What is this talk about?

- ▶ D-Bus generality & IPC
- ▶ The D-Bus principles
- ▶ Different tools and libraries with demo
- ▶ Different projects using D-Bus
- ▶ A short use case with Connman and Ofono

D-Bus generality

D-Bus

- ▶ Created in 2002
- ▶ Is part of the *freedesktop.org* project
- ▶ Maintained by RedHat and the community
- ▶ Is an Inter-process communication mechanism
- ▶ Initiated to standardize services of Linux desktop environments

freedesktop.org

redhat.

Inter-Process Communication (IPC)

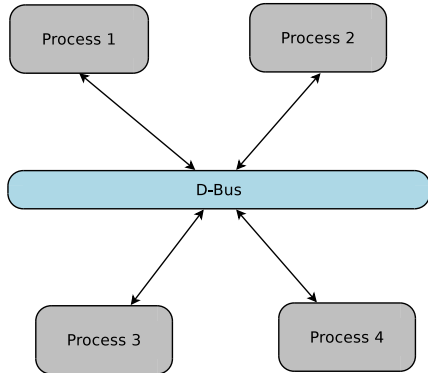

- ▶ Mechanisms allowing processes to communicate with each other
 - ▶ **Shared memory**: read/write into a defined memory location
 - ▶ **Memory-mapped file**: same as `shared memory` but uses a file
 - ▶ **Pipe**: two-way data stream (standard input / output)
 - ▶ **Named pipe**: same as `pipe` but uses a file (FIFO)
 - ▶ **Socket**: communication even on distant machines
 - ▶ and others

IPC using D-Bus

- ▶ Uses the socket mechanism
- ▶ Provides software bus abstraction
- ▶ Way simpler than most alternatives

How D-Bus is working ?

- ▶ D-Bus includes:
 - ▶ `libdbus`: a low-level library
 - ▶ `dbus-daemon`: a daemon based on `libdbus`. Handles and controls data transfers between D-Bus peers
 - ▶ two types of busses: a `system` and a `session` one. Each bus instance is managed by a `dbus-daemon`
 - ▶ a security mechanism using `policy` files

System & Session busses

- ▶ System bus
 - ▶ On desktop, a single bus for all users
 - ▶ Dedicated to system services
 - ▶ Is about low-level events such as connection to a network, USB devices, etc
 - ▶ On embedded Linux systems, this bus is often the only D-Bus type
- ▶ Session bus
 - ▶ One instance per user session
 - ▶ Provides desktop services to user applications
 - ▶ Linked to the X session

The principles

Generality

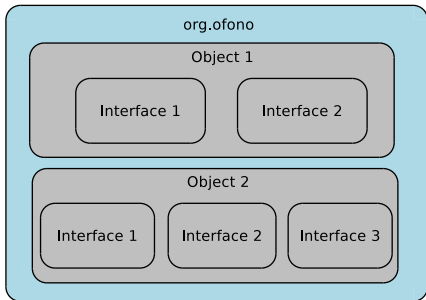

- ▶ D-Bus is working with different elements:
 - ▶ Services
 - ▶ Objects
 - ▶ Interfaces
 - ▶ Clients: applications using a D-Bus service
- ▶ One D-Bus *service* contains *object(s)* which implements *interface(s)*

Service

- ▶ An application can expose its services to all D-Bus users by registering to a bus instance
- ▶ A `service` is a collection of `objects` providing a specific set of features
- ▶ When an application opens a connection to a bus instance, it is assigned a unique name (ie `:1.40`)
- ▶ Can request a more human-readable service name: the **well-known name** (ie `org.ofono`) See the [freedesktop.org specification](https://freedesktop.org/specification)

Objects

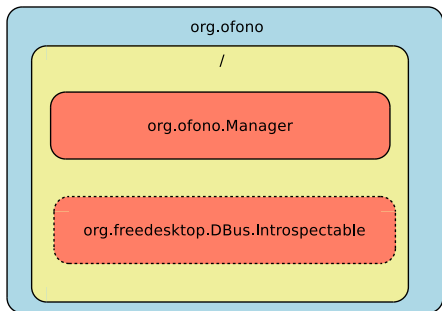

- ▶ Are attached to one service
- ▶ Can be dynamically created or removed
- ▶ Are uniquely identified by an **object path** (ie / or /net/connman/technology/cellular)
- ▶ Implement one or several interfaces

