([still-classified]**)** For example, important information concerning the reliability of two of the main sources on Iraq's alleged mobile biological weapons program was not available to most Iraq biological weapons analysts outside the CIA. Some analysts at other agencies were aware of some of the credibility concerns about the sources, but the CIA's DO did not disseminate cables throughout the Intelligence Community that would have provided this information to all Iraq biological weapons analysts. [Still-classified section here.]

([still classified]**)** The CIA also failed to share important information about Iraq's UAV software procurement efforts with other intelligence analysts. The CIA did share sensitive information that indicated Iraq [still-classified section here] was trying to obtain mapping software that could only be used for mapping in the U.S. This suggested to many analysts that Iraq may have been intending to use the software to target the U.S. The CIA failed to pass on additional information, until well after the coordination and publication of the National Intelligence Estimate (NIE). [Still-classified section here.] This information was essential for analysts to make fully informed judgments about Iraq's intentions to target the U.S.

(U) In some cases CIA analysts were not open to fully considering information and opinions from other intelligence analysts or creating a level playing field in which outside analysts fully participated in meetings or analytic efforts. This problem was particularly evident in the case of the CIA's analysis of Iraq's procurement of aluminum tubes during which the Committee believes the agency lost objectivity and in several cases took action that improperly excluded useful expertise from the intelligence debate. For example, the CIA performed testing of the tubes without inviting experts from the Department of Energy (DOE) to participate. A CIA analyst told Committee staff that the DOE was not invited "because we funded it. It was our testing. We were trying to prove some things that we wanted to prove with the testing. It wasn't a joint effort." The Committee believes that such an effort should never have been intended to prove what the CIA wanted to prove, but should have been a Community effort to get to the truth about Iraq's intended use for the tubes. By excluding DOE analysts, the Intelligence Community's nuclear experts, the CIA was not able to take advantage of their potentially valuable analytic insights. In another instance, an independent Department of Defense (DOD) rocket expert told the Committee that he did not think the CIA analysts came to him for an objective opinion, but were trying "to encourage us to come up with [the] answer" that the tubes were not intended to be used for a rocket program.

(U) The Committee also found that while the DCI was supposed to function as both the head of the CIA and the head of the Intelligence Community, in many instances he only acted as head of the CIA. For example, the DCI told the Committee that he was not aware that there were dissenting opinions within the Intelligence Community on whether Iraq intended use the aluminum tubes for a nuclear program until the NIE was drafted in September 2002, despite the fact that intelligence agencies had been fervently debating the issue since the spring of 2001. While the DCI, as the President's principal intelligence advisor, should provide policymakers, in particular the President, with the best analysis available from throughout the Intelligence Community, the DCI told Committee staff that he does not even expect to learn of dissenting opinions "until the issue gets joined" through interagency coordination of an NIE. This means that contentious debate about

significant national security issues can go on at the analytic level for months, or years, without the DCI or senior policymakers being informed of any opinions other than those of CIA analysts. In addition, the Presidential Daily Briefs (PDBs) are prepared by CIA analysts and are presented by CIA briefers who may or may not include an explanation of alternative views from other intelligence agencies. Other Intelligence Community agencies essentially must rely on the analysts who disagree with their positions to accurately convey their analysis to the nation's most senior policymakers.

(U) These factors worked together to allow CIA analysts and officials to provide the agency's intelligence analysis to senior policymakers without having to explain dissenting views or defend their analysis from potential challenges from other Intelligence Community agencies. The Committee believes that policymakers at all levels of government and in both the executive and legislative branches would benefit from understanding the full range of analytic opinions directly from the agencies who hold those views, or from truly impartial representatives of the entire Intelligence Community.

C. IRAQ'S TIES TO TERRORISM

(U) The terrorism related sections of the report recount the Committee's efforts to evaluate the quantity and quality of the intelligence underlying prewar assessments. Each section contains it own set of conclusions. There is also a separate section on the issue of objectivity and whether analysts were pressured to reach specific conclusions to support a particular policy objective. Unlike the WMD sections of the report, in some instances, the issue of accuracy has been addressed as post-war reporting has become available.

(U) Because there was no National Intelligence Estimate specifically focused on Iraq's ties to terrorism, the Committee focused its work primarily the January 2003 Intelligence Report entitled *Iraqi Support for Terrorism.* This intelligence assessment was drafted by the Director of Central Intelligence's (DCI) Counterterrorist Center (CTC). (The CTC includes analysts from across the Intelligence Community.) *Iraqi Support for Terrorism* was first published for a limited executive audience in September 2002 under the same title. There were a few changes made to the January 2003 version of the document including the addition of new information that had been collected following the September publication. The Committee chose to evaluate it as the IC's most comprehensive product on the subject because the January 2003 paper was the most current version and was disseminated to a much wider audience.

(U) To complete this section of the report, the Committee's staff interviewed a total of sixty-two individuals and reviewed more than 1,000 documents provided by the Central Intelligence Agency (CIA), the Defense Intelligence Agency (DIA), the State Department's Bureau of Intelligence and Research (INR), and the Federal Bureau of Investigation (FBI). To gain an in-depth understanding of the Intelligence Community (IC) and CTC collection posture, Committee staff received a briefing from the Assistant Director of Central Intelligence for Collection (ADCI/C) and met with two former heads of the DCI's Counterterrorist Center (CTC). Committee staff interviewed analysts from the CTC, DIA, and FBI who were responsible for assessing Iraq's links to al-Qaida. Committee staff also met with National Security Agency (NSA) employees who collected and analyzed signals intelligence (SIGINT) related to Iraq's links to terrorism. To address analytical objectivity and allegations concerning the politicization of the intelligence process, Committee staff received a briefing from the CIA Ombudsman for Politicization and interviewed IC analysts

who interacted with, *inter alia,* personnel from the Office of the Under Secretary of Defense for Policy (OUSDP).

(U) In addition to reviewing activities specifically relating to Iraq's links to terrorism, the Committee staff participated in a briefing to the Committee by the Under Secretary of Defense for Policy and in a Committee hearing with the former Special Advisor to the DCI on Iraq's Weapons of Mass Destruction. On each occasion, the Committee raised the issue of Iraq's links to terrorism.

(U) Intelligence from the 1960s and 1970s first established the link between Iraq and terrorism, resulting in Iraq's inclusion in the State Department's 1979 list of State Sponsors of Terrorism. The State Department removed Iraq from the list in 1982.[4] Iraq returned to the list in 1990 based upon intelligence information linking the regime to acts of terrorism conducted by the Iraqi Intelligence Service (IIS) and its support for Palestinian terrorists. The first intelligence reports suggesting links between Iraq and al-Qaida emerged in the mid-1990s. The IC continues to receive reporting on these links from detainees and document exploitation.

(U) While the nature of the intelligence reporting produced or obtained by the IC has not changed dramatically in the past decade, there has been a significant shift in the way IC analysts evaluate reporting regarding terrorism, particularly in the aftermath of the September 11 attacks. CIA officials interviewed by Committee staff indicated that, following the terrorist attacks of September 11, 2001, the trade craft of terrorism analysis shifted and analysts now feel obligated to make more conclusive assessments regardless of the quality of the available intelligence. In this new analytic environment analysts cannot set aside intelligence reports because the information does not fit within the context of their prior knowledge or because the report has not been corroborated. The CIA Deputy Director for Intelligence (DDI), describing the unique nature of terrorism analysis, said, "... terrorism analysis is just fundamentally different on some issues." She commented further that:

> Sometimes it is the walk-in who has the best information about the impending attack. What we teach people in trade craft is that you want to get a report. It's preferable that that report come from a fully-vetted source whose information is from a long-established reporting record, has direct access and you've been able to corroborate it somehow. That's what you would ideally like and that's what you ideally teach analysts to look for. But with terrorism you can't dismiss the walk-in.

The Deputy Director of the CTC's Office of Terrorism Analysis noted that this is the most difficult issue he has encountered in his eighteen years of intelligence analysis. He also stated that:

> On the other hand, I would also say that we've encouraged and developed a sense of trade craft specifically on terrorism that says push the envelope because the implications are so high and because we have to acknowledge up front that, unlike in some other cases, some other lines of analysis, that we have to accept that often our information is going to be fragmentary and, if we wait too long to reach conclusions, we might make a mistake.

[4] The 1982 State Department publication *Patterns of Global Terrorism* explained Iraq's removal from the list of State Sponsors of Terrorism in the following manner: "The Iraqi Government has reduced support to non-Palestinian groups, thereby moving closer to the policies of its moderate Arab neighbors."

(U) The focus of the Committee's terrorism review, *Iraqi Support for Terrorism,* addressed four main issues:

- terrorist activities conducted by the IIS;
- Iraqi support for terrorist activities conducted by regional terrorist groups;
- Iraqi contacts with al-Qaida; and,
- potential Iraqi use of terrorism in the event of a war with the United States.

(U) Committee staff evaluated each of these and other issues including the intelligence source reporting underlying the assessments. The terrorism related sections of this report discuss the assessments and the intelligence reporting in detail.

1. Overall Conclusions—Terrorism

(U) Conclusion 8. Intelligence Community analysts lack a consistent post-September 11 approach to analyzing and reporting on terrorist threats.

(U) Though analysts have been wrong on major issues in the past, no previous intelligence failure has been so costly as the September 11 attacks. As the Deputy Director of Intelligence (DDT) explained during an interview with Committee staff, terrorist threat analysts now use a different type of trade craft than generally employed by political, leadership or regional analysts. Threat analysts are encouraged to "push the envelope" and look at various possible threat scenarios that can be drawn from limited and often fragmentary information. As a result, analysts can no longer dismiss a threat as incredible because they cannot corroborate it. They cannot dismiss what may appear to be the rantings of a walk-in until additional vetting shows those stories to be fabricated.

(U) To compensate for the fragmentary nature of the reporting on Iraq's potential links to al-Qaida, Intelligence Community (IC) analysts included as much detail as they could about the nature of the sources and went to great lengths to describe their analytic approach to the problem. For example, where information was limited to a single or untested source or to a foreign government service, a source description was provided. As discussed in more detail in the body of this report, a "Scope Note" was incorporated in each product to describe the analytic approach the drafters had taken to address the issue. In *Iraq and al-Qaida: Interpreting a Murky Relationship,* the Scope Note explained that the authors had purposefully taken an aggressive approach to interpreting the available data. In both the September 2002 and January 2003 versions of *Iraqi Support for Terrorism,* the Scope Note did not describe an analytic approach, but rather it highlighted the gaps in information and described the analysts' understanding of the Iraq–al-Qaida relationship as "evolving."

(U) Though the Committee understands the need for different analytical approaches and expressions of competing viewpoints, the IC should have considered that their readership would not necessarily understand the nuance between the first "purposely aggressive" approach and a return, in *Iraqi Support for Terrorism,* to a more traditional analysis of the reporting concerning Iraq's links to al-Qaida. A consistent approach in both assessments which carefully explained the intelligence reports and then provided a spectrum of possible conclusions would have been more useful and would have assisted policymakers in their public characterizations of the intelligence.

(U) Conclusion 9. Source protection policies within the Intelligence Community direct or encourage reports officers to exclude relevant detail about the nature of

their sources. As a result, analysts community-wide are unable to make fully informed judgments about the information they receive, relying instead on nonspecific source lines to reach their assessments. Moreover, relevant operational data is nearly always withheld from analysts, putting them at a further analytical disadvantage.

(U) A significant portion of the intelligence reporting that was used to evaluate whether Iraq's interactions with al-Qaida operatives constituted a relationship was stripped of details prior to being made available to analysts community-wide. Source information and operational detail was provided only to Central Intelligence Agency (CIA) analysts. This lack of information sharing limited the level of discussion and debate that should have taken place across the Community on this critical issue. While in the case of Iraq's links to terrorism, the final analysis has proven, thus far, to have been accurate and not affected by a lack of relevant source or operational detail, we cannot rely on this system in the future. Until changes are made concerning how and when source information is made available to analysts, we run the risk of missing critical data that might provide early warning.

(U) The absence of source and operational detail affects not only analysts, but policymakers as well. The Committee found that policymakers took an active role by personally examining individual intelligence reports for themselves. If this trend continues, it is even more important that such relevant detail be provided.

([still-classified]) **Conclusion 10. The Intelligence Community relies too heavily on foreign government services and third party reporting, thereby increasing the potential for manipulation of U.S. policy by foreign interests.**

([still-classified]) Due to the lack of unilateral sources on Iraq's links to terrorist groups like al-Qaida [still-classified section here], the Intelligence Community (IC) relied too heavily on foreign government service reporting and sources to whom it did not have direct access to determine the relationship between Iraq and [still-classified] terrorist groups. While much of this reporting was credible, the IC left itself open to possible manipulation by foreign governments and other parties interested in influencing U.S. policy. The Intelligence Community's collectors must develop and recruit unilateral sources with direct access to terrorist groups to confirm, complement or confront foreign government service reporting on these critical targets.

(U) Conclusion 11. Several of the allegations of pressure on Intelligence Community (IC) analysts involved repeated questioning. The Committee believes that IC analysts should expect difficult and repeated questions regarding threat information. Just as the post 9/11 environment lowered the Intelligence Community's reporting threshold, it has also affected the intensity with which policymakers will review and question threat information.

(U) A number of the individuals interviewed by the Committee in conducting its review stated that Administration officials questioned analysts repeatedly on the potential for cooperation between Saddam Hussein's regime and al-Qaida. Though these allegations appeared repeatedly in the press and in other public reporting on the lead-up to the war, no analyst questioned by the Committee stated that the questions were unreasonable, or that they were encouraged by the questioning to alter their conclusions regarding Iraq's links to al-Qaida.

(U) In some cases, those interviewed stated that the questions had forced them to go back and review the intelligence reporting, and that during this exercise they came across information they had overlooked in initial readings. The Committee found that this process—the policymakers probing questions—actually improved the Central Intelligence

Agency's (CIA) products. The review revealed that the CIA analysts who prepared *Iraqi Support for Terrorism* made careful, measured assessments which did not overstate or mischaracterize the intelligence reporting upon which it was based.

(U) The Committee also found that CIA analysts are trained to expect questions from policymakers, and to tailor their analysis into a product that is useful to them. In an Occasional Paper on improving CIA analytic performance, written by a Research Fellow at the Sherman Kent Center, the fellow states:

> If the mission of intelligence analysis is to inform policymaking—to help the U.S. government anticipate threats and seize opportunities—then customization of analysis is the essence of the professional practice, not a defilement of it (i.e., politicization). **In effect there is no such thing as an unprofessional policymaker question for intelligence to address so long as the answer reflects professional analytic trade craft (e.g., tough-minded weighing of evidence and open-minded consideration of alternatives).** (Emphasis added)

(U) The same Research Fellow commented on strategic warning stating, "Key to the warning challenge is that the substantive uncertainty surrounding threats to U.S. interests requires analysts, and policymakers, to make judgments that are inherently vulnerable to error." This vulnerability has never been so apparent as in the failure to detect and deter the attacks on September 11, 2001. While analysts cannot dismiss a threat because at first glance it seems unreasonable or it cannot be corroborated by other credible reporting, policymakers have the ultimate responsibility for making decisions based on this same fragmentary, inconclusive reporting. If policymakers did not respond to analysts' caveated judgments with pointed, probing questions, and did not require them to produce the most complete assessments possible, they would not be doing their jobs.

GLOSSARY

ACCM	Alternative or Compensatory Control Measure
AFIO	Association of Former Intelligence Officers
AG	Attorney General
Aman	Agaf ha-Modi'in (Israeli military intelligence)
ANC	African National Congress
BDA	Battle Damage Assessment
BfV	Bundesamt für Verfassungsschutz (German equivalent of the FBI)
BMD	Ballistic Missile Defense
BND	Bundesnachrichtendienst (German foreign intelligence service)
BSO	Black September Organization
BW	Biological Weapons
CA	Covert Action
CAS	Covert Action Staff (CIA)
CBW	Chemical/Biological Warfare
CCP	Consolidated Cryptographic Program
CDA	Congressionally Directed Action
CE	Counterespionage
CHAOS	Code name for CIA illegal domestic spying
CI	Counterintelligence
CIA	Central Intelligence Agency
CIFA	Counterintelligence Field Activity
CIG	Central Intelligence Group
CMS	Community Management Staff
CNC	Crime and Narcotics Center (CIA)

COINTELPRO	FBI Counterintelligence Program
COMINT	Communications Intelligence
Corona	Codename for first U.S. spy satellite system
COS	Chief of Station (CIA)
COSPO	Community Open Source Program Office
CPA	Covert Political Action
CPSU	Communist Party of the Soviet Union
CSI	Committee on Intelligence Services (Britain)
CT	Counterterrorism
CTC	Counterterrorism Center (CIA)
CW	Chemical Weapons
D & D	Denial and Deception
DARP	Defense Airborne Reconnaissance Program
DAS	Deputy Assistant Secretary
DBA	Dominant Battlefield Awareness
DC	Deputies Committee (NSC)
DCD	Domestic Contact Division (CIA)
DCI	Director of Central Intelligence
D/CIA	Director of Central Intelligence Agency
DDA	Deputy Director of Administration (CIA)
DDCI	Deputy Director for Central Intelligence (DDCI)
DD/CIA	Deputy Director, Central Intelligence Agency
DDO	Deputy Director for Operations (CIA)
DDP	Deputy Director for Plans (CIA)
DDS&T	Deputy Director for Science and Technology (CIA)
DEA	Drug Enforcement Administration
DGSE	Directorie Génerale de la Sécurité Extérieure (French intelligence service)
DHS	Department of Homeland Security
DI	Directorate of Intelligence (CIA)
DIA	Defense Intelligence Agency
DIA/Humint	Defense Humint Service
DINSUM	*Defense Intelligence Summary*
DNI	Director of National Intelligence
DO	Directorate of Operations
DoD	Department of Defense
DOD	Domestic Operations Division (CIA)
DOE	Department of Energy
DOJ	Department of Justice
DOT	Department of Treasury
DOS	Department of State
DP	Directorate of Plans (CIA)
DST	Directoire de Surveillance Territore (France)
ECHR	European Convention of Human Rights

ELINT	Electronic Intelligence
ENIGMA	Code machine used by the Germans during World War II
EO	Executive Order
EOP	Executive Office of the President
ETF	Environmental Task Force (CIA)
FARC	Fuerzas Armadas Revolucionarias in Colombia
FBI	Federal Bureau of Investigation
FBIS	Foreign Broadcast Information Service
FISA	Foreign Intelligence Surveillance Act (1978)
FNLA	National Front for the Liberation of Angola
FOIA	Freedom of Information Act
FRD	Foreign Resources Division (CIA)
FSB	Federal'naya Sluzba Besnopasnoti (Federal Security Service, Russia)
GAO	General Accountability Office (Congress)
GCHQ	Government Communications Headquarters (the British NSA)
GEO	Geosynchronous Orbit
GEOINT	Geospatial Intelligence
GRU	Soviet Military Intelligence
GSG	German Counterterrorism Service
HEO	High Elliptical Orbit
HPSCI	House Permanent Select Committee on Intelligence
HUAC	House Un-American Activities Committee
HUMINT	Human Intelligence (assets)
I & W	Indicators and Warning
IAEA	International Atomic Energy Agency
IAF	Israel Air Force
IC	Intelligence Community
ICS	Intelligence Community Staff
IDF	Israeli Defense Force
IG	Inspector General
IMINT	Imagery Intelligence (photographs)
INR	Bureau of Intelligence and Research (Department of State)
INTELINK	An intelligence community computer information system
INTs	Collection disciplines (IMINT, SIGINT, OSINT, HUMINT, MASINT)
IOB	Intelligence Oversight Board (White House)
ISA	Israeli Security Agency
ISC	Intelligence and Security Committee (U.K.)
ISI	Inter-Services Intelligence (Pakistani intelligence agency)
IT	Information Technology
JCAE	Joint Committee on Atomic Energy
JCS	Joint Chiefs of Staff
JIC	Joint Intelligence Committee (U.K.)

JSOC	Joint Special Operations Command
JSTARS	Joint Surveillance Target Attack Radar Systems
KGB	Soviet Secret Police
KH	Keyhole (satellite)
LTTE	Tamil Tigers of Tamil Elam
MAGIC	Allied code-breaking operations against the Japanese in the World War II
MASINT	Measurement and Signatures Intelligence
MI5	Security Service (U.K.)
MI6	Secret Intelligence Service (U.K.)
MON	Memoranda of Notification
MONGOOSE	Code name for CIA covert actions against Fidel Castro of Cuba (1961–62)
Mossad	Israeli Intelligence Service
MPLA	Popular Movement for the Liberation of Angola
NAACP	National Association for the Advancement of Colored People
NBC	Nuclear, Biological, and Chemical (Weapons)
NCS	National Clandestine Service
NCIC	National Counterintelligence Center
NCTC	National Counterterrorism Center
NED	National Endowment for Democracy
NFIB	National Foreign Intelligence Board
NFIC	National Foreign Intelligence Council
NFIP	National Foreign Intelligence Program
NGA	National Geospatial-Intelligence Agency
NGO	Nongovernmental organization
NIA	National Intelligence Authority
NIC	National Intelligence Council
NID	*National Intelligence Daily*
NIE	National Intelligence Estimate
NIO	National Intelligence Officer
NOC	Nonofficial Cover
NPIC	National Photographic Interpretation Center
NRO	National Reconnaissance Office
NSA	National Security Agency
NSC	National Security Council (White House)
NSCID	National Security Council Intelligence Directive
NTM	National Technical Means
OB	Order of Battle
OC	Official Cover
ODNI	Office of the Director of National Intelligence
OMB	Office of Management and Budget
ONI	Office of Naval Intelligence

OPC	Office of Policy Coordination

PFIAB	President's Foreign Intelligence Advisory Board (White House)
PFLP	Popular Front for the Liberation of Palestine
PIJ	Palestinian Islamic Jihad
PLO	Palestine Liberation Organization
PM	Paramilitary
PRO	Public Record Office (U.K.)
RADINT	Radar Intelligence
RFE	Radio Free Europe
RL	Radio Liberty
SA	Special Activities Division (DO/CIA)
SAS	Special Air Service (U.K.)
SBS	Special Boat Service (U.K.)
SDO	Support to Diplomatic Operations
SHAMROCK	Code name for illegal NSA interception of cables
SIG	Senior Interagency Group
SIGINT	Signals Intelligence
SIS	Secret Intelligence Service (U.K., also known as MI6)
SISDE	Italian Intelligence Service
SMO	Support to Military Operations
SMS	Secretary's *Morning Summary* (Department of State)
SNIE	Special National Intelligence Estimate
SO	Special Operations (CIA)
SOCOM	Special Operations Command (Department of Defense)
SOE	Special Operations Executive (U.K.)
SOG	Special Operations Group (DO/CIA)
SOVA	Office of Soviet Analysis (CIA)
SSCI	Senate Select Committee on Intelligence
SVR	Russian Foreign Intelligence Service
TECHINT	Technical Intelligence
TELINT	Telemetery Intelligence
TIARA	Tactical Intelligence and Related Activities
TPED	Tasking, Processing, Exploitation, and Dissemination
UAV	Unmanned Aerial Vehicle (drone)
ULTRA	Code name for the Allied operation that deciphered the German ENIGMA code in World War II
UN	United Nations
UNITA	National Union for the Total Independence of Angola

UNSCOM	United Nations Special Commission
USIB	United States Intelligence Board
USTR	United States Trade Representative
VCI	Viet Cong Infrastructure
VENONA	Code name for SIGINT intercepts against Soviet spying in America
VOA	Voice of America
VX	A deadly nerve agent used in chemical weapons
WMD	Weapons of mass destruction

INDEX

ABOUT THE EDITOR AND CONTRIBUTORS

EDITOR

Loch K. Johnson is Regents Professor of Public and International Affairs at the University of Georgia and author of several books and over 100 articles on U.S. intelligence and national security. His books include *The Making of International Agreements* (1984); *A Season of Inquiry* (1985); *Through the Straits of Armageddon* (1987, coedited with Paul Diehl); *Decisions of the Highest Order* (1988, coedited with Karl F. Inderfurth); *America's Secret Power* (1989); *Runoff Elections in the United States* (1993, coauthored with Charles S. Bullock III); *America as a World Power* (1995); *Secret Agencies* (1996); *Bombs, Bugs, Drugs, and Thugs* (2000); *Fateful Decisions* (2004, coedited with Karl F. Inderfurth); *Strategic Intelligence* (2004, coedited with James J. Wirtz); *Who's Watching the Spies?* (2005, coauthored with Hans Born and Ian Leigh); *American Foreign Policy* (2005, coauthored with Daniel Papp and John Endicott); and *Seven Sins of American Foreign* Policy (2007). He has served as special assistant to the chair of the Senate Select Committee on Intelligence (1975–76), staff director of the House Subcommittee on Intelligence Oversight (1977–79), and special assistant to the chair of the Aspin-Brown Commission on Intelligence (1995–96). In 1969–70, he was an American Political Science Association Congressional Fellow. He has served as secretary of the American Political Science Association and President of the International Studies Association, South. Born in New Zealand and educated at the University of California, Johnson has taught at the University of Georgia since 1979, winning its Meigs Professorship for meritorious teaching and its Owens Award for outstanding accomplishments in the field of social science research. In 2000, he led the founding of the School of Public and

International Affairs at the University of Georgia. He is the senior editor of the international journal *Intelligence and National Security*.

CONTRIBUTORS

Matthew M. Aid is Managing Director in the Washington, DC, office of Citigate Global Intelligence and Security and coeditor of *Secrets of Signals Intelligence During the Cold War and Beyond* (2001).

James E. Baker sits on the U.S. Court of Appeals for the Armed Forces. He previously served as Special Assistant to the President and Legal Adviser to the National Security Council and as Deputy Legal Adviser to the NSC. He has also served as Counsel to the President's Foreign Intelligence Advisory Board, an attorney at the Department of State, a legislative aide to Senator Daniel Patrick Moynihan, and as a Marine Corps infantry officer. He is the coauthor with Michael Reisman of *Regulating Covert Action* (Yale University Press, 1992).

David M. Barrett is Associate Professor of Political Science at Villanova University and author of *Congress and the CIA* (Kansas, 2005).

Hans Born is a senior fellow in democratic governance of the security sector at the Geneva Centre for Democratic Control of the Armed Forces (DCAF). He is an external member of the crisis management and security policy faculty of the Federal Institute of Technology and a guest lecturer on governing nuclear weapons at the UN Disarmament Fellowship Programme. He has written, co-authored, and co-edited various books on international relations and security policy, including the Inter-Parliamentary Union Handbook on *Parliamentary Oversight of the Security Sector: Principles, Mechanisms and Practices* (Geneva: IPU/DCAF, 2003, translated in 30 languages); *Making Intelligence Accountable: Legal Standards and Best Practice for Oversight of Intelligence Agencies* (Oslo: Publishing House of the Parliament of Norway, 2005, translated in 10 languages); *Who is Watching the Spies? Establishing Intelligence Agency Accountability* (Dulles, VA: Potomac Publishers, 2005); *Civil-Military Relations in Europe: Learning from Crisis and Institutional Change* (London: Routledge, 2006); and *The Double Democratic Deficit: Parliamentary Accountability and the Use of Force under International Auspices* (London: Ashgate Publishers: Aldershot).

A. Denis Clift is President of the Department of Defense Joint Military Intelligence College. He was born in New York City and educated at Friends Seminary, Phillips Exeter Academy (1954), Stanford University (B.A., 1958), and the London School of Economics and Political Science (M.Sc., 1967). He began a career of public service as a naval officer in the Eisenhower and Kennedy administrations and has served in military and civilian capacities in ten administrations, including thirteen successive years in the Executive Office of the President and the White House. From 1971–76, he served on the National Security

Council staff. From 1974–76, he was head of President Ford's National Security Council staff for the Soviet Union and Eastern and Western Europe. From 1977–81, he was Assistant for National Security Affairs to the Vice President. From 1991–94, he was Chief of Staff, Defense Intelligence Agency. From 1963–66, he was the editor of the U.S. Naval Institute *Proceedings*. His published fiction and nonfiction include the novel *A Death in Geneva* (Ballantine Books, Random House), *Our World in Antarctica* (Rand McNally), *With Presidents to the Summit* (George Mason University Press), and *Clift Notes: Intelligence and the Nation's Security* (JMIC Writing Center Press).

William J. Daugherty holds a doctorate in government from the Claremont Graduate School and is Associate Professor of government at Armstrong Atlantic State University in Savannah, Georgia. A retired senior officer in the CIA, he is also the author of *In the Shadow of the Ayatollah: A CIA Hostage in Iran* (Annapolis, 2001) and *Executive Secrets: Covert Action and the Presidency* (Kentucky, 2004).

Jack Davis served in the CIA from 1956 to 1990 as analyst, manager, and teacher of analysts. He now is an independent contractor with the Agency, specializing in analytic methodology. He is a frequent contributor to the journal *Studies in Intelligence*.

Stuart Farson is Lecturer, Political Science Department, Simon Fraser University, Vancouver/Surrey, Canada. He is a former Secretary-Treasurer of the Canadian Association for Security and Intelligence Studies, and served as Director of Research for the Special Committee of the House Commons (Canada) on the Review of the Canadian Security Intelligence Service Act and the Security Offences Act. He has numerous articles on security, intelligence, and policing issues and is the coeditor of *Security and Intelligence in a Changing World* (with David Stafford and Wesley K. Wark, Cass, 1991).

Timothy Gibbs is a final-year doctoral student in history at Robinson College, Cambridge University, and a member of the Cambridge University Intelligence Seminar. He is also a former Visiting Scholar at the University of Georgia. His doctoral dissertation, titled *British and American Intelligence and the Atom Spies*, was submitted in the summer of 2006 and was supervised by Professor Christopher Andrew.

Peter Gill is Reader in Politics and Security, Liverpool John Moores University, Liverpool, United Kingdom. He is coauthor of *Introduction to Politics* (1988, 2nd ed.) and *Intelligence in an Insecure World* (2006). He is currently researching the control and oversight of domestic security in intelligence agencies.

Harold M. Greenberg graduated with a B.A. in history from Yale University in 2005. At Yale, he participated in the Studies in Grand Strategy program, and he has recently published research on CIA covert action in the 1950s. He now works as a legislative aide in the U.S. House of Representatives.

Daniel S. Gressang IV is Professor at the Joint Military Intelligence College (JMIC) in Washington, DC, and serves concurrently as the National Security Agency/National Cryptologic School of Liaison to JMIC. He has researched, written, and lectured extensively on terrorism and counterinsurgency. His research focuses primarily on the application of complex adaptive systems perspectives to understanding the dynamics of terror and other forms of unconventional warfare. In 2004, he was designated Intelligence Community Officer by the Director of Central Intelligence.

Glenn Hastedt received his doctorate in political science from Indiana University. Until recently he was Professor and Chair of the Political Science Department at James Madison University. He is now chair of the Justice Studies Department there. Among his publications is *American Foreign Policy: Past, Present, Future*, 6th ed. (Prentice Hall).

John Hollister Hedley, during more than thirty years at CIA, edited the *President's Daily Brief*, briefed the *PDB* at the White House, served as Managing Editor of the *National Intelligence Daily*, and was Chairman of the CIA's Publications Review Board. Now retired, Hedley has taught intelligence at Georgetown University and serves as a consultant to the National Intelligence Council and the Center for the Study of Intelligence.

Michael Herman served from 1952 to 1987 in Britain's Government Communications Headquarters, with secondments to the Cabinet Office and the Ministry of Defence. Since retirement he has written extensively on intelligence matters, with official clearance. He has had academic affiliations with Nuffield and St. Antony's Colleges in Oxford and is Founder Director of the Oxford Intelligence Group and Honorary Departmental Fellow at Aberystwyth University. In 2005 he received the degree of Honorary D.Litt from Nottingham University. He is a leading British intelligence scholar and author of *Intelligence Power in Peace and War* (Cambridge, 2001).

Frederick P. Hitz is Lecturer (Diplomat in Residence) in Public and International Affairs, Woodrow Wilson School, Princeton University.

Max M. Holland is the author of *The Kennedy Assassination Tapes* (Knopf, 2004).

Arthur S. Hulnick is Associate Professor of International Relations at Boston University. He is a veteran of thirty-five years of intelligence service, including seven years in Air Force Intelligence and twenty-eight years in the CIA. He is author of *Fixing the Spy Machine* (Praeger, 1999) and *Keeping Us Safe* (Praeger, 2004).

Rhodri Jeffreys-Jones is Professor of American History at the University of Edinburgh. The author of several books on intelligence history, he is currently completing a study of the FBI.

Ephraim Kahana is Professor of Political Science and faculty member in the Western Galilee College, Acre, Israel. He teaches courses on international relations, national security and intelligence, and foreign policy in the National Security Program in the University of Haifa. Kahana has written numerous papers on intelligence and foreign policy. His most recent book is the *Historical Dictionary of Israeli Intelligence* (2006).

Patrick Radden Keefe is a graduate of the School of Law at Yale University and is presently a Fellow with the Century Foundation in New York City. He is the author of *Chatter: Uncovering the Echelon Surveillance Network and the Secret World of Global Eavesdropping* (Random House, 2006), and has published essays in *The New York Review of Books*, *The New York Times Magazine*, the *New York Times*, the *Boston Globe*, the *Yale Journal of International Law*, *Legal Affairs*, *Slate*, and *Wired*. He has been a Marshall Scholar and a 2003 fellow at the Dorothy and Lewis B. Cullman Center for Scholars and Writers at the New York Public Library.

Jennifer D. Kibbe is Assistant Professor of Government at Franklin and Marshall College. Between 2002 and 2004, she was a postdoctoral fellow at the Brookings Institution. Her research interests include U.S. foreign policy, intelligence and covert action, presidential decision making, and political psychology. She has published work on U.S. policy in Iraq and the Middle East, and the military's involvement in covert actions.

Katharina von Knop is a doctoral candidate in Political Science at Leopold-Franzens University in Innsbruck, Austria, specializing in counter- and antiterrorism, and coeditor with Heinrich Neisser and Martin van Creveld of *Countering Modern Terrorism: History, Current Issues, and Future Threats* (2005).

Lawrence J. Lamanna is a doctoral candidate in the School of Public and International Affairs at the University of Georgia. He holds an M.A. from Yale University and a B.A. from the University of Notre Dame.

Ian Leigh is Professor of Law and Codirector of the Human Rights Centre at the University of Durham. He lives in Durham, England.

Kristin M. Lord is Associate Dean at George Washington University's Elliott School of International Affairs. In 2005–2006, she was a Council on Foreign Relations International Affairs Fellow and Special Adviser to the Under Secretary of State for Democracy and Global Affairs. Lord is the author of *The Perils and Promise of Global Transparency: Why the Information Revolution May Not Lead to Security Democracy or Peace* (SUNY Press, 2006); coeditor, with Bernard I. Finel, of *Power and Conflict in the Age of Transparency* (Palgrave Macmillan, 2000); and the author of numerous book chapters, articles, and papers on international politics and security. Lord received her doctorate in government from Georgetown University.

Minh A. Luong is Assistant Director of International Security Studies at Yale University, where he teaches in the Department of History. He also serves as adjunct Assistant Professor of Public Policy at the Taubman Center at Brown University.

Cynthia M. Nolan earned a doctorate at American University in the School of International Service, researching intelligence oversight. She is a former officer in the Directorate of Operations in the CIA and has published in the *International Journal of Intelligence and Counterintelligence*.

Kevin A. O'Brien is a former research associate with the Canadian Institute of Strategic Studies and is currently a senior analyst for RAND Europe.

Mark Phythian is Professor of International Security and Director of the History and Governance Research Institute at the University of Wolverhampton, United Kingdom. He is the author of *Intelligence in an Insecure World* (2006, with Peter Gill), *The Politics of British Arms Sales Since 1964* (2000), and *Arming Iraq* (1997), as well as numerous journal articles on intelligence and security issues.

Harry Howe Ransom is Professor Emeritus of Political Science at Vanderbilt University. He has a B.A. from Vanderbilt and an M.A. and Ph.D. from Princeton University. He was a Congressional Fellow of the American Political Science Association and a Fellow of the Woodrow Wilson International Center for Scholars. He taught at Princeton, Vassar College, Michigan State University, Harvard University, and the University of Leeds. His books include *Central Intelligence and National Security* (1958), *Can American Democracy Survive Cold War?* (1963), and *The Intelligence Establishment* (1970).

Jeffrey T. Richelson is Senior Fellow with the National Security Archive in Washington, DC, and author of *The Wizards of Langley*, *The U.S. Intelligence Community*, *A Century of Spies*, and *America's Eyes in Space*, as well as numerous articles on intelligence activities. He received his doctorate in political science from the University of Rochester and has taught at the University of Texas, Austin, and the American University, Washington, DC. He lives in Los Angeles.

Jerel A. Rosati is Professor of Political Science and International Studies at the University of South Carolina since 1982. His area of specialization is the theory and practice of foreign policy, focusing on the U.S. policy-making process, decision-making theory, and the political psychological study of human cognition. He is the author and editor of five books and over forty articles and chapters. He has received numerous outstanding teaching awards. He has been Visiting Professor at Somalia National University in Mogadishu and Visiting Scholar at China's Foreign Affairs College in Beijing. He also has been a Research Associate in the Foreign Affairs and National Defense Division of the Library of Congress's Congressional Research Service, President of the International

Studies Association's Foreign Policy Analysis Section, and President of the Southern region of the International Studies Association.

Richard L. Russell is Professor of national security studies at the National Defense University. He is also an adjunct associate professor in the Security Studies Program and research associate in the Institute for the Study of Diplomacy at Georgetown University. He previously served as a CIA political-military analyst. Russell is the author of *Weapons Proliferation and War in the Greater Middle East: Strategic Contest* (2005).

Frederick A. O. Schwarz Jr. received an A.B. from Harvard University and J.D. from Harvard Law School, where he was an editor of the *Law Review*. After a year's clerkship with Hon. J. Edward Lumbard, U.S. Court of Appeals for the Second Circuit, he worked one year for the Nigerian government as Assistant Commissioner for Law Revision under a Ford Foundation grant. He joined the New York City law firm of Cravath, Swaine and Moore in 1963 and was elected a partner in 1969. From 1975 through mid-1976, he served as Chief Counsel to the Senate Select Committee to Study Government Operations with Respect to Intelligence Activities (the Church Committee); from 1982–89, he served as Corporation Counsel and head of the Law Department of the City of New York. In 1989, he chaired the New York City Charter Revision Commission.

James M. Scott is Professor and Chair of the Department of Political Science at Oklahoma State University. His areas of specialization include foreign policy analysis and international relations, with particular emphasis on U.S. foreign policy making and the domestic sources of foreign policy. He is author or editor of four books, over forty articles, book chapters, review essays, and other publications. He has been President of the Foreign Policy Analysis section and President of the Midwest region of the International Studies Association, where he has also served as conference organizer for both sections and has been a two-time winner of the Klingberg Award for Outstanding Faculty Paper at the ISA Midwest Annual Meeting. Since 1996, he has received over two dozen awards from students and peers for his outstanding teaching and research, including his institution's highest awards for scholarship in 2000 and 2001. Since 2005, he has been Director of the Democracy and World Politics Summer Research Program, a National Science Foundation Research Experience for Undergraduates.

Len Scott is Professor of International Politics at the University of Wales, Aberystwyth, where he is Director of the Centre for Intelligence and International Security Studies. Among his recent publications are *Understanding Intelligence in the Twenty-First Century: Journeys in Shadows* (2004, coedited with Peter Jackson) and *Planning Armageddon: Britain, the United States and the Command of Nuclear Forces, 1943–1964* (2000, coedited with Stephen Twigge).

Katherine A. S. Sibley is Professor and Chair of the History Department at St. Joseph's University. She is currently working on a biography of Florence Kling

Harding, titled *America's First Feminist First Lady*. Sibley's work will revise the typical portrait of Mrs. Harding as manipulative, unhappy wife, casting new light on her public and private life. In 2004, Sibley published *Red Spies in America: Stolen Secrets and the Dawn of the Cold War* with the University Press of Kansas. She is also the author of *The Cold War* (1998) and *Loans and Legitimacy: The Evolution of Soviet-American Relations, 1919–1933* (1996). Her work has appeared in journals including *American Communist History*, *Peace and Change*, and *Diplomatic History*, and she also serves as book review editor for *Intelligence and National Security*. She is a three-term Commonwealth Speaker for the Pennsylvania Humanities Council.

Jennifer Sims is Director of Intelligence Studies and Visiting Professor in the Security Studies Program at Georgetown University's Edmund A. Walsh School of Foreign Service. She also consults for the U.S. government and private sector on homeland security and intelligence related matters. Prior to this, Sims was Research Professor at Johns Hopkins University's Nitze School of Advanced International Studies in Washington, DC (Fall 2001–Summer 2003). She has served as defense and foreign policy adviser to Senator John Danforth (1990–94), a professional staff member of the Senate Select Committee on Intelligence (1991–94), Deputy Assistant Secretary of State for Intelligence Coordination (1994–98), and as the Department of State's first Coordinator for Intelligence Resources and Planning in the office of the Under Secretary for Management. In 1998 Sims was awarded the U.S. Intelligence Community's Distinguished Service Medal. She received her B.A. degree from Oberlin College and her M.A. and Ph.D. in national security studies from Johns Hopkins University in 1978 and 1985, respectively. She is the author of a number of books and articles on intelligence and arms control. The most recent of these include "Foreign Intelligence Liaison: Devils, Deals and Details," *International Journal of Intelligence and Counterintelligence Affairs* (Summer 2006); *Transforming US Intelligence,* coedited with Burton Gerber (Georgetown University Press, 2005); "Transforming U.S. Espionage: A Contrarian's Approach," *Georgetown Journal of International Affairs* (Winter/Spring 2005); "Domestic Factors in Arms Control: The U.S. Case," in Jeffrey A Larson (ed.), *Arms Control: Cooperative Security in a Changing Environment* (Lynne Rienner, 2002); "What Is Intelligence? Information for Decision-Makers," in Roy Godson, Ernest R. May, and Gary Schmitt, *U.S. Intelligence at the Crossroads* (Brassey's, 1995); "The Cambridge Approach Reconsidered," *Daedalus* 120 (Winter 1991); and *Icarus Restrained: An Intellectual History of American Arms Control* (Westview Press, 1990).

Robert David Steele is CEO of OSS.Net, an international open source intelligence provider. As the son of an oilman, a Marine Corps infantry officer, and a clandestine intelligence case officer for the CIA, he has spent over twenty years abroad in Asia and Central and South America. As a civilian intelligence officer he spent three back-to-back tours overseas, including one tour as one of the first officers assigned full-time to terrorism, and three headquarters tours in offensive

counterintelligence, advanced information technology, and satellite program management. He resigned from the CIA in 1988 to be the senior civilian founder of the Marine Corps Intelligence Command. He resigned from the Marines in 1993. He is the author of three works on intelligence, as well as the editor of a book on peacekeeping intelligence. He has earned graduate degrees in international relations and public administration, is a graduate of the Naval War College, and has a certificate in Intelligence Policy. He is also a graduate of the Marine Corps Command and Staff Course and of the CIA's Mid-Career Course 101.

John D. Stempel is Senior Professor of International Relations at the University of Kentucky's Patterson School of Diplomacy and International Commerce, where he was Associate Director (1988–93) and Director (1993–2003). He came to the University of Kentucky following a 24-year career in the U.S. Foreign Service. There he focused on political and economic affairs, with overseas assignments in Africa (Guinea, Burundi, Zambia), Iran, and India, concluding with three years as U.S. Consul General in Madras. His Middle East service (1975–79) in Tehran provided the material for his book *Inside the Iranian Revolution*. His subsequent academic writings have focused on religion and diplomacy, intelligence and diplomacy, and American views of negotiation. His Washington assignments featured duty for both the State and Defense Departments, including a two-year tour as Director of the State Department's Crisis Center. He has taught at George Washington and American Universities, plus two years as Diplomat in Residence at the U.S. Naval Academy, Annapolis. Stemple is a member of the New York Council on Foreign Relations and is listed in *Who's Who in the World* and *Who's Who in America*. He holds an A.B. degree from Princeton University and M.A. and Ph.D. degrees from the University of California at Berkeley.

Stan A. Taylor is an Emeritus Professor of Political Science at Brigham Young University in Provo, Utah. He has taught in England, Wales, and New Zealand and in 2006 was a visiting professor at the University of Otago in Dunedin, New Zealand. He is founder of the David M. Kennedy Center for International Studies at Brigham Young University. He writes frequently on intelligence, national security, and U.S. foreign policy.

Athan Theoharis is Professor of History at Marquette University whose research has focused on government secrecy, Cold War politics, and the history of the FBI. He is the author, coauthor, and editor of eighteen books, including *The FBI and American Democracy* (2004), *Chasing Spies* (2002), *A Culture of Secrecy* (1998), and *The FBI: A Comprehensive Reference Guide* (1998). He has received numerous awards, including the American Bar Association's Gavel Award and selection as a fellow by the Wisconsin Academy of Arts, Sciences, and Letters.

Gregory F. Treverton is senior analyst at the RAND Corporation. Earlier, he directed RAND's Intelligence Policy Center and its International Security and Defense Policy Center, and he is Associate Dean of the Pardee RAND Graduate School. His recent work has examined at terrorism, intelligence, and law

enforcement, with a special interest in new forms of public-private partnership. He has served in government for the first Senate Select Committee on Intelligence, handling Europe for the National Security Council, and most recently as vice chair of the National Intelligence Council, overseeing the writing of America's National Intelligence Estimates. He holds an A.B. *summa cum laude* from Princeton University, a master's in public policy, and Ph.D. in economics and politics from Harvard University. His latest books are *Reshaping National Intelligence for an Age of Information* (Cambridge University Press, 2001), and *New Challenges, New Tools for Defense Decisionmaking* (edited, RAND, 2003).

Michael A. Turner is a political scientist who has taught international relations and national security matters in San Diego, California, for the past twelve years. Before that, he spent over fifteen years in various positions within the CIA. Turner is the author of *Why Secret Intelligence Fails* (2005; 2006) and the *Historical Dictionary of United States Intelligence* (2006).

Michael Warner serves as Historian for the Office of the Director of National Intelligence.

Nigel West is a military historian specializing in security and intelligence topics. He is the European editor of the *World Intelligence Review* and is on the faculty at the Center for Counterintelligence and Security Studies in Washington, DC. He is the author of more than two dozen works of nonfiction and recently edited *Guy Liddell Diaries*.

Reg Whitaker is Distinguished Research Professor Emeritus, York University, and Adjunct Professor of Political Science, University of Victoria, Canada. He has written extensively on Canadian and international security and intelligence issues.

James J. Wirtz is Professor in the Department of National Security Affairs at the Naval Postgraduate School, Monterey, California. He is Section Chair of the Intelligence Studies Section of the International Studies Association and President of the International Security and Arms Control Section of the American Political Science Association. Wirtz is the series editor for *Initiatives in Strategic Studies: Issues and Policies*, published by Palgrave Macmillan.

Amy B. Zegart is Associate Professor of Public Policy at the University of California, Los Angeles. A specialist on national and homeland security, she has served on the National Security Council staff, as a foreign policy advisor to the Bush-Cheney 2000 presidential campaign, and as a consultant to California state and local homeland security agencies. She has published articles in leading academic journals, including *International Security* and *Political Science Quarterly*, and is the author of *Flawed by Design: The Origins of the CIA, JCS, and NSC* (Stanford, 1999). She received her Ph.D. in political science from Stanford, where she studied under Condoleezza Rice, and an A.B. in East Asian Studies from Harvard University.

PREFACE

THIS FIVE-VOLUME SERIES IN INTELLIGENCE IS SOMETHING of a landmark in the study of intelligence. Thirty years ago, one would have been hard-pressed to find enough good articles on the subject to fill two volumes, let alone five. In those three decades since 1975, however, the study of intelligence has grown considerably. Today there are several solid professional journals in the field, including the premier publications *Intelligence and National Security* (published in the United Kingdom), *International Journal of Intelligence and Counterintelligence* (the United States), and *Studies in Intelligence* (from the Central Intelligence Agency, in both classified and unclassified form). In just the past two years, bulging anthologies on the general topic "strategic intelligence," as well as a "handbook" on intelligence and a collection of chapters within the more specialized niche of "intelligence and ethics" have appeared, along with a tidal wave of books and articles on one aspect or another of this subject (see the bibliographic essay in volume 1).

Except in times of scandal (Watergate in 1973, CIA domestic spying in 1974, the Iran-*contra* affair in 1987), one could find in this earlier era little newspaper coverage of intelligence activities, so tightly held were these operations by the government. Now, fueled by the events of the September 11, 2001, terrorist attacks and the erroneous prediction in 2002 that weapons of mass destruction (WMDs) were being developed and stockpiled by Iraq, hardly a week goes by without reports on intelligence in the *New York Times* and other leading newspapers. These days, the *Atlantic Monthly* and the *New Yorker*, America's top literary magazines, visit the subject with some regularity, too. The latter has hired Seymour M. Hersh, the nation's most well-known investigative reporter with an intelligence beat.

Intelligence studies has come of age.

Certainly the chapters in these volumes display a breadth of inquiry that suggests an admirable vibrancy in this relatively new field of study. Presented here are empirical inquiries, historical treatments, theoretical frameworks, memoirs, case studies, interviews, legal analyses, comparative essays, and ethical assessments. The authors come from the ranks of academe (twenty-five); the intelligence agencies (thirteen); think tanks (seven); Congress, the State Department, and the National Security Council (three); and the legal world (three).[1] Over a quarter of the contributors are from other nations, including Canada, England, Germany, Israel, Scotland, Switzerland, and Wales. The American writers come from every region of the United States. As a collective, the authors represent a wide range of scholarly disciplines, including computer science, history, international affairs, law, sociology, political science, public administration, public policy studies, and strategic studies. Many of the contributors are from the ranks of the top intelligence scholars in the world; a few young ones stand at the gateway to their academic careers.

Notable, too, is the number of women who have entered this field of study. Thirty years ago, it would have been rare to find one or two women writing on this subject. Seven have contributed chapters to these pages, and another two wrote documents that appear in the appendixes. This is still fewer than one would like, especially in light of the major contribution women have made as intelligence officers. One thinks of the heroic efforts of British women in code breaking and in the Special Operations Executive during World War II, and the American women who contributed so much to the analytic efforts of the Office of Strategic Studies (OSS) during that same war. At least, though, the number attracted to the scholar study of intelligence appears to be rapidly expanding.

The end result of this mix is a landscape illuminated by a variety of methods and appreciations—a rich research trove that examines all the key aspects of intelligence. In addition, each of the volumes contains backup materials in the appendixes. These documents provide the reader with access to significant primary and secondary sources referred to in the chapters.

The volumes are organized according to the major topics of studies in the field. The first volume, titled *Understanding the Hidden Side of Government*, introduces the reader to methods commonly used in the study of intelligence. It imparts, as well, a sense of the "state of the discipline," beginning with a bibliographic essay (by the editor) and continuing with an examination of specific approaches scholars have adopted in their inquiries into this especially difficult discipline, where doors are often shut against outsiders.

In the bibliographic essay that opens the volume, I argue that the literature on intelligence has mushroomed over the past thirty years. Some of this literature is unreliable, but much of it is of high quality. Amy B. Zegart follows my chapter with an important caveat: the literature may be more voluminous these days, but intelligence studies as an academic field has yet to be accepted as a vital part of national security scholarship. The mainstream journals of history, international

affairs, and political science have still regarded the study of intelligence as a marginal pursuit. In this regard, Zegart points out, there is a major disconnect between academic scholarship and those who make decisions in Washington, London, and other capitals around the world.

Following this introduction, Len Scott and Timothy Gibbs look at methods that have been used to study intelligence in the United Kingdom; Stuart Farson and Reg Whitaker in Canada; and Michael Warner in the United States. The volume then turns to a more specific inquiry into the central question of how intelligence is interpreted by professionals—the issue of analysis—explored by John Hollister Hedley. An overview of the sometimes turbulent relationship between intelligence officers and the policy makers they serve is explored by James J. Wirtz; and British scholar Peter Gill recalls the failures associated with the 9/11 attacks and the poor judgments about Iraqi WMDs, in hopes of extracting lessons from these intelligence disasters. In the next chapter, the youngest scholar represented in this collection, Harold M. Greenberg, takes us back in time with a remembrance of the legendary CIA officer and Yale history professor Sherman Kent, often known as the dean of CIA analysts. Kristin Lord rounds out the first volume with a look forward into future prospects for a more transparent world—the ultimate goal of intelligence.

As with each of the books, Volume 1 has a set of appendixes designed to supplement the original chapters with supportive materials from government documents and other sources. Appendix A contains the relevant intelligence excerpts from the National Security Act of 1947—the founding charter for the modern American intelligence establishment. Appendix B provides a history of U.S. intelligence since 1947, prepared for the Aspin-Brown Commission in 1995–96 by staff member Phyllis Provost McNeil. These two documents present a contextual backdrop for the Volume 1 chapters. Appendix C provides "wiring diagrams" of the intelligence community, that is, organizational blueprints for the sixteen agencies and related entities. One chart displays the community as it is today, and another displays how it looked in 1985. As the contrast between the two illustrates, the events of September 11, 2001, have led to a larger and more complex intelligence apparatus in the United States. Appendix D shows a photograph of the CIA Headquarters Building, as an example of what one of the secret agencies actually looks like from an aerial perspective. The white dome in the foreground is an assembly hall seating around 600 people and to its left is the main entrance to the original CIA headquarters, built during the Eisenhower years. Behind this older wing is the new green-glass structure erected during the Reagan administration, often known as the Casey addition because William J. Casey was the Director of Central Intelligence (DCI) at the time of its construction during the 1980s.

Appendix E lists the top leadership in the America's intelligence community: the DCIs from 1947–2005 and today's DNI. Included here as well are the leaders in Congress who have been responsible for intelligence accountability in the past, along with the current members of the two congressional Intelligence

Committees: the Senate Select Committee on Intelligence (SSCI, or "sissy" in the unflattering and sometimes true homophone of Capitol Hill vernacular) and the House Permanent Select Committee on Intelligence (HPSCI or "hipsee"). Appendix F presents a 1955 statement from historian and CIA analyst Sherman Kent about the need for a more robust intelligence literature. He would probably be amazed by how much is being written on this subject now. Appendix G offers an overview on the purpose and challenges of intelligence, drawn from the introductory chapters of the Aspin-Brown Commission Report. Finally, Appendix H provides an opening glimpse into the subject of counterintelligence, a world of counterspies and betrayal taken up more fully in Volume 4.

With the second volume, titled *The Intelligence Cycle: The Flow of Secret Information From Overseas to the Highest Councils of Government*, the focus shifts from a broad overview of intelligence to a more detailed examination of its core mission: the collection, analysis, and dissemination of information from around the world. The National Security Act of 1947, which created America's modern intelligence establishment, made it clear that the collection, analysis, and dissemination of information would be the primary duty of the intelligence agencies. As Allen Dulles—the most famous DCI (America's top intelligence official, until this title changed to director of National Intelligence or DNI in 2005)—put it, the intelligence agencies were expected "to weigh facts, and to draw conclusions from those facts, without having either the facts or the conclusions warped by the inevitable and even proper prejudices of the men whose duty it is to determine policy."[2] The collection and interpretation of information, through espionage and from the public record, would be the primary responsibility of America's secret agencies.

At the heart of this mission lies the so-called intelligence cycle. Professional intelligence officers define the cycle as "the process by which information is acquired, converted into intelligence, and made available to policymakers."[3] The cycle has five phases: planning and direction, collection, processing, production and analysis, and dissemination (see Appendix A in Volume 2 for a depiction). As former CIA officer Arthur S. Hulnick notes, however, in the opening chapter, the idea of a "cycle" fails to capture the complexity of how intelligence is collected, assessed, and distributed by intelligence officers.

The next five chapters in Volume 2 take us into the world of the "ints," that is, the specialized "intelligences" (methods) used by intelligence officers to collect information. Patrick Radden Keefe and Matthew M. Aid probe the method of signals intelligence or SIGINT, a generic term used to describe the interception and analysis of communications intelligence and other electronic emissions, from wiretapping telephones to studying the particles emitted by missiles in test flights. Both authors are sensitive to the possible abuse of these techniques, which can be and have been used to spy on Americans without a proper judicial warrant. Jeffrey T. Richelson explores the IMINT domain, that is, imagery intelligence or, in simple terms, photographs taken by surveillance satellites and reconnaissance airplanes (piloted and unpiloted). Telephone conversations can be revealing, but

in the old saying, a picture can be worth a thousand words. (Appendix B provides photographic examples of these spy platforms, and Appendix C offers illustrations of the IMINT data they can collect.)

Important, too, is information that can be acquired by human agents ("assets") guided by case officers inside the CIA or the Defense Department, the topic of human intelligence or HUMINT, examined by Frederick P. Hitz. Not all the information needed by policy makers is acquired through SIGINT, IMINT, or HUMINT; indeed, the overwhelming majority—upward of 95 percent—is already in the public domain. This open-source intelligence (OSINT) must be sorted through, organized, and integrated with the secretly gained information. Robert David Steele's chapter looks at OSINT and its ties to the other ints.

In the next chapter, Daniel S. Gressang IV dissects some of the technological challenges faced by intelligence agencies in sorting through the avalanche of data that pours into their headquarters from various intelligence collectors around the world. Here is the Herculean task of sorting out the wheat from the chaff (or the signal from the noise, in another widely used metaphor) in the search for information that may warn the nation of impending peril. Here is the vital task of providing "indicators and warnings" (I&W) to a nation's leaders.

One of the most difficult relationships in the complex process of collection, analysis, and dissemination of information comes at the intersection between intelligence professionals and policy makers—groups of individuals that often have very different training, aspirations, and cultures. Jack Davis sheds light on this often turbulent relationship in the United States, and Michael Herman tackles the same topic in the United Kingdom. Minh A. Luong offers a case study on economic intelligence that underscores some of the difficulties encountered as information travels from the collectors and analysts (the "producers" of intelligence) to the policy makers (the "consumers"). Finally, Max M. Holland takes a look at how intelligence agencies examine their own mistakes ("postmortems") and attempt to make corrections—and how political consideration enter into the process.

By way of supporting documentation, in addition to the appendixes already mentioned, Appendix D outlines the general types of reports prepared by the producers of intelligence, along with a listing of specific examples. Appendixes E and F provide samples of key intelligence products: National Intelligence Estimates (NIEs)—the most important long-range and in-depth forecasting carried out by the U.S. secret agencies ("research intelligence," in contrast to shorter intelligence reports that tend to focus on near-term events, or "current intelligence"); Special National Intelligence Estimates (SNIEs), which concentrate on a narrow, high-priority information requirement (say, the capabilities of the Chinese military); and the *President's Daily Brief* (PDB), the most exclusive current intelligence report prepared by the intelligence agencies for the consumption of the president and a few other high-ranking officials.

In light of the fact that every study of the 9/11 and Iraqi WMD intelligence failures find fault, in part, with America's capacity for human intelligence—

especially in the Middle East and Southwest Asia—Appendix G presents one of the most searing critiques of this int. The critique, by the House Permanent Select Committee on Intelligence, has become all the more significant because the panel's chairman, Representative Porter Goss (R-FL), soon after the completion of the report rose to the position of the DCI. Last, Appendix H provides an excerpt from a key report on the Iraqi WMD mistakes, prepared by the "Roberts Committee": the Senate Select Committee on Intelligence, led by Pat Roberts (R-KS).

The third volume, titled *Covert Action: Behind the Veils of Secret Foreign Policy*, enters an especially controversial compartment of intelligence: the means by which the United States attempts to not just gather and analyze information about the world—hard enough—but to manipulate global events through secret activities in the advancement of America's best interests. An ambiguous passage of the National Security Act of 1947 charged the National Security Council (NSC), the boss over the sixteen U.S. secret agencies, to "perform such other functions and duties related to intelligence [over and beyond collection-and-analysis] affecting the national security as the National Security Council may from time to time direct."[4] The phrase "other functions and duties" left the door open for launching the CIA (and more recently the Pentagon) on a wide range of covert actions around the world.

Covert action (CA), sometimes referred to as the "quiet option," is based on the supposition that this secret approach to foreign affairs is likely to be less noisy and obtrusive than sending in the Marines. Sometimes professional practitioners also refer to covert action as the "third option," between diplomacy and open warfare. As former Secretary of State and National Security Adviser Henry Kissinger once put it: "We need an intelligence community that, in certain complicated situations, can defend the American national interest in the gray areas where military operations are not suitable and diplomacy cannot operation."[5] Still others prefer the euphemism "special activities" to describe covert action. Whatever the variation in terminology, the goal of covert action remains constant: to influence events overseas secretly and in support of American foreign policy.

Covert action operations are often grouped according to four broad categories: propaganda, political, economic, and paramilitary (PM) activities. An example of a propaganda operation was the CIA's use of Radio Free Europe during the Cold War to transmit anti-communist themes into nations behind the Iron Curtain. A political CA during the Cold War was the CIA's clandestine funneling of funds to the anti-communist Christian Democratic Party in Italy. An economic example: the CIA attempted to destroy electric power stations in Nicaragua during the 1980s, as a means of undermining the Marxist-oriented S*andinista* regime. PM operations can including everything from assassination plots against foreign heads of state to arming and guiding pro-American insurgent armies in one country or another. Little wonder this has been a controversial subject.

Gregory F. Treverton introduces the reader to covert action in the first chapter of Volume 3. He is followed by Kevin A. O'Brien and Ephraim Kahana, who discuss the use of covert action by other nations. The next four chapters illuminate certain aspects of CA, with James M. Scott and Jerel A. Rosati providing an overview of CA tradecraft (that is, the tools used to implement such operations); Michael A. Turner evaluating the merits of CIA covert propaganda operations; William J. Daugherty looking at political and economic examples of covert action; Jennifer D. Kibbe exploring the entry of the Defense Department into this domain; and former diplomat John D. Stempel contrasting the uses of covert action to diplomatic initiatives. Winding up the volume is Judge James E. Baker's legal analysis of covert action.

Supporting documents include excerpts from the Church Committee Report on the evolution of covert action as carried out by the CIA (Appendix A). The supervision of covert action went from an informal to a highly formal process, as a result of a law known as the Hughes-Ryan Act, passed on December 31, 1974. The language of this statute is presented in Appendix B, and the covert action procedures that resulted from the law are outlined in Appendix C. At the center of the covert action decision process since the Hughes-Ryan Act is the *finding*, a term of art that stems from the passage in the law that requires the president to "find" that a particular covert action proposal is important and has the president's approval. Appendix D contains two findings from the Iran-*contra* era in the mid-1980s. Covert actions must have an organizational apparatus to carry them out, and Appendix E displays what that apparatus looked like during the Cold War (and in basic form remains the organizational chart today, with a few name changes in the boxes).

One of the most controversial forms of covert action has been the assassination of foreign leaders. Appendix F presents a case study from the Church Committee on the CIA assassination plot hatched against the leader of the Republic of Congo, Patrice Lumumba, in 1960. The Committee's exposé of this and other plots led President Gerald R. Ford to sign an executive order prohibiting assassination as an instrument of American foreign policy (see Appendix G). The executive order has been waived in times of authorized warfare against other nations, however, leading to failed attempts to assassinate Saddam Hussein in the first and second Persian Gulf Wars (he was eventually captured alive in 2004, hidden away in a hole near his hometown in Iraq) and Al Qaeda leader Osama bin Laden during the Clinton administration. Considerable ambiguity exists regarding the current status of the executive order and under what conditions it might be waived by administrations. Finally, Appendix H—drawing on a presidential commission study and congressional hearings—examines covert action at its lowest state: the Iran-*contra* affair of the 1980s, when this approach to foreign policy subverted the U.S. Constitution and several laws (including the Hughes-Ryan Act).

A third intelligence mission, after collection-and-analysis and covert action, is counterintelligence (CI) and its associated activity, counterterrorism (CT).

Here is the concentration in Volume 4, titled *Counterintelligence and Counterterrorism: Defending the Nation Against Hostile Forces*. Like covert action, CI went without specific mention in the National Security Act of 1947. By the early 1950s, however, it had similarly achieved a status of considerable importance as an intelligence mission. CI specialists soon waged nothing less than a secret war against antagonistic intelligence services (especially the Soviet KGB); and, after the Cold War, CT specialists would focus on efforts to block terrorists who targeted the United States and its allies. Explaining why the mission of counterintelligence/counterterrorism evolved, a CI expert has pointed out that "in the absence of an effective U.S. counterintelligence program, [adversaries of democracy] function in what is largely a benign environment."[6]

The practice of counterintelligence consists of two matching halves: security and counterespionage. Security is the passive or defensive side of CI, involving such devices as background investigations, fences, sentries, alarms, badges, watchdogs, and polygraphs (lie detection machines). Counterespionage (CE) is the offensive or aggressive side of CI. The most effective CE operation is the infiltration of an American agent or "mole" into the enemy camp, whether a hostile intelligence service or a terrorist cell—a ploy called a penetration. Thus, the practice of security is, according to one of America's top counterintelligence experts, "All that concerns perimeter defense, badges, knowing everything you have to know about your own people," whereas the CE side "involves knowing all about intelligence services—hostile intelligence services: their people, their installations, their methods, and their operations."[7]

Stan A. Taylor and Nigel West clarify these issues in the first two chapters of this volume, then in the next two chapters Katherine A. S. Sibley and Athan Theoharis examine the challenges of keeping the United States spy-free. Rhodri Jeffreys-Jones looks at the efforts in Europe to create a counterintelligence capability similar to that practiced by America's Federal Bureau of Investigation (FBI). Glenn Hastedt takes the reader into the counterterrorism thicket in Washington, DC, explaining how politics influences CI and CT operations. Richard L. Russell and Jennifer Sims discuss the ups and downs of trying to establish an effective counterterrorism response in the United States, complicated by the fragmentation of authority and widely differing cultures among the sixteen U.S. intelligence agencies. Finally, Katharina von Knop looks at the rising role of women in terrorist organizations.

The back-of-the-book documents in Volume 4 begin with a look at the Church Committee findings regarding counterintelligence in 1975 (Appendix A), followed by the notorious Huston Plan—a master counterintelligence spy plan drafted by White House aide Tom Charles Huston in 1970, in response to a nation at unrest over the war in Vietnam (Appendix B). The Huston Plan is a classic illustration of overreaction in a time of domestic strife. In Appendix C, the Senate Select Committee on Intelligence summarizes its findings about the Aldrich H. Ames counterintelligence disaster. Next the appendixes include a series of U.S. commission conclusions about how to improve intelligence in the struggle

against global terrorism, whether locating and penetrating their cells in advance of a terrorist attack or thwarting the ability of terrorists to acquire WMDs. The panel reports include: the Hart-Rudman Commission of 2001 (Appendix D); the 9/11 or Kean Commission of 2004 (Appendix E); and the Silberman-Robb Commission of 2005 (Appendix F). For purposes of comparison, the final appendix (G) examines the conclusions reached by a British commission that also probed the Iraqi WMD failure: the Butler Report of 2004.

The fifth volume in the series, titled *Intelligence and Accountability: Safeguards Against the Abuse of Secret Power*, stems from a concern that secret power might be misused by those in high office. This danger was underscored in 1975 when Congress found the U.S. intelligence agencies guilty of spying against law-abiding American citizens, and again in 1987 during the Iran-*contra* affair when some elements of the intelligence community violated the public trust by ignoring intelligence laws. The United States has been one of the few nations in the world to conduct an ongoing experiment in bringing democratic accountability to secret government activities. Democracy and spying don't mix well. Secrecy runs counter to democratic openness, while at the same time openness possesses a threat to the success of espionage operations. Democracies need intelligence agencies to acquire information that may protect them, but thoughtful citizens worry about having secret agencies in an open society.

Until 1975, the nation's remedy for the tension between intelligence gathering and democracy was to trust the intelligence agencies and hope for the best. Elected officials treated the secret services as exceptional organizations, immune from the checks and balances envisioned by the framers of the Constitution. Lawmakers were satisfied with this arrangement, because if an operation went awry they could duck responsibility. When James R. Schlesinger, DCI in 1973, attempted to inform John Stennis (D-MS), a key member of the Senate Armed Services Committee, about an approaching operation, the Senator stopped him short: "No, no, my boy, don't tell me. Just go ahead and do it, but I don't want to know."[8]

This attitude on Capitol Hill—overlook rather than oversight—underwent a dramatic turnabout in December 1974, however, when the *New York Times* reported on allegations of CIA spying at home and questionable covert actions in Chile. Congress might have waved aside the revelations about Chile as just another Cold War necessity in the struggle against regimes leaning toward Moscow, but spying on American citizens—voters—was another matter altogether. In January 1975, President Ford created the Commission on CIA Activities Within the United States (the Rockefeller Commission, led by his vice president, Nelson Rockefeller). Later that month the Senate established a select committee to investigate intelligence activities. The committee was headed by Frank Church, D-ID, and became known as the Church Committee (the editor served as Church's assistant). A counterpart House committee, led by Representative Otis Pike (D-NY), began investigations the following month.

These various panels, especially the Church Committee, found many more improprieties than they had expected. Not only had the CIA engaged in domestic

spying in violation of its charter, so had the FBI and several military intelligence units. Furthermore, the FBI had carried out secret operations, known collectively as COINTELPRO, against thousands of civil rights activists, members of the Ku Klux Klan, and Vietnam War dissenters. The objective was to make their lives miserable by disrupting their marriages and employment. The Bureau even attempted to blackmail Dr. Martin Luther King Jr. into committing suicide. Church Committee investigators also discovered CIA assassination plots against foreign leaders and efforts to topple President Salvador Allende of Chile, even though he had been democratically elected.

These revelations convinced lawmakers that the time had come to bring accountability into the dark recesses of government. Congress established intelligence oversight committees in both chambers—the Senate in 1976 and the House a year later—and, by 1980, required by law timely reports on all secret intelligence operations. The new Committees pored over intelligence budgets, held regular hearings (mostly in closed session to protect spy sources and methods) and seriously examined the performance of America's intelligence agencies. No other nation has ever so thoroughly applied democratic principles to its secret services, although a number are now beginning to follow the leadership of the United States toward greater intelligence supervision.[9]

Since 1975, this effort has evolved in fits and starts. Sometimes lawmakers have insisted on close accountability, as when they enacted the Intelligence Oversight Act of 1980 with its stringent reporting requirements for covert operations, or when a series of laws in the 1980s sought to end covert actions in Nicaragua. At other times, members of Congress have loosened the reins—for example, repealing in 1985 a prohibition against covert action in Angola. On still other occasions, Congress has concentrated on helping the intelligence agencies improve their security and performance, as with a law in 1982 that prohibited exposing the names of undercover officers. The Iran-*contra* scandal of 1987 was a major setback to this new oversight, as the Reagan administration bypassed most of these rules and statutes in its conduct of a covert war in Nicaragua against the will of Congress. The scandal was an alert to lawmakers. The Intelligence Oversight Act of 1991 further tightened intelligence supervision by clarifying reporting requirements. Lawmakers also set up an Office of Inspector General in the CIA, confirmed by and accountable to Congress.

The pulling and tugging has continued, most recently over whether President George W. Bush violated the Foreign Intelligence Surveillance Act (FISA) of 1978 by conducting warrantless wiretaps as part of the war against terrorism in the aftermath of the 9/11 attacks. The FISA required warrants, but the White House claimed (when the secret operation leaked to the media) the law had become to cumbersome and, besides, the president had inherit authority to conduct the war against terrorism as he saw fit. This debate aside for the moment (several authors address the issue in these volumes), one thing is certain: the intelligence agencies in the United States are now very much a part of the nation's system of checks and balances. Americans want and deserve both civil liberties and a secure defense

against threats; so the search continues for an appropriate balance between liberty and security, democracy and effectiveness—precisely the topic of Volume 5.

The set of chapters on intelligence accountability are introduced with a chapter by David M. Barrett, the foremost authority on the history of accountability in the early years of modern U.S. intelligence (1947 to 1963). The chief counsel of the Church Committee, Frederick A. O. Schwarz Jr., then reflects back on the effects of that watershed inquiry. Next, the editor offers a previously unpublished interview with DCI William E. Colby, who stood at the helm of the intelligence community as it weathered the storm of the investigations into domestic spying during 1975. Mark Phythian presents a chapter on the British experience with intelligence accountability; and, comparing British and American oversight, Lawrence J. Lamanna contrasts the responses on both sides of the Atlantic to the faulty Iraqi WMD assessments in 2002.

The next chapter, written by Cynthia M. Nolan, looks at contemporary issues of intelligence oversight in the United States. Hans Born and Ian Leigh follow with a comparative dimension by contrasting intelligence accountability practices in a variety other nations. Finally, A. Denis Clift and Harry Howe Ransom, who have witnessed the unfolding of intelligence accountability over the past four decades, offer their appraisals of where the experiment stands today.

The first supporting document in this volume is a succinct legislative history of intelligence accountability from 1947 to 1993, prepared by the Senate Select Committee on Intelligence (Appendix A). Then come a series of important oversight laws, beginning with FISA in 1978. With this law, members of Congress sought to rein in the open-ended authority of the executive branch to wiretap and otherwise spy on individuals considered risks to the national security—a privilege abused by a number of administrations from the 1930s forward. Henceforth, FISA required a warrant from a special court (the FISA Court, whose members are appointed by the Chief Justice of the Supreme Court) before such intrusive measures could be carried out. This law, a hot topic in 2005–6 when critics charged the second Bush administration with violation of the warrant requirement, can be found in Appendix B.

The Intelligence Oversight Act of 1980 is presented in Appendix C. This is a brief but nonetheless far-reaching law, enacted by Congress as an attempt to become an equal partner with the executive branch when it came to intelligence. The 1991 Intelligence Oversight Act (Appendix D) emerged after the Iran-*contra* scandal and provided a tightening and clarification of the language in its 1980 precursor, especially with respect to the approval and reporting rules for covert action. The political tug-of-war over the drafting of this currently prevailing oversight statute was intense, leading to the first and only presidential veto of an intelligence act. President George H. W. Bush found the proposal's insistence on prior reporting of covert action objectionable in times of emergency. Lawmakers entered into a compromise with the chief executive, settling on a two-day reporting delay in emergencies. The bill passed Congress again, this time without a presidential veto.

In 1995, the House Permanent Select Committee on Intelligence launched an inquiry into a wide assortment of intelligence issues, stimulated initially by counterintelligence concerns (Aldrich Ames's treasonous activities at the CIA had recently been discovered) but turning into an opportunity for a broad review of new challenges that faced the secret agencies now that the Cold War had ended. In Appendix E, an excerpt from the Committee's final report examines the state of intelligence accountability in the mid-1990s. The next document, in Appendix F, carries the examination into the twenty-first century, with the appraisal of the 9/11 Commission on the same subject. The commissioners were unimpressed, referring to intelligence accountability as "dysfunctional."

At the center of any efforts to maintain accountability for the secret agencies lies the question of funding—the mighty power of the pursue, held in the hands of lawmakers. Appendix G draws on the findings of the Aspin-Brown Commission to provide official documentation about how the United States spends money for spying. Finally, in Appendix H, DCI Robert M. Gates (1991–93) offers observations about oversight from the perspective of the intelligence community management team, located at that time on the Seventh Floor of the CIA.

Here, then, is what the reader will find in these five volumes. The editor and the contributors hope the chapters and documents will help educate the public about the importance of intelligence agencies, as well as stimulate scholars around the world to further the blossoming of this vital field of study. I am pleased to acknowledge my gratitude to Praeger's Heather Staines, senior project editor, and Anne Rehill, development editor, each a pleasure to work with and most helpful in their guidance; Julie Maynard at the University of Georgia for her administrative assistance; Lawrence J. Lamanna, my graduate research assistant, for his good counsel and logistical help; Leena S. Johnson for her indispensable encouragement and support; and the contributors to these volumes for their outstanding scholarship and their much appreciated cooperation in keeping the publishing train running on time.

These volumes are enthusiastically dedicated to Harry Howe Ransom, who has done so much in the United States to lead the way toward a serious discipline of intelligence studies.

1

COVERT ACTION

Forward to the Past?

GREGORY F. TREVERTON

MY INTRODUCTION TO COVERT ACTION WAS A fascinating one, moving as a graduate student and then freshly minted Ph.D. to Washington to work for the original Senate Select Committee on Intelligence—often called the Church Committee after its chair, Sen. Frank Church (D-ID).[1] The investigations, hard on the heels of Watergate and allegations of covert U.S. intervention in Chile, were the nation's first ever look behind the green wall of intelligence. I had written about presidential decision making and expected to work on the role of intelligence analysis in those decisions.

In fact, I spent virtually all my time on covert action, and much of that on Chile.[2] That stint in Washington was exhilarating and frustrating, and it produced one of very few "aha!" moments I've had researching in deeply classified documents. Press accounts had attributed to Henry Kissinger, then the National Security Advisor, the line: "I don't see why the United States should stand by and watch Chile go communist merely due to the stupidity of the Chilean people." The quote rang true enough, but I hadn't seen a source and didn't expect to. Then, we received a spate of highly classified documents, including minutes from the 40 Committee, the administration's interagency committee for reviewing covert actions.[3]

Kissinger, previously a scholar, had changed the committee's record keeping from the terse notations of previous administrations—"CIA project 123 is approved," with no mention of operation or country—to those of a recording secretary. So there it was at the end of the notes on one meeting: "The chairman [Kissinger] closed the meeting by observing that he didn't see why . . ."

When I reflected some years later on covert action, what struck me was how much the targets of U.S. covert action had changed from the 1940s to the 1990s.[4]

Many of the CIA's early postwar targets, like Iran's Mossadeq or Guatemala's Arbenz, wanted, almost pleadingly, not to be enemies of the United States. However, for later targets, like Nicaragua's Sandinistas or Iran's Khomeini, the United States was more useful as an enemy than a friend. Cuba's Castro bridged the two periods, with America-as-foe becoming the best thing he had going for him.

By the end of the 1990s, a second theme was also apparent: major American "secret" operations, from Nicaragua and Angola to Cambodia and Afghanistan, were not very secret. They had become "overt" covert action, in that actions became public not just when their results were known but while they were in progress. Support for the Nicaraguan rebels, or contras, the most controversial example, was openly debated and openly funded. Neither opponents nor supporters had reason to keep it secret; for its part the Reagan administration regarded covert action as good policy and good domestic politics, a key element of the Reagan Doctrine, which was intended to challenge Marxist-Leninist states around the world. Indeed, when the Reagan administration decided to sell arms to Iran and keep the operation secret, it turned inward, to the White House staff.[5] In embroidering that operation to divert money for the contras, White House aides apparently kept the president ignorant to protect him—providing him with plausible denial of the sort the CIA had long since abandoned.

Now, the United States has come full circle. Not only are most covert actions not very secret, they are mostly paramilitary actions in support of broader, mostly military counterterrorism operations. The campaign against terror has thrown CIA covert operators and Pentagon special forces together in new ways. The successes of that cooperation, in Afghanistan and Iraq, have been impressive. Because the operations are not very secret and because they are part of the broader campaign against a fearsome foe—transnational terrorism—the questions of how to square them with America's values are less evident. Yet the process is making for less clarity about who does what and why. More important, it is complicating who *authorizes* lethal force and on what basis.

This chapter first reviews the early history that set the pattern for U.S. covert action in the half a century after World War II and inquires into how the success or failure of covert actions should be judged. It then looks at the circumstances, both at home and abroad, that changed covert action to "overt covert," and it argues for a bias toward acting openly, not covertly. If covert action is to be employed, what lessons emerge from the history? It then asks how those lessons apply in current circumstances, and it concludes with a coda on how the oversight of intelligence, especially covert action, by Congress has functioned.

EARLY SUCCESSES SET THE PATTERN

Spying may be the world's second oldest profession, but for the United States it was only the Cold War, coming on the heels of America's wartime experience with secret operations conducted by the Office of Strategic Services,

that led to the creation of an intelligence service in peacetime and to covert operations. Notice that spying—human intelligence or HUMINT, in the jargon of the trade—and covert action are superficially similar but in fact quite different. Both involve secret relationships between U.S. intelligence officers and foreigners. But the point of spying is information; the U.S. officer is relatively passive and the process is designed to protect the foreign spy's link to the United States. For covert action, by contrast, the purpose is doing something; the U.S. officer is active and the process carries inherent risks of being blown—the riskier it is, the more ambitious the action.

Wartime success and postwar threat: these were the backdrop for the creation of the Central Intelligence Agency (CIA). In a few years America plunged from the euphoria of victory in World War I1 to the confrontation with a looming Soviet threat, when Western Europe seemed to teeter in the balance. The first line of American response to the onset of the Cold War was overt: the surge of assistance to Europe through the Truman Doctrine and the Marshall Plan. But the second line was renewed interest in what was then called covert psychological warfare—what we could now call propaganda—as a way to respond to the Soviet Union by means that were less than war but more than nothing.

In this atmosphere, the National Security Council approved NSC 1012, a plan that had originated with George Kennan, then director of the State Department's Policy Planning Staff and the author of the famous X article outlining the policy of containment of the Soviet Union. NSC 1012 was the turning point for covert action, expanding it from propaganda to direct intervention. In the words of the document, covert action comprised: "propaganda, economic warfare; preventive direct action, including sabotage, anti-sabotage, demolition and evacuation measures; subversion against hostile states, including assistance to underground resistance movements, guerrillas and refugee liberation groups, and support of indigenous anticommunist elements."[6] NSC 1012 also codified the notion of plausible denial: operations were to be "so planned and executed that any U.S. Government responsibility for them is not evident to unauthorized persons and that if uncovered the U.S. Government can plausibly disclaim any responsibility for them."

The fledgling CIA's first success came that same year, in 1948, when its covert support to the Italian Christian Democrats helped them beat back an electoral challenge from the Italian Communist Party. By 1950 the United States had succeeded in the covert struggle in Western Europe; in Eastern Europe its covert operations wound down to propaganda and intelligence gathering. The center of the battle against communism moved, as Washington saw the world, away from Europe to small, weak countries. Europe had put the CIA into the business of covert political action, but Asia got the agency into secret paramilitary operations in the Korean War, a pattern repeated a decade later in another Asian war, Vietnam.

The incoming Eisenhower administration called for a more active response to the Soviet threat than the passive containment of the Truman administration.

CIA operators soon registered two successes that set the pattern for the next two decades. On August 21, 1953, after a week of turmoil in the streets of Tehran, the Iranian prime minister, Mohammed Mossadeq, who had nationalized that country's oil industry, surrendered. Three days later the shah, who had fled Iran the previous week with his queen, returned to the capital. At his palace a few days later, he offered a toast to Kermit "Kim" Roosevelt, the chief of the CIA's Near East and Africa Division and the man who had improvised Mossadeq's downfall: "I owe my throne to God, my people, my army—and you!"[7]

The next year, on June 16, 1954, Guatemalan Colonel Carlos Castillo Armas crossed the border into his country from Honduras with a few hundred men trained and armed by the CIA. Pilots under CIA contract flew air cover. The president of Guatemala, Jacobo Arbenz Guzmán, was deserted by his air force and his army, which refused his order to arm workers and peasants. The American ambassador hastily arranged a transfer of power to the chief of the armed forces. (In a moment of tragicomedy, that man immediately pledged that he would continue the struggle against Castillo Armas, America's designated successor to Arbenz. Only after complicated negotiations led by the ambassador did Castillo Armas emerge as president.)[8]

The Iran and Guatemala operations—code-named TPAJAX and PBSUCCESS, respectively—coming within a few years of the CIA's success in Western Europe, made the agency's reputation and set the pattern for covert action in the years ahead. Small, cheap, fast, and tolerably secret, they encouraged Washington to think other covert actions could be likewise. When the next administration decided to confront revolution in Cuba, its covert response was the same as in Guatemala. So were the CIA officers who carried it out.

The blush of short-run success amidst the Cold War obscured several warnings. In the early 1950s, both Iran and Guatemala were eminently vulnerable to manipulation by an outside power, particularly the United States. In both, contending political forces were in close balance. Those balances might have tipped against Mossadeq and Arbenz even if the CIA had not intervened. So it appeared that relatively small operations were enough to tip the balance. Yet in both cases, limited interventions might have failed. In fact, Kermit Roosevelt's first plot did fail; CIA Director Allen Dulles was ready to roll up the operation and bring the troops home. And the CIA officers who ran PBSUCCESS were under no illusions: if their deceptions failed and Arbenz were able to get his military into combat, the invaders would be overwhelmed.

Thus, success was purchased at the price of enlarging the intervention. American purposes did not change, but the operational requirements of achieving them did. Once the United States was committed, in secret and in a small way, the stakes increased, and the CIA took the next step. The effort to intimidate Arbenz became a paramilitary campaign, if a small one. In the process, plausible deniability became more tenuous.

Six years later at the Bay of Pigs, deniability evaporated entirely. "How could I have been so stupid, to let them go ahead?"[9] The words were from John

Kennedy. When the CIA trained invasion force of Cuban exiles hit the beach in the early dawn hours of April 17, 1961, everything went wrong: the lives of brave Cubans were spent; the United States was seen to be intervening; and the intervention failed. Once the plan had changed (without anyone outside the CIA quite noticing it) from a guerrilla operation into a full-fledged amphibious invasion, the chance of keeping it tolerably secret diminished to the vanishing point.

JUDGING SUCCESS

Evaluating covert action in retrospect is speculative, for it is bedeviled by the imponderable of what might have been; history permits no reruns. Failures, such as the Bay of Pigs invasion, are apparent, but successes are harder to judge. Consider the CIA intervention in the Angolan civil war of 1975. On the surface it was a failure: the Cuban- and Soviet-supported faction, the MPLA (Popular Movement for the Liberation of Angola), was installed while the U.S. role in trying to prevent that outcome was being exposed. If, however, the initial purpose was more limited—for instance, to raise the price of victory for the MPLA and its Soviet and Cuban backers—then Angola might be counted a short-run success. Yet American officials did not convey the impression that their aims actually were so limited, either at the time or later.

When, on the one hand, covert actions have succeeded in their short-run purposes, it may be that the action, though marginal, was just the bit of "support for our friends" that tipped the balance in the internal politics of a foreign country. On the other hand, it may be that the American support was entirely superfluous, and the same successful outcome would have ensued without the U.S. involvement. If this is so, all the covert action accomplished was to implicate the United States and tarnish the success by labeling it "made in America" when the existence of the covert action became known.

A case in point was covert American support to opposition political parties and media in Chile during the presidential tenure of Salvador Allende (1970–73), a self-proclaimed Marxist. There is no question that those parties and media were under pressure from the Allende government.[10] The opposition forces survived to fight another day, but there is no telling whether CIA support for them was decisive or irrelevant.

What is clear is the signal conveyed to history by the revelations of American covert action. In retrospect, most reasonably objective observers conclude that Allende's experiment in Chile would have failed on its own terms.[11] Yet history's lesson is not that Allende fell of his own accord but that the United States overthrew him in 1973. That is the public perception, even though this lesson is untrue in the narrow sense: Washington did not engineer his coup, nor did the CIA or the American military participate in it. The very fact of American covert action meant that at a minimum, "it is fair to say that the United States cannot escape some responsibility for [Allende's] downfall."[12]

By the same token, in 1975 when South Africa intervened to back the U.S.-supported Angolan factions, the FNLA (National Front for the Liberation of Angola) and UNITA (National Union for the Total Independence of Angola), a covert action originally intended to counter the Soviet Union and Cuba, then signaled something else. It indicated an alliance with the apartheid regime in Pretoria. In December 1975, when Congress reacted by cutting off the CIA operation, that only ratified what was seen as the inevitable result—defeat—in the eyes of both Washington policy makers and the rest of the world.

In a longer perspective, neither the Iran nor the Guatemala operations can fairly be given too much credit—or too much blame—for what happened afterward in Iran and Guatemala. On one hand, TPAJAX restored the shah of Iran to his throne, where he remained for nearly a quarter century, a pro-Western bastion in a turbulent region. Twenty-five years of stability is no mean feat in international affairs. On the other hand, American covert action identified the shah's Iran more closely with the United States than was good for either of them.

In any case, however, the aspects of U.S. policy that loomed so large in the shah's downfall in 1979 were overt, not covert. They were his image as an American client, the waste and corruption associated with his massive U.S. arms purchases, and his own dependence on the United States. These factors owed much more to American policy during the 1970s than to the event of 1953.

A similar conclusion also applies to Guatemala in 1953. If, in retrospect, the "success" of PBSUCCESS also looks more ambiguous than it seemed at the time, most of the blame or credit lies with American foreign policy, not with covert action. PBSUCCESS did not make it inevitable that Washington would then forget about Guatemala; it only made it possible. David Phillips, a CIA officer who worked on PBSUCCESS, the Bay of Pigs, and Chile, laments that "Castillo Armas was a bad president, tolerating corruption throughout his government and kowtowing to the United Fruit Company more than his own people." But he argues that the United States "could have prevented this with the vigorous exercise of diplomatic pressure . . . to assure that he pursued social reform for the many rather than venal satisfaction for a few. Instead, Washington breathed a collective sigh of relief and turned to other international problems."[13]

Several covert operations of the 1950s remained secret for a long time: The CIA's assistance to Tibetans resisting the domination of their land by the People's Republic of China, regarded in intelligence lore as a successful holding action, is still a little discussed operation, especially because it is an embarrassment now that Sino-American relations have thawed. The effort to unseat President Sukarno of Indonesia, who had earned Washington's opposition for his espousal of nonalignment, ranged from covert political action to a paramilitary operation; it is not much better known than the Tibetan operation.[14]

Even in the 1960s, several brief and limited interventions—small in terms of numbers of people involved, though not in terms of purpose—remained secret for some time. So-called Track II—a secret effort to touch off a military coup in 1970 to prevent Allende from being seated as Chile's president, an operation run

without the knowledge of the State or Defense Departments—was not revealed for five years after it happened. And the sad plots in the early 1960s to assassinate Fidel Castro stayed buried for over ten years.[15]

CHANGING TARGETS, CHANGING TIMES

Yet times changed. Major covert actions became likely to become public knowledge—sooner rather than later, perhaps even before the operation was over. In 1986, the arms sales to Iran became public even though the leak did not initially come from Washington but from an article published in Beirut in Arabic. Americans became more skeptical of their government, of its information, and its capacity, a skepticism that is a legacy of the long history beginning with the label "Watergate." By 1986, when Ronald Reagan, the most popular president in generations, first denied that his administration had traded arms sales to Iran for the release of American hostages in Lebanon, most Americans did not believe him.

This skepticism has been reinforced by the prominence of investigative journalism; every cub reporter aspires to be Woodward or Bernstein of Watergate fame. The media now contain more people asking hard questions, even of secret operations, and probing for leaks; and there are fewer who are prepared to take the government at its word. If reporters are more likely to seek information on "secret" operations, so are they more likely to find it. Leaking, always present, has become routine in Washington; it has become almost acceptable. Officials sometimes leak information merely for the gratification of being pandered to by journalists more famous than they. More often, they leak to rally opposition to or (more rarely) support for a given policy. Administration after administration, regardless of its political persuasion, declares war on leakers. Those wars always fail. They fail for a simple reason: the ship of state is like no other, for it leaks from the top.

Officials at the top of government are precisely those who know of covert actions and thus are most likely to take their opposition to particular programs into the open. This is true of the executive branch, and all the more so of Congress, where this tendency is reinforced by institutional pride and often by partisan politics. On the whole the intelligence committees of the House and Senate have kept secrets at least as well as the executive branch. Yet their role in overseeing covert action means that those who might oppose a particular project are more likely to know of it. The process creates a set of frustrated opponents who will, on occasion, go public with their frustration.

Not every exposé, however, has created a controversy. Even now, not every covert action is controversial. Of the forty or so covert actions under way in the mid-1980s, at least half had been the subject of some press account.[16] Yet only several were controversial enough that the original leaks developed into continuing stories. Most of the rest were open secrets, more unacknowledged than

unknown; most members of Congress thought they made sense, as did most Americans who knew or thought about them—and, no doubt, most of the journalists who reported them.

Before September 11, 2001, the biggest open secret, or overt covert operation, was U.S. aid to those in Afghanistan resisting Soviet occupation of their country. Former CIA Director William Colby characterized the reaction to revelations of American assistance to the resistance in Afghanistan: "Afghanistan was a two-column headline in *The Washington Post* for one day, then almost nothing."[17] Americans in and out of Congress broadly supported the cause of the rebels, or *mujahedeen* (often called freedom fighters at the time, which became a cruel irony on 9/11), and the aid was a way to increase the cost of the Soviet occupation. American assistance reportedly begun in a small way in the last year of the Carter administration escalated sharply to reach as much as a half billion dollars a year by the late 1980s.[18]

The secret was an open one; the American role was not so much covert as unacknowledged, by tacit agreement. The reason for circumspection was the delicate position of the Pakistan government, the conduit for the American supplies to the rebels. Pakistan was prepared to support the rebels but was unwilling to be too visible in doing so lest it antagonize its powerful neighbor, the Soviet Union. In those circumstances, resorting to the CIA, rather than the American military, was more a matter of being discreet than of keeping the whole affair secret.

Certainly there will be cycles in American attitudes toward international threats, as there have been before. In the early 1980s most Americans evidently shared their president's concern with the Soviet threat, and their congressional representatives went along with huge increases in defense spending—and in covert action. Ronald Reagan was able to rebuild considerable authority and discretion in the American presidency, the Iran-*contra* debacle notwithstanding. After September 11, 2001, George W. Bush had at least as much of both support and authority. Most Americans enthusiastically supported the war in Afghanistan, and they were prepared, initially at least, to support the war in Iraq as a front in a longer fight against terrorism.

Still, if the changes in American domestic politics since the mid-1970s have made it more difficult for the United States to achieve its purposes secretly, other changes make it harder now than in the 1950s for the United States to intervene successfully at all, covertly or openly. Despite the controversy and mystique that surrounded covert action (and to some extent still do), history suggests that there is no magic to it. It means providing foreigners secretly with money, weapons, or training as tokens of American support.

With the passage of time, however, a little money here, a few weapons there became less likely to achieve grand foreign policy purposes. Castro was a target of a different order than Arbenz. To think in 1975 that a few million dollars might alter the fate of Angola was a faint hope at best, and an illusion at worst, especially given that the CIA recognized that the Soviet Union and other external actors might counter American support with more assistance of their own. Even

the CIA officials who planned the Bay of Pigs covert action knew that to delay the invasion until Cuba had received deliveries of advanced Soviet fighter planes would be to condemn the plan to certain failure.

Also, notice the contrast between two Central American cases three decades apart—Guatemala and Nicaragua. Castillo Armas's liberators numbered no more than several hundred. Their "invasion" was more conjured than real. Yet they had control of the air, in large part because Arbenz, unsure of the loyalty of his air force, was unwilling to risk putting his own pilots in the air. *Sulphates*—Spanish for "laxatives," the name Guatemalans gave to the invaders' bombs—plus rumors exaggerating the size of the invasion were enough to induce Arbenz to capitulate. In the case of Nicaragua, the contras numbered about 10,000 by the mid-1980s, yet not even the most ardent advocates of U.S. assistance to them argued that they were about to induce the Sandinistas to say uncle, much less that they posed a threat sufficient to overthrow the regime by sheer force of arms.

The makers of revolutions learned their own lessons from history, including the history of American covert action. They were determined not to repeat the mistakes of Arbenz and Mossadeq. They sought to assure themselves the loyalty of the army or to build revolutionary cadres of their own. Before the fall of communism, they also learned that if the United States threatened them, there were other sources of support to which they could turn. And, unlike Arbenz or Mossadeq, they turned to those sources sooner rather than later. Moreover, they learned that the United States could be very useful as an enemy. Arbenz, Mossadeq, and even Allende sought Washington's approval, or at least its acquiescence. By contrast, if the United States was of use to Castro, the Sandinistas, and the Ayatollah Ruhollah Khomeini, it was primarily as a foreign demon against which their revolutions could rally—even though the Sandinistas were prepared to accept American aid as long as it was forthcoming, and the revolutionary Iranians were not above seeking American spare parts for their military. In 1979 Iranians took Americans hostage and released them only when they ceased to be useful counters in the bargaining within the revolution. Suffice it to say that no one learned the value of America-as-enemy better than Osama bin Laden.

VALUES AND INSTRUMENTS

In all likelihood, the record shows, covert operations will become known, and America will be judged for having undertaken them. Thus, the practical lessons lead into moral issues. These issues are muted now by the fearsomeness of the terrorist threat. They are hardly unique to covert intervention, though they are powerfully present there, and they risked—and may still risk—being obscured in policy making by the presumption that covert actions will remain secret. Overt interventions, such as the American invasion of Grenada in 1983 or Panama in 1989, or military attacks, such as the bombing of Libya in 1986 or Sudan and Afghanistan in 1998, raise similar moral and instrumental concerns.

These concerns are not absolute; they must be considered against the gravity of the threat and the adequacy of other available responses.

In December 1976, when I was in Washington working with several old friends who were making arrangements for the transition between the Ford National Security Council (NSC) and the Carter NSC, we had decided to retain the basic structure of the Ford operation, with its network of sub-Cabinet committees for particular purposes. Yet of course, as a new administration, it was necessary to change the names of those committees, and so we joked about naming options. The 40 Committee, the Ford administration's group for discussing covert action, would become the "If They Can Do It, So Can We" Committee.

Yet, "if they can do it, so can we" did not seem, even then, to be an unacceptable rationale on either moral or instrumental grounds. What the Soviet Union or other nations did could not settle the issue, nor can how terrorists act. We consider ourselves different from them and imagine that the difference is not only basic to what we are as a people but also a source of American influence in the world, part of this country's moral armor.

We also believe that the example of democracy is powerful, one toward which peoples all over the world will gravitate if given the chance. Believing that, we must also believe that the example is a powerful part of our external behavior, not just of our internal arrangements. If people will choose democracy when given the chance, then democracy is demeaned, perhaps doomed to fail, if it is imposed from the outside. There is something incongruous about helping overthrow governments—especially ones that come to power through elections that we would define as tolerably fair (as in Chile in 1970)—in the name of democracy.

In this view, some of the successes of covert action seem, on the one hand, ambiguous or transient in retrospect, accomplished at significant cost to what we hold dear as a people and to America's image in the world. On the other hand, the world is a nasty, complicated place. The fight against terror has driven home that lesson. In that regard Americans' historical ambivalence between the high moral view and the feeling that international politics is a dirty business is understandable.

Terrorism aside, nations affect each other's politics in so many ways that any too-tidy definition of *intervention* is suspect. In all the examples cited, covert action formed only part of American policy. The United States decided whether to grant economic aid to Cuba, Chile, or Angola, and whether to release Iranian assets held in the United States. Most of these decisions were based on explicitly political criteria. Even if similar decisions toward other countries are not so clearly political, the decisions in any case have political effects on the country in question; foreign political leaders have no doubt of that fact.

The same is true of actions by private American actors. U.S.-based businesses either invest or do not invest in a country, and that decision too has not just an economic but also a political effect. That is the case even if the decision is not political in any narrow sense of the term. Most of the businesses or banks that chose not to invest in Chile under Allende probably did not make that choice for

any specific political reason, despite Washington's pressure. Rather, their decision was a business one, based on the climate in Chile. They saw that judgment as an economic one, though political instability surely was a factor in it.

In this context, if a unilateral self-denying ordinance against all intervention—open or covert—seemed too restrictive when the Soviet threat existed, it surely does now in an era of terrorism. Some threats to American national security require responses. Some American friends deserve support. What is imperative to keep in mind is the long-term costs of intervention for a government that is not notable for attending to long-term considerations.

Given that "covert" action is not likely to remain secret, why not act openly? In the case of aid to the FNLA and UNITA in Angola, covert rather than overt aid spared the first identification with the United States for only a few months; as for aid to the contras in Nicaragua, the "covert" form made not one whit of difference. The operation quickly became known, and the same was true of aid to the *mujahedeen* in Afghanistan. Nor is it obvious that in most of these cases that the recipients of American largesse minded the source of the money being known. There is also the risk that covertness creates a self-fulfilling prophecy: If the United States only aids its friends secretly, then any link to the United States may seem sinister, portending much more than is actually the case.

The scope for doing openly what might earlier have been done covertly has increased dramatically since the 1970s. Sovereignty has become less absolute, and international law has come to recognize people, not just nation-states. In that sense, international law has moved in a very "American" direction, even if Americans do not always like the results, as with the creation of the International Criminal Court. But international practice (if not law) has come to recognize that some behavior by national leaders justifies external intervention, even with force of arms.

American radio stations broadcasting into Eastern Europe and the Soviet Union from Munich, Radio Free Europe, and Radio Liberty, were private organizations in form; advertisements exhorted Americans to contribute to them. In fact, they were created and financed covertly by the CIA as propaganda vehicles. When that support was disclosed in 1967, the radio stations nevertheless continued to operate; they became supervised by a board and supported openly by appropriations from Congress.

In the 1980s, the Reagan administration was moved to create the National Endowment for Democracy (NED), on the model of the (then West) German party foundations, like the Konrad Adenauer Stiftung. They are instruments of the major parties but are supported openly by government money. They have openly assisted kindred parties and labor movements around the world. The NED, whose core budget reached $40 million in 2003, channels money to institutes of the two American political parties plus an AFL-CIO group and a business group, which then make grants in support of democratic institutions in a number of countries around the world.[19]

So far, the record of the endowment is mixed but hopeful. Its grants, and those of its four constituent institutes, began by being cautious and close to government policy. It remains an open question whether, given American politics, public funding is compatible with creative (and thus controversial) acts by private groups. The original NED budget was only an eighth of that of the German party foundations. Over the years, Congress has put a variety of restrictions on the endowment—for instance, in 1985 Congress halved the endowment budget and denied any funding to the Republican and Democratic institutes, although that prohibition was relaxed the next year. It may still be easier for the CIA to get money from Congress secretly than for another institution to get it openly—even if the purposes of the two are broadly similar. Funding for the CIA remains wrapped in the cloak of national security, so members of Congress may be prepared to fund particular activities but prefer not to be seen to vote for them openly.

Still, the endowment organizations have become more venturesome as the international and domestic climate has changed. More important, the endowment now works with scores of kindred organizations, both from other governments and from the private sector. To illustrate the change, in the mid-1980s, the NED provided more than $400,000 over two years to the American Friends of Afghanistan to develop educational and cultural facilities inside those portions of the country controlled by the resistance groups—activity that might in other times have been called the civic action component of a paramilitary operation.

By contrast, before Slobodan Milosevic fell from power in 2000, the endowment and other U.S. government sources openly funded opposition parties and groups to the tune of some $25 million.[20] Indeed, the whole operation was almost a carbon copy, done overtly, of what the United States had done earlier covertly in Chile, for instance. In the instance of Serbia, the main difference other than overtness was that U.S. government agencies had lots of company from other countries and private nongovernmental organizations (NGOs). In other respects, the post mortem could have been written by a CIA operative about Chile. For instance: "Foreign assistance should focus not only on political parties but should continue to support a broad range of nongovernmental organizations, labor unions, think tanks, and media."

Acting openly, however, is not always easy or a complete substitute for covert action. It requires an explicitness about influencing the politics of a foreign country that is uncomfortable for Americans and hence likely to be controversial. Moreover, governments that feel threatened by that open assistance can act to prevent it more easily than if it were covert. Yet even that ability is diminishing; national borders are more porous. Milosevic's Serbia did try to limit the assistance to opposition organizations. It had some success keeping foreign advisors out but much less success stopping money flows, and thus ended, somewhat paradoxically, with the worst of outcomes from its perspective: the antigovernment effort was well funded but harder to tar with the epithet "foreign influence" than it would have been had scores of foreign advisors been present. To quote the

post mortem again: "While foreign assistance helped to build and sustain the broad anti-Milosevic coalition, indigenous organizations and action were mainly responsible for driving events."

A bias toward openness has it limitations, but surely it is the right long-term direction for American policy. Openness would reflect the reality that, as the century ends, national boundaries are more and more permeable. Given this reality, moreover, those groups the United States would like to support may not be so chary of accepting help, even—perhaps especially—if it is open. The United States would say to them: "We are prepared to support you but only openly. We think that is better for you. In any case, we know it is better for us."

CHOOSING THE COVERT OPTION: LESSONS FROM HISTORY

The history of covert action before September 11, 2001, suggests that in deciding whether to choose the covert option, prudent policy makers should ask themselves a careful series of "what if" questions. That injunction applies to all policies, foreign and domestic. But it applies with special force to covert action because of the presumption of secrecy.

