environment for several reasons. The most important of these is that it is  
119622 deterministic: the highest-priority process is always run and, among processes of equal  
119623 priority, the process that has been runnable for the longest time is executed first. Because of  
119624 this determinism, cooperating processes can implement more complex scheduling simply  
119625 by altering their priority. For instance, if processes at a single priority were to reschedule  
119626 themselves at fixed time intervals, a time-slice policy would result.
- 119627 In a dedicated operating system in which all processes are well-behaved realtime  
119628 applications, non-migrating priority scheduling is sufficient. However, many existing  
119629 implementations provide for more complex scheduling policies.
- 119630 POSIX.1-2008 specifies a linear scheduling model. In this model, every process in the  
119631 system has a priority. The system scheduler always dispatches a process that has the  
119632 highest (generally the most time-critical) priority among all runnable processes in the  
119633 system. As long as there is only one such process, the dispatching policy is trivial. When  
119634 multiple processes of equal priority are eligible to run, they are ordered according to a  
119635 strict run-to-completion (FIFO) policy.
- 119636 The priority is represented as a positive integer and is inherited from the parent process.  
119637 For processes running under a fixed priority scheduling policy, the priority is never altered  
119638 except by an explicit function call.
- 119639 It was determined arbitrarily that larger integers correspond to “higher priorities”.
- 119640 Certain implementations might impose restrictions on the priority ranges to which  
119641 processes can be assigned. There also can be restrictions on the set of policies to which  
119642 processes can be set.
- 119643 • Requirements
- 119644 Realtime processes require that scheduling be fast and deterministic, and that it guarantees  
119645 to preempt lower priority processes.
- 119646 Thus, given the linear scheduling model, realtime processes require that they be run at a  
119647 priority that is higher than other processes. Within this framework, realtime processes are  
119648 free to yield execution resources to each other in a completely portable and  
119649 implementation-defined manner.
- 119650 As there is a generally perceived requirement for processes at the same priority level to  
119651 share processor resources more equitably, provisions are made by providing a scheduling  
119652 policy (that is, SCHED\_RR) intended to provide a timeslice-like facility.
- 119653 **Note:** The following topics assume that low numeric priority implies low scheduling criticality  
119654 and *vice versa*.
- 119655 • Rationale for New Interface
- 119656 Realtime applications need to be able to determine when processes will run in relation to  
119657 each other. It must be possible to guarantee that a critical process will run whenever it is  
119658 runnable; that is, whenever it wants to for as long as it needs. SCHED\_FIFO satisfies this  
119659 requirement. Additionally, SCHED\_RR was defined to meet a realtime requirement for a  
119660 well-defined time-sharing policy for processes at the same priority.
- 119661 It would be possible to use the BSD *setpriority()* and *getpriority()* functions by redefining  
119662 the meaning of the “nice” parameter according to the scheduling policy currently in use by

119663 the process. The System V *nice()* interface was felt to be undesirable for realtime because it  
 119664 specifies an adjustment to the “nice” value, rather than setting it to an explicit value.  
 119665 Realtime applications will usually want to set priority to an explicit value. Also, System V  
 119666 *nice()* does not allow for changing the priority of another process.

119667 With the POSIX.1b interfaces, the traditional “nice” value does not affect the SCHED\_FIFO  
 119668 or SCHED\_RR scheduling policies. If a “nice” value is supported, it is implementation-  
 119669 defined whether it affects the SCHED\_OTHER policy.

119670 An important aspect of POSIX.1-2008 is the explicit description of the queuing and  
 119671 preemption rules. It is critical, to achieve deterministic scheduling, that such rules be  
 119672 stated clearly in POSIX.1-2008.

119673 POSIX.1-2008 does not address the interaction between priority and swapping. The issues  
 119674 involved with swapping and virtual memory paging are extremely implementation-  
 119675 defined and would be nearly impossible to standardize at this point. The proposed  
 119676 scheduling paradigm, however, fully describes the scheduling behavior of runnable  
 119677 processes, of which one criterion is that the working set be resident in memory. Assuming  
 119678 the existence of a portable interface for locking portions of a process in memory, paging  
 119679 behavior need not affect the scheduling of realtime processes.

119680 POSIX.1-2008 also does not address the priorities of “system” processes. In general, these  
 119681 processes should always execute in low-priority ranges to avoid conflict with other  
 119682 realtime processes. Implementations should document the priority ranges in which system  
 119683 processes run.

119684 The default scheduling policy is not defined. The effect of I/O interrupts and other system  
 119685 processing activities is not defined. The temporary lending of priority from one process to  
 119686 another (such as for the purposes of affecting freeing resources) by the system is not  
 119687 addressed. Preemption of resources is not addressed. Restrictions on the ability of a  
 119688 process to affect other processes beyond a certain level (influence levels) is not addressed.

119689 The rationale used to justify the simple time-quantum scheduler is that it is common  
 119690 practice to depend upon this type of scheduling to ensure “fair” distribution of processor  
 119691 resources among portions of the application that must interoperate in a serial fashion. Note  
 119692 that POSIX.1-2008 is silent with respect to the setting of this time quantum, or whether it is  
 119693 a system-wide value or a per-process value, although it appears that the prevailing  
 119694 realtime practice is for it to be a system-wide value.

119695 In a system with  $N$  processes at a given priority, all processor-bound, in which the time  
 119696 quantum is equal for all processes at a specific priority level, the following assumptions  
 119697 are made of such a scheduling policy:

- 119698 1. A time quantum  $Q$  exists and the current process will own control of the processor  
 119699 for at least a duration of  $Q$  and will have the processor for a duration of  $Q$ .
- 119700 2. The  $N$ th process at that priority will control a processor within a duration of  $(N-1)$   
 119701  $\times Q$ .

119702 These assumptions are necessary to provide equal access to the processor and bounded  
 119703 response from the application.

119704 The assumptions hold for the described scheduling policy only if no system overhead,  
 119705 such as interrupt servicing, is present. If the interrupt servicing load is non-zero, then one  
 119706 of the two assumptions becomes fallacious, based upon how  $Q$  is measured by the system.

119707 If  $Q$  is measured by clock time, then the assumption that the process obtains a duration  $Q$   
 119708 processor time is false if interrupt overhead exists. Indeed, a scenario can be constructed  
 119709 with  $N$  processes in which a single process undergoes complete processor starvation if a

119710 peripheral device, such as an analog-to-digital converter, generates significant interrupt  
119711 activity periodically with a period of  $N \times Q$ .

119712 If  $Q$  is measured as actual processor time, then the assumption that the  $N$ th process runs in  
119713 within the duration  $(N-1) \times Q$  is false.

119714 It should be noted that SCHED\_FIFO suffers from interrupt-based delay as well. However,  
119715 for SCHED\_FIFO, the implied response of the system is “as soon as possible”, so that the  
119716 interrupt load for this case is a vendor selection and not a compliance issue.

119717 With this in mind, it is necessary either to complete the definition by including bounds on  
119718 the interrupt load, or to modify the assumptions that can be made about the scheduling  
119719 policy.

119720 Since the motivation of inclusion of the policy is common usage, and since current  
119721 applications do not enjoy the luxury of bounded interrupt load, item (2) above is sufficient  
119722 to express existing application needs and is less restrictive in the standard definition. No  
119723 difference in interface is necessary.

119724 In an implementation in which the time quantum is equal for all processes at a specific  
119725 priority, our assumptions can then be restated as:

119726 — A time quantum  $Q$  exists, and a processor-bound process will be rescheduled after a  
119727 duration of, at most,  $Q$ . Time quantum  $Q$  may be defined in either wall clock time or  
119728 execution time.

119729 — In general, the  $N$ th process of a priority level should wait no longer than  $(N-1) \times Q$   
119730 time to execute, assuming no processes exist at higher priority levels.

119731 — No process should wait indefinitely.

119732 For implementations supporting per-process time quanta, these assumptions can be  
119733 readily extended.

### 119734 **Sporadic Server Scheduling Policy**

119735 The sporadic server is a mechanism defined for scheduling aperiodic activities in time-critical  
119736 realtime systems. This mechanism reserves a certain bounded amount of execution capacity for  
119737 processing aperiodic events at a high priority level. Any aperiodic events that cannot be  
119738 processed within the bounded amount of execution capacity are executed in the background at a  
119739 low priority level. Thus, a certain amount of execution capacity can be guaranteed to be  
119740 available for processing periodic tasks, even under burst conditions in the arrival of aperiodic  
119741 processing requests (that is, a large number of requests in a short time interval). The sporadic  
119742 server also simplifies the schedulability analysis of the realtime system, because it allows  
119743 aperiodic processes or threads to be treated as if they were periodic. The sporadic server was  
119744 first described by Sprunt, et al.

119745 The key concept of the sporadic server is to provide and limit a certain amount of computation  
119746 capacity for processing aperiodic events at their assigned normal priority, during a time interval  
119747 called the “replenishment period”. Once the entity controlled by the sporadic server mechanism  
119748 is initialized with its period and execution-time budget attributes, it preserves its execution  
119749 capacity until an aperiodic request arrives. The request will be serviced (if there are no higher  
119750 priority activities pending) as long as there is execution capacity left. If the request is completed,  
119751 the actual execution time used to service it is subtracted from the capacity, and a replenishment  
119752 of this amount of execution time is scheduled to happen one replenishment period after the  
119753 arrival of the aperiodic request. If the request is not completed, because there is no execution  
119754 capacity left, then the aperiodic process or thread is assigned a lower background priority. For  
119755 each portion of consumed execution capacity the execution time used is replenished after one

119756 replenishment period. At the time of replenishment, if the sporadic server was executing at a  
 119757 background priority level, its priority is elevated to the normal level. Other similar  
 119758 replenishment policies have been defined, but the one presented here represents a compromise  
 119759 between efficiency and implementation complexity.

119760 The interface that appears in this section defines a new scheduling policy for threads and  
 119761 processes that behaves according to the rules of the sporadic server mechanism. Scheduling  
 119762 attributes are defined and functions are provided to allow the user to set and get the parameters  
 119763 that control the scheduling behavior of this mechanism, namely the normal and low priority, the  
 119764 replenishment period, the maximum number of pending replenishment operations, and the  
 119765 initial execution-time budget.

119766 • Scheduling Aperiodic Activities

119767 Virtually all realtime applications are required to process aperiodic activities. In many  
 119768 cases, there are tight timing constraints that the response to the aperiodic events must  
 119769 meet. Usual timing requirements imposed on the response to these events are:

- 119770 — The effects of an aperiodic activity on the response time of lower priority activities  
 119771 must be controllable and predictable.
- 119772 — The system must provide the fastest possible response time to aperiodic events.
- 119773 — It must be possible to take advantage of all the available processing bandwidth not  
 119774 needed by time-critical activities to enhance average-case response times to aperiodic  
 119775 events.

119776 Traditional methods for scheduling aperiodic activities are background processing, polling  
 119777 tasks, and direct event execution:

- 119778 — Background processing consists of assigning a very low priority to the processing of  
 119779 aperiodic events. It utilizes all the available bandwidth in the system that has not  
 119780 been consumed by higher priority threads. However, it is very difficult, or  
 119781 impossible, to meet requirements on average-case response time, because the  
 119782 aperiodic entity has to wait for the execution of all other entities which have higher  
 119783 priority.
- 119784 — Polling consists of creating a periodic process or thread for servicing aperiodic  
 119785 requests. At regular intervals, the polling entity is started and its services  
 119786 accumulated pending aperiodic requests. If no aperiodic requests are pending, the  
 119787 polling entity suspends itself until its next period. Polling allows the aperiodic  
 119788 requests to be processed at a higher priority level. However, worst and average-case  
 119789 response times of polling entities are a direct function of the polling period, and there  
 119790 is execution overhead for each polling period, even if no event has arrived. If the  
 119791 deadline of the aperiodic activity is short compared to the inter-arrival time, the  
 119792 polling frequency must be increased to guarantee meeting the deadline. For this case,  
 119793 the increase in frequency can dramatically reduce the efficiency of the system and,  
 119794 therefore, its capacity to meet all deadlines. Yet, polling represents a good way to  
 119795 handle a large class of practical problems because it preserves system predictability,  
 119796 and because the amortized overhead drops as load increases.
- 119797 — Direct event execution consists of executing the aperiodic events at a high fixed-  
 119798 priority level. Typically, the aperiodic event is processed by an interrupt service  
 119799 routine as soon as it arrives. This technique provides predictable response times for  
 119800 aperiodic events, but makes the response times of all lower priority activities  
 119801 completely unpredictable under burst arrival conditions. Therefore, if the density of  
 119802 aperiodic event arrivals is unbounded, it may be a dangerous technique for time-  
 119803 critical systems. Yet, for those cases in which the physics of the system imposes a

- 119804 bound on the event arrival rate, it is probably the most efficient technique.
- 119805 — The sporadic server scheduling algorithm combines the predictability of the polling  
119806 approach with the short response times of the direct event execution. Thus, it allows  
119807 systems to meet an important class of application requirements that cannot be met by  
119808 using the traditional approaches. Multiple sporadic servers with different attributes  
119809 can be applied to the scheduling of multiple classes of aperiodic events, each with  
119810 different kinds of timing requirements, such as individual deadlines, average  
119811 response times, and so on. It also has many other interesting applications for  
119812 realtime, such as scheduling producer/consumer tasks in time-critical systems,  
119813 limiting the effects of faults on the estimation of task execution-time requirements,  
119814 and so on.
- 119815 • Existing Practice
- 119816 The sporadic server has been used in different kinds of applications, including military  
119817 avionics, robot control systems, industrial automation systems, and so on. There are  
119818 examples of many systems that cannot be successfully scheduled using the classic  
119819 approaches, such as direct event execution, or polling, and are schedulable using a  
119820 sporadic server scheduler. The sporadic server algorithm itself can successfully schedule  
119821 all systems scheduled with direct event execution or polling.
- 119822 The sporadic server scheduling policy has been implemented as a commercial product in  
119823 the run-time system of the Verdex Ada compiler. There are also many applications that  
119824 have used a much less efficient application-level sporadic server. These realtime  
119825 applications would benefit from a sporadic server scheduler implemented at the scheduler  
119826 level.
- 119827 • Library-Level *versus* Kernel-Level Implementation
- 119828 The sporadic server interface described in this section requires the sporadic server policy  
119829 to be implemented at the same level as the scheduler. This means that the process sporadic  
119830 server must be implemented at the kernel level and the thread sporadic server policy  
119831 implemented at the same level as the thread scheduler; that is, kernel or library level.
- 119832 In an earlier interface for the sporadic server, this mechanism was implementable at a  
119833 different level than the scheduler. This feature allowed the implementor to choose between  
119834 an efficient scheduler-level implementation, or a simpler user or library-level  
119835 implementation. However, the working group considered that this interface made the use  
119836 of sporadic servers more complex, and that library-level implementations would lack some  
119837 of the important functionality of the sporadic server, namely the limitation of the actual  
119838 execution time of aperiodic activities. The working group also felt that the interface  
119839 described in this chapter does not preclude library-level implementations of threads  
119840 intended to provide efficient low-overhead scheduling for those threads that are not  
119841 scheduled under the sporadic server policy.
- 119842 • Range of Scheduling Priorities
- 119843 Each of the scheduling policies supported in POSIX.1-2008 has an associated range of  
119844 priorities. The priority ranges for each policy might or might not overlap with the priority  
119845 ranges of other policies. For time-critical realtime applications it is usual for periodic and  
119846 aperiodic activities to be scheduled together in the same processor. Periodic activities will  
119847 usually be scheduled using the SCHED\_FIFO scheduling policy, while aperiodic activities  
119848 may be scheduled using SCHED\_SPORADIC. Since the application developer will require  
119849 complete control over the relative priorities of these activities in order to meet his timing  
119850 requirements, it would be desirable for the priority ranges of SCHED\_FIFO and  
119851 SCHED\_SPORADIC to overlap completely. Therefore, although POSIX.1-2008 does not

119852 require any particular relationship between the different priority ranges, it is  
119853 recommended that these two ranges should coincide.

119854 • Dynamically Setting the Sporadic Server Policy

119855 Several members of the working group requested that implementations should not be  
119856 required to support dynamically setting the sporadic server scheduling policy for a thread.  
119857 The reason is that this policy may have a high overhead for library-level implementations  
119858 of threads, and if threads are allowed to dynamically set this policy, this overhead can be  
119859 experienced even if the thread does not use that policy. By disallowing the dynamic setting  
119860 of the sporadic server scheduling policy, these implementations can accomplish efficient  
119861 scheduling for threads using other policies. If a strictly conforming application needs to  
119862 use the sporadic server policy, and is therefore willing to pay the overhead, it must set this  
119863 policy at the time of thread creation.

119864 • Limitation of the Number of Pending Replenishments

119865 The number of simultaneously pending replenishment operations must be limited for each  
119866 sporadic server for two reasons: an unlimited number of replenishment operations would  
119867 need an unlimited number of system resources to store all the pending replenishment  
119868 operations; on the other hand, in some implementations each replenishment operation will  
119869 represent a source of priority inversion (just for the duration of the replenishment  
119870 operation) and thus, the maximum amount of replenishments must be bounded to  
119871 guarantee bounded response times. The way in which the number of replenishments is  
119872 bounded is by lowering the priority of the sporadic server to *sched\_ss\_low\_priority* when  
119873 the number of pending replenishments has reached its limit. In this way, no new  
119874 replenishments are scheduled until the number of pending replenishments decreases.

119875 In the sporadic server scheduling policy defined in POSIX.1-2008, the application can  
119876 specify the maximum number of pending replenishment operations for a single sporadic  
119877 server, by setting the value of the *sched\_ss\_max\_repl* scheduling parameter. This value must  
119878 be between one and {SS\_REPL\_MAX}, which is a maximum limit imposed by the  
119879 implementation. The limit {SS\_REPL\_MAX} must be greater than or equal to  
119880 {\_POSIX\_SS\_REPL\_MAX}, which is defined to be four in POSIX.1-2008. The minimum  
119881 limit of four was chosen so that an application can at least guarantee that four different  
119882 aperiodic events can be processed during each interval of length equal to the  
119883 replenishment period.

119884 B.2.8.5 *Clocks and Timers*

119885 • Clocks

119886 POSIX.1-2008 and the ISO C standard both define functions for obtaining system time.  
119887 Implicit behind these functions is a mechanism for measuring passage of time. This  
119888 specification makes this mechanism explicit and calls it a clock. The CLOCK\_REALTIME  
119889 clock required by POSIX.1-2008 is a higher resolution version of the clock that maintains  
119890 POSIX.1 system time. This is a “system-wide” clock, in that it is visible to all processes  
119891 and, were it possible for multiple processes to all read the clock at the same time, they  
119892 would see the same value.

119893 An extensible interface was defined, with the ability for implementations to define  
119894 additional clocks. This was done because of the observation that many realtime platforms  
119895 support multiple clocks, and it was desired to fit this model within the standard interface.  
119896 But implementation-defined clocks need not represent actual hardware devices, nor are  
119897 they necessarily system-wide.

119898 • Timers

119899 Two timer types are required for a system to support realtime applications:

119900 1. One-shot

119901 A one-shot timer is a timer that is armed with an initial expiration time, either  
 119902 relative to the current time or at an absolute time (based on some timing base, such  
 119903 as time in seconds and nanoseconds since the Epoch). The timer expires once and  
 119904 then is disarmed. With the specified facilities, this is accomplished by setting the  
 119905 *it\_value* member of the *value* argument to the desired expiration time and the  
 119906 *it\_interval* member to zero.

119907 2. Periodic

119908 A periodic timer is a timer that is armed with an initial expiration time, again either  
 119909 relative or absolute, and a repetition interval. When the initial expiration occurs,  
 119910 the timer is reloaded with the repetition interval and continues counting. With the  
 119911 specified facilities, this is accomplished by setting the *it\_value* member of the *value*  
 119912 argument to the desired initial expiration time and the *it\_interval* member to the  
 119913 desired repetition interval.

119914 For both of these types of timers, the time of the initial timer expiration can be specified in  
 119915 two ways:

119916 1. Relative (to the current time)

119917 2. Absolute

119918 • Examples of Using Realtime Timers

119919 In the diagrams below, *S* indicates a program schedule, *R* shows a schedule method  
 119920 request, and *E* suggests an internal operating system event.

119921 — Periodic Timer: Data Logging

119922 During an experiment, it might be necessary to log realtime data periodically to an  
 119923 internal buffer or to a mass storage device. With a periodic scheduling method, a  
 119924 logging module can be started automatically at fixed time intervals to log the data.

119925 Program schedule is requested every 10 seconds.

119929 [Time (in Seconds)]

119930 To achieve this type of scheduling using the specified facilities, one would allocate a  
 119931 per-process timer based on clock ID `CLOCK_REALTIME`. Then the timer would be  
 119932 armed via a call to `timer_settime()` with the `TIMER_ABSTIME` flag reset, and with an  
 119933 initial expiration value and a repetition interval of 10 seconds.

119934 — One-shot Timer (Relative Time): Device Initialization

119935 In an emission test environment, large sample bags are used to capture the exhaust  
 119936 from a vehicle. The exhaust is purged from these bags before each and every test.  
 119937 With a one-shot timer, a module could initiate the purge function and then suspend  
 119938 itself for a predetermined period of time while the sample bags are prepared.

119939 Program schedule requested 20 seconds after call is issued.

119941  
119942  
119943 [Time (in Seconds)]  
119944 To achieve this type of scheduling using the specified facilities, one would allocate a  
119945 per-process timer based on clock ID CLOCK\_REALTIME. Then the timer would be  
119946 armed via a call to *timer\_settime()* with the *TIMER\_ABSTIME* flag reset, and with an  
119947 initial expiration value of 20 seconds and a repetition interval of zero.

119948 Note that if the program wishes merely to suspend itself for the specified interval, it  
119949 could more easily use *nanosleep()*.

119950 — One-shot Timer (Absolute Time): Data Transmission

119951 The results from an experiment are often moved to a different system within a  
119952 network for post-processing or archiving. With an absolute one-shot timer, a module  
119953 that moves data from a test-cell computer to a host computer can be automatically  
119954 scheduled on a daily basis.

119955 Program schedule requested for 2:30 a.m.

119959 [Time of Day]  
119960 To achieve this type of scheduling using the specified facilities, a per-process timer  
119961 would be allocated based on clock ID CLOCK\_REALTIME. Then the timer would be  
119962 armed via a call to *timer\_settime()* with the *TIMER\_ABSTIME* flag set, and an initial  
119963 expiration value equal to 2:30 a.m. of the next day.

119964 — Periodic Timer (Relative Time): Signal Stabilization

119965 Some measurement devices, such as emission analyzers, do not respond  
119966 instantaneously to an introduced sample. With a periodic timer with a relative initial  
119967 expiration time, a module that introduces a sample and records the average response  
119968 could suspend itself for a predetermined period of time while the signal is stabilized  
119969 and then sample at a fixed rate.

119970 Program schedule requested 15 seconds after call is issued and every 2 seconds  
119971 thereafter.

119975 [Time (in Seconds)]  
119976 To achieve this type of scheduling using the specified facilities, one would allocate a  
119977 per-process timer based on clock ID CLOCK\_REALTIME. Then the timer would be  
119978 armed via a call to *timer\_settime()* with *TIMER\_ABSTIME* flag reset, and with an  
119979 initial expiration value of 15 seconds and a repetition interval of 2 seconds.

119980 — Periodic Timer (Absolute Time): Work Shift-related Processing

119981 Resource utilization data is useful when time to perform experiments is being  
119982 scheduled at a facility. With a periodic timer with an absolute initial expiration time,  
119983 a module can be scheduled at the beginning of a work shift to gather resource  
119984 utilization data throughout the shift. This data can be used to allocate resources

119985 effectively to minimize bottlenecks and delays and maximize facility throughput.  
 119986 Program schedule requested for 2:00 a.m. and every 15 minutes thereafter.  
 119987 R S S S S S S  
 119988 -----+-----+-----+-----+-----+-----+-----+-----+----->  
 119989 23:00 23:30 24:00 00:30 01:00 01:30 02:00 02:30 03:00

119990 [Time of Day]

119991 To achieve this type of scheduling using the specified facilities, one would allocate a  
 119992 per-process timer based on clock ID CLOCK\_REALTIME. Then the timer would be  
 119993 armed via a call to *timer\_settime()* with TIMER\_ABSTIME flag set, and with an initial  
 119994 expiration value equal to 2:00 a.m. and a repetition interval equal to 15 minutes.

119995 • Relationship of Timers to Clocks

119996 The relationship between clocks and timers armed with an absolute time is  
 119997 straightforward: a timer expiration signal is requested when the associated clock reaches  
 119998 or exceeds the specified time. The relationship between clocks and timers armed with a  
 119999 relative time (an interval) is less obvious, but not unintuitive. In this case, a timer  
 120000 expiration signal is requested when the specified interval, *as measured by the associated clock*,  
 120001 has passed. For the required CLOCK\_REALTIME clock, this allows timer expiration  
 120002 signals to be requested at specified “wall clock” times (absolute), or when a specified  
 120003 interval of “realtime” has passed (relative). For an implementation-defined clock—say, a  
 120004 process virtual time clock—timer expirations could be requested when the process has  
 120005 used a specified total amount of virtual time (absolute), or when it has used a specified  
 120006 *additional* amount of virtual time (relative).

120007 The interfaces also allow flexibility in the implementation of the functions. For example, an  
 120008 implementation could convert all absolute times to intervals by subtracting the clock value  
 120009 at the time of the call from the requested expiration time and “counting down” at the  
 120010 supported resolution. Or it could convert all relative times to absolute expiration time by  
 120011 adding in the clock value at the time of the call and comparing the clock value to the  
 120012 expiration time at the supported resolution. Or it might even choose to maintain absolute  
 120013 times as absolute and compare them to the clock value at the supported resolution for  
 120014 absolute timers, and maintain relative times as intervals and count them down at the  
 120015 resolution supported for relative timers. The choice will be driven by efficiency  
 120016 considerations and the underlying hardware or software clock implementation.

120017 • Data Definitions for Clocks and Timers

120018 POSIX.1-2008 uses a time representation capable of supporting nanosecond resolution  
 120019 timers for the following reasons:

120020 — To enable POSIX.1-2008 to represent those computer systems already using  
 120021 nanosecond or submicrosecond resolution clocks.

120022 — To accommodate those per-process timers that might need nanoseconds to specify an  
 120023 absolute value of system-wide clocks, even though the resolution of the per-process  
 120024 timer may only be milliseconds, or *vice versa*.

120025 — Because the number of nanoseconds in a second can be represented in 32 bits.

120026 Time values are represented in the **timespec** structure. The *tv\_sec* member is of type **time\_t**  
 120027 so that this member is compatible with time values used by POSIX.1 functions and the  
 120028 ISO C standard. The *tv\_nsec* member is a **signed long** in order to simplify and clarify code  
 120029 that decrements or finds differences of time values. Note that because 1 billion (number of  
 120030 nanoseconds per second) is less than half of the value representable by a signed 32-bit

120031 value, it is always possible to add two valid fractional seconds represented as integral  
 120032 nanoseconds without overflowing the signed 32-bit value.

120033 A maximum allowable resolution for the CLOCK\_REALTIME clock of 20 ms (1/50  
 120034 seconds) was chosen to allow line frequency clocks in European countries to be  
 120035 conforming. 60 Hz clocks in the US will also be conforming, as will finer granularity  
 120036 clocks, although a Strictly Conforming Application cannot assume a granularity of less  
 120037 than 20 ms (1/50 seconds).

120038 The minimum allowable maximum time allowed for the CLOCK\_REALTIME clock and  
 120039 the function *nanosleep()*, and timers created with *clock\_id=CLOCK\_REALTIME*, is  
 120040 determined by the fact that the *tv\_sec* member is of type **time\_t**.

120041 POSIX.1-2008 specifies that timer expirations must not be delivered early, and *nanosleep()*  
 120042 must not return early due to quantization error. POSIX.1-2008 discusses the various  
 120043 implementations of *alarm()* in the rationale and states that implementations that do not  
 120044 allow alarm signals to occur early are the most appropriate, but refrained from mandating  
 120045 this behavior. Because of the importance of predictability to realtime applications,  
 120046 POSIX.1-2008 takes a stronger stance.

120047 The standard developers considered using a time representation that differs from  
 120048 POSIX.1b in the second 32 bit of the 64-bit value. Whereas POSIX.1b defines this field as a  
 120049 fractional second in nanoseconds, the other methodology defines this as a binary fraction  
 120050 of one second, with the radix point assumed before the most significant bit.

120051 POSIX.1b is a software, source-level standard and most of the benefits of the alternate  
 120052 representation are enjoyed by hardware implementations of clocks and algorithms. It was  
 120053 felt that mandating this format for POSIX.1b clocks and timers would unnecessarily  
 120054 burden the application developer with writing, possibly non-portable, multiple precision  
 120055 arithmetic packages to perform conversion between binary fractions and integral units  
 120056 such as nanoseconds, milliseconds, and so on.

#### 120057 **Rationale for the Monotonic Clock**

120058 For those applications that use time services to achieve realtime behavior, changing the value of  
 120059 the clock on which these services rely may cause erroneous timing behavior. For these  
 120060 applications, it is necessary to have a monotonic clock which cannot run backwards, and which  
 120061 has a maximum clock jump that is required to be documented by the implementation.  
 120062 Additionally, it is desirable (but not required by POSIX.1-2008) that the monotonic clock  
 120063 increases its value uniformly. This clock should not be affected by changes to the system time;  
 120064 for example, to synchronize the clock with an external source or to account for leap seconds.  
 120065 Such changes would cause errors in the measurement of time intervals for those time services  
 120066 that use the absolute value of the clock.

120067 One could argue that by defining the behavior of time services when the value of a clock is  
 120068 changed, deterministic realtime behavior can be achieved. For example, one could specify that  
 120069 relative time services should be unaffected by changes in the value of a clock. However, there are  
 120070 time services that are based upon an absolute time, but that are essentially intended as relative  
 120071 time services. For example, *pthread\_cond\_timedwait()* uses an absolute time to allow it to wake  
 120072 up after the required interval despite spurious wakeups. Although sometimes the  
 120073 *pthread\_cond\_timedwait()* timeouts are absolute in nature, there are many occasions in which they  
 120074 are relative, and their absolute value is determined from the current time plus a relative time  
 120075 interval. In this latter case, if the clock changes while the thread is waiting, the wait interval will  
 120076 not be the expected length. If a *pthread\_cond\_timedwait()* function were created that would take a  
 120077 relative time, it would not solve the problem because to retain the intended “deadline” a thread  
 120078 would need to compensate for latency due to the spurious wakeup, and preemption between

120079 wakeup and the next wait.

120080 The solution is to create a new monotonic clock, whose value does not change except for the  
120081 regular ticking of the clock, and use this clock for implementing the various relative timeouts  
120082 that appear in the different POSIX interfaces, as well as allow *pthread\_cond\_timedwait()* to choose  
120083 this new clock for its timeout. A new *clock\_nanosleep()* function is created to allow an application  
120084 to take advantage of this newly defined clock. Notice that the monotonic clock may be  
120085 implemented using the same hardware clock as the system clock.

120086 Relative timeouts for *sigtimedwait()* and *aio\_suspend()* have been redefined to use the monotonic  
120087 clock, if present. The *alarm()* function has not been redefined, because the same effect but with  
120088 better resolution can be achieved by creating a timer (for which the appropriate clock may be  
120089 chosen).

120090 The *pthread\_cond\_timedwait()* function has been treated in a different way, compared to other  
120091 functions with absolute timeouts, because it is used to wait for an event, and thus it may have a  
120092 deadline, while the other timeouts are generally used as an error recovery mechanism, and for  
120093 them the use of the monotonic clock is not so important. Since the desired timeout for the  
120094 *pthread\_cond\_timedwait()* function may either be a relative interval or an absolute time of day  
120095 deadline, a new initialization attribute has been created for condition variables to specify the  
120096 clock that is used for measuring the timeout in a call to *pthread\_cond\_timedwait()*. In this way, if  
120097 a relative timeout is desired, the monotonic clock will be used; if an absolute deadline is  
120098 required instead, the `CLOCK_REALTIME` or another appropriate clock may be used. This  
120099 capability has not been added to other functions with absolute timeouts because for those  
120100 functions the expected use of the timeout is mostly to prevent errors, and not so often to meet  
120101 precise deadlines. As a consequence, the complexity of adding this capability is not justified by  
120102 its perceived application usage.

120103 The *nanosleep()* function has not been modified with the introduction of the monotonic clock.  
120104 Instead, a new *clock\_nanosleep()* function has been created, in which the desired clock may be  
120105 specified in the function call.

120106 • History of Resolution Issues

120107 Due to the shift from relative to absolute timeouts in IEEE Std 1003.1d-1999, the  
120108 amendments to the *sem\_timedwait()*, *pthread\_mutex\_timedlock()*, *mq\_timedreceive()*, and  
120109 *mq\_timedsend()* functions of that standard have been removed. Those amendments  
120110 specified that `CLOCK_MONOTONIC` would be used for the (relative) timeouts if the  
120111 Monotonic Clock option was supported.

120112 Having these functions continue to be tied solely to `CLOCK_MONOTONIC` would not  
120113 work. Since the absolute value of a time value obtained from `CLOCK_MONOTONIC` is  
120114 unspecified, under the absolute timeouts interface, applications would behave differently  
120115 depending on whether the Monotonic Clock option was supported or not (because the  
120116 absolute value of the clock would have different meanings in either case).

120117 Two options were considered:

- 120118 1. Leave the current behavior unchanged, which specifies the `CLOCK_REALTIME`  
120119 clock for these (absolute) timeouts, to allow portability of applications between  
120120 implementations supporting or not the Monotonic Clock option.
- 120121 2. Modify these functions in the way that *pthread\_cond\_timedwait()* was modified to  
120122 allow a choice of clock, so that an application could use `CLOCK_REALTIME` when  
120123 it is trying to achieve an absolute timeout and `CLOCK_MONOTONIC` when it is  
120124 trying to achieve a relative timeout.

120125 It was decided that the features of `CLOCK_MONOTONIC` are not as critical to these

120126 functions as they are to `pthread_cond_timedwait()`. The `pthread_cond_timedwait()` function is  
120127 given a relative timeout; the timeout may represent a deadline for an event. When these  
120128 functions are given relative timeouts, the timeouts are typically for error recovery  
120129 purposes and need not be so precise.

120130 Therefore, it was decided that these functions should be tied to `CLOCK_REALTIME` and  
120131 not complicated by being given a choice of clock.

## 120132 Execution Time Monitoring

### 120133 • Introduction

120134 The main goals of the execution time monitoring facilities defined in this chapter are to  
120135 measure the execution time of processes and threads and to allow an application to  
120136 establish CPU time limits for these entities.

120137 The analysis phase of time-critical realtime systems often relies on the measurement of  
120138 execution times of individual threads or processes to determine whether the timing  
120139 requirements will be met. Also, performance analysis techniques for soft deadline realtime  
120140 systems rely heavily on the determination of these execution times. The execution time  
120141 monitoring functions provide application developers with the ability to measure these  
120142 execution times online and open the possibility of dynamic execution-time analysis and  
120143 system reconfiguration, if required.

120144 The second goal of allowing an application to establish execution time limits for individual  
120145 processes or threads and detecting when they overrun allows program robustness to be  
120146 increased by enabling online checking of the execution times.

120147 If errors are detected—possibly because of erroneous program constructs, the existence of  
120148 errors in the analysis phase, or a burst of event arrivals—online detection and recovery is  
120149 possible in a portable way. This feature can be extremely important for many time-critical  
120150 applications. Other applications require trapping CPU-time errors as a normal way to exit  
120151 an algorithm; for instance, some realtime artificial intelligence applications trigger a  
120152 number of independent inference processes of varying accuracy and speed, limit how long  
120153 they can run, and pick the best answer available when time runs out. In many periodic  
120154 systems, overrun processes are simply restarted in the next resource period, after necessary  
120155 end-of-period actions have been taken. This allows algorithms that are inherently data-  
120156 dependent to be made predictable.

120157 The interface that appears in this chapter defines a new type of clock, the CPU-time clock,  
120158 which measures execution time. Each process or thread can invoke the clock and timer  
120159 functions defined in POSIX.1 to use them. Functions are also provided to access the CPU-  
120160 time clock of other processes or threads to enable remote monitoring of these clocks.  
120161 Monitoring of threads of other processes is not supported, since these threads are not  
120162 visible from outside of their own process with the interfaces defined in POSIX.1.

### 120163 • Execution Time Monitoring Interface

120164 The clock and timer interface defined in POSIX.1 historically only defined one clock, which  
120165 measures wall-clock time. The requirements for measuring execution time of processes and  
120166 threads, and setting limits to their execution time by detecting when they overrun, can be  
120167 accomplished with that interface if a new kind of clock is defined. These new clocks  
120168 measure execution time, and one is associated with each process and with each thread. The  
120169 clock functions currently defined in POSIX.1 can be used to read and set these CPU-time  
120170 clocks, and timers can be created using these clocks as their timing base. These timers can  
120171 then be used to send a signal when some specified execution time has been exceeded. The  
120172 CPU-time clocks of each process or thread can be accessed by using the symbols

- 120173 CLOCK\_PROCESS\_CPUTIME\_ID or CLOCK\_THREAD\_CPUTIME\_ID.
- 120174 The clock and timer interface defined in POSIX.1 and extended with the new kind of CPU-  
120175 time clock would only allow processes or threads to access their own CPU-time clocks.  
120176 However, many realtime systems require the possibility of monitoring the execution time  
120177 of processes or threads from independent monitoring entities. In order to allow  
120178 applications to construct independent monitoring entities that do not require cooperation  
120179 from or modification of the monitored entities, two functions have been added:  
120180 *clock\_getcpuclockid()*, for accessing CPU-time clocks of other processes, and  
120181 *pthread\_getcpuclockid()*, for accessing CPU-time clocks of other threads. These functions  
120182 return the clock identifier associated with the process or thread specified in the call. These  
120183 clock IDs can then be used in the rest of the clock function calls.
- 120184 The clocks accessed through these functions could also be used as a timing base for the  
120185 creation of timers, thereby allowing independent monitoring entities to limit the CPU time  
120186 consumed by other entities. However, this possibility would imply additional complexity  
120187 and overhead because of the need to maintain a timer queue for each process or thread, to  
120188 store the different expiration times associated with timers created by different processes or  
120189 threads. The working group decided this additional overhead was not justified by  
120190 application requirements. Therefore, creation of timers attached to the CPU-time clocks of  
120191 other processes or threads has been specified as implementation-defined.
- 120192 • Overhead Considerations
- 120193 The measurement of execution time may introduce additional overhead in the thread  
120194 scheduling, because of the need to keep track of the time consumed by each of these  
120195 entities. In library-level implementations of threads, the efficiency of scheduling could be  
120196 somehow compromised because of the need to make a kernel call, at each context switch,  
120197 to read the process CPU-time clock. Consequently, a thread creation attribute called *cpu-  
120198 clock-requirement* was defined, to allow threads to disconnect their respective CPU-time  
120199 clocks. However, the Ballot Group considered that this attribute itself introduced some  
120200 overhead, and that in current implementations it was not worth the effort. Therefore, the  
120201 attribute was deleted, and thus thread CPU-time clocks are required for all threads if the  
120202 Thread CPU-Time Clocks option is supported.- 120203 • Accuracy of CPU-Time Clocks

120204 The mechanism used to measure the execution time of processes and threads is specified in  
120205 POSIX.1-2008 as implementation-defined. The reason for this is that both the underlying  
120206 hardware and the implementation architecture have a very strong influence on the  
120207 accuracy achievable for measuring CPU time. For some implementations, the specification  
120208 of strict accuracy requirements would represent very large overheads, or even the  
120209 impossibility of being implemented.

120210 Since the mechanism for measuring execution time is implementation-defined, realtime  
120211 applications will be able to take advantage of accurate implementations using a portable  
120212 interface. Of course, strictly conforming applications cannot rely on any particular degree  
120213 of accuracy, in the same way as they cannot rely on a very accurate measurement of wall  
120214 clock time. There will always exist applications whose accuracy or efficiency requirements  
120215 on the implementation are more rigid than the values defined in POSIX.1-2008 or any  
120216 other standard.

120217 In any case, there is a minimum set of characteristics that realtime applications would  
120218 expect from most implementations. One such characteristic is that the sum of all the  
120219 execution times of all the threads in a process equals the process execution time, when no  
120220 CPU-time clocks are disabled. This need not always be the case because implementations  
120221 may differ in how they account for time during context switches. Another characteristic is

120222 that the sum of the execution times of all processes in a system equals the number of  
 120223 processors, multiplied by the elapsed time, assuming that no processor is idle during that  
 120224 elapsed time. However, in some implementations it might not be possible to relate CPU  
 120225 time to elapsed time. For example, in a heterogeneous multi-processor system in which  
 120226 each processor runs at a different speed, an implementation may choose to define each  
 120227 “second” of CPU time to be a certain number of “cycles” that a CPU has executed.

120228 • Existing Practice

120229 Measuring and limiting the execution time of each concurrent activity are common  
 120230 features of most industrial implementations of realtime systems. Almost all critical  
 120231 realtime systems are currently built upon a cyclic executive. With this approach, a regular  
 120232 timer interrupt kicks off the next sequence of computations. It also checks that the current  
 120233 sequence has completed. If it has not, then some error recovery action can be undertaken  
 120234 (or at least an overrun is avoided). Current software engineering principles and the  
 120235 increasing complexity of software are driving application developers to implement these  
 120236 systems on multi-threaded or multi-process operating systems. Therefore, if a POSIX  
 120237 operating system is to be used for this type of application, then it must offer the same level  
 120238 of protection.

120239 Execution time clocks are also common in most UNIX implementations, although these  
 120240 clocks usually have requirements different from those of realtime applications. The  
 120241 POSIX.1 *times()* function supports the measurement of the execution time of the calling  
 120242 process, and its terminated child processes. This execution time is measured in clock ticks  
 120243 and is supplied as two different values with the user and system execution times,  
 120244 respectively. BSD supports the function *getrusage()*, which allows the calling process to get  
 120245 information about the resources used by itself and/or all of its terminated child processes.  
 120246 The resource usage includes user and system CPU time. Some UNIX systems have options  
 120247 to specify high resolution (up to one microsecond) CPU-time clocks using the *times()* or  
 120248 the *getrusage()* functions.

120249 The *times()* and *getrusage()* interfaces do not meet important realtime requirements, such  
 120250 as the possibility of monitoring execution time from a different process or thread, or the  
 120251 possibility of detecting an execution time overrun. The latter requirement is supported in  
 120252 some UNIX implementations that are able to send a signal when the execution time of a  
 120253 process has exceeded some specified value. For example, BSD defines the functions  
 120254 *getitimer()* and *setitimer()*, which can operate either on a realtime clock (wall-clock), or on  
 120255 virtual-time or profile-time clocks which measure CPU time in two different ways. These  
 120256 functions do not support access to the execution time of other processes.

120257 IBM’s MVS operating system supports per-process and per-thread execution time clocks. It  
 120258 also supports limiting the execution time of a given process.

120259 Given all this existing practice, the working group considered that the POSIX.1 clocks and  
 120260 timers interface was appropriate to meet most of the requirements that realtime  
 120261 applications have for execution time clocks. Functions were added to get the CPU time  
 120262 clock IDs, and to allow/disallow the thread CPU-time clocks (in order to preserve the  
 120263 efficiency of some implementations of threads).

120264 • Clock Constants

120265 The definition of the manifest constants `CLOCK_PROCESS_CPUTIME_ID` and  
 120266 `CLOCK_THREAD_CPUTIME_ID` allows processes or threads, respectively, to access their  
 120267 own execution-time clocks. However, given a process or thread, access to its own  
 120268 execution-time clock is also possible if the clock ID of this clock is obtained through a call  
 120269 to *clock\_getcpuclockid()* or *pthread\_getcpuclockid()*. Therefore, these constants are not  
 120270 necessary and could be deleted to make the interface simpler. Their existence saves one

120271 system call in the first access to the CPU-time clock of each process or thread. The working  
 120272 group considered this issue and decided to leave the constants in POSIX.1-2008 because  
 120273 they are closer to the POSIX.1b use of clock identifiers.

120274 • Library Implementations of Threads

120275 In library implementations of threads, kernel entities and library threads can coexist. In  
 120276 this case, if the CPU-time clocks are supported, most of the clock and timer functions will  
 120277 need to have two implementations: one in the thread library, and one in the system calls  
 120278 library. The main difference between these two implementations is that the thread library  
 120279 implementation will have to deal with clocks and timers that reside in the thread space,  
 120280 while the kernel implementation will operate on timers and clocks that reside in kernel  
 120281 space. In the library implementation, if the clock ID refers to a clock that resides in the  
 120282 kernel, a kernel call will have to be made. The correct version of the function can be chosen  
 120283 by specifying the appropriate order for the libraries during the link process.

120284 • History of Resolution Issues: Deletion of the *enable* Attribute

120285 In early proposals, consideration was given to inclusion of an attribute called *enable* for  
 120286 CPU-time clocks. This would allow implementations to avoid the overhead of measuring  
 120287 execution time for those processes or threads for which this measurement was not  
 120288 required. However, this is unnecessary since processes are already required to measure  
 120289 execution time by the POSIX.1 *times()* function. Consequently, the *enable* attribute is not  
 120290 present.

120291 **Rationale Relating to Timeouts**

120292 • Requirements for Timeouts

120293 Realtime systems which must operate reliably over extended periods without human  
 120294 intervention are characteristic in embedded applications such as avionics, machine control,  
 120295 and space exploration, as well as more mundane applications such as cable TV, security  
 120296 systems, and plant automation. A multi-tasking paradigm, in which many independent  
 120297 and/or cooperating software functions relinquish the processor(s) while waiting for a  
 120298 specific stimulus, resource, condition, or operation completion, is very useful in producing  
 120299 well engineered programs for such systems. For such systems to be robust and fault-  
 120300 tolerant, expected occurrences that are unduly delayed or that never occur must be  
 120301 detected so that appropriate recovery actions may be taken. This is difficult if there is no  
 120302 way for a task to regain control of a processor once it has relinquished control (blocked)  
 120303 awaiting an occurrence which, perhaps because of corrupted code, hardware malfunction,  
 120304 or latent software bugs, will not happen when expected. Therefore, the common practice  
 120305 in realtime operating systems is to provide a capability to time out such blocking services.  
 120306 Although there are several methods to achieve this already defined by POSIX, none are as  
 120307 reliable or efficient as initiating a timeout simultaneously with initiating a blocking service.  
 120308 This is especially critical in hard-realtime embedded systems because the processors  
 120309 typically have little time reserve, and allowed fault recovery times are measured in  
 120310 milliseconds rather than seconds.

120311 The working group largely agreed that such timeouts were necessary and ought to become  
 120312 part of POSIX.1-2008, particularly vendors of realtime operating systems whose customers  
 120313 had already expressed a strong need for timeouts. There was some resistance to inclusion  
 120314 of timeouts in POSIX.1-2008 because the desired effect, fault tolerance, could, in theory, be  
 120315 achieved using existing facilities and alternative software designs, but there was no  
 120316 compelling evidence that realtime system designers would embrace such designs at the  
 120317 sacrifice of performance and/or simplicity.

- 120318 • Which Services should be Timed Out?
- 120319 Originally, the working group considered the prospect of providing timeouts on all  
 120320 blocking services, including those currently existing in POSIX.1, POSIX.1b, and POSIX.1c,  
 120321 and future interfaces to be defined by other working groups, as sort of a general policy.  
 120322 This was rather quickly rejected because of the scope of such a change, and the fact that  
 120323 many of those services would not normally be used in a realtime context. More traditional  
 120324 timesharing solutions to timeout would suffice for most of the POSIX.1 interfaces, while  
 120325 others had asynchronous alternatives which, while more complex to utilize, would be  
 120326 adequate for some realtime and all non-realtime applications.
- 120327 The list of potential candidates for timeouts was narrowed to the following for further  
 120328 consideration:
- 120329 — POSIX.1b
    - 120330 — *sem\_wait()*
    - 120331 — *mq\_receive()*
    - 120332 — *mq\_send()*
    - 120333 — *lio\_listio()*
    - 120334 — *aio\_suspend()*
    - 120335 — *sigwait()* (timeout already implemented by *sigtimedwait()*)
  - 120336 — POSIX.1c
    - 120337 — *pthread\_mutex\_lock()*
    - 120338 — *pthread\_join()*
    - 120339 — *pthread\_cond\_wait()*
    - 120340 (timeout already implemented by *pthread\_cond\_timedwait()*)
  - 120341 — POSIX.1
    - 120342 — *read()*
    - 120343 — *write()*
- 120344 After further review by the working group, the *lio\_listio()*, *read()*, and *write()* functions (all  
 120345 forms of blocking synchronous I/O) were eliminated from the list because of the  
 120346 following:
- 120347 — Asynchronous alternatives exist
  - 120348 — Timeouts can be implemented, albeit non-portably, in device drivers
  - 120349 — A strong desire not to introduce modifications to POSIX.1 interfaces
- 120350 The working group ultimately rejected *pthread\_join()* since both that interface and a timed  
 120351 variant of that interface are non-minimal and may be implemented as a function. See  
 120352 below for a library implementation of *pthread\_join()*.
- 120353 Thus, there was a consensus among the working group members to add timeouts to 4 of  
 120354 the remaining 5 functions (the timeout for *aio\_suspend()* was ultimately added directly to  
 120355 POSIX.1b, while the others were added by POSIX.1d). However, *pthread\_mutex\_lock()*  
 120356 remained contentious.
- 120357 Many feel that *pthread\_mutex\_lock()* falls into the same class as the other functions; that is,  
 120358 it is desirable to time out a mutex lock because a mutex may fail to be unlocked due to

120359 errant or corrupted code in a critical section (looping or branching outside of the unlock  
 120360 code), and therefore is equally in need of a reliable, simple, and efficient timeout. In fact,  
 120361 since mutexes are intended to guard small critical sections, most `pthread_mutex_lock()` calls  
 120362 would be expected to obtain the lock without blocking nor utilizing any kernel service,  
 120363 even in implementations of threads with global contention scope; the timeout alternative  
 120364 need only be considered after it is determined that the thread must block.

120365 Those opposed to timing out mutexes feel that the very simplicity of the mutex is  
 120366 compromised by adding a timeout semantic, and that to do so is senseless. They claim that  
 120367 if a timed mutex is really deemed useful by a particular application, then it can be  
 120368 constructed from the facilities already in POSIX.1b and POSIX.1c. The following two C-  
 120369 language library implementations of mutex locking with timeout represent the solutions  
 120370 offered (in both implementations, the timeout parameter is specified as absolute time, not  
 120371 relative time as in the proposed POSIX.1c interfaces).

#### 120372 • Spinlock Implementation

```

120373 #include <pthread.h>
120374 #include <time.h>
120375 #include <errno.h>

120376 int pthread_mutex_timedlock(pthread_mutex_t *mutex,
120377                             const struct timespec *timeout)
120378 {
120379     struct timespec timenow;

120380     while (pthread_mutex_trylock(mutex) == EBUSY)
120381     {
120382         clock_gettime(CLOCK_REALTIME, &timenow);
120383         if (timespec_cmp(&timenow, timeout) >= 0)
120384         {
120385             return ETIMEDOUT;
120386         }
120387         pthread_yield();
120388     }
120389     return 0;
120390 }

```

120391 The Spinlock implementation is generally unsuitable for any application using priority-  
 120392 based thread scheduling policies such as SCHED\_FIFO or SCHED\_RR, since the mutex  
 120393 could currently be held by a thread of lower priority within the same allocation domain,  
 120394 but since the waiting thread never blocks, only threads of equal or higher priority will ever  
 120395 run, and the mutex cannot be unlocked. Setting priority inheritance or priority ceiling  
 120396 protocol on the mutex does not solve this problem, since the priority of a mutex owning  
 120397 thread is only boosted if higher priority threads are blocked waiting for the mutex; clearly  
 120398 not the case for this spinlock.