Interfaces

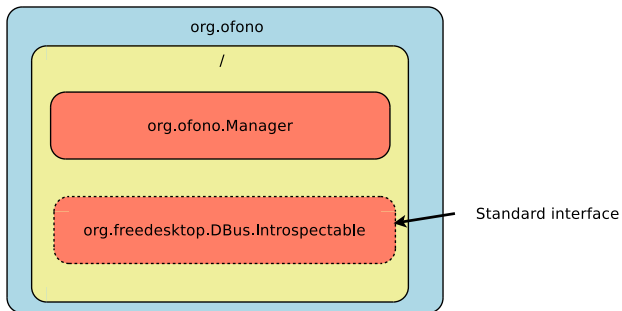

- ▶ Can be compared to a “namespace” in Java
- ▶ Has a unique name resembling Java interface names, using dots (ie `org.ofono.Manager`)
- ▶ Contains *members*: properties, methods and signals

Interfaces

- ▶ Can be compared to a “namespace” in Java
- ▶ Has a unique name resembling Java interface names, using dots (ie `org.ofono.Manager`)
- ▶ Contains *members*: properties, methods and signals

Interfaces

- ▶ D-Bus defines a few standard interfaces
- ▶ They all belong to the namespace “org.freedesktop.DBus” :
 - ▶ **org.freedesktop.DBus.Introspectable** : Provides an introspection mechanism. Exposes information about the object (interfaces, methods and signals it implements)
 - ▶ **org.freedesktop.DBus.Peer** : Provides methods to know if a connection is alive (ping)
 - ▶ **org.freedesktop.DBus.Properties** : Provides methods and signals to handle properties
 - ▶ **org.freedesktop.DBus.ObjectManager** : Provides an helpful API to handle sub-tree objects
- ▶ Interfaces expose properties, methods and signals

Properties

- ▶ Directly accessible fields
- ▶ Can be read / written
- ▶ Can be of different types defined by the D-Bus specification :
 - ▶ basic types: bytes, boolean, integer, double, ...
 - ▶ string-like types : string, object path (must be valid) and signature
 - ▶ container-types: structure, array, variant (complex types) and dictionary entry (hash)
- ▶ Very convenient standard interface : `org.freedesktop.DBus.Properties`
- ▶ Types are represented by characters

byte	y	string	s	variant	v
boolean	b	object-path	o	array of int32	ai
int32	i	array	a	array of an array of int32	aai
uint32	u	struct	()	array of a struct with 2 int32 fields	a(ii)
double	d	dict	{}	dict of string and int32	{si}

- ▶ allow remote procedure calls from one process to another
- ▶ Can be passed one or several parameters
- ▶ Can return values/objects
- ▶ Look like any method you could know from other languages

```
org.freedesktop.DBus.Properties :
```

```
  Get (String interface_name, String property_name) => Variant value
```

```
  GetAll (String interface_name) => Dict of {String, Variant} props
```

```
  Set (String interface_name, String property_name, Variant value)
```

- ▶ Messages / notifications
- ▶ Unidirectionnal
- ▶ Sent to every clients that are listening to it
- ▶ Can contain parameters
- ▶ A client will subscribe to signals to get notifications

`org.freedesktop.DBus.Properties :`

`PropertiesChanged (String, Dict of {String, Variant}, Array of String)`

- ▶ Adds a security mechanism
- ▶ Represented by XML files
- ▶ Handled by each `dbus-daemon` (under `/etc/dbus-1/session.d` and `/etc/dbus-1/system.d`)
- ▶ Allows the administrator to control which user can talk to which interface, which user can send message to which interface, and so on
- ▶ If you are not able to talk with a D-Bus service or get an `org.freedesktop.DBus.Error.AccessDenied` error, check this file!
- ▶ `org.freedesktop.PolicyKit1` has been created to handle all security accesses