The most obvious "what if" is "what happens if—or more likely, *when*—it becomes public? What if it becomes public in midstream?" This is the *New York Times* test. Large covert actions will not remain secret, a reminder that is easy to state but hard to embody in the making of policy when the pressures go in the direction of wishful thinking. Witness the reflections on the Bay of Pigs invasion by Richard Bissell, then head of the CIA's clandestine service: "The argument was [not] made that this is now a very public business, and we'd better treat it as such, and either cancel it if we can't stand the publicity, or else do some of the things that will increase the chances of success if we are going to go forward with it."[21]

If the Iran operation of 1985–86 had remained secret for several years after all the U.S. hostages in Lebanon had been released, that success might have outweighed the costs of being seen to have traded arms for hostages when the operations became public. Perhaps. We cannot know for certain. It did not, however, take a sophisticated analysis to show that a covert policy targeted on some Iranians was vulnerable to being publicized by opposing Iranian factions if and when it suited their political purposes. And it was equally likely that when the cover was blown, trading arms for hostages with a nation the United States had denounced as terrorist would be deemed unacceptable—by America's allies, much of the rest of the world, and most important, the American people.

Of course, whether a particular covert operation can bear the test of disclosure is apparent in retrospect but often far from obvious before the fact. Prudence suggests that presidents pay careful attention to such warning signals as the review process throws up—the views of Cabinet officers, people in the White

House who attend to the president's interests, and congressional overseers who are surrogates for public reaction.

One warning signal, however, is evident in advance: Does the intervention contradict overt American policy? If it does, as with arms sales to Iran, it is especially improbable that the operation will withstand the test of disclosure. The arms sales were exactly the opposite of the administration's public policies, which had twisted the arms of America's allies not to sell arms to Iran, had sought an end to the Iran-Iraq war with neither a victor nor a vanquished, and had pledged not to bargain with terrorists over hostages, much less to sell arms to them.

A second "what if" is "what if the first intervention does not succeed? What then?" If covert action is to remain secret, most of the time it will have to be small. Small operations have often begun with grand purposes, objectives incommensurate with the instrument. When the goals could not be achieved, leaders were tempted to take the next step and the next. This happened in the Bay of Pigs invasion, Angola, and Iran in the mid-1980s. Sometimes a limited objective can be achieved, but its achievement makes it appealing to hope for more—witness Angola and perhaps Nicaragua, where the United States did seem to achieve its initial aim of cutting weapons supplies from Nicaragua to the antigovernment rebels in El Salvador. Answering this "what if" suggests, at a minimum, careful attention to the CIA's covert operators themselves, for signs of skepticism about whether operations as initially conceived can achieve their purposes. Such signs were present between the lines of Track II in Chile, Angola, and Nicaragua. Some risks are worth running, but few are worth running in ignorance.

A third set of "what if" questions is "what signal will be received, by whom and with what result?" These judgments are also easier with the benefit of hindsight, for they involve calculations of threat and of American interests. Intelligence assessments by the CIA or the State Department provide one set of indicators. In 1985–86, for example, American intelligence on Iran was weak, but what there was offered precious little ground for believing there were moderates who might be detached from their revolutionary colleagues. Later U.S. intelligence cast doubt on the imminence of a Soviet threat to Iran, one of the original premises of the operation. These were cautions that the intended signals might go awry.

The nature of those who are to receive secret American assistance can provide another warning signal. Because their relationship to the United States is meant to be clandestine, the CIA is often in a weak position to compel them to act to suit American purposes, yet the United States inevitably will become associated with their actions, like it or not, if and when the fact of support becomes known. Aid to the contras was dogged by their origins in Somoza's hated National Guard and by charges of human rights violations. Similarly, support for resistance forces in Afghanistan could have been justified as a way to put strategic pressure on Soviet occupation of that country; but given the character of the

resistance forces, it was hardly a way to bring democracy to Afghanistan—far from it.

The regional context, in particular the attitude of American friends in the region, is another source of guidance. In the instance of Afghanistan, American assistance to the resistance was supported, though with varying degrees of publicity, by nations ranging from Pakistan and Egypt to Saudi Arabia and China. In Central America this indicator was more ambiguous, for most of the nations of the region publicly expressed qualms about the aid to the contras while privately hoping the Sandinistas could be made to go away.

The second round of covert action in Angola raised these questions of signals given versus those intended, questions for which the 1975 episode provided guidance. In early 1986, the CIA was authorized to provide $15 million in weaponry to Jonas Savimbi's UNITA. For the Reagan administration, the intended signal was anticommunism. For the administration, there was nothing incompatible about supporting anticommunism in Angola and antiapartheid in South Africa. Alas, the reality of southern Africa frustrated that conception in the heads of Washington policy makers. Whatever his attractions, Savimbi had one flaw, a fatal one: he was almost completely dependent on South Africa, his army almost a unit of South Africa's. To support him was to signal to Africans that the United States was throwing its lot in with South Africa, in 1986 just as in 1975.

These rules of thumb amount to establishing a presumption against covert action. The guidance is mostly negative, a series of cautions. It is unwelcome to officials who are looking for something to do rather than something to avoid—a trait that runs deep in the American character and is reinforced by the circumstances in which covert action becomes an option. Yet given how both America and the world have changed over the postwar period, the circumstances in which major covert action makes sense as policy are sharply limited.

Guidelines akin to these were articulated in the 1970s by Cyrus Vance, later Secretary of State. For Vance, the criterion for covert action in the National Security Act of 1974—"affecting the national security"—was too loose. Instead, he recommended covert intervention only as an exceptional measure, when it was "absolutely essential to the national security" and when no other means would do.[22] Decisions would still be matters of judgment under this more restrictive guide, but no one has improved on the Vance standard.

COVERT ACTION SINCE SEPTEMBER 11, 2001

How has covert action changed since 9/11? And how do those changes relate to the lessons from earlier operations? Most strikingly, 9/11 underscored all too dramatically another theme from my review of earlier covert actions—the problem of control. The very fact that the interventions are meant to be covert gives rise to special problems of control. The link between U.S. intentions and the

actions of those foreigners is tenuous at best. They are acting; the United States is only helping. Their purposes may not be ours. They have every incentive to hear from their CIA liaisons what they want to hear or construe it to their own purposes. In the details of earlier operations, that meant that covertly supported groups sometimes engaged in a little unsanctioned drug dealing or killing along the way or tried to overturn regimes when the United States only thought it was keeping opposition forces alive.

In supporting the anti-Soviet *mujahedeen* in Afghanistan, however, the problem of control was strategic. To minimize the American role, the CIA provided mostly money. Most of the contact in Afghanistan with the *mujahedeen* was done by Pakistan's Inter-Services Intelligence (ISI). For its own and Pakistani reasons, ISI gave preference to the radical Islamists among the *mujahedeen*, and in doing so, sowed the seeds for the takeover of Afghanistan by the Taliban and the formation of Al Qaeda as a unified fighting force. "Their" purposes were manifestly not "ours." The two sets of purposes converged only so long as both wanted to expel the Soviet Union from Afghanistan.

In that sense, the problem of control merges with the more general problem of longer term, unintended side effects, one that afflicts not only foreign policy but all of human action. In this case, however, as in most others, it seems unlikely that any amount of asking "what if" could have changed the decisions in the 1970s and 1980s. The "what if" was simply too iffy. The Soviet Union was there in Afghanistan. Getting it out, somehow, was more than U.S. policy makers at the time could hope for. No story about the trail from ISI support to the Taliban to Al Qaeda to collapsing towers could have been made vivid enough to change the decision. The most that might have been accomplished would have echoed David Phillips's comment about Guatemala a half century earlier: support for the *mujahedeen* didn't have to entail that the United States would forget about Afghanistan after the Soviet Union departed.

One big part of the change in covert action happened before 9/11, as Serbia illustrated. Given the end of the Cold War and the changing currents in international law and attitudes, the CIA seems all but out of the business of Chile-style political actions to sustain opposition forces or overturn regimes. In 2006, the Bush administration proposed major funding in support of Iranian opposition groups, but it did so openly, through the State Department. There may arise cases in which covert funding seems imperative—it is hard to imagine supporting North Korean opposition elements at all, and surely impossible openly—but they should be rare. In promoting democracy, or even regime change, the world has transformed enough to allow the bias toward openness to prevail, along with the bias toward company.

To that extent, covert action has become, post-9/11, primarily paramilitary, with the CIA operating either independently or, more often, with military special operators. Surely, the CIA's performance as the first Americans in Afghanistan was impressive.[23] Its operations were secret only in their tactical details, and thus

met the *New York Times* test. The national investigation of 9/11 lauded that CIA role and the Afghanistan precedent of joint CIA-military teams. It recommended, though that the CIA cede responsibility for directing and executing operations to the military, with agency officers and capabilities integrated into military-directed teams, giving both the CIA and the Special Forces the opportunity to do what each does best.[24] The December 2004 intelligence reform bill was silent on this issue, and the CIA and the military decided that both would remain in the paramilitary operations business.

Which agency is responsible for conducting paramilitary operations has been at issue well before 9/11, driven by Vietnam and other episodes. The arguments for giving the military control have been, historically, the ones the 9/11 Commission cited: the requisite capabilities are military, the task has not been a continuous priority for the CIA, and it makes no sense for the nation to build two parallel capacities. Operations by the military would give those carrying them out the status of combatants under international law, at least if they were visibly soldiers. On the other side is the concern that the military was never very agile or discreet, let alone covert. That concern may have diminished, but not disappeared, as the special forces have developed a wide variety of units and types of operations.

Whatever else is occurring, the special forces and the CIA are being thrust together, and the CIA is being pushed into counterterrorism operations, both with the military and independently. Both kinds of operations raise thorny questions of authorization and accountability. In 2002, CIA operatives killed five suspected Al Qaeda operatives in Yemen with a Predator missile fired from an unmanned aerial vehicle (UAV). One of the five was a U.S. citizen.[25] The CIA conducted a similar attack in 2006 along the border between Pakistan and Afghanistan.

CIA covert operations require a presidential finding, one transferred in secret to the relevant committees of Congress.[26] Existing findings apparently provided authorization for the CIA to conduct both Predator attacks. By contrast, a similar operation conducted by military special forces could be set in motion simply by the chain of command from the president as commander-in-chief. Unfortunately, the difference may be less than meets the eye, however, if findings have become so broad in the war on terror as to cover almost any CIA operation. If so, however, the problem lies with the breadth of the findings. If they are so broad as to cover almost anything, then the finding process has become a sham.

COVERT ACTION AND OPEN DEMOCRACY

The United States will remain in the business of covert action. It will continue to confront the paradox of secret operations in a democracy, even if those operations are mostly paramilitary and counterterrorist in character. Unfortunately, the process of congressional oversight of intelligence, including covert

action, so carefully crafted in the 1970s, is now regarded as something of a joke in Washington. Terrorism is frightening enough to the body politic to justify almost any action in response—though the controversy in 2006 over eavesdropping on Americans by the National Security Agency in the wake of the terrorist attacks of 9/11 emphasizes the "almost." The House and Senate oversight committees have not escaped the bitter partisanship that has come to afflict Congress as a whole, and for a variety of reasons, the stature of the committee members has declined, though with several sparkling exceptions.

The 9/11 Commission suggested that if a single national intelligence director is to oversee the entire intelligence community—and preside over funding for all of it—Congress also should concentrate its oversight. Accordingly, the commission called on Congress to renew its commitments from the 1970s, having either a single joint committee to oversee intelligence (on the model of the old Atomic Energy Committee) or single committees in each house. Like the House Homeland Security Committee after them, the intelligence committees were never given the monopoly that was intended at their creation, and through the years even more committees have become involved.

The commission also sought to revamp ideas from the 1970s agreements in several other ways. To represent other committees with interests in the field, the new oversight committee or committees would revert to the practice of having a member who also serves on each of the following committees or subcommittees: Armed Services, Judiciary, Foreign Affairs, and Defense Appropriations. To promote continuity and expertise, oversight committee members should serve indefinitely on the new intelligence committees. The new committees should be smaller—perhaps seven or nine members in each chamber of Congress—so that each member feels a greater sense of responsibility and accountability for the quality of the committee's work.

Here, too, the arguments are of long standing, running back to the congressional investigations of the 1970s. However, changing times reshuffle the arguments. Surely the idea of having real focal points is the right one. The objective was identical in the 1970s, but it was never fully achieved and has eroded since then as more committees have gotten into the act. In those days, the model favored by the 9/11 Commission, a single committee for both houses on the Atomic Energy Committee model, was not in favor, for it was regarded as having become the captive of the agency it oversaw. That fear that permanent committee members might become too cozy with the agencies they oversaw also led Congress in the 1970s to give the intelligence committees rotating memberships.

Now, however, those memories are distant and the need for focal points more intense. To try to achieve those points, the commission also favored the 1970s practice of appointing members from other committees with stakes in intelligence to the oversight committees. So, too, by the lights of 2004, when the commission reported, the need for experience on the oversight committees outweighed concerns over cooption, and so the commission favored open-ended assignments to

the committee or committees, not rotating ones. But these are details. The real challenge for Congress is not to lag too far behind the executive branch in its own reshaping for the intelligence challenges of the twenty-first century.

The Iran-*contra* affair two decades earlier showed how difficult it can be to manage the paradox of secret operations in an open society. When the president finally signed the finding in January 1986 for the Iran arms sales operation, that finding was explicit: do not tell Congress. The congressional overseers did not find out about the Iran operation until autumn—hardly the law's requirement of "fully and currently informed" by anyone's definition. Later on the president himself apparently was not told, when the Iran and *contra* operations crossed with proceeds from the arms sales to Iran used to fund the contras without congressional appropriation.

In another sense, however, the system worked. In deciding to sell arms to Iran, the president pursued a line of policy opposed by both his Secretaries of State and Defense, about which he was afraid to inform the congressional intelligence committees and which was liable to be revealed by Iranian factions when it suited them. It is hard to imagine any system providing more warning signals. When most of the government's senior foreign policy officials are opposed, it is likely that the policy is wrong. The president thus proceeded at his own peril.

With regard to the diversion of money for the contras, the lesson is a caution for presidents and those who advise them: do not run covert operations from the White House. Before the 1970s it would have been unthinkable for an administration to do so; then the reason was that presidents wanted to stay at arm's length from such things, even if they could not plausibly deny them in a pinch. Now, though, if covert actions are to be undertaken, they should be done by the agency of government constructed to do them—the CIA. It has both the expertise and the accountability.

Moreover, the history of covert action suggests that if the president's closest advisors become the operators, the president loses them as sources of detached judgment on the operations. The president's own circle become advocates, as Allen Dulles did in the Bay of Pigs invasion, not protectors of the president's stakes (even if he does not quite realize his need for protection). So it was with Reagan's National Security Advisors, Robert McFarlane and John Poindexter; once committed, they had reason to overlook the warning signals thrown up by the process. Excluding the designated congressional overseers also excluded one more "political scrub," one more source of advice about what the American people would find acceptable. And the chances increased that someone like Lt. Col. Oliver North would misguidedly interpret the president's interest after his own fashion.

William Miller, the staff director of the first Senate Intelligence Committee, reflected on the Iran-*contra* affair: "If clear lines hadn't been drawn a decade ago, there would have been no hue and cry now."[27] Now is the time to remember again those lines and draw them again, all the more so as the boundary between covert action and military special operations blurs.

COVERT ACTION

The "Quiet Option" in International Statecraft

KEVIN A. O'BRIEN

INTRODUCTION

SINCE THE DAWN OF THE NATION-STATE IN international relations, great powers have attempted to control and, if necessary, destroy other powers in a quest for world dominion and control. The nineteenth and twentieth centuries saw the evolution of these policies into refined, fully developed state actions throughout the world, dominated by a few powers alone. The mechanisms and methods used in this quest evolved over time, in most cases becoming more refined and successful—and generally involved three categories of activities: diplomacy, war, and "statecraft," the latter the activities of states when neither of the first two activities were viable options. Indeed, it would appear that these mechanisms of state power developed to their fullest in the post-1945 era, when the third option—statecraft and its primary instrument, covert action—became the mainstay of the Cold War.

Covert action is often been referred to as "the quiet option," both in terms of the intelligence activity and—more broadly—international relations. Used throughout human history, it became—much like the rest of the intelligence activity—a formalized, bureaucratized element of intelligence during the twentieth century. Reaching its height during the Cold War, during which it was used extensively by both East and West blocs in pursuit of both their geostrategic interests and their own rivalry, as a tool it has witnessed a few changes since the end of the Cold War.

Over the past three decades, particularly within the institutions of U.S. governance, covert action has been both far more broadly defined and constrained under legislative and executive statutes and norms; however, this has not meant an end to the use of covert action as a tool of state policy—far from it. Although

today covert action would appear to be less of a concern to those interested in the oversight and accountability of intelligence matters and activities, it has remained an often used tool of states around the world. Much like during the Cold War—and for decades, if not centuries, before it—covert action continues to be a tool used to support states' interests and rivalries around the world.

This chapter discusses the "uses and limits" (as Treverton refers to it) of covert action over history, outlining the different categories of covert action witnessed and the utility to which each was put. I provide examples as case studies of these uses and limits, and will consider the implications and impact of the use of each category of covert action outlined. I outline these uses in the different historical periods considered—war, peace, in the shadow world of the Cold War, finally considering "wither covert action today" as the post–Cold War interregnum came to a close in mid-2001 and the twenty-first century's first global war—the war on terrorism—began. My focus centers heavily on the United States (most particularly) and the Soviet Union during the Cold War—both because covert action was very much *the* tool of the Cold War's bipolar confrontation and because assessing quantifiable data on covert activities more recently is difficult (given their recent occurrence)—with other countries providing examples throughout.[1]

DELINEATING COVERT ACTION

In many ways, covert action (CA)—referred to by the Soviets as active measures—reached its height during the Cold War in terms of the extent of its uses, the bureaucracy that developed to support it, and the interest that was taken in it by the public. The scope of CA is very broad—Johnson calls it the "'third option' between diplomacy and open warfare"[2] placed firmly between these options; Godson defines it simply as "the attempt by a government to influence events in another state or territory without revealing its involvement."[3] Its covert nature allows states to use it when the first option—diplomacy—is insufficient to achieve an aim, but the second—warfare—is not an option. In British terms, covert action was always seen as "special political action," emphasizing its direct linkage to policy.[4] According to official American definitions—or, at least, delineations of covert activities—it constitutes both "such other functions and duties related to intelligence affecting the national security" and "activities conducted in support of national foreign policy objectives abroad which are planned and executed so that the role of the [government] is not apparent or acknowledged publicly" (according to the 1947 U.S. National Security Act and Executive Order 12333 signed by President Reagan in 1981).[5] This latter element—the fact that this option is chosen by governments when they do not want their presence or hand acknowledged or notable, granting "plausible deniability"—is central to appreciating all aspects of CA. Such catchall phrases have—in the U.S. case, legally speaking—allowed for the undertaking of significant covert activities by

the government in a manner that attempts to find the balance between the stagnancy of diplomacy and the risk of overt military force.

The key categories of CA are *propaganda* (also referred to as psychological operations), *political CA* (CPA), *economic CA*, and *paramilitary CA*.[6] Each will be explored in greater depth in this chapter.

Godson also provides a distinction between covert action and counterintelligence, where the latter is "targeted at adversary intelligence operatives and their political masters" compared to the former which targets "non-intelligence players"—this distinction is as true in the twenty-first century as it was during the Cold War.[7] Finally, covert action is linked to but not an element of the intelligence process: it can both contribute and react to intelligence. As Steiner warns recently, CA is "the most sensitive technique for implementing national security policy. . . . [CA] is all about making things happen, while intelligence consists of making the right decisions about what to make happen."[8]

COVERT ACTION THROUGHOUT HISTORY

Since the dawn of time, CA has been used as an element of societies both conducting intelligence activities against each other and wishing to undermine each other. Examples throughout history are manifold—a key example of covert action was the bribery of foreign officials and rulers as a means of persuasion. As Blackstock notes, throughout the eighteenth century, the major European powers used secret state funds extensively (and unsuccessfully) to bribe various foreign leaders to their cause—such as in Sweden in the 1740s, when England, France, Russia, and Denmark spent enormous sums on the bribery of political party leaders, with little result.[9]

During periods of war in the twentieth century, CA was used extensively. In World War I, the so-called Campaign in the Desert carried out by Lawrence of Arabia saw a key, covert sabotage and destruction raiding element deployed—using British officers and Arab (Bedouin) tribes to both distract the Ottoman Turks (whom, as allies of Imperial Germany in the War, the British were fighting in the Middle East) and press the British advantage in capturing and securing large territories in the Middle East against French and American interests. Such guerrilla warfare tactics that Lawrence developed became the touchstone for similar activities in the post-1945 decolonization wars and the example on which most Western covert paramilitary insurgency/counterinsurgency tactics were predicated.[10]

As World War I drew to a close and the Russian Revolution and subsequent civil war gathered momentum, the teeter-totter of the twentieth century's global conflict between the forces of worldwide communism and capitalism began to deploy CA as a key element of the struggle between them. Though such activities came into their prime during the Cold War period, during the interregnum of 1917 to 1939, CA was used widely by newly established Soviet Russia to both

counteract the activities abroad of anti-Bolshevik elements (especially in the United Kingdom and United States) and to begin the spread of world socialism through the Communist International as the first stages of worldwide socialist revolution. One of the best (and most successful) examples of this in history was the Monarchist Association of Central Russia, better known as "The Trust": targeting White Russian émigré groups in a massive deception operation aimed at penetrating these groups and flushing out remaining White Russian supporters and sympathizers back in Soviet Russia.[11]

In Ireland, following the 1916 Easter Rising, the newly formed Irish Republican Army under Michael Collins used covert tactics to harass, assassinate, and sabotage institutions and individuals of British power in Ireland during the Irish War of Independence (1919–21)—and later the opposing side in Irish civil war (1922–23)—so successfully that his activities became the template for covert urban and rural paramilitary operations for the rest of that century.[12]

During World War II, CA was used extensively in many forms—economic, political, paramilitary and (certainly) psychological—to support the overt war operations. Indeed, it could be said that the war began with a covert paramilitary operation that simultaneously had an extreme propaganda intention: the deployment of German soldiers, SS men dressed in Polish uniforms (in their own pseudo-operation), and dead concentration camp inmates at the German-Polish border to give the impression that Germany had been provoked into counterattacking Poland on September 1, 1939.

The May 1942 assassination in Prague of SS intelligence chief Reinhard Heydrich by Czech partisans working with the British Special Operations Executive (SOE) is a prime example of assassination as a form of covert paramilitary action. Indeed, the very establishment of the SOE, its sister organization the Political Warfare Executive, and the U.S. Office of Strategic Services (OSS) were all aimed at establishing the ability to conduct covert operations against Axis interests throughout the territories that they occupied during the war. Significant deception operations—such as the Double-Cross System used in the intelligence war between the British and Germans on the personal level and Operation FORTITUDE, the massive deception operation used to support the D-Day landings, on the grand strategic deception level—were played out as a component of both covert political action and psychological operations. Overall, the quantity and variety of covert actions deployed during World War II was massive.[13]

COVERT ACTION DURING THE COLD WAR

It was truly during the period since 1945—centered on the Cold War period—when covert action came into its prime as one of the key elements of statecraft. The Cold War could be appreciated as "a war carried on by means short of sustained, overt, military confrontation," implicitly conveying the understanding that the confrontation between the Western world (dominated by the United

States) and the communist bloc (dominated by the Soviet Union) was covert in nature—resorting more often than not to nonmilitary means in an attempt to undermine the authority of the opposing power while maintaining control and influence over their own sphere. This clash was not unforeseen: Lenin stated in 1921 that "the existence of the Soviet Republic side by side with the imperialist States is in the long run unthinkable . . . a series of the most terrible clashes between the Soviet Republic and the bourgeois States is unavoidable."[14]

In this sense, therefore, the origins of the use of covert action during the Cold War lay with the governments of both the United States and the Soviet Union and their interactions both between the years 1919 and 1939 and during World War II. The main concern of the United States (as well as significant Allied countries, such as the United Kingdom, Canada, and Australia) was the growth in communist influence within Western societies. This increased until, during the period following the early days of the Cold War, it was perceived as "the global challenge of Communism . . . to be confronted wherever and whenever it seemed to threaten our interests."[15] Ultimately, as Maurer has pointed out, whereas the United States—like most democratic countries (as well as leading regional powers such as South Africa or India)—tended to distinguish between overt and covert activities, "the Soviet Union [placed] a premium on influencing other countries' beliefs about both itself and the [United States], and that the Soviets [made] little distinction between overt and covert means [in so doing]"—an important distinction to keep in mind throughout this chapter.[16]

Covert action during the Cold War symbolized an ideological conquest for the soul of the world that was the basis of the rivalry between the Western and Soviet (East bloc communist) intelligence services. Within the period of 1945 to 1991, both powers developed their security and intelligence services as a mechanism by which this confrontation could be carried out; in the United States, the Central Intelligence Agency (CIA) was founded in 1947 for (originally) the purpose of intelligence collection and dissemination. In the Soviet Union, the KGB was reorganized out of the previous intelligence and security services following Stalin's death in 1953. Both services soon rapidly developed covert action arms that far outweighed their intelligence collection missions. In the case of the KGB, such activity had been the mainstay of the previous incarnations of Soviet security (Cheka, GPU, OGPU, NKVD, MGB, MVD), whereas the United States had only developed such an ability with the founding of the OSS during World War II—which was disbanded at the end of the war, two years before the founding of the CIA.

The Development of U.S. Covert Action

In any discussion of covert action—particularly within the Cold War context—the United States provides some of the best (and worst) examples. Covert action is an instrument of statecraft that the United States had long deployed (as with any other power) over the course of its development and expansion (at the

least, following the 1898 Spanish-American War). In the post-1945 period in its confrontation with the Soviet Union—both directly and, more frequently, indirectly—the United States used CA extensively and increasingly. Given the nature of the Cold War, CA became the tool for the United States to deploy to both further its interests and undermine its adversaries, particularly the Soviets, in pursuit of their own interests. Indeed, the establishment of the primary tool—the CIA—by which covert actions were developed and used changed the entire raison d'être of the agency as it was originally envisaged. Covert action developed largely due to the plausible deniability implicit in its definition, and the official delineation of CA ("such other functions and duties related to intelligence affecting the national security," as taken from the 1947 National Security Act) provided foreign policy makers the "allowance" to use the CIA to conduct clandestine operations as its primary mission, rather than the collection and dissemination of intelligence as the original formers of its mandate envisioned. This has been further institutionalized by the Executive Orders of successive presidents.[17]

This is not to say that using such means are peculiar to the post-1947 period in U.S. foreign policy. In reality, the use of such covert actions in U.S. foreign policy took flight at the end of the nineteenth century with the Spanish-American War but began their development much earlier. Although a complex subject unto itself, such capabilities and operations that were later inherent to American covert activities abroad were the direct descendants of the methods of intervention, control, and subversion that the United States deployed—particularly in Central and South America—as part of its Monroe-driven hemispheric hegemony during the second half of the nineteenth and first half of the twentieth centuries. These included the processes of direct and indirect interventions, the use of front or partner organizations (such as the United Fruit Company) in assisting with such control, and the deployment of covert economic and political activities to further those methods of control. By the 1950s, these same approaches had matured into fully developed covert action capabilities.

The Growth of U.S. Covert Action Capabilities

Despite the growth of its covert (and overt) intervention and control capabilities during the previous 100 years, by 1941 the United States—unlike the Soviet Union, the United Kingdom, and virtually every other major power in the world—still did not have an established intelligence service. The attack on Pearl Harbor caused the United States to seriously reexamine their intelligence abilities, as this came to symbolize the worst failure ever of intelligence facilities in modern times.[18] Realizing that it could never again suffer such a surprise attack and to avert it from happening again, the U.S. government determined that it would be necessary to establish a foreign intelligence service with the aim of information collection, covert action, and counterintelligence.

In July 1942, Roosevelt established the Office of Strategic Services (OSS) to coordinate and develop methods of subterfuge and covert warfare. At the end of World War II, Truman abolished the OSS as unnecessary in its current form, having been designed for war. But it was soon apparent that the need for strategic intelligence, which had been divided up under control of the various branches of the military and state departments, would be of increasing importance as tensions began to build with the Soviet Union. The framework for this was pronounced in Kennan's famous article, "The Sources of Soviet Conduct", in which he stated that "in these circumstances it is clear that the main element of any United States policy toward the Soviet Union must be that of a long-term, patient but firm and vigilant containment of Russian expansive tendencies . . . by the adroit and vigilant application of counter-force at a series of constantly shifting geographical and political points, corresponding to the shifts and maneuvers of Soviet policy."[19] The worldview that this professed was further outlined in Eisenhower's secret 1954 National Security Council (NSC) memorandum, which stated: "If the US is to survive, long-standing American concepts of 'fair play' must be reconsidered. We must develop effective espionage and counterespionage services. We must learn to subvert, sabotage and destroy our enemies by more clear, more sophisticated and more effective methods than those used against us."[20] This centered on the idea that the Soviets would need to be confronted throughout the world on an increasingly involved level; this led Truman to institutionalize, through the Department of Defense and the Central Intelligence Group (later Agency), the military and intelligence/covert bureaus as the key arms of conducting this covert foreign policy.

In 1946, Truman established the Central Intelligence Group (CIG), modeled on the OSS; on July 26, 1947, the National Security Act was passed by Congress, replacing the CIG with the CIA and establishing the NSC as the sole advisory committee reporting directly to the president on matters of national security. This was followed two years later by the Central Intelligence Agency Act, which further defined the CIA's mandate.[21] As one of the five directives granted it by the National Security Act, the CIA was authorized to "perform such other functions and duties related to intelligence affecting the national security as the National Security Council may from time to time direct."[22] The ambiguity found in this directive was included to "provide flexibility to the newly created CIA in order to meet unforeseen challenges."[23] In reality, it was perceived to grant the authority to undertake covert actions around the globe as often as it liked without the necessity of congressional approval, some of which came dangerously close to undeclared war operations against foreign governments.

U.S. Covert Action During the Cold War

Contemporary politics had a great deal to do with the origins of the policies related to covert action. In the case of the CIA, Europe during the late 1940s and

into the 1950s was the United States' prime concern. Reconstruction was being carried out in Western Europe, but communist influence was strong. Politically in Italy and France, the communists threatened to destabilize the postwar political and economic balance that the United States was attempting to establish throughout the Western world. In addition, communist unions and organizations posed serious threats to the economic and social welfare of rebuilding Europe. In support of this covert confrontation within the emerging Cold War, the Covert Action Staff (CAS) was established within the CIA and given the Kennan-esque task of rolling back communism, initially in Europe.[24] The CAS—residing initially in the Office of Special Operations, which gave way to first the Directorate for Plans and later the Directorate of Operations—was to serve as a complementary branch to the Office of Policy Coordination (OPC)—itself founded in May 1948 on Kennan's encouragement and intended to "undercut debilitating strikes by Communist trade unions and election advances by Communist parties."[25] These operational roles were laid out in not only the National Security Act of 1947 but also in directives like NSC 10/2 and NSC 5412/2.[26] NSC 10/2, passed on June 18, 1948, by Truman, stated that "the overt foreign activities of the US Government must be supplemented by covert operations," which initiated the CIA's program of propaganda and paramilitary action against the Soviet Union. These operations could involve activities "up to a level just short of armed conflict by recognized military forces."[27]

This policy can be clearly summarized in three points: create and exploit problems for international communism, discredit international communism and reduce the strength of its parties and organizations, and reduce international communist control over any areas of the world.[28] More directly, as Marchetti and Marks state, "in most countries . . . the United States policy [was] usually to maintain the *status quo*, so most [CIA] subsidies are designed to strengthen the political base of those in power."[29] But the status quo could prove difficult to maintain, as Kolko notes: "The credibility of American military power and the emergence of geopolitical analogies and linkages in the form of the domino theory soon subjected US behavior and policies in many areas to new influences that paralleled and sometimes outweighed the more traditional narrower assessments of the economic and political stakes involved in success of failure, action or inaction, in some nation or region." This in turn led to "A growing number of de facto and formal alliances with Developing World surrogates . . . raising for the first time the United States' increasing dependence on inherently unstable men and regimes."[30]

The original policies of the CIA were to stabilize Western politics in favor of the United States as much as possible during the postwar period, while at the same time destabilizing and removing any elements that could threaten economic reconstruction and the political stability that it was intended to bring. The CAS was used extensively in support of this; however, by 1954 with the consolidation of American power in Europe—and the full development of the paramilitary capacity of the CIA—the agency turned its focus onto the developing world.[31] The shift of

focus from Eastern Europe to the underdeveloped countries during the 1960s was due to, first, the establishment of the Iron Curtain and the Berlin Wall, lessening availability/opportunities to use classical forms of intelligence collection, leading to heavier reliance on electronic intelligence; and second, the general development of increased activity with policies in developing areas and the shift from a Soviet/Chinese focus to one on the developing world.[32] Furthermore, following African decolonization, CIA activity in Africa increased 56 percent (1959–63) due to fears of Soviet encroachment on these newly independent states.[33]

This shift in focus to the developing world was not solely due to the emerging Cold War confrontation there; it was also a continuation—indeed, reinvigoration—of previous American (and other powers') neocolonial interests in these countries. The 1953 joint CIA–Secret Intelligence Service (U.K.) operation in Iran in support of the shah (and, in turn, his support for the Anglo-Iranian Oil Company) and the 1954 operation in Guatemala (which attempted to use (once again) the United Fruit Company as a covert conduit for intervention, which ultimately was rejected by the company) both exemplified perfectly the growing interlinkage that the United States and other Western powers feared between socialist/communist movements and the efforts of decolonization (including its associated moves to "nationalize" strategic assets previously owned by Western companies, alongside other politico-economic moves that disturbed Western intelligence services and their political masters. Given the assistance that the Soviet Union rendered to these "national liberation" movements, one can find the central interests of Western intelligence in the 1950s and 1960s at this crossroads between the West's attempts to forestall or otherwise control the decolonization process while conducting similar efforts to confront the spread of Soviet influence and interest in the developing world.

These shifts also resulted in the aforementioned overall change in focus and mission of the CIA from an agency dedicated to intelligence collection and counterintelligence actions against its main adversary (the Soviet KGB and its satellite services) to an agency focused heavily on covert actions throughout the developing world—most of these the general (or even specific) continuation of the twin U.S. policies of noninterference and intervention practiced from the nineteenth century onward. The diachronic growth of covert action has been relative to the rapid growth of other aspects of foreign policy implementation due to the leading role the United States has played on the world stage since 1945. As successive presidents have been presented with the opportunity to use this quiet option rather than the other means of intervention, its very use increased immeasurably the number of times it would have to be used.[34] This self-perpetuation is just one of the problems that exist—the other being how successfully congressional oversight has ensured both adherence to mandates by the agencies involved and the accountability of the executive in authorizing covert actions.

In 1975—known as the Year of Intelligence, in which the U.S. intelligence community (and most particularly the CIA) were labeled as a "rogue elephant on the rampage" by the congressional Church Committee, investigating a growing

succession of revelations relating to illegal covert activities conducted overseas by U.S. intelligence and military agencies (many dealing with the assassination of foreign nationals and leaders)—Congress moved to regain control over these activities. Starting with the 1974 Hughes-Ryan Act, which established a law requiring the reporting of secret arms sales and covert actions to the congressional intelligence review committees, Congress passed its own succession of legislation attempting to control such operations—including the 1980 Intelligence Accountability Act and the 1982 Boland Amendment.[35] However, as was evidenced by the Iran-*contra* arms dealers, who found their way around even these types of stipulations, serious flaws may continue to exist in the safeguards established to prevent such things from occurring.[36]

Soviet Covert Action Development

In the case of the KGB, the Soviet intelligence services were carrying out such actions since the time of the Russian Revolution (such as the noted example of the Trust). Covert activities—clandestine political action in particular—were considered to be "the central thrust of the Kremlin's [foreign policy] . . . the leaders' prime executor of such policies is . . . the KGB."[37] From 1945, the United States was referred to as the "main adversary" of the KGB, a designation indicating the main focus of all activities, and as such policies were designed to take this into consideration.[38] KGB goals were not laid out as clearly as those of the CIA, but their aims do not seem to differ that much: generally an effort to influence the world toward a policy of friendliness for their parent state. Where they did differ was in their actions and aims against communist dissidents, defectors, and other threats to the continuation of the global communist revolution.

The KGB became the main arm of the Kremlin in dealing with both world communism and communists around the world. On the former, it justified the control it exerted over all aspects of international communism (client regimes, front organizations, proxy armies, etc.) by stating that "to ignore the activities of international progressive public movements . . . may isolate and weaken national revolutionary forces . . . fraught with the danger of defeat."[39] On the latter, it used its international reach to undermine and if necessary silence those from the East Bloc communist countries who had defected or otherwise organized external opposition to the supremacy and longevity of the Soviet state.

Soviet interests were essentially the same as in the West: a desire to establish influence throughout as much of the globe as possible. In the 1940s and early 1950s, these activities were focused on Europe. But like the CIA, the KGB shifted its focus to the developing world during the 1950s and 1960s, attempting to establish influence in this uncultivated area. One of the most significant defectors to the CIA throughout the course of the Cold War, Anatoli Golitsyn, stated that in 1959 the KGB's primary mission had changed from conventional espionage to "covert statecraft": the use of agents and other mechanisms to achieve geopolitical goals.[40] One final aspect of the relationship between the KGB and its

proxies was that the KGB was itself the sword of another organization, the Communist Party of the Soviet Union (CPSU). All actions the KGB undertook internationally throughout the period were coordinated with the International Department of the Central Committee of the CPSU; the KGB was the conduit for implementing the internationalist policies of the party. The main branch of the KGB that carried out these activities was Department D (later Service A) of the First Chief Directorate; this department coordinated action directly with the International Department.[41] Much of this emerged out of the prewar policies of the COMINTERN: developing international organizations with the "basic aims of promoting the national Communist parties, propagating the Soviet line, and developing political forces subservient to Moscow."[42]

EXAMPLES OF COVERT ACTIVITIES

Propaganda and Psychological (Information) Operations

Propaganda—often referred to as psychological warfare/operations or *psy ops*—is a broad category under which a wide range of information operations can be undertaken. As part of what he refers to as "political warfare" (i.e., statecraft and covert action), Janowitz defined propaganda as "the planned dissemination of news, information, special arguments, and appeals designed to influence the beliefs, thoughts, and actions of a specific group."[43] Focused generally on activities undertaken as part of both covert and overt action—with corresponding deployment of white and black propaganda—it is often deployed in conjunction with other covert activities (e.g., covert political action) and with a wider aim than simply to propagandize. It can include activities in peacetime (such as benign government spin or malign persuasion activities) or wartime (such as military communications operations, cyber or "information" operations, or active psychological operations on both the tactical and strategic levels). A good example of such activities would involve leaks to various press outlets, either friendly (Western) or national outlets within the target country, in which a certain story or approach to a story is conveyed—for example, a pro–United States or pro-Soviet story in a country where the government opposes said power. Through this medium, native citizens can be seen to be supporting a particular U.S. position contrary to their own government, with the intended outcome often being the aiding or debasing of foreign political figures.[44] In one way, this is nothing new in the twentieth century: in a June 1853 article in the *New York Tribune* titled "The Russian Humbug," Karl Marx discounted widespread European press reports of Russian troop movements toward the Balkans as "nothing but so many ridiculous attempts on the part of Russian agents to strike a wholesome terror into the Western World."[45]

One key aim of propaganda is "persuasion": a term encompassing issues broader than simple propaganda, persuasion may be a mixture of threats and appeals which include a large element of spiritual or physical coercion and

violence. This can include the use of bribery, blackmail, and the threat or application of such physical acts of violence as kidnapping, torture, and the use of "controls" over selected targets or agents. In this sense, "persuasion" is directly linked to what Allen Dulles described as the primary interests of "clandestine intelligence collection"—or espionage.

These activities were practiced equally by both Superpowers during the Cold War: in the 1950s, the US established a Psychological Strategy Board directly responsible to the President.[46] The Soviets subscribed to the same principle: "persuasion first, coercion afterward."[47] The media was used extensively in this pursuit by the CIA, the KGB, and virtually all any other intelligence service who wished to promote a particular view. The policies behind media usage were clear: general propaganda and support of one's own policies were the goal. To achieve this, the CIA used

> networks of several hundred foreign individuals . . . who provide intelligence for the CIA and at times attempt to influence foreign opinion through the use of covert propaganda. These individuals provide the CIA with direct access to a large number of foreign newspapers and periodicals . . . press services and news agencies, radio and television stations, commercial book publishers, and other foreign media outlets.[48]

For the KGB, a distinction was made between propaganda and disinformation: propaganda was described as "directly attributed to the Soviets, the satellites, the client states, or the obviously predisposed," whereas disinformation was "seldom attributable to these sources and depends on its false attribution to an ally, to 'discovered' classified documents that purport to reveal plans to attack the USSR and to other rumors, forgeries and orchestrated deceptions with enough verifiable content to raise serious doubts among allies."[49] Irvine has pointed out, half-jokingly, that "the extension of Communist control over vast areas and populations since the end of the Second World War has owed more to the propaganda and disinformation offensive of the Communist countries than to the power of their arms."[50]

While Radio Free Europe/Radio Liberty—established in 1949 and 1951 respectively, and run by the CIA until the early 1970s—operated overtly,[51] the hand of the U.S. government was covert, as it was assumed that they would "be more effective if the role of the [USG] was not apparent."[52] Other examples of CIA use of radio propaganda include the Voice of Liberation radio used during the coup in Guatemala in 1954;[53] Radio Nejat (Liberation) out of the "Front for the Liberation of Iran" to which the CIA reportedly paid $100,000 per month in 1982;[54] and Radio Swan, established under the Gibraltar Steamship Corporation in Miami, against Cuba from 1960 (this later became Radio Americas and Vanguard Service Corp., respectively, after the Bay of Pigs invasion) until 1969.[55]

The KGB never used radio to the extent the CIA did but preferred to carry out its active measures in disinformation and propaganda through surrogates in the communist world and by influencing the print press. The aim behind such

usage was as noted: propagating the Soviet line, encouraging negative reactions to their opponents, and recruiting and developing agents. This was done through a number of methods, the primary of which was the planting of *dezinformatsia* in neutral papers either knowingly or unknowingly. An example of this was the late 1960s reporting of the use of bacteriological weapons by the United States in Indochina in the Bombay *Free Press Journal*. This story was picked up by the *Times* in 1968, as well as other Western print media.[56] Another example was London's *New Statesman*, which was unwittingly used in November 1982 to discredit U.S. Ambassador to the United Nations Jeane Kirkpatrick by linking her with South Africa's infamous security police and South African military intelligence.[57] A final example is the use of the media to better leaders' images: stories picked up by *Time* and *Newsweek* during Andropov's tenure as chairman of the KGB stated that he was "a closet liberal" who "speaks English well . . . collects big band records and relaxes with American novels, [and] sought friendly discussions with dissident protesters."[58] The KGB also used press agencies as fronts extensively—such as the Novosti Press Agency, which acted "as one of the vehicles for Soviet 'active measures'—both for the promotion of stories and to act as 'covers' for KGB officers abroad."[59] Finally, individual journalists—such as Danish journalist Petersen who was directed to attack the British Conservative Party, Thatcher, and other anti-Soviet elements in British politics between 1973 and 1981 through pamphlets and articles either written by himself or by Service A under his name[60]—to push the party line covertly. Indeed, Barron states that out of the approximately 500 Soviet journalists abroad at any given time during the later Cold War, although the majority were intelligence officers, the minority (who weren't free to travel outside of the Soviet Union without KGB authorization) could not refuse a request by the KGB to carry out an assignment.[61]

The CIA used similar methods, but not to the same extent. In 1953, Allen Dulles expressed the desire to use the press for both intelligence collection and propaganda.[62] However, rather than doing so blatantly, the CIA relied on U.S. journalists who would want to "help their country,"[63] maintaining a vast network of reporters, magazines, electronic media, and other media personnel to supplement official information to promote current U.S. policies—including covert propaganda and psy ops—through quiet channels.[64] Though most did so unknowingly, the CIA did use journalists directly—both American and foreign nationals—in "clandestine relationships of one sort or another" with the CIA.[65] Carl Bernstein claimed that more than 400 U.S. journalists secretly carried out CIA activities from 1952 to 1976. The Church Committee stated fifty for the same time period, CIA official sources suggest thirty-six.[66]

Finally, the CIA also funded and covertly supported newspapers, journals, and other print media around the world. Some, like its funding of *Der Monat* (FRG), *Encounter* (U.K.), and the *Daily American* (Rome),[67] was within the context of direct rivalry with the Soviets. Others, like *El Mercurio* (Chile) and *Elimo* and *Salongo* (Angola),[68] were to promote CIA interests in a specific region of the globe in support of other operations—for example, during the Vietnam

War, the CIA allegedly wrote whole articles for *The Economist* on the war.[69] Last, numerous books were published with covert CIA funding and support—including *The Dynamics of Soviet Society* and *The Foreign Aid Programs of the Soviet Bloc and Communist China*.

Covert Political Action

The second and perhaps most extensively used form of CA is *covert political action* (CPA). Treverton defined CPA as "attempts to change the balance of political forces in a particular country, most often by secretly providing money to particular groups."[70] Blackstock further broke down CPA into three stages: *infiltration-penetration*, *forced disintegration*, and *subversion-defection*. Infiltration ("the deliberate/planned penetration of political and social groups within a state by agents of an intervening power for manipulative purposes") as well as subversion ("the undermining or detachment of the loyalties of significant political and social groups within the victimized state, and their transference, under ideal conditions, to the symbols and institutions of the aggressor") are the most relevant here.[71]

CPA has often provided the central desired outcome in a covert action where other activities—such as paramilitary or propaganda activities—have also been deployed. In some senses, therefore, CPA can be seen as the strategic covert action (encompassing propaganda/disinformation, direct political influencing, paramilitary support, and use of social organizations where related to the Cold War confrontation) and other activities intended on attaining a political outcome.

CPA has been conducted both directly by the state seeking an intended outcome and by proxy or partner organizations working on behalf of the state. The latter have taken many forms: for example, both the CIA and the KGB attempted to influence political parties throughout the world in an effort to directly or indirectly undermine the influence of the other, as well as to further consolidate U.S. or Soviet interests in a region. Social organizations, such as student groups, international front organizations and legitimate bodies, and proxy armies were founded, penetrated, and funded by both services. Media outlets, individuals, and services were utilized either knowingly or unwittingly by the CIA and the KGB. Various corporate organizations or services were used as fronts for CIA or KGB activities across the globe. Finally, individuals fell prey to or were used by such activities in such gambits as false-flag recruitments, the deployment of agents of influence, and the role of defectors and disinformation agents in both Cold War camps.

PERSUASION AND INFLUENCE

Blackstock refers to this as manipulative persuasion or control, in which—in the pursuit of intelligence collection activities—the source is controlled or made

dependent on his handler through payment in money, goods, drugs, sex, or other perquisites. The latter activity included the use of first- and second-level agents (targets and people with access to the targets) for manipulation and control, as well as the use of bribery or "quiet assistance," as William Colby referred to it. Such activities were nothing new for the United States (as with other powers). Bribery had been used extensively as a form of persuasion for centuries. In the first U.S. congressional appropriation act in 1789, a contingent fund for the bribery of foreign statesmen in the pursuit of American national interests was approved as part of the public purse.[72] More recently, recipients of funds as part of these activities reportedly included the Christian Democratic Party of Italy, King Hussein of Jordan, and various pro-Western factions in Greece, Germany, Egypt, Sudan, Surinam, Mauritius, the Philippines, Iran, Ecuador, and Chile.[73] The influencing of elections—especially in Western Europe, where the United States pushed the opening of Europe to ensure the development and continuation of economic reconstruction along friendly lines—was a prime CPA activity; indeed, Treverton states that these election projects became central to all nonmilitary CA in the future.[74] CPA was developed even further under Dulles in the 1950s: his personal interests in securing democracy against the Soviets in Eastern and Western Europe led to a dominance of CPA during the 1950s, with direct influence on parties and politicians in Western Europe,[75] which continued over the years.

Case Study: Italian Elections and CIA Funding

Italy provides the best example of the use of CPA funding to influence elections. Beginning with the 1948 Italian elections, in which the CIA funded heavily the Christian Democrats, between 1948 and 1975, over $75 million was spent by the CIA on Italian elections, $10 million for the 1972 elections alone. The CIA reportedly funded over $1 million to Amintore Fanfani, the secretary-general of the Christian Democrats, in the 1970 elections; at the same time, over $800,000 was given to Gen. Vito Miceli, leader of the neofascist MSI and former head of Italian military intelligence, to ensure success. Even following the Church Report (1976), President Ford approved an additional $6 million for the next election.[76]

The CIA was most often the instrument used to provide clandestine support to such parties and states not only because of its black budget, which allowed for expenditures without justification (unlike, for example, foreign aid budgets) and meant that often the recipient might not even be aware of from whence the funds derived. Finally, it also provided the U.S. government with the all-important plausible deniability should such activities come to light.[77] Other states/parties that received such extensive support included the new Federal Republic of Germany and its Christian Democrat Party (and, reportedly, the Social Democratic Party), as part of wider CPA efforts in West Germany to establish or revive

anticommunist, pro-American institutions, discrediting and destroying leftist opposition movements.[78] The Christian Democrats—favorites of the CIA around the world—were also supported in Portugal following the April 1974 coup.[79]

The KGB was also active in this regard. In general, foreign Communist Parties were used as auxiliaries by the KGB as well as recruiting grounds in foreign countries (there is no evidence found to indicate that the CIA recruited within these Communist Parties, although logically this would have often been the case).[80] For example, a great deal of the activities of the French Communist Party were directed from Moscow and were used as a means of penetrating the French government.[81] Moscow Centre's instructions to its stations in this regard states that the main thrust of active measures were to achieve political influence and penetration, such as in Denmark.[82] Overall, although there is indication of attempts made to influence the socialist parties in Western Europe, in general (with the possible exception of the British Labour Party) there has been little success by the KGB in influencing any noncommunist party in Western Europe.[83]

In the developing world, the use of political parties was significantly different. Whereas in Europe, influence over political parties was carried out purely along ideological lines, in the developing world a different pattern emerged. It appears that the CIA operated under the belief that if a party was not aligned with Washington and was not helped along toward that end, then it would automatically fall into Moscow's camp. As is clearly evident with hindsight, nothing could have been further from the truth; indeed, as the example of Castro in Cuba in 1959–60 provides, there were clear cases where such parties were scorned by the CIA or even pushed into the KGB/Soviet camp through CIA action/inaction. Prados refers to these CIA-supported parties as "third force" political movements—generally noncommunist (preferably anticommunist) but also not fascist and politically moderate (usually Christian Democrats). In Latin America, they were usually associated with established oligarchies and in Africa and Asia with tribes. In instances where no third force existed, one was created: examples include the Committee for the Defense of National Interests (Laos), Committee for a Free Albania, Holden Roberto in Angola, and Mobutu Sese Seko in the Congo. The problem that emerged with these groups was that usually, such minorities did little to satisfy general, popular aspirations and often led to further upheaval and, as in Laos, additional obligations for U.S. support. They were generally perceived as "agents of American power."[84]

Case Study: The CIA in Chile, 1963–74

The most obvious case of CIA involvement with developing world political parties is that of Chile. Overall political control and penetration was attempted through the Organization of American States to legitimize U.S. anticommunist actions throughout the hemisphere but was largely unsuccessful. But in Chile, after fears that Allende would become another Castro for the United States to deal with, a psy ops action was authorized that started in 1963 and lasted until

Allende was deposed in 1973. Consequently, the CIA intervened in every election in that time. During the Popular Unity coalition government in Chile, the Christian Democrats and the National Party were funded with over $4 million from the CIA; at the same time, monies were used to attempt to lure away factions from the coalition. In 1964, $2.6 million was given to the candidate Frei (who later won) to prevent Allende and the socialists from gaining power.[85] The United States also spent—through the CIA, supported by various private corporations (such as ITT) with business interests in Chile—$12 million to blacken Allende's name.[86]

On its side, the KGB generally helped communist and socialist movements in the developing world, but almost without exception only when they were linked to paramilitary formations involved in war. One clear example is that of the Popular Movement for the Liberation of Angola (MPLA), supported by the KGB until 1974, when Cuba became their prime supporter at the time of the Portuguese coup. This was against not only Jonas Savimbi's South African– and CIA-backed UNITA but also (as noted) Holden Roberto's CIA-supported National Front for the Liberation of Angola (FNLA), the largest anticommunist party in that country.[87] This provides the perfect (and perhaps best) example of a developing country where at least three sides were supported against each other (and their benefactors) to the detriment of the country and its citizens. In Afghanistan, the head of the dominant faction in the Afghan Communist Party, Babrak Karmal, was a KGB agent. Moscow Centre was also reported to have a number of agents directly in Nasser's entourage, including Nasser's head of intelligence.[88] Finally, Andrew and Gordievsky state that the African National Congress (ANC) was greatly penetrated by the KGB due to the ANC's close links with the South African Communist Party, itself deeply tied to Moscow.[89] Finally, a strong example of CPA activities by a Soviet satellite is the extensive operations conducted by Markus Wolf's Foreign Intelligence Division in the East German Ministry for State Security (or Stasi) against the West German government in Bonn (as well as business circles throughout West Germany) over many decades of the Cold War, resulting in the resignation of West German Chancellor Willy Brandt in 1974 after his private secretary was exposed as one of Wolf's moles.

In general, though, neither the KGB nor the CIA were very successful in their usage of political parties in the developing world. The United States and, to a lesser extent, the Soviet Union failed to understand the nature of developing world socialist movements and their links to international ideologies. As already stated, the end result more often than not was additional problems for the individual service, whether on a massive scale such as Indochina and Afghanistan or on a smaller scale such as Central America or Angola. As Prados states, one of the problems of working through proxies is that of suffering political liabilities as a result of acts by such allies, as well as the obvious one of lack of full or even sufficient control over these allies. Examples of such problems would include the

drug smuggling carried out by the Indonesian military regime, Li Mi's Chinese, and Vang Pao's Meo.[90]

FRONT ORGANIZATIONS

The extensive development and use of front organizations by both the CIA and KGB—as well as other intelligence services, such as the Israeli Mossad and the apartheid South African National Intelligence Service and Police Security Branch—provides some of the best examples of covert political activities. Some such fronts include the proxy-ized political parties noted above, but the truest of such organizations were those without apparent linkage to any foreign government.

The use of front organizations by both the CIA and KGB was widespread throughout the whole of the Cold War. These organizations took on different guises depending on the requirements of the period, the intended action, and the hoped-for outcome. In the case of the CIA, however, the vast majority of these fronts were direct appendages of the agency. The CIA's policy was to base its support on a wide range of groups and institutions (besides political parties) in various countries to "shift the balance of that country's politics by countering groups perceived as threatening to American interests and aiding those friendly to the United States."[91] In the case of the Soviets, the KGB often acted as a filter for other Soviet organizations (primarily the International Department of the CPSU); therefore, even in instances where a front was not a direct arm of the KGB, it was linked through the committee to other organizations.

For the Soviets, who had established the use of fronts with the GRU (Soviet military intelligence) in the 1920s to obtain monies and economic considerations without it being apparent that these were going to the Soviet Union,[92] their policy was articulated in the March 1926 statement from the Comintern advocating "creating a whole solar system of organizations and smaller committees around the Communist Party . . . actually working under the influence of the Party, but not under its mechanical control." The overall task of these fronts were to "advance the cause of Soviet Communism, to defend the policies of the Soviet Union . . . and to attack the policies of those it opposes." They were also used to recruit agents, provide covers for illegals, and "mould and manipulate public opinion."[93] Most of the fronts that the Soviets used during the Cold War were legitimate in their founding but were captured by the Soviets during the period from the 1920s until 1950.

The CIA's approach to fronts was generally to use a variety of corporate fronts, usually referred to as either "proprietaries" or "Delaware Corporations,"[94] which took many different guises and forms throughout the Cold War, depending on geography, mission, and time. Indeed, it could be argued that the post–Cold War growth in private security and military companies operating internationally—and the role that they fill not only for their client governments or corporations in the Developing World but also in the contracts that they undertake on behalf of Western governments—are a direct descendant of such organizations However,

throughout the Cold War and as far back as the U.S. government's use of Vinnell Corporation in Mexico in the early-1930s and throughout World War II (later described by a CIA official as "our own private army in Vietnam"), such private security and military companies provided the same type of service that was secured through these fronts, under very similar circumstances of plausible deniability and ease of use far from the public's eye.

The most well-known type of proprietary was the air corporations. These were established (generally) during the wars in Indochina and in relation to the conflict between Formosa (Taiwan) and communist China; the best known of these was Civil Air Transport (CAT),[95] used in operations involving Li Mi's Nationalist Chinese forces, as well as in support of the French in Indochina, and Air America, which emerged out of the CAT experience and the desire for an International Volunteer Air Group in Southeast Asia.[96] Double-Chek Corporation, listed as a brokerage firm in Florida government records, was in reality a recruiting front for pilots flying against Cuba after 1959; many of the pilots flying B-26s out of Central America against Cuba were recruited by a company called Caribbean Marine Aero Corp. (Caramar), a CIA proprietary.[97] More recent examples include Summit Aviation, which was linked to the CIA during the 1980s with operations in El Salvador and Honduras;[98] and St. Lucia Airways, which, although they deny it, was conclusively tied to the Iran-*contra* operations (along with several other such fronts) as well as to operations in Angola and the Congo (Zaire).[99]

Other types of fronted activities include the use of United Business Associates (Washington) to fund corporate development in the developing world to "offset the Communists from moving in,"[100] and—as a direct continuation of previous U.S. activities—the CIA was supported by the United Fruit Company in developing plans to carry out the 1953 coup against Arbenz in Guatemala, but it never followed through.[101] Finally, one of the best known front organizations of the CIA was Zenith Technical Enterprises, a Miami-based corporation used to organize, direct, fund, and carry out Operation Mongoose, the CIA's war against Castro.[102]

In contrast, no evidence was found to indicate that the Soviets, having pioneered the corporate front with Arcos (All-Russian Cooperative Society, officially the Soviet trade mission in London but in reality the cover for extensive industrial and commercial espionage) in 1921 (and subsequently smashed by MI5 in 1928),[103] continued with corporate fronts after 1945.

South Africa engaged heavily in all manner of covert activity during its wars against the anti-apartheid movements, both in Southern Africa and further afield. Its best-known police intelligence operative—Craig Williamson—was also one of its most successful in conducting CPA operations against the worldwide anti-apartheid movement, particularly in its strongholds in London and Western Europe. In 1972, Williamson, along with Craig Edwards, successfully infiltrated the ANC's structures via the International University Exchange Fund based in Geneva (of which Williamson eventually became deputy director), redirecting

virtually all of its fundraising income into South African government secret accounts. He returned to South Africa only after being exposed in 1980, having run the operation for eight years.[104] Indeed, over the course of the 1960s through the 1980s, a triangle of covert support and activities developed between the CIA, South African intelligence, and Israeli intelligence—with British and French intelligence and Zaire's Mobutu sitting somewhat uncomfortably on the edge of the triangle—to confront Soviet/Chinese/general communist influence in Africa while ensuring access to strategic resources.

The CIA also used social and educational organizations—such as the National Student Association, which the CIA had funded (to 80 percent of their budget) between 1952 and 1967 in an attempt to counter Soviet efforts to mobilize world youth,[105] or the European Market Movement to which the CIA provided £380,000 between 1947 and 1953 in an attempt to directly balance KGB activities in the same manner.[106] Finally, anticommunist trade unions were heavily funded by the CIA in Europe and the developing world.[107]

On the Soviet part, Lenin first introduced the idea of propagating communism through trade unions, youth organizations, and other social groups in 1921;[108] over the proceeding years, hundreds if not thousands of Soviet front social organizations existed. Most emerged initially out of Willi Münzenberg's "Innocents' Clubs" of the 1920s where individuals were recruited to the communist cause;[109] since 1945, these have been more concerned with rallying specific social groups across the globe. In 1965, there were eleven official such fronts—such as the World Federation of Trade Unions and the International Union of Students—linked to the Soviet Union.[110] Regionally, such organizations as the Nigerian Trade Union Congress and the Afro-Asian People's Solidarity Organization were funded and utilized by the KGB.[111] The largest such social front was the World Council of Peace/International Institute for Peace, expelled from Paris in 1951 for "fifth column activities," then from Prague to Vienna, where it was banned in 1957 for "activities directed against the interest of the Austrian state," finally establishing itself in Helsinki in 1968.[112] It is believed to have received over $50 million annually through the KGB and even achieved recognition from the United Nations and UNESCO.[113] Finally, although often claiming responsibility for encouraging peace movements (such as the Campaign for Nuclear Disarmament responsible for the protest at Greenham Common), KGB aid could not have motivated them any further, according to Andrew, as they were already in the 1980s very intensely anti–United States.[114]

Covert Economic Action

The third form is *covert economic action*. This includes the attempt, through covert means, to disrupt or destabilize adversaries' economies. Methods used have included counterfeiting foreign currencies, depressing the world price of agricultural products vital to adversaries (especially one-crop developing nations), trying to control the rainfall over enemy territory through cloud seeding,

preparing and introducing parasites for the destruction of crops, contaminating oil supplies (as was done against North Vietnam), dynamiting power lines, and mining harbors to discourage commercial shipping (as Reagan authorized against Nicaragua).[115]

Covert Paramilitary Action

Finally, the fourth method encompasses both covert paramilitary action (PM) and counterintelligence[116]—or what are collectively sometimes referred to as "secret wars." These include all manner of assassination, coup, raid, counterguerrilla activity and other (generally) armed covert acts. Charters states that these "involve the active direction, deployment, or support of regular or irregular armed bodies of men employing unconventional military means to achieve their (or their sponsor's) political objectives." In this sense, Charters maintains that these activities are closer to military special operations—fitting, given that military special forces and their missions often form part of covert PM actions.[117]

The first American covert PM involved the only time in which the United States engaged in *direct* covert military activities against the Soviet Union—the CIA's (and U.S. military Counterintelligence Corps in occupied Germany) support for anti-Soviet Ukrainian partisans in 1947–48. After that time, the United States did not take direct PM activities within the Soviet Union (unlike, for example, its support for the Afghan *mujahedeen* during the Soviet-Afghan War).

Throughout Africa during the Cold War, the CIA supported Mobutu in the Congo as both a bag man and staging point for all manner of covert paramilitary (and other) activities in Africa—including extensive covert cooperation with apartheid South Africa within the anticommunist Cold War context. The Soviets parried by providing extensive support (alongside and often in competition with the Chinese) to the liberation and revolutionary guerrilla movements across the continent—including especially in Angola, Mozambique, Rhodesia/Zimbabwe, and South-West Africa/Namibia. This, in turn, generated further South African–Rhodesian covert efforts to undermine these revolutionary guerilla movements using their own panoply of covert activities (including the extensive use of assassinations, pseudo-operations, third-force [proxy] counterguerrilla forces, and the like)—creating a spiral of covert action-reaction across the breadth of central and southern Africa throughout the 1970s and 1980s.

In Latin America, covert paramilitary activities against Castro and in Chile, Guatemala, Nicaragua, and El Salvador—culminating in the Iran-*contra* scandal of the 1980s—witnessed the continuation of U.S. interventionist policies from the last century. In Vietnam, initial covert assistance to the French during their Indochinese campaign evolved slowly into the CIA's biggest "war" by the mid-1960s, culminating in the PHOENIX Project. Outside of the Cold War context, the 1985 French special services attack on the Greenpeace *Rainbow Warrior* in Auckland harbor symbolized other aims of covert activities (in this case, acting against a group actively protesting nuclear testing in the South Pacific).

Case Study: Nicaragua, 1933–87

The most well-known example of transition from direct to indirect control is the case of Nicaragua. Before pulling the armed forces out of Nicaragua in 1933, the United States trained and equipped the National Guard, whose leader, Anastasio Somoza, instigated a successful coup in 1936. After maintaining very close ties, in all aspects, with the U.S. government for forty-six years, the Somoza government was overthrown in a revolution led by the Sandinistas in 1979. The funding of the National Guard, now called the *contrarevolucionarios* (contras), continued by the CIA from 1979 until it became public in 1987.[118]

At their height in the United States in the 1980s, the combination of both PM and CI authorizations—Reagan's 1981 Executive Order 12333—was the basis for CIA foreign activities under the Reagan Doctrine. As is noted, however, it was long before that the United States developed and deployed its covert paramilitary capability under the Cold War rubric.

The United States was no stranger to counterintelligence operations, having performed their first ones under the Committee of Secret Correspondence, established by George Washington in 1776, against British agents in New England. The first covert action carried out by the U.S. government (in conjunction with France) was the funding of arms to back a coup in Tripoli to place a ruler friendlier to the United States on the throne.[119] But as a prelude to U.S. actions two centuries later, these were child's play.

PM action primarily involves the support of guerilla and other insurgent groups against governments unfriendly or threatening to the United States. For example, from 1963 to 1973, the CIA supported the Meo tribesmen in Laos against the communist Pathet Lao government. Other countries where this type of CA has reportedly taken place include Ukraine, Poland, Albania, Hungary, Indonesia, China, Oman, Malaysia, Iraq, the Dominican Republic, Venezuela, North Korea, Bolivia, Thailand, Haiti, Guatemala, Cuba, Greece, Turkey, Vietnam, Afghanistan, Angola, and Nicaragua, to mention but a few.[120]

These operations were historically carried out jointly by the Directorates of Operations and Administration (responsible for training and support). As well as insurgent support, the CIA has funded various PM training activities throughout the world, provided military advisors (as in Vietnam before full-scale military deployment, and in the recent Afghani war against the Soviets) and transported arms shipments internationally to supply pro-U.S. factions world wide (such as the delivering of Stinger and Blowpipe missiles to the Afghan *mujahedeen* resistance during the 1980s Soviet-Afghan War).[121] Much more recently, as the first U.S. government activity directly against the Taliban and its Al Qaeda supporters in Afghanistan before and during Operation Enduring Freedom, the CIA deployed the "Jawbreaker" team as a covert PM activity aimed at supporting the Afghan Northern Alliance against these foes to foment direct action against them.

As an issue that—like others—intersected CPA and covert PM action, the instigation of physical terror, kidnapping, and assassination serves a double purpose. While political opponents are temporarily or permanently removed from the scene, violence itself is used to create fear and hatred, often discrediting or undermining one entity against another. This is what Blackstock has referred to as "the essence of forced disintegration or atomization," by which the political and social structure of the state is split apart. This use of "executive action" (more commonly referred to as assassination) is something that the CIA has never admitted to, but it is known that several attempts were made on Castro, either by CIA personnel or by CIA-backed assassins (such as the Mafia).

Less well-known, however, are the attempts (and successes) at lower-level assassinations (not prime political figures)—with paramilitary operations such as the PHOENIX Project in Vietnam (see later discussion), the promotion of selected targeting or extrajudicial killings through the School of the Americas at Fort Benning, and other initiatives aimed at decapitating revolutionary or guerrilla movements at the command-and-control level. The death squads run throughout Central America by the CIA during the early 1980s followed similar lines.[122] Following the 1975 Year of Intelligence revelations in the United States and moratoriums on "assassination" initiated by Presidents Ford and Carter, section 2.11 of Executive Order 12333 now prohibits this.

Assassination was also a favored practice of the Soviet intelligence services and their satellites—usually conducted against dissidents from communist countries (such as Georgi Markov of Bulgaria, infamously assassinated in 1978 on London's Waterloo Bridge by a lethal ricin dose delivered by a sharpened umbrella) in exile or those who helped support them and their activities. The Israeli government has made extensive use of assassination—against not only its opponents in the Arab world (such as Hamas bomb maker Yahya Ayyash, known as "The Engineer," assassinated by mobile phone bomb in 1996) but also those who were suspected of helping their enemies (such as Gerald Bull, the Canadian designer of the Iraqi super-gun, assassinated in Brussels in 1990). The apartheid South African government made extensive use of assassination as a covert tool furthering state policies, not only within South Africa but across the front-line states of southern Africa and even as far abroad as London, Brussels, and Paris, where members of the ANC and other liberation movements in exile as well as other players in the anti-apartheid movement worldwide were assassinated with extreme professionalism and success. Indeed, as an example of the success of covert paramilitary activities, the apartheid government's use of assassination (alongside other covert activities) was probably one of the best, forcing the ANC to first withdraw their presence (military bases, offices, and representatives) further from South Africa's borders in southern Africa, and, second, both acknowledge an inability to overthrow the apartheid government by force or revolution and seek a negotiated settlement to the conflict as a result. Israel's assassination activities to this day against Palestinian militants would appear to have had a similar success, at the least in eliminating a considerable cadre of

paramilitary technical expertise from among the ranks of the various Palestinian terrorist and militant groups.

Support for paramilitary formations, proxy armies, and similar covert activities followed directly from this: the CIA supported paramilitary formations in Indochina, Angola, Nicaragua, El Salvador, Ethiopia, Afghanistan, and many other regions. The KGB, almost without exception, supported proxy armies in the same areas opposed to the ones the CIA supported. This involved not only direct activities—such as the PHOENIX Program in Vietnam—but also indirect and support activities, such as training. Although good examples of the latter include the training of the GVN police at Michigan State University under a program using USAID cover[123] and the creation and training of Savak (Iranian security service) by the CIA as a means of gathering information on the Soviet Union in exchange for helping repress dissident activity against the shah's regime[124]—the PHOENIX Program represents the best example of this, and probably the most successful CIA covert paramilitary operation ever. Run by CIA-backed South Vietnamese forces against the Viet Cong Infrastructure (VCI), some 20,000 VCI leaders and sympathizers were killed as a result of this program according to Colby. Despite claims that none of them were killed by assassination methods, members of this program have confirmed at least 10,000 assassinations against the VCI. It is never been confirmed whether or not American agents took part as assassins.

The CIA also used Reinhard Gehlen's intelligence network in postwar Germany (called The Organization, the forerunner of the Bundesnachrichtendienst, or BND) to train Baltic émigrés and refugees to carry out paramilitary CA against the Soviets. These groups acted in concert with the Ukrainian partisan groups in operations against the Soviets in Poland, the Baltics, and the Soviet Union. Eisenhower's Task Force C programs in the 1950s had included the development of a Volunteer Freedom Corps, employing cadres of European émigré fighters, as an aspect of rollback. They failed miserably during the late 1940s and early 1950s.[125] Finally, Vang Pao's Armée Clandestine (Meo units including Operation White Star Green Beret forces) was used to combat Pathet Lao forces in Laos. These included the use of Police Aerial Resupply Units (PARU), not to be confused with the Provincial Reconnaissance Unit (PRU) used in PHOENIX.[126]

For the Soviets, use of such fronts was different from that of the CIA. As already stated, use of proxy armies in the developing world was very similar to that of the CIA. The KGB influenced (and often controlled) the armies of client states (such as Cuba, Angola, Afghanistan, Ethiopia) through replicated Soviet political administrations that placed informers throughout the armies' ranks.[127] The main difference between the two services lay in the KGB's use of "friendly" intelligence services. The KGB directly controlled the intelligence and security services of all the Soviet bloc countries, as well as using the intelligence services of client states, such as Libya. This was done to "give distance and deniability in potentially embarrassing operations," as well as to carry out false-flag recruitment.[128] Examples of this would be the KGB's direction to Czech intelligence to "cause conflict and exploit tension between individual countries, even

countries that recently gained their independence."[129] As well, the East German Staatsicherheitsdienst (SSD) was used between 1959 and 1960 as agents provocateurs to try to destabilize West Germany by infiltrating agents into Jewish areas to desecrate graves, spray swastikas on property, and other similar acts. In 1968, the KGB took direct control of Cuba's DGI in a secret agreement with Castro.[130] In international terrorism, although never directly controlled by the KGB, terrorist organizations, such as the Red Brigades in Italy or the Baader-Meinhof Gang in West Germany, were sponsored by Moscow Centre. This was most often accomplished through surrogate intelligence services, such as East German and Romanian secret services. Links existed as well between these organizations and the Palestine Liberation Organization, as well as the Provisional Irish Republican Army for a number of years.[131] No evidence can be found to indicate a similar relationship between the CIA and its allies regarding either of these two categories.

Ultimately, this is the theory and practice of the propaganda of the deed—practiced by both revolutionaries/terrorists and intelligence officials as part of their covert options.[132] However, these activities were not always successful: Mossad estimated that by 1960, Saudi Arabia had already paid out over $3 million in a vain attempt to arrange for the assassination of President Nasser of Egypt.[133] However, Mossad itself was caught in an embarrassing attempt to assassinate Hamas leader Sheikh Khaled Mashal in Amman, Jordan, in 1997 when their assassins not only failed in their direct action attempt but were caught and publicly humiliated by Jordanian police. Mossad has used assassination extensively throughout its existence, not the least of which in its attempts to hunt down and kill every member of the Black September terrorist group responsible for the Munich Olympics massacre.

Covert Action in Perspective

In all of these actions, overlaps can often be found in practice. A number of these have already been noted—indeed, in most covert actions, multiple outcomes either are intended or are the result (i.e., economic plus political, psychological plus economic, or paramilitary and political). It must also always be kept in mind that these actions are deployed both directly by the instigator—the CIA, the KGB, or another government's instrument—and by the proxies which it supports. Propaganda, for example, can be used to effect or delay political change (as the United States did in Western Europe in the early days of the Cold War or the South African apartheid government did against its ANC enemies) or inspire terror (as was done frequently by both fascist and communist regimes worldwide). Conversely, the actual use of terror—sometimes under the guise of covert paramilitary actions—has its own propaganda effect. A prime example of this mixture between propaganda and covert paramilitary activities is the use of what the British government in Kenya called pseudo-operations—whereby covert units of "turned" guerrillas would visit villages to either gauge local support for

the government or the rebels, or (as the Rhodesian and South African apartheid governments conducted to far greater degrees than the British, French, or Portuguese in their decolonization wars) carry out attacks on those villages to make it look like rebels had been responsible.

COVERT ACTION TODAY

Since the end of the Cold War and across the interregnum of the 1990s CA has evolved to some degree. Indeed, some would argue that it has had to evolve, given that the global environment within which it functions has evolved around it. No longer solely aimed at furthering the aims of intervention, control, or subversion, it has been used by various powers to support more altruistic aims, particularly within the new intervention agenda of the post–Cold War world. With an international security regime driven heavily by humanitarian-led concerns over the rule of law—both domestically and internationally—and a far greater (at least compared to the Cold War context) willingness to push peacekeeping and peace-support operations at the international level and through the United Nations, covert action as a tool of statecraft has been used for support. Part of the reason for this forced evolution is not the least because, in the information age—with the spread and coverage of nonstop news—very few activities can occur unnoticed around the world. Though the original intention of covert activities has not changed—even in those situations where the action is visible, let alone when it occurs under the radar, and the hand of the initiating government is not seen in its undertaking—this rise in media scrutiny combined with ever-increasing public accountability drives the intelligence services (at least in the developed world) has made such undertakings a greater challenge for the intelligence services.

This is not to suggest that covert actions have been undertaken through a United Nations or other regional organizational mandate—but rather that individual powers, acting sometimes with this greater altruistic attitude, have supported a far broader target/interest base than ever was the case during the Cold War. Examples of this include the British government's use of the private military company Sandline International to provide covert support to the exiled government of Sierra Leone in 1999 against the horrendous rebels of the Revolutionary United Front. Another case is CIA support—bungled and dropped in 1995—for the Iraqi Kurds against Saddam Hussein's military and intelligence onslaught after the 1991 Gulf War. In the war on terrorism—really started initially by President Clinton in the mid-1990s—the United States had covert operations against terrorist networks and supporters underway in at least eighty countries by September 2001.[134]

This is not to say that the more traditional state-interest activities have not continued. The CIA's bungles in Haiti in the mid-1990s clashed directly with the Clinton administration's declared intentions and activities aimed at restoring democracy (in the form of Jean-Bertrand Aristide) to that troubled country. In its

war with the Chechen rebels, Russia has deployed significant covert paramilitary actions—including especially assassination, but also propaganda and psy ops—against the Chechen rebels, the Chechen people, and (in terms of propaganda) to the outside world. There are even suspicions that Russia's "special services" have conducted pseudo-operations (both inside and outside Chechnya) in an effort to further blacken the reputation of the Chechen rebels.

Probably the best known post–Cold War covert action gone awry was the use of the UN Special Commission on Iraq (UNSCOM) as a cover for CIA and NSA activities in Iraq during the period of international weapons inspections in that country until its exposure in 1998. Greeted with horror and abhorrence, the CIA was vilified for using the United Nations—with its cloak of impartiality and benevolence—as a cover for intelligence activities. The fallout from this operation not only led to the expulsion of the UN weapons inspectors from Iraq but—it could be argued—directly to the 2003 Iraq War.[135] More recently, it has been suspected that the CIA has been ordered to subvert Hugo Chávez's government in Venezuela, much as it did for the better part of a decade against Castro in Cuba and for much the same reasons.

In the war on terrorism, launched following the September 11, 2001, attacks on the United States by Al Qaeda, the known use of covert action has demonstrated the continuation of similar activities from the Cold War period. The use of propaganda—both overtly through media such as Radio Sawa (much like Radio Free Europe in its latter days) and more covertly through attempts to support the promotion of a more understanding and benevolent image of the United States (and the West more generally) across the Muslim world—has seen extensive examination, both by the media and academia. Covert political action, in the form of attempts to influence or support various governments around the world (such as in Pakistan, Uzbekistan, Indonesia, and other regional governments of interest), has continued unabated. The deployment of CIA Counterterrorism Center/Special Activities Division Jawbreaker teams—armed with both Special Operations Forces and suitcases full of cash—into Afghanistan in the weeks before the launch of Operation Enduring Freedom in October 2001 was the best recent example of this continued practice of nurturing and supporting proxy forces (in the form of the Northern Alliance in this case) through covert paramilitary action. Existing concerns over rogue states or states of concern (such as Iran, Syria, and North Korea) in the first decade of the twenty-first century will likely see the continuation of such activities, both within the context of this war on terrorism and in terms of the broad interests of individual states.

CONCLUSIONS: THE USES AND LIMITS OF COVERT ACTION

It is clear that by the 1990s, the mechanisms of covert action used by the United States became more refined but not necessarily more successful. Overall,

the United States achieved more successes—in this pursuit of statecraft and national interests—during the 1898–1933 period than they have since the 1939–45. Success is a relative concept. In terms of achieving hegemony and maintaining it in their chosen sphere of influence, the United States achieved this by 1914 and maintained it until 1933. The period from 1945 to the present has witnessed the attempts by the United States to reintroduce this concept of hegemony throughout the world with, to a large degree, less success comparatively. The clear difference between the two periods was the evolution of these methods from direct political control and full use of military force, to proxy activities and covert operations spanning the globe. Many of these methods have been, in contrast, very successful in the achievement of immediate goals. In the long run, they had considerably less effect.

During the Cold War, the activities of the United States—and other Western powers—were balanced by those of the Soviet bloc. Since the end of that conflict, the concerns of the CIA—and the United States and other Western powers and their intelligence services—have been redirected to countering regional and local instability and collapse, dealing with humanitarian crises, countering regional and local wars through (generally UN-mandated) interventions, and dealing with rogue states, dictators, and the proliferation of weapons of mass destruction and international terrorism. Although individual states' self-interests have continued to drive not only these activities but also more selfish traditional ones, the geostrategic global balance has now shifted—perhaps irrevocably—to the point where the great (at least Western) powers now act with generally global benevolence in their pursuit of their goals. With the additional challenges that the information age presents to keeping covert actions covert, the pursuit of covert action has become more difficult at the same time that the global public demand for states to be "seen to be acting" with altruistic, globally benevolent interests has increased dramatically. Therefore, *overt* action has come more to the fore in the pursuit of those activities that previously would have been undertaken covertly.

This is not to say that all (or any) states have dropped the pursuit of their own self-interests through the medium of covert action. In the case of previously Soviet (now democratic) Russia, the collapse of Soviet communism and the end of the Cold War also meant the end of the general Soviet pursuit of both supporting the advance of global communism and dealing with those of its citizens abroad who dissented from such a view (along with their supporters), especially in terms of the Cold War covert confrontation between the KGB and CIA in the developing world and all it entailed. The end to these activities symbolizes perhaps the greatest change in covert action goals and aims from the Cold War to the post–Cold War periods. Russia today still covertly pursues its interests abroad through not only its civilian but also (more particularly, in some regards) its military intelligence services. Other states continue to use covert action as a tool of statecraft, such as Israel's pursuit of its national security against its enemies, various rogue states' pursuit of the matériel and capability to develop

weapons of mass destruction capability, and China's pursuit of its growing interests globally.

Assessing Success

At the general level, one may say that the CIA was successful in carrying out many of its covert operations; this is because, as Prados points out, with almost no exception, the actions carried out by the CIA forced the Soviets or the Chinese (the specific opponents named in NSC-5412) to respond in kind without escalating to open military confrontation.[136] This is in contradiction to the general record of CIA covert actions that indicate those CA undertaken over time were more often than not failures in the long or short run. At a more specific level, limited operations were never allowed to stay limited due to the aforementioned problem of escalating commitments, the quagmire of covert action. Thus, even though CA in Angola in 1975 and in Nicaragua in 1980 were initially limited activities aimed at preventing the consolidation of a government in the former case and at harassing the regime in the latter case to prevent its continued support of guerillas in El Salvador, they eventually escalated to such a level that failure was inevitable unless the next step (military intervention) was taken.[137] At this level, the CIA had a number of debacles (Indochina, Cuba) as well as number of limited successes (Chile, Western Europe). Propaganda operations had certain successes; Guatemala is one of the most obvious. Even though the CIA admitted in the post mortem that communism was never a threat in Guatemala, there was not even evidence of contacts with the Soviets.[138] But it was these successes that later led to failures or "problems that rebounded in the face of the [U.S. government]."[139] As far as media successes, opponents of propaganda (or psychological warfare) argue that if overt means had failed, it was unlikely that the target would be persuaded by covert use of media organs. The problem of "blowback" is also of concern; information planted abroad finds its way back into domestic press sources, deceiving one's own citizens.[140] The question is raised as well as to why the U.S. I.A. (United States Information Agency) does not carry out the same role in propaganda because its mission is overt and aimed at spreading U.S. views anyway.[141]

At the most basic level, that of assessing operations individually, the CIA comes up lacking. Mistakes were often made in the planning stages, predetermining failure. This was the case in Libya, where the CIA bypassed the best potential replacement for Qaddafi, and in Iran, where no attempts were made to penetrate religious groups prior to the revolution.[142] In funding support to Tibet, Afghanistan, and Indochina, large portions of CIA assistance was soaked up while still in transit due to corruption. And in some operations, follow-up support could not be granted for various reasons. The most evident case of this was the link between Radio Free Europe (RFE) and the Hungarian uprising in 1956. RFE made vague hints about Western assistance to students and workers in Budapest prior to the revolt; however, once the uprising began, RFE was forced to sit

helplessly and listen to broadcasts from Budapest describing the slaughter. An estimated 30,000 died in the Soviet suppression.[143]

On the Soviet side, in many areas successes were more apparent than with the CIA. The use of paramilitary fronts in Eastern Europe linked to deception operations in the years following the war forced the CIA to establish a Counterintelligence Staff (under James JesusAngleton) in 1954 to counter such KGB operations.[144] At the general level, social fronts were by and large successful in that they forced the CIA to always react, one step *behind* the KGB. The KGB's use of the World Council of Peace (WPC) was very successful in coordinating world opinion, through its leadership of the other social fronts, against the United States during the Vietnam War. But even it ultimately failed in 1989 when it admitted that 90 percent of its funding came from the Soviets.[145] Other perceived successes were in reality distinct from KGB operations. For example, in 1984, the KGB launched an anti-Reagan propaganda campaign using the slogan *Reagan: eto voina!* (Reagan Means War!) during his election campaign. The anti-U.S. reaction to Reagan's victory was claimed by the KGB as a sweeping success; however, the fact that this slogan went unused everywhere indicates another area where the KGB had little to do with world opinion.[146] Where the KGB was successful at this level was in gaining recognition for most of its social fronts by the United Nations, UNESCO, United Council of Churches, and other international bodies. This was largely accomplished through the use of developing world surrogates to influence colleagues and decisions. Furthermore, outside of the known social fronts, many splinter committees, action groups, subsidiary organizations, and the like emerged that carried out much the same work as their parent bodies but without apparent Soviet involvement.[147]

Therefore, it is clear that many similarities and differences existed in the use of covert action during the Cold War—not only as part of the bipolar confrontation but also in unilateral activities by many states. In the case of the United States and the Soviet Union, where the CIA generally dealt with any noncommunist political organizations and individuals that would further their cause, the KGB dealt almost exclusively with communist parties or organizations in an attempt to further world communism. But one could argue that both powers were simply looking out for their own interests and using whatever vehicles necessary to fulfill and secure those interests. Prados has concluded about the CIA that "in all these CIA operations, there is a lesson . . . the United States acts in its own interests, which are those of a Great Power. There is little true identity of interest between the restive local minority and the Great Power."[148] This could easily be said for the KGB and the Soviet Union as well. As far as such fronts are concerned, the Soviets proved themselves much more adept at developing and wielding social fronts internationally than the CIA. The use of the media for propaganda, cover and influence was equally successful on both sides. But where the CIA generally failed in its use of proxy armies, the Soviets can be said to have been successful in their use of surrogate intelligence services and armies to accomplish the spread of the Soviet point of view.

Orwell summed up the raison d'être behind the extensive use of covert action when he opined, "We sleep safe in our beds because rough men stand ready in the night to visit violence on those who would do us harm." However, although the Cold War confrontation saw extensive use made of covert actions to further the aims of an individual service or power, more often than not the interests of that power and the deployment of said covert action acted against the wider global interest. Although the complexities of covert action can be found in Treverton's observation that "secret operations in a democracy are a paradox, all the more so if those operations intervene in the politics of another country,"[149] John Le Carré's observation of intelligence as a barely controlled circus may be closer to the truth of the role of intelligence and the need to stay vigilant over its activities: "Now that we had defeated Communism, we were going to have to set about defeating capitalism, but that wasn't really [the] point: the evil was not in the system, but in the man . . . you want to say: 'I slew the dragon, I left the world a safer place.' You can't really, not these days. Perhaps you never could."[150]

NOTES

1. Although such a vast topic is impossible to tackle adequately within one chapter, there are numerous important academic contributions to be found to this debate within the literature. For excellent discussions of covert action generally—including its uses, links to policy and intelligence, implications, and outcomes—see Paul W. Blackstock, *The Strategy of Subversion* (Chicago: Quadrangle Books, 1964); Loch K. Johnson, *America's Secret Power: The CIA in a Democratic Society* (New York: Oxford University Press, 1989); Walter Laqueur, *A World of Secrets: The Uses and Limits of Intelligence* (New York: Basic Books, 1985); John Prados, *Presidents' Secret Wars: CIA and Pentagon Covert Operations from World War II to the Persian Gulf* (New York: William Morrow, 1996); Gregory F. Treverton, *Covert Action: The Limits of Intervention in the Postwar World* (New York: Basic Books, 1987); Roy Godson, ed., *Intelligence Requirements for the 1980s: Covert Action* (Washington: National Security Information Center, 1981); and David Charters, "The Role of Intelligence Services in the Direction of Covert Paramilitary Operations," in Alfred C. Maurer et al., eds., *Intelligence: Policy and Process* (London: Westview Press, 1985). For studies on the CIA and American democracy specifically, see Loch K. Johnson, *A Season of Inquiry: The Senate Intelligence Investigation* (Lexington: University of Kentucky Press, 1985); Frank J. Smist Jr., *Congress Oversees the United States Intelligence Community, 1947–1989* (Knoxville: University of Tennessee Press, 1990); Gabriel Kolko, *Confronting the Developing World: United States Foreign Policy 1945–1980* (New York: Pantheon Books, 1988); Rhodri Jeffrey-Jones, *The CIA and American Democracy,* 2nd ed. (New Haven, CT: Yale University Press, 1989); Victor Marchetti and John D. Marks, *The CIA and the Cult of Intelligence* (New York: Dell, 1989); Lyman B. Kirkpatrick Jr., *The U.S. Intelligence Community: Foreign Policy and Domestic Activities* (New York: Hill and Wang, 1973); Admiral Stansfield Turner, *Secrecy and Democracy: The CIA in Transition* (Boston: Houghton Mifflin, 1985); *New York Times*, *The Tower Commission Report* (Toronto: Bantam Books, 1987); Bob Woodward, *Veil: The Secret Wars of the CIA 1981–1987* (Toronto: Pocket Books, 1987); Rhodri

10. The term *guerrilla* originates with the period of Napoleon's occupation of Spain during the early nineteenth century when Spanish "guerrillas" (from the Spanish term *guerra*—"war"—with the *-illa* ending diminutive, meaning "little war") carried out a harassment, sabotage, and assassination campaign from their mountain hideouts against imperial French forces across Portugal and Spain. Lawrence's desert campaign evinced the exact same activities against the Turkish forces, using the desert (instead of mountains) as their hideout from which to engage in irregular (i.e., not regular) warfare—the epitome of covert paramilitary action witnessed during the Cold War.

11. Andrew and Gordievsky, *KGB: The Inside Story*, pp. 71–78.

12. The Irish Republican Army, formed of the Irish Republican Brotherhood and Irish Volunteers following the 1916 Easter Rising, formed the basis for the new National Army of the Irish Republic following its independence in 1922; this should not be confused with any of the organizations that have used that name since 1922.

13. For more on this, see Howard, *Strategic Deception*.

17. As an example, sect.1.8(e) of Executive Order 12333 states that one of the roles of the CIA is to "conduct special activities approved by the President." *Special activities* is defined as "activities conducted in support of national foreign policy objectives abroad which are planned and executed so that the role of the [USG] is not apparent or acknowledged publicly" (3.4(h)-EO12333). Further authorization is given in sect.1.8(i): "conduct such administrative and *technical support activities* within and outside the United States as are necessary to perform the functions described . . . above, including procurement and essential cover and proprietary arrangements" (emphasis added). In this single phrase, Reagan justified the whole arms-for-hostages deal with Iran.

COVERT ACTION

The Israeli Experience

EPHRAIM KAHANA

COVERT ACTION HAS ALWAYS BEEN A SIGNIFICANT element of international politics. When it has served their interests, governments have secretly disseminated propaganda in other countries, manipulated foreign economies, and abetted coups against their adversaries, on either a direct or indirect basis.

Israel, like other countries, has and uses the tool of covert action, with varying degrees of success. Israeli covert action includes the full range of options, inclusive but not limited to paramilitary incursions and the rescue of Jews from foreign territories. In this chapter, the most significant and sometimes most controversial covert actions are described.

THE BAD BUSINESS

The Bad Business, known in Hebrew as the *Esek Ha'Bish*, was the most controversial Israeli covert action to date in the public domain. This covert action is commonly known as well as either Operation Susannah, or the Lavon Affair, named after the Israeli Defense minister of the period (1954), Pinhas Lavon. In essence, the Bad Business was a paramilitary action of sabotage against primarily American/British targets in Egypt.[1]

Egypt, historically the largest and most powerful of Israel's neighboring Arab countries, was always of primary interest to the Israeli intelligence services. At Military Intelligence (MI), it was decided to set up a network of sleeper agents in Egypt, who, at the appropriate time, would be assigned to carry out secret missions. In May 1951, an Israeli intelligence officer from Unit 131, Maj. Avraham Dar, was secretly dispatched to Egypt under the assumed name of John Darling,

using the cover of a British businessman, with a mission to recruit Egyptian Jews for an espionage network. Dar succeeded in this task fairly easily, because several young Egyptian Jews with Zionistic tendencies simply volunteered. Dar set up two espionage cells, one in the port city of Alexandria and the other in Cairo. With respect to the Cairo cell, Dar recruited Ceasar Cohen, Moshe Marzouk, Eli Ya'acov Naim, and Victorine Marcel Ninio as operatives. For the Alexandria cell, he recruited Shmuel Becor Azzar, Robert Nissim Dassa, Victor Moise Levy, Meir Shmuel Meyuhas, Philip Hermann Nathanson, and Meir Yosef Za'afran. Several of the candidate agents were transported secretly to Israel for military training and tradecraft. Despite the fact that many remained rank amateurs after the training, the operatives were nonetheless sent back to Egypt. They "slept" for three years until the agreed code word was broadcast over the army radio channel, *Galei Zahal.*

Toward the end of 1951, Avraham (Avri) Elad, a former major in the Israeli Defense Force (IDF), contacted Dar and the commander of Unit 131, Lt. Col. Mordechai (Motke) Ben-Tsur, to seek employment. Despite certain reservations, the heads of Unit 131 decided to involve Elad in the operation, and he was assigned cover as a German businessman named Paul Frank. Elad resided initially in West Germany to construct and develop his cover story further. In December 1953, Elad arrived in Egypt (as Paul Frank), a wealthy businessman. He soon blended into the expanding colony of expatriate Germans, many of whom were past Nazis. Elad was to take command of the sleeping Jewish espionage network. He contacted all its members and became closely acquainted with their details.

After the revolution in Egypt in 1952, the United States exerted pressure on Britain to withdraw from the Suez Canal zone to keep Egypt in the pro-Western camp. There was concern in Israel concerning the forthcoming British evacuation because the Israeli government regarded the presence of British forces in the canal zone as a check and balance against possible Egyptian adventurism under Gamal Abdel Nasser. However, by the end of June 1954, the British evacuation of the Suez Canal zone appeared imminent. Israeli Defense Minister Lavon asked Binyamin Gibli, the director of MI, to use all of Unit 131's resources in Egypt to prevent the British pullout. Lavon, however, did not immerse himself in the details of strategy, to his discredit. Accordingly, Gibli came up with the idea of preventing or delaying the British withdrawal by staging a series of sabotage acts directed primarily against Western embassies and other institutions that would, according to Gibli, be interpreted by the British as acts being perpetrated by the Egyptians. Gibli believed that under such circumstances the British might reconsider the planned evacuation program.

On June 30, 1954, Gibli instructed Elad to carry out the covert sabotage in Egypt, resulting in small firebombs being placed in mailboxes in Alexandria two days later. On July 14, small, harmless bombs exploded at the U.S. cultural centers in Cairo and the library of the U.S. Information Center in Alexandria, as well as in the luggage storage depot at the Alexandria Railway Station.

However, when Philip Nathanson entered the Rio Cinema in Alexandria, the charge he was carrying went off prematurely, which resulted in his arrest. Within days the Egyptian security police arrested and interrogated the rest of the network's members. They also arrested Max Binnet, another Israeli spy working under cover at the time in Egypt, but who was not directly connected to the group.

Members of the MI's inner circle were forced to accept responsibility for recruiting and training Egyptian Jews for their espionage network, while Gibli admitted the operatives clandestine duties—however, these admissions were not made public. Prime Minister Moshe Sharett knew nothing of the operation. Gibli asserted that the order to activate the operatives was given to him by Lavon.

After the capture of the espionage network's members in Egypt, Gibli tried to activate a European lobby to ease the Egyptians' treatment of their Israeli-trained Jewish prisoners, who were being interrogated under torture in appalling conditions in an Egyptian jail. A trial began on December 11, 1954, with the sentencing a month later. Cohen and Na'im were acquitted. Meyuhas and Za'afran were each sentenced to seven years, and Ninio and Dassa each received fifteen years in prison. Levy and Nathanson were sentenced to life imprisonment, whereas Azzar and Marzuq were sentenced to death and executed. Dar and Elad, the Israeli handlers of the network, were tried in absentia and sentenced to death. Max Binnet, the Israeli spy apprehended with the network but not directly involved in its operations, committed suicide in an Egyptian jail on December 21, 1954, after undergoing severe torture sessions.

For years, Israel denied any connection to the bombing in Egypt, with the local media being barred by the military censor from mentioning the affair. Since the story was published in the foreign press, Israeli inner circles began to demand the establishment of a commission of inquiry. Subsequently, Israeli weekly publication *Ha'Olam Ha'Zeh* printed the story without the censor's permission with an invented name for the country involved.

Ultimately the scandal was made public, and Lavon was forced to resign. David Ben-Gurion returned from retirement and replaced Lavon as Minister of Defense. In 1960, new evidence emerged from a secret trial of Elad, held in 1958. Apparently it is understood that Elad betrayed the Jewish network in Egypt. The Israeli establishment remained anxious, fearing the opening of a Pandora's box regarding the person who gave the order to activate the Jewish network in Egypt. Subsequently, Lavon asked Ben-Gurion to exonerate him, but Ben-Gurion refused.

Several Israeli commissions investigated the Bad Business, but they failed to reach unambiguous conclusions as to who gave the order or who was responsible for the fiasco. In 1960, a commission revealed the forging of a document used by Moshe Dayan and Shimon Peres, then deputy minister of Defense, to attract the responsibility for the botched 1954 Egyptian operation to Lavon. In a subsequent hearing, the results of which were accepted by the government, it was revealed that Peres, Dayan, and Gibli were all involved.

The specific question of "who gave the order?" has been asked countless times by the Israeli public, yet it appears the answer will not be forthcoming. A more important question revolves around who was responsible for the Bad Business, even if it was not that person who actually gave the order. The answer to this question is definitive; as the supreme commander of the IDF, the Israeli government bears the ultimate responsibility for all military intelligence failures, including this one. This also applies to the minister of Defense, even if he did not give the specific order.

In the aftermath of the Sinai Campaign in October 1956, it seemed reasonable to expect negotiations for the release of the prisoners of the Jewish espionage network. Israel held over 5,500 Egyptian POWs after its conquest of the Sinai Peninsula. Among the most senior of the captives was Gen. Fuad el Digwi, who had been the presiding judge at the trial of the members of the Jewish espionage ring in 1954. When he fell into Israeli custody, he was the military governor of the Gaza Strip. All 5,500 Egyptian prisoners were consequently traded for 10 Israeli POWs, including one pilot. The Israeli government did not request the release of the members of the Jewish network from prison because its policy was still to deny any Israeli connection to the events in Egypt in 1954. Top Israeli echelons believed that requesting the prisoners release might endanger Israel's relations with the United States.

After fourteen years of rotting in Egyptian jails, Dassa, Levy, Nathanson, and Ninio were released, as part of the agreement to return 5,237 Egyptian POWs captured during the 1967 Six-Day War. The four members of the network were released separately from the Israeli POWs and reached Israel via Europe. This time the inclusion of the Jewish spy network prisoners in the POW exchange was settled only at the insistence of the director of the Mossad, Meir Amit, who threatened to resign if he would not be allowed to seek their release during negotiations with the Egyptians. For all that, the presence in Israel of the released network members remained an official secret until Prime Minister Golda Meir announced her intention to attend Marcelle Ninio's wedding in 1971 and to inform the Israeli press.

The key result of the Bad Business was that the Israeli government adopted a tenet of never activating Jews in the diaspora for espionage or any other covert action against their own country's government, with a belief that such activity might ruin relations between the Jewish citizens of such countries and their government. In nondemocracies, like the Arab states, activating Jewish spies would in any case have a limited effect, because their access to important governmental positions or secrets, if any, is negligible. The Pollard Affair by definition is dissimilar in nature. Jonathan Jay Pollard was not operated by an official intelligence organization in Israel but by an amateur outfit known as the Bureau of Scientific Liaison, known by its Hebrew acronym as LAKAM.

On March 30, 2005, the three last surviving members of the espionage network in Egypt, Ninio, Dassa, and Za'afran, were accorded recognition by Israel's President Katsav and the chief of the General Staff Lt. Gen. Moshe

Ya'alon, for their services to the state and their years of incarceration and suffering.[2]

THE KHALED MASHAL FIASCO

The Khaled Mashal fiasco occurred on September 24, 1997, when members of the Kidon (bayonet) Unit of the Mossad arrived in Jordan, where they checked in as tourists at the Intercontinental Hotel in Amman. Two of them, who used fake Canadian passports in the names of Barry Beads and Sean Kendall, were to execute the team's mission, which was to assassinate Khaled Mashal, the leader of Hamas, whom Israel believed to be behind many terrorist attacks that cost the lives of Israeli civilians. The Israeli Committee X, chaired by Prime Minister Benjamin Netanyahu, had decided on the assassination, determining that the mission should be accomplished on Jordanian soil. Although Mashal resided in Jordan, this was a curious decision at best, considering the extremely delicate Israeli-Jordanian relations after the two countries signed a peace treaty in 1994.[3]

The day after their arrival, "Beads" and "Kendall" attempted to poison Mashal in a crowded Amman street by spraying him with a nerve agent. They barely managed to use only half the aerosol can's content when their actions were observed, and they fled the scene immediately but were later arrested. Mashal was hospitalized, while the support members of the Kidon Unit succeeded in departing Jordan.

This fiasco caused enormous embarrassment to both governments and jeopardized Israel's relations with one of its few Middle Eastern allies. King Hussein threatened Netanyahu that he would put the men on trial if the Mossad did not provide an antidote to save Mashal's life. Israel acceded to Hussein's demand and Mashal was saved.

At the demand of Hussein, Israel also released Hamas leader Sheikh Ahmed Yassin, imprisoned in Israel for his role in terrorist acts. The two Mossad agents were delivered to the Canadian embassy in Amman and driven to Israel, with the Israeli government assuring the Canadians that it would never again use false Canadian documents. The Khaled Mashal fiasco was considered the second Bad Business; however, the period was different and this fiasco almost immediately became public, unlike the Bad Business.[4]

OPERATION WRATH OF GOD

The Munich massacre of the Israeli athletes during the 1972 Olympic Games shook the Israeli defense establishment to its very foundations, and the street demanded vengeance. Golda Meir's government was indeed bent on revenge, and its first response was a massive air bombardment of terror bases in Lebanon. Three days later, the Israel Air Force launched an air raid involving approximately

seventy-five aircraft, the largest such attack since the 1967 Six-Day War. Israeli ground troops were additionally ordered into Lebanon to engage Palestinian terrorists who had been mining Israeli roads. Despite this aggressive military response, a select group of high-ranking Israeli officials felt that more had to be done. They decided that a message should be sent not only to those who had perpetrated the Munich massacre but also to those who might consider terrorist attacks against Israelis in the future, so that others might see and fear.[5]

This led to the decision to establish the so-called Committee X, chaired by Meir and Defense Minister Moshe Dayan. The committee authorized the assassination of all the individuals involved, either directly or indirectly, in the Munich massacre. Committee X listed thirty-five main assassination targets. The mission was assigned to several different Mossad teams, formed by the commander of the Caesarea Division in the Mossad, Michael (Mike) Harari. It was carried out mainly by Kidon (bayonet), an ultra-secret subunit of Caesarea.

The operations conducted to assassinate key Palestinian terrorist leaders were known by their unofficial names: Operation Wrath of God and the Sword of Gideon. A general mobilization was declared within the Israeli Security Agency (ISA) and in Unit 504 of the IDF. For the purpose of the assassinations, the most talented intelligence-gathering officers were called up, including Shmuel Goren, commander of Keshet (an intelligence-gathering unit), Baruch Cohen, Zadok Ofir, Raphael (Rafi) Sutton, Eliezer (Geyzi) Tsafrir, and Nahum Admoni, commander of Tevel, the branch in charge of connections with foreign intelligence agencies.

During the search for the terrorists involved in the Munich massacre, it emerged that of the eight who had taken part in the massacre, five had been killed by the German police officers and three had been detained. After the hijacking of a Lufthansa airliner in October 1972, the detained terrorists were released to Libya and then onto Damascus, whereupon traces of them were lost. As far as is known now, they were still alive. However, about twenty other Palestinians with blood on their hands or who had been involved in preparing acts of terror but were not necessarily connected to the Munich massacre met their deaths in strange and mysterious ways.

In any event, the Munich massacre signified a real turning point in Israel's war on terror. This was the beginning of a war to the death against the terror organizations, a campaign of elimination and vengeance. One of the first targeted for assassination, whose name and nickname are still classified, was a Black September Organization (BSO) member who arrived in Athens with the task of sending a container of raisins covering hidden explosives to the Haifa port, where it would be detonated by remote control.

The Mossad received information about this plan, and its operatives left for Athens, where they searched for the perpetrator. They discovered a female customs broker who, unknown to her, was handling that cargo of raisins bound for Israel. Documents were seized, and through them Mossad agents located the storage depot where they hoped to find the raisin bomb, but nothing was discovered. The

documents did reveal, however, the man behind the shipment, who was then followed and shot dead. BSO members concluded that the customs broker had given details about their comrade's activities to the Mossad, and they killed her.[6]

According to George Jonas's book *Vengeance*, one of the teams assigned to assassinate Palestinian terrorists was headed by a former IDF officer, who was referred to in his book by the pseudonym Avner, who controlled a team of five operatives and operated in a semi-autonomous fashion. It is, however, impossible to verify the existence of Avner and his specific team. As it is better known today, Kidon's teams were assigned to assassinate a list of targets, as follows: Kamal Adwan, the chief of sabotage operations for the Al Fatah organization in the 1967 occupied territories; Hussein Abad Al-Chir, the Palestinian Liberation Organization (PLO) contact man with the KGB in Cyprus; Mohammed Boudia, the BSO liaison with the European PLO; Abu Daoud, a BSO member; Dr. Wadi Haddad, a chief terrorist linked with Dr. George Habash; Mahmoud Hamshari, a PLO member and coordinator of the Munich Olympic Games massacre; Dr. Basil Raoud Kubaisi, an official of the Popular Front for the Liberation of Palestine (PFLP) in charge of logistics; Kamal Nasser, the official PLO spokesman and a member of the PLO Executive Committee; Ali Hassan Salameh, a developer and executor of the assault on the Israeli athletes at Munich; Abu Yussuf, a high-ranking PLO official; and Wael Zwaiter, a PLO organizer of terror in Europe and Yasser Arafat's cousin. Kidon's teams succeeded in tracking down and killing several of the targets on the list: Zwaiter on October 6, 1972; Hamshari on October 8, 1972; Abad al-Chir on January 24, 1973; Kubaisi on April 6, 1973; and Boudia on June 28, 1973. After killing Abad al-Chir, Ziad Muchassi replaced him as the PLO contact with the KGB, and he was belatedly added to the target list. He was killed on April 12, 1973.