#### 120399 • Condition Wait Implementation

```

120400 #include <pthread.h>
120401 #include <time.h>
120402 #include <errno.h>

120403 struct timed_mutex
120404 {
120405     int locked;
120406     pthread_mutex_t mutex;

```

```

120407         pthread_cond_t cond;
120408     };
120409     typedef struct timed_mutex timed_mutex_t;
120410
120411     int timed_mutex_lock(timed_mutex_t *tm,
120412                        const struct timespec *timeout)
120413     {
120414         int timedout=FALSE;
120415         int error_status;
120416
120417         pthread_mutex_lock(&tm->mutex);
120418
120419         while (tm->locked && !timedout)
120420         {
120421             if ((error_status=pthread_cond_timedwait(&tm->cond,
120422             &tm->mutex,
120423             timeout))!=0)
120424             {
120425                 if (error_status==ETIMEDOUT) timedout = TRUE;
120426             }
120427         }
120428
120429         if(timedout)
120430         {
120431             pthread_mutex_unlock(&tm->mutex);
120432             return ETIMEDOUT;
120433         }
120434         else
120435         {
120436             tm->locked = TRUE;
120437             pthread_mutex_unlock(&tm->mutex);
120438             return 0;
120439         }
120440     }
120441
120442     void timed_mutex_unlock(timed_mutex_t *tm)
120443     {
120444         pthread_mutex_lock(&tm->mutex); / for case assignment not atomic /
120445         tm->locked = FALSE;
120446         pthread_mutex_unlock(&tm->mutex);
120447         pthread_cond_signal(&tm->cond);
120448     }

```

120444 The Condition Wait implementation effectively substitutes the *pthread\_cond\_timedwait()*  
120445 function (which is currently timed out) for the desired *pthread\_mutex\_timedlock()*. Since  
120446 waits on condition variables currently do not include protocols which avoid priority  
120447 inversion, this method is generally unsuitable for realtime applications because it does not  
120448 provide the same priority inversion protection as the untimed *pthread\_mutex\_lock()*. Also,  
120449 for any given implementations of the current mutex and condition variable primitives, this  
120450 library implementation has a performance cost at least 2.5 times that of the untimed  
120451 *pthread\_mutex\_lock()* even in the case where the timed mutex is readily locked without  
120452 blocking (the interfaces required for this case are shown in bold). Even in uniprocessors or  
120453 where assignment is atomic, at least an additional *pthread\_cond\_signal()* is required.  
120454 *pthread\_mutex\_timedlock()* could be implemented at effectively no performance penalty in  
120455 this case because the timeout parameters need only be considered after it is determined  
120456 that the mutex cannot be locked immediately.

120457 Thus it has not yet been shown that the full semantics of mutex locking with timeout can  
 120458 be efficiently and reliably achieved using existing interfaces. Even if the existence of an  
 120459 acceptable library implementation were proven, it is difficult to justify why the interface  
 120460 itself should not be made portable, especially considering approval for the other four  
 120461 timeouts.

120462 • Rationale for Library Implementation of *pthread\_timedjoin()*

120463 Library implementation of *pthread\_timedjoin()*:

```

120464 /*
120465  * Construct a thread variety entirely from existing functions
120466  * with which a join can be done, allowing the join to time out.
120467  */
120468 #include <pthread.h>
120469 #include <time.h>

120470 struct timed_thread {
120471     pthread_t t;
120472     pthread_mutex_t m;
120473     int exiting;
120474     pthread_cond_t exit_c;
120475     void *(*start_routine)(void *arg);
120476     void *arg;
120477     void *status;
120478 };

120479 typedef struct timed_thread *timed_thread_t;
120480 static pthread_key_t timed_thread_key;
120481 static pthread_once_t timed_thread_once = PTHREAD_ONCE_INIT;

120482 static void timed_thread_init()
120483 {
120484     pthread_key_create(&timed_thread_key, NULL);
120485 }

120486 static void *timed_thread_start_routine(void *args)

120487 /*
120488  * Routine to establish thread-specific data value and run the actual
120489  * thread start routine which was supplied to timed_thread_create().
120490  */
120491 {
120492     timed_thread_t tt = (timed_thread_t) args;

120493     pthread_once(&timed_thread_once, timed_thread_init);
120494     pthread_setspecific(timed_thread_key, (void *)tt);
120495     timed_thread_exit((tt->start_routine)(tt->arg));
120496 }

120497 int timed_thread_create(timed_thread_t ttp, const pthread_attr_t *attr,
120498 void *(*start_routine)(void *), void *arg)

120499 /*
120500  * Allocate a thread which can be used with timed_thread_join().
120501  */
120502 {
120503     timed_thread_t tt;
```

```

120504         int result;
120505         tt = (timed_thread_t) malloc(sizeof(struct timed_thread));
120506         pthread_mutex_init(&tt->m, NULL);
120507         tt->exiting = FALSE;
120508         pthread_cond_init(&tt->exit_c, NULL);
120509         tt->start_routine = start_routine;
120510         tt->arg = arg;
120511         tt->status = NULL;
120512
120513         if ((result = pthread_create(&tt->t, attr,
120514             timed_thread_start_routine, (void *)tt)) != 0) {
120515             free(tt);
120516             return result;
120517         }
120518         pthread_detach(tt->t);
120519         ttp = tt;
120520         return 0;
120521     }
120522
120523     int timed_thread_join(timed_thread_t tt,
120524         struct timespec *timeout,
120525         void **status)
120526     {
120527         int result;
120528
120529         pthread_mutex_lock(&tt->m);
120530         result = 0;
120531         /*
120532          * Wait until the thread announces that it is exiting,
120533          * or until timeout.
120534          */
120535         while (result == 0 && ! tt->exiting) {
120536             result = pthread_cond_timedwait(&tt->exit_c, &tt->m, timeout);
120537         }
120538         pthread_mutex_unlock(&tt->m);
120539         if (result == 0 && tt->exiting) {
120540             *status = tt->status;
120541             free((void *)tt);
120542             return result;
120543         }
120544         return result;
120545     }
120546
120547     void timed_thread_exit(void *status)
120548     {
120549         timed_thread_t tt;
120550         void *specific;
120551
120552         if ((specific=pthread_getspecific(timed_thread_key)) == NULL) {
120553             /*
120554              * Handle cases which won't happen with correct usage.
120555              */
120556             pthread_exit( NULL);
120557         }

```

```

120553         tt = (timed_thread_t) specific;
120554         pthread_mutex_lock(&tt->m);
120555         /*
120556          * Tell a joiner that we're exiting.
120557          */
120558         tt->status = status;
120559         tt->exiting = TRUE;
120560         pthread_cond_signal(&tt->exit_c);
120561         pthread_mutex_unlock(&tt->m);
120562         /*
120563          * Call pthread exit() to call destructors and really
120564          * exit the thread.
120565          */
120566         pthread_exit(NULL);
120567     }

```

120568 The *pthread\_join()* C-language example shown above demonstrates that it is possible,  
120569 using existing pthread facilities, to construct a variety of thread which allows for joining  
120570 such a thread, but which allows the join operation to time out. It does this by using a  
120571 *pthread\_cond\_timedwait()* to wait for the thread to exit. A **timed\_thread\_t** descriptor  
120572 structure is used to pass parameters from the creating thread to the created thread, and  
120573 from the exiting thread to the joining thread. This implementation is roughly equivalent to  
120574 what a normal *pthread\_join()* implementation would do, with the single change being that  
120575 *pthread\_cond\_timedwait()* is used in place of a simple *pthread\_cond\_wait()*.

120576 Since it is possible to implement such a facility entirely from existing pthread interfaces,  
120577 and with roughly equal efficiency and complexity to an implementation which would be  
120578 provided directly by a pthreads implementation, it was the consensus of the working  
120579 group members that any *pthread\_timedjoin()* facility would be unnecessary, and should not  
120580 be provided.

#### 120581 • Form of the Timeout Interfaces

120582 The working group considered a number of alternative ways to add timeouts to blocking  
120583 services. At first, a system interface which would specify a one-shot or persistent timeout  
120584 to be applied to subsequent blocking services invoked by the calling process or thread was  
120585 considered because it allowed all blocking services to be timed out in a uniform manner  
120586 with a single additional interface; this was rather quickly rejected because it could easily  
120587 result in the wrong services being timed out.

120588 It was suggested that a timeout value might be specified as an attribute of the object  
120589 (semaphore, mutex, message queue, and so on), but there was no consensus on this, either  
120590 on a case-by-case basis or for all timeouts.

120591 Looking at the two existing timeouts for blocking services indicates that the working  
120592 group members favor a separate interface for the timed version of a function. However,  
120593 *pthread\_cond\_timedwait()* utilizes an absolute timeout value while *sigtimedwait()* uses a  
120594 relative timeout value. The working group members agreed that relative timeout values  
120595 are appropriate where the timeout mechanism's primary use was to deal with an  
120596 unexpected or error situation, but they are inappropriate when the timeout must expire at  
120597 a particular time, or before a specific deadline. For the timeouts being introduced in  
120598 POSIX.1-2008, the working group considered allowing both relative and absolute timeouts  
120599 as is done with POSIX.1b timers, but ultimately favored the simpler absolute timeout form.

120600 An absolute time measure can be easily implemented on top of an interface that specifies  
120601 relative time, by reading the clock, calculating the difference between the current time and

120602 the desired wakeup time, and issuing a relative timeout call. But there is a race condition  
120603 with this approach because the thread could be preempted after reading the clock, but  
120604 before making the timed-out call; in this case, the thread would be awakened later than it  
120605 should and, thus, if the wakeup time represented a deadline, it would miss it.

120606 There is also a race condition when trying to build a relative timeout on top of an interface  
120607 that specifies absolute timeouts. In this case, the clock would have to be read to calculate  
120608 the absolute wakeup time as the sum of the current time plus the relative timeout interval.  
120609 In this case, if the thread is preempted after reading the clock but before making the timed-  
120610 out call, the thread would be awakened earlier than desired.

120611 But the race condition with the absolute timeouts interface is not as bad as the one that  
120612 happens with the relative timeout interface, because there are simple workarounds. For the  
120613 absolute timeouts interface, if the timing requirement is a deadline, the deadline can still  
120614 be met because the thread woke up earlier than the deadline. If the timeout is just used as  
120615 an error recovery mechanism, the precision of timing is not really important. If the timing  
120616 requirement is that between actions A and B a minimum interval of time must elapse, the  
120617 absolute timeout interface can be safely used by reading the clock after action A has been  
120618 started. It could be argued that, since the call with the absolute timeout is atomic from the  
120619 application point of view, it is not possible to read the clock after action A, if this action is  
120620 part of the timed-out call. But looking at the nature of the calls for which timeouts are  
120621 specified (locking a mutex, waiting for a semaphore, waiting for a message, or waiting  
120622 until there is space in a message queue), the timeouts that an application would build on  
120623 these actions would not be triggered by these actions themselves, but by some other  
120624 external action. For example, if waiting for a message to arrive to a message queue, and  
120625 waiting for at least 20 milliseconds, this time interval would start to be counted from some  
120626 event that would trigger both the action that produces the message, as well as the action  
120627 that waits for the message to arrive, and not by the wait-for-message operation itself. In  
120628 this case, the workaround proposed above could be used.

120629 For these reasons, the absolute timeout is preferred over the relative timeout interface.

## 120630 **B.2.9 Threads**

120631 Threads will normally be more expensive than subroutines (or functions, routines, and so on) if  
120632 specialized hardware support is not provided. Nevertheless, threads should be sufficiently  
120633 efficient to encourage their use as a medium to fine-grained structuring mechanism for  
120634 parallelism in an application. Structuring an application using threads then allows it to take  
120635 immediate advantage of any underlying parallelism available in the host environment. This  
120636 means implementors are encouraged to optimize for fast execution at the possible expense of  
120637 efficient utilization of storage. For example, a common thread creation technique is to cache  
120638 appropriate thread data structures. That is, rather than releasing system resources, the  
120639 implementation retains these resources and reuses them when the program next asks to create a  
120640 new thread. If this reuse of thread resources is to be possible, there has to be very little unique  
120641 state associated with each thread, because any such state has to be reset when the thread is  
120642 reused.

120643 **Thread Creation Attributes**

120644 Attributes objects are provided for threads, mutexes, and condition variables as a mechanism to  
120645 support probable future standardization in these areas without requiring that the interface itself  
120646 be changed.

120647 Attributes objects provide clean isolation of the configurable aspects of threads. For example,  
120648 “stack size” is an important attribute of a thread, but it cannot be expressed portably. When  
120649 porting a threaded program, stack sizes often need to be adjusted. The use of attributes objects  
120650 can help by allowing the changes to be isolated in a single place, rather than being spread across  
120651 every instance of thread creation.

120652 Attributes objects can be used to set up *classes* of threads with similar attributes; for example,  
120653 “threads with large stacks and high priority” or “threads with minimal stacks”. These classes  
120654 can be defined in a single place and then referenced wherever threads need to be created.  
120655 Changes to “class” decisions become straightforward, and detailed analysis of each  
120656 *pthread\_create()* call is not required.

120657 The attributes objects are defined as opaque types as an aid to extensibility. If these objects had  
120658 been specified as structures, adding new attributes would force recompilation of all multi-  
120659 threaded programs when the attributes objects are extended; this might not be possible if  
120660 different program components were supplied by different vendors.

120661 Additionally, opaque attributes objects present opportunities for improving performance.  
120662 Argument validity can be checked once when attributes are set, rather than each time a thread is  
120663 created. Implementations will often need to cache kernel objects that are expensive to create.  
120664 Opaque attributes objects provide an efficient mechanism to detect when cached objects become  
120665 invalid due to attribute changes.

120666 Because assignment is not necessarily defined on a given opaque type, implementation-defined  
120667 default values cannot be defined in a portable way. The solution to this problem is to allow  
120668 attribute objects to be initialized dynamically by attributes object initialization functions, so that  
120669 default values can be supplied automatically by the implementation.

120670 The following proposal was provided as a suggested alternative to the supplied attributes:

- 120671 1. Maintain the style of passing a parameter formed by the bitwise-inclusive OR of flags to  
120672 the initialization routines (*pthread\_create()*, *pthread\_mutex\_init()*, *pthread\_cond\_init()*). The  
120673 parameter containing the flags should be an opaque type for extensibility. If no flags are  
120674 set in the parameter, then the objects are created with default characteristics. An  
120675 implementation may specify implementation-defined flag values and associated  
120676 behavior.
- 120677 2. If further specialization of mutexes and condition variables is necessary, implementations  
120678 may specify additional procedures that operate on the **pthread\_mutex\_t** and  
120679 **pthread\_cond\_t** objects (instead of on attributes objects).

120680 The difficulties with this solution are:

- 120681 1. A bitmask is not opaque if bits have to be set into bit-vector attributes objects using  
120682 explicitly-coded bitwise-inclusive OR operations. If the set of options exceeds an **int**,  
120683 application programmers need to know the location of each bit. If bits are set or read by  
120684 encapsulation (that is, *get\*()* or *set\*()* functions), then the bitmask is merely an  
120685 implementation of attributes objects as currently defined and should not be exposed to  
120686 the programmer.
- 120687 2. Many attributes are not Boolean or very small integral values. For example, scheduling  
120688 policy may be placed in 3 bits or 4 bits, but priority requires 5 bits or more, thereby taking  
120689 up at least 8 bits out of a possible 16 bits on machines with 16-bit integers. Because of this,

120690 the bitmask can only reasonably control whether particular attributes are set or not, and it  
120691 cannot serve as the repository of the value itself. The value needs to be specified as a  
120692 function parameter (which is non-extensible), or by setting a structure field (which is non-  
120693 opaque), or by *get\**() and *set\**() functions (making the bitmask a redundant addition to  
120694 the attributes objects).

120695 Stack size is defined as an optional attribute because the very notion of a stack is inherently  
120696 machine-dependent. Some implementations may not be able to change the size of the stack, for  
120697 example, and others may not need to because stack pages may be discontinuous and can be  
120698 allocated and released on demand.

120699 The attribute mechanism has been designed in large measure for extensibility. Future extensions  
120700 to the attribute mechanism or to any attributes object defined in POSIX.1-2008 have to be done  
120701 with care so as not to affect binary-compatibility.

120702 Attribute objects, even if allocated by means of dynamic allocation functions such as *malloc*(),  
120703 may have their size fixed at compile time. This means, for example, a *pthread\_create*() in an  
120704 implementation with extensions to the **pthread\_attr\_t** cannot look beyond the area that the  
120705 binary application assumes is valid. This suggests that implementations should maintain a size  
120706 field in the attributes object, as well as possibly version information, if extensions in different  
120707 directions (possibly by different vendors) are to be accommodated.

## 120708 Thread Implementation Models

120709 There are various thread implementation models. At one end of the spectrum is the “library-  
120710 thread model”. In such a model, the threads of a process are not visible to the operating system  
120711 kernel, and the threads are not kernel-scheduled entities. The process is the only kernel-  
120712 scheduled entity. The process is scheduled onto the processor by the kernel according to the  
120713 scheduling attributes of the process. The threads are scheduled onto the single kernel-scheduled  
120714 entity (the process) by the runtime library according to the scheduling attributes of the threads.  
120715 A problem with this model is that it constrains concurrency. Since there is only one kernel-  
120716 scheduled entity (namely, the process), only one thread per process can execute at a time. If the  
120717 thread that is executing blocks on I/O, then the whole process blocks.

120718 At the other end of the spectrum is the “kernel-thread model”. In this model, all threads are  
120719 visible to the operating system kernel. Thus, all threads are kernel-scheduled entities, and all  
120720 threads can concurrently execute. The threads are scheduled onto processors by the kernel  
120721 according to the scheduling attributes of the threads. The drawback to this model is that the  
120722 creation and management of the threads entails operating system calls, as opposed to subroutine  
120723 calls, which makes kernel threads heavier weight than library threads.

120724 Hybrids of these two models are common. A hybrid model offers the speed of library threads  
120725 and the concurrency of kernel threads. In hybrid models, a process has some (relatively small)  
120726 number of kernel scheduled entities associated with it. It also has a potentially much larger  
120727 number of library threads associated with it. Some library threads may be bound to kernel-  
120728 scheduled entities, while the other library threads are multiplexed onto the remaining kernel-  
120729 scheduled entities. There are two levels of thread scheduling:

- 120730 1. The runtime library manages the scheduling of (unbound) library threads onto kernel-  
120731 scheduled entities.
- 120732 2. The kernel manages the scheduling of kernel-scheduled entities onto processors.

120733 For this reason, a hybrid model is referred to as a two-level threads scheduling model. In this  
120734 model, the process can have multiple concurrently executing threads; specifically, it can have as  
120735 many concurrently executing threads as it has kernel-scheduled entities.

120736 **Thread-Specific Data**

120737 Many applications require that a certain amount of context be maintained on a per-thread basis  
 120738 across procedure calls. A common example is a multi-threaded library routine that allocates  
 120739 resources from a common pool and maintains an active resource list for each thread. The thread-  
 120740 specific data interface provided to meet these needs may be viewed as a two-dimensional array  
 120741 of values with keys serving as the row index and thread IDs as the column index (although the  
 120742 implementation need not work this way).

## 120743 • Models

120744 Three possible thread-specific data models were considered:

## 120745 1. No Explicit Support

120746 A standard thread-specific data interface is not strictly necessary to support  
 120747 applications that require per-thread context. One could, for example, provide a hash  
 120748 function that converted a **pthread\_t** into an integer value that could then be used to  
 120749 index into a global array of per-thread data pointers. This hash function, in  
 120750 conjunction with *pthread\_self()*, would be all the interface required to support a  
 120751 mechanism of this sort. Unfortunately, this technique is cumbersome. It can lead to  
 120752 duplicated code as each set of cooperating modules implements their own per-  
 120753 thread data management schemes.

120754 2. Single (**void \***) Pointer

120755 Another technique would be to provide a single word of per-thread storage and a  
 120756 pair of functions to fetch and store the value of this word. The word could then hold  
 120757 a pointer to a block of per-thread memory. The allocation, partitioning, and general  
 120758 use of this memory would be entirely up to the application. Although this method  
 120759 is not as problematic as technique 1, it suffers from interoperability problems. For  
 120760 example, all modules using the per-thread pointer would have to agree on a  
 120761 common usage protocol.

## 120762 3. Key/Value Mechanism

120763 This method associates an opaque key (for example, stored in a variable of type  
 120764 **pthread\_key\_t**) with each per-thread datum. These keys play the role of identifiers  
 120765 for per-thread data. This technique is the most generic and avoids the problems  
 120766 noted above, albeit at the cost of some complexity.

120767 The primary advantage of the third model is its information hiding properties. Modules  
 120768 using this model are free to create and use their own key(s) independent of all other such  
 120769 usage, whereas the other models require that all modules that use thread-specific context  
 120770 explicitly cooperate with all other such modules. The data-independence provided by the  
 120771 third model is worth the additional interface.

## 120772 • Requirements

120773 It is important that it be possible to implement the thread-specific data interface without  
 120774 the use of thread private memory. To do otherwise would increase the weight of each  
 120775 thread, thereby limiting the range of applications for which the threads interfaces provided  
 120776 by POSIX.1-2008 is appropriate.

120777 The values that one binds to the key via *pthread\_setspecific()* may, in fact, be pointers to  
 120778 shared storage locations available to all threads. It is only the key/value bindings that are  
 120779 maintained on a per-thread basis, and these can be kept in any portion of the address space  
 120780 that is reserved for use by the calling thread (for example, on the stack). Thus, no per-  
 120781 thread MMU state is required to implement the interface. On the other hand, there is

120782 nothing in the interface specification to preclude the use of a per-thread MMU state if it is  
 120783 available (for example, the key values returned by `pthread_key_create()` could be thread  
 120784 private memory addresses).

120785 • Standardization Issues

120786 Thread-specific data is a requirement for a usable thread interface. The binding described  
 120787 in this section provides a portable thread-specific data mechanism for languages that do  
 120788 not directly support a thread-specific storage class. A binding to POSIX.1-2008 for a  
 120789 language that does include such a storage class need not provide this specific interface.

120790 If a language were to include the notion of thread-specific storage, it would be desirable  
 120791 (but *not* required) to provide an implementation of the pthreads thread-specific data  
 120792 interface based on the language feature. For example, assume that a compiler for a C-like  
 120793 language supports a *private* storage class that provides thread-specific storage. Something  
 120794 similar to the following macros might be used to effect a compatible implementation:

```
120795 #define pthread_key_t                private void *
120796 #define pthread_key_create(key)      /* no-op */
120797 #define pthread_setspecific(key,value) (key)=(value)
120798 #define pthread_getspecific(key)     (key)
```

120799 **Note:** For the sake of clarity, this example ignores destructor functions. A correct  
 120800 implementation would have to support them.

120801 **Barriers**

120802 • Background

120803 Barriers are typically used in parallel DO/FOR loops to ensure that all threads have  
 120804 reached a particular stage in a parallel computation before allowing any to proceed to the  
 120805 next stage. Highly efficient implementation is possible on machines which support a  
 120806 “Fetch and Add” operation as described in the referenced Almasi and Gottlieb (1989).

120807 The use of return value `PTHREAD_BARRIER_SERIAL_THREAD` is shown in the  
 120808 following example:

```
120809 if ( (status=pthread_barrier_wait(&barrier)) ==
120810     PTHREAD_BARRIER_SERIAL_THREAD) {
120811     ...serial section
120812 }
120813     else if (status != 0) {
120814     ...error processing
120815 }
120816 status=pthread_barrier_wait(&barrier);
120817 ...
```

120818 This behavior allows a serial section of code to be executed by one thread as soon as all  
 120819 threads reach the first barrier. The second barrier prevents the other threads from  
 120820 proceeding until the serial section being executed by the one thread has completed.

120821 Although barriers can be implemented with mutexes and condition variables, the  
 120822 referenced Almasi and Gottlieb (1989) provides ample illustration that such  
 120823 implementations are significantly less efficient than is possible. While the relative  
 120824 efficiency of barriers may well vary by implementation, it is important that they be  
 120825 recognized in the POSIX.1-2008 to facilitate applications portability while providing the  
 120826 necessary freedom to implementors.

- 120827
- Lack of Timeout Feature

120828 Alternate versions of most blocking routines have been provided to support watchdog  
120829 timeouts. No alternate interface of this sort has been provided for barrier waits for the  
120830 following reasons:

- 120831
- Multiple threads may use different timeout values, some of which may be indefinite.  
120832 It is not clear which threads should break through the barrier with a timeout error if  
120833 and when these timeouts expire.
  - The barrier may become unusable once a thread breaks out of a `pthread_barrier_wait()`  
120834 with a timeout error. There is, in general, no way to guarantee the consistency of a  
120835 barrier's internal data structures once a thread has timed out of a  
120836 `pthread_barrier_wait()`. Even the inclusion of a special barrier reinitialization function  
120837 would not help much since it is not clear how this function would affect the behavior  
120838 of threads that reach the barrier between the original timeout and the call to the  
120839 reinitialization function.  
120840

## 120841 Spin Locks

- 120842
- Background

120843 Spin locks represent an extremely low-level synchronization mechanism suitable primarily  
120844 for use on shared memory multi-processors. It is typically an atomically modified Boolean  
120845 value that is set to one when the lock is held and to zero when the lock is freed.

120846 When a caller requests a spin lock that is already held, it typically spins in a loop testing  
120847 whether the lock has become available. Such spinning wastes processor cycles so the lock  
120848 should only be held for short durations and not across sleep/block operations. Callers  
120849 should unlock spin locks before calling sleep operations.

120850 Spin locks are available on a variety of systems. The functions included in POSIX.1-2008  
120851 are an attempt to standardize that existing practice.

- 120852
- Lack of Timeout Feature

120853 Alternate versions of most blocking routines have been provided to support watchdog  
120854 timeouts. No alternate interface of this sort has been provided for spin locks for the  
120855 following reasons:

- 120856
- It is impossible to determine appropriate timeout intervals for spin locks in a  
120857 portable manner. The amount of time one can expect to spend spin-waiting is  
120858 inversely proportional to the degree of parallelism provided by the system.
  - It can vary from a few cycles when each competing thread is running on its own  
120859 processor, to an indefinite amount of time when all threads are multiplexed on a  
120860 single processor (which is why spin locking is not advisable on uniprocessors).  
120861
  - When used properly, the amount of time the calling thread spends waiting on a spin  
120862 lock should be considerably less than the time required to set up a corresponding  
120863 watchdog timer. Since the primary purpose of spin locks is to provide a low-  
120864 overhead synchronization mechanism for multi-processors, the overhead of a  
120865 timeout mechanism was deemed unacceptable.  
120866

120867 It was also suggested that an additional `count` argument be provided (on the  
120868 `pthread_spin_lock()` call) in lieu of a true timeout so that a spin lock call could fail gracefully  
120869 if it was unable to apply the lock after `count` attempts. This idea was rejected because it is  
120870 not existing practice. Furthermore, the same effect can be obtained with  
120871 `pthread_spin_trylock()`, as illustrated below:

```

120872     int n = MAX_SPIN;
120873     while ( --n >= 0 )
120874     {
120875         if ( !pthread_spin_try_lock(...) )
120876             break;
120877     }
120878     if ( n >= 0 )
120879     {
120880         /* Successfully acquired the lock */
120881     }
120882     else
120883     {
120884         /* Unable to acquire the lock */
120885     }

```

120886 • *process-shared* Attribute

120887 The initialization functions associated with most POSIX synchronization objects (for  
120888 example, mutexes, barriers, and read-write locks) take an attributes object with a *process-*  
120889 *shared* attribute that specifies whether or not the object is to be shared across processes. In  
120890 the draft corresponding to the first balloting round, two separate initialization functions  
120891 are provided for spin locks, however: one for spin locks that were to be shared across  
120892 processes (*spin\_init()*), and one for locks that were only used by multiple threads within a  
120893 single process (*pthread\_spin\_init()*). This was done so as to keep the overhead associated  
120894 with spin waiting to an absolute minimum. However, the balloting group requested that,  
120895 since the overhead associated to a bit check was small, spin locks should be consistent with  
120896 the rest of the synchronization primitives, and thus the *process-shared* attribute was  
120897 introduced for spin locks.

120898 • Spin Locks *versus* Mutexes

120899 It has been suggested that mutexes are an adequate synchronization mechanism and spin  
120900 locks are not necessary. Locking mechanisms typically must trade off the processor  
120901 resources consumed while setting up to block the thread and the processor resources  
120902 consumed by the thread while it is blocked. Spin locks require very little resources to set  
120903 up the blocking of a thread. Existing practice is to simply loop, repeating the atomic  
120904 locking operation until the lock is available. While the resources consumed to set up  
120905 blocking of the thread are low, the thread continues to consume processor resources while  
120906 it is waiting.

120907 On the other hand, mutexes may be implemented such that the processor resources  
120908 consumed to block the thread are large relative to a spin lock. After detecting that the  
120909 mutex lock is not available, the thread must alter its scheduling state, add itself to a set of  
120910 waiting threads, and, when the lock becomes available again, undo all of this before taking  
120911 over ownership of the mutex. However, while a thread is blocked by a mutex, no processor  
120912 resources are consumed.

120913 Therefore, spin locks and mutexes may be implemented to have different characteristics.  
120914 Spin locks may have lower overall overhead for very short-term blocking, and mutexes  
120915 may have lower overall overhead when a thread will be blocked for longer periods of time.  
120916 The presence of both interfaces allows implementations with these two different  
120917 characteristics, both of which may be useful to a particular application.

120918 It has also been suggested that applications can build their own spin locks from the  
120919 *pthread\_mutex\_trylock()* function:

120920           while (pthread\_mutex\_trylock(&mutex));

120921           The apparent simplicity of this construct is somewhat deceiving, however. While the actual  
120922           wait is quite efficient, various guarantees on the integrity of mutex objects (for example,  
120923           priority inheritance rules) may add overhead to the successful path of the trylock  
120924           operation that is not required of spin locks. One could, of course, add an attribute to the  
120925           mutex to bypass such overhead, but the very act of finding and testing this attribute  
120926           represents more overhead than is found in the typical spin lock.

120927           The need to hold spin lock overhead to an absolute minimum also makes it impossible to  
120928           provide guarantees against starvation similar to those provided for mutexes or read-write  
120929           locks. The overhead required to implement such guarantees (for example, disabling  
120930           preemption before spinning) may well exceed the overhead of the spin wait itself by many  
120931           orders of magnitude. If a “safe” spin wait seems desirable, it can always be provided  
120932           (albeit at some performance cost) via appropriate mutex attributes.

### 120933           **Robust Mutexes**

120934           Robust mutexes are intended to protect applications that use mutexes to protect data shared  
120935           between different processes. If a process is terminated by a signal while a thread is holding a  
120936           mutex, there is no chance for the process to clean up after it. Waiters for the locked mutex might  
120937           wait indefinitely.

120938           With robust mutexes the problem can be solved: whenever a fatal signal terminates a process,  
120939           current or future waiters of the mutex are notified about this fact. The locking function provides  
120940           notification of this condition through the error condition [EOWNERDEAD]. A thread then has  
120941           the chance to clean up the state protected by the mutex and mark the state as consistent again by  
120942           a call to *pthread\_mutex\_consistent()*.

120943           Pre-existing implementations have used the semantics of robust mutexes for a variety of  
120944           situations, some of them not defined in the standard. Where a normally terminated process (i.e.,  
120945           when one thread calls *exit()*) causes notification of other waiters of robust mutexes if the mutex  
120946           is locked by any thread in the process. This behavior is defined in the standard and makes sense  
120947           because no thread other than the thread calling *exit()* has the chance to clean up its data.

120948           If a thread is terminated by cancellation or if it calls *pthread\_exit()*, the situation is different. In  
120949           both these situations the thread has the chance to clean up after itself by registering appropriate  
120950           cleanup handlers. There is no real reason to demand that other waiters for a robust mutex the  
120951           terminating thread owns are notified. The committee felt that this is actively encouraging bad  
120952           practice because programmers are tempted to rely on the robust mutex semantics instead of  
120953           correctly cleaning up after themselves.

120954           Therefore, the standard does not require notification of other waiters at the time a thread is  
120955           terminated while the process continues to run. The mutex is still recognized as being locked by  
120956           the process (with the thread gone it makes no sense to refer to the thread owning the mutex).  
120957           Therefore, a terminating process will cause notifications about the dead owner to be sent to all  
120958           waiters. This delay in the notification is not required, but programmers cannot rely on prompt  
120959           notification after a thread is terminated.

120960           For the same reason is it not required that an implementation supports robust mutexes that are  
120961           not shared between processes. If a robust mutex is used only within one process, all the cleanup  
120962           can be performed by the threads themselves by registering appropriate cleanup handlers. Fatal  
120963           signals are of no importance in this case because after the signal is delivered there is no thread  
120964           remaining to use the mutex.

120965           Some implementations might choose to support intra-process robust mutexes and they might  
120966           also send notification of a dead owner right after the previous owner died. But applications

120967 must not rely on this. Applications should only use robust mutexes for the purpose of handling  
 120968 fatal signals in situations where inter-process mutexes are in use.

### 120969 **Supported Threads Functions**

120970 On POSIX-conforming systems, the following symbolic constants are always conforming:

120971 `_POSIX_READER_WRITER_LOCKS`  
 120972 `_POSIX_THREADS`

120973 Therefore, the following threads functions are always supported:

|        |                                            |                                              |
|--------|--------------------------------------------|----------------------------------------------|
| 120974 | <code>pthread_atfork()</code>              | <code>pthread_mutex_destroy()</code>         |
| 120975 | <code>pthread_attr_destroy()</code>        | <code>pthread_mutex_init()</code>            |
| 120976 | <code>pthread_attr_getdetachstate()</code> | <code>pthread_mutex_lock()</code>            |
| 120977 | <code>pthread_attr_getguardsize()</code>   | <code>pthread_mutex_trylock()</code>         |
| 120978 | <code>pthread_attr_getschedparam()</code>  | <code>pthread_mutex_unlock()</code>          |
| 120979 | <code>pthread_attr_init()</code>           | <code>pthread_mutexattr_destroy()</code>     |
| 120980 | <code>pthread_attr_setdetachstate()</code> | <code>pthread_mutexattr_getpshared()</code>  |
| 120981 | <code>pthread_attr_setguardsize()</code>   | <code>pthread_mutexattr_gettype()</code>     |
| 120982 | <code>pthread_attr_setschedparam()</code>  | <code>pthread_mutexattr_init()</code>        |
| 120983 | <code>pthread_cancel()</code>              | <code>pthread_mutexattr_setpshared()</code>  |
| 120984 | <code>pthread_cleanup_pop()</code>         | <code>pthread_mutexattr_settype()</code>     |
| 120985 | <code>pthread_cleanup_push()</code>        | <code>pthread_once()</code>                  |
| 120986 | <code>pthread_cond_broadcast()</code>      | <code>pthread_rwlock_destroy()</code>        |
| 120987 | <code>pthread_cond_destroy()</code>        | <code>pthread_rwlock_init()</code>           |
| 120988 | <code>pthread_cond_init()</code>           | <code>pthread_rwlock_rdlock()</code>         |
| 120989 | <code>pthread_cond_signal()</code>         | <code>pthread_rwlock_tryrdlock()</code>      |
| 120990 | <code>pthread_cond_timedwait()</code>      | <code>pthread_rwlock_trywrlock()</code>      |
| 120991 | <code>pthread_cond_wait()</code>           | <code>pthread_rwlock_unlock()</code>         |
| 120992 | <code>pthread_condattr_destroy()</code>    | <code>pthread_rwlock_wrlock()</code>         |
| 120993 | <code>pthread_condattr_getpshared()</code> | <code>pthread_rwlockattr_destroy()</code>    |
| 120994 | <code>pthread_condattr_init()</code>       | <code>pthread_rwlockattr_getpshared()</code> |
| 120995 | <code>pthread_condattr_setpshared()</code> | <code>pthread_rwlockattr_init()</code>       |
| 120996 | <code>pthread_create()</code>              | <code>pthread_rwlockattr_setpshared()</code> |
| 120997 | <code>pthread_detach()</code>              | <code>pthread_self()</code>                  |
| 120998 | <code>pthread_equal()</code>               | <code>pthread_setcancelstate()</code>        |
| 120999 | <code>pthread_exit()</code>                | <code>pthread_setcanceltype()</code>         |
| 121000 | <code>pthread_getconcurrency()</code>      | <code>pthread_setconcurrency()</code>        |
| 121001 | <code>pthread_getspecific()</code>         | <code>pthread_setspecific()</code>           |
| 121002 | <code>pthread_join()</code>                | <code>pthread_sigmask()</code>               |
| 121003 | <code>pthread_key_create()</code>          | <code>pthread_testcancel()</code>            |
| 121004 | <code>pthread_key_delete()</code>          | <code>sigwait()</code>                       |
| 121005 | <code>pthread_kill()</code>                |                                              |

121006 On POSIX-conforming systems, the symbolic constant `_POSIX_THREAD_SAFE_FUNCTIONS` is  
121007 always defined. Therefore, the following functions are always supported:

|        |                                 |                                 |
|--------|---------------------------------|---------------------------------|
| 121008 | <code>asctime_r()</code>        | <code>getpwuid_r()</code>       |
| 121009 | <code>ctime_r()</code>          | <code>gmtime_r()</code>         |
| 121010 | <code>flockfile()</code>        | <code>localtime_r()</code>      |
| 121011 | <code>ftrylockfile()</code>     | <code>putc_unlocked()</code>    |
| 121012 | <code>funlockfile()</code>      | <code>putchar_unlocked()</code> |
| 121013 | <code>getc_unlocked()</code>    | <code>rand_r()</code>           |
| 121014 | <code>getchar_unlocked()</code> | <code>readdir_r()</code>        |
| 121015 | <code>getgrgid_r()</code>       | <code>strerror_r()</code>       |
| 121016 | <code>getgrnam_r()</code>       | <code>strtok_r()</code>         |
| 121017 | <code>getpwnam_r()</code>       |                                 |

### 121018 Threads Extensions

121019 The following extensions to the IEEE P1003.1c draft standard are now supported in  
121020 POSIX.1-2008 as part of the alignment with the Single UNIX Specification:

- 121021 • Extended mutex attribute types
- 121022 • Read-write locks and attributes (also introduced by the IEEE Std 1003.1j-2000 amendment)
- 121023 • Thread concurrency level
- 121024 • Thread stack guard size
- 121025 • Parallel I/O
- 121026 • Robust mutexes

121027 These extensions carefully follow the threads programming model specified in POSIX.1c. As  
121028 with POSIX.1c, all the new functions return zero if successful; otherwise, an error number is  
121029 returned to indicate the error.

121030 The concept of attribute objects was introduced in POSIX.1c to allow implementations to extend  
121031 POSIX.1-2008 without changing the existing interfaces. Attribute objects were defined for  
121032 threads, mutexes, and condition variables. Attributes objects are defined as implementation-  
121033 defined opaque types to aid extensibility, and functions are defined to allow attributes to be set  
121034 or retrieved. This model has been followed when adding the new type attribute of  
121035 **pthread\_mutexattr\_t** or the new read-write lock attributes object **pthread\_rwlockattr\_t**.

- 121036 • Extended Mutex Attributes

121037 POSIX.1c defines a mutex attributes object as an implementation-defined opaque object of  
121038 type **pthread\_mutexattr\_t**, and specifies a number of attributes which this object must  
121039 have and a number of functions which manipulate these attributes. These attributes  
121040 include *detachstate*, *inheritsched*, *schedparm*, *schedpolicy*, *contentionscope*, *stackaddr*, and  
121041 *stacksize*.

121042 The System Interfaces volume of POSIX.1-2008 specifies another mutex attribute called  
121043 *type*. The *type* attribute allows applications to specify the behavior of mutex locking  
121044 operations in situations where POSIX.1c behavior is undefined. The OSF DCE threads  
121045 implementation, based on Draft 4 of POSIX.1c, specified a similar attribute. Note that the  
121046 names of the attributes have changed somewhat from the OSF DCE threads  
121047 implementation.

121048 The System Interfaces volume of POSIX.1-2008 also extends the specification of the  
121049 following POSIX.1c functions which manipulate mutexes:

121050 `pthread_mutex_lock()`  
 121051 `pthread_mutex_trylock()`  
 121052 `pthread_mutex_unlock()`

121053 to take account of the new mutex attribute type and to specify behavior which was  
 121054 declared as undefined in POSIX.1c. How a calling thread acquires or releases a mutex now  
 121055 depends upon the mutex *type* attribute.

121056 The *type* attribute can have the following values:

121057 PTHREAD\_MUTEX\_NORMAL

121058 Basic mutex with no specific error checking built in. Does not report a deadlock error.

121059 PTHREAD\_MUTEX\_RECURSIVE

121060 Allows any thread to recursively lock a mutex. The mutex must be unlocked an equal  
 121061 number of times to release the mutex.

121062 PTHREAD\_MUTEX\_ERRORCHECK

121063 Detects and reports simple usage errors; that is, an attempt to unlock a mutex that is  
 121064 not locked by the calling thread or that is not locked at all, or an attempt to relock a  
 121065 mutex the thread already owns.

121066 PTHREAD\_MUTEX\_DEFAULT

121067 The default mutex type. May be mapped to any of the above mutex types or may be  
 121068 an implementation-defined type.

121069 *Normal* mutexes do not detect deadlock conditions; for example, a thread will hang if it  
 121070 tries to relock a normal mutex that it already owns. Attempting to unlock a mutex locked  
 121071 by another thread, or unlocking an unlocked mutex, results in undefined behavior. Normal  
 121072 mutexes will usually be the fastest type of mutex available on a platform but provide the  
 121073 least error checking.

121074 *Recursive* mutexes are useful for converting old code where it is difficult to establish clear  
 121075 boundaries of synchronization. A thread can relock a recursive mutex without first  
 121076 unlocking it. The relocking deadlock which can occur with normal mutexes cannot occur  
 121077 with this type of mutex. However, multiple locks of a recursive mutex require the same  
 121078 number of unlocks to release the mutex before another thread can acquire the mutex.  
 121079 Furthermore, this type of mutex maintains the concept of an owner. Thus, a thread  
 121080 attempting to unlock a recursive mutex which another thread has locked returns with an  
 121081 error. A thread attempting to unlock a recursive mutex that is not locked returns with an  
 121082 error. Never use a recursive mutex with condition variables because the implicit unlock  
 121083 performed by `pthread_cond_wait()` or `pthread_cond_timedwait()` will not actually release the  
 121084 mutex if it had been locked multiple times.

121085 *Errorcheck* mutexes provide error checking and are useful primarily as a debugging aid. A  
 121086 thread attempting to relock an errorcheck mutex without first unlocking it returns with an  
 121087 error. Again, this type of mutex maintains the concept of an owner. Thus, a thread  
 121088 attempting to unlock an errorcheck mutex which another thread has locked returns with  
 121089 an error. A thread attempting to unlock an errorcheck mutex that is not locked also returns  
 121090 with an error. It should be noted that errorcheck mutexes will almost always be much  
 121091 slower than normal mutexes due to the extra state checks performed.

121092 The default mutex type provides implementation-defined error checking. The default  
 121093 mutex may be mapped to one of the other defined types or may be something entirely  
 121094 different. This enables each vendor to provide the mutex semantics which the vendor feels  
 121095 will be most useful to their target users. Most vendors will probably choose to make  
 121096 normal mutexes the default so as to give applications the benefit of the fastest type of

- 121097 mutexes available on their platform. Check your implementation's documentation.
- 121098 An application developer can use any of the mutex types almost interchangeably as long  
121099 as the application does not depend upon the implementation detecting (or failing to  
121100 detect) any particular errors. Note that a recursive mutex can be used with condition  
121101 variable waits as long as the application never recursively locks the mutex.
- 121102 Two functions are provided for manipulating the *type* attribute of a mutex attributes object.  
121103 This attribute is set or returned in the *type* parameter of these functions. The  
121104 `pthread_mutexattr_settype()` function is used to set a specific type value while  
121105 `pthread_mutexattr_gettype()` is used to return the type of the mutex. Setting the *type*  
121106 attribute of a mutex attributes object affects only mutexes initialized using that mutex  
121107 attributes object. Changing the *type* attribute does not affect mutexes previously initialized  
121108 using that mutex attributes object.
- 121109 • Read-Write Locks and Attributes
- 121110 The read-write locks introduced have been harmonized with those in IEEE Std  
121111 1003.1j-2000; see also [Section B.2.9.6](#) (on page 3590).
- 121112 Read-write locks (also known as reader-writer locks) allow a thread to exclusively lock  
121113 some shared data while updating that data, or allow any number of threads to have  
121114 simultaneous read-only access to the data.
- 121115 Unlike a mutex, a read-write lock distinguishes between reading data and writing data. A  
121116 mutex excludes all other threads. A read-write lock allows other threads access to the data,  
121117 providing no thread is modifying the data. Thus, a read-write lock is less primitive than  
121118 either a mutex-condition variable pair or a semaphore.
- 121119 Application developers should consider using a read-write lock rather than a mutex to  
121120 protect data that is frequently referenced but seldom modified. Most threads (readers) will  
121121 be able to read the data without waiting and will only have to block when some other  
121122 thread (a writer) is in the process of modifying the data. Conversely a thread that wants to  
121123 change the data is forced to wait until there are no readers. This type of lock is often used  
121124 to facilitate parallel access to data on multi-processor platforms or to avoid context  
121125 switches on single processor platforms where multiple threads access the same data.
- 121126 If a read-write lock becomes unlocked and there are multiple threads waiting to acquire  
121127 the write lock, the implementation's scheduling policy determines which thread acquires  
121128 the read-write lock for writing. If there are multiple threads blocked on a read-write lock  
121129 for both read locks and write locks, it is unspecified whether the readers or a writer  
121130 acquire the lock first. However, for performance reasons, implementations often favor  
121131 writers over readers to avoid potential writer starvation.
- 121132 A read-write lock object is an implementation-defined opaque object of type  
121133 **pthread\_rwlock\_t** as defined in `<pthread.h>`. There are two different sorts of locks  
121134 associated with a read-write lock: a read lock and a write lock.
- 121135 The `pthread_rwlockattr_init()` function initializes a read-write lock attributes object with the  
121136 default value for all the attributes defined in the implementation. After a read-write lock  
121137 attributes object has been used to initialize one or more read-write locks, changes to the  
121138 read-write lock attributes object, including destruction, do not affect previously initialized  
121139 read-write locks.
- 121140 Implementations must provide at least the read-write lock attribute *process-shared*. This  
121141 attribute can have the following values:

- 121142 PTHREAD\_PROCESS\_SHARED  
 121143 Any thread of any process that has access to the memory where the read-write lock  
 121144 resides can manipulate the read-write lock.
- 121145 PTHREAD\_PROCESS\_PRIVATE  
 121146 Only threads created within the same process as the thread that initialized the read-  
 121147 write lock can manipulate the read-write lock. This is the default value.
- 121148 The *pthread\_rwlockattr\_setpshared()* function is used to set the *process-shared* attribute of an  
 121149 initialized read-write lock attributes object while the function  
 121150 *pthread\_rwlockattr\_getpshared()* obtains the current value of the *process-shared* attribute.
- 121151 A read-write lock attributes object is destroyed using the *pthread\_rwlockattr\_destroy()*  
 121152 function. The effect of subsequent use of the read-write lock attributes object is undefined.
- 121153 A thread creates a read-write lock using the *pthread\_rwlock\_init()* function. The attributes  
 121154 of the read-write lock can be specified by the application developer; otherwise, the default  
 121155 implementation-defined read-write lock attributes are used if the pointer to the read-write  
 121156 lock attributes object is NULL. In cases where the default attributes are appropriate, the  
 121157 PTHREAD\_RWLOCK\_INITIALIZER macro can be used to initialize statically allocated  
 121158 read-write locks.
- 121159 A thread which wants to apply a read lock to the read-write lock can use either  
 121160 *pthread\_rwlock\_rdlock()* or *pthread\_rwlock\_tryrdlock()*. If *pthread\_rwlock\_rdlock()* is used, the  
 121161 thread acquires a read lock if a writer does not hold the write lock and there are no writers  
 121162 blocked on the write lock. If a read lock is not acquired, the calling thread blocks until it  
 121163 can acquire a lock. However, if *pthread\_rwlock\_tryrdlock()* is used, the function returns  
 121164 immediately with the error [EBUSY] if any thread holds a write lock or there are blocked  
 121165 writers waiting for the write lock.
- 121166 A thread which wants to apply a write lock to the read-write lock can use either of two  
 121167 functions: *pthread\_rwlock\_wrlock()* or *pthread\_rwlock\_trywrlock()*. If *pthread\_rwlock\_wrlock()*  
 121168 is used, the thread acquires the write lock if no other reader or writer threads hold the  
 121169 read-write lock. If the write lock is not acquired, the thread blocks until it can acquire the  
 121170 write lock. However, if *pthread\_rwlock\_trywrlock()* is used, the function returns  
 121171 immediately with the error [EBUSY] if any thread is holding either a read or a write lock.
- 121172 The *pthread\_rwlock\_unlock()* function is used to unlock a read-write lock object held by the  
 121173 calling thread. Results are undefined if the read-write lock is not held by the calling thread.  
 121174 If there are other read locks currently held on the read-write lock object, the read-write  
 121175 lock object remains in the read locked state but without the current thread as one of its  
 121176 owners. If this function releases the last read lock for this read-write lock object, the read-  
 121177 write lock object is put in the unlocked read state. If this function is called to release a write  
 121178 lock for this read-write lock object, the read-write lock object is put in the unlocked state.
- 121179 • Thread Concurrency Level
- 121180 On threads implementations that multiplex user threads onto a smaller set of kernel  
 121181 execution entities, the system attempts to create a reasonable number of kernel execution  
 121182 entities for the application upon application startup.
- 121183 On some implementations, these kernel entities are retained by user threads that block in  
 121184 the kernel. Other implementations do not *timeslice* user threads so that multiple compute-  
 121185 bound user threads can share a kernel thread. On such implementations, some  
 121186 applications may use up all the available kernel execution entities before their user-space  
 121187 threads are used up. The process may be left with user threads capable of doing work for  
 121188 the application but with no way to schedule them.

121189 The *pthread\_setconcurrency()* function enables an application to request more kernel  
 121190 entities; that is, specify a desired concurrency level. However, this function merely  
 121191 provides a hint to the implementation. The implementation is free to ignore this request or  
 121192 to provide some other number of kernel entities. If an implementation does not multiplex  
 121193 user threads onto a smaller number of kernel execution entities, the  
 121194 *pthread\_setconcurrency()* function has no effect.

121195 The *pthread\_setconcurrency()* function may also have an effect on implementations where  
 121196 the kernel mode and user mode schedulers cooperate to ensure that ready user threads are  
 121197 not prevented from running by other threads blocked in the kernel.

121198 The *pthread\_getconcurrency()* function always returns the value set by a previous call to  
 121199 *pthread\_setconcurrency()*. However, if *pthread\_setconcurrency()* was not previously called,  
 121200 this function returns zero to indicate that the threads implementation is maintaining the  
 121201 concurrency level.