Policy - file example

- ▶ In this example, "toto" can :
 - ▶ own the interface `org.ofono`
 - ▶ send messages to the owner of the given service
 - ▶ call `GetContexts` from interface `org.ofono.ConnectionManager`

```
<!DOCTYPE busconfig PUBLIC
  "-//freedesktop//DTD D-BUS Bus Configuration 1.0//EN"
  "http://www.freedesktop.org/standards/dbus/1.0/busconfig.dtd">
<busconfig>
  <policy user="toto">
    <allow own="org.ofono"/>
    <allow send_destination="org.ofono"/>
    <allow send_interface="org.ofono.ConnectionManager" send_member="GetContexts"/>
  </policy>
</busconfig>
```

- ▶ Can allow or deny

Tools and libraries

- ▶ Libdbus
 - ▶ This is the low-level library used by the dbus-daemon.
 - ▶ As the homepage of the project says: *“If you use this low-level API directly, you’re signing up for some pain”*.
 - ▶ Recommended to use it only for small programs and you do not want to add many dependencies
- ▶ GDBus
 - ▶ Is part of GLib (GIO)
 - ▶ Provides a very comfortable API
- ▶ QtDBus
 - ▶ Is a Qt module
 - ▶ Is useful if you already have Qt on your system
 - ▶ Contains many classes to handle/interact such as `QDBusInterface`

- ▶ Bindings exist for other languages: dbus-python, dbus-java, ...
- ▶ All the bindings allow to:
 - ▶ Interact with existing D-Bus services
 - ▶ Create your own D-Bus services, objects, interfaces, and so on!
 - ▶ but... D-Bus is not a high performance IPC
 - ▶ Should be used only for **control** and not data
 - ▶ For example, you can use it to activate an audio pipeline but not to send the audio stream

- ▶ Will present every tool with a demo
- ▶ `dbus-send`: Command-line interface (cli) to call method of interfaces (and get/set properties)
- ▶ `dbus-monitor`: Cli to subscribe and monitor signals
- ▶ `gdbus`: A GLib implementation of a more complete tool than `dbus-send/monitor`
- ▶ `d-feet`: A GUI application to handle all D-Bus services
- ▶ and others...

Tools: dbus-send

- ▶ Can chose the session or system bus (`--session` or `--system`)
- ▶ Here is an example:

```
dbus-send --system --print-reply --dest=org.ofono / org.ofono.Manager.GetModems
```

Tools: dbus-send - demo

- ▶ Get properties:

```
dbus-send --system --print-reply --dest=net.connman / net.connman.Clock.GetProperties
```

- ▶ Set property:

```
dbus-send --system --print-reply --dest=net.connman \  
/ net.connman.Clock.SetProperty \  
string:TimeUpdates variant:string>manual
```

- ▶ Using standard interfaces:

```
dbus-send --system --print-reply --dest=net.connman \  
/ org.freedesktop.DBus.Introspectable.Introspect
```

```
dbus-send --system --print-reply --dest=fi.w1.wpa_supplicant1 \  
/fi/w1/wpa_supplicant1 org.freedesktop.DBus.Properties.Get \  
string:fi.w1.wpa_supplicant1 string:Interfaces
```

Tools: dbus-monitor

- ▶ Can monitor all traffic (including methods and signals if enabled in policy):

```
dbus-monitor
```

- ▶ Or filter messages based on the interface:

```
dbus-monitor --system type=signal interface=net.connman.Clock
```

- ▶ Also provides a command line interface
- ▶ Is more featureful than `dbus-send` because it handles “dict entry”
- ▶ Has a different interface: must add a “command” such as “call” or “monitor”

```
gdbus call --system --dest net.connman \  
    --object-path / --method net.connman.Clock.GetProperties  
gdbus call --system --dest net.connman --object-path / \  
    --method net.connman.Clock.SetProperty 'TimeUpdates' "<'manual'>"  
gdbus monitor --system --dest net.connman
```

- ▶ Can even emit signals

```
gdbus emit --session --object-path / --signal \  
    net.connman.Clock.PropertyChanged `['TimeUpdates', ``\<'auto'\>']`
```