As for the other targets listed by Committee X, six terrorists remained at large. Wadi Haddad was not traced by Israel, but he died of cancer on March 28, 1977 in an East Berlin hospital. Abu Daoud was arrested in Germany in March 1973 and confessed to his involvement in the Munich massacre. Kamal Adwan, Kamal Nasser, and Abu Yussuf were killed by a covert commando raid on April 9, 1973, carried out as a joint Mossad-IDF mission (see Operation Spring of Youth). Ali Hassan Salameh was killed on January 22, 1979, in a Beirut car bomb explosion by another Mossad team.

A high price for Operation Wrath of God was paid by Mossad personnel who collected intelligence data about those marked for elimination. For example, following an arranged meeting with a Palestinian in a café in Madrid, Baruch Cohen was shot dead by another Palestinian as he was leaving the café. Likewise, Zadok Ofir was gravely wounded in Brussels at his meeting with a dubious informer. Other members of the team that mistakenly killed Ahmad Bouchiki (in Lillehammer, Norway) were arrested in Oslo, and four members of the team, Dan Arbel, Marianne Gladnikoff, Sylvia Raphael, and Michael Dorf, were sentenced to prison terms.

OPERATION DAMOCLES

Operation Damocles was another paramilitary operation of assassination. After the 1956 Sinai Campaign, Egyptian President Gamal Abdel Nasser requested West Germany to build a surface-to-surface missile capability that could be used in future Egyptian wars against Israel. In 1962, Mossad Chief Isser Harel learned that work on the project had begun and requested Israeli Prime Minister David Ben-Gurion to seek the intervention of West German Chancellor Konrad Adenauer to halt it. Ben-Gurion however, was determined not to clash with the West German government. At his own initiative, Harel set in motion subversive actions with the overall title of Operation Damocles against German scientists and their families working on the project in Egypt. This campaign involved abductions and letter bombs, causing the deaths of at least five people between 1962 and 1963. Several letters were mailed by an Israeli spy in Egypt, Wolfgang Lotz. Aharon Moshel, another Israeli spy in Egypt, also engaged in hunting German scientists in that country.

Measures against Germans involved in the missile project were mainly under the command of Joseph (Joe) Ra'anan, who had joined the Mossad after serving as an intelligence officer in the Israel Air Force, and Yitzhak Shamir, who later became prime minister of Israel. One success was the disappearance of Dr. Heinz Krug, probably murdered in September 1962. In February 1963, Dr. Hans Kleinwachter, an electronics specialist, who in World War II was engaged in Nazi Germany's V2 rocket project, survived an assassination attempt by Shamir's team.

In the 1950s, Israel decided to clandestinely assassinate the chief the Egyptian commanders of the Palestinian terrorism. Col. Hafez Mustafa, then commander of Egyptian Intelligence in the Gaza Strip, was listed as a target and was assassinated. At that time, Egypt customarily sent cells of marauding Arabs (*Fedayeen*) from the Gaza Strip into Israel for the purpose of terrorizing Israeli society by murdering Israelis. Mustafa was in charge of those operations.

In June 1956, the director of Israel's DMI Maj. Gen. Yehoshafat Harkabi proposed a plan to assassinate Mustafa, which was successfully carried out on June 12, 1956, by an explosive device hidden in a book handed to him by an Egyptian double agent. Another book bomb was sent the following day via an East Jerusalem post office to Col. Salah Mustafa, Egypt's Amman-based military attaché, who had dispatched infiltrators via the West Bank into Israel. He opened the package and was killed by the blast. In the 1960s mail bombs became a central assassination tool of Israeli intelligence, especially against (former Nazi) German scientists who were involved in developing a missiles program for Egypt.

These paramilitary covert actions were not designed to be made public; their goals were to enhance Israeli security. The Bad Business and the Khaled Mashal affair became public knowledge because they failed. Operation Wrath of God was never officially connected to Israel, consequently Israel has never admitted partaking in the killings. However, Israeli fingerprints were well stamped on these operations. Two more covert actions of assassination in which Israel has

never admitted playing any part were the assassinations of Abu Jihad and Yahya Ayyash.[7]

The Engineer was the nickname of Ayyash, who was born in 1966 near Nablus and studied electrical engineering at Bir Zeit University near Ramallah, where he joined Hamas. During a 24-month campaign of terror beginning on April 6, 1994, Ayyash killed 130 Israelis and wounded nearly 500. As the carnage in the streets of Israeli cities grew, Ayyash became revered by masses of Palestinians. One of the largest manhunts in Israeli history was mounted for Israel's most wanted man, involving the British Secret Service (MI5), the Royal Jordanian Special Forces, the FBI, and the New York City Police Department. In charge of catching Ayash was the ISA. The ISA, among the elite of Israel's security agencies, succeeded in handing Ayyash a mobile phone via an operative. On January 5, 1996, the cell phone was detonated after Ayyash answered an incoming call, and he was killed. More than 100,000 Palestinians attended his funeral.[8]

THE SPRING OF YOUTH

Other paramilitary covert actions were carried out secretly but became public immediately after the operation ended. These operations were covert for tactical purposes only, to maintain the effect of surprise. Operation Spring of Youth was one of these, and it remained covert as long as the forces were engaged in the field. The operation was launched on April 9, 1973, and was carried out by approximately forty highly trained commandos of the most elite unit of the IDF, Sayeret Matkal. Its purpose was to avenge the deaths of the Israeli athletes slaughtered at the 1972 Munich Olympics by eliminating those in any way responsible for the massacre.[9]

In February 1973, Lt. Col. Ehud Barak, the commander of Sayeret Matkal, obtained photographs and precise information as to the whereabouts of three Palestinians involved in the massacre, Kamal Adwan, Kamal Nasser, and Mahmoud Yussuf Najjer, better known as Abu Yussuf, who were all then residing in Beirut. The Mossad obtained information that two of them lived on the second and third floors of the same building in Beirut, and the third lived across the street. The information also specified the exact architectural plans of the buildings.

After cross-referencing the intelligence, the strategy selected and executed by Sayeret Matkal was for the commando teams to infiltrate the Lebanese border by sea, disguised as tourists, with their weapons hidden. The distance from the beach landing point to the Beirut target apartments was approximately six miles. Three commando units would attack the individual apartments, and a guard unit would be positioned outside the apartment to contain any Lebanese police, army, or Palestinian reinforcements. The operation was calculated to last twenty minutes from the time of the initial shots until Lebanese or Palestinian reinforcements arrived on the scene. By then the commandos were expected to be back on the beach boarding the craft that would return them to Israel.

Barak, dressed as an Arab woman, commanded the operation and lead the guard unit. Another officer, Amiram Levine, was also disguised as an Arab woman. This unit maintained contact with their forward operational headquarters located aboard Israeli navy boats, offshore from Beirut.

Alighting on the Lebanese coast, the commandos were met by three cars driven by Mossad operatives, planted in Lebanon beforehand, who had intimate knowledge of the city. They drove the commandos to the apartments and returned them to the beach once the operation was accomplished. The drivers were Gilbert Rimbaud (Belgian) and Dieter Altnuder (German). In addition to the three apartments, a unit from the Israel Paratroop Regiment, led by Amnon Lipkin-Shahak, was assigned to strike the six-story headquarters of the world's most notorious hijacker, Dr. George Habash of the PFLP. Another paratrooper unit, as well as the Naval Commando Unit Sayetet 13, were to raid weapons manufacturing facilities and fuel dumps that the PLO maintained in the Tyre-Sidon area.

Among other well-known officers who took part in Operation Spring of Youth were Muki Betser and Yoni Netanyahu; the latter was killed in 1976 in Operation Yehonathan (also commonly known as Operation Entebbe).

Operation Spring of Youth succeeded because of excellent intelligence and ground assistance carried out by the Mossad. All the commandos of the Sayeret Matkal returned alive from the operation, with one wounded. During the (paratrooper) raid led by Lipkin-Shahak, two soldiers were killed.[10]

OPERATION YEHONATHAN

Operation Yehonathan was another covert operation carried out for tactical purposes of surprise: a rescue mission of Israelis who were hijacked by terrorists to Uganda. This operation, which took place on the night between July 3–4, 1976, came belatedly to be known as Operation Yehonathan, in honor of Lt. Col. Yehonathan "Yoni" Netanyahu, who was killed during the operation. The same operation was additionally known as Operation Entebbe, Operation Thunderball, or Operation Thunderbolt.[11]

On June 27, 1976, Air France flight 139 from Israel to Paris with 246 passengers was hijacked after taking off from its stopover point in Athens, Greece. It was diverted to Benghazi Airport in Libya, then onto Entebbe Airport in Uganda, where it landed. Eight of the hijackers were PLO members, and two belonged to the Baader-Meinhof gang. They were apparently supported by the Ugandan regime of pro-Palestinian President Idi Amin. In their ultimatum, the hijackers demanded that the government of Israel release all convicted Palestinian terrorist murderers; they set a 3-day deadline of June 30.

In principle the government of Israel is against any kind of negotiating or bargaining with hijackers, because to do so might serve as a precedent for further hijacking attempts. The alternative option, in this instance, was a rescue attempt by means of a military operation. The IDF chief of the General Staff, Lt. Gen.

Mordechai Gur, was reluctant to recommend a military rescue operation unless relevant and updated intelligence was gathered. The only information at hand concerned the blueprints of the terminal building at Entebbe Airport, obtained from the Israeli construction firm Solel Boneh, which had constructed the building in the 1960s. But this intelligence was insufficient. Parallel to the planning of a military rescue operation of the passengers, the Israeli government stated its readiness to pursue several political paths for the release of the hostages, which was a ploy to gain time for acquiring more intelligence on the situation and planning the rescue operation. As the negotiations proceeded, the hijackers extended their ultimatum to July 4.

The passengers were held in the old terminal's transit hall. The terrorists subsequently freed a large number of them, keeping only Israelis and Jews, whom they threatened to kill if the Israeli government did not meet their demands. The hijackers said they would free the airplane's crew, and an Air France plane was sent to Entebbe for that purpose. The plane's captain, Michael Bacos, and his crew refused to depart without all the passengers and accordingly remained with the hijacked passengers. One hundred three Israelis—men, women, and children—remained hostage in Entebbe.

Following the release of the non-Israeli/non-Jewish hostages, reserve Lt. Col. Amiram Levine in the Collection Department of the DMI flew to Paris on July 1 with Lt. Col. Amnon Biran to collect all possible information from the freed hostages, only two of whom remembered varying levels of detail.

At a preset time, four Hercules transport aircraft flew to Entebbe Airport and night-landed without any ground aid. They were followed by an Israeli air force jet with medical facilities that flew into Nairobi Airport in Kenya. Over 100 Israeli soldiers, including members of the elite Sayeret Matkal Unit, arrived to conduct the assault with Mossad operatives alledgedly taking part by way of providing ground assistance.

The aircraft landed an hour before midnight on July 3, 1976. A black Mercedes Benz limousine with an accompanying jeep convoy were driven toward the airport buildings to divert attention. It was hoped that this cavalcade would be taken to signify the arrival of a high Ugandan official with his escort, possibly Amin himself. Meanwhile the Israeli troops drove from the aircraft to the terminal building.

The raid took place during the early hours of July 4 and lasted about three minutes. Six or eight terrorists were killed, and all the hostages in the terminal were released alive, except for one who was killed when he frantically leaped at the Israeli forces. Another hostage, 75-year-old Dora Bloch, who was recovering from a choking episode in a Kampala hospital on the night of the raid, was left behind in Uganda and later murdered by two Ugandan army officers. During the incursion, Ugandan forces opened fire on Israeli troops, killing Netanyahu. Forty-five Ugandan soldiers were killed during the raid, and the Ugandan Airforce fighter planes parked on the ramp were taken out of action. Shortly after the fighting ceased, the rescued hostages were flown out via Nairobi to Israel.

One of the factors behind the excellent planning of the raid was superior intelligence. The success of Operation Yehonathan was result of the first-class troops of Sayeret Makal, but also, and no less importantly, to the essential information obtained by Israeli intelligence. The successful rescue from Entebbe Airport, a little less than three years after the failure to provide an early warning on the eve of the 1973 Yom Kippur War, afforded a major boost to morale among Israeli intelligence officers.[12]

COVERT RESCUE MISSIONS

Other covert actions were carried out for purposes of rescuing Jews from hostile Arab dictatorships. In 1970, intelligence began to trickle into the Israeli government from Syria with respect to privations suffered by the Jewish communities in Aleppo and Damascus. The reports told of young Jews making an effort to flee Syria, despite the difficulties and the dangers. The Israeli government, under Golda Meir, resolved to embark on an operation to bring the Syrian Jews to Israel. Operation Blanket began in 1970 and lasted several years; it was in fact a series of individualized and intricate operations. The operations were carried out by combat troops of Naval Commando Shayetet 13 of the Israeli navy, acting under orders of the Mossad, which was charged with the implementation of the operations. As part of the overall plan, Mossad operatives made dozens of incursions into Syria, as did combatants of Shayetet 13.

The Israeli government invested many resources in Operation Blanket, which in total succeeded in taking to Israel only a few dozen young Jews. The operational participants made the Syrian capital almost their home while taking enormous risks. Moreover, this was a mere few years after the capture and execution of an Israeli spy in Syria: Eli Cohen. Other covert actions for purposes of rescuing Jews that became well known were Operations Moses and Solomon. However the first rescue-type operations were Operations Magic Carpet and Tushia.

Operation Magic Carpet involved the secret airlifting of Yemeni Jews to Israel. Toward the end of April 1949, the imam of Yemen agreed to let most of the Jews, some 45,000 out of around 46,000, depart the country of their birth, Yemen. From remote corners of the country, the Yemeni Jews made their way on foot to an airport where they unobtrusively boarded Israeli transport aircraft, totaling 380 flights, to Israel. British and American airplanes were also engaged in the airlift. Most of these impoverished and isolated Jews had never seen an airplane, and on landing in Israel described their flying mode of transport as a "magic carpet." Thus Operation Magic Carpet became the name of this highly complex and dangerous rescue-immigration campaign. Operation Magic Carpet ran from May 1949 to the end of September 1950. Operatives of the Mossad Le'Aliyah Beth were dispatched to Yemen to organize the operation, which was kept secret and revealed to the media only after completion.[13]

Operation Tushia (meaning "initiative" in Hebrew) was carried out in 1956 after the Sinai Campaign. The operation was executed by Israeli intelligence in the hope that its operatives in Egypt would be in a position to contact Egyptian Jews and persuade most to leave for Israel. On November 9, 1956, Maj. Avraham Dar and Aryeh (Lova) Eliav, together with their radio operator, slipped into the war zone pretending to be French officers in French military uniforms and advanced with the British and the French troops. In Port Said they found only 200 mostly elderly Jews with no interest in moving to Israel. In the Jewish synagogue in the town they encountered only sixty-five Jews willing to leave with them for Israel. Secretly the three took them to the harbor and with the assistance of the French army, boarded them onto two French military landing craft. After sailing about one and a half miles offshore, the French craft met up with two tiny Israeli navy vessels camouflaged as Italian fishing boats, which carried the Egyptian Jews to Israel, with Dar and Eliav following days later.[14]

Operation Moses, known in Hebrew as Mivtza Moshe, came to fruition in 1974 after Ethiopian Emperor Haile Selassie was overthrown by a Marxist regime, resulting in the local Jewish community suffering in the Marxist revolutionary chaos. In 1977 and for several more years, Ethiopian Jews began arriving in Israel. As economic and political conditions in Ethiopia deteriorated, tens of thousands of Jews set out to cross the border into neighboring Sudan. In 1979, Israel (and to a lesser degree private organizations) began to evacuate the Ethiopian Jews from Sudan to Israel by various covert means. As word reached the Jewish villages in Ethiopia that the route to Israel was through Sudan, the flow of refugees across the border increased dramatically. The Mossad, through it Tsafririm Unit, was tasked with handling the rescue of the Ethiopian Jews. During winter 1984, it became clear that the refugee camps in Sudan were filling up so quickly that the mode of rescue had to be revamped.[15]

Israeli officials approached the United States for assistance, but the request created a major dilemma because unlike Israel, which was technically at war with Sudan, the United States enjoyed very close relations with President Gaafar al-Numeiry. Accordingly, the United States provided Sudan with large amounts of aid and subsequently exercised leverage over Numeiry. In 1984, Numeiry was in urgent need of further U.S. aid because of Sudan's failing economy, civil unrest, and the need to take care of the nearly half a million refugees, the majority of whom were non-Jews. The problem was that as a member of the Arab League, Numeiry could not afford to be seen to be helping the "Zionists." U.S. officials were well aware of Sudan's instability and were hesitant to do anything that might further endanger Numeiry's regime.

A Sudanese representative traveled to the United States in June 1984 to ask for additional economic aid. In a meeting with Richard Krieger and Eugene Banks of the State Department, Krieger decided to play on his visitor's anti-Semitic feelings; he suggested that the approval of the omnipotent Jewish lobby would be necessary to obtain congressional support for an increase in aid and suggested that Sudan could help by allowing the United States to take the Ethiopian Jews out of

the refugee camps. The Sudanese official found this line of argument appealing, and moves were made to arrange a rescue operation. The Refugee Affairs Co-ordinator at the U.S. embassy in Khartoum, Jerry Weaver, met with Sudanese vice president and security chief Omar Tayeb and secured his agreement to a plan for evacuating the Ethiopian Jews.

According to the plan, the Mossad and the Sudanese secret police would devise the secret operation, known later as Operation Moses. It lasted from November 21, 1984, to January 5, 1985. Altogether 7,800 Ethiopian Jews were rescued in this manner. However, as news of the airlift leaked out, the Sudanese ordered a halt to the operation. As an Arab country, Sudan would not allow its image in the Arab world to be tarnished by way of assisting in enlarging the Jewish population in Israel.[16]

U.S. officials considered the resumption of Operation Moses. On March 3, 1985, Vice President George H.W. Bush met with Numeiry. The latter was reluctant to resume the operation and instead agreed to a quick, one-time secret U.S. (not Israeli) operation in which the flights would not go directly to Israel. The result was that the United States released to Sudan, within a week, US$15 million out of $200 million promised. The remainder was remitted later. To avoid any possibility of disclosure, President Ronald Reagan wanted the operation to be carried out within three or four days. The CIA Station chief in Khartoum thus took an embassy plane to reconnoiter the runway of a remote airstrip near Gedaref and found that it was fit for landings and take-offs.[17]

On March 28, 1985, Operation Sheba began, with Israeli Ethiopian Jews working for Mossad identifying the Ethiopian Jews in the camps and bringing them by truck to the airstrip, eight miles outside Gedaref. Six U.S. Hercules airplanes loaded with food and medical supplies departed to Sudan from a U.S. airbase near Frankfurt, Germany, and landed at twenty-minute intervals to pick up the remaining Ethiopian Jews. However, instead of flying to intermediate destinations, the airplanes flew directly to an Israeli air force base near Eilat, in southern Israel. The original plan of Operation Sheba was to rescue as many as 2,000 Ethiopian Jews from the camps, but they found only 494.

After Operation Sheba concluded, the Israeli government believed that all of the Ethiopian Jews had been evacuated from the refugee camps in Sudan. In fact, many were left, mainly the old and infirm. Soon after Operation Sheba came to an end, Numeiry was overthrown and found asylum in Cairo. The former Sudanese Vice-President Tayeb and other officials were imprisoned or executed for allowing the Ethiopian Jews to leave Sudan for Israel. In sum, out the approximately 76,000 people of the Ethiopian Jewish community, 16,975 were taken to Israel during the 1980s.

Operation Solomon, known in Hebrew as Mivtza Shlomo, was another attempt at the beginning of 1990 at rescuing Jews from Ethiopia. Despite the rescue operations in the 1980s, many Jews still remained in Ethiopia, with numerous families having been divided. Following the resumption of diplomatic relations between Israel and Ethiopia in early 1990, thousands of Jews flocked to the

compound around the Israeli embassy in Addis Ababa awaiting their turn to be evacuated to Israel. In 1990 the Mossad embarked on a complex and politically sensitive mission, code-named Operation Solomon, to airlift thousands of Jews from Ethiopia to Israel. The Israeli government had reached an agreement with Ethiopia's ruler, Col. Mengistu Haile Mariam, to allow their departure for US$30 million. On May 24, 1991, with Ethiopian antigovernment rebels closing in on the Ethiopian capital, Operation Solomon was activated and lasted for thirty-three hours, evacuating some 14,325 Ethiopian Jews. The Mossad, which had a key role in the operation, had been assisted on the ground in Ethiopia mainly by Wonderferer Aweke, an Ethiopian Jew.[18]

THEFT OPERATIONS

Soon after Meir Amit's appointment as director of the Mossad on March 25, 1963, he met with many commanders in the IDF to clarify the Mossad's objectives. He asked what they thought could be the Mossad's most valuable contribution to Israeli security. Maj. Gen. Ezer Weizman, then commander of the Israel Air Force (IAF), remarked that bringing a Soviet-made MiG-21 to Israel would contribute the most to Israeli security. Israel would then have access to the secrets of the most advanced fighter planes the Arab states possessed and, according to the Russians, the most advanced strike aircraft in the world.[19]

The Soviet Union began introducing the MiG-21 into the Middle East in 1961 under heavy secrecy. By 1963 this aircraft had become the major aircraft of the air forces of Egypt, Syria, and Iraq. Few in the West knew much about the MiG-21, but all feared its capabilities. The Mossad had tried unsuccessfully twice to bring a MiG-21 to Israel, and proverbially the third attempt paid off from an unexpected source with little prompting from Israeli intelligence. An Iraqi Jew called Yusuf contacted Mossad officers with somewhat curious information that he might be able to arrange the theft of a MiG-21.

Yusuf had been born to an impoverished Jewish family in Iraq and became an indentured servant to an Iraqi Maronite Christian family at age ten. Although he never attended school and was illiterate, he, not unlike the biblical Joseph, rose to prominence in this family's household. When he was almost sixty, however, the head of the household told Yusuf during a quarrel that without the family he would have had nothing, a taunt Yusuf would not forget. He decided then and there to explore his "otherness"—his Jewish identity, something he had hardly given a thought to. In 1964 he contacted Israeli officials in Tehran (until 1979 Israel had sound relations with non-Arab Iran) and in Europe.

Through Yusuf, Israel made contact with a Maronite Christian pilot in the Iraqi air force, whose family felt the pressure of their Maronite Christian coreligionists under Muslim authoritarian rule. In a previous conversation with Yusuf, the pilot mentioned he would like to leave the country, and this was reported by Yusuf to the Israelis. An American woman, an agent for the Mossad in Baghdad,

was assigned to draw out Munir Redfa, an Iraqi Christian air force pilot and a member of Yusuf's adoptive family. The two bonded well, and several salient points were mentioned by Redfa: his disagreement with the war waged by his government against the Kurdish minority in northern Iraq, the fact that although he was a squadron commander he was stationed far from his home in Baghdad, and that because of to his Christian beliefs he was only allowed to fly with small fuel tanks. Furthermore, he commented on his admiration for the Israelis: the few against so many Muslims.

The female agent developed the relationship and suggested they take a holiday together in Europe in July 1966. After a few days of vacation, she suggested to Redfa that he fly with her to Israel, adding that she had friends there who might assist him. Despite initial disquiet from Redfa, the couple arrived in Israel and Redfa was given VIP treatment. After assessing the matter, Redfa was offered Israeli citizenship and US$1 million, an offer he accepted on condition that the Mossad arrange for the escape of his entire family from Iraq as well: his wife, his children, and his parents, along with the rest of his extended family.

The new commander of the IAF from April 1966, Maj. Gen. Mordechai Hod, met Redfa to plan the dangerous MiG flight together. All that remained for Redfa was to fix the date for his flight, which he set for August 16, 1966.

Soon members of Redfa's family began leaving Iraq for a variety of reasons. On that day in August, Redfa went about his business in Iraq as usual, and requested that the ground crew fill his tanks to capacity, an order the Russian advisors generally had to countersign. But the Iraqis disliked the Russian advisors, who seemed to hold them in contempt. This worked to Redfa's benefit, and he took off on his dangerous mission, knowing his fellow pilots would be ordered to shoot him down once Iraqi ground control realized he had diverted from his flight plan. Iraqi ground crew radar picked up a blip on the screen heading west, and they frantically radioed Redfa to turn around, warning he would be shot down. Hundreds of miles away Israeli radar picked up the blip on their screen, and sent a squad of IAF Mirages to escort him, while Redfa went through his prearranged signals, eventually meeting up with the Israeli fighter pilots who escorted him to a base deep in the Negev Desert, in the south of Israel.

On the same day, Mossad agents in Iraq picked up all the remaining members of the pilot's family, who had left Baghdad ostensibly for a picnic, and smuggled them out of the country. Newspapers all over the world carried the sensational story of an Iraqi pilot who had defected with his MiG-21 to Israel. It was no surprise when, during the Six-Day War in June 1967, the IAF demonstrated its superiority over the MiG-21 aircraft of the Arab air forces.

Operation Noah's Ark was the second "theft" covert operation, which involved the "stealing" of five missile boats Israel had ordered and paid for from the French shipyard at Cherbourg at the end of 1969. In 1962, Israel placed an order for missile boats with West German shipyards, as part of the reparations agreement between the two countries. Chancellor Adenauer agreed that the shipyards would build twelve missile boats for the Israeli navy on condition that the

transaction be kept secret so as not to incur the wrath of the Arab world. By the end of 1964, three of the twelve missile boats had been built and delivered. However, certain members of the West German government leaked news of the deal to the *New York Times*, with the result that the missile boats would still be financed by the reparations scheme but would be built outside West Germany. The contract for building the remaining boats was given to the Cherbourg shipyards in Normandy on the northern coast of France. In April 1967, the first of the nine boats was delivered to the Israeli navy, and a month later Israel received the second vessel, accumulatively the fifth boat in the purchasing contract.[20]

During the crisis on the eve of the 1967 Six-Day War, on June 2 French President Charles de Gaulle declared that France would no longer supply offensive weapons to the Middle East, which in real terms meant that Israel was to suffer a disadvantage, as the Arab world was being supplied by the Soviet Union. However, since the building of the missile boats in the Cherbourg shipyards was considered a contract in progress, two more boats were delivered to the Israeli navy in the fall of 1967.

Following a Palestinian terror attack on an Israeli aircraft at Athens airport on December 26, 1967, and the Israeli retaliation against Beirut airport two days later with the blowing up of thirteen Lebanese airplanes on the ground, de Gaulle declared that the French arms embargo would now be absolute, including the Cherbourg boats, despite the fact that they had been paid for.

On January 4, 1969, a week after de Gaulle's announcement, small teams of Israeli naval officers and sailors made their way to France and boarded three more missile boats that were almost complete. They spent three hours completing the vessels for sail, after which they hoisted the Israeli ensign and set off. They moved into the English Channel and never returned.

But Israel still desired the remaining boats and, in November of 1969, the clandestine Operation Noah's Ark was implemented. The Israeli Maritime Fruit Company registered the fictitious Starboat Line. A few days later, the Israeli navy informed Cherbourg shipyard management that the Israeli government had decided to seek compensation from the French government for breaching the agreement to deliver the boats to Israel; Israel would concede the boats. Renowned Norwegian shipping expert Ole Martin Siem was invited to join Starboat's board of directors for the specific purpose of purchasing the missile boats. On November 11, 1969, the France-based Israeli coordinator of the naval purchase, Israeli navy reserve Rear Adm. Mordechai Limon, received an acceptable compensation offer from the Cherbourg officials, whereupon Limon gave the go-ahead to Siem for the fictitious purchase of the missile boats.

Shortly thereafter, Siem met the French government's arms vendor, Gen. Louis Bone, and told him that he had heard that several missile boats were for sale and they might be converted to drill for oil. The French general agreed to the sale. One hundred twenty Israeli seamen entered France in pairs as the next stage of the operation and surreptitiously prepared the vessels. On Christmas Eve 1969,

despite the unstable weather conditions, final checks were carried out with the boats, which departed France on Christmas Day for Israel.

On December 26, the French authorities realized what had just happened. Although the Israeli government did not admit responsibility for the affair, Limon, who had lived in France for seven years, was declared persona non grata by the French authorities and ordered to leave. Two French generals were dismissed for their part in approving the sale of the missile boats to the fictitious Starboat Line. Seven days after leaving Cherbourg, the missile boats were anchored in Israel.[21]

OPERATIONS ISORAD AND PLUMBAT

For the purpose of secretly obtaining uranium for the Israeli nuclear reactor in Dimona in the 1960s, Israel used the services of the American company Nuclear Material and Equipment Corporation (NUMEC), a Pennsylvania-based manufacturer of nuclear fuels and specialty metals. For this purpose a dummy company, Isotopes and Radiation Enterprises (ISORAD), was formed in the United States.

During Operation Isorad, Dr. Zalman Shapiro, president of NUMEC, succeeded in diverting large quantities of weapons-grade uranium to Israel. In those years the unaccounted-for uranium missing from NUMEC's plant sparked the curiosity of the American federal authorities, and NUMEC paid almost US$930,000 in fines.[22]

Operation Plumbat, also known as the Uranium Ship Operation, was another covert operation related to stealing uranium. This was a joint operation of LAKAM and the Mossad, in support of the Israeli nuclear weapons effort. A West German chemical corporation named Asmara had bought uranium through subsidiaries from a Belgian company, Société Générale de Mianro. The uranium was loaded in Antwerp onto the vessel *Scheersberg A*. According to the manifest, the ship and its cargo was bound for Genoa. Entering the Mediterranean, the ship sailed east instead of south according to its declared destination, and somewhere between Cyprus and Turkey it rendezvoused with an Israeli freighter chartered by the Mossad. The cargo of some 200 tons of yellow cake uranium in 560 oil drums labeled "Plumbat" (lead) was smuggled onto the Israeli freighter.[23]

The *Scheersberg A* then simply disappeared for a couple of days, showing up later at Iskenderun (a port in Turkey) where the cargo was discovered to be missing. The West German government may well have been directly involved, but if so, this fact remained under wraps to avoid antagonizing the Soviets or the Arabs.[24]

THE IRANGATE AFFAIR

Israel, along with the United States, suffered a grave loss with the fall of the shah of Iran at the end of 1979. The Israeli leaders assumed that consistent

geopolitical interests would eventually triumph over religious ideology and produce an accommodation between Israel and Iran. The onset of the Iran-Iraq war in 1980 gave Israeli leaders the incentive to keep their door open to the Islamic rulers in Iran. The director general of Israel's Foreign Ministry, David Kimche, recommended selling arms to relatively moderate Iranians in positions of power, such as Ayatollah Ali Akbar Hashemi Rafsanjani. His comments were echoed by Uri Lubrani, Israel's chief representative in Iran under the Iranian leader, Shah Pahlavi. The Israeli Defense Minister, Reserve Gen. Ariel Sharon, also supported the idea and believed that Israel's vital interest was a continuation of the war in the Persian Gulf, with an eventual Iranian victory.[25]

The head of the Jaffee Center for Strategic Studies at that time, Aharon Yariv, a retired major general and former director of MI, stated at a scholarly conference at Tel Aviv University in late 1986 that it would be to Israel's advantage if the Iran-Iraq war ended in a stalemate, but it would be even more advantageous for Israel if the war continued. The salient understanding was that once the war ended, Iraq may open up an "eastern front" against Israel.

The first renewed Israeli arms sales to Iran in 1980 included spare parts for U.S.-made F-4 Phantom jets; a later deal that year included parts for U.S.-made tanks, and Israeli officials only informed Washington after the fact, because they believed that the United States would not grant upfront approval of such transactions. The administration of Jimmy Carter was outraged that its embargo had been blatantly violated by the Israelis, especially in light of the hostage crisis with which the United States was being confronted by the Iranians. This had erupted in November 1979 in the early days of the revolution, when Iranian radicals seized the U.S. embassy in Tehran and took sixty-six American diplomats hostage. Thereafter, and until the diplomats were released in January 1981, U.S. Secretary of State Edmund Muskie demanded that Israel cease its shipments.

Israeli Prime Minister Begin promised to comply with the U.S. demands, but in fact Israel continued to sell arms to Iran without U.S. approval. On July 24, 1981, Ya'acov Nimrodi, an Israeli businessman and longtime associate of Ariel Sharon, signed a deal with Iran's Ministry of National Defense to supply arms worth US$135,842,000, including Lance missiles, Copperhead shells, and Hawk missiles. A sale of such a magnitude must have had Israeli government acquiescence. President Reagan's administration took office in 1981 and, toward the end of that year, Kimche approached U.S. Secretary of State Alexander Haig and National Security Adviser Robert McFarlane to discuss proposed Israeli shipments of U.S.-made spare parts worth $10–15 million to a relatively moderate faction in Iran. Haig disapproved the request. In November 1981, Ariel Sharon visited the United States and requested approval from his counterpart, Caspar Weinberger, to sell arms to Iran. Weinberger deferred the decision to Haig, who rejected the request outright. In May 1982 a clandestine gathering took place between Al Schwimmer (an American Jewish billionaire who had founded the Israeli aircraft industry), Nimrodi, Kimche, and Sharon and his wife, Lily, together with Sudanese President Gaafar Numeiry, at a Kenyan safari resort owned

*Nonmilitary.

†Paramilitary. For the purpose of this chapter, *paramilitary* means *auxiliary* military, that is, something not quite military performing military duties. There are political connotations to the term *paramilitary* that often override the original meaning, hence there are contradicting understandings of the term. Those political connotations, however, are localized and at times may again be contradictory. There are paramilitary units that carry out paramilitary activity that are an officially legislated arm of the government. Paramilitary actions carried out by such groups can serve many different functions.

by Saudi business tycoon Adnan Khashoggi. At the meeting, Israel won Numeiry's agreement to allow Ethiopian Jews safe passage through Sudan to migrate to the Jewish state, and in return Numeiry requested Israel's assistance in evacuating him from his country should his regime be toppled

Under U.S. pressure, Israel halted arms sales for a short period, but private Israeli citizens, including Nimrodi, continued making plans to resume trade ties with Iran. In 1985 Nimrodi succeeded in obtaining approval for his plans from Israel's national unity government headed by Shimon Peres. Nimrodi and his partner Schwimmer, a close friend of Peres, were authorized to provide Iran with Lau antitank missiles and antiaircraft Hawk missiles from Israel's stockpiles. These deals were part of what was later known as Irangate—half of the Iran-*contra* affair revealed in 1986.

In the mid-1980s, Schwimmer played a key role in persuading the U.S. administration itself to sell arms to Iran. Through a secret agreement between the United States and the Israeli Defense Ministry in 1985, the arms went to Iran via Nimrodi, with the United States replenishing the supplies Israel transferred to the Iranians. One aspect of the deal was that Iran was to exert pressure on its protégé, the Hezbollah organization in Lebanon, to release U.S. and Western hostages kidnapped after 1982. The Reagan administration was fully aware of attempts at freeing the hostages by means of unsanctioned arms sales to Iran.

News of Irangate, or as it was more commonly known, the Iran-*contra* affair, first began appearing in the media toward the end of 1986. It revealed how deeply

the United States was involved in arms sales to Iran, breaching its own laws. One law prohibited the sale of U.S. weapons for resale to a third country listed as a terrorist nation, and this occurred precisely at a time when the Washington was publicly calling for a worldwide ban on selling arms to Iran. Moreover, the monies paid by Iran for the U.S. arms were redirected by senior officials in the Reagan administration to buy arms for the *contra* rebels in Nicaragua. This went against the Boland Amendment of December 8, 1982, which specifically prohibited military assistance to the *contras*. One of the administration officials involved in the scandal was Lt. Col. Oliver L. North, military aide to the National Security Council, who reported in the White House to Robert McFarlane and later to his successor, Vice Adm. John M. Poindexter. The entire scheme was conducted without Congress's knowledge, again contravening a law requiring sales above US$14 million to be reported to Congress.[26]

CONCLUSION

Although not all of the Israeli covert actions and clandestine collection operations discussed here were carried out in a clandestine manner, of those in the public domain, the most widely known were operationally executed under varying levels of secrecy. In reviewing several of the literally hundreds of diverse covert missions carried out by the different branches of the Israeli intelligence community, it becomes clear that in defense of the homeland, the style and type of operation selected is only limited by the imagination of those involved.

"SUCH OTHER FUNCTIONS AND DUTIES"

Covert Action and American Intelligence Policy

JAMES M. SCOTT AND JEREL A. ROSATI

ALTHOUGH THE U.S. GOVERNMENT HAS EMPLOYED COVERT operations since the time of the American Revolution, World War II marks the point at which such activities became a major element of U.S. security policy. Building on the activities of the Office of Strategic Services (OSS) in World War II, U.S. policy makers first established the Central Intelligence Group in January 1946 (by executive order), and then, about eighteen months later, the Central Intelligence Agency (CIA), through the National Security Act. Among other things, the 1947 National Security Act charged the CIA with a variety of intelligence gathering and analysis functions, as well as "such other functions and duties related to intelligence affecting the national security as the National Security Council may from time to time direct." This ambiguous language was the only indication in this seminal legislation that the CIA would be engaged in covert action. Over time, of course, covert action became a signature activity of the agency and perhaps the most controversial as well. In fact, it was only days after the passage of the 1947 act that the Truman administration authorized a series of propaganda activities in Europe.[1] From this relatively modest start, covert action and the CIA's role in it grew considerably.

This chapter reviews the use of covert action in U.S. foreign policy since World War II, focusing on the methods that have been employed over time. After a discussion of the definition of covert action, it surveys covert actions through several periods from the end of World War II until the present. Following this brief overview, the chapter then discusses the range and methods of covert action and concludes by reflecting on key dilemmas associated with the use of covert action as a foreign policy instrument.

COVERT ACTION

Covert action has often been characterized as the "middle option," "third way," or "quiet approach" to be used when doing nothing and using force are both unacceptable. Accordingly, as other observers have noted, it has more to do with a method than with any particular actions. Indeed, according to Berkowitz and Goodman, almost every activity that has been typically considered a covert action has also been conducted overtly.[2] Hence, what constitutes covert action is somewhat elusive.

As already noted, the 1947 National Security Act mentioned only "such other functions and duties." In mid-1948, George Kennan authored a policy document—NSC 10/2—that characterized covert action as those activities "so planned and conducted that any U.S. government responsibility for them is not evident to unauthorized persons and that if uncovered the U.S. government can plausibly disclaim any responsibility for them."[3] In 1978, President Jimmy Carter issued an executive order that defined covert action as

> operations conducted abroad in support of national foreign policy objectives which are designed to further official United States programs and policies abroad and which are planned and executed so that the role of the United States Government is not apparent or acknowledged publicly, and functions in support of such activities, but not including diplomatic activity or the collection and production of intelligence or related support functions.[4]

Just a few years later, Ronald Reagan's Executive Order 12333 essentially restated this definition, adding that covert actions "are not intended to influence United States political processes, public opinion, polices, or the media and do not include diplomatic activities or the collection or production of intelligence and related support functions."[5] The essence of these definitions was captured in the 1991 Intelligence Authorization Act, which defined covert action as "activities of the United States Government to influence political, economic, or military conditions abroad, where it is intended that the role of the United States Government will not be apparent or acknowledged publicly."[6]

The National Clandestine Service (NCS), the modern-day name for what has been known as the Office of Policy Coordination, the Directorate of Plans, and then the Directorate of Operations, is primarily responsible for U.S. covert operations. The NCS actually involves three types of activities: espionage, counterintelligence, and covert action. Espionage involves human intelligence, such as running spies and double agents abroad to access information, and counterintelligence emphasizes preventing foreign intelligence agencies from penetrating the CIA. Covert actions, by contrast, are influence operations.[7]

A core element of covert action is obviously that the U.S. government conceals its responsibility. As Berkowitz and Goodman have noted, there are two main justifications for such subterfuge: "one is when open knowledge of U.S.

responsibility would make an operation infeasible . . . the other valid reason . . . is to avoid retaliation or to control the potential for escalation."[8] In either case, covert action is fundamentally a foreign policy option, not an intelligence activity.[9] As Loch K. Johnson has noted, "whatever the variation in terminology, the objective of covert action remains constant: to influence events overseas secretly and in support of U.S. foreign policy."[10] As the following historical overview suggests, the use of covert action as a foreign policy instrument has been closely tied to the overarching foreign policy ethos of the time.

COVERT ACTION SINCE WORLD WAR II: AN OVERVIEW

From its creation until the collapse of the Soviet Union, the CIA and its covert operations have evolved through four stages: (1) the "good old days," 1947 through the early 1970s; (2) the "fall" and reform, early 1970s to 1979; (3) the resurgence, during the 1980s; and (4) the adjustment, in the post–Cold War and post–September 11, 2001, periods.[11]

The Good Old Days, 1946–73

In terms of budget, personnel, and missions, the CIA grew quickly in the late 1940s and 1950s. All the agency's bureaucratic directorates and functions expanded, but none more so than the operations directorate. Initially, extensive covert operations were probably not envisioned; many observers, including Clark Clifford, George Kennan, Sidney Souers, and President Harry Truman, commented later that the CIA's covert action mission grew well beyond what was imagined at its inception.[12] The CIA was created to provide the president with an intelligence capability to engage in data collection and analysis as well as coordinate the larger intelligence community existing at the time. However, as suggested, one clause of the CIA charter allowed it to "perform such other functions and duties," which provided the later legal justification for involving the CIA in cloak-and-dagger operations.[13] Over time, the CIA soon became the major governmental organization responsible for covert actions abroad in support of the policy of containment.

The rise of the Cold War was the essential factor prompting the growth of the covert action mission. Estimates are that the vast majority of the CIA's budget and personnel throughout the Cold War were devoted to operations. According to Johnson, for example, by the mid-1960s, more than 60 percent of the CIA's budget was dedicated to covert action.[14] The president used the CIA to perform various covert activities that no other agency performed and that were officially denied in public. In fact, the CIA was allowed considerable independence in running its covert operations under presidential supervision.

Although extensive operations were initiated in Europe in the years after World War II, including information campaigns, the provision of political support to preferred parties and individuals, subversion, and other activities, the heyday of covert operations occurred under Director Allen Dulles from 1952 to 1961, a time when his brother, John Foster Dulles, also served as secretary of State.[15] Even though the president often remained distant from the details of an operation, the director responded to presidential initiative and choice. Also, no real oversight existed outside the executive branch, as Congress generally preferred to remain on the sidelines in deference to presidential leadership and the Cold War consensus.[16]

Prevailing Cold War attitudes help explain the vital role that covert action came to play in U.S. foreign policy. American leaders saw a world divided between the forces of good and evil—the free world represented by the United States against the totalitarian, communist bloc represented by the Soviet Union. The Soviet Union was also seen as aggressive, expanding its territorial control and directly threatening American interests and the status quo. Consequently, American policy makers were preoccupied with rearming and creating alliances to deter Soviet expansionism and, if deterrence failed, to fighting a "hot" war. At the same time, American policy makers increasingly came to rely on covert operations to fight the "Cold" War. Such measures were justified in terms of an anticommunist philosophy and a strategy of power politics, in which the ends justifies the means. A secret report authored by Gen. James Doolittle for the 1954 Hoover Commission captured the perspective nicely:

> It is now clear that we are facing an implacable enemy whose avowed objective is world domination by whatever means at whatever cost. There are no rules in such a game. Hitherto acceptable norms of human conduct do not apply. If the U.S. is to survive . . .We must learn to subvert, sabotage and destroy our enemies by more clever, more sophisticated and more effective methods than those used against us. It may become necessary that the American people will be made acquainted with, understand and support this fundamentally repugnant philosophy.[17]

Driven by this perspective, the CIA became an important tool of U.S. foreign policy immediately after its creation in 1947. The examples discussed next highlight just a few of the important covert activities abroad, which include: (1) manipulating foreign democratic elections; (2) organizing partisan resistance movements; (3) overthrowing foreign governments; (4) participating in foreign assassinations; (5) supporting friendly, often authoritarian governments; and (6) training foreign military, intelligence, and police personnel.

It has been reported that by 1953 the CIA had major covert operations in progress in forty-eight countries.[18] A U.S. Senate select committee investigating foreign and military intelligence in 1975 found that the CIA had "conducted some 900 major or sensitive covert action projects plus several thousand smaller projects since 1961."[19] In other words, the CIA, in its heyday, was engaged in

covert operations all over the world, with as much as one-third of its interventions taking place in "pro-Western" democracies.[20] Table 4-1 highlights some of the major covert operations during the "good old days" that have come to light, although much CIA covert activity remains unknown.

In the years after World War II, one frequently employed type of covert activity of the CIA involved influencing foreign elections. In both Italy and France in 1948, for example, the United States worried that the economic and political instability after the war, which strengthened legal communist parties in those countries, would eventually result in communist electoral victories. Consequently, the CIA engaged in a variety of efforts to undermine the communists and strengthen the centrist parties. In Italy, for example, the agency funded and supported the Christian Democratic Party and distributed propaganda and disinformation through a network of Italian media assets (paid agents) employed throughout the print and electronic media to discredit the Communist Party. The Christian Democrats won the election, although the extent of CIA influence remains unclear.

In the late 1940s and 1950s, the CIA also supported partisan resistance movements in communist countries to promote internal instability and domestic uprisings. For example, the agency trained émigrés and secretly transported them into Albania, Poland, Yugoslavia, the Baltic states, Soviet Georgia, and the Ukraine. These partisan resistance efforts made very little headway; in fact, in most cases they were speedy failures. For example, the fairly extensive effort in Albania persisted for a number of years until it became clear that the communist regime had infiltrated the resistance and virtually all the agents had been apprehended almost immediately.

Under President Eisenhower, the CIA became involved in a series of efforts to overthrow foreign governments. For example, with help from the British MI6 (their CIA equivalent), the CIA staged the Iranian coup of 1953 to overthrow the nationalist leader Mohammed Mossadeq and restore the Pahlavi dynasty, headed by the shah. Mossadeq had proclaimed an independent and neutralist state in the growing Cold War and demanded that Great Britain renegotiate its most favorable contract for Iranian oil, and U.S. policy makers feared he was playing into the hands of the communists and the Soviet Union. Once restored, the shah subsequently awarded Gulf, Standard of New Jersey, Texaco, and Socony-Mobil a 40 percent share of Iranian oil rights.[21]

A year later, the CIA staged the 1954 coup in Guatemala, which became the model for many of the agency's subsequent actions. With a history of dictatorial rule, in 1950 Guatemala experienced its first taste of democracy when Jacobo Arbenz Guzmán was elected president. However, when Arbenz promoted agrarian reform and expropriated 234,000 acres of uncultivated land owned by the United Fruit Company, an American company that owned over 40 percent of Guatemalan territory, U.S. policy makers, including President Eisenhower and Secretary of State Dulles, concluded that the Arbenz regime was "playing the communist card" and posed a threat to American national security. The CIA thus

Table 4-1. Major CIA Covert Operations During the "Good Old Days"

1947–48	Propaganda campaign during the 1948 Italian national elections
1947–48	Propaganda campaign during the 1948 French national elections
1948–52	Partisan resistance movements in Eastern Europe and Soviet Union
1949	Anglo-American effort to overthrow the Albanian government
1950–70s	Propaganda campaigns through Radio Liberty and Radio Free Europe
1952–60	Kuomintang Chinese partisan resistance movement on Sino-Burmese border
1953	Anglo-American overthrow of Prime Minister Mohammed Mossadegh of Iran
1953–54	Campaign to support Ramon Magsaysay's presidential candidacy and counter Huk insurgency in the Philippines
1954	Overthrow of President Jacobo Arbenz of Guatemala
1950s–70s	Subsidization of domestic and foreign groups and publications
1953–70s	Drug testing and mind-control program
1954–70s	Effort to overthrow leader Ho Chi Minh and the North Vietnamese government
1955	Effort to destabilize President José Figueres's government of Costa Rica
1958	Support of Tibetan partisan resistance movement in China
1958–65	Effort to destabilize President Sukarno of Indonesia
1960	Alleged effort to assassinate Gen. Abdul Kassem, leader of Iraq
1960	Alleged effort to assassinate President Abdul Nasser of Egypt
1960	Alleged effort to assassinate political leader Patrice Lumumba of Congo
1961	Effort to overthrow Fidel Castro, leader of Cuba
1961	Effort to assassinate Rafael Trujillo, leader of Dominican Republic
1961	Effort to destabilize President Kwame Nkrumah of Ghana
1960s	Effort to assassinate Fidel Castro of Cuba
1960s	Fought secret war in Laos
1962–63	Destabilized the Ecuadorean governments of Ibarra and Arosemena
1963	Destabilized Prime Minister Cheddi Jagan's government of British Guiana
1963	Supported overthrow of President Ngo Dinh Diem of South Vietnam
1960s	Conducted pacification and Phoenix programs in Vietnam
1964	Campaign in support of President Eduardo Frei in 1964 Chilean elections
1964	Supported military coup against President Joao Goulart of Brazil
1967	Supported military coup in Greece
1967–70s	Domestic campaign against antiwar movement and political dissent
1970–73	Destabilized Chilean government of President Salvador Allende

trained several hundred Guatemalans on a United Fruit plantation in neighboring Honduras and, when it sent the unit into Guatemala, waged an extensive information and psychological warfare campaign to make the force appear larger. The CIA also piloted several small planes in a bombing run over Guatemala City and other key towns. Arbenz lost his nerve and fled the country, and Castillo Armas became the new military dictator.[22]

In the 1950s and 1960s, the CIA also began to be involved in efforts to assassinate foreign leaders, although it appears that the agency was never actually successful in such attempts. For example, during the 1960 independence crisis in the Congo, it is alleged that the CIA attempted to assassinate the first prime minister and nationalist African leader, Patrice Lumumba, who was perceived as being too independent of American interests and open to communist subversion. The CIA was apparently unsuccessful, but Lumumba was assassinated eventually, clearing away for the U.S.–backed dictator, Mobutu Sese Seko, who ruled a corrupt regime for thirty years and impoverished the country.[23] In the 1960s, the CIA made numerous attempts to arrange the assassination of Cuban leader Fidel Castro, none of which came to fruition (see following for more discussion of the anti-Castro campaign).

The CIA also supported foreign governments allied to the United States in such places as Iran, Nicaragua, Cuba, and elsewhere, often participating in an allied government's violent repression of its own people. As George Kennan, in a report to Secretary of State Dean Acheson, stated as early as 1950: "We cannot be too dogmatic about the methods by which local communists can be dealt with. . . . Where the concepts and the traditions of popular government are too weak to absorb successfully the intensity of communist attack, then we must concede that harsh governmental measures of repression may be the only answer."[24]

For example, in Indonesia, after actively destabilizing President Sukarno, a prominent leader of the Third World nonaligned movement beginning in 1958, the CIA actively supported his successor after Sukarno's ouster. The CIA then assisted the new government of General Suharto in eliminating Indonesian Communist Party members and repressing all internal dissent, which included providing the Indonesian army with lists of people to be arrested and killed. Estimates of the number of Indonesians killed in the ruthless campaign range from 300,000 to as many as 1 million, with hundreds of thousands jailed without trial. In South Africa, the CIA supported the white apartheid regime, even providing the regime with a tip from a deep cover CIA agent which led to the August 5, 1962, arrest of Nelson Mandela, the underground leader of the African National Congress, the major force opposing the Afrikaner government and the system of apartheid.[25] Mandela remained imprisoned by the South African government until February 1990; after the transition to black majority rule, he became the first president of South Africa.

The CIA also frequently offered retainers to foreign leaders, putting them on the CIA payroll, and the agency frequently engaged in training of foreign intelligence personnel, including those engaged in covert operations. The armed

forces and the national police of many governments allied with the United States also were trained by U.S. military and government personnel. Thus, the U.S. government was heavily engaged in providing overt and covert support with billions of dollars of foreign assistance to friendly governments to ensure their security as part of America's larger campaign to fight the Cold War.

In the late 1950s and 1960s, the CIA relied on a variety of covert operations to be rid of Castro in Cuba. The initial operation was modeled on the 1954 Guatemalan operation. Hundreds of exiled Cubans were recruited and trained by the CIA in Honduras as an invasion force. In 1961, President John Kennedy supported the Bay of Pigs invasion, and the Cubans invaded with limited air cover provided by the CIA. Unlike the Guatemalan operation, however, the Bay of Pigs invasion was a complete failure. The actual invasion strategy was flawed to begin with, and Castro did not flee but used the Cuban military to destroy and capture the invading force. The Bay of Pigs fiasco was the first major CIA covert operation that became public, embarrassing the U.S. government and President Kennedy.[26]

From that point on, President Kennedy and his brother, Attorney General Robert Kennedy, mounted a vendetta against Castro, authorizing the CIA to use all means available to destabilize and assassinate him. The CIA went so far as to turn to the Mafia for assistance, for the Mafia maintained connections in Cuba forged in the days when they ran gambling casinos, before Castro took power. Yet the covert plans to assassinate Castro failed. Most were harebrained schemes that only James Bond could have pulled off, such as attempts to slip Castro the hallucinogen LSD via a cigar, give him a pen with a poison tip, explode clamshells while he dove in the Caribbean, and sprinkle his shoes with an agent to make his beard fall out and with it, according to the psychological warfare experts, his Latin machismo.[27]

Failures did not deter the CIA's involvement in covert operations, nor the president from relying on such operations as a major instrument of U.S. foreign policy. Thus the Americanization of the war in Vietnam not only led to a major overt military effort to keep South Vietnam independent of North Vietnamese communism but included major covert efforts in Vietnam, as well. The U.S. government, with the use of the CIA, supported President Ngo Dinh Diem beginning in 1954. When Diem became less effective and lost credibility as an independent leader of South Vietnam, the U.S. government backed a military coup against him in 1963. The CIA was very active in Vietnam. It trained members of the Meo and Hmong tribes to conduct military operations in support of the American war effort, including a secret war in Laos. It also conducted the infamous PHOENIX program, which targeted thousands of suspected Viet Cong and communist supporters for "neutralization." Not only were many innocent individuals jailed, but torture, terrorism, and assassination were also used as part of the PHOENIX operation.

The last major covert operation during the good old days occurred in the Chilean coup d'état during the Nixon administration. Although Chile had been a

democracy since the early 1960s, the Nixon administration worried that the electoral process would bring to power Salvador Allende, an avowed Marxist who believed in socialist democracy. The CIA attempted to influence the elections, but Allende won anyway. The United States then began a campaign to destabilize the Allende regime, highlighted by a CIA covert program to destabilize the Chilean economy and persuade the Chilean military to stage a coup. The military coup came in 1973 and installed Augusto Pinochet as the dictator of Chile for the next sixteen years.

Fall and Reform in the 1970s

Beginning with the Bay of Pigs fiasco through the 1960s, the CIA faced increasing scrutiny. Operations were less successful than in the 1950s and were being exposed in the media, creating embarrassment and controversy for the U.S. government and American people at home and abroad. The failure of Vietnam politicized segments of American society and contributed to the collapse of the anticommunist consensus. The domestic political environment became even more critical when the revelations of Watergate uncovered abuses of presidential power. In this new political climate, charges were made that the president had become too powerful and abused his office in the name of national security. The CIA was a special focus of attention and was accused of activities that were immoral, illegal, and counterproductive to the long-term interests of the American people.

A period of intense scrutiny ensued. President Gerald Ford appointed the Rockefeller Commission in 1975 to investigate the intelligence community and recommend reforms. But while the Rockefeller Commission was operating, President Ford and Secretary of State Henry Kissinger were supervising a major CIA covert operation in Angola. This involved funding, training, and equipping two independence forces that were battling a Soviet-backed force for control of Angola following the end of Portuguese colonialism. Ford and Kissinger tried to keep the operation secret, but when word of the Angolan operation leaked, Congress voted to abort it and began its own investigation of intelligence.[28]

The House and Senate each conducted major investigations of the intelligence community and covert operations. The Pike and Church Committee investigations (named after the chairman of each chamber's Foreign Relations Committee) led to the first public knowledge of the scale of covert operations conducted by the CIA. Most Americans were, to put it mildly, shocked to discover the degree to which their government was in the business of overthrowing democracies, conducting coups d'état, and planning political assassinations. In this political climate, the intelligence community, especially the CIA and covert operations, experienced a major decline. Under President Ford and to a greater extent under President Jimmy Carter, the CIA budget, personnel, and activities were cut, especially in the directorate of operations, and greater emphasis was placed on the intelligence side of the agency and its technological capabilities. During this time, over 1,800 covert operatives were fired or forced to take early

retirement, and most covert operations were cut, including major political and paramilitary programs.

Congress also asserted itself in oversight. For example, in the 1980 Intelligence Oversight Act it established new, permanent intelligence committees in both chambers and required the submission to Congress of a "presidential finding" explaining the need and nature of any covert actions. Presidential executive orders were issued that limited the kinds of covert operations the CIA could conduct, such as forbidding U.S. governmental personnel from becoming involved in political assassinations. Furthermore, the Freedom of Information Act, first passed in 1967, was strengthened to allow public access to classified information. The net impact was that the use of covert operations as a tool of U.S. foreign policy (and morale among covert operatives) reached its nadir by the end of the 1970s.[29]

The Resurgence of Covert Action in the 1980s

Beginning in 1980, the CIA and covert operations got a new lease on life. The resurgence of the agency began during the last year of the Carter administration, amid growing concern with the threat of the Soviet Union after its invasion of Afghanistan in December 1979. President Carter approved a major covert operation to send money and arms to the Afghan resistance forces through U.S.-controlled sources and agents in Pakistan and Saudi Arabia. Support to the Afghan resistance escalated under presidents Reagan and George H. W. Bush and continued into the early 1990s.[30]

It was under the Reagan administration, however, that the CIA and the use of covert operations became a major force in U.S. foreign policy reminiscent of the early Cold War days. William J. Casey, a strident anticommunist and former member of the OSS during World War II, was selected as Director of Central Intelligence (DCI). Under Casey, the CIA rejuvenated its operations division and rehired many former covert operatives.[31] Under Casey, the CIA again became active in combating communism abroad. The agency launched over a dozen "major" covert operations (defined by the congressional intelligence committees as an operation costing more than $5 million or designed to overthrow a foreign government) in places such as Central America, Angola, Libya, Ethiopia, Mauritius, Cambodia, Afghanistan, and Iran. Among the most significant of these was the huge CIA Afghanistan operation to support insurgents—known as the *mujahedeen*—against the invading Soviet military. Through Pakistan and Saudi Arabia, the CIA provided billions in support for arms and training and played an important role in helping the insurgents force the Soviets to withdraw (although it also inadvertently helped to create the Al Qaeda network that would plague the United States a decade later).[32]

Another major and more controversial operation at the time occurred in Nicaragua and involved creating the *contra* resistance force in an attempt to destabilize and overthrow the new Nicaraguan Sandinista regime. The *contra* covert war was eventually outlawed by Congress in the early 1980s. Nevertheless, the

Reagan administration circumvented the law by pursuing the *contra* operation through the NSC staff and relying on private operatives and groups.[33] The administration attempted to destabilize the country and overthrow the government. The U.S. "rollback" policy under DCI Casey predominantly consisted of a major covert operation devised by the CIA to develop, train, equip, and support a counterrevolutionary force of Nicaraguans, known as the contras, that grew to a 10,000–15,000-strong military force. These activities also included CIA—rather than *contra*—attacks on Nicaraguan oil installations and mining of Nicaraguan harbors; the secret channeling of military equipment to the contras from the Pentagon or cooperative third countries (such as Honduras and Panama); CIA preparation of a training manual for the contras that may have advocated assassination; and efforts to pressure Costa Rica (which was officially neutral) to support the creation of a southern front for the contras (such as the CIA staging phony Sandinista raids on the Costa Rican border).

The Reagan administration took other steps to expand CIA operations. First, the administration eased many restrictions on the conduct of intelligence operations within the United States.[34] In addition, the administration also tightened the security and secrecy system that had developed throughout the intelligence community and the government. It became much more difficult for the public to gain access to information under the Freedom of Information Act. Moreover, to pursue its covert operations, the Reagan administration resisted and circumvented congressional oversight of the intelligence community. It was such actions that triggered the Iran-contra affair and caused Reagan's final two years to be dominated by investigations of this scandal, along with concerns that the CIA was out of control.

Adjusting to the Post–Cold War and Post–9/11 Periods

The Cold War's end ushered in a set of challenges for the CIA and its covert action mission, which appeared much less central to U.S. foreign policy without the Cold War's context. According to Theodore Draper, "Of all the organizations that miss having the Soviet Union as an enemy, the CIA has undoubtedly been hit the hardest. The reason is that the CIA was specifically established in 1947 to struggle with the Soviet enemy. . . . But now the enemy has vanished. Its most dedicated American antagonist has been deprived of its mission. . . . [Now] the CIA wanders about in a wilderness of self-doubt and recrimination."[35] Recent years have not been much kinder, as the spectacular failures of September 11, 2001, and Iraq left the CIA reeling. One recent analysis concluded the CIA has "lost its place and standing in Washington," while a CIA veteran reacted to the 2004 intelligence reforms by saying, "The agency, as we know it, is gone."[36] Yet in late 2005, the CIA's central role in coordinating covert operations was confirmed with the strengthening of the National Clandestine Service, the new name for its directorate of operations. And after September 11, the agency's covert antiterror programs grew into the largest covert action program since the height of the Cold War.[37]

Prior to this recent expansion, however, as the CIA sought new missions in the post–Cold War context, its budget growth first slowed under George H. W. Bush and then began to decline under Bill Clinton. At the same time, challenges to CIA activities began. Congress attempted to enact tighter controls over covert action, but Bush vetoed the legislation in 1992. Not long after, Senator Daniel Patrick Moynihan (D-NY) sponsored legislation to eliminate the CIA entirely, ending covert action and placing the agency's intelligence analysis function in the State Department. Between 1990 and 2001, a spate of studies—some from Congress, some from special commissions, and some from policy think-tanks—all recommended reforms of the intelligence community.[38]

In the midst of this turmoil, the CIA continued some traditional covert operations, and added some new actions as well. For example, the agency applied its traditional instruments in the 1990s against Iraq and Kosovo. In Iraq, starting with a Bush (Sr.) finding that authorized efforts to destabilize the Iraqi economy in 1990 (after the Iran-Iraq War), the CIA engaged in a series of efforts to undermine Saddam Hussein, none of which was particularly effective. Under Bill Clinton, for example, the CIA supported the Iraqi National Congress, spending about $120 million seeking Hussein's assassination or overthrow. These operations collapsed when the resistance was infiltrated by Hussein's forces, although the United States committed itself to regime change in Iraq again in 1998. The initial campaign was an unmitigated disaster, however—"the greatest covert action debacle since Vietnam" in the words of two observers.[39] In Kosovo in 1999, the CIA launched a campaign against Serbia and Slobodan Milosevic that combined propaganda, destabilization, support of opposition groups, and other methods to undermine the regime.[40]

At the same time, the CIA took up a role in new areas as well, including drug trafficking, economic intelligence, and counterterrorism. On the drug war, the CIA began to cooperate with other agencies, including the FBI and the Drug Enforcement Agency, to break up drug rings. The CIA also increased its activities in the highly controversial arena of economic espionage, not only collecting information on trade practices but even attempting to steal trade secrets. Finally, with rising concerns about terrorism after the 1993 World Trade Center bombing, the CIA accelerated its counterterrorism operations as well. Osama bin Laden and theAl Qaeda network were especially important targets, and the CIA established a new counterterrorism center and a "bin Laden station" to oversee its efforts. Although some success occurred, the attacks in 1998 on U.S. embassies in Kenya and Tanzania, the 2000 bombing of the USS *Cole* in Yemen, and, of course, the September 11, 2001, attacks amply demonstrate the limits to the efforts.[41]

The attacks of 9/11 initiated a new season for the CIA and its covert operations mission. Just a few days after the attack, George W. Bush signed a presidential finding starting what has grown into the largest covert operation since the heydays of the Cold War, dwarfing even the decade-long Afghanistan operations of the 1980s. In addition to activities in advance and support of U.S. operations in Afghanistan and Iraq, the CIA began a host of interrelated programs to break up

terror cells, assassinate terrorists, capture and interrogate Al Qaeda suspects, gain access to and disrupt financial networks, eavesdrop, and a variety of other activities.[42] As Bob Woodward reported, "The gloves are off. The president has given the agency the green light to do whatever is necessary. Lethal operations that were unthinkable pre-September 11 are now underway."[43] The CIA budget was again increased, rising from about $27 billion in 1998 to over $44 billion in 2005. For the first time in a decade, the CIA began to expand its operations directorate as well, and the counterterrorism center at the agency more than doubled in size, becoming the center of covert actions against terrorism.[44]

At the same time, however, the CIA came under criticism for its failures to prevent the 9/11 attacks and then, later, for its role in the prewar Iraq intelligence fiasco. A number of investigations issued scathing reports of CIA failures. Additionally, as some of the covert actions become public—especially the CIA programs for assassination, capture and interrogation, rendition, and its secret prison system—heightened scrutiny was instigated. Hence, by 2006, with major intelligence reform weakening the CIA's role, sagging morale from the failures of the previous five years, and new challenges from the Defense Department for roles in covert operations, the future of CIA activities in this arena was far from certain.[45]

METHODS OF COVERT ACTION

In light of this brief overview, it is perhaps no surprise that when most people think of the CIA, they think of covert operations and "dirty tricks." Covert operations involve a variety of operations, where so-called dirty tricks and coercive force are most commonly practiced. According to an important NSC document from the Eisenhower administration, covert action included

> Propaganda, political action; economic warfare; escape and evasion and evacuation measures; subversion against hostile states or groups including assistance to underground movements, guerrillas and refugee liberation groups; support of indigenous and anticommunist elements in threatened countries of the free world; deception plans and operations; and all activities compatible with this directive necessary to accomplish the foregoing.[46]

Most observers lump such covert actions into four or five broad categories. According to Johnson, for example, covert action includes propaganda, political, economic, and paramilitary operations.[47]

Propaganda

Propaganda involves the use of information to influence the climate of opinion. Much of this activity is done overtly, through government statements, published information in the media and other outlets, television and radio broadcasts, and a

wide variety of other means. When such information is disseminated in a way that keeps the true sponsor secret, it becomes a covert action. By far the most common covert action, propaganda of a variety of kinds has been a staple of American covert policy since World War II.[48] The brief survey above includes a number of examples of propaganda ranging from so-called white propaganda to gray and black propaganda. White propaganda is overt, essentially truthful information disseminated through official government pronouncements, broadcasts, and other means. The activities of the U.S. Information Agency (until its dissolution in 1999), as well as Radio Liberty/Radio Free Europe are good examples. According to Godson, "Gray propaganda hides its sources from the uninitiated public, but not from sophisticated observers."[49] The information itself may range from essentially true to one-sided to false. Black propaganda occurs "when the source is false and well concealed, or when the information itself is false" or both.[50] Examples include forgery, rumor, disinformation and the like. According to Loch K. Johnson, "the CIA provides a flood of supportive but unattributed propaganda, distributed through its vase network of media 'assets' (paid agents): reporters newspaper and magazine editors, television producers—the whole range of personnel in the print and electronic media. . . . the extensive CIA propaganda capability produces a great tide of information flowing secretly from Washington into hundreds of hidden channels around the world."[51]

Political Activity

Usually in combination with propaganda, political activity involves more direct action to affect the political situation in a given country. Typically, such actions involve secret support provided to nationals, parties, or organizations of another country. For example, when the CIA provided covert assistance to political parties in Italy or France in the 1948 elections, anti-Allende parties in Chile in the 1960s, and anti-Milosevic factions in Yugoslavia in 1999, these were instances of political activity. According to Treverton, political activity might typically involve support for media, labor unions, and political parties; influencing elections; and support for individuals or other groups.[52] Such support may range from simple financial aid to more complex campaigns of support. At times, as one long-time analyst of the CIA has described, "the Covert Action Staff at CIA headquarters has resembled nothing less than a group of political campaign consultants, producing slick materials for favored foreign candidates."[53] Not only do propaganda and political action work together, but many major paramilitary operations of the kind already discussed began as political action.[54]

Economic Activity

A third category of covert action involves efforts to disrupt the economy of another country. Of the examples presented in the preceding summary, operations in Cuba and Chile provide good representations. In Cuba, the CIA engaged

in numerous activities to undermine the economy, including an abortive plan to contaminate Cuban sugar with chemicals, the sabotage of shipments of machinery and spare parts, and raids against railroads, oil and sugar refineries, and other factories.[55] In Chile, a variety of efforts were undertaken to destabilize the economy and create unrest to undermine the Allende regime. More recently, economic activities were central to the range of covert actions designed to bring pressure to bear on Slobodan Milosevic in Yugoslavia and currently play a key role in the extensive covert actions in the war on terrorism.

Paramilitary Operations

The most intrusive—and, paradoxically, high profile—type of covert action are extensive secret wars directed against hostile states (or other targets). According to John Prados,

> American secret wars have been carried out on almost every continent since . . . 1947. These covert operations have involved thousands of native fighters, significant numbers of American clandestine agents, and even regular United States military forces. United States involvement has run the gamut from advice to arms, from supplying full support for invasions of independent nations to secret bombing in support of clandestine military operations.[56]

The paramilitary campaigns in Guatemala, Cuba, Angola, Afghanistan, Nicaragua, and Iraq discussed earlier provide good examples and illustrate the range of activities involved in such operations, from full-scale wars to "little more than the clandestine transfer of a few weapons or of small amounts of training."[57] Also included in this category are assassinations, prohibited since the 1970s by executive order. However, in the wake of the 2001 terrorist attacks on New York and Washington, George W. Bush signed an intelligence order authorizing assassinations of terrorist leaders through such high-tech means as the use of the unmanned Predator drones equipped with Hellfire missiles.[58]

With respect to these categories, one last point bears mentioning. As the descriptions of Guatemala in the 1950s, Nicaragua in the 1980s, and the covert operations against terrorism in the early twenty-first century indicate, covert action typically involves a *campaign* of activities from these categories. At their most successful, such campaigns are carefully orchestrated and integrated into broader foreign policy plans and purposes.

The "Ladder of Escalation" for Covert Operations

According to Loch K. Johnson, covert actions such as those summarized in the preceding pages can be arrayed along a ladder of escalation as modest intrusions, high risk, and extreme categories (see Table 4-2). Covert actions all fall above the first "threshold" on the ladder dividing "routine intelligence operations" from

Table 4-2. Covert Action and the "Ladder of Escalation"

Extreme Options	Use of chemical-biological, other deadly agents
	Major secret wars
	Assassination plots
	Small scale coups d'état
	Major economic dislocation
	Environmental alterations
	Pinpointed retaliations against noncombatants
	Torture
	Hostage taking
	Major hostage rescue attempts
	Theft of sophisticated weapons or matériel
	Sophisticated arms supplies
High-Risk Options	Massive increases of funding in democracies
	Disinformation against democratic regimes
	Disinformation against autocracies
	Small-scale hostage rescue attempts
	Training of foreign military forces for war
	Limited arms supplies for offensive purposes
	Limited arms supplies for balancing purposes
	Economic disruption without loss of life
	Large increases of funding in democracies
	Truthful, contentious information in democracies
	Truthful, contentious information in autocracies
Modest Intrusions	Low-level funding of friendly groups
	Truthful, benign information in democracies
	Truthful, benign information in autocracies

Source: Adapted from Loch K. Johnson, "On Drawing a Bright Line for Covert Operations," *American Journal of International Law* 86 (April 1992), p. 286.

more intrusive actions.[59] For the purposes of this chapter, the ladder of escalation provides a convenient means to organize the methods of covert activity. With each step up the ladder, the activities become more risky and more likely to trigger a response. Actions on the highest end of the ladder are also the most controversial in terms of both domestic accountability and international law. As such, they must be carefully considered and tightly integrated into foreign policy tactics, strategies, and objectives. Because the options at the high end of the ladder increase in both risk and controversy, such methods demand greater accountability

DILEMMAS AND CONSIDERATIONS

We conclude this chapter with a few observations on the dilemmas posed by the methods of covert action, followed by a synthesis of guidelines for increasing

their legitimacy and effectiveness. First, and most broadly, use of and attitudes toward covert action are strongly shaped by the foreign policy ethos of the time, which is strongly influenced by the nature of threat. When perceptions of enemy threat are high, the demands of national security tend to prevail, resulting in the rise of intelligence activities, particularly covert operations. When threat perceptions decline, democratic considerations tend to rise, and the legitimacy of intelligence functions, especially covert operations, is often questioned.[60] This helps explain the major patterns in our historical overview: (1) During the Cold War years of high threat perceptions, acceptance of and latitude for covert action was greatest; (2) after the Vietnam War, lower threat perceptions prevailed and covert actions received more scrutiny; (3) the 9/11 attacks and the war on terrorism have so far resulted in a similar pattern, with national security demands—and thus support for covert action—ascendant in the immediate postattack period, whereas concerns for the methods and legitimacy of covert action growing after 2003 when the threat environment appeared less urgent. As Godson explains,

> The acceptance of covert action in the 1940s and 1950s, based on the perception of external threat, gave way, beginning in the 1960s and continuing on into the 1980s, to a quite different ethos. That new ethos, "exceptionalism," has over the course of its development wreaked havoc on American covert action capabilities. . . . Exceptionalism holds that covert action should not be engaged in unless there are grave and unusual circumstances.[61]

Within this context, both policy and accountability dilemmas exist.

Policy Dilemmas

With respect to policy dilemmas, as many observers have routinely noted, there are legal, moral, and practical dilemmas posed by the methods of covert action. Legally, covert action poses dilemmas because "many covert operations, if carried out by different persons and under other circumstances, would be plainly and seriously criminal," as Berkowitz and Goodman have characterized it.[62] This is true in terms of national laws, but there are also international legal concerns posed by the methods we have discussed, beginning with their implications for norms of sovereignty.[63] As well, morally, dilemmas arise from the dirty tricks and coercive nature of many of the methods. Practically the dilemmas stem from the costs, trade-offs, and long-term implications of covert actions. For example, resort to propaganda bears with it the potential for blowback, whereby disinformation intended to influence a foreign target is recycled into the American media, thereby impacting the U.S. public.

Similarly, the excesses of CIA covert operations often damaged the reputation of the U.S. government and its foreign policy. In Iran, for example, the U.S. government overthrew a nationalist leader, installed the shah on the throne, and backed his ruthless dictatorship for over twenty-five years. This knowledge

should allow Americans to better understand the hatred that so many Iranians felt toward the U.S. government and why the United States was portrayed by many Iranians as the Great Satan since the 1970s, especially under Ayatollah Khomeini. CIA excess has also bred mistrust among U.S. allies, whose secrets have been compromised and whose involvement risks considerable political embarrassment. Finally, it has bred distrust and cynicism among the American public about their own government.[64]

Accountability Dilemmas

In terms of accountability dilemmas, the crux of the matter concerns the extensive secrecy and deniability demanded by covert action, on one hand, and the demands of democracy on the other. Since the erosion of the Cold War consensus, serious concerns about the potential for excess has driven repeated searches for appropriate and effective oversight measures whereby the activities of the intelligence community can be reconciled with the demands of democracy. In the wake of the controversies of the 1970s, the Iran-*contra* episode, and the more recent failures and excesses concerning the war on terror, adequate and appropriate oversight remains a concern.[65] Congress asserted itself in the 1970s after the first wave of revelations, establishing new intelligence committees and oversight procedures, but problems continued. On one hand, democracy requires that governmental agencies be held accountable to elected leaders and the public. The demands of national security, on the other hand, often require a quick and efficient foreign policy response. A premium is placed on the independence and secrecy of governmental operations to keep the enemy at bay. The use of all available means to protect and further national security is often considered a necessity in a world where morality is seen to have little relevance. Covert action, by its nature, therefore generates a fundamental tension in a democratic society.

Guidelines for Legitimacy and Effectiveness

Given the methods and controversies of covert action, it is no surprise that many policy makers, practitioners, observers, and analysts have expressed concern for guidelines for employing such options. Table 4-3 presents a select list of such concerns, synthesized from the work of leading analysts.[66] As the table indicates, we organize them into three categories: relevance, coherence, and consequences. For relevance, the guidelines urge consideration of the desirability and applicability of covert methods. In particular, they recommend careful weighing of such issues as the need and possibility for deniability, the nature of the target, the relevance of other options, and perhaps most significant, the unsuitability of covert action as a way to take action in the face of pressure to do something when other options appear impossible. Those guidelines related to coherence build on this last point and emphasize, first, the need to embed covert action into a broader foreign policy strategy with explicit goals and objectives (including assessment

Table 4-3. Guidelines for Covert Action Legitimacy and Effectiveness

Relevance	Make sure deniability is necessary and possible
	Consider the nature of the target
	Carefully consider other options, including diplomacy, first
	Consider proportional response and opt for actions at the lowest end of the "ladder of escalation"
	Do not resort to covert action for crisis resolution
	Do not resort to covert action as a last resort in the absence of other viable policy options
	Do not resort to covert action to rescue a failed policy
Coherence	Embed covert action in a strategy that makes geopolitical sense
	Tie covert action to specific goals and carefully defined objectives
	Ensure that covert action is in harmony with publicly stated policy objectives
	Evaluate covert action options through the full interagency process, including consultation with intelligence analysts, not just covert action specialists
	Never violate U.S. laws, including reporting requirements
Consequences	Consider blowback possibilities and consequences
	Consider consequences of the covert action becomes public, including the possibility of embarrassment and the impact on reputation
	Consider consequences if first step in covert action is unsuccessful
	Consider what signal the covert action will send, to whom, and with what result

of the nature of the threat) and, second, to ensure that the covert options are carefully vetted through the interagency process and consistent with U.S. laws (including procedural rules for reporting, oversight, and the like). The guidelines related to consequences urge careful consideration of the short- and long-term consequences of the covert action, including key questions about the implications of exposure, failure, and blowback. As Godson suggests, a key question that must be asked is "what if—or more likely, when—it becomes public."[67]

CONCLUSION

Since World War II, the U.S. has engaged in a wide variety of covert actions all over the globe. During the Cold War, such activities were widely accepted and justified as a necessary part of the intense ideological and geopolitical struggle with the Soviet Union. After the Vietnam War and the revelation of the extent and consequences of covert actions in highly controversial settings such as Cuba, Vietnam, and Chile, to name a few, covert action came under increased scrutiny as Congress in particular sought to exercise greater oversight. For many, the

gung-ho enthusiasm of the Cold War gave way to a reluctant exceptionalism that has generated considerable tension since the 1970s. The emergence of terrorism as a central concern in the twenty-first century injected new life into covert action as a foreign policy tool, especially since the shady world of terrorism would seem to be an especially rich target for covert action. The demands of such a "war" would seem to ensure that policy makers will continue to reach for covert action methods of the kinds reviewed here—and new ones to contend with the new environment—to address threats and achieve objectives.

COVERT ACTION

An Appraisal of the Effects of Secret Propaganda

MICHAEL A. TURNER

SECRET PROPAGANDA IS AN ESSENTIAL PART OF America's covert action capabilities. The 1991 Intelligence Authorization Act, which currently governs the covert action reporting process, defines covert action as an "activity or activities of the U.S. Government to influence political, economic, or military conditions abroad, where it is intended that the [U.S.] role will not be apparent or acknowledged publicly." Implicit in this definition is the fact that covert actions involve interference in the domestic affairs of other states or the internal workings of nonstate groups. This invariably makes such operations highly problematic from operational and ethical viewpoints. The generally accepted standard today, first embodied in Executive Order 12036 of 1978 and reaffirmed in various other orders since then, is that covert actions are to be employed only when essential to the national security of the United States and as a last resort. Secret propaganda, a form of covert action, has historically been excluded from this formulation despite its dubious benefits.

COVERT ACTION TYPES

The U.S. government engages in three categories of covert actions, each of which contains a bewildering range of activities. Political and economic actions are the most obvious and historically the most notorious, in that they involve instigating changes in governments, leadership, or social conditions. For example, the covert operations to prevent Salvador Allende from winning Chile's presidency in 1970 and then to oust him from office in 1973 fell into this category. This category of actions also includes assistance to political parties and labor

unions as well as political assassination attempts—of Cuba's Fidel Castro or the Congo's Patrice Lumumba, for example. It says a good deal about their controversial nature that the Chilean operations and the attempts against Castro served as catalysts for the public investigations of U.S. intelligence in general and the Central Intelligence Agency (CIA) in particular during the mid-1970s.

Political and economic actions also include covert support to paramilitary groups and insurgents. According to press reports, the United States, for example, gave military assistance to moderate Afghan dissident groups during the Carter administration in the late 1970s and, following the Soviet invasion in 1979, to Afghan rebels, some of whom were Islamic extremists who later turned their insurgent capabilities against the United States.[1]

The second category of covert actions is paramilitary activity, which often involves the use of CIA's own paramilitary forces or joint arrangements with the U.S. military for combat operations and activities like sabotage. Most paramilitary (as well as political and economic) actions make liberal use of the third type of covert action—propaganda—as the lead or supplemental covert activity. *Propaganda* is defined as the dissemination of information intended to manipulate perceptions in support of one's cause or to damage an adversary.

From the start, when the 1947 National Security Act set up the CIA and later legislation gave the agency responsibility for managing America's covert actions, there has been a symbiosis among the three types of covert operations. By 1953, the CIA's Office of Secret Operations had merged with the Office of Policy Coordination (OPC), the government's covert action arm, to set up CIA's Directorate of Plans. According to the *Los Angeles Times*, this directorate established a massive propaganda machine, with thousands of employees who were adept at not only placing press and radio stories but also in simultaneously carrying out such covert acts as engaging with labor unions, applying economic pressure, offering direct money payments, and waging political and cultural warfare—all to prevent European countries from falling to the communists. The *Los Angeles Times* also asserts that the congressional investigations in the mid-1970s revealed that by then CIA owned or subsidized at various times more than fifty newspapers, news services, radio stations, periodicals, and other communication facilities, most of them abroad. In some cases, these assets were used for propaganda purposes; in other instances, they served as covers for other operations. In any event, paid CIA agents infiltrated a dozen foreign news organizations, and at least twenty-two American news outlets employed journalists working for the CIA. Nearly a dozen U.S. publishing houses printed more than a thousand books that had been produced or subsidized by the CIA.[2]

Of the three types of covert actions, propaganda is an integral part of the government's influence operations. The most overt of these operations, public diplomacy, seeks to explain government policy and project soft power without attempting to hide government sponsorship. Soon after the terrorist attacks of September 11, 2001, the U.S. government began a public diplomacy effort, characterized by fits and starts, that has focused on three strategic imperatives. First,

the United States must offer a positive vision of hope and opportunity to people around the world, rooted in America's commitment to freedom. Second, the United States must isolate and marginalize violent extremists and undermine their efforts at terror. Third, the United States must foster a sense of common interests and common values between Americans and people of different countries, cultures, and faiths.[3]

Strategic influence operations, the second type of influence venture, are generally the domain of the U.S. military and attempt to alter attitudes and behaviors in favor of policy stands the U.S. government favors. Winning the hearts and minds of foreign populations is always a tricky proposition, but the *Quadrennial Defense Review Report* of 2006 says that victory in the war on terror depends on strategic communication.[4] Such operations may include information warfare, which is quickly becoming an important part of America's strategic posture.

Secret propaganda, the last of the three types of influence operations, may incorporate aspects of the previous two, in addition to psychological warfare operations. Though conceptually discrete, the three categories of influence operations overlap to such an extent that the best and most effective operation is one that employs the resources of all three and intermixes the capabilities in strategically significant ways.

SECRET PROPAGANDA

Because propaganda is often built around incomplete or false news stories in an effort to alter perceptions and elicit conditioned responses, its effectiveness often depends on such factors as the way statements are presented, the timing of the story's release, and the path it takes to get it into the media outlets. Experts agree that secret propaganda has three intended effects—mobilizing the target audience toward an intended objective, achieving concealment or surprise, or protecting legitimacy. Secret propaganda that seeks to mobilize does so either to persuade the target to commit itself in support of a cause or provide the illusion that old and new causes are compatible. An example of secret propaganda intended to mobilize is the British efforts prior to the onset of World War II to rally Americans to support the British cause. Another example is the effort by American senior military officers just prior to the 1968 Tet Offensive in Vietnam possibly to falsify Viet Cong order-of-battle figures and underreport North Vietnamese infiltrations of South Vietnam, all intended to strengthen the president's hand and convince the country and ultimately the North Vietnamese of America's determination to stay the course.

Secret propaganda to achieve surprise or to conceal plans usually occurs in wartime. Examples are the propaganda that accompanied the American interventions in the first Gulf War in 1991 and also just prior to the Iraq war in 2003, Soviet deception over the installations of the missiles in Cuba in 1962, and myriad efforts by various governments to mask weakness through a show of strength.

Secret propaganda to achieve, maintain, or restore legitimacy typically occur prior to, during, or just after military operations and are usually defensive in nature. Soviet interventions in Hungary, Suez, Czechoslovakia, Afghanistan, and Poland were accompanied by deceptions to protect legitimacy. The United States also engaged in secret propaganda to establish and defend the legitimacy of the Bay of Pigs operation in 1961. Propaganda to protect legitimacy also includes attempts to shift the blame for fiascoes, as did the Soviets after they shot down Korean Air flight 007 in 1983.

Today, numerous U.S. agencies, including the Department of Defense, engage in propaganda activities, but under U.S. law, propaganda is part of the covert action repertoire of the CIA. Propaganda activities range from overt (or white) propaganda—broadcasting news about the United States by Voice of America (VOA), for example—to black propaganda, which is spreading disinformation. Gray propaganda falls somewhere in between and includes broadcast activities intended to cast the United States in a positive light.

White Propaganda

White propaganda is the overt dissemination of factual but often biased information for strategic objectives. The activities of the U.S. Information Agency (USIA) during the Cold War, for example, were in the category of white propaganda, for that agency openly disseminated the U.S. policy line through libraries, cultural exchanges, publications, and media outlets. Although the USIA was disbanded in 1999, the U.S. government today floods the Iraqi and Afghan airwaves and print media with good news of schools opened after the U.S. military refurbishment, water systems repaired, or terrorist leaders captured—all truthful reports that essentially leave out items that may not be complimentary to U.S. interests.

Gray Propaganda

Gray propaganda, the second category, is the covert and unacknowledged dissemination of the official policy lines. Paying a journalist in a target country to write favorable reports about the United States, for example, would fit in this category. So would the surreptitious placement of favorable news items in foreign media outlets, as was the case for the past several years with the Pentagon's secret operations to provide a positive spin to America's efforts in Iraq. According to press reports, the Defense Department has secretly operated radio stations and newspapers in Iraq, placed editorials in Iraqi newspapers and websites, offered TV stations money to run unattributed segments, and contracted with writers of newspaper opinion pieces.[5] Furthermore, Pentagon contractors may have paid Iraqi Islamic religious leaders to offer propaganda advice and print positive articles about the American mission.[6]

This kind of unattributed propaganda has a long pedigree. At the onset of the Cold War, the U.S. government began employing propaganda as an instrument of its foreign policy, intended to "expose the fallacies of communism," warn of its dangers, strengthen Western-oriented regimes, increase awareness of the Soviet threat, and build greater willingness to cooperate with the West.[7] In June 1949, the CIA established the National Committee for a Free Europe to provide cover for a psychological warfare program that included radio propaganda to Eastern Europe. In July, Radio Free Europe (RFE) began broadcasting prodemocracy, anticommunist messages to Poland, Czechoslovakia, Hungary, Romania, and Bulgaria. It also beamed talks by exiles, personal messages, replies to mail from listeners, names of communist secret agents and informers, news items embarrassing the communist regimes, and American popular music banned in Eastern Europe. The CIA also founded RFE's sister station, Radio Liberty (RL), which broadcast similar messages to the Soviet Union in both Russian and the languages of the non-Russian peoples.[8]

The genius of these propaganda efforts was that far from lauding American popular culture or the Western way of life, they focused on issues closest to their listening publics, such as agricultural collectivization, the persecution of religion, the suppression of culture, party purges, and the like.[9]

Some American critics of the stations in the 1970s tried to shut them down, claiming that they were relics of the Cold War and served no useful purpose other than to goad the Soviet Union and its puppet regimes in Eastern Europe. This attempt failed, but the management of RFE/RL eventually was transferred from the CIA to an independent agency. RFE and RL were officially closed down on November 28, 2003, as a cost-saving measure.

One of the CIA's more daring and effective Cold War secret propaganda actions was the establishment of the Congress for Cultural Freedom in 1950. Initiated as a conference of intellectuals in West Berlin in June 1950, the congress published literary and political journals and hosted dozens of conferences bringing together some of the most eminent Western thinkers. Its purpose was to demonstrate that communism, despite its rhetoric, was an enemy of art and thought. By doing so, it sought to negate communism's appeal among artists and intellectuals and at the same time, undermine the communist claim to moral superiority. The CIA's sponsorship of the Congress for Cultural Freedom became publicly known in 1967, effectively ending the operation.[10]

The CIA undertook a similar propaganda venture against Fidel Castro beginning in 1960 as part of a larger covert operation against Cuba. Radio Swan carried programs taped in CIA radio stations in Miami, consisting of news analysis, entertainment, and anti-Castro speeches by Cuban exiles. The CIA also bought time in Caribbean stations for anti-Castro programming. Such programming continued well into the 1970s, stopping only after the congressional investigations of U.S. intelligence activities. Nonetheless, President Ronald Reagan announced plans on September 23, 1981, to revive a radio station to transmit

news reports to Cuba. Despite controversy and occasional attempts to disband the station, Radio Marti continues its broadcasts as part of the VOA.[11]

More recently, the United States engaged in psychological operations against Iraqi dictator Saddam Hussein during the first Gulf War in 1990–91 by inciting the Kurds, Shias, and other Iraqis to rise up against the regime. Press reports say that in addition to dropping leaflets over urban areas, messages were broadcast over two "black" radio stations, the Voice of Free Iraq and Radio Free Iraq, both of which were operated by the CIA. Once the ground war began in 1991, the Voice of Free Iraq stepped up its calls for an uprising by suggesting that Saddam Hussein was preparing to flee the country. Although these insurrections failed to materialize in 1991, America's propaganda promises paved the way for rebellions in 1995 that were brutally crushed by Iraq's dictator.[12]

Black Propaganda

Black propaganda, the purposeful manipulation of the perceptions of a target audience through the use of disinformation or deception, constitutes the third type of propaganda that the United States employs as part of its covert action arsenal. This general category, although used less frequently than the other two types, requires particular specificity to either direct the target into specific types of behaviors or alter attitudes of target audiences to forestall actions detrimental to U.S. interests. Black propaganda may employ white and gray propaganda to fulfill its goals, but its distinguishing characteristic is the nature of its content—information is either exaggerated or false. Given the nature of information technology today, black propaganda may involve spreading disinformation into government or terrorist computer networks.[13] As such, black propaganda more often than not is part of a broader covert action plan.

Black propaganda has been a potent instrument in CIA's arsenal since its inception. Beginning at the onset of the Cold War, the CIA infiltrated Western literature into the totalitarian regimes of the eastern bloc; sponsored anticommunist books written by Soviet and eastern bloc defectors as well as by American scholars; and developed media proprietaries abroad, including a secret propaganda printing plant in West Germany and various press outlets, such as the West German *Der Monat*, the British *Encounter*, and the Italian *Daily American*.[14]

In the campaign to prevent the Italian communists from coming to power in 1948, the CIA's psychological operatives inspired stories in the Italian press and letters from Italian Americans to their relatives in Italy. Funds were handed to Christian Democrats, in part for pamphlets, posters, and other paraphernalia of election campaigns. Publication of the Zorin Plan in *Tempo*, possibly a CIA disinformation story outlining Soviet plans for repressing Italy after the victory of the Italian communists, undoubtedly helped divert voters to the Italian socialists or the right-of-center Christian Democrats instead.[15]

In Guatemala in 1954, CIA engaged in secret propaganda by broadcasting the Voice of Liberation, a dissident station claiming to be based somewhere in the

Guatemalan countryside. The station broadcast the lie that a revolution was under way and an inflated number of troops were marching toward the capital—all calculated to encourage others to rally around the small cadre of CIA-backed insurgents and intimidate president Jacobo Arbenz Guzmán and his supporters into believing that they faced a superior force. This deception ultimately persuaded President Arbenz to flee the country.[16]

The CIA's attempts against Chile's Marxist politician Salvador Allende also involved propaganda in support of a wider covert operation. Much of this propaganda campaign involved discrediting Allende. The CIA spent $3 million in 1964 and another $3 million in 1972 to blacken his name. Between 1963 and 1973, when Allende was ousted by CIA-backed Chilean military officers, the agency spent $12 million on propaganda, employing extensive use of the press, radio, films, pamphlets, posters, leaflets, direct mailings, paper streamers, and wall painting.

On August 25, 1986, the *Wall Street Journal* ran a story that the United States was contemplating military or covert action against Libya and that internal opposition to Libyan leader Muammar Qaddafi was growing. The report in the American newspaper was actually blowback from a U.S. deception operation abroad, designed to create alarm in Libya and possibly precipitate Qaddafi's overthrow by Libyans.

The Soviets also were adept at black propaganda. In 1983 Moscow began a deception operation, first initiated in the Indian daily *Patriot*, designed to attribute blame for the AIDS epidemic to the United States by spreading the false story that the virus had been brought into existence by genetic engineering experiments conducted at Fort Dietrich, Maryland—allegedly to develop new biological weapons. Moscow then spread the story to Africa, South America, and Europe by advertising the investigations of a Soviet biochemist who supposedly had verified the link. The Soviet government acknowledged the disinformation campaign in 1989 and apologized for it, but to this day some extremist Americans and a substantial portion of Africa's population still hold to the fiction that the United States developed the HIV virus for use in the third world.

APPRAISING EFFECTS

Much of the U.S. government's information machinery, including the USIA and most covert action programs, were dismantled after the Cold War. The Department of Defense created an office soon after the 9/11 attacks to provide news items, both true and false, to foreign news organizations, but the office was quickly shut down after the plan became public and the effort was criticized as damaging U.S. credibility abroad.

Five years after 9/11, however, both the Pentagon and the CIA have undertaken a secret propaganda war to counter the insurgencies in Iraq and Afghanistan. The Pentagon has taken the lead in this effort and, together with CIA's

propaganda efforts, has been outsourcing its information campaigns to such contractors as Science Applications International, SyColeman, and the Lincoln Group.[17] For example, these firms have obtained contracts for "media approach planning" on behalf of the Joint Psychological Operations Support Element within the U.S. Special Operations Command.[18] Moreover, an intelligence expert asserts that half of the CIA's efforts have been outsourced to private contractors, which worries many people because these contractors are not subject to the kinds of controls or oversight that CIA employees experience.[19]

On balance, U.S. propaganda activities have had a mixed record. At the operational level, secret propaganda operations are effective (i.e., they succeed) under three conditions: the extent to which (1) their presentation attracts the intended target's attention and holds interest; (2) the effort does not alert the target to its presence; and (3) the target acts in the manner intended. All these factors aligned perfectly in the 1947 propaganda operation to keep the communists from electoral victory in Italy, which cost only about $10 million and resulted in the victory of pro-Western (and anticommunist) Christian Democrats. Logically then, secret propaganda fails if the target takes no notice of the presentation, notices but judges it to be irrelevant, misconstrues its intended meaning, detects the method of deception, or does not behave in the manner intended.

The effectiveness of secret propaganda operations also depends on the degree to which they remain secret. Once they become known, their effectiveness drops precipitously, and in many cases they become either an embarrassment to the government or result in negative and other unintended consequences. For example, in late September 1986, the deceptive nature of the Libyan operation was revealed in the press, and the Reagan administration was criticized for deceiving Americans as well as other publics. A similar result occurred when the *Washington Post* revealed that the U.S. military was planting positive stories in Iraq after the onset of the war in 2003.

On a broader level, secret propaganda can have positive as well as negative consequences. Whether the former outweighs the latter is unclear, but in either case, the legitimacy of secret propaganda appears to rest on the existence of a broad consensus about the country's foreign policy objectives and the means of achieving them. On the positive side, secret propaganda efforts like RFE and RL, whose existence remained unattributed well into the 1980s, benefited from broad consensus about the necessity of opposing the Soviet Union by employing methods short of nuclear war. These radio operations became well known and respected among their listeners. Some Polish leaders, for example, later asserted that the stations played an important role in bringing down at least three Polish Communist Party leaders and were instrumental in sustaining the Solidarity trade union in Poland when it was forced underground by martial law in 1981. During Romanian strongman Nicolae Ceausescu's time, RFE was Romania's most popular source of news. After the end of the Cold War, RFE/RL journalists visiting their target countries were greeted as heroes. Another successful propaganda effort was the CIA's effective campaign in the late 1970s to counter the Soviet propaganda

campaign against the U.S. deployment of the neutron bomb in Europe by comparing the bomb to the similarly dangerous Soviet SS-20 missile.

The propaganda effort to foment discontent within the Iraqi population in 1990–91 fell far short of sparking a popular uprising, primarily because of the pervasive internal security Saddam Hussein maintained, but these measures encouraged and gave false hope to the Kurds and the Shias subsequently to launch rebellions. In March 1995, Kurdish guerrillas trained by CIA launched raids against the Saddam Hussein regime, hoping to spark local insurrections, generate defections from government forces, and persuade Saddam that his army would not fight for him. The operation failed because of internal Kurdish defections and when it became clear that the United States would not follow through on its propaganda promises.[20]

Overall, the benefits of successful secret propaganda revolve around the "facts on the ground," that is, secret propaganda may generate greater local credibility than an official (or white) propaganda outlet. In addition, secret propaganda may be the only way for the United States to counter propaganda against it. This may be especially true when the adversary has had success in its propaganda against the United States. This was the case during the Cold War and may be the case now in the counterterrorism fight. It is certainly true that truthful information is essential to counter false information, but the truth may often need the assistance of secret propaganda to overcome preconception, misconception, and prejudice.

An additional benefit of secret propaganda is its possible effects on the actions of leaders. Successful secret propaganda may manipulate the attitudes and perceptions of elites in ways that are desired by the U.S. government. Allied propaganda during the Kosovo war, for example, was directly responsible for Serbian strongman Milosevic's decision in June 1999 to accept NATO's terms for settling the conflict, motivated by his belief that NATO was poised to launch an even more massive bombing campaign if its terms were rejected.

On the negative side, secret propaganda may result in unforeseen consequences that could be detrimental to U.S. interests. One unintended and dire effect of secret propaganda is blowback, the domestic consequences of intended propaganda (and other covert action) program abroad. The issue is particularly relevant today because information flows around the globe at an unprecedented rate with the growing use of computer technology and the Internet. A disinformation campaign abroad, for example, may be reported at home by the American press or American scholars as true, as was the case with the *Wall Street Journal* in 1986 in the Libya operation. This kind of domestic consequence almost certainly skews the domestic political debate and possibly affects its outcome. Activities that may result in blowback also contravene the terms of the 1991 Intelligence Authorization Act, which stipulates that the government will refrain from engaging in actions that may directly or indirectly influence American domestic politics, public opinion, or the media.[21]

Furthermore, there are ethical and moral arguments against secret propaganda programs, especially those that use the press as their conduits. One moral

argument holds that secret propaganda undermines the free press, in that journalists in free countries should not be bought and their media corrupted for questionable gains by the U.S. government. Another ethical argument says that recruiting foreign journalists may backfire on the United States. It is possible, for example, for foreign journalists, under covert circumstances, to turn on the United States and reveal their covert recruitment, thus providing pretexts for propaganda against the United States and embarrassment to the government.

THE BALANCE SHEET

Although propaganda—the dissemination of information for strategic objectives—is part of any government's repertoire, secret propaganda stands on its own to mean the use of information to manipulate, control, or direct a target's preferences in specific ways. The secrecy associated with it gives such propaganda its notoriety and sinister veneer. Though there are legitimate policy reasons for employing secret propaganda to implement aspects of American foreign policy, its success depends to a large extent on highly specific and narrowly construed factors.

On balance, secret propaganda works well when driven by a foreign policy consensus on its utility and when designed in ways commensurate with its intended objectives, as was the case in many of the secret propaganda efforts during the Cold War. Secret propaganda that does not elicit broad-based elite support or that is designed poorly, such as the recent efforts in Iraq and Afghanistan, will almost certainly backfire on the government and result in policy failure.

6

POLITICAL ACTION AS A TOOL OF PRESIDENTIAL STATECRAFT

WILLIAM J. DAUGHERTY

THE INTELLIGENCE DISCIPLINE OF COVERT ACTION HAS been a policy staple of every post–World War II American president, Democrat or Republican, and most often employed against countries and organizations that were or are hostile toward the United States or U.S. interests. But covert action didn't start with the Cold War; indeed, a number of earlier presidents, going back to George Washington, also relied on what we would call covert action to achieve foreign policy objectives. Thus, covert action is traditional tool of presidential statecraft, the purpose of which is, simply stated, to influence a foreign audience either to do something, or to refrain from doing something, in a direction that coincides with American foreign policy objectives. Put differently, covert action is applied, by specific presidential direction, to compel the target audience to change its policies or its behavior. The target audience might be a foreign government, a foreign nation's general population or distinct part of a population, or members of a hostile nongovernmental organization, such as a narcotics cartel or terrorist group.

Individual covert action operations are managed very much like intelligence collection or counterintelligence operations in that foreign nationals recruited and directed clandestinely to perform a specific mission, usually the provision of confidential information. The difference is that, whereas all aspects of a collection or counterintelligence operation are to remain secret, a covert action operation must ultimately produce some result that is clearly apparent, or overt, at least to the target audience (if not the wider public) if it is have any influence or effect. Although the result must be visible, the sponsorship, for example, the government or intelligence service, of the persons or group that generated the apparent result must remain hidden so as not to undermine the result's credibility with the target audience. In sum, the identity of the sponsor is actually the secret, not the

operation itself. For example, if a respected labor leader in a country whose population was generally unsympathetic to the United States were to organize a general strike to emphasize the incompetence of his government, neither he nor the strike would be credible if it were known that the U.S. government was secretly paying him to perform this act.

Purely clandestine operations that are run either to collect sensitive information or to serve a counterintelligence objective are legally considered as routine missions of the U.S. intelligence community. As such, the individual intelligence agencies within the community possess continuing legal authorities to conduct these operations, a great deal of institutional latitude in how they do it, and a fairly low level of congressional oversight. Conversely, covert action programs are not routine intelligence activities: they must have special authorizations to meet federal law requirements, they are denied a good deal of the policy and operational flexibility that other intelligence operations enjoy, and they receive intense oversight from not only Congress but also the National Security Council. Arguably, because they are implemented explicitly to support a president's foreign policy initiative, covert action programs are not even "intelligence" in nature, even though they are executed by the Central Intelligence Agency (CIA) and rely on clandestine methodologies. These differences ultimately remove covert action programs from the realm of general intelligence activities and transform them into highly sensitive instruments of presidential policy.

In essence, covert action programs are secret adjuncts to a particular foreign policy established by the president and employed to support overt policy implementation measures (e.g., diplomacy, trade favoritism or sanctions, foreign aid, military force, training initiatives, and loan guarantees or grants). It is the president, advised by the National Security Council, who decides whether a policy will have a covert component and, if so, how that component will be used. For each covert action program, under which dozens or even hundreds of individual operations may be run, federal law dictates that the president sign a document declaring that he "finds" that the covert action program is necessary for national security purposes. This finding (as it is known in the parlance) spells out the objectives and implementation limits of each program, sets a program budget, defines the role of the CIA and any supporting agencies in executing the program, and includes a risk versus gain assessment. Furthermore, all findings must be sent to the intelligence oversight committees in Congress within forty-eight hours of the president signing the document. Once begun, covert action programs receive nearly continuous scrutiny from CIA senior management, Congress, and the president and his national security team. This oversight is conducted until the program is abolished, a move that again requires a presidential signature. These extra measures necessary to initiate, execute, and terminate covert action programs truly make them "presidential" in all respects.