121202 • Thread Stack Guard Size

121203 DCE threads introduced the concept of a “thread stack guard size”. Most thread  
 121204 implementations add a region of protected memory to a thread’s stack, commonly known  
 121205 as a “guard region”, as a safety measure to prevent stack pointer overflow in one thread  
 121206 from corrupting the contents of another thread’s stack. The default size of the guard  
 121207 regions attribute is {PAGESIZE} bytes and is implementation-defined.

121208 Some application developers may wish to change the stack guard size. When an  
 121209 application creates a large number of threads, the extra page allocated for each stack may  
 121210 strain system resources. In addition to the extra page of memory, the kernel’s memory  
 121211 manager has to keep track of the different protections on adjoining pages. When this is a  
 121212 problem, the application developer may request a guard size of 0 bytes to conserve system  
 121213 resources by eliminating stack overflow protection.

121214 Conversely an application that allocates large data structures such as arrays on the stack  
 121215 may wish to increase the default guard size in order to detect stack overflow. If a thread  
 121216 allocates two pages for a data array, a single guard page provides little protection against  
 121217 thread stack overflows since the thread can corrupt adjoining memory beyond the guard  
 121218 page.

121219 The System Interfaces volume of POSIX.1-2008 defines a new attribute of a thread  
 121220 attributes object; that is, the *guardsize* attribute which allows applications to specify the size  
 121221 of the guard region of a thread’s stack.

121222 Two functions are provided for manipulating a thread’s stack guard size. The  
 121223 *pthread\_attr\_setguardsize()* function sets the thread *guardsize* attribute, and the  
 121224 *pthread\_attr\_getguardsize()* function retrieves the current value.

121225 An implementation may round up the requested guard size to a multiple of the  
 121226 configurable system variable {PAGESIZE}. In this case, *pthread\_attr\_getguardsize()* returns  
 121227 the guard size specified by the previous *pthread\_attr\_setguardsize()* function call and not  
 121228 the rounded up value.

121229 If an application is managing its own thread stacks using the *stackaddr* attribute, the  
 121230 *guardsize* attribute is ignored and no stack overflow protection is provided. In this case, it is  
 121231 the responsibility of the application to manage stack overflow along with stack allocation.

121232 • Parallel I/O

121233 Suppose two or more threads independently issue read requests on the same file. To read  
 121234 specific data from a file, a thread must first call *lseek()* to seek to the proper offset in the  
 121235 file, and then call *read()* to retrieve the required data. If more than one thread does this at

121236 the same time, the first thread may complete its seek call, but before it gets a chance to  
 121237 issue its read call a second thread may complete its seek call, resulting in the first thread  
 121238 accessing incorrect data when it issues its read call. One workaround is to lock the file  
 121239 descriptor while seeking and reading or writing, but this reduces parallelism and adds  
 121240 overhead.

121241 Instead, the System Interfaces volume of POSIX.1-2008 provides two functions to make  
 121242 seek/read and seek/write operations atomic. The file descriptor's current offset is  
 121243 unchanged, thus allowing multiple read and write operations to proceed in parallel. This  
 121244 improves the I/O performance of threaded applications. The *pread()* function is used to do  
 121245 an atomic read of data from a file into a buffer. Conversely, the *pwrite()* function does an  
 121246 atomic write of data from a buffer to a file.

#### 121247 B.2.9.1 *Thread-Safety*

121248 All functions required by POSIX.1-2008 need to be thread-safe. Implementations have to  
 121249 provide internal synchronization when necessary in order to achieve this goal. In certain cases—  
 121250 for example, most floating-point implementations—context switch code may have to manage  
 121251 the writable shared state.

121252 While a read from a pipe of {PIPE\_MAX}\*2 bytes may not generate a single atomic and thread-  
 121253 safe stream of bytes, it should generate “several” (individually atomic) thread-safe streams of  
 121254 bytes. Similarly, while reading from a terminal device may not generate a single atomic and  
 121255 thread-safe stream of bytes, it should generate some finite number of (individually atomic) and  
 121256 thread-safe streams of bytes. That is, concurrent calls to read for a pipe, FIFO, or terminal device  
 121257 are not allowed to result in corrupting the stream of bytes or other internal data. However,  
 121258 *read()*, in these cases, is not required to return a single contiguous and atomic stream of bytes.

121259 It is not required that all functions provided by POSIX.1-2008 be either async-cancel-safe or  
 121260 async-signal-safe.

121261 As it turns out, some functions are inherently not thread-safe; that is, their interface  
 121262 specifications preclude async-signal-safety. For example, some functions (such as *asctime()*)  
 121263 return a pointer to a result stored in memory space allocated by the function on a per-process  
 121264 basis. Such a function is not thread-safe, because its result can be overwritten by successive  
 121265 invocations. Other functions, while not inherently non-thread-safe, may be implemented in  
 121266 ways that lead to them not being thread-safe. For example, some functions (such as *rand()*) store  
 121267 state information (such as a seed value, which survives multiple function invocations) in  
 121268 memory space allocated by the function on a per-process basis. The implementation of such a  
 121269 function is not thread-safe if the implementation fails to synchronize invocations of the function  
 121270 and thus fails to protect the state information. The problem is that when the state information is  
 121271 not protected, concurrent invocations can interfere with one another (for example, applications  
 121272 using *rand()* may see the same seed value).

#### 121273 *Thread-Safety and Locking of Existing Functions*

121274 Originally, POSIX.1 was not designed to work in a multi-threaded environment, and some  
 121275 implementations of some existing functions will not work properly when executed concurrently.  
 121276 To provide routines that will work correctly in an environment with threads (“thread-safe”), two  
 121277 problems need to be solved:

- 121278 1. Routines that maintain or return pointers to static areas internal to the routine (which  
 121279 may now be shared) need to be modified. The routines *ttyname()* and *localtime()* are  
 121280 examples.

121281 2. Routines that access data space shared by more than one thread need to be modified. The  
121282 *malloc()* function and the *stdio* family routines are examples.

121283 There are a variety of constraints on these changes. The first is compatibility with the existing  
121284 versions of these functions—non-thread-safe functions will continue to be in use for some time,  
121285 as the original interfaces are used by existing code. Another is that the new thread-safe versions  
121286 of these functions represent as small a change as possible over the familiar interfaces provided  
121287 by the existing non-thread-safe versions. The new interfaces should be independent of any  
121288 particular threads implementation. In particular, they should be thread-safe without depending  
121289 on explicit thread-specific memory. Finally, there should be minimal performance penalty due to  
121290 the changes made to the functions.

121291 It is intended that the list of functions from POSIX.1 that cannot be made thread-safe and for  
121292 which corrected versions are provided be complete.

#### 121293 *Thread-Safety and Locking Solutions*

121294 Many of the POSIX.1 functions were thread-safe and did not change at all. However, some  
121295 functions (for example, the math functions typically found in **libm**) are not thread-safe because  
121296 of writable shared global state. For instance, in IEEE Std 754-1985 floating-point  
121297 implementations, the computation modes and flags are global and shared.

121298 Some functions are not thread-safe because a particular implementation is not reentrant,  
121299 typically because of a non-essential use of static storage. These require only a new  
121300 implementation.

121301 Thread-safe libraries are useful in a wide range of parallel (and asynchronous) programming  
121302 environments, not just within pthreads. In order to be used outside the context of pthreads,  
121303 however, such libraries still have to use some synchronization method. These could either be  
121304 independent of the pthread synchronization operations, or they could be a subset of the pthread  
121305 interfaces. Either method results in thread-safe library implementations that can be used without  
121306 the rest of pthreads.

121307 Some functions, such as the *stdio* family interface and dynamic memory allocation functions  
121308 such as *malloc()*, are inter-dependent routines that share resources (for example, buffers) across  
121309 related calls. These require synchronization to work correctly, but they do not require any  
121310 change to their external (user-visible) interfaces.

121311 In some cases, such as *getc()* and *putc()*, adding synchronization is likely to create an  
121312 unacceptable performance impact. In this case, slower thread-safe synchronized functions are to  
121313 be provided, but the original, faster (but unsafe) functions (which may be implemented as  
121314 macros) are retained under new names. Some additional special-purpose synchronization  
121315 facilities are necessary for these macros to be usable in multi-threaded programs. This also  
121316 requires changes in **<stdio.h>**.

121317 The other common reason that functions are unsafe is that they return a pointer to static storage,  
121318 making the functions non-thread-safe. This has to be changed, and there are three natural  
121319 choices:

121320 1. Return a pointer to thread-specific storage

121321 This could incur a severe performance penalty on those architectures with a costly  
121322 implementation of the thread-specific data interface.

121323 A variation on this technique is to use *malloc()* to allocate storage for the function output  
121324 and return a pointer to this storage. This technique may also have an undesirable  
121325 performance impact, however, and a simplistic implementation requires that the user  
121326 program explicitly free the storage object when it is no longer needed. This technique is  
121327 used by some existing POSIX.1 functions. With careful implementation for infrequently

121328 used functions, there may be little or no performance or storage penalty, and the  
121329 maintenance of already-standardized interfaces is a significant benefit.

121330 2. Return the actual value computed by the function

121331 This technique can only be used with functions that return pointers to structures—  
121332 routines that return character strings would have to wrap their output in an enclosing  
121333 structure in order to return the output on the stack. There is also a negative performance  
121334 impact inherent in this solution in that the output value has to be copied twice before it  
121335 can be used by the calling function: once from the called routine's local buffers to the top  
121336 of the stack, then from the top of the stack to the assignment target. Finally, many older  
121337 compilers cannot support this technique due to a historical tendency to use internal static  
121338 buffers to deliver the results of structure-valued functions.

121339 3. Have the caller pass the address of a buffer to contain the computed value

121340 The only disadvantage of this approach is that extra arguments have to be provided by  
121341 the calling program. It represents the most efficient solution to the problem, however,  
121342 and, unlike the *malloc()* technique, it is semantically clear.

121343 There are some routines (often groups of related routines) whose interfaces are inherently non-  
121344 thread-safe because they communicate across multiple function invocations by means of static  
121345 memory locations. The solution is to redesign the calls so that they are thread-safe, typically by  
121346 passing the needed data as extra parameters. Unfortunately, this may require major changes to  
121347 the interface as well.

121348 A floating-point implementation using IEEE Std 754-1985 is a case in point. A less problematic  
121349 example is the *rand48* family of pseudo-random number generators. The functions *getrgid()*,  
121350 *getgrnam()*, *getpwnam()*, and *getpwuid()* are another such case.

121351 The problems with *errno* are discussed in [Alternative Solutions for Per-Thread \*errno\*](#) (on page  
121352 3506).

121353 Some functions can be thread-safe or not, depending on their arguments. These include the  
121354 *tmpnam()* and *ctermid()* functions. These functions have pointers to character strings as  
121355 arguments. If the pointers are not NULL, the functions store their results in the character string;  
121356 however, if the pointers are NULL, the functions store their results in an area that may be static  
121357 and thus subject to overwriting by successive calls. These should only be called by multi-thread  
121358 applications when their arguments are non-NULL.

121359 *Asynchronous Safety and Thread-Safety*

121360 A floating-point implementation has many modes that effect rounding and other aspects of  
121361 computation. Functions in some math library implementations may change the computation  
121362 modes for the duration of a function call. If such a function call is interrupted by a signal or  
121363 cancellation, the floating-point state is not required to be protected.

121364 There is a significant cost to make floating-point operations async-cancel-safe or async-signal-  
121365 safe; accordingly, neither form of async safety is required.

121366 *Functions Returning Pointers to Static Storage*

121367 For those functions that are not thread-safe because they return values in fixed size statically  
121368 allocated structures, alternate “\_r” forms are provided that pass a pointer to an explicit result  
121369 structure. Those that return pointers into library-allocated buffers have forms provided with  
121370 explicit buffer and length parameters.

121371 For functions that return pointers to library-allocated buffers, it makes sense to provide “\_r”  
121372 versions that allow the application control over allocation of the storage in which results are  
121373 returned. This allows the state used by these functions to be managed on an application-specific

121374 basis, supporting per-thread, per-process, or other application-specific sharing relationships.

121375 Early proposals had provided “\_r” versions for functions that returned pointers to variable-size  
121376 buffers without providing a means for determining the required buffer size. This would have  
121377 made using such functions exceedingly clumsy, potentially requiring iteratively calling them  
121378 with increasingly larger guesses for the amount of storage required. Hence, *sysconf()* variables  
121379 have been provided for such functions that return the maximum required buffer size.

121380 Thus, the rule that has been followed by POSIX.1-2008 when adapting single-threaded non-  
121381 thread-safe functions is as follows: all functions returning pointers to library-allocated storage  
121382 should have “\_r” versions provided, allowing the application control over the storage  
121383 allocation. Those with variable-sized return values accept both a buffer address and a length  
121384 parameter. The *sysconf()* variables are provided to supply the appropriate buffer sizes when  
121385 required. Implementors are encouraged to apply the same rule when adapting their own  
121386 existing functions to a pthreads environment.

121387 *B.2.9.2 Thread IDs*

121388 Separate applications should communicate through well-defined interfaces and should not  
121389 depend on each other’s implementation. For example, if a programmer decides to rewrite the  
121390 *sort* utility using multiple threads, it should be easy to do this so that the interface to the *sort*  
121391 utility does not change. Consider that if the user causes SIGINT to be generated while the *sort*  
121392 utility is running, keeping the same interface means that the entire *sort* utility is killed, not just  
121393 one of its threads. As another example, consider a realtime application that manages a reactor.  
121394 Such an application may wish to allow other applications to control the priority at which it  
121395 watches the control rods. One technique to accomplish this is to write the ID of the thread  
121396 watching the control rods into a file and allow other programs to change the priority of that  
121397 thread as they see fit. A simpler technique is to have the reactor process accept IPCs  
121398 (Interprocess Communication messages) from other processes, telling it at a semantic level what  
121399 priority the program should assign to watching the control rods. This allows the programmer  
121400 greater flexibility in the implementation. For example, the programmer can change the  
121401 implementation from having one thread per rod to having one thread watching all of the rods  
121402 without changing the interface. Having threads live inside the process means that the  
121403 implementation of a process is invisible to outside processes (excepting debuggers and system  
121404 management tools).

121405 Threads do not provide a protection boundary. Every thread model allows threads to share  
121406 memory with other threads and encourages this sharing to be widespread. This means that one  
121407 thread can wipe out memory that is needed for the correct functioning of other threads that are  
121408 sharing its memory. Consequently, providing each thread with its own user and/or group IDs  
121409 would not provide a protection boundary between threads sharing memory.

121410 Some applications make the assumption that the implementation can always detect invalid uses  
121411 of thread IDs of type **pthread\_t**. This is an invalid assumption. Specifically, if **pthread\_t**  
121412 is defined as a pointer type, no access check needs to be performed before using the ID.

121413 As with other interfaces that take pointer parameters, the outcome of passing an invalid  
121414 parameter can result in an invalid memory reference or an attempt to access an undefined  
121415 portion of a memory object, cause signals to be sent (SIGSEGV or SIGBUS) and possible  
121416 termination of the process. This is a similar case to passing an invalid buffer pointer to *read()*.  
121417 Some implementations might implement *read()* as a system call and set an [EFAULT] error  
121418 condition. Other implementations might contain parts of *read()* at user level and the first  
121419 attempt to access data at an invalid reference will cause a signal to be sent instead.

121420 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
121421 that the function should fail and report an [ESRCH] error. This does not imply that

121422 implementations are required to return in this case. It is legitimate behavior to send an “invalid  
 121423 memory reference” signal (SIGSEGV or SIGBUS). It is the application’s responsibility to use only  
 121424 valid thread IDs and to keep track of the lifetime of the underlying threads.

121425 *B.2.9.3 Thread Mutexes*

121426 There is no additional rationale provided for this section.

121427 *B.2.9.4 Thread Scheduling*

121428 • Scheduling Implementation Models

121429 The following scheduling implementation models are presented in terms of threads and  
 121430 “kernel entities”. This is to simplify exposition of the models, and it does not imply that  
 121431 an implementation actually has an identifiable “kernel entity”.

121432 A kernel entity is not defined beyond the fact that it has scheduling attributes that are used  
 121433 to resolve contention with other kernel entities for execution resources. A kernel entity  
 121434 may be thought of as an envelope that holds a thread or a separate kernel thread. It is not a  
 121435 conventional process, although it shares with the process the attribute that it has a single  
 121436 thread of control; it does not necessarily imply an address space, open files, and so on. It is  
 121437 better thought of as a primitive facility upon which conventional processes and threads  
 121438 may be constructed.

121439 — System Thread Scheduling Model

121440 This model consists of one thread per kernel entity. The kernel entity is solely  
 121441 responsible for scheduling thread execution on one or more processors. This model  
 121442 schedules all threads against all other threads in the system using the scheduling  
 121443 attributes of the thread.

121444 — Process Scheduling Model

121445 A generalized process scheduling model consists of two levels of scheduling. A  
 121446 threads library creates a pool of kernel entities, as required, and schedules threads to  
 121447 run on them using the scheduling attributes of the threads. Typically, the size of the  
 121448 pool is a function of the simultaneously runnable threads, not the total number of  
 121449 threads. The kernel then schedules the kernel entities onto processors according to  
 121450 their scheduling attributes, which are managed by the threads library. This set model  
 121451 potentially allows a wide range of mappings between threads and kernel entities.

121452 • System and Process Scheduling Model Performance

121453 There are a number of important implications on the performance of applications using  
 121454 these scheduling models. The process scheduling model potentially provides lower  
 121455 overhead for making scheduling decisions, since there is no need to access kernel-level  
 121456 information or functions and the set of schedulable entities is smaller (only the threads  
 121457 within the process).

121458 On the other hand, since the kernel is also making scheduling decisions regarding the  
 121459 system resources under its control (for example, CPU(s), I/O devices, memory), decisions  
 121460 that do not take thread scheduling parameters into account can result in unspecified  
 121461 delays for realtime application threads, causing them to miss maximum response time  
 121462 limits.

- 121463
- Rate Monotonic Scheduling
- 121464 Rate monotonic scheduling was considered, but rejected for standardization in the context  
121465 of pthreads. A sporadic server policy is included.
- 121466
- Scheduling Options
- 121467 In POSIX.1-2008, the basic thread scheduling functions are defined under the threads  
121468 functionality, so that they are required of all threads implementations. However, there are  
121469 no specific scheduling policies required by this functionality to allow for conforming  
121470 thread implementations that are not targeted to realtime applications.
- 121471 Specific standard scheduling policies are defined to be under the Thread Execution  
121472 Scheduling option, and they are specifically designed to support realtime applications by  
121473 providing predictable resource-sharing sequences. The name of this option was chosen to  
121474 emphasize that this functionality is defined as appropriate for realtime applications that  
121475 require simple priority-based scheduling.
- 121476 It is recognized that these policies are not necessarily satisfactory for some multi-processor  
121477 implementations, and work is ongoing to address a wider range of scheduling behaviors.  
121478 The interfaces have been chosen to create abundant opportunity for future scheduling  
121479 policies to be implemented and standardized based on this interface. In order to  
121480 standardize a new scheduling policy, all that is required (from the standpoint of thread  
121481 scheduling attributes) is to define a new policy name, new members of the thread  
121482 attributes object, and functions to set these members when the scheduling policy is equal  
121483 to the new value.
- 121484 **Scheduling Contention Scope**
- 121485 In order to accommodate the requirement for realtime response, each thread has a scheduling  
121486 contention scope attribute. Threads with a system scheduling contention scope have to be  
121487 scheduled with respect to all other threads in the system. These threads are usually bound to a  
121488 single kernel entity that reflects their scheduling attributes and are directly scheduled by the  
121489 kernel.
- 121490 Threads with a process scheduling contention scope need be scheduled only with respect to the  
121491 other threads in the process. These threads may be scheduled within the process onto a pool of  
121492 kernel entities. The implementation is also free to bind these threads directly to kernel entities  
121493 and let them be scheduled by the kernel. Process scheduling contention scope allows the  
121494 implementation the most flexibility and is the default if both contention scopes are supported  
121495 and none is specified.
- 121496 Thus, the choice by implementors to provide one or the other (or both) of these scheduling  
121497 models is driven by the need of their supported application domains for worst-case (that is,  
121498 realtime) response, or average-case (non-realtime) response.
- 121499 **Scheduling Allocation Domain**
- 121500 The SCHED\_FIFO and SCHED\_RR scheduling policies take on different characteristics on a  
121501 multi-processor. Other scheduling policies are also subject to changed behavior when executed  
121502 on a multi-processor. The concept of scheduling allocation domain determines the set of  
121503 processors on which the threads of an application may run. By considering the application's  
121504 processor scheduling allocation domain for its threads, scheduling policies can be defined in  
121505 terms of their behavior for varying processor scheduling allocation domain values. It is  
121506 conceivable that not all scheduling allocation domain sizes make sense for all scheduling  
121507 policies on all implementations. The concept of scheduling allocation domain, however, is a  
121508 useful tool for the description of multi-processor scheduling policies.

121509 The “process control” approach to scheduling obtains significant performance advantages from  
121510 dynamic scheduling allocation domain sizes when it is applicable.

121511 Non-Uniform Memory Access (NUMA) multi-processors may use a system scheduling structure  
121512 that involves reassignment of threads among scheduling allocation domains. In NUMA  
121513 machines, a natural model of scheduling is to match scheduling allocation domains to clusters of  
121514 processors. Load balancing in such an environment requires changing the scheduling allocation  
121515 domain to which a thread is assigned.

#### 121516 **Scheduling Documentation**

121517 Implementation-provided scheduling policies need to be completely documented in order to be  
121518 useful. This documentation includes a description of the attributes required for the policy, the  
121519 scheduling interaction of threads running under this policy and all other supported policies, and  
121520 the effects of all possible values for processor scheduling allocation domain. Note that for the  
121521 implementor wishing to be minimally-compliant, it is (minimally) acceptable to define the  
121522 behavior as undefined.

#### 121523 **Scheduling Contention Scope Attribute**

121524 The scheduling contention scope defines how threads compete for resources. Within  
121525 POSIX.1-2008, scheduling contention scope is used to describe only how threads are scheduled  
121526 in relation to one another in the system. That is, either they are scheduled against all other  
121527 threads in the system (“system scope”) or only against those threads in the process (“process  
121528 scope”). In fact, scheduling contention scope may apply to additional resources, including  
121529 virtual timers and profiling, which are not currently considered by POSIX.1-2008.

#### 121530 **Mixed Scopes**

121531 If only one scheduling contention scope is supported, the scheduling decision is straightforward.  
121532 To perform the processor scheduling decision in a mixed scope environment, it is necessary to  
121533 map the scheduling attributes of the thread with process-wide contention scope to the same  
121534 attribute space as the thread with system-wide contention scope.

121535 Since a conforming implementation has to support one and may support both scopes, it is useful  
121536 to discuss the effects of such choices with respect to example applications. If an implementation  
121537 supports both scopes, mixing scopes provides a means of better managing system-level (that is,  
121538 kernel-level) and library-level resources. In general, threads with system scope will require the  
121539 resources of a separate kernel entity in order to guarantee the scheduling semantics. On the  
121540 other hand, threads with process scope can share the resources of a kernel entity while  
121541 maintaining the scheduling semantics.

121542 The application is free to create threads with dedicated kernel resources, and other threads that  
121543 multiplex kernel resources. Consider the example of a window server. The server allocates two  
121544 threads per widget: one thread manages the widget user interface (including drawing), while  
121545 the other thread takes any required application action. This allows the widget to be “active”  
121546 while the application is computing. A screen image may be built from thousands of widgets. If  
121547 each of these threads had been created with system scope, then most of the kernel-level  
121548 resources might be wasted, since only a few widgets are active at any one time. In addition,  
121549 mixed scope is particularly useful in a window server where one thread with high priority and  
121550 system scope handles the mouse so that it tracks well. As another example, consider a database  
121551 server. For each of the hundreds or thousands of clients supported by a large server, an  
121552 equivalent number of threads will have to be created. If each of these threads were system scope,  
121553 the consequences would be the same as for the window server example above. However, the  
121554 server could be constructed so that actual retrieval of data is done by several dedicated threads.  
121555 Dedicated threads that do work for all clients frequently justify the added expense of system

121556 scope. If it were not permissible to mix system and process threads in the same process, this type  
121557 of solution would not be possible.

#### 121558 **Dynamic Thread Scheduling Parameters Access**

121559 In many time-constrained applications, there is no need to change the scheduling attributes  
121560 dynamically during thread or process execution, since the general use of these attributes is to  
121561 reflect directly the time constraints of the application. Since these time constraints are generally  
121562 imposed to meet higher-level system requirements, such as accuracy or availability, they  
121563 frequently should remain unchanged during application execution.

121564 However, there are important situations in which the scheduling attributes should be changed.  
121565 Generally, this will occur when external environmental conditions exist in which the time  
121566 constraints change. Consider, for example, a space vehicle major mode change, such as the  
121567 change from ascent to descent mode, or the change from the space environment to the  
121568 atmospheric environment. In such cases, the frequency with which many of the sensors or  
121569 actuators need to be read or written will change, which will necessitate a priority change. In  
121570 other cases, even the existence of a time constraint might be temporary, necessitating not just a  
121571 priority change, but also a policy change for ongoing threads or processes. For this reason, it is  
121572 critical that the interface should provide functions to change the scheduling parameters  
121573 dynamically, but, as with many of the other realtime functions, it is important that applications  
121574 use them properly to avoid the possibility of unnecessarily degrading performance.

121575 In providing functions for dynamically changing the scheduling behavior of threads, there were  
121576 two options: provide functions to get and set the individual scheduling parameters of threads,  
121577 or provide a single interface to get and set all the scheduling parameters for a given thread  
121578 simultaneously. Both approaches have merit. Access functions for individual parameters allow  
121579 simpler control of thread scheduling for simple thread scheduling parameters. However, a single  
121580 function for setting all the parameters for a given scheduling policy is required when first setting  
121581 that scheduling policy. Since the single all-encompassing functions are required, it was decided  
121582 to leave the interface as minimal as possible. Note that simpler functions (such as  
121583 *pthread\_setprio()* for threads running under the priority-based schedulers) can be easily defined  
121584 in terms of the all-encompassing functions.

121585 If the *pthread\_setschedparam()* function executes successfully, it will have set all of the scheduling  
121586 parameter values indicated in *param*; otherwise, none of the scheduling parameters will have  
121587 been modified. This is necessary to ensure that the scheduling of this and all other threads  
121588 continues to be consistent in the presence of an erroneous scheduling parameter.

121589 The [EPERM] error value is included in the list of possible *pthread\_setschedparam()* error returns  
121590 as a reflection of the fact that the ability to change scheduling parameters increases risks to the  
121591 implementation and application performance if the scheduling parameters are changed  
121592 improperly. For this reason, and based on some existing practice, it was felt that some  
121593 implementations would probably choose to define specific permissions for changing either a  
121594 thread's own or another thread's scheduling parameters. POSIX.1-2008 does not include  
121595 portable methods for setting or retrieving permissions, so any such use of permissions is  
121596 completely unspecified.

**121597 Mutex Initialization Scheduling Attributes**

121598 In a priority-driven environment, a direct use of traditional primitives like mutexes and  
121599 condition variables can lead to unbounded priority inversion, where a higher priority thread can  
121600 be blocked by a lower priority thread, or set of threads, for an unbounded duration of time. As a  
121601 result, it becomes impossible to guarantee thread deadlines. Priority inversion can be bounded  
121602 and minimized by the use of priority inheritance protocols. This allows thread deadlines to be  
121603 guaranteed even in the presence of synchronization requirements.

121604 Two useful but simple members of the family of priority inheritance protocols are the basic  
121605 priority inheritance protocol and the priority ceiling protocol emulation. Under the Basic  
121606 Priority Inheritance protocol (governed by the Non-Robust Mutex Priority Inheritance option), a  
121607 thread that is blocking higher priority threads executes at the priority of the highest priority  
121608 thread that it blocks. This simple mechanism allows priority inversion to be bounded by the  
121609 duration of critical sections and makes timing analysis possible.

121610 Under the Priority Ceiling Protocol Emulation protocol (governed by the Thread Priority  
121611 Protection option), each mutex has a priority ceiling, usually defined as the priority of the  
121612 highest priority thread that can lock the mutex. When a thread is executing inside critical  
121613 sections, its priority is unconditionally increased to the highest of the priority ceilings of all the  
121614 mutexes owned by the thread. This protocol has two very desirable properties in uni-processor  
121615 systems. First, a thread can be blocked by a lower priority thread for at most the duration of one  
121616 single critical section. Furthermore, when the protocol is correctly used in a single processor, and  
121617 if threads do not become blocked while owning mutexes, mutual deadlocks are prevented.

121618 The priority ceiling emulation can be extended to multiple processor environments, in which  
121619 case the values of the priority ceilings will be assigned depending on the kind of mutex that is  
121620 being used: local to only one processor, or global, shared by several processors. Local priority  
121621 ceilings will be assigned the usual way, equal to the priority of the highest priority thread that  
121622 may lock that mutex. Global priority ceilings will usually be assigned a priority level higher  
121623 than all the priorities assigned to any of the threads that reside in the involved processors to  
121624 avoid the effect called remote blocking.

**121625 Change the Priority Ceiling of a Mutex**

121626 In order for the priority protect protocol to exhibit its desired properties of bounding priority  
121627 inversion and avoidance of deadlock, it is critical that the ceiling priority of a mutex be the same  
121628 as the priority of the highest thread that can ever hold it, or higher. Thus, if the priorities of the  
121629 threads using such mutexes never change dynamically, there is no need ever to change the  
121630 priority ceiling of a mutex.

121631 However, if a major system mode change results in an altered response time requirement for one  
121632 or more application threads, their priority has to change to reflect it. It will occasionally be the  
121633 case that the priority ceilings of mutexes held also need to change. While changing priority  
121634 ceilings should generally be avoided, it is important that POSIX.1-2008 provide these interfaces  
121635 for those cases in which it is necessary.

**121636 B.2.9.5 Thread Cancellation**

121637 Many existing threads packages have facilities for canceling an operation or canceling a thread.  
121638 These facilities are used for implementing user requests (such as the CANCEL button in a  
121639 window-based application), for implementing OR parallelism (for example, telling the other  
121640 threads to stop working once one thread has found a forced mate in a parallel chess program), or  
121641 for implementing the ABORT mechanism in Ada.

121642 POSIX programs traditionally have used the signal mechanism combined with either *longjmp()*

121643 or polling to cancel operations. Many POSIX programmers have trouble using these facilities to  
121644 solve their problems efficiently in a single-threaded process. With the introduction of threads,  
121645 these solutions become even more difficult to use.

121646 The main issues with implementing a cancellation facility are specifying the operation to be  
121647 canceled, cleanly releasing any resources allocated to that operation, controlling when the target  
121648 notices that it has been canceled, and defining the interaction between asynchronous signals and  
121649 cancellation.

#### 121650 **Specifying the Operation to Cancel**

121651 Consider a thread that calls through five distinct levels of program abstraction and then, inside  
121652 the lowest-level abstraction, calls a function that suspends the thread. (An abstraction boundary  
121653 is a layer at which the client of the abstraction sees only the service being provided and can  
121654 remain ignorant of the implementation. Abstractions are often layered, each level of abstraction  
121655 being a client of the lower-level abstraction and implementing a higher-level abstraction.)  
121656 Depending on the semantics of each abstraction, one could imagine wanting to cancel only the  
121657 call that causes suspension, only the bottom two levels, or the operation being done by the entire  
121658 thread. Canceling operations at a finer grain than the entire thread is difficult because threads  
121659 are active and they may be run in parallel on a multi-processor. By the time one thread can make  
121660 a request to cancel an operation, the thread performing the operation may have completed that  
121661 operation and gone on to start another operation whose cancellation is not desired. Thread IDs  
121662 are not reused until the thread has exited, and either it was created with the *Attr detachstate*  
121663 attribute set to *PTHREAD\_CREATE\_DETACHED* or the *pthread\_join()* or *pthread\_detach()*  
121664 function has been called for that thread. Consequently, a thread cancellation will never be  
121665 misdirected when the thread terminates. For these reasons, the canceling of operations is done at  
121666 the granularity of the thread. Threads are designed to be inexpensive enough so that a separate  
121667 thread may be created to perform each separately cancelable operation; for example, each  
121668 possibly long running user request.

121669 For cancellation to be used in existing code, cancellation scopes and handlers will have to be  
121670 established for code that needs to release resources upon cancellation, so that it follows the  
121671 programming discipline described in the text.

#### 121672 **A Special Signal Versus a Special Interface**

121673 Two different mechanisms were considered for providing the cancellation interfaces. The first  
121674 was to provide an interface to direct signals at a thread and then to define a special signal that  
121675 had the required semantics. The other alternative was to use a special interface that delivered the  
121676 correct semantics to the target thread.

121677 The solution using signals produced a number of problems. It required the implementation to  
121678 provide cancellation in terms of signals whereas a perfectly valid (and possibly more efficient)  
121679 implementation could have both layered on a low-level set of primitives. There were so many  
121680 exceptions to the special signal (it cannot be used with *kill()*, no POSIX.1 interfaces can be used  
121681 with it) that it was clearly not a valid signal. Its semantics on delivery were also completely  
121682 different from any existing POSIX.1 signal. As such, a special interface that did not mandate the  
121683 implementation and did not confuse the semantics of signals and cancellation was felt to be the  
121684 better solution.

### 121685 **Races Between Cancellation and Resuming Execution**

121686 Due to the nature of cancellation, there is generally no synchronization between the thread  
 121687 requesting the cancellation of a blocked thread and events that may cause that thread to resume  
 121688 execution. For this reason, and because excess serialization hurts performance, when both an  
 121689 event that a thread is waiting for has occurred and a cancellation request has been made and  
 121690 cancellation is enabled, POSIX.1-2008 explicitly allows the implementation to choose between  
 121691 returning from the blocking call or acting on the cancellation request.

### 121692 **Interaction of Cancellation with Asynchronous Signals**

121693 A typical use of cancellation is to acquire a lock on some resource and to establish a cancellation  
 121694 cleanup handler for releasing the resource when and if the thread is canceled.

121695 A correct and complete implementation of cancellation in the presence of asynchronous signals  
 121696 requires considerable care. An implementation has to push a cancellation cleanup handler on the  
 121697 cancellation cleanup stack while maintaining the integrity of the stack data structure. If an  
 121698 asynchronously-generated signal is posted to the thread during a stack operation, the signal  
 121699 handler cannot manipulate the cancellation cleanup stack. As a consequence, asynchronous  
 121700 signal handlers may not cancel threads or otherwise manipulate the cancellation state of a  
 121701 thread. Threads may, of course, be canceled by another thread that used a *sigwait()* function to  
 121702 wait synchronously for an asynchronous signal.

121703 In order for cancellation to function correctly, it is required that asynchronous signal handlers  
 121704 not change the cancellation state. This requires that some elements of existing practice, such as  
 121705 using *longjmp()* to exit from an asynchronous signal handler implicitly, be prohibited in cases  
 121706 where the integrity of the cancellation state of the interrupt thread cannot be ensured.

### 121707 **Thread Cancellation Overview**

#### 121708 • Cancellability States

121709 The three possible cancellability states (disabled, deferred, and asynchronous) are encoded  
 121710 into two separate bits ((disable, enable) and (deferred, asynchronous)) to allow them to be  
 121711 changed and restored independently. For instance, short code sequences that will not block  
 121712 sometimes disable cancellability on entry and restore the previous state upon exit.  
 121713 Likewise, long or unbounded code sequences containing no convenient explicit  
 121714 cancellation points will sometimes set the cancellability type to asynchronous on entry and  
 121715 restore the previous value upon exit.

#### 121716 • Cancellation Points

121717 Cancellation points are points inside of certain functions where a thread has to act on any  
 121718 pending cancellation request when cancellability is enabled. For functions in the “shall  
 121719 occur” list, a cancellation check must be performed on every call regardless of whether,  
 121720 absent the cancellation, the call would have blocked. For functions in the “may occur” list,  
 121721 a cancellation check may be performed on some calls but not others; i.e., whether or not a  
 121722 cancellation point occurs when one of these functions is being executed can depend on  
 121723 current conditions.

121724 The idea was considered of allowing implementations to define whether blocking calls  
 121725 such as *read()* should be cancellation points. It was decided that it would adversely affect  
 121726 the design of conforming applications if blocking calls were not cancellation points  
 121727 because threads could be left blocked in an uncancelable state.

121728 There are several important blocking routines that are specifically not made cancellation  
 121729 points:

- 121730 — *pthread\_mutex\_lock()*
- 121731 If *pthread\_mutex\_lock()* were a cancellation point, every routine that called it would  
 121732 also become a cancellation point (that is, any routine that touched shared state would  
 121733 automatically become a cancellation point). For example, *malloc()*, *free()*, and *rand()*  
 121734 would become cancellation points under this scheme. Having too many cancellation  
 121735 points makes programming very difficult, leading to either much disabling and  
 121736 restoring of cancelability or much difficulty in trying to arrange for reliable cleanup  
 121737 at every possible place.
- 121738 Since *pthread\_mutex\_lock()* is not a cancellation point, threads could result in being  
 121739 blocked uninterruptibly for long periods of time if mutexes were used as a general  
 121740 synchronization mechanism. As this is normally not acceptable, mutexes should only  
 121741 be used to protect resources that are held for small fixed lengths of time where not  
 121742 being able to be canceled will not be a problem. Resources that need to be held  
 121743 exclusively for long periods of time should be protected with condition variables.
- 121744 — *pthread\_barrier\_wait()*
- 121745 Canceling a barrier wait will render a barrier unusable. Similar to a barrier timeout  
 121746 (which the standard developers rejected), there is no way to guarantee the  
 121747 consistency of a barrier's internal data structures if a barrier wait is canceled.
- 121748 — *pthread\_spin\_lock()*
- 121749 As with mutexes, spin locks should only be used to protect resources that are held for  
 121750 small fixed lengths of time where not being cancelable will not be a problem.
- 121751 Every library routine should specify whether or not it includes any cancellation points.  
 121752 Typically, only those routines that may block or compute indefinitely need to include  
 121753 cancellation points.
- 121754 Correctly coded routines only reach cancellation points after having set up a cancellation  
 121755 cleanup handler to restore invariants if the thread is canceled at that point. Being  
 121756 cancelable only at specified cancellation points allows programmers to keep track of  
 121757 actions needed in a cancellation cleanup handler more easily. A thread should only be  
 121758 made asynchronously cancelable when it is not in the process of acquiring or releasing  
 121759 resources or otherwise in a state from which it would be difficult or impossible to recover.
- 121760 • Thread Cancellation Cleanup Handlers
- 121761 The cancellation cleanup handlers provide a portable mechanism, easy to implement, for  
 121762 releasing resources and restoring invariants. They are easier to use than signal handlers  
 121763 because they provide a stack of cancellation cleanup handlers rather than a single handler,  
 121764 and because they have an argument that can be used to pass context information to the  
 121765 handler.
- 121766 The alternative to providing these simple cancellation cleanup handlers (whose only use is  
 121767 for cleaning up when a thread is canceled) is to define a general exception package that  
 121768 could be used for handling and cleaning up after hardware traps and software-detected  
 121769 errors. This was too far removed from the charter of providing threads to handle  
 121770 asynchrony. However, it is an explicit goal of POSIX.1-2008 to be compatible with existing  
 121771 exception facilities and languages having exceptions.
- 121772 The interaction of this facility and other procedure-based or language-level exception  
 121773 facilities is unspecified in this version of POSIX.1-2008. However, it is intended that it be  
 121774 possible for an implementation to define the relationship between these cancellation  
 121775 cleanup handlers and Ada, C++, or other language-level exception handling facilities.

121776 It was suggested that the cancellation cleanup handlers should also be called when the  
 121777 process exits or calls the *exec* function. This was rejected partly due to the performance  
 121778 problem caused by having to call the cancellation cleanup handlers of every thread before  
 121779 the operation could continue. The other reason was that the only state expected to be  
 121780 cleaned up by the cancellation cleanup handlers would be the intraprocess state. Any  
 121781 handlers that are to clean up the interprocess state would be registered with *atexit()*. There  
 121782 is the orthogonal problem that the *exec* functions do not honor the *atexit()* handlers, but  
 121783 resolving this is beyond the scope of POSIX.1-2008.

121784 • Async-Cancel Safety

121785 A function is said to be async-cancel-safe if it is written in such a way that entering the  
 121786 function with asynchronous cancelability enabled will not cause any invariants to be  
 121787 violated, even if a cancellation request is delivered at any arbitrary instruction. Functions  
 121788 that are async-cancel-safe are often written in such a way that they need to acquire no  
 121789 resources for their operation and the visible variables that they may write are strictly  
 121790 limited.

121791 Any routine that gets a resource as a side-effect cannot be made async-cancel-safe (for  
 121792 example, *malloc()*). If such a routine were called with asynchronous cancelability enabled,  
 121793 it might acquire the resource successfully, but as it was returning to the client, it could act  
 121794 on a cancellation request. In such a case, the application would have no way of knowing  
 121795 whether the resource was acquired or not.

121796 Indeed, because many interesting routines cannot be made async-cancel-safe, most library  
 121797 routines in general are not async-cancel-safe. Every library routine should specify whether  
 121798 or not it is async-cancel safe so that programmers know which routines can be called from  
 121799 code that is asynchronously cancelable.

121800 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/8 is applied, adding the *pselect()* function  
 121801 to the list of functions with cancellation points.

121802 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/5 is applied, adding the *fdatasync()*  
 121803 function into the table of functions that shall have cancellation points.

121804 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/6 is applied, adding the numerous  
 121805 functions into the table of functions that may have cancellation points.

121806 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/7 is applied, clarifying the requirements  
 121807 in Thread Cancellation Cleanup Handlers.

121808 B.2.9.6 *Thread Read-Write Locks*

121809 **Background**

121810 Read-write locks are often used to allow parallel access to data on multi-processors, to avoid  
 121811 context switches on uni-processors when multiple threads access the same data, and to protect  
 121812 data structures that are frequently accessed (that is, read) but rarely updated (that is, written).  
 121813 The in-core representation of a file system directory is a good example of such a data structure.  
 121814 One would like to achieve as much concurrency as possible when searching directories, but limit  
 121815 concurrent access when adding or deleting files.

121816 Although read-write locks can be implemented with mutexes and condition variables, such  
 121817 implementations are significantly less efficient than is possible. Therefore, this synchronization  
 121818 primitive is included in POSIX.1-2008 for the purpose of allowing more efficient  
 121819 implementations in multi-processor systems.

121820 **Queuing of Waiting Threads**

121821 The `pthread_rwlock_unlock()` function description states that one writer or one or more readers  
 121822 must acquire the lock if it is no longer held by any thread as a result of the call. However, the  
 121823 function does not specify which thread(s) acquire the lock, unless the Thread Execution  
 121824 Scheduling option is supported.

121825 The standard developers considered the issue of scheduling with respect to the queuing of  
 121826 threads blocked on a read-write lock. The question turned out to be whether POSIX.1-2008  
 121827 should require priority scheduling of read-write locks for threads whose execution scheduling  
 121828 policy is priority-based (for example, `SCHED_FIFO` or `SCHED_RR`). There are tradeoffs  
 121829 between priority scheduling, the amount of concurrency achievable among readers, and the  
 121830 prevention of writer and/or reader starvation.

121831 For example, suppose one or more readers hold a read-write lock and the following threads  
 121832 request the lock in the listed order:

```
121833 pthread_rwlock_wrlock() - Low priority thread writer_a
121834 pthread_rwlock_rdlock() - High priority thread reader_a
121835 pthread_rwlock_rdlock() - High priority thread reader_b
121836 pthread_rwlock_rdlock() - High priority thread reader_c
```

121837 When the lock becomes available, should *writer\_a* block the high priority readers? Or, suppose a  
 121838 read-write lock becomes available and the following are queued:

```
121839 pthread_rwlock_rdlock() - Low priority thread reader_a
121840 pthread_rwlock_rdlock() - Low priority thread reader_b
121841 pthread_rwlock_rdlock() - Low priority thread reader_c
121842 pthread_rwlock_wrlock() - Medium priority thread writer_a
121843 pthread_rwlock_rdlock() - High priority thread reader_d
```

121844 If priority scheduling is applied then *reader\_d* would acquire the lock and *writer\_a* would block  
 121845 the remaining readers. But should the remaining readers also acquire the lock to increase  
 121846 concurrency? The solution adopted takes into account that when the Thread Execution  
 121847 Scheduling option is supported, high priority threads may in fact starve low priority threads  
 121848 (the application developer is responsible in this case for designing the system in such a way that  
 121849 this starvation is avoided). Therefore, POSIX.1-2008 specifies that high priority readers take  
 121850 precedence over lower priority writers. However, to prevent writer starvation from threads of  
 121851 the same or lower priority, writers take precedence over readers of the same or lower priority.

121852 Priority inheritance mechanisms are non-trivial in the context of read-write locks. When a high  
 121853 priority writer is forced to wait for multiple readers, for example, it is not clear which subset of  
 121854 the readers should inherit the writer's priority. Furthermore, the internal data structures that  
 121855 record the inheritance must be accessible to all readers, and this implies some sort of  
 121856 serialization that could negate any gain in parallelism achieved through the use of multiple  
 121857 readers in the first place. Finally, existing practice does not support the use of priority  
 121858 inheritance for read-write locks. Therefore, no specification of priority inheritance or priority  
 121859 ceiling is attempted. If reliable priority-scheduled synchronization is absolutely required, it can  
 121860 always be obtained through the use of mutexes.

121861 **Comparison to fcntl() Locks**

121862 The read-write locks and the *fcntl()* locks in POSIX.1-2008 share a common goal: increasing  
121863 concurrency among readers, thus increasing throughput and decreasing delay.

121864 However, the read-write locks have two features not present in the *fcntl()* locks. First, under  
121865 priority scheduling, read-write locks are granted in priority order. Second, also under priority  
121866 scheduling, writer starvation is prevented by giving writers preference over readers of equal or  
121867 lower priority.

121868 Also, read-write locks can be used in systems lacking a file system, such as those conforming to  
121869 the minimal realtime system profile of IEEE Std 1003.13-1998.

121870 **History of Resolution Issues**

121871 Based upon some balloting objections, early drafts specified the behavior of threads waiting on a  
121872 read-write lock during the execution of a signal handler, as if the thread had not called the lock  
121873 operation. However, this specified behavior would require implementations to establish  
121874 internal signal handlers even though this situation would be rare, or never happen for many  
121875 programs. This would introduce an unacceptable performance hit in comparison to the little  
121876 additional functionality gained. Therefore, the behavior of read-write locks and signals was  
121877 reverted back to its previous mutex-like specification.

121878 *B.2.9.7 Thread Interactions with Regular File Operations*

121879 There is no additional rationale provided for this section.

121880 *B.2.9.8 Use of Application-Managed Thread Stacks*

121881 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/8 is applied, adding this new section. It  
121882 was added to make it clear that the current standard does not allow an application to determine  
121883 when a stack can be reclaimed. This may be addressed in a future version.

121884 **B.2.10 Sockets**

121885 The base document for the sockets interfaces in POSIX.1-2008 is the XNS, Issue 5.2 specification.  
121886 This was primarily chosen as it aligns with IPv6. Additional material has been added from  
121887 IEEE Std 1003.1g-2000, notably socket concepts, raw sockets, the *pselect()* function, the  
121888 *socketmark()* function, and the `<sys/select.h>` header.

121889 *B.2.10.1 Address Families*

121890 There is no additional rationale provided for this section.

121891 *B.2.10.2 Addressing*

121892 There is no additional rationale provided for this section.

121893 B.2.10.3 *Protocols*

121894 There is no additional rationale provided for this section.

121895 B.2.10.4 *Routing*

121896 There is no additional rationale provided for this section.

121897 B.2.10.5 *Interfaces*

121898 There is no additional rationale provided for this section.

121899 B.2.10.6 *Socket Types*

121900 The type **socklen\_t** was invented to cover the range of implementations seen in the field. The  
121901 intent of **socklen\_t** is to be the type for all lengths that are naturally bounded in size; that is, that  
121902 they are the length of a buffer which cannot sensibly become of massive size: network addresses,  
121903 host names, string representations of these, ancillary data, control messages, and socket options  
121904 are examples. Truly boundless sizes are represented by **size\_t** as in *read()*, *write()*, and so on.

121905 All **socklen\_t** types were originally (in BSD UNIX) of type **int**. During the development of  
121906 POSIX.1-2008, it was decided to change all buffer lengths to **size\_t**, which appears at face value  
121907 to make sense. When dual mode 32/64-bit systems came along, this choice unnecessarily  
121908 complicated system interfaces because **size\_t** (with **long**) was a different size under ILP32 and  
121909 LP64 models. Reverting to **int** would have happened except that some implementations had  
121910 already shipped 64-bit-only interfaces. The compromise was a type which could be defined to be  
121911 any size by the implementation: **socklen\_t**.

121912 B.2.10.7 *Socket I/O Mode*

121913 There is no additional rationale provided for this section.

121914 B.2.10.8 *Socket Owner*

121915 There is no additional rationale provided for this section.

121916 B.2.10.9 *Socket Queue Limits*

121917 There is no additional rationale provided for this section.

121918 B.2.10.10 *Pending Error*

121919 There is no additional rationale provided for this section.

121920 B.2.10.11 *Socket Receive Queue*

121921 There is no additional rationale provided for this section.

121922 *B.2.10.12 Socket Out-of-Band Data State*

121923 There is no additional rationale provided for this section.

121924 *B.2.10.13 Connection Indication Queue*

121925 There is no additional rationale provided for this section.

121926 *B.2.10.14 Signals*

121927 There is no additional rationale provided for this section.

121928 *B.2.10.15 Asynchronous Errors*

121929 There is no additional rationale provided for this section.

121930 *B.2.10.16 Use of Options*

121931 There is no additional rationale provided for this section.

121932 *B.2.10.17 Use of Sockets for Local UNIX Connections*

121933 There is no additional rationale provided for this section.

121934 *B.2.10.18 Use of Sockets over Internet Protocols*

121935 A raw socket allows privileged users direct access to a protocol; for example, raw access to the  
121936 IP and ICMP protocols is possible through raw sockets. Raw sockets are intended for  
121937 knowledgeable applications that wish to take advantage of some protocol feature not directly  
121938 accessible through the other sockets interfaces.

121939 *B.2.10.19 Use of Sockets over Internet Protocols Based on IPv4*

121940 There is no additional rationale provided for this section.

121941 *B.2.10.20 Use of Sockets over Internet Protocols Based on IPv6*

121942 The Open Group Base Resolution bwg2001-012 is applied, clarifying that IPv6 implementations  
121943 are required to support use of AF\_INET6 sockets over IPv4.

121944 **B.2.11 Tracing**

121945 The organization of the tracing rationale differs from the traditional rationale in that this tracing  
121946 rationale text is written against the trace interface as a whole, rather than against the individual  
121947 components of the trace interface or the normative section in which those components are  
121948 defined. Therefore the sections below do not parallel the sections of normative text in  
121949 POSIX.1-2008.

## 121950 B.2.11.1 Objectives

121951 The intended uses of tracing are application-system debugging during system development, as a  
121952 “flight recorder” for maintenance of fielded systems, and as a performance measurement tool.  
121953 In all of these intended uses, the vendor-supplied computer system and its software are, for this  
121954 discussion, assumed error-free; the intent being to debug the user-written and/or third-party  
121955 application code, and their interactions. Clearly, problems with the vendor-supplied system and  
121956 its software will be uncovered from time to time, but this is a byproduct of the primary activity,  
121957 debugging user code.