Tools: d-feet

- ▶ Is a GUI interface
- ▶ Handles system and session busses
- ▶ Can call methods with parameters

The screenshot displays the d-feet application window. On the left, a list of services is shown, including 'com.Ap.ApUp', 'fl.epltest.hostap.WPAsupplicant', 'fl.wl.wpa_supplicant1', 'net.commonman', 'net.commonman.vpn', 'org.bluez', 'org.cmt.roothelper', 'org.freedesktop.Avalhi', 'org.freedesktop.ColorManager', 'org.freedesktop.DBus', 'org.freedesktop.ModemManager1', and 'org.freedesktop.PolicyKit1'. The 'net.commonman' service is selected. The main area shows a tree view of the 'net.commonman' interface, with 'Methods' expanded to show 'GetProperties'. The 'Execute D-Bus Method' dialog is open, showing the method name 'GetProperties', object path '/', and interface 'net.commonman.Clock'. The 'Method output' field contains a JSON object: {"Time": 1463279491, "TimeUpdates": "auto", "TimeServers": ["Europe/Paris", "TimezoneUpdates": "auto"]}. The 'Method execution' section shows a progress bar and buttons for 'Former' and 'Execute'.

- ▶ Alternatives: *bustle* (dbus-monitor like), *D-Bus inspector*, ...

Projects using D-Bus

Projects using D-Bus

- ▶ KDE: A desktop environment based on Qt
- ▶ Gnome: A desktop environment based on gtk
- ▶ Systemd: An init system
- ▶ Bluez: A project adding Bluetooth support under Linux
- ▶ Pidgin: An instant messaging client
- ▶ Network-manager: A daemon to manage network interfaces
- ▶ Modem-manager: A daemon to provide an API to dial with modems - works with Network-Manager
- ▶ Connman: Same as Network-Manager but works with Ofono for modem
- ▶ Ofono: A daemon that exposing features provided by telephony devices such as modem

Use case with ofono & connman

- ▶ Started in 2009
- ▶ Developed by Intel and Nokia
- ▶ Used in 2013 by Canonical for Ubuntu-touch
- ▶ Handles all the different parts to connect a modem: pin code, network registration, etc
- ▶ Communicates with connman using D-Bus

- ▶ Started in 2008
- ▶ Developed by Intel
- ▶ Used by Sailfish OS and Jolla
- ▶ Manages internet connexion within embbeded devices
- ▶ Provides a plugin based architecture (ofono provides such a plugin to communicate with the ofono daemon)

Communication

- ▶ Ofono and Connman communication is an interesting use case
- ▶ Ofono handles the connection with a modem
- ▶ The user interacts with Ofono to enter PIN code, for example
- ▶ Once the PPP connection is established, Ofono exchanges informations with Connman
- ▶ Connman handles all the IP stack of Linux and updates ofono's informations using its plugin

- ▶ Connman communicates with Ofono internally
- ▶ On the contrary, Ofono exposes its connman plugin so the user can interact with ConnMan via Ofono's service

```
# Get the properties from ConnMan
```

```
dbus-send --system --print-reply --dest=org.ofono /mymodem_0 \  
          org.ofono.ConnectionManager.GetProperties
```

```
# Create a context in ConnMan which is used to create the data connection
```

```
dbus-send --system --print-reply --dest=org.ofono /mymodem_0 \  
          org.ofono.ConnectionManager.AddContext string:'internet'
```