Covert action programs fall under one of four general operational categories: propaganda, political action, information warfare, and paramilitary operations. Political action programs, the focus of this chapter, generally seek to achieve

influence through covert activities that involve the manipulation, legitimate or otherwise, of a foreign nation's political and/or economic system, with the instigating hand of the U.S. government remaining hidden from view. Political action operations are always provocative to some degree, ranging from operations that slightly irritate (e.g., paying a few individuals to carry protest signs in front of a government office or bribing public officials) to the highly antagonistic and hostile (e.g., flooding a country with counterfeit currency or creating a major strike to cripple the economy and undermine the ruling regime). Regardless, political action operations, whether directed at a nation's political institutions or its economy (and often both), seek to change the behavior or policies of a government. Such meddling is contrary to international law and the United Nations Charter and may, if compromised with the sponsorship of the American government exposed, generate many problems, both political and practical, for the president at home and abroad.

But offsetting this risk—and hence its attractiveness to presidents—is the fact that operations that covertly manipulate a country's political processes or economic system are usually much less costly than other forms of pressure, especially military force. For example, if a covert political action program to oust Panamanian dictator Manuel Noriega in 1989 had been attempted and succeeded, the financial and political costs of such would have been far less than the costs (including humanitarian) of using the U.S. military to invade and occupy the country until Noriega was captured.

American history is replete with examples of presidents authorizing secret activities intended to foster and further American interests at the expense of foreign governments. In point of fact, George Washington used covert action programs in addition to intelligence collection operations during the American Revolution and continued doing so after his election to the presidency in 1791 to secure the fledgling democracy. Arguably, the first use of covert action in the new administration was not against an overseas government but against the sovereign governments of Native American tribes.

Once in office, Washington was abetted by his secretary of state, Thomas Jefferson, in implementing a covert action program—a classic example of a political action operation—intended to create confidence and goodwill with various tribes whose lands lay between the settled East Coast and the interior of the continent, awaiting further exploration. Jefferson's objective was to lay the foundation for the U.S. government eventually to acquire their lands for the development or construction of inland transportation systems, such as roads, bridges, and canals, an infrastructure vital to the movement of commercial goods and people within the country. The need to grow the economy was critical to sustaining the faith of the Americans in the newly created democracy, the permanence of which was by no means assured just because the U.S. Constitution was ratified. Quite simply, if Americans were not better off economically under the new Constitution, there would little reason for them to continue to support it. Gaining access to tribal lands for the movement of goods, as well as to encourage

the migration to and settlement of the West was, hence, an important part of Washington's economic policy.

The methods Washington and Jefferson employed are easily recognized as basic political action tactics. First, the secretary of War was given visible responsibility for this program, putatively acting autonomously to insulate the president and secretary of State from any negative consequences that might occur. The War secretary then proceeded, through the help of clandestine agents, to bribe tribal chiefs, selectively dole out financing for trading posts and other businesses, extend (or threaten to foreclose) loans granted to tribal leaders, and manipulate the chiefs' human foibles (here, greed) to run them into heavy debt. Owing monies that they had no way of repaying left the tribal leaders vulnerable to exploitation by government agents, who agreed secretly to swap tribal debts for treaties transferring Indian land titles to the United States.

When Jefferson acceded to the White House, he was bedeviled by the predatory actions of the Barbary pirates, seagoing thugs who plundered American commerce in the western Mediterranean and captured American sailors for ransom. Jefferson's solution was the same that later presidents, including Dwight D. Eisenhower, John F. Kennedy, and Richard M. Nixon, found so attractive—implementing a political action program to undermine covertly the offending government (the Tripolitan Pasha) and affect a change of regime by placing a rival on the throne. Jefferson's scheme also involved bribery, secret funding of opposition groups, and a small paramilitary operation conducted by U.S. Marines. The Pasha, seeing the writing on the wall, decided to deal with Jefferson, resulting in an accord that halted acts of piracy against the U.S. merchant fleet and released the American hostages, while allowing the Pasha to retain his throne.

Covert actions, particularly political/economic action programs, were employed through the mid-1800s as America expanded westward, to gain land for the United States from European colonial powers and neighboring Mexico. Under James Madison's direction, two territorial administrators infiltrated secret agents into the Florida panhandle, at the time under Spanish control, to foment a rebellion that would appear to be the actions of local, pro-U.S. residents. The anticipated Spanish reaction would then provide the pretext for the president to order the occupation of the land by U.S. troops to protect lives and property, followed by a proclamation granting the locals their proclaimed wish for independence from Spain. The operation relied on individuals who, in today's intelligence lexicon, would be labeled "agents provocateur" and who were well supplied with secret funds and used a clandestine communications system to coordinate their schemes. A supposedly spontaneous insurgency against the Spanish did break out, with the rebels declaring independence and asking for assistance from the American government. Madison responded by proclaiming that west Florida was actually already a U.S. possession by dint of its (rather suspect) inclusion with the Louisiana Purchase, and soon the Stars and Stripes flew over Pensacola and Mobile.

Madison followed this land expansion with similar covert tactics (i.e., a spontaneous uprising and call for independence) from pro-U.S. inhabitants in eastern Florida, to acquire that territory before the British could seize it from the steadily weakening Spanish empire. His successors—James Monroe, John Quincy Adams, and Andrew Jackson—all employed elements of covert political action operations in their policies toward Mexico. Monroe maneuvered to reduce British influence with the Mexican regime, and Jackson attempted to induce the Mexicans to sell or cede land north of the Rio Grande to the United States. Bribery, support for underground opposition groups, inflammatory propaganda, the public dissemination of erroneous information (disinformation, in espionage parlance), and secret slush funds were all covert methods set in motion by these presidents. That Jackson was ultimately unsuccessful in gaining any Mexican land does not obviate the fact that he carefully and skillfully employed political action operations to further his overt foreign policy.

In an interesting parallel to a large covert political action program initiated in the 1980s under President Ronald Reagan that used a variety of means to deny sensitive emerging technologies to the Soviet Union, Abraham Lincoln established a clandestine network in Europe to prevent those nations from providing much-needed military supplies to the Confederate States during the Civil War. The complex program began with the collection of raw intelligence, the analysis of which identified individuals and companies secretly trading with the South. Political action operations were then run against the traders to disrupt the production of the war matériel, sabotage the factories, and intercept the matériel en route to the Confederate States. Knowing that the Union navy could not always snare the South's blockade runners, waging a covert interdiction campaign in Europe to prevent war matériel from being loaded on a Confederacy-bound ship in the first place proved an effective and economical way to deny the South vital war-making capabilities.

Prior to the Civil War, American presidents essentially used covert action in general and political action operations in particular to expand the land territory of the nation and protect American lives and commerce from foreign interference. But within two decades of the ending of the American insurrection, and well before the United States became a world military force, presidents began using these covert methodologies to strengthen foreign commercial ties, protect American economic interests, and expand international trade. In the 1880s, the American government became cognizant of the tremendous economic potential of Asia as a source of raw materials and a destination for the export of finished goods. It became the goal of presidents to open these markets to trade and to protect the markets once established. A concomitant objective was to reach agreements with Asian regimes for coaling stations for the U.S. Navy's growing Asiatic fleet. Korea drew the interest of the navy and, hence, of President Chester A. Arthur (not a president one usually associates with an aggressive foreign policy), early in that decade for both a trading partner and a refueling post. But Japan and China

had squared off over which was to exercise the dominant political and economic influence over the Korean Peninsula, leaving Korea much like a fish caught between two cats. Arthur relied on covert political activities, particularly the supply of arms and funds to a Korean group interested in upsetting the pro-Chinese regime that held power (with the U.S. involvement remaining under the table), to drive a wedge between Tokyo and Beijing in hopes of creating and then filling a power void. A quick-rising squabble between France and China distracted the latter and provided a fortuitous opening for the American-supported clique, which then moved into power.

Under President Benjamin Harrison, America's annexation of Hawaii, whose natural port at Pearl Harbor was a matter of strategic import for the Asiatic fleet, was the consequence of a political action operation bearing similarities to Madison's grab of west Florida. It likewise involved, in 1893, the clandestine fomenting of a "popular" insurrection that portended bloodshed and justified intervention to protect American diplomatic facilities and citizens. Navy sailors and marines occupied Hawaiian government buildings, and the American ambassador soon thereafter declared the establishment of a provisional—and pro-American—government.

But it was, of course, the Cold War and the creation of the CIA that truly made covert political action a critical component of presidential statecraft. Throughout the Cold War, it was the fundamental objective of the United States to (1) counter Soviet expansionary policies; (2) support pro-West governments that were targets of Soviet subversion; and (3) weaken or undermine foreign governments that had fallen into the Soviet orbit. (Policies of transforming oppressive regimes into democracies had to wait until the presidencies of George H. W. Bush and his son, George W. Bush.) The attraction for American presidents in employing political and economic covert actions against the Russian bear was that it permitted the U.S. government to apply a varying degree of pressure against the Moscow regime, but to do so without generating a clear and direct threat to core Soviet interests that might eventually invite a military response. Because covert action programs used a broad spectrum of capabilities that allowed presidents to calibrate the intensity of the pressure felt or perceived by the Soviet leadership, the interests of the United States were protected and advanced but without backing the Soviets into a corner that might have left them no recourse but war. (Of course, the Soviets were concurrently doing the same things against the United States, using the term "active measures" in place of covert action.)

Although at first rather reluctant to open an intelligence war against the Soviet Union, which had been, after all, America's ally in the recent world war, by 1947 President Harry S. Truman had become convinced that Soviet hostility toward the United States, the Western democracies, and capitalist systems would only increase, ultimately threatening democracies and nations seeking to become democratic. To counter Soviet subversive operations in regions considered vital to U.S. national security, Truman implemented overt policies such as the Truman Doctrine (for Greece and Turkey) in March 1947, and the Marshall

Plan (for the reconstruction of Western Europe) just three months later. But overt programs intended to strengthen democratic political systems and rebuild devastated economies in Europe and the Near East were also judged to be insufficient when considering the scope and depth of Soviet covert machinations to undermine those same countries. Under Truman's personal initiative, his newly established National Security Council (NSC) drew up its first national security directive—an order for the CIA (created concurrently with the NSC by federal statute) to counter Soviet political and economic subversive programs in Italy and France, operations by which the Stalinist regime in Moscow sought to acquire control of those governments through manipulation of legitimate electoral processes.

To be sure, there were precedents from which one could learn. Elections in Eastern European countries following the war found the local communist parties legitimately winning seats in those parliaments, from which party members were then chosen to fill key Cabinet positions in the government. With covert assistance from Moscow, the democratic processes were subverted from within (Czechoslovakia was particularly instructive), resulting in the establishment of oppressive pro-Soviet communist regimes. In France and Italy, Soviet agents were likewise seeking to gain control of those elements of society that are fundamental to democracy—political parties, newspapers, labor unions, publishing houses, student groups, and more—through the provision of nearly unlimited funds and then employ these societal influences as front organizations for Soviet intelligence to use to corrupt the democratic processes.

NSC documents from 1947 and 1948 show that the Truman administration viewed a victory for the French and Italian communist parties as an unacceptable outcome and, should that happen, reached the conclusion that all governments in Western Europe would be menaced. The CIA was given the responsibility of countering the Soviet operations, in part by political action—the provision of secret funding to individual candidates for political office as well as to the multiple political parties. In this, neither the U.S. government nor the CIA had a preferred candidate or party. The funds, millions of dollars, were given liberally to groups, organizations, unions, and politicians across the political spectrum, from the far right to the left of center. It mattered not so much who won, but who had to be defeated. Ultimately, between overt U.S. policies and the covert program, the communists lost at the polls. Still, it terms of the role that political action operations played in the greater scheme of things, it is important to understand that the millions of dollars in covert funding constituted only a small percentage of the monies expended in the overt diplomatic programs meant to strengthen governmental institutions and to rebuild the economies devastated from war. Covert action programs, certainly including political and economic operations, are most effective when supporting well-established overt policies, and the operations in Italy and France are proof of this. The perceived need to secretly fund Italian politicians and parties continued through the administration of Lyndon B. Johnson, ending only in 1967.

Perhaps the most familiar—or notorious—political action operations are those in which the president directs the CIA to oust a foreign government or regime. Again, the idea is to make it appear as though local opposition groups act on their own initiative and through their own resources. Presidents Eisenhower, Kennedy, and Nixon each issued orders to the CIA to do overthrow regimes deemed to be politically too close to the Soviet Union, but with varying degrees of success. Operations to reverse regimes in Iran and Guatemala managed to achieve their objective, but similar efforts in Indonesia, Cuba (after paramilitary operations failed in each), and Chile did not. Kennedy furthered toyed with the idea of ordering political action programs to unseat regimes in Santo Domingo and British Guyana as did Reagan early in his administration with Surinam.

The covert overthrow of a foreign regime by the United States is never as easy as its proponents seem to believe, nor are successes truly positive or unalloyed in the long term. For many intelligence professionals, the overthrow of the Iranian regime of Mohammed Mossadeq in 1953 was a double-edged sword, for the ease with which it seemingly occurred served to mislead future presidents and CIA directors into attempting similar operations with less fortunate results. In the case of Iran, the fact is that the CIA itself did not cause the overthrow of Mossadeq. What the CIA did was to provide, in essence, a push at the margins of an already developed and much larger indigenous political movement unhappy with Mossadeq and his policies. It is unknown whether the anti-Mossadeq forces would have prevailed had the CIA not stepped in at a key moment, but it is beyond doubt that the CIA as an institution did not itself effect the change. Indeed, the operation at first appeared to be an abject failure, and it was only the fortuitous appearance of a popular Iranian general to rally the mobs at a critical moment that brought about the ouster of Mossadeq. It is not an oversimplification to say that the Americans contributed just the right amount of pressure, at just the right moment, with just the right people. Said differently, the operation succeeded mostly (or even only) because of luck.

Yet the lesson the CIA and the Eisenhower (and later Kennedy) administration took away from the Iranian program was that the reversal of hostile regimes was nothing particularly difficult; that American ingenuity and righteousness of purpose were enough to prevail. Interestingly, the one person who realized differently was the man who orchestrated the Iranian program, Kermit Roosevelt. Asked to lead the next such operation, the removal of Guatemalan leader Jacobo Arbenz, barely a year later, Roosevelt declined and left the agency. That the Guatemalan operation, a blend of paramilitary, political action, and propaganda operations went well further solidified the belief in the Washington circle that the United States could replace governments at will and without fear of failure.

After the Guatemalan program, the Eisenhower administration took aim at the Indonesian government of Sukarno, who announced his intentions of allowing Communist Party members to hold positions in his Cabinet. Eisenhower, duly alarmed at the prospect of a pro-Soviet regime in that county, authorized a robust

covert action program, including operations aimed at manipulating the political and economic processes, to remove Sukarno from power. This effort failed miserably, with the consequence that Sukarno's hold on power was stronger. An astute, objective student analyzing this program might have reached the conclusion that maybe, just maybe, political action operations to change an entrenched regime might not be as easy nor as useful as thought. But with the apparent successes of Iran and Guatemala in the background, the lessons of Indonesia were lost.

It is instructive to note that the definition of *success* as applied to a political action program, especially one in which the change of a regime through subversive measures is the objective, can be elusive. Eisenhower, Kennedy, and Nixon each believed that success constituted the replacement of a pro-Soviet or potentially pro-Soviet government with a right-wing, pro-American regime. And in the short term, that was perhaps so. But over the longer run, arguably more harm was done. The hapless Mossadeq was replaced by a monarchy that grew more oppressive and dictatorial over the years, itself eventually overthrown by indigenous elements, transforming America's most important ally in the Middle East into radical Islamic fundamentalist state that has now waged a war of terrorism against America for a quarter century. Although communist forces were thwarted in Guatemala in 1954, the resulting oppressive right-wing military dictatorship murdered hundreds of thousand of its own citizens over the next forty years, leaving an impoverished nation in its stead.

Chile was the target of covert electoral manipulations beginning with Kennedy, who sought to forestall socialist or communist regimes by directing the provision of secret funds to several Chilean political parties and, especially to one presidential candidate, Eduardo Frei. The program continued through President Nixon, who at one time toyed with instigating a military coup to prevent the election of socialist Salvador Allende. When this proved unfeasible and Allende was elected, Nixon turned his efforts toward destabilizing the new regime. Included in his bag of tricks were monies given to political parties and candidates, payments to various mass media outlets to produce political advertisements or messages, and funds to social and professional organizations—labor unions, student groups, women's clubs, and business and civic associations. In the end, the military acted unilaterally, instigating a coup that left Allende dead and the government in the hands of an oppressive right-wing military cabal that endured for two decades.

But not all political action programs are failures. The CIA managed a number of covert political action operations against the Soviet Union, some for nearly the length of the Cold War. These programs picked up strength and importance during the administration of Jimmy Carter, including operations that fostered the printing and underground distribution within the Soviet Union of prohibited political tracts, the writings of banned Russian authors like Aleksandr Solzhenitsyn and Boris Pasternak, and religious works (Bibles and Korans). Along with the infiltration of printed materials, these political action operations provided, through secret channels, desktop publishing equipment to Soviet

dissidents to print and disseminate their writings, known as *samizdat*, within the Soviet Union. Additionally, operations funded Soviet exiles in Western Europe, enabling them to write and publish books, journals, and monographs that, though intended primarily for distribution within émigré circles, likewise found their way clandestinely with to readers inside the Soviet Union. An adjunct initiative known as the Nationalities Program, funded the printing and distribution of journals and pamphlets directed towards the non-Russian ethnic minorities in the Soviet Union, keeping alive their history, culture, and language at a time when the Soviet government was attempting to suppress them. Other CIA political action programs in Europe funded human rights and prodemocracy organizations as part of a larger effort to counter anti-Western Soviet propaganda. These programs and more were continued and expanded during the administration of Ronald Reagan, effectively and inexpensively applying pressures on the Soviet government that contributed to the ultimate demise of the Soviet Union.

But perhaps the most successful political action program ever was a broad-based effort to undermine the legitimacy of the Polish military government that came to power in 1980 while concurrently supporting the independence movement headed by Polish labor union Solidarity. If a critical attribute of any covert action program is that it would, if exposed, meet with the approval of the American public, this was one such program. Although much of the program remains classified, despite its overwhelming success, elements of it have come into the public eye.[1]

As the end of the Carter administration drew near, it was faced with the Soviet Union pressuring the Polish government to outlaw Solidarity and its supporters, as well as threatening to move its military across the border if the Polish power structure failed to contain the growing influence of the union. In response, Carter directed his National Security Advisor, Zbigniew Brzezinski, to advise the Vatican that the United States had clandestine intelligence resources available to aid Solidarity. Moreover, with European governments reluctant to openly confront the Soviet Union over its aggression, Brzezinski bluntly asked Pope John Paul II if he would consent to joining with the United States to isolate economically, culturally, and politically the Soviets if they openly intervened in Poland. The Pope would and did.

The Reagan administration thus inherited an expanding covert political action program that first deterred a Soviet military intervention in Poland (similar to the Soviet invasions of Hungary in 1956 and Czechoslovakia in 1968) and then enabled Solidarity and other underground organizations to survive and resist the martial law government of Gen. Wojciech Jaruzelski. But the CIA's covert operations did not end with just Poland: Reagan believed that if Poland was able to throw off the communist system and emerge as a free and democratic nation, the other five Eastern European countries would follow. The Polish program thus expanded into a worldwide confrontation of the legitimacy of the communist governments of Eastern Europe and the Soviet Union itself. Poland held its first free elections in 1989, and within two years not only were Eastern European countries free of Soviet domination, but the Soviet Union as a political system

disappeared into the dustbin of history. Of course, Eastern Europe did not gain its independence nor did the Soviet Union collapse solely because of the covert action operations initiated by the Reagan administration, but these missions did fulfill their intended goal and then some, supporting a vast array of overt United States political, economic, and military policies that collectively made it impossible for Moscow to continue the Cold War.

This abbreviated introduction to covert political action programs operations is meant neither to convince the skeptical of their efficacy nor to provide support to those who see them as a solution to difficult or seemingly insoluble foreign policy issues.[2] Truman and Eisenhower employed political action operations against the Soviet threat with mixed results. Truman's use of covert action in Italy and France must be judged as highly successful, whereas the long-term consequences of the Iran and Guatemalan operations, as well as the clear failure of the Indonesian venture, place into question the wisdom of Eisenhower's decisions to use covert methods against those regimes. Kennedy's efforts in influencing the Chilean elections was successful only in the short term, with a socialist government eventually coming to power despite his efforts, as well as Johnson's, and Nixon's use of multiple political action operations to forestall it. Similarly, Kennedy's intense efforts to overthrow the Cuban regime of Fidel Castro were not only unmitigated failures but might well have placed his administration in serious jeopardy, had the operations become public knowledge during his tenure in office. Unrecognized by many historians, Carter's reliance on covert programs, political action especially, was more successful than not, especially in that he laid the foundation for many of Reagan's programs against the Soviet Union directly and in countering Soviet interventions in places like Afghanistan and Central America.

Whether or not political action programs are an appropriate tool for the president in implementing foreign policies depends on a number of factors, not the least of which is the ability of the president and the national security team to recognize and accept the limits of any covert action program. Certainly it should be clear that these political action operations are not suitable for crisis resolution; rather, they are most wisely employed in consonance with a thoughtfully developed, comprehensive, foreign policy with well-defined objectives implemented in a methodical manner. Successful foreign policies are never the responsibility of just one agency of government, and certainly not intelligence agencies. But covert actions that influence the political or economic systems of target audiences may, when wisely employed, serve a president and the country well.

NOTES

The author thanks Matthew Easterwood, presently a student at Stetson Law School, for his research assistance with this chapter.

1. Robert M. Gates, a former director of the CIA, has provided some detail in his memoir, *From the Shadows: The Ultimate Insider's Story of Five Presidents and How*

They Won the Cold War (New York: Simon & Schuster,1996), which was cleared for publication by the CIA. Other partial accounts have appeared in Zbigniew Brzezinski, *Power and Principle: Memoirs of a National Security Advisor 1977–1981* (New York: Farrar, Straus & Giroux, 1985); and Carl Bernstein and Marco Politi, *His Holiness, John Paul II and the Hidden History of Our Time* (New York: Doubleday, 1996), on which the CIA will not comment. This is unfortunate in that the story is generally now in the public domain, but also at a time when the CIA and the intelligence community are under serious attack, a story that is clearly a great success would only redound to the benefit of the CIA.

2. Mention of more recent covert programs, including political and economic action operations, which might provide more enlightenment for this chapter, is precluded by continuing classification of programs after the Reagan era and the CIA's requirement that this author clear his writings with them prior to publication.

7

COVERT ACTION AND THE PENTAGON

JENNIFER D. KIBBE

THE TERRORIST ATTACKS ON SEPTEMBER 11, 2001, brought about a number of changes in the U.S. national security outlook, not the least of which was a renewed willingness to consider covert action as a policy option. During this same period, the single most significant change in the military services has been the expansion (in both size and responsibility) of its special operations forces. The concurrence of these two trends has led to a blurring of the distinction of whether military units are conducting covert operations and has raised questions about congressional oversight. The *Quadrennial Defense Review* issued by the Pentagon in February 2006 stated unequivocally that special operations forces would be leading the war on terror, making it that much more important to understand the issues raised by potential military involvement in covert action.

Covert action is defined in U.S. law as activity that is meant "to influence political, economic, or military conditions abroad, where it is intended that the role of the United States Government will not be apparent or acknowledged publicly."[1] Covert actions are thus legally distinct from clandestine missions: "clandestine" refers to the tactical secrecy of the operation itself, and "covert" refers to the secrecy of its sponsor. Although most often associated with the assassination of leaders or the overthrow of a government, the category of covert action can include a wide range of activity, from propaganda and disinformation to political influence operations, training and support for foreign military forces, to paramilitary operations. Historically, the Central Intelligence Agency (CIA) has been the main agent of U.S. covert action, but the growth of special operations forces over the past two decades and their ability to conduct direct action operations has raised new questions in the debate over congressional versus executive control of covert action.

EVOLUTION OF SOCOM

The military's unconventional warfare operations, whether covert or clandestine, are part of the U.S. Special Operations Command (SOCOM), a relatively new command that has now been designated as the leader in the U.S. war against terrorism. Although their roots can be traced to various World War II forces, including the Office of Strategic Services (OSS), air commandos, Scouts, and Raiders, American special operations forces were first really built up in Vietnam as a result of President Kennedy's interest in using the Green Berets to conduct unconventional warfare. However, these forces were somewhat resented by the regular troops and officers who felt that the armed forces' conventional training and approach to warfare had always been good enough before and that there was no need to introduce any sort of "special" forces. Thus, when the end of the war in Vietnam led to severe budget cuts, every one of the armed services drastically cut its special operations units.

The event that caused the pendulum to swing back the other way was the failed mission to rescue the American hostages in Iran in 1980. Because the United States had no standing counterterrorist task force, the necessary personnel and equipment were drawn from the various services, leaving a significant gap in overall coordination. When two aircraft collided in the desert outside Tehran, eight members of the operation died and the rest were forced to turn back without attempting to rescue the hostages, leaving behind three intact helicopters to boot. Within weeks, a commission had been formed to review the failed operation and determine how to improve the United States' ability to run such operations in the future. The Holloway Commission, named for its chair, Chief of Naval Operations Adm. James Holloway, emphasized the uncoordinated nature of U.S. special operations, as well as the lack of any independent review of the operational plans and the poor intelligence support. The commission's recommendation for the creation of a Counterterrorist Joint Task Force was adopted and implemented over the next several years.

The early 1980s saw increased funding for special operations forces, an expansion in personnel and the creation of the Joint Special Operations Command (JSOC, pronounced "jay sock"), whose goal was to provide increased coordination. The first real operational test of the improvements was Operation Urgent Fury, the 1983 invasion of Grenada. Special operations forces, including Navy SEALs, Army Rangers, and members of Delta Force, were directly involved in seven of the operation's eight targets, of which only two were fully successful. Three of the operations were costly failures, with special operations forces incurring heavy casualties as a result of poor planning, coordination, and intelligence.

The failures at Grenada fueled a new round of calls for reform, and not just of special operations forces. This time, however, those interested in reform included some on Capitol Hill. This round of investigations eventually resulted in the Department of Defense Reorganization Act of 1986, also known as the

Goldwater-Nichols Act, which substantially strengthened the power of the chairman of the Joint Chiefs of Staff and the unified combatant commanders (the commanders of the various regional theaters). The element of the Goldwater-Nichols Act that most affected special operations, though, was the subsequent Nunn-Cohen amendment that, most importantly, established SOCOM. Although SOCOM was established as a supporting command, meaning that it could not plan or execute its own independent operations and could only operate in support of other commands' operations, the new legislation still represented a significant step forward in the coordination and enhancement of special operations forces. The Nunn-Cohen amendment also specifically laid out in law, for the first time, the types of operations that would be included under the rubric of special operations: "Direct action, strategic reconnaissance, unconventional warfare, foreign internal defense, civil affairs, psychological operations, counterterrorism, humanitarian assistance, theater search and rescue, [and] such other activities as may be specified by the Secretary of Defense."

In the four major conflicts involving the United States since Grenada (the invasion of Panama, the Gulf War, the Afghanistan war, and the Iraq war), special operations forces have proven to be increasingly effective and useful.

SPECIAL OPERATIONS FORCES TODAY

SOCOM is comprised of both units that conduct overt or "white" operations, and those that conduct "black" operations, including both covert and clandestine missions. Those involved in white special operations include Army Special Forces (Green Berets), most Ranger units, most of the Navy SEALs, and numerous aviation, civil affairs, and psychological operations units. These white special operators are largely involved in training selected foreign forces in counterterror, counterinsurgency, and counternarcotics tactics; helping with various civil government projects; and disseminating information to foreign audiences through the mass media. The black operators fall under JSOC, which commands the elite units of each service's special operations forces, including Special Forces Operational Detachment—Delta (Delta Force), Naval Special Warfare Development Group (DEVGRU, or SEAL Team 6), the Air Force's 24th Special Tactics Squadron, the Army's 160th Special Operations Aviation Regiment and 75th Ranger Regiment, and a highly classified Intelligence Support Activity team (known as ISA, or more recently as Gray Fox, although its name changes frequently). These units (also known as special mission units) specialize in direct action operations such as hunting terrorists and rescuing hostages. Although it is generally understood that these units exist, the Pentagon does not officially acknowledge them.

From the beginning of his term, one of Secretary of Defense Donald Rumsfeld's chief priorities has been to transform the military from a large conventional force built to face another superpower into a leaner, more flexible, and

agile force capable of fighting the less conventional conflicts that have dominated the post–Cold War period. Though his desire to expand special operations was part of that original overall goal, it received a huge boost when at the beginning of the war in Afghanistan, the military's special operations units had to rely on CIA operatives to establish links to the Northern Alliance fighters. By all accounts, Rumsfeld was incensed and was determined to build up his special operations capabilities to eliminate any future dependence on the CIA.

That determination has gradually led to significant increases in funding, personnel, and authority for special operations forces. The FY 2007 defense budget called for special operations funding to grow to $5.1 billion, approximately $1 billion more than the previous year and double the amount allocated to them in 2001. The 2006 *Quadrennial Defense Review*, the Pentagon's main planning document for the next four years, aimed to increase special operations troops, which numbered about 50,000 at the beginning of 2006, by 14,000 through 2011, at a cost of nearly $28 billion. (Note that of the 50,000 current special operations forces, only approximately 10,000–13,000 are "trigger-pullers," i.e., those in the field involved in operations. The remainder are support and administrative staff.)

Beyond the actual numbers, Rumsfeld has also effected several substantive changes in the way SOCOM is run. First, he replaced those leaders of SOCOM who were, in his estimation, too cautious about the command assuming a more aggressive role in the war on terror. He also significantly increased SOCOM's authority by changing it from a supporting to a supported command, meaning that it could now plan and execute its own missions (if authorized by the secretary and, if necessary, the president). This change gave SOCOM a considerable amount of increased flexibility, because it meant the chain of command now went directly from SOCOM to the secretary, without having to go through a regional unified command (Southern Command, for example). This change could also be seen as giving the secretary increased control over special operations. Cutting out the regional commands, however, also presents an increased risk that special operations units may plan missions without taking sufficient account of possible regional repercussions.

In March 2004, after an intensive bureaucratic struggle, Rumsfeld was successful in his campaign to install SOCOM as the leader of the war on terror, ahead of the conventional forces whose leaders he perceived as too tentative. President Bush signed the new Unified Command Plan 2004, which designated SOCOM as the "lead combatant commander for planning, synchronizing, and as directed, executing global operations" in the war on terror (although it did leave the regional commanders in charge of counterterrorism operations in their own theaters).

An amendment to the defense authorization bill in October 2004 represented a further step along SOCOM's road to independence as Congress granted its forces the authority, for the first time, to spend money to pay informants, recruit foreign paramilitary fighters, and purchase equipment or other items from foreigners. Previously, only the CIA had been authorized to disburse such funds, meaning that special operations forces had to rely on the CIA to provide the funds for

various operations. One other significant step in the special operations forces' rise to prominence came in January 2006 when JSOC's headquarters was raised from a two-star to a three-star command, thus giving its chief more authority and influence in dealing with other military officers.

There is little doubt that Rumsfeld's vision for SOCOM is a long-term one. Indeed, in presenting the 2006 *Quadrennial Defense Review* to the press in February 2006, Rumsfeld described its emphasis on developing special operations forces as a necessary component of U.S. preparation for what he called the "long war" ahead against extremism. The review calls not only for significant increases in forces but also for increased training of conventional troops in "irregular" operations, such as counterinsurgency and stabilization operations, thus freeing up special forces operators for "more demanding and specialized tasks, especially long-duration, indirect and clandestine operations in politically sensitive environments and denied areas." In addition, the document states that for direct action, special operations forces "will possess an expanded organic ability to locate, tag and track dangerous individuals and other high-value targets globally."[2]

Also in February 2006, Gen. Peter Pace, Chairman of the Joint Chiefs of Staff, reportedly signed a new, classified counterterrorism strategy that orders the Defense Department to undertake a broad campaign to find and attack or neutralize terrorist leaders, their havens, financial networks, methods of communication, and ability to travel. According to the *New York Times*, the strategy document specifies that the effort to defeat terrorism requires "continuous military operations to develop the situation and generate the intelligence that allows us to attack global terrorist organizations."[3]

Another major facet of SOCOM's burgeoning role is its wide geographic scope. In the five years since 9/11, special forces operations have been reported in the Philippines, Malaysia, Georgia, Colombia, Indonesia, Pakistan, Yemen, Algeria, Morocco, Mauritania, Niger, Mali, Chad, Nigeria, and Jordan. Although most of the reported operations are of the white variety, usually involving counterinsurgency and counterterrorism training of indigenous forces, there is little doubt that with the Pentagon's stated goal of hunting down terrorists, black special operators are or will be active in many of those same countries.

SOCOM's growth in size, scope, and influence raises the questions of whether it is conducting any covert operations and of the degree and adequacy of congressional oversight of its activities.

LEGAL REQUIREMENTS

Congress first tried to assert control over covert action in the mid-1970s in reaction to revelations of U.S. involvement in the coup against Salvador Allende in Chile and assassination attempts against Fidel Castro. The Church Committee, named for Sen. Frank Church (D-ID), chair of the Senate Select Committee to Study Governmental Operations with Respect to Intelligence Activities, conducted

an investigation that led to the establishment of permanent intelligence committees in both the House and the Senate. The Iran-*contra* scandal in the Reagan administration, however, highlighted important gaps in the new congressional oversight requirements. In response, Congress adopted more stringent provisions in the 1991 Intelligence Authorization Act, which is still the governing legislation on congressional oversight requirements. The act codified two requirements for any covert action. First, there must be a written presidential finding stating that the action is important to U.S. national security, which cannot be issued retroactively. Second, the administration must notify the intelligence committees of the action as soon as possible after the finding has been issued and before the initiation of the operation, unless "extraordinary circumstances" exist, in which case the president must fully inform the committees "in a timely fashion."[4]

The other significant feature of the 1991 Intelligence Authorization Act is that in response to the Reagan administration's use of the National Security Council to conduct covert action in connection with Iran-*contra*, it expressly applied the requirements to "any department, agency, or entity of the United States Government." In other words, Congress no longer assumed that only the CIA could or would conduct covert operations. The law also included, however, a few designated exceptions to the definition of covert action. Under the most significant one, "traditional . . . military activities or routine support to such activities" are deemed not to be covert action and thus do not require a presidential finding or congressional notification. Although the act itself does not define "traditional military activities," the conference committee report presenting the legislative history states that the phrase is meant to include actions preceding and related to hostilities that are anticipated to involve (conventional) U.S. military forces or where such hostilities are ongoing, whether U.S. involvement in the action is made public or not, as well as any military action where the U.S. role is apparent or to be acknowledged publicly.[5]

The interpretation of the "traditional military activities" exception has caused considerable controversy as the Bush administration relies increasingly on special operations forces in the war on terror. Covert operations conducted by special operations forces during wartime clearly do not require a presidential finding and congressional notification. The definition leaves a gray area, however, around the interpretation of the word *anticipated*. It is most commonly thought of in the literal sense of "preparing the battle space" and, in fact, the conference committee report of the 1991 law defines "anticipated" hostilities as those for which operational planning has been approved. Defense Department officials, however, have explained that under the Pentagon's interpretation, the language could refer to events taking place "years in advance" of any involvement of U.S. military forces. Critics contend that the Bush administration has been eager to shift more covert activity from the CIA to the military precisely because they see it as giving them more of a free rein.

But the Pentagon's interpretation of *anticipated* raises an obvious and important question: In prosecuting the war on terrorism, when special operations forces conduct an unacknowledged operation in a country where U.S. troops are not already present, how can they prove that it is in anticipation of involvement of the regular armed forces later on, and thus not a covert action that requires a presidential finding and congressional notification (particularly if it is "years in advance")?

An even more difficult question is, who will ask them to prove it? Legally, the ultimate arbiters of what does and does not constitute covert action would be the House and Senate intelligence committees, which exert a type of veto through their control of the intelligence authorization process. However, there are several problems with that argument. First, if it is a special operations mission, the funding would be controlled by the House and Senate Armed Services Committees, creating a crucial split between the authority to determine whether it is a covert action and budgetary control. Second, the Armed Services Committees have ultimate control over the intelligence authorization process in any case, because they must sign off on intelligence authorization bills before they go to the full House and Senate for a vote. As one Senate Armed Services Committee staffer described the relationship, "We prevail because they're subordinate to us." Finally, the fact of the matter is that congressional committees only know about those operations that the administration tells them about. They cannot ask questions about operations they do not know about.

Beyond the technicalities of arguing the meaning of the word *anticipated*, the Bush administration has made an even broader claim regarding its use of the military to conduct what would be called covert action if it were conducted by the CIA. Having defined the broad post-9/11 strategic situation as a "war on terror," administration officials argue that anything the government does to prosecute the fight against terrorism is part of a "war" and thus, legitimately a "traditional military activity." A variant of this argument stems from Senate Joint Resolution 23, the authorization to use force granted by the Congress in response to the September 11 attacks. That resolution authorizes the president "to use all necessary and appropriate force against those nations, organizations, or persons he determines planned, authorized, committed, or aided the terrorist attacks that occurred on September 11, 2001, or harbored such organizations or persons, in order to prevent any future acts of international terrorism against the United States by such nations, organizations or persons." Thus, according to some legal experts, the resolution grants the president virtually unlimited authority, as long as he "determines" that a particular target has some connection to Al Qaeda.

Finally, some Pentagon lawyers have interpreted the post-9/11 landscape even more broadly. Bush does not even need the resolution's authority, they contend; because of the attacks, anything he does in the fight against terrorism can be seen as a legitimate act of self-defense, and thus a "traditional military activity."

"SPECIAL ACTIVITIES"

Another aspect of the potentially increasing intersection of covert action and special operations forces, and its implications for congressional oversight, concerns whether the Pentagon is actually conducting covert operations but calling them something else. The Department of Defense has defined a category of so-called special activities with four characteristics. These are activities (1) that are conducted abroad; (2) in which the U.S. role is not apparent or acknowledged; (3) that do not include the collection or production of intelligence; and (4) that are not diplomatic activities. It is difficult to obtain precise information about such special activities, but they are conducted under some presidential authority, such as executive orders, and do entail some degree of congressional notification, although it is impossible to know how many and which members that includes. What is clear is that they are not conducted under the covert action requirements of the law and do not involve notification of whole committees, whether intelligence or armed services. The relevant question is, whatever they are called, are these operations subject to effective oversight?

Another overlapping category that includes unacknowledged operations is that of special access programs, or SAPs. SAPs, established by Executive Order 12958, are sensitive programs that impose "need-to-know and access controls beyond those normally provided for access to confidential, secret, or top secret information." This "beyond top secret" designation is to be established only on an agency head's determination that (1) the vulnerability of or threat to specific information is exceptional, and (2) the normal criteria for determining eligibility for access are not deemed sufficient to protect the information.

The standard reporting requirement for SAPs is that the congressional defense committees be given thirty days' notice before the program is initiated. However, the Bush administration has effectively nullified this requirement since January 2002. In various executive orders and presidential signing statements accompanying defense legislation, Bush has included language claiming that the Supreme Court "has stated that the President's authority to classify and control access to information bearing on national security flows from the Constitution and does not depend upon a legislative grant of authority." As a result, he states that although in most situations the thirty-day advance notice can be provided, "as a matter of comity, situations may arise, especially in wartime, in which the President must promptly establish special access controls on classified national security information under his constitutional grants of the executive power and authority as Commander in Chief of the Armed Forces." The statements then make plain that the executive branch will interpret the reporting requirements "in a manner consistent with the constitutional authority of the President."

There are three categories of special access programs: (1) acknowledged programs, which are unclassified; (2) unacknowledged programs, which are classified but reported to Congress in the same form as acknowledged SAPs; and (3) waived programs, where the classifying agency head waives the standard

reporting requirement. Waived SAPs are only orally briefed to the so-called Gang of Eight, that is, the chair and ranking (minority) members of both the Senate and House intelligence (or Armed Services) committees, and the House and Senate Majority and Minority Leaders. The controversial program involving the National Security Agency (NSA)'s program of warrantless domestic surveillance that surfaced in late 2005 was one such waived SAP, apparently authorized by the CIA.

Army documents that came to light in early 2006 as a result of the ongoing Freedom of Information Act lawsuit brought by the American Civil Liberties Union against the Defense Department regarding the abuses at Abu Ghraib prison highlight the risks involved in special operations forces being both involved in the war on terror and covered by SAPs. These documents confirm that a special operations unit known as Task Force 6-26 (also known as Task Force Omaha) has been implicated in numerous detainee abuse incidents in Iraq. Moreover, one army file details how—because the unit was part of a SAP—an investigator was unable to continue an investigation into claims that a detainee captured by Task Force 6-26 in Tikrit, Iraq, was stripped, humiliated, and physically abused until he passed out.

There exists yet another process that provides for the protection of classified information. Known as Alternative or Compensatory Control Measures (ACCMs), these are a way of applying "need-to-know" restrictions on information to, in essence, compartmentalize a program. According to a Navy directive, ACCMs are to be used in situations where need-to-know restrictions are deemed necessary but SAP controls are not warranted. These measures are distinct from SAPs in that although they provide the same internal security standards, they do not need the formal approval of the agency head and they do not have to be reported to Congress. Since September 11, hundreds of ACCMs have been established to compartmentalize information regarding a range of sensitive activities, from special operations in specific countries to intelligence collection and processing programs to various war planning contingencies.

One indication of the potential for abuse of ACCMs came in an internal Navy audit conducted in 2005. The audit reportedly found that secrecy was being used to restrict congressional, Defense Department, and internal access to potentially controversial or even illegal activities. As a result of the audit's findings, the Navy's new directive on ACCMs states, "The use of ACCM measures shall not preclude, nor unnecessarily impede, Congressional, Office of the Secretary of Defense, or other appropriate oversight of programs, command functions, or operations."

There have been indications that some members of Congress are becoming uncomfortable with the Pentagon's increasing independence in the area of unacknowledged operations. In June 2005, the House Permanent Select Committee on Intelligence's report on the 2006 Intelligence Authorization Act stated the committee's belief "that it does not have full visibility over some defense intelligence programs" that fall outside of specific budget categories. Speaking to the press, Representative Peter Hoekstra (R-MI), the chair of the House committee,

expressed his concern that the Pentagon was trying to hide activities such as information operations programs, including electronic warfare, psychological operations, and counterpropaganda programs from both the newly created Director of National Intelligence and Congress.

Periodically, information about some previously unknown program will reach the public eye, and a few members of Congress will express their concern about whether the Pentagon is evading oversight restrictions. They often issue calls for hearings, which may or may not be held. Momentum for developing a more robust congressional oversight role of special operations, however, tends to be derailed by a combination of factors. Often, the Pentagon sends representatives to Capitol Hill for either closed-door briefings or closed hearings in which they explain how they are not violating the covert action restrictions because, by their own definition, they do not indulge in covert action (unless an individual operative is on assignment to the CIA). Rather, they explain, they are conducting special activities and they have complied with the relevant notification requirements (as interpreted by the administration).

Another factor working against congressional efforts for a larger role is the underlying antagonism between the intelligence and defense committees, and their respective sense of ownership of their particular issues. The concerns raised by today's special operations invariably involve both committees and will not be addressed adequately until this fundamental issue of turf sharing is resolved. Moreover, although members on both sides of the aisle have voiced concern, it has more frequently been expressed by the Democratic minority, which of course opens it up to partisan debate and power struggles, struggles the minority inevitably loses. Finally, members' motivation to increase their oversight role tends to wither in the face of Congress's traditional reluctance to go up against the Pentagon in a time of war.

ISSUES BEYOND CONGRESS

Another controversy regarding the expansion of special operations forces into the realm traditionally occupied by the CIA's covert operators involves the question of who is better suited to conduct such operations, whatever they are called. Pentagon officials contend that the CIA is not responsive enough to the military's needs, that it is too risk-averse, and that it is simply too small to meet the global terrorist challenge. The CIA has approximately 700–800 covert operators, compared to the roughly 10,000–13,000 special operations forces. On the other hand, their relative sizes are not as unbalanced as these numbers seem to indicate. Of that total, no more than 2,000 are JSOC black operators, that is, directly comparable to CIA operatives. Moreover, according to many analysts, the difference in size of the overall organizations is a significant advantage for CIA operators. Having much less bureaucracy to deal with, they can do things faster, cheaper, and with more flexibility than special operations forces—the

main reason, the CIA's advocates contend, that the agency was able to have men on the ground at the beginning of the Afghanistan war quicker than the military. Even though this has clearly been one of the Pentagon's priorities in enacting its SOCOM reforms, most analysts still believe that the CIA continues to retain an advantage in speed and flexibility.

The CIA also has the advantage of experience: It has been conducting this type of operation for a long time and thus has case officers stationed at embassies throughout the world who have built up an extensive network of contacts that the military simply does not have. In addition, conducting operations where the role of the United States is unacknowledged means, by definition, operating out of uniform. If captured, therefore, a special operations soldier is in an inherently different position than a conventional one. Whereas the latter is covered by international legal mechanisms such as the Geneva Conventions, which govern the conduct of war and the treatment of prisoners, a special operations soldier will have no such recourse. People who join the CIA's operations division are aware of and accept the risk that if captured, they will essentially be completely on their own and that their country will not acknowledge them. Soldiers, however, join with a different set of expectations. They generally assume that if they fight for and defend their country, Washington will do its best to protect them if they are captured. Although many special operations soldiers knowingly accept that risk, analysts point out that it is a dangerously slippery slope. Once some contingent of U.S. military personnel is left without protection, they argue, that endangers the protection of all military personnel serving abroad and could damage troop morale as well.

Many CIA and JSOC operators oppose the Pentagon's emphasis on moving special operations forces into the unacknowledged realm for precisely these reasons. There was, for instance, considerable opposition among special operations forces themselves to the 9/11 Commission's recommendation of moving all paramilitary responsibilities to SOCOM. Furthermore, these critics argue, JSOC's direct action units do not have the training for covert action operations, and if they do undertake the training required, that will detract from their readiness for their traditional, highly specialized missions, such as hostage rescue, close-quarters combat, and dealing with weapons of mass destruction. However, though there are other personnel capable of conducting covert action (i.e., in the CIA), if special operations forces are distracted from their traditional missions, there is no one else who can take their place, leaving the United States vulnerable in certain situations.

Critics of the Pentagon have also raised the concern that the military is running its own unacknowledged operations without notifying the "country team" (the CIA station chief and the ambassador) in the relevant location. Not only would this run the risk of embarrassing the United States diplomatically, but if the CIA were conducting an operation in the same area and the operators were unknown to each other, they could conceivably perceive each other as the enemy, a situation known as "confliction." In response to stories about such situations in the press in 2005, some members of Congress asked for an explanation from the

Pentagon. Defense Department officials testified that they had never conducted an operation without first notifying the country team, which allayed congressional concern. In addition, the Pentagon and CIA had various discussions regarding how to coordinate their operations better to avoid any risk of confliction.

Another question revolves around the actual difficulties in expanding special operations forces, particularly black operators. The Pentagon has called for a significant increase in special operations soldiers by 2011. However, the whole point of special operations forces is that they are the best of the best and are put through much more rigorous and thorough training than conventional soldiers. Many analysts have questioned SOCOM's ability to produce that many more operators, particularly when its training infrastructure is already under stress as a result of increased training loads ever since September 11. The command has revamped some of its training to make it more efficient and get more done in less time, but the fact remains that the high level of training for special operations requires a considerable amount of time, and many question whether the Pentagon's push for increased numbers will result in compromising the quality of the resulting forces.

One final issue that arises in weighing the differences between unacknowledged operations conducted by the CIA and by special forces stems from the differences in mission planning procedures between the two organizations. Traditionally, CIA covert operations are developed by an operational planning group and then subjected to several levels of approval within the Agency. After receiving the CIA's approval, the proposal is then reviewed by the deputies' committee at the National Security Council, and possibly by the principals themselves, before being passed on to the president. Military operational planning, however, is conducted quite differently. Because its primary mission is combat, the military has full authority to make its own operational decisions with no input from outside agencies. A military black operation, therefore, is planned completely within the Pentagon and approved by the secretary of defense. This insulated decision-making system raises obvious risks in a situation where special operations forces are conducting unacknowledged operations in a wide range of countries with which the U.S. has a variety of relationships.

COMMISSION RECOMMENDATIONS

In its final report, the 9/11 Commission stepped squarely into the debate over who is actually better suited to be leading the covert battle against terrorism. The commission recommended, "Lead responsibility for directing and executing paramilitary operations, whether clandestine or covert, should shift to the Defense Department. There it should be consolidated with the capabilities for training, direction, and execution of such operations already being developed in the Special Operations Command."[6] In response, President Bush asked the Pentagon and the CIA to study the commission's conclusion and come up with a joint recommendation. Although many assumed that because of the Pentagon's

political muscle and Rumsfeld's expressed goals, it was a foregone conclusion that the Pentagon-CIA study would agree with the commission's recommendation; in fact they ended up rejecting it, as did the President.

When the Commission on the Intelligence Capabilities of the United States Regarding Weapons of Mass Destruction (Silberman-Robb Commission, after its chairs, Judge Laurence Silberman and former Senator Charles Robb) issued its recommendations in mid-2005, it reportedly included a classified recommendation that also would have given the Pentagon greater authority to conduct covert action. Once again, though, the White House rejected the recommendation. While this would seem to run counter to the Pentagon's moves to expand special operations in the years since 9/11, in the context of the definitional issues just explained, it appears likely that in fact the Pentagon does not want more control of covert action. It has the greatest freedom of action in the present system, whereby the CIA conducts covert action per se and is thus subject to more formal congressional oversight, whereas the Pentagon can continue conducting its special activities, SAPs and ACCMs, with minimal, sometimes nonexistent, oversight.

CONCLUSION

The question of the military's involvement in unacknowledged operations is shaped by four main factors. First is the Pentagon's broad vision of SOCOM's future role in the "long war" against terrorism. Second is the geographic expansion of special operations forces, in terms of the number of different countries in which both black and white operators are present. A third facet of the issue is the Pentagon's definition of unacknowledged operations as special activities, with more lenient congressional notification requirements than the covert action conducted by the CIA. In addition, the military has the special categories of SAPs and ACCMs that restrict information even further. Finally, there are the indications that some past SAPs have led to highly controversial policies, including renditions (the practice of seizing suspects in one country and delivering them into custody in another country), covert media influence operations in Iraq and Afghanistan, and the direct evidence of the involvement of Task Force 6-26 in interrogations at Abu Ghraib. The military's role in unacknowledged operations is an increasingly complex issue and it remains to be seen how Congress will serve the twin goals of protecting the United States from terrorism and ensuring that there is sufficient accountability to the public.

COVERT ACTION AND DIPLOMACY

JOHN D. STEMPEL

COVERT ACTION AND DIPLOMACY HAVE HAD A long and checkered career together for over two millennia. From the earliest organized governments, when functions were not sufficiently differentiated, clandestine operations were standard practice in international relations. Beginning with the Achaemenid Persians between the sixth and fourth centuries B.C., the organization of intelligence as part of government was developed to a very high degree and copied by Arabs, Turks, Afghans, Mongols, and Hindus over the following centuries. Activities that we now consider covert action—assassination, coopting the king's counselor (or mistress), paramilitary support for insurgencies, and propaganda—were common. There was little or no distinction between "intelligence" and "covert action" until the nineteenth and twentieth centuries. That developed in the West as a result of the evolution of Westphalian diplomacy in the fifteenth and sixteenth centuries.[1]

The emergence of Western diplomacy was driven by the disastrous desolation caused by the Thirty Years' War. Crude but temporary diplomatic missions began in the fifteenth century in Venice and the Italian states and spread to Europe. Intelligence and eventually secret operations were an integral part of these activities, though they were fairly simple by modern standards. In the Elizabethan period, British covert action multiplied the effective power of England, especially when the use of gold and Protestant mercenaries as diplomatic weapons saved the Protestant cause in France and the Low Countries.

By end of the Napoleonic Wars in 1815, the Treaty of Vienna included the regulation of diplomatic ranks and began the formal organization of diplomacy under international laws regulating diplomatic rights and duties. It included the principles that diplomats are not to interfere in the internal affairs of states and an outright condemnation of espionage.[2] Of course, this did not stop spying, but it

forced intelligence services to become more professional and began the differentiation between intelligence and diplomacy in terms of norms, objectives, and means and methods.

As other European societies followed Britain through the Industrial Revolution, and as continental European politics became more complex through the eighteenth and nineteenth centuries, intelligence services and capabilities grew. The United States entered the diplomatic arena in the late eighteenth century after winning its independence from Britain, but distance, communications, and time kept it from playing a serious role in European and world politics until nearly a century later. The 1898 Spanish-American War, coupled with World War I brought the United States into the world arena.

Because of this history, America lagged behind the rest of the world in developing an organized intelligence capability. Throughout most of the nineteenth and early twentieth centuries, both U.S. intelligence and diplomacy were ad hoc affairs, which included secret operations on occasion, where needed and possible. Roosevelt's maneuvers involving the acquisition of the Panama Canal are a good example. In fact, the United States had no professional diplomatic community until the Rogers Act of 1924, and until 1940, no formal intelligence organizations existed except the military service intelligence departments.

George Washington created his own informal intelligence network during the American Revolution, but it dissolved after the American victory at Yorktown. The U.S. Army began to develop intelligence units during and after the Civil War experiment with outsourcing intelligence to Allan Pinkerton's organization. Formal organizations were not created until the 1880s in the Army and Navy Departments.[3]

In World War I, the military services ran their own shows, and a civilian Committee on Public Information under George Creel focused largely on propaganda and internal security. During the interwar years (1919–39), American intelligence lapsed back into previous peacetime routines, with the military service units dominating the field. American code-breaking efforts were terminated in 1929.

As the war clouds grew over Europe again in the late 1930s, President Franklin Roosevelt selected William O. Donovan to create the Office of the Coordinator of Information in June 1941, which became the Office of Strategic Services (OSS) the next year. This was the first organized American effort to conduct what became know within the next decade as covert activities—propaganda, political operations, economic operations, and paramilitary activities, as well as sabotage, espionage, and counterespionage during World War II.

When the OSS was disbanded in September 1945, President Truman transferred its intelligence functions to the State Department, where they became the Bureau of Intelligence and Research. He also created the Central Intelligence Group (CIG) a year later to keep the rest of the trained professionals, including covet action operators, together until the United States could sort out its postwar needs.[4]

Most of today's scholarly work cites the creation of the Central Intelligence Agency (CIA) in 1947 as part of the National Security Act as the real beginning of professionalized intelligence in American government.[5] The vast increase in technological capabilities—such as better communications and space photography—required a much greater concentration of resources and manpower to succeed. Cooperation with Allied intelligence services in World War II socialized Americans to international intelligence work. The imperatives of postwar politics and the rise of the Cold War made such an effort necessary on a continuing basis.[6]

The CIA has maintained its links with the State Department and the military in Washington. Abroad, U.S. and other countries' embassies often host resident personnel under "official" cover. However, the overall tension between the utility of covert action and the requirements of diplomacy and foreign policy continue to this day, breaking out in open hostility on occasion.

COVERT ACTION: METHODS AND OPERATIONS

Covert action is formally referred to in presidential executive orders as "special activities." Perhaps the most inclusive general description is Jeff Richelson's: "Covert action, also known as "special activities," includes any operation designed to influence foreign governments, persons, or events in support of the sponsoring government' s foreign policy objectives while keeping the sponsoring government's support of the operation secret. Whereas in clandestine collection, the emphasis is on keeping the activity secret, in covert action the emphasis is on keeping the sponsorship secret."[7] Such activities are aimed at keeping the sponsoring government's role secret, but they also do violate the diplomatic Vienna Convention injunctions against interference in the domestic affairs of the host country.

When a covert action is uncovered, the sponsoring country's relations with the target country are adversely affected. This generally brings diplomats back into the problem, because they are the ones who take the brunt of criticism and later raise the general foreign policy question of whether such actions were or are worth the cost. Before pursuing this discussion, the following section examines the types of actions and individual issues/problems. Although much is known about historical operations, details on present-day activities are scarce. This circumstance hampers a complete and fully informed discussion.

Propaganda, sometimes called psychological warfare, or psy ops, has both overt and covert aspects. The press and cultural sections of embassies pass out overt, or "white" information that is attributed to official sources and represents the government's official view. "Gray," or partially concealed propaganda and "black" propaganda that are attributed to someone else, such as falsified statements from a foreign government, are concealed variants. All these types of propaganda were used to influence the 1948 elections in Greece and Italy against the

communists. The Soviets made heavy use of all three types from 1945 to the demise of the Soviet Union.[8] Other countries consistently use white propaganda (e.g., the British Broadcasting Company and the French Press Agency).

Examples of black operations include the American establishment of a clandestine radio station in Guatemala that broadcast news of a revolutionary army so convincingly that the procommunist president resigned. Soviet efforts to convince Africans that the United States was responsible for creating AIDS are similar black efforts. A similar clandestine operation publicized in late 2005 told of U.S. military officials paying to have stories placed in the Iraqi press lauding the role of American soldiers in trying to enhance security in Iraq.

For many years, Radio Free Europe and Radio Free Liberty dispensed gray information while covertly supported by the CIA as privately supported organizations. In 1973, Congress gave them independent status under the Board for International Broadcasting to "whiten" their offerings. Such activities are estimated to constitute about 40 percent of the CIA's covert activities.

Economic operations have been the least used covert activities by the CIA, accounting for only 10 percent of U.S. covert activities. Economic support in terms of goods shipments to support friendly governments or withholding trade with unfriendly countries occurs on both the overt and covert levels. Sanctions are overt; manipulating a national currency clandestinely is covert. Much of the action against the Allende government in Chile in the early 1970s involved economic issues, including inciting labor strikes and depressing the world copper price. Positive efforts include measures to restore Iraq's economy after the American defeat of Saddam Hussein in 2003 and shipments of food to friendly countries under the Public Law (PL) 480 program. Economic measures are often overt as well as covert, and these include foreign aid as well as favorable trade pacts. Efforts to beef up the cattle and food industries in Africa are normally overt, but given sensitivities in some areas to the HIV/AIDS problem, covert measures to give additional vaccines and medicines to people in certain places may be necessary.

Political action is a more diffuse and complex category, involving everything from financial support for key leaders to creating insurgencies. Such action accounts for about 30 percent of U.S. covert activities. Some known examples include payments to Jordan's King Hussein, giving money and campaign advice to the Solidarity movement in Poland in the 1980s, and supplying political organizational personnel and money to Afghan politicians since 2002.

In addition to major U.S. efforts in Western Europe in the 1940s, there were two campaigns in Chile in 1964 and 1970. The first was a solid success; the second failed to prevent Salvadore Allende from becoming president and led to a campaign to overthrow him that was a major trigger for the Church Commission's 1974–75 investigation of the CIA.

Moving toward activities that present an even greater challenge to international norms, there are instances where both the United States and the Soviets Union supported coupes d'etat against foreign leaders. Soviet support for coups

in Czechoslovakia in 1948 and in Afghanistan 1n 1978 are clear-cut cases of the exercise of Soviet political and eventually military power. The Soviets supplied political support to a number of other regimes including Cuba, Angola, Iraq, and Mozambique up to and including use of force over the past 60 years.

The U.S. has been identified with four other coups in addition to the Guatemalan and Chilean examples given. In 1953, some money and organizational skills were supplied to forces loyal to the shah, which brought down Prime Minister Mossadeq's government and restored the monarchy. The overthrow of the shah twenty-five years later drew substantially on Iranian anger at the earlier effort and raised the question of whether the 1953 coup was effective in protecting long-term U.S. interests. Successful U.S. efforts in 1961 to oust Trujillo from the Dominican Republic and acquiescence in an army coup that killed South Vietnamese President Ngo Dinh Diem in 1963 are other cases the Church Commission discussed.The United States also gave political support to those seeking to oust Philippines President Ferdinand Marcos in 1986 and political and active military support to oust the regime in Grenada in 1983, Panamanian President Manuel Noriega in 1989, and the Haitian military dictatorship in 1993–94.

Paramilitary activities, including assassinations, often overlap with or are carried out in conjunction with political action operations. They generally involve more risk and controversy than any other type of covert action. The CIA's Special Operations Unit ran a "secret" war against the North Vietnamese puppet regime in Laos from 1963 until the United States withdrew from Vietnam in 1973. CIA support for other wars/guerilla operations has included action in twenty-six publicly identified countries, including the Ukraine, Poland, Albania, Hungary, Indonesia, China, Oman, Malaysia, North Korea, Venezuela, the Dominican Republic, Bolivia, Guatemala, Cuba, Nicaragua, El Salvador, Angola, Greece, Afghanistan, and Iraq. Soviet operations include at least that many countries over the seventy-two years of the regime's existence.

Some clandestine American activities involved support for or protection of other elements of the clandestine intelligence collection process, including the maintenance in Iran of monitoring stations to track Soviet missile launches and monitoring sites in Laos and Cambodia for following North Vietnamese troop movements. In the 1980s, American covert operations involving Pakistani aid to the Afghan rebels against the Soviet puppet regime there were major factors in the eventual Soviet withdrawal in 1989. As in most other large-scale operations, part of the activity was covert, the rest merely secret, much of which eventually became public.

THE NEW TERRORISM

One of the spillovers from American Afghan operations in the 1980s and the Gulf War of 1990–91 was the rise of Islamic terrorism, which eventually led to the destruction of the World Trade Center towers and damage to the Pentagon on

September 11, 2001, when Al Qaeda–trained terrorists flew aircraft into these buildings. Subsequent military action in Afghanistan that destroyed Taliban rule there and chased Al Qaeda into Pakistan was greatly facilitated by both overt and covert operations that relied heavily on CIA cooperation with U.S. military forces, and paramilitary efforts were key to early success. Coordination between the CIA and Defense Department forces, however, did not remain uniformly good throughout and remains a subject of concern to intelligence reformers.[9] Failure to destroy or capture a significant number of Al Qaeda forces and leaders was one of the issues that led to the 9/11 hearings and intelligence reform in 2004–5. A related issue was the use of intelligence in the decision to attack Iraq in March 2003. The misreading of Iraqi nuclear and chemical/biological capabilities and the limited American understanding of Iraq and its politics brought forth criticism on both counts.

The concentration on intelligence reform led to a reassessment of American intelligence capabilities and a reorganization of the intelligence community under a new Director of National Intelligence (DNI).[10] Although the most intense focus centered on the more strenuous overt and secret activities, covert action has been affected as well. Information now available suggests there is more increased covert activity in support of penetrating terrorist cells and infrastructures. Support activities related to U.S. invasion and occupation of Iraq, and U.S. support of Afghanistan's democratic experiment post-2001, have grown dramatically. In these areas, paramilitary operations and support are crucial, overt or covert. This concentration suggests there are fewer resources for and less reliance on covert activities elsewhere, but this is speculative at this time (2006).[11]

COVERT ACTION: ASSESSMENT

As covert action became a bureaucratized activity in U.S. foreign policy after World War II, rather than an ad hoc political or military event, it became controversial. For over twenty-five years after 1945, during the Cold war, Americans treated covert activities with a "don't ask, don't tell" mentality. This followed a familiar pattern: most nations do not now and never have openly discussed their covert activities. There have been some academic discussions of past efforts when material became available or when enterprising journalists uncovered unsuspected connections. However, these tended to be one-shot stories with little follow-up. This began to change in the United States in the early 1970s when U.S. involvement in Chile drew the attention of Senator Frank Church and others. In 1975–76 a congressional commission investigated alleged intelligence abuses.[12] The Church Commission and subsequent government and scholarly efforts have focused on three issues: Is covert action effective? Is covert action under control? Is covert action moral?

Literature on effectiveness from both academic and professional sources stresses several negative points:

1. The "blowback" from failed operations—or even successful ones—damages U.S. foreign policy.
2. Americans are deficient in the cultural understanding necessary to successfully manipulate other cultures, hence covert action often ends badly.
3. Covert action is not an effective mechanism for resolving crises and has to be integrated as part of an effective policy to succeed.
4. Often, the objectives of the covert activity are not compatible with American values.
5. Often, unclear boundaries between covert action and military operations result in failures.
6. Short-term successes often lead to long-term disasters.[13]

Others, including some critics, concede that despite difficulties, covert action is something that can be useful if it is used properly: (1) if covert activities are integrated into coherent overall foreign policy; (2) if active coordination is maintained between all government agencies; and (3) if no overt options will accomplish the mission. Most agree that other options should be exhausted—much of the political and propaganda work should be done openly, and it must be done competently with a good chance of success. Like other choices for effective action, there are pitfalls as well as possibilities.[14]

The dispute over effectiveness spills over to the second issue: Is covert action under proper control? For Americans, this means conforming to relevant legislation and final presidential approval of such action. President Reagan's definition of covert action, published in Executive Order 12333 in 1981 and still in effect today, covers "special activities conducted in support of national foreign policy objects abroad which are planned and executed so that the role of the United States Government is not apparent or acknowledged publicly . . . but which are not intended to influence United States political processes, public opinion, policies, or media and *do not include diplomatic activities or the collection or production of intelligence and related support functions*" (emphasis added).[15]

The U.S. Congress found this definition acceptable and incorporated similar language in its 1991 Intelligence Authorization Act. The common theme was that covert action is *not* an intelligence activity, and the requirements for a presidential finding did not apply to diplomatic activities. Also, such special activities were not to be targeted at or designed to influence the American public or American politics.

The development of a working definition of *covert action* stemmed from the work of the Church Commission, which at first called the CIA a "rogue elephant," but then backed away from that view in its final report. No other country deals with covert action this way. In 1994, the Hughes-Ryan legislation, which required the presidential finding for covert action, also ended the doctrine of plausible denialability for the president.

The presidential finding combines a determination that the activity is important enough to U.S. national security that it should be undertaken despite the risks and

possible exposure, and that the purpose for which it is undertaken and the methods used would be approved should it become public—the risk should be worth it. In 1986, the Iran-*contra* scandal underscored the reason for such legislation when it broke. National Security Council officials John Poindexter and Oliver North concocted a scheme to sell weapons to Iran in return for the release of American captives in Beirut and then (illegally) use the proceeds to fund U.S. operations against the Nicaraguan Sandinista government by supporting the contras.

This operation was never a true covert action, because approval was never sought. Some CIA, diplomatic, and military officials were involved in these basically criminal activities that were kept from Congress's attention until the story was revealed abroad. A few were tried in court, others were fired, and some left government voluntarily. There was considerable anger among the professionals in the various agencies. President Reagan escaped serious censure when he apologized to the country in a televised speech following the scandal.[16]

Journalists and students of intelligence had a field day with the Church Commission's initial allegations about rogue elephants and with the Iran-*contra* scandal, as they often do when intelligence operations go awry.[17] Ever since the 1960s, periodic book and magazine exposés have vied with serious analysis for public attention when covert action is the subject. This highlights the continuing tension between the secrecy needed for covert action and intelligence activities and the requirements for democratic transparency in government. A few other democracies have begun to gently question intelligence activities, but in most nations this is a nonproblem—these matters are simply not discussed.

The final question is whether covert action is moral. It is always justified as important or even vital for national security. It has been separated from diplomacy and discouraged in international law because it is not considered an acceptable part of international relations. Nevertheless, it persists—as do efforts to codify and extend international law.

Throughout the Cold War, America operated on the basis of the view developed by a panel appointed by President Eisenhower. Headed by retired Gen. Jimmy Doolittle, its report said that in view of communism's win-at-all-costs approach to foreign affairs, the United States would have to reconsider its concepts of fair play and undertake to subvert, sabotage, and destroy our enemies.[18] America did not fully trade morals for realpolitik, but it certainly erred on the side of a more vigorous covert action policy.

Beginning with the Carter administration and reemerging with the Clinton administration, the question of how moral our foreign policy was continued to bubble. The Reagan administration returned to the more forceful arguments for fewer limits on covert action, and so did the first President Bush; after 9/11, so did President George W. Bush. Key players in his administration consistently made the argument that the brutality and viciousness of the terrorists required the utmost response. However, the president's policy of bringing democracy to the Middle East, which justified the 2003 invasion of Iraq, also raised the question of

whether covert actions by their very nature undercut strategies to promote democracy in Iraq and elsewhere.[19]

Several writers have made the argument that covert action must be considered in terms of just war theory and that covert action can be justified in some circumstances, but it should not be used as a "lazy country's way of avoiding hard diplomatic work."[20] Some former agents argue that collecting intelligence and covert action often involve working with amoral characters, especially when terrorists such as Al Qaeda are the targets.[21]

They have a point, and no one has said the choices are easy. Most thoughtful writers suggest that some form of the following guidelines would give a government a solid base for defending covert actions if they went bad, and that most people would support covert action taken for the following reasons:

1. The president approves the covert action after organized deliberation within the executive branch and the legally required consultation with Congress.
2. The action's intentions and objectives are clear, reasonable, and just and are also part of a coherent foreign policy.
3. Overt means of advancing the policy will not work.
4. There is significant probability of success, with minimal damage to innocent people.
5. Damage inflicted should be proportional to the threat reduced or averted.

Of course, such assessments have and could turn out to be wrong, or actions could be botched or turn out badly. There is really no way of averting criticism or political damage, but a defense of just covert action will limit damage to the diplomacy of the country that can so defend itself politically if matters go badly.

Using such guidelines may also assist in minimizing organizational struggles and clashes within the intelligence, defense, and diplomatic communities. If all work from the same page, intragovernmental spats will be minimized because positions will have to be harmonized or adjusted before action can get under way. Legal issues would be minimized, and there will also be more markers for judging the effectiveness of covert action. Those who have put themselves above the requirements for control are those who caused real damage to the system. They have also raised the bar of distrust across both international as well as domestic dimensions.

CONCLUSION: THE FUTURE

Combining considerations of effectiveness, control, and morality has and will help governments assess and carry out special activities in a future that is coming at us with dizzying speed.

When the United States began its romance with covert action in the late 1940s and '50s, leaders of developing new nations had not yet mobilized masses of people in the developing world for political action. Politics was still very much an elite game when Kermit Roosevelt helped restore the shah to power in 1953. The mobilization of Iran's Islamic population by Khomeini and others made covert action almost impossible. The OSS successes in France and Burma during World War II were difficult to repeat in the Eastern Europe of the 1940s and '50s. Similarly, the triumph of mass movements in other African and Middle Eastern states in the 1960s increased the need for effective diplomacy while simultaneously reducing the productive scope of covert activities.

Similarly today, the explosion of cell phones, computers, and the Internet has complicated covert operations. The geometric increase in surveillance capacities and means for harming others has both helped and hindered cover actions, and foreign policy and intelligence become more complex and interlinked than they have ever been.

The result, certainly for the United States, had been a reassessment of intelligence and the creation of a new Director of National Intelligence. Covert action has come under renewed scrutiny. Paramilitary efforts were stepped up in the wake of 9/11. Efforts have been made to increase public diplomacy and bring politics activities into more transparent light.

All postwar presidents have used covert action with congressional approval since 1974 (the exceptions have resulted in disgrace and/or punishment for the culprits). It is not unreasonable to suggest that they will continue to do so in a dangerous world. To achieve success, however, they will have to keep in mind the pitfalls and problems connected with such activities, as well as the guidelines for success listed above.

Ultimately, all connected with such activities need to bear in mind the words of former National Security Agency Director William E. Odom: "Intelligence performance simply can not be separated from foreign policy making and military operations."[22]

FROM COLD WAR TO LONG WAR

Covert Action in U.S. Legal Context

JAMES E. BAKER

INTRODUCTION

ALTHOUGH COVERT ACTION HAS HISTORICALLY PLAYED A small part in the overall intelligence budget, as an intelligence function it has played a disproportionately large role in defining public perceptions of "intelligence,"[1] shaping congressional oversight, and policy impact. This reflects the reality that covert activities bear particular policy and legal risks as well as benefits. Covert action has historically included activities on a continuum between diplomacy and acts of war undertaken to hide the national footprint.[2] As a result, these activities are undertaken without the ordinary mechanisms of policy preview and external validation. Thus, although the law pertaining to covert action permits and prohibits, most of all it regulates its use by creating substantive thresholds triggering statutory and executive processes for authorizing and then appraising covert activities. These processes are intended to ensure that the means to effect covert actions are lawful, but also that the policy choices are sound and effective and that the gain from action exceeds the pain, in both the short and long run.

This chapter is divided into two sections. The first places covert action in contemporary policy and legal context. In a global low-intensity conflict against nonstate actors intent on conducting acts of terrorism with high-intensity consequences, clandestine activities of the sort historically identified as covert action play a central role. However, because this conflict is fought over values, including legal values, and because success in this conflict requires intelligence alliance, the when, why, where, and how of covert action takes on added importance. Contemporary law provides a procedural framework for addressing these issues within a context of limited access.

The second section raises three legal policy issues: (1) Will the president's wartime authority as commander-in-chief eclipse or marginalize the statutory framework for addressing covert action? (2) Does the statutory definition of *covert action* remain viable in light of the evolving use of "liaison" and "traditional activities" to combat terrorism? (3) Is the measure of executive preview and review adequate to address the policy and legal risks inherent in covert action, as well as those contemporary activities that bear comparable policy and legal risks?

LEGAL FRAMEWORK: A THUMBNAIL SKETCH

American covert action predates the Republic. Benjamin Franklin, the colonial envoy in France employed tradecraft like secret writing and dead drops to organize an espionage ring in Paris. Notably for this chapter, he also engaged in the covert planting of disinformation in the Paris press and the clandestine shipment of arms to the Colonies.[3] Covert action has been one of America's national security tools ever since. During the Cold War the United States (and the Soviet Union) engaged in a number of "overt-covert actions," such as the landings at the Bay of Pigs, the supply of the *contras*, and provision of support to the Afghan *mujahedeen*. Such "covert" mechanisms allowed proxies to engage in hot war, while the great power conflict remained "cold." (However, most covert activities, then and now, are secret and remain so.) Resort to covert action also reflected the strategic view that the threat posed by communism warranted resort to all the instruments of national policy.[4]

In a conflict against Islamic Jihadists, the United States should be expected to use all the national security tools, including covert action. Indeed, the instrument is well suited to address a nonstate opponent, acting outside the laws of armed conflict and operating without necessity of a particular territory, base, or even chain of command. In theory and in law, covert action is fast and flexible, allowing prompt response or proactive use against a mobile opponent within states either unwilling or unable to effect their capture. And in theory and in law, covert action is nonattributable and secret. This allows assisting states to otherwise deny complicity in necessary but locally unpopular actions. It also removes the "made in America" label, where for example, an audience might otherwise be receptive to the message, but not the messenger. For these reasons the law related to the authorization and review of covert activity is on the front line of counterterrorism. For these same reasons, the law, process, and practice of covert action will surely evolve from Cold War to "Long War" understandings and applications.

Constitutional Context

The president's inherent intelligence powers are found in enumerated constitutional authorities over foreign affairs and national defense as recognized in long-standing executive practice as well as in those few Supreme Court decisions

that address intelligence.[5] The extent to which the president's inherent authority is magnified as commander-in-chief in time of conflict is a matter of debate, in the intelligence as well as military spheres of security. However, there is surely a wartime gloss that attaches to exercise of executive authority during conflict overseas, but wider debate on whether or how such a gloss applies at home.

Congress's authority over the intelligence function is found in the funding power, the "necessary and proper" clause, its general legislative power, as well as the range of enumerated authorities the Congress possesses over national defense. The law provides for congressional notification of covert action and not consultation or approval, a constitutional acknowledgment of the president's particular authority in this area. However, in constitutional practice, strong legislative resistance can shape or even lead to the termination of a covert action program. Congress's leverage increases when a program requires the authorization and appropriation of new money (as opposed to presidential authorization to spend existing funds) or where Congress chooses to use the power of the purse to "fence" funding.

Statutory Context

Although there are a number of statutes that address intelligence, the National Security Act of 1947, as amended, remains the bedrock of U.S. intelligence laws. This is true in the area of covert activity. The act, in some manner or another, has served as statutory authorization for covert activity since 1947;[6] however, it was not until 1990, in the wake of the Iran-*contra* affair, that the Congress defined covert action in law. "DEFINITION: Covert Action is defined by what it is, an activity or activities of the United States Government to influence political, economic, or military conditions abroad, where it is intended that the role of the United States Government will not be apparent or acknowledged publicly."[7] Through negative definition, "Covert action . . . does not include—(1) activities the primary purpose of which is to acquire intelligence or traditional counterintelligence activities; (2) traditional diplomatic or military activities or routine support to such activities; (3) traditional law enforcement activities; or, (4) activities to provide routine support to overt U.S. activities abroad."[8]

This definition was intended to capture activities that Congress determined should be channeled through a particularized process of executive authorization and congressional notification because of the nature of and risk inherent to the activities involved. The definition was meant to reflect existing practice, the legislative history stating: "It is not intended that the new definition exclude activities which were heretofore understood to be covert actions, nor to include activities not heretofore understood to be covert actions."[9] As a result, historical practice is particularly relevant to legal interpretation, albeit hard to ascertain using ordinary methods of legal research. The legislative history as well is particularly important in fleshing out the meaning of "traditional" activities exempt from the definition's reach.

Notably, this definition is act-based, not actor-based. This means that the law applies not just to the Central Intelligence Agency (CIA) but also to the Department of Defense and the Federal Bureau of Investigation (FBI) and other government entities, *provided* the contemplated activity fits the positive definition of covert action and is not otherwise "traditional." However, identity *is* relevant in determining whether an activity is traditional. For example, certain activities like raids might be traditional if undertaken by military actors in uniform during armed conflict; however, the same result may not follow if the raid were undertaken by nonattributable U.S. surrogates in peacetime. Of course, activities that were "extraordinary" before September 11, 2001, may have become ordinary and traditional since then.

FINDINGS

The act also recognizes the president's direct responsibility for covert action. The president is required to find that "an action is necessary to support identifiable foreign policy objectives of the United States and is important to the national security of the United States."[10] Findings must be in writing, "unless immediate action by the United States is required," in which case a contemporaneous notation of the president's decision shall be made and a written finding produced within forty-eight hours. Reflecting some of the issues identified in the Iran-*contra* context, findings must also specify the department or agencies authorized to fund or participate "in any significant way" in an action, as well as specify whether the participation of third parties (e.g., third countries or persons) is contemplated.[11]

REPORTING

The act also requires the president to ensure that findings are reported to the intelligence committees "as soon as possible after . . . approval and before initiation."[12] The ordinary process of notification is in writing to the full committees. In practice, this means not only to the members but also designated staff with an oral briefing accompanying the underlying document. However, "To meet extraordinary circumstances affecting vital interests of the United States,"[13] the president may limit notification to the so-called Gang of Eight (the chairs and vice chairs of the Intelligence Committees and the Majority and Minority Leaders of each house of Congress) "and such other member or members of the congressional leadership as may be included by the President." Exercise of this option requires a statement from the president indicating why the action in question warrants limited notification. It follows that a limited notification is to members only and may be done orally. The president may, of course, authorize notification to additional members of Congress, or staff, something in between the full committee and the Gang of Eight. Although there may be good tactical reasons to do so, as in the case of members serving on the Appropriations Committees, selective

notification to preferred members of Congress or staff would seem to erode the premise behind limited notification.

Finally, the act implicitly authorizes the president to withhold notification altogether by stating that "whenever a finding is not reported [in one of the first two manners], the President shall fully inform the intelligence committees in a timely fashion and shall provide a statement of the reasons."[14] There is no public indication of whether this provision has ever been invoked.

In addition to reporting findings, significant changes to or significant undertakings pursuant to a previously approved action must be reported "in the same manner as findings are reported." This language is implemented through presidential Memoranda of Notification (MONs), which supplement, amend, or clarify previously approved findings. It follows that MONs are reported to the Congress using one of the three mechanisms specified for reporting findings. The triggering threshold for significant undertakings or changes has been the subject of internal executive debate as well as debate in Congress. The legislative history gives two examples. First, "this would occur when the President authorizes a change in the scope of a previously approved finding to authorize additional activities to occur. The second type of change specified in this subsection pertains to significant undertakings pursuant to a previously approved finding. This would occur when the President authorizes a significant activity under a previously-approved finding without changing the scope of the finding concerned."[15] These same terms were addressed in National Security Decision Directive 286, signed by President Reagan in the wake of Iran-*contra*, stating: "In the event of any proposal to change substantially the means of implementation of, or the level of resources, assets, or activity under, a Finding; or in the event of any significant change in the operational condition, country or countries significantly engaged, or risks associated with a special activity, a written Memorandum of Notification (MON) shall be submitted to the President for his approval."[16]

Finally, the act requires the president to "ensure that the Intelligence Committees are kept fully and currently informed of the intelligence activities of the United States, including any significant anticipated intelligence activity as required by this Title."[17] Likewise, Section 503 of the title pertaining to covert action requires the Director of National Intelligence and the heads of any other government entities involved in covert action

> To the extent consistent with due regard for the protection from unauthorized disclosure of classified information relating to sensitive intelligence sources and methods or other exceptionally sensitive matters or other exceptionally sensitive matters . . . keep the intelligence committees fully and currently informed of all covert actions which are the responsibility of, are engaged in by, or are carried out for or on behalf of, any department, agency, or entity of the United States Government, including significant failures.[18]

These are important provisions. At the higher levels of the political branches, program initiation receives more attention and consideration than program

administration. Moreover, policy-level oversight tends to focus on moments of crisis or failure and less on ensuring that programs are on track and in fact accomplishing what they were intended to achieve and in the manner contemplated and represented to the president.

Executive Process and Review

In addition to determining whether presidential approval is required, as a parallel matter, the definition of covert action also triggers specific processes of executive review. These processes are classified. However, in the wake of the Iran-*contra* scandal, President Reagan issued and released NSD-286, Approval and Review of Special Activities, describing the process the president intended apply to the review and authorization of covert activities. The document describes a process by which covert actions reviewed at working group level and then by the Deputies Committee and Principals Committee before submission to the president.[19] The public record also reflects that in establishing his National Security Council (NSC) system, President Clinton directed that "the Attorney General shall be invited to attend meetings pertaining to his jurisdiction, including covert actions."[20] Where the president has directed that a particular process of review occur, then he must authorize deviation from that process or otherwise delegate the authority to do so. Law or not, certainly the president should be informed when expected or important views are omitted from NSC consideration.

The special relationship between the president and the intelligence instrument is also recognized in executive directives as it is in statute. Executive Order 12333, for example, states: "The NSC shall act as the highest Executive Branch entity that provides review of, guidance for and direction to the conduct of all national foreign intelligence, counterintelligence, and special activities, and attendant policies and programs."[21]

This observation should not be lost on intelligence officials who disagree with policy or commentators who disagree with the acts of commission or omission placed at the CIA's door, rather than in the NSC Situation Room or the Oval Office.

Legal Permits and Constraints

In addition to authorizing covert activities, the law imposes certain constraints on the conduct of those activities. Of course, much of the relevant law is found in classified presidential and executive directives (e.g., attorney general guidelines and intelligence directives). "A finding may not authorize any action that would violate the Constitution or any statute of the United States."[22] This means that an otherwise lawful intelligence activity must comply with applicable U.S. law unless the law exempts the government or intelligence actors from its reach. This would include international law to the extent such law is incorporated

into U.S. law. For example, the law of armed conflict is found in the U.S. criminal code at Title 18, section 2441. Thus, when the United States placed the threat posed by Al Qaeda into a law of armed conflict construct before the embassy attacks in August 1998, this section of law became applicable to the conduct of covert activities against Osama bin Laden. This is evident in the instructions conveyed to certain Afghan "tribals," as reported by the 9/11 Commission. The instructions reference some of the staples of the law of armed conflict that one might expect to find on a military rules of engagement card, involving the treatment of prisoners and discrimination in attack. "The United States preferred that Bin Laden and his lieutenants be captured, but if a successful capture operation was not feasible, the tribals were permitted to kill them. The instructions added that the tribals must avoid killing others unnecessarily and must not kill or abuse Bin Ladin or his lieutenant if they surrendered."[23]

A prohibition on assassination, originally promulgated by President Ford in 1976, is documented in Executive Order 12333: "2.11 Prohibition on Assassination. No person employed by or acting on behalf of the United States Government shall engage in, or conspire to engage in, assassination." This order continues in force, subject, like other executive orders, to classified presidential interpretation, amendment, or suspension. However, what is acknowledged publicly is that the targeting of legitimate military targets consistent with the law of armed conflict is not considered assassination under the executive order. As former National Security Advisor Samuel Berger testified before the 9/11 Commission with respect to the August 1998 (overt) missile strikes in Afghanistan: "We received rulings in the Department of Justice—[that the] executive order [did] not prohibit our ability—prohibit our effort to try to kill Bin Laden because it did not apply to situations in which you are acting in self-defense or you're acting against command and control targets against an enemy, which he certainly was."[24] As evidenced by parallel executive statements, similar conclusions were reached at the time of the 1986 U.S. air strikes on Tripoli, which included a tent used at times by Col. Muammar Qaddafi, and in April 2003 when the United States targeted buildings where Saddam Hussein was thought located.

In addition, "No covert action may be conducted which is intended to influence United States political processes, public opinion, policies, or media."[25] For example, in the vernacular of intelligence law, the prospect of U.S. covert propaganda influencing the American media and public is known as blowback, a real risk in a global world with around-the-clock news cycles. As criminal lawyers will recognize, the critical term in the prohibition is *intended*, defining the restriction as one of specific intent. Of course, lawyers might find that the United States should be deemed to have intended something that is a predictable and logical consequence of action.

Regardless of legal argument, as a matter of legal policy, decision makers must evaluate the consequences of U.S. covert activities blowing back into the United States even where such a result is not intended. To pick a safe example, the

covert recruitment and insertion of a rebel force may lead unwitting policy observers to make unfounded conclusions about the strength of the opposition to a regime. Likewise, were the United States to covertly place favorable news articles in the foreign press, a historical mechanism for disseminating propaganda during the Cold War, the potential for blowback might hinge on whether the material was disseminated in English and/or in a forum likely to be covered by the U.S. media.

LEGAL PRISM

For the handful of lawyers who practice in this area, each covert activity will present questions of domestic, international, and foreign law. For example, in the context of a hypothetical extraordinary rendition, say, the kidnapping in 1960 of Nazi war criminal Adolf Eichmann by Israeli agents in Argentina, a lawyer might first determine whether the operation constitutes covert action, and if so whether it was authorized by an existing authority or required subsequent presidential approval. Whether considered covert or not, the operation must be approved in a manner consistent with internal U.S. directives, unclassified in the case of *The U.S. Attorney's Manual*, but otherwise generally classified. Depending on the circumstances, congressional notification might also be warranted or required.

U.S. criminal law and procedure might also be implicated depending on context. For example, if the subject was intended for U.S. prosecution, then lawyers would need to consider whether and how Fourth and Fifth Amendment protections might apply. Lawyers would also need to ensure that the means of abduction and transfer did not otherwise violate U.S. law, including the *Ker-Frisbie-Toscanino* doctrine—the concept that U.S. courts will generally not look to the manner by which a defendant came before the court so long as it did not involve conduct that "shocks the conscience."[26]

U.S., international, and foreign law relating to the Torture Convention might also be implicated.[27] In the case of foreign assistance or transfers, assurances involving the treatment of the subject might be required or prudent depending in part on the degree of U.S. involvement and direction during and after the rendition. Assurances may take different forms, including oral assurances, diplomatic notes, and liaison channel agreements. The government of the United Kingdom and the government of Jordan, for example, have concluded a public Memorandum of Understanding on the subject of rendition.[28] Whether assurances are required as a matter of law and in what form and level of authority will depend on context,[29] including for example, the track records of the country or persons involved, with respect to both their treatment of prisoners and adherence to prior assurances. Of course, the more intrusive the U.S. requirements, the less likely a third country or U.S. agents will agree to assist with a rendition.

International law might also be implicated with such an Eichmann rendition. Under international law, abduction without the meaningful consent of the host government would violate the territorial integrity of the host state and in all likelihood violate local law as well. However, as a matter of international law, the

violation of sovereignty would implicate the rights of the host state and not the subject of rendition. Call this the Eichmann Rule. In the Eichmann hypothetical, we will stipulate that the United States is not acting in self-defense or collective self-defense, but rather to vindicate the Nuremberg principles and the victims of the Holocaust. Such a rendition might also implicate bilateral treaties between the countries affected.

Such a rendition could also implicate the local (foreign) law of the jurisdiction where the rendition takes place and along the route of egress. Thus, even when an operation is conducted in a manner consistent with U.S. law, it may yet subject U.S. actors and others to criminal exposure in foreign states for kidnapping or for violating local law implementing international treaties or prescribing domestic rights. Such risks would need to be balanced against the importance of the seizure in question, the risk to bilateral relations (including the prospects for future extradition cooperation), as well as to multilateral efforts to bring war criminals to justice. Recall as well that in *Ker*, the Court did not object to the manner in which the defendant was brought before the court, but the Court suggested that Peru was not without recourse, for the extradition treaty between the United States and Peru "provides for the extradition of persons charged with kidnapping, and, on demand . . . the party who is guilty of it, *could* be surrendered" (emphasis added).[30]

LEGAL POLICY ISSUES

There are sometimes tensions between the requirements for successful action and the evaluation of the risks associated with covert action. On the one hand, successful covert action requires secrecy. In context, this is self-evident: if the intended policy effect will be lost if the U.S. hand is apparent; if the cost will outweigh the gain if the United States is held to account; or if the opportunity will be lost if the target is alerted. Secrecy is also generally essential to protect those persons engaged in the action. In context, covert action also requires speed. A terrorist target of opportunity may come and go in the wink of a Predator drone's eye. Moreover, covert activities occur within a context where the president has already determined that the action(s) in question "is important to the national security of the United States." These interests all point in the direction of a rapid, secret, and truncated process of authorization.

On the other hand, covert activities have historically carried significant policy risks. As a result, presidents have subjected covert activities to specialized processes of interagency and intra-agency review within the executive branch, and Congress has enacted a specialized process of notification. The Intelligence Committees have also adopted specialized internal procedures for addressing covert action, including a staff-directed quarterly review in the Senate. These parallel and sometime competing considerations result in a number of legal policy tensions.

What Is the Scope of the President's Authority over Covert Action in Wartime? What Role Must and Should Congress Play?

Heretofore the National Security Act has successfully served as an agreed mechanism between branches for addressing covert action. The act incorporates the ultimate constitutional positions of both branches (prior reporting and no reporting), without either side having conceded ultimate authority. The act leaves the political branches to work through the constitutional principles and tensions in an informal and contextual manner. In this way, the statute plays an overlooked but important constitutional role by defining expectations and suggesting limits—that is, setting the constitutional rules of the road between the president and Congress on the meaning and reporting requirements for covert action.

Thus, where the president and Congress have disagreed on an important point of law, they have also agreed to disagree and worked out accommodations. For example, when President Bush signed the 1990 Intelligence Authorization Act into law, he stated his constitutional view that he was not required to report findings in advance or at all; but in a side letter to the chairmen of the Intelligence Committees, Bush undertook as a matter of practice not to withhold notification to the Congress beyond a few days after signing a finding, understood on the Hill as within forty-eight hours.[31]

The question presented is whether these same constitutional rules of the road still abide, or should abide during wartime, and in particular during a conflict of indefinite duration. The question is all the more apt in light of presidential assertions of inherent authority to engage in certain electronic surveillance in wartime. The president (by which I mean a president, not necessarily the incumbent president) may assert a coterminous authority during "wartime" to engage in covert action outside the framework of the National Security Act or entirely within that provision of the National Security Act contemplating post facto notification. In the covert action context, there are arguments supporting a broad reading of presidential authority. Moreover, such a claim of authority would be impenetrable, provided the action in question in fact remained covert. However, the question is not just whether such a reading is lawful, but also whether it is a good idea.

APPRAISAL

Both the 9/11 Commission and the WMD Commission included recommendations to reform the manner in which Congress conducts intelligence oversight.[32] In particular, the commissions were critical of the episodic and reactive nature of oversight, as well as the disparate sources of congressional input into the design and funding of intelligence. Congressional oversight is selective. Few members of Congress outside the committees possess the background to address intelligence issues. Moreover, by definition, the intelligence committees operate with the inherently inductive knowledge that comes from periodic briefings rather than daily contact with operators and policy makers. Members see only part of the

picture, and then only that part of the picture contained in executive talking points that have survived layers of editing and are designed to fend off policy or partisan attack. Moreover, where members do follow intelligence closely, the interest tends to flow toward the "sexy" areas and not to areas like computer interoperability and funding audits, where appraisal may be needed most. Recall that approximately 85 percent of intelligence funding is directed to the Department of Defense.[33]

Nonetheless, congressional appraisal of the covert action instrument remains an essential source of balance on executive action, in part because in this area it may be the only source of balance. This is not a matter of constitutional idealism, although it pertains to the rule of law, but a matter of national security efficacy. In a system of shared powers and separate branches, Congress can provide a source of legitimacy and constitutional safeguard to intelligence activities that are conducted outside the reach of public knowledge and review. At times, the committee members and staff may be the only persons outside the NSC process and relevant intelligence agencies aware of an activity, and certainly the only persons without a direct policy stake in the success or funding of the activity. Therefore, whether their views are desired or not, they may be the only source of outside perspective at the advent of activity.

Sustained conflict will involve difficult policy trade-offs that will require sustained public support—that means support from a majority of the population, not just the president's political base or party. Chances are if the executive cannot sell a policy to a few members of Congress, the executive will not be able to convince the American public or the international community that a program or activity was prudent and/or lawful if it is disclosed.

The president alone has the authority to wield the covert action tool and the bureaucratic wherewithal to do so effectively. However, that is not to say the president should not strive to maximize his authority through the involvement and validation of Congress. Whatever can be said of the president's independent authority to act, when he acts with the express or implied authorization of Congress he acts at the zenith of his authority.[34] Therefore, those who believe in the necessity of executive action to preempt and respond to security threats should favor legal arguments that maximize presidential authority.

The inclusion of an independent check on executive action also reduces the potential for mistake. That is because the executive takes particular care in what it tells the Congress. War Powers Reports may be bland, for example, but they do necessitate an internal process before they are submitted that causes senior officials to check their assumptions and their arguments one more time before they send the report to the president and then Congress. In similar fashion, in notifying Congress of covert action, executive branch actors may well determine whether they have, in fact, covered all the angles and addressed or mitigated divergent views.

Finally, risk taking in the field increases where the government exercises shared authority. Certainly, this statement is hard to empirically demonstrate; the

concept is nonetheless real. As reflected in statements made to the 9/11 Commission, there is a cultural perception in the intelligence community that there is danger in acting too aggressively when the authority to do so is unclear or subject to political change. Where authority is embedded in a written finding provided to Congress, intelligence actors are on surer footing. There can be no legitimate debate as to what was or was not authorized, unless the finding is itself ambiguous, and therefore no excuse for not leaning forward in execution.

Nor does the inclusion of the legislative branch *necessarily* undermine the requirements for speed and secrecy. Although it is hard to prove a negative or demonstrate a general truth from a single point, it is noteworthy that one of the most significant intelligence secrets briefed to the Gang of Eight in the terrorism context—the U.S. effort to capture or kill Osama bin Laden in the late 1990s did not leak.

Is the Definition of Covert Action Still Viable?

Concerns for security, speed, and flexibility may also drive activities that heretofore received internal and external appraisal as covert action into legal pockets or rubrics subject to less preview and review. The same result may occur as a product of the good faith application of law to fact. For example, activities historically considered covert actions may become common in the context of a global conflict with Islamic Jihadists and thus come to constitute "traditional military, law enforcement, and diplomatic activities." These same activities may also properly fall within the construct of "liaison."

COVERT ACTION AND LIAISON

Liaison involves the formal and informal ties between allied or like-minded intelligence services. As an intelligence function, it lies somewhere between collection and covert action. Liaison incorporates all that the United States brings to the collection table as well as all that foreign liaison services bring. This is particularly important in the area of human intelligence and counterterrorism where foreign services may have greater access based on ethnicity, nationality, proximity, or security focus. Moreover, a global collection effort is too broad for any one service, however competent, to successfully cover all the gaps.

However, liaison also entails action. Most liaison entails the routine passage of information that one might expect between allies. Closer to the edge of the liaison envelope there is a thin line between liaison and covert action. This line is in sight where, for example, U.S. information may not just inform a liaison ally but predictably result in the ally taking action on the basis of the intelligence provided. The provision of satellite photographs, for example, or information pinpointing the location of a weapons lab, might be used to inform defensive planning or as the missing link in a decision to take military action. In other circumstances, where the United States is itself engaging in action, say, an extraordinary rendition with the participation of the host nation, the activity may fall outside the

construct of covert action, because the U.S. role is indeed apparent (at least to the assisting government).

Liaison can carry all the policy implications, benefits, and risks of a covert activity. (Our liaison counterparts would not be any good at intelligence if they were not getting something in return for their assistance other than goodwill.) This is noteworthy because U.S. liaison relationships extend beyond a predictable ring of democracies. Moreover, there is additional policy risk with liaison, because generally liaison activities receive less formal executive review than covert action. Most intelligence liaison is considered internal intelligence agency activity.[35] Returning to the hypothetical extraordinary rendition of Eichmann, one might imagine that an intra-agency review of the operation might identify a different set of policy pros, cons, and risks than an interagency review might.

The legal question, in context, is how much involvement is too much, such that the activities should be considered U.S. covert action? The legal policy question is this: Are such activities subject to an adequate measure of preview and review to confirm that (1) we are accomplishing all that we can accomplish, but (2) that we do so cognizant of the policy and legal risks involved and where appropriate that we mitigate, curtail, or eliminate those risks?

MILITARY ACTIVITIES AND COVERT ACTION

As noted, the definition of *covert action* is action rather than actor based. However, uniformed military operations have historically not been considered or treated as covert activities. Thus, even if the definition is action-based, the exception for traditional military activities may effectively remove clandestine military operations from its reach. This legal paradigm is reinforced by the military's long-standing cultural aversion to covert action. This antipathy may reflect a desire to avoid the additional internal and external oversight that accrues to covert action, as well as a desire to avoid the occasional tarnish that emerges from the retrospective glitter of certain covert activities. It may also emulate the traditional differences in military outlook and focus between Special Forces and regular units.

The military–covert action bifurcation is significant in light of the importance of special operations in a worldwide conflict against Islamic Jihadists. As with liaison, the critical question is not whether an activity is covert action but whether those activities that raise the sorts of policy and legal risks that covert activities do are subject to a process of rigorous policy and legal preview before they are undertaken. This is important not just as a matter of law but as a matter of national security success.

The Nature and Scope of Review

With respect to activities that are encompassed within the definition of covert action, two legal policy questions linger: How much executive process is appropriate before a finding or MON is signed or authorization for a specific

operation given? How much detail should be specified in these documents beyond that necessary to satisfy the statutory requirements?

PROCESS AND APPRAISAL

There are good arguments for and against process. In the view of some, *process* itself is a euphemism for *bureaucracy*, pejorative meaning intended.[36] Bureaucracy can delay (if not lose) operational opportunity. Bureaucracy increases the prospect of security breach. And bureaucracy usually brings layers of lawyers with it.

At the same time, national security is not subject to the same processes of internal, external, or public evaluation that may occur in other public policy areas. Where appraisal is structural, as in the case of agency inspectors general, the focus of analysis is on the identification of retrospective fault, rather than the ingredients of prospective success. To start, national security programs, and certainly compartmented intelligence programs, are secret. Limits on external appraisal also derive from certain functional and structural aspects of national security decision making and the presidency, especially during war. First, where national security is concerned, the policy pressure to succeed is at its greatest. As James Madison observed, "Safety from external danger is [indeed] the most powerful director of national conduct."[37] For presidents, this responsibility is real, immediate, and sincere. As a result, as Justice Jackson observed of executive deliberation, "The tendency is strong to emphasize transient results upon policies . . . and lose sight of enduring consequences upon the balanced power structure of our Republic."[38] Furthermore, for a presidency conditioned to crisis and command, which is to say the modern presidency, appraisal is a difficult decisional function to implement. There is also less opportunity for appraisal because where national security activities are subject to external review, they are subject to doctrines of judicial and political deference.

Process can be good or bad. Good process should be viewed as a source of policy strength in an area of historical risk, rather than an impediment to operational success. Good process alerts decision makers to the pros and cons of contemplated action, including the benefits and risks of accomplishing the task covertly rather than overtly. Process also helps ensure that secret policies are consistent with overt policies, and where they are not, whether there is good reason for any divergence. In an area where U.S. actions are intended to be kept secret, policy makers and those actors who may become aware of the underlying acts (if not their impetus) must also know of their existence to avoid blowback or inadvertent disclosure.

Clearly, streamlined executive decision has advantages in speed and secrecy. Speed comes in part from the absence of objection or dissent. But there are also benefits in the foreknowledge of objection and the improvements in policy or execution that dissent might influence. Because the conflict against Islamic fundamentalism is a conflict fought over values with words and not just territory

with weapons, careful review also allows policy makers to balance the relative benefits and costs represented by both the means and ends of action. We may in fact do harm to our physical security by losing cooperation or moral leverage when we employ arguments and methods that address our safety but are perceived as contradicting the values we otherwise espouse and that will help to undermine the jihadist terrorist movement. This tension is surely found in the area of extraordinary rendition, where there are sometime difficult trade-offs between preventing attacks and intelligence gathering, on one hand, and public diplomacy and human rights, on the other hand. When these decisions are taken solely within security agencies, the trade-offs will invariably balance in favor of action, just as company grade infantry officers will generally lean toward force protection when faced with questions of proportional balance between physical security and securing local support. Generally, executive review tends to be more inclusive, and therefore more rigorous, when a decision is subject to interagency review and senior policy review than when it is subject to single agency review.

Additional checks do not necessarily eliminate mistakes; they diminish the potential for error. In the context of intelligence operations using military means, such as the use of a Predator drone to attack the enemy, covert or not, the value of rigorous process is obvious. The military, for example, uses multiple tiered computer modeling to assess the potential for collateral damage. Targets are validated through a tested and recognized staff process. In short, rigorous but timely processes can demonstrate confidence in policy choice, legal arguments, and a willingness to account for effect.

When process proves bureaucratic, the answer is not to remove internal mechanisms of appraisal but to streamline them. For example, a legal question can go straight to the attorney general sitting in the Oval Office. As noted earlier, in the case of immediate need, the act provides for oral authorization where "immediate action by the United States is required," in which case a contemporaneous notation of the president's decision shall be made and a written finding produced within forty-eight hours.[39]

SPECIFICITY

Policy makers and lawyers must also consider the measure of detail to include in a finding or MON. There exists a tension between the generic authorizing instrument that provides the greatest flexibility and the too-specific instrument, which may need amendment with every change in the field. From the standpoint of legal policy, such documents should be crafted with sufficient specificity so that it is clear to the president what he is approving and the policy implications and risks of doing so, including the risks of taking no action. When flexibility may be required—for example, where the geographic foci of activity may shift—there should also be sufficient authority to adjust in the field or a viable process to garner prompt policy consideration, such as approval by the Principals or Deputies Committees or an appropriate subset of them.

Operators will almost always push for more flexibility, as those familiar with headquarters-field relationships will appreciate. A worldwide threat from Jihadists requires worldwide authority to respond and do so on short or immediate time frames. However, presidents should be careful they do not go too far and surrender authority over the actual substance of decision. For one cannot have effective appraisal and accountability if there is no discernible standard against which to measure result. Moreover, presidential decision is an essential source of democratic legitimacy for actions taken in secret with limited or no external input or review. At the same time, field operatives should press for sufficient detail so that the policy intent is clear and operatives are protected from second-guessing in the event of failure, and therefore will take greater risks in accomplishing the intended objectives. Moreover, clear direction also helps mitigate against the conscious and subconscious bias toward risk taking or risk aversion that individual case officers may possess.

CONCLUSION

Faced with an intractable opponent intent on catastrophic attack, the United States should respond with all the lawful national security tools. This includes covert action, which is fast, flexible, and often daring. It is also suited to a conflict that is as dependent on public diplomacy as it is on military action.

The success or failure of its use will depend on the successful assessment and allocation of risks. First, intelligence decision makers will have to find the optimum balance between counterintelligence risk and operational need. Effective penetration of terrorist targets requires the employment or utilization of persons with necessary ethnic and cultural background. These persons may not be U.S. citizens, and if they are, the ordinary degree of background inquiry may not be available. If we assume too little risk of counterintelligence penetration, we may forgo important opportunities. If we assume too much risk, we may find our agents and officers dead, our avenues of intelligence attack compromised, and our moral leadership undermined.

Second, the mission requires modulation of the risk the United States is prepared to assume in introducing U.S. personnel into high-risk environments, with the encompassing danger that Americans will be captured or killed. Intelligence operations on this battlefield are exceptionally dangerous where the opponent does not play by the "rules of the road" that state intelligence services generally accepted during the Cold War.