121958 Another need for defining a trace interface in POSIX stems from the objective to provide an  
121959 efficient portable way to perform benchmarks. Existing practice shows that such interfaces are  
121960 commonly used in a variety of systems but with little commonality. As part of the benchmarking  
121961 needs, two aspects within the trace interface must be considered.

121962 The first, and perhaps more important one, is the qualitative aspect.

121963 The second is the quantitative aspect.

## 121964 • Qualitative Aspect

121965 To better understand this aspect, let us consider an example. Suppose that you want to  
121966 organize a number of actions to be performed during the day. Some of these actions are  
121967 known at the beginning of the day. Some others, which may be more or less important,  
121968 will be triggered by reading your mail. During the day you will make some phone calls  
121969 and synchronously receive some more information. Finally you will receive asynchronous  
121970 phone calls that also will trigger actions. If you, or somebody else, examines your day at  
121971 work, you, or he, can discover that you have not efficiently organized your work. For  
121972 instance, relative to the phone calls you made, would it be preferable to make some of  
121973 these early in the morning? Or to delay some others until the end of the day? Relative to  
121974 the phone calls you have received, you might find that somebody you called in the  
121975 morning has called you 10 times while you were performing some important work. To  
121976 examine, afterwards, your day at work, you record in sequence all the trace events relative  
121977 to your work. This should give you a chance of organizing your next day at work.

121978 This is the qualitative aspect of the trace interface. The user of a system needs to keep a  
121979 trace of particular points the application passes through, so that he can eventually make  
121980 some changes in the application and/or system configuration, to give the application a  
121981 chance of running more efficiently.

## 121982 • Quantitative Aspect

121983 This aspect concerns primarily realtime applications, where missed deadlines can be  
121984 undesirable. Although there are, in POSIX.1-2008, some interfaces useful for such  
121985 applications (timeouts, execution time monitoring, and so on), there are no APIs to aid in  
121986 the tuning of a realtime application’s behavior (**timespec** in timeouts, length of message  
121987 queues, duration of driver interrupt service routine, and so on). The tuning of an  
121988 application needs a means of recording timestamped important trace events during  
121989 execution in order to analyze offline, and eventually, to tune some realtime features  
121990 (redesign the system with less functionalities, readjust timeouts, redesign driver interrupts,  
121991 and so on).

121992 **Detailed Objectives**

121993 Objectives were defined to build the trace interface and are kept for historical interest. Although  
 121994 some objectives are not fully respected in this trace interface, the concept of the POSIX trace  
 121995 interface assumes the following points:

- 121996 1. It must be possible to trace both system and user trace events concurrently.
- 121997 2. It must be possible to trace per-process trace events and also to trace system trace events  
 121998 which are unrelated to any particular process. A per-process trace event is either user-  
 121999 initiated or system-initiated.
- 122000 3. It must be possible to control tracing on a per-process basis from either inside or outside  
 122001 the process.
- 122002 4. It must be possible to control tracing on a per-thread basis from inside the enclosing  
 122003 process.
- 122004 5. Trace points must be controllable by trace event type ID from inside and outside of the  
 122005 process. Multiple trace points can have the same trace event type ID, and will be  
 122006 controlled jointly.
- 122007 6. Recording of trace events is dependent on both trace event type ID and the  
 122008 process/thread. Both must be enabled in order to record trace events. System trace events  
 122009 may or may not be handled differently.
- 122010 7. The API must not mandate the ability to control tracing for more than one process at the  
 122011 same time.
- 122012 8. There is no objective for trace control on anything bigger than a process; for example,  
 122013 group or session.
- 122014 9. Trace propagation and control:
  - 122015 a. Trace propagation across *fork()* is optional; the default is to not trace a child  
 122016 process.
  - 122017 b. Trace control must span *pthread\_create()* operations; that is, if a process is being  
 122018 traced, any thread will be traced as well if this thread allows tracing. The default is  
 122019 to allow tracing.
- 122020 10. Trace control must not span *exec* or *posix\_spawn()* operations.
- 122021 11. A triggering API is not required. The triggering API is the ability to command or stop  
 122022 tracing based on the occurrence of a specific trace event other than a  
 122023 POSIX\_TRACE\_START trace event or a POSIX\_TRACE\_STOP trace event.
- 122024 12. Trace log entries must have timestamps of implementation-defined resolution.  
 122025 Implementations are exhorted to support at least microsecond resolution. When a trace  
 122026 log entry is retrieved, it must have timestamp, PC address, PID, and TID of the entity that  
 122027 generated the trace event.
- 122028 13. Independently developed code should be able to use trace facilities without coordination  
 122029 and without conflict.
- 122030 14. Even if the trace points in the trace calls are not unique, the trace log entries (after any  
 122031 processing) must be uniquely identified as to trace point.
- 122032 15. There must be a standard API to read the trace stream.

- 122033 16. The format of the trace stream and the trace log is opaque and unspecified.
- 122034 17. It must be possible to read a completed trace, if recorded on some suitable non-volatile  
122035 storage, even subsequent to a power cycle or subsequent cold boot of the system.
- 122036 18. Support of analysis of a trace log while it is being formed is implementation-defined.
- 122037 19. The API must allow the application to write trace stream identification information into  
122038 the trace stream and to be able to retrieve it, without it being overwritten by trace entries,  
122039 even if the trace stream is full.
- 122040 20. It must be possible to specify the destination of trace data produced by trace events.
- 122041 21. It must be possible to have different trace streams, and for the tracing enabled by one  
122042 trace stream to be completely independent of the tracing of another trace stream.
- 122043 22. It must be possible to trace events from threads in different CPUs.
- 122044 23. The API must support one or more trace streams per-system, and one or more trace  
122045 streams per-process, up to an implementation-defined set of per-system and per-process  
122046 maximums.
- 122047 24. It must be possible to determine the order in which the trace events happened, without  
122048 necessarily depending on the clock, up to an implementation-defined time resolution.
- 122049 25. For performance reasons, the trace event point call(s) must be implementable as a macro  
122050 (see the ISO POSIX-1: 1996 standard, 1.3.4, Statement 2).
- 122051 26. POSIX.1-2008 must not define the trace points which a conforming system must  
122052 implement, except for trace points used in the control of tracing.
- 122053 27. The APIs must be thread-safe, and trace points should be lock-free (that is, not require a  
122054 lock to gain exclusive access to some resource).
- 122055 28. The user-provided information associated with a trace event is variable-sized, up to some  
122056 maximum size.
- 122057 29. Bounds on record and trace stream sizes:
- 122058 a. The API must permit the application to declare the upper bounds on the length of  
122059 an application data record. The system must return the limit it used. The limit used  
122060 may be smaller than requested.
- 122061 b. The API must permit the application to declare the upper bounds on the size of  
122062 trace streams. The system must return the limit it used. The limit used may be  
122063 different, either larger or smaller, than requested.
- 122064 30. The API must be able to pass any fundamental data type, and a structured data type  
122065 composed only of fundamental types. The API must be able to pass data by reference,  
122066 given only as an address and a length. Fundamental types are the POSIX.1 types (see the  
122067 **<sys/types.h>** header) plus those defined in the ISO C standard.
- 122068 31. The API must apply the POSIX notions of ownership and permission to recorded trace  
122069 data, corresponding to the sources of that data.

122070 **Comments on Objectives**

122071 **Note:** In the following comments, numbers in square brackets refer to the above objectives.

122072 It is necessary to be able to obtain a trace stream for a complete activity. Thus there is a  
122073 requirement to be able to trace both application and system trace events. A per-process trace  
122074 event is either user-initiated, like the *write()* function, or system-initiated, like a timer expiration.  
122075 There is also a need to be able to trace the activity of an entire process even when it has threads  
122076 in multiple CPUs. To avoid excess trace activity, it is necessary to be able to control tracing on a  
122077 trace event type basis.

122078 [Objectives 1,2,5,22]

122079 There is a need to be able to control tracing on a per-process basis, both from inside and outside  
122080 the process; that is, a process can start a trace activity on itself or any other process. There is also  
122081 the perceived need to allow the definition of a maximum number of trace streams per system.

122082 [Objectives 3,23]

122083 From within a process, it is necessary to be able to control tracing on a per-thread basis. This  
122084 provides an additional filtering capability to keep the amount of traced data to a minimum. It  
122085 also allows for less ambiguity as to the origin of trace events. It is recognized that thread-level  
122086 control is only valid from within the process itself. It is also desirable to know the maximum  
122087 number of trace streams per process that can be started. The API should not require thread  
122088 synchronization or mandate priority inversions that would cause the thread to block. However,  
122089 the API must be thread-safe.

122090 [Objectives 4,23,24,27]

122091 There was no perceived objective to control tracing on anything larger than a process; for  
122092 example, a group or session. Also, the ability to start or stop a trace activity on multiple  
122093 processes atomically may be very difficult or cumbersome in some implementations.

122094 [Objectives 6,8]

122095 It is also necessary to be able to control tracing by trace event type identifier, sometimes called a  
122096 trace hook ID. However, there is no mandated set of system trace events, since such trace points  
122097 are implementation-defined. The API must not require from the operating system facilities that  
122098 are not standard.

122099 [Objectives 6,26]

122100 Trace control must span *fork()* and *pthread\_create()*. If not, there will be no way to ensure that an  
122101 application's activity is entirely traced. The newly forked child would not be able to turn on its  
122102 tracing until after it obtained control after the fork, and trace control externally would be even  
122103 more problematic.

122104 [Objective 9]

122105 Since *exec* and *posix\_spawn()* represent a complete change in the execution of a task (a new  
122106 program), trace control need not persist over an *exec* or *posix\_spawn()*.

122107 [Objective 10]

122108 Where trace activities are started on multiple processes, these trace activities should not interfere  
122109 with each other.

122110 [Objective 21]

122111 There is no need for a triggering objective, primarily for performance reasons; see also [Section](#)  
122112 [B.2.11.8](#) (on page 3618), rationale on triggering.

122113 [Objective 11]

122114 It must be possible to determine the origin of each traced event. The process and thread  
122115 identifiers for each trace event are needed. Also there was a perceived need for a user-specifiable  
122116 origin, but it was felt that this would create too much overhead.

122117 [Objectives 12,14]

- 122118 An allowance must be made for trace points to come embedded in software components from  
122119 several different sources and vendors without requiring coordination.  
122120 [Objective 13]
- 122121 There is a requirement to be able to uniquely identify trace points that may have the same trace  
122122 stream identifier. This is only necessary when a trace report is produced.  
122123 [Objectives 12,14]
- 122124 Tracing is a very performance-sensitive activity, and will therefore likely be implemented at a  
122125 low level within the system. Hence the interface must not mandate any particular buffering or  
122126 storage method. Therefore, a standard API is needed to read a trace stream. Also the interface  
122127 must not mandate the format of the trace data, and the interface must not assume a trace storage  
122128 method. Due to the possibility of a monolithic kernel and the possible presence of multiple  
122129 processes capable of running trace activities, the two kinds of trace events may be stored in two  
122130 separate streams for performance reasons. A mandatory dump mechanism, common in some  
122131 existing practice, has been avoided to allow the implementation of this set of functions on small  
122132 realtime profiles for which the concept of a file system is not defined. The trace API calls should  
122133 be implemented as macros.  
122134 [Objectives 15,16,25,30]
- 122135 Since a trace facility is a valuable service tool, the output (or log) of a completed trace stream  
122136 that is written to permanent storage must be readable on other systems of the type that  
122137 produced the trace log. Note that there is no objective to be able to interpret a trace log that was  
122138 not successfully completed.  
122139 [Objectives 17,18,19]
- 122140 For trace streams written to permanent storage, a way to specify the destination of the trace  
122141 stream is needed.  
122142 [Objective 20]
- 122143 There is a requirement to be able to depend on the ordering of trace events up to some  
122144 implementation-defined time interval. For example, there is a need to know the time period  
122145 during which, if trace events are closer together, their ordering is unspecified. Events that occur  
122146 within an interval smaller than this resolution may or may not be read back in the correct order.  
122147 [Objective 24]
- 122148 The application should be able to know how much data can be traced. When trace event types  
122149 can be filtered, the application should be able to specify the approximate maximum amount of  
122150 data that will be traced in a trace event so resources can be more efficiently allocated.  
122151 [Objectives 28,29]
- 122152 Users should not be able to trace data to which they would not normally have access. System  
122153 trace events corresponding to a process/thread should be associated with the ownership of that  
122154 process/thread.  
122155 [Objective 31]

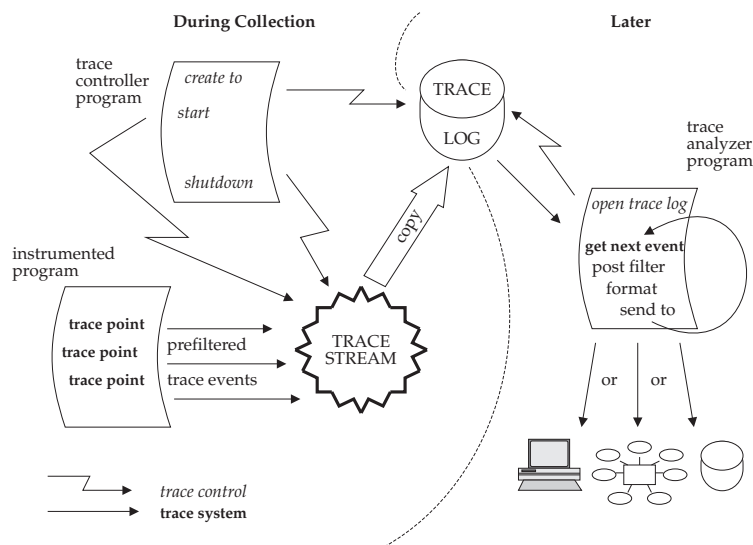

122156 B.2.11.2 Trace Model

122157 **Introduction**

122158 The model is based on two base entities: the “Trace Stream” and the “Trace Log”, and a recorded  
 122159 unit called the “Trace Event”. The possibility of using Trace Streams and Trace Logs separately  
 122160 gives two use dimensions and solves both the performance issue and the full-information  
 122161 system issue. In the case of a trace stream without log, specific information, although reduced in  
 122162 quantity, is required to be registered, in a possibly small realtime system, with as little overhead  
 122163 as possible. The Trace Log option has been added for small realtime systems. In the case of a  
 122164 trace stream with log, considerable complex application-specific information needs to be  
 122165 collected.

122166 **Trace Model Description**

122167 The trace model can be examined for three different subfunctions: Application Instrumentation,  
 122168 Trace Operation Control, and Trace Analysis.

122169 **Figure B-2** Trace System Overview: for Offline Analysis

122170 Each of these subfunctions requires specific characteristics of the trace mechanism API.

## 122171 • Application Instrumentation

122172 When instrumenting an application, the programmer is not concerned about the future use  
 122173 of the trace events in the trace stream or the trace log, the full policy of the trace stream, or  
 122174 the eventual pre-filtering of trace events. But he is concerned about the correct  
 122175 determination of the specific trace event type identifier, regardless of how many  
 122176 independent libraries are used in the same user application; see [Figure B-2](#) and [Figure B-3](#)  
 122177 (on page 3601).

122178 This trace API provides the necessary operations to accomplish this subfunction. This is  
 122179 done by providing functions to associate a programmer-defined name with an  
 122180 implementation-defined trace event type identifier (see the `posix_trace_eventid_open()`  
 122181 function), and to send this trace event into a potential trace stream (see the  
 122182 `posix_trace_event()` function).

122183 • Trace Operation Control

122184 When controlling the recording of trace events in a trace stream, the programmer is  
 122185 concerned with the correct initialization of the trace mechanism (that is, the sizing of the  
 122186 trace stream), the correct retention of trace events in a permanent storage, the correct  
 122187 dynamic recording of trace events, and so on.

122188 This trace API provides the necessary material to permit this efficiently. This is done by  
 122189 providing functions to initialize a new trace stream, and optionally a trace log:

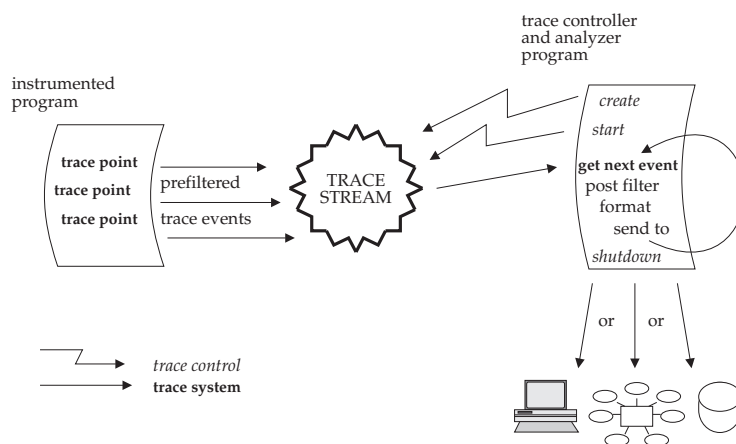

- 122190 — Trace Stream Attributes Object Initialization (see *posix\_trace\_attr\_init()*)
- 122191 — Functions to Retrieve or Set Information About a Trace Stream (see  
 122192 *posix\_trace\_attr\_getgenversion()*)
- 122193 — Functions to Retrieve or Set the Behavior of a Trace Stream (see  
 122194 *posix\_trace\_attr\_getinherited()*)
- 122195 — Functions to Retrieve or Set Trace Stream Size Attributes (see  
 122196 *posix\_trace\_attr\_getmaxusereventsize()*)
- 122197 — Trace Stream Initialization, Flush, and Shutdown from a Process (see  
 122198 *posix\_trace\_create()*)
- 122199 — Clear Trace Stream and Trace Log (see *posix\_trace\_clear()*)

122200 To select the trace event types that are to be traced:

- 122201 — Manipulate Trace Event Type Identifier (see *posix\_trace\_trid\_eventid\_open()*)
- 122202 — Iterate over a Mapping of Trace Event Type (see *posix\_trace\_eventtypelist\_getnext\_id()*)
- 122203 — Manipulate Trace Event Type Sets (see *posix\_trace\_eventset\_empty()*)
- 122204 — Set Filter of an Initialized Trace Stream (see *posix\_trace\_set\_filter()*)

122205 To control the execution of an active trace stream:

- 122206 — Trace Start and Stop (see *posix\_trace\_start()*)
- 122207 — Functions to Retrieve the Trace Attributes or Trace Statuses (see  
 122208 *posix\_trace\_get\_attr()*)

122209 **Figure B-3** Trace System Overview: for Online Analysis

122210 • Trace Analysis

122211 Once correctly recorded, on permanent storage or not, an ultimate activity consists of the  
 122212 analysis of the recorded information. If the recorded data is on permanent storage, a  
 122213 specific open operation is required to associate a trace stream to a trace log.

122214 The first intent of the group was to request the presence of a system identification structure  
 122215 in the trace stream attribute. This was, for the application, to allow some portable way to  
 122216 process the recorded information. However, there is no requirement that the **utsname**  
 122217 structure, on which this system identification was based, be portable from one machine to  
 122218 another, so the contents of the attribute cannot be interpreted correctly by an application  
 122219 conforming to POSIX.1-2008.

122220 This modification has been incorporated and requests that some unspecified information  
 122221 be recorded in the trace log in order to fail opening it if the analysis process and the  
 122222 controller process were running in different types of machine, but does not request that  
 122223 this information be accessible to the application. This modification has implied a  
 122224 modification in the *posix\_trace\_open()* function error code returns.

122225 This trace API provides functions to:

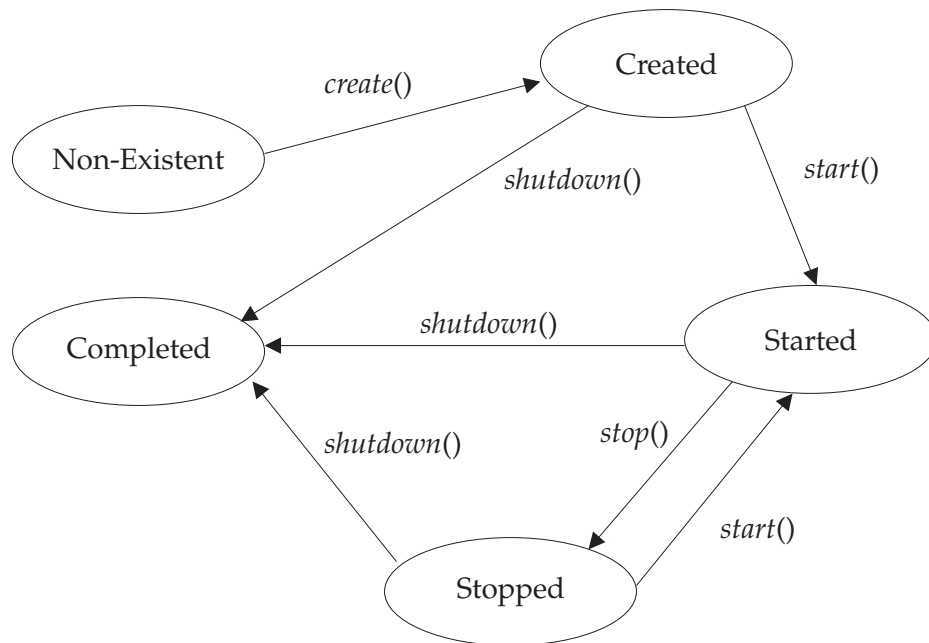

- 122226 — Extract trace stream identification attributes (see *posix\_trace\_attr\_getgenversion()*)
- 122227 — Extract trace stream behavior attributes (see *posix\_trace\_attr\_getinherited()*)
- 122228 — Extract trace event, stream, and log size attributes (see  
 122229 *posix\_trace\_attr\_getmaxusereventsizesize()*)
- 122230 — Look up trace event type names (see *posix\_trace\_eventid\_get\_name()*)
- 122231 — Iterate over trace event type identifiers (see *posix\_trace\_eventtypelist\_getnext\_id()*)
- 122232 — Open, rewind, and close a trace log (see *posix\_trace\_open()*)
- 122233 — Read trace stream attributes and status (see *posix\_trace\_get\_attr()*)
- 122234 — Read trace events (see *posix\_trace\_getnext\_event()*)

122235 Due to the following two reasons:

- 122236 1. The requirement that the trace system must not add unacceptable overhead to the traced  
 122237 process and so that the trace event point execution must be fast
- 122238 2. The traced application does not care about tracing errors

122239 the trace system cannot return any internal error to the application. Internal error conditions can  
 122240 range from unrecoverable errors that will force the active trace stream to abort, to small errors  
 122241 that can affect the quality of tracing without aborting the trace stream. The group decided to  
 122242 define a system trace event to report to the analysis process such internal errors. It is not the  
 122243 intention of POSIX.1-2008 to require an implementation to report an internal error that corrupts  
 122244 or terminates tracing operation. The implementor is free to decide which internal documented  
 122245 errors, if any, the trace system is able to report.

122246

**States of a Trace Stream**

122247

**Figure B-4** Trace System Overview: States of a Trace Stream

122248

122249

122250

122251

122252

122253

122254

122255

122256

**Figure B-4** shows the different states an active trace stream passes through. After the *posix\_trace\_create()* function call, a trace stream becomes CREATED and a trace stream is associated for the future collection of trace events. The status of the trace stream is POSIX\_TRACE\_SUSPENDED. The state becomes STARTED after a call to the *posix\_trace\_start()* function, and the status becomes POSIX\_TRACE\_RUNNING. In this state, all trace events that are not filtered out will be stored into the trace stream. After a call to *posix\_trace\_stop()*, the trace stream becomes STOPPED (and the status POSIX\_TRACE\_SUSPENDED). In this state, no new trace events will be recorded in the trace stream, but previously recorded trace events may continue to be read.

122257

122258

122259

122260

122261

After a call to *posix\_trace\_shutdown()*, the trace stream is in the state COMPLETED. The trace stream no longer exists but, if the Trace Log option is supported, all the information contained in it has been logged. If a log object has not been associated with the trace stream at the creation, it is the responsibility of the trace controller process to not shut the trace stream down while trace events remain to be read in the stream.

122262

**Tracing All Processes**

122263

122264

122265

122266

Some implementations have a tracing subsystem with the ability to trace all processes. This is useful to debug some types of device drivers such as those for ATM or X25 adapters. These types of adapters are used by several independent processes, that are not issued from the same process.

122267

122268

122269

122270

The POSIX trace interface does not define any constant or option to create a trace stream tracing all processes. POSIX.1 does not prevent this type of implementation and an implementor is free to add this capability. Nevertheless, the trace interface allows tracing of all the system trace events and all the processes issued from the same process.

122271 If such a tracing system capability has to be implemented, when a trace stream is created, it is  
 122272 recommended that a constant named `POSIX_TRACE_ALLPROC` be used instead of the process  
 122273 identifier in the argument of the `posix_trace_create()` or `posix_trace_create_withlog()` function. A  
 122274 possible value for `POSIX_TRACE_ALLPROC` may be `-1` instead of a real process identifier.

122275 The implementor has to be aware that there is some impact on the tracing behavior as defined in  
 122276 the POSIX trace interface. For example:

- 122277 • If the default value for the inheritance attribute is set to  
 122278 `POSIX_TRACE_CLOSE_FOR_CHILD`, the implementation has to stop tracing for the child  
 122279 process.
- 122280 • The trace controller which is creating this type of trace stream must have the appropriate  
 122281 privilege to trace all the processes.

## 122282 Trace Storage

122283 The model is based on two types of trace events: system trace events and user-defined trace  
 122284 events. The internal representation of trace events is implementation-defined, and so the  
 122285 implementor is free to choose the more suitable, practical, and efficient way to design the  
 122286 internal management of trace events. For the timestamping operation, the model does not  
 122287 impose the `CLOCK_REALTIME` or any other clock. The buffering allocation and operation  
 122288 follow the same principle. The implementor is free to use one or more buffers to record trace  
 122289 events; the interface assumes only a logical trace stream of sequentially recorded trace events.  
 122290 Regarding flushing of trace events, the interface allows the definition of a trace log object which  
 122291 typically can be a file. But the group was also aware of defining functions to permit the use of  
 122292 this interface in small realtime systems, which may not have general file system capabilities. For  
 122293 instance, the three functions `posix_trace_getnext_event()` (blocking),  
 122294 `posix_trace_timedgetnext_event()` (blocking with timeout), and `posix_trace_trygetnext_event()` (non-  
 122295 blocking) are proposed to read the recorded trace events.

122296 The policy to be used when the trace stream becomes full also relies on common practice:

- 122297 • For an active trace stream, the `POSIX_TRACE_LOOP` trace stream policy permits  
 122298 automatic overrun (overwrite of oldest trace events) while waiting for some user-defined  
 122299 condition to cause tracing to stop. By contrast, the `POSIX_TRACE_UNTIL_FULL` trace  
 122300 stream policy requires the system to stop tracing when the trace stream is full. However, if  
 122301 the trace stream that is full is at least partially emptied by a call to the `posix_trace_flush()`  
 122302 function or by calls to the `posix_trace_getnext_event()` function, the trace system will  
 122303 automatically resume tracing.

122304 If the Trace Log option is supported, the operation of the `POSIX_TRACE_FLUSH` policy is  
 122305 an extension of the `POSIX_TRACE_UNTIL_FULL` policy. The automatic free operation (by  
 122306 flushing to the associated trace log) is added.

- 122307 • If a log is associated with the trace stream and this log is a regular file, these policies also  
 122308 apply for the log. One more policy, `POSIX_TRACE_APPEND`, is defined to allow  
 122309 indefinite extension of the log. Since the log destination can be any device or pseudo-  
 122310 device, the implementation may not be able to manipulate the destination as required by  
 122311 POSIX.1-2008. For this reason, the behavior of the log full policy may be unspecified  
 122312 depending on the trace log type.

122313 The current trace interface does not define a service to preallocate space for a trace log file,  
 122314 because this space can be preallocated by means of a call to the `posix_fallocate()` function.  
 122315 This function could be called after the file has been opened, but before the trace stream is  
 122316 created. The `posix_fallocate()` function ensures that any required storage for regular file data  
 122317 is allocated on the file system storage media. If `posix_fallocate()` returns successfully,

122318 subsequent writes to the specified file data will not fail due to the lack of free space on the  
 122319 file system storage media. Besides trace events, a trace stream also includes trace attributes  
 122320 and the mapping from trace event names to trace event type identifiers. The implementor  
 122321 is free to choose how to store the trace attributes and the trace event type map, but must  
 122322 ensure that this information is not lost when a trace stream overrun occurs.

### 122323 B.2.11.3 Trace Programming Examples

122324 Several programming examples are presented to show the code of the different possible  
 122325 subfunctions using a trace subsystem. All these programs need to include the `<trace.h>` header.  
 122326 In the examples shown, error checking is omitted for more simplicity.

### 122327 Trace Operation Control

122328 These examples show the creation of a trace stream for another process; one which is already  
 122329 trace instrumented. All the default trace stream attributes are used to simplify programming in  
 122330 the first example. The second example shows more possibilities.

### 122331 First Example

```

122332 /* Caution. Error checks omitted */
122333 {
122334     trace_attr_t attr;
122335     pid_t pid = traced_process_pid;
122336     int fd;
122337     trace_id_t trid;
122338     - - - - -
122339     /* Initialize trace stream attributes */
122340     posix_trace_attr_init(&attr);
122341     /* Open a trace log */
122342     fd=open("/tmp/mytracelog",...);
122343     /*
122344      * Create a new trace associated with a log
122345      * and with default attributes
122346      */
122347     posix_trace_create_withlog(pid, &attr, fd, &trid);
122348     /* Trace attribute structure can now be destroyed */
122349     posix_trace_attr_destroy(&attr);
122350     /* Start of trace event recording */
122351     posix_trace_start(trid);
122352     - - - - -
122353     - - - - -
122354     /* Duration of tracing */
122355     - - - - -
122356     - - - - -
122357     /* Stop and shutdown of trace activity */
122358     posix_trace_shutdown(trid);
122359     - - - - -
122360 }
  
```

122361 **Second Example**

122362 Between the initialization of the trace stream attributes and the creation of the trace stream, these  
 122363 trace stream attributes may be modified; see [Trace Stream Attribute Manipulation](#) (on page  
 122364 3609) for a specific programming example. Between the creation and the start of the trace  
 122365 stream, the event filter may be set; after the trace stream is started, the event filter may be  
 122366 changed. The setting of an event set and the change of a filter is shown in [Create a Trace Event  
 122367 Type Set and Change the Trace Event Type Filter](#) (on page 3610).

```

122368 /* Caution. Error checks omitted */
122369 {
122370     trace_attr_t attr;
122371     pid_t pid = traced_process_pid;
122372     int fd;
122373     trace_id_t trid;
122374     - - - - -
122375     /* Initialize trace stream attributes */
122376     posix_trace_attr_init(&attr);
122377     /* Attr default may be changed at this place; see example */
122378     - - - - -
122379     /* Create and open a trace log with R/W user access */
122380     fd=open("/tmp/mytracelog",O_WRONLY|O_CREAT,S_IRUSR|S_IWUSR);
122381     /* Create a new trace associated with a log */
122382     posix_trace_create_withlog(pid, &attr, fd, &trid);
122383     /*
122384      * If the Trace Filter option is supported
122385      * trace event type filter default may be changed at this place;
122386      * see example about changing the trace event type filter
122387      */
122388     posix_trace_start(trid);
122389     - - - - -
122390     /*
122391      * If you have an uninteresting part of the application
122392      * you can stop temporarily.
122393      *
122394      * posix_trace_stop(trid);
122395      * - - - - -
122396      * - - - - -
122397      * posix_trace_start(trid);
122398      */
122399     - - - - -
122400     /*
122401      * If the Trace Filter option is supported
122402      * the current trace event type filter can be changed
122403      * at any time (see example about how to set
122404      * a trace event type filter)
122405      */
122406     - - - - -
122407     /* Stop the recording of trace events */
122408     posix_trace_stop(trid);
122409     /* Shutdown the trace stream */
122410     posix_trace_shutdown(trid);
122411     /*
  
```

```

122412     * Destroy trace stream attributes; attr structure may have
122413     * been used during tracing to fetch the attributes
122414     */
122415     posix_trace_attr_destroy(&attr);
122416     - - - - -
122417 }

```

## 122418 Application Instrumentation

122419 This example shows an instrumented application. The code is included in a block of instructions,  
 122420 perhaps a function from a library. Possibly in an initialization part of the instrumented  
 122421 application, two user trace event names are mapped to two trace event type identifiers  
 122422 (function `posix_trace_eventid_open()`). Then two trace points are programmed.

```

122423 /* Caution. Error checks omitted */
122424 {
122425     trace_event_id_t eventid1, eventid2;
122426     - - - - -
122427     /* Initialization of two trace event type ids */
122428     posix_trace_eventid_open("my_first_event", &eventid1);
122429     posix_trace_eventid_open("my_second_event", &eventid2);
122430     - - - - -
122431     - - - - -
122432     - - - - -
122433     /* Trace point */
122434     posix_trace_event(eventid1, NULL, 0);
122435     - - - - -
122436     /* Trace point */
122437     posix_trace_event(eventid2, NULL, 0);
122438     - - - - -
122439 }

```

## 122440 Trace Analyzer

122441 This example shows the manipulation of a trace log resulting from the dumping of a completed  
 122442 trace stream. All the default attributes are used to simplify programming, and data associated  
 122443 with a trace event is not shown in the first example. The second example shows more  
 122444 possibilities.

### 122445 First Example

```

122446 /* Caution. Error checks omitted */
122447 {
122448     int fd;
122449     trace_id_t trid;
122450     posix_trace_event_info trace_event;
122451     char trace_event_name[TRACE_EVENT_NAME_MAX];
122452     int return_value;
122453     size_t returndatasize;
122454     int lost_event_number;
122455     - - - - -
122456     /* Open an existing trace log */
122457     fd=open("/tmp/tracelog", O_RDONLY);

```

```

122458     /* Open a trace stream on the open log */
122459     posix_trace_open(fd, &trid);
122460     /* Read a trace event */
122461     posix_trace_getnext_event(trid, &trace_event,
122462         NULL, 0, &returndatasize,&return_value);

122463     /* Read and print all trace event names out in a loop */
122464     while (return_value == NULL)
122465     {
122466         /*
122467          * Get the name of the trace event associated
122468          * with trid trace ID
122469          */
122470         posix_trace_eventid_get_name(trid, trace_event.event_id,
122471             trace_event_name);
122472         /* Print the trace event name out */
122473         printf("%s\n",trace_event_name);
122474         /* Read a trace event */
122475         posix_trace_getnext_event(trid, &trace_event,
122476             NULL, 0, &returndatasize,&return_value);
122477     }

122478     /* Close the trace stream */
122479     posix_trace_close(trid);
122480     /* Close the trace log */
122481     close(fd);
122482 }

```

## 122483 Second Example

122484 The complete example includes the two other examples in [Retrieve Information from a Trace Log](#) (on page 3611) and in [Retrieve the List of Trace Event Types Used in a Trace Log](#) (on page 3612). For example, the *maxdatasize* variable is set in [Retrieve the List of Trace Event Types Used in a Trace Log](#) (on page 3612).

```

122488     /* Caution. Error checks omitted */
122489     {
122490         int fd;
122491         trace_id_t trid;
122492         posix_trace_event_info trace_event;
122493         char trace_event_name[TRACE_EVENT_NAME_MAX];
122494         char * data;
122495         size_t maxdatasize=1024, returndatasize;
122496         int return_value;
122497         - - - - -

122498         /* Open an existing trace log */
122499         fd=open("/tmp/tracelog", O_RDONLY);
122500         /* Open a trace stream on the open log */
122501         posix_trace_open( fd, &trid);
122502         /*
122503          * Retrieve information about the trace stream which
122504          * was dumped in this trace log (see example)
122505          */
122506         - - - - -

```

```

122507     /* Allocate a buffer for trace event data */
122508     data=(char *)malloc(maxdatasize);
122509     /*
122510     * Retrieve the list of trace events used in this
122511     * trace log (see example)
122512     */
122513     - - - - -

122514     /* Read and print all trace event names and data out in a loop */
122515     while (1)
122516     {
122517     posix_trace_getnext_event(trid, &trace_event,
122518         data, maxdatasize, &returndatasize,&return_value);
122519         if (return_value != NULL) break;
122520         /*
122521         * Get the name of the trace event type associated
122522         * with trid trace ID
122523         */
122524         posix_trace_eventid_get_name(trid, trace_event.event_id,
122525             trace_event_name);
122526         {
122527         int i;

122528         /* Print the trace event name out */
122529         printf("%s: ", trace_event_name);
122530         /* Print the trace event data out */
122531         for (i=0; i<returndatasize, i++) printf("%02.2X",
122532             (unsigned char)data[i]);
122533         printf("\n");
122534         }
122535     }

122536     /* Close the trace stream */
122537     posix_trace_close(trid);
122538     /* The buffer data is deallocated */
122539     free(data);
122540     /* Now the file can be closed */
122541     close(fd);
122542 }

```

## 122543 **Several Programming Manipulations**

122544 The following examples show some typical sets of operations needed in some contexts.

### 122545 **Trace Stream Attribute Manipulation**

122546 This example shows the manipulation of a trace stream attribute object in order to change the  
122547 default value provided by a previous *posix\_trace\_attr\_init()* call.

```

122548     /* Caution. Error checks omitted */
122549     {
122550         trace_attr_t attr;
122551         size_t logsize=100000;
122552         - - - - -
122553         /* Initialize trace stream attributes */

```

```

122554     posix_trace_attr_init(&attr);
122555     /* Set the trace name in the attributes structure */
122556     posix_trace_attr_setname(&attr, "my_trace");
122557     /* Set the trace full policy */
122558     posix_trace_attr_setstreamfullpolicy(&attr, POSIX_TRACE_LOOP);
122559     /* Set the trace log size */
122560     posix_trace_attr_setlogsize(&attr, logsize);
122561     - - - - -
122562 }

```

### 122563 Create a Trace Event Type Set and Change the Trace Event Type Filter

122564 This example is valid only if the Trace Event Filter option is supported. This example shows the  
122565 manipulation of a trace event type set in order to change the trace event type filter for an  
122566 existing active trace stream, which may be just-created, running, or suspended. Some sets of  
122567 trace event types are well-known, such as the set of trace event types not associated with a  
122568 process, some trace event types are just-built trace event types for this trace stream; one trace  
122569 event type is the predefined trace event error type which is deleted from the trace event type set.

```

122570 /* Caution. Error checks omitted */
122571 {
122572     trace_id_t trid = existing_trace;
122573     trace_event_set_t set;
122574     trace_event_id_t trace_event1, trace_event2;
122575     - - - - -
122576     /* Initialize to an empty set of trace event types */
122577     /* (not strictly required because posix_trace_event_set_fill() */
122578     /* will ignore the prior contents of the event set.) */
122579     posix_trace_eventset_emptyset(&set);
122580     /*
122581     * Fill the set with all system trace events
122582     * not associated with a process
122583     */
122584     posix_trace_eventset_fill(&set, POSIX_TRACE_WOPID_EVENTS);
122585     /*
122586     * Get the trace event type identifier of the known trace event name
122587     * my_first_event for the trid trace stream
122588     */
122589     posix_trace_trid_eventid_open(trid, "my_first_event", &trace_event1);
122590     /* Add the set with this trace event type identifier */
122591     posix_trace_eventset_add_event(trace_event1, &set);
122592     /*
122593     * Get the trace event type identifier of the known trace event name
122594     * my_second_event for the trid trace stream
122595     */
122596     posix_trace_trid_eventid_open(trid, "my_second_event", &trace_event2);
122597     /* Add the set with this trace event type identifier */
122598     posix_trace_eventset_add_event(trace_event2, &set);
122599     - - - - -
122600     /* Delete the system trace event POSIX_TRACE_ERROR from the set */
122601     posix_trace_eventset_del_event(POSIX_TRACE_ERROR, &set);
122602     - - - - -

```

```

122603     /* Modify the trace stream filter making it equal to the new set */
122604     posix_trace_set_filter(trid, &set, POSIX_TRACE_SET_EVENTSET);
122605     - - - - -
122606     /*
122607     * Now trace_event1, trace_event2, and all system trace event types
122608     * not associated with a process, except for the POSIX_TRACE_ERROR
122609     * system trace event type, are filtered out of (not recorded in) the
122610     * existing trace stream.
122611     */
122612 }

```

### 122613 **Retrieve Information from a Trace Log**

122614 This example shows how to extract information from a trace log, the dump of a trace stream.  
 122615 This code:

- 122616 • Asks if the trace stream has lost trace events
- 122617 • Extracts the information about the version of the trace subsystem which generated this  
 122618 trace log
- 122619 • Retrieves the maximum size of trace event data; this may be used to dynamically allocate  
 122620 an array for extracting trace event data from the trace log without overflow

```

122621 /* Caution. Error checks omitted */
122622 {
122623     struct posix_trace_status_info statusinfo;
122624     trace_attr_t attr;
122625     trace_id_t trid = existing_trace;
122626     size_t maxdatasize;
122627     char genversion[TRACE_NAME_MAX];
122628     - - - - -
122629     /* Get the trace stream status */
122630     posix_trace_get_status(trid, &statusinfo);
122631     /* Detect an overrun condition */
122632     if (statusinfo.posix_stream_overrun_status == POSIX_TRACE_OVERRUN)
122633         printf("trace events have been lost\n");
122634     /* Get attributes from the trid trace stream */
122635     posix_trace_get_attr(trid, &attr);
122636     /* Get the trace generation version from the attributes */
122637     posix_trace_attr_getgenversion(&attr, genversion);
122638     /* Print the trace generation version out */
122639     printf("Information about Trace Generator:%s\n", genversion);
122640     /* Get the trace event max data size from the attributes */
122641     posix_trace_attr_getmaxdatasize(&attr, &maxdatasize);
122642     /* Print the trace event max data size out */
122643     printf("Maximum size of associated data:%d\n", maxdatasize);
122644     /* Destroy the trace stream attributes */
122645     posix_trace_attr_destroy(&attr);
122646 }

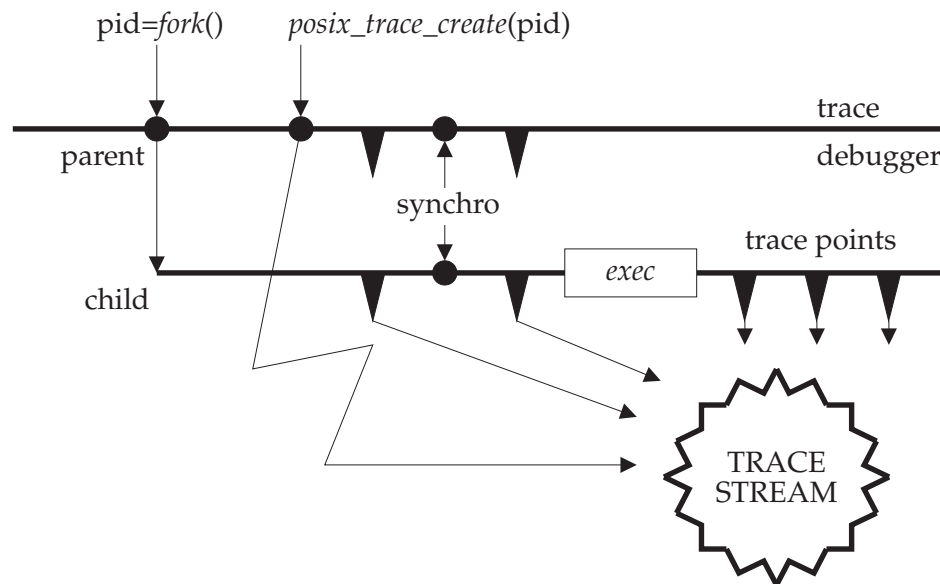

```

122647 **Retrieve the List of Trace Event Types Used in a Trace Log**

122648 This example shows the retrieval of a trace stream's trace event type list. This operation may be  
122649 very useful if you are interested only in tracking the type of trace events in a trace log.

```
122650 /* Caution. Error checks omitted */
122651 {
122652     trace_id_t trid = existing_trace;
122653     trace_event_id_t event_id;
122654     char event_name[TRACE_EVENT_NAME_MAX];
122655     int return_value;
122656     - - - - -
122657     /*
122658      * In a loop print all existing trace event names out
122659      * for the trid trace stream
122660      */
122661     while (1)
122662     {
122663         posix_trace_eventtypelist_getnext_id(trid, &event_id
122664             &return_value);
122665         if (return_value != NULL) break;
122666         /*
122667          * Get the name of the trace event associated
122668          * with trid trace ID
122669          */
122670         posix_trace_eventid_get_name(trid, event_id, event_name);
122671         /* Print the name out */
122672         printf("%s\n", event_name);
122673     }
122674 }
```

122675 B.2.11.4 Rationale on Trace for Debugging

122676

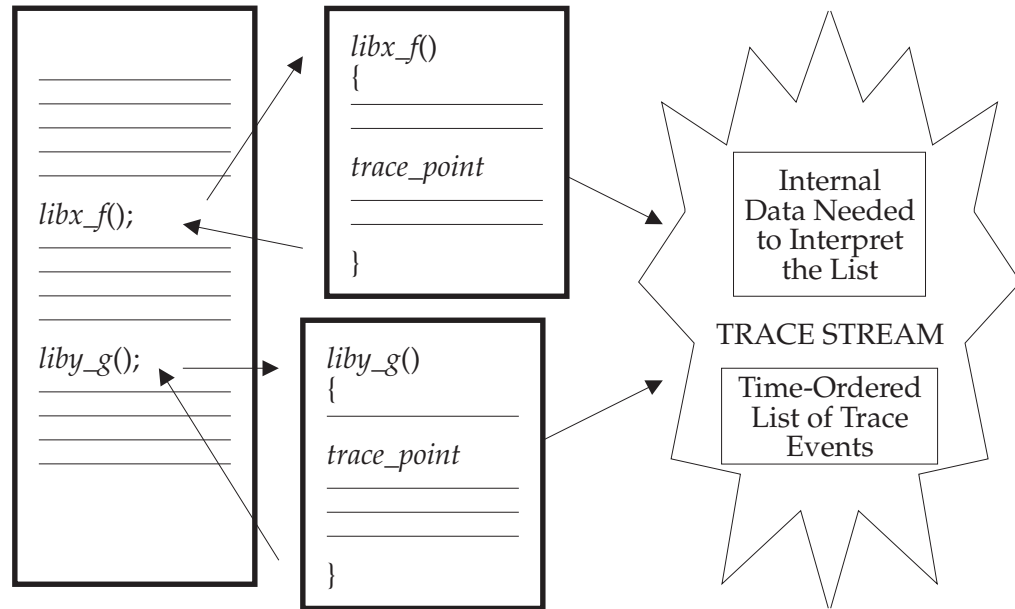

**Figure B-5** Trace Another Process

122677 Among the different possibilities offered by the trace interface defined in POSIX.1-2008, the  
 122678 debugging of an application is the most interesting one. Typical operations in the controlling  
 122679 debugger process are to filter trace event types, to get trace events from the trace stream, to stop  
 122680 the trace stream when the debugged process is executing uninteresting code, to start the trace  
 122681 stream when some interesting point is reached, and so on. The interface defined in POSIX.1-2008  
 122682 should define all the necessary base functions to allow this dynamic debug handling.

122683 **Figure B-5** shows an example in which the trace stream is created after the call to the *fork()*  
 122684 function. If the user does not want to lose trace events, some synchronization mechanism  
 122685 (represented in the figure) may be needed before calling the *exec()* function, to give the parent a  
 122686 chance to create the trace stream before the child begins the execution of its trace points.

122687 B.2.11.5 Rationale on Trace Event Type Name Space

122688 At first, the working group was in favor of the representation of a trace event type by an integer  
 122689 (*event\_name*). It seems that existing practice shows the weakness of such a representation. The  
 122690 collision of trace event types is the main problem that cannot be simply resolved using this sort  
 122691 of representation. Suppose, for example, that a third party designs an instrumented library. The  
 122692 user does not have the source of this library and wants to trace his application which uses in  
 122693 some part the third-party library. There is no means for him to know what are the trace event  
 122694 types used in the instrumented library so he has some chance of duplicating some of them and  
 122695 thus to obtain a contaminated tracing of his application.

122696

**Figure B-6** Trace Name Space Overview: With Third-Party Library

122697  
122698  
122699  
122700  
122701  
122702  
122703  
122704  
122705  
122706  
122707

There are requirements to allow program images containing pieces from various vendors to be traced without also requiring those of any other vendors to coordinate their uses of the trace facility, and especially the naming of their various trace event types and trace point IDs. The chosen solution is to provide a very large name space, large enough so that the individual vendors can give their trace types and tracepoint IDs sufficiently long and descriptive names making the occurrence of collisions quite unlikely. The probability of collision is thus made sufficiently low so that the problem may, as a practical matter, be ignored. By requirement, the consequence of collisions will be a slight ambiguity in the trace streams; tracing will continue in spite of collisions and ambiguities. “The show must go on”. The *posix\_prog\_address* member of the **posix\_trace\_event\_info** structure is used to allow trace streams to be unambiguously interpreted, despite the fact that trace event types and trace event names need not be unique.

122708  
122709  
122710  
122711  
122712  
122713  
122714  
122715  
122716  
122717

The *posix\_trace\_eventid\_open()* function is required to allow the instrumented third-party library to get a valid trace event type identifier for its trace event names. This operation is, somehow, an allocation, and the group was aware of proposing some deallocation mechanism which the instrumented application could use to recover the resources used by a trace event type identifier. This would have given the instrumented application the benefit of being capable of reusing a possible minimum set of trace event type identifiers, but also the inconvenience to have, possibly in the same trace stream, one trace event type identifier identifying two different trace event types. After some discussions the group decided to not define such a function which would make this API thicker for little benefit, the user having always the possibility of adding identification information in the *data* member of the trace event structure.

122718  
122719  
122720  
122721  
122722  
122723  
122724

The set of the trace event type identifiers the controlling process wants to filter out is initialized in the trace mechanism using the function *posix\_trace\_set\_filter()*, setting the arguments according to the definitions explained in *posix\_trace\_set\_filter()*. This operation can be done statically (when the trace is in the STOPPED state) or dynamically (when the trace is in the STARTED state). The preparation of the filter is normally done using the function defined in *posix\_trace\_eventtypelist\_getnext\_id()* and eventually the function *posix\_trace\_eventtypelist\_rewind()* in order to know (before the recording) the list of the potential

122725 set of trace event types that can be recorded. In the case of an active trace stream, this list may  
122726 not be exhaustive. Actually, the target process may not have yet called the function  
122727 *posix\_trace\_eventid\_open()*. But it is a common practice, for a controlling process, to prepare the  
122728 filtering of a future trace stream before its start. Therefore the user must have a way to get the  
122729 trace event type identifier corresponding to a well-known trace event name before its future  
122730 association by the pre-cited function. This is done by calling the *posix\_trace\_trid\_eventid\_open()*  
122731 function, given the trace stream identifier and the trace name, and described hereafter. Because  
122732 this trace event type identifier is associated with a trace stream identifier, where a unique  
122733 process has initialized two or more traces, the implementation is expected to return the same  
122734 trace event type identifier for successive calls to *posix\_trace\_trid\_eventid\_open()* with different  
122735 trace stream identifiers. The *posix\_trace\_eventid\_get\_name()* function is used by the controller  
122736 process to identify, by the name, the trace event type returned by a call to the  
122737 *posix\_trace\_eventtypelist\_getnext\_id()* function.