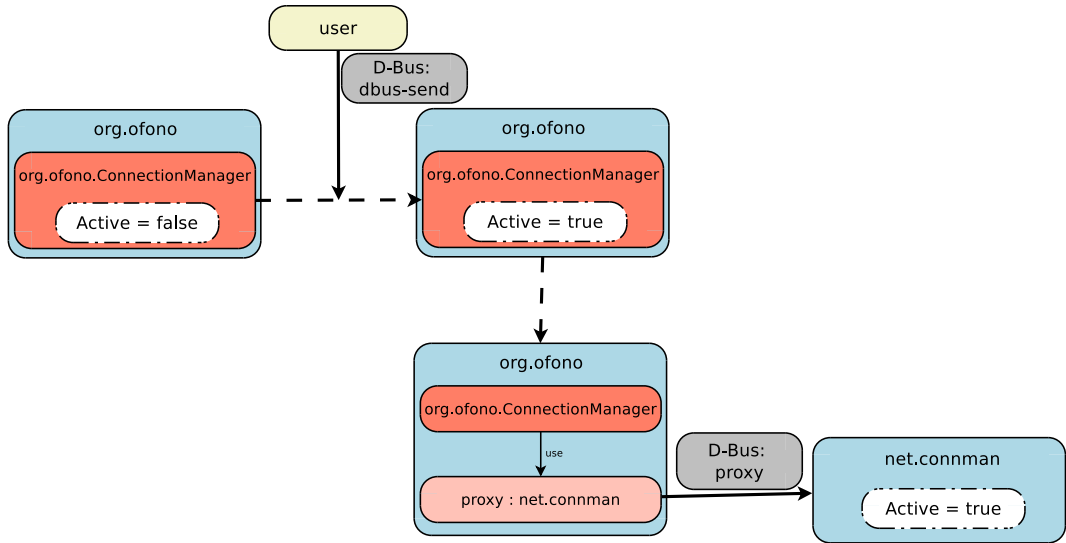

```
# Activate the ConnMan's context => Ofono's work ends and
```

```
# and ConnMan takes over from Ofono
```

```
dbus-send --system --print-reply --dest=org.ofono /mymodem_0/context1 \  
          org.ofono.ConnectionContext.SetProperty \  
          string:'Active' variant:boolean:true
```

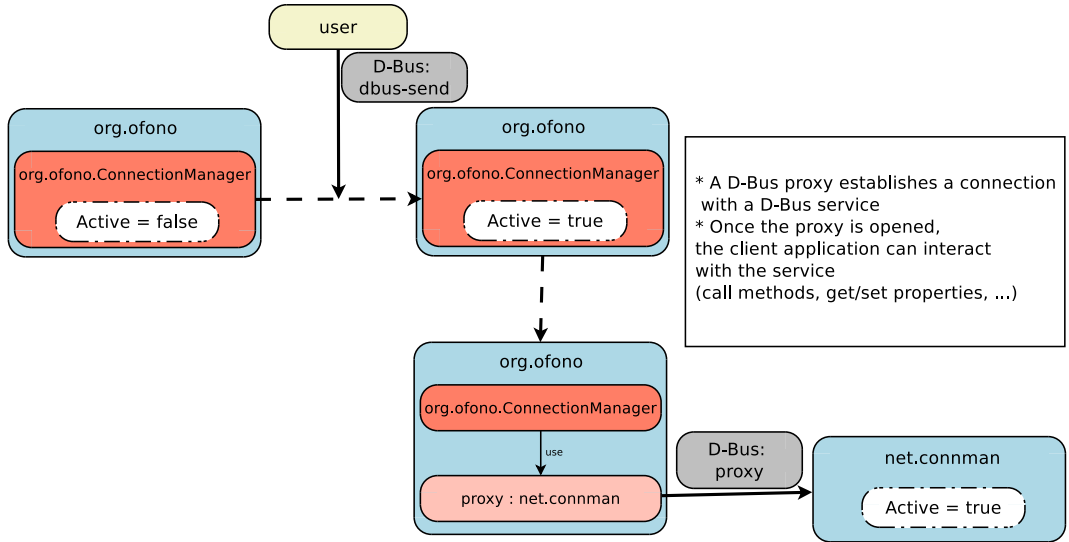

Example with *Active* property

Example with *Active* property

Conclusion

Conclusion

- ▶ D-Bus is an IPC mechanism using sockets
- ▶ Should be used only for `control`
- ▶ Uses services, interfaces and objects
- ▶ Provides methods, properties and signals
- ▶ Many bindings are available in different languages: Qt, C++, Python, Java, etc
- ▶ Used in many projects: the kernel has even tried to implement a `kdbus` but abandoned it