Intelligence policy makers will also have to factor in the risk of moral or legal compromise. Although lawful, is an operation a good idea? Do the potential benefits outweigh the policy costs? Have decision makers identified and weighed the enduring consequences of their actions or just their immediate results? If one, for instance, works back from the threat of a WMD being used in a major U.S.

city or that of an ally, then one must hope that the government is continuously appraising and reappraising how we have balanced these risks.

Covert action law addresses these risks in two main ways. First, in statute and executive directive, the law imposes certain minimum requirements of process to address the policy and legal risks and trade-offs of action. Second, the law establishes clarity in accountability. In some cases this is done through imposition of substantive limits on conduct. But more directly, the law does so by making it clear that the president is responsible. Where covert action is concerned, the buck does indeed stop on the president's desk.

However, law does not dictate results; it provides opportunity for success. Changes in the legal landscape will occur because the definition of covert action is, by its own terms, evolving. Moreover, as the United States moves from Cold War understandings to Long War applications of the intelligence and military instruments, a broad range of activities important to national security will be conducted as liaison or clandestine military operations. As a result, the success or failure of covert operations will not only depend on how the executive uses the covert action instrument but on the measure of process applied to those activities that bear comparable benefits and risks.

NOTES

1. Covert action is one of the five intelligence functions along with collection, analysis and dissemination, liaison, and counterintelligence. R. Gates, "The CIA and Foreign Policy," *Foreign Affairs* 66, no. 2 (Winter 1987/88), p. 216.

2. For a historical overview see, G. Treverton, *Covert Action: The Limits of Intervention in the Postwar World* (New York: Basic Books, 1987); M. Reisman and J. Baker, *Regulating Covert Action* (New Haven, CT: Yale University Press, 1992).

8. 50 U.S.C. §§ 413b(e)(1), (2), (3), and (4) (2006).

9. Senate Report No. 102-85, "Legislative History, Intelligence Authorization Act of 1990," P.L. 102-88, p. 235.

10. For a discussion of the etymology of the phrase "national security" see M. Shulman, "The Progressive Era Origins of the National Security Act," *Dickinson. Law Review* 104 (Winter 2000), p. 289.

11. 50 U.S.C. § 413b(a) (2006).

12. 50 U.S.C. § 413b(c)(1) (2006).

13. 50 U.S.C. § 413b(c)(2) (2006).

14. 50 U.S.C. § 413b(c)(3) (2006).

15. Senate Report No. 102-85, p. 234.

16. Ronald Reagan, National Security Decision Directive 286, "Approval and Review of Special Activities," October 15, 1987.

17. 50 U.S.C. § 413(a)(1) (2006).

18. 50 U.S.C. § 413(a) (2006), as amended by the Intelligence Reform and Terrorism Prevention Act of 2004, P.L. 108-458 §1071(a)(Y).

19. The NSC is comprised of the president, vice president, secretary of State, and secretary of Defense. The director of National Intelligence and the chairman of the Joint Chiefs of Staff are statutory advisors to the NSC. The president designates members of the NSC Principals Committee and the NSC Deputies Committee. Membership may vary depending on the subject matter. In general, the Principals Committee is chaired by the assistant to the president for National Security Affairs and is comprised of the secretary of State, secretary of Defense, the DNI, the chairman of the Joint Chiefs, the national security advisor to the vice president, and, depending on the subject matter, the attorney general, and the secretary of the Treasury. Depending on the president, the chief of staff to the president, the secretary of the Treasury, the U.S. Ambassador to the United Nations, and others have been designated members of the Principals Committee. The Deputies Committee generally is chaired by the principal deputy assistant to the president for National Security Affairs and is comprised of the deputies or designated representatives of the Principals. Of course, other senior officials and staff may attend designated meetings of the committees.

29. In the context of detainees transferred from Guantánamo Bay to third countries, the assistant U.S. attorney representing the United States in litigation has stated in court: "We have obtained assurances before they are released that it is more likely than not that they will not be tortured in a country that they go to. In fact it has happened where we have not been satisfied with the assurances that a foreign government has given the United States, and we have not transferred those detainees." V. Blum, "Gaining a Foothold in Guantanamo: Defense Lawyers Want Access to Every Detainee—And Say in Prisoner Transfers," *Legal Times*, March 28, 2005.

30. *Ker*, 444.

31. Senate Report 102-85, p. 233, quoting the text of a letter sent to the chairmen of the Senate and House Intelligence Committees. "Dear Mr. Chairman: I am aware of your concerns regarding the provision of notice Congress of covert action. . . . I anticipate that in almost all instances, prior notice will be possible. In those rare instances where prior notice is not provided, I anticipate that notice will be provided within a few days. Any withholding beyond this period will be based upon my assertion of authorities granted to this office by the Constitution." For an example of an instance when a president might withhold notification occurring before these provisions were enacted see S. Turner, "Covert Common Sense: Don't Throw the CIA out with the Ayatollah," *Washington Post,* November 23, 1986.

32. See 9/11 Commission, *Final Report*, pp. 419–23; Commission on the Intelligence Capabilities of the United States Regarding Weapons of Mass Destruction, *Report to the President of the United States* (Washington: Government Printing Office, 2005), pp. 337–41.

33. Congressional Research Service, "Director of National Intelligence: Statutory Authorities," April 11, 2005, p. 2; Commission on the Roles and Capabilities of the Intelligence Community, p. 45, available at http://www.access.gpo.gov/intelligence/int/pdf/report.html (accessed March 14, 2006).

34. *Youngstown Sheet & Tube Co. v. Sawyer*, 343 U.S. 579, 635–36 (1952).

35. Like covert action, liaison authority is expressly authorized in statute and unclassified executive directive. Section 104(e), for example, of the National Security Act includes within the DNI's authorities "Coordination with Foreign Governments." Specifically, "under the direction of the National Security Council . . . the Director shall coordinate the relationships between elements of the intelligence community and the intelligence security services of foreign governments on all matters involving intelligence related to the national security or involving intelligence acquired through clandestine

means." Liaison might also be conducted solely pursuant to the president's constitutional authority as delegated by directive. Executive Order 12333 directs the (then) DCI to "Formulate policies concerning foreign intelligence and counterintelligence arrangements with foreign governments, coordinate foreign intelligence and counterintelligence relationships between agencies of the Intelligence community and the intelligence and or internal security services of foreign governments, and establish procedures governing the conduct of liaison by any department or agency with such services on narcotics matters."

APPENDIX A

EXCERPT FROM THE CHURCH COMMITTEE REPORT ON THE EVOLUTION OF CIA COVERT ACTION

CLANDESTINE ACTIVITIES

A. ORIGINS OF COVERT ACTION

The concept of a central intelligence agency developed out of a concern for the quality of intelligence analysis available to policymakers. The 1945 discussion which surrounded the creation of CIG focused on the problem of intelligence coordination. Two years later debates on the CIA in the Congress and the Executive assumed only the coordination role along with intelligence collection (both overt and clandestine) and analysis for the newly constituted Agency.

Yet, within one year of the passage of the National Security Act, the CIA was charged with the conduct of covert psychological, political, paramilitary, and economic activities.[21] The acquisition of this mission had a profound impact on the direction of the Agency and on its relative stature within the government.

The precedent for covert activities existed in OSS. The clandestine collection capability had been preserved through the Strategic Services Unit, whose responsibilities CIG absorbed in June 1946. The maintenance of that capability and its presence in CIA contributed to the Agency's ultimate assumption of a covert operational role.

Source: Select Committee to Study Governmental Operations with Respect to Intelligence Activities (the Church Committee), *Supplementary Detailed Staff Reports on Foreign And Military Intelligence, Final Report,* Book IV, 94th Cong., 2d Sess., Sen. Rept. No. 94–755 (April 23, 1976), pp. 25–41 (written by staff member Dr. Anne Karalekas). Footnotes reflect original numbering.

[21] Psychological operations were primarily media-related activities, including unattributed publications, forgeries, and subsidization of publications; political action involved exploitation of dispossessed persons and defectors, and support to political parties; paramilitary activities included support to guerrillas and sabotage; economic activities consisted of monetary operations.

The United States, initiation of covert operations is usually associated with the 1948 Western European elections. It is true that this was the first officially recorded evidence of U.S. covert political intervention abroad. However, American policymakers had formulated plans for covert action—at first covert psychological action—much earlier. Decisions regarding U.S. sponsorship of clandestine activities were gradual but consistent, spurred on by the growing concern over Soviet intentions.

By late 1946, cabinet officials were preoccupied with the Soviet threat, and over the next year their fears intensified. For U.S. policymakers, international events seemed to be a sequence of Soviet incursions. In March 1946, the Soviet Union refused to withdraw its troops from the Iranian province of Azerbaijan; two months later civil war involving Communist rebel forces erupted in Greece. By 1947, Communists had assumed power in Poland, Hungary, and Rumania; and in the Phillipines the government was under attack by the Hukbalahaps, a communist-led guerrilla group.

For U.S. officials, the perception of the Soviet Union as a global threat demanded new modes of conduct in foreign policy to supplement the traditional alternatives of diplomacy and war. Massive economic aid represented one new method of achieving U.S. foreign policy objectives. In 1947, the United States embarked on an unprecedented economic assistance program to Europe with the Truman Doctrine and the Marshall Plan. By insuring economic stability, U.S. officials hoped to limit Soviet encroachments. Covert operations represented another, more activist departure in the conduct of U.S. peacetime foreign policy. Covert action was an option that was something more than diplomacy but still short of war. As such, it held the promise of frustrating Soviet ambitions without provoking open conflict.

The suggestion for the initiation of covert operations did not originate in CIG. Sometime in late 1946, Secretary of War Robert Patterson suggested to Forrestal that military and civilian personnel study this form of war for future use. What prompted Patterson's suggestion is unclear. However, from Patterson's suggestion policymakers proceeded to consider the lines of authority for the conduct of psychological operations. Discussion took place in the State-War-Navy Coordinating Committee (SWNCC), whose members included the Secretaries of the three Departments, Byrnes, Patterson and Forrestal.[22] In December 1946, a SWNCC subcommittee formulated guidelines for the conduct of psychological warfare in peacetime and wartime.[23] The full SWNCC adopted the recommendation later that month.

Discussion continued within the Executive in the spring and summer of 1947. From all indications, only senior-level officials were involved, and the discussions were closely held. From establishing guidelines for the possibility of psychological warfare, policymakers proceeded to contingency planning. On April 30, 1947, a SWNCC subcommittee was organized to consider and actually plan for a U.S. psychological warfare effort. On June 5, 1947, the subcommittee was accorded a degree of permanency and renamed the

[22] SWNCC was established late in 1944 as an initial attempt at more centralized decisionmaking.

[23] In peacetime, psychological warfare would be directed by an interdepartmental subcommittee of SWNCC with the approval of the JCS and the National Intelligence Authority. During war, a Director of Psychological Warfare would assume primary responsibility under a central committee responsible to the President. The committee would consist of representatives from the SWNCC and from CIG.

Special Studies and Evaluations Subcommittee. By this time, the fact that the U.S. would engage in covert operations was a given; what remained were decisions about the organizational arrangements and actual implementation. Senior officials had moved from the point of conceptualization to determination of a specific need. Yet it is not clear whether or not they had in mind specific activities geared to specific countries or events.

In the fall of 1947 policymakers engaged in a series of discussions on the assignment of responsibility for the conduct of covert operations. There was no ready consensus and a variety of opinions emerged. DCI Hillenkoetter had his own views on the subject. Sometime in October 1947 he recommended "vitally needed psychological operations"—again in general terms without reference to specific countries or groups—but believed that such activities were military rather than intelligence functions and therefore belonged in an organization responsible to the JCS. Hillenkoetter also believed congressional authorization would be necessary both for the initiation of psychological warfare and for the expenditure of funds for that purpose. Whatever Hillenkoetter's views on the appropriate authorization for a psychological warfare function, his opinions were undoubtedly influenced by the difficulties he had experienced in dealing with the Departments. It is likely that he feared CIA's acquisition of an operational capability would precipitate similar problems of departmental claims on the Agency's operational functions. Hillenkoetter's stated preferences had no apparent impact on the outcome of the psychological warfare debate.

Within a few weeks of Hillenkoetter's statement, Forrestal, the Secretaries of the Army, Navy, and Air Force, along with the JCS, advanced their recommendations regarding the appropriate organization to conduct covert psychological warfare. In a proposal dated November 4, they held that propaganda of all kinds was a function of the State Department and that an Assistant Secretary of State in consultation with the DCI and a military representative should be responsible for the operations.

On November 24, President Truman approved the November 4 recommendation, assigning psychological warfare coordination to the Secretary of State. Within three weeks, the decision was reversed. Despite the weight of numbers favoring State Department control, the objections of Secretary of State George Marshall eliminated the option advanced by the other Secretaries. Marshall opposed State Department responsibility for covert action. He was vehement on the point and believed that such activities, if exposed as State Department actions, would embarrass the Department and discredit American foreign policy both short-term and long-term.

Apart from his position as Secretary of State, the impact of Marshall's argument derived from the more general influence he exerted at the time. Marshall had emerged from the war as one of America's "silent heroes." To the public, he was a quiet, taciturn, almost unimpressive figure, but as the Army Chief of Staff during the war, he had gained the universal respect of his civilian and military colleagues for his commitment, personal integrity, and ability.

In the transition from military officer to diplomat, he had developed a strong sense that the United States would have to adopt an activist role against the Soviet Union. Immediately after his appointment as Secretary in February 1947, he played a key role in the decision to aid Greece and Turkey and quickly after, in June 1947, announced the sweeping European economic recovery program which bore his name. It was out of concern for the success and credibility of the United States' recently articulated economic program that Marshall objected to State Department conduct of covert action. Marshall favored placing covert activities outside the Department, but still subject to guidance from the Secretary of State.

Marshall's objections prevailed, and on December 14 the National Security Council adopted NSC 4/A, a directive which gave the CIA responsibility for covert psychological operations. The DCI was charged with ensuring that psychological operations were consistent with U.S. foreign policy and overt foreign information activities. On December 22 the Special Procedures Group was established within the CIA's Office of Special Operations to carry out psychological operations.

Although Marshall's position prevented State from conducting psychological warfare, it does not explain why the CIA was charged with the responsibility. The debate which ensued in 1947 after the agreement on the need for psychological warfare had focused on control and responsibility. At issue were the questions of who would plan, direct, and oversee the actual operations.

State and the military wanted to maintain control over covert psychological operations, but they did not want to assume operational responsibility. The sensitive nature of the operations made the Departments fear exposure of their association with the activities. The CIA offered advantages as the organization to execute covert operations. Indeed, in 1947 one-third of the CIA's personnel had served with OSS. The presence of former OSS personnel, who had experience in wartime operations, provided the Agency with a group of individuals who could quickly develop and implement programs. This, coupled with its overseas logistical apparatus, gave the Agency a ready capability. In addition, the Agency also possessed a system of unvouchered funds for its clandestine collection mission, which meant that there was no need to approach Congress for separate appropriations. With the Departments unwilling to assume the risks involved in covert activities, the CIA provided a convenient mechanism.

During the next six months psychological operations were initiated in Central and Eastern Europe. The activities were both limited and amateur and consisted of unattributed publications, radio broadcasts, and blackmail. By 1948 the Special Procedures Group had acquired a radio transmitter for broadcasting behind the Iron Curtain, had established a secret propaganda printing plant in Germany, and had begun assembling a fleet of balloons to drop propaganda materials into Eastern European countries.

Both internally and externally the pressure continued for an expansion in the scope of U.S. covert activity. The initial definition of covert action had been limited to covert psychological warfare. In May 1948, George F. Kennan, Director of the State Department's Policy Planning Staff, advocated the development of a covert political action capability. The distinction at that time was an important and real one. Political action meant direct intervention in the electoral processes of foreign governments rather than attempts to influence public opinion through media activities.

International events gave force to Kennan's proposal. In February 1948, Communists staged a successful coup in Czechoslovakia. At the same time, France and Italy were beleaguered by a wave of Communist-inspired strikes. In March 1948, near hysteria gripped the U.S. Government with the so-called "war scare." The crisis was precipitated by a cable from General Lucius Clay, Commander in Chief, European Command, to Lt. General Stephen J. Chamberlin, Director of Intelligence, Army General Staff, in which Clay said, "I have felt a subtle change in Soviet attitude which I cannot define but which now gives me a feeling that it [war] may come with dramatic suddenness."

The war scare launched a series of interdepartmental intelligence estimates on the likelihood of a Soviet attack on Western Europe and the United States. Although the estimates concluded that there was no evidence that the U.S.S.R. would start a war, Clay's

cable had articulated the degree of suspicion and outright fear of the Soviet Union that was shared by policymakers at this time. Kennan proposed that State, specifically the Policy Planning Staff, have a "directorate" for overt and covert political warfare. The director of the Special Studies Group, as Kennan named it, would be under State Department control, but not formally associated with the Department. Instead, he would have concealed funds and personnel elsewhere, and his small staff of eight people would be comprised of representatives from State and Defense.

Kennan's concept and statement of function were endorsed by the NSC. In June 1948, one month after his proposal, the NSC adopted NSC 10/2, a directive authorizing a dramatic increase in the range of covert operations directed against the Soviet Union, including political warfare, economic warfare, and paramilitary activities.

While authorizing a sweeping expansion in covert activities, NSC 10/2 established the Office of Special Projects, soon renamed the Office of Policy Coordination (OPC), within the CIA to replace the Special Procedures Group. As a CIA component OPC was an anomaly. OPC's budget and personnel were appropriated within CIA allocations, but the DCI had little authority in determining OPC's activities. Responsibility for the direction of OPC rested with the Office's director, designated by the Secretary of State. Policy guidance—decisions on the need for specific activities—came to the OPC director from State and Defense, bypassing the DCI.

The organizational arrangements established in 1948 for the conduct of covert operations reflected both the concept of covert action as defined by U.S. officials and the perception of the CIA as an institution. Both the activities and the institution were regarded as extensions of State and the military services. The Departments (essentially the NSC) defined U.S. policy objectives; covert action represented one means of attaining those objectives; and the CIA executed the operations.

In a conversation on August 12, 1948, Hillenkoetter, Kennan, and Sidney Souers discussed the implementation of NSC 10/A. The summary of the conversation reveals policymakers firm expectation that covert political action would serve strictly as a support function for U.S. foreign and military policy and that State and the services would define the scope of covert activities in specific terms. The summaries of the participants' statements as cited in a CIA history bear quoting at length:

> Mr. Kennan made the point that as the State Department's designated representative he would want to have specific knowledge of the objectives of every operation and also of the procedures and methods employed in all cases where those procedures and methods involved political decisions.
>
> Mr. Souers indicated his agreement with Mr. Kennan's thesis and stated specifically that it has been the intention of the National Security Council in preparing the document that it should reflect the recognition of the principle that the Departments of State and the National Military Establishment are responsible for the conduct of the activities of the Office of Special Projects, with the Department of State taking preeminence in time of peace and the National Military Establishment succeeding the pre-eminent position in wartime.
>
> Admiral Hillenkoetter agreed with Mr. Kennan's statement that the political warfare activity should be conducted as an instrument of U.S. foreign policy and subject in peacetime to direct guidance by the State Department.
>
> Mr. Kennan agreed that it was necessary that the State Department assume responsibility for stating whether or not individual projects are politically desirable and stated that as the State Department's designated representative he would be accountable for providing such decisions.

Likewise, reflecting on his intentions and those of his colleagues in 1948, Kennan recently stated:

> . . . we were alarmed at the inroads of the Russian influence in Western Europe beyond the point where the Russian troops had reached. And we were alarmed particularly over the situation in France and Italy. We felt that the Communists were using the very extensive funds that they then had in hand to gain control of key elements of life in France and Italy, particularly the publishing companies, the press, the labor unions, student organizations, women's organizations, and all sort of organizations of that sort, to gain control of them and use them as front organizations. . . .
>
> That was just one example that I recall of why we thought that we ought to have some facility for covert operations. . . .
>
> . . . It ended up with the establishment within CIA of a branch, an office for activities of this nature, and one which employed a great many people. It did not work out at all the way I had conceived it or others of my associates in the Department of State. We had thought that this would be a facility which could be used when and if an occasion arose when it might be needed. There might be years when we wouldn't have to do anything like this. But if the occasion arose we wanted somebody in the Government who would have the funds, the experience, the expertise to do these things and to do them in a proper way.[24]

Clearly, in recommending the development of a covert action capability in 1948, policymakers intended to make available a small contingency force that could mount operations on a limited basis. Senior officials did not plan to develop large-scale continuing covert operations. Instead, they hoped to establish a small capability that could be activated at their discretion.

B. THE OFFICE OF POLICY COORDINATION, 1948–1952

OPC developed into a far different organization from that envisioned by Forrestal, Marshall, and Kennan in August 1948. By 1952, when it merged with the Agency's clandestine collection component, the Office of Special Operations, OPC had expanded its activities to include worldwide covert operations, and it had achieved an institutional independence that was unimaginable at the time of its inception.

The outbreak of the Korean War in the summer of 1950 had a significant effect on OPC. Following the North Korean invasion of South Korea, the State Department as well as the Joint Chiefs of Staff recommended the initiation of paramilitary activities in Korea and China. OPC's participation in the war effort contributed to its transformation from an organization that was to provide the capability for a limited number of *ad hoc* operations to an organization that conducted continuing, ongoing activities on a massive scale. In concept, manpower, budget, and scope of activities, OPC simply skyrocketed. The comparative figures for 1949 and 1952 are staggering. In 1949 OPC's total personnel strength was 302; in 1952 it was 2,812 plus 3,142 overseas contract personnel. In 1949 OPC's budget figure was $4,700,000; in 1952 it was $82,000,000. In 1949, OPC had personnel assigned to seven overseas stations; in 1952 OPC had personnel at forty-seven stations.

Apart from the impetus provided by the Korean War several other factors converged to alter the nature and scale of OPC's activities. First, policy direction took the form of condoning and fostering activity without providing scrutiny and control. Officials

[24] George F. Kennan testimony, October 28 1975, pp. 8–10.

throughout the government regarded the Soviet Union as an aggressive force, and OPC's activities were initiated and justified on the basis of this shared perception. The series of NSC directives which authorized covert operations laid out broad objectives and stated in bold terms the necessity for meeting the Soviet challenge head on. After the first 1948 directive authorizing covert action, subsequent directives in 1950 and 1951 called for an intensification of these activities without establishing firm guidelines for approval.

On April 14, 1950, the National Security Council issued NSC 68, which called for a non-military counter-offensive against the U.S.S.R., including covert economic, political, and psychological warfare to stir up unrest and revolt in the satellite countries. A memo written in November 1951 commented on the fact that such broad and comprehensive undertakings as delineated by the NSC could only be accomplished by the establishment of a worldwide structure for covert operations on a much grander scale than OPC had previously contemplated. The memo stated:

> It would be a task similar in concept, magnitude and complexity to the creation of widely deployed military forces together with the logistical support required to conduct manifold, complex and delicate operations in a wide variety of overseas locations.

On October 21, 1951 NSC 10/5 replaced NSC 10/2 as the governing directive for covert action. It once again called for an intensification of covert action and reaffirmed the responsibility of the DCI in the conduct of covert operations. Each of these policy directives provided the broadest justification for large-scale covert activity.

Second, OPC operations had to meet the very different policy needs of the State and Defense Departments. The State Department encouraged political action and propaganda activities to support its diplomatic objectives, while the Defense Department requested paramilitary activities to support the Korean War effort and to counter communist-associated guerrillas. These distinct missions required OPC to develop and maintain different capabilities, including manpower and support material.

The third factor contributing to OPC's expansion was the organizational arrangements that created an internal demand for projects. The decision to undertake covert political action and to lodge that responsibility in a group distinct from the Departments required the creation of a permanent structure. OPC required regular funding to train and pay personnel, to maintain overseas stations (and provide for the supporting apparatus), and to carry out specific projects. That funding could not be provided on an *ad hoc* basis. It had to be budgeted for in advance. With budgeting came the need for ongoing activities to justify future allocations—rather than leaving the flexibility of responding to specific requirements.

To fulfill the different State and Defense requirements OPC adopted a "project" system rather than a programmed financial system. This meant that operations were organized around projects—individual activities, e.g. funding to a political candidate—rather than general programs or policy objectives, and that OPC budgeted in terms of anticipated numbers of projects. The project system had important internal effects. An individual within OPC judged his own performance, and was judged by others, on the importance and number of projects he initiated and managed. The result was competition among individuals and among the OPC divisions to generate the maximum number of projects. Projects remained the fundamental units around which clandestine activities were organized, and two generations of Agency personnel have been conditioned by this system.

The interaction among the OPC components reflected the internal competition that the project system generated. OPC was divided between field personnel stationed overseas and Headquarters personnel stationed in Washington. Split into four functional staffs (dealing with political warfare, psychological warfare, paramilitary operations and economic warfare) and six geographical divisions, Headquarters was to retain close control over the initiation and implementation of projects to insure close policy coordination with State and Defense. Field stations were to serve only as standing mechanisms for the performance of tasks assigned from Washington.

The specific relationship between the functional staffs, the geographical divisions and the overseas stations was intended to be as follows: With guidance from the NSC, the staffs would generate project outlines for the divisions. In turn, the divisions would provide their respective overseas stations with detailed instructions on project action. Very soon, however, each of the three components was attempting to control project activities. Within the functional staffs proprietary attitudes developed toward particular projects at the point when the regional divisions were to take them over. The staffs were reluctant to adopt an administrative support role with respect to the divisions in the way that was intended. Thus, the staffs and the divisions began to look upon each other as competitors rather than joint participants. In November 1949 an internal study of OPC concluded that:

> . . . the present organization makes for duplication of effort and an extensive amount of unnecessary coordination and competition rather than cooperation and teamwork. . . .

A reorganization in 1950 attempted to rectify the problem by assigning responsibility for planning single-country operations to the appropriate geographical division. This meant that the divisions assumed real operational control. The staffs were responsible for coordinating multiple country operations as well as providing the guidance function. In principle the staffs were to be relegated to the support role they were intended to serve. However, the break was never complete. The distinctions themselves were artificial, and staffs seized on their authority over multiple country activities to maintain an operational role in such areas as labor operations. This tension between the staffs and the divisions continued through the late 1960's as some staffs achieved maximum operational independence. The situation is a commentary on the project orientation which originated with OPC and the recognition that promotion and rewards were derived from project management—not from disembodied guidance activities.

The relationship between Washington and the field was subject to pressures similar to those that influenced the interaction between the divisions and the staffs. Predictably, field personnel began to develop their own perspective on suitable operations and their mode of conduct. Being "there," field personnel could and did argue that theirs was the most realistic and accurate view. Gradually, as the number of overseas personnel grew and as the number of stations increased, the stations assumed the initiative in project development.

The regional divisions at Headquarters tended to assume an administrative support role but still retained approval authority for projects of particular sensitivity and cost. The shift in initiative first from the staffs to the divisions, then to the stations, affected the relative desirability of assignments. Since fulfillment of the OPC mission was measured in terms of project development and management, the sought-after places were those where the projects originated. Individuals who were assigned those places rose quickly within the Directorate.

C. POLICY GUIDANCE

Responsibility for coordination with the State and Defense Departments rested with Frank G. Wisner, appointed Assistant Director for Policy Coordination (ADPC) on September 1, 1948. Described almost unanimously by those who worked with him as "brilliant," Wisner possessed the operational instincts, the activist temperament, and the sheer physical energy required to develop and establish OPC as an organization. Wisner also had the advantages of independent wealth and professional and social contacts which he employed skillfully in advancing OPC's position within the Washington bureaucracy.

Wisner was born into a prominent Southern family and distinguished himself as an undergraduate and a law student at the University of Virginia. Following law school, Wisner joined a New York law firm where he stayed for seven years. After a brief stint in the Navy, Wisner was assigned to OSS and spent part of his time serving under Allen Dulles in Wiesbaden, Germany. At the end of the war he returned to law practice, but left again in 1947 to accept the post of Deputy to the Assistant Secretary of State for Occupied Areas. It was from this position that Wisner was tapped to be ADPC.

Although the stipulation of NSC 10/2 that the Secretary of State designate the ADPC was intended to insure the ADPC's primary identification with State, that did not occur. Wisner quickly developed an institutional loyalty to OPC and its mission and drew on the web of New York law firm connections that existed in postwar Washington as well as on his State Department ties to gain support for OPC's activities.

The guidance that State and Defense provided OPC became very general and allowed the maximum opportunity for project development. Approximately once a week Wisner met with the designated representatives of State and Defense. Given that Kennan had been a prime mover in the establishment of OPC, it was unlikely that as the State Department's designated representative from 1948 to 1950 he would discourage the overall direction of the organization he had helped create. From 1948 to 1949 Defense was represented by General Joseph T. McNarney, the former Commander of U.S. Forces in Europe. Having stood "eyeball to eyeball" with the Russians in Germany, McNarney was highly sympathetic to the OPC mission.

With the broad objectives laid out in NSC 10/2, the means of implementation were left to OPC. The representatives were not an approval body, and there was no formal mechanism whereby individual projects had to be brought before them for discussion. Because it was assumed that covert action would be exceptional, strict provisions for specific project authorization were not considered necessary. With minimal supervision from State and Defense and with a shared agreement on the nature of the OPC mission, individuals in OPC could take the initiative in conceiving and implementing projects. In this context, operational tasks, personnel, money and material tended to grow in relation to one another with little outside oversight.

In 1951, DCI Walter Bedell Smith took the initiative in requesting more specific high-level policy direction. In May of that year, after a review of NSC 68, Smith sought a clarification of the OPC mission from the NSC.[26] In a paper dated May 8, 1951, entitled the "Scope and Pace of Covert Operations" Smith called for NSC restatement or

[26] Soon after his appointment as DCI in October 1950, Smith succeeded in having OPC placed directly under the jurisdiction of the DCI, making Wisner responsible to him rather than to the Department of State and Defense. See pp. 37–38.

redetermination of the several responsibilities and authorities involved in U.S. covert operations. More importantly, Smith proposed that the newly created Psychological Strategy Board provide CIA guidance on the conduct of covert operations.[27]

The NSC adopted Smith's proposal making the Psychological Strategy Board the approval body for covert action. The body that had been responsible for exercising guidance over the CIA had received it from the DCI. Whatever the dimensions of the growth in OPC operations, the NSC had not attempted to limit the expansion.

D. OPC ACTIVITIES

At the outset OPC activities were directed toward four principal operational areas: refugee programs, labor activities, media development, and political action. Geographically, the area of concentration was Western Europe. There were two reasons for this. First, Western Europe was the area deemed most vulnerable to Communist encroachment; and second, until 1950 both CIA (OSO) and OPC were excluded from the Far East by General Douglas MacArthur, who refused to concede any jurisdiction to the civilian intelligence agency in the Pacific theater—just as he had done with OSS during the war.

OPC inherited programs from both the Special Procedures Group (SPG) and the Economic Cooperation Administration (ECA). After the issuance of NSC 10/2 SPG turned over to OPC all of its resources, including an unexpended budget of over $2 million, a small staff, and its communications equipment. In addition to SPG's propaganda activities OPC acquired the ECA's fledgling labor projects as well as the accompanying funds. Foreign labor operations continued and became a major focus of CIA activity on a worldwide basis throughout the 1950's and into the mid-1960's.

The national elections in Europe in 1948 had been a primary motivation in the establishment of OPC. By channeling funds to center parties and developing media assets, OPC attempted to influence election results—with considerable success. These activities formed the basis for covert political action for the next twenty years. By 1952 approximately forty different covert action projects were underway in one central European country alone. Other projects were targeted against what was then referred to as the "Soviet bloc."

During his term in the State Department Wisner had spent much of his time on problems involving refugees in Germany, Austriaa and Trieste. In addition, his service with OSS had been oriented toward Central Europe. The combination of State's continuing interest and Wisner's personal experience led to OPC's immediate emphasis on Central European refugee operations. OPC representatives made contact with thousands of Soviet refugees and emigrés for the purpose of influencing their political leadership. The National Committee for Free Europe, a group of prominent American businessmen, lawyers, and philanthropists, and Radio Free Europe were products of the OPC program.

Until 1950 OPC's paramilitary activities (also referred to as preventive direct action) were limited to plans and preparations for stay-behind nets in the event of future war. Requested by the Joint Chiefs of Staff, these projected OPC operations focused, once again, on Western Europe and were designed to support NATO forces against Soviet attack.

---

[27] The Psychological Strategy Board (PSB) was an NSC subcommittee established on April 4, 1951 to exercise direction over psychological warfare programs. Its membership included departmental representatives and PSB staff members.

The outbreak of the Korean War significantly altered the nature of OPC's paramilitary activities as well as the organization's overall size and capability. Between fiscal year 1950 and fiscal year 1951, OPC's personnel strength jumped from 584 to 1531. Most of that growth took place in paramilitary activities in the Far East. In the summer of 1950, following the North Korean invasion of South Korea, the State Department requested the initiation of paramilitary and psychological operations on the Chinese mainland. Whatever MacArthur's preferences, the JCS were also eager for support activities in the Far East. This marked the beginning of OPC's active paramilitary engagement. The Korean War established OPC's and CIA's jurisdiction in the Far East and created the basic paramilitary capability that the Agency employed for twenty years. By 1953, the elements of that capability were "in place"—aircraft, amphibious craft, and an experienced group of personnel. For the next quarter century paramilitary activities remained the major CIA covert activity in the Far East.

E. OPC INTEGRATION AND THE OPC-OSO MERGER

The creation of OPC and its ambiguous relationship to the Agency precipitated two major administrative problems, the D'CI's relationship to OPC and antagonism between OPC and the Agency's clandestine collection component, the Office of Special Operations. DCI Walter Bedell Smith acted to rectify both problems.

As OPC continued to grow, Smith's predecessor, Admiral Hillenkoetter, resented the fact that he had no management authority over OPC, although its budget and personnel were being allocated through the CIA. Hillenkoetter's clashes with the State and Defense Departments as well as with Wisner, the Director of OPC, were frequent. Less than a week after taking office Smith announced that as DCI he would assume administrative control of OPC and that State and Defense would channel their policy guidance through him rather than through Wisner. On October 12, 1950, the representatives of State, Defense and the Joint Chiefs of Staff formally accepted the change. The ease with which the shift occurred was primarily a result of Smith's own position of influence with the Departments.

OPC's anomalous position in the Agency revealed the difficulty of maintaining two separate organizations for the execution of varying but overlapping clandestine activities. The close "tradecraft" relationship between clandestine collection and covert action, and the frequent necessity for one to support the other was totally distorted with the separation of functions in OSO and OPC. Organizational rivalry rather than interchange dominated the relationship between the two components.

On the operating level the conflicts were intense. Each component had representatives conducting separate operations at each station. Given the related missions of the two, OPC and OSO personnel were often competing for the same agents and, not infrequently, attempting to wrest agents from each other. In 1952 the outright hostility between the two organizations in Bangkok required the direct intervention of the Assistant Director for Special Operations, Lyman Kirkpatrick. There an important official was closely tied to OPC, and OSO was trying to lure him into its employ.

The OPC-OSO conflict was only partially the result of overseas competition for assets. Salary differentials and the differences in mission were other sources of antagonism. At the time of its creation in 1948 OPC was granted liberal funding to attract personnel quickly in order to get its operation underway. In addition, the burgeoning activities enabled people, once hired, to rise rapidly. The result was that OPC personnel held higher-ranking, better-paid positions, than their OSO counterparts.

Many OSO personnel had served with OSS, and their resentment of OPC was intensified by the fact that they regarded themselves as the intelligence "purists," the professionals who engaged in collection rather than action and whose prewar experience made them more knowledgeable and expert than the OPC recruits. In particular, OSO personnel regarded OPC's high-risk operations as a threat to the maintenance of OSO security and cover. OPC's favored position with State and Defense, its generous budget, and its visible accomplishments all contrasted sharply with OSO's silent, long-term objectives in espionage and counterespionage. By June 1952 OPC had overtaken OSO in personnel and budget allocation. Soon after his appointment as DCI, Smith addressed the problem of the OPC-OSO conflict. Lawrence Houston, the CIA's General Counsel, had raised the issue with him and recommended a merger of the two organizations.[28] Sentiment in OSO and OPC favored the principle of a merger. Lyman Kirkpatrick, the Executive Assistant to the DCI, Major General W. G. Wyman, Assistant Director for Special Operations, Wisner, and William Jackson all appeared to have favored a merger—although there was disagreement on the form it should take.

Between 1951 and 1952 Smith made several cosmetic changes to foster better coordination between OPC and OSO. Among them was the appointment of Allen W. Dulles as Deputy Director for Plans in January 1951.[29] Dulles was responsible for supervising both OPC and OSO, although the two components were independently administered by their own Directors. During this period of "benign coordination" Smith consulted extensively with senior officials in OPC and OSO. OPC's rapid growth and its institutional dynamism colored the attitude of OSO toward a potential merger. In the discussions which Bedell Smith held, senior OSO personnel, specifically Lyman Kirkpatrick and Richard Helms, argued for an integration of OPC functions under OSO control rather than an integrated chain of command down to station level. Fundamentally, the OSO leadership feared being engulfed by OPC in both operations and in personnel. However, by this time Bedell Smith was committed to the idea of an integrated structure.

Although some effort was made to combine the OSO and OPC Western Hemisphere Divisions in June 1951, real integration at the operations level did not occur until August 1952, when OSO and OPC became the Directorate of Plans (DDP). Under this arrangement, Wisner was named Deputy Director for Plans and assumed the command functions of the ADSO and ADPC. Wisner's second in command, Chief of Operations, was Richard Helms, drawn from the OSO side to strike a balance at the senior level. At this time Dulles replaced Jackson as DDCI.

The merger resulted in the maximum development of covert action over clandestine collection. There were several reasons for this. First was the orientation of Wisner himself. Wisner's OSS background and his OPC experience had established his interests in the operational side of clandestine activities. Second, for people in the field, rewards came more quickly through visible operational accomplishments than through the silent, long-term development of agents required for clandestine collection. In the words of one former high-ranking DDP official, "Collection is the hardest thing of all; it's much easier to plant an article in a local newspaper."

---

[28] The Dulles-Jackson-Correa survey had also advised a merger of OPC, OSO and the Office of Operations, the Agency's overt collection component.

[29] Dulles had been serving as an advisor to successive DCIs since 1947. Smith and Jackson prevailed upon him to join the Agency on a full-time basis.

F. CONGRESSIONAL REVIEW

The CIA was conceived and organized as an agent of the Executive branch. Traditionally, Congress' only formal relationship to the Agency was through the appropriations process. The concept of Congressional oversight in the sense of scrutinizing and being fully informed of Agency activities did not exist. The international atmosphere, Congress relationship to the Executive branch and the Congressional committee structure determined the pattern of interaction between the Agency and members of the legislature. Acceptance of the need for clandestine activities and of the need for secrecy to protect those activities contributed to Congress' relatively unquestioning and uncritical attitude regarding the CIA, as did the Executive branch's ascendancy in foreign policy for nearly two decades following World War II. The strong committee system which accorded enormous power to committee chairmen and limited the participation of less senior members in committee business resulted in informal arrangements whereby selected members were kept informed of Agency activities primarily through one-to-one exchanges with the DCI.

In 1946, following a Joint Committee review Congress enacted the Legislative Reorganization Act which reduced the number of committees and realigned their jurisdictions.[30] The prospect of a unified military establishment figured into the 1946 debates and decisions on Congressional reorganization. However, Congress did not anticipate having to deal with the CIA. This meant that after the passage of the National Security Act in 1947 CIA affairs had to be handled within a committee structure which had not accommodated itself to the existence of a central intelligence agency.

In the House and Senate the Armed Services and Appropriations Committees were granted jurisdiction over the Agency. No formal CIA subcommittees were organized until 1956. Until then small *ad hoc* groups composed of a few senior committee members reviewed the budget, appropriated funds, and received annual briefings on CIA activities. The DCIs kept senior committee members informed of large-scale covert action projects at the approximate time of implementation. There was no formal review or approval process involved; it was simply a matter of courtesy to the senior members. The initiative in gaining information on specific activities rested with the members.

For nearly twenty years a small group of ranking members dominated these relationships with the Agency. As Chairman of the House Armed Services Committee, Representative Carl Vinson, a Democrat from Georgia, presided over CIA matters from 1949 to 1953 and from 1955 to 1965. Clarence Cannon served as chairman of the House Appropriations Committee from 1949 to 1953 and from 1955 to 1964 and chaired the Defense Subcommittee which had supervising authority over CIA appropriations. Cannon organized a special group of five members to meet informally on CIA appropriations. In the Senate between 1947 and 1954 chairmanship of the Armed Services Committee was held by Chan Gurney, Millard Tydings, Richard Russell and Leverett Saltonstall. In 1955 Russell assumed the chairmanship and held the position until 1968.

Because the committee chairmen maintained their positions for extended periods of time, they established continuing relationships with DCIs and preserved an exclusivity in their knowledge of Agency activities. They were also able to develop relationships of

[30] The Act limited members' committee assignments, provided for professional staffing, tried to regularize meetings, and made some changes in the appropriations process as well as legislating other administrative modifications.

mutual trust and understanding with the DCIs which allowed informal exchanges to prevail over formal votes and close supervision.

Within the Congress procedures governing the Agency's budget assured maximum secrecy. The DCI presented his estimate of the budget for the coming fiscal year broken down into general functional categories. Certification by the subcommittee chairmen constituted approval. Exempt from floor debate and from public disclosure, CIA appropriations were and are concealed in the Department of Defense budget. In accordance with the 1949 Act the DCI has only to certify that the money as appropriated has been spent. He does not have to account publicly for specific expenditures, which would force him to reveal specific activities.

To allow greater flexibility for operational expenditures the Contingency Reserve Fund was created in 1952. The Fund provided a sum independent of the regular budget to be used for unanticipated large projects. For example, the initial funding for the development of the U-2 reconnaissance aircraft was drawn from the Contingency Reserve Fund. The most common use of the Fund was for covert operations.

Budgetary matters rather than the specific nature of CIA activities were the concern of Congressional members, and given the perception of the need for action against the Soviet Union, approval was routine. A former CIA Legislative Counsel characterized Congressional attitudes in the early 1950s in this way:

> In the view of the general public, and of the Congress which in the main reflected the public attitude, a national intelligence service in those days was more or less a part and parcel of our overall defense establishment. Therefore, as our defense budget went sailing through Congress under the impact of the Soviet extension of power into Eastern Europe, Soviet probes into Iran and Greece, the Berlin blockade, and eventually the Korean War, the relatively modest CIA budget in effect got a free ride, buried as it was in the Defense and other budgets. When Directors appeared before Congress, which they did only rarely, the main concern of the members was often to make sure that we [the CIA] had what we needed to do our job.

Limited information-sharing rather than rigorous oversight characterized Congress relationship to the Agency. Acceptance of the need for secrecy and Congressional procedures would perpetuate what amounted to mutual accommodation.

By 1953 the Agency had achieved the basic structure and scale it retained for the next twenty years.[30a] The Korean War, United States foreign policy objectives, and the Agency's internal organizational arrangements had combined to produce an enormous impetus for growth. The CIA was six times the size it had been in 1947.

Three Directorates had been established. In addition to the DDP and the DDI, Smith created the Deputy Directorate for Administration (DDA). Its purpose was to consolidate the management functions required for the burgeoning organization. The Directorate was responsible for budget, personnel, security, and medical services Agency-wide. However, one quarter of DDA's total personnel strength was assigned to logistical support for overseas operations. The DDP commanded the major share of the Agency's budget, personnel, and resources; in 1952 clandestine collection and covert action accounted for 74 percent of

[30a] For chart showing CIA organization as of 1953, see p. 98.

the Agency's total budget;[31] its personnel constituted 60 percent of the CIA's personnel strength. While production rather than coordination dominated the DDI, operational activities rather than collection dominated the DDP. The DDI and the DDP emerged at different times out of disparate policy needs. There were, in effect, separate organizations. These fundamental distinctions and emphases were reinforced in the next decade.

[31] This did not include DDA budgetary allocations in support of DDP operations.

APPENDIX B

THE HUGHES-RYAN ACT, 1974

Editor's note: The Hughes-Ryan Act, the first statutory tightening of controls over the CIA since the National Security Act of 1947, aimed at improving accountability for covert action through two steps: first, requiring that the president approve all important covert actions with a "finding" ("the president finds that each such operation is important") and, second, requiring that each finding be reported to lawmakers on the congressional Intelligence Committees. The law was passed on the last day of 1974, in the throes of the Watergate scandal and allegations that the CIA was involved in domestic spying and inappropriate covert actions against the democratically elected regime of President Salvador Allende of Chile.

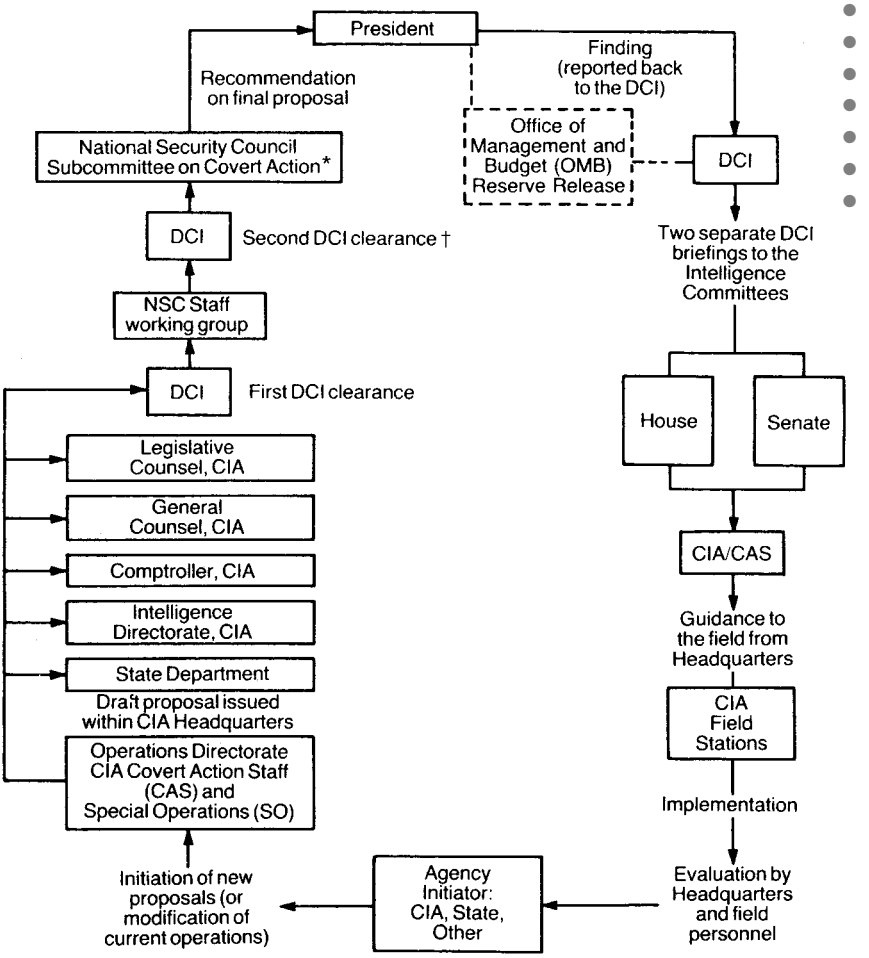
THE 1974 HUGHES-RYAN ACT

Also known as Section 662 (a) of the Foreign Assistance Act of 1974, the amendment states:

> No funds appropriated under the authority of this or any other Act may be expended by or on behalf of the Central Intelligence Agency for operations in foreign countries other than activities intended solely for obtaining necessary intelligence unless and until the President finds that each such operation is important to the national security of the United States and reports, in a timely fashion, a description and scope of each operation to the appropriate committees of Congress.

APPENDIX C

COVERT ACTION DECISION AND REPORTING PATHWAY



*Known as the Special Coordination Committee (SCC) during the Carter administration and the National Security Planning Group (NSPG) during the Reagan administration.

†Since 2005, the Director of National Intelligence (DNI) reveiws covert action proposals at this stage.

Editor's note: Since passage of the Hughes-Ryan Act in 1974, the pathway that a decision in favor of a covert action must follow is much more complicated than used to be the case. Before Hughes-Ryan, the Director of Central Intelligence (DCI) and the national security adviser would sometimes decide on covert actions without the involvement of anyone else, other than the intelligence officers and foreign assets engaged in the planning and implementation of the operation: no congressional involvement and often no presidential involvement. Now, as the diagram illustrates, covert actions must run a gauntlet of critics—valuable from the point of view of accountability, but, arguably, reducing efficiency and timeliness. Yet, as a staff intelligence overseer in the House of Representatives, the editor has seen this process take less than an hour in times of emergency, as a result of rapid and secure telephone conversations among the key participants in the review. The diagram presented here is from 1989 but remains valid today, except for the addition of another layer: the new Director of National Intelligence (replacing the DCI in 2005), placed between the NSC Staff working group and the NSC Subcommittee on Covert Action. One other related change: the Director of the Central Intelligence Agency (D/CIA) now provides the CIA's clearance before the proposal travels to the NSC Staff working group. The entry of the Department of Defense into the covert action domain is worrisome to many observers, who fear that the Hughes-Ryan checks on the wisdom of any particular covert action may be bypassed by the Pentagon, on grounds that the law applies to the CIA and not to the military—a dubious argument.

APPENDIX D

EXAMPLES OF PRESIDENTIAL FINDINGS FOR COVERT ACTION

Editor's note: The findings presented below were approved by President Ronald Reagan, the first regarding Central America on March 9, 1981, which received written approval; and the second regarding Iran on January 17, 1986, which received only an oral approval. Both were originally top secret, then declassified in the context of the congressional inquiry into the Iran-*contra* affair in 1987. Notice how in each instance, the "purpose" or "description" is succinct, leaving considerable leeway for the CIA to fill in the details during implementation of the covert action.

Example No. 1: Central America

> Finding Pursuant to Section 662 of the Foreign Assistance Act of 1961, As Amended, Concerning Operations Undertaken by the Central Intelligence Agency in Foreign Countries, Other Than Those Intended Solely for the Purpose of Intelligence Collection

I hereby find that the following operations in foreign countries (including all support necessary to such operations) are important to the national security of the United States, and direct the Director of Central Intelligence, or his designee, to report this Finding to the

---

Sources: *Public Papers of the President: Ronald Reagan* (Washington, DC: U.S. Government Printing Office, 1986); Presidential Finding on Central America, N16574; Iran Finding, 1/17/86, Hearings, Ex. JMP-29-D, *Report of the Congressional Committees Investigating the Iran-Contra Affair,* S. Rept. No. 100–216 and H. Rept. No. 100–433, 100th Cong., 1st Sess, U.S. Senate Select Committee on Secret Military Assistance to Iran and the Nicaraguan Opposition and U.S. House of Representatives Select Committee to Investigate Covert Arms Transactions with Iran (the Inouye-Hamilton Committee), November 1987.

concerned committees of the Congress pursuant to law, and to provide such briefings as necessary.

SCOPE	*PURPOSE*
Central America	Provide all forms of training, equipment and related assistance to cooperating governments throughout Central America in order to counter foreign-sponsored subversion and terrorism. [still-classified section missing here] Encourage and influence foreign governments around the world to support all of the above objectives.

Example No. 2: Iran

> Finding Pursuant to Section 662 of The Foreign Assistance Act of 1961 As Amended. Concerning Operations Undertaken by the Central Intelligence Agency in Foreign Countries. Other Than Those Intended Solely for the Purpose of Intelligence Collection

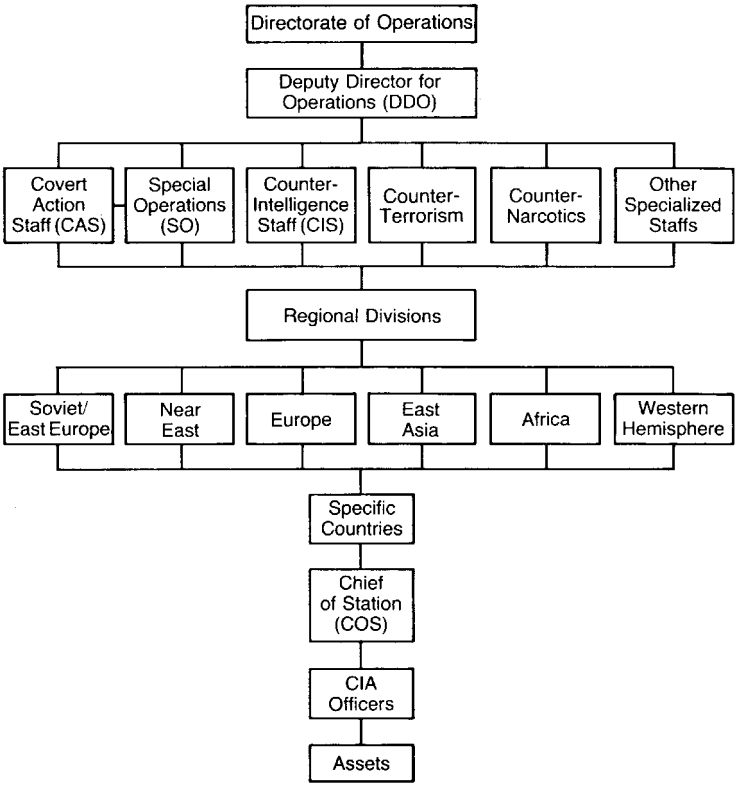
I hereby find that the following operation in a foreign country (including all support necessary to such operation) is important to the national security of the United States, and due to its extreme sensitivity and security risks. I determine it is essential to limit prior notice, and direct the Director of Central Intelligence to refrain from reporting this Finding to the Congress as provided in Section 501 of the National Security Act of 1947, as amended, until I otherwise direct.

SCOPE	*DESCRIPTION*
Iran	Assist selected friendly foreign liaison services, third countries and third parties which have established relationships with Iranian elements, groups, and individuals sympathetic to U.S. Government interests and which do not conduct or support terrorist actions directed against U.S. persons, property or interests, for the purpose of: (1) establishing a more moderate government in Iran, (2) obtaining from them significant intelligence not otherwise obtainable, determine the current Iranian Government's methods with respect to its neighbors and with respect to terrorist acts, and (3) furthering the release of the American hostages held in Beirut and preventing additional terrorist acts by these groups. Provide funds, intelligence, counter-intelligence, training, guidance and communications and other necessary assistance to these elements, groups, individuals, liaison services and third countries in support of these activities. The USG will act to facilitate efforts by third parties and third countries to establish contact with moderate elements within and outside the Government of Iran by providing these elements with arms, equipment and related material in order to enhance the credibility of these elements in their effort to achieve a more pro-U.S.

government in Iran by demonstrating their ability to obtain requisite resources to defend their country against Iraq and intervention by the Soviet Union. This support will be discontinued if the U.S. Government learns that these elements have abandoned their goals of moderating their government and appropriated the material for purposes other than that provided by this finding.

APPENDIX E

THE ORGANIZATION DURING THE COLD WAR OF THE CIA'S DIRECTORATE OF OPERATIONS—HOME BASE FOR COVERT OPERATIONS



Editor's note: The phrase "Special Operations" (SO) in the chart refers to paramilitary activities, a subset of covert action; the word "assets" refers to foreign nationals employed secretly by the CIA.

APPENDIX F

THE CIA ASSASSINATION PLOT IN THE CONGO, 1960–61

III. ASSASSINATION PLANNING AND THE PLOTS

A. CONGO

1. Introduction

The Committee has received solid evidence of a plot to assassinate Patrice Lumumba. Strong hostility to Lumumba, voiced at the very highest levels of government may have been intended to initiate an assassination operation; at the least it engendered such an operation. The evidence indicates that it is likely that President Eisenhower's expression of strong concern about Lumumba at a meeting of the National Security Council on August 18, 1960, was taken by Allen Dulles as authority to assassinate Lumumba.[1] There is, however, testimony by Eisenhower Administration officials, and ambiguity and lack of clarity in the records of high-level policy meetings, which tends to contradict the evidence that the President intended an assassination effort against Lumumba.

The week after the August 18 NSC meeting, a presidential advisor reminded the Special Group of the "necessity for very straightforward action" against Lumumba and prompted a decision not to rule out consideration of "any particular kind of activity which might contribute to getting rid of Lumumba." The following day, Dulles cabled

Source: "Alleged Assassination Plots Involving Foreign Leaders," *An Interim Report,* Select Committee to Study Governmental Operations with Respect to Intelligence Activities (the Church Committee), U.S. Senate, 94th Cong., 2d Sess (1975), pp. 13–70.

[1] Indeed, one NSC staff member present at the August 18 meeting, believed that he witnessed a presidential order to assassinate Lumumba.

a CIA Station Officer in Leopoldville, Republic of the Congo,[2] that "in high quarters" the "removal" of Lumumba was "an urgent and prime objective." Shorty thereafter the CIA's clandestine service formulated a plot to assassinate Lumumba. The plot proceeded to the point that lethal substances and instruments specifically intended for use in an assassination were delivered by the CIA to the Congo Station. There is no evidence that these instruments of assassination were actually used against Lumumba.

A thread of historical background is necessary to weave these broad questions together with the documents and testimony received by the Committee.

In the summer of 1960, there was great concern at the highest levels in the United States government about the role of Patrice Lumumba in the Congo. Lumumba, who served briefly as Premier of the newly independent nation, was viewed with alarm by United States policymakers because of what they perceived as his magnetic public appeal and his leanings toward the Soviet Union.

Under the leadership of Lumumba and the new President, Joseph Kasavubu, the Congo declared its independence from Belgium on June 30, 1960.[3] In the turbulent month that followed, Lumumba threatened to invite Soviet troops to hasten the withdrawal of Belgian armed forces. The United Nations Security Council requested Belgium's withdrawal and dispatched a neutral force to the Congo to preserve order. In late July, Lumumba visited Washington and received pledges of economic aid from Secretary of State Christian Herter. By the beginning of September, Soviet airplanes, trucks, and technicians were arriving in the province where Lumumba's support was strongest.

In mid-September, after losing a struggle for the leadership of the government to Kasavubu and Joseph Mobutu, Chief of Staff of the Congolese armed forces, Lumumba sought protection from the United Nations forces in Leopoldville. Early in December, Mobutu's troops captured Lumumba while he was traveling toward his stronghold at Stanleyville and imprisoned him. On January 17, 1961, the central government of the Congo transferred Lumumba to the custody of authorities in Katanga province, which was then asserting its own independence from the Congo. Several weeks later, Katanga authorities announced Lumumba's death.

Accounts of the circumstances and timing of Lumumba's death vary. The United Nations investigation concluded that Lumumba was killed on January 17, 1961.[4]

---

[2] Since the period in which the events under examination occurred, the names of many geographical units and governmental institutions have changed. For instance, the nation formerly known as the Republic of the Congo is now the Republic of Zaire and the present capital city, Kinshasa, was known then as Leopoldville. For the sake of clarity in dealing with many of the documents involved in this section, the names used in this report are those which applied in the early 1960's.

[3] For detailed reporting of the events in the Congo during this period, see the *New York Times,* especially July 7, 1960, 7:3; July 14, 1960, 1:1; July 16, 1960, 1:1 and 3:2; July 28, 1960, 3:7; September 3, 1960, 3:2; September 6, 1960, 1:8; December 3, 1960, 1:8; January 18, 1961, 3:1; February 14, 1961, 1:1.

[4] Report of the Commission of Investigation. U.N. Security Council, Official Records, Supplement for October, November, and December, 11/11/61, p. 117. (Cited hereinafter as "U.N. Report, 11/11/61."

2. Dulles Cable to Leopoldville: August 26, 1960

The Congo declared its independence from Belgium on June 30, 1960. Shortly thereafter, the CIA assigned a new officer to its Leopoldville Station. The "Station Officer"[5] said that assassinating Lumumba was not discussed during his CIA briefings prior to departing for the Congo, nor during his brief return to Headquarters in connection with Lumumba's visit to Washington in late July. (Hedgman, 8/21/75, pp. 8–9)

During August, there was increasing concern about Lumumba's political strength in the Congo among the national security policymakers of the Eisenhower Administration.[6] This concern was nurtured by intelligence reports such as that cabled to CIA Headquarters by the Station Officer:

> EMBASSY AND STATION BELIEVE CONGO EXPERIENCING CLASSIC COMMUNIST EFFORT TAKEOVER GOVERNMENT. MANY FORCES AT WORK HERE: SOVIETS *** COMMUNIST PARTY, ETC. ALTHOUGH DIFFICULT DETERMINE MAJOR INFLUENCING FACTORS TO PREDICT OUTCOME STRUGGLE FOR POWER, DECISIVE PERIOD NOT FAR OFF. WHETHER OR NOT LUMUMBA ACTUALLY COMMIE OR JUST PLAYING COMMIE GAME TO ASSIST HIS SOLIDIFYING POWER, ANTI-WEST FORCES RAPIDLY INCREASING POWER CONGO AND THERE MAY BE LITTLE TIME LEFT IN WHICH TAKE ACTION TO AVOID ANOTHER CUBA. (CIA Cable, Leopoldville to Director, 8/18/60)

This cable stated the Station's operational "objective [of] replacing Lumumba with pro Western Group." Bronson Tweedy, who was Chief of the Africa Division of CIA's clandestine services, replied that he was seeking State Department approval for the proposed operation based upon "your and our belief Lumumba must be removed if possible." (CIA Cable, Tweedy to Leopoldville, 8/18/60) On August 19, DDP Richard Bissell, Director of CIA's covert operations branch, signed a follow-up cable to Leopoldville, saying: "You are authorized proceed with operation." (CIA Cable, Director to Leopoldville, 8/19/60)

Several days later, the Station Officer reported:

> ANTI-LUMUMBA LEADERS APPROACHED KASAVUBU WITH PLAN ASSASSINATE LUMUMBA *** KASAVUBU REFUSED AGREE SAYING HE RELUCTANT RESORT VIOLENCE AND NO OTHER LEADER SUFFICIENT STATURE REPLACE LUMUMBA. (CIA Cable, Leopoldville to Director, 8/24/60)

On August 25, Director of Central Intelligence, Allen Dulles attended a meeting of the Special Group—the National Security Council subcommittee responsible for the planning of covert operations.[7] In response to the outline of some CIA plans for political actions

---

[5] Victor Hedgman was one of the CIA officers in Leopoldville attached to the Congo Station and will be referred to hereinafter as "Station Officer."

[6] See Section 7, *infra,* for a full discussion of the prevailing anti-Lumumba attitude in the United States government as shown by minutes of the National Security Council and Special Group and the testimony of high Administration officials.

[7] The August 25th Special Group meeting and the testimony about its significance for the issue of authorization is discussed in detail in Section 7(a) (iii), *infra.*

That meeting was preceded by an NSC meeting on August 18, at which an NSC staff executive heard the President make a statement that impressed him as an order for the assassination of Lumumba. (Johnson, 6/18/75, pp. 6–7) The testimony about this NSC meeting is set forth in detail at Section 7 (a) (ii), *infra.*

against Lumumba, such as arranging a vote of no confidence by the Congolese Parliament, Gordon Gray, the Special Assistant to the President for National Security Affairs reported that the President "had expressed extremely strong feelings on the necessity for very straightforward action in this situation, and he wondered whether the plans as outlined were sufficient to accomplish this." (Special Group Minutes, 8/25/60) The Special Group "finally agreed that planning for the Congo would not necessarily rule out 'consideration' of any particular kind of activity which might contribute to getting rid of Lumumba." (Special Group Minutes, 8/25/60)

The next day, Allen Dulles signed a cable[8] to the Leopoldville Station Officer stating:

> IN HIGH QUARTERS HERE IT IS THE CLEAR-CUT CONCLUSION THAT IF [LUMUMBA] CONTINUES TO HOLD HIGH OFFICE, THE INEVITABLE RESULT WILL AT BEST BE CHAOS AND AT WORST PAVE THE WAY TO COMMUNIST TAKEOVER OF THE CONGO WITH DISASTROUS CONSEQUENCES FOR THE PRESTIGE OF THE UN AND FOR THE INTERESTS OF THE FREE WORLD GENERALLY. CONSEQUENTLY WE CONCLUDE THAT HIS REMOVAL MUST BE AN URGENT AND PRIME OBJECTIVE AND THAT UNDER EXISTING CONDITIONS THIS SHOULD BE A HIGH PRIORITY OF OUR COVERT ACTION. (CIA Cable, Dulles to Station Officer, 8/26/60)[9]

The cable said that the Station Officer was to be given "wider authority"—along the lines of the previously authorized operation to replace Lumumba with a pro-Western group—"including even more aggressive action if it can remain covert . . . we realize that targets of opportunity may present themselves to you." Dulles' cable also authorized the expenditure of up to $100,000 "to carry out any crash programs on which you do not have the opportunity to consult HQS," and assured the Station Officer that the message had been "seen and approved at competent level" in the State Department. (CIA Cable, 8/26/60) The cable continued:

> TO THE EXTENT THAT AMBASSADOR MAY DESIRE TO BE CONSULTED, YOU SHOULD SEEK HIS CONCURRENCE. IF IN ANY PARTICULAR CASE, HE DOES NOT WISH TO BE CONSULTED YOU CAN ACT ON YOUR OWN AUTHORITY WHERE TIME DOES NOT PERMIT REFERRAL HERE.

This cable raises the question of whether the DCI was contemplating action against Lumumba for which the United States would want to be in a position to "plausibly deny" responsibility. On its face, the cable could have been read as authorizing only the "removal" of Lumumba from office. DDP Richard Bissell was "almost certain" that he was informed about the Dulles cable shortly after its transmission. He testified that it was his

[8] Cables issued under the personal signature of the DCI are a relative rarity in CIA communications and call attention to the importance and sensitivity of the matter discusseed. By contrast, cable traffic to and from CIA field stations routinely refers to the sender or recipient as "Director" which simply denotes "CIA Headquarters."

[9] The bracketed words in cables throughout this section signify that a cryptonym, pseudonym, or other coded reference has been translated in order to maintain the security of CIA communications and to render the cable traffic comprehensible. The translations were provided to the Committee by the CIA Review Staff and by various witnesses.

"belief" that the cable was a circumlocutious means of indicating that the President wanted Lumumba killed.[10] (Bissell, 9/10/75, pp. 12, 33, 64–65)

Bronson Tweedy testified that he may have seen Dulles' cable of August 26, before it was transmitted and that he "might even have drafted it." Tweedy called this cable the "most authoritative statement" on the "policy consensus in Washington about the need for the removal of Lumumba" by any means, including assassination. He said that he "never knew" specifically who was involved in formulating this policy. But he believed that the cable indicated that Dulles had received authorization at the "policy level" which "certainly ∗∗∗ would have involved the National Security Council." Tweedy testified that the $100,000 was probably intended for "political operations against Lumumba ∗∗∗ not assassination-type programs." (Tweedy, 10/9/75 1, p. 5, II, pp. 5–7, 24, 26)

3. CIA Encouragement of Congolese Efforts to "Eliminate" Lumumba

On September 5, 1960, President Kasavubu dismissed Premier Lumumba from the government despite the strong support for Lumumba in the Congolese Parliament. After losing the ensuing power struggle with Kasavubu and Mobutu, who seized power by a military coup on September 14, Lumumba asked the United Nations peace-keeping force for protection.

The evidence indicates that the ouster of Lumumba did not alleviate the concern about him in the United States government. Rather, CIA and high Administration officials[11] continued to view him as a threat.

During this period, CIA officers in the Congo advised and aided Congolese contacts known to have an intent to assassinate Lumumba. The officers also urged the "permanent disposal" of Lumumba by some of these Congolese contacts. Moreover, the CIA opposed reopening Parliament after the coup because of the likelihood that Parliament would return Lumumba to power.

The day after Kasavubu deposed Lumumba, two CIA officers met with a high-level Congolese politician who was in close contact with the Leopoldville Station. The Station reported to CIA Headquarters:

> TO [STATION OFFICER] COMMENT THAT LUMUMBA IN OPPOSITION IS ALMOST AS DANGEROUS AS IN OFFICE, [THE CONGOLESE, POLITICIAN] INDICATED UNDERSTOOD AND IMPLIED MIGHT PHYSICALLY ELIMINATE LUMUMBA. (CIA Cable, Leopoldville to Director, 9/7/60)

The cable also stated that the Station Officer had offered to assist this politician "in preparation new government program" and assured him that the United States would supply technicians. (CIA Cable, 9/7/60)

As the struggle for power raged, Bronson Tweedy summarized the prevalent apprehension of the United States about Lumumba's ability to influence events in the Congo by virtue of his personality, irrespective of his official position:

---

[10] See Section 7(c), *infra* for additional testimony by Bissell on the question of authorization for the assassination effort against Lumumba. Bissell testified, *inter alia,* that Dulles would have used the phrase "highest quarters" to refer to the President.

[11] A detailed treatment of the expressions of continued concern over Lumumba at the National Security Council level is set forth in Section 7, *infra.*

> LUMUMBA TALENTS AND DYNAMISM APPEAR OVERRIDING FACTOR IN RE-ESTABLISHING HIS POSITION EACH TIME IT SEEMS HALF LOST. IN OTHER WORDS EACH TIME LUMUMBA HAS OPPORTUNITY HAVE LAST WORD HE CAN SWAY EVENTS TO HIS ADVANTAGE. (CIA Cable, Director to Leopoldville, 9/13/60)

The day after Mobutu's coup, the Station Officer reported that he was serving as an advisor to a Congolese effort to "eliminate" Lumumba due to his "fear" that Lumumba might, in fact, have been strengthened by placing himself in U.N. custody, which afforded a safe base of operations. Hedginan concluded: "Only solution is remove him from scene soonest." (CIA Cable, Leopoldville to Director, 9/15/60)

On September 17, another CIA operative in the Congo met with a leading Congolese senator. The cable to CIA Headquarters concerning the meeting reported:

> [CONGOLESE SENATOR] REQUESTED CLANDESTINE SUPPLY SMALL ARMS TO EQUIP *** TROOPS RECENTLY ARRIVED [LEOPOLDVILLE] AREA *** [THE SENATOR] SAYS THIS WOULD PROVIDE CORE ARMED MEN WILLING AND ABLE TAKE DIRECT ACTION *** [SENATOR] RELUCTANTLY AGREES LUMUMBA MUST GO PERMANENTLY. DISTRUSTS [ANOTHER CONGOLESE LEADER] BUT WILLING MAKE PEACE WITH HIM FOR PURPOSES ELIMINATION LUMUMBA. (CIA Cable, Leopoldville to Director, 9/17/60)

The CIA operative told the Congolese senator that, "he would explore possibility obtaining arms" and he recommended to CIA headquarters that they should:

> HAVE [ARMS] SUPPLIES READY TO GO AT NEAREST BASE PENDING [UNITED STATES] DECISION THAT SUPPLY WARRANTED AND NECESSARY. (CIA Cable, 9/17/60)[12]

Several days later, the Station Officer warned a key Congolese leader about coup plots led by Lumumba and two of his supporters, and: "Urged arrest or other more permanent disposal of Lumumba, Gizenga, and Mulele." (CIA Cable, Leopoldville to Director, 9/20/61) Gizenga and Mulele Were Lumumba's lieutenants who led his supporters while Lumumba was in U.N. custody.

---

[12] This recommendation proved to be in line with large scale planning at CIA Headquarters for clandestine paramilitary support to anti-Lumumba elements. On October 6, 1960, Richard Bissell and Bronson Tweedy signed a cable concerning plans which the Station Officer was instructed not to discuss with State Department representatives or operational contacts:

> [IN] VIEW UNCERTAIN OUTCOME CURRENT DEVELOPMENTS [CIA] CONDUCTING CONTINGENCY PLANNING FOR CONGO AT REQUEST POLICY ECHELONS. THIS PLANNING DESIGNED TO PREPARE FOR SITUATION IN WAY [UNITED STATES] WOULD PROVIDE CLANDESTINE SUPPORT TO ELEMENTS IN ARMED OPPOSITION TO LUMUMBA. CONTEMPLATED ACTION INCLUDES PROVISION ARMS, SUPPLIES AND PERHAPS SOME TRAINING TO ANTI-LUMUMBA RESISTANCE GROUPS. (CIA Cable, Director in Leopoldville, 10/6/60)

Throughout the fall of 1960, while Lumumba remained in U.N. protective custody,[13] the CIA continued to view him as a serious political threat. One concern was that if Parliament were re-opened and the moderates failed to obtain a majority vote, the "pressures for [Lumumba's] return will be almost irresistible." (CIA Cable, Leopoldville to Director, 10/26/60).[14] Another concern at CIA Headquarters was that foreign powers would intervene in the Congo and bring Lumumba to power. (CIA Cable, Director to Leopoldville, 10/17/60) Lumumba was also viewed by the CIA and the Administration as a stalking horse for "what appeared to be a Soviet effort to take over the Congo." (Hedgman, 8/21/75, pp. 10, 45)[15]

After Lumumba was in U.N. custody, the Leopoldville Station continued to maintain close contact with Congolese who expressed a desire to assassinate Lumumba.[16] CIA officers encouraged and offered to aid these Congolese in their efforts against Lumumba, although there is no evidence that aid was ever provided for the specific purpose of assassination.

4. The Plot to Assassinate Lumumba

SUMMARY

In the Summer of 1960, DDP Richard Bissell asked the Chief of the Africa Division, Bronson Tweedy, to explore the feasibility of assassinating Patrice Lumumba. Bissell also asked a CIA scientist, Joseph Scheider, to make preparations to assassinate or incapacitate an unspecified "African leader." According to Scheider, Bissell said that the assignment

---

[13] Both Richard Bissell and Bronson Tweedy confirmed that the CIA continued to view Lumumba as a threat even after he placed himself in U.N. custody. (Bissell, 9/10/75, pp. 68–69, 79: Tweedy, 9/9/75, pp. 48–50) Two factors were mentioned consistently in testimony by government officials to substantiate this view: first, Lumumba was a spellbinding orator with the ability to stir masses of people to action; and second, the U.N. forces did not restrain Lumumba's freedom of movement and the Congolese army surrounding them were often lax in maintaining their vigil. (Mulroney, 9/11/75, pp. 22–24; Dillon, 9/2/75. p. 49) As CIA officer Michael J. Mulroney put it, the fact that Lumumba was in United Nations custody "did not result in a cessation of his political activity." (Mulroney, 9/11/75, p. 23)

[14] A CIA Cable from Leopoldville to the Director on November 3, 1960 returned to this theme: the opening of the Congolese Parliament by the United Nations is opposed because it "WOULD PROBABLY RETURN LUMUMBA TO POWER."

[15] See Section 7, *infra*, for a treatment of the expression of this viewpoint at high-level policy meetings.

Tweedy expressed an even broader "domino theory" about the impact of Lumumba's leadership in the Congo upon events in the rest of Africa:

"The concern with Lumumba was not really the concern with Lumumba as a person. It was concern at this very pregnant point in the new African development [with] the effect on the balance of the Continent of a disintegration of the Congo. [I]t was the general feeling that Lumumba had it within his power to bring about this dissolution, and this was the fear that it would merely be the start—the Congo, after all, was the largest geographical expression. Contained in it were enormously important mineral resources ∗∗∗. The Congo itself, is adjacent to Nigeria, which at that point was considered to be one of the main hopes of the future stability of Africa. [I]f the Congo had fallen, then the chances were Nigeria would be seized with the same infection.

"This was why Washington ∗∗∗ was so concerned about Lumumba, not because there was something unique about Lumumba, but it was the Congo." (Tweedy. 10/9/75 II. p. 42)

[16] A Congolese in contact with the CIA "IMPLIED HE TRYING HAVE [LUMUMBA] KILLED BUT ADDED THIS MOST DIFFICULT AS JOB WOULD HAVE BE DONE BY AFRICAN WITH NO APPARENT INVOLVEMENT WHITE MAN." (CIA Cable, Leopoldville to Director, 10/28S/60)

had the "highest authority." Scheider procured toxic biological materials in response to Bissell's request, and was then ordered by Tweedy to take these materials to the Station Officer in Leopoldville. According to Scheider, there was no explicit requirement that the Station check back with Headquarters for final approval before proceeding to assassinate Lumumba. Tweedy maintained, however, that whether or not he had explicitly levied such a requirement, the Station Officer was not authorized to move from exploring means of assassination to actually attempting to kill Lumumba without referring the matter to Headquarters for a policy decision.

In late September, Scheider delivered the lethal substances to the Station Officer in Leopoldville and instructed him to assassinate Patrice Lumumba. The Station Officer testified that after requesting and receiving confirmation from CIA Headquarters that he was to carry out Scheider's instructions, he proceeded to take "exploratory steps" in furtherance of the assassination plot. The Station Officer also testified that he was told by Scheider that President Eisenhower had ordered the assassination of Lumumba. Scheider's testimony generally substantiated this account, although he acknowledged that his meetings with Bissell and Tweedy were the only bases for his impression about Presidential authorization. Scheider's mission to the Congo was preceded and followed by cables from Headquarters urging the "elimination" of Lumumba transmitted through an extraordinarily restricted "Eyes Only" channel—including two messages bearing the personal signature of Allen Dulles.

The toxic substances were never used. But there is no evidence that the assassination operation was terminated before Lumumba's death. There is, however, no suggestion of a connection between the assassination plot and the events which actually led to Lumumba's death.[17]

(a) Bissell/Tweedy Meetings on Feasibility of Assassinating Lumumba

Bronson Tweedy testified that Richard Bissell initiated a discussion with him in the summer of 1960 about the feasibility of assassinating Patrice Lumumba, and that they discussed the subject "more than once" during the following fall. Tweedy said the first such conversation probably took place shortly before Dulles' cable of August 26, instructing the Station Officer that Lumumba's "removal" was a "high priority of our covert action."[18] Whether his talk with Bissell was "shortly before or shortly after" the Dulles cable, it was clear to Tweedy that the two events "were totally in tandem." (Tweedy, 9/9/75, pp. 14–15; 10/9/75 II, p. 6)

Tweedy testified that he did not recall the exact exchange but the point of the conversation was clear:

What Mr. Bissell was saying to me was that there was agreement, policy agreement, in Washington that Lumumba must be removed from the position of control and influence in the Congo * * * and that among the possibilities of that elimination was indeed assassination.

* * * The purpose of his conversation with me was to initiate correspondence with the Station for them to explore with Headquarters the possibility of * * * assassination, or indeed any other means of removing Lumumba from power * * * to have the Station start reviewing possibilities, assets, and discussing them with Headquarters in detail in the same way we would with any operation. (Tweedy, 10/9/75 II, pp. 6, 8)

---

[17] See Section 6, *infra*, for a discussion of the evidence about the circumstances surrounding Lumumba's death in Katanga.

[18] See Section 2, *supra*.

Tweedy was "sure" that in his discussions with Bissell poisoning "must have" been mentioned as one means of assassination that was being considered and which the Station Officer should explore. (Tweedy, 9/9/75, pp. 26–27)

Tweedy testified that Bissell assigned him the task of working out the "operational details," such as assessing possible agents and the security of the operation, and of finding "some solution that looked as if it made sense, and had a promise of success." Tweedy stated that Bissell "never said ∗∗∗ go ahead and do it in your own good time without any further reference to me." Rather, Tweedy operated under the impression that if a feasible means of assassinating Lumumba were developed, the decision on proceeding with an assassination attempt was to be referred to Bissell. (Tweedy, 10/9/75 I, pp. 7, 17–18)

Tweedy stated that he did not know whether Bissell had consulted with any "higher authority" about exploring the possibilities for assassinating Lumumba. Tweedy said, that generally, when he received an instruction from Bissell:

I would proceed with it on the basis that he was authorized to give me instructions and it was up to him to bloody well know what he was empowered to tell me to do. (Tweedy, 9/9/75, p. 13)[19]

(b) Bissell/Scheider Meetings on Preparations for Assassinating "An African Leader"

Joseph Scheider[20] testified that he had "two or three conversations" with Richard Bissell in 1960 about the Agency's technical capability to assassinate foreign leaders. In the late spring or early summer, Bissell asked Scheider generally about technical means of assassination or incapacitation that could be developed or procured by the CIA. Scheider informed Bissell that the CIA had access to lethal or potentially lethal biological materials that could be used in this manner. Following their initial "general discussion," Scheider said he discussed assassination capabilities with Bissell in the context of "one or two meetings about Africa." (Scheider, 10/7/75, pp. 6–7, 41)

Scheider testified that in the late summer or early fall, Bissell asked him to make all preparations necessary for having biological materials ready on short notice for use in the assassination of an unspecified African leader, "in case the decision was to go ahead."[21]

---

[19] When asked whether he considered declining Bissell's assignment to move toward the assassination of Lumumba, Tweedy responded:

TWEEDY: I certainly did not attempt to decline it, and I felt, in view of the position of the government on the thing, that at least the exploration of this, or possibility of removing Lumumba from power in the Congo was an objective worth pursuing.

Q: Including killing him?

TWEEDY: Yes. I suspect I was ready to consider this ∗∗∗ Getting rid of him was an objective worth pursuing, and if the government and my betters wished to pursue it, professionally, I was perfectly willing to play my role in it, yes ∗∗∗. Having to do it all over again, it would be my strong recommendation that we not get into it. (Tweedy, 10/9/75, II, pp. 39–41)

[20] During the events discussed in the Lumumba case, Joseph Scheider served as Special Assistant to the DDP (Bissell) for Scientific Matters. Scheider holds a degree in bio-organic chemistry. (Scheider, 10/7/75, pp. 13, 25–29)

[21] Scheider said it was possible that Bissell subsequently gave him the "go signal" for his trip to the Congo and specified Lumumba as the target of the assassination operation. (Scheider, 10/7/75, pp. 65, 113–114; 10/7/75, p. 8) Scheider had a clearer memory, however, of another meeting, where the top officers of CIA's Africa Division, acting under Bissell's authority, actually dispatched to the Congo. (See Section 4(c), *infra*)

Scheider testified that Bissell told him that "he had direction from the highest authority ∗ ∗ ∗ for getting into that kind of operation." Scheider stated that the reference to "highest authority" by Bissell "signified to me that he meant the President."[22] (Scheider, 10/7/75, pp. 51–55, 58; 10/9/75, p. 8)

Scheider said that he "must have" outlined to Bissell the steps he planned to take to execute Bissell's orders. (Scheider, 10/7/75, p. 58) After the meeting, Scheider reviewed a list of biological materials available at the Army Chemical Corps installation at Fort Detrick, Maryland which would produce diseases that would "either kill the individual or incapacitate him so severely that he would be out of action." (Scheider, 10/7/75, pp. 63–64; 10/9/75, pp. 8–9, 12)[23] Scheider selected one material from the list which "was supposed to produce a disease that was ∗ ∗ ∗ indigenous to that area [of Africa] and that could be fatal." (Scheider, 10/7/75, p. 63) Scheider testified that he obtained this material and made preparation for its use:

> We had to get it bottled and packaged in a way that it could pass for something else and I needed to have a second material that could absolutely inactivate it in case that is what I desired to do for some contingency. (Scheider, 10/7/75, p. 64)

Scheider also "prepared a packet of ∗ ∗ ∗ accessory materials," such as hypodermic needles, rubber gloves, and gauze masks, "that would be used in the handling of this pretty dangerous material." (Scheider, 10/7/75, p. 59)

(c) Scheider Mission to the Congo on an Assassination Operation

Scheider testified that he remembered "very clearly" a conversation with Tweedy and the Deputy Chief of the Africa Division in September 1960 which "triggered" his trip to the Congo after he had prepared toxic biological materials and accessories for use in an assassination operation. (Scheider, 10/7/75, pp. 41, 65) According to Scheider, Tweedy and his Deputy asked him to take the toxic materials to the Congo and deliver instructions from Headquarters to the Station Officer: "to mount an operation, if he could do it securely ∗ ∗ ∗ to either seriously incapacitate or eliminate Lumumba." (Scheider, 10/7/75, p. 66)

Scheider said that he was directed to provide technical support to the Station Officer's attempt to find a feasible means of carrying out the assassination operation:

> They urged me to be sure that ∗ ∗ ∗ if these technical materials were used ∗ ∗ ∗ I was to make the technical judgments if there were any reasons the things shouldn't go, that was my responsibility. (Scheider, 10/7/75, p. 68)[24]

---

[22] See Section 7(d), *infra* for additional testimony by Scheider about the question of Presidential authorization for the assassination of Lumumba.

[23] Schieder said that there were "seven or eight materials" on the list, including tularemia ("rabbit fever"), brucellosis (undulant fever), tuberculosis, anthrax, smallpox, and Venezuelan equine encephalitis ("sleeping sickness"). (Scheider, 10/7/75, p. 64; 10/9/75, p. 9)

[24] When asked if he had considered declining to undertake the assignment to provide technical support to an assassination operation, Scheider stated:

"I think that my view of the job at the time and the responsibilities I had was in the context of a silent war that was being waged, although I realize that one of my stances could have been ∗ ∗ ∗ as a conscientious objector to this war. That was not my view. I felt that a decision had been made ∗ ∗ ∗ at the highest level that this be done and that as unpleasant a responsibility as it was, it was my responsibility to carry out my part of that." (Scheider, 10/9/75, p. 63)

According to Scheider, the Station Officer was to be responsible for "the operations aspects, what assets to use and other non-technical considerations." Scheider said that in the course of directing him to carry instructions to the Station Officer in the Congo, Tweedy and his Deputy "referred to the previous conversation I had with Bissell," and left Scheider with, "the impression that Bissell's statements to me in our previous meeting held and that they were carrying this message from Bissell to me." (Scheider, 10/9/75, pp. 13, 15, 69)

Although he did not have a specific recollection, Scheider stated that it was "probable" that he would have "checked with Bissell" to validate the extraordinary assignment he received from Tweedy and his Deputy, if indeed he had not actually received the initial assignment itself from Bissell. (Scheider, 10/7/75, pp. 113–114)

After being informed of Scheider's testimony about their meeting, and reviewing the contemporaneous cable traffic, Tweedy stated that it was "perfectly clear" that he had met with Scheider. He assumed that he had ordered Scheider to deliver lethal materials to the Leopoldville Station Officer and to serve as a technical adviser to the Station Officer's attempts to find a feasible means of assassinating Lumumba. (Tweedy, 10/9/75 I, pp. 18–21; 10/9/75 II, p. 9)

Tweedy said that his Deputy Chief was the only other person in the Africa Division who would have known that the assassination of Lumumba was being considered. (Tweedy, 9/9/75. p. 64) Tweedy assumed Scheider had "already been given his marching orders to go to the Congo by Mr. Bissell, not by me." (Tweedy, 10/9/75 II, p. 11)

Scheider testified that he departed for the Congo within a week of his meeting with Tweedy and his Deputy (Scheider, 10/9/75, p. 15)

(d) Congo Station Officer Told To Expect Scheider: Dulles Cables About "Elimination" of Lumumba

On September 19, 1960, several days after Lumumba placed himself in the protective custody of the United Nations peacekeeping force in Leopoldville, Richard Bissell and Bronson Tweedy sent a cryptic cable to Leopoldville to arrange a clandestine meeting between the Station Officer and "Joseph Braun," who was traveling to the Congo on an unspecified assignment. Joseph Scheider testified that "Joseph Braun" was his alias and was used because this was "an extremely sensitive operation." (Scheider, 10/7/75, pp. 78, 80) The cable informed the Station Officer:

> ["JOE"] SHOULD ARRIVE APPROX 27 SEPT * * * WILL ANNOUNCE HIMSELF AS "JOE FROM PARIS" * * * IT URGENT YOU SHOULD SEE ["JOE"] SOONEST POSSIBLE AFTER HE PHONES YOU. HE WILL FULLY IDENTIFY HIMSELF AND EXPLAIN HIS ASSIGNMENT TO YOU. (CIA Cable, Bissell, Tweedy to the Station Officer, 9/19/60)

The cable bore the codeword "PROP," which indicated extraordinary sensitivity and restricted circulation at CIA headquarters to Dulles, Bissell, Tweedy, and Tweedy's Deputy. The PROP designator restricted circulation in the Congo to the Station Officer. (Tweedy, 10/9/75 I, pp. 14–15; II, pp. 9, 37)

Tweedy testified that the PROP channel was established and used exclusively for the assassination operation. (Tweedy, 10/9/75 II, p. 37; 10/9/75 I, pp. 48–49) The Bissell/Tweedy cable informed the Station Officer that the PROP channel was to be used for:

> ALL [CABLE] TRAFFIC THIS OP, WHICH YOU INSTRUCTED HOLD ENTIRELY TO YOURSELF. (CIA Cable, 9/19/60)

Tweedy testified that the fact that he and Bissell both signed the cable indicated that authorization for Scheider's trip to the Congo had come from Bissell. Tweedy stated that Bissell "signed off" on cables originated by a Division Chief "on matters of particular sensitivity or so important that the DDP wished to be constantly informed about correspondence." Tweedy said that Bissell read much of the cable traffic on this operation and was "generally briefed on the progress of the planning." (Tweedy, 10/9/75 I, pp. 14, 54)

The Station Officer, Victor Hedgman testified to a clear, independent recollection of receiving the Tweedy/Bissell cable. He stated that in September of 1960 he received a "most unusual" cable from CIA Headquarters which advised that:

> someone who I would have recognized would arrive with instructions for me ∗∗∗ I believe the message was also marked for my eyes only ∗∗∗ and contained instructions that I was not to discuss the message with anyone.

He said that the cable did not specify the kind of instructions he was to receive, and it "did not refer to Lumumba in any way." (Hedgman, 8/21/75, pp. 11–13, 43)

Three days after the Bissell/Tweedy cable, Tweedy sent another cable through the PROP channel which stated that if it was decided that "support for prop objectives [was] essential" a third country national should be used as an agent in the assassination operation to completely conceal the American role.[25] (CIA Cable, 9/22/60) Tweedy testified that "PROP objectives" referred to an assassination attempt. (Tweedy, 10/9/75 I, p. 30) Tweedy also indicated to the Station Officer and his "colleague" Scheider:

> YOU AND COLLEAGUE[26] UNDERSTAND WE CANNOT READ OVER YOUR SHOULDER AS YOU PLAN AND ASSESS OPPORTUNITIES. OUR PRIMARY CONCERN MUST BE CONCEALMENT [AMERICAN] ROLE, UNLESS OUTSTANDING OPPORTUNITY EMERGES WHICH MAKES CALCULATED RISK FIRST CLASS BET. READY ENTERTAIN ANY SERIOUS PROPOSALS YOU MAKE BASED OUR HIGH REGARD BOTH YOUR PROFESSIONAL JUDGMENTS. (CIA Cable, 9/22/60)

On September 24, the DCI personally sent a cable to Leopoldville stating:

> WE WISH GIVE EVERY POSSIBLE SUPPORT IN ELIMINATING LUMUMBA FROM ANY POSSIBILITY RESUMING GOVERNMENTAL POSITION OR IF HE FAILS IN LEOPOLDVILLE, SETTING HIMSELF IN STANLEYVILLE OR ELSEWHERE. (CIA Cable, Dulles to Leopoldville, 9/24/60)

Dulles had expressed a similar view three days before in President Eisenhower's presence at an NSC meeting.[27]

---

[25] Tweedy also expressed reservations about two agents that the Station Officer was considering for this operation and said "WE ARE CONSIDERING A THIRD NATIONAL CUTOUT CONTACT CANDIDATE AVAILABLE HERE WHO MIGHT FILL BILL." (CIA Cable, 9/22/60) This is probably a reference to agent OJ/WIN, who was later dispatched to the Congo. His mission is discussed in Sections 5(b)–5(c), *infra*.

[26] Tweedy identified Scheider as the "colleague" referred to in this cable. (Tweedy, 10/9/75 I, p. 32) Scheider was en route to the Congo at this point.

[27] Dulles' statement at the NSC meeting of September 21, 1960 is discussed in detail at Section 7(a)(v), *infra.*

Scheider recalled that Tweedy and his Deputy had told him that the Station Officer would receive a communication assuring him that there was support at CIA Headquarters for the assignment Scheider was to give him. (Scheider, 10/7/75, pp. 88–90)

(e) Assassination Instructions Issued to Station Officer and Lethal Substances Delivered: September 26, 1960

Station Officer Hedgman reported through the PROP channel that he had contacted Scheider on September 26. (CIA Cable, Leopoldville to Tweedy, 9/27/60)

According to Hedgman:

HEDGMAN: It is my recollection that he advised me, or my instructions were, to eliminate Lumumba.

Q: By eliminate, do you mean assassinate?

HEDGMAN: Yes, I would say that was * * * my understanding of the primary means. I don't think it was probably limited to that, if there was some other way of * * * removing him from a position of political threat. (Hedgman, 8/21/75, pp. 17–18)

Hedgman said that he and Scheider also may have discussed non-lethal means of removing Lumumba as a "political threat," but he could not "recall with certainty on that." (Hedgman, 8/21/75, p. 28)

Scheider testified:

> I explained to him [Station Officer] what Tweedy and his Deputy had told me, that Headquarters wanted him to see if he could use this [biological] capability I brought against Lumumba [and] to caution him that it had to be done * * * without attribution to the USA. (Scheider, 10/9/75, p. 16)

The Station Officer testified that he received "rubber gloves, a mask, and a syringe" along with lethal biological material from Scheider, who also instructed him in their use.[28] Hedgman indicated that this paraphernalia was for administering the poison to Lumumba for the purpose of assassination. (Hedgman, 8/21/75, pp. 18–21, 24) Scheider explained that the toxic material was to be injected into some substance that Lumumba would ingest: "it had to do with anything he could get to his mouth, whether it was food or a toothbrush, * * * [so] that some of the material could get to his mouth." (Scheider, 10/7/75, p. 100)

Hedgman said that the means of assassination was not restricted to use of the toxic material provided by Scheider. (Hedgman, 8/21/75, p. 19)

He testified that he may have "suggested" shooting Lumumba to Scheider as an alternative to poisoning. (Hedgman, 8/21/75, pp. 19, 27–29) Scheider said it was his "impression" that Tweedy and his Deputy empowered him to tell the Station Officer that he could pursue other means of assassination. (Scheider, 10/7/75, pp. 100–101) Station Officer Hedgman testified that, although the selection of a mode of assassination was left to his judgment, there was a firm requirement that:

---

[28] Scheider testified that he sent the medical paraphernalia via diplomatic pouch. (Schelder, 10/7/75, pp. 59, 99)

> [I]f I implemented these instructions ∗ ∗ ∗ it had to be a way which could not be traced back ∗ ∗ ∗ either to an American or the United States government. (Hedgman, 8/21/75, p. 19)

Hedgman said Scheider assured him that the poisons were produced to: [leave] normal traces found in people that die of certain diseases." (Hedgman, 8/21/75, p. 23.)

Hedgman said that he had an "emotional reaction of great surprise" when it first became clear that Scheider had come to discuss an assassination plan. (Hedgman, 8/21/75, p. 30) He told Scheider he "would explore this." (Hedgman, 8/21/75, p. 46) and left Scheider with the impression "that I was going to look into it and try and figure if there was a way ∗ ∗ ∗ I believe I stressed the difficulty of trying to carry out such an operation." (Hedgman, 8/21/75, p. 47) Scheider said that the Station Officer was "sober [and] grim" but willing to proceed with the operation. (Scheider, 10/7/75, pp. 98, 121)

The Station Officer's report of his initial contact with Scheider was clearly an affirmative response to the assignment, and said that he and Scheider were "on same wavelength." (CIA Cable, Leopoldville to Tweedy, 9/27/60) Hedgman was "afraid" that the central government was "weakening under" foreign pressure to effect a reconciliation with Lumumba, and said:

> HENCE BELIEVE MOST RAPID ACTION CONSISTENT WITH SECURITY INDICATED. (CIA Cable, 9/27/60)[29]

(f) Hedgman's Impression That President Eisenhower Ordered Lumumba's Assassination

Station Officer Hedgman testified that Scheider indicated to him that President Eisenhower had authorized the assassination of Lumumba.[30] Hedgman had a "quite strong recollection" of asking about the source of authority for the assignment:

> HEDGMAN: I must have ∗ ∗ ∗ pointed out that this was not a common or usual Agency tactic ∗ ∗ ∗ never in my training or previous work in the Agency had I ever heard any references to such methods. And it is my recollection I asked on whose authority these instructions were issued.
>
> Q: And what did Mr. Scheider reply?
>
> HEDGMAN: It is my recollection that he identified the President ∗ ∗ ∗ and I cannot recall whether he said "the President," or whether he identified him by name. (Hedgman, 8/21/75, pp. 30–31)

Hedgman explained that Scheider told him "something to the effect that the President had instructed the Director" to assassinate Lumumba. (Hedgman, 8/21/75, pp. 32, 34)

Scheider stated that he had an "independent recollection" of telling the Station Officer about his meetings with Bissell, Tweedy, and Tweedy's Deputy, including Bissell's reference to "the highest authority." (Scheider, 10/7/75, p. 102) Scheider believed that he left

---

[29] Scheider interpreted this cable to mean that Hedgman was informing Headquarters: "that he has talked to me and that he is going to go ahead and see if he could mount the operation ∗ ∗ ∗ [H]e believes we ought to do it, if it is going to be done, as quickly as we can." (Scheider, 10/7/75, p. 121)

[30] See Section 7(d), *infra,* for a more detailed treatment of the testimony of the Station Officer and Scheider on the question of Presidential authorization for the assassination of Lumumba.

the Station Officer with the impression that there was presidential authorization for an assassination attempt against Lumumba. (Scheider, 10/7/75, pp. 90, 102–103)

(g) Steps in Furtherance of the Assassination Operation

(i) Hedgman's Testimony About Confirmation From Headquarters of the Assassination Plan.

Hedgman's testimony, taken fifteen years after the events in question and without the benefit of reviewing the cables discussed above, was compatible with the picture presented by the cables of a fully authorized and tightly restricted assassination operation. The only variance is that the cables portray Hedgman as taking an affirmative, aggressive attitude toward the assignment, while he testified that his pursuit of the operation was less vigorous.

The Station Officer testified that soon after cabling his request for confirmation that he was to carry out the assassination assignment, he received a reply from Headquarters, which he characterized as follows:

> I believe I received a reply which I interpreted to mean yes, that he was the messenger and his instructions were ∗∗∗ duly authorized. (Hedgman, 8/21/75, pp. 37–38)

Despite the cryptic nature of the cables, Hedgman said "I was convinced that yes, it was right," but he had no "desire to carry out these instructions." (Hedgman, 8/21/75, pp. 44, 50, 106) Hedgman stated:

> "I think probably that I would have gone back and advised that I intended to carry out and sought final approval before carrying it out had I been going to do it, had there been a way to do it. I did not see it as ∗∗∗ a matter which could be accomplished practically, certainly. (Hedgman, 8/21/75, pp. 51–52)

Hedgman said that his reason for seeking a final approval would have been to receive assurances about the practicality of the specific mode of assassination that he planned to use. (Hedgman, 8/21/75, p. 53)

All CIA officers involved in the plot to kill Lumumba testified that, by virtue of the standard operating procedure of the clandestine services, there was an implicit requirement that a field officer check back with Headquarters for approval of any major operational plan.[31] Moreover, Hedgman's cable communications with Headquarters indicate that he consistently informed Tweedy of each significant step in the formulation of assassination plans, thus allowing Headquarters the opportunity to amend or disapprove the plans. The personal cable from Dulles to the Station Officer on August 26, made it clear, however, that if Lumumba appeared as a "target of opportunity" in a situation where time did not permit referral to headquarters, Hedgeman was authorized to proceed with the assassination.

The Station Officer testified that for several months after receiving Scheider's instructions he took "exploratory steps in furtherance of the assassination plot." He sent several cables to CIA Headquarters which "probably reflected further steps I had taken," and stated that his cables to Headquarters were essentially "progress reports" on his attempts to find access to Lumumba. (Hedgman, 8/21/75, pp. 50, 59–60)

---

[31] See Tweedy, 10/9/75, I, pp. 10, 24–27; Hedgman, 8/21/75, pp. 39, 51–53; Scheider, 10/7/75, p. 92; Deputy Chief, Africa Division, affidavit, 10/17/75, p. 5.

The cable traffic conforms to the Station Officer's recollection. For two months after Scheider's arrival in the Congo, a regular stream of messages assessing prospects for the assassination operation flowed through the PROP channel between Headquarters and Leopoldville.

(ii) "Exploratory Steps"

On the basis of his talks with Scheider, Station Officer Hedgman listed a number of "possibilities" for covert action against Lumumba. At the top of the list was the suggestion that a particular agent be used in the following manner:

> HAVE HIM TAKE REFUGE WITH BIG BROTHER. WOULD THUS ACT AS INSIDE MAN TO BRUSH UP DETAILS TO RAZOR EDGE. (CIA Cable, 9/27/60)

Tweedy testified that "Big Brother" referred to Lumumba. (Tweedy, 10/9/75 II, p. 13) Tweedy and Scheider both said that this cable indicated that Hedgman's top priority plan was to instruct his agent to infiltrate Lumumba's entourage to explore means of poisoning Lumumba. (Tweedy, 10/9/75 I, p. 38, II, pp. 13–14; Scheider, 10/7/75, pp. 124–125) The Station Officer reported that he would begin to follow this course by recalling the agent to Leopoldville, and informed Headquarters:

> BELIEVE MOST RAPID ACTION CONSISTENT WITH SECURITY INDICATED * * * PLAN PROCEED ON BASIS PRIORITIES AS LISTED ABOVE, UNLESS INSTRUCTED TO CONTRARY. (CIA Cable, 9/27/60)

Scheider testified that at this point the Station Officer was reporting to Headquarters that he was proceeding to "go ahead" to carry out Scheider's instructions as quickly as possible. (Scheider, 10/7/75, pp. 121–123) Tweedy's Deputy stated that the form of the Station Officer's request would have satisfied the standard requirement for confirmation of an operational plan

> * * * it is my professional opinion that, under normal operational procedure at that time, the Station Officer would have been expected to advise Headquarters that he was preparing to implement the plan unless advised to the contrary. (Deputy Chief, Africa Division, affidavit, 10/17/75, p. 5)

On September 30, the Station Officer specifically urged Headquarters to authorize "exploratory conversations" to launch his top priority plan:

> NO REALLY AIRTIGHT OP POSSIBLE WITH ASSETS NOW AVAILABLE. MUST CHOOSE BETWEEN CANCELLING OP OR ACCEPTING CALCULATED RISKS OF VARYING DEGREES.
>
> * * * [IN] VIEW NECESSITY ACT IMMEDIATELY, IF AT ALL, URGE HQS AUTHORIZE EXPLORATORY CONVERSATIONS TO DETERMINE IF [AGENT] WILLING TAKE ROLE AS ACTIVE AGENT OR CUT-OUT THIS OP. (WOULD APPROACH ON HYPOTHETICAL BASIS AND NOT REVEAL PLANS.) IF HE APPEARS WILLING ACCEPT ROLE, WE BELIEVE IT NECESSARY REVEAL OBJECTIVE OP TO HIM.
>
> * * * REQUEST HQS REPLY [IMMEDIATELY]. (CIA Cable, Leopoldville to Tweedy, 9/30/60)

Headquarters replied:

> YOU ARE AUTHORIZED HAVE EXPLORATORY TALKS WITH [AGENT] TO ASSESS HIS ATTITUDE TOWARD POSSIBLE ACTIVE AGENT OR CUTOUT ROLE *** IT DOES APPEAR FROM HERE THAT OF POSSIBILITIES AVAILABLE [THIS AGENT] IS BEST *** WE WILL WEIGH VERY CAREFULLY YOUR INITIAL ASSESSMENT HIS ATTITUDE AS WELL AS ANY SPECIFIC APPROACHES THAT MAY EMERGE *** APPRECIATE MANNER YOUR APPROACH TO PROBLEM "HOPE *** FOR MODERATE HASTE" (CIA Cable, Deputy Chief, Africa Division to Leopoldville, 9/30/60)

Tweedy and his Deputy made it clear that the agent was being viewed as a potential assassin. (Tweedy, 10/9/75 I, p. 41; Deputy Chief, Africa Division, affidavit, 10/17/75, p. 4) Tweedy stated that it would have been proper for his Deputy to issue this cable authorizing the Station Officer to take the assassination operation "one step further" and it was "quite possible" that Richard Bissell was informed of this directive. (Tweedy, 10/9/75, pp. 42–43)

On October 7, the Station Officer reported to Headquarters on his meeting with the agent who was his best candidate for gaining access to Lumumba:

> CONDUCTED EXPLORATORY CONVERSATION WITH [AGENT] *** AFTER EXPLORING ALL POSSIBILITIES [AGENT] SUGGESTED SOLUTION RECOMMENDED BY HQS. ALTHOUGH DID NOT PICK UP BALL, BELIEVE HE PREPARED TAKE ANY ROLE NECESSARY WITHIN LIMITS SECURITY ACCOMPLISH OBJECTIVE. (CIA Cable, Station Officer to Tweedy, 10/7/60)

The Station Officer testified that the subject "explored was the agent's ability to find a means to inject the toxic material into Lumumba's food or toothpaste:

> I believe that I queried the agent who had access to Lumumba, and his entourage, in detail about just what access he actually had, as opposed to speaking to people. In other words, did he have access to the bathroom did he have access to the kitchen, things of that sort.
> I have a recollection of a having queried him on that without specifying why I wanted to know this. (Hedgman, 8/21/75, pp. 48, 60)

The Station Officer said that he was left with doubts about the wisdom or practicality of the assassination plot:

> [C]ertainly I looked on it as a pretty wild scheme professionally. I did not think that it *** was practical professionally, certainly, in a short time, if you were going to keep the U.S. out of it *** I explored it, but I doubt that I ever really expected to carry it out. (Hedgman, 8/21/75, p. 11)

(iii) The Assassination Operation Moves Forward After Scheider's Return to Headquarters: October 5–7, 1960

Despite the Station Officer's testimony about the dubious practicality of the assassination operation, the cables indicate that he planned to continue his efforts to implement the operation and sought the resources to do so successfully. For example, he urged Headquarters to send an alternate agent:

> IF HQS BELIEVE [AGENT'S CIRCUMSTANCES] BAR HIS PARTICIPATION, WISH STRESS NECESSITY PROVIDE STATION WITH QUALIFIED THIRD COUNTRY NATIONAL. (CIA Cable, Leopoldville to Tweedy, 10/7/60)

Tweedy cabled the Station Officer that he "had good discussion your colleague 7 Oct"—referring to a debriefing of Scheider upon his return to the United States. Tweedy indicated that he continued to support the assassination operation and advised (Tweedy, 10/9/75 II, pp. 48–49):

> BE ASSURED DID NOT EXPECT PROP OBJECTIVES BE REACHED IN SHORT PERIOD ∗∗∗ CONSIDERING DISPATCHING THIRD COUNTRY NATIONAL OPERATIVE WHO, WHEN HE ARRIVES, SHOULD BE ASSESSED BY YOU OVER PERIOD TO SEE WHETHER HE MIGHT PLAY ACTIVE OR CUTOUT ROLE ON FULL TIME BASIS. IF YOU CONCLUDE HE SUITABLE AND BEARING IN MIND HEAVY EXTRA LOAD THIS PLACES ON YOU, WOULD EXPECT DISPATCH [TEMPORARY DUTY] SENIOR CASE OFFICER RUN THIS OP ∗∗∗ UNDER YOUR DIRECTION. (CIA Cable, Tweedy to Station Officer, 10/7/60)[32]

According to the report of the Station Officer, Joseph Scheider left the Congo to return to Headquarters on October 5 in view of the "expiration date his material" (CIA Cable, Leopoldville to Tweedy, 10/7/60)—a reference to the date beyond which the substances would no longer have lethal strength. (Scheider, 10/7/75, pp. 132–133) The cable from the Station Officer further stated that:

> [JOE] LEFT CERTAIN ITEMS OF CONTINUING USEFULNESS. [STATION OFFICER] PLANS CONTINUE TRY IMPLEMENT OP. (CIA Cable, Leopoldville to Tweedy, 10/7/60)

Notwithstanding the influence of the Station Officer's October 7 cable that some toxic substances were left with Hedgman, Scheider specifically recalled that he had "destroyed the viability" of the biological material and disposed of it in the Congo River before he departed for the United States on October 5, 1960. (Scheider, 10/7/75, pp. 133, 117, 135–136; 10/9/75, p. 20) In the only real conflict between his testimony and Schieder's, Hedgman testified that the toxic material was not disposed of until after Lumumba was imprisoned by the Congolese in early December. (Hedgman, 8/21/75, pp. 85–86)[33]

---

[32] See Sections 5(b)–5(c), *infra,* for a detailed account of the activities in the Congo of two "third country national" agents: QJ/WIN and WI/ROGUE. See Section 5(a), *infra,* for discussion of the temporary duty assignment in the Congo of senior case officer" Michael Mulroney.