122738 Afterwards, the set of trace event types is constructed using the functions defined in  
122739 *posix\_trace\_eventset\_empty()*, *posix\_trace\_eventset\_fill()*, *posix\_trace\_eventset\_add()*, and  
122740 *posix\_trace\_eventset\_del()*.

122741 A set of functions is provided devoted to the manipulation of the trace event type identifier and  
122742 names for an active trace stream. All these functions require the trace stream identifier argument  
122743 as the first parameter. The opacity of the trace event type identifier implies that the user cannot  
122744 associate directly its well-known trace event name with the system-associated trace event type  
122745 identifier.

122746 The *posix\_trace\_trid\_eventid\_open()* function allows the application to get the system trace event  
122747 type identifier back from the system, given its well-known trace event name. This function is  
122748 useful only when a controlling process needs to specify specific events to be filtered.

122749 The *posix\_trace\_eventid\_get\_name()* function allows the application to obtain a trace event name  
122750 given its trace event type identifier. One possible use of this function is to identify the type of a  
122751 trace event retrieved from the trace stream, and print it. The easiest way to implement this  
122752 requirement, is to use a single trace event type map for all the processes whose maps are  
122753 required to be identical. A more difficult way is to attempt to keep multiple maps identical at  
122754 every call to *posix\_trace\_eventid\_open()* and *posix\_trace\_trid\_eventid\_open()*.

#### 122755 B.2.11.6 Rationale on Trace Events Type Filtering

122756 The most basic rationale for runtime and pre-registration filtering (selection/rejection) of trace  
122757 event types is to prevent choking of the trace collection facility, and/or overloading of the  
122758 computer system. Any worthwhile trace facility can bring even the largest computer to its  
122759 knees. Otherwise, everything would be recorded and filtered after the fact; it would be much  
122760 simpler, but impractical.

122761 To achieve debugging, measurement, or whatever the purpose of tracing, the filtering of trace  
122762 event types is an important part of trace analysis. Due to the fact that the trace events are put  
122763 into a trace stream and probably logged afterwards into a file, different levels of filtering—that  
122764 is, rejection of trace event types—are possible.

### 122765 **Filtering of Trace Event Types Before Tracing**

122766 This function, represented by the `posix_trace_set_filter()` function in POSIX.1-2008 (see  
122767 `posix_trace_set_filter()`), selects, before or during tracing, the set of trace event types to be filtered  
122768 out. It should be possible also (as OSF suggested in their ETAP trace specifications) to select the  
122769 kernel trace event types to be traced in a system-wide fashion. These two functionalities are  
122770 called the pre-filtering of trace event types.

122771 The restriction on the actual type used for the `trace_event_set_t` type is intended to guarantee  
122772 that these objects can always be assigned, have their address taken, and be passed by value as  
122773 parameters. It is not intended that this type be a structure including pointers to other data  
122774 structures, as that could impact the portability of applications performing such operations. A  
122775 reasonable implementation could be a structure containing an array of integer types.

### 122776 **Filtering of Trace Event Types at Runtime**

122777 It is possible to build this functionality using the `posix_trace_set_filter()` function. A privileged  
122778 process or a privileged thread can get trace events from the trace stream of another process or  
122779 thread, and thus specify the type of trace events to record into a file, using implementation-  
122780 defined methods and interfaces. This functionality, called inline filtering of trace event types, is  
122781 used for runtime analysis of trace streams.

### 122782 **Post-Mortem Filtering of Trace Event Types**

122783 The word “post-mortem” is used here to indicate that some unanticipated situation occurs  
122784 during execution that does not permit a pre or inline filtering of trace events and that it is  
122785 necessary to record all trace event types to have a chance to discover the problem afterwards.  
122786 When the program stops, all the trace events recorded previously can be analyzed in order to  
122787 find the solution. This functionality could be named the post-filtering of trace event types.

### 122788 **Discussions about Trace Event Type Filtering**

122789 After long discussions with the parties involved in the process of defining the trace interface, it  
122790 seems that the sensitivity to the filtering problem is different, but everybody agrees that the level  
122791 of the overhead introduced during the tracing operation depends on the filtering method  
122792 elected. If the time that it takes the trace event to be recorded can be neglected, the overhead  
122793 introduced by the filtering process can be classified as follows:

122794 Pre-filtering      System and process/thread-level overhead

122795 Inline-filtering    Process/thread-level overhead

122796 Post-filtering     No overhead; done offline

122797 The pre-filtering could be named “critical realtime” filtering in the sense that the filtering of  
122798 trace event type is manageable at the user level so the user can lower to a minimum the filtering  
122799 overhead at some user selected level of priority for the inline filtering, or delay the filtering to  
122800 after execution for the post-filtering. The counterpart of this solution is that the size of the trace  
122801 stream must be sufficient to record all the trace events. The advantage of the pre-filtering is that  
122802 the utilization of the trace stream is optimized.

122803 Only pre-filtering is defined by POSIX.1-2008. However, great care must be taken in specifying  
122804 pre-filtering, so that it does not impose unacceptable overhead. Moreover, it is necessary to  
122805 isolate all the functionality relative to the pre-filtering.

122806 The result of this rationale is to define a new option, the Trace Event Filter option, not  
122807 necessarily implemented in small realtime systems, where system overhead is minimized to the  
122808 extent possible.

122809 B.2.11.7 Tracing, pthread API

122810 The objective to be able to control tracing for individual threads may be in conflict with the  
 122811 efficiency expected in threads with a *contentionscope* attribute of PTHREAD\_SCOPE\_PROCESS.  
 122812 For these threads, context switches from one thread that has tracing enabled to another thread  
 122813 that has tracing disabled may require a kernel call to inform the kernel whether it has to trace  
 122814 system events executed by that thread or not. For this reason, it was proposed that the ability to  
 122815 enable or disable tracing for PTHREAD\_SCOPE\_PROCESS threads be made optional, through  
 122816 the introduction of a Trace Scope Process option. A trace implementation which did not  
 122817 implement the Trace Scope Process option would not honor the tracing-state attribute of a thread  
 122818 with PTHREAD\_SCOPE\_PROCESS; it would, however, honor the tracing-state attribute of a  
 122819 thread with PTHREAD\_SCOPE\_SYSTEM. This proposal was rejected as:

- 122820 1. Removing desired functionality (per-thread trace control)
- 122821 2. Introducing counter-intuitive behavior for the tracing-state attribute
- 122822 3. Mixing logically orthogonal ideas (thread scheduling and thread tracing)
- 122823 [Objective 4]

122824 Finally, to solve this complex issue, this API does not provide *pthread\_gettracingstate()*,  
 122825 *pthread\_settracingstate()*, *pthread\_attr\_gettracingstate()*, and *pthread\_attr\_settracingstate()*  
 122826 interfaces. These interfaces force the thread implementation to add to the weight of the thread  
 122827 and cause a revision of the threads libraries, just to support tracing. Worse yet,  
 122828 *posix\_trace\_event()* must always test this per-thread variable even in the common case where it is  
 122829 not used at all. Per-thread tracing is easy to implement using existing interfaces where  
 122830 necessary; see the following example.

### 122831 Example

```

122832 /* Caution. Error checks omitted */
122833 static pthread_key_t my_key;
122834 static trace_event_id_t my_event_id;
122835 static pthread_once_t my_once = PTHREAD_ONCE_INIT;

122836 void my_init(void)
122837 {
122838     (void) pthread_key_create(&my_key, NULL);
122839     (void) posix_trace_eventid_open("my", &my_event_id);
122840 }

122841 int get_trace_flag(void)
122842 {
122843     pthread_once(&my_once, my_init);
122844     return (pthread_getspecific(my_key) != NULL);
122845 }

122846 void set_trace_flag(int f)
122847 {
122848     pthread_once(&my_once, my_init);
122849     pthread_setspecific(my_key, f? &my_event_id: NULL);
122850 }

122851 fn()
122852 {
122853     if (get_trace_flag())
122854         posix_trace_event(my_event_id, ...)
122855 }
```

- 122856 The above example does not implement third-party state setting.
- 122857 Lastly, per-thread tracing works poorly for threads with PTHREAD\_SCOPE\_PROCESS  
122858 contention scope. These “library” threads have minimal interaction with the kernel and would  
122859 have to explicitly set the attributes whenever they are context switched to a new kernel thread in  
122860 order to trace system events. Such state was explicitly avoided in POSIX threads to keep  
122861 PTHREAD\_SCOPE\_PROCESS threads lightweight.
- 122862 The reason that keeping PTHREAD\_SCOPE\_PROCESS threads lightweight is important is that  
122863 such threads can be used not just for simple multi-processors but also for co-routine style  
122864 programming (such as discrete event simulation) without inventing a new threads paradigm.  
122865 Adding extra runtime cost to thread context switches will make using POSIX threads less  
122866 attractive in these situations.
- 122867 *B.2.11.8 Rationale on Triggering*
- 122868 The ability to start or stop tracing based on the occurrence of specific trace event types has been  
122869 proposed as a parallel to similar functionality appearing in logic analyzers. Such triggering, in  
122870 order to be very useful, should be based not only on the trace event type, but on trace event-  
122871 specific data, including tests of user-specified fields for matching or threshold values.
- 122872 Such a facility is unnecessary where the buffering of the stream is not a constraint, since such  
122873 checks can be performed offline during post-mortem analysis.
- 122874 For example, a large system could incorporate a daemon utility to collect the trace records from  
122875 memory buffers and spool them to secondary storage for later analysis. In the instances where  
122876 resources are truly limited, such as embedded applications, the application incorporation of  
122877 application code to test the circumstances of a trace event and call the trace point only if needed  
122878 is usually straightforward.
- 122879 For performance reasons, the *posix\_trace\_event()* function should be implemented using a macro,  
122880 so if the trace is inactive, the trace event point calls are latent code and must cost no more than a  
122881 scalar test.
- 122882 The API proposed in POSIX.1-2008 does not include any triggering functionality.
- 122883 *B.2.11.9 Rationale on Timestamp Clock*
- 122884 It has been suggested that the tracing mechanism should include the possibility of specifying the  
122885 clock to be used in timestamping the trace events. When application trace events must be  
122886 correlated to remote trace events, such a facility could provide a global time reference not  
122887 available from a local clock. Further, the application may be driven by timers based on a clock  
122888 different from that used for the timestamp, and the correlation of the trace to those untraced  
122889 timer activities could be an important part of the analysis of the application.
- 122890 However, the tracing mechanism needs to be fast and just the provision of such an option can  
122891 materially affect its performance. Leaving aside the performance costs of reading some clocks,  
122892 this notion is also ill-defined when kernel trace events are to be traced by two applications  
122893 making use of different tracing clocks. This can even happen within a single application where  
122894 different parts of the application are served by different clocks. Another complication can occur  
122895 when a clock is maintained strictly at the user level and is unavailable at the kernel level.
- 122896 It is felt that the benefits of a selectable trace clock do not match its costs. Applications that wish  
122897 to correlate clocks other than the default tracing clock can include trace events with sample  
122898 values of those other clocks, allowing correlation of timestamps from the various independent  
122899 clocks. In any case, such a technique would be required when applications are sensitive to

122900 multiple clocks.

122901 *B.2.11.10 Rationale on Different Overrun Conditions*

122902 The analysis of the dynamic behavior of the trace mechanism shows that different overrun  
122903 conditions may occur. The API must provide a means to manage such conditions in a portable  
122904 way.

122905 **Overrun in Trace Streams Initialized with POSIX\_TRACE\_LOOP Policy**

122906 In this case, the user of the trace mechanism is interested in using the trace stream with  
122907 POSIX\_TRACE\_LOOP policy to record trace events continuously, but ideally without losing any  
122908 trace events. The online analyzer process must get the trace events at a mean speed equivalent to  
122909 the recording speed. Should the trace stream become full, a trace stream overrun occurs. This  
122910 condition is detected by getting the status of the active trace stream (function  
122911 *posix\_trace\_get\_status()*) and looking at the member *posix\_stream\_overrun\_status* of the read  
122912 **posix\_stream\_status** structure. In addition, two predefined trace event types are defined:

- 122913 1. The beginning of a trace overflow, to locate the beginning of an overflow when reading a  
122914 trace stream
- 122915 2. The end of a trace overflow, to locate the end of an overflow, when reading a trace stream

122916 As a timestamp is associated with these predefined trace events, it is possible to know the  
122917 duration of the overflow.

122918 **Overrun in Dumping Trace Streams into Trace Logs**

122919 The user lets the trace mechanism dump the trace stream initialized with  
122920 POSIX\_TRACE\_FLUSH policy automatically into a trace log. If the dump operation is slower  
122921 than the recording of trace events, the trace stream can overrun. This condition is detected by  
122922 getting the status of the active trace stream (the *posix\_trace\_get\_status()* function) and looking at  
122923 the member *posix\_stream\_overrun\_status* of the read **posix\_stream\_status** structure. This overrun  
122924 indicates that the trace mechanism is not able to operate in this mode at this speed. It is the  
122925 responsibility of the user to modify one of the trace parameters (the stream size or the trace  
122926 event type filter, for instance) to avoid such overrun conditions, if overruns are to be prevented.  
122927 The same already predefined trace event types (see [Overrun in Trace Streams Initialized with  
122928 POSIX\\_TRACE\\_LOOP Policy](#)) are used to detect and to know the duration of an overflow.

122929 **Reading an Active Trace Stream**

122930 Although this trace API allows one to read an active trace stream with log while it is tracing, this  
122931 feature can lead to false overflow origin interpretation: the trace log or the reader of the trace  
122932 stream. Reading from an active trace stream with log is thus non-portable, and has been left  
122933 unspecified.

122934 **B.2.12 Data Types**122935 *B.2.12.1 Defined Types*

122936 The requirement that additional types defined in this section end in “\_t” was prompted by the  
 122937 problem of name space pollution. It is difficult to define a type (where that type is not one  
 122938 defined by POSIX.1-2008) in one header file and use it in another without adding symbols to the  
 122939 name space of the program. To allow implementors to provide their own types, all conforming  
 122940 applications are required to avoid symbols ending in “\_t”, which permits the implementor to  
 122941 provide additional types. Because a major use of types is in the definition of structure members,  
 122942 which can (and in many cases must) be added to the structures defined in POSIX.1-2008, the  
 122943 need for additional types is compelling.

122944 The types, such as **ushort** and **ulong**, which are in common usage, are not defined in  
 122945 POSIX.1-2008 (although **ushort\_t** would be permitted as an extension). They can be added to  
 122946 **<sys/types.h>** using a feature test macro (see [Section B.2.2.1](#), on page 3498). A suggested symbol  
 122947 for these is **\_SYSIII**. Similarly, the types like **u\_short** would probably be best controlled by **\_BSD**.

122948 Some of these symbols may appear in other headers; see [Section B.2.2.2](#) (on page 3499).

122949 **dev\_t** This type may be made large enough to accommodate host-locality considerations  
 122950 of networked systems.

122951 This type must be arithmetic. Earlier proposals allowed this to be non-arithmetic  
 122952 (such as a structure) and provided a *samefile()* function for comparison.

122953 **gid\_t** Some implementations had separated **gid\_t** from **uid\_t** before POSIX.1 was  
 122954 completed. It would be difficult for them to coalesce them when it was  
 122955 unnecessary. Additionally, it is quite possible that user IDs might be different from  
 122956 group IDs because the user ID might wish to span a heterogeneous network,  
 122957 where the group ID might not.

122958 For current implementations, the cost of having a separate **gid\_t** will be only  
 122959 lexical.

122960 **mode\_t** This type was chosen so that implementations could choose the appropriate  
 122961 integer type, and for compatibility with the ISO C standard. 4.3 BSD uses  
 122962 **unsigned short** and the SVID uses **ushort**, which is the same. Historically, only the  
 122963 low-order sixteen bits are significant.

122964 **nlink\_t** This type was introduced in place of **short** for *st\_nlink* (see the **<sys/stat.h>** header)  
 122965 in response to an objection that **short** was too small.

122966 **off\_t** This type is used to represent a file offset or file size. On systems supporting large  
 122967 files, **off\_t** is larger than 32 bits in at least one programming environment. Other  
 122968 programming environments may use different sizes for **off\_t**, for compatibility or  
 122969 other reasons.

122970 **pid\_t** The inclusion of this symbol was controversial because it is tied to the issue of the  
 122971 representation of a process ID as a number. From the point of view of a  
 122972 conforming application, process IDs should be “magic cookies”<sup>8</sup> that are produced  
 122973 by calls such as *fork()*, used by calls such as *waitpid()* or *kill()*, and not otherwise

---

122974 8. An historical term meaning: “An opaque object, or token, of determinate size, whose significance is known only to the entity which  
 122975 created it. An entity receiving such a token from the generating entity may only make such use of the ‘cookie’ as is defined and permitted  
 122976 by the supplying entity.”

|        |                |                                                                                                                                       |
|--------|----------------|---------------------------------------------------------------------------------------------------------------------------------------|
| 122977 |                | analyzed (except that the sign is used as a flag for certain operations).                                                             |
| 122978 |                | The concept of a {PID_MAX} value interacted with this in early proposals. Treating                                                    |
| 122979 |                | process IDs as an opaque type both removes the requirement for {PID_MAX} and                                                          |
| 122980 |                | allows systems to be more flexible in providing process IDs that span a large range                                                   |
| 122981 |                | of values, or a small one.                                                                                                            |
| 122982 |                | Since the values in <b>uid_t</b> , <b>gid_t</b> , and <b>pid_t</b> will be numbers generally, and                                     |
| 122983 |                | potentially both large in magnitude and sparse, applications that are based on                                                        |
| 122984 |                | arrays of objects of this type are unlikely to be fully portable in any case. Solutions                                               |
| 122985 |                | that treat them as magic cookies will be portable.                                                                                    |
| 122986 |                | {CHILD_MAX} precludes the possibility of a “toy implementation”, where there                                                          |
| 122987 |                | would only be one process.                                                                                                            |
| 122988 | <b>ssize_t</b> | This is intended to be a signed analog of <b>size_t</b> . The wording is such that an                                                 |
| 122989 |                | implementation may either choose to use a longer type or simply to use the signed                                                     |
| 122990 |                | version of the type that underlies <b>size_t</b> . All functions that return <b>ssize_t</b> ( <i>read()</i>                           |
| 122991 |                | and <i>write()</i> ) describe as “implementation-defined” the result of an input exceeding                                            |
| 122992 |                | {SSIZE_MAX}. It is recognized that some implementations might have <b>ints</b> that                                                   |
| 122993 |                | are smaller than <b>size_t</b> . A conforming application would be constrained not to                                                 |
| 122994 |                | perform I/O in pieces larger than {SSIZE_MAX}, but a conforming application                                                           |
| 122995 |                | using extensions would be able to use the full range if the implementation                                                            |
| 122996 |                | provided an extended range, while still having a single type-compatible interface.                                                    |
| 122997 |                | The symbols <b>size_t</b> and <b>ssize_t</b> are also required in <b>&lt;unistd.h&gt;</b> to minimize the                             |
| 122998 |                | changes needed for calls to <i>read()</i> and <i>write()</i> . Implementors are reminded that it                                      |
| 122999 |                | must be possible to include both <b>&lt;sys/types.h&gt;</b> and <b>&lt;unistd.h&gt;</b> in the same                                   |
| 123000 |                | program (in either order) without error.                                                                                              |
| 123001 | <b>uid_t</b>   | Before the addition of this type, the data types used to represent these values                                                       |
| 123002 |                | varied throughout early proposals. The <b>&lt;sys/stat.h&gt;</b> header defined these values                                          |
| 123003 |                | as type <b>short</b> , the <b>&lt;passwd.h&gt;</b> file (now <b>&lt;pwd.h&gt;</b> and <b>&lt;grp.h&gt;</b> ) used an <b>int</b> , and |
| 123004 |                | <i>getuid()</i> returned an <b>int</b> . In response to a strong objection to the inconsistent                                        |
| 123005 |                | definitions, all the types were switched to <b>uid_t</b> .                                                                            |
| 123006 |                | In practice, those historical implementations that use varying types of this sort can                                                 |
| 123007 |                | typedef <b>uid_t</b> to <b>short</b> with no serious consequences.                                                                    |
| 123008 |                | The problem associated with this change concerns object compatibility after                                                           |
| 123009 |                | structure size changes. Since most implementations will define <b>uid_t</b> as a <b>short</b> , the                                   |
| 123010 |                | only substantive change will be a reduction in the size of the <b>passwd</b> structure.                                               |
| 123011 |                | Consequently, implementations with an overriding concern for object                                                                   |
| 123012 |                | compatibility can pad the structure back to its current size. For that reason, this                                                   |
| 123013 |                | problem was not considered critical enough to warrant the addition of a separate                                                      |
| 123014 |                | type to POSIX.1.                                                                                                                      |
| 123015 |                | The types <b>uid_t</b> and <b>gid_t</b> are magic cookies. There is no {UID_MAX} defined by                                           |
| 123016 |                | POSIX.1, and no structure imposed on <b>uid_t</b> and <b>gid_t</b> other than that they be                                            |
| 123017 |                | positive arithmetic types. (In fact, they could be <b>unsigned char</b> .) There is no                                                |
| 123018 |                | maximum or minimum specified for the number of distinct user or group IDs.                                                            |

123019 B.2.12.2 *The char Type*

123020 POSIX.1-2008 explicitly requires that a **char** type is exactly one byte (8 bits).

123021 B.2.12.3 *Pointer Types*

123022 POSIX.1-2008 explicitly requires implementations to convert pointers to **void \*** and back with no  
123023 loss of information. This is an extension over the ISO C standard.

## 123024 **B.3 System Interfaces**

123025 See the RATIONALE sections on the individual reference pages.

### 123026 **B.3.1 System Interfaces Removed in this Version**

123027 The following section contains a list of the interfaces removed in POSIX.1-2008, together with  
123028 advice for application developers on the alternative interfaces that should be used for maximum  
123029 portability.

123030 B.3.1.1 *bcmp()*

123031 Applications are recommended to use the *memcmp()* function instead of this function.

123032 For maximum portability, it is recommended to replace the function call to *bcmp()* as follows:

```
123033 #define bcmp(b1,b2,len) memcmp((b1), (b2), (size_t)(len))
```

123034 B.3.1.2 *bcopy()*

123035 Applications are recommended to use the *memmove()* function instead of this function.

123036 The following are approximately equivalent (note the order of the arguments):

```
123037 bcopy(s1,s2,n) ≈ memmove(s2,s1,n)
```

123038 For maximum portability, it is recommended to replace the function call to *bcopy()* as follows:

```
123039 #define bcopy(b1,b2,len) (void)(memmove((b2), (b1), (len)))
```

123040 B.3.1.3 *bsd\_signal()*

123041 Applications are recommended to use the *sigaction()* function instead of this function.

123042 The *bsd\_signal()* function was supplied as a migration path for the BSD *signal()* function for  
123043 simple applications that installed a single-argument signal handler function.

123044 Historically, the *bsd\_signal()* function differs from *signal()* in that the SA\_RESTART flag is set  
123045 and the SA\_RESETHAND flag is clear when *bsd\_signal()* is used. The state of these flags is not  
123046 specified for *signal()*.

- 123047 B.3.1.4 *bzero()*
- 123048 Applications are recommended to use the *memset()* function instead of this function.
- 123049 For maximum portability, it is recommended to replace the function call to *bzero()* as follows:
- 123050 

```
#define bzero(b, len) (void) (memset ((b), '\0', (len)))
```
- 123051 B.3.1.5 *ecvt(), fcvt(), gcvt()*
- 123052 Applications are recommended to use the *sprintf()* function instead of these functions.
- 123053 The *sprintf()* function is required by ISO C and is thus more portable.
- 123054 B.3.1.6 *ftime()*
- 123055 Applications are recommended to use the *time()* function to determine the current time.
- 123056 Realtime applications should use *clock\_gettime()* to determine the current time.
- 123057 B.3.1.7 *getcontext(), makecontext(), swapcontext()*
- 123058 Due to portability issues with these functions, especially with the manipulation of contexts,
- 123059 applications are recommended to be rewritten to use POSIX threads.
- 123060 B.3.1.8 *gethostbyaddr(), gethostbyname()*
- 123061 Applications are recommended to use the *getaddrinfo()* and *getnameinfo()* functions instead of
- 123062 these functions.
- 123063 The *gethostbyaddr()* and *gethostbyname()* functions may return pointers to static data, which may
- 123064 be overwritten by subsequent calls to any of these functions. The suggested replacements do not
- 123065 have this problem and are also IPv6-capable.
- 123066 B.3.1.9 *getwd()*
- 123067 Applications are recommended to use the *getcwd()* function to determine the current working
- 123068 directory.
- 123069 B.3.1.10 *h\_errno*
- 123070 Applications are recommended not to use this error return code. Previously it was set by the
- 123071 *gethostbyname()* and *gethostbyaddr()* functions.
- 123072 B.3.1.11 *index()*
- 123073 Applications are recommended to use the *strchr()* function instead of this function.
- 123074 For maximum portability, it is recommended to replace the function call to *index()* as follows:
- 123075 

```
#define index(a, b) strchr ((a), (b))
```

123076 B.3.1.12 *makecontext()*

123077 Applications using the *getcontext()*, *makecontext()*, and *swapcontext()* functions should be  
123078 rewritten to use POSIX threads.

123079 B.3.1.13 *mktemp()*

123080 Applications are recommended to use the *mkstemp()* function instead of this function.

123081 The *mktemp()* function makes an application vulnerable to possible security problems since  
123082 between the time a pathname is created and the file opened, it is possible for some other process  
123083 to create a file with the same name. The *mkstemp()* function does not have this vulnerability.

123084 B.3.1.14 *pthread\_attr\_getstackaddr()*, *pthread\_attr\_setstackaddr()*

123085 Applications are recommended to use the *pthread\_attr\_setstack()* and *pthread\_attr\_getstack()*  
123086 functions instead of these functions.

123087 There are a number of ambiguities in the specification of the *stackaddr* attribute that makes  
123088 portable use of these interfaces impossible.

123089 B.3.1.15 *rindex()*

123090 Applications are recommended to use the *strrchr()* function instead of this function.

123091 For maximum portability, it is recommended to replace the function call to *rindex()* as follows:

```
123092 #define rindex(a,b) strrchr((a),(b))
```

123093 B.3.1.16 *scalb()*

123094 Applications are recommended to use either *scalbln()*, *scalblnf()*, or *scalblnl()* instead of these  
123095 functions.

123096 The behavior for the *scalb()* function was only defined when the *n* argument is an integer, a  
123097 NaN, or Inf. The behavior of other values for the *n* argument was unspecified.

123098 B.3.1.17 *ualarm()*

123099 Applications are recommended to use *timer\_create()*, *timer\_delete()*, *timer\_getoverrun()*,  
123100 *timer\_gettime()*, or *timer\_settime()* instead of this function.

123101 B.3.1.18 *usleep()*

123102 Applications are recommended to use the *nanosleep()* function instead of this function.

123103 B.3.1.19 *vfork()*

123104 Applications are recommended to use the *fork()* function instead of this function.

123105 The *vfork()* function was previously under-specified.

123106 B.3.1.20 *wcswcs()*

123107 Applications are recommended to use the *wcsstr()* function instead of this function.

123108 The *wcsstr()* function is technically equivalent and is portable across all ISO C implementations.

### 123109 B.3.2 System Interfaces Removed in the Previous Version

123110 The following system interfaces, headers, and external variables were removed in the previous  
123111 version of this standard:

|        |                  |                        |                   |                          |               |
|--------|------------------|------------------------|-------------------|--------------------------|---------------|
| 123112 | <i>advance()</i> | <i>getdtablesize()</i> | <i>re_exec()</i>  | <i>ttyslot()</i>         | <i>loc1</i>   |
| 123113 | <i>brk()</i>     | <i>getpagesize()</i>   | <i>regcmp()</i>   | <i>valloc()</i>          | <i>__loc1</i> |
| 123114 | <i>chroot()</i>  | <i>getpass()</i>       | <i>regex()</i>    | <i>wait3()</i>           | <i>loc2</i>   |
| 123115 | <i>compile()</i> | <i>getw()</i>          | <i>sbrk()</i>     | <b>&lt;re_comp.h&gt;</b> | <i>locs</i>   |
| 123116 | <i>cuserid()</i> | <i>putw()</i>          | <i>sigstack()</i> | <b>&lt;regex.h&gt;</b>   |               |
| 123117 | <i>gamma()</i>   | <i>re_comp()</i>       | <i>step()</i>     | <b>&lt;varargs.h&gt;</b> |               |

### 123118 B.3.3 Examples for Spawn

123119 The following long examples are provided in the Rationale (Informative) volume of  
123120 POSIX.1-2008 as a supplement to the reference page for *posix\_spawn()*.

#### 123121 Example Library Implementation of Spawn

123122 The *posix\_spawn()* or *posix\_spawnnp()* functions provide the following:

- 123123 • Simply start a process executing a process image. This is the simplest application for  
123124 process creation, and it may cover most executions of *fork()*.
- 123125 • Support I/O redirection, including pipes.
- 123126 • Run the child under a user and group ID in the domain of the parent.
- 123127 • Run the child at any priority in the domain of the parent.

123128 The *posix\_spawn()* or *posix\_spawnnp()* functions do not cover every possible use of the *fork()*  
123129 function, but they do span the common applications: typical use by a shell and a login utility.

123130 The price for an application is that before it calls *posix\_spawn()* or *posix\_spawnnp()*, the parent  
123131 must adjust to a state that *posix\_spawn()* or *posix\_spawnnp()* can map to the desired state for the  
123132 child. Environment changes require the parent to save some of its state and restore it afterwards.  
123133 The effective behavior of a successful invocation of *posix\_spawn()* is as if the operation were  
123134 implemented with POSIX operations as follows:

```

123135 #include <sys/types.h>
123136 #include <stdlib.h>
123137 #include <stdio.h>
123138 #include <unistd.h>
123139 #include <sched.h>
123140 #include <fcntl.h>
123141 #include <signal.h>
123142 #include <errno.h>
123143 #include <string.h>
123144 #include <signal.h>
123145 /* #include <spawn.h> */

```

```

123146  /*****
123147  /* Things that could be defined in spawn.h */
123148  *****/
123149  typedef struct
123150  {
123151      short posix_attr_flags;
123152      #define POSIX_SPAWN_SETPGROUP          0x1
123153      #define POSIX_SPAWN_SETSIGMASK        0x2
123154      #define POSIX_SPAWN_SETSIGDEF         0x4
123155      #define POSIX_SPAWN_SETSCHEDULER      0x8
123156      #define POSIX_SPAWN_SETSCHEDPARAM     0x10
123157      #define POSIX_SPAWN_RESETEIDS         0x20
123158      pid_t posix_attr_pgroup;
123159      sigset_t posix_attr_sigmask;
123160      sigset_t posix_attr_sigdefault;
123161      int posix_attr_schedpolicy;
123162      struct sched_param posix_attr_schedparam;
123163  } posix_spawnattr_t;

123164  typedef char *posix_spawn_file_actions_t;

123165  int posix_spawn_file_actions_init(
123166      posix_spawn_file_actions_t *file_actions);
123167  int posix_spawn_file_actions_destroy(
123168      posix_spawn_file_actions_t *file_actions);
123169  int posix_spawn_file_actions_addclose(
123170      posix_spawn_file_actions_t *file_actions, int fildes);
123171  int posix_spawn_file_actions_adddup2(
123172      posix_spawn_file_actions_t *file_actions, int fildes,
123173      int newfildes);
123174  int posix_spawn_file_actions_addopen(
123175      posix_spawn_file_actions_t *file_actions, int fildes,
123176      const char *path, int oflag, mode_t mode);
123177  int posix_spawnattr_init(posix_spawnattr_t *attr);
123178  int posix_spawnattr_destroy(posix_spawnattr_t *attr);
123179  int posix_spawnattr_getflags(const posix_spawnattr_t *attr,
123180      short *lags);
123181  int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);
123182  int posix_spawnattr_getpgroup(const posix_spawnattr_t *attr,
123183      pid_t *pgroup);
123184  int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);

### 123533 **I/O Redirection with Spawn**

123534 I/O redirection with *posix\_spawn()* or *posix\_spawnp()* is accomplished by crafting a *file\_actions*  
123535 argument to effect the desired redirection. Such a redirection follows the general outline of the  
123536 following example:

```

123537     /* To redirect new standard output (fd 1) to a file, */
123538     /* and redirect new standard input (fd 0) from my fd socket_pair[1], */
123539     /* and close my fd socket_pair[0] in the new process. */
123540     posix_spawn_file_actions_t file_actions;
123541     posix_spawn_file_actions_init(&file_actions);
123542     posix_spawn_file_actions_addopen(&file_actions, 1, "newout", ...);
123543     posix_spawn_file_actions_dup2(&file_actions, socket_pair[1], 0);
123544     posix_spawn_file_actions_close(&file_actions, socket_pair[0]);
123545     posix_spawn_file_actions_close(&file_actions, socket_pair[1]);
123546     posix_spawn(..., &file_actions, ...);

```

123547        `posix_spawn_file_actions_destroy(&file_actions);`

123548        **Spawning a Process Under a New User ID**

123549        Spawning a process under a new user ID follows the outline shown in the following example:

```
123550        Save = getuid();  
123551        setuid(newid);  
123552        posix_spawn(...);  
123553        setuid(Save);
```

# Rationale for Shell and Utilities

## 123561 C.1 Introduction

### 123562 C.1.1 Change History

123563 The change history is provided as an informative section, to track changes from earlier versions  
123564 of this standard.

123565 The following sections describe changes made to the Shell and Utilities volume of POSIX.1-2008  
123566 since Issue 6 of the base document. The CHANGE HISTORY section for each utility describes  
123567 technical changes made to that utility from Issue 5. Changes between earlier versions of the base  
123568 document and Issue 5 are not included.

#### 123569 Changes from Issue 6 to Issue 7 (POSIX.1-2008)

123570 The following list summarizes the major changes that were made in the Shell and Utilities  
123571 volume of POSIX.1-2008 from Issue 6 to Issue 7:

- 123572 • Austin Group defect reports, IEEE Interpretations against IEEE Std 1003.1, and responses  
123573 to ISO/IEC defect reports against ISO/IEC 9945 are applied.
- 123574 • The Open Group corrigenda and resolutions are applied.
- 123575 • Features, marked legacy or obsolescent in the base document, have been considered for  
123576 removal in this version.
- 123577 • A review of the use of fixed path filenames within the standard has been undertaken; for  
123578 example, the *at*, *batch*, and *crontab* utilities previously had a requirement for use of the  
123579 directory **/usr/lib/cron**.
- 123580 • The options within the standard have been revised.
  - 123581 — The Batch Environment Services and Utilities option is marked obsolescent.
  - 123582 — The UUCP utilities option is added.
  - 123583 — The User Portability Utilities option is revised so that only the *bg*, *ex*, *fc*, *fg*, *jobs*, *more*,  
123584 *talk*, and *vi* utilities are included, the rest being moved to the Base.

123585 **New Features in Issue 7**

123586 There are no new utilities in Issue 7.

123587 **C.1.2 Relationship to Other Documents**123588 *C.1.2.1 System Interfaces*

123589 It has been pointed out that the Shell and Utilities volume of POSIX.1-2008 assumes that a great  
 123590 deal of functionality from the System Interfaces volume of POSIX.1-2008 is present, but never  
 123591 states exactly how much (and strictly does not need to since both are mandated on a conforming  
 123592 system). This section is an attempt to clarify the assumptions.

123593 **File Read, Write, and Creation**

123594 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/2 is applied, updating Table 1-1.

123595 **File Removal**

123596 This is intended to be a summary of the *unlink()* and *rmdir()* requirements. Note that it is  
 123597 possible using the *unlink()* function for item 4. to occur.

123598 *C.1.2.2 Concepts Derived from the ISO C Standard*

123599 This section was introduced to address the issue that there was insufficient detail presented by  
 123600 such utilities as *awk* or *sh* about their procedural control statements and their methods of  
 123601 performing arithmetic functions.

123602 The ISO C standard was selected as a model because most historical implementations of the  
 123603 standard utilities were written in C. Thus, it was more likely that they would act in the desired  
 123604 manner without modification.

123605 Using the ISO C standard is primarily a notational convenience so that the many procedural  
 123606 languages in the Shell and Utilities volume of POSIX.1-2008 would not have to be rigorously  
 123607 described in every aspect. Its selection does not require that the standard utilities be written in  
 123608 Standard C; they could be written in Common Usage C, Ada, Pascal, assembler language, or  
 123609 anything else.

123610 The sizes of the various numeric values refer to C-language data types that are allowed to be  
 123611 different sizes by the ISO C standard. Thus, like a C-language application, a shell application  
 123612 cannot rely on their exact size. However, it can rely on their minimum sizes expressed in the  
 123613 ISO C standard, such as {LONG\_MAX} for a **long** type.

123614 The behavior on overflow is undefined for ISO C standard arithmetic. Therefore, the standard  
 123615 utilities can use “bignum” representation for integers so that there is no fixed maximum unless  
 123616 otherwise stated in the utility description. Similarly, standard utilities can use infinite-precision  
 123617 representations for floating-point arithmetic, as long as these representations exceed the ISO C  
 123618 standard requirements.

123619 This section addresses only the issue of semantics; it is not intended to specify syntax. For  
 123620 example, the ISO C standard requires that 0L be recognized as an integer constant equal to zero,  
 123621 but utilities such as *awk* and *sh* are not required to recognize 0L (though they are allowed to, as  
 123622 an extension).

123623 The ISO C standard requires that a C compiler must issue a diagnostic for constants that are too  
 123624 large to represent. Most standard utilities are not required to issue these diagnostics; for  
 123625 example, the command:

```
123626 diff -C 2147483648 file1 file2
```

123627 has undefined behavior, and the *diff* utility is not required to issue a diagnostic even if the  
 123628 number 2 147 483 648 cannot be represented.

### 123629 C.1.3 Utility Limits

123630 This section grew out of an idea that originated with the original POSIX.1, in the tables of system  
 123631 limits for the *sysconf()* and *pathconf()* functions. The idea being that a conforming application  
 123632 can be written to use the most restrictive values that a minimal system can provide, but it should  
 123633 not have to. The values provided represent compromises so that some vendors can use  
 123634 historically limited versions of UNIX system utilities. They are the highest values that a strictly  
 123635 conforming application can assume, given no other information.

123636 However, by using the *getconf* utility or the *sysconf()* function, the elegant application can be  
 123637 tailored to more liberal values on some of the specific instances of specific implementations.

123638 There is no explicitly stated requirement that an implementation provide finite limits for any of  
 123639 these numeric values; the implementation is free to provide essentially unbounded capabilities  
 123640 (where it makes sense), stopping only at reasonable points such as {ULONG\_MAX} (from the  
 123641 ISO C standard). Therefore, applications desiring to tailor themselves to the values on a  
 123642 particular implementation need to be ready for possibly huge values; it may not be a good idea  
 123643 to allocate blindly a buffer for an input line based on the value of {LINE\_MAX}, for instance.  
 123644 However, unlike the System Interfaces volume of POSIX.1-2008, there is no set of limits that  
 123645 return a special indication meaning “unbounded”. The implementation should always return an  
 123646 actual number, even if the number is very large.

123647 The statement:

123648 “It is not guaranteed that the application ...”

123649 is an indication that many of these limits are designed to ensure that implementors design their  
 123650 utilities without arbitrary constraints related to unimaginative programming. There are certainly  
 123651 conditions under which combinations of options can cause failures that would not render an  
 123652 implementation non-conforming. For example, {EXPR\_NEST\_MAX} and {ARG\_MAX} could  
 123653 collide when expressions are large; combinations of {BC\_SCALE\_MAX} and {BC\_DIM\_MAX}  
 123654 could exceed virtual memory.

123655 In the Shell and Utilities volume of POSIX.1-2008, the notion of a limit being guaranteed for the  
 123656 process lifetime, as it is in the System Interfaces volume of POSIX.1-2008, is not as useful to a  
 123657 shell script. The *getconf* utility is probably a process itself, so the guarantee would be without  
 123658 value. Therefore, the Shell and Utilities volume of POSIX.1-2008 requires the guarantee to be for  
 123659 the session lifetime. This will mean that many vendors will either return very conservative  
 123660 values or possibly implement *getconf* as a built-in.

123661 It may seem confusing to have limits that apply only to a single utility grouped into one global  
 123662 section. However, the alternative, which would be to disperse them out into their utility  
 123663 description sections, would cause great difficulty when *sysconf()* and *getconf* were described.  
 123664 Therefore, the standard developers chose the global approach.

123665 Each language binding could provide symbol names that are slightly different from those shown  
 123666 here. For example, the C-Language Binding option adds a leading <underscore> to the symbols  
 123667 as a prefix.

123668 The following comments describe selection criteria for the symbols and their values:

123669 {ARG\_MAX}

123670 This is defined by the System Interfaces volume of POSIX.1-2008. Unfortunately, it is very

123671 difficult for a conforming application to deal with this value, as it does not know how much

123672 of its argument space is being consumed by the environment variables of the user.

123673 {BC\_BASE\_MAX}

123674 {BC\_DIM\_MAX}

123675 {BC\_SCALE\_MAX}

123676 These were originally one value, {BC\_SCALE\_MAX}, but it was unreasonable to link all

123677 three concepts into one limit.

123678 {CHILD\_MAX}

123679 This is defined by the System Interfaces volume of POSIX.1-2008.

123680 {COLL\_WEIGHTS\_MAX}

123681 The weights assigned to **order** can be considered as “passes” through the collation

123682 algorithm.

123683 {EXPR\_NEST\_MAX}

123684 The value for expression nesting was borrowed from the ISO C standard.

123685 {LINE\_MAX}

123686 This is a global limit that affects all utilities, unless otherwise noted. The {MAX\_CANON}

123687 value from the System Interfaces volume of POSIX.1-2008 may further limit input lines from

123688 terminals. The {LINE\_MAX} value was the subject of much debate and is a compromise

123689 between those who wished to have unlimited lines and those who understood that many

123690 historical utilities were written with fixed buffers. Frequently, utility writers selected the

123691 UNIX system constant BUFSIZ to allocate these buffers; therefore, some utilities were

123692 limited to 512 bytes for I/O lines, while others achieved 4 096 bytes or greater.

123693 It should be noted that {LINE\_MAX} applies only to input line length; there is no

123694 requirement in POSIX.1-2008 that limits the length of output lines. Utilities such as *awk*, *sed*,

123695 and *paste* could theoretically construct lines longer than any of the input lines they received,

123696 depending on the options used or the instructions from the application. They are not

123697 required to truncate their output to {LINE\_MAX}. It is the responsibility of the application

123698 to deal with this. If the output of one of those utilities is to be piped into another of the

123699 standard utilities, line length restrictions will have to be considered; the *fold* utility, among

123700 others, could be used to ensure that only reasonable line lengths reach utilities or

123701 applications.

123702 {LINK\_MAX}

123703 This is defined by the System Interfaces volume of POSIX.1-2008.

123704 {MAX\_CANON}

123705 {MAX\_INPUT}

123706 {NAME\_MAX}

123707 {NGROUPS\_MAX}

123708 {OPEN\_MAX}

123709 {PATH\_MAX}

123710 {PIPE\_BUF}

123711 These limits are defined by the System Interfaces volume of POSIX.1-2008. Note that the

123712 byte lengths described by some of these values continue to represent bytes, even if the

123713 applicable character set uses a multi-byte encoding.

123714 {RE\_DUP\_MAX}  
 123715 The value selected is consistent with historical practice. Although the name implies that it  
 123716 applies to all REs, only BREs use the interval notation  $\{m,n\}$  addressed by this limit.

123717 {POSIX2\_SYMLINKS}  
 123718 The {POSIX2\_SYMLINKS} variable indicates that the underlying operating system supports  
 123719 the creation of symbolic links in specific directories. Many of the utilities defined in  
 123720 POSIX.1-2008 that deal with symbolic links do not depend on this value. For example, a  
 123721 utility that follows symbolic links (or does not, as the case may be) will only be affected by a  
 123722 symbolic link if it encounters one. Presumably, a file system that does not support symbolic  
 123723 links will not contain any. This variable does affect such utilities as *ln -s* and *pax* that  
 123724 attempt to create symbolic links.

123725 There are different limits associated with command lines and input to utilities, depending on the  
 123726 method of invocation. In the case of a C program *exec*-ing a utility, {ARG\_MAX} is the  
 123727 underlying limit. In the case of the shell reading a script and *exec*-ing a utility, {LINE\_MAX}  
 123728 limits the length of lines the shell is required to process, and {ARG\_MAX} will still be a limit. If a  
 123729 user is entering a command on a terminal to the shell, requesting that it invoke the utility,  
 123730 {MAX\_INPUT} may restrict the length of the line that can be given to the shell to a value below  
 123731 {LINE\_MAX}.

123732 When an option is supported, *getconf* returns a value of 1. For example, when C development is  
 123733 supported:

```
123734 if [ "$(getconf POSIX2_C_DEV)" -eq 1 ]; then
123735     echo C supported
123736 fi
```

123737 The *sysconf()* function in the C-Language Binding option would return 1.

123738 The following comments describe selection criteria for the symbols and their values:

123739 POSIX2\_C\_BIND  
 123740 POSIX2\_C\_DEV  
 123741 POSIX2\_FORT\_DEV  
 123742 POSIX2\_FORT\_RUN  
 123743 POSIX2\_SW\_DEV  
 123744 POSIX2\_UPE

123745 It is possible for some (usually privileged) operations to remove utilities that support these  
 123746 options or otherwise to render these options unsupported. The header files, the *sysconf()*  
 123747 function, or the *getconf* utility will not necessarily detect such actions, in which case they  
 123748 should not be considered as rendering the implementation non-conforming. A test suite  
 123749 should not attempt tests such as:

```
123750 rm /usr/bin/c99
123751 getconf POSIX2_C_DEV
```

123752 POSIX2\_LOCALEDEF  
 123753 This symbol was introduced to allow implementations to restrict supported locales to only  
 123754 those supplied by the implementation.

123755 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/2 is applied, deleting the entry for  
 123756 {POSIX2\_VERSION} since it is not a utility limit minimum value.

123757 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/3 is applied, changing the text in Utility  
 123758 Limits from: “utility (see *getconf*) through the *sysconf()* function defined in the System Interfaces  
 123759 volume of POSIX.1-2008. The literal names shown in Table 1-3 apply only to the *getconf* utility;  
 123760 the high-level language binding describes the exact form of each name to be used by the

123761 interfaces in that binding.” to: “utility (see *getconf*).”.

#### 123762 **C.1.4 Grammar Conventions**

123763 There is no additional rationale provided for this section.

#### 123764 **C.1.5 Utility Description Defaults**

123765 This section is arranged with headings in the same order as all the utility descriptions. It is a  
123766 collection of related and unrelated information concerning:

- 123767 1. The default actions of utilities
- 123768 2. The meanings of notations used in POSIX.1-2008 that are specific to individual utility  
123769 sections

123770 Although this material may seem out of place here, it is important that this information appear  
123771 before any of the utilities to be described later.

#### 123772 **NAME**

123773 There is no additional rationale provided for this section.

#### 123774 **SYNOPSIS**

123775 There is no additional rationale provided for this section.

#### 123776 **DESCRIPTION**

123777 There is no additional rationale provided for this section.

#### 123778 **OPTIONS**

123779 Although it has not always been possible, the standard developers tried to avoid repeating  
123780 information to reduce the risk that duplicate explanations could each be modified differently.

123781 The need to recognize `--` is required because conforming applications need to shield their  
123782 operands from any arbitrary options that the implementation may provide as an extension. For  
123783 example, if the standard utility *foo* is listed as taking no options, and the application needed to  
123784 give it a pathname with a leading `<hyphen>`, it could safely do it as:

```
123785 foo -- -myfile
```

123786 and avoid any problems with `-m` used as an extension.

#### 123787 **OPERANDS**

123788 The usage of `-` is never shown in the SYNOPSIS. Similarly, the usage of `--` is never shown.

123789 The requirement for processing operands in command-line order is to avoid a “WeirdNIX”  
123790 utility that might choose to sort the input files alphabetically, by size, or by directory order.  
123791 Although this might be acceptable for some utilities, in general the programmer has a right to  
123792 know exactly what order will be chosen.

123793 Some of the standard utilities take multiple *file* operands and act as if they were processing the  
123794 concatenation of those files. For example:

```
123795 asa file1 file2
```

123796 and:

123797 `cat file1 file2 | asa`

123798 have similar results when questions of file access, errors, and performance are ignored. Other  
 123799 utilities such as *grep* or *wc* have completely different results in these two cases. This latter type of  
 123800 utility is always identified in its DESCRIPTION or OPERANDS sections, whereas the former is  
 123801 not. Although it might be possible to create a general assertion about the former case, the  
 123802 following points must be addressed:

- 123803 • Access times for the files might be different in the operand case *versus* the *cat* case.
- 123804 • The utility may have error messages that are cognizant of the input filename, and this  
 123805 added value should not be suppressed. (As an example, *awk* sets a variable with the  
 123806 filename at each file boundary.)

## 123807 STDIN

123808 There is no additional rationale provided for this section.

## 123809 INPUT FILES

123810 A conforming application cannot assume the following three commands are equivalent:

```
123811 tail -n +2 file
123812 (sed -n 1q; cat) < file
123813 cat file | (sed -n 1q; cat)
```

123814 The second command is equivalent to the first only when the file is seekable. In the third  
 123815 command, if the file offset in the open file description were not unspecified, *sed* would have to  
 123816 be implemented so that it read from the pipe 1 byte at a time or it would have to employ some  
 123817 method to seek backwards on the pipe. Such functionality is not defined currently in POSIX.1  
 123818 and does not exist on all historical systems. Other utilities, such as *head*, *read*, and *sh*, have similar  
 123819 properties, so the restriction is described globally in this section.

123820 The definition of “text file” is strictly enforced for input to the standard utilities; very few of  
 123821 them list exceptions to the undefined results called for here. (Of course, “undefined” here does  
 123822 not mean that historical implementations necessarily have to change to start indicating error  
 123823 conditions. Conforming applications cannot rely on implementations succeeding or failing when  
 123824 non-text files are used.)

123825 The utilities that allow line continuation are generally those that accept input languages, rather  
 123826 than pure data. It would be unusual for an input line of this type to exceed {LINE\_MAX} bytes  
 123827 and unreasonable to require that the implementation allow unlimited accumulation of multiple  
 123828 lines, each of which could reach {LINE\_MAX}. Thus, for a conforming application the total of all  
 123829 the continued lines in a set cannot exceed {LINE\_MAX}.

123830 The format description is intended to be sufficiently rigorous to allow other applications to  
 123831 generate these input files. However, since <blank> characters can legitimately be included in  
 123832 some of the fields described by the standard utilities, particularly in locales other than the POSIX  
 123833 locale, this intent is not always realized.

**123834 ENVIRONMENT VARIABLES**

123835 There is no additional rationale provided for this section.

**123836 ASYNCHRONOUS EVENTS**

123837 Because there is no language prohibiting it, a utility is permitted to catch a signal, perform some  
123838 additional processing (such as deleting temporary files), restore the default signal action (or  
123839 action inherited from the parent process), and resignal itself.

**123840 STDOUT**

123841 The format description is intended to be sufficiently rigorous to allow post-processing of output  
123842 by other programs, particularly by an *awk* or *lex* parser.

**123843 STDERR**

123844 This section does not describe error messages that refer to incorrect operation of the utility.  
123845 Consider a utility that processes program source code as its input. This section is used to  
123846 describe messages produced by a correctly operating utility that encounters an error in the  
123847 program source code on which it is processing. However, a message indicating that the utility  
123848 had insufficient memory in which to operate would not be described.

123849 Some utilities have traditionally produced warning messages without returning a non-zero exit  
123850 status; these are specifically noted in their sections. Other utilities shall not write to standard  
123851 error if they complete successfully, unless the implementation provides some sort of extension to  
123852 increase the verbosity or debugging level.

123853 The format descriptions are intended to be sufficiently rigorous to allow post-processing of  
123854 output by other programs.

**123855 OUTPUT FILES**

123856 The format description is intended to be sufficiently rigorous to allow post-processing of output  
123857 by other programs, particularly by an *awk* or *lex* parser.

123858 Receipt of the SIGQUIT signal should generally cause termination (unless in some debugging  
123859 mode) that would bypass any attempted recovery actions.

**123860 EXTENDED DESCRIPTION**

123861 There is no additional rationale provided for this section.

**123862 EXIT STATUS**

123863 Note the additional discussion of exit values in *Exit Status for Commands* in the *sh* utility. It  
123864 describes requirements for returning exit values greater than 125.

123865 A utility may list zero as a successful return, 1 as a failure for a specific reason, and greater than  
123866 1 as “an error occurred”. In this case, unspecified conditions may cause a 2 or 3, or other value,  
123867 to be returned. A strictly conforming application should be written so that it tests for successful  
123868 exit status values (zero in this case), rather than relying upon the single specific error value listed  
123869 in POSIX.1-2008. In that way, it will have maximum portability, even on implementations with  
123870 extensions.

123871 The standard developers are aware that the general non-enumeration of errors makes it difficult  
123872 to write test suites that test the *incorrect* operation of utilities. There are some historical  
123873 implementations that have expended effort to provide detailed status messages and a helpful  
123874 environment to bypass or explain errors, such as prompting, retrying, or ignoring unimportant

123875 syntax errors; other implementations have not. Since there is no realistic way to mandate system  
 123876 behavior in cases of undefined application actions or system problems—in a manner acceptable  
 123877 to all cultures and environments—attention has been limited to the correct operation of utilities  
 123878 by the conforming application. Furthermore, the conforming application does not need detailed  
 123879 information concerning errors that it caused through incorrect usage or that it cannot correct.

123880 There is no description of defaults for this section because all of the standard utilities specify  
 123881 something (or explicitly state “Unspecified”) for exit status.

#### 123882 **CONSEQUENCES OF ERRORS**

123883 Several actions are possible when a utility encounters an error condition, depending on the  
 123884 severity of the error and the state of the utility. Included in the possible actions of various  
 123885 utilities are: deletion of temporary or intermediate work files; deletion of incomplete files; and  
 123886 validity checking of the file system or directory.

123887 The text about recursive traversing is meant to ensure that utilities such as *find* process as many  
 123888 files in the hierarchy as they can. They should not abandon all of the hierarchy at the first error  
 123889 and resume with the next command-line operand, but should attempt to keep going.

#### 123890 **APPLICATION USAGE**

123891 This section provides additional caveats, issues, and recommendations to the developer.

#### 123892 **EXAMPLES**

123893 This section provides sample usage.

#### 123894 **RATIONALE**

123895 There is no additional rationale provided for this section.

#### 123896 **FUTURE DIRECTIONS**

123897 FUTURE DIRECTIONS sections act as pointers to related work that may impact the interface in  
 123898 the future, and often cautions the developer to architect the code to account for a change in this  
 123899 area. Note that a future directions statement should not be taken as a commitment to adopt a  
 123900 feature or interface in the future.

#### 123901 **SEE ALSO**

123902 There is no additional rationale provided for this section.

#### 123903 **CHANGE HISTORY**

123904 There is no additional rationale provided for this section.

### 123905 **C.1.6 Considerations for Utilities in Support of Files of Arbitrary Size**

123906 This section is intended to clarify the requirements for utilities in support of large files.

123907 The utilities listed in this section are utilities which are used to perform administrative tasks  
 123908 such as to create, move, copy, remove, change the permissions, or measure the resources of a file.  
 123909 They are useful both as end-user tools and as utilities invoked by applications during software  
 123910 installation and operation.

123911 The *chgrp*, *chmod*, *chown*, *ln*, and *rm* utilities probably require use of large file-capable versions of  
 123912 *stat()*, *lstat()*, *ftw()*, and the **stat** structure.

123913 The *cat*, *cksum*, *cmp*, *cp*, *dd*, *mv*, *sum*, and *touch* utilities probably require use of large file-capable  
 123914 versions of *creat()*, *open()*, and *fopen()*.

123915 The *cat*, *cksum*, *cmp*, *dd*, *df*, *du*, *ls*, and *sum* utilities may require writing large integer values. For  
 123916 example:

- 123917 • The *cat* utility might have a `-n` option which counts <newline> characters.
- 123918 • The *cksum* and *ls* utilities report file sizes.
- 123919 • The *cmp* utility reports the line number at which the first difference occurs, and also has a  
 123920 `-l` option which reports file offsets.
- 123921 • The *dd*, *df*, *du*, *ls*, and *sum* utilities report block counts.

123922 The *dd*, *find*, and *test* utilities may need to interpret command arguments that contain 64-bit  
 123923 values. For *dd*, the arguments include *skip=n*, *seek=n*, and *count=n*. For *find*, the arguments  
 123924 include `-sizen`. For *test*, the arguments are those associated with algebraic comparisons.

123925 The *df* utility might need to access large file systems with *statofs()*.

123926 The *ulimit* utility will need to use large file-capable versions of *getrlimit()* and *setrlimit()* and be  
 123927 able to read and write large integer values.

### 123928 C.1.7 Built-In Utilities

123929 All of these utilities can be *exec*-ed. There is no requirement that these utilities are actually built  
 123930 into the shell itself, but many shells need the capability to do so because XCU Section 2.9.1.1 (on  
 123931 page 2317) requires that they be found prior to the *PATH* search. The shell could satisfy its  
 123932 requirements by keeping a list of the names and directly accessing the file-system versions  
 123933 regardless of *PATH*. Providing all of the required functionality for those such as *cd* or *read* would  
 123934 be more difficult.

123935 There were originally three justifications for allowing the omission of *exec*-able versions:

- 123936 1. It would require wasting space in the file system, at the expense of very small systems.  
 123937 However, it has been pointed out that all 16 utilities in the table can be provided with 16  
 123938 links to a single-line shell script:

```
123939 $0 "$@"
```

- 123940 2. It is not logical to require invocation of utilities such as *cd* because they have no value  
 123941 outside the shell environment or cannot be useful in a child process. However, counter-  
 123942 examples always seemed to be available for even the most unusual cases:

```
123943 find . -type d -exec cd {} \; -exec foo {} \;  

  123944 (which invokes "foo" on accessible directories)
```

```
123945 ps ... | sed ... | xargs kill
```

```
123946 find . -exec true \; -a ...  