[33] Scheider said he destroyed and disposed of the toxic materials: "for the reason that it didn't look like on this trip he could mount the operational ∗∗∗ assets to do the job and ∗∗∗ the material was not refrigerated and unstable." He said that he and the Station Offices "both felt that we shouldn't go ahead with this until there were no doubts." (Scheider, 10/7/75, p. 116) The Station Officer had been unable "to find a secure enough agent with the right access" to Lumumba before the potency of the biological material was "no longer reliable." (Scheider, 10/9/75, p. 28: 10/7/75, pp. 132–133) Scheider speculated that the Station Officer's reference to retaining "items of continuing usefulness" may have meant the gloves, mask, and hypodermic syringe left with Hedgman. Scheider said: "perhaps he is talking about leaving these accessory materials in case there will be a round two of this, and someone brings more material." (Scheider, 10/7/75, p. 135)

The central point remains that the Station Officer planned to continue the assassination effort, by whatever means, even after Scheider's departure. (Scheider, 10/7/75, p. 143) Scheider was under the impression that the Station Officer was still authorized to move ahead with an assassination attempt against Lumumba at that point, although he would have continued to submit his plans to Headquarters. (Scheider, 10/7/75, p.135; 10/9/75, pp. 20–21)[34]

(iv) Headquarters Continues to Place "Highest Priority" on the Assassination Operation

SUMMARY

The cable traffic during this period demonstrates that there was a clear intent at Headquarters to authorize and support rapid progress of the assassination operation. Even after Lumumba placed himself in the protective custody of the United Nations, CIA Headquarters continued to regard his assassination as the "highest priority" of covert action in the Congo. The cables also show an intent at Headquarters to severely restrict knowledge of the assassination operation among officers in CIA's Africa Division and among United States diplomatic personnel in the Congo, excluding, even those who were aware of, and involved in, other covert activities.

The Station Officer, despite the burden of his other operational responsibilities, was actively exploring, evaluating, and reporting on the means and agents that might be used in an attempt to assassinate Lumumba. When his implementation of the assassination operation was thwarted by the failure of his prime candidate to gain access to Lumumba, Hedgman requested additional operational and supervisory personnel to help him carry out the assignment, which he apparently pursued until Lumumba was imprisoned by Congolese authorities.

On October 15, 1960, shortly after Tweedy offered additional manpower for the assassination operation, a significant pair of cables were sent from CIA Headquarters to Leopoldville.

One cable was issued by a desk officer in CIA's Africa Division, released under Bronson Tweedy's signature, and transmitted through standard CIA channels, thus permitting distribution of the message to appropriate personnel in the CIA Station and the

---

In support of his position the Station Officer speculated that it was "possible" that be had preserved the poisons in his safe until after Lumumba's death. (Hedgman, 8/21/75, p. 85) He said that after Scheider's visit, he locked the toxic material in the bottom drawer of his safe, "probably" sealed in an envelope marked "Eyes Only" with his name on it. (Hedgman, 8/21/75, pp. 48–49) He did not recall taking the materials out of his safe except when he disposed of them months later. (Hedgman, 8/21/75, p. 84)

Both Scheider and the Station Officer specifically recalled disposing of the toxic material in the Congo River and each recalled performing the act alone. (Scheider, 10/7/75, pp. 117–118; Hedgman, 8/21/75, p. 84)

The Station Officer's testimony is bolstered by Michael Malroney's account that when he arrived in the Congo nearly a month after Scheider had returned to Headquarters. Hedgman informed him that there was a lethal virus in the station safe. (See Section 5(a) (iii), *infra*.) Moreover, the Station Officer distinctly remembered disposing of the medical paraphernalia. (Hedgman, 8/21/75, p. 84) This would indicate that, at the least, the operation had not been "stood down" to the point of disposing of all traces of the plot until long after Scheider's departure from the Congo.

[34] For Tweedy's testimony about the operational authority possessed by the Station Officer on October 7, see Section 4(h), *infra.*

United States Embassy. (Tweedy, 10/9/75 I, pp. 60–62) The cable discussed the possibility of covertly supplying certain Congolese leaders with funds and military aid and advised:

> ONLY DIRECT ACTION WE CAN NOW STAND BEHIND IS TO SUPPORT IMMOBILIZING OR ARRESTING [LUMUMBA], DESIRABLE AS MORE DEFINITIVE ACTION MIGHT BE. ANY ACTION TAKEN WOULD HAVE TO BE ENTIRELY CONGOLESE. (CIA Cable, Director to Leopoldville, 10/15/60)

On the same day Tweedy dispatched, a second cable, via the PROP channel for Hedgman's "Eyes Only," which prevented the message from being distributed to anyone else, including the Ambassador.[35] Tweedy's Deputy stated that "the cable which carried the PROP indicator would have controlling authority as between the two cables." (Deputy Chief, Africa Division affidavit, 10/17/75, p. 4) The second cable stated:

> YOU WILL NOTE FROM CABLE THROUGH NORMAL CHANNEL CURRENTLY BEING TRANSMITTED A PARA[GRAPH] ON PROP TYPE SUGGESTIONS. YOU WILL PROBABLY RECEIVE MORE ALONG THESE LINES AS STUMBLING BLOC [LUMUMBA] REPRESENTS INCREASINGLY APPARENT ALL STUDYING CONGO SITUATION CLOSELY AND HIS DISPOSITION SPONTANEOUSLY BECOMES NUMBER ONE CONSIDERATION.
>
> RAISE ABOVE SO YOU NOT CONFUSED BY ANY APPARENT DUPLICATION. THIS CHANNEL REMAINS FOR SPECIFIC PURPOSE YOU DISCUSSED WITH COLLEAGUE AND ALSO REMAINS HIGHEST PRIORITY. (CIA Cable, Tweedy to Station Officer, 10/15/60)

Tweedy testified that the "specific purpose discussed with colleague" referred to the Station Officer's discussion of "assassination with Scheider." He stated that the premise of his message was that "there is no solution to the Congo as long as Lumumba stays in a position of power or influence there." (Tweedy, 10/9/75 I, pp. 59, 60)[36]

Tweedy went on to request the Station Officer's reaction to the prospect of sending a senior CIA case officer to the Congo on a "direct assignment ∗ ∗ ∗ to concentrate entirely this aspect" (CIA Cable, Tweedy to Station Officer, 10/15/60).[37]

The cable also provided an insight into why the assassination operation had not progressed more rapidly under the Station Officer:

> SEEMS TO US YOUR OTHER COMMITMENTS TOO HEAVY GIVE NECESSARY CONCENTRATION PROP.

---

[35] Hedgman testified that he did not discuss the assassination operation with anyone at the United States embassy in Leopoldville. Moreover, he testified that he never discussed the prospect of assassinating Lumumba with Clare H. T. Timberlake, who was the Ambassador to the Congo at that time. (Hedgman, 8/21/75, p. 91)

[36] See Section 4(h), *infra,* for Tweedy's testimony on the conditions under which he believed the operation was authorized to proceed.

This referred to CIA officer Michael Mulroney (Tweedy, 10/9/75 I, p. 56), who testified that in late October he was asked by Richard Bissell to undertake the mission of assassinating Lumumba.

[37] For a full account of the meeting between Bissell and Mulroney and Mulroney's subsequent activities in the Congo, see Section 5 (a), *infra.*

In contradiction of the limitations on anti-Lumumba activity outlined in the cable sent through normal channels, Tweedy's cable suggested:

> POSSIBILITY USE COMMANDO TYPE GROUP FOR ABDUCTION [LUMUMBA], EITHER VIA ASSAULT ON HOUSE UP CLIFF FROM RIVER OR, MORE PROBABLY, IF [LUMUMBA] ATTEMPTS ANOTHER BREAKOUT INTO TOWN * * * REQUEST YOUR VIEWS. (CIA Cable, Tweedy to Station Officer, 10/15/60)

Two days later the Station Officer made a number of points in a reply to Tweedy. First, the agent he had picked for the assassination operation had difficulty infiltrating Lumumba's inner circle:[38]

> HAS NOT BEEN ABLE PENETRATE-ENTOURAGE. THUS HE HAS NOT BEEN ABLE PROVIDE OPS INTEL NEEDED THIS JOB. * * * ALTHOUGH MAINTAINING PRIORITY INTEREST THIS OP, ABLE DEVOTE ONLY LIMITED AMOUNT TIME, VIEW MULTIPLE OPS COMMITMENTS. * * * BELIEVE EARLY ASSIGNMENT SENIOR CASE OFFICER HANDLE PROP OPS EXCELLENT IDEA * * * IF CASE OFFICER AVAILABLE [STATION OFFICER] WOULD DEVOTE AS MUCH TIME AS POSSIBLE TO ASSISTING AND DIRECTING HIS EFFORTS, (CIA Cable, 10/17/60)

The Station Officer concluded this cable with the following cryptic recommendation, reminiscent of his testimony that he may have "suggested" shooting Lumumba to Scheider as an alternative to poisoning (Hedgman, 8/21/75, pp. 27–29):

> IF CASE OFFICER SENT, RECOMMEND HQS POUCH SOONEST HIGH POWERED FOREIGN MAKE RIFLE WITH TELESCOPIC SCOPE AND SILENCER. HUNTING GOOD HERE WHEN LIGHTS RIGHT. HOWEVER AS HUNTING RIFLES NOW FORBIDDEN, WOULD KEEP RIFLE IN OFFICE PENDING OPENING OF HUNTING SEASON. (CIA Cable, 10/17/60)

Tweedy testified that the Station Officer's recommendation clearly referred to sending to the Congo via diplomatic pouch a weapon suited for assassinating Lumumba. (Tweedy, 10/9/75 I, p. 64) Senior case officer Mulroney stated that lie never heard discussion at Headquarters of sending a sniper-type weapon to the Congo, nor did he have any knowledge that such a weapon had been "pouched" to the Congo. (Mulroney affidavit, 11/7/75)

The oblique suggestion of shooting Lumumba at the "opening of hunting season" could be interpreted as a plan to assassinate Lumumba as soon as lie was seen outside the residence where he remained in U.N. protective custody. Tweedy interpreted the cable to mean that "an operational plan involving a rifle" had not yet been formulated by the Station Officer and that the "opening of hunting season" would depend upon approval of such a plan by CIA headquarters. (Tweedy, 10/9/75 1, pp. 64–65)

A report sent the next month by the Station Officer through the PROP channel for Tweedy's "Eyes Alone" indicated that, whatever the intention about moving forward with a plan for assassination by rifle fire, Lumumba was being viewed as a "target" and his movements were under close surveillance. Hedgman's cable described the stalemate which prevailed from mid-September until Lumumba's departure for Stanleyville on November 27; Lumumba was virtually a prisoner in U.N. custody, and inaccessible to CIA agents and the Congolese:

---

[38] This agent left Leopoldville "sometime in October" and their discussions terminated. (Hedgman, 8/21/75, p. 61)

TARGET HAS NOT LEFT BUILDING IN SEVERAL WEEKS. HOUSE GUARDED DAY AND NIGHT BY CONGOLESE AND UN TROOPS ***. CONGOLESE TROOPS ARE THERE TO PREVENT TARGET'S ESCAPE AND TO ARREST HIM IF HE ATTEMPTS. UN TROOPS THERE TO PREVENT STORMING OF PALACE BY CONGOLESE. CONCENTRIC RINGS OF DEFENSE MAKE ESTABLISHMENT OF OBSERVATION POST IMPOSSIBLE. ATTEMPTING GET COVERAGE OF ANY MOVEMENT INTO OR OUT OF HOUSE BY CONGOLESE ***. TARGET HAS DISMISSED MOST OF SERVANTS SO ENTRY THIS MEANS SEEMS REMOTE. (CIA Cable, Station Officer to Tweedy, 11/14/60)

(h) Tweedy/Bissell Testimony: Extent of Implementation; Extent o f Authorization

SUMMARY

The testimony of Richard Bissell and Bronson Tweedy is at some variance from the picture of the assassination plot presented by the Station Officer and by the cable traffic from the period.

The cables demonstrate that CIA Headquarters placed the "highest priority" on the effort to assassinate Lumumba. They also show that the assassination operation involving Scheider and the Station Officer was initiated by a cable signed personally by Bissell and Tweedy and transmitted in a specially restricted cable channel established solely for communications about this operation. Bissell and Tweedy both testified to an absence of independent recollection of Scheider's assignment in the Congo and of any specific operation to poison Lumumba.

The cables appear to indicate that the Station Officer was authorized to proceed with an assassination attempt if he determined it to be a feasible, secure operation and if time did not permit referral to Headquarters for approval. Tweedy alone testified that the Station Officer was empowered only to explore and assess the means of assassinating Lumumba and not to proceed with an assassination attempt even when "time did not permit" referral to Headquarters.

(i) Tweedy's Testimony About the Scope of the Assassination Operation

As Chief of the Africa Division, Bronson Tweedy had the principal supervisory responsibility at CIA Headquarters for the operations of the Station Officer Hedgman in Leopoldville. Most of the reports and recommendations cabled by Hedgman on the assassination operation were marked for Tweedy's "Eyes Only." Through Tweedy, instructions were issued, plans were approved, and progress reports were assessed concerning the effort to assassinate Lumumba.[39]

[39] Tweedy personally signed both the cable which initially informed the Station Officer that "JOE" would arrive in Leopoldville with an assignment (CIA Cable, Bissell, Tweedy to Station Officer, 9/19/60) and the cable of October 7 indicating that he had debriefed Scheider upon his return from the Congo. (CIA Cable, Tweedy to Station Officer, 10/7/60) Tweedy was also the "Eyes Only" recipient of Hedgman's reports on Scheider's arrival in the Congo (CIA Cable, Station Officer to Tweedy, 9/27/60) and of subsequent communications about the top priority plan that emerged from the discussions between Scheider and Hedgman: i.e., infiltrating an agent into Lumumba's entourage to administer a lethal poison to the Congolese leader, (CIA Cable, Station Officer to Tweedy, 9/30/60; CIA Cable, Station Officer to Tweedy, 10/7/60; CIA Cable, Station Officer to Tweedy, 10/17/60) See Sections 4(a)–4(e) *supra* for a full treatment of the cables sent in the PROP channel between Tweedy and the Station Officer in Leopoldville.

Before reviewing all of the cables, Tweedy testified that he had no knowledge of the plot to poison Lumumba. (Tweedy, 9/9/75, pp. 30–31) He stated that if Scheider went to the Congo as a courier carrying lethal biological material, "I will bet I knew it, but I don't recall it." (Tweedy, 9/9/75, p. 35)

Tweedy commented that rather than questioning the truth of the Station Officer's testimony,[40] the discrepancies between their testimony could be attributed to his own lack of recall.[41]

Even after he reviewed the cables on the PROP operation, Tweedy said that he did not recall talking to Scheider about an assignment to the Congo, although he assumed he had done so. Tweedy's review enabled him to "recall the circumstances in which these things occurred; and there's no question that Mr. Scheider went to the Congo." (Tweedy, 10/9/75 I, p. 13; II, pp. 5–6)[42]

Despite Tweedy's lack of recollection about the actual plot to poison Lumumba, he recalled discussing the feasibility of an assassination attempt against Lumumba with Bissell and communicating with the Station Officer about gaining access to Lumumba for this purpose. (Tweedy, 9/9/75, pp. 14–15, 19–21)

Tweedy characterized his discussions with Bissell about assassinating Lumumba as "contingency planning" (Tweedy, 9/9/75, p. 28):

TWEEDY. ∗∗∗ I think it came up in the sense that Dick would have said we probably better be thinking about whether it might ever be necessary or desirable to get rid of Lumumba, in which case we presumably should be in position to assess whether we could do it or not successfully.

Q. Do it, meaning carry off an assassination?

TWEEDY. Yes, but it was never discussed with him in any other sense but a planning exercise. ∗∗∗ never were we instructed to do anything of this kind. We were instructed to ask whether such a thing would be feasible and to have the Station Officer thinking along those lines as well. (Tweedy, 9/9/75, pp. 15, 28)

Tweedy testified that Bissell never authorized him to proceed beyond the planning stage to move forward with an assassination attempt. (Tweedy, 10/9/75 I, p. 17)

Tweedy characterized the entire assassination operation as "exploratory":

> This involved the launching of the idea with the field so they could make the proper operational explorations into the feasibility of this, reporting back to Headquarters for guidance. At no point

[40] Tweedy expressed a high regard for the credibility of the Station Officer. Tweedy said that he never had occasion to doubt Hedgman's veracity or integrity, adding, "I would trust his memory and I certainly trust his integrity." (Tweedy, 9/9/75, p. 36)

[41] Tweedy explained his difficulty in recalling the assassination operation:

"[T]he things that I recall the most vividly about all my African experiences were ∗∗∗ the things I was basically concerned with all the time, which was putting this Division together and the rest of it. When it comes to operational detail I start getting fuzzy and you would have thought with something like thinking about Mr. Lumumba in these terms that I would have gone to bed and got up thinking about Lumumba, I can assure you this wasn't the case." (Tweedy, 9/9/75, p 34)

[42] For a detailed treatment of Tweedy's testimony on Scheider's assignment to the Congo and the assassination operation against Lumumba, see Sections 4(a)–(g), *supra.*

> was the field given carte blanche if they thought they had found a way to do the job, just to carry it out with no further reference. (Tweedy, 10/9/75 II, p. 22)

He testified that the period of exploration of access to Lumumba remained "a planning interval and at no point can I recall that I ever felt it was imminent that somebody would say 'go.' " (Tweedy, 9/9/75, pp. 18–19)

Tweedy stated that, despite his inability to specifically recall his directive to Scheider, he would not have given the Station Officer an instruction "to use this [toxic] material and go ahead and assassinate Lumumba, as if * * * that is all the authority that was necessary." He said that:

> Under no circumstances would that instruction have been given by me without reference to higher authority up through the chain of command * * * my higher authority, in the first instance, would be Mr. Bissell * * * and I know Mr. Bissell would have talked to Mr Dulles. (Tweedy, 10/9/75 I, pp. 17–18; 10/9/75 II, pp. 25, 33)

It is difficult to reconcile some of the cables and the testimony of Scheider and Hedgman with Tweedy's testimony that there was "no misunderstanding" that the PROP operation was purely exploratory "contingency planning" and that no authorization was granted for attempting an assassination without checking back with headquarters.

For example, Dulles' August 26 directive appeared to indicate wide latitude for making operational decisions in the field "where time does not permit referral" to Headquarters.

Tweedy testified that sending a potentially lethal biological material with a short period of toxicity to the Congo did not mean that the Station Officer was empowered to take action without seeking final approval from Headquarters.

> TWEEDY: If, as a result of the Station focusing on the problem for the first time, as a result of Headquarters' request, they had come up with a plan that they thought was exceedingly solid and which Headquarters approved, it is not surprising, perhaps, that we wanted the materials there to take advantage of such * * * an unlikely event.
>
> Q: Because Scheider took lethal materials to the Congo with him that had such a short period of lethality, were you not contemplating at that tine that the operation might well move from the exploration phase to the implementation phase just as soon as Scheider and Hedgman determined that it was feasible?
>
> TWEEDY: I think I would put it quite differently. I think that I would say that we would have been remiss in not being in a position to exploit, if we reached the point where we all agreed that the thing was possible. (Tweedy, 10/9/75 I, pp. 49–50)

The dispatch of toxic material and medical paraphernalia to the Congo certainly demonstrates that the "exploration" of the feasibility of assassinating Lumumba had progressed beyond mere assessment and "contingency planning."

Tweedy further disagreed that the Station Officer's October 7 message that he would "continue try implement op[eration]" signified that the Officer was prepared to proceed to "implement" an assassination attempt:

> He would continue to explore the possibilities of this operation and continue to report to Headquarters. That is all this means. It does not mean that * * * he would try to pull off the

> operation without further reference to Headquarters * * * [H]e was to continue to explore it to determine whether or not there was a feasible means. (Tweedy, 10/9/75 II, pp. 14–15)

Finally, Tweedy's recollection that a "go ahead" on the assassination operation was never imminent is brought into question by the cable he sent for Hedgman's "Eyes Only" on October 15 to assure him that there was a policy-level consensus that Lumumba's "disposition spontaneously becomes number one consideration" and that the PROP operation "remains highest priority." (CIA Cable, Tweedy to Station, 10/15/60)

(ii) Bissell's Testimony About Moving the Assassination Operation From Planning to Implementation

Richard Bissell testified that he did not remember discussing the feasibility of assassinating Lumumba with Bronson Tweedy, but it seemed "entirely probable" to him that such discussions took place. Bissell, who did not review the cable traffic, said he "may have" given Tweedy specific instructions about steps to further an assassination plan, but he did not remember doing so. He said that seeking information from the Station Officer about access for poisoning or assassinating Lumumba by other means would "almost certainly" have been a "major part" of his "planning and preparatory activity" but he had no specific recollection of cable communications on this subject. He did recall that the Station Officer had an agent who supposedly had direct access to Lumumba. (Bissell, 9/10/75, pp. 3, 4, 6–8, 80)

Bissell testified that he "most certainly" approved any cables that Tweedy sent to the Station Officer seeking information about gaining access to Lumumba because in "a matter of this sensitivity," Tweedy probably would have referred cables to him for final dispatch. But Bissell added:

> I think Mr. Tweedy, on the basis of an oral authorization from me, would have had the authority to send such a cable without my signing off on it. (Bissell, 9/10/75, p. 8)

Bissell's failure to recall discussing his assignment to Michael Mulroney[43] with Tweedy provided a basis for his speculation that Tweedy might also have been unaware of the true purpose of Scheider's visit. (Bissell, 9/10/75, pp. 20–22)

Bissell did not recall cables concerning Scheider's mission, and confirming that Scheider's instructions were to be followed; but he said "this sounds highly likely * * * I would expect, given the background, that the confirmation would have been forthcoming." (Bissell, 9/10/75, p. 43)

Bissell said that it was "very probable" that he discussed the assassination of Lumumba with Scheider, who was then his science advisor. On a number of occasions he and Scheider had discussed "the availability of means of incapacitation, including assassination." Although he had no "specific recollection," Bissell assumed that, if Scheider went to the Congo, Bissell would have approved the mission, which "might very well" have dealt with the assassination of Lumumba. (Bissell, 9/10/75, pp. 14, 60, 18, 20, 44)

Bissell testified that it would not have been against CIA policy in the fall of 1960 to send poisons to the Congo. He characterized "the act of taking the kit to the Congo * * * as still in the planning stage." (Bissell, 9/10/75, pp. 35, 49). He acknowledged, however, that:

---

[43] Bissell's assignment to Mulroney is discussed in Sections 5(a) (i) and 5(a) (ii), *infra*.

> It would indeed have been rather unusual to send such materials—a specific kit * * * of this sort—out to a relatively small Station, unless planning for their use was quite far along. (Bissell, 9/10/7, p. 37)

Nonetheless, Bissell said that he "probably believed" that he had sufficient authority at that point to direct CIA officers to move from the stage of planning to implementation. (Bissell, 9/10/75, pp. 60–61) Although he did not have a specific recollection, Bissell assumed that if Scheider had instructed Hedgman to assassinate Lumumba, Scheider would not have been acting beyond the mandate given to him by Bissell and the assassination plot would then have "passed into an implementation phase." (Bissell, 9/10/75, pp. 39, 41, 49)

5. The Question of a Connection Between the Assassination Plot and Other Actions of CIA Officers and Their Agents in the Congo

SUMMARY

Michael Mulroney, a senior CIA officer in the Directorate for Plans, testified that in October 1960 he had been asked by Richard Bissell to go to the Congo to carry out the assassination of Lumumba. Mulroney said he refused to participate in an assassination operation, but proceeded to the Congo to attempt to draw Lumumba away from the protective custody of the U.N. guard and place him in the hands of Congolese authorities. (Mulroney, 6/9/75, pp. 11–14)

Shortly after Mulroney's arrival in the Congo, he was joined by QJ/WIN, a CIA agent with a criminal background.[44] Late in 1960, WI/ROGUE, one of Hedgman's operatives approached QJ/WIN with a proposition to join an "execution squad." (CIA Cable, Leopoldville to Director, 12/7/60)

It is unlikely that Mulroney was actually involved in implementing the assassination assignment. Whether there was any connection between the assassination plot and either of the two operatives—QJ/WIN and WI/ROGUE—is less clear.

(a) Mulroney's Assignment in the Congo

(i) Mulroney's Testimony That He Went to the Congo After Refusing an Assassination Assignment From Bissell

In early October, 1960, several PROP cables discussed a plan to send a "senior case officer" to the Congo to aid the overburdened Station Officer with the assassination operation.[45] Shortly after the Station Officer's request on October 17, for a senior case officer to concentrate on the assassination operation. Bissell broached the subject with Mulroney. At the time, Mulroney was the Deputy Chief of an extraordinarily secret unit within the Directorate of Plans. (Mulroney, 6/9/75, p. 8)

Mulroney testified that in October of 1960, Bissell asked him to undertake the mission of assassinating Patrice Lumumba:

> MULRONEY: He called me in and told me he wanted to go down to the Belgian Congo, the former Belgian Congo, and to eliminate Lumumba * * *.

---

[44] See Part III, Section c, of this Report for a discussion of the CIA's use of QJ/WIN in developing a stand-by assassination capability in the Executive Action project.

[45] See Section 4(g), *supra*, for full treatment of these cables.

Q: What did you understand him to mean by eliminate?

MULRONEY: To kill him and thereby eliminate his influence.

Q: What was the basis for your interpreting his remarks, whatever his precise language, as meaning that he was talking about assassination rather than merely neutralizing him through some other means?

MULRONEY: It was not neutralization ∗∗∗ clearly the context of our talk was to kill him. (Mulroney, 6/9/75, pp. 11–12, 19, 43)

Mulroney testified:

> I told him that I would absolutely not have any part of killing Lumumba. He said, I want you to go over and talk to Joseph Scheider. (Mulroney, 6/9/75, p. 12)

Mulroney said that it was "inconceivable that Bissell would direct such a mission without the personal permission of Allen Dulles":

> I assumed that he had authority from Mr. Dulles in such as important issue, but it was not discussed [with me], nor did he purport to have higher authority to do it. (Mulroney, 9/9/75, pp. 15, 44)

Mulroney then met promptly with Scheider and testified that he was "sure that Mr. Bissell had called Scheider and told him I was coming over" to his office. Scheider told Mulroney "that there were four or five ∗∗∗ lethal means of disposing of Lumumba ∗∗∗. One of the methods was a virus and the others included poison." Mulroney said that Scheider "didn't even hint ∗∗∗ that he had been in the Congo and that he had transported any lethal agent to the Congo." (Mulroney, 6/9/75, pp. 12–13; 9/11/75, pp. 7–7A)

Mulroney testified that after speaking with Scheider:

> I then left his office, and I went back to Mr. Bissell's office, and I told him in no way would I have any part in the assassination of Lumumba ∗∗∗ and reasserted in absolute terms that I would not be involved in a murder attempt. (Mulroney, 9/11/75, p. 43)[46]

---

[46] When asked at the conclusion of his testimony to add anything to the record that he felt was necessary to present a full picture of the operation against Lumumba, Mulroney volunteered a statement about the moral climate in which it took place:

"All the people that I knew acted in good faith. I think they acted in the light of ∗∗∗ maybe not their consciences, but in the light of their concept of patriotism. [T]hey felt that this was in the best interests of the U.S. I think that we have to much of the 'good German' in us, in that we do something because the boss says it is okay. And they are not essentially evil people. But you can do an awful lot of wrong in this.

"∗∗∗ This is such a dishonest business that only honest people can be in it. That is the only thing that will save the Agency and make you trust the integrity of what they report ∗∗∗. An intelligence officer ∗∗∗ must be scrupulous and he must be moral ∗∗∗ he must have personal integrity ∗∗∗. They must be particularly conscious of the moral element in intelligence operations." (Mulroney, 9/11/75, pp. 57, 61)

Earlier in his testimony, Mulroney succinctly summarized his philosophical opposition to assassinating Lumumba: "murder corrupts." (Mulroney, 9/11/75, p. 9)

Mulroney said that in one of his two conversations with Bissell about Lumumba, he raised the prospect "that conspiracy to commit murder being done in the District of Columbia might be in violation of federal law." He said that Bissell "airily dismissed" this prospect. (Mulroney, 6/9/75, p. 14)

Although he refused to participate in assassination, Mulroney agreed to go to the Congo on a general mission to "neutralize" Lumumba "as a political factor" (Mulroney, 9/11/75, pp. 43–44):

> I said I would go down and I would have no compunction about operating to draw Lumumba out [of UN custody], to run an operation to neutralize his operations which were against Western interests, against, I thought, American interests. (Mulroney, 6/9/75, p. 13)[47]

Although Mulroney did not formulate a precise plan until he reached the Congo, he discussed a general strategy with Bissell:

MULRONEY: I told Mr. Bissell that I would be willing to go down to neutralize his activities and operations and try to bring him out [of UN custody] and turn him over to the Congolese authorities.

Senator MONDALE: Was it discussed then that his life might be taken by the Congolese authorities?

MULRONEY: It was, I think, considered * * * not to have him killed, but then it would have been a Congolese being judged by Congolese for Congolese crimes. Yes, I think it was discussed. (Mulroney, 6/9/75, p. 38)

According to Mulroney there was a "very, very high probability" that Lumumba would receive capital punishment at the hands of the Congolese authorities. But he "had no compunction about bringing him out and then having him tried by a jury of his peers." (Mulroney, 6/9/75, pp. 24, 14)

Despite Mulroney's expressed aversion to assassination and his agreement to undertake a more general mission to "neutralize" Lumumba's influence, Bissell continued pressing him to consider an assassination operation:

> In leaving at the conclusion of our second discussion * * * he said, well, I wouldn't rule out that possibility—meaning the possibility of the elimination or the killing of Lumumba * * *. In other words, even though you have said this, don't rule it out * * *. There is no question about it, he said, I wouldn't rule this other out, meaning the elimination or the assassination. (Mulroney, 9/11/75, p. 45)

Mulroney distinctly recalled that after his second discussion with Bissell, he meet with Richard Helms, who was then Deputy to the DDP and Chief of Operations in the clandestine services division, in order to make his opposition to assassinating Lumumba a matter of record (Mulroney, 9/11/75, pp. 44–45):

---

[47] Bissell also recalled that, after discussing assassination with Mulroney, Mulroney went to the Congo "with the assignment * * * of looking at other ways of neutralizing Lumumba." (Bissell, 9/10/75, p. 53)

> [I]n the Agency, since you don't have documents, you have to be awfully canny and you have to get things on record, and I went into Mr. Helms' office, and I said, Dick, here is what Mr. Bissell proposed to me, and I told him that I would under no conditions do it, and Helms said, 'you're absolutely right.' (Mulroney 6/9/75, pp. 15–16)

Helms testified that it was "likely" that he had such a conversation with Mulroney and he assumed that Mulroney's version of their conversation was correct. (Helms, 9/16/75, pp. 22–23)[48]

William Harvey was Mulroney's immediate superior at that time[49] He testified:

> Mr. Mulroney came to me and said that he had been approached by Richard Bissell ∗∗∗ to undertake an operation in the Congo, one of the objectives of which was the elimination of Patrice Lumumba. He also told me that he had declined to undertake this assignment. (Harvey, 6/25/75, p. 9)

Harvey said that in a later conversation with Bissell, Bissell told him that he had asked Mulroney to undertake such an operation. (Harvey, 6/25/75, p. 9)

Tweedy's Deputy, who aided in making preparations for Mulroney's trip to the Congo, recalled that Mulroney had "reacted negatively" to Bissell's request to undertake an assassination operation. (Deputy Chief, Africa Division affidavit, 10/17/75, p. 2) He stated:

> Despite the fact that Mulroney had expressed a negative reaction to this assignment, it was clear to me that when Mulroney went to the Congo, exploration of the feasibility of assassinating Lumumba was part of his assignment from Bissell. As far as I know, Mulroney was not under assignment to attempt to assassinate Lumumba, but rather merely to make plans for such an operation. (Deputy Chief, Africa Division affidavit, 10/17/75, p. 2)

In Tweedy's mind, Mulroney's eventual mission to the Congo was also linked to assessing the possibility for assassinating Lumumba rather than to a general plan to draw Lumumba out of U.N. custody. (Tweedy, 9/9/75, pp. 24, 26)

Mulroney testified, however, that because he was "morally opposed to assassination" he would "absolutely not" have explored the means by which such access could be gained, nor would he have undertaken a mission to the Congo to assess an assassination operation even if it were directed by someone else. (Mulroney, 9/11/75, p. 26)

Mulroney said that he departed for the Congo within forty-eight hours of his second discussion with Bissell. (Mulroney, 9/11/75, pp. 45–46)

(ii) Bissell's Testimony About the Assignment to Mulroney

Bissell remembered "very clearly" that he and Mulroney discussed the assassination of Lumumba in the fall of 1960 (Bissell, 6/9/75, pp. 74–750 and the Mulroney reacted negatively. (Bissell 9/11/75, p. 18) Accrodingly to Bissell, Mulroney said that assassination

---

[48] Helms testified that he did not inquire further into the subject of this conversation in any way. He did not recall why Mulroney had gone to the Congo or what his mission was. (Helms, 9/16/75, pp. 32–33)

[49] Harvey was later centrally involved in the Castro case and the Executive Action project. See Parts III (B) and Part III (C), *infra*.

"was an inappropriate action and that the desired object could be accomplished better in other ways." (Bissell, 6/11/75, p. 54)

Bissell's testimony differs from Mulroney's account on only one important point—the degree to which Bissell's initial assignment to Mulroney contemplated the mounting of an operation as opposed to contingency planning. Mulroney flatly testified that Bissell requested him to attempt to kill Lumumba. In his first testimony on the subject, Bissell said that he asked Mulroney "to investigate the possibility of killing Lumumba." (Bissell, 6/11/75, p. 54; *see also* pp. 55, 75) In a later appearance, however, Bissell stated that Mulroney "had been asked to plan and prepare for" the assassination of Lumumba. (Bissell, 9/10/75, p. 24)

Bissell said that after his conversations with Mulroney, he considered "postponing" the assassination operation:

> I seem to recollect that after this conversation with him, I wanted this put very much on the back burner and inactivated for quite some time. Now that doesn't rule out the possibility that some action through completely different channels might have gone forward. But the best of my recollection is, I viewed this not only as terminating the assignment for him, but also as reason for at least postponing anything further along that line. (Bissell, 9/10/75, pp. 25–26)

(iii) Mulroney Informed of Virus in Station Safe Upon Arriving in Congo: November 3, 1960

On October 29, the Station Officer was informed that Michael Mulroney would soon arrive in Leopoldville "in furtherance this project." (CIA Cable Deputy Chief, Africa Division, to Station Officer 10/29/60) On November 3, Mulroney arrived in Leopoldville. (CIA Cable, Leopoldville to Director, 11/4/60) Hedgman said it was "very possible" that he regarded the dispatch to the Congo of a senior officer as a signal that CIA Headquarters was "dissatisfied with my handling" of Scheider's instructions. (Hedgman, 8/21/75, p. 42)

Hedgman had only a general picture of Mulroney's assignment:

> I understood it to be that—similar to mine, that is, the removal or neutralization of Lumumba * * * I have no clear recollection of his discussing the assassination. (Hedgman, 8/21/75, p. 54)

Station Officer Hedgman said that he did not recall if Mulroney indicated whether he was considering assassination as a means of "neutralizing" Lumumba. Hedgman said, "in view of my instructions, I may have assumed that he was" considering assassination. Generally, however, the Station Officer perceived Mulroney as unenthusiastic about his assignment. (Hedgman, 8/21/75, pp. 55, 56, 88–89)

When Mulroney arrived in the Congo, he met with the Station Officer, who informed him that there was "a virus in the safe." (Mulroney, 9/11/75, p. 7–A; 6/9/75, p. 16) Mulroney said he assumed it was a "lethal agent," although the Station Officer was not explicit:

> I knew it wasn't for somebody to get his polio shot up to date. (Mulroney, 6/9/75, pp. 16, 37)[50]

[50] Mulroney added that if the virus was to be used for medical purposes, "It would have been in the custody of the State Department" personnel, not the CIA Station. (Mulroney, 6/9/75, p. 36)

Mulroney said that he did not recall the Station Officer's mentioning the source of the virus, but:

> It would have had to come from Washington, in my estimation, and I would think, since it had been discussed with Scheider that it probably would have emanated from his office. (Mulroney, 6/9/75, p. 28)[51]

Hedgman did not recall discussing Scheider's trip to the Congo with Mulroney, but "assumed" that he did so. (Hedgman, 8/21/75, pp. 60–61)

Mulroney was "certain" that the virus had arrived before he did. (Mulroney, 6/9/75, p. 24) He was surprised to learn that such a virus was at the Leopoldville Station because he had refused an assassination mission before departing for the Congo. (Mulroney, 6/9/75, p. 17)

Mulroney stated that he knew of no other instance where a CIA Station had possessed lethal biological substances. He assumed that its purpose was assassination, probably targeted against Lumumba. (Mulroney, 9/11/75, p. 50):

> My feeling definitely is that it was for a specific purpose, and was just not an all-purpose capability there, being held for targets of opportunity, unspecified targets. (Mulroney, 9/11/75, p. 49)

Mulroney said that the Station Officer never indicated that Mulroney was to employ the virus, that he "never discussed his assassination effort, he never even indicated that this was one." (Mulroney, 9/11/75, pp. 52, 54)

While Station Officer Hedgman had no direct recollection of discussing the assassination operation with Mulroney, he "assumed" that he had at least mentioned the problem of gaining access to Lumumba for the purpose of assassinating him. (Hedgman, 8/21/75, pp. 55, 60)

Mulroney was "sure" that he "related everything" to Hedgman about his conversations with Bissell concerning the assassination of Lumumba. (Mulroney, 9/11/75, p. 46) Hedgman, however, did not recall learning this from Mulroney. (Hedgman, 8/21/75, p. 56)

Mulroney said that his discussions of assassination with Hedgman were general and philosophical, dealing with "the morality of assassinations. (Mulroney, 9/11/75, pp. 46, 54):

> From my point of view I told him I had moral objections to it, not just qualms, but objections. I didn't think it was the right thing to do. (Mulroney, 9/11/75, p. 9)

When asked to characterize Hedgman's attitude toward assassination based on those discussions, Mulroney said:

> He would not have been opposed in principle to assassination in the interests of national security * * *. I know that he is a man of great moral perception and decency and honor * * *. And

[51] When Mulroney was informed about Hedgman's testimony concerning Scheider's trip to the Congo and the plot to poison Lumumba, he said, "I believe absolutely in its credibility. Mulroney found nothing in the facts as he knew them, nor in Hedgman's character, to raise a question about that testimony. He regarded Hedgman as "an honest and a decent man—a totally truthful man." (Mulroney, 9/11/75, pp. 19, 53, 56)

> that it would disturb him to be engaged in something like that. But I think I would have to say that in our conversations, my memory of those, at no time would he rule it out as being a possibility. (Mulroney, 9/11/75, p. 18)

(iv) Mulroney's Plan to "Neutralize" Lumumba

After Mulroney arrived in the Congo, he formulated a plan for "neutralizing" Lumumba by drawing him away from the custody of the U.N. force which was guarding his residence:

MULRONEY: [W]hat I wanted to do was to get him out, to trick him out, if I could, and then turn him over *** to the legal authorities and let him stand trial. Because he had atrocity attributed to him for which he could very well stand trial.

Q: And for which he could very well have received capital punishment?

MULRONEY: Yes. And I am not opposed to capital punishment. (Mulroney, 9/11/75, pp. 20–21)[52]

To implement his plan, Mulroney made arrangements to rent "an observation post over the palace in which Lumumba was safely ensconced." He also made the acquaintance of a U.N. guard to recruit him for an attempt to lure Lumumba outside U.N. protective custody. (Mulroney, 6/9/75, p. 20; 9/11/75, p. 21) Mulroney said that he cabled progress reports to CIA Headquarters, and kept the Station Officer informed about his activities. (Mulroney, 9/11/75, pp. 26–27, 56)

Mulroney arranged for CIA agent QJ/WIN, to come to the Congo to work with him:

> What I wanted to use him for was *** counter-espionage. *** I had to screen the U.S. participation in this *** by using a foreign national whom we knew, trusted, and had worked with *** the idea was for me to use him as an alter ego. (Mulroney, 6/9/75, pp. 19–20)

In mid-November, two cables from Leopoldville urged CIA Headquarters to send QJ/WIN:

> LOCAL OPERATIONAL CIRCUMSTANCES REQUIRE IMMEDIATE EXPEDITION OF QJ/WIN TRAVEL TO LEOPOLDVILLE. (CIA Cable, Leopoldville to Director, 11/13/60; see also 11/11/60)

The cables did not explain the "operational circumstances."

---

[52] When Mulroney's mission to draw Lumumba out of the hands of the U.N. was described to C. Douglas Dillon, who was Undersecretary of State at that time, Dillon testified that it conformed to United States policy toward Lumumba. (Dillon, 9/21/75, p. 50)

According to an earlier report from the Station Officer, it was the view of the Special Representative of the Secretary General of the United Nations that arrest by Congolese authorities was "JUST A TRICK TO ASSASSINATE LUMUMBA." (CIA Cable, Station Officer to Director, 10/11/60) The Station Officer proceeded to recommend Lumumba's arrest in the same cable:

> STATION HAS CONSISTENTLY URGED [CONGOLESE] LEADERS ARREST LUMUMBA IN BELIEF LUMUMBA WILL CONTINUE BE THREAT TO STABILITY CONGO UNTIL REMOVED FROM SCENE.

(b) QJ/WIN's Mission in the Congo: November–December 1960

QJ/WIN was a foreign citizen with a criminal background, recruited in Europe. (Memo to CIA Finance Division, Re: Payments to QJ/WIN, 1/31/61) In November 1960, agent QJ/WIN was dispatched to the Congo to undertake a mission that "might involve a large element of personal risk." (CIA Cable, 11/2/60)[53]

A cable from Headquarters to Leopoldville stated:

> In view of the extreme sensitivity of the objective for which we want [QJ/WIN] to perform his task, he was not told precisely what we want him to do ∗∗∗. Instead, he was told ∗∗∗ that we would like to have him spot, assess, and recommend some dependable, quick-witted persons for our use ∗∗∗. It was thought best to withhold our true, specific requirements pending the final decision to use [him]. (CIA Cable, 11/2/60)

This message itself was deemed too sensitive to be retained at the station: "this dispatch should be reduced to cryptic necessary notes and destroyed after the first reading." (CIA Cable, 11/2/60)

QJ/WIN arrived in Leopoldville on November 21, 1960, and returned to Europe in late December 1960. (CIA Cable, 11/29/60; CIA Cable, Director to Leopoldville, 12/9/60)

Mulroney described QJ/WIN as follows:

MULRONEY: ∗∗∗ I would say that he would not be a man of many scruples.
Q: So he was a man capable of doing anything?
MULRONEY: I would think so, yes.
Q: And that would include assassination?
MULRONEY: I would think so. (Mulroney, 9/11/75, pp. 35–36)

But Mulroney had no knowledge that QJ/WIN was ever used for an assassination operation. (Mulroney, 9/11/75, pp. 36, 42)

Mulroney said that, as far as he knew, he was the only CIA officer with supervisory responsibility for QJ/WIN, and QJ/WIN did not report independently to anyone else. When asked if it was possible that QJ/WIN had an assignment independent of his operations for Mulroney, he said:

> Yes, that is possible—or it could have been that somebody contacted him after he got down there, that they wanted him to do something along the lines of assassination. I don't know. (Mulroney, 9/11/75, pp. 28, 29)

[53] An additional purpose in dispatching QJ/WIN was to send him from the Congo to another African country for an unspecified mission. QJ/WIN's mission to this country is not explained in the cable traffic between CIA Headquarters and the various stations that dealt with him.

There is no indication in CIA files as to whether QJ/WIN completed this operation. Mulroney said he had no knowledge of any assignment that would have taken QJ/WIN to this other country. (Mulroney, 9/11/75, pp. 32–33) William Harvey stated that he recalled that QJ/WIN might have been sent to an African country other than the Congo, but Harvey was "almost certain that this was not connected in any way to an assassination mission." (Harvey affidavit, 9/14/75, p. 5)

Mulroney discounted this possibility as "highly unlikely" because it would be a departure from standard CIA practice by placing an agent in a position of knowledge superior to that of his supervising officer. (Mulroney, 9/11/75, p. 29)

Despite Mulroney's doubt that QJ/WIN had an independent line of responsibility to Station Officer Hedgman, Hedgman's November 29 cable to Tweedy reported that QJ/WIN had begun implementing a plan to "pierce both Congolese and U.N. guards" to enter Lumumba's residence and "provide escort out of residence." (CIA Cable, Station Officer to Tweedy, 11/29/60) Mulroney said that he had directed QJ/WIN to make the acquaintance of the member of U.N. force. (Mulroney, 9/11/75, p. 21) By this point, Lumumba had already left U.N. custody to travel toward his stronghold at Stanleyville. This did not deter QJ/WIN:

> VIEW CHANGE IN LOCATION TARGET, QJ/WIN ANXIOUS GO STANLEYVILLE AND EXPRESSED DESIRE EXECUTE PLAN BY HIMSELF WITHOUT USING ANY APPARAT (CIA Cable, 11/29/60)

It is unclear whether this latter "plan" contemplated assassination as well as abduction. Headquarters replied affirmatively the next day in language which could have been interpreted as an assassination order:

> CONCUR QJ/WIN GO STANLEYVILLE ∗∗∗ WE ARE PREPARED CONSIDER DIRECT ACTION BY QJ/WIN BUT WOULD LIKE YOUR READING ON SECURITY FACTORS. HOW CLOSE WOULD THIS PLACE [UNITED STATES] TO THE ACTION? (CIA Cable, Chief of Africa Division to Station Officer, 11/30/60)

Mulroney said that QJ/WIN's stay in the Congo was "coextensive with my own, allowing for the fact that he came after I did." (Mulroney, 6/9/75, p. 19)

In a memorandum to arrange the accounting for QJ/WIN's activities in the Congo, William Harvey, Mulroney's immediate superior in the Directorate of Plans, noted: "QJ/WIN was sent on this trip for a specific, highly sensitive operational purpose which has been completed." (Memo for Finance Division from Harvey, 1/11/61) Mulroney explained Harvey's reference by saying that once Lumumba was in the hands of the Congolese authorities "the reason for the mounting of the project ∗∗∗ had become moot." When asked if he and QJ/WIN were responsible for Lumumba's departure from U.N. custody and subsequent capture, Mulroney replied: "Absolutely not." (Mulroney, 9/11/75, p. 35)[54]

Despite the suggestive language of the cables at the end of November about the prospect of "direct action" by QJ/WIN and an indication in the Inspector General's Report that QJ/WIN may have been recruited initially for an assassination mission[55] there is no clear evidence that QJ/WIN was actually involved in any assassination plan or attempt. The Inspector General's Report may have accurately reported a plan for the use of QJ/WIN

[54] Harvey did not recall the meaning of the memorandum, but he assumed that the mere fact that Mulroney had returned from the Congo would have constituted the "completion" of QJ/WIN's mission. (Harvey affidavit, 9/14/75, p. 2)

[55] The CIA Inspector General's Report said that QJ/ WIN "had been recruited earlier ∗∗∗ for use in a special operation in the Congo (the assassination of Patrice Lumumba) to be run by Michael Mulroney." (LG. Report, p. 38)

As explained above, Bissell and Mulroney testified that Mulroney had refused to be associated with an assassination operation. *See* sections 5(a) (ii) and (iii).

which predated Mulroney's refusal to accept the assassination assignment from Bissell. But there is no evidence from which to conclude that QJ/WIN was actually used for such an operation.

Station Officer Hedgman had a "vague recollection" that QJ/WIN was in the Congo working for Mulroney. But Hedgman did not recall why QJ/WIN was in the Congo and said that QJ/WIN was not one of his major operatives. (Hedgman, 8/21/75, p. 95) Bissell and Tweedy did not recall anything about QJ/WIN's activities in the Congo. (Bissell, 9/10/75, pp. 54–57; Tweedy, 9/9/75, pp. 54, 61)

Harvey, whose division "loaned" QJ/ WIN to the Congo Station, testified:

> I was kept informed of the arrangements for QJ/WIN's trip to the Congo and, subsequently, of his presence in the Congo. I do not know specifically what QJ/WIN did in the Congo. I do not think that I ever had such knowledge ∗∗∗. If QJ/WIN were to be used on an assassination mission, it would have been cleared with me. I was never informed that he was to be used for such a mission. (Harvey affidavit, 9/14/75, pp. 3–4)[56]

A 1962 CIA cable indicates the value the CIA accorded QJ/WIN and the inherent difficulty for an intelligence agency in employing criminals. The CIA had learned that QJ/WIN was about to go on trial in Europe on smuggling charges and Headquarters suggested:

> If ∗∗∗ INFOR[MATION] TRUE WE MAY WISH ATTEMPT QUASH CHARGES OR ARRANGE SOMEHOW SALVAGE QJ/WIN FOR OUR PURPOSES. (CIA Cable, 1962)

(c) WI/ROGUE Asks QJ/WIN to Join "Execution Squad": December 1960

The only suggestion that QJ/WIN had any connection with assassination was a report that WI/ROGUE, another asset of the Congo Station, once asked QJ/WIN to join an "execution squad."

WI/ROGUE was an "essentially stateless" soldier of fortune, "a forger and former bank robber." (Inspector General Memo, 3/14/75)[57] The CIA sent him to the Congo after providing him with plastic surgery and a toupee so that Europeans traveling in the Congo would not recognize him. (I.G. Memo, 3/14/75) The CIA characterized WI/ROGUE as a man who "learns quickly and carries out any assignment without regard for danger." (CIA Cable, Africa Division to Leopoldville, 10/27/60) CIA's Africa Division recommended WI/ROGUE as an agent in the following terms:

> He is indeed aware of the precepts of right and wrong, but if he is given an assignment which may be morally wrong in the eyes of the world, but necessary because his case officer ordered him to

[56] Harvey stated that the memoranda concerning QJ/WIN were probably written for his signature by the officer who supervised QJ/WIN's activities in Europe. (Harvey affidavit, 9/14/75, pp. 1, 4)

Harvey said that in later discussions he held with Scheider concerning the development of a general assassination capability, Scheider never mentioned QJ/WIN's activities in the Congo, nor did Scheider refer to his own trip to Leopoldville. Harvey also stated that before the formation of that project, QJ/WIN's case officer had not previously used him "as an assassination capability or even viewed him as such." (Harvey affidavit, 9/14/75, pp. 7, 8) *See* discussion in Part III, Section C.

[57] This information was derived from a report on WI/ROGUE'S assignment to the Congo prepared by a former Africa Division officer on March 14, 1975 at the request of the CIA Office of the Inspector General.

> carry it out, then it is right, and he will dutifully undertake appropriate action for its execution without pangs of conscience. In a word, he can rationalize all actions.

Station Officer Hedgman described WI/ROGUE as "a man with a rather unsavory reputation, who would try anything once, at least." Hedgman used him as "a general utility agent" because "I felt we needed surveillance capability, developing new contacts, various things." Hedgman supervised WI/ROGUE directly and did not put him in touch with Mulroney. (Hedgman, 8/21/75, pp. 96–97)

A report on agent WI/ROGUE, prepared for the CIA Inspector General's Office in 1975, described the training he received:

> On 19 September 1960 two members of Africa Division met with him to discuss "an operational assignment in Africa Division." In connection with this assignment, WI/ROGUE was to be trained in demolitions, small arms, and medical immunization. (I.G. Memo, 3/14/75)[58]

The report also outlined WI/ROGUE'S assignment to the Congo and recorded no mention of the use to which WI/ROGUE'S "medical immunization" training would be put:

> In October 1960 a cable to Leopoldville stated that * * * Headquarters [had] * * * intent to use him as utility agent in order to (a) organize and conduct a surveillance team; (b) intercept packages; (c) blow up bridges; and (d) execute other assignments requiring positive action. His utilization is not to be restricted to Leopoldville." (I.G. Memo, 3/14/75)

WI/ROGUE made his initial contact with Hedgman in Leopoldville on December 2, 1960. Hedgman instructed him to 'build cover during initial period;" and to "spot persons for [a] surveillance team" of intelligence agents in the province where Lumumba's support was strongest. (CIA Cable, 12/17/60)

Soon thereafter Hedgman cabled Headquarters:

> QJ/WIN WHO RESIDES SAME HOTEL AS WI/ROGUE REPORTED * * * WI/ROGUE SMELLED AS THOUGH HE IN INTEL BUSINESS. STATION DENIED ANY INFO ON WI/ROGUE. 14 DEC QJ/WIN REPORTED WI/ROGUE HAD OFFERED HIM THREE HUNDRED DOLLARS PER MONTH TO PARTICIPATE IN INTEL NET AND BE MEMBER "EXECUTION SQUAD." WHEN WI/ROGUE ADDED THERE WOULD BE BONUSES FOR SPECIAL JOBS. UNDER QJ/WIN QUESTIONING, WI/ROGUE LATER SAID HE WORKING FOR [AMERICAN] SERVICE.
>
> * * * IN DISCUSSING LOCAL CONTACTS, WI/ROGUE MENTIONED QJ/WIN BUT DID NOT ADMIT TO HAVING TRIED RECRUIT HIM. WHEN [STATION OFFICER] TRIED LEARN WHETHER WI/ROGUE HAD MADE APPROACH LATTER CLAIMED HAD TAKEN NO STEPS. [STATION OFFICER] WAS UNABLE CONTRADICT, AS DID NOT WISH REVEAL QJ/WIN CONNECTION [WITH CIA]. (CIA Cable, Leopoldville to Director, 12/17/60)

---

[58] A case officer who prepared WI/ROGUE for his mission in the Congo stated that he had no knowledge that WI/ROGUE received any training in "medical immunization." The case officer assumed that an unclear cable reference to the fact that WI/ROGUE received innoculations before his journey was misinterpreted in the memorandum prepared for the Inspector General's Office on March 14, 1975. (WI/ROGUE Case Officer affidavit, 11/14/75)

The cable also expressed Hedgman's concern about WI/ROGUE's actions:

> *** LEOP CONCERNED BY WI/ROGUE FREE WHEELING AND LACK SECURITY. STATION HAS ENOUGH HEADACHES WITHOUT WORRYING ABOUT AGENT WHO NOT ABLE HANDLE FINANCES AND WHO NOT WILLING FOLLOW INSTRUCTIONS. IF HQS DESIRES, WILLING KEEP HIM ON PROBATION, BUT IF CONTINUE HAVE DIFFICULTIES, BELIEVE WI/ROGUE RECALL BEST SOLUTION. (CIA Cable, Leopoldville to Director, 12/17/60)

Hedgman explained WI/ROGUE's attempt to recruit QJ/WIN for an execution squad as an unauthorized unexpected contact. He testified that he had not instructed WI/ROGUE to make this kind of proposition to QJ/WIN or anyone else:

> I would like to stress that I don't know what WI/ROGUE was talking about as an "execution squad," and I am sure he was never asked to go out and execute anyone. (Hedgman, 8/21/75, p. 100)

Hedgman suggested that WI/ROGUE had concocted the idea of an execution squad:

> His idea of what an intelligence operative should do, I think, had been gathered by reading a few novels or something of the sort. (Hedgman, 8/21/75, p. 100)

Mulroney said he knew of no attempt by anyone connected with the CIA to recruit an execution squad and he did not remember WI/ROGUE. (Mulroney, 9/11/75, pp. 39–42) He stated that QJ/WIN was considered for use on "strong arm squad[s]," unrelated to assassinations:

> Surveillance teams where you have to go into crime areas *** where you need a fellow that if he gets in a box can fight his way out of it. (Mulroney, 9/11/75, p. 36)

Richard Bissell recalled nothing about WI/ROGUE's approach to QJ/WIN. (Bissell, 9/11/75, p. 71) Bronson Tweedy remembered that WI/ROGUE was "dispatched on a general purpose mission" to the Congo. But Tweedy testified that WI/ROGUE would "absolutely not" have been used on an assassination mission against Lumumba because " he was basically dispatched, assessed and dealt with by the balance of the Division" rather than by the two people in the Africa Division, Tweedy and his Deputy, who would have known that the assassination of Lumumba was being considered. (Tweedy, 9/9/75, pp. 63–65)

The Station Officer said that if WI/ROGUE had been involved in an actual assassination plan, he would have transmitted messages concerning WI/ROGUE in the PROP channel. Instead, he limited distribution of the cable about WI/ROGUE in a routine manner—as a CIA officer would "normally do *** when you speak in a derogatory manner of an asset." (Hedgman, 8/21/75, pp. 101–102)

Hedgman maintained that WI/ROGUE's proposition to QJ/WIN to join an "execution squad" could be attributed to WI/ROGUE's "freewheeling" nature:

> I had difficulty controlling him in that he was not a professional intelligence officer as such. He seemed to act on his own without seeking guidance or authority *** I found he was rather an unguided missile *** the kind of man that could get you in trouble before you knew you were in trouble. (Hedgman, 8/21/75, pp. 96–97)

But Hedgman did not disavow all responsibility for WI/ROGUE's actions:

> [I]f you give a man an order and he carries it out and causes a problem for the Station, then you accept responsibility. (Hedgman, 8/21/75, p. 97)

In sum, the testimony of the CIA officers involved in the PROP operation and the concern about WI/ROGUE'S "freewheeling" in Hedgman's cable suggests that agent WI/ROGUE's attempt to form an "execution squad" was an unauthorized, maverick action, unconnected to any CIA operation. However, the fact that WI/ROGUE was to be trained in "medical immunization" (I.G. Report Memo, 3/14/75) precludes a definitive conclusion to that effect.

6. The Question of Whether the CIA Was Involved in Bringing About Lumumba's Death in Katanga Province

The CIA officers most closely connected with the plot to poison Lumumba testified uniformly that they knew of no CIA involvement in Lumumba's death. The Congo Station had advance knowledge of the central government's plan to transport Lumumba into the hands of his bitterest enemies, where he was likely to be killed. But there is no evidentiary basis for concluding that the CIA conspired in this plan or was connected to the events in Katanga that resulted in Lumumba's death.

(a) Lumumba's Imprisonment After Leaving U.N. Custody: November 27–December 3, 196

The only suggestion that the CIA may have been involved in the capture of Lumumba by Mobutu's troops after Lumumba left U.N. custody on November 27, is a PROP cable from the Station Officer to Tweedy on November 14. The cable stated that a CIA agent had learned that Lumumba's

> POLITICAL FOLLOWERS IN STANLEYVILLE DESIRE THAT HE BREAK OUT OF HIS CONFINEMENT AND PROCEED TO THAT CITY BY CAR TO ENGAGE IN POLITICAL ACTIVITY. *** DECISION ON BREAKOUT WILL PROBABLY BE MADE SHORTLY. STATION EXPECTS TO BE ADVISED BY [AGENT] OF DECISION WAS MADE. *** STATION HAS SEVERAL POSSIBLE ASSETS TO USE IN EVENT OF BREAKOUT AND STUDYING SEVERAL PLANS OF ACTION. (CIA Cable, Station Officer to Tweedy, 11/14/60)

There is no other evidence that the CIA actually learned in advance of Lumumba's plan to depart for Stanleyville. In fact, a cable from Leopoldville on the day after Lumumba's escape evidenced the Station's complete ignorance about the circumstances of Lumumba's departure. (CIA Cable, Leopoldville to Director, 11/28/60) However, the same cable raises a question concerning whether the CIA was involved in Lumumba's subsequent capture en route by Congolese troops:

> [STATION] WORKING WITH [CONGOLESE GOVERNMENT] TO GET ROADS BLOCKED AND TROOPS ALERTED [BLOCK] POSSIBLE ESCAPE ROUTE. (CIA Cable, 11/28/60)

Station Officer Hedgman testified that he was "quite certain that there was no Agency involvement in any way" in Lumumba's departure from U.N. custody and that he had no advance knowledge of Lumumba's plan. He stated that he consulted with Congolese

officers about the possible routes Lumumba might take to Stanleyville, but he was "not a major assistance" in tracking down Lumumba prior to his capture. (Hedgman, 8/21/75, pp. 63–65)

Mulroney, who had planned to draw Lumumba out of U.N. custody and turn him over to Congolese authorities, testified that Lumumba escaped by his own devices and was not tricked by the CIA. (Mulroney, 9/11/75, p. 22)

(b) Lumumba's Death

The contemporaneous cable traffic shows that the CIA was kept informed of Lumumba's condition and movements in January of 1961 by the Congolese and that the CIA continued to consider Lumumba a serious political threat. Despite the fact that the Station Officer knew of a plan to deliver Lumumba into the hands of his enemies at a time when the CIA was convinced that "drastic steps" were necessary to prevent Lumumba's return to power, there is no evidence of CIA involvement in this plan or in bringing about the death of Luntumba in Katanga.

There is no doubt that the CIA and the Congolese government shared a concern in January 1961 that Lumumba might return to power, particularly since the Congolese army and police were threatening to mutiny if they were not given substantial pay raises. Station Officer Hedgman reported that a mutiny "almost certainly would * * * bring about [Lumumba] return power" and said he had advised the Congolese government of his opinion that the army garrison at Leopoldville

> WILL MUTINY WITHIN TWO OR THREE DAYS UNLESS DRASTIC ACTION TAKEN SATISFY COMPLAINTS. (CIA Cable, Leopoldville to Director, 1/12/61)

Hedgman urged Headquarters to consider an immediate reaction to the crisis. (CIA Cable, 1/12/61) This cable, which was sent through the ordinary channel, made no reference, even indirectly, to assassination, and instead recommended a different course of action.

The next day, Hedgman cabled Headquarters:

> STATION AND EMBASSY BELIEVE PRESENT GOVERNMENT MAY FALL WITHIN FEW DAYS. RESULT WOULD ALMOST CERTAINLY BE CHAOS AND RETURN [LUMUMBA] TO POWER. (CIA Cable, Leopoldville to Director, 1/13/61)

Hedgman advised that reopening the Congolese Parliament under United Nations supervision was unacceptable because:

> THE COMBINATION OF [LUMUMBA'S] POWERS AS DEMAGOGUE, HIS ABLE USE OF GOON SQUADS AND PROPAGANDA AND SPIRIT OF DEFEAT WITHIN [GOVERNMENT] COALITION WHICH WOULD INCREASE RAPIDLY UNDER SUCH CONDITIONS WOULD ALMOST CERTAINLY INSURE [LUMUMBA] VICTORY IN PARLIAMENT. * * * REFUSAL TAKE DRASTIC STEPS AT THIS TIME WILL LEAD TO DEFEAT OF [UNITED STATES] POLICY IN CONGO. (CIA Cable, Leopoldville to Director, 1/13/61)

On January 14, Hedgman was advised by a Congolese government leader that Lumumba was to be transferred from the Thysville military camp, where he had been held since shortly after Mobutu's troops captured him, to a prison in Bakwanga, the capital of another Congolese province reported to be the "home territory of * * * Lumumba's sworn enemy." (CIA Cable, Leopoldville to Director, 1/17/61; CIA Information Report, 1/17/61)

On January 17, authorities in Leopoldville placed Lumumba and two of his leading supporters, Maurice Mpolo and Joseph Okito aboard an airplane bound for Bakwanga. Appparently the aircraft was redirected in midflight to Elisabethville in Katanga Province "when it was learned that United Nations troops were at Bakwanga airport." On February 13, the government of Katanga reported that Lumumba and his two companions escaped the previous day and died at the hands of hostile villagers. (U.N. Report, 11/12/61, pp. 98–100; 109)

The United Nations Commission on Investigation was "not convinced by the version of the facts given by the provincial government of Katanga." The Commission concluded instead, that Lumumba was killed on January 17, almost immediately after his arrival in Katanga, probably with the knowledge of the central government and at the behest of the Katanga authorities. (U.N. Report, 11/11/61, pp. 100, 117):

> The Commission wishes to put on record its view that President Kasavubu and his aides, on the one hand, and the provincial government of Katanga headed by Mr. Tshombe on the other, should not escape responsibility for the death of Mr. Lumumba, Mr. Okito, and Mr. Mpolo. For Mr. Kasavubu and his aides had handed over Mr. Lumumba and his colleagues to the Katanga authorities knowing full well, in doing so, that they were throwing them into the hands of their bitterest political enemies. The government of the province of Katanga in turn not only failed to safeguard the lives of the three prisoners but also had, by its action, contributed, directly or indirectly, to the murder of the prisoners. (U.N. Report, 11/11/61, p. 118)

Cables from the Station Officer demonstrated no CIA involvement in the plan to transport Lumumba to Bakwanga. But the Station Officer clearly had prior knowledge of the plan to transfer Lumumba to a state where it was probable that he would be killed. Other supporters of Lumumba who had been sent to Bakwanga earlier by Lepoldville authorities

> Were killed there in horrible circumstances, and the place was known as the 'slaughterhouse.' It was therefore improbable that Mr. Lumumba and his companions would have met a different fate at Bakwanga if they had been taken there. (U.N. Report, 11/11/61, p. 109)

After learning that Lumumba was to be flown to Bakwanga, the Station Officer cabled:

> IT NOW MORE IMPORTANT THAN EVER SUPPORT THOSE SINGLE ELEMENTS WHICH CAN STRENGTHEN FABRIC OVERALL * * * OPPOSITION [LUMUMBA]. WISH ASSURE HQS WE TRYING SHORE UP * * * DEFENSES ONLY IN TERMS OUR OWN OBJECTIVES DENY CONGO GOVT CONTROL [LUMUMBA]. (CIA Cable, 1/16/61)

Despite his perception of an urgent need to prevent Lumumba's return to power at this time, the Station Officer testified that the CIA was not involved in bringing about Lumumba's death in Katanga and that he did not have any first-hand knowledge of the circumstances of Lumumba's death. (Hedgman, 8/25/75, pp. 31, 33)[59]

[59] Hedgman also testified that he had no discussions with the Congolese central government, after Lumumba was in its custody, about executing Lumumba or sending him to Katanga. Hedgman said:

To the best of my knowledge, neither the Station nor the Embassy had any input in the decision to send him to Katanga * * * I think there was a general assumption, once we learned he had been sent to Katanga, that his goose was cooked, because Tshombe hated him and looked on him as a danger and rival. (Hedgman, 8/21/75, p. 78)

In late November, Hedgman attended a meeting of CIA officers from African Stations with Bissell and Tweedy. Hedgman testified that he briefed Bissell and Tweedy on developments in the Congo, including Lumumba's flight from Leopoldville, but he could not recall any discussion at the meeting of the possibility of assassinating Lumumba. (Hedgman, 8/21/75, pp. 66, 68)

Two days after Lumumba was flown to Katanga, the CIA Base Chief in Elisabethville sent an unusual message to headquarters:

> THANKS FOR PATRICE. IF WE HAD KNOWN HE WAS COMING WE WOULD HAVE BAKED A SNAKE.

The cable also reported that the Base's sources had provided "no advance word whatsoever" of Lumumba's flight to Katanga and that the Congolese central government "does not plan to liquidate Lumumba." (CIA Cable, Elisabethville to Director, 1/19/61)

This cable indicates that the CIA did not have knowledge of the central government's decision to transfer Lumumba from Thysville military camp to a place where he would be in the hands of his avowed enemies. This cable indicates that the CIA was not kept informed of Lumumba's treatment after he arrived in Katanga because, according to the report of the United Nations Commission, Lumumba had already been killed when the cable was sent.[60]

On February 10, several weeks after Lumumba died, but before his death was announced by the Katanga government, the Elisabethville Base cabled Headquarters that "Lumumba fate is best kept secret in Katanga." (CIA Cable, Elisabethville to Director, 2/10/61) The cable gave different versions from several sources about Lumumba's death. Hedgman testified that the cable conformed to his recollection that the CIA "did not have any hard information" as of that date about Lumumba's fate after arrival in Katanga. (Hedgman, 8/25/75, p. 34)

Hedgman acknowledged that the CIA was in close contact with some Congolese officials who "quite clearly knew" that Lumumba was to be shipped to Katanga "because they were involved." But Hedgman said that these Congolese contacts "were not acting under CIA instructions if and when they did this." (Hedgman, 8/21/75, p. 35)

Tweedy and Mulroney agreed with Hedgman's account that the CIA was not involved in the events that led to Lhmumba's death.[61]

7. The Question of The Level at Which The Assassination Plot Was Authorized

SUMMARY

The chain of events revealed by the documents and testimony is strong enough to permit a reasonable inference that the plot to assassinate Lumumba was authorized by

[60] Hedgman testified that neither he nor the Elisabethville Base knew of a Congolese plan to send Lumumba to Katanga. (Hedgman, 8/25/75, pp. 25–26)

[61] When asked if there was any CIA involvement, Tweedy replied that there was "none whatsoever." Tweedy stated that "the fate of Lumumba in the end was purely an African event." (Tweedy, 9/9/75, p. 53) Mulroney testified "CIA had absolutely no connection, to my certain knowledge, with the death of Patrice Lumumba." (Mulroney, 6/9/75, p. 20)

During his tenure as DCI, several years after Lumumba's death, Richard Helms was told by CIA investigators that "it was clear that the Agency had not murdered Lumumba," and that "the Agency had no involvement" in the events that led to Lumumba's death. (Helms, 9/16/75, p. 26)

President Eisenhower. Nevertheless, there is enough countervailing testimony by Eisenhower Administration officials and enough ambiguity and lack of clarity in the records of high-level policy meetings to preclude the Committee from making a finding that the President intended an assassination effort against Lumumba.

It is clear that the Director of Central Intelligence, Allen Dulles, authorized an assassination plot. There is, however, no evidence of United States involvement in bringing about the death of Lumumba at the hands of Congolese authorities in Katanga.

Strong expressions of hostility toward Lumumba from the President and his national security assistant, followed immediately by CIA steps in furtherance of an assassination operation against Lumumba, are part of a sequence of events that, at the least, make it appear that Dulles believed assassination was a permissible means of complying with pressure from the President to remove Lumumba from the political scene.

The chain of significant events in the Lumumba case begins with the testimony that President Eisenhower made a statement at a meeting of the National Security Council in the summer or early fall of 1960 that came across to one staff member in attendance as an order for the assassination of Patrice Lumumba. The next link is a memorandum of the Special Group meeting of August 25, 1960, which indicated that when the President's "extremely strong feelings on the necessity for very straightforward action" were conveyed, the Special Group

> * * * agreed that planning for the Congo would not necessarily rule out "consideration" of any particular kind of activity which might contribute to getting rid of Lumumba. (Special Group Minutes, 8/25/60)

The following day, CIA Director Allen Dulles, who had attended the Special Group meeting, personally cabled to the Station Officer in Leopoldville that Lumumba's

> REMOVAL MUST BE AN URGENT AND PRIME OBJECTIVE * * * A HIGH PRIORITY OF OUR COVERT ACTION. YOU CAN ACT ON YOUR OWN AUTHORITY WHERE TIME DOES NOT PERMIT REFERRAL HERE. (CIA Cable, Dulles to Station Officer, 8/26/60)

Although the Dulles cable does not explicitly mention assassination, Richard Bissell—the CIA official under whose aegis the assassination effort against Lumumba took place—testified that, in his opinion, this cable was a direct outgrowth of the Special Group meeting and signaled to him that the President had authorized assassination as one means of effecting Lumumba's "removal." (Bissell, 9/10/75, pp. 33–34 61–62; see Section 7(c), *infra*) Bronson Tweedy, who had direct operational responsibility at Headquarters for activities against Lumumba, testified that the Dulles cable confirmed the policy that no measure, including assassination, was to be overlooked in the attempt to remove Lumumba from a position of influence. (Tweedy, 10/9/75, pp. 4–5)

On September 19, 1960, Bissell and Tweedy cabled Station Officer Hedgman to expect a messenger from CIA Headquarters. Two days later, in the presence of the President at a meeting of the National Security Council, Allen Dulles stated that Lumumba "would remain a grave danger as long as he was not yet disposed of." (Memorandum, 460th NSC Meeting, 9/21/60) Five days after this meeting, CIA scientist, Joseph Scheider, arrived in Leopoldville and provided the Station Officer with toxic biological substances, instructed

him to assassinate Lumumba, and informed him that the President had authorized this operation.

Two mitigating factors weaken this chain just enough so that it will not support an absolute finding of Presidential authorization for the assassination effort against Lumumba.

First, the two officials of the Eisenhower Administration responsible to the President for national security affairs and present at the NSC meetings in question testified that they knew of no Presidential approval for, or knowledge of, an assassination operation.

Second, the minutes of discussions at meetings of the National Security Council and its Special Group do not record an explicit Presidential order for the assassination of Lumumba. The Secretary of the Special Group maintained that his memoranda reflected the actual language used at the meetings without omission or euphemism for extremely sensitive statements. (Parrott, 7/10/75, p. 19) All other NSC staff executives stated however, that there was a strong possibility that a statement as sensitive as an assassination order would have been omitted from the record or handled by means of euphemism. Several high Government officials involved in policymaking and planning for covert operations testified that the language in these minutes clearly indicated that assassination was contemplated at the NSC as one means of eliminating Lumumba as a political threat; other officials testified to the contrary.

(a) High-Level Meetings at which "Getting Rid of Lumumba" Was Discussed

(i) Dillon's Testimony About Pentagon Meeting: Summer 1960

In late July 1960, Patrice Lumumba visited the United States and met with Secretary of State Christian Herter and Undersecretary of State C. Douglas Dillon. While Lumumba was in Washington, D.C., Secretary Herter pledged aid to the newly formed Government of the Republic of the Congo.

According to Dillon, Lumumba impressed American officials as an irrational, almost "psychotic" personality:

> When he was in the State Department meeting, either with me or with the Secretary in my presence * * * he would never look you in the eye. He looked up at the sky. And a tremendous flow of words came out. He spoke in French, and he spoke it very fluently. And his words didn't ever have any relation to the particular things that we wanted to discuss * * *. You had a feeling that he was a person that was gripped by this fervor that I can only characterize as messianic * * *. [H]e was just not a rational being. (Dillon, 9/2/75, p. 24)

Dillon said that the willingness of the United States government to work with Lumumba vanished after these meetings:

> [T]he impression that was left was * * * very bad, that this was an individual whom it was impossible to deal with. And the feelings of the Government as a result of this sharpened very considerably at that time * * *. We [had] hoped to see him and see what we could do to come to a better understanding with him. (Dillon, 9/2/75, pp. 23–24)

Dillon testified that shortly after Lumumba's visit in late July or August, he was present at a meeting at the Pentagon attended by representatives of the State Department, Defense Department, Joint Chiefs of Staff and the CIA. (Dillon, 9/2/75, pp. 17–20, 25–26)[62]

[62] Dillon was unable to recall the precise date of this meeting. (Dillon, 9/2/75, pp. 25–26)

According to Dillon, "a question regarding the possibility of an assassination attempt against Lumumba was briefly raised. Dillon did not recall anything about the language used in raising the question. Dillon assumed that when the subject of Lumumba's assassination was raised, "it was turned off by the CIA" because "the CIA people, whoever they were, were negative to any such action." This opposition "wasn't moral," according to Dillon, but rather an objection on the grounds that it was "not a possible thing." Dillon said the CIA reaction "might have been" made out of the feeling that the group was too large for such a sensitive discussion. (Dillon, 9/2/75, pp. 15–17, 25, 30, 60)

Dillon did not remember who lodged the negative reaction to the assassination question although he thought it "would have to have been either Allen Dulles, or possibly [General] Cabell * * * most likely Cabell."[63] (Dillon, 9/2/75, pp. 22, 25) Dillon thought it was "very likely that Richard Bissell attended the meeting. (Dillon, 9/2/75, p. 21)

Dillon stated that this discussion could not have served as authorization for an actual assassination effort against Lumumba, but he believed that the CIA:

> Could have decided they wanted to develop the capability * * * just by knowing the concern that everyone had about Lumumba. * * * They wouldn't have had to tell anyone about that. That is just developing their own internal capability, and then they would have to come and get permission. (Dillon, 9/2/75, pp. 30, 31)

Dillon testified that he had never heard any mention of the plot to poison Lumumba nor, even a hint that the CIA asked permission to mount such an operation. (Dillon, 9/2/75, p. 50) But after he was informed of the poison plot, Dillon made the following comment about the Pentagon meeting:

> I think it is * * * likely that it might have been the beginning of this whole idea on the CIA's part that they should develop such a capacity. And maybe they didn't have it then and went to work to develop it beginning in August. (Dillon, 9/2/75, p. 61)

Dillon said that it was unlikely that formal notes were taken at the meeting or preserved because it was a small "ad hoc" group rather than an official body. Such interdepartmental meetings were "not unusual," according to Dillon. (Dillon, 9/2/75, p. 18)

The only officials Dillon named as probable participants other than the CIA representatives were Deputy Secretary of Defense James Douglas and Assistant Secretary of Defense John N. Irwin II. (Dillon, 9/2/75, pp. 19, 21) Douglas stated that it was possible that he attended such a meeting at the Pentagon, but he did not recall it. Nor did he recall the question of Lumumba's assassination ever being raised in his presence. (Douglas affidavit, 9/5/75) Irwin stated that it was "likely" that he attended the meeting to which Dillon referred, but he did not remember whether he was present "at any meeting at the Pentagon where the question of assassinating Patrice Lumumba was raised." (Irwin affidavit, 9/22/75, p. 3)

(ii) Robert Johnson's Testimony That He Understood the President to Order Lumumba's Assassination at an NSC Meeting

Robert H. Johnson, a member of the National Security Council staff from 1951 to January 1962, offered what he termed a "clue" to the extent of Presidential involvement in

[63] General Cabell was Allen Dulles' Deputy DCI at this time.

the decision to assassinate Lumumba. (Johnson, 6/18/75, pp. 4–5)[64] Johnson recounted the following occurrence at an NSC meeting, in the summer of 1960, which began with a briefing on world developments by the DCI:

> At some time during that discussion, President Eisenhower said something—I can no longer remember his words—that came across to me as an order for the assassination of Lumumba who was then at the center of political conflict and controversy in the Congo. There was no discussion; the meeting simply moved on. I remember my sense of that moment quite clearly because the President's statement came as a great shock to me. I cannot, however, reconstruct the moment more specifically.
>
> Although I was convinced at the time—and remained convinced when I thought about it later—that the President's statement was intended as an order for the assassination of Lumumba, I must confess that in thinking about the incident more recently I have had some doubts. As is well known, it was quite uncharacteristic of President Eisenhower to make or announce policy decisions in NSC meetings. Certainly, it was strange if he departed from that normal pattern on a subject so sensitive as this. Moreover, it was not long after this, I believe, that Lumumba was dismissed as premier by Kasavubu in an action that was a quasi-coup. I have come to wonder whether what I really heard was only an order for some such political action. All I can tell you with any certainty at the present moment is my sense of that moment in the Cabinet Room of the White House. (Johnson, 6/18/75, pp. 6–7)

Johnson "presumed" that the President made his statement while "looking toward the Director of Central Intelligence." (Johnson, 6/18/75, p. 11) He was unable to recall with any greater specificity the words used by the President. (Johnson, 9/13/75, p. 10) Johnson was asked:

Q: ∗∗∗ Would it be fair to say that although you allow for the possibility that a coup or some more general political action was being discussed, it is your clear impression that you had heard an order for the assassination of Lumumba?

JOHNSON: It was my clear impression at the time.

Q: And it remains your impression now?

---

[64] Robert Johnson introduced his testimony before the Committee with the following statement:

"∗∗∗ I would like to preface my remarks by pointing out that my decision to offer testimony to this committee has involved for me a profound personal, moral dilemma. In my role as a member of the NSC Staff for ten and one-half years, I was privy to a great deal of information that involved relationships of confidentiality with high officials of the United States government. I have always taken very seriously the responsibilities implied in such relationships.

"These responsibilities extend, in my view, far beyond questions of security classification or other legal or foreign policy concerns. They relate to the very basis of human society and government—to the relationships of trust without which no free society can long survive and no government can operate.

"I have been forced by recent developments, however to weigh against these considerable responsibilities, my broader responsibilities as a citizen on an issue that involves major questions of public morality, as well as questions of sound policy. Having done so, I have concluded, not without a great deal of reluctance, to come to your committee with information bearing upon your inquiry into government decisions relating to the assassination of foreign leaders." (Johnson, 6/18/75, pp. 4–5)

After his tenure on the staff of the National Security Council, Robert Johnson served from 1962 to 1967 on the Policy Planning Council at the Department of State.

JOHNSON: It remains my impression now. I have reflected on this other kind of possibility; but that is the sense * * * that persists. (Johnson, 9/13/75, pp. 24–25)[65]

Johnson stated that the incident provoked a strong reaction from him:

> I was surprised * * * that I would ever hear a President say anything like this in my presence or the presence of a group of people. I was startled. (Johnson, 6/18/75, p. 13)

A succinct summary of Johnson's testimony was elicited by Senator Mathias in the following exchange:

Senator MATHIAS: * * * What comes across is that you do have a memory, if not of exact words, but of your own reaction really to a Presidential order which you considered to be an order for an assassination.

JOHNSON: That is correct.

Senator MATHIAS: And that although precise words have escaped you in the passage of fifteen years, that sense of shock remains?

JOHNSON: Right. Yes, Sir. (Johnson, 6/18/75, p. 8)

After the meeting, Johnson, who was responsible for writing the memorandum of the discussion, consulted with a senior official on the NSC staff to determine how to handle the President's statement in the memorandum and in the debriefing of the NSC Planning Board that followed each meeting:

> I suspect—but no longer have an exact recollection—that I omitted it from the debriefing. I also do not recall how I handled the subject in the memo of the meeting, though I suspect that some kind of reference to the President's statement was made. (Johnson, 6/18/75, p. 7)

In his second appearance before the Committee, Johnson stated that it was "quite likely that it [the President's statement] was handled through some kind of euphemism or may have been omitted altogether." (Johnson, 9/13/75, p. 21)[66]

---

[65] Johnson further explained that his allowance for the possibility that he had heard an order for a coup did not disturb his recollection of hearing an assassination order:

"It was a retrospective reflection on what I had heard, and since this coup did occur, it occurred to me that it was possible that that is what I heard, but that would not change my sense of the moment when I heard the President speak, which I felt then, and I continue to feel, was a statement designed to direct the disposal, assassnation, of Lumumba." (Johnson, 9/13/75, p. 12)

[66] In 1960 Johnson was Director of the Planning Board Secretariat—third in command on the NSC staff. He attended NSC meetings to take notes on the discussions whenever one of the two senior NSC officials was absent.

Johnson testified that the person with whom he consulted about the manner of recording the President's statement in the minutes was one of the two top NSC staff officials at that time: NCS Executive Secretary James Lay or Deputy Executive Secretary Marion Boggs. (Johnson, 9/13/75, pp. 12–13) Johnson could not recall which of the two officials he had consulted, but he "inferred" that it must have been the "top career NSC staff person present" at the meeting where he heard the President's statement. (Johnson, 9/13/75, p. 12) At both of the NSC meetings where the President and Johnson were present for a discussion of Lumumba—August 18 and September 7—James Lay was absent and Marion Boggs served as Acting Executive Secretary.

As Johnson stated, his testimony standing alone is "a clue, rather than precise evidence of Presidential involvement in decision making with respect to assassinations." (Johnson, 6/18/75, p. 5) To determine the significance of this "clue," it must be placed in the context of the records of the NSC meetings attended by Johnson, testimony about those meetings, and the series of events that preceded the dispatch of poisons to the Congo for Lumumba's assassination.

In the summer of 1960, Robert Johnson attended four NSC meetings at which developments in the Congo were discussed. The President was not in attendance on two of those occasions—July 15 and July 21. (NSC Minutes, 7/15/60; NSC Minutes, 7/21/60) The attitude toward Lumumba at these first two meetings was vehement:

> Mr. Dulles said that in Lumumba we were faced with a person who was a Castro or worse * * * Mr. Dulles went on to describe Mr. Lumumba's background which he described as "harrowing" * * * It is safe to go on the assumption that Lumumba has been bought by the Communists; this also, however, fits with his own orientation. (NSC Minutes, 7/21/60)

The President presided over the other two NSC meetings—on August 18 and September 7. After looking at the records of those meetings, Johnson was unable to determine with certainty at which meeting he heard the President's statement.[67] (Johnson, 9/13/75, p. 16)

The chronology of meetings, cables, and events in the Congo during this period makes it most likely that Johnson's testimony refers to the NSC meeting of August 18, 1960.

The meeting of August 18 took place at the beginning of the series of events that preceded the dispatch of Scheider to Leopoldville with poisons for assassinating Lumumba.[68] The September 7 meeting took place in the midst of these events.

Marion Bogg's statement about his method of handling the situation described by Johnson is in accord with Johnson's testimony:

"I have no independent recollection of being consulted by Mr. Johnson about how to handle in the memorandum of discussion any sensitive statement regarding Lumumba. I am not saying I was not consulted; merely that I do not remember such an incident. If I had been consulted, I would almost certainly have directed Mr. Johnson to omit the matter from the memorandum of discussion." (Boggs affidavit, 10/10/75, p. 2)

James Lay, who attended other NSC meetings where Lumumba was discussed (*e.g.*, September 21, 1960), also confirmed the fact that NSC minutes would not be likely to record a statement as sensitive as a Presidential order for an assassination, if such an order were given:

"If extremely sensitive matters were discussed at an NSC meeting, it was sometimes the practice that the official NSC minutes would record only the general subject discussed without identifying the specially sensitive subject of the discussion. In highly sensitive cases, no reference to the subject would be made in the NSC minutes." (Lay affidavit, 9/8/75, p. 2)

[67] Johnson testified without benefit of review of the complete Memorandum of Discussion of the meeting of September 7 because the Committee had not received it at that point. Instead, he reviewed the Record of Action which summarized the decisions made at that meeting. As discussed at Section (7) (a) (iv), *infra,* when the complete minutes of the meetings of August 18 and September 7 are compared, it is clear that the subject of Lumumba's role in the Congo received far more attention at the meeting of August 18.

[68] Each of the major events in this series is discussed in detail in other sections of the report and summarized at the beginning of section 7, *supra.*

The NSC meeting of August 18, 1960 was held three weeks before Lumumba's dismissal by Kasavubu, which Johnson remembers as taking place "not long after" he heard the President's statement. The only other meeting at which Johnson could have heard the statement by the President was held two days after this event, on September 7.[69]

Robert Johnson's memorandum of the meeting of August 18, 1960 indicates that Acting Secretary of State C. Douglas Dillon[70] introduced the discussion of United States policy toward the Congo. In the course of his remarks, Dillon maintained that the presence of United Nations troops in the Congo was necessary to prevent Soviet intervention at Lumumba's request:

> If * * * Lumumba carried out his threat to force the U.N. out, he might then offer to accept help from anyone. * * * The elimination of the U.N. would be a disaster which, Secretary Dillon stated, we should do everything we could to prevent. If the U.N. were forced out, we might be faced by a situation where the Soviets intervened by invitation of the Congo.
>
> * * * Secretary Dillon said that he [Lumumba] was working to serve the purposes of the Soviets and Mr. Dulles pointed out that Lumumba was in Soviet pay. (NSC Minutes, 8/18/60)

Dillon's remarks prompted the only statements about Lumumba attributed to the President in the Memorandum of the August 18 meeting:

> The President said that the possibility that the U.N. would be forced out was simply inconceivable. We should keep the U.N. in the Congo even if we had to ask for European troops to do it. We should do so even if such action was used by the Soviets as the basis for starting a fight. Mr. Dillon indicated that this was State's feeling but that the Secretary General and Mr. Lodge doubted whether, if the Congo put up really determined opposition to the U.N., the U.N. could stay in. In response, the President stated that Mr. Lodge was wrong to this extent—we were talking of one man forcing us out of the Congo; of Lumumba supported by the Soviets. There was no indication, the President stated, that the Congolese did not want U.N. support and the maintenance of order. Secretary Dillon reiterated that this was State's feeling about the matter. The situation that would be created by a U. N. withdrawal was altogether too ghastly to contemplate. (NSC Minutes, 8/18/60)

As reported, this statement clearly does not contain an order for the assassination of Lumumba. But the statement does indicate extreme Presidential concern focused on Lumumba: the President was so disturbed by the situation in the Congo that he was willing to risk a fight with the Soviet Union and he felt that Lumumba was the "one man" who was responsible for this situation, a man who did not represent the sentiment of the Congolese people in the President's estimation.

After reviewing NSC documents and being informed of Robert Johnson's testimony, Douglas Dillon stated his "opinion that it is most likely that the NSC meeting of August 18,

---

[69] See Section 7(a) (iv), *infra*, for an analysis of the substance of the NSC discussion on September 7, 1960.

[70] In 1960, Dillon served as Undersecretary of State, the "number two position in the State Department." The title was subsequently changed to Deputy Secretary of State. In this post, Dillon frequently served as Acting Secretary of State and either attended or was kept informed about NSC and Special Group meetings. Dillon later served as Secretary of the Treasury under President Kennedy. (Dillon, 9/2/75, pp. 2–4)

1960 is the meeting referred to by Mr. Johnson." (Dillon affidavit, 9/15/75, p. 2) However, Dillon testified that he did not "remember such a thing" as a "clearcut order" from the President for the assassination of Lumumba. (Dillon, 9/2/75, pp. 32–33) Dillon explained how he thought the President may have expressed himself about Lumumba:

DILLON: It could have been in view of this feeling of everybody that Lumumba was [a] very difficult if not impossible person to deal with, and was dangerous to the peace and safety of the world, that the President expressed himself, we will have to do whatever is necessary to get rid of him. I don't know that I would have taken that as a clearcut order as Mr. Johnson apparently did. And I think perhaps others present may have interpreted it other ways. (Dillon, 9/2/75, pp. 32–33)

Q: Did you ever hear the President make such a remark about Lumumba, let's get rid of him, or let's take action right away on this?

DILLON: I don't remember that. But certainly this was the general feeling of Government at that time, and it wouldn't have been if the President hadn't agreed with it. (Dillon, 9/2/75, p. 33)

Dillon said that he would have thought that such a statement "was not a direct order to have an assassination." But he testified that it was "perfectly possible" that Allen Dulles would have translated such strong Presidential language about "getting rid of" Lumumba into authorization for an assassination effort. (Dillon, 9/2/75, pp. 33, 34–35):

> I think that Allen Dulles would have been quite responsive to what he considered implicit authorization, because he felt very strongly that we should not involve the President directly in things of this nature. And he was perfectly willing to take the responsibility personally that maybe some of his successors wouldn't have been. And so I think that this is a perfectly plausible thing, knowing Allen Dulles. (Dillon, 9/2/75, p. 34)

According to President Eisenhower's national security advisor, Gordon Gray, Dulles would have placed the CIA in a questionable position if he mounted an assassination operation on the basis of such "implicit authorization." Gray testified that the CIA would have been acting beyond its authority if it undertook an assassination operation without a specific order to do so. (Gray, 9/9/75, p. 18)

Marion Boggs, who attended the meeting of August 18, as Acting Executive Secretary of the NSC, stated after reviewing the Memorandum of Discussion at that Meeting:

> I recall the discussion at that meeting, but have no independent recollection of any statements or discussion not summarized in the memorandum. Specifically, I have no recollection of any statement, order or reference by the President (or anyone else present at the meeting) which could be interpreted as favoring action by the United States to bring about the assassination of Lumumba.[71] (Boggs affidavit, 10/10/75, pp. 1–2)

[71] Boggs added:

"Based on my whole experience with the NSC, I would have considered it highly unusual if a matter of this nature had been referred to in a Council meeting where a number of persons with no 'need to know' were present." (Boggs affidavit, 10/10/75, p. 2)

There are at least four possible explanations of the failure of NSC records to reveal whether the President ordered the assassination of Lumumba at one of the meetings where Robert Johnson was present.

First, an assassination order could have been issued but omitted from the records. Johnson testified that it was "very likely" that the Presidential statement he heard would have been handled by means of a euphemistic reference or by complete omission "rather than given as [a] * * * direct quotation" in the Memorandum of Discussion. (Johnson, 9/13/75, p. 14) NSC staff executives Marion Boggs and James Lay substantiated Johnson's testimony about the manner of handling such a statement in the records.

Second, as illustrated by Douglas Dillon's testimony, the President could have made a general statement about "getting rid of" Lumumba with the intent to convey to Allen Dulles implicit authorization for an assassination effort.

Third, despite general discussions about removing Lumumba, the President may not have intended to order the assassination of Lumumba even though Allen Dulles may have thought it had been authorized. The three White House staff members responsible to the President for national security affairs testified that there was no such order.[72]

Fourth, whatever language he used, the President may have intended to authorize "contingency planning" for an assassination effort against Lumumba, while reserving decision on whether to authorize an actual assassination attempt. This interpretation can be supported by a strict construction of the decision of the Special Group on August 25, in response to the "strong feelings" of the President, not to rule out " 'consideration' of any particular kind of activity which might contribute to getting rid of Lumumba" and by the testimony of Bronson Tweedy that the assassination operation was limited to "exploratory activity."[73]

(iii) Special Group Agrees to Consider Anything That Might Get Rid of Lumumba: August 25, 1960

On August 25, 1960, five men[74] attended a meeting of the Special Group, the subcommittee of the National Security Council responsible for planning covert operations. Thomas Parrott, a CIA officer who served as Secretary to the Group, began the meeting by outlining the CIA operations that had been undertaken in "mounting an anti-Lumumba campaign in the Congo." (Special Group Minutes, 8/25/60) This campaign involved covert operations through certain labor groups and "the planned attempt * * * to arrange a vote of no confidence in Lumumba" in the Congolese Senate. (Special Group Minutes, 8/25/60) The outline of this campaign evoked the followed dialogue:

---

[72] See Section 7 (b), *infra*, for a general treatment of the testimony of Gray, Goodpaster, and Eisenhower.

[73] This interpretation of the Special Group minutes must be posed against the testimony of other witnesses who construed the minutes as authorizing action, as well as planning an assassination operation. (Special Group Minutes, 8/25/60, p. 1; see Section 7 (a) (ii) *infra*) See Section 4 (h) (ii), *supra*, for a detailed discussion of Tweedy's testimony.

[74] The four standing members of the Special Group were in attendance: Allen Dulles, Director of Central Intelligence; Gordon Gray, Special Assistant to the President for National Security Affairs; Livingston Merchant, Undersecretary of State for Political Affairs; and John N. Irwin II, Assistant Secretary of Defense. Also in attendance was Thomas A. Parrott, Secretary to the Special Group.

> The Group agreed that the action contemplated is very much in order. Mr. Gray commented, however, that his associates had expressed extremely strong feelings on the necessity for very straightforward action in this situation, and he wondered whether the plans as outlined were sufficient to accomplish this. Mr. Dulles replied that he had taken the comments referred to seriously and had every intention of proceeding as vigorously as the situation permits or requires, but added that he must necessarily put himself in a position of interpreting instructions of this kind within the bounds of necessity and capability. It was finally agreed that planning for the Congo would not necessarily rule out "consideration" of any particular kind of activity which might contribute to getting rid of Lumumba. (Special Group Minutes, 8/25/60, p. 1)

Both Gordon Gray and Thomas Parrott testified that the reference to Gray's "associates" was a euphemism for President Eisenhower which was employed to preserve "plausible deniability" by the President of discussion of covert operations memorialized in Special Group Minutes. (Gray, 7/9/75, p. 27; Parrott, 7/10/75, pp. 8–9)

The four living participants at the meeting have all stated that they do not recall any discussion of or planning for the assassination of Lumumba. Gray said that he did not consider the President's desire for "very straightforward action" to include "any thought in his mind of assassination." Parrott testified to the same effect, maintaining that he would have recorded a discussion of assassination in explicit terms in the Special Group Minutes if such a discussion had taken place. (Gray, 7/9/75, pp. 27, 32; Parrott, 7/10/75, pp. 25–26; Merchant affidavit, 9/8/75, p. 1; Irwin affidavit, 9/22/75, pp. 1–2) John N. Irwin II acknowledged, however, that while he did not have "any direct recollection of the substance of that meeting," the reference in the minutes to the planning for "getting rid of Lumumba" was "broad enough to cover a discussion of assassination." (Irwin affidavit, 9/22/75, p. 2)

Irwin's interpretation was shared by Douglas Dillon and Richard Bissell who were not participants at this Special Group meeting but were involved in the planning and policy-making for covert operations in the Congo during this period.

As a participant in NSC meetings of this period, Dillon said that he would read the Special Group minutes of August 25 to indicate that assassination was within the bounds of the kind of activity that might be used to "get rid of" Lumumba. Dillon noted that the reference in the minutes to Dulles' statement that he "had taken the comments referred to seriously" probably pointed to the President's statement at the NSC meeting on August 18. (Dillon, 9/2/75, pp. 39–42) When asked whether the CIA would have the authority to mount an assassination effort against Lumumba on the basis of the discussion at the Special Group, Dillon said:

> They would certainly have the authority to plan. It is a close question whether this would be enough to actually go ahead with it. But certainly the way this thing worked, as far as I know, they didn't do anything just on their own. I think they would have checked back at least with the senior people in the State Department or the Defense Department. (Dillon, 9/2/75, p. 43)

Dillon said that if the CIA checked with the State Department, it might have done so in a way that would not appear on any record. (Dillon, 9/2/75, p. 43) Dillon added that "to protect the President as the public representative of the U.S. from any bad publicity in connection with this," Allen Dulles "wouldn't return to the President" to seek further approval if an assassination operation were mounted. (Dillon, 9/2/75, pp. 42–43)

Bissell stated that in his opinion the language of the August 25 Special Group Minutes indicated that the assassination of Lumumba was part of a general NSC strategy and was

within the CIA's mandate for removing Lumumba from the political scene. (Bissell, 9/10/75, pp. 29, 32) He added:

> The Agency had put a top priority, probably, on a range of different methods of getting rid of Lumumba in the sense of either destroying him physically, incapacitating him, or eliminating his political influence. (Bissell, 9/10/75, p. 29)

Bissell pointed to the Special Group Minutes of August 25 as a "prime example" of the circumlocutious manner in which a topic like assassination would be discussed by high government officials:

> When you use the language that no particular means were ruled out, that is obviously what it meant, and it meant that to everybody in the room. * * * Meant that if it had to be assassination, that that was a permissible means.
>
> You don't use language of that kind except to mean in effect, the Director is being told, get rid of the guy, and if you have to use extreme means up to and including assassination, go ahead. (Bissell, 9/10/75, pp. 32–33)

Bissell added that this message was, "in effect," being given to Dulles by the President through his representative, Gordon Gray. (Bissell, 9/10/75, p. 33)

(iv) Dulles Reminded by Gray of "Top-Level Feeling" That "Vigorous Action" Was Necessary in the Congo: September 7–8, 1960

The Memorandum of Discussion from the NSC meeting of September 7, 1960—the only other meeting at which Johnson could have heard the President's statement—records only a brief, general discussion of developments in the Congo. As part of Allen Dulles' introductory intelligence briefing on world events, the Memorandum contained his remarks on the situation in the Congo following Kasavubu's dismissal of Lumumba from the government. Neither the length nor the substance of the record of this discussion indicates that Lumumba's role in the Congo received the same intense consideration as the NSC had given it on August 18.[75] There is no record of any statement by the President during the September 7 discussion. (NSC Minutes, 9/7/60, p. 4–5)

In the course of Dulles' briefing, he expressed his continuing concern over the amount of personnel and equipment that was being sent to the Congo by the Soviet Union, primarily to aid Lumumba. Dulles concluded this part of his briefing with an observation that demonstrated that Lumumba's dismissal from the government had not lessened the extent to which he was regarded at the NSC as a potent political threat in any power struggle in the Congo:

> Mr. Dulles stated that Lumumba always seemed to come out on top in each of these struggles. (NSC Minutes, 9/7/60, p. 5)

At a Special Group Meeting the next day, Gordon Gray made a pointed reminder to Allen Dulles of the President's concern about the Congo:

[75] The NSC minutes of the meeting of September 7 deal with the discussion of the Congo in two pages. (NSC Minutes, 9/7/60, pp. 4–5). By comparison, the August 18 meeting required an extraordinarily lengthy (fifteen pages) summary of discussion on the Congo and related policy problems in Africa, indicating that this topic was the focal point of the meeting. (NSC Minutes, 8/18/60, pp. 1–15)

> Mr. Gray said that he hoped that Agency people in the field are fully aware of the top-level feeling in Washington that vigorous action would not be amiss. (Special Group Minutes, 9/8/60)

(v) Dulles Tells NSC That Lumumba Remains a Grave Danger Until "Disposed of": September 21, 1960

In the course of his intelligence briefing to the NSC on September 21, 1960, Allen Dulles stressed the danger of Soviet influence in the Congo. Despite, the fact that Lumumba had been deposed as Premier and was in U.N. custody, Dulles continued to regard him as a threat, especially in light of reports of an impending reconciliation between Lumumba and the post-coup Congolese government. In the presence of the President, Dulles concluded:

> Mobutu appeared to be the effective power in the Congo for the moment but Lumumba was not yet disposed of and remained a grave danger as long as he was not disposed of. (NSC Minutes, 9/21/60)

Three days after this NSC meeting, Dulles sent a personal cable to the Station Officer in Leopoldville which included the following message:

> WE WISH GIVE EVERY POSSIBLE SUPPORT' IN ELIMINATING LUMUMBA FROM ANY POSSIBILITY RESUMING GOVERNMENTAL POSITION OR IF HE FAILS IN LEOP[OLDVILLE], SETTING HIMSELF IN STANLEYVILLE OR ELSEWHERE (CIA Cable, Dulles, Tweedy to Leopoldville, 9/24/60)

On September 26, Joseph Scheider, under assignment from CIA Headquarters, arrived in Leopoldville, provided the Station Officer with poisons, conveyed Headquarters' instruction to assassinate Lumumba, and assured him that there was Presidential authorization for this mission.[76]

Marion Boggs, the NSC Deputy Executive Secretary, who wrote the Memorandum of Discussion of September 21, did not interpret Dulles' remark as referring to assassination:

> I have examined the memorandum (which I prepared) summarizing the discussion of the Congo at the September 21, 1960 meeting of the NSC. I recall the discussion and believe it is accurately and adequately summarized in the memorandum. I have no recollection of any discussion of a possible assassination of Lumumba at this meeting. With specific reference to the statement of the Director of Central Intelligence * * * I believe this is almost a literal rendering of what Mr. Dulles said. My own interpretation of this statement * * * was that Mr. Dulles was speaking in the context of efforts being made within the Congolese government to force Lumumba from power. I did not interpret it as referring to assassination.[77] (Boggs affidavit, 10/10/75, pp. 2–3)

Boggs, however, was not in a position to analyze Dulles' remark in the context of the actual planning for covert operations that took place during this period because Boggs was not privy to most such discussions. (Boggs affidavit, 10/10/75, p. 2)

---

[76] See Sections 4(e)–4(f), *supra.*

[77] NSC Executive Secretary James Lay, who was also present at the meeting of September 21, 1960, stated: "I cannot recall whether there was any discussion of assassinating Lumumba at any NSC meetings." (Lay affidavit, 9/8/75, p. 1)

Dillon, who attended this NSC meeting as Acting Secretary of State, did not recall the discussion. Dillon said that the minutes "could mean that" assassination would have been one acceptable means of "disposing of" Lumumba, although he felt that "getting him out [of the Congo] or locking him up" would have been a preferable disposition of Lumumba at that point since he was already out of office. (Dillon, 9/2/75, pp. 47–48)[78] When reminded of the fact that Lumumba's movement and communications were not restricted by the U.N. force and that the Congolese army continued to seek his arrest after the September 21 meeting, Dillon acknowledged that during this period Lumumba continued to be viewed by the United States as a potential threat and a volatile force in the Congo:

> * * * He had this tremendous ability to stir up a crowd or a group. And if he could have gotten out and started to talk to a battalion of the Congolese Army, he probably would have had them in the palm of his hand in five minutes. (Dillon, 9/20/75, p. 49)

Irwin, who attended the NSC meeting as Assistant Secretary of Defense, stated that although he had no recollection of the discussion, the language of these minutes, like that of the August 25 minutes, was "broad enough to cover a discussion of assassination." (Irwin affidavit, 9/22/75, p. 2)

Bissell testified that, based upon his understanding of the policy of the NSC toward Lumumba even after Lumumba was in U.N. custody, he would read the minutes of September 21 to indicate that assassination was contemplated "as one possible means" of "disposing of" Lumumba[79] (Bissell, 9/10/75, p. 70)

Bissell's opinion stands in opposition to Gordon Gray's testimony. Gray stated that he could not remember the NSC discussion, but he interpreted the reference to "disposing of" Lumumba as "in the same category as 'get rid of,' 'eliminate'." (Gray, 7/9/75, p. 59) He said: "It was not my impression that we had in mind the assassination of Lumumba.") (Gray, 7/9/75, p. 60)[80]

(b) Testimony of Eisenhower White House Officials

Gordon Gray and Andrew Goodpaster—the two members of President Eisenhower's staff who were responsible for national security affairs—both testified that they had no knowledge of any Presidential consideration of assassination during their tenure.[81]

---

[78] See Section 3, *supra,* for discussion of CIA cable traffic indicating that Lumumba continued to be regarded as capable of taking over the government after he was deposed and that pressure to "eliminate" him did not cease until his death.

[79] Bissell was not present at the NSC meeting. (NSC Minutes, 9/21/60)

[80] John Eisenhower, the President's son, who attended the NSC meeting as Assistant White House Staff Secretary, said that he had no "direct recollection" of the discussion but he found the minutes of the meeting consonant with his "recollection of the atmosphere" at the time: "The U.S. position was very much anti-Lumumba." He said:

"I would not conjecture that the words 'disposed of' meant an assassination, if for no other reason than if I had something as nasty as this to plot, I wouldn't do it in front of 21 people * * * the number present [at] the meeting." (Eisenhower, 7/18/75, pp. 9–10)

[81] For a more detailed treatment of the testimony of Gray, Goodpaster, and other Eisenbower Administration officials on the general question of discussion of assassination by the President, see Part 3, Section B(3) (a), *infra.*

Gray served as Special Assistant to the President for National Security Affairs, in which capacity he coordinated the National Security Council and represented the President at Special Group meetings. Gray testified that despite the prevalent attitude of hostility toward Lumumba in the Administration, he did not recall President Eisenhower "ever saying anything that contemplated killing Lumumba." (Gray, 7/9/75, p. 28)[82] When asked to interpret phrases such as "getting rid of" or "disposing of" Lumumba from the minutes of particular NSC and Special Group Meetings, Gray stated:

> It is the intent of the user of the expression or the phrase that is controlling and there may well have been in the Central Intelligence Agency plans and/or discussions of assassinations, but * * * at the level of the Forty Committee [Special Group] or a higher level than that, the National Security Council, there was no active discussion in any way planning assassination.
>
> * * * I agree that assassination could have been on the minds of some people when they used these words 'eliminate' or 'get rid of' * * * I am just trying to say it was not seriously considered as a program of action by the President or even the Forty [Special] Group. (Gray, 7/9/75, pp. 16–17)

Goodpaster, the White House Staff Secretary to President Eisenhower, said that he and Gray were the "principal channels" between the President and the CIA, outside of NSC meetings. Goodpaster was responsible for "handling with the President all matters of day-to-day operations in the general fields of international affairs and security affairs." He regularly attended NSC meetings and was listed among the participants at the NSC meetings of August 18, 1960 and September 21, 1960. (Goodpaster, 7/17/75, pp. 3, 4)

When asked if he ever heard about any assassination effort during the Eisenhower Administration, Goodpaster replied unequivocally:

> * * * at no time and in no way did I ever know of or hear about any mention of such an activity. * * * [I]t is my belief that had such a thing been raised with the President other than in my presence, I would have known about it, and * * * it would have been a matter of such significance and sensitivity that I am confident that * * * I would have recalled it had such a thing happened. (Goodpaster, 7/17/75, p. 5)

John Eisenhower, the President's son who served under Goodpaster as Assistant White House Staff Secretary, stated that the use of assassination was contrary to the President's philosophy that "no man is indispensable." As a participant at NSC meetings who frequently attended Oval Office discussions relating to national security affairs, John Eisenhower testified that nothing that came to his attention in his experience at the White House "can be construed in my mind in the remotest way to mean any Presidential knowledge of our concurrence in any assassination plots or plans." (Eisenhower, 7/18/75, pp. 4, 14)

Each of the other Eisenhower Administration officials who was active in the Special Group in late 1960—Assistant Secretary of Defense John N. Irwin II, Undersecretary of State for Political Affairs Livingston Merchant, and Deputy Secretary of Defense James

[82] At the outset of his testimony on the subject, Gordon Gray acknowledged that he did not have a clear, independent recollection of Lumumba's role in the Congo. (Gray, 7/9/75, pp. 25–26)

Douglas—stated that he did not recall any discussion about assassinating Lumumba. (Irwin affidavit, 9/22/75; Merchant affidavit, 9/8/75; Douglas affidavit, 9/5/75)[83]

Even if the documentary record is read to indicate that there was consideration of assassination at high-level policy meetings, there is no evidence that any officials of the Eisenhower Administration outside the CIA were aware of the specific operational details of the plot to poison Lumumba.[84]

(c) Bissell's Assumptions About Authorization by President Eisenhower and Allen Dulles

Richard Bissell's testimony on the question of high-level authorization for the effort to assassinate Lumumba is problematic. Bissell stated that he had no direct recollection of receiving such authorization and that all of his testimony on this subject "has to be described as inference." (Bissell, 9/10/75, p. 48)

Bissell began his testimony on the subject by asserting that on his own initiative he instructed Michael Mulroney to plan the assassination of Lumumba. (Bissell, 6/11/75, pp. 54–55)[85] Nevertheless, Bissell's conclusion—based on his inferences from the totality of circumstances relating to the entire assassination effort against Lumumba—was that an assassination attempt had been authorized at the highest levels of the government. (Bissell, 9/10/75, pp. 32–33, 47–49, 60–62, 65)

As discussed above, Bissell testified that the minutes of meetings of the Special Group on August 25, 1960 and the NSC on September 21, 1960 indicate that assassination was contemplated at the Presidential level as one acceptable means of "getting rid of Lumumba."[86]

There was "no question," according to Bissell, that the cable from Allen Dulles to the Station Officer in Leopoldville on August 26—which called for Lumumba's "removal" and authorized Hedgman to take action without consulting Headquarters if time did not

[83] Douglas Dillon testified that the subject of assassination never arose in his "direct dealings with either President Eisenhower or President Kennedy." (Dillon, 9/2/75, p. 22) He was asked by a member of the Committee, however, to speculate upon the general philosophical approach that Presidents Eisenhower and Kennedy would have taken to decision-making on the question of using assassination as a tool of foreign policy:

"SENATOR HART (Colorado): I would invite your speculation at this point as a sub-Cabinet officer under President Eisenhower, and as a Cabinet Officer under President Kennedy, I think the Committee would be interested in your view as to the attitude of each of them toward this subject, that is to say, the elimination, violent elimination of foreign leaders.

"DILLON: Well, that is a difficult thing to speculate on in a totally different atmosphere. But I think probably both of them would have approached it in a very pragmatic way, most likely, simply weighed the process and consequence rather than in a way that was primarily of a moral principle. That is what would probably have been their attitude in a few cases. Certainly the idea that this was going to be a policy of the U.S., generally both of them were very much opposed to it." (Dillon, 9/2/75, pp. 22–23)

Dillon served as Undersecretary of State in the Eisenhower Administration and as Secretary of the Treasury under Kennedy.

[84] Although several CIA officers involved in the PROP operation to poison Lumumba testified that the operation was within the scope of actions authorized by the NSC and Special Group, there is no testimony that any official of the Eisenhower Administration outside the CIA had specific knowledge of the operational planning and progress.

[85] See Sections 5 (a) (i) and 5 (a) (ii), *supra.*

[86] See Sections 7 (a) (iii) and 7 (a) (v).

permit—was a direct outgrowth of the Special Group meeting Dulles had attended the previous day. (Bissell, 9/10/75, pp. 31–32) Bissell was "almost certain" that he had been informed about the Dulles cable shortly after its transmission. (Bissell, 9/10/75, p. 12) Bissell said that he assumed that assassination was one of the means of removing Lumumba from the scene that was contemplated by Dulles' cable, despite the fact that it was not explicitly mentioned. (Bissell, 9/10/75, p. 32)

> It is my belief on the basis of the cable drafted by Allen Dulles that he regarded the action of the Special Group as authorizing implementation [of an assassination] if favorable circumstances presented themselves, if it could be done covertly. (Bissell, 9/10/75, pp. 64–65)[87]

Dulles' cable signaled to Bissell that there was Presidential authorization for him to order action to assassinate Lumumba. (Bissell, 9/10/75, pp. 61–62):

Q: Did Mr. Dulles tell you that President Eisenhower wanted Lumumba killed?

Mr. BISSELL: I am sure he didn't.

Q: Did he ever tell you even circumlocutiously through this kind of cable?

Mr. BISSELL: Yes, I think his cable says it in effect. (Bissell, 9/10/75, p. 33)

As for discussions with Dulles about the source of authorization for an assassination effort against Lumumba, Bissell stated:

> I think it is probably unlikely that Allen Dulles would have said either the President or President Eisenhower even to me. I think he would have said, this is authorized in the highest quarters, and I would have known what he meant. (Bissell, 9/10/75, p. 48)

When asked if he had sufficient authority to move beyond the consideration or planning of assassination to order implementation of a plan, Bissell said, "I probably did think I had [such] authority." (Bissell, 9/10/75, pp. 61–62)

When informed of the Station Officer's testimony about the instructions he received from Scheider, Bissell said that despite his absence of a specific recollection:

> I would strongly infer in this case that such an authorization did pass through me, as it were, if Joe Scheider gave that firm instruction to the Station Officer. (Bissell, 9/10/75, p. 40)[88]

Bissell said that the DCI would have been the source of this authorization. (Bissell, 9/10/75, p. 40)

Bissell did not recall being informed by Scheider that Scheider had represented to the Station Officer that Lumumba's assassination had been authorized by the President. But he said that assuming he had instructed Scheider to carry poison to the Congo, "there was no possibility" that he would have issued such an instruction without authorization from

---

[87] Joseph Scheider also testified that, in the context of the Dulles cable, "removal" would signify to someone familiar with "intelligence terminology" a "range of things, from just getting him out of office to killing him." (Scheider, 10/9/75, pp. 45–48)

[88] See Section 7 (d), *infra*, for Scheider's testimony on his impression that Bissell had authorized his assignment to the Congo.

Dulles. Likewise Bissell said he "probably did" tell Scheider that the mission had the approval of President Eisenhower. (Bissell, 9/10/75, pp. 46, 47) This led to Bissell's conclusion that if, in fact, the testimony of the Station Officer about Scheider's actions was accurate, then Scheider's actions were fully authorized.[89] Bissell further stated:

> Knowing Mr. Scheider, it is literally inconceivable to me that we would have acted beyond his instructions. (Bissell, 9/10/75, p. 41)

Bronson Tweedy functioned as a conduit between Bissell and Scheider for instructions relating to the PROP operation. Scheider's impression about the extent of authorization for the assassination operation stemmed ultimately from his conversation with Bissell which was referred to by Tweedy during the meeting in which Scheider was ordered to the Congo.[90]

Tweedy testified that Bissell never referred to the President as the source of authorization for the assassination operation. Tweedy said, however, that the "impression" he derived from his meetings with Bissell and from the Dulles cable of August 26 was that the Agency had authorization at the highest level of the government. But Tweedy found it "very difficult ∗∗∗ to judge whether the President*per se*had been in contact with the Agency" because he was not involved in decisionmaking at "the policy level." (Tweedy, 10/9/75 I, pp. 9, 10)

Concerning the assignment of Mulroney to "plan and prepare for" the assassination of Lumumba, Bissell testified that "it was my own idea to give Mulroney this assignment." But he said that this assignment was made only after an assassination mission against Lumumba already had authorization above the level of DDP. (Bissell, 9/10/75, pp. 24, 50; see also pp. 32–33, 47–48, 60–62)

(d) The Impression of Scheider and Hedgman That the Assassination Operation had Presidential Authorization

The Station Officer and Scheider shared the impression that the President authorized an assassination effort against Lumumba.[91] This impression was derived solely from conversations Scheider had with Bissell and Tweedy. Thus, the testimony of Scheider and the Station Officer does not, in itself, establish Presidential authorization. Neither Scheider nor the Station Officer had first-hand knowledge of any statements by Allen Dulles about Presidential authorization—statements which Bissell assumed he had heard, although he had no specific recollection. Moreover, Scheider may have misconstrued Bissell's reference to "highest authority."

Station Officer Hedgman testified that Scheider indicated to him that President Eisenhower had authorized the assassination of Lumumba by an order to Dulles. Hedgman stated that Scheider initially conveyed this account of Presidential authorization when

---

[89] Q: in light of the entire atmosphere at the Agency and the policy at the Agency at the time Mr. Scheider's representation to the Station Officer that the President bad instructed the DCI to carry out this mission would not have been beyond the pale of Mr. Scheider's authority, at that point?

BISSELL. No, it would not. (Bissell, 9/10/75, p. 65)

[90] See Section 7 (d), *infra*.

[91] See Section 4 (f), *infra*, for additional testimony of the Station Officer and Scheider on this issue.

Hedgman asked him about the source of authority for the Lumumba assassination assignment. (Hedgman, 8/21/75, pp. 30–34)
Hedgman was under the clear impression that the President was the ultimate source of the assassination operation:

Q: Your understanding then was that these instructions were instructions coming to you from the office of the President?

HEDGMAN: That's correct.

Q: Or that he had instructed the Agency, and they were passed on to you?

HEDGMAN: That's right.

Q: You are not the least unclear whether ∗∗∗ the President's name had been invoked in some fashion?

HEDGMAN: At the time, I certainly felt that I was under instructions from the President, yes. (Hedgman, 8/21/75, pp. 32–33)

Hedgman cautioned:

> [A]fter fifteen years, I cannot be 100 percent certain, but I have always, since that date, had the impression in my mind that these orders had come from the President. (Hedgman, 8/21/75, p. 34; *accord,* p. 102)

Hedgman testified that he was under the impression that a "policy decision" had been made—that assassination had been "approved" as "one means" of eliminating Lumumba as a political threat (Hedgman 8/21/75, p. 52):

> I thought the policy decision had been made in the White House, not in the Agency, and that the Agency had been selected as the Executive agent if you will, to carry out a political decision. (Hedgman, 8/21/75, p. 52.)

Although Hedgman assumed that the President had not personally selected the means of assassination, he testified that he was under the impression that the President had authorized the CIA to proceed to take action:

HEDGMAN: ∗∗∗ I doubt that I thought the President had said, you use this system. But my understanding is the President had made a decision that an act should take place, but then put that into the hands of the Agency to carry out his decision.

Q: Whatever that act was to be, it was clearly to be assassination or the death of the foreign political leader?

HEDGMAN: Yes. (Hedgman, 8/21/75, p. 104)

The Station Officer's impression about Presidential authorization stemmed from his conversations with Scheider in the Congo and from his reading of the cable traffic from CIA Headquarters which, in fact, never explicitly mentioned the President although it referred to "high quarters."[92]

[92] See Section 7 (c) for Bissell's interpretation of the reference to "high quarters" in the Dulles cable of August 26, 1960.

Joseph Scheider's testimony about these discussions is compatible with Hedgman's account. (Scheider, 10/7/75, pp. 107–108) Despite the fact that he did not recall mentioning the President by name to Hedgman, Scheider believed that he left Hedgman with the impression that there was Presidential authorization for an assassination attempt against Lumumba. (Scheider, 10/7/75, pp. 103–104, 110; 10/9/75, p. 17) However, Scheider made it clear that the basis for his own knowledge about Presidential authorization for the assassination of Lumumba were the statements to him by Bissell, Tweedy, and Tweedy's Deputy. (Scheider, 10/9/75, pp. 10;/7/75, p. 90)

Scheider testified that in the late summer or early fall of 1960, Richard Bissell asked him to make all the preparations necessary for toxic materials to be ready on short notice for use in the assassination of an unspecified African leader, "in case the decision was to go ahead."[93] (Scheider, 10/7/75, pp. 51–55; 10/9/75, p. 8) Scheider had a specific recollection that Bissell told him that "he had direction from the highest authority" for undertaking an assassination operation. (Scheider, 10/7/75, pp. 51–52, 58):

SCHEIDER: The memory I carry was that he indicated that he had the highest authority for getting into that kind of an operation.

Q: Getting into an operation which would result in the death or incapacitation of a foreign leader?

SCHEIDER: Yes, yes, yes. (Scheider, 10/7/75, p. 52)

Scheider acknowledged the possibility that he "may have been wrong" in his assumptions of Presidential authorization which he based on Bissell's words:

> The specific words, as best I can recollect them, [were] "on the highest authority." (Scheider, 10/9/75, p. 11).

Scheider testified that there was a basis of experience for his assumption that "highest authority" signified the President. He said he "had heard it before" at the CIA and had always interpreted it to denote the President. (Scheider, 10/9/75, p. 51) Likewise, Bronson Tweedy testified that " 'highest authority' was a term that we used in the Agency and it was generally recognized as meaning 'the President'." (Tweedy, 10/9/75 II, p. 20)

According to Scheider, Allen Dulles would have approved the assassination operation before Bissell broached the subject with other CIA officers:

> I would have assumed that Bissell would never have told me that it was to be undertaken under the highest authority until his line ran through Dulles and until Dulles was in on it. (Scheider, 10/7/75, p. 76)

Scheider said that he left the meeting with Bissell under the impression that the Presidential authorization extended only to making preparations to carry out an assassination mission and that the implementation of such a plan might require a separate "go ahead." (Scheider, 10/7/75, pp. 53, 56–8) As far as Scheider was concerned, the "go ahead" on the assassination operation was given to him shortly thereafter by Tweedy and

[93] See section 4 (b), *infra,* for a full treatment of Scheider's meetings with Bissell and his preparation of toxic biological materials and medical paraphernalia pursuant to Bissell's directive.

his Deputy.[94] When they instructed him on his Congo trip, Scheider said Tweedy and his Deputy "referred to the previous conversation I had with Bissell" and they conveyed to Scheider the impression that Bissell "felt the operation had Presidential authority." (Scheider, 10/7/75, pp. 65, 69, 71; 10/9/75, p. 13)[95] Scheider interpreted the statements by Tweedy and his Deputy to mean that Bissell's reference to "highest authority" for the operation had carried over from planning to the implementation stage. (Scheider, 10/7/75, p. 90)

Scheider's impression that there was Presidential authorization for the assassination operation clearly had a powerful influence on the Station Officer's attitude toward undertaking such an assignment.

Hedgman had severe doubts about the wisdom of a policy of assassination in the Congo. At the conclusion of his testimony about the assassination plot, he was asked to give a general characterization of the advisability of the plot and the tenor of the times in which it took place. His response indicated that although he was willing to carry out what he considered a duly authorized order, he was not convinced of the necessity of assassinating Lumumba:

> I looked upon the Agency as an executive arm of the Presidency * * *. Therefore, I suppose I thought that it was an order issued in due form from an authorized authority.
>
> On the other hand, I looked at it as a kind of operation that I could do without, that I thought that probably the Agency and the U.S. government could get along without. I didn't regard Lumumba as the kind of person who was going to bring on World War III.
>
> I might have had a somewhat different attitude if I thought that one man could bring on World War III and result in the deaths of millions of people or something, but I didn't see him in that light. I saw his as a danger to the political position of the United States in Africa, but nothing more than that. (Hedgman, 8/21/75, pp. 110–111)

[94] See Section 4 (c), *infra*, for a detailed account of the testimony about the meeting of Tweedy, his Deputy, and Scheider.

[95] Tweedy was unable to shed much light on the discussion of authorization at his meeting with Scheider:

I do not recall that Scheider and I ever discussed higher authority and approval. I do not say that it did not occur." (Tweedy, 10/9/75, p. 65)

APPENDIX H

WHEN COVERT ACTION SUBVERTS U.S. LAW: THE IRAN-*CONTRA* CASE

Tower Commission

In the aftermath of the Iran-*contra* scandal involving questionable arms sales to Iran and the funneling of the profits to the *contras* for a covert war in Nicaragua, President Ronald Reagan established a blue-ribbon panel to investigate the affair. The president selected a former U.S. senator, Republican John Tower of Texas, to head up the inquiry. This selection summarizes the commission's findings, which were highly critical of both the president and the NSC staff.

WHAT WAS WRONG

The arms transfers to Iran and the activities of the NSC staff in support of the Contras are case studies in the perils of policy pursued outside the constraints of orderly process.

The Iran initiative ran directly counter to the Administration's own policies on terrorism, the Iran/Iraq war, and military support to Iran. This inconsistency was never re-

Sources: Report of the President's *Special Review Board* (Tower Commission), Washington, DC, February 26, 1987), pp. IV, 1–13; and witness testimony, *Hearings,* Select Committee on Secret Military Assistance to Iran and the Nicaraguan Opposition (the Inouye-Hamilton Joint Committee, co-chaired by Senator Daniel K. Inouye, D-Hawaii, and Representative Lee Hamilton, D-Indiana), July and August 1987. The Tower Commission members included the chair, John Tower (R-Texas); Edmund Muskie, former Democratic Senator from Maine and secretary of state in the Carter administration; and Brent Scowcroft, national security adviser in the Ford and first Bush administrations. In the second part of this appendix, the congressional testimony is from national security adviser Vice Admiral John M. Poindexter and NSC staff aide Lieut. Col. Oliver L. North, as well as Secretary of State George P. Shultz.

solved, nor were the consequences of this inconsistency fully considered and provided for. The result taken as a whole was a U.S. policy that worked against itself.

The Board believes that failure to deal adequately with these contradictions resulted in large part from the flaws in the manner in which decisions were made. Established procedures for making national security decisions were ignored. Reviews of the initiative by all the NSC principals were too infrequent. The initiatives were not adequately vetted below the cabinet level. Intelligence resources were underutilized. Applicable legal constraints were not adequately addressed. The whole matter was handled too informally, without adequate written records of what had been considered, discussed, and decided.

This pattern persisted in the implementation of the Iran initiative. The NSC staff assumed direct operational control. The initiative fell within the traditional jurisdictions of the Departments of State, Defense, and CIA. Yet these agencies were largely ignored. Great reliance was placed on a network of private operators and intermediaries. How the initiative was to be carried out never received adequate attention from the NSC principals or a tough working-level review. No periodic evaluation of the progress of the initiative was ever conducted. The result was an unprofessional and, in substantial part, unsatisfactory operation.

In all of this process, Congress was never notified. . . .

A. A FLAWED PROCESS

1. Contradictory Policies Were Pursued

The arms sales to Iran and the NSC support for the Contras demonstrate the risks involved when highly controversial initiatives are pursued covertly.

ARMS TRANSFERS TO IRAN

The initiative to Iran was a covert operation directly at odds with important and well-publicized policies of the Executive Branch. But the initiative itself embodied a fundamental contradiction. Two objectives were apparent from the outset: a strategic opening to Iran, and release of the U.S. citizens held hostage in Lebanon. The sale of arms to Iran appeared to provide a means to achieve both these objectives. It also played into the hands of those who had other interests—some of them personal financial gain—in engaging the United States in an arms deal with Iran.

In fact, the sale of arms was not equally appropriate for achieving both these objectives. Arms were what Iran wanted. If all the United States sought was to free the hostages, then an arms-for-hostages deal could achieve the immediate objectives of both sides. But if the U.S. objective was a broader strategic relationship, then the sale of arms should have been contingent upon first putting into place the elements of that relationship. An arms-for-hostages deal in this context could become counter-productive to achieving this broader strategic objective. In addition, release of the hostages would require exerting influence with Hizballah, which could involve the most radical elements of the Iranian regime. The kind of strategic opening sought by the United States, however, involved what were regarded as more moderate elements.

The U.S. officials involved in the initiative appeared to have held three distinct views. For some, the principal motivation seemed consistently a strategic opening to Iran. For others, the strategic opening became a rationale for using arms sales to obtain the release of

the hostages. For still others, the initiative appeared clearly as an arms-for-hostages deal from first to last.

Whatever the intent, almost from the beginning the initiative became in fact a series of arms-for-hostages deals. . . .

While the United States was seeking the release of the hostages in this way, it was vigorously pursuing policies that were dramatically opposed to such efforts. The Reagan Administration in particular had come into office declaring a firm stand against terrorism, which it continued to maintain. In December of 1985, the Administration completed a major study under the chairmanship of the Vice President. It resulted in a vigorous reaffirmation of U.S. opposition to terrorism in all its forms and a vow of total war on terrorism whatever its source. The Administration continued to pressure U.S. allies not to sell arms to Iran and not to make concessions to terrorists.

No serious effort was made to reconcile the inconsistency between these policies and the Iran initiative. No effort was made systematically to address the consequences of this inconsistency—the effect on U.S. policy when, as it inevitably would, the Iran initiative became known. . . .

NSC STAFF SUPPORT FOR THE CONTRAS

The activities of the NSC staff in support of the Contras sought to achieve an important objective of the Administration's foreign policy. The President had publicly and emphatically declared his support for the Nicaragua resistance. That brought his policy in direct conflict with that of the Congress, at least during the period that direct or indirect support of military operations in Nicaragua was barred.

Although the evidence before the Board is limited, no serious effort appears to have been made to come to grips with the risks to the President of direct NSC support for the Contras in the face of these Congressional restrictions. Even if it could be argued that these restrictions did not technically apply to the NSC staff, these activities presented great political risk to the President. The appearance of the President's personal staff doing what Congress had forbade other agencies to do could, once disclosed, only touch off a firestorm in the Congress and threaten the Administration's whole policy on the Contras.

2. The Decision-making Process Was Flawed

Because the arms sales to Iran and the NSC support for the Contras occurred in settings of such controversy, one would expect that the decisions to undertake these activities would have been made only after intense and thorough consideration. In fact, a far different picture emerges.

ARMS TRANSFERS TO IRAN

The Iran initiative was handled almost casually and through informal channels, always apparently with an expectation that the process would end with the next arms-for-hostages exchange. It was subjected neither to the general procedures for interagency consideration and review of policy issues nor the more restrictive procedures set out in NSDD 159 for handling covert operations. This had a number of consequences.

(i) The opportunity for a full hearing before the President was inadequate. In the last half of 1985, the Israelis made three separate proposals to the United States with respect to

the Iran initiative (two in July and one in August). In addition, Israel made three separate deliveries of arms to Iran, one each in August, September, and November. Yet prior to December 7, 1985, there was at most one meeting of the NSC principals, a meeting which several participants recall taking place on August 6. There is no dispute that full meetings of the principals did occur on December 7, 1985, and on January 7, 1986. But the proposal to shift to direct U.S. arms sales to Iran appears not to have been discussed until later. It was considered by the President at a meeting on January 17 which only the Vice President, Mr. Regan, Mr. Fortier, and VADM Poindexter attended. Thereafter, the only senior-level review the Iran initiative received was during one or another of the President's daily national security briefings. These were routinely attended only by the President, the Vice President, Mr. Regan, and VADM Poindexter. There was no subsequent collective consideration of the Iran initiative by the NSC principals before it became public 11 months later.

This was not sufficient for a matter as important and consequential as the Iran initiative. Two or three cabinet-level reviews in a period of 17 months was not enough. The meeting on December 7 came late in the day, after the pattern of arms-for-hostages exchanges had become well established. The January 7 meeting had earmarks of a meeting held after a decision had already been made. Indeed, a draft Covert Action Finding authorizing the initiative had been signed by the President, though perhaps inadvertently, the previous day.

At each significant step in the Iran initiative, deliberations among the NSC principals in the presence of the President should have been virtually automatic. This was not and should not have been a formal requirement, something prescribed by statute. Rather, it should have been something the NSC principals desired as a means of ensuring an optimal environment for Presidential judgment. The meetings should have been preceded by consideration by the NSC principals of staff papers prepared according to the procedures applicable to covert actions. These should have reviewed the history of the initiative, analyzed the issues then presented, developed a range of realistic options, presented the odds of success and the costs of failure, and addressed questions of implementation and execution. Had this been done, the objectives of the Iran initiative might have been clarified and alternatives to the sale of arms might have been identified.

(ii) The initiative was never subjected to a rigorous review below the cabinet level. Because of the obsession with secrecy, interagency consideration of the initiative was limited to the cabinet level. With the exception of the NSC staff and, after January 17, 1986, a handful of CIA officials, the rest of the executive departments and agencies were largely excluded.

As a consequence, the initiative was never vetted at the staff level. This deprived those responsible for the initiative of considerable expertise—on the situation in Iran; on the difficulties of dealing with terrorists; on the mechanics of conducting a diplomatic opening. It also kept the plan from receiving a tough, critical review.

Moreover, the initiative did not receive a policy review below cabinet level. Careful consideration at the Deputy/Under Secretary level might have exposed the confusion in U.S. objectives and clarified the risks of using arms as an instrument of policy in this instance.

The vetting process would also have ensured better use of U.S. intelligence. As it was, the intelligence input into the decision process was clearly inadequate. First, no independent evaluation of other Israeli proposals offered in July and August appears to have

been sought or offered by U.S. intelligence agencies. The Israelis represented that they for some time had had contacts with elements in Iran. The prospects for an opening to Iran depended heavily on these contacts, yet no systematic assessment appears to have been made by U.S. intelligence agencies of the reliability and motivations of these contacts, and the identity and objectives of the elements in Iran that the opening was supposed to reach. Neither was any systematic assessment made of the motivation of the Israelis.

Second, neither Mr. Ghorbanifar nor the second channel seem to have been subjected to a systematic intelligence vetting before they were engaged as intermediaries. Mr. Ghorbanifar had been known to the CIA for some time and the agency had substantial doubts as to his reliability and truthfulness. Yet the agency did not volunteer that information or inquire about the identity of the intermediary if his name was unknown. Conversely, no early request for a name check was made of the CIA, and it was not until January 11, 1986, that the agency gave Mr. Ghorbanifar a new polygraph, which he failed. Notwithstanding this situation, with the signing of the January 17 Finding, the United States took control of the initiative and became even more directly involved with Mr. Ghorbanifar. The issues raised by the polygraph results do not appear to have been systematically addressed. In similar fashion, no prior intelligence check appears to have been made on the second channel.

Third, although the President recalled being assured that the arms sales to Iran would not alter the military balance with Iran, the Board could find no evidence that the President was ever briefed on this subject. The question of the impact of any intelligence shared with the Iranians does not appear to have been brought to the President's attention.

A thorough vetting would have included consideration of the legal implications of the initiative. There appeared to be little effort to face squarely the legal restrictions and notification requirements applicable to the operation. At several points, other agencies raised questions about violations of law or regulations. These concerns were dismissed without, it appears, investigating them with the benefit of legal counsel.

Finally, insufficient attention was given to the implications of implementation. The implementation of the initiative raised a number of issues: should the NSC staff rather than the CIA have had operational control; what were the implications of Israeli involvement; how reliable were the Iranian and various other private intermediaries; what were the implications of the use of Mr. Secord's private network of operatives; what were the implications for the military balance in the region; was operational security adequate. Nowhere do these issues appear to have been sufficiently addressed.

The concern for preserving the secrecy of the initiative provided an excuse for abandoning sound process. Yet the initiative was known to a variety of persons with diverse interests and ambitions—Israelis, Iranians, various arms dealers and business intermediaries, and Lt. Col. North's network of private operatives. While concern for secrecy would have justified limiting the circle of persons knowledgeable about the initiative, in this case it was drawn too tightly. As a consequence, important advice and counsel were lost.

In January of 1985, the President had adopted procedures for striking the proper balance between secrecy and the need for consultation on sensitive programs. These covered the institution, implementation, and review of covert operations. In the case of the Iran initiative, these procedures were almost totally ignored.

The only staff work the President apparently reviewed in connection with the Iran initiative was prepared by NSC staff members, under the direction of the National Security Advisor. These were, of course, the principal proponents of the initiative. A portion of this

staff work was reviewed by the Board. It was frequently striking in its failure to present the record of past efforts—particularly past failures. Alternative ways of achieving U.S. objectives—other than yet another arms-for-hostages deal—were not discussed. Frequently it neither adequately presented the risks involved in pursuing the initiative nor the full force of the dissenting views of other NSC principals. On balance, it did not serve the President well.

(iii) The process was too informal. The whole decision process was too informal. Even when meetings among NSC principals did occur, often there was no prior notice of the agenda. No formal written minutes seem to have been kept. Decisions subsequently taken by the President were not formally recorded. An exception was the January 17 Finding, but even this was apparently not circulated or shown to key U.S. officials.

The effect of this informality was that the initiative lacked a formal institutional record. This precluded the participants from undertaking the more informed analysis and reflection that is afforded by a written record, as opposed to mere recollection. It made it difficult to determine where the initiative stood, and to learn lessons from the record that could guide future action. This lack of an institutional record permitted specific proposals for arms-for-hostages exchanges to be presented in a vacuum, without reference to the results of past proposals. Had a searching and thorough review of the Iran initiative been undertaken at any stage in the process, it would have been extremely difficult to conduct. The Board can attest first hand to the problem of conducting a review in the absence of such records. Indeed, the exposition in the wake of public revelation suffered the most.

NSC STAFF SUPPORT FOR THE CONTRAS

It is not clear how Lt. Col. North first became involved in activities in direct support of the Contras during the period of the Congressional ban. The Board did not have before it much evidence on this point. In the evidence that the Board did have, there is no suggestion at any point of any discussion of Lt. Col. North's activities with the President in any forum. There also does not appear to have been any interagency review of Lt. Col. North's activities at any level.

This latter point is not surprising given the Congressional restrictions under which the other relevant agencies were operating. But the NSC staff apparently did not compensate for the lack of any interagency review with its own internal vetting of these activities. Lt. Col. North apparently worked largely in isolation, keeping first Mr. McFarlane and then VADM Poindexter informed.

The lack of adequate vetting is particularly evident on the question of the legality of Lt. Col. North's activities. The Board did not make a judgment on the legal issues raised by his activities in support of the Contras. Nevertheless, some things can be said.

If these activities were illegal, obviously they should not have been conducted. If there was any doubt on the matter, systematic legal advice should have been obtained. The political cost to the President of illegal action by the NSC staff was particularly high, both because the NSC staff is the personal staff of the President and because of the history of serious conflict with the Congress over the issue of Contra support. For these reasons, the President should have been kept apprised of any review of the legality of Lt. Col. North's activities.

Legal advice was apparently obtained from the President's Intelligence Oversight Board. Without passing on the quality of that advice, it is an odd source. It would be one

thing for the Intelligence Oversight Board to review the legal advice provided by some other agency. It is another for the Intelligence Oversight Board to be originating legal advice of its own. That is a function more appropriate for the NSC staff's own legal counsel.

3. Implementation Was Unprofessional

The manner in which the Iran initiative was implemented and Lt. Col. North undertook to support the Contras are very similar. This is in large part because the same cast of characters was involved. In both cases the operations were unprofessional, although the Board has much less evidence with respect to Lt. Col. North's Contra activities.

ARMS TRANSFERS TO IRAN

With the signing of the January 17 Finding, the Iran initiative became a U.S. operation run by the NSC staff. Lt. Col. North made most of the significant operational decisions. He conducted the operation through Mr. Secord and his associates, a network of private individuals already involved in the Contra resupply operation. To this was added a handful of selected individuals from the CIA.

But the CIA support was limited. Two CIA officials, though often at meetings, had a relatively limited role. One served as the point man for Lt. Col. North in providing logistics and financial arrangements. The other (Mr. Allen) served as a contact between Lt. Col. North and the intelligence community. By contrast, George Cave actually played a significant and expanding role. However, Clair George, Deputy Director for Operations at CIA, told the Board: "George was paid by me and on the paper was working for me. But I think in the heat of the battle, . . . George was working for Oliver North."

Because so few people from the departments and agencies were told of the initiative, Lt. Col. North cut himself off from resources and expertise from within the government. He relied instead on a number of private intermediaries, businessmen and other financial brokers, private operators, and Iranians hostile to the United States. Some of these were individuals with questionable credentials and potentially large personal financial interests in the transactions. This made the transactions unnecessarily complicated and invited kickbacks and payoffs. This arrangement also dramatically increased the risks that the initiative would leak. Yet no provision was made for such an eventuality. Further, the use of Mr. Secord's private network in the Iran initiative linked those operators with the resupply of the Contras, threatening exposure of both operations if either became public.

The result was a very unprofessional operation. . . .

The implementation of the initiative was never subjected to a rigorous review. Lt. Col. North appears to have kept VADM Poindexter fully informed of his activities. In addition, VADM Poindexter, Lt. Col. North, and the CIA officials involved apparently apprised Director Casey of many of the operational details. But Lt. Col. North and his operation functioned largely outside the orbit of the U.S. Government. Their activities were not subject to critical reviews of any kind.

After the initial hostage release in September, 1985, it was over 10 months before another hostage was released. This despite recurring promises of the release of all the hostages and four intervening arms shipments. Beginning with the November shipment, the United States increasingly took over the operation of the initiative. In January, 1986, it decided to transfer arms directly to Iran.

Any of these developments could have served as a useful occasion for a systematic reconsideration of the initiative. Indeed, at least one of the schemes contained a provision for reconsideration if the initial assumptions proved to be invalid. They did, but the reconsideration never took place. It was the responsibility of the National Security Advisor and the responsible officers on the NSC staff to call for such a review. But they were too involved in the initiative both as advocates and as implementors. This made it less likely that they would initiate the kind of review and reconsideration that should have been undertaken.

NSC STAFF SUPPORT FOR THE CONTRAS

As already noted, the NSC activities in support of the Contras and its role in the Iran initiative were of a piece. In the former, there was an added element of Lt. Col. North's intervention in the customs investigation of the crash of the SAT aircraft. Here, too, selected CIA officials reported directly to Lt. Col. North. The limited evidence before the Board suggested that the activities in support of the Contras involved unprofessionalism much like that in the Iran operation.

iv. Congress was never notified. Congress was not apprised either of the Iran initiative or of the NSC staff's activities in support of the Contras.

In the case of Iran, because release of the hostages was expected within a short time after the delivery of equipment, and because public disclosure could have destroyed the operation and perhaps endangered the hostages, it could be argued that it was justifiable to defer notification of Congress prior to the first shipment of arms to Iran. The plan apparently was to inform Congress immediately after the hostages were safely in U.S. hands. But after the first delivery failed to release all the hostages, and as one hostage release plan was replaced by another, Congress certainly should have been informed. This could have been done during a period when no specific hostage release plan was in execution, Consultation with Congress could have been useful to the President, for it might have given him some sense of how the public would react to the initiative. It also might have influenced his decision to continue to pursue it. . . .

B. FAILURE OF RESPONSIBILITY

The NSC system will not work unless the President makes it work. After all, this system was created to serve the President of the United States in ways of his choosing. By his actions, by his leadership, the President therefore determines the quality of its performance.

By his own account, as evidenced in his diary notes, and as conveyed to the Board by his principal advisors, President Reagan was deeply committed to securing the release of the hostages. It was this intense compassion for the hostages that appeared to motivate his steadfast support of the Iran initiative, even in the face of opposition from his Secretaries of State and Defense.

In his obvious commitment, the President appears to have proceeded with a concept of the initiative that was not accurately reflected in the reality of the operation. The President did not seem to be aware of the way in which the operation was implemented and the full consequences of U.S. participation.

The President's expressed concern for the safety of both the hostages and the Iranians who could have been at risk may have been conveyed in a manner so as to inhibit the full functioning of the system.

The President's management style is to put the principal responsibility for policy review and implementation on the shoulders of his advisors. Nevertheless, with such a complex, high-risk operation and so much at stake, the President should have ensured that the NSC system did not fail him. He did not force his policy to undergo the most critical review of which the NSC participants and the process were capable. At no time did he insist upon accountability and performance review. Had the President chosen to drive the NSC system, the outcome could well have been different. As it was, the most powerful features of the NSC system—providing comprehensive analysis, alternatives and follow-up—were not utilized.

The Board found a strong consensus among NSC participants that the President's priority in the Iran initiative was the release of U.S. hostages. But setting priorities is not enough when it comes to sensitive and risky initiatives that directly affect U.S. national security. He must ensure that the content and tactics of an initiative match his priorities and objectives. He must insist upon accountability. For it is the President who must take responsibility for the NSC system and deal with the consequences.

Beyond the President, the other NSC principals and the National Security Advisor must share in the responsibility for the NSC system.

President Reagan's personal management style places an especially heavy responsibility on his key advisors. Knowing his style, they should have been particularly mindful of the need for special attention to the manner in which this arms sale initiative developed and proceeded. On this score, neither the National Security Advisor nor the other NSC principals deserve high marks.

It is their obligation as members and advisors to the Council to ensure that the President is adequately served. The principal subordinates to the President must not be deterred from urging the President not to proceed on a highly questionable course of action even in the face of his strong conviction to the contrary.

In the case of the Iran initiative, the NSC process did not fail, it simply was largely ignored. The National Security Advisor and the NSC principals all had a duty to raise this issue and insist that orderly process be imposed. None of them did so.

All had the opportunity. While the National Security Advisor had the responsibility to see that an orderly process was observed, his failure to do so does not excuse the other NSC principals. It does not appear that any of the NSC principals called for more frequent consideration of the Iran initiative by the NSC principals in the presence of the President. None of the principals called for a serious vetting of the initiative by even a restricted group of disinterested individuals. The intelligence questions do not appear to have been raised, and legal considerations, while raised, were not pressed. No one seemed to have complained about the informality of the process. No one called for a thorough reexamination once the initiative did not meet expectations or the manner of execution changed. While one or another of the NSC principals suspected that something was amiss, none vigorously pursued the issue.

Mr. Regan also shares in this responsibility. More than almost any Chief of Staff of recent memory, he asserted personal control over the White House staff and sought to extend this control to the National Security Advisor. He was personally active in national security affairs and attended almost all of the relevant meetings regarding the Iran initiative.

He, as much as anyone, should have insisted that an orderly process be observed. In addition, he especially should have ensured that plans were made for handling any public disclosure of the initiative. He must bear primary responsibility for the chaos that descended upon the White House when such disclosure did occur.

Mr. McFarlane appeared caught between a President who supported the initiative and the cabinet officers who strongly opposed it. While he made efforts to keep these cabinet officers informed, the Board heard complaints from some that he was not always successful. VADM Poindexter on several occasions apparently sought to exclude NSC principals other than the President from knowledge of the initiative. Indeed, on one or more occasions Secretary Shultz may have been actively misled by VADM Poindexter.

VADM Poindexter also failed grievously on the matter of Contra diversion. Evidence indicates that VADM Poindexter knew that a diversion occurred, yet he did not take the steps that were required given the gravity of that prospect. He apparently failed to appreciate or ignored the serious legal and political risks presented. His clear obligation was either to investigate the matter or take it to the President—or both. He did neither. Director Casey shared a similar responsibility. Evidence suggests that he received information about the possible diversion of funds to the Contras almost a month before the story broke. He, too, did not move promptly to raise the matter with the President. Yet his responsibility to do so was clear.

The NSC principals other than the President may be somewhat excused by the insufficient attention on the part of the National Security Advisor to the need to keep all the principals fully informed. Given the importance of the issue and the sharp policy divergences involved, however, Secretary Shultz and Secretary Weinberger in particular distanced themselves from the march of events. Secretary Shultz specifically requested to be informed only as necessary to perform his job. Secretary Weinberger had access through intelligence to details about the operation. Their obligation was to give the President their full support and continued advice with respect to the program or, if they could not in conscience do that, to so inform the President. Instead, they simply distanced themselves from the program. They protected the record as to their own positions on this issue. They were not energetic in attempting to protect the President from the consequences of his personal commitment to freeing the hostages.

Director Casey appears to have been informed in considerable detail about the specifics of the Iranian operation. He appears to have acquiesced in and to have encouraged North's exercise of direct operational control over the operation. Because of the NSC staff's proximity to and close identification with the President, this increased the risks to the President if the initiative became public or the operation failed.

There is no evidence, however, that Director Casey explained this risk to the President or made clear to the President that Lt. Col. North, rather than the CIA, was running the operation. The President does not recall ever being informed of this fact. Indeed, Director Casey should have gone further and pressed for operational responsibility to be transferred to the CIA.

Director Casey should have taken the lead in vetting the assumptions presented by the Israelis on which the program was based and in pressing for an early examination of the reliance upon Mr. Ghorbanifar and the second channel as intermediaries. He should also have assumed responsibility for checking out the other intermediaries involved in the operation. Finally, because Congressional restrictions on covert actions are both largely

directed at and familiar to the CIA, Director Casey should have taken the lead in keeping the question of Congressional notification active.

Finally, Director Casey, and, to a lesser extent, Secretary Weinberger, should have taken it upon themselves to assess the effect of the transfer of arms and intelligence to Iran on the Iran/Iraq military balance, and to transmit that information to the President. . . .

Inouye—Hamilton Committee

In response to the Iran-*contra* scandal, the Congress created an investigative panel to examine what had happened. The House-Senate Joint Committee heard from twenty-eight witnesses in public hearings, including Lieut. Col. Oliver L. North, Vice Admiral John N. Poindexter (President Reagan's national security adviser at the time), and Secretary of State George P. Shultz. Their testimony, excerpted in this selection, takes us behind the scenes of the Iran-*contra* affair, disclosing many of the intrigues that occurred inside the NSC during this period, as well as the systematic attempts by several key NSC officials to conceal them from lawmakers.

THE COMMITTEE HEARD FROM LIEUT. COL. OLIVER L. NORTH IN JULY OF 1987

JULY 7, 1987

John W. Nields Jr., chief counsel for the House.

Q The American people were told by this Government that our Government had nothing to do with the Hasenfus airplane [a secret CIA military-supply flight which crashed in Nicaragua in 1986], and that was false. And it is a principal purpose of these hearings to replace secrecy and deception with disclosure and truth. And that's one of the reasons we have called you here, sir. And one question the American people would like to know the answer to is what did the President know about the diversion of the proceeds of Iranian arms sales to the contras. Can you tell us what you know about that, sir?

A You just took a long leap from Mr. Hasenfus's airplane.

As I told this committee several days ago—and if you will indulge me, counsel, in a brief summary of what I said: I never personally discussed the use of the residuals or profits from the sale of U.S. weapons to Iran for the purpose of supporting the Nicaraguan resistance with the President. I never raised it with him and he never raised it with me during my entire tenure with the National Security Council staff.

Throughout the conduct of my entire tenure at the National Security Council, I assumed that the President was aware of what I was doing and had, through my superiors, approved it. I sought approval of my superiors for every one of my actions, and it is well documented.

I assumed, when I had approval to proceed from either Judge Clark, Bud McFarlane or Admiral Poindexter, that they had indeed solicited and obtained the approval of the President. To my recollection, Admiral Poindexter never told me that he met with the President on the issue of using residuals from the Iranian sales to support the Nicaraguan resistance. Or that he discussed the residuals or profits for use by the contras with the President. Or that he got the President's specific approval.

Nor did he tell me that the President had approved such a transaction.

But again, I wish to reiterate throughout I believed that the President had indeed authorized such activity.

No other person with whom I was in contact with during my tenure at the White House told me that he or she ever discussed the issue of the residuals or profits with the President.

In late November, two other things occurred which relate to this issue. On or about Friday, Nov. 21, [1986] I asked Admiral Poindexter directly: Does the President know? He told me he did not. And on Nov. 25, the day I was reassigned back to the United States Marine Corps for service, the President of the United States called me. In the course of that call, the President said to me words to the effect that: I just didn't know.

Those are the facts as I know them, Mr. Nields. I was glad that . . . you said that you wanted to hear the truth. I came here to tell you the truth, the good, the bad and the ugly. I am here to tell it all, pleasant and unpleasant. And I am here to accept responsibility for that which I did. I will not accept responsibility for that which I did not do. . . .

Q I'm not asking you about words now, Colonel. I am asking you whether you didn't continue to send memoranda seeking approval of diversions or residuals—whatever the word—for the benefit of the contras up to the President for approval?

A I did not send them to the President, Mr. Nields. This memorandum went to the National Security Adviser, seeking that he obtain the President's approval. There is a big difference. This is not a memorandum to the President.

Q And my question to you is: Didn't—isn't it true that you continued to send them up to the National Security Adviser, seeking the President's approval?

A Is it my recollection that I did, yes sir.

Q And Admiral Poindexter never told you: Stop sending those memoranda?

A I do not recall the admiral saying that. It is entirely possible, Mr. Nields, that that did happen.

Q Well if it had happened, then you would have stopped sending them, isn't that true?

A Yes.

Q But you didn't stop sending them. You've just testified you sent them on five different occasions.

A I testified that to my recollection there were about five times when we thought we had an arrangement that would result in the release of American hostages and the opening of a dialogue with Iran. And that we thought the deal was sufficiently framed that we could proceed with it. And that I thought—because I don't have those records before me—that I had sent memoranda forward, as I always did, seeking approval.

That's what I think and that's what I recall.

Q And was there ever a time when Admiral Poindexter said: Don't send them up for the President's approval; just send them up for my approval?

A Again, I don't recall such a conversation.

Q Well in fact, isn't it true that it was Admiral Poindexter that wanted you to send these memoranda up for the President to approve?

A I don't recall Admiral Poindexter instructing me to do that, either. . . .

Q So far from telling you to stop sending memoranda up for the President's approval, Admiral Poindexter was specifically asking you to send memoranda up for the President's approval?

A Well, again, in this particular case that's true, Mr. Nields. And I don't believe that I have said that Admiral Poindexter told me to stop. Did I?

Q Where are these memoranda?

A Which memoranda?

Q The memoranda that you sent up to Admiral Poindexter, seeking the President's approval?

A Well, they're probably in these books to my left that I haven't even looked through yet. And if I try to guess, I'm going to be wrong. But I think I shredded most of that. Did I get them all. I'm not trying to be flippant, I'm just—

Q Well, that was going to be my very next question, Colonel North. Isn't it true that you shredded them?

A I believe I did. . . .

Q Well, that's the whole reason for shredding documents, isn't it, Colonel North—so that you can later say you don't remember whether you had them and you don't remember what's in them?

A No, Mr. Nields. The reason for shredding documents and the reason the Government of the United States gave me a shredder—I mean, I didn't buy it myself—was to destroy documents that were no longer relevant; that did not apply or that should not be divulged.

And again, I want to go back to the whole intent of a covert operation. Part of a covert operation is to offer plausible deniability of the association of the Government of the United States with the activity. Part of it is to deceive our adversaries. Part of it is to insure that those people who are at great peril carrying out those activities are not further endangered.

All of those are good and sufficient reasons to destroy documents. And that's why the Government buys [and] gives them to people running [a] covert operation. Not so that they can have convenient memories. I came here to tell you the truth; to tell you and this committee and the American people the truth. And I'm trying to do that, Mr. Nields. And I don't like the insinuation that I'm up here having a convenient memory lapse like perhaps some others have had. . . .

Q Is it correct to say that following the enactment of the Boland Amendment, our support for the war in Nicaragua did not end and that you were the person in the United States Government who managed it?

A Starting in the spring of 1984, well before the Boland proscription of no appropriated funds made available to the D.O.D. and the C.I.A., etc., I was already engaged in supporting the Nicaraguan resistance and the democratic outcome in Nicaragua.

I did so as part of a covert operation. It was carried out starting as early as the spring of '84, when we ran out of money and people started to look in Nicaragua, in Honduras and Guatemala, El Salvador and Costa Rica for some sign of what the Americans were really going to do, and that that help began much earlier than the most rigorous of the Boland proscriptions. And yes, it was carried out covertly, and it was carried out in such a way as to insure that the heads of state and the political leadership in Nicaragua—in Central America—recognized the United States was going to meet the commitments of the President's foreign policy.

And the President's foreign policy was that we are going to achieve a democratic outcome in Nicaragua and that our support for the Nicaraguan freedom fighters was

going to continue, and that I was given the job of holding them together in body and soul. And it slowly transitioned into a more difficult task as time went on and as the C.I.A. had to withdraw further and further from that support, until finally we got to the point in October when I was the only person left talking to them. . . .

Q Well maybe it would be most useful to get into specifics of the areas of your support. I take it one area of your support was to endeavor to raise money from sources other than the U.S. Treasury?

A That's correct. Boland proscriptions do not allow us to do so, and so we sought a means of complying with those Boland proscriptions by going elsewhere for those monies.

Q And you went to foreign countries?

A I did not physically go to those foreign countries.

Q Representatives of—

A Representatives of foreign countries and I had discussions about those matters, yes.

Q And you asked them for money for the contras?

A I want to be a little bit more specific about that. I don't recall going hat in hand to anybody asking for money. I do recall sitting and talking about how grateful this country would be if the issue that they had discussed with others were indeed brought to fruition. For example, a representative of Country 3 and I met and we talked about an issue that had been raised with him beforehand by others outside the Government, and I told him that I thought that was a dandy idea. And I told him where he could send the money. And he did so. . . .

Q Now, my next question is you've indicated that the national security advisers, for whom you worked, authorized you to seek support from foreign countries, both financial and operational?

A Yes.

Q Was your—were your activities, in that respect, known to others in the White House, other than the national security advisers?

A Well, I want to go back to something I said at the very beginning of all of this, Mr. Nields. I assumed that those matters which required the attention and decision of the President of the United States did indeed get them.

I assumed that. I never asked that. I never walked up to the President and said, oh by the way Mr. President, yesterday I met with so-and-so from Country 4. Nor did he ever say, I'm glad you had a meeting with Country 4 and it went well.

Q Do you know whether or not the President was aware of your activities seeking funds and operational support for the contras, from third countries?

A I do not know.

Q Were you ever—

A I assumed that he did.

Q Were you ev—what was the basis of your assumption?

A Just that there was a lot going on and it was very obvious that the Nicaraguan resistance survived—I sent forward innumerable documents, some of which you've just shown us as exhibits, that demonstrated that I was keeping my superiors fully informed, as to what was going on. . . .

Q Mr. McFarlane has testified that he gave you instructions not to solicit money from foreign countries or private sources. Did he give you those instructions?

A I never carried out a single act—not one, Mr. Nields—in which I did not have authority from my superiors. I haven't, in the 23 years that I have been in the uniformed services of the United States of America ever violated an order—not one.

Q But that wasn't the question. The question was—

A That *is* the answer to your question.

Q No, the question was did Mr. McFarlane give you such instructions?

A No. I never heard those instructions.

Q And I take it that it was your understanding, from what you've just said, that quite to the contrary, you were authorized to seek money from foreign countries?

A I was authorized to do everything that I did.

Q Well, again, that isn't the question.

A I was authorized to have a meeting, in this particular case by Mr. McFarlane, for the purpose of talking to the man about a suggestion that had been made to him by others, and to encourage that process along. And I did so. I had already provided to Mr. McFarlane a card with the address of an account, an offshore account which would support the Nicaraguan resistance. And thank God, somebody put money into that account and the Nicaraguan resistance didn't die—as perhaps others intended. Certainly the Sandinistas and Moscow and Cuba intended that. And they didn't die, they grew in strength and numbers and effectiveness as a consequence. And I think that is a good thing. . . .

I get the sense that somehow or another we've tried to create the impression that Oliver North picked up his hat and wandered around Washington and foreign capitals begging for money, and I didn't do that. I didn't have to do it because others were more willing to put up the money than the Congress because they saw well what was happening to us in Central America, and the devastating consequences of a contra wipeout and an American walkaway and write-off; to what was going to happen to this country and to democracy elsewhere in the world.

I didn't have to wander around and beg. There were other countries in the world, and other people in this country, who were more willing to help the Nicaraguan resistance survive, and cause democracy to prosper in Central America, than this body here. And that is an important factor in all of what you do, counsel, and in what this committee is going to do. It's got to be part of your assessment, as to why is it that other countries in the world were willing to step up and help in a desperate cause when we were not willing to do so ourselves.

That has got to be something that is debated not just by pulling people before this group and hammering at them and haranguing them and reducing it to pettiness. It has got to be something that the American people come to understand, how desperately important it was not just to us, not just to Ollie North and not just to President Ronald Reagan. It was important to these other people who put forth that money. And I didn't beg them, they offered. And that's important, sir. . . .

JULY 8, 1987

Q You testified about Admiral Poindexter and the President. Who else, if anyone—and I don't mean to imply anything in the question. But leaving those two people aside,

who else in the Government was aware of either the plan or the fact of using proceeds of arms sales to Iran for the contras?

A Well I, if I may clarify what I testified to yesterday, it is my assumption the President knew and then I subsequently testified that I was told he did not know. I know that Admiral Poindexter knew. I know that Mr. McFarlane knew at a point in time when he was no longer in the Government. And [CIA] Director [William J.] Casey knew.

Aside from that, I can't speak with certainty as to who else, inside the government, knew for sure. . . . But the only ones that I know for sure, who I confirmed it with, were those three. . . .

Q When did Director Casey first learn of it?

A Actually, I—my recollection is Director Casey learned about it before the fact. Since I'm confessing to things, I may have raised it with him before I raised it with Admiral Poindexter. Probably when I returned from the February—from the January discussions.

Q You're referring now to the discussions, the trip, during which you had the discussion with Mr. [Nanucher] Ghorbanifar [a go-between in the Iranian arms deal] in the bathroom?

A Yes, I don't recall raising the bathroom [discussion], specifically, with the Director, but I do recall talking with the Director and I don't remember whether it was before or after I talked to Admiral Poindexter about it. But I—I was not the only one who was enthusiastic about this idea. And I—Director Casey used several words to describe how he felt about it, all of which were effusive.

He referred to it as the ultimate irony, the ultimate covert operation kind of thing, and was very enthusiastic about it. He also recognized that there were potential liabilities. And that there was risk involved. . . .

Q What kinds of risks did he identify to you?

A This very political risk that we see being portrayed out here now; that it could indeed be dangerous, or not dangerous so much as politically damaging.

Q Do you have any reason to believe that Director Casey, given the political risk, ever discussed the matter with the President?

A I have no reason to believe that he did because he never addressed that to me. I never, as I indicated yesterday, no one ever told me that they had discussed it with the President. . . .

Q And there came a time, did there not, when you had an interview with members of the House Intelligence Committee?

A I did. . . .

Q And they were interested in finding out the answers to the questions raised by the resolution of inquiry?

A Exactly.

Q Your fund-raising activities, military support for the contras?

A That's right. . . .

Q But I take it you did considerably more which you did not tell the committee about?

A I have admitted that here before you today. . . . I will tell you right now, counsel, and all the members here gathered, that I misled the Congress. . . .

Q You made false statements to them about your activities in support of the contras?

A I did. Furthermore, I did so with a purpose. And I did so with the purpose of hopefully avoiding the very kind of thing that we have before us now, and avoiding a shut-off of help for the Nicaraguan resistance, and avoiding an elimination of the resistance facilities in three Central American countries, wherein we had promised those heads of state on my specific orders—on specific orders to me I had gone down there and assured them of our absolute and total discretion.

And I am admitting to you that I participated in the preparation of documents to the Congress that were erroneous, misleading, evasive and wrong. And I did it again here when I appeared before that committee convened in the White House Situation Room. And I make no excuses for what I did. I will tell you now that I am under oath and I was not then.

Q We do live in a democracy, don't we?

A We do sir, thank God.

Q In which it is the people not one marine lieutenant colonel that get to decide the important policy decisions for the nation?

A Yes, and I would point out that part of that answer is that this marine lieutenant colonel was not making all of those decisions on his own. As I indicated yesterday in my testimony, Mr. Nields, I sought approval for everything that I did.

Q But you denied Congress the facts?

A I did.

Q You denied the elected representatives of our people the facts, upon which, which they needed—

A I did.

Q —to make a very important decision for this nation?

A I did, because of what I have just described to you as our concerns. And I did it because we have had incredible leaks from discussions with closed committees of the Congress.

THE CONGRESSIONAL COMMITTEE HEARD FROM REAR ADM. JOHN M. POINDEXTER. HERE ARE EXCERPTS FROM HIS TESTIMONY, AS RECORDED BY THE NEW YORK TIMES

JULY 15, 1987

Arthur L. Liman, chief counsel to the Senate committee.

Now let's turn to the Iran initiative. Were you advised sometime in August of 1985 by Mr. McFarlane that the President had approved some Israeli transactions with Iran?

Admiral Poindexter Mr. Liman, that is a very fuzzy time period for me. . . . The period of time you're asking about, August of 1985, I was the deputy, and I did not have primary responsibility on this issue. . . .

Q But you did become aware that there was an Iran initiative?

A Yes, I did.

Q And you became aware of that from a conversation with Mr. McFarlane?

A I did. . . .

Q Now, admiral, did there come a time in connection with this transaction, when the C.I.A. sent over to you a proposed finding for the President to sign?

A Yes, Mr. Liman. That is the finding that I discussed with you earlier on the second of May.

Q Did you receive the letter of Nov. 26, 1985, from William Casey addressed to you which says, pursuant to our conversation, this should go to the President for his signature and should not be passed around in any hands below our level?

A I did receive that.

Q And you received the finding with it. Is that correct?

A Well, I must say that I don't actually remember getting it, but I'm sure that I did. I'm sure they came together.

Q Now, Admiral, when you saw the finding, am I correct that the finding itself was essentially a straight arms-for-hostage finding?

A That is correct. It had been prepared essentially by the C.I.A. as a what we call a C.Y.A. effort.

Q Did the President of the United States sign that finding?

A As I've testified before, he did, on or about the 5th of December. I'm vague on the date. . . .

Q Do you recall who was present when the President signed the finding?

A No, I don't. One of the reasons that I think my recollection is very poor on the circumstances of the President's actually signing this is that, recall that, that was a day or so after Mr. McFarlane had resigned and the President had just—I guess we had announced it on the fourth. Mr. McFarlane actually resigned, I think, on the 30th of November, we announced it on the fourth of December, and my recollection is that he signed this the following day on the fifth. My recollection now is that the C.I.A., especially the Deputy Director, John McMahon, was very anxious to get this signed. I frankly was never happy with it, because it was not fully staffed, and I frankly can't recall when I showed it to the President who was there or exactly what the discussion was or even what I recommended to him at this point. I simply can't remember that.

Q But you do recall that whatever you recommended, the President read it and he signed it.

A Yes, he did. He did sign it.

Q And there was, in fact, the recommendation from Bill Casey that he sign it, and Bill Casey was a person whose advice the President valued.

A He did.

Q Now what happened to that finding?

A As I said earlier, I destroyed that by tearing it up on the 21st of November because I thought it was a significant political embarrassment to the President. And I wanted to protect him from possible disclosure of this. To get into the details of exactly how it happened, which I assume you're interested in—

Q Yes. When you say the 21st of November, you're talking about the 21st of November 1986.

A 1986. That's correct.

Q Now, would you tell the panel the circumstances of your destroying this finding because you thought it would be a significant political embarrassment to the President?

A I will. The finding, the existence of the finding I had completely forgotten in early November 1986. As I said before, the finding initially was prepared by the C.I.A. for the reason that I stated. I can recall in my time at the White House one or possibly two other findings that had a retroactive nature to them. I frankly was always uncomfortable with that because I thought it didn't particularly make a lot of sense.

The finding was very narrow. It was prepared before there had been thorough discussion of the issue. As I said earlier, I came into the issue in a full, responsible way in early December of 1985. Prior to that time, Mr. McFarlane had handled it. I felt that it was important that we improve on this finding so that we clearly lay out what the objectives were in the Iranian . . . After this finding was signed, it was retained in my immediate office and at some point after it was signed I had apparently given it to Commander Thompson, my military assistant, to put in an envelope in his safe to keep.

I had, as I said, completely forgotten about it. On November the 21st, when Ed Meese [the Attorney General] called me and said—well, to go back a step, we'd run into a problem in November of what had actually happened in 1985. It was very dim in people's memories. We didn't think we had much in writing.

As I think you've heard Colonel North testify, we frankly did not realize the old PROF notes [the White House electronic message system] existed. My policy was to erase them, and I apparently did it the right way, and I don't think Colonel North did it the right way. So we didn't have the benefit that these committees have in going back over these old PROF notes, or we didn't realize that we had that opportunity.

But Ed Meese and I talked many times during the month of November, and when it became clear that there was a disagreement between Cabinet-level officials as to what had happened in November of 1985, he indicated that he wanted to come over and ask the President to have a fact-finding session primarily with the Cabinet-level officials involved to try to sort out what had happened, actually happened in November of 1985. And he called me early in the morning on the 21st of November and told me this, and he said he had an appointment to see the President at 11:30, and he wanted me and Don Regan [the White House chief of staff] to go with him, which we did at 11:30.

He told the President about the controversy, not really controversy, the different recollections as to what had happened in November. And he said he thought it would be useful if he would have a couple of his people that were close to him look into the matter to see if they could piece together what had happened. The President readily agreed. . . .

So Ed called me after lunch. . . . and he asked if I would have the appropriate documents pulled together so they could take a look at them. I said I would do that. After he called, I called Commander Thompson, my military assistant, and asked him to take charge of pulling these documents together.

And then I called Colonel North and told him of my conversation with Mr. Meese and asked him to cooperate with Commander Thompson and Mr. Meese's people. . . .

Later in the afternoon or early evening, Commander Thompson brought into my office the envelopes that I had given him earlier containing the material we had on the

Iranian project in the immediate office, which was essentially the various findings. And he pulled out this November finding—it was actually signed in December. And my recollection is that he said something to the effect that they'll have a field day with this, or something to that effect. . . . The import of his comment was that up until that time in November of 1986, the President was being beaten about the head and shoulders, that this was, the whole Iranian project, was just an arms-for-hostage deal.

Well, this finding, unfortunately, gave that same impression. And I, frankly, didn't see any need for it at the time. I thought it was politically embarrassing, and so I decided to tear it up. And I tore it up, put it in the burn basket behind my desk.

I can't recall, but I believe that Colonel North was there in the office, but I'm a little fuzzy on that point.

Q Was Commander Thompson there when you tore it up?

A I believe he was, but I can't swear to it. I know he brought it in, and I can recall his comment, but exactly how long it took me, because I—when he made his comment he said, I said, well let me see the finding. And he pulled it out and gave it to me, and I read it and at some point after that I tore it up, but it was within a short period of time.

Q Admiral, you talked about the fact that the President was being beaten around the head and shoulders by the media for sanctioning an arms-for-hostage deal and that this finding seemed to corroborate it, and you therefore destroyed it in order to prevent significant political embarrassment. Did you regard one of the responsibilities of the national security adviser to protect the President from political embarrassment?

A I think that it's always the responsibility of a staff to protect their leader and certainly in this case where the leader is the Commander in Chief. I feel very strongly that that's one of the roles. And I don't mean that in any sense of covering up, but one has to always put things in the President's perspective and to make sure that he's not put in a position that can be politically embarrassing.

Q Now, Admiral, a finding represents a decision of the President of the United States, correct?

A A finding, I don't believe, is discussed in any statute. It is discussed in various Presidential directives. It is an artifact of what the statute calls a Presidential determination.

Q And the President, when he signed this finding, was making a determination?

A That's correct, but it's important to point out that the finding, that early finding was designed for a very specific purpose, and was not fully staffed and did not in any way ever represent the total thinking on the subject.

Q The President didn't authorize you to destroy the finding, correct?

A He certainly did not.

MEETING OF THE N.S.C.

Q Let's go to the—on Dec. 7, 1985, after the finding had been signed by the President, there was a meeting, was there not, between the principals of the National Security Council?

A Yes, there was.

Q And you recall Mr. Weinberger was there, and Secretary Shultz was there, Don Regan was there, Mr. McMahon of the C.I.A. was there, do you recall that?

A Yes, I do.

Q . . . At this meeting, there was a discussion again, or there was a discussion of the Iran initiative? Is that so? . . .

A Yes, yes, there was. . . .

Q And the subject on the table was an Israeli initiative, under which the Israelis would ship arms to the Iranians and we would replenish the arms. Hopefully there would be better relations with Iran. And as a token of good faith, the American hostages would be released. Is that a fair summary?

A Well, I think it's a partial summary.

Q Well, why don't you complete it?

A We had been concerned, in the National Security Council, for some period of time, with the situation in Iran. Unfortunately, we have very poor intelligence on what's happening in Iran. The National Security Council staff had prepared a draft finding, earlier in 1985, to try to get the Government focused on what we saw as a very significant, looming problem in Iran, as Ayatollah Khomeini eventually passed from the scene and there was some sort of succession.

We didn't want a repeat of the 1970's, when things were happening in Iran that we weren't aware of, and eventually went out of our control, and out of control of the Government there.

. . . We felt that we needed to take an initiative to get closer to people in the Iranian Government, so that we could find out what's happening and hopefully have some influence in the future or, at least, have information on which to base the United States policy.

Q Admiral, see if this part is correct: that the currency for trying to get that influence that was being demanded, as reported by the Israelis, involved arms?

A That is often the currency of any sort of business in the Middle East.

Q And in this case that was the currency being demanded?

A Yes, that is correct.

Q And it is also true that we did not want to authorize arms shipments to the Iranians, unless we were assured of getting our hostages back, is that so?

A As I was trying to lay out a moment ago, what our concerns were, what our major objective was, the President was clearly also concerned about the hostages. The President is a very sensitive person, and he is concerned about individuals when they're in difficulty. And so he, just as a human being, was concerned about the hostages.

I don't think that the President is overly concerned about them, but he recognized that we did have an opportunity here to try to get the hostages back. And there was no way that we could carry on discussions with Iranian officials about broader objectives, until we got over the first obstacle. And the first obstacle was to get the hostages back. And the President felt that, that it was worth taking some risks here.

Q Now, did the Secretary of State and the Secretary of Defense express objections?

A They expressed, as opposed to some reports, very strong, vociferous objection and clearly laid out for the President the other side of the issue.

Q And without going into undue detail, could you just tick off the points they made?

A Well, there are the obvious points that have been made since this all has become public. Secretary Shultz was concerned about our operation to staunch the flow of arms into Iran, which is one of the methods that we are using to try to stop the war between Iran and Iraq. . . .

But in its simplest terms, what was being proposed here was not in accordance with that particular method that we were using. He was concerned that if the European countries found out about it, that it would lessen their willingness to cooperate. In reality though, in my opinion, we've never had good cooperation from anybody on Operation Staunch. The European countries continue to send military equipment and supplies into Iran. Iran's been able to carry on the war for six, going on seven, years now, I guess.

Other objections were that of it was contrary to the Arms Export Control Act. Secretary Weinberger had slightly different reasons, but they're generally along the same lines.

Q And there's no doubt in your mind that the President listened to, and understood, those objections?

A . . . The President listened to all of this very carefully. And at the end of the discussion, at least the first round, he sat back and he said something to the effect—and I, this is not a direct quote—but it was something to the effect that, I don't feel that we can leave any stone unturned in trying to get the hostages back. We clearly have a situation here where there are larger strategic interests. But it's also an opportunity to get the hostages back. And I think that we ought to at least take the next step. . . .

Q Now, one other question which just has been handed to me, that Colonel North apparently testified that Secretary Shultz and Secretary Weinberger's opposition was not vigorously expressed in this January period. I take it that it was vigorously expressed at the January 7th meeting, and it was expressed by the Secretary of State at that January 16th meeting and that no one had any doubt about where both of them stood.

A That's true of the earlier meetings. On the 16th of January, I think it was pretty clear to George [Shultz] that the President wanted to go ahead with this at that point, and so although he voiced objection, I wouldn't say that, and this is probably why Colonel North's recollection is as it was. In fact, I think probably the 16 January meeting may have been the only meeting that Colonel North was in attendance where he may have heard the other Cabinet officers give their views. But it is accurate that both George Shultz and Cap Weinberger vigorously made this case as to why we should not do this.

LEGALITY AND APPROVAL

Q Right. Now, admiral, is it correct that in the discussions that you had leading up to the January 17th finding, there was no discussion with the President of the United States about the possibility of using proceeds of the sale to support the contras?

A There was none.

Q And there was none with you.

A There was none with me.

Q Now, would you tell us, and I'm going to break this into different questions, when was the first time that you were told by Colonel North about this possibility?

A My best recollection is that this took place sometime in February of 1986.

Q And would you tell us what Colonel North said to you?

A My recollection is that he had just come back from a meeting in London, and he was giving me a general update on the situation as he saw it. And he was reviewing the status of the work that was in progress at C.I.A. and Defense in addition to the results of his meeting in London. And near the end of the conversation, my recollection is that he said something to the effect that, Admiral, I think we can, I have found a way that we can legally provide some funds to the democratic resistance or as they have been called here—and I frankly agree with Congressman [Henry J.] Hyde [R.-Illinois] that I have no problem with calling them contras—through funds that will accrue from the arms sales to the Iranians.

Q Did he use the word legally?

A My best recollection is that he did, but of course I know that Colonel North is not a lawyer, and so I was taking that in a layman's sense that that was his conclusion.

Q Do you recall in reciting this in your deposition you didn't use the word legally?

A I don't recall that, that I didn't. I believe that he did, he may not have.

Q Now, did he tell you what the method would be for doing this?

A This was a very general discussion, but this was clearly a new aspect that I had not thought about before. To make a long story short, in the end I thought it was a very good idea at the end of this conversation, and I personally approved it.

Q Did he ask you for your approval?

A I don't recall how he phrased his request, but he was clearly looking for a signal from me whether or not to proceed ahead along this line.

Q And you gave it.

A And I gave it to him. . . .

In order to put this in perspective, and I think it's important to understand my state of mind at the time and what things were of concern to us. The President's policy with regard to support for the contras had not changed since 1981. The various versions of the Boland Amendment came and went. But the President was steadfast in his support for the contras. . . . So 1was absolutely convinced as to what the President's policy was with regard to support for the contras.

I was aware that the President was aware of third-country support, that the President was aware of private support. And the way Colonel North described this to me at the time, it was obvious to me that this fell in exactly the same category that these funds could either be characterized as private funds because of the way that we had, that Director Casey and I had agreed to carry out the finding. They could be characterized as private funds or they could be characterized as third-country funds. In my view, it was a matter of implementation of the President's policy, with regard to support for the contras.

We were in the process of working on our legislative plan to get $100 million from Congress for essentially unrestricted support to the contras. . . .

The President was bound and determined and still is, that he will not sit still for the consolidation of a Communist government on the mainland of America. And in

order to prevent that, he feels that the most effective way, with which I also agree, is to keep pressure on the Communist Sandinista Government. And the most effective way to do that, given all of the factors considered and because we don't want to send U.S. soldiers to Nicaragua, is to provide support to the contras and keep them alive until we can get the $100 million. . . .

And so after weighing all of these matters—and I also felt that I had the authority to approve it because I had a commission from the President which was in very broad terms. My role was to make sure that his policies were implemented. In this case, the policy was very clear, and that was to support the contras. After working with the President for five and a half years, the last three of which were very close and probably closer than any other officer in the White House except the chief of staff, I was convinced that I understood the President's thinking on this and that if I had taken it to him that he would have approved it.

Now I was not so naïve as to believe that it was not a politically volatile issue; it clearly was because of the divisions that existed within the Congress on the issue of support for the contras. And it was clear that there would be a lot of people that would disagree, that would make accusations that indeed have been made. So although I was convinced that we could properly do it and that the President would approve if asked, I made a very deliberate decision not to ask the President so that I could insulate him from the decision and provide some future deniability for the President if it ever leaked out. Of course, our hope was that it would not leak out.

Q When you say deniability, are you saying that your decision was not to tell the President so that he would be able to deny that he knew of it?

A That's correct.

Q And did you at any time prior to the Attorney General's finding this on November 22d tell the President of the United States of the fact that proceeds from the Iranian arms sale were being used to support the contras?

A I don't—I did not. I want to make this very clear because I understand it's an important issue. I did not talk to anybody else except Colonel North about this decision until, to my knowledge, my best recollection—and I don't want to quibble here over times in late November 1986—but my recollection is the first mention that I made to anybody besides Colonel North was on November 24, 1986, to Ed Meese.

Q And so that the answer is you did not tell the President of the United States.

A I did not.

Q And that for a period of whatever it is, nine months, you kept it from the President of the United States, for the reasons you've given.

A Mr. Liman, this clearly was an important decision but it was also an implementation of very clear policy. If the President had asked me, I very likely would have told him about it. But he didn't. And I think—you know, an important point here is that on this whole issue, you know, the buck stops here with me. I made the decision; I felt that I had the authority to do it. I thought it was a good idea. I was convinced that the President would in the end think it was a good idea. But I did not want him to be associated with the decision. . . .

Q Were there any other examples during your term as national security adviser where you withheld a decision from the President that you had made in order to give him deniability?

A Well, this again—this decision, in my view, was a matter of implementation, and there were many details of implementation that were not discussed with the President. This particular detail was the only one of its kind in terms of the disagreements and the controversy that existed over the issue.

Q Were there any other decisions that you withheld from the President that you had made because they were politically explosive?

A I don't recall anything else that fell in that same category, although there were lots—I want to make a distinction here between what I felt my authority was and why I didn't discuss it with the President. Number one, I felt that it was within my authority because it was an implementation of a policy that was well understood, that the President felt very strongly about. It was not a secret foreign policy, the President's policy with regard to the contras was clearly understood by every member of the Congress and the American people. So it wasn't matter of going out and making a secret foreign policy. . . .

You know, frankly, as Colonel North has testified, I thought it was a neat idea, too. And I'm sure the President would have enjoyed knowing about it. But on the other hand, because it would be controversial—and I must say that I don't believe that I estimated how controversial it would be accurately—but I knew very well that it would be controversial, and I wanted the President to have some deniability so that he would be protected and at the same time we'd be able to carry out his policy and provide the opposition to the Sandinista Government. . . .

AIDING THE CONTRAS

Q Now as I understand your testimony, you genuinely believed that in approving the diversion, that it was consistent with the policies of the President, in terms of third-country support. You've already testified to that. And I'd like to ask you some questions about that. Is it a fact that the Administration had gone to Congress in 1985 and gotten permission from Congress to solicit third-country support?

A Yes, we worked with members of Congress to get that provision.

Q And is it a fact that that provision for obtaining third-country support was limited to humanitarian aid?

A Since leaving the White House and going back over this material, that is correct. I can't say that during the discussions, that I can recall in the White House, there was great distinction made between humanitarian aid or any other kind of aid, at that particular time. There was with respect to the $27 million. But I just simply don't recall great distinctions being made.

Q Well, are you saying that when Congress worked out the legislation with the Administration that authorized solicitation for humanitarian aid, the Administration interpreted that as meaning that it could solicit for lethal aid?

A No, I'm not saying that at all. I'm just giving you my recollection of the time.

Q Now, and you also understood that that bill provided that it was only the State Department that could do the solicitation, do you recall that, sir?

A Yes, I recall that.

Q Now, was the money that you were getting from the Ayatollah, or [Gen. Richard]

Secord [another go-between], however you viewed it, was that money to be limited to being disbursed for humanitarian aid?

A In no way. You see the distinction here is that—and this is contrary to what you have heard before, from other witnesses. But I never believed, and I don't believe today, that the Boland Amendment ever applied to the National Security Council staff or the President's personal staff. But the problem was that the Boland Amendment did apply to the State Department. It did apply to C.I.A. And it did apply to the Defense Department.

We had been running this operation, on our own, for a long period of time because there was no other alternative, in order to keep the contras alive. And we wanted help. We wanted also a more public recognition of the fact that the U.S. was supporting the contras in some way.

I frankly, I personally still wanted that to be done in—the public support to be done in such way that we could slowly turn back to a covert program, run by the C.I.A. But it was important to me, and to others, that we get the State Department back into the game.

Q I understand you. Did you ever discuss, with the President of the United States, that the N.S.C. was raising money for lethal aid?

A Mr. Liman does—are you, if I may ask to clarify the question—are you saying that raising money is soliciting money?

Q I don't want to get into a semantic debate about solicitation. I mean every day in the newspapers, in the financial sections, they have announcements of offerings, and they say this is not a solicitation. So please do not get me into that semantic debate. Let's talk about raising money, obtaining money, for lethal aid. That the N.S.C. was obtaining money for lethal aid?

A The President was aware that we were encouraging, I guess would be a fair way to describe it, third countries to contribute to the cause of the contras in Central America, in their fight against the Communist Sandinistas. And, of course, we were doing that primarily by pointing out to them the dangers that we saw. And, as Colonel North has testified, it wasn't very difficult. They clearly understood the problem. The Central American countries understood, the neighboring countries. The other countries that are on your list, that I've heard you talk about up here. . . .

FINANCING COVERT PROJECTS

Q Colonel North testified that in addition to the use of the proceeds of the Iranian arms sale for the contras, it was to be used for a series of other covert projects. Do you remember that testimony of his?

A I heard that testimony.

Q Was that the first time you ever heard about that?

A It's the first time that I heard it discussed in that depth. I must say there was, as far as I was concerned, no such plan. I don't at all doubt that Colonel North and Director Casey may have discussed that. Frankly, it's an idea that has some attractive features in my mind, but there was no plan that was brought to me or that I took to the President to proceed in that kind of direction. That would have required substantial discussion. . . .

Q You testified this morning that if the President had asked you about what countries were helping, you probably would have told him about this. Do you recall that?

A That would have been a difficult situation, and I don't—

Q But you wouldn't lie to the President?

A I wouldn't lie to the President, and if he had outright asked me about it, I would have told him. He didn't.

Q Are you saying that with the interest the President had in the contra movement and his concern about the dire straits it was in financially that he never asked you which countries were helping?

A That's correct. The President is—as I've said—is not a man for great detail. He—and I don't mean that in any sort of funny way—I don't think a President ought to get involved in details—he has to maintain a strategic perspective, and he's got enough to worry about. I think by and large the President has the same sort of management philosophy that I do, and that is that he picks good people for the job and gives them a lot of authority to carry out that job, and he wanted the contras supported. We were reporting to him on the status of the contras, in general terms, and he knew that they were surviving and that was the thing that was important to him.

AT THE CONCLUSION OF POINDEXTER'S APPEARANCE, REPRESENTATIVE LEE H. HAMILTON, DEMOCRAT OF INDIANA, THE CHAIRMAN OF THE HOUSE COMMITTEE, ADDRESSED HIM ABOUT HIS TESTIMONY DURING THE HEARINGS:

JULY 21, 1987

Representative Hamilton. . . . Admiral Poindexter, I want to say that we have indeed appreciated your testimony. . . . None of us, I think, can know all of the circumstances that you confronted as the national security adviser to the President.

. . . It is, however, . . . our job to examine your role in the decision-making process. . . .

Now, your comments about secrecy in government . . . concerned me . . . a great deal. You have testified that you intentionally withheld information from the President, denied him the opportunity to make, probably, the most fateful decision of his Presidency—whether to divert the funds from the Iranian arms sales to aid the contras.

You said your objective was to withhold information from the Congress. And apparently, so far as I understood the testimony, without direction or authority to do so. As many have mentioned, you destroyed the Dec. 5, '85, finding. You apparently intended to have original documents, relating to the contras, either altered or removed. You were unwilling to speak candidly with senior Justice and C.I.A. officials about the Hawk missile shipments to Iran. And you kept the . . . Secretaries of State and Defense, uninformed. . . .

All of us who work with our system of government sometimes feel impatient with its painstaking procedures. . . . Yet, your comment about Congress, and I quote it directly: I simply did not want any outside interference, reflects an attitude which makes, in my judgment at least, our constitutional system of checks and balances unworkable.

Instead of bringing each agency dealing with foreign policy into the process, you cut those agencies out of the process. You told the committees, I firmly believe in very tight

compartmentation. You compartmentalized not only the President's senior advisers, but in effect, you locked the President himself out of the process.

You began your testimony by saying that the function of a national security adviser is to present options and to advise the President. Yet, you told the committees the buck stops here with me. That is not where the buck is supposed to stop.

You wanted to deflect blame from the President but that is another way of saying you wanted to deflect responsibility from the President. And that should not be done in our system of government.

You testified that diverting funds to the contras was a detail, a matter of implementation of the President's policies. And you felt that you had the authority to approve it. Yet, this was a major foreign policy initiative, as subsequent events have shown, with very far-reaching ramifications. And this member, at least, wonders what else could be done in the President's name, if this is mere implementation of policy. . . .

Probably more important, secrecy contributed to disarray in the Oval Office. The President apparently did not know that you were making some of the most important foreign policy decisions of his Presidency. You've testified, I was convinced that the President would, in the end, think the diversion was a good idea. Yet, the President has stated that he would not've approved the diversion.

Excessive secrecy placed the President in an untenable position and caused him to make false and contradictory public statements. Let me cite some of them:

On Nov. 6, 1986, the President said, the speculation, the commenting and all, on a story that came out of the Middle East has no foundation.

A week later, the President said, we did not, repeat, we did not, trade weapons, or anything else, for hostages.

But on March 4, the President said: A few months ago, I told the American people I did not trade arms for hostages. My heart and my best intentions still tell me that's true but the facts and the evidence tell me it is not.

Turning to the solicitation of private aid for the contras, the President said, on May 5, I don't know how that money was to be used. And I have no knowledge that there was ever any solicitation by our people with these people.

But on May 15, the President altered his view. He said: As a matter of fact, I was definitely involved in the decisions about support to the freedom fighters. It was my idea to begin with.

May I suggest that the President was unaware of some important actions taken by his staff and, therefore, he misspoke. Because he lacked information, the President inflicted serious and repeated political wounds upon himself. Polls continue to indicate that a majority of the American people still feels that the President, despite his statements to the contrary, did know that money from the Iran arms sales was channeled to the contras. . . .

POINDEXTER I just have one brief comment.

HAMILTON Yes, indeed.

POINDEXTER Mr. Chairman, with regard to your closing statement I would just simply say that we'll have to agree, you and I, to disagree on your interpretation of many of the events. And finally, I leave this hearing with my head held high that I have done my very best to promote the long-term national security interests of the United States. Thank you.

FOLLOWING ARE EXCERPTS FROM SECRETARY OF STATE GEORGE P SHULTZ'S TESTIMONY:

JULY 24, 1987

Representative Lee H. Hamilton, chairman of the House committee. Mr. Secretary, do you have an opening statement?

MR. SHULTZ No, I don't. But with your permission, Mr. Chairman, I'd like to make a few remarks.

Q Please proceed.

A . . . I have on numerous occasions—including, I think, before your committee right here, Chairman [Dante B.] Fascell [D.-Florida, chairman of the House Foreign Affairs Committee]—been asked about what advice I gave the President on this, that or the other, subject. And I have always taken a position, in 10 and a half years as a member of the Cabinet, that those conversations are privileged and I would not discuss them. This is an exception, and I have made this material available on the President's instruction. But I mention it because if I'm testifying before you on some other subject sometime and you try to use this as a precedent, I won't buy it. I'm just putting you on notice right now.

Thank you, Mr. Chairman.

Q Thank you, Mr. Secretary. We'll begin the questions this morning with Mr. Belnick. . . .

Mark A. Belnick, executive assistant to the chief counsel of the Senate committee. Mr. Secretary, I'd like to begin this morning by reviewing certain key events that the panel has been considering in order to establish when the Secretary of State was first informed of those events. . . .

Let me begin by this question. Mr. Secretary, when were you first informed that the President of the United States had signed a covert action finding authorizing the sale of U.S. arms to Iran?

A On November the 10th, 1986, at a meeting in the Oval Office, with the President's principal advisers, during a briefing by Admiral Poindexter on what had transpired over the past year or so. . . .

Q Mr. Secretary, when were you first informed that this nation had sold weapons directly to Iran?

A . . . This all started to break in very early November 1986. . . .

Q Prior to then, . . . had any member of the United States Government informed you that the United States had sold weapons directly . . . to Iran?

A No.

Q Mr. Secretary, when were you first informed of the McFarlane mission to Teheran?

A It was after the mission, but I think shortly after it was completed.

Q And were you given the details of the mission at that time?

A I was told that it had fizzled, . . . that the whole project had been told to stand down.

Q Were you told at that time that Mr. McFarlane had brought U.S. weapons with him to Teheran?

A No. . . .

Q Mr. Secretary, when were you first informed that United States negotiations with the second channel in the early autumn of 1986 had produced agreement on a so-called nine-point agenda which provided for additional arms sales to Iran in exchange for hostages and which contained provision also with respect to actions directed at the Government of Iraq?

A On December 13th of 1986. But if I may interrupt your questioning, I'd like to expand on that.

Q Please.

A In the course of the effort to come to grips with what was taking place, the President put the management of Iran matters into my hands by that time—we're talking in December—sort of at first a little bit but then for sure. And I discovered that the C.I.A. had a meeting scheduled with an Iranian for that date. And so we considered what to do. And we decided that we should go ahead with that meeting, that the C.I.A. representative who was scheduled to be the representative there, Mr. Cave, should go. But we would have accompanying him Mr. Charles Dunbar, who is a Foreign Service officer and Farsi speaker. And we would have instructions carefully written, designed to use the meeting as a means to tell that channel that there would be no more arms sales discussed in that channel or anywhere else. . . .

At the meeting, the message was delivered, but also as our representative listened, there was back and forth discussion about this agenda, nine-point agenda. And so gradually then, and in discussion with Mr. Cave, Mr. Dunbar got a reasonable idea of what was on this agenda. And then he called that back on Dec. 13, which was a Saturday, to the department. And I saw it on Saturday afternoon. And it was astonishing.

So I called the President, or I called the White House to get an appointment with the President. And there was a lot of back and forth, what did I want to see him about and so on. And I didn't seem to be getting an appointment right away, so I picked up the phone Sunday morning and I called the President. I said, "Mr. President, I have something I should bring over here and tell you about right now." So he said, 'Fine, come over.' He happened to be in Washington.

I went up to the family quarters, and Al Keel, who was then acting national security adviser, went with me, at my request. And I told the President the items on this agenda, including such things as doing something about the Dawa prisoners, which made me sick to my stomach that anybody would talk about that as something we would consider doing.

And the President was astonished. And I have never seen him so mad. He's a very genial, pleasant man and doesn't—very easy-going. But his jaw set, and his eyes flashed, and both of us, I think, felt the same way about it. And I think in that meeting I finally felt that the President deeply understands that something is radically wrong here. . . .

Q . . . In particular, Admiral Poindexter testified that he did not withhold anything from you that you did not want withheld from you. . . . Mr. Secretary, . . . let me ask you first whether you ever told Admiral Poindexter or any other member of the Administration that you did not want to be kept informed of the Iran initiative?

A I never made such a statement. What I did say to Admiral Poindexter was that I wanted to be informed of the things I needed to know to do my job as Secretary of State, but he didn't need to keep me posted on the details, the operational details of

what he was doing. That's what I told him. . . . The reason for that was that there had been a great amount of discussion of leaks in the Administration, and justifiably so. And we were all very concerned about it. And there had been in connection with what to do about it, discussion of the idea of giving very large numbers of people who were—who had access to classified information, lie detector tests on a regular or random basis, which I opposed.

While I was on a trip abroad in the latter part of 1985, a directive encompassing that idea was signed. So I didn't comment on it while I was abroad, but when I got back here I did comment on it, registered my opposition, talked to the President about it. And it got changed. Now that, I recognized, put me at odds with the intelligence and national security community, to put it mildly. So . . . in terms of particulars, like who is going to go someplace to meet somebody and so forth, . . . it seemed to me in the light of the suspicions cast on me as a result, and the hostility, that I would not know that. So I felt it would probably leak, and then it wouldn't be my leak. . . .

But that doesn't mean that I just bowed out insofar as major things having to do with our foreign policy are concerned. . . . To consider that that statement would mean that I shouldn't be informed of things like that is ridiculous. . . .

Q Do you recall what you told Admiral Poindexter about your views concerning the Iran initiative, as he described it to you in that briefing?

A Well, I told him that I thought it was a very bad idea, that I was opposed to it. . . . I was in favor of doing things that had any potential for rear-ranging the behavior of Iran and our relationship with Iran. But I was very much opposed to arms sales in connection with that.

Q Did you tell him at that time that in your view, the proposed policy amounted to paying for hostages and had to be stopped?

A Yes.

Q In that same conversation, sir, on Dec. 5, . . . did he tell you that on the very same day, the President had signed a covert action finding authorizing an arms shipment to Iran?

A No. . . .

Q Now do you recall another briefing, listed on the chronology by Admiral Poindexter a month later, on Feb. 28, in which he discussed the hostage situation and advised you then of a possible high-level meeting between Bud McFarlane and certain Iranian representatives?

A Yes, I do. He told me that as a result of the discussions they had been having, that the Iranians had said they wanted a high-level meeting and if there were a proper high-level meeting, discussing our future possible relationships, that would be the occasion in which hostages . . . would be released. I said, 'Well, that sounds almost too good to be true. But anyway, if that's the case, I'm in favor of it.' . . .

Q Did Admiral Poindexter tell you that the agenda for any meeting between Mr. McFarlane and Iranian representatives would include current deliveries of U.S. arms?

A No. . . . This negotiation had been taking place in a manner consistent with what I thought was proper, and I thought, well, maybe I won the argument after all, with the President.

Q In that light, did Admiral Poindexter tell you on Feb. 28 that only one day before, that was on Feb. 27, the United States had shipped 500 TOW's, TOW missiles, to Iran,

and that about 10 days earlier the United States had also shipped 500 TOW missiles to Iran?

A No, he did not. . . .

Q In May 1986, . . . you were advised . . . of an approach to a British entrepreneur by Mr. Nir about . . . an arms deal to Iran . . . which supposedly had White House approval which had John Poindexter as the point man and which included participants such as Mr. Adnan Khashoggi and Mr. Ghorbanifar?

A Yes. . . . I received a cable from the Under Secretary of State, Mr. Armacost, . . . in Tokyo. . . .

Q Once you received this information, you spoke to Don Regan . . . and Admiral Poindexter. Am I correct?

A That's correct.

Q I understand that in those conversations you objected strongly to any such deal, to the United States being involved, insisted that if there was such an operation it be called off and warned that the President was seriously exposed and at risk. . . . Is that a fair summary?

A Yes. . . . You can imagine how I felt when I read this cable. . . . I said more or less what you said. Don Regan seemed to me to be very upset about it. He said he would take it up with the President when he saw him. . . . He later told me that the President was upset and this was not anything he knew about. And Admiral Poindexter told me . . . we are not dealing with these people, this is not our deal. . . .

Q Well, when Admiral Poindexter told you that this was not our deal, . . . did he inform you that our deal involved an upcoming mission . . . to Teheran, which would be led by Bud McFarlane, which would include a shipment of Hawk spare parts to Iran?

A No. . . .

Q Also, Mr. Secretary, if I could, let me ask you to turn to exhibit 24. That exhibit, sir, is a PROF note dated May 17, 1986. . . . from Oliver North to Admiral Poindexter about the McFarlane mission to Teheran. . . . Colonel North suggests to Admiral Poindexter that there be a quiet meeting with Bud McFarlane and the President prior to the departure of the mission, and he queries whether the participants . . . ought to include you and the Secretary of Defense and the D.C.I. [Director, Central Intelligence: William J. Casey]. Do you see that?

A Yes, I see that.

Q If you turn, then, please, to the next exhibit, . . . you'll see Admiral Poindexter's reply to that suggestion, . . . and I quote, 'I don't want a meeting with R.R., Shultz and Weinberger.' . . . I take it you were unaware of this exchange, as well?

A Obviously. . . .

Q Mr. Secretary, you testified earlier, . . . that you had told Admiral Poindexter that while you didn't need to be informed of what you called operational details, you did want and need to be kept informed of those facts which you needed in order to do your job—correct?

A Correct.

Q Sir, in order to do your job as the nation's chief diplomat, and as a statutory member of the National Security Council, and at a time when, through Operation Staunch, you

were in charge of attempting to persuade our allies and other nations throughout the world not to sell arms to Iran, did you need to know that the United States itself was selling arms to Iran, that the President had signed covert action findings authorizing those sales, and that the President's former national security adviser was in Teheran on a diplomatic mission, bringing with him the first installment on the delivery of U.S. Hawk parts? Did you need to know those facts?

A Certainly. One of the many arguments that I used, and Secretary Weinberger used, in opposing having an arms sale dimension to the Iran initiative, one of the arguments, was that we felt that one way of getting the Iran-Iraq war to come to an end was to do everything we could to deny weapons to the country that was refusing to come to an end, and so we had a rather vigorous program, called Operation Staunch.

Q Sir, did you ever express the view that Colonel North was a loose cannon?

A No, I didn't. What I said—I think what you're referring to is an incident . . . in which I told Elliott Abrams [Assistant Secretary of State for Latin America]—the question was where, where are the freedom fighters getting their arms. . . . And Elliott said he didn't know. And I said, well, you're our pointman here, you should find out, or something like that.

Q As I understand, that conversation took place on Sept. 4, 1985. Secretary Abrams has described that conversation here, based on a note that he took, in which he said you told him to 'monitor Ollie.' Is that your recollection? . . .

A . . . No reason why Elliott shouldn't have taken it that way, because Colonel North was commonly seen as a principal contact with the freedom fighters.

Q Did you have a view at that time that Colonel North, because of any information that you had about him, was someone who had to be watched closely or that Elliott ought to monitor?

A There was talk around about erratic behavior on his part, but I had no particular knowledge about it and didn't want to pass judgment. . . . I can't get myself in the position of supervising people down the line working for others.

Q But you did expect, based on what you told Secretary Abrams Sept. 4, 1985, that he would keep himself informed about . . . how the contras were getting supplied with arms, and not simply shut his eyes to that?

A Yes.

Q All right, sir, in light of what you now know, . . . regarding, for example, the role of Colonel North and other N.S.C. staff members in assisting the contras during the period of the Boland restrictions, the involvement in the Hasenfus flight, the involvement of at least one of our own ambassadors, Mr. Tams, in negotiations for an airstrip to be used in Central America for contra resupply and in helping, as he testified to this panel, on instructions from Colonel North, to open a southern military front against Nicaragua, during the period of the Boland restrictions, . . . is it your view that Secretary Abrams carried out your instruction to keep himself, and you, informed?

A What has been brought out, in these hearings about all of the activities you mentioned, has surprised a lot of people. It surprised me. It must have been a surprise to Chairman Hamilton, who looked into this a couple of times and had assurances. So I imagine it has surprised the President. So things have come out that we didn't know about. . . .

Senator Daniel K. Inouye, chairman of the Senate Committee. Mr. Secretary, at the outset of these hearings, which began about two months ago, I made a sad prediction that when the story began to unfold, the American people will have the right to ask, how did this ever happen here? Or, how could this ever happen in the United States? And I think, at the same time, Americans would have the right to demand that it never happen again.

The story we have heard over the past 10 weeks of testimony, to some has been sad and depressing and distressing, and to many of us on this panel, many of us old-timers and a bit sophisticated, but we found it shocking and at times frightening.

And I believe that made the question that the Americans will ask, and the expectations they have, a bit more compelling.

Mr. Secretary, you and I have lived through the agony and the nightmare of Watergate. And we saw it ruin a President, ruin his senior advisers, demoralize the country and cause the American people to lose faith in their political leaders.

And therefore, it's especially troubling to me, and I'm sure it's to you, to see this nation once again faced with this breakdown of trust, between the important branches of Government, and more importantly, between the Government and the American people. . . .

My question is a very general one, Mr. Secretary, but with your background in public service and being at the helm of the State Department, I hope you can give us a response. How did this happen again? And how did life-long public servants, and patriotic Americans, like Admiral Poindexter, Bud McFarlane and Bill Casey and Oliver North, find themselves in a position where they misled you, kept information away from the Secretary of State, from the Secretary of Defense, lied to the Congress, withheld information from the President of the United States, destroyed . . . Government documents to hide or cover up their activities, and involved rather shady characters—and that's an understatement, I think—in participating in the formulation of foreign policy, and the implementation of such, while, at the same time, skirting around the people who should be doing that work, to wit, the Secretary of State and the ambassadors.

And more importantly, Mr. Secretary, if you could also touch upon and advise us as to how we can prevent this from happening again. . . .

A I would say with respect to the revelations that were brought out this morning, . . . that's not the way life is in Government as I have experienced it. . . .

Public service is a very rewarding and honorable thing, and nobody has to think they need to lie and cheat in order to be a public servant or to work in foreign policy. Quite to the contrary. If you are really going to be effective, . . . you have to be straightforward, and you have to conduct yourself in a basically honest way. . . .

I think there are a lot of things to be learned myself reflecting on these events, if not from these events, that seem to me . . . worth mentioning. . . . One that I think was most vivid in response to Senator [Sam] Nunn's [D.-Georgia] question, and that is I think the importance of separating the function of gathering and analyzing intelligence from the function of developing and carrying out policy. If the two things are mixed in together, it is too tempting to have your analysis and the selection of information that's presented favor the policy that you're advocating.

I believe that one of the reasons the President was given what I regard as wrong information, for example, about Iran and terrorism was that the agency, or the people

in the C.I.A., were too involved in this. So that's one point. And I feel very clear in my mind about this point.

And I know that long before this all emerged, I had come to have grave doubts about the objectivity and reliability of some of the intelligence I was getting. . . .

Mark A. Belnick, executive assistant to the chief counsel of the Senate committee. And did you begin developing the view, particularly as of Nov. 10, . . . that the President's advisers were misleading him and not giving him the facts concerning what had actually transpired in the Iran initiative?

A I developed a very clear opinion that the President was not being given accurate information, and I was very alarmed about it, and it became the preoccupying thing that I was working on through this period. And I felt that it was tremendously important for the President to get accurate information. . . . His judgment is excellent when he's given the right information, and he was not being given the right information.

And I felt as this went on that the people who were giving him the information . . . had a conflict of interest with the President. And they were trying to use his undoubted skills as a communicator to have him give a speech and give a press conference and say these things, and in doing so he would bail them out. . . . I don't want to try to attribute motives to other people too much, although I realize I am, but that's the way it shaped up to me. So I was in a battle to try to get what I saw as the facts to the President and get—and see that he understood them.