  123947 (where "true" is used for temporary debugging)
```

- 123948 3. It is confusing to have a utility such as *kill* that can easily be in the file system in the base  
 123949 standard, but that requires built-in status for the User Portability Utilities option (for the  
 123950 % job control job ID notation). It was decided that it was more appropriate to describe the  
 123951 required functionality (rather than the implementation) to the system implementors and  
 123952 let them decide how to satisfy it.

123953 On the other hand, it was realized that any distinction like this between utilities was not useful  
 123954 to applications, and that the cost to correct it was small. These arguments were ultimately the

- 123955 most effective.
- 123956 There were varying reasons for including utilities in the table of built-ins:
- 123957 *alias, fc, unalias*
- 123958 The functionality of these utilities is performed more simply within the shell itself and that
- 123959 is the model most historical implementations have used.
- 123960 *bg, fg, jobs*
- 123961 All of the job control-related utilities are eligible for built-in status because that is the model
- 123962 most historical implementations have used.
- 123963 *cd, getopts, newgrp, read, umask, wait*
- 123964 The functionality of these utilities is performed more simply within the context of the
- 123965 current process. An example can be taken from the usage of the *cd* utility. The purpose of
- 123966 the *cd* utility is to change the working directory for subsequent operations. The actions of *cd*
- 123967 affect the process in which *cd* is executed and all subsequent child processes of that process.
- 123968 Based on the POSIX standard process model, changes in the process environment of a child
- 123969 process have no effect on the parent process. If the *cd* utility were executed from a child
- 123970 process, the working directory change would be effective only in the child process. Child
- 123971 processes initiated subsequent to the child process that executed the *cd* utility would not
- 123972 have a changed working directory relative to the parent process.
- 123973 *command*
- 123974 This utility was placed in the table primarily to protect scripts that are concerned about
- 123975 their *PATH* being manipulated. The “secure” shell script example in the *command* utility in
- 123976 the Shell and Utilities volume of POSIX.1-2008 would not be possible if a *PATH* change
- 123977 retrieved an alien version of *command*. (An alternative would have been to implement
- 123978 *getconf* as a built-in, but the standard developers considered that it carried too many
- 123979 changing configuration strings to require in the shell.)
- 123980 *kill* Since *kill* provides optional job control functionality using shell notation (%1, %2, and so on),
- 123981 some implementations would find it extremely difficult to provide this outside the shell.
- 123982 *true, false*
- 123983 These are in the table as a courtesy to programmers who wish to use the "while true"
- 123984 shell construct without protecting *true* from *PATH* searches. (It is acknowledged that
- 123985 "while :" also works, but the idiom with *true* is historically pervasive.)
- 123986 All utilities, including those in the table, are accessible via the *system()* and *popen()* functions in
- 123987 the System Interfaces volume of POSIX.1-2008. There are situations where the return
- 123988 functionality of *system()* and *popen()* is not desirable. Applications that require the exit status of
- 123989 the invoked utility will not be able to use *system()* or *popen()*, since the exit status returned is
- 123990 that of the command language interpreter rather than that of the invoked utility. The alternative
- 123991 for such applications is the use of the *exec* family.

## 123992 C.2 Shell Command Language

### 123993 C.2.1 Shell Introduction

123994 The System V shell was selected as the starting point for the Shell and Utilities volume of  
123995 POSIX.1-2008. The BSD C shell was excluded from consideration for the following reasons:

- 123996 • Most historically portable shell scripts assume the Version 7 Bourne shell, from which the  
123997 System V shell is derived.
- 123998 • The majority of tutorial materials on shell programming assume the System V shell.

123999 The construct "#!" is reserved for implementations wishing to provide that extension. If it were  
124000 not reserved, the Shell and Utilities volume of POSIX.1-2008 would disallow it by forcing it to be  
124001 a comment. As it stands, a strictly conforming application must not use "#!" as the first two  
124002 characters of the file.

### 124003 C.2.2 Quoting

124004 There is no additional rationale provided for this section.

#### 124005 C.2.2.1 Escape Character (Backslash)

124006 There is no additional rationale provided for this section.

#### 124007 C.2.2.2 Single-Quotes

124008 A <backslash> cannot be used to escape a single-quote in a single-quoted string. An embedded  
124009 quote can be created by writing, for example: "'a'\ 'b'", which yields "a'b". (See XCU  
124010 [Section 2.6.5](#) (on page 2311) for a better understanding of how portions of words are either split  
124011 into fields or remain concatenated.) A single token can be made up of concatenated partial  
124012 strings containing all three kinds of quoting or escaping, thus permitting any combination of  
124013 characters.

#### 124014 C.2.2.3 Double-Quotes

124015 The escaped <newline> used for line continuation is removed entirely from the input and is not  
124016 replaced by any white space. Therefore, it cannot serve as a token separator.

124017 In double-quoting, if a <backslash> is immediately followed by a character that would be  
124018 interpreted as having a special meaning, the <backslash> is deleted and the subsequent  
124019 character is taken literally. If a <backslash> does not precede a character that would have a  
124020 special meaning, it is left in place unmodified and the character immediately following it is also  
124021 left unmodified. Thus, for example:

124022 "\$" -> \$

124023 "\a" -> \a

124024 It would be desirable to include the statement "The characters from an enclosed "\${" to the  
124025 matching '}' shall not be affected by the double-quotes", similar to the one for "\$()".  
124026 However, historical practice in the System V shell prevents this.

124027 The requirement that double-quotes be matched inside "\${...}" within double-quotes and the  
 124028 rule for finding the matching '}' in XCU Section 2.6.2 (on page 2306) eliminate several subtle  
 124029 inconsistencies in expansion for historical shells in rare cases; for example:

```
124030 "${foo-bar}"
```

124031 yields **bar** when **foo** is not defined, and is an invalid substitution when **foo** is defined, in many  
 124032 historical shells. The differences in processing the "\${...}" form have led to inconsistencies  
 124033 between historical systems. A consequence of this rule is that single-quotes cannot be used to  
 124034 quote the '}' within "\${...}"; for example:

```
124035 unset bar  
124036 foo="${bar-' }'"
```

124037 is invalid because the "\${...}" substitution contains an unpaired unescaped single-quote. The  
 124038 <backslash> can be used to escape the '}' in this example to achieve the desired result:

```
124039 unset bar  
124040 foo="${bar-\}]"
```

124041 The differences in processing the "\${...}" form have led to inconsistencies between the  
 124042 historical System V shell, BSD, and KornShells, and the text in the Shell and Utilities volume of  
 124043 POSIX.1-2008 is an attempt to converge them without breaking too many applications. The only  
 124044 alternative to this compromise between shells would be to make the behavior unspecified  
 124045 whenever the literal characters single-quote, '{', '}', and '"' appear within "\${...}". To  
 124046 write a portable script that uses these values, a user would have to assign variables; for example:

```
124047 squote='\ ' dquote=\" lbrace='{ ' rbrace='}'  
124048 ${foo-$squote$rbrace$squote}
```

124049 rather than:

```
124050 ${foo-"'"}
```

124051 Some implementations have allowed the end of the word to terminate the backquoted command  
 124052 substitution, such as in:

```
124053 "`echo hello"
```

124054 This usage is undefined; the matching backquote is required by the Shell and Utilities volume of  
 124055 POSIX.1-2008. The other undefined usage can be illustrated by the example:

```
124056 sh -c '` echo "foo`'
```

124057 The description of the recursive actions involving command substitution can be illustrated with  
 124058 an example. Upon recognizing the introduction of command substitution, the shell parses input  
 124059 (in a new context), gathering the source for the command substitution until an unbalanced ')' or  
 124060 or '`' is located. For example, in the following:

```
124061 echo "$(date; echo "  
124062     one" )"
```

124063 the double-quote following the *echo* does not terminate the first double-quote; it is part of the  
 124064 command substitution script. Similarly, in:

```
124065 echo "$(echo *)"
```

124066 the <asterisk> is not quoted since it is inside command substitution; however:

```
124067 echo "$(echo "*" )"
```

124068 is quoted (and represents the <asterisk> character itself).

124069 **C.2.3 Token Recognition**

124070 The "(" and ")" symbols are control operators in the KornShell, used for an alternative  
 124071 syntax of an arithmetic expression command. A conforming application cannot use "(" as a  
 124072 single token (with the exception of the "\$ (" form for shell arithmetic).

124073 On some implementations, the symbol "(" is a control operator; its use produces unspecified  
 124074 results. Applications that wish to have nested subshells, such as:

```
124075 ((echo Hello);(echo World))
```

124076 must separate the "(" characters into two tokens by including white space between them.  
 124077 Some systems may treat these as invalid arithmetic expressions instead of subshells.

124078 Certain combinations of characters are invalid in portable scripts, as shown in the grammar.  
 124079 Implementations may use these combinations (such as "|&") as valid control operators. Portable  
 124080 scripts cannot rely on receiving errors in all cases where this volume of POSIX.1-2008 indicates  
 124081 that a syntax is invalid.

124082 The (3) rule about combining characters to form operators is not meant to preclude systems from  
 124083 extending the shell language when characters are combined in otherwise invalid ways.  
 124084 Conforming applications cannot use invalid combinations, and test suites should not penalize  
 124085 systems that take advantage of this fact. For example, the unquoted combination "|&" is not  
 124086 valid in a POSIX script, but has a specific KornShell meaning.

124087 The (10) rule about '#' as the current character is the first in the sequence in which a new token  
 124088 is being assembled. The '#' starts a comment only when it is at the beginning of a token. This  
 124089 rule is also written to indicate that the search for the end-of-comment does not consider escaped  
 124090 <newline> specially, so that a comment cannot be continued to the next line.

124091 **C.2.3.1 Alias Substitution**

124092 The alias capability was added because it is widely used in historical implementations by  
 124093 interactive users.

124094 The definition of "alias name" precludes an alias name containing a <slash> character. Since the  
 124095 text applies to the command words of simple commands, reserved words (in their proper  
 124096 places) cannot be confused with aliases.

124097 The placement of alias substitution in token recognition makes it clear that it precedes all of the  
 124098 word expansion steps.

124099 An example concerning trailing <blank> characters and reserved words follows. If the user  
 124100 types:

```
124101 $ alias foo="/bin/ls "  

  124102 $ alias while="/"
```

124103 The effect of executing:

```
124104 $ while true  

  124105 > do  

  124106 > echo "Hello, World"  

  124107 > done
```

124108 is a never-ending sequence of "Hello, World" strings to the screen. However, if the user  
 124109 types:

```
124110 $ foo while
```

124111 the result is an *ls* listing of */*. Since the alias substitution for **foo** ends in a <space>, the next word  
 124112 is checked for alias substitution. The next word, **while**, has also been aliased, so it is substituted  
 124113 as well. Since it is not in the proper position as a command word, it is not recognized as a  
 124114 reserved word.

124115 If the user types:

124116 **\$** foo; while

124117 **while** retains its normal reserved-word properties.

## 124118 C.2.4 Reserved Words

124119 All reserved words are recognized syntactically as such in the contexts described. However, note  
 124120 that **in** is the only meaningful reserved word after a **case** or **for**; similarly, **in** is not meaningful as  
 124121 the first word of a simple command.

124122 Reserved words are recognized only when they are delimited (that is, meet the definition of XBD  
 124123 Section 3.438, on page 104), whereas operators are themselves delimiters. For instance, ' ( ' and  
 124124 ' ) ' are control operators, so that no <space> is needed in (*list*). However, ' { ' and ' } ' are  
 124125 reserved words in { *list*; }, so that in this case the leading <space> and <semicolon> are required.

124126 The list of unspecified reserved words is from the KornShell, so conforming applications cannot  
 124127 use them in places a reserved word would be recognized. This list contained **time** in early  
 124128 proposals, but it was removed when the *time* utility was selected for the Shell and Utilities  
 124129 volume of POSIX.1-2008.

124130 There was a strong argument for promoting braces to operators (instead of reserved words), so  
 124131 they would be syntactically equivalent to subshell operators. Concerns about compatibility  
 124132 outweighed the advantages of this approach. Nevertheless, conforming applications should  
 124133 consider quoting ' { ' and ' } ' when they represent themselves.

124134 The restriction on ending a name with a <colon> is to allow future implementations that support  
 124135 named labels for flow control; see the RATIONALE for the *break* built-in utility.

124136 It is possible that a future version of the Shell and Utilities volume of POSIX.1-2008 may require  
 124137 that ' { ' and ' } ' be treated individually as control operators, although the token "{ }" will  
 124138 probably be a special-case exemption from this because of the often-used *find*{ } construct.

## 124139 C.2.5 Parameters and Variables

### 124140 C.2.5.1 Positional Parameters

124141 There is no additional rationale provided for this section.

### 124142 C.2.5.2 Special Parameters

124143 Most historical implementations implement subshells by forking; thus, the special parameter  
 124144 ' \$ ' does not necessarily represent the process ID of the shell process executing the commands  
 124145 since the subshell execution environment preserves the value of ' \$ '.

124146 If a subshell were to execute a background command, the value of " \$ ! " for the parent would  
 124147 not change. For example:

```

124148     (
124149     date &
124150     echo $!
124151     )
124152     echo $!

```

124153 would echo two different values for "\$!".

124154 The "\$-" special parameter can be used to save and restore *set* options:

```

124155     Save=$(echo $- | sed 's/[ics]//g')
124156     ...
124157     set +aCefnuvx
124158     if [ -n "$Save" ]; then
124159         set -$Save
124160     fi

```

124161 The three options are removed using *sed* in the example because they may appear in the value of  
124162 "\$-" (from the *sh* command line), but are not valid options to *set*.

124163 The descriptions of parameters '\*' and '@' assume the reader is familiar with the field  
124164 splitting discussion in XCU [Section 2.6.5](#) (on page 2311) and understands that portions of the  
124165 word remain concatenated unless there is some reason to split them into separate fields.

124166 Some examples of the '\*' and '@' properties, including the concatenation aspects:

```

124167     set "abc" "def ghi" "jkl"

124168     echo $*      => "abc" "def" "ghi" "jkl"
124169     echo "$*"   => "abc def ghi jkl"
124170     echo $@     => "abc" "def" "ghi" "jkl"

```

124171 but:

```

124172     echo "$@"   => "abc" "def ghi" "jkl"
124173     echo "xx$@yy" => "xxabc" "def ghi" "jkllyy"
124174     echo "$@$@" => "abc" "def ghi" "jklabc" "def ghi" "jkl"

```

124175 In the preceding examples, the double-quote characters that appear after the "=>" do not  
124176 appear in the output and are used only to illustrate word boundaries.

124177 The following example illustrates the effect of setting *IFS* to a null string:

```

124178     $ IFS=''
124179     $ set foo bar bam
124180     $ echo "$@"
124181     foo bar bam
124182     $ echo "$*"
124183     foobarbam
124184     $ unset IFS
124185     $ echo "$*"
124186     foo bar bam

```

## 124187 C.2.5.3 Shell Variables

124188 See the discussion of *IFS* in [Section C.2.6.5](#) (on page 3659) and the RATIONALE for the *sh* utility.

124189 The prohibition on *LC\_CTYPE* changes affecting lexical processing protects the shell  
 124190 implementor (and the shell programmer) from the ill effects of changing the definition of  
 124191 <blank> or the set of alphabetic characters in the current environment. It would probably not be  
 124192 feasible to write a compiled version of a shell script without this rule. The rule applies only to  
 124193 the current invocation of the shell and its subshells—invoking a shell script or performing *exec*  
 124194 *sh* would subject the new shell to the changes in *LC\_CTYPE*.

124195 Other common environment variables used by historical shells are not specified by the Shell and  
 124196 Utilities volume of POSIX.1-2008, but they should be reserved for the historical uses.

124197 Tilde expansion for components of *PATH* in an assignment such as:

```
124198 PATH=~hlj/bin:~dwc/bin:$PATH
```

124199 is a feature of some historical shells and is allowed by the wording of XCU [Section 2.6.1](#) (on page  
 124200 2305). Note that the <tilde> characters are expanded during the assignment to *PATH*, not when  
 124201 *PATH* is accessed during command search.

124202 The following entries represent additional information about variables included in the Shell and  
 124203 Utilities volume of POSIX.1-2008, or rationale for common variables in use by shells that have  
 124204 been excluded:

124205 \_ (Underscore.) While <underscore> is historical practice, its overloaded usage  
 124206 in the KornShell is confusing, and it has been omitted from the Shell and  
 124207 Utilities volume of POSIX.1-2008.

124208 *ENV* This variable can be used to set aliases and other items local to the invocation  
 124209 of a shell. The file referred to by *ENV* differs from **\$HOME/.profile** in that  
 124210 **.profile** is typically executed at session start-up, whereas the *ENV* file is  
 124211 executed at the beginning of each shell invocation. The *ENV* value is  
 124212 interpreted in a manner similar to a dot script, in that the commands are  
 124213 executed in the current environment and the file needs to be readable, but not  
 124214 executable. However, unlike dot scripts, no *PATH* searching is performed. This  
 124215 is used as a guard against Trojan Horse security breaches.

124216 *ERRNO* This variable was omitted from the Shell and Utilities volume of POSIX.1-2008  
 124217 because the values of error numbers are not defined in POSIX.1-2008 in a  
 124218 portable manner.

124219 *FCEDIT* Since this variable affects only the *fc* utility, it has been omitted from this more  
 124220 global place. The value of *FCEDIT* does not affect the command-line editing  
 124221 mode in the shell; see the description of *set -o vi* in the *set* built-in utility.

124222 *PS1* This variable is used for interactive prompts. Historically, the “superuser”  
 124223 has had a prompt of '#'. Since privileges are not required to be monolithic, it  
 124224 is difficult to define which privileges should cause the alternate prompt.  
 124225 However, a sufficiently powerful user should be reminded of that power by  
 124226 having an alternate prompt.

124227 *PS3* This variable is used by the KornShell for the *select* command. Since the POSIX  
 124228 shell does not include *select*, *PS3* was omitted.

124229 *PS4* This variable is used for shell debugging. For example, the following script:

```
124230 PS4=' [ ${LINENO} ] + '  

  124231 set -x  

  124232 echo Hello
```

124233 writes the following to standard error:  
 124234 [3]+ echo Hello  
 124235 *RANDOM* This pseudo-random number generator was not seen as being useful to  
 124236 interactive users.  
 124237 *SECONDS* Although this variable is sometimes used with *PS1* to allow the display of the  
 124238 current time in the prompt of the user, it is not one that would be manipulated  
 124239 frequently enough by an interactive user to include in the Shell and Utilities  
 124240 volume of POSIX.1-2008.

## 124241 C.2.6 Word Expansions

124242 Step (2) refers to the “portions of fields generated by step (1)”. For example, if the word being  
 124243 expanded were "\$x+\$y" and *IFS*=+, the word would be split only if "\$x" or "\$y" contained  
 124244 ' + ' ; the ' + ' in the original word was not generated by step (1).

124245 *IFS* is used for performing field splitting on the results of parameter and command substitution;  
 124246 it is not used for splitting all fields. Earlier versions of the shell used it for splitting all fields  
 124247 during field splitting, but this has severe problems because the shell can no longer parse its own  
 124248 script. There are also important security implications caused by this behavior. All useful  
 124249 applications of *IFS* use it for parsing input of the *read* utility and for splitting the results of  
 124250 parameter and command substitution.

124251 The rule concerning expansion to a single field requires that if **foo=abc** and **bar=def**, that:

124252 "\$foo"\$bar"

124253 expands to the single field:

124254 abcdef

124255 The rule concerning empty fields can be illustrated by:

```
124256 $ unset foo
124257 $ set $foo bar ' ' xyz "$foo" abc
124258 $ for i
124259 > do
124260 >     echo "-$i-"
124261 > done
124262 -bar-
124263 --
124264 -xyz-
124265 --
124266 -abc-
```

124267 Step (1) indicates that parameter expansion, command substitution, and arithmetic expansion  
 124268 are all processed simultaneously as they are scanned. For example, the following is valid  
 124269 arithmetic:

```
124270 x=1
124271 echo $(( $(echo 3)+$x ))
```

124272 An early proposal stated that tilde expansion preceded the other steps, but this is not the case in  
 124273 known historical implementations; if it were, and if a referenced home directory contained a ' \$ '  
 124274 character, expansions would result within the directory name.

## 124275 C.2.6.1 Tilde Expansion

124276 Tilde expansion generally occurs only at the beginning of words, but an exception based on  
124277 historical practice has been included:

```
124278 PATH=/posix/bin:~dgk/bin
```

124279 This is eligible for tilde expansion because <tilde> follows a <colon> and none of the relevant  
124280 characters is quoted. Consideration was given to prohibiting this behavior because any of the  
124281 following are reasonable substitutes:

```
124282 PATH=$(printf %s ~karels/bin : ~bostic/bin)
```

```
124283 for Dir in ~maat/bin ~srb/bin ...
```

```
124284 do
```

```
124285     PATH=${PATH:+$PATH:}$Dir
```

```
124286 done
```

124287 In the first command, explicit <colon> characters are used for each directory. In all cases, the  
124288 shell performs tilde expansion on each directory because all are separate words to the shell.

124289 Note that expressions in operands such as:

```
124290 make -k mumble LIBDIR=~chet/lib
```

124291 do not qualify as shell variable assignments, and tilde expansion is not performed (unless the  
124292 command does so itself, which *make* does not).

124293 Because of the requirement that the word is not quoted, the following are not equivalent; only  
124294 the last causes tilde expansion:

```
124295 \~hlj/   ~h\lj/   ~"hlj"/   ~hlj\   ~hlj/
```

124296 In an early proposal, tilde expansion occurred following any unquoted <equals-sign> or  
124297 <colon>, but this was removed because of its complexity and to avoid breaking commands such  
124298 as:

```
124299 rcp hostname:~marc/.profile .
```

124300 A suggestion was made that the special sequence "\$~" should be allowed to force tilde  
124301 expansion anywhere. Since this is not historical practice, it has been left for future  
124302 implementations to evaluate. (The description in XCU [Section 2.2](#) (on page 2298) requires that a  
124303 <dollar-sign> be quoted to represent itself, so the "\$~" combination is already unspecified.)

124304 The results of giving <tilde> with an unknown login name are undefined because the KornShell  
124305 "~+" and "~-" constructs make use of this condition, but in general it is an error to give an  
124306 incorrect login name with <tilde>. The results of having *HOME* unset are unspecified because  
124307 some historical shells treat this as an error.

124308 Historically, the Korn shell performed field splitting and pathname expansion on the results of  
124309 tilde expansion, and earlier versions of this standard reflected this. However, tilde expansion  
124310 results in a pathname, and performing field splitting and pathname expansion on something  
124311 that is already a pathname is at best redundant and at worst will change the value from the  
124312 correct pathname to one or more incorrect ones. Later versions of the Korn shell do not perform  
124313 these expansions and POSIX.1-2008 has been updated to match. Note that although pathname  
124314 expansion is not performed on the results of tilde expansion, this does not prevent other parts of  
124315 the same word from being expanded. For example, ~/a\* expands to all files in *\$HOME*  
124316 beginning with 'a'.

124317 C.2.6.2 *Parameter Expansion*

124318 The rule for finding the closing '}' in "\${...}" is the one used in the KornShell and is  
 124319 upwardly-compatible with the Bourne shell, which does not determine the closing '}' until the  
 124320 word is expanded. The advantage of this is that incomplete expansions, such as:

124321 \${foo

124322 can be determined during tokenization, rather than during expansion.

124323 The string length and substring capabilities were included because of the demonstrated need for  
 124324 them, based on their usage in other shells, such as C shell and KornShell.

124325 Historical versions of the KornShell have not performed tilde expansion on the word part of  
 124326 parameter expansion; however, it is more consistent to do so.

124327 C.2.6.3 *Command Substitution*

124328 The "\$()" form of command substitution solves a problem of inconsistent behavior when using  
 124329 backquotes. For example:

124330

124331

124332

124333

| Command              | Output |
|----------------------|--------|
| echo '\\$x'          | \\$x   |
| echo `echo '\\$x'`   | \$x    |
| echo \$(echo '\\$x') | \\$x   |

124334 Additionally, the backquoted syntax has historical restrictions on the contents of the embedded  
 124335 command. While the newer "\$()" form can process any kind of valid embedded script, the  
 124336 backquoted form cannot handle some valid scripts that include backquotes. For example, these  
 124337 otherwise valid embedded scripts do not work in the left column, but do work on the right:

124338

124339

124340

124341

124342

124343

124344

124345

124346

124347

124348

```

echo `                echo $(
cat <<\eof           cat <<\eof
a here-doc with `   a here-doc with )
eof                  eof
`                    )

echo `                echo $(
echo abc # a comment with `   echo abc # a comment with )
`                            )

echo `                echo $(
echo ` `                echo ` `
`                            )

```

124349 Because of these inconsistent behaviors, the backquoted variety of command substitution is not  
 124350 recommended for new applications that nest command substitutions or attempt to embed  
 124351 complex scripts.

124352 The KornShell feature:

124353

124354

124355

If *command* is of the form *<word, word* is expanded to generate a pathname, and the value of the command substitution is the contents of this file with any trailing *<newline>* characters deleted.

124356

124357

124358

was omitted from the Shell and Utilities volume of POSIX.1-2008 because *\$(cat word)* is an appropriate substitute. However, to prevent breaking numerous scripts relying on this feature, it is unspecified to have a script within "\$()" that has only redirections.

124359 The requirement to separate "\$ (" and ' (' when a single subshell is command-substituted is to  
124360 avoid any ambiguities with arithmetic expansion.

124361 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/4 is applied, changing the text from: "If a  
124362 command substitution occurs inside double-quotes, it shall not be performed on the results of  
124363 the substitution." to: "If a command substitution occurs inside double-quotes, field splitting and  
124364 pathname expansion shall not be performed on the results of the substitution.". The  
124365 replacement text taken from the ISO POSIX-2:1993 standard is clearer about the items that are  
124366 not performed.

124367 SD5-XCU-ERN-84 is applied, clarifying how the search for the matching backquote is satisfied.

#### 124368 C.2.6.4 Arithmetic Expansion

124369 The standard developers agreed that there was a strong desire for some kind of arithmetic  
124370 evaluator to provide functionality similar to *expr*, that relating it to '\$' makes it work well with  
124371 the standard shell language and provides access to arithmetic evaluation in places where  
124372 accessing a utility would be inconvenient.

124373 The syntax and semantics for arithmetic were revised for the ISO/IEC 9945-2:1993 standard.  
124374 The language represents a simple subset of the previous arithmetic language (which was  
124375 derived from the KornShell "(())" construct). The syntax was changed from that of a  
124376 command denoted by *((expression))* to an expansion denoted by *\$(expression)*. The new form is  
124377 a dollar expansion ('\$') that evaluates the expression and substitutes the resulting value.  
124378 Objections to the previous style of arithmetic included that it was too complicated, did not fit in  
124379 well with the use of variables in the shell, and its syntax conflicted with subshells. The  
124380 justification for the new syntax is that the shell is traditionally a macro language, and if a new  
124381 feature is to be added, it should be accomplished by extending the capabilities presented by the  
124382 current model of the shell, rather than by inventing a new one outside the model; adding a new  
124383 dollar expansion was perceived to be the most intuitive and least destructive way to add such a  
124384 new capability.

124385 The standard requires assignment operators to be supported (as listed in XCU [Section 1.1.2](#), on  
124386 page 2283), and since arithmetic expansions are not specified to be evaluated in a subshell  
124387 environment, changes to variables there have to be in effect after the arithmetic expansion, just  
124388 as in the parameter expansion "\${x=value}".

124389 Note, however, that "\$(( x=5 ))" need not be equivalent to "\$(\$x=5 )". If the value of  
124390 the environment variable *x* is the string "y=", the expansion of "\$(( x=5 ))" would set *x* to 5  
124391 and output 5, but "\$(\$x=5 )" would output 0 if the value of the environment variable *y* is  
124392 not 5 and would output 1 if the environment variable *y* is 5. Similarly, if the value of the  
124393 environment variable is 4, the expansion of "\$(( x=5 ))" would still set *x* to 5 and output 5,  
124394 but "\$(\$x=5 )" (which would be equivalent to "\$(( 4=5 ))") would yield a syntax  
124395 error.

124396 In early proposals, a form *\$(expression)* was used. It was functionally equivalent to the "\$(( ))"  
124397 of the current text, but objections were lodged that the 1988 KornShell had already implemented  
124398 "\$(( ))" and there was no compelling reason to invent yet another syntax. Furthermore, the  
124399 "\$[]" syntax had a minor incompatibility involving the patterns in **case** statements.

124400 The portion of the ISO C standard arithmetic operations selected corresponds to the operations  
124401 historically supported in the KornShell. In addition to the exceptions listed in XCU [Section 2.6.4](#)  
124402 (on page 2310), the use of the following are explicitly outside the scope of the rules defined in  
124403 XCU [Section 1.1.2.1](#) (on page 2283):

- The prefix operator '&' and the "[ ]", "->", and '.' operators.
- Casts

It was concluded that the *test* command (I) was sufficient for the majority of relational arithmetic tests, and that tests involving complicated relational expressions within the shell are rare, yet could still be accommodated by testing the value of "\$ ( ( ) )" itself. For example:

```
# a complicated relational expression
while [ $(( (($x + $y)/($a * $b)) < ($foo*$bar) )) -ne 0 ]
```

or better yet, the rare script that has many complex relational expressions could define a function like this:

```
val() {
    return $(!$1)
}
```

and complicated tests would be less intimidating:

```
while val $(( (($x + $y)/($a * $b)) < ($foo*$bar) ))
do
    # some calculations
done
```

A suggestion that was not adopted was to modify *true* and *false* to take an optional argument, and *true* would exit true only if the argument was non-zero, and *false* would exit false only if the argument was non-zero:

```
while true $((($x > 5 && $y <= 25))
```

There is a minor portability concern with the new syntax. The example "\$ ( (2+2) )" could have been intended to mean a command substitution of a utility named "2+2" in a subshell. The standard developers considered this to be obscure and isolated to some KornShell scripts (because "\$ ( )" command substitution existed previously only in the KornShell). The text on command substitution requires that the "\$ (" and '( ' be separate tokens if this usage is needed.

An example such as:

```
echo $((echo hi);(echo there))
```

should not be misinterpreted by the shell as arithmetic because attempts to balance the parentheses pairs would indicate that they are subshells. However, as indicated by XBD [Section 3.113](#) (on page 51), a conforming application must separate two adjacent parentheses with white space to indicate nested subshells.

The standard is intentionally silent about how a variable's numeric value in an expression is determined from its normal "sequence of bytes" value. It could be done as a text substitution, as a conversion like that performed by *strtol()*, or even recursive evaluation. Therefore, the only cases for which the standard is clear are those for which both conversions produce the same result. The cases where they give the same result are those where the sequence of bytes form a valid integer constant. Therefore, if a variable does not contain a valid integer constant, the behavior is unspecified.

For the commands:

```
x=010; echo $((x += 1))
```

the output must be 9.

For the commands:

124448 `x=' 1'; echo $((x += 1))`

124449 the results are unspecified.

124450 For the commands:

124451 `x=1+1; echo $((x += 1))`

124452 the results are unspecified.

124453 Although the ISO/IEC 9899:1999 standard now requires support for **long long** and allows  
 124454 extended integer types with higher ranks, POSIX.1-2008 only requires arithmetic expansions to  
 124455 support **signed long** integer arithmetic. Implementations are encouraged to support signed  
 124456 integer values at least as large as the size of the largest file allowed on the implementation.

124457 Implementations are also allowed to perform floating-point evaluations as long as an  
 124458 application won't see different results for expressions that would not overflow **signed long**  
 124459 integer expression evaluation. (This includes appropriate truncation of results to integer values.)

124460 Changes made in response to IEEE PASC Interpretation 1003.2 #208 removed the requirement  
 124461 that the integer constant suffixes `l` and `L` had to be recognized. The ISO POSIX-2:1993 standard  
 124462 did not require the `u`, `ul`, `uL`, `U`, `Ul`, `UL`, `lu`, `lU`, `Lu`, and `LU` suffixes since only signed integer  
 124463 arithmetic was required. Since all arithmetic expressions were treated as handling **signed long**  
 124464 integer types anyway, the `l` and `L` suffixes were redundant. No known scripts used them and  
 124465 some historic shells did not support them. When the ISO/IEC 9899:1999 standard was used as  
 124466 the basis for the description of arithmetic processing, the `ll` and `LL` suffixes and combinations  
 124467 were also not required. Implementations are still free to accept any or all of these suffixes, but  
 124468 are not required to do so.

124469 There was also some confusion as to whether the shell was required to recognize character  
 124470 constants. Syntactically, character constants were required to be recognized, but the  
 124471 requirements for the handling of <backslash> and single-quote characters (needed to specify  
 124472 character constants) within an arithmetic expansion were ambiguous. Furthermore, no known  
 124473 shells supported them. Changes made in response to IEEE PASC Interpretation 1003.2 #208  
 124474 removed the requirement to support them (if they were indeed required before). POSIX.1-2008  
 124475 clearly does not require support for character constants.

124476 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/3 is applied, clarifying arithmetic  
 124477 expressions.

#### 124478 C.2.6.5 *Field Splitting*

124479 The operation of field splitting using *IFS*, as described in early proposals, was based on the way  
 124480 the KornShell splits words, but it is incompatible with other common versions of the shell.  
 124481 However, each has merit, and so a decision was made to allow both. If the *IFS* variable is unset  
 124482 or is <space><tab><newline>, the operation is equivalent to the way the System V shell splits  
 124483 words. Using characters outside the <space><tab><newline> set yields the KornShell behavior,  
 124484 where each of the non-<space><tab><newline>s is significant. This behavior, which affords the  
 124485 most flexibility, was taken from the way the original *awk* handled field splitting.

124486 Rule (3) can be summarized as a pseudo-ERE:

124487  $(s^*nS^* | s^+)$

124488 where *s* is an *IFS* white-space character and *n* is a character in the *IFS* that is not white space.  
 124489 Any string matching that ERE delimits a field, except that the *s+* form does not delimit fields at  
 124490 the beginning or the end of a line. For example, if *IFS* is <space>/<comma>/<tab>, the string:

124491 <space><space>red<space><space>, <space>white<space>blue

124492 yields the three colors as the delimited fields.

124493 C.2.6.6 *Pathname Expansion*

124494 There is no additional rationale provided for this section.

124495 C.2.6.7 *Quote Removal*

124496 There is no additional rationale provided for this section.

## 124497 C.2.7 Redirection

124498 In the System Interfaces volume of POSIX.1-2008, file descriptors are integers in the range  
124499 0–(OPEN\_MAX)–1). The file descriptors discussed in XCU [Section 2.7](#) (on page 2312) are that  
124500 same set of small integers.

124501 Having multi-digit file descriptor numbers for I/O redirection can cause some obscure  
124502 compatibility problems. Specifically, scripts that depend on an example command:

```
124503 echo 22>/dev/null
```

124504 echoing "2" to standard error or "22" to standard output are no longer portable. However, the  
124505 file descriptor number must still be delimited from the preceding text. For example:

```
124506 cat file2>foo
```

124507 writes the contents of **file2**, not the contents of **file**.

124508 The ">|" format of output redirection was adopted from the KornShell. Along with the  
124509 *noclobber* option, set **-C**, it provides a safety feature to prevent inadvertent overwriting of  
124510 existing files. (See the RATIONALE for the *pathchk* utility for why this step was taken.) The  
124511 restriction on regular files is historical practice.

124512 The System V shell and the KornShell have differed historically on pathname expansion of *word*;  
124513 the former never performed it, the latter only when the result was a single field (file). As a  
124514 compromise, it was decided that the KornShell functionality was useful, but only as a shorthand  
124515 device for interactive users. No reasonable shell script would be written with a command such  
124516 as:

```
124517 cat foo > a*
```

124518 Thus, shell scripts are prohibited from doing it, while interactive users can select the shell with  
124519 which they are most comfortable.

124520 The construct "2>&1" is often used to redirect standard error to the same file as standard  
124521 output. Since the redirections take place beginning to end, the order of redirections is significant.  
124522 For example:

```
124523 ls > foo 2>&1
```

124524 directs both standard output and standard error to file **foo**. However:

```
124525 ls 2>&1 > foo
```

124526 only directs standard output to file **foo** because standard error was duplicated as standard  
124527 output before standard output was directed to file **foo**.

124528 The "<>" operator could be useful in writing an application that worked with several terminals,  
124529 and occasionally wanted to start up a shell. That shell would in turn be unable to run

124530 applications that run from an ordinary controlling terminal unless it could make use of "<>"  
 124531 redirection. The specific example is a historical version of the pager *more*, which reads from  
 124532 standard error to get its commands, so standard input and standard output are both available  
 124533 for their usual usage. There is no way of saying the following in the shell without "<>":

```
124534 cat food | more - >/dev/tty03 2<>/dev/tty03
```

124535 Another example of "<>" is one that opens **/dev/tty** on file descriptor 3 for reading and writing:

```
124536 exec 3<> /dev/tty
```

124537 An example of creating a lock file for a critical code region:

```
124538 set -C
124539 until 2> /dev/null > lockfile
124540 do sleep 30
124541 done
124542 set +C
124543 perform critical function
124544 rm lockfile
```

124545 Since **/dev/null** is not a regular file, no error is generated by redirecting to it in *noclobber* mode.

124546 Tilde expansion is not performed on a here-document because the data is treated as if it were  
 124547 enclosed in double-quotes.

#### 124548 C.2.7.1 *Redirecting Input*

124549 There is no additional rationale provided for this section.

#### 124550 C.2.7.2 *Redirecting Output*

124551 There is no additional rationale provided for this section.

#### 124552 C.2.7.3 *Appending Redirected Output*

124553 Note that when a file is opened (even with the `O_APPEND` flag set), the initial file offset for that  
 124554 file is set to the beginning of the file. Some historic shells set the file offset to the current end-of-  
 124555 file when **append** mode shell redirection was used, but this is not allowed by POSIX.1-2008.

#### 124556 C.2.7.4 *Here-Document*

124557 There is no additional rationale provided for this section.

#### 124558 C.2.7.5 *Duplicating an Input File Descriptor*

124559 There is no additional rationale provided for this section.

#### 124560 C.2.7.6 *Duplicating an Output File Descriptor*

124561 There is no additional rationale provided for this section.

124562 C.2.7.7 *Open File Descriptors for Reading and Writing*

124563 There is no additional rationale provided for this section.

## 124564 C.2.8 Exit Status and Errors

124565 C.2.8.1 *Consequences of Shell Errors*

124566 There is no additional rationale provided for this section.

124567 C.2.8.2 *Exit Status for Commands*

124568 There is a historical difference in *sh* and *ksh* non-interactive error behavior. When a command  
 124569 named in a script is not found, some implementations of *sh* exit immediately, but *ksh* continues  
 124570 with the next command. Thus, the Shell and Utilities volume of POSIX.1-2008 says that the shell  
 124571 “may” exit in this case. This puts a small burden on the programmer, who has to test for  
 124572 successful completion following a command if it is important that the next command not be  
 124573 executed if the previous command was not found. If it is important for the command to have  
 124574 been found, it was probably also important for it to complete successfully. The test for successful  
 124575 completion would not need to change.

124576 Historically, shells have returned an exit status of  $128+n$ , where  $n$  represents the signal number.  
 124577 Since signal numbers are not standardized, there is no portable way to determine which signal  
 124578 caused the termination. Also, it is possible for a command to exit with a status in the same range  
 124579 of numbers that the shell would use to report that the command was terminated by a signal.  
 124580 Implementations are encouraged to choose exit values greater than 256 to indicate programs that  
 124581 terminate by a signal so that the exit status cannot be confused with an exit status generated by a  
 124582 normal termination.

124583 Historical shells make the distinction between “utility not found” and “utility found but cannot  
 124584 execute” in their error messages. By specifying two seldomly used exit status values for these  
 124585 cases, 127 and 126 respectively, this gives an application the opportunity to make use of this  
 124586 distinction without having to parse an error message that would probably change from locale to  
 124587 locale. The *command*, *env*, *nohup*, and *xargs* utilities in the Shell and Utilities volume of  
 124588 POSIX.1-2008 have also been specified to use this convention.

124589 When a command fails during word expansion or redirection, most historical implementations  
 124590 exit with a status of 1. However, there was some sentiment that this value should probably be  
 124591 much higher so that an application could distinguish this case from the more normal exit status  
 124592 values. Thus, the language “greater than zero” was selected to allow either method to be  
 124593 implemented.

## 124594 C.2.9 Shell Commands

124595 A description of an “empty command” was removed from an early proposal because it is only  
 124596 relevant in the cases of *sh -c ""*, *system("")*, or an empty shell-script file (such as the  
 124597 implementation of *true* on some historical systems). Since it is no longer mentioned in the Shell  
 124598 and Utilities volume of POSIX.1-2008, it falls into the silently unspecified category of behavior  
 124599 where implementations can continue to operate as they have historically, but conforming  
 124600 applications do not construct empty commands. (However, note that *sh* does explicitly state an  
 124601 exit status for an empty string or file.) In an interactive session or a script with other commands,

124602 extra <newline> or <semicolon> characters, such as:

```
124603 $ false
124604 $
124605 $ echo $?
124606 1
```

124607 would not qualify as the empty command described here because they would be consumed by  
124608 other parts of the grammar.

#### 124609 C.2.9.1 Simple Commands

124610 The enumerated list is used only when the command is actually going to be executed. For  
124611 example, in:

```
124612 true || $foo *
```

124613 no expansions are performed.

124614 The following example illustrates both how a variable assignment without a command name  
124615 affects the current execution environment, and how an assignment with a command name only  
124616 affects the execution environment of the command:

```
124617 $ x=red
124618 $ echo $x
124619 red
124620 $ export x
124621 $ sh -c 'echo $x'
124622 red
124623 $ x=blue sh -c 'echo $x'
124624 blue
124625 $ echo $x
124626 red
```

124627 This next example illustrates that redirections without a command name are still performed:

```
124628 $ ls foo
124629 ls: foo: no such file or directory
124630 $ > foo
124631 $ ls foo
124632 foo
```

124633 A command without a command name, but one that includes a command substitution, has an  
124634 exit status of the last command substitution that the shell performed. For example:

```
124635 if      x=$(command)
124636 then    ...
124637 fi
```

124638 An example of redirections without a command name being performed in a subshell shows that  
124639 the here-document does not disrupt the standard input of the **while** loop:

```
124640 IFS=:
124641 while read a b
124642 do     echo $a
124643       <<-eof
124644       Hello
124645       eof
124646 done </etc/passwd
```

124647 Following are examples of commands without command names in AND-OR lists:

```
124648 > foo || {
124649     echo "error: foo cannot be created" >&2
124650     exit 1
124651 }
```

```
124652 # set saved if /vmunix.save exists
124653 test -f /vmunix.save && saved=1
```

124654 Command substitution and redirections without command names both occur in subshells, but  
124655 they are not necessarily the same ones. For example, in:

```
124656 exec 3> file
124657 var=$(echo foo >&3) 3>&1
```

124658 it is unspecified whether **foo** is echoed to the file or to standard output.

### 124659 Command Search and Execution

124660 This description requires that the shell can execute shell scripts directly, even if the underlying  
124661 system does not support the common "#!" interpreter convention. That is, if file **foo** contains  
124662 shell commands and is executable, the following executes **foo**:

```
124663 ./foo
```

124664 The command search shown here does not match all historical implementations. A more typical  
124665 sequence has been:

- 124666 • Any built-in (special or regular)
- 124667 • Functions
- 124668 • Path search for executable files

124669 But there are problems with this sequence. Since the programmer has no idea in advance which  
124670 utilities might have been built into the shell, a function cannot be used to override portably a  
124671 utility of the same name. (For example, a function named *cd* cannot be written for many  
124672 historical systems.) Furthermore, the *PATH* variable is partially ineffective in this case, and only  
124673 a pathname with a <slash> can be used to ensure a specific executable file is invoked.

124674 After the *execve()* failure described, the shell normally executes the file as a shell script. Some  
124675 implementations, however, attempt to detect whether the file is actually a script and not an  
124676 executable from some other architecture. The method used by the KornShell is allowed by the  
124677 text that indicates non-text files may be bypassed.

124678 The sequence selected for the Shell and Utilities volume of POSIX.1-2008 acknowledges that  
124679 special built-ins cannot be overridden, but gives the programmer full control over which  
124680 versions of other utilities are executed. It provides a means of suppressing function lookup (via  
124681 the *command* utility) for the user's own functions and ensures that any regular built-ins or  
124682 functions provided by the implementation are under the control of the path search. The  
124683 mechanisms for associating built-ins or functions with executable files in the path are not  
124684 specified by the Shell and Utilities volume of POSIX.1-2008, but the wording requires that if  
124685 either is implemented, the application is not able to distinguish a function or built-in from an  
124686 executable (other than in terms of performance, presumably). The implementation ensures that  
124687 all effects specified by the Shell and Utilities volume of POSIX.1-2008 resulting from the  
124688 invocation of the regular built-in or function (interaction with the environment, variables, traps,  
124689 and so on) are identical to those resulting from the invocation of an executable file.

124690 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/4 is applied, updating the case where

124691 `execve()` fails due to an error equivalent to the [ENOEXEC] error.

### 124692 **Examples**

124693 Consider three versions of the `ls` utility:

- 124694 1. The application includes a shell function named `ls`.
- 124695 2. The user writes a utility named `ls` and puts it in `/fred/bin`.
- 124696 3. The example implementation provides `ls` as a regular shell built-in that is invoked (either  
124697 by the shell or directly by `exec`) when the path search reaches the directory `/posix/bin`.

124698 If `PATH=/posix/bin`, various invocations yield different versions of `ls`:

|        | Invocation                                                   | Version of <code>ls</code> |
|--------|--------------------------------------------------------------|----------------------------|
| 124699 | <code>ls</code> (from within application script)             | (1) function               |
| 124700 | <code>command ls</code> (from within application script)     | (3) built-in               |
| 124701 | <code>ls</code> (from within makefile called by application) | (3) built-in               |
| 124702 | <code>system("ls")</code>                                    | (3) built-in               |
| 124703 | <code>PATH="/fred/bin:\$PATH" ls</code>                      | (2) user's version         |
| 124704 |                                                              |                            |

### 124705 C.2.9.2 Pipelines

124706 Because pipeline assignment of standard input or standard output or both takes place before  
124707 redirection, it can be modified by redirection. For example:

```
124708 $ command1 2>&1 | command2
```

124709 sends both the standard output and standard error of `command1` to the standard input of  
124710 `command2`.

124711 The reserved word `!` allows more flexible testing using AND and OR lists.

124712 It was suggested that it would be better to return a non-zero value if any command in the  
124713 pipeline terminates with non-zero status (perhaps the bitwise-inclusive OR of all return values).  
124714 However, the choice of the last-specified command semantics are historical practice and would  
124715 cause applications to break if changed. An example of historical behavior:

```
124716 $ sleep 5 | (exit 4)
124717 $ echo $?
124718 4
124719 $ (exit 4) | sleep 5
124720 $ echo $?
124721 0
```

### 124722 C.2.9.3 Lists

124723 The equal precedence of `&&` and `||` is historical practice. The standard developers  
124724 evaluated the model used more frequently in high-level programming languages, such as C, to  
124725 allow the shell logical operators to be used for complex expressions in an unambiguous way, but  
124726 they could not allow historical scripts to break in the subtle way unequal precedence might  
124727 cause. Some arguments were posed concerning the `{ }` or `( )` groupings that are required  
124728 historically. There are some disadvantages to these groupings:

124729 • The " ( ) " can be expensive, as they spawn other processes on some implementations. This  
 124730 performance concern is primarily an implementation issue.

124731 • The "{ }" braces are not operators (they are reserved words) and require a trailing  
 124732 <space> after each '{', and a <semicolon> before each '}'. Most programmers (and  
 124733 certainly interactive users) have avoided braces as grouping constructs because of the  
 124734 problematic syntax required. Braces were not changed to operators because that would  
 124735 generate compatibility issues even greater than the precedence question; braces appear  
 124736 outside the context of a keyword in many shell scripts.

124737 IEEE PASC Interpretation 1003.2 #204 is applied, clarifying that the operators "&&" and "||"  
 124738 are evaluated with left associativity.

### 124739 **Asynchronous Lists**

124740 The grammar treats a construct such as:

```
124741 foo & bar & bam &
```

124742 as one "asynchronous list", but since the status of each element is tracked by the shell, the term  
 124743 "element of an asynchronous list" was introduced to identify just one of the **foo**, **bar**, or **bam**  
 124744 portions of the overall list.

124745 Unless the implementation has an internal limit, such as {CHILD\_MAX}, on the retained process  
 124746 IDs, it would require unbounded memory for the following example:

```
124747 while true  
124748 do     foo & echo $!  
124749 done
```

124750 The treatment of the signals SIGINT and SIGQUIT with asynchronous lists is described in XCU  
 124751 [Section 2.11](#) (on page 2330).

124752 Since the connection of the input to the equivalent of **/dev/null** is considered to occur before  
 124753 redirections, the following script would produce no output:

```
124754 exec < /etc/passwd  
124755 cat <&0 &  
124756 wait
```

### 124757 **Sequential Lists**

124758 There is no additional rationale provided for this section.

### 124759 **AND Lists**

124760 There is no additional rationale provided for this section.

### 124761 **OR Lists**

124762 There is no additional rationale provided for this section.

124763 C.2.9.4 Compound Commands

### 124764 Grouping Commands

124765 The semicolon shown in `{compound-list;}` is an example of a control operator delimiting the }  
124766 reserved word. Other delimiters are possible, as shown in XCU Section 2.10 (on page 2325);  
124767 <newline> is frequently used.

124768 A proposal was made to use the <do-done> construct in all cases where command grouping in  
124769 the current process environment is performed, identifying it as a construct for the grouping  
124770 commands, as well as for shell functions. This was not included because the shell already has a  
124771 grouping construct for this purpose ("`{ }`"), and changing it would have been counter-  
124772 productive.

### 124773 For Loop

124774 The format is shown with generous usage of <newline> characters. See the grammar in XCU  
124775 Section 2.10 (on page 2325) for a precise description of where <newline> and <semicolon>  
124776 characters can be interchanged.

124777 Some historical implementations support '`{`' and '`}`' as substitutes for **do** and **done**. The  
124778 standard developers chose to omit them, even as an obsolescent feature. (Note that these  
124779 substitutes were only for the **for** command; the **while** and **until** commands could not use them  
124780 historically because they are followed by compound-lists that may contain "`{ . . . }`" grouping  
124781 commands themselves.)

124782 The reserved word pair **do** ... **done** was selected rather than **do** ... **od** (which would have  
124783 matched the spirit of **if** ... **fi** and **case** ... **esac**) because *od* is already the name of a standard  
124784 utility.

124785 PASC Interpretation 1003.2 #169 has been applied changing the grammar.

### 124786 Case Conditional Construct

124787 An optional <left-parenthesis> before *pattern* was added to allow numerous historical KornShell  
124788 scripts to conform. At one time, using the leading parenthesis was required if the **case** statement  
124789 was to be embedded within a "`$( )`" command substitution; this is no longer the case with the  
124790 POSIX shell. Nevertheless, many historical scripts use the <left-parenthesis>, if only because it  
124791 makes matching-parenthesis searching easier in *vi* and other editors. This is a relatively simple  
124792 implementation change that is upwards-compatible for all scripts.

124793 Consideration was given to requiring *break* inside the *compound-list* to prevent falling through to  
124794 the next pattern action list. This was rejected as being nonexistent practice. An interesting  
124795 undocumented feature of the KornShell is that using "`;&`" instead of "`;;`" as a terminator  
124796 causes the exact opposite behavior—the flow of control continues with the next *compound-list*.

124797 The pattern '`*`', given as the last pattern in a **case** construct, is equivalent to the default case in  
124798 a C-language **switch** statement.

124799 The grammar shows that reserved words can be used as patterns, even if one is the first word on  
124800 a line. Obviously, the reserved word **esac** cannot be used in this manner.

124801 **If Conditional Construct**

124802 The precise format for the command syntax is described in XCU [Section 2.10](#) (on page 2325).

124803 **While Loop**

124804 The precise format for the command syntax is described in XCU [Section 2.10](#) (on page 2325).

124805 **Until Loop**

124806 The precise format for the command syntax is described in XCU [Section 2.10](#) (on page 2325).

124807 C.2.9.5 *Function Definition Command*

124808 The description of functions in an early proposal was based on the notion that functions should  
124809 behave like miniature shell scripts; that is, except for sharing variables, most elements of an  
124810 execution environment should behave as if they were a new execution environment, and  
124811 changes to these should be local to the function. For example, traps and options should be reset  
124812 on entry to the function, and any changes to them do not affect the traps or options of the caller.  
124813 There were numerous objections to this basic idea, and the opponents asserted that functions  
124814 were intended to be a convenient mechanism for grouping common commands that were to be  
124815 executed in the current execution environment, similar to the execution of the *dot* special  
124816 built-in.

124817 It was also pointed out that the functions described in that early proposal did not provide a local  
124818 scope for everything a new shell script would, such as the current working directory, or *umask*,  
124819 but instead provided a local scope for only a few select properties. The basic argument was that  
124820 if a local scope is needed for the execution environment, the mechanism already existed: the  
124821 application can put the commands in a new shell script and call that script. All historical shells  
124822 that implemented functions, other than the KornShell, have implemented functions that operate  
124823 in the current execution environment. Because of this, traps and options have a global scope  
124824 within a shell script. Local variables within a function were considered and included in another  
124825 early proposal (controlled by the special built-in *local*), but were removed because they do not fit  
124826 the simple model developed for functions and because there was some opposition to adding yet  
124827 another new special built-in that was not part of historical practice. Implementations should  
124828 reserve the identifier *local* (as well as *typeset*, as used in the KornShell) in case this local variable  
124829 mechanism is adopted in a future version of this standard.

124830 A separate issue from the execution environment of a function is the availability of that function  
124831 to child shells. A few objectors maintained that just as a variable can be shared with child shells  
124832 by exporting it, so should a function. In early proposals, the *export* command therefore had a *-f*  
124833 flag for exporting functions. Functions that were exported were to be put into the environment  
124834 as *name()=value* pairs, and upon invocation, the shell would scan the environment for these and  
124835 automatically define these functions. This facility was strongly opposed and was omitted. Some  
124836 of the arguments against exportable functions were as follows:

- 124837 • There was little historical practice. The Ninth Edition shell provided them, but there was  
124838 controversy over how well it worked.
- 124839 • There are numerous security problems associated with functions appearing in the  
124840 environment of a user and overriding standard utilities or the utilities owned by the  
124841 application.
- 124842 • There was controversy over requiring *make* to import functions, where it has historically  
124843 used an *exec* function for many of its command line executions.

124844 • Functions can be big and the environment is of a limited size. (The counter-argument was  
 124845 that functions are no different from variables in terms of size: there can be big ones, and  
 124846 there can be small ones—and just as one does not export huge variables, one does not  
 124847 export huge functions. However, this might not apply to the average shell-function writer,  
 124848 who typically writes much larger functions than variables.)

124849 As far as can be determined, the functions in the Shell and Utilities volume of POSIX.1-2008  
 124850 match those in System V. Earlier versions of the KornShell had two methods of defining  
 124851 functions:

```
124852 function fname { compound-list }
```

124853 and:

```
124854 fname() { compound-list }
```

124855 The latter used the same definition as the Shell and Utilities volume of POSIX.1-2008, but  
 124856 differed in semantics, as described previously. The current edition of the KornShell aligns the  
 124857 latter syntax with the Shell and Utilities volume of POSIX.1-2008 and keeps the former as is.

124858 The name space for functions is limited to that of a *name* because of historical practice.  
 124859 Complications in defining the syntactic rules for the function definition command and in  
 124860 dealing with known extensions such as the "@()" usage in the KornShell prevented the name  
 124861 space from being widened to a *word*. Using functions to support synonyms such as the "!!"  
 124862 and '% ' usage in the C shell is thus disallowed to conforming applications, but acceptable as an  
 124863 extension. For interactive users, the aliasing facilities in the Shell and Utilities volume of  
 124864 POSIX.1-2008 should be adequate for this purpose. It is recognized that the name space for  
 124865 utilities in the file system is wider than that currently supported for functions, if the portable  
 124866 filename character set guidelines are ignored, but it did not seem useful to mandate extensions  
 124867 in systems for so little benefit to conforming applications.

124868 The "()" in the function definition command consists of two operators. Therefore, intermixing  
 124869 <blank> characters with the *fname*, '(', and ')' is allowed, but unnecessary.

124870 An example of how a function definition can be used wherever a simple command is allowed:

```
124871 # If variable i is equal to "yes",
124872 # define function foo to be ls -l
124873 #
124874 [ "$i" = yes ] && foo() {
124875     ls -l
124876 }
```

## 124877 C.2.10 Shell Grammar

124878 There are several subtle aspects of this grammar where conventional usage implies rules about  
 124879 the grammar that in fact are not true.

124880 For *compound\_list*, only the forms that end in a *separator* allow a reserved word to be recognized,  
 124881 so usually only a *separator* can be used where a compound list precedes a reserved word (such as  
 124882 **Then**, **Else**, **Do**, and **Rbrace**). Explicitly requiring a separator would disallow such valid (if rare)  
 124883 statements as:

```
124884 if (false) then (echo x) else (echo y) fi
```

124885 See the Note under special grammar rule (1).

124886 Concerning the third sentence of rule (1) ("Also, if the parser ..."):

124887 • This sentence applies rather narrowly: when a compound list is terminated by some clear  
 124888 delimiter (such as the closing **fi** of an inner **if\_clause**) then it would apply; where the  
 124889 compound list might continue (as in after a **' ; '**), rule (7a) (and consequently the first  
 124890 sentence of rule (1)) would apply. In many instances the two conditions are identical, but  
 124891 this part of rule (1) does not give license to treating a **WORD** as a reserved word unless it  
 124892 is in a place where a reserved word has to appear.

124893 • The statement is equivalent to requiring that when the LR(1) lookahead set contains  
 124894 exactly one reserved word, it must be recognized if it is present. (Here “LR(1)” refers to the  
 124895 theoretical concepts, not to any real parser generator.)

124896 For example, in the construct below, and when the parser is at the point marked with **' ^ '**,  
 124897 the only next legal token is **then** (this follows directly from the grammar rules):

```
124898 if if...fi then ... fi
124899         ^
```

124900 At that point, the **then** must be recognized as a reserved word.

124901 (Depending on the parser generator actually used, “extra” reserved words may be in some  
 124902 lookahead sets. It does not really matter if they are recognized, or even if any possible  
 124903 reserved word is recognized in that state, because if it is recognized and is not in the  
 124904 (theoretical) LR(1) lookahead set, an error is ultimately detected. In the example above, if  
 124905 some other reserved word (for example, **while**) is also recognized, an error occurs later.

124906 This is approximately equivalent to saying that reserved words are recognized after other  
 124907 reserved words (because it is after a reserved word that this condition occurs), but avoids  
 124908 the “except for ...” list that would be required for **case**, **for**, and so on. (Reserved words  
 124909 are of course recognized anywhere a *simple\_command* can appear, as well. Other rules take  
 124910 care of the special cases of non-recognition, such as rule (4) for **case** statements.)

124911 Note that the body of here-documents are handled by token recognition (see XCU [Section 2.3](#), on  
 124912 page 2299) and do not appear in the grammar directly. (However, the here-document I/O  
 124913 redirection operator is handled as part of the grammar.)

124914 The start symbol of the grammar (**complete\_command**) represents either input from the  
 124915 command line or a shell script. It is repeatedly applied by the interpreter to its input and  
 124916 represents a single “chunk” of that input as seen by the interpreter.

#### 124917 C.2.10.1 Shell Grammar Lexical Conventions

124918 There is no additional rationale provided for this section.

#### 124919 C.2.10.2 Shell Grammar Rules

124920 There is no additional rationale provided for this section.

124921 **C.2.11 Signals and Error Handling**

124922 SD5-XCU-ERN-93 is applied, updating the first paragraph of XCU [Section 2.11](#) (on page 2330).

124923 **C.2.12 Shell Execution Environment**

124924 Some implementations have implemented the last stage of a pipeline in the current environment  
124925 so that commands such as:

124926 `command | read foo`

124927 set variable **foo** in the current environment. This extension is allowed, but not required;  
124928 therefore, a shell programmer should consider a pipeline to be in a subshell environment, but  
124929 not depend on it.

124930 In early proposals, the description of execution environment failed to mention that each  
124931 command in a multiple command pipeline could be in a subshell execution environment. For  
124932 compatibility with some historical shells, the wording was phrased to allow an implementation  
124933 to place any or all commands of a pipeline in the current environment. However, this means that  
124934 a POSIX application must assume each command is in a subshell environment, but not depend  
124935 on it.

124936 The wording about shell scripts is meant to convey the fact that describing “trap actions” can  
124937 only be understood in the context of the shell command language. Outside of this context, such  
124938 as in a C-language program, signals are the operative condition, not traps.

124939 **C.2.13 Pattern Matching Notation**

124940 Pattern matching is a simpler concept and has a simpler syntax than REs, as the former is  
124941 generally used for the manipulation of filenames, which are relatively simple collections of  
124942 characters, while the latter is generally used to manipulate arbitrary text strings of potentially  
124943 greater complexity. However, some of the basic concepts are the same, so this section points  
124944 liberally to the detailed descriptions in XBD [Chapter 9](#) (on page 181).

124945 **C.2.13.1 Patterns Matching a Single Character**

124946 Both quoting and escaping are described here because pattern matching must work in three  
124947 separate circumstances:

- 124948 1. Calling directly upon the shell, such as in pathname expansion or in a **case** statement. All  
124949 of the following match the string or file **abc**:

124950 `abc "abc" a"b" c a\bc a[b]c a["b"]c a[\b]c a["\b"]c a?c a*c`

124951 The following do not:

124952 `"a?c" a*c a\b]c`

- 124953 2. Calling a utility or function without going through a shell, as described for *find* and the  
124954 *fnmatch()* function defined in the System Interfaces volume of POSIX.1-2008.

- 124955 3. Calling utilities such as *find*, *cpio*, *tar*, or *pax* through the shell command line. In this case,  
124956 shell quote removal is performed before the utility sees the argument. For example, in:

124957 `find /bin -name "e\c[\h]o" -print`

124958 after quote removal, the `<backslash>` characters are presented to *find* and it treats them as

124959 escape characters. Both precede ordinary characters, so the *c* and *h* represent themselves  
 124960 and *echo* would be found on many historical systems (that have it in */bin*). To find a  
 124961 filename that contained shell special characters or pattern characters, both quoting and  
 124962 escaping are required, such as:

```
124963 pax -r ... "*a\(\?"
```

124964 to extract a filename ending with "a(?".

124965 Conforming applications are required to quote or escape the shell special characters (sometimes  
 124966 called metacharacters). If used without this protection, syntax errors can result or  
 124967 implementation extensions can be triggered. For example, the KornShell supports a series of  
 124968 extensions based on parentheses in patterns.

124969 The restriction on a <circumflex> in a bracket expression is to allow implementations that  
 124970 support pattern matching using the <circumflex> as the negation character in addition to the  
 124971 <exclamation-mark>. A conforming application must use something like "[\^!]" to match  
 124972 either character.

### 124973 C.2.13.2 Patterns Matching Multiple Characters

124974 Since each <asterisk> matches zero or more occurrences, the patterns "a\*b" and "a\*\*b" have  
 124975 identical functionality.

#### 124976 Examples

124977 a[bc] Matches the strings "ab" and "ac".

124978 a\*d Matches the strings "ad", "abd", and "abcd", but not the string "abc".

124979 a\*d\* Matches the strings "ad", "abcd", "abcdef", "aaaad", and "adddd".

124980 \*a\*d Matches the strings "ad", "abcd", "efabcd", "aaaad", and "adddd".

### 124981 C.2.13.3 Patterns Used for Filename Expansion

124982 The caveat about a <slash> within a bracket expression is derived from historical practice. The  
 124983 pattern "a[b/c]d" does not match such pathnames as **abd** or **a/d**. On some implementations  
 124984 (including those conforming to the Single UNIX Specification), it matched a pathname of  
 124985 literally "a[b/c]d". On other systems, it produced an undefined condition (an unescaped '['  
 124986 used outside a bracket expression). In this version, the XSI behavior is now required.

124987 Filenames beginning with a <period> historically have been specially protected from view on  
 124988 UNIX systems. A proposal to allow an explicit <period> in a bracket expression to match a  
 124989 leading <period> was considered; it is allowed as an implementation extension, but a  
 124990 conforming application cannot make use of it. If this extension becomes popular in the future, it  
 124991 will be considered for a future version of the Shell and Utilities volume of POSIX.1-2008.

124992 Historical systems have varied in their permissions requirements. To match **f\*/bar** has required  
 124993 read permissions on the **f\*** directories in the System V shell, but the Shell and Utilities volume of  
 124994 POSIX.1-2008, the C shell, and KornShell require only search permissions.

## 124995 **C.2.14 Special Built-In Utilities**

124996 See the RATIONALE sections on the individual reference pages.

## 124997 **C.3 Batch Environment Services and Utilities**

### 124998 **Scope of the Batch Environment Services and Utilities Option**

124999 This section summarizes the deliberations of the IEEE P1003.15 (Batch Environment) working  
125000 group in the development of the Batch Environment Services and Utilities option, which covers  
125001 a set of services and utilities defining a batch processing system.

125002 This informative section contains historical information concerning the contents of the  
125003 amendment and describes why features were included or discarded by the working group.

### 125004 **History of Batch Systems**

125005 The supercomputing technical committee began as a “Birds Of a Feather” (BOF) at the January  
125006 1987 Usenix meeting. There was enough general interest to form a supercomputing attachment  
125007 to the /usr/group working groups. Several subgroups rapidly formed. Of those subgroups, the  
125008 batch group was the most ambitious. The first early meetings were spent evaluating user needs  
125009 and existing batch implementations.

125010 To evaluate user needs, individuals from the supercomputing community came and presented  
125011 their needs. Common requests were flexibility, interoperability, control of resources, and ease-of-  
125012 use. Backward-compatibility was not an issue. The working group then evaluated some existing  
125013 systems. The following different systems were evaluated:

- 125014 • PROD
- 125015 • Convex Distributed Batch
- 125016 • NQS
- 125017 • CTSS
- 125018 • MDQS from Ballistics Research Laboratory (BRL)

125019 Finally, NQS was chosen as a model because it satisfied not only the most user requirements, but  
125020 because it was public domain, already implemented on a variety of hardware platforms, and  
125021 network-based.

### 125022 **Historical Implementations of Batch Systems**

125023 Deferred processing of work under the control of a scheduler has been a feature of most  
125024 proprietary operating systems from the earliest days of multi-user systems in order to maximize  
125025 utilization of the computer.

125026 The arrival of UNIX systems proved to be a dilemma to many hardware providers and users  
125027 because it did not include the sophisticated batch facilities offered by the proprietary systems.  
125028 This omission was rectified in 1986 by NASA Ames Research Center who developed the  
125029 Network Queuing System (NQS) as a portable UNIX application that allowed the routing and  
125030 processing of batch “jobs” in a network. To encourage its usage, the product was later put into  
125031 the public domain. It was promptly picked up by UNIX hardware providers, and ported and  
125032 developed for their respective hardware and UNIX implementations.

125033 Many major vendors, who traditionally offer a batch-dominated environment, ported the  
125034 public-domain product to their systems, customized it to support the capabilities of their

125035 systems, and added many customer-requested features.

125036 Due to the strong hardware provider and customer acceptance of NQS, it was decided to use  
125037 NQS as the basis for the POSIX Batch Environment amendment in 1987. Other batch systems  
125038 considered at the time included CTSS, MDQS (a forerunner of NQS from the Ballistics Research  
125039 Laboratory), and PROD (a Los Alamos Labs development). None were thought to have both the  
125040 functionality and acceptability of NQS.

#### 125041 **NQS Differences from the *at* utility**

125042 The base standard *at* and *batch* utilities are not sufficient to meet the batch processing needs in a  
125043 supercomputing environment and additional functionality in the areas of resource management,  
125044 job scheduling, system management, and control of output is required.

#### 125045 **Batch Environment Services and Utilities Option Definitions**

125046 The concept of a batch job is closely related to a session with a session leader. The main  
125047 difference is that a batch job does not have a controlling terminal. There has been much debate  
125048 over whether to use the term “request” or “job”. Job was the final choice because of the  
125049 historical use of this term in the batch environment.

125050 The current definition for job identifiers is not sufficient with the model of destinations. The  
125051 current definition is:

125052 `sequence_number.originating_host`

125053 Using the model of destination, a host may include multiple batch nodes, the location of which  
125054 is identified uniquely by a name or directory service. If the current definition is used, batch  
125055 nodes running on the same host would have to coordinate their use of sequence numbers, as  
125056 sequence numbers are assigned by the originating host. The alternative is to use the originating  
125057 batch node name instead of the originating host name.

125058 The reasons for wishing to run more than one batch system per host could be the following.

125059 A test and production batch system are maintained on a single host. This is most likely in a  
125060 development facility, but could also arise when a site is moving from one version to another. The  
125061 new batch system could be installed as a test version that is completely separate from the  
125062 production batch system, so that problems can be isolated to the test system. Requiring the batch  
125063 nodes to coordinate their use of sequence numbers creates a dependency between the two  
125064 nodes, and that defeats the purpose of running two nodes.

125065 A site has multiple departments using a single host, with different management policies. An  
125066 example of contention might be in job selection algorithms. One group might want a FIFO type  
125067 of selection, while another group wishes to use a more complex algorithm based on resource  
125068 availability. Again, requiring the batch nodes to coordinate is an unnecessary binding.

125069 The proposal eventually accepted was to replace originating host with originating batch node.  
125070 This supplies sufficient granularity to ensure unique job identifiers. If more than one batch node  
125071 is on a particular host, they each have their own unique name.

125072 The queue portion of a destination is not part of the job identifier as these are not required to be  
125073 unique between batch nodes. For instance, two batch nodes may both have queues called small,  
125074 medium, and large. It is only the batch node name that is uniquely identifiable throughout the  
125075 batch system. The queue name has no additional function in this context.

125076 Assume there are three batch nodes, each of which has its own name server. On batch node one,  
125077 there are no queues. On batch node two, there are fifty queues. On batch node three, there are  
125078 forty queues. The system administrator for batch node one does not have to configure queues,  
125079 because there are none implemented. However, if a user wishes to send a job to either batch

125080 node two or three, the system administrator for batch node one must configure a destination  
125081 that maps to the appropriate batch node and queue. If every queue is to be made accessible from  
125082 batch node one, the system administrator has to configure ninety destinations.

125083 To avoid requiring this, there should be a mechanism to allow a user to separate the destination  
125084 into a batch node name and a queue name. Then, an implementation that is configured to get to  
125085 all the batch nodes does not need any more configuration to allow a user to get to all of the  
125086 queues on all of the batch nodes. The node name is used to locate the batch node, while the  
125087 queue name is sent unchanged to that batch node.

125088 The following are requirements that a destination identifier must be capable of providing:

- 125089 • The ability to direct a job to a queue in a particular batch node.
- 125090 • The ability to direct a job to a particular batch node.
- 125091 • The ability to group at a higher level than just one queue. This includes grouping similar  
125092 queues across multiple batch nodes (this is a pipe queue).
- 125093 • The ability to group batch nodes. This allows a user to submit a job to a group name with  
125094 no knowledge of the batch node configuration. This also provides aliasing as a special  
125095 case. Aliasing is a group containing only one batch node name. The group name is the  
125096 alias.

125097 In addition, the administrator has the following requirements:

- 125098 • The ability to control access to the queues.
- 125099 • The ability to control access to the batch nodes.
- 125100 • The ability to control access to groups of queues (pipe queues).
- 125101 • The ability to configure retry time intervals and durations.

125102 The requirements of the user are met by destination as explained in the following.

125103 The user has the ability to specify a queue name, which is known only to the batch node  
125104 specified. There is no configuration of these queues required on the submitting node.

125105 The user has the ability to specify a batch node whose name is network-unique. The  
125106 configuration required is that the batch node be defined as an application, just as other  
125107 applications such as FTP are configured.

125108 Once a job reaches a queue, it can again become a user of the batch system. The batch node can  
125109 choose to send the job to another batch node or queue or both. In other words, the routing is at  
125110 an application level, and it is up to the batch system to choose where the job will be sent.  
125111 Configuration is up to the batch node where the queue resides. This provides grouping of  
125112 queues across batch nodes or within a batch node. The user submits the job to a queue, which by  
125113 definition routes the job to other queues or nodes or both.

125114 A node name may be given to a naming service, which returns multiple addresses as opposed to  
125115 just one. This provides grouping at a batch node level. This is a local issue, meaning that the  
125116 batch node must choose only one of these addresses. The list of addresses is not sent with the  
125117 job, and once the job is accepted on another node, there is no connection between the list and the  
125118 job. The requirements of the administrator are met by destination as explained in the following.

125119 The control of queues is a batch system issue, and will be done using the batch administrative  
125120 utilities.

125121 The control of nodes is a network issue, and will be done through whatever network facilities  
125122 are available.

125123 The control of access to groups of queues (pipe queues) is covered by the control of any other  
125124 queue. The fact that the job may then be sent to another destination is not relevant.

125125 The propagation of a job across more than one point-to-point connection was dropped because  
125126 of its complexity and because all of the issues arising from this capability could not be resolved.  
125127 It could be provided as additional functionality at some time in the future.

125128 The addition of *network* as a defined term was done to clarify the difference between a network  
125129 of batch nodes as opposed to a network of hosts. A network of batch nodes is referred to as a  
125130 batch system. The network refers to the actual host configuration. A single host may have  
125131 multiple batch nodes.

125132 In the absence of a standard network naming convention, this option establishes its own  
125133 convention for the sake of consistency and expediency. This is subject to change, should a future  
125134 working group develop a standard naming convention for network pathnames.

### 125135 C.3.1 Batch General Concepts

125136 During the development of the Batch Environment Services and Utilities option, a number of  
125137 topics were discussed at length which influenced the wording of the normative text but could  
125138 not be included in the final text. The following items are some of the most significant terms and  
125139 concepts of those discussed:

- 125140 • Small and Consistent Command Set

125141 Often, conventional utilities from UNIX systems have a very complicated utility syntax  
125142 and usage. This can often result in confusion and errors when trying to use them. The  
125143 Batch Environment Services and Utilities option utility set, on the other hand, has been  
125144 paired to a small set of robust utilities with an orthogonal calling sequence.

- 125145 • Checkpoint/Restart

125146 This feature permits an already executing process to checkpoint or save its contents. Some  
125147 implementations permit this at both the batch utility level (for example, checkpointing this  
125148 job upon its abnormal termination) or from within the job itself via a system call. Support  
125149 of checkpoint/restart is optional. A conscious, careful effort was made to make the *qsub*  
125150 utility consistently refer to checkpoint/restart as optional functionality.

- 125151 • Rerunability

125152 When a user submits a job for batch processing, they can designate it “rerunnable” in that  
125153 it will automatically resume execution from the start of the job if the machine on which it  
125154 was executing crashes for some reason. The decision on whether the job will be rerun or  
125155 not is entirely up to the submitter of the job and no decisions will be made within the batch  
125156 system. A job that is rerunnable and has been submitted with the proper  
125157 checkpoint/restart switch will first be checkpointed and execution begun from that point.  
125158 Furthermore, use of the implementation-defined checkpoint/restart feature will not be  
125159 defined in this context.

- 125160 • Error Codes

125161 All utilities exit with error status zero (0) if successful, one (1) if a user error occurred, and  
125162 two (2) for an internal Batch Environment Services and Utilities option error.

- 125163 • Level of Portability

125164 Portability is specified at both the user, operator, and administrator levels. A conforming  
125165 batch implementation prevents identical functionality and behavior at all these levels.  
125166 Additionally, portable batch shell scripts with embedded Batch Environment Services and

- 125167 Utilities option utilities add an additional level of portability.
- 125168 • Resource Specification
- 125169 A small set of globally understood resources, such as memory and CPU time, is specified.  
125170 All conforming batch implementations are able to process them in a manner consistent  
125171 with the yet-to-be-developed resource management model. Resources not in this  
125172 amendment set are ignored and passed along as part of the argument stream of the utility.
- 125173 • Queue Position
- 125174 Queue position is the place a job occupies in a queue. It is dependent on a variety of factors  
125175 such as submission time and priority. Since priority may be affected by the implementation  
125176 of fair share scheduling, the definition of queue position is implementation-defined.
- 125177 • Queue ID
- 125178 A numerical queue ID is an external requirement for purposes of accounting. The  
125179 identification number was chosen over queue name for processing convenience.
- 125180 • Job ID
- 125181 A common notion of “jobs” is a collection of processes whose process group cannot be  
125182 altered and is used for resource management and accounting. This concept is  
125183 implementation-defined and, as such, has been omitted from the batch amendment.
- 125184 • Bytes *versus* Words
- 125185 Except for one case, bytes are used as the standard unit for memory size. Furthermore, the  
125186 definition of a word varies from machine to machine. Therefore, bytes will be the default  
125187 unit of memory size.
- 125188 • Regular Expressions
- 125189 The standard definition of regular expressions is much too broad to be used in the batch  
125190 utility syntax. All that is needed is a simple concept of “all”; for example, delete all my jobs  
125191 from the named queue. For this reason, regular expressions have been eliminated from the  
125192 batch amendment.
- 125193 • Display Privacy
- 125194 How much data should be displayed locally through functions? Local policy dictates the  
125195 amount of privacy. Library functions must be used to create and enforce local policy.  
125196 Network and local *qstats* must reflect the policy of the server machine.
- 125197 • Remote Host Naming Convention
- 125198 It was decided that host names would be a maximum of 255 characters in length, with at  
125199 most 15 characters being shown in displays. The 255 character limit was chosen because it  
125200 is consistent with BSD. The 15-character limit was an arbitrary decision.
- 125201 • Network Administration
- 125202 Network administration is important, but is outside the scope of the batch amendment.  
125203 Network administration could be done with *rsh*. However, authentication becomes two-  
125204 sided.
- 125205 • Network Administration Philosophy
- 125206 Keep it simple. Centralized management should be possible. For example, Los Alamos  
125207 needs a dumb set of CPUs to be managed by a central system *versus* several  
125208 independently-managed systems as is the general case for the Batch Environment Services  
125209 and Utilities option.

- 125210 • Operator Utility Defaults (that is, Default Host, User, Account, and so on)
- 125211 It was decided that usability would override orthogonality and syntactic consistency.
- 125212 • The Batch System Manager and Operator Distinction
- 125213 The distinction between manager and operator is that operators can only control the flow
- 125214 of jobs. A manager can alter the batch system configuration in addition to job flow. POSIX
- 125215 makes a distinction between user and system administrator but goes no further. The
- 125216 concepts of manager and operator privileges fall under local policy. The distinction
- 125217 between manager and operator is historical in batch environments, and the Batch
- 125218 Environment Services and Utilities option has continued that distinction.
- 125219 • The Batch System Administrator
- 125220 An administrator is equivalent to a batch system manager.

### 125221 C.3.2 Batch Services

125222 This rationale is provided as informative rather than normative text, to avoid placing  
 125223 requirements on implementors regarding the use of symbolic constants, but at the same time to  
 125224 give implementors a preferred practice for assigning values to these constants to promote  
 125225 interoperability.

125226 The *Checkpoint* and *Minimum\_Cpu\_Interval* attributes induce a variety of behavior depending  
 125227 upon their values. Some jobs cannot or should not be checkpointed. Other users will simply  
 125228 need to ensure job continuation across planned downtimes; for example, scheduled preventive  
 125229 maintenance. For users consuming expensive resources, or for jobs that run longer than the  
 125230 mean time between failures, however, periodic checkpointing may be essential. However,  
 125231 system administrators must be able to set minimum checkpoint intervals on a queue-by-queue  
 125232 basis to guard against, for example, naive users specifying interval values too small on memory-  
 125233 intensive jobs. Otherwise, system overhead would adversely affect performance.

125234 The use of symbolic constants, such as `NO_CHECKPOINT`, was introduced to lend a degree of  
 125235 formalism and portability to this option.

125236 Support for checkpointing is optional for servers. However, clients must provide for the `-c`  
 125237 option, since in a distributed environment the job may run on a server that does provide such  
 125238 support, even if the host of the client does not support the checkpoint feature.

125239 If the user does not specify the `-c` option, the default action is left unspecified by this option.  
 125240 Some implementations may wish to do checkpointing by default; others may wish to checkpoint  
 125241 only under an explicit request from the user.

125242 The *Priority* attribute has been made non-optional. All clients already had been required to  
 125243 support the `-p` option. The concept of prioritization is common in historical implementations.  
 125244 The default priority is left to the server to establish.

125245 The *Hold\_Types* attribute has been modified to allow for implementation-defined hold types to  
 125246 be passed to a batch server.

125247 It was the intent of the IEEE P1003.15 working group to mandate the support for the  
 125248 *Resource\_List* attribute in this option by referring to another amendment, specifically the  
 125249 IEEE P1003.1a draft standard. However, during the development of the IEEE P1003.1a draft  
 125250 standard this was excluded. As such this requirement has been removed from the normative  
 125251 text.

125252 The *Shell\_Path* attribute has been modified to accept a list of shell paths that are associated with  
 125253 a host. The name of the attribute has been changed to *Shell\_Path\_List*.

### 125254 C.3.3 Common Behavior for Batch Environment Utilities

125255 This section was defined to meet the goal of a “Small and Consistent Command Set” for this  
125256 option.

## 125257 C.4 Utilities

125258 For the utilities included in POSIX.1-2008, see the RATIONALE sections on the individual  
125259 reference pages.

### 125260 C.4.1 Utilities Removed in this Version

125261 None.

### 125262 C.4.2 Utilities Removed in the Previous Version

125263 The following utilities were removed in the previous version of this standard:

|        |                 |               |               |              |               |
|--------|-----------------|---------------|---------------|--------------|---------------|
| 125264 | <i>calendar</i> | <i>cu</i>     | <i>line</i>   | <i>pcat</i>  | <i>unpack</i> |
| 125265 | <i>cancel</i>   | <i>dircmp</i> | <i>lint</i>   | <i>pg</i>    | <i>uulog</i>  |
| 125266 | <i>cc</i>       | <i>dis</i>    | <i>lpstat</i> | <i>spell</i> | <i>uuname</i> |
| 125267 | <i>col</i>      | <i>egrep</i>  | <i>mail</i>   | <i>sum</i>   | <i>uupick</i> |
| 125268 | <i>cpio</i>     | <i>fgrep</i>  | <i>pack</i>   | <i>tar</i>   | <i>uuto</i>   |

### 125269 C.4.3 Exclusion of Utilities

125270 The set of utilities contained in POSIX.1-2008 is drawn from the base documents, with one  
125271 addition: the *c99* utility. This section contains rationale for some of the deliberations that led to  
125272 this set of utilities, and why certain utilities were excluded.

125273 Many utilities were evaluated by the standard developers; more historical utilities were  
125274 excluded from the base documents than included. The following list contains many common  
125275 UNIX system utilities that were not included as mandatory utilities, in the User Portability  
125276 Utilities option, in the XSI option, or in one of the software development groups. It is logistically  
125277 difficult for this rationale to distribute correctly the reasons for not including a utility among the  
125278 various utility options. Therefore, this section covers the reasons for all utilities not included in  
125279 POSIX.1-2008.

125280 This rationale is limited to a discussion of only those utilities actively or indirectly evaluated by  
125281 the standard developers of the base documents, rather than the list of all known UNIX utilities  
125282 from all its variants.

125283 *adb* The intent of the various software development utilities was to assist in the  
125284 installation (rather than the actual development and debugging) of applications.  
125285 This utility is primarily a debugging tool. Furthermore, many useful aspects of *adb*  
125286 are very hardware-specific.

125287 *as* Assemblers are hardware-specific and are included implicitly as part of the  
125288 compilers in POSIX.1-2008.

|        |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 125289 | <i>banner</i>   | The only known use of this command is as part of the <i>lp</i> printer header pages. It was decided that the format of the header is implementation-defined, so this utility is superfluous to application portability.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 125290 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 125291 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 125292 | <i>calendar</i> | This reminder service program is not useful to conforming applications.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 125293 | <i>cancel</i>   | The <i>lp</i> (line printer spooling) system specified is the most basic possible and did not need this level of application control.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 125294 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 125304 | <i>dc</i>       | The functionality of this utility can be provided by the <i>bc</i> utility; <i>bc</i> was selected because it was easier to use and had superior functionality. Although the historical versions of <i>bc</i> are implemented using <i>dc</i> as a base, POSIX.1-2008 prescribes the interface and not the underlying mechanism used to implement it.                                                                                                                                                                                                                                                                                                                            |

| 125311 | <i>dis</i>      | Disassemblers are hardware-specific.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 125312 | <i>emacs</i>    | The community of <i>emacs</i> editing enthusiasts was adamant that the full <i>emacs</i> editor not be included in the base documents because they were concerned that an attempt to standardize this very powerful environment would encourage vendors to ship versions conforming strictly to the standard, but lacking the extensibility required by the community. The author of the original <i>emacs</i> program also expressed his desire to omit the program. Furthermore, there were a number of historical UNIX systems that did not include <i>emacs</i> , or included it without supporting it, but there were very few that did not include and support <i>vi</i> . |

| 125321 | <i>line</i>     | The functionality of <i>line</i> can be provided with <i>read</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 125322 | <i>lint</i>     | This technology is partially subsumed by <i>c99</i> . It is also hard to specify the degree of checking for possible error conditions in programs in any compiler, and specifying what <i>lint</i> would do in these cases is equally difficult.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 125323 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 125324 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 125325 |                 | It is fairly easy to specify what a compiler does. It requires specifying the language, what it does with that language, and stating that the interpretation of any incorrect program is unspecified. Unfortunately, any description of <i>lint</i> is required to specify what to do with erroneous programs. Since the number of possible errors and questionable programming practices is infinite, one cannot require <i>lint</i> to detect all errors of any given class.                                                                                                                                                                                                   |
| 125326 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 125327 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 125328 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 125329 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 125330 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 125331 |                 | Additionally, some vendors complained that since many compilers are distributed in a binary form without a <i>lint</i> facility (because the ISO C standard does not require one), implementing the standard as a stand-alone product will be much                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 125332 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 125333 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|        |               |                                                                                                                                         |
|--------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 125334 |               | harder. Rather than being able to build upon a standard compiler component                                                              |
| 125335 |               | (simply by providing <i>c99</i> as an interface), source to that compiler would most                                                    |
| 125336 |               | likely need to be modified to provide the <i>lint</i> functionality. This was considered a                                              |
| 125337 |               | major burden on system providers for a very small gain to developers (users).                                                           |
| 125338 | <i>login</i>  | This utility is terminal-oriented and is not useful from shell scripts or typical                                                       |
| 125339 |               | application programs.                                                                                                                   |
| 125340 | <i>lorder</i> | This utility is an aid in creating an implementation-defined detail of object libraries                                                 |
| 125341 |               | that the standard developers did not feel required standardization.                                                                     |
| 125342 | <i>lpstat</i> | The <i>lp</i> system specified is the most basic possible and did not need this level of                                                |
| 125343 |               | application control.                                                                                                                    |
| 125344 | <i>mail</i>   | This utility was omitted in favor of <i>mailx</i> because there was a considerable                                                      |
| 125345 |               | functionality overlap between the two.                                                                                                  |
| 125346 | <i>mknod</i>  | This was omitted in favor of <i>mkfifo</i> , as <i>mknod</i> has too many implementation-                                               |
| 125347 |               | defined functions.                                                                                                                      |
| 125348 | <i>news</i>   | This utility is terminal-oriented and is not useful from shell scripts or typical                                                       |
| 125349 |               | application programs.                                                                                                                   |
| 125350 | <i>pack</i>   | This compression program was considered inferior to <i>compress</i> .                                                                   |
| 125351 | <i>passwd</i> | This utility was proposed in a historical draft of the base documents but met with                                                      |
| 125352 |               | too many objections to be included. There were various reasons:                                                                         |
| 125353 |               | <ul style="list-style-type: none"> <li>• Changing a password should not be viewed as a command, but as part of the</li> </ul>           |
| 125354 |               | <ul style="list-style-type: none"> <li>login sequence. Changing a password should only be done while a trusted</li> </ul>               |
| 125355 |               | <ul style="list-style-type: none"> <li>path is in effect.</li> </ul>                                                                    |

| 125364 | <i>pcat</i>   | This compression program was considered inferior to <i>zcat</i> .                                                                       |
| 125365 | <i>pg</i>     | This duplicated many of the features of the <i>more</i> pager, which was preferred by the                                               |
| 125366 |               | standard developers.                                                                                                                    |
| 125367 | <i>prof</i>   | The intent of the various software development utilities was to assist in the                                                           |
| 125368 |               | installation (rather than the actual development and debugging) of applications.                                                        |
| 125369 |               | This utility is primarily a debugging tool.                                                                                             |
| 125370 | RCS           | RCS was originally considered as part of a version control utilities portion of the                                                     |
| 125371 |               | scope. However, this aspect was abandoned by the standard developers. SCCS is                                                           |
| 125372 |               | now included as an optional part of the XSI option.                                                                                     |
| 125373 | <i>red</i>    | Restricted editor. This was not considered by the standard developers because it                                                        |
| 125374 |               | never provided the level of security restriction required.                                                                              |
| 125375 | <i>rsh</i>    | Restricted shell. This was not considered by the standard developers because it                                                         |
| 125376 |               | does not provide the level of security restriction that is implied by historical                                                        |
| 125377 |               | documentation.                                                                                                                          |

|        |               |                                                                                                                                                                                                                                                                                                                                 |
|--------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 125378 | <i>sdb</i>    | The intent of the various software development utilities was to assist in the installation (rather than the actual development and debugging) of applications. This utility is primarily a debugging tool. Furthermore, some useful aspects of <i>sdb</i> are very hardware-specific.                                           |
| 125379 |               |                                                                                                                                                                                                                                                                                                                                 |
| 125380 |               |                                                                                                                                                                                                                                                                                                                                 |
| 125381 |               |                                                                                                                                                                                                                                                                                                                                 |
| 125382 | <i>sdiff</i>  | The “side-by-side <i>diff</i> ” utility from System V was omitted because it is used infrequently, and even less so by conforming applications. Despite being in System V, it is not in the SVID or XPG.                                                                                                                        |
| 125383 |               |                                                                                                                                                                                                                                                                                                                                 |
| 125384 |               |                                                                                                                                                                                                                                                                                                                                 |
| 125385 |               |                                                                                                                                                                                                                                                                                                                                 |
| 125386 | <i>shar</i>   | Any of the numerous “shell archivers” were excluded because they did not meet the requirement of existing practice.                                                                                                                                                                                                             |
| 125387 |               |                                                                                                                                                                                                                                                                                                                                 |
| 125388 | <i>shl</i>    | This utility is terminal-oriented and is not useful from shell scripts or typical application programs. The job control aspects of the shell command language are generally more useful.                                                                                                                                        |
| 125389 |               |                                                                                                                                                                                                                                                                                                                                 |
| 125390 |               |                                                                                                                                                                                                                                                                                                                                 |
| 125391 | <i>size</i>   | The intent of the various software development utilities was to assist in the installation (rather than the actual development and debugging) of applications. This utility is primarily a debugging tool.                                                                                                                      |
| 125392 |               |                                                                                                                                                                                                                                                                                                                                 |
| 125393 |               |                                                                                                                                                                                                                                                                                                                                 |
| 125394 | <i>spell</i>  | This utility is not useful from shell scripts or typical application programs. The <i>spell</i> utility was considered, but was omitted because there is no known technology that can be used to make it recognize general language for user-specified input without providing a complete dictionary along with the input file. |
| 125395 |               |                                                                                                                                                                                                                                                                                                                                 |
| 125396 |               |                                                                                                                                                                                                                                                                                                                                 |
| 125397 |               |                                                                                                                                                                                                                                                                                                                                 |
| 125398 | <i>su</i>     | This utility is not useful from shell scripts or typical application programs. (There was also sentiment to avoid security-related utilities.)                                                                                                                                                                                  |
| 125399 |               |                                                                                                                                                                                                                                                                                                                                 |
| 125400 | <i>sum</i>    | This utility was renamed <i>cksum</i> .                                                                                                                                                                                                                                                                                         |
| 125401 | <i>tar</i>    | This has been replaced by <i>pax</i> , for reasons explained in the rationale for that utility.                                                                                                                                                                                                                                 |
| 125402 | <i>unpack</i> | This compression program was considered inferior to <i>uncompress</i> .                                                                                                                                                                                                                                                         |
| 125403 | <i>wall</i>   | This utility is terminal-oriented and is not useful in shell scripts or typical applications. It is generally used only by system administrators.                                                                                                                                                                               |

125409

125410

## Portability Considerations (Informative)

125411

This section contains information to satisfy various international requirements:

125412

- [Section D.1](#) describes perceived user requirements.

125413

- [Section D.2](#) (on page 3689) indicates how the facilities of POSIX.1-2008 satisfy those requirements.

125414

125415

- [Section D.3](#) (on page 3697) offers guidance to writers of profiles on how the configurable options, limits, and optional behavior of POSIX.1-2008 should be cited in profiles.

125416

### 125417 **D.1 User Requirements**

125418

This section describes the user requirements that were perceived by the standard developers. The primary source for these requirements was an analysis of historical practice in widespread use, as typified by the base documents listed in [Section A.1.1](#) (on page 3411).

125419

125420

125421

POSIX.1-2008 addresses the needs of users requiring open systems solutions for source code portability of applications. It currently addresses users requiring open systems solutions for source-code portability of applications involving multi-programming and process management (creating processes, signaling, and so on); access to files and directories in a hierarchy of file systems (opening, reading, writing, deleting files, and so on); access to asynchronous communications ports and other special devices; access to information about other users of the system; facilities supporting applications requiring bounded (realtime) response.

125422

125423

125424

125425

125426

125427

125428

The following users are identified for POSIX.1-2008:

125429

- Those employing applications written in high-level languages, such as C, Ada, or FORTRAN.

125430

125431

- Users who desire conforming applications that do not necessarily require the characteristics of high-level languages (for example, the speed of execution of compiled languages or the relative security of source code intellectual property inherent in the compilation process).

125432

125433

125434

125435

- Users who desire conforming applications that can be developed quickly and can be modified readily without the use of compilers and other system components that may be unavailable on small systems or those without special application development capabilities.

125436

125437

125438

125439

- Users who interact with a system to achieve general-purpose time-sharing capabilities common to most business or government offices or academic environments: editing, filing, inter-user communications, printing, and so on.

125440

125441

125442

- Users who develop applications for POSIX-conformant systems.

125443

- Users who develop applications for UNIX systems.

125444

An acknowledged restriction on applicable users is that they are limited to the group of individuals who are familiar with the style of interaction characteristic of historically-derived systems based on one of the UNIX operating systems (as opposed to other historical systems

125445

125446

125447 with different models, such as MS/DOS, Macintosh, VMS, MVS, and so on). Typical users  
125448 would include program developers, engineers, or general-purpose time-sharing users.

125449 The requirements of users of POSIX.1-2008 can be summarized as a single goal: *application source*  
125450 *portability*. The requirements of the user are stated in terms of the requirements of portability of  
125451 applications. This in turn becomes a requirement for a standardized set of syntax and semantics  
125452 for operations commonly found on many operating systems.

125453 The following sections list the perceived requirements for application portability.

#### 125454 **D.1.1 Configuration Interrogation**

125455 An application must be able to determine whether and how certain optional features are  
125456 provided and to identify the system upon which it is running, so that it may appropriately adapt  
125457 to its environment.

125458 Applications must have sufficient information to adapt to varying behaviors of the system.

#### 125459 **D.1.2 Process Management**

125460 An application must be able to manage itself, either as a single process or as multiple processes.  
125461 Applications must be able to manage other processes when appropriate.

125462 Applications must be able to identify, control, create, and delete processes, and there must be  
125463 communication of information between processes and to and from the system.

125464 Applications must be able to use multiple flows of control with a process (threads) and  
125465 synchronize operations between these flows of control.

#### 125466 **D.1.3 Access to Data**

125467 Applications must be able to operate on the data stored on the system, access it, and transmit it  
125468 to other applications. Information must have protection from unauthorized or accidental access  
125469 or modification.

#### 125470 **D.1.4 Access to the Environment**

125471 Applications must be able to access the external environment to communicate their input and  
125472 results.

#### 125473 **D.1.5 Access to Determinism and Performance Enhancements**

125474 Applications must have sufficient control of resource allocation to ensure the timeliness of  
125475 interactions with external objects.

**125476 D.1.6 Operating System-Dependent Profile**

125477 The capabilities of the operating system may make certain optional characteristics of the base  
125478 language in effect no longer optional, and this should be specified.

**125479 D.1.7 I/O Interaction**

125480 The interaction between the C language I/O subsystem (*stdio*) and the I/O subsystem of  
125481 POSIX.1-2008 must be specified.

**125482 D.1.8 Internationalization Interaction**

125483 The effects of the environment of POSIX.1-2008 on the internationalization facilities of the C  
125484 language must be specified.

**125485 D.1.9 C-Language Extensions**

125486 Certain functions in the C language must be extended to support the additional capabilities  
125487 provided by POSIX.1-2008.

**125488 D.1.10 Command Language**

125489 Users should be able to define procedures that combine simple tools and/or applications into  
125490 higher-level components that perform to the specific needs of the user. The user should be able  
125491 to store, recall, use, and modify these procedures. These procedures should employ a powerful  
125492 command language that is used for recurring tasks in conforming applications (scripts) in the  
125493 same way that it is used interactively to accomplish one-time tasks. The language and the  
125494 utilities that it uses must be consistent between systems to reduce errors and retraining.

**125495 D.1.11 Interactive Facilities**

125496 Use the system to accomplish individual tasks at an interactive terminal. The interface should be  
125497 consistent, intuitive, and offer usability enhancements to increase the productivity of terminal  
125498 users, reduce errors, and minimize retraining costs. Online documentation or usage assistance  
125499 should be available.

**125500 D.1.12 Accomplish Multiple Tasks Simultaneously**

125501 Access applications and interactive facilities from a single terminal without requiring serial  
125502 execution: switch between multiple interactive tasks; schedule one-time or periodic background  
125503 work; display the status of all work in progress or scheduled; influence the priority scheduling  
125504 of work, when authorized.

**125505 D.1.13 Complex Data Manipulation**

125506 Manipulate data in files in complex ways: sort, merge, compare, translate, edit, format, pattern  
125507 match, select subsets (strings, columns, fields, rows, and so on). These facilities should be  
125508 available to both conforming applications and interactive users.

**125509 D.1.14 File Hierarchy Manipulation**

125510 Create, delete, move/rename, copy, backup/archive, and display files and directories. These  
125511 facilities should be available to both conforming applications and interactive users.

**125512 D.1.15 Locale Configuration**

125513 Customize applications and interactive sessions for the cultural and language conventions of the  
125514 user. Employ a wide variety of standard character encodings. These facilities should be available  
125515 to both conforming applications and interactive users.

**125516 D.1.16 Inter-User Communication**

125517 Send messages or transfer files to other users on the same system or other systems on a network.  
125518 These facilities should be available to both conforming applications and interactive users.

**125519 D.1.17 System Environment**

125520 Display information about the status of the system (activities of users and their interactive and  
125521 background work, file system utilization, system time, configuration, and presence of optional  
125522 facilities) and the environment of the user (terminal characteristics, and so on). Inform the  
125523 system operator/administrator of problems. Control access to user files and other resources.

**125524 D.1.18 Printing**

125525 Output files on a variety of output device classes, accessing devices on local or network-  
125526 connected systems. Control (or influence) the formatting, priority scheduling, and output  
125527 distribution of work. These facilities should be available to both conforming applications and  
125528 interactive users.

**125529 D.1.19 Software Development**

125530 Develop (create and manage source files, compile/interpret, debug) portable open systems  
125531 applications and package them for distribution to, and updating of, other systems.

## 125532 D.2 Portability Capabilities

125533 This section describes the significant portability capabilities of POSIX.1-2008 and indicates how  
 125534 the user requirements listed in [Section D.1](#) (on page 3685) are addressed. The capabilities are  
 125535 listed in the same format as the preceding user requirements; they are summarized below:

- 125536 • Configuration Interrogation
- 125537 • Process Management
- 125538 • Access to Data
- 125539 • Access to the Environment
- 125540 • Access to Determinism and Performance Enhancements
- 125541 • Operating System-Dependent Profile
- 125542 • I/O Interaction
- 125543 • Internationalization Interaction
- 125544 • C-Language Extensions
- 125545 • Command Language
- 125546 • Interactive Facilities
- 125547 • Accomplish Multiple Tasks Simultaneously
- 125548 • Complex Data Manipulation
- 125549 • File Hierarchy Manipulation
- 125550 • Locale Configuration
- 125551 • Inter-User Communication
- 125552 • System Environment
- 125553 • Printing
- 125554 • Software Development

### 125555 D.2.1 Configuration Interrogation

125556 The *uname()* operation provides basic identification of the system. The *sysconf()*, *pathconf()*, and  
 125557 *fpathconf()* functions and the *getconf* utility provide means to interrogate the implementation to  
 125558 determine how to adapt to the environment in which it is running. These values can be either  
 125559 static (indicating that all instances of the implementation have the same value) or dynamic  
 125560 (indicating that different instances of the implementation have the different values, or that the  
 125561 value may vary for other reasons, such as reconfiguration).

#### 125562 Unsatisfied Requirements

125563 None directly. However, as new areas are added, there will be a need for additional capability in  
 125564 this area.

## 125565 D.2.2 Process Management

125566 The *fork()*, *exec* family, *posix\_spawn()*, and *posix\_spawnp()* functions provide for the creation of  
 125567 new processes or the insertion of new applications into existing processes. The *\_Exit()*, *\_exit()*,  
 125568 *exit()*, and *abort()* functions allow for the termination of a process by itself. The *wait()*, *waitid()*,  
 125569 and *waitpid()* functions allow one process to deal with the termination of another.

125570 The *times()* function allows for basic measurement of times used by a process. Various  
 125571 functions, including *fstat()*, *getegid()*, *geteuid()*, *getgid()*, *getgrgid()*, *getgrnam()*, *getlogin()*,  
 125572 *getpid()*, *getppid()*, *getpwnam()*, *getpwuid()*, *getuid()*, *lstat()*, and *stat()*, provide for access to the  
 125573 identifiers of processes and the identifiers and names of owners of processes (and files).

125574 The various functions operating on environment variables provide for communication of  
 125575 information (primarily user-configurable defaults) from a parent to child processes.

125576 The operations on the current working directory control and interrogate the directory from  
 125577 which relative filename searches start. The *umask()* function controls the default protections  
 125578 applied to files created by the process.

125579 The *alarm()*, *pause()*, *sleep()*, *ualarm()*, and *usleep()* operations allow the process to suspend until  
 125580 a timer has expired or to be notified when a period of time has elapsed. The *time()* operation  
 125581 interrogates the current time and date.

125582 The signal mechanism provides for communication of events either from other processes or  
 125583 from the environment to the application, and the means for the application to control the effect  
 125584 of these events. The mechanism provides for external termination of a process and for a process  
 125585 to suspend until an event occurs. The mechanism also provides for a value to be associated with  
 125586 an event.

125587 Job control provides a means to group processes and control them as groups, and to control their  
 125588 access to the function between the user and the system (the “controlling terminal”). It also  
 125589 provides the means to suspend and resume processes.

125590 The Process Scheduling option provides control of the scheduling and priority of a process.

125591 The Message Passing option provides a means for interprocess communication involving small  
 125592 amounts of data.

125593 The Memory Management facilities provide control of memory resources and for the sharing of  
 125594 memory. This functionality is mandatory on POSIX-conforming systems.

125595 The Threads facilities provide multiple flows of control with a process (threads),  
 125596 synchronization between threads (including mutexes, barriers, and spin locks), association of  
 125597 data with threads, and controlled cancellation of threads.

125598 The XSI interprocess communications functionality provide an alternate set of facilities to  
 125599 manipulate semaphores, message queues, and shared memory. These are provided on XSI-  
 125600 conformant systems to support conforming applications developed to run on UNIX systems.

## 125601 D.2.3 Access to Data

125602 The *open()*, *close()*, *fclose()*, *fopen()*, and *pipe()* functions provide for access to files and data.  
 125603 Such files may be regular files, interprocess data channels (pipes), or devices. Additional types  
 125604 of objects in the file system are permitted and are being contemplated for standardization.

125605 The *access()*, *chmod()*, *chown()*, *dup()*, *dup2()*, *fchmod()*, *fcntl()*, *fstat()*, *ftruncate()*, *lstat()*,  
 125606 *readlink()*, *realpath()*, *stat()*, and *utime()* functions allow for control and interrogation of file and  
 125607 file-related objects (including symbolic links), and their ownership, protections, and timestamps.

125608 The *fgetc()*, *fputc()*, *fread()*, *fseek()*, *fsetpos()*, *fwrite()*, *getc()*, *getchar()*, *lseek()*, *putchar()*, *putc()*,  
 125609 *read()*, and *write()* functions provide for data transfer from the application to files (in all their  
 125610 forms).

125611 The *closedir()*, *link()*, *mkdir()*, *opendir()*, *readdir()*, *rename()*, *rmdir()*, *rewinddir()*, and *unlink()*  
 125612 functions provide for a complete set of operations on directories. Directories can arbitrarily  
 125613 contain other directories, and a single file can be mentioned in more than one directory.

125614 The *faccessat()*, *openat()*, *fchmodat()*, *fchownat()*, *fstatat()*, *linkat()*, *renameat()*, *readlinkat()*,  
 125615 *symlinkat()*, and *unlinkat()* functions allow for race-free and thread-safe file access. The  
 125616 motivation for the introduction of these functions was as follows:

- 125617 • Interfaces taking a pathname may be limited by the maximum length of a pathname  
 125618 ({PATH\_MAX}). The absolute path of files can far exceed this length. The alternative  
 125619 solution of changing the working directory and using relative pathnames is not thread-  
 125620 safe.
- 125621 • A second motivation is that files accessed outside the current working directory are subject  
 125622 to attacks caused by the race condition created by changing any of the elements of the  
 125623 pathnames used.
- 125624 • A third motivation is to allow application code which makes use of a virtual current  
 125625 working directory for each individual thread. In the alternative model there is only one  
 125626 current working directory for all threads.

125627 The file-locking mechanism provides for advisory locking (protection during transactions) of  
 125628 ranges of bytes (in effect, records) in a file.

125629 The *confstr()*, *fpathconf()*, *pathconf()*, and *sysconf()* functions provide for enquiry as to the  
 125630 behavior of the system where variability is permitted.

125631 The asynchronous input and output functions *aio\_cancel()*, *aio\_error()*, *aio\_fsync()*, *aio\_read()*,  
 125632 *aio\_return()*, *aio\_suspend()*, *aio\_write()*, and *lio\_listio()* provide for initiation and control of  
 125633 asynchronous data transfers.

125634 The Synchronized Input and Output option provides for assured commitment of data to media.

#### 125635 **D.2.4 Access to the Environment**

125636 The operations and types in XBD are provided for access to asynchronous serial devices. The  
 125637 primary intended use for these is the controlling terminal for the application (the interaction  
 125638 point between the user and the system). They are general enough to be used to control any  
 125639 asynchronous serial device. The functions are also general enough to be used with many other  
 125640 device types as a user interface when some emulation is provided.

125641 Less detailed access is provided for other device types, but in many instances an application  
 125642 need not know whether an object in the file system is a device or a regular file to operate  
 125643 correctly.

**125644 Unsatisfied Requirements**

125645 Detailed control of common device classes, specifically magnetic tape, is not provided.

**125646 D.2.5 Bounded (Realtime) Response**

125647 The realtime signal functions *sigqueue()*, *sigtimedwait()*, and *sigwaitinfo()* provide queued signals and the prioritization of the handling of signals.

125649 The SCHED\_FIFO, SCHED\_SPORADIC, and SCHED\_RR scheduling policies provide control over processor allocation.

125651 The semaphore functions *sem\_close()*, *sem\_destroy()*, *sem\_getvalue()*, *sem\_init()*, *sem\_open()*, *sem\_post()*, *sem\_timedwait()*, *sem\_trywait()*, *sem\_unlink()*, and *sem\_wait()* provide high-performance synchronization.

125654 The memory management functions provide memory locking for control of memory allocation, file mapping for high performance, and shared memory for high-performance interprocess communication. The Message Passing option provides for interprocess communication without being dependent on shared memory.

125658 The timers functions *clock\_getres()*, *clock\_gettime()*, *clock\_settime()*, *nanosleep()*, *timer\_create()*, *timer\_delete()*, *timer\_getoverrun()*, *timer\_gettime()*, and *timer\_settime()* provide functionality to manipulate clocks and timers and include a high resolution function called *nanosleep()* with a finer resolution than the *sleep()* function.

125662 The timeout functions — *pthread\_mutex\_timedlock()*, *pthread\_rwlock\_timedrdlock()*, *pthread\_rwlock\_timedwrlock()*, and *sem\_timedwait()* — the Typed Memory Objects option and the Monotonic Clock option provide further facilities for applications to use to obtain predictable bounded response.

**125666 D.2.6 Operating System-Dependent Profile**

125667 POSIX.1-2008 makes no distinction between text and binary files. The values of EXIT\_SUCCESS and EXIT\_FAILURE are further defined.

**125669 Unsatisfied Requirements**

125670 None known, but the ISO C standard may contain some additional options that could be specified.

**125672 D.2.7 I/O Interaction**

125673 POSIX.1-2008 defines how each of the ISO C standard *stdio* functions interact with the POSIX.1 operations, typically specifying the behavior in terms of POSIX.1 operations.

125675 **Unsatisfied Requirements**

125676 None.

125677 **D.2.8 Internationalization Interaction**

125678 The POSIX.1-2008 environment operations provide a means to define the environment for  
 125679 *setlocale()* and time functions such as *ctime()*. The *tzset()* function is provided to set time  
 125680 conversion information.

125681 The *nl\_langinfo()* function is provided to query locale-specific cultural settings.

125682 The multiple concurrent locale functions *duplocale()*, *freelocale()*, *is\*\_l()*, *newlocale()*,  
 125683 *strcasemp\_l()*, *strcoll\_l()*, *strfmon\_l()*, *strncasemp\_l()*, *strxfrm\_l()*, *tolower\_l()*, *toupper\_l()*,  
 125684 *towctrans\_l()*, *towlower()*, *towupper()*, *uselocale()*, *wscasemp\_l()*, *wscoll\_l()*, *wscncasemp\_l()*,  
 125685 *wcsxfrm\_l()*, *wctrans\_l()*, and *wctype\_l()* are provide to support per-thread locale information.

125686 **Unsatisfied Requirements**

125687 None.

125688 **D.2.9 C-Language Extensions**

125689 The *setjmp()* and *longjmp()* functions are not defined to be cognizant of the signal masks defined  
 125690 for POSIX.1. The *sigsetjmp()* and *siglongjmp()* functions are provided to fill this gap.

125691 The *\_setjmp()* and *\_longjmp()* functions are provided as XSI options to support historic practice.

125692 **Unsatisfied Requirements**

125693 None.

125694 **D.2.10 Command Language**

125695 The shell command language, as described in XCU [Chapter 2](#) (on page 2297), is a common  
 125696 language useful in batch scripts, through an API to high-level languages (for the C-Language  
 125697 Binding option, *system()* and *popen()*) and through an interactive terminal (see the *sh* utility).  
 125698 The shell language has many of the characteristics of a high-level language, but it has been  
 125699 designed to be more suitable for user terminal entry and includes interactive debugging  
 125700 facilities. Through the use of pipelining, many complex commands can be constructed from  
 125701 combinations of data filters and other common components. Shell scripts can be created, stored,  
 125702 recalled, and modified by the user with simple editors.

125703 In addition to the basic shell language, the following utilities offer features that simplify and  
 125704 enhance programmatic access to the utilities and provide features normally found only in high-  
 125705 level languages: *basename*, *bc*, *command*, *dirname*, *echo*, *env*, *expr*, *false*, *printf*, *read*, *sleep*, *tee*, *test*,  
 125706 *time\**,<sup>9</sup> *true*, *wait*, *xargs*, and all of the special built-in utilities in XCU [Section 2.14](#) (on page 2334).

---

125707 9. The utilities listed with an asterisk here and later in this section are present only on systems which support the User Portability Utilities  
 125708 option. There may be further restrictions on the utilities offered with various configuration option combinations; see the individual utility  
 125709 descriptions.

125710 **Unsatisfied Requirements**

125711 None.

125712 **D.2.11 Interactive Facilities**

125713 The utilities offer a common style of command-line interface through conformance to the Utility  
 125714 Syntax Guidelines (see XBD [Section 12.2](#), on page 215) and the common utility defaults (see XCU  
 125715 [Section 1.4](#), on page 2288). The *sh* utility offers an interactive command-line history and editing  
 125716 facility.

125717 The following utilities can be used interactively as well as by scripts; *alias*, *fc*, *mailx*, *unalias*, and  
 125718 *write*.

125719 The following utilities in the User Portability Utilities option provide for interactive use: *ex*, *more*,  
 125720 and *vi*; the *man* utility offers online access to system documentation.

125721 **Unsatisfied Requirements**

125722 The command line interface to individual utilities is as intuitive and consistent as historical  
 125723 practice allows. Work underway based on graphical user interfaces may be more suitable for  
 125724 novice or occasional users of the system.

125725 **D.2.12 Accomplish Multiple Tasks Simultaneously**

125726 The shell command language offers background processing through the asynchronous list  
 125727 command form; see XCU [Section 2.9](#) (on page 2316).

125728 The *nohup* utility makes background processing more robust and usable.

125729 The *kill* utility can terminate background jobs.

125730 The following utilities support periodic job scheduling, control, and display: *at*, *batch*, *crontab*,  
 125731 *nice*, *ps*, and *renice*.

125732 When the User Portability Utilities option is supported, the following utilities allow  
 125733 manipulation of jobs: *bg*, *fg*, and *jobs*.

125734 **Unsatisfied Requirements**

125735 Terminals with multiple windows may be more suitable for some multi-tasking interactive uses  
 125736 than the job control approach in POSIX.1-2008. See the comments on graphical user interfaces in  
 125737 [Section D.2.11](#). The *nice* and *renice* utilities do not necessarily take advantage of complex system  
 125738 scheduling algorithms that are supported by the realtime options within POSIX.1-2008.

125739 **D.2.13 Complex Data Manipulation**

125740 The following utilities address user requirements in this area: *asa*, *awk*, *bc*, *cmp*, *comm*, *csplit*, *cut*,  
 125741 *dd*, *diff*, *ed*, *ex\**, *expand*, *expr*, *find*, *fold*, *grep*, *head*, *join*, *od*, *paste*, *pr*, *printf*, *sed*, *sort*, *split*, *tabs*, *tail*, *tr*,  
 125742 *unexpand*, *uniq*, *uudecode*, *uuencode*, and *wc*.

125743 **Unsatisfied Requirements**

125744 Sophisticated text formatting utilities, such as *troff* or *TeX*, are not included. Standards work in  
125745 the area of SGML may satisfy this.

125746 **D.2.14 File Hierarchy Manipulation**

125747 The following utilities address user requirements in this area: *basename*, *cd*, *chgrp*, *chmod*, *chown*,  
125748 *cksum*, *cp*, *dd*, *df*, *diff*, *dirname*, *du*, *find*, *ls*, *ln*, *mkdir*, *mkfifo*, *mv*, *patch*, *pathchk*, *pax*, *pwd*, *rm*, *rmdir*,  
125749 *test*, and *touch*.

125750 **Unsatisfied Requirements**

125751 Some graphical user interfaces offer more intuitive file manager components that allow file  
125752 manipulation through the use of icons for novice users.

125753 **D.2.15 Locale Configuration**

125754 The standard utilities are affected by the various *LC\_* variables to achieve locale-dependent  
125755 operation: character classification, collation sequences, regular expressions and shell pattern  
125756 matching, date and time formats, numeric formatting, and monetary formatting. When the  
125757 POSIX2\_LOCALEDEF option is supported, applications can provide their own locale definition  
125758 files.

125759 The following utilities address user requirements in this area: *date*, *ed*, *ex\**, *find*, *grep*, *locale*,  
125760 *localedef*, *more\**, *sed*, *sh*, *sort*, *tr*, *uniq*, and *vi\**.

125761 The *iconv()*, *iconv\_close()*, and *iconv\_open()* functions are available to allow an application to  
125762 convert character data between supported character sets.

125763 The *genccat* utility and the *catopen()*, *catclose()*, and *catgets()* functions provide for message  
125764 catalog manipulation.

125765 **Unsatisfied Requirements**

125766 Some aspects of multi-byte character and state-encoded character encodings have not yet been  
125767 addressed. The C-language functions, such as *getopt()*, are generally limited to single-byte  
125768 characters. The effect of the *LC\_MESSAGES* variable on message formats is only suggested at  
125769 this time.

125770 **D.2.16 Inter-User Communication**

125771 The following utilities address user requirements in this area: *cksum*, *mailx*, *mesg*, *patch*, *pax*, *talk*,  
125772 *uudecode*, *uuencode*, *who*, and *write*.

125773 The historical UUCP utilities are included as a separate UUCP Utilities option.

125774 **Unsatisfied Requirements**

125775 None.

125776 **D.2.17 System Environment**125777 The following utilities address user requirements in this area: *chgrp, chmod, chown, df, du, env, getconf, id, logger, logname, mesg, newgrp, ps, stty, tput, tty, umask, uname, and who.*125778 The *closelog()*, *openlog()*, *setlogmask()*, and *syslog()* functions provide system logging facilities on XSI-conformant systems; these are analogous to the *logger* utility.125781 **Unsatisfied Requirements**

125782 None.

125783 **D.2.18 Printing**125784 The following utilities address user requirements in this area: *pr* and *lp*.125785 **Unsatisfied Requirements**

125786 There are no features to control the formatting or scheduling of the print jobs.

125787 **D.2.19 Software Development**125788 The following utilities address user requirements in this area: *ar, asa, awk, c99, ctags, fort77, getconf, getopts, lex, localedef, make, nm, od, patch, pax, strings, strip, time, and yacc.*125790 The *system()*, *popen()*, *pclose()*, *regcomp()*, *regex()*, *regerror()*, *regfree()*, *fnmatch()*, *getopt()*, *glob()*, *globfree()*, *wordexp()*, and *wordfree()* functions allow C-language programmers to access some of the interfaces used by the utilities, such as argument processing, regular expressions, and pattern matching.

125794 The SCCS source-code control system utilities are available on systems supporting the XSI Development option.

125796 **Unsatisfied Requirements**

125797 There are no language-specific development tools related to languages other than C and FORTRAN. The C tools are more complete and varied than the FORTRAN tools. There is no data dictionary or other CASE-like development tools.

125800 **D.2.20 Future Growth**

125801 It is arguable whether or not all functionality to support applications is potentially within the scope of POSIX.1-2008. As a simple matter of practicality, it cannot be. Areas such as graphics, application domain-specific functionality, windowing, and so on, should be in unique standards. 125802 As such, they are properly “Unsatisfied Requirements” in terms of providing fully conforming applications, but ones which are outside the scope of POSIX.1-2008. 125803 125804 125805

125806 However, as the standards evolve, certain functionality once considered “exotic” enough to be part of a separate standard become common enough to be included in a core standard such as this. Realtime and networking, for example, have both moved from separate standards (with 125807 125808

125809 much difficult cross-referencing) into this standard over time, and although no specific areas  
125810 have been identified for inclusion in a future version, such inclusions seem likely.

## 125811 **D.3 Profiling Considerations**

125812 This section offers guidance to writers of profiles on how the configurable options, limits, and  
125813 optional behavior of POSIX.1-2008 should be cited in profiles. Profile writers should consult the  
125814 general guidance in POSIX.0 when writing POSIX Standardized Profiles.

125815 The information in this section is an inclusive list of features that should be considered by profile  
125816 writers. Subsetting of POSIX.1-2008 should follow XBD [Section 2.1.5.1](#) (on page 20). A set of  
125817 profiling options is described in [Appendix E](#) (on page 3711).

### 125818 **D.3.1 Configuration Options**

125819 There are two set of options suggested by POSIX.1-2008: those for POSIX-conforming systems  
125820 and those for X/Open System Interface (XSI) conformance. The requirements for XSI  
125821 conformance are documented in the Base Definitions volume of POSIX.1-2008 and not discussed  
125822 further here, as they superset the POSIX conformance requirements.

### 125823 **D.3.2 Configuration Options (Shell and Utilities)**

125824 There are three broad optional configurations for the Shell and Utilities volume of POSIX.1-2008:  
125825 basic execution system, development system, and user portability interactive system. The  
125826 options to support these, and other minor configuration options, are listed in XBD [Chapter 2](#) (on  
125827 page 15). Profile writers should consult the following list and the comments concerning user  
125828 requirements addressed by various components in [Section D.2](#) (on page 3689).

125829 POSIX2\_UPE

125830 The system supports the User Portability Utilities option.

125831 This option is a requirement for a user portability interactive system. It is required  
125832 frequently except for those systems, such as embedded realtime or dedicated application  
125833 systems, that support little or no interactive time-sharing work by users or operators. XSI-  
125834 conformant systems support this option.

125835 POSIX2\_SW\_DEV

125836 The system supports the Software Development Utilities option.

125837 This option is required by many systems, even those in which actual software development  
125838 does not occur. The *make* utility, in particular, is required by many application software  
125839 packages as they are installed onto the system. If POSIX2\_C\_DEV is supported,  
125840 POSIX2\_SW\_DEV is almost a mandatory requirement because of *ar* and *make*.

125841 POSIX2\_C\_BIND

125842 The system supports the C-Language Bindings option.

125843 This option is required on some implementations developing complex C applications or on  
125844 any system installing C applications in source form that require the functions in this option.  
125845 The *system()* and *popen()* functions, in particular, are widely used by applications; the  
125846 others are rather more specialized.

- 125847 POSIX2\_C\_DEV  
 125848 The system supports the C-Language Development Utilities option.
- 125849 This option is required by many systems, even those in which actual C-language software  
 125850 development does not occur. The *c99* utility, in particular, is required by many application  
 125851 software packages as they are installed onto the system. The *lex* and *yacc* utilities are used  
 125852 less frequently.
- 125853 POSIX2\_FORT\_DEV  
 125854 The system supports the FORTRAN Development Utilities option
- 125855 As with C, this option is needed on any system developing or installing FORTRAN  
 125856 applications in source form.
- 125857 POSIX2\_FORT\_RUN  
 125858 The system supports the FORTRAN Runtime Utilities option.
- 125859 This option is required for some FORTRAN applications that need the *asa* utility to convert  
 125860 Hollerith printing statement output. It is unknown how frequently this occurs.
- 125861 POSIX2\_LOCALEDEF  
 125862 The system supports the creation of locales.
- 125863 This option is needed if applications require their own customized locale definitions to  
 125864 operate. It is presently unknown whether many applications are dependent on this.  
 125865 However, the option is virtually mandatory for systems in which internationalized  
 125866 applications are developed.
- 125867 XSI-conformant systems support this option.
- 125868 POSIX2\_PBS  
 125869 The system supports the Batch Environment Services and Utilities option.
- 125870 POSIX2\_PBS\_ACCOUNTING  
 125871 The system supports the optional feature of accounting within the Batch Environment  
 125872 Services and Utilities option. It will be required in servers that implement the optional  
 125873 feature of accounting.
- 125874 POSIX2\_PBS\_CHECKPOINT  
 125875 The system supports the optional feature of checkpoint/restart within the Batch  
 125876 Environment Services and Utilities option.
- 125877 POSIX2\_PBS\_LOCATE  
 125878 The system supports the optional feature of locating batch jobs within the Batch  
 125879 Environment Services and Utilities option.
- 125880 POSIX2\_PBS\_MESSAGE  
 125881 The system supports the optional feature of sending messages to batch jobs within the Batch  
 125882 Environment Services and Utilities option.
- 125883 POSIX2\_PBS\_TRACK  
 125884 The system supports the optional feature of tracking batch jobs within the Batch  
 125885 Environment Services and Utilities option.
- 125886 POSIX2\_CHAR\_TERM  
 125887 The system supports at least one terminal type capable of all operations described in  
 125888 POSIX.1-2008.
- 125889 On systems with POSIX2\_UPE, this option is almost always required. It was developed  
 125890 solely to allow certain specialized vendors and user applications to bypass the requirement  
 125891 for general-purpose asynchronous terminal support. For example, an application and

125892 system that was suitable for block-mode terminals, such as IBM 3270s, would not need this  
 125893 option.  
 125894 XSI-conformant systems support this option.

### 125895 D.3.3 Configurable Limits

125896 Very few of the limits need to be increased for profiles. No profile can cite lower values.  
 125897 {POSIX2\_BC\_BASE\_MAX}  
 125898 {POSIX2\_BC\_DIM\_MAX}  
 125899 {POSIX2\_BC\_SCALE\_MAX}  
 125900 {POSIX2\_BC\_STRING\_MAX}  
 125901 No increase is anticipated for any of these *bc* values, except for very specialized applications  
 125902 involving huge numbers.  
 125903 {POSIX2\_COLL\_WEIGHTS\_MAX}  
 125904 Some natural languages with complex collation requirements require an increase from the  
 125905 default 2 to 4; no higher numbers are anticipated.  
 125906 {POSIX2\_EXPR\_NEST\_MAX}  
 125907 No increase is anticipated.  
 125908 {POSIX2\_LINE\_MAX}  
 125909 This number is much larger than most historical applications have been able to use. At some  
 125910 future time, applications may be rewritten to take advantage of even larger values.  
 125911 {POSIX2\_RE\_DUP\_MAX}  
 125912 No increase is anticipated.  
 125913 {POSIX2\_VERSION}  
 125914 This is actually not a limit, but a standard version stamp. Generally, a profile should specify  
 125915 XCU [Chapter 2](#) (on page 2297) by name in the normative references section, not this value.

### 125916 D.3.4 Configuration Options (System Interfaces)

125917 {NGROUPS\_MAX}  
 125918 A non-zero value indicates that the implementation supports supplementary groups.  
 125919 This option is needed where there is a large amount of shared use of files, but where a  
 125920 certain amount of protection is needed. Many profiles<sup>10</sup> are known to require this option; it  
 125921 should only be required if needed, but it should never be prohibited.  
 125922 \_POSIX\_ADVISORY\_INFO  
 125923 The system provides advisory information for file management.  
 125924 This option allows the application to specify advisory information that can be used to  
 125925 achieve better or even deterministic response time in file manager or input and output  
 125926 operations.  
 125927 \_POSIX\_ASYNCHRONOUS\_IO  
 125928 Support for asynchronous input and output is mandatory in POSIX.1-2008.

---

125929 10. There are no formally approved profiles of POSIX.1-2008 at the time of publication; the reference here is to various profiles generated by  
 125930 private bodies or governments.

- 125931 `_POSIX_BARRIERS`  
125932 Support for barrier synchronization is mandatory in POSIX.1-2008.
- 125933 This facility allows efficient synchronization of multiple parallel threads in multi-processor  
125934 systems in which the operation is supported in part by the hardware architecture.
- 125935 `_POSIX_CHOWN_RESTRICTED`  
125936 The system restricts the right to “give away” files to other users. It is mandatory that an  
125937 implementation be able to support this facility in POSIX.1-2008; however, it is recognized  
125938 that implementations need not enable the functionality by default.
- 125939 Some applications expect that they can change the ownership of files in this way. It is  
125940 provided where either security or system account requirements cause this ability to be a  
125941 problem. It is also known to be specified in many profiles.
- 125942 `_POSIX_CLOCK_SELECTION`  
125943 Support for clock selection is mandatory in POSIX.1-2008.
- 125944 This facility allows applications to request a high resolution sleep in order to suspend a  
125945 thread during a relative time interval, or until an absolute time value, using the desired  
125946 clock. It also allows the application to select the clock used in a `pthread_cond_timedwait()`  
125947 function call.
- 125948 `_POSIX_CPUTIME`  
125949 The system supports the Process CPU-Time Clocks option.
- 125950 This option allows applications to use a new clock that measures the execution times of  
125951 processes or threads, and the possibility to create timers based upon these clocks, for  
125952 runtime detection (and treatment) of execution time overruns.
- 125953 `_POSIX_FSYNC`  
125954 The system supports file synchronization requests.
- 125955 This option was created to support historical systems that did not provide the feature.  
125956 Applications that are expecting guaranteed completion of their input and output operations  
125957 should require the `_POSIX_SYNC_IO` option. This option should never be prohibited.
- 125958 XSI-conformant systems support this option.
- 125959 `_POSIX_IPV6`  
125960 The system supports facilities related to Internet Protocol Version 6 (IPv6).
- 125961 This option was created to allow systems to transition to IPv6.
- 125962 `_POSIX_JOB_CONTROL`  
125963 Support for job control is mandatory in POSIX.1-2008.
- 125964 Most applications that use it can run when it is not present, although with a degraded level  
125965 of user convenience.
- 125966 `_POSIX_MAPPED_FILES`  
125967 Support for memory mapped files is mandatory in POSIX.1-2008.
- 125968 This facility provides for the mapping of regular files into the process address space.
- 125969 Both this facility and the Shared Memory Objects option provide shared access to memory  
125970 objects in the process address space. The `mmap()` and `munmap()` functions provide the  
125971 functionality of existing practice for mapping regular files. This functionality was deemed  
125972 unnecessary, if not inappropriate, for embedded systems applications and is expected to be  
125973 optional in subprofiles.

- 125974        \_posix\_memlock  
125975        The system supports the locking of the address space.
- 125976        This option was created to support historical systems that did not provide the feature. It  
125977        should only be required if needed, but it should never be prohibited.
- 125978        \_posix\_memlock\_range  
125979        The system supports the locking of specific ranges of the address space.
- 125980        For applications that have well-defined sections that need to be locked and others that do  
125981        not, POSIX.1-2008 supports an optional set of functions to lock or unlock a range of process  
125982        addresses. The following are two reasons for having a means to lock down a specific range:
- 125983            1. An asynchronous event handler function that must respond to external events in a  
125984            deterministic manner such that page faults cannot be tolerated
- 125985            2. An input/output “buffer” area that is the target for direct-to-process I/O, and the  
125986            overhead of implicit locking and unlocking for each I/O call cannot be tolerated
- 125987        It should only be required if needed, but it should never be prohibited.
- 125988        \_posix\_memory\_protection  
125989        Support for memory protection is mandatory in POSIX.1-2008.
- 125990        The provision of this facility typically imposes additional hardware requirements.
- 125991        \_posix\_prioritized\_io  
125992        The system provides prioritization for input and output operations.
- 125993        The use of this option may interfere with the ability of the system to optimize input and  
125994        output throughput. It should only be required if needed, but it should never be prohibited.
- 125995        \_posix\_message\_passing  
125996        The system supports the passing of messages between processes.
- 125997        This option was created to support historical systems that did not provide the feature. The  
125998        functionality adds a high-performance XSI interprocess communication facility for local  
125999        communication. It should only be required if needed, but it should never be prohibited.
- 126000        \_posix\_monotonic\_clock  
126001        The system supports the Monotonic Clock option.
- 126002        This option allows realtime applications to rely on a monotonically increasing clock that  
126003        does not jump backwards, and whose value does not change except for the regular ticking  
126004        of the clock.
- 126005        \_posix\_priority\_scheduling  
126006        The system provides priority-based process scheduling.
- 126007        Support of this option provides predictable scheduling behavior, allowing applications to  
126008        determine the order in which processes that are ready to run are granted access to a  
126009        processor. It should only be required if needed, but it should never be prohibited.
- 126010        \_posix\_realtime\_signals  
126011        Support for realtime signals is mandatory in POSIX.1-2008.
- 126012        This facility provides prioritized, queued signals with associated data values.
- 126013        \_posix\_regexp  
126014        Support for regular expression facilities is mandatory in POSIX.1-2008.

- 126015        \_posix\_saved\_ids  
126016            Support for this feature is mandatory in POSIX.1-2008.
- 126017            Certain classes of applications rely on it for proper operation, and there is no alternative  
126018            short of giving the application root privileges on most implementations that did not provide  
126019            \_posix\_saved\_ids.
- 126020        \_posix\_semaphores  
126021            Support for counting semaphores is mandatory in POSIX.1-2008.
- 126022        \_posix\_shared\_memory\_objects  
126023            The system supports the mapping of shared memory objects into the process address space.
- 126024            Both this option and the Memory Mapped Files option provide shared access to memory  
126025            objects in the process address space. The functions defined under this option provide the  
126026            functionality of existing practice for shared memory objects. This functionality was deemed  
126027            appropriate for embedded systems applications and, hence, is provided under this option.  
126028            It should only be required if needed, but it should never be prohibited.
- 126029        \_posix\_shell  
126030            Support for the *sh* utility command line interpreter is mandatory in POSIX.1-2008.
- 126031        \_posix\_spawn  
126032            The system supports the spawn option.
- 126033            This option provides applications with an efficient mechanism to spawn execution of a new  
126034            process.
- 126035        \_posix\_spinlocks  
126036            Support for spin locks is mandatory in POSIX.1-2008.
- 126037            This facility provides a simple and efficient synchronization mechanism for threads  
126038            executing in multi-processor systems.
- 126039        \_posix\_sporadic\_server  
126040            The system supports the sporadic server scheduling policy.
- 126041            This option provides applications with a new scheduling policy for scheduling aperiodic  
126042            processes or threads in hard realtime applications.
- 126043        \_posix\_synchronized\_io  
126044            The system supports guaranteed file synchronization.
- 126045            This option was created to support historical systems that did not provide the feature.  
126046            Applications that are expecting guaranteed completion of their input and output operations  
126047            should require this option, rather than the File Synchronization option. It should only be  
126048            required if needed, but it should never be prohibited.
- 126049        \_posix\_threads  
126050            Support for multiple threads of control within a single process is mandatory in  
126051            POSIX.1-2008.
- 126052        \_posix\_thread\_attr\_stackaddr  
126053            The system supports specification of the stack address for a created thread.
- 126054            Applications may take advantage of support of this option for performance benefits, but  
126055            dependence on this feature should be minimized. This option should never be prohibited.
- 126056            XSI-conformant systems support this option.

- 126057     \_POSIX\_THREAD\_ATTR\_STACKSIZE  
126058         The system supports specification of the stack size for a created thread.
- 126059         Applications may require this option in order to ensure proper execution, but such usage  
126060         limits portability and dependence on this feature should be minimized. It should only be  
126061         required if needed, but it should never be prohibited.
- 126062         XSI-conformant systems support this option.
- 126063     \_POSIX\_THREAD\_PRIORITY\_SCHEDULING  
126064         The system provides priority-based thread scheduling.
- 126065         Support of this option provides predictable scheduling behavior, allowing applications to  
126066         determine the order in which threads that are ready to run are granted access to a processor.  
126067         It should only be required if needed, but it should never be prohibited.
- 126068     \_POSIX\_THREAD\_PRIO\_INHERIT  
126069         The system provides mutual-exclusion operations with priority inheritance.
- 126070         Support of this option provides predictable scheduling behavior, allowing applications to  
126071         determine the order in which threads that are ready to run are granted access to a processor.  
126072         It should only be required if needed, but it should never be prohibited.
- 126073     \_POSIX\_THREAD\_PRIO\_PROTECT  
126074         The system supports a priority ceiling emulation protocol for mutual-exclusion operations.
- 126075         Support of this option provides predictable scheduling behavior, allowing applications to  
126076         determine the order in which threads that are ready to run are granted access to a processor.  
126077         It should only be required if needed, but it should never be prohibited.
- 126078     \_POSIX\_THREAD\_PROCESS\_SHARED  
126079         The system provides shared access among multiple processes to synchronization objects.
- 126080         This option was created to support historical systems that did not provide the feature. It  
126081         should only be required if needed, but it should never be prohibited.
- 126082         XSI-conformant systems support this option.
- 126083     \_POSIX\_THREAD\_SAFE\_FUNCTIONS  
126084         Support for thread-safe functions is mandatory in POSIX.1-2008.
- 126085     \_POSIX\_THREAD\_SPORADIC\_SERVER  
126086         The system supports the thread sporadic server scheduling policy.
- 126087         Support for this option provides applications with a new scheduling policy for scheduling  
126088         aperiodic threads in hard realtime applications.
- 126089     \_POSIX\_TIMEOUTS  
126090         Support for timeouts for some blocking services is mandatory in POSIX.1-2008.
- 126091     \_POSIX\_TIMERS  
126092         Support for higher resolution clocks with multiple timers per process is mandatory in  
126093         POSIX.1-2008.
- 126094         This facility is appropriate for applications requiring higher resolution timestamps or  
126095         needing to control the timing of multiple activities.
- 126096     \_POSIX\_TRACE  
126097         The system supports the Trace option.
- 126098         This option was created to allow applications to perform tracing.

- 126099     \_POSIX\_TRACE\_EVENT\_FILTER  
 126100         The system supports the Trace Event Filter option.  
 126101         This option is dependent on support of the Trace option.
- 126102     \_POSIX\_TRACE\_INHERIT  
 126103         The system supports the Trace Inherit option.  
 126104         This option is dependent on support of the Trace option.
- 126105     \_POSIX\_TRACE\_LOG  
 126106         The system supports the Trace Log option.  
 126107         This option is dependent on support of the Trace option.
- 126108     \_POSIX\_TYPED\_MEMORY\_OBJECTS  
 126109         The system supports the Typed Memory Objects option.  
 126110         This option was created to allow realtime applications to access different kinds of physical  
 126111         memory, and allow processes in these applications to share portions of this memory.

### 126112 **D.3.5 Configurable Limits**

126113     In general, the configurable limits in the `<limits.h>` header defined in the Base Definitions  
 126114     volume of POSIX.1-2008 have been set to minimal values; many applications or implementations  
 126115     may require larger values. No profile can cite lower values.

126116     {AIO\_LISTIO\_MAX}

126117         The current minimum is likely to be inadequate for most applications. It is expected that  
 126118         this value will be increased by profiles requiring support for list input and output  
 126119         operations.

126120     {AIO\_MAX}

126121         The current minimum is likely to be inadequate for most applications. It is expected that  
 126122         this value will be increased by profiles requiring support for asynchronous input and  
 126123         output operations.

126124     {AIO\_PRIO\_DELTA\_MAX}

126125         The functionality associated with this limit is needed only by sophisticated applications. It  
 126126         is not expected that this limit would need to be increased under a general-purpose profile.

126127     {ARG\_MAX}

126128         The current minimum is likely to need to be increased for profiles, particularly as larger  
 126129         amounts of information are passed through the environment. Many implementations are  
 126130         believed to support larger values.

126131     {CHILD\_MAX}

126132         The current minimum is suitable only for systems where a single user is not running  
 126133         applications in parallel. It is significantly too low for any system also requiring windows,  
 126134         and if `_POSIX_JOB_CONTROL` is specified, it should be raised.

126135     {CLOCKRES\_MIN}

126136         It is expected that profiles will require a finer granularity clock, perhaps as fine as 1  $\mu$ s,  
 126137         represented by a value of 1 000 for this limit.

126138     {DELAYTIMER\_MAX}

126139         It is believed that most implementations will provide larger values.

|        |                                                                                                 |
|--------|-------------------------------------------------------------------------------------------------|
| 126140 | {LINK_MAX}                                                                                      |
| 126141 | For most applications and usage, the current minimum is adequate. Many implementations          |
| 126142 | have a much larger value, but this should not be used as a basis for raising the value unless   |
| 126143 | the applications to be used require it.                                                         |
| 126144 | {LOGIN_NAME_MAX}                                                                                |
| 126145 | This is not actually a limit, but an implementation parameter. No profile should impose a       |
| 126146 | requirement on this value.                                                                      |
| 126147 | {MAX_CANON}                                                                                     |
| 126148 | For most purposes, the current minimum is adequate. Unless high-speed burst serial              |
| 126149 | devices are used, it should be left as is.                                                      |
| 126150 | {MAX_INPUT}                                                                                     |
| 126151 | See {MAX_CANON}.                                                                                |
| 126152 | {MQ_OPEN_MAX}                                                                                   |
| 126153 | The current minimum should be adequate for most profiles.                                       |
| 126154 | {MQ_PRIO_MAX}                                                                                   |
| 126155 | The current minimum corresponds to the required number of process scheduling priorities.        |
| 126156 | Many realtime practitioners believe that the number of message priority levels ought to be      |
| 126157 | the same as the number of execution scheduling priorities.                                      |
| 126158 | {NAME_MAX}                                                                                      |
| 126159 | Many implementations now support larger values, and many applications and users                 |
| 126160 | assume that larger names can be used. Many existing profiles also specify a larger value.       |
| 126161 | Specifying this value will reduce the number of conforming implementations, although this       |
| 126162 | might not be a significant consideration over time. Values greater than 255 should not be       |
| 126163 | required.                                                                                       |
| 126164 | {NGROUPS_MAX}                                                                                   |
| 126165 | The value selected will typically be 8 or larger.                                               |
| 126166 | {OPEN_MAX}                                                                                      |
| 126167 | The historically common value for this has been 20. Many implementations support larger         |
| 126168 | values. If applications that use larger values are anticipated, an appropriate value should be  |
| 126169 | specified.                                                                                      |
| 126170 | {PAGESIZE}                                                                                      |
| 126171 | This is not actually a limit, but an implementation parameter. No profile should impose a       |
| 126172 | requirement on this value.                                                                      |
| 126173 | {PATH_MAX}                                                                                      |
| 126174 | Historically, the minimum has been either 1024 or indefinite, depending on the                  |
| 126175 | implementation. Few applications actually require values larger than 256, but some users        |
| 126176 | may create file hierarchies that must be accessed with longer paths. This value should only     |
| 126177 | be changed if there is a clear requirement.                                                     |
| 126178 | {PIPE_BUF}                                                                                      |
| 126179 | The current minimum is adequate for most applications. Historically, it has been larger. If     |
| 126180 | applications that write single transactions larger than this are anticipated, it should be      |
| 126181 | increased. Applications that write lines of text larger than this probably do not need it       |
| 126182 | increased, as the text line is delimited by a <newline>.                                        |
| 126183 | {POSIX_VERSION}                                                                                 |
| 126184 | This is actually not a limit, but a standard version stamp. Generally, a profile should specify |
| 126185 | POSIX.1-2008 by a name in the normative references section, not this value.                     |

|        |                                                                                               |
|--------|-----------------------------------------------------------------------------------------------|
| 126186 | {PTHREAD_DESTRUCTOR_ITERATIONS}                                                               |
| 126187 | It is unlikely that applications will need larger values to avoid loss of memory resources.   |
| 126188 | {PTHREAD_KEYS_MAX}                                                                            |
| 126189 | The current value should be adequate for most profiles.                                       |
| 126190 | {PTHREAD_STACK_MIN}                                                                           |
| 126191 | This should not be treated as an actual limit, but as an implementation parameter. No         |
| 126192 | profile should impose a requirement on this value.                                            |
| 126193 | {PTHREAD_THREADS_MAX}                                                                         |
| 126194 | It is believed that most implementations will provide larger values.                          |
| 126195 | {RTSIG_MAX}                                                                                   |
| 126196 | The current limit was chosen so that the set of POSIX.1 signal numbers can fit within a       |
| 126197 | 32-bit field. It is recognized that most existing implementations define many more signals    |
| 126198 | than are specified in POSIX.1 and, in fact, many implementations have already exceeded 32     |
| 126199 | signals (including the “null signal”). Support of {_POSIX_RTSIG_MAX} additional signals       |
| 126200 | may push some implementations over the single 32-bit word line, but is unlikely to push       |
| 126201 | any implementations that are already over that line beyond the 64 signal line.                |
| 126202 | {SEM_NSEMS_MAX}                                                                               |
| 126203 | The current value should be adequate for most profiles.                                       |
| 126204 | {SEM_VALUE_MAX}                                                                               |
| 126205 | The current value should be adequate for most profiles.                                       |
| 126206 | {SSIZE_MAX}                                                                                   |
| 126207 | This limit reflects fundamental hardware characteristics (the size of an integer), and should |
| 126208 | not be specified unless it is clearly required. Extreme care should be taken to assure that   |
| 126209 | any value that might be specified does not unnecessarily eliminate implementations            |
| 126210 | because of accidents of hardware design.                                                      |
| 126211 | {STREAM_MAX}                                                                                  |
| 126212 | This limit is very closely related to {OPEN_MAX}. It should never be larger than              |
| 126213 | {OPEN_MAX}, but could reasonably be smaller for application areas where most files are        |
| 126214 | not accessed through <i>stdio</i> . Some implementations may limit {STREAM_MAX} to 20 but     |
| 126215 | allow {OPEN_MAX} to be considerably larger. Such implementations should be allowed for        |
| 126216 | if the applications permit.                                                                   |
| 126217 | {TIMER_MAX}                                                                                   |
| 126218 | The current limit should be adequate for most profiles, but it may need to be larger for      |
| 126219 | applications with a large number of asynchronous operations.                                  |
| 126220 | {TTY_NAME_MAX}                                                                                |
| 126221 | This is not actually a limit, but an implementation parameter. No profile should impose a     |
| 126222 | requirement on this value.                                                                    |
| 126223 | {TZNAME_MAX}                                                                                  |
| 126224 | The minimum has been historically adequate, but if longer timezone names are anticipated      |
| 126225 | (particularly such values as UTC-1), this should be increased.                                |

**D.3.6 Optional Behavior**

126227  
126228  
126229  
126230  
126231  
126232  
126233

In POSIX.1-2008, there are no instances of the terms unspecified, undefined, implementation-defined, or with the verbs “may” or “need not”, that the standard developers anticipate or sanction as suitable for profile or test method citation. All of these are merely warnings to conforming applications to avoid certain areas that can vary from system to system, and even over time on the same system. In many cases, these terms are used explicitly to support extensions, but profiles should not anticipate and require such extensions; future versions of this standard may do so.

## Subprofiling Considerations (Informative)

126241 This section contains further information to satisfy the requirement that the project scope enable  
 126242 subprofiling of POSIX.1-2008. The approach taken is to include a general requirement in  
 126243 normative text regarding subprofiling and to include an informative section (here) containing a  
 126244 proposed set of subprofiling options.

### 126245 E.1 Subprofiling Option Groups

126246 The following Option Groups<sup>11</sup> are defined to support profiling. Systems claiming support to  
 126247 POSIX.1-2008 need not implement these options apart from the requirements stated in XBD  
 126248 Section 2.1.3 (on page 16). These Option Groups allow profiles to subset the System Interfaces  
 126249 volume of POSIX.1-2008 by collecting sets of related functions.

126250 POSIX\_ASYNCHRONOUS\_IO: Asynchronous Input and Output Functions

126251 *aio\_cancel()*, *aio\_error()*, *aio\_fsync()*, *aio\_read()*, *aio\_return()*, *aio\_suspend()*, *aio\_write()*,  
 126252 *lio\_listio()*

126253 POSIX\_BARRIERS: Barriers

126254 *pthread\_barrier\_destroy()*, *pthread\_barrier\_init()*, *pthread\_barrier\_wait()*, *pthread\_barrierattr()*

126255 POSIX\_C\_LANG\_JUMP: Jump Functions

126256 *longjmp()*, *setjmp()*