Now this was a very traumatic period for me because everybody was saying I'm disloyal to the President. I'm not speaking up for the policy. And I'm battling away here, and I could see people were calling for me to resign if I can't be loyal to the President, even including some of my friends and people who had held high office and should know that maybe there's more involved than they're seeing. And I frankly felt that I was the one who was loyal to the President, because I was the one who was trying to get him the facts so he could make a decision. And I must say, as he absorbed this, he did; he made the decision that we must get all these facts out. But it was a—it was a battle royal.

Q Mr. Secretary, in that battle royal to get out the facts, which you waged and which the record reflects that you waged, who was on the other side?

A Well, I can't say for sure, I—I feel that Admiral Poindexter was certainly on the other side of it. I felt that Director Casey was on the other side of it. And I don't know who all else, but they were the principals. . . .

Senator Inouye. Mr. Secretary, I have another question. And I ask this with great reluctance because I realize it is rather personal in nature, but I think it is relevant. . . . I've been advised that in August of 1986 you tendered a letter of resignation to the President of the United States. Is that true? And if so, can you tell us something about it?

A . . . That is true. And I have asked the President to let me leave this office on a couple of other occasions, earlier. . . .

Q Was that in any way related to the Iran-contra affair?

A Well, in August of 1986 I thought that it was over. . . . I didn't know anything about the contra side of it anyway. But on the effort with Iran, I thought it was basically on a proper track.

But it was because I felt a sense of estrangement. I knew the White House was very uncomfortable with me. I was very uncomfortable with what I was getting from the intelligence community, and I knew they were very uncomfortable with me—perhaps going back to the lie-detector test business. I could feel it.

What I have learned about the various things that were being done, I suppose explains why I was not in good odor with the N.S.C. staff and some of the others in the White House. I had a terrible time. There was a kind of guerrilla warfare going on, on all kinds of little things. For example, as you know, the Congress doesn't treat the State Department very well when it comes to appropriated funds. And not only have we historically taken a beating but we've been cut brutally . . . and I think in a manner that is not in the interests of the United States. . . .

But anyway, one of the conventions that's grown up—because we have no travel money to speak of . . .—the Air Force runs a White House Presidential Wing and when the Secretary of State has a mission, that gets approved and then I get an airplane and the airplane, it is paid for out of this budget. If I had to pay for that airplane, I couldn't travel. So you have me grounded unless I can get approved.

Now it's not a problem; the system works all right and it's just assumed that that's the way it's supposed to be. But I started having trouble because some people on the White House staff decided that they were going to make my life unhappy and they stopped approving these airplane things. And we fought about it and so on. And finally, I—I hated to do this. I went to the President and I gave him little memorandums to check off—yes, no. And that's no business for the Secretary of State to be taking up with the President of the United States.

But I found out there was a character in the White House that was in charge of doing this. His name was Jonathan Miller, and you've seen him here, and he was . . . trying to knock me out of trips. . . . But this was an atmosphere that I found—I felt that I was no longer on the wavelength that I should be on. And so I told the President, "I'd like to leave and here's my letter." And he stuck it in his drawer and he said, "You're tired. It's about time to go on vacation and let's talk about it after you get back from vacation." So I said, "O.K.," and I guess everybody knows what happened. In early—beginning early September last year, it was a tremendous stretch of activity and so nothing ever happened on that. . . .

At an earlier time, in the middle of 1983, I resigned. And that was because I discovered that Bud McFarlane, who was then the deputy national security adviser, was sent on a secret trip to the Middle East . . . without my knowledge, while we're busy negotiating out there. And also I found some things happened with respect to actions on Central America that I didn't know about beforehand.

So I went to the President and I said, "Mr. President, you don't need a guy like me for Secretary of State if this is the way things are going to be done, because when you send somebody out like that McFarlane trip, I'm done." In the labor relations business—I used to be Secretary of Labor and there used to be a lot of intervention in labor disputes and we used to say, "When the President hangs out his shingle, he'll get all the business." When—when the President hangs out his shingle and says, "You don't have to go through the State Department, just come right into the White House," he'll get all the business.

That's a big signal to countries out there about how to deal with the U.S.

Government. And it may have had had something to do with how events transpired, for all I know. But it's wrong; you can't do it that way. . . .

So the other time I resigned was after my big lie-detector test flap, and again I could see that I was on the outs with everybody and so I said, "Mr. President, why don't you let me go home. I like it in California." . . . And again, he wouldn't let that happen. And that was in late 1985. Mr. McFarlane had resigned, and Mr. McFarlane and I, I think, worked very effectively together in . . . our efforts with the U.S.S.R. and . . . in the end I didn't feel, with Mr. McFarlane having left, that it was fair to the President or the country for me to leave at the same time, so I didn't.

But I do think that in jobs like the job I have, where it is a real privilege to serve in this kind of job, or the others that you recounted, that you can't do the job well if you want it too much. You have to be willing to say goodbye, and I am.

Q I thank you very much, Mr. Secretary.

RECOMMENDATIONS ON ORGANIZING FOR NATIONAL SECURITY*

Tower Commission

In selection 28 (found in Part VIII of this text), weaknesses in the NSC as discovered by the Tower Commission were laid out. Presented here are the commission's recommendations for reform.

RECOMMENDATIONS

"Not only . . . is the Federal power over external affairs in origin and essential character different from that over internal affairs, but participation in the exercise of the power is significantly limited. In this vast external realm, with its important, complicated, delicate and manifold problems, the President alone has the power to speak or listen as a representative of the nation."
—United States v. Curtiss-Wright Export Corp., 299 U.S. 304, 319 (1936).

Whereas the ultimate power to formulate domestic policy resides in the Congress, the primary responsibility for the formulation and implementation of national security policy falls on the President.

It is the President who is the usual source of innovation and responsiveness in this field. The departments and agencies—the Defense Department, State Department, and CIA bureaucracies—tend to resist policy change. Each has its own perspective based on long experience. The challenge for the President is to bring his perspective to bear on these bureaucracies for they are his instruments for executing national security policy, and he must work through them. His task is to provide them leadership and direction.

The National Security Act of 1947 and the system that has grown up under it affords the President special tools for carrying out this important role. These tools are the National Security Council, the National Security Advisor, and the NSC staff. These are the means through which the creative impulses of the President are brought to bear on the permanent government. The National Security Act, and custom and practice, rightly give the President wide latitude in fashioning exactly how these means are used.

There is no magic formula which can be applied to the NSC structure and process to produce an optimal system. Because the system is the vehicle through which the President formulates and implements his national security policy, it must adapt to each individual President's style and management philosophy. This means that NSC structures and processes must be flexible, not rigid. Overprescription would . . . either destroy the system or render it ineffective.

Nevertheless, this does not mean there can be no guidelines or recommendations that might improve the operation of the system, whatever the particular style of the incumbent President. We have reviewed the operation of the system over the past 40 years, through good times and bad. We have listened carefully to the views of all the living former Presidents as well as those of most of the participants in their own national security systems.

---

* Reprinted from Report of the President's Special Review Board (the Tower Commission), Washington, D.C., February 26, 1987, pp. V-1–V-7.

With the strong caveat that flexibility and adaptability must be at the core, it is our judgment that the national security system seems to have worked best when it has in general operated along the lines set forth below.

Organizing for National Security Because of the wide latitude in the National Security Act, the President bears a special responsibility for the effective performance of the NSC system. A President must at the outset provide guidelines to the members of the National Security Council, his National Security Advisor, and the National Security Council staff. These guidelines, to be effective, must include how they will relate to one another, what procedures will be followed, what the President expects of them. If his advisors are not performing as he likes, only the President can intervene.

The National Security Council principals other than the President participate on the Council in a unique capacity.[1] Although holding a seat by virtue of their official positions in the Administration, when they sit as members of the Council they sit not as cabinet secretaries or department heads but as advisors to the President. They are there not simply to advance or defend the particular positions of the departments or agencies they head but to give their best advice to the President. Their job—and their challenge—is to see the issue from this perspective, not from the narrower interests of their respective bureaucracies.

The National Security Council is only advisory. It is the President alone who decides. When the NSC principals receive those decisions, they do so as heads of the appropriate departments or agencies. They are then responsible to see that the President's decisions are carried out by those organizations accurately and effectively.

This is an important point. The policy innovation and creativity of the President encounters a natural resistance from the executing departments. While this resistance is a source of frustration to every President, it is inherent in the design of the government. It is up to the politically appointed agency heads to ensure that the President's goals, designs, and policies are brought to bear on this permanent structure. Circumventing the departments, perhaps by using the National Security Advisor or the NSC staff to execute policy, robs the President of the experience and capacity resident in the departments. The President must act largely through them, but the agency heads must ensure that they execute the President's policies in an expeditious and effective manner. It is not just the obligation of the National Security Advisor to see that the national security process is used. All of the NSC principals—and particularly the President—have that obligation.

This tension between the President and the Executive Departments is worked out through the national security process described in the opening sections of this report. It is through this process that the nation obtains both the best of the creativity of the President and the learning and expertise of the national security departments and agencies.

This process is extremely important to the President. His decisions will benefit from the advice and perspective of all the concerned departments and agencies. History offers numerous examples of this truth. President Kennedy, for example, did not have adequate consultation before entering upon the Bay of Pigs invasion, one of his greatest failures. He remedied this in time for the Cuban missile crisis, one of his greatest successes. Process will not always produce brilliant ideas, but history suggests it can at least help prevent bad ideas from becoming Presidential policy.

The National Security Advisor It is the National Security Advisor who is primarily responsible for managing this process on a daily basis. The job requires skill, sensitivity,

and integrity. It is his responsibility to ensure that matters submitted for consideration by the Council cover the full range of issues on which review is required; that those issues are fully analyzed; that a full range of options is considered; that the prospects and risks of each are examined; that all relevant intelligence and other information is available to the principals; that legal considerations are addressed; that difficulties in implementation are confronted. Usually, this can best be accomplished through interagency participation in the analysis of the issue and a preparatory policy review at the Deputy or Under Secretary level.

The National Security Advisor assumes these responsibilities not only with respect to the President but with respect to all the NSC principals. He must keep them informed of the President's thinking and decisions. They should have adequate notice and an agenda for all meetings. Decision papers should, if at all possible, be provided in advance.

The National Security Advisor must also ensure that adequate records are kept of NSC consultations and Presidential decisions. This is essential to avoid confusion among Presidential advisors and departmental staffs about what was actually decided and what is wanted. Those records are also essential for conducting a periodic review of a policy or initiative, and to learn from the past.

It is the responsibility of the National Security Advisor to monitor policy implementation and to ensure that policies are executed in conformity with the intent of the President's decision. Monitoring includes initiating periodic reassessments of a policy or operation, especially when changed circumstances suggest that the policy or operation no longer serves U.S. interests.

But the National Security Advisor does not simply manage the national security process. He is himself an important source of advice on national security matters to the President. He is not the President's only source of advice, but he is perhaps the one most able to see things from the President's perspective. He is unburdened by departmental responsibilities. The President is his only master. His advice is confidential. He is not subject to Senate confirmation and traditionally does not formally appear before Congressional committees.

To serve the President well, the National Security Advisor should present his own views, but he must at the same time represent the views of others fully and faithfully to the President. The system will not work well if the National Security Advisor does not have the trust of the NSC principals. He, therefore, must not use his proximity to the President to manipulate the process so as to produce his own position. He should not interpose himself between the President and the NSC principals. He should not seek to exclude the NSC principals from the decision process. Performing both these roles well is an essential, if not easy, task.

In order for the National Security Advisor to serve the President adequately, he must have direct access to the President. Unless he knows first hand the views of the President and is known to reflect them in his management of the NSC system, he will be ineffective. He should not report to the President through some other official. While the Chief of Staff or others can usefully interject domestic political considerations into national security deliberations, they should do so as additional advisors to the President.

Ideally, the National Security Advisor should not have a high public profile. He should not try to compete with the Secretary of State or the Secretary of Defense as the articulator of public policy. They, along with the President, should be the spokesmen for the policies of the Administration. While a "passion for anonymity" is perhaps too strong a term, the National Security Advisor should generally operate offstage.

The NSC principals of course must have direct access to the President, with whatever frequency the President feels is appropriate. But these individual meetings should not be used by the principal to seek decisions or otherwise circumvent the system in the absence of the other principals. In the same way, the National Security Advisor should not use his scheduled intelligence or other daily briefings of the President as an opportunity to seek Presidential decision on significant issues.

If the system is to operate well, the National Security Advisor must promote cooperation rather than competition among himself and the other NSC principals. But the President is ultimately responsible for the operation of this system. If rancorous infighting develops among his principal national security functionaries, only he can deal with them. Public dispute over external policy by senior officials undermines the process of decision-making and narrows his options. It is the President's responsibility to ensure that it does not take place.

Finally, the National Security Advisor should focus on advice and management, not implementation and execution. Implementation is the responsibility and the strength of the departments and agencies. The National Security Advisor and the NSC staff generally do not have the depth of resources for the conduct of operations. In addition, when they take on implementation responsibilities, they risk compromising their objectivity. They can no longer act as impartial overseers of the implementation, ensuring that Presidential guidance is followed, that policies are kept under review, and that the results are serving the President's policy and the national interest.

The NSC Staff The NSC staff should be small, highly competent, and experienced in the making of public policy. Staff members should be drawn both from within and from outside government. Those from within government should come from the several departments and agencies concerned with national security matters. No particular department or agency should have a predominate role. A proper balance must be maintained between people from within and outside the government. Staff members should generally rotate with a stay of more than four years viewed as the exception.

A large number of staff action officers organized along essentially horizontal lines enhances the possibilities for poorly supervised and monitored activities by individual staff members. Such a system is made to order for energetic self-starters to take unauthorized initiatives. Clear vertical lines of control and authority, responsibility and accountability, are essential to good management.

One problem affecting the NSC staff is lack of institutional memory. This results from the understandable desire of a President to replace the staff in order to be sure it is responsive to him. Departments provide continuity that can help the Council, but the Council as an institution also needs some means to assure adequate records and memory. This was identified to the Board as a problem by many witnesses.

We recognize the problem and have identified a range of possibilities that a President might consider on this subject. One would be to create a small permanent executive secretariat. Another would be to have one person, the Executive Secretary, as a permanent position. Finally, a pattern of limited tenure and overlapping rotation could be used. Any of these would help reduce the problem of loss of institutional memory; none would be practical unless each succeeding President subscribed to it.

The guidelines for the role of the National Security Advisor also apply generally to the NSC staff. They should protect the process and thereby the President. Departments and

agencies should not be excluded from participation in that process. The staff should not be implementors or operators and staff should keep a low profile with the press.

PRINCIPAL RECOMMENDATION

The model we have outlined above for the National Security Council system constitutes our first and most important recommendation. It includes guidelines that address virtually all of the deficiencies in procedure and practice that the Board encountered in the Iran/Contra affair as well as in other case studies of this and previous administrations.

We believe this model can enhance the performance of a President and his administration in the area of national security. It responds directly to President Reagan's mandate to describe the NSC system as it ought to be.

The Board recommends that the proposed model be used by Presidents in their management of the national security system.

SPECIFIC RECOMMENDATIONS

In addition to its principal recommendation regarding the organization and functioning of the NSC system and roles to be played by the participants, the Board has a number of specific recommendations.

1. The National Security Act of 1947 The flaws of procedure and failures of responsibility revealed by our study do not suggest any inadequacies in the provisions of the National Security Act of 1947 that deal with the structure and operation of the NSC system. Forty years of experience under that Act demonstrate to the Board that it remains a fundamentally sound framework for national security decision-making. It strikes a balance between formal structure and flexibility adequate to permit each President to tailor the system to fit his needs.

As a general matter, the NSC staff should not engage in the implementation of policy or the conduct of operations. This compromises their oversight role and usurps the responsibilities of the departments and agencies. But the inflexibility of a legislative restriction should be avoided. Terms such as "operation" and "implementation" are difficult to define, and a legislative proscription might preclude some future President from making a very constructive use of the NSC staff.

Predisposition on sizing of the staff should be toward fewer rather than more. But a legislative restriction cannot foresee the requirements of future Presidents. Size is best left to the discretion of the President, with the admonition that the role of the NSC staff is to review, not to duplicate or replace, the work of the departments and agencies.

We recommend that no substantive change be made in the provisions of the National Security Act dealing with the structure and operation of the NSC system.

2. Senate Confirmation of the National Security Advisor It has been suggested that the job of the National Security Advisor has become so important that its holder should be screened by the process of confirmation, and that once confirmed he should return frequently for questioning by the Congress. It is argued that this would improve the accountability of the National Security Advisor.

We hold a different view. The National Security Advisor does, and should continue, to serve only one master, and that is the President. Further, confirmation is inconsistent with the role the National Security Advisor should play. He should not decide, only advise. He should not engage in policy implementation or operations. He should serve the President, with no collateral and potentially diverting loyalties.

Confirmation would tend to institutionalize the natural tension that exists between the Secretary of State and the National Security Advisor. Questions would increasingly arise about who really speaks for the President in national security matters. Foreign governments could be confused or would be encouraged to engage in "forum shopping."

Only one of the former government officials interviewed favored Senate confirmation of the National Security Advisor. While consultation with Congress received wide support, confirmation and formal questioning were opposed. Several suggested that if the National Security Advisor were to become a position subject to confirmation, it could induce the President to turn to other internal staff or to people outside government to play that role.

We urge the Congress not to require Senate confirmation of the National Security Advisor.

3. The Interagency Process It is the National Security Advisor who has the greatest interest in making the national security process work, for it is this process by which the President obtains the information, background, and analysis he requires to make decisions and build support for his program. Most Presidents have set up interagency committees at both a staff and policy level to surface issues, develop options, and clarify choices. There has typically been a struggle for the chairmanships of these groups between the National Security Advisor and the NSC staff on the one hand, and the cabinet secretaries and department officials on the other.

Our review of the operation of the present system and that of other administrations where committee chairmen came from the departments has led us to the conclusion that the system generally operates better when the committees are chaired by the individual with the greatest stake in making the NSC system work.

We recommend that the National Security Advisor chair the senior-level committees of the NSC system.

4. Covert Actions Policy formulation and implementation are usually managed by a team of experts led by policymaking generalists. Covert action requirements are no different, but there is a need to limit, sometimes severely, the number of individuals involved. The lives of many people may be at stake, as was the case in the attempt to rescue the hostages in Tehran. Premature disclosure might kill the idea in embryo, as could have been the case in the opening of relations with China. In such cases, there is a tendency to limit those involved to a small number of top officials. This practice tends to limit severely the expertise brought to bear on the problem and should be used very sparingly indeed.

The obsession with secrecy and preoccupation with leaks threaten to paralyze the government in its handling of covert operations. Unfortunately, the concern is not misplaced. The selective leak has become a principal means of waging bureaucratic warfare. Opponents of an operation kill it with a leak; supporters seek to build support through the same means.

We have witnessed over the past years a significant deterioration in the integrity of process. Rather than a means to obtain results more satisfactory than the position of any of

the individual departments, it has frequently become something to be manipulated to reach a specific outcome. The leak becomes a primary instrument in that process.

This practice is destructive of orderly governance. It can only be reversed if the most senior officials take the lead. If senior decision-makers set a clear example and demand compliance, subordinates are more likely to conform.

Most recent administrations have had carefully drawn procedures for the consideration of covert activities. The Reagan Administration established such procedures in January, 1985, then promptly ignored them in their consideration of the Iran initiative.

We recommend that each administration formulate precise procedures for restricted consideration of covert action and that, once formulated, those procedures be strictly adhered to.

5. The Role of the CIA Some aspects of the Iran arms sales raised broader questions in the minds of members of the Board regarding the role of the CIA. The first deals with intelligence.

The NSC staff was actively involved in the preparation of the May 20, 1985, update to the Special National Intelligence Estimate on Iran. It is a matter for concern if this involvement and the strong views of NSC staff members were allowed to influence the intelligence judgments contained in the update. It is also of concern that the update contained the hint that the United States should change its existing policy and encourage its allies to provide arms to Iran. It is critical that the line between intelligence and advocacy of a particular policy be preserved if intelligence is to retain its integrity and perform its proper function. In this instance, the CIA came close enough to the line to warrant concern.

We emphasize to both the intelligence community and policymakers the importance of maintaining the integrity and objectivity of the intelligence process.

6. Legal Counsel From time to time issues with important legal ramifications will come before the National Security Council. The Attorney General is currently a member of the Council by invitation and should be in a position to provide legal advice to the Council and the President. It is important that the Attorney General and his department be available to interagency deliberations.

The Justice Department, however, should not replace the role of counsel in the other departments. As the principal counsel on foreign affairs, the Legal Adviser to the Secretary of State should also be available to all the NSC participants.

Of all the NSC participants, it is the Assistant for National Security Affairs who seems to have had the least access to expert counsel familiar with his activities.

The Board recommends that the position of Legal Adviser to the NSC be enhanced in stature and in its role within the NSC staff.

7. Secrecy and Congress There is a natural tension between the desire for secrecy and the need to consult Congress on covert actions. Presidents seem to become increasingly concerned about leaks of classified information as their administrations progress. They blame Congress disproportionately. Various cabinet officials from prior administrations indicated to the Board that they believe Congress bears no more blame than the Executive Branch.

However, the number of Members and staff involved in reviewing covert activities is large; it provides cause for concern and a convenient excuse for Presidents to avoid Congressional consultation.

We recommend that Congress consider replacing the existing Intelligence Committees of the respective Houses with a new joint committee with a restricted staff to oversee the intelligence community, patterned after the Joint Committee on Atomic Energy that existed until the mid-1970s.

8. Privatizing National Security Policy Careful and limited use of people outside the U.S. Government may be very helpful in some unique cases. But this practice raises substantial questions. It can create conflict of interest problems. Private or foreign sources may have different policy interests or personal motives and may exploit their association with a U.S. government effort. Such involvement gives private and foreign sources potentially powerful leverage in the form of demands for return favors or even blackmail.

The U.S. has enormous resources invested in agencies and departments in order to conduct the government's business. In all but a very few cases, these can perform the functions needed. If not, then inquiry is required to find out why.

We recommend against having implementation and policy oversight dominated by intermediaries. We do not recommend barring limited use of private individuals to assist in United States diplomatic initiatives or in covert activities. We caution against use of such people except in very limited ways and under close observation and supervision.

EPILOGUE

If but one of the major policy mistakes we examined had been avoided, the nation's history would bear one less scar, one less embarrassment, one less opportunity for opponents to reverse the principles this nation seeks to preserve and advance in the world.

As a collection, these recommendations are offered to those who will find themselves in situations similar to the ones we reviewed; under stress, with high stakes, given little time, using incomplete information, and troubled by premature disclosure. In such a state, modest improvements may yield surprising gains. This is our hope.

NOTE

1. As discussed in more detail in Part II [not reprinted in this text] the statutory members of the National Security Council are the President, Vice President, Secretary of State, and Secretary of Defense. By the phrase "National Security Council principals" or "NSC principals," the Board generally means those four statutory members plus the Director of Central Intelligence and the Chairman of the Joint Chiefs of Staff.

GLOSSARY

ACCM	Alternative or Compensatory Control Measure
AFIO	Association of Former Intelligence Officers
AG	Attorney General
Aman	Agaf ha-Modi'in (Israeli military intelligence)
ANC	African National Congress
BDA	Battle Damage Assessment
BfV	Bundesamt für Verfassungsschutz (German equivalent of the FBI)
BMD	Ballistic Missile Defense
BND	Bundesnachrichtendienst (German foreign intelligence service)
BSO	Black September Organization
BW	Biological Weapons
CA	Covert Action
CAS	Covert Action Staff (CIA)
CBW	Chemical/Biological Warfare
CCP	Consolidated Cryptographic Program
CDA	Congressionally Directed Action
CE	Counterespionage
CHAOS	Code name for CIA illegal domestic spying
CI	Counterintelligence
CIA	Central Intelligence Agency
CIFA	Counterintelligence Field Activity
CIG	Central Intelligence Group
CMS	Community Management Staff
CNC	Crime and Narcotics Center (CIA)

COINTELPRO	FBI Counterintelligence Program
COMINT	Communications Intelligence
Corona	Codename for first U.S. spy satellite system
COS	Chief of Station (CIA)
COSPO	Community Open Source Program Office
CPA	Covert Political Action
CPSU	Communist Party of the Soviet Union
CSI	Committee on Intelligence Services (Britain)
CT	Counterterrorism
CTC	Counterterrorism Center (CIA)
CW	Chemical Weapons
D & D	Denial and Deception
DARP	Defense Airborne Reconnaissance Program
DAS	Deputy Assistant Secretary
DBA	Dominant Battlefield Awareness
DC	Deputies Committee (NSC)
DCD	Domestic Contact Division (CIA)
DCI	Director of Central Intelligence
D/CIA	Director of Central Intelligence Agency
DDA	Deputy Director of Administration (CIA)
DDCI	Deputy Director for Central Intelligence (DDCI)
DD/CIA	Deputy Director, Central Intelligence Agency
DDO	Deputy Director for Operations (CIA)
DDP	Deputy Director for Plans (CIA)
DDS&T	Deputy Director for Science and Technology (CIA)
DEA	Drug Enforcement Administration
DGSE	Directorie Génerale de la Sécurité Extérieure (French intelligence service)
DHS	Department of Homeland Security
DI	Directorate of Intelligence (CIA)
DIA	Defense Intelligence Agency
DIA/Humint	Defense Humint Service
DINSUM	*Defense Intelligence Summary*
DNI	Director of National Intelligence
DO	Directorate of Operations
DoD	Department of Defense
DOD	Domestic Operations Division (CIA)
DOE	Department of Energy
DOJ	Department of Justice
DOT	Department of Treasury
DOS	Department of State
DP	Directorate of Plans (CIA)
DST	Directoire de Surveillance Territore (France)
ECHR	European Convention of Human Rights

ELINT	Electronic Intelligence
ENIGMA	Code machine used by the Germans during World War II
EO	Executive Order
EOP	Executive Office of the President
ETF	Environmental Task Force (CIA)
FARC	Fuerzas Armadas Revolucionarias in Colombia
FBI	Federal Bureau of Investigation
FBIS	Foreign Broadcast Information Service
FISA	Foreign Intelligence Surveillance Act (1978)
FNLA	National Front for the Liberation of Angola
FOIA	Freedom of Information Act
FRD	Foreign Resources Division (CIA)
FSB	Federal'naya Sluzba Besnopasnoti (Federal Security Service, Russia)
GAO	General Accountability Office (Congress)
GCHQ	Government Communications Headquarters (the British NSA)
GEO	Geosynchronous Orbit
GEOINT	Geospatial Intelligence
GRU	Soviet Military Intelligence
GSG	German Counterterrorism Service
HEO	High Elliptical Orbit
HPSCI	House Permanent Select Committee on Intelligence
HUAC	House Un-American Activities Committee
HUMINT	Human Intelligence (assets)
I & W	Indicators and Warning
IAEA	International Atomic Energy Agency
IAF	Israel Air Force
IC	Intelligence Community
ICS	Intelligence Community Staff
IDF	Israeli Defense Force
IG	Inspector General
IMINT	Imagery Intelligence (photographs)
INR	Bureau of Intelligence and Research (Department of State)
INTELINK	An intelligence community computer information system
INTs	Collection disciplines (IMINT, SIGINT, OSINT, HUMINT, MASINT)
IOB	Intelligence Oversight Board (White House)
ISA	Israeli Security Agency
ISC	Intelligence and Security Committee (U.K.)
ISI	Inter-Services Intelligence (Pakistani intelligence agency)
IT	Information Technology
JCAE	Joint Committee on Atomic Energy
JCS	Joint Chiefs of Staff
JIC	Joint Intelligence Committee (U.K.)

JSOC	Joint Special Operations Command
JSTARS	Joint Surveillance Target Attack Radar Systems
KGB	Soviet Secret Police
KH	Keyhole (satellite)
LTTE	Tamil Tigers of Tamil Elam
MAGIC	Allied code-breaking operations against the Japanese in the World War II
MASINT	Measurement and Signatures Intelligence
MI5	Security Service (U.K.)
MI6	Secret Intelligence Service (U.K.)
MON	Memoranda of Notification
MONGOOSE	Code name for CIA covert actions against Fidel Castro of Cuba (1961–62)
Mossad	Israeli Intelligence Service
MPLA	Popular Movement for the Liberation of Angola
NAACP	National Association for the Advancement of Colored People
NBC	Nuclear, Biological, and Chemical (Weapons)
NCS	National Clandestine Service
NCIC	National Counterintelligence Center
NCTC	National Counterterrorism Center
NED	National Endowment for Democracy
NFIB	National Foreign Intelligence Board
NFIC	National Foreign Intelligence Council
NFIP	National Foreign Intelligence Program
NGA	National Geospatial-Intelligence Agency
NGO	Nongovernmental organization
NIA	National Intelligence Authority
NIC	National Intelligence Council
NID	*National Intelligence Daily*
NIE	National Intelligence Estimate
NIO	National Intelligence Officer
NOC	Nonofficial Cover
NPIC	National Photographic Interpretation Center
NRO	National Reconnaissance Office
NSA	National Security Agency
NSC	National Security Council (White House)
NSCID	National Security Council Intelligence Directive
NTM	National Technical Means
OB	Order of Battle
OC	Official Cover
ODNI	Office of the Director of National Intelligence
OMB	Office of Management and Budget
ONI	Office of Naval Intelligence

OPC	Office of Policy Coordination
OSD	Office of the Secretary of Defense
OSINT	Open-Source Intelligence
OSS	Office of Strategic Services
P & E	Processing and Exploitation
PDB	*President's Daily Brief*
PFIAB	President's Foreign Intelligence Advisory Board (White House)
PFLP	Popular Front for the Liberation of Palestine
PIJ	Palestinian Islamic Jihad
PLO	Palestine Liberation Organization
PM	Paramilitary
PRO	Public Record Office (U.K.)
RADINT	Radar Intelligence
RFE	Radio Free Europe
RL	Radio Liberty
SA	Special Activities Division (DO/CIA)
SAS	Special Air Service (U.K.)
SBS	Special Boat Service (U.K.)
SDO	Support to Diplomatic Operations
SHAMROCK	Code name for illegal NSA interception of cables
SIG	Senior Interagency Group
SIGINT	Signals Intelligence
SIS	Secret Intelligence Service (U.K., also known as MI6)
SISDE	Italian Intelligence Service
SMO	Support to Military Operations
SMS	Secretary's *Morning Summary* (Department of State)
SNIE	Special National Intelligence Estimate
SO	Special Operations (CIA)
SOCOM	Special Operations Command (Department of Defense)
SOE	Special Operations Executive (U.K.)
SOG	Special Operations Group (DO/CIA)
SOVA	Office of Soviet Analysis (CIA)
SSCI	Senate Select Committee on Intelligence
SVR	Russian Foreign Intelligence Service
TECHINT	Technical Intelligence
TELINT	Telemetery Intelligence
TIARA	Tactical Intelligence and Related Activities
TPED	Tasking, Processing, Exploitation, and Dissemination
UAV	Unmanned Aerial Vehicle (drone)
ULTRA	Code name for the Allied operation that deciphered the German ENIGMA code in World War II
UN	United Nations
UNITA	National Union for the Total Independence of Angola

UNSCOM	United Nations Special Commission
USIB	United States Intelligence Board
USTR	United States Trade Representative
VCI	Viet Cong Infrastructure
VENONA	Code name for SIGINT intercepts against Soviet spying in America
VOA	Voice of America
VX	A deadly nerve agent used in chemical weapons
WMD	Weapons of mass destruction

INDEX

ABOUT THE EDITOR AND CONTRIBUTORS

EDITOR

Loch K. Johnson is Regents Professor of Public and International Affairs at the University of Georgia and author of several books and over 100 articles on U.S. intelligence and national security. His books include *The Making of International Agreements* (1984); *A Season of Inquiry* (1985); *Through the Straits of Armageddon* (1987, coedited with Paul Diehl); *Decisions of the Highest Order* (1988, coedited with Karl F. Inderfurth); *America's Secret Power* (1989); *Runoff Elections in the United States* (1993, coauthored with Charles S. Bullock III); *America as a World Power* (1995); *Secret Agencies* (1996); *Bombs, Bugs, Drugs, and Thugs* (2000); *Fateful Decisions* (2004, coedited with Karl F. Inderfurth); *Strategic Intelligence* (2004, coedited with James J. Wirtz); *Who's Watching the Spies?* (2005, coauthored with Hans Born and Ian Leigh); *American Foreign Policy* (2005, coauthored with Daniel Papp and John Endicott); and *Seven Sins of American Foreign* Policy (2007). He has served as special assistant to the chair of the Senate Select Committee on Intelligence (1975–76), staff director of the House Subcommittee on Intelligence Oversight (1977–79), and special assistant to the chair of the Aspin-Brown Commission on Intelligence (1995–96). In 1969–70, he was an American Political Science Association Congressional Fellow. He has served as secretary of the American Political Science Association and President of the International Studies Association, South. Born in New Zealand and educated at the University of California, Johnson has taught at the University of Georgia since 1979, winning its Meigs Professorship for meritorious teaching and its Owens Award for outstanding accomplishments in the field of social science research. In 2000, he led the founding of the School of Public and

International Affairs at the University of Georgia. He is the senior editor of the international journal *Intelligence and National Security*.

CONTRIBUTORS

Matthew M. Aid is Managing Director in the Washington, DC, office of Citigate Global Intelligence and Security and coeditor of *Secrets of Signals Intelligence During the Cold War and Beyond* (2001).

James E. Baker sits on the U.S. Court of Appeals for the Armed Forces. He previously served as Special Assistant to the President and Legal Adviser to the National Security Council and as Deputy Legal Adviser to the NSC. He has also served as Counsel to the President's Foreign Intelligence Advisory Board, an attorney at the Department of State, a legislative aide to Senator Daniel Patrick Moynihan, and as a Marine Corps infantry officer. He is the coauthor with Michael Reisman of *Regulating Covert Action* (Yale University Press, 1992).

David M. Barrett is Associate Professor of Political Science at Villanova University and author of *Congress and the CIA* (Kansas, 2005).

Hans Born is a senior fellow in democratic governance of the security sector at the Geneva Centre for Democratic Control of the Armed Forces (DCAF). He is an external member of the crisis management and security policy faculty of the Federal Institute of Technology and a guest lecturer on governing nuclear weapons at the UN Disarmament Fellowship Programme. He has written, co-authored, and co-edited various books on international relations and security policy, including the Inter-Parliamentary Union Handbook on *Parliamentary Oversight of the Security Sector: Principles, Mechanisms and Practices* (Geneva: IPU/DCAF, 2003, translated in 30 languages); *Making Intelligence Accountable: Legal Standards and Best Practice for Oversight of Intelligence Agencies* (Oslo: Publishing House of the Parliament of Norway, 2005, translated in 10 languages); *Who is Watching the Spies? Establishing Intelligence Agency Accountability* (Dulles, VA: Potomac Publishers, 2005); *Civil-Military Relations in Europe: Learning from Crisis and Institutional Change* (London: Routledge, 2006); and *The Double Democratic Deficit: Parliamentary Accountability and the Use of Force under International Auspices* (London: Ashgate Publishers: Aldershot).

A. Denis Clift is President of the Department of Defense Joint Military Intelligence College. He was born in New York City and educated at Friends Seminary, Phillips Exeter Academy (1954), Stanford University (B.A., 1958), and the London School of Economics and Political Science (M.Sc., 1967). He began a career of public service as a naval officer in the Eisenhower and Kennedy administrations and has served in military and civilian capacities in ten administrations, including thirteen successive years in the Executive Office of the President and the White House. From 1971–76, he served on the National Security

Council staff. From 1974–76, he was head of President Ford's National Security Council staff for the Soviet Union and Eastern and Western Europe. From 1977–81, he was Assistant for National Security Affairs to the Vice President. From 1991–94, he was Chief of Staff, Defense Intelligence Agency. From 1963–66, he was the editor of the U.S. Naval Institute *Proceedings*. His published fiction and nonfiction include the novel *A Death in Geneva* (Ballantine Books, Random House), *Our World in Antarctica* (Rand McNally), *With Presidents to the Summit* (George Mason University Press), and *Clift Notes: Intelligence and the Nation's Security* (JMIC Writing Center Press).

William J. Daugherty holds a doctorate in government from the Claremont Graduate School and is Associate Professor of government at Armstrong Atlantic State University in Savannah, Georgia. A retired senior officer in the CIA, he is also the author of *In the Shadow of the Ayatollah: A CIA Hostage in Iran* (Annapolis, 2001) and *Executive Secrets: Covert Action and the Presidency* (Kentucky, 2004).

Jack Davis served in the CIA from 1956 to 1990 as analyst, manager, and teacher of analysts. He now is an independent contractor with the Agency, specializing in analytic methodology. He is a frequent contributor to the journal *Studies in Intelligence*.

Stuart Farson is Lecturer, Political Science Department, Simon Fraser University, Vancouver/Surrey, Canada. He is a former Secretary-Treasurer of the Canadian Association for Security and Intelligence Studies, and served as Director of Research for the Special Committee of the House Commons (Canada) on the Review of the Canadian Security Intelligence Service Act and the Security Offences Act. He has numerous articles on security, intelligence, and policing issues and is the coeditor of *Security and Intelligence in a Changing World* (with David Stafford and Wesley K. Wark, Cass, 1991).

Timothy Gibbs is a final-year doctoral student in history at Robinson College, Cambridge University, and a member of the Cambridge University Intelligence Seminar. He is also a former Visiting Scholar at the University of Georgia. His doctoral dissertation, titled *British and American Intelligence and the Atom Spies*, was submitted in the summer of 2006 and was supervised by Professor Christopher Andrew.

Peter Gill is Reader in Politics and Security, Liverpool John Moores University, Liverpool, United Kingdom. He is coauthor of *Introduction to Politics* (1988, 2nd ed.) and *Intelligence in an Insecure World* (2006). He is currently researching the control and oversight of domestic security in intelligence agencies.

Harold M. Greenberg graduated with a B.A. in history from Yale University in 2005. At Yale, he participated in the Studies in Grand Strategy program, and he has recently published research on CIA covert action in the 1950s. He now works as a legislative aide in the U.S. House of Representatives.

Daniel S. Gressang IV is Professor at the Joint Military Intelligence College (JMIC) in Washington, DC, and serves concurrently as the National Security Agency/National Cryptologic School of Liaison to JMIC. He has researched, written, and lectured extensively on terrorism and counterinsurgency. His research focuses primarily on the application of complex adaptive systems perspectives to understanding the dynamics of terror and other forms of unconventional warfare. In 2004, he was designated Intelligence Community Officer by the Director of Central Intelligence.

Glenn Hastedt received his doctorate in political science from Indiana University. Until recently he was Professor and Chair of the Political Science Department at James Madison University. He is now chair of the Justice Studies Department there. Among his publications is *American Foreign Policy: Past, Present, Future*, 6th ed. (Prentice Hall).

John Hollister Hedley, during more than thirty years at CIA, edited the *President's Daily Brief*, briefed the *PDB* at the White House, served as Managing Editor of the *National Intelligence Daily*, and was Chairman of the CIA's Publications Review Board. Now retired, Hedley has taught intelligence at Georgetown University and serves as a consultant to the National Intelligence Council and the Center for the Study of Intelligence.

Michael Herman served from 1952 to 1987 in Britain's Government Communications Headquarters, with secondments to the Cabinet Office and the Ministry of Defence. Since retirement he has written extensively on intelligence matters, with official clearance. He has had academic affiliations with Nuffield and St. Antony's Colleges in Oxford and is Founder Director of the Oxford Intelligence Group and Honorary Departmental Fellow at Aberystwyth University. In 2005 he received the degree of Honorary D.Litt from Nottingham University. He is a leading British intelligence scholar and author of *Intelligence Power in Peace and War* (Cambridge, 2001).

Frederick P. Hitz is Lecturer (Diplomat in Residence) in Public and International Affairs, Woodrow Wilson School, Princeton University.

Max M. Holland is the author of *The Kennedy Assassination Tapes* (Knopf, 2004).

Arthur S. Hulnick is Associate Professor of International Relations at Boston University. He is a veteran of thirty-five years of intelligence service, including seven years in Air Force Intelligence and twenty-eight years in the CIA. He is author of *Fixing the Spy Machine* (Praeger, 1999) and *Keeping Us Safe* (Praeger, 2004).

Rhodri Jeffreys-Jones is Professor of American History at the University of Edinburgh. The author of several books on intelligence history, he is currently completing a study of the FBI.

Ephraim Kahana is Professor of Political Science and faculty member in the Western Galilee College, Acre, Israel. He teaches courses on international relations, national security and intelligence, and foreign policy in the National Security Program in the University of Haifa. Kahana has written numerous papers on intelligence and foreign policy. His most recent book is the *Historical Dictionary of Israeli Intelligence* (2006).

Patrick Radden Keefe is a graduate of the School of Law at Yale University and is presently a Fellow with the Century Foundation in New York City. He is the author of *Chatter: Uncovering the Echelon Surveillance Network and the Secret World of Global Eavesdropping* (Random House, 2006), and has published essays in *The New York Review of Books*, *The New York Times Magazine*, the *New York Times*, the *Boston Globe*, the *Yale Journal of International Law*, *Legal Affairs*, *Slate*, and *Wired*. He has been a Marshall Scholar and a 2003 fellow at the Dorothy and Lewis B. Cullman Center for Scholars and Writers at the New York Public Library.

Jennifer D. Kibbe is Assistant Professor of Government at Franklin and Marshall College. Between 2002 and 2004, she was a postdoctoral fellow at the Brookings Institution. Her research interests include U.S. foreign policy, intelligence and covert action, presidential decision making, and political psychology. She has published work on U.S. policy in Iraq and the Middle East, and the military's involvement in covert actions.

Katharina von Knop is a doctoral candidate in Political Science at Leopold-Franzens University in Innsbruck, Austria, specializing in counter- and antiterrorism, and coeditor with Heinrich Neisser and Martin van Creveld of *Countering Modern Terrorism: History, Current Issues, and Future Threats* (2005).

Lawrence J. Lamanna is a doctoral candidate in the School of Public and International Affairs at the University of Georgia. He holds an M.A. from Yale University and a B.A. from the University of Notre Dame.

Ian Leigh is Professor of Law and Codirector of the Human Rights Centre at the University of Durham. He lives in Durham, England.

Kristin M. Lord is Associate Dean at George Washington University's Elliott School of International Affairs. In 2005–2006, she was a Council on Foreign Relations International Affairs Fellow and Special Adviser to the Under Secretary of State for Democracy and Global Affairs. Lord is the author of *The Perils and Promise of Global Transparency: Why the Information Revolution May Not Lead to Security Democracy or Peace* (SUNY Press, 2006); coeditor, with Bernard I. Finel, of *Power and Conflict in the Age of Transparency* (Palgrave Macmillan, 2000); and the author of numerous book chapters, articles, and papers on international politics and security. Lord received her doctorate in government from Georgetown University.

Minh A. Luong is Assistant Director of International Security Studies at Yale University, where he teaches in the Department of History. He also serves as adjunct Assistant Professor of Public Policy at the Taubman Center at Brown University.

Cynthia M. Nolan earned a doctorate at American University in the School of International Service, researching intelligence oversight. She is a former officer in the Directorate of Operations in the CIA and has published in the *International Journal of Intelligence and Counterintelligence*.

Kevin A. O'Brien is a former research associate with the Canadian Institute of Strategic Studies and is currently a senior analyst for RAND Europe.

Mark Phythian is Professor of International Security and Director of the History and Governance Research Institute at the University of Wolverhampton, United Kingdom. He is the author of *Intelligence in an Insecure World* (2006, with Peter Gill), *The Politics of British Arms Sales Since 1964* (2000), and *Arming Iraq* (1997), as well as numerous journal articles on intelligence and security issues.

Harry Howe Ransom is Professor Emeritus of Political Science at Vanderbilt University. He has a B.A. from Vanderbilt and an M.A. and Ph.D. from Princeton University. He was a Congressional Fellow of the American Political Science Association and a Fellow of the Woodrow Wilson International Center for Scholars. He taught at Princeton, Vassar College, Michigan State University, Harvard University, and the University of Leeds. His books include *Central Intelligence and National Security* (1958), *Can American Democracy Survive Cold War?* (1963), and *The Intelligence Establishment* (1970).

Jeffrey T. Richelson is Senior Fellow with the National Security Archive in Washington, DC, and author of *The Wizards of Langley*, *The U.S. Intelligence Community*, *A Century of Spies*, and *America's Eyes in Space*, as well as numerous articles on intelligence activities. He received his doctorate in political science from the University of Rochester and has taught at the University of Texas, Austin, and the American University, Washington, DC. He lives in Los Angeles.

Jerel A. Rosati is Professor of Political Science and International Studies at the University of South Carolina since 1982. His area of specialization is the theory and practice of foreign policy, focusing on the U.S. policy-making process, decision-making theory, and the political psychological study of human cognition. He is the author and editor of five books and over forty articles and chapters. He has received numerous outstanding teaching awards. He has been Visiting Professor at Somalia National University in Mogadishu and Visiting Scholar at China's Foreign Affairs College in Beijing. He also has been a Research Associate in the Foreign Affairs and National Defense Division of the Library of Congress's Congressional Research Service, President of the International

Studies Association's Foreign Policy Analysis Section, and President of the Southern region of the International Studies Association.

Richard L. Russell is Professor of national security studies at the National Defense University. He is also an adjunct associate professor in the Security Studies Program and research associate in the Institute for the Study of Diplomacy at Georgetown University. He previously served as a CIA political-military analyst. Russell is the author of *Weapons Proliferation and War in the Greater Middle East: Strategic Contest* (2005).

Frederick A. O. Schwarz Jr. received an A.B. from Harvard University and J.D. from Harvard Law School, where he was an editor of the *Law Review*. After a year's clerkship with Hon. J. Edward Lumbard, U.S. Court of Appeals for the Second Circuit, he worked one year for the Nigerian government as Assistant Commissioner for Law Revision under a Ford Foundation grant. He joined the New York City law firm of Cravath, Swaine and Moore in 1963 and was elected a partner in 1969. From 1975 through mid-1976, he served as Chief Counsel to the Senate Select Committee to Study Government Operations with Respect to Intelligence Activities (the Church Committee); from 1982–89, he served as Corporation Counsel and head of the Law Department of the City of New York. In 1989, he chaired the New York City Charter Revision Commission.

James M. Scott is Professor and Chair of the Department of Political Science at Oklahoma State University. His areas of specialization include foreign policy analysis and international relations, with particular emphasis on U.S. foreign policy making and the domestic sources of foreign policy. He is author or editor of four books, over forty articles, book chapters, review essays, and other publications. He has been President of the Foreign Policy Analysis section and President of the Midwest region of the International Studies Association, where he has also served as conference organizer for both sections and has been a two-time winner of the Klingberg Award for Outstanding Faculty Paper at the ISA Midwest Annual Meeting. Since 1996, he has received over two dozen awards from students and peers for his outstanding teaching and research, including his institution's highest awards for scholarship in 2000 and 2001. Since 2005, he has been Director of the Democracy and World Politics Summer Research Program, a National Science Foundation Research Experience for Undergraduates.

Len Scott is Professor of International Politics at the University of Wales, Aberystwyth, where he is Director of the Centre for Intelligence and International Security Studies. Among his recent publications are *Understanding Intelligence in the Twenty-First Century: Journeys in Shadows* (2004, coedited with Peter Jackson) and *Planning Armageddon: Britain, the United States and the Command of Nuclear Forces, 1943–1964* (2000, coedited with Stephen Twigge).

Katherine A. S. Sibley is Professor and Chair of the History Department at St. Joseph's University. She is currently working on a biography of Florence Kling

Harding, titled *America's First Feminist First Lady*. Sibley's work will revise the typical portrait of Mrs. Harding as manipulative, unhappy wife, casting new light on her public and private life. In 2004, Sibley published *Red Spies in America: Stolen Secrets and the Dawn of the Cold War* with the University Press of Kansas. She is also the author of *The Cold War* (1998) and *Loans and Legitimacy: The Evolution of Soviet-American Relations, 1919–1933* (1996). Her work has appeared in journals including *American Communist History*, *Peace and Change*, and *Diplomatic History*, and she also serves as book review editor for *Intelligence and National Security*. She is a three-term Commonwealth Speaker for the Pennsylvania Humanities Council.

Jennifer Sims is Director of Intelligence Studies and Visiting Professor in the Security Studies Program at Georgetown University's Edmund A. Walsh School of Foreign Service. She also consults for the U.S. government and private sector on homeland security and intelligence related matters. Prior to this, Sims was Research Professor at Johns Hopkins University's Nitze School of Advanced International Studies in Washington, DC (Fall 2001–Summer 2003). She has served as defense and foreign policy adviser to Senator John Danforth (1990–94), a professional staff member of the Senate Select Committee on Intelligence (1991–94), Deputy Assistant Secretary of State for Intelligence Coordination (1994–98), and as the Department of State's first Coordinator for Intelligence Resources and Planning in the office of the Under Secretary for Management. In 1998 Sims was awarded the U.S. Intelligence Community's Distinguished Service Medal. She received her B.A. degree from Oberlin College and her M.A. and Ph.D. in national security studies from Johns Hopkins University in 1978 and 1985, respectively. She is the author of a number of books and articles on intelligence and arms control. The most recent of these include "Foreign Intelligence Liaison: Devils, Deals and Details," *International Journal of Intelligence and Counterintelligence Affairs* (Summer 2006); *Transforming US Intelligence,* coedited with Burton Gerber (Georgetown University Press, 2005); "Transforming U.S. Espionage: A Contrarian's Approach," *Georgetown Journal of International Affairs* (Winter/Spring 2005); "Domestic Factors in Arms Control: The U.S. Case," in Jeffrey A Larson (ed.), *Arms Control: Cooperative Security in a Changing Environment* (Lynne Rienner, 2002); "What Is Intelligence? Information for Decision-Makers," in Roy Godson, Ernest R. May, and Gary Schmitt, *U.S. Intelligence at the Crossroads* (Brassey's, 1995); "The Cambridge Approach Reconsidered," *Daedalus* 120 (Winter 1991); and *Icarus Restrained: An Intellectual History of American Arms Control* (Westview Press, 1990).

Robert David Steele is CEO of OSS.Net, an international open source intelligence provider. As the son of an oilman, a Marine Corps infantry officer, and a clandestine intelligence case officer for the CIA, he has spent over twenty years abroad in Asia and Central and South America. As a civilian intelligence officer he spent three back-to-back tours overseas, including one tour as one of the first officers assigned full-time to terrorism, and three headquarters tours in offensive

counterintelligence, advanced information technology, and satellite program management. He resigned from the CIA in 1988 to be the senior civilian founder of the Marine Corps Intelligence Command. He resigned from the Marines in 1993. He is the author of three works on intelligence, as well as the editor of a book on peacekeeping intelligence. He has earned graduate degrees in international relations and public administration, is a graduate of the Naval War College, and has a certificate in Intelligence Policy. He is also a graduate of the Marine Corps Command and Staff Course and of the CIA's Mid-Career Course 101.

John D. Stempel is Senior Professor of International Relations at the University of Kentucky's Patterson School of Diplomacy and International Commerce, where he was Associate Director (1988–93) and Director (1993–2003). He came to the University of Kentucky following a 24-year career in the U.S. Foreign Service. There he focused on political and economic affairs, with overseas assignments in Africa (Guinea, Burundi, Zambia), Iran, and India, concluding with three years as U.S. Consul General in Madras. His Middle East service (1975–79) in Tehran provided the material for his book *Inside the Iranian Revolution*. His subsequent academic writings have focused on religion and diplomacy, intelligence and diplomacy, and American views of negotiation. His Washington assignments featured duty for both the State and Defense Departments, including a two-year tour as Director of the State Department's Crisis Center. He has taught at George Washington and American Universities, plus two years as Diplomat in Residence at the U.S. Naval Academy, Annapolis. Stemple is a member of the New York Council on Foreign Relations and is listed in *Who's Who in the World* and *Who's Who in America*. He holds an A.B. degree from Princeton University and M.A. and Ph.D. degrees from the University of California at Berkeley.

Stan A. Taylor is an Emeritus Professor of Political Science at Brigham Young University in Provo, Utah. He has taught in England, Wales, and New Zealand and in 2006 was a visiting professor at the University of Otago in Dunedin, New Zealand. He is founder of the David M. Kennedy Center for International Studies at Brigham Young University. He writes frequently on intelligence, national security, and U.S. foreign policy.

Athan Theoharis is Professor of History at Marquette University whose research has focused on government secrecy, Cold War politics, and the history of the FBI. He is the author, coauthor, and editor of eighteen books, including *The FBI and American Democracy* (2004), *Chasing Spies* (2002), *A Culture of Secrecy* (1998), and *The FBI: A Comprehensive Reference Guide* (1998). He has received numerous awards, including the American Bar Association's Gavel Award and selection as a fellow by the Wisconsin Academy of Arts, Sciences, and Letters.

Gregory F. Treverton is senior analyst at the RAND Corporation. Earlier, he directed RAND's Intelligence Policy Center and its International Security and Defense Policy Center, and he is Associate Dean of the Pardee RAND Graduate School. His recent work has examined at terrorism, intelligence, and law

enforcement, with a special interest in new forms of public-private partnership. He has served in government for the first Senate Select Committee on Intelligence, handling Europe for the National Security Council, and most recently as vice chair of the National Intelligence Council, overseeing the writing of America's National Intelligence Estimates. He holds an A.B. *summa cum laude* from Princeton University, a master's in public policy, and Ph.D. in economics and politics from Harvard University. His latest books are *Reshaping National Intelligence for an Age of Information* (Cambridge University Press, 2001), and *New Challenges, New Tools for Defense Decisionmaking* (edited, RAND, 2003).

Michael A. Turner is a political scientist who has taught international relations and national security matters in San Diego, California, for the past twelve years. Before that, he spent over fifteen years in various positions within the CIA. Turner is the author of *Why Secret Intelligence Fails* (2005; 2006) and the *Historical Dictionary of United States Intelligence* (2006).

Michael Warner serves as Historian for the Office of the Director of National Intelligence.

Nigel West is a military historian specializing in security and intelligence topics. He is the European editor of the *World Intelligence Review* and is on the faculty at the Center for Counterintelligence and Security Studies in Washington, DC. He is the author of more than two dozen works of nonfiction and recently edited *Guy Liddell Diaries*.

Reg Whitaker is Distinguished Research Professor Emeritus, York University, and Adjunct Professor of Political Science, University of Victoria, Canada. He has written extensively on Canadian and international security and intelligence issues.

James J. Wirtz is Professor in the Department of National Security Affairs at the Naval Postgraduate School, Monterey, California. He is Section Chair of the Intelligence Studies Section of the International Studies Association and President of the International Security and Arms Control Section of the American Political Science Association. Wirtz is the series editor for *Initiatives in Strategic Studies: Issues and Policies*, published by Palgrave Macmillan.

Amy B. Zegart is Associate Professor of Public Policy at the University of California, Los Angeles. A specialist on national and homeland security, she has served on the National Security Council staff, as a foreign policy advisor to the Bush-Cheney 2000 presidential campaign, and as a consultant to California state and local homeland security agencies. She has published articles in leading academic journals, including *International Security* and *Political Science Quarterly*, and is the author of *Flawed by Design: The Origins of the CIA, JCS, and NSC* (Stanford, 1999). She received her Ph.D. in political science from Stanford, where she studied under Condoleezza Rice, and an A.B. in East Asian Studies from Harvard University.

CONTENTS

PREFACE

THIS FIVE-VOLUME SERIES IN INTELLIGENCE IS SOMETHING of a landmark in the study of intelligence. Thirty years ago, one would have been hard-pressed to find enough good articles on the subject to fill two volumes, let alone five. In those three decades since 1975, however, the study of intelligence has grown considerably. Today there are several solid professional journals in the field, including the premier publications *Intelligence and National Security* (published in the United Kingdom), *International Journal of Intelligence and Counterintelligence* (the United States), and *Studies in Intelligence* (from the Central Intelligence Agency, in both classified and unclassified form). In just the past two years, bulging anthologies on the general topic "strategic intelligence," as well as a "handbook" on intelligence and a collection of chapters within the more specialized niche of "intelligence and ethics" have appeared, along with a tidal wave of books and articles on one aspect or another of this subject (see the bibliographic essay in volume 1).

Except in times of scandal (Watergate in 1973, CIA domestic spying in 1974, the Iran-*contra* affair in 1987), one could find in this earlier era little newspaper coverage of intelligence activities, so tightly held were these operations by the government. Now, fueled by the events of the September 11, 2001, terrorist attacks and the erroneous prediction in 2002 that weapons of mass destruction (WMDs) were being developed and stockpiled by Iraq, hardly a week goes by without reports on intelligence in the *New York Times* and other leading newspapers. These days, the *Atlantic Monthly* and the *New Yorker*, America's top literary magazines, visit the subject with some regularity, too. The latter has hired Seymour M. Hersh, the nation's most well-known investigative reporter with an intelligence beat.

Intelligence studies has come of age.

Certainly the chapters in these volumes display a breadth of inquiry that suggests an admirable vibrancy in this relatively new field of study. Presented here are empirical inquiries, historical treatments, theoretical frameworks, memoirs, case studies, interviews, legal analyses, comparative essays, and ethical assessments. The authors come from the ranks of academe (twenty-five); the intelligence agencies (thirteen); think tanks (seven); Congress, the State Department, and the National Security Council (three); and the legal world (three).[1] Over a quarter of the contributors are from other nations, including Canada, England, Germany, Israel, Scotland, Switzerland, and Wales. The American writers come from every region of the United States. As a collective, the authors represent a wide range of scholarly disciplines, including computer science, history, international affairs, law, sociology, political science, public administration, public policy studies, and strategic studies. Many of the contributors are from the ranks of the top intelligence scholars in the world; a few young ones stand at the gateway to their academic careers.

Notable, too, is the number of women who have entered this field of study. Thirty years ago, it would have been rare to find one or two women writing on this subject. Seven have contributed chapters to these pages, and another two wrote documents that appear in the appendixes. This is still fewer than one would like, especially in light of the major contribution women have made as intelligence officers. One thinks of the heroic efforts of British women in code breaking and in the Special Operations Executive during World War II, and the American women who contributed so much to the analytic efforts of the Office of Strategic Studies (OSS) during that same war. At least, though, the number attracted to the scholar study of intelligence appears to be rapidly expanding.

The end result of this mix is a landscape illuminated by a variety of methods and appreciations—a rich research trove that examines all the key aspects of intelligence. In addition, each of the volumes contains backup materials in the appendixes. These documents provide the reader with access to significant primary and secondary sources referred to in the chapters.

The volumes are organized according to the major topics of studies in the field. The first volume, titled *Understanding the Hidden Side of Government*, introduces the reader to methods commonly used in the study of intelligence. It imparts, as well, a sense of the "state of the discipline," beginning with a bibliographic essay (by the editor) and continuing with an examination of specific approaches scholars have adopted in their inquiries into this especially difficult discipline, where doors are often shut against outsiders.

In the bibliographic essay that opens the volume, I argue that the literature on intelligence has mushroomed over the past thirty years. Some of this literature is unreliable, but much of it is of high quality. Amy B. Zegart follows my chapter with an important caveat: the literature may be more voluminous these days, but intelligence studies as an academic field has yet to be accepted as a vital part of national security scholarship. The mainstream journals of history, international

affairs, and political science have still regarded the study of intelligence as a marginal pursuit. In this regard, Zegart points out, there is a major disconnect between academic scholarship and those who make decisions in Washington, London, and other capitals around the world.

Following this introduction, Len Scott and Timothy Gibbs look at methods that have been used to study intelligence in the United Kingdom; Stuart Farson and Reg Whitaker in Canada; and Michael Warner in the United States. The volume then turns to a more specific inquiry into the central question of how intelligence is interpreted by professionals—the issue of analysis—explored by John Hollister Hedley. An overview of the sometimes turbulent relationship between intelligence officers and the policy makers they serve is explored by James J. Wirtz; and British scholar Peter Gill recalls the failures associated with the 9/11 attacks and the poor judgments about Iraqi WMDs, in hopes of extracting lessons from these intelligence disasters. In the next chapter, the youngest scholar represented in this collection, Harold M. Greenberg, takes us back in time with a remembrance of the legendary CIA officer and Yale history professor Sherman Kent, often known as the dean of CIA analysts. Kristin Lord rounds out the first volume with a look forward into future prospects for a more transparent world—the ultimate goal of intelligence.

As with each of the books, Volume 1 has a set of appendixes designed to supplement the original chapters with supportive materials from government documents and other sources. Appendix A contains the relevant intelligence excerpts from the National Security Act of 1947—the founding charter for the modern American intelligence establishment. Appendix B provides a history of U.S. intelligence since 1947, prepared for the Aspin-Brown Commission in 1995–96 by staff member Phyllis Provost McNeil. These two documents present a contextual backdrop for the Volume 1 chapters. Appendix C provides "wiring diagrams" of the intelligence community, that is, organizational blueprints for the sixteen agencies and related entities. One chart displays the community as it is today, and another displays how it looked in 1985. As the contrast between the two illustrates, the events of September 11, 2001, have led to a larger and more complex intelligence apparatus in the United States. Appendix D shows a photograph of the CIA Headquarters Building, as an example of what one of the secret agencies actually looks like from an aerial perspective. The white dome in the foreground is an assembly hall seating around 600 people and to its left is the main entrance to the original CIA headquarters, built during the Eisenhower years. Behind this older wing is the new green-glass structure erected during the Reagan administration, often known as the Casey addition because William J. Casey was the Director of Central Intelligence (DCI) at the time of its construction during the 1980s.

Appendix E lists the top leadership in the America's intelligence community: the DCIs from 1947–2005 and today's DNI. Included here as well are the leaders in Congress who have been responsible for intelligence accountability in the past, along with the current members of the two congressional Intelligence

Committees: the Senate Select Committee on Intelligence (SSCI, or "sissy" in the unflattering and sometimes true homophone of Capitol Hill vernacular) and the House Permanent Select Committee on Intelligence (HPSCI or "hipsee"). Appendix F presents a 1955 statement from historian and CIA analyst Sherman Kent about the need for a more robust intelligence literature. He would probably be amazed by how much is being written on this subject now. Appendix G offers an overview on the purpose and challenges of intelligence, drawn from the introductory chapters of the Aspin-Brown Commission Report. Finally, Appendix H provides an opening glimpse into the subject of counterintelligence, a world of counterspies and betrayal taken up more fully in Volume 4.

With the second volume, titled *The Intelligence Cycle: The Flow of Secret Information From Overseas to the Highest Councils of Government*, the focus shifts from a broad overview of intelligence to a more detailed examination of its core mission: the collection, analysis, and dissemination of information from around the world. The National Security Act of 1947, which created America's modern intelligence establishment, made it clear that the collection, analysis, and dissemination of information would be the primary duty of the intelligence agencies. As Allen Dulles—the most famous DCI (America's top intelligence official, until this title changed to director of National Intelligence or DNI in 2005)—put it, the intelligence agencies were expected "to weigh facts, and to draw conclusions from those facts, without having either the facts or the conclusions warped by the inevitable and even proper prejudices of the men whose duty it is to determine policy."[2] The collection and interpretation of information, through espionage and from the public record, would be the primary responsibility of America's secret agencies.

At the heart of this mission lies the so-called intelligence cycle. Professional intelligence officers define the cycle as "the process by which information is acquired, converted into intelligence, and made available to policymakers."[3] The cycle has five phases: planning and direction, collection, processing, production and analysis, and dissemination (see Appendix A in Volume 2 for a depiction). As former CIA officer Arthur S. Hulnick notes, however, in the opening chapter, the idea of a "cycle" fails to capture the complexity of how intelligence is collected, assessed, and distributed by intelligence officers.

The next five chapters in Volume 2 take us into the world of the "ints," that is, the specialized "intelligences" (methods) used by intelligence officers to collect information. Patrick Radden Keefe and Matthew M. Aid probe the method of signals intelligence or SIGINT, a generic term used to describe the interception and analysis of communications intelligence and other electronic emissions, from wiretapping telephones to studying the particles emitted by missiles in test flights. Both authors are sensitive to the possible abuse of these techniques, which can be and have been used to spy on Americans without a proper judicial warrant. Jeffrey T. Richelson explores the IMINT domain, that is, imagery intelligence or, in simple terms, photographs taken by surveillance satellites and reconnaissance airplanes (piloted and unpiloted). Telephone conversations can be revealing, but

in the old saying, a picture can be worth a thousand words. (Appendix B provides photographic examples of these spy platforms, and Appendix C offers illustrations of the IMINT data they can collect.)

Important, too, is information that can be acquired by human agents ("assets") guided by case officers inside the CIA or the Defense Department, the topic of human intelligence or HUMINT, examined by Frederick P. Hitz. Not all the information needed by policy makers is acquired through SIGINT, IMINT, or HUMINT; indeed, the overwhelming majority—upward of 95 percent—is already in the public domain. This open-source intelligence (OSINT) must be sorted through, organized, and integrated with the secretly gained information. Robert David Steele's chapter looks at OSINT and its ties to the other ints.

In the next chapter, Daniel S. Gressang IV dissects some of the technological challenges faced by intelligence agencies in sorting through the avalanche of data that pours into their headquarters from various intelligence collectors around the world. Here is the Herculean task of sorting out the wheat from the chaff (or the signal from the noise, in another widely used metaphor) in the search for information that may warn the nation of impending peril. Here is the vital task of providing "indicators and warnings" (I&W) to a nation's leaders.

One of the most difficult relationships in the complex process of collection, analysis, and dissemination of information comes at the intersection between intelligence professionals and policy makers—groups of individuals that often have very different training, aspirations, and cultures. Jack Davis sheds light on this often turbulent relationship in the United States, and Michael Herman tackles the same topic in the United Kingdom. Minh A. Luong offers a case study on economic intelligence that underscores some of the difficulties encountered as information travels from the collectors and analysts (the "producers" of intelligence) to the policy makers (the "consumers"). Finally, Max M. Holland takes a look at how intelligence agencies examine their own mistakes ("postmortems") and attempt to make corrections—and how political consideration enter into the process.

By way of supporting documentation, in addition to the appendixes already mentioned, Appendix D outlines the general types of reports prepared by the producers of intelligence, along with a listing of specific examples. Appendixes E and F provide samples of key intelligence products: National Intelligence Estimates (NIEs)—the most important long-range and in-depth forecasting carried out by the U.S. secret agencies ("research intelligence," in contrast to shorter intelligence reports that tend to focus on near-term events, or "current intelligence"); Special National Intelligence Estimates (SNIEs), which concentrate on a narrow, high-priority information requirement (say, the capabilities of the Chinese military); and the *President's Daily Brief* (PDB), the most exclusive current intelligence report prepared by the intelligence agencies for the consumption of the president and a few other high-ranking officials.

In light of the fact that every study of the 9/11 and Iraqi WMD intelligence failures find fault, in part, with America's capacity for human intelligence—

especially in the Middle East and Southwest Asia—Appendix G presents one of the most searing critiques of this int. The critique, by the House Permanent Select Committee on Intelligence, has become all the more significant because the panel's chairman, Representative Porter Goss (R-FL), soon after the completion of the report rose to the position of the DCI. Last, Appendix H provides an excerpt from a key report on the Iraqi WMD mistakes, prepared by the "Roberts Committee": the Senate Select Committee on Intelligence, led by Pat Roberts (R-KS).

The third volume, titled *Covert Action: Behind the Veils of Secret Foreign Policy*, enters an especially controversial compartment of intelligence: the means by which the United States attempts to not just gather and analyze information about the world—hard enough—but to manipulate global events through secret activities in the advancement of America's best interests. An ambiguous passage of the National Security Act of 1947 charged the National Security Council (NSC), the boss over the sixteen U.S. secret agencies, to "perform such other functions and duties related to intelligence [over and beyond collection-and-analysis] affecting the national security as the National Security Council may from time to time direct."[4] The phrase "other functions and duties" left the door open for launching the CIA (and more recently the Pentagon) on a wide range of covert actions around the world.

Covert action (CA), sometimes referred to as the "quiet option," is based on the supposition that this secret approach to foreign affairs is likely to be less noisy and obtrusive than sending in the Marines. Sometimes professional practitioners also refer to covert action as the "third option," between diplomacy and open warfare. As former Secretary of State and National Security Adviser Henry Kissinger once put it: "We need an intelligence community that, in certain complicated situations, can defend the American national interest in the gray areas where military operations are not suitable and diplomacy cannot operation."[5] Still others prefer the euphemism "special activities" to describe covert action. Whatever the variation in terminology, the goal of covert action remains constant: to influence events overseas secretly and in support of American foreign policy.

Covert action operations are often grouped according to four broad categories: propaganda, political, economic, and paramilitary (PM) activities. An example of a propaganda operation was the CIA's use of Radio Free Europe during the Cold War to transmit anti-communist themes into nations behind the Iron Curtain. A political CA during the Cold War was the CIA's clandestine funneling of funds to the anti-communist Christian Democratic Party in Italy. An economic example: the CIA attempted to destroy electric power stations in Nicaragua during the 1980s, as a means of undermining the Marxist-oriented S*andinista* regime. PM operations can including everything from assassination plots against foreign heads of state to arming and guiding pro-American insurgent armies in one country or another. Little wonder this has been a controversial subject.

Gregory F. Treverton introduces the reader to covert action in the first chapter of Volume 3. He is followed by Kevin A. O'Brien and Ephraim Kahana, who discuss the use of covert action by other nations. The next four chapters illuminate certain aspects of CA, with James M. Scott and Jerel A. Rosati providing an overview of CA tradecraft (that is, the tools used to implement such operations); Michael A. Turner evaluating the merits of CIA covert propaganda operations; William J. Daugherty looking at political and economic examples of covert action; Jennifer D. Kibbe exploring the entry of the Defense Department into this domain; and former diplomat John D. Stempel contrasting the uses of covert action to diplomatic initiatives. Winding up the volume is Judge James E. Baker's legal analysis of covert action.

Supporting documents include excerpts from the Church Committee Report on the evolution of covert action as carried out by the CIA (Appendix A). The supervision of covert action went from an informal to a highly formal process, as a result of a law known as the Hughes-Ryan Act, passed on December 31, 1974. The language of this statute is presented in Appendix B, and the covert action procedures that resulted from the law are outlined in Appendix C. At the center of the covert action decision process since the Hughes-Ryan Act is the *finding*, a term of art that stems from the passage in the law that requires the president to "find" that a particular covert action proposal is important and has the president's approval. Appendix D contains two findings from the Iran-*contra* era in the mid-1980s. Covert actions must have an organizational apparatus to carry them out, and Appendix E displays what that apparatus looked like during the Cold War (and in basic form remains the organizational chart today, with a few name changes in the boxes).

One of the most controversial forms of covert action has been the assassination of foreign leaders. Appendix F presents a case study from the Church Committee on the CIA assassination plot hatched against the leader of the Republic of Congo, Patrice Lumumba, in 1960. The Committee's exposé of this and other plots led President Gerald R. Ford to sign an executive order prohibiting assassination as an instrument of American foreign policy (see Appendix G). The executive order has been waived in times of authorized warfare against other nations, however, leading to failed attempts to assassinate Saddam Hussein in the first and second Persian Gulf Wars (he was eventually captured alive in 2004, hidden away in a hole near his hometown in Iraq) and Al Qaeda leader Osama bin Laden during the Clinton administration. Considerable ambiguity exists regarding the current status of the executive order and under what conditions it might be waived by administrations. Finally, Appendix H—drawing on a presidential commission study and congressional hearings—examines covert action at its lowest state: the Iran-*contra* affair of the 1980s, when this approach to foreign policy subverted the U.S. Constitution and several laws (including the Hughes-Ryan Act).

A third intelligence mission, after collection-and-analysis and covert action, is counterintelligence (CI) and its associated activity, counterterrorism (CT).

Here is the concentration in Volume 4, titled *Counterintelligence and Counterterrorism: Defending the Nation Against Hostile Forces*. Like covert action, CI went without specific mention in the National Security Act of 1947. By the early 1950s, however, it had similarly achieved a status of considerable importance as an intelligence mission. CI specialists soon waged nothing less than a secret war against antagonistic intelligence services (especially the Soviet KGB); and, after the Cold War, CT specialists would focus on efforts to block terrorists who targeted the United States and its allies. Explaining why the mission of counterintelligence/counterterrorism evolved, a CI expert has pointed out that "in the absence of an effective U.S. counterintelligence program, [adversaries of democracy] function in what is largely a benign environment."[6]

The practice of counterintelligence consists of two matching halves: security and counterespionage. Security is the passive or defensive side of CI, involving such devices as background investigations, fences, sentries, alarms, badges, watchdogs, and polygraphs (lie detection machines). Counterespionage (CE) is the offensive or aggressive side of CI. The most effective CE operation is the infiltration of an American agent or "mole" into the enemy camp, whether a hostile intelligence service or a terrorist cell—a ploy called a penetration. Thus, the practice of security is, according to one of America's top counterintelligence experts, "All that concerns perimeter defense, badges, knowing everything you have to know about your own people," whereas the CE side "involves knowing all about intelligence services—hostile intelligence services: their people, their installations, their methods, and their operations."[7]

Stan A. Taylor and Nigel West clarify these issues in the first two chapters of this volume, then in the next two chapters Katherine A. S. Sibley and Athan Theoharis examine the challenges of keeping the United States spy-free. Rhodri Jeffreys-Jones looks at the efforts in Europe to create a counterintelligence capability similar to that practiced by America's Federal Bureau of Investigation (FBI). Glenn Hastedt takes the reader into the counterterrorism thicket in Washington, DC, explaining how politics influences CI and CT operations. Richard L. Russell and Jennifer Sims discuss the ups and downs of trying to establish an effective counterterrorism response in the United States, complicated by the fragmentation of authority and widely differing cultures among the sixteen U.S. intelligence agencies. Finally, Katharina von Knop looks at the rising role of women in terrorist organizations.

The back-of-the-book documents in Volume 4 begin with a look at the Church Committee findings regarding counterintelligence in 1975 (Appendix A), followed by the notorious Huston Plan—a master counterintelligence spy plan drafted by White House aide Tom Charles Huston in 1970, in response to a nation at unrest over the war in Vietnam (Appendix B). The Huston Plan is a classic illustration of overreaction in a time of domestic strife. In Appendix C, the Senate Select Committee on Intelligence summarizes its findings about the Aldrich H. Ames counterintelligence disaster. Next the appendixes include a series of U.S. commission conclusions about how to improve intelligence in the struggle

against global terrorism, whether locating and penetrating their cells in advance of a terrorist attack or thwarting the ability of terrorists to acquire WMDs. The panel reports include: the Hart-Rudman Commission of 2001 (Appendix D); the 9/11 or Kean Commission of 2004 (Appendix E); and the Silberman-Robb Commission of 2005 (Appendix F). For purposes of comparison, the final appendix (G) examines the conclusions reached by a British commission that also probed the Iraqi WMD failure: the Butler Report of 2004.

The fifth volume in the series, titled *Intelligence and Accountability: Safeguards Against the Abuse of Secret Power*, stems from a concern that secret power might be misused by those in high office. This danger was underscored in 1975 when Congress found the U.S. intelligence agencies guilty of spying against law-abiding American citizens, and again in 1987 during the Iran-*contra* affair when some elements of the intelligence community violated the public trust by ignoring intelligence laws. The United States has been one of the few nations in the world to conduct an ongoing experiment in bringing democratic accountability to secret government activities. Democracy and spying don't mix well. Secrecy runs counter to democratic openness, while at the same time openness possesses a threat to the success of espionage operations. Democracies need intelligence agencies to acquire information that may protect them, but thoughtful citizens worry about having secret agencies in an open society.

Until 1975, the nation's remedy for the tension between intelligence gathering and democracy was to trust the intelligence agencies and hope for the best. Elected officials treated the secret services as exceptional organizations, immune from the checks and balances envisioned by the framers of the Constitution. Lawmakers were satisfied with this arrangement, because if an operation went awry they could duck responsibility. When James R. Schlesinger, DCI in 1973, attempted to inform John Stennis (D-MS), a key member of the Senate Armed Services Committee, about an approaching operation, the Senator stopped him short: "No, no, my boy, don't tell me. Just go ahead and do it, but I don't want to know."[8]

This attitude on Capitol Hill—overlook rather than oversight—underwent a dramatic turnabout in December 1974, however, when the *New York Times* reported on allegations of CIA spying at home and questionable covert actions in Chile. Congress might have waved aside the revelations about Chile as just another Cold War necessity in the struggle against regimes leaning toward Moscow, but spying on American citizens—voters—was another matter altogether. In January 1975, President Ford created the Commission on CIA Activities Within the United States (the Rockefeller Commission, led by his vice president, Nelson Rockefeller). Later that month the Senate established a select committee to investigate intelligence activities. The committee was headed by Frank Church, D-ID, and became known as the Church Committee (the editor served as Church's assistant). A counterpart House committee, led by Representative Otis Pike (D-NY), began investigations the following month.

These various panels, especially the Church Committee, found many more improprieties than they had expected. Not only had the CIA engaged in domestic

spying in violation of its charter, so had the FBI and several military intelligence units. Furthermore, the FBI had carried out secret operations, known collectively as COINTELPRO, against thousands of civil rights activists, members of the Ku Klux Klan, and Vietnam War dissenters. The objective was to make their lives miserable by disrupting their marriages and employment. The Bureau even attempted to blackmail Dr. Martin Luther King Jr. into committing suicide. Church Committee investigators also discovered CIA assassination plots against foreign leaders and efforts to topple President Salvador Allende of Chile, even though he had been democratically elected.

These revelations convinced lawmakers that the time had come to bring accountability into the dark recesses of government. Congress established intelligence oversight committees in both chambers—the Senate in 1976 and the House a year later—and, by 1980, required by law timely reports on all secret intelligence operations. The new Committees pored over intelligence budgets, held regular hearings (mostly in closed session to protect spy sources and methods) and seriously examined the performance of America's intelligence agencies. No other nation has ever so thoroughly applied democratic principles to its secret services, although a number are now beginning to follow the leadership of the United States toward greater intelligence supervision.[9]

Since 1975, this effort has evolved in fits and starts. Sometimes lawmakers have insisted on close accountability, as when they enacted the Intelligence Oversight Act of 1980 with its stringent reporting requirements for covert operations, or when a series of laws in the 1980s sought to end covert actions in Nicaragua. At other times, members of Congress have loosened the reins—for example, repealing in 1985 a prohibition against covert action in Angola. On still other occasions, Congress has concentrated on helping the intelligence agencies improve their security and performance, as with a law in 1982 that prohibited exposing the names of undercover officers. The Iran-*contra* scandal of 1987 was a major setback to this new oversight, as the Reagan administration bypassed most of these rules and statutes in its conduct of a covert war in Nicaragua against the will of Congress. The scandal was an alert to lawmakers. The Intelligence Oversight Act of 1991 further tightened intelligence supervision by clarifying reporting requirements. Lawmakers also set up an Office of Inspector General in the CIA, confirmed by and accountable to Congress.

The pulling and tugging has continued, most recently over whether President George W. Bush violated the Foreign Intelligence Surveillance Act (FISA) of 1978 by conducting warrantless wiretaps as part of the war against terrorism in the aftermath of the 9/11 attacks. The FISA required warrants, but the White House claimed (when the secret operation leaked to the media) the law had become to cumbersome and, besides, the president had inherit authority to conduct the war against terrorism as he saw fit. This debate aside for the moment (several authors address the issue in these volumes), one thing is certain: the intelligence agencies in the United States are now very much a part of the nation's system of checks and balances. Americans want and deserve both civil liberties and a secure defense

against threats; so the search continues for an appropriate balance between liberty and security, democracy and effectiveness—precisely the topic of Volume 5.

The set of chapters on intelligence accountability are introduced with a chapter by David M. Barrett, the foremost authority on the history of accountability in the early years of modern U.S. intelligence (1947 to 1963). The chief counsel of the Church Committee, Frederick A. O. Schwarz Jr., then reflects back on the effects of that watershed inquiry. Next, the editor offers a previously unpublished interview with DCI William E. Colby, who stood at the helm of the intelligence community as it weathered the storm of the investigations into domestic spying during 1975. Mark Phythian presents a chapter on the British experience with intelligence accountability; and, comparing British and American oversight, Lawrence J. Lamanna contrasts the responses on both sides of the Atlantic to the faulty Iraqi WMD assessments in 2002.

The next chapter, written by Cynthia M. Nolan, looks at contemporary issues of intelligence oversight in the United States. Hans Born and Ian Leigh follow with a comparative dimension by contrasting intelligence accountability practices in a variety other nations. Finally, A. Denis Clift and Harry Howe Ransom, who have witnessed the unfolding of intelligence accountability over the past four decades, offer their appraisals of where the experiment stands today.

The first supporting document in this volume is a succinct legislative history of intelligence accountability from 1947 to 1993, prepared by the Senate Select Committee on Intelligence (Appendix A). Then come a series of important oversight laws, beginning with FISA in 1978. With this law, members of Congress sought to rein in the open-ended authority of the executive branch to wiretap and otherwise spy on individuals considered risks to the national security—a privilege abused by a number of administrations from the 1930s forward. Henceforth, FISA required a warrant from a special court (the FISA Court, whose members are appointed by the Chief Justice of the Supreme Court) before such intrusive measures could be carried out. This law, a hot topic in 2005–6 when critics charged the second Bush administration with violation of the warrant requirement, can be found in Appendix B.

The Intelligence Oversight Act of 1980 is presented in Appendix C. This is a brief but nonetheless far-reaching law, enacted by Congress as an attempt to become an equal partner with the executive branch when it came to intelligence. The 1991 Intelligence Oversight Act (Appendix D) emerged after the Iran-*contra* scandal and provided a tightening and clarification of the language in its 1980 precursor, especially with respect to the approval and reporting rules for covert action. The political tug-of-war over the drafting of this currently prevailing oversight statute was intense, leading to the first and only presidential veto of an intelligence act. President George H. W. Bush found the proposal's insistence on prior reporting of covert action objectionable in times of emergency. Lawmakers entered into a compromise with the chief executive, settling on a two-day reporting delay in emergencies. The bill passed Congress again, this time without a presidential veto.

In 1995, the House Permanent Select Committee on Intelligence launched an inquiry into a wide assortment of intelligence issues, stimulated initially by counterintelligence concerns (Aldrich Ames's treasonous activities at the CIA had recently been discovered) but turning into an opportunity for a broad review of new challenges that faced the secret agencies now that the Cold War had ended. In Appendix E, an excerpt from the Committee's final report examines the state of intelligence accountability in the mid-1990s. The next document, in Appendix F, carries the examination into the twenty-first century, with the appraisal of the 9/11 Commission on the same subject. The commissioners were unimpressed, referring to intelligence accountability as "dysfunctional."

At the center of any efforts to maintain accountability for the secret agencies lies the question of funding—the mighty power of the pursue, held in the hands of lawmakers. Appendix G draws on the findings of the Aspin-Brown Commission to provide official documentation about how the United States spends money for spying. Finally, in Appendix H, DCI Robert M. Gates (1991–93) offers observations about oversight from the perspective of the intelligence community management team, located at that time on the Seventh Floor of the CIA.

Here, then, is what the reader will find in these five volumes. The editor and the contributors hope the chapters and documents will help educate the public about the importance of intelligence agencies, as well as stimulate scholars around the world to further the blossoming of this vital field of study. I am pleased to acknowledge my gratitude to Praeger's Heather Staines, senior project editor, and Anne Rehill, development editor, each a pleasure to work with and most helpful in their guidance; Julie Maynard at the University of Georgia for her administrative assistance; Lawrence J. Lamanna, my graduate research assistant, for his good counsel and logistical help; Leena S. Johnson for her indispensable encouragement and support; and the contributors to these volumes for their outstanding scholarship and their much appreciated cooperation in keeping the publishing train running on time.

These volumes are enthusiastically dedicated to Harry Howe Ransom, who has done so much in the United States to lead the way toward a serious discipline of intelligence studies.

Loch K. Johnson

NOTES

1. Some of the authors have had multiple careers, so in categorizing them I have counted the place where they have spent most of their professional lives.

2. Quoted by Senator Frank Church (D-ID), in *Congressional Record* (January 27, 1976), p. 1165.

3. *Fact Book on Intelligence* (Washington DC: CIA Office of Public Affairs, April 1983), p. 17.

4. National Security Act of 1947, signed on July 26, 1947 (P.L. 97-222; 50 U.S.C. 403, Sec. 102).

5. Comment, "Evening News," NBC (January 13, 1978).

6. Editor's interview with a FBI counterintelligence specialist, Washington, DC (May 16, 1975).

7. Editor's interview with Raymond Rocca, CIA/CI specialist, Washington, DC (November 23, 1975).

8. Editor's interview with James R. Schlesinger, Washington, DC (June 16, 1994).

DEFINITIONS AND THEORIES OF COUNTERINTELLIGENCE

STAN A. TAYLOR

Counterintelligence is to intelligence as epistemology is to philosophy. Both go back to the fundamental question of how we know things, both challenge what we are inclined to take most for granted and both offer heavy advantage in debate to those who are skeptical of appearances.

—Thomas Powers[1]

INTRODUCTION

THEORIES ARE DEVELOPED AND USED IN SCIENCE to present conceptual frameworks that allow one to understand and explain phenomena. Theories also generate questions that are useful in research. These frameworks normally consist of assumptions (often called hypotheses) and statements, usually described as necessary and sufficient, for both explanation and prediction. However, in social sciences, the explanatory function is somewhat more important than the predictive function of theory because all of the controls necessary for a predictive theory are not available. Theories in the social sciences can be very useful in *explaining* phenomena but only moderately useful as *predictive* tools in what are called post hoc predictions that are much the same as explanations of historical events. This chapter presents a counterintelligence (CI) theory that explains (to some extent) the existence of counterintelligence practices in any state. The theory is drawn from broader intelligence theories of which counterintelligence is a part.

This attempt to theorize about counterintelligence begins with a brief discussion of intelligence theories and then derives counterintelligence theories from them.

DEFINITIONS AND THEORIES OF INTELLIGENCE

Intelligence scholars argue about definitions of intelligence, but the primary difference between these efforts is merely the expansiveness of the definitions. In its most expansive application, *intelligence* refers to:

- The process that begins when national decision makers identify what information is needed to help them make better informed decisions regarding any entity with which they must deal.
- The prioritization, collection, analysis, production, and use of that information.
- The organizations and groups that actually collect, analyze, and produce the information.
- The other activities of various groups who participate in the intelligence cycle.
- The information and insights that flow from this process.

As defined, intelligence differs from the general use of information by human beings in everyday social intercourse in, at a minimum, six ways:

- The fate of ideologies, nations, economies, and people may depend on how effectively the information or intelligence is utilized.
- The information desired is usually (although not always) information that other individuals, groups, and nations do not want revealed.
- The information desired is about individuals, groups, or nations who often (but not always) are hostile or potentially hostile toward the collecting nation.
- The collection of this information is usually, although not always, done clandestinely.
- Individual, group, or national rights may be violated in the collection of this information.
- The broader intelligence process may generate secret special activities meant to influence the foreign or domestic policies of other states without revealing the source of the influence.

The Latin origins of the word *intelligence* are revealing. The prefix *inter* means between or among. Thus, the term *international relations* refers to the relations between or among nations. The remainder of the word *intelligence* comes from the Latin word *leger*—the gathering of fruit or vegetables. Over time, these two terms were combined into one word referring to the knowledge and skills necessary to distinguish between good and bad fruit and vegetables. Gradually, the meaning of *intelligence* came to connote the skills and aptitudes needed to make wise and productive choices about any aspect of one's life. It is

used in this chapter to refer to the knowledge and information necessary to make informed decisions about statecraft.

Although some scholars stress the difference between intelligence as used by psychologists and intelligence as used by national strategists, in reality they come from the same origins. The word *intelligence* in "intelligence quotient" (IQ) really refers to the human ability to process environmental information into usable and productive knowledge. That is not substantially different from the ability to collect and process information about the interstate environment as a necessary prelude to informed statecraft.

National Security and Intelligence

At the outset, it is useful to understand the relationship between security and intelligence. Two early pioneers in the analysis of state power, Harold and Margaret Sprout of Princeton University, argued that there were five functions or variables by which the power of any state could be analyzed or measured.[2]

1. The information-providing function. How well do states define a need for information and then collect, analyze, and utilize that information?
2. The decision-making function. Can a nation coordinate all of its resources into an effective strategy?
3. The means-providing function. How well can states provide the elements of power needed to achieve strategic goals?
4. The means-utilizing functions. How well can a government utilize or effectively organize all of the means it may possess?
5. The resistance-to-demands function. How resilient is a state to the demands and challenges of other states?

Intelligence operations are critical in the first function, but also play a significant role in the fifth. Demands are more easily resisted when the intentions and capabilities of a threatening state are known. In sum, intelligence is a significant part of state power, and power—the ability to influence other states in a predictable way—is a crucial and critical key to national security.

Theories of Intelligence

Humans use theories to explain observed reality. They are necessary for the development of any discipline. However, only a few scholars have attempted to develop theories of intelligence; among them are David Kahn and Loch K. Johnson.[3] Kahn believes his theory meets the requirements of all theories—it is both explanatory and predictive. He begins with the assumption that all biological organisms, from amoebas to nation-states, need to sense their environment sufficiently to protect their existence. This leads him to his notion that intelligence, by its very nature, is for protection or for defense. That is, it is "essential to survival,

but not to dominance."[4] He discusses both the antiquity and ubiquity of intelligence but notes the changing relative importance between physical intelligence (for example, information about physical objects—tanks, troops, etc.), whose importance is in relative decline, and verbal intelligence (for example, captured communications that may reveal enemy plans), which is increasing in importance. Kahn believes intelligence is increasing in importance, but he acknowledges that it will never be perfect. He also believes that the greatest contemporary and future problem intelligence faces is to be accepted by generals and heads of state whose minds are often set before they view intelligence information.

Johnson's approach is less of a general theory and more specific to strategic intelligence—that is, intelligence needed to support foreign policy and national strategy. He modestly calls his effort a "preface" to a theory and addresses the question of how much of a nation's scarce resources should be devoted to intelligence. He argues that such variables as a nation's global involvement, foreign policy goals, perceived threats, number of intelligence targets, and its ability to consume intelligence information will need to be studied more closely to construct an explanatory and predictive theory of intelligence. Johnson's greatest contribution is his insistence that intelligence must be viewed in the overall context of a nation's global strategy and threats.

A third and more general theory of intelligence, one into which both Kahn's and Johnson's theories would fit quite comfortably, can be drawn from cybernetics, a discipline developed in 1947 by mathematician Norbert Weiner and others.[5] The word *cybernetics* comes from a Greek word meaning helmsman or governor—one who steers a ship. A helmsman must use skill, intuition, and constant feedback from the environment to achieve accurate steerage of the vessel.

Cybernetics is a complex science drawn from biology, neural modeling, psychology, mathematics, electrical engineering, as well as other disciplines. It is the science of feedback—the study of how information can maintain or alter any biological, social, mechanical, or artificial system. Cybernetics has contributed to the development of general systems theory, artificial intelligence, and robotics, as well as significant developments in psychology and learning theories.

It is a perfect paradigm or theory for the role of intelligence applied to statecraft. Decision makers are the helmsmen, the governors, who must use skill, intuition, and a constant flow of information or intelligence to optimize efficiency (defined as the most security at the least cost) for the state. Cybernetics is the iterative flow of information that allows thermostats to maintain temperature in a building, computers to manufacture goods, guided missiles to reach their targets, and human beings to function in an often hostile world. It is about goal-oriented behavior at all levels of living systems. It allows these systems to reach defined goals based on information flows. It is a unifying theory that runs through all levels of human interaction. Though not frequently acknowledged, it played a role in the development of constructivism, particularly social constructivism—the notion that social institutions adapt through the constant processing of stimuli (information) from the environment.

Intelligence, defined as process, product, or people, collects and analyzes stimuli from the international environment. This information is used by decision makers as they act as helmsmen in steering the ship of state through the hazardous waters of international politics.

It should be obvious that all theories of intelligence or counterintelligence are overlaid on the traditional realist approach to international affairs. That is, it is the anarchic nature of global affairs that forces states to look out for their own interests, knowing that no others will look out for those interests for them. As long as states are sovereign, and as long as there is no ultimate authority among states, intelligence will be collected by all states, and counterintelligence efforts will be taken to protect state secrets.

COUNTERINTELLIGENCE

Counterintelligence "refers to the efforts taken to protect one's own intelligence operations from penetration and disruption by hostile nations" or groups and to protect state secrets.[6] Its primary functions are to:

- Protect classified information from unauthorized disclosure.
- Collect information about foreign intelligence services to prevent them from obtaining classified information from your nation.
- Collect information about hostile or potentially hostile group or state sponsored intelligence services to prevent them from disrupting or compromising your own operations through penetration, disinformation, or other means.
- Identify and recruit foreign intelligence agents to feed false and misleading information through them; that is, to "double" them and use them for your own purposes.

Counterintelligence Techniques

Several techniques, practices, and procedures are necessary to perform the primary functions.[7]

PRE-EMPLOYMENT PERSONNEL SECURITY

All intelligence community (IC) employees, as well as all people who handle classified information, are subject to background checks. These background checks begin with biographical information but include interviews with people who have known the applicants. For many IC agencies, this background check may also involve a polygraph or lie detector test. Although some scholars doubt the validity of the polygraph, few doubt that the fear of "being put on the box" has a deterring effect. While the Central Intelligence Agency (CIA), the National

Reconnaissance Office (NRO), the Defense Intelligence Agency (DIA), and the National Security Agency (NSA) have used the polygraph for many years, the Federal Bureau of Investigation (FBI) only began to polygraph employees after the disastrous Robert Hanssen case. Hanssen had spied for both the Soviet Union and Russia for about twenty-two years and would most likely have continued had his treason not been revealed by another spy who knew of his activities.

IN-SERVICE PERSONNEL SECURITY

Each agency also monitors its own employees during their period of employment. Many require periodic polygraph tests during which the employees are asked questions about their lifestyles as well as about foreign contacts and classified material they have handled. Other aspects of employee lifestyles—such as dramatic changes in financial worth, changes in spending habits, or aberrant sexual practices—are also observed independently and may provide questions for future polygraph sessions as well as act as warning signs to counterintelligence officers.

FACILITY SECURITY

Successful counterintelligence is impossible if facilities where secrets are produced and stored are not secure. Every agency in the IC as well as government offices, institutes, businesses, and contractors that handle classified information are responsible for facility security. Often this will also include computer security. Facility security varies widely from location to location, and some of America's worst security breaches have occurred at defense contractor facilities. It is the responsibility of IC counterintelligence officers to monitor security at all of these sites and to takes actions when that security is lax.

COMMUNICATIONS SECURITY

Overall communications security in the United States is the responsibility of the NSA, which provides, maintains, and verifies secure communications equipment at most IC agencies and other offices that handle classified information. However, each agency also carries out some communications security functions within its own facilities.

CLASSIFICATION AND COMPARTMENTATION

Information that might reveal sensitive national security secrets is classified by the government. Information may be classified both vertically and horizontally. There are three horizontal levels of classified information—confidential (used with decreasing frequency), secret, and top secret. Top secret information may be divided into vertical divisions called codeword compartments. The

information in each compartment usually comes from a unique and specific intelligence collection source. That is, top secret/codeword material derived from a particular human source will be classified top secret and given a unique codeword. Information derived from intelligence intercepts of encrypted Soviet government communications throughout the 1950s, for example, was classified as top secret/Venona. A person's access to compartmented information is given on a need-to-know basis. That is, is knowledge of the particular information necessary for the performance of the person's official duties?

Issues of classification and compartmentation are continual thorns in the side of democratic governments. Virtually no one believes they protect classified information as they should, but virtually everyone agrees that governments have a legitimate right to keep sensitive national security information secret.

SIGNALS INTELLIGENCE

All intercepted communications are searched for clues that might reveal foreign agents operating in the United States or that might reveal U.S. persons working under foreign control. For example, the Venona project, already mentioned, was begun in 1941 by Army security and taken over by the NSA when it was created in 1952. The names of many well-known American and British traitors—Klaus Fuchs, Kim Philby, Alger Hiss, Julius and Ethel Rosenberg, just to name a few—were revealed through Venona decrypted information.

PROSECUTING TRAITORS

Antiespionage laws are not effective unless penalties exist for revealing or stealing secret information. Foreign agents in the United States who are caught stealing secrets or receiving classified information will be jailed if they do not have official cover, or they will be declared persona non grata and deported if they are in the country as a representative of their governments under official cover. U.S. citizens or U.S. persons who are caught revealing classified information are subject to federal prosecution.

Catching foreign agents or their American assets is a complicated task, primarily under the direction of the FBI. The Bureau, on the one hand, has a long history of detecting law breakers, gathering solid evidence against them, and then relying on the Department of Justice for prosecution. The CIA, on the other hand, prefers to detect traitors, monitor their activities, and use them as leads to other traitors and spies of whom they might not be aware. Rather than prosecuting them, they might wish to double them or supply them with misleading information. The clash between these two cultures has created a strained relationship between these two agencies marked by an absence of collaboration and cooperation of legendary proportions. And as has often been said, the success of counterintelligence in America rises or falls with the level of cooperation between the FBI and the CIA.

The counterintelligence techniques and practices listed here constitute an arsenal of no small significance. Nevertheless, the record of counterintelligence within the United States is not particularly distinguished. As William Webster, former director of both the FBI and the CIA, stated before U.S. Senate hearings in 2002, "Almost every spy that we have found both in the CIA and the FBI, has been found with the aid of recruited sources of our own in other hostile intelligence agencies."[8] In fact, from William Sebold, the German American recruited by German intelligence in 1939 who voluntarily became a double agent for the FBI, down to the most recent Americans caught in the act of treason, the information revealing them generally has come from defectors or from security files obtained from foreign states.

The testimony of former senior Soviet military spymaster Stanislav Lunev before the U.S. House of Representatives does not add any luster to the record of American counterintelligence. According to Lunev, "Despite the tireless work of the men and women of [US intelligence agencies], I must honestly report to you that obtaining highly sensitive and classified information was not very difficult."[9] In his testimony, Lunev went on to describe that while posing as a Soviet journalist, he attended the official unveiling of the Stealth aircraft, took photographs of highly sensitive parts of the aircraft, and sent them to Soviet military analysts to see what they could learn from them.

Assumptions of Counterintelligence Theory

Counterintelligence arises from the existence of four conditions or assumptions. First, it assumes that a nation has a decision-making system that deals with information that in the hands of hostile groups or nations, could jeopardize national security. Second, it assumes that a nation has one or more intelligence services that collect that information and then try to prevent it from falling into enemy hands. Third, it assumes that foreign intelligence services will attempt to obtain other nations' classified information through normal intelligence procedures (human intelligence and signals intelligence) as well as attempting to identify some who possess classified information and enticing them to reveal it. Fourth, a theory of counterintelligence assumes a very low level of trustworthiness in virtually all people. This last assumption will be discussed at greater length shortly.

These assumptions add up to a theory of counterintelligence that explains the existence of CI activities in the intelligence services in all internationally active nations. The first three assumptions fit nicely into each of the theories of intelligence discussed earlier. Counterintelligence is primarily defensive—it attempts to protect national secrets from other groups or nations in whose hands that information might be harmful. Kahn's theory of intelligence stresses its defensive value, a subsidiary function of which is counterintelligence. Johnson's theory is also useful in understanding counterintelligence. Among other things, it suggests that the extensiveness of a nation's global involvements explains the extensiveness and the costs of intelligence services. And the scope and

extensiveness of a nation's intelligence services also explains both the efforts and the funds necessary to protect the security of the information collected.

The cybernetic theory of intelligence is what is called a "grand theory"—it explains a large variety of human behavior from which more narrow and specific activities can also be explained. As applied to the field of intelligence and counterintelligence, this theory also works very well. Nations require information so that decision makers can steer the ship of state safely through the hazardous waters of international politics. That information or intelligence diminishes in value if it is known to other nations or groups, particularly hostile ones. In fact, counterintelligence is essential for intelligence to be useful. Revealed classified information is more dangerous than the absence of information because it means that the steering of the ship of state may be based on false information, on information describing conditions that no longer exist, or on information deliberately revealed to deceive. Uncertainty about a state's environment may be better than unwarranted certainty, and the illusion of security may be worse than the absence of any intelligence services at all. As Thomas Powers has written,

> An insecure [intelligence] service is not merely useless; it is positively dangerous, because it allows a hostile agency to manipulate the penetrated organization, as the British, for example, manipulated German intelligence during World War II. MI 5 turned German agents in Britain, used them to feed false information to Germany, and thereby thoroughly confused the Germans as to the probable site and nature of the invasion of Europe. The Germans would have done better with no agents in Britain at all. . . . It is better to have no intelligence service at all than to have one which is insecure.[10]

Trust

More must be said about the fourth assumption of counterintelligence—the absence of trust—because it is particularly critical to an understanding of counterintelligence. Were all people fully trustworthy, many CI functions would be unnecessary. Most elements of personnel security and certain aspects of facility security (checking briefcases and packages that leave secure facilities, for example) would be unnecessary, and there would be few or no traitors to prosecute. Communication lines would still need to be made secure, and captured communications of other states would still have to be mined to see if foreign agents had penetrated any agencies or facilities, but it is the absence of trust that makes much of counterintelligence necessary.

This assumption is a human-level application of realism. It is based on that notion that for whatever reasons, humans possess an inherent dark side that causes them to doubt the goodness of others. Human nature is flawed, as Niebuhr and other realists have argued. Thus, they must always take steps to see that they are not hurt by their trust of others. When sixteen-year veteran CIA officer Harold Nicholson attempted to justify selling classified information to the Soviet Union, he explained that because his work had kept him away from his family and

prevented him from being a good father, he thought he needed to look out for his own interests for once and earn some extra money for his family.

Not only is distrust the basis of much counterintelligence, but its very practice magnifies its presence. It is a curious conundrum—an automatic and self-feeding cycle that ultimately degenerates into paranoia and worse. The act of counterintelligence quite literally feeds feelings of suspicion, which in turn create greater distrust. And a culture of distrust spawns disgruntled employees who are ripe for recruitment by foreign intelligence services. In his 1953 play *Camino Real*, Tennessee Williams has the following dialogue:

John: "Why does disappointment make people unkind to each other?"

Marguerite: "Each of us is very much alone."

John: "Only if we distrust each other."

Marguerite: "We have to distrust each other. It is our only defense against betrayal."

As two former CIA employees have written, "The function of the counter-espionage officers is to question and verify every aspect of CIA operations; taking nothing at face value, they tend to see deceit everywhere. In an agency full of extremely mistrustful people, they are the professional paranoids."[11] Counterintelligence officers must distrust their fellow employees, look suspiciously at the good faith of—and even challenge—defectors, and study foreign intelligence entities so thoroughly so they begin to think like foreign intelligence agencies and officers.

James Jesus Angleton, the legendary and controversial director of CIA counterintelligence for over twenty years, described the landscape of counterintelligence as "a wilderness of mirrors," an "ever-fluid landscape where fact and illusion merge."[12] It is not an easy environment in which to work. Rebecca West has noted that "people who work in a self-contained [counterintelligence] unit are apt to develop theories which develop none the better for never being subject to open discussion."[13]

It is widely believed that Angleton's culture of distrust pervaded the CIA for so long that counterintelligence gained a very bad reputation within the agency—a reputation that lingered long after Angleton's forced resignation in 1974. In reaction to this culture of distrust, employees tended to question the need for both counterintelligence functions and officers. They tended to believe that their fellow officers who had been vetted and cleared and were in the service of their country could be trusted. It was a notion somewhat like joining a community service or business club; once a Rotarian, for example, one could be trusted forever.

This anticounterintelligence culture may have contributed to the failure to detect subsequent traitors throughout the entire IC. For example, the treason of Aldrich Ames, a CIA officer who spied for the Soviet Union and then for Russia for nine years, was nurtured partially by this culture. Information he sold resulted in the betrayal and death of nearly all of the CIA's most productive Soviet assets

at the height of the Cold War. Time and time again, a failure to take counterintelligence seriously, in part a reaction against the Angleton years, resulted in ignoring clear signals of Ames's treason.

On his just under $70,000 a year salary, Ames paid cash for a $540,000 home, purchased a $40,000 red Jaguar automobile (which he drove to work), and had money left over for cosmetic dental surgery. Ames once even cited Angleton's legacy as a reason for his decision to spy.[14] Whether this statement is true or merely his attempt to blame someone else for his actions, it is undoubtedly true that counterintelligence was not taken as seriously as it should have been at that time.

Sources of Treason

This trust-distrust paradox was first stated by first-century Roman philosopher and statesman Seneca in his *Letters to Lucilius*: "It is a vice to trust all, and equally a vice to trust none." But whom can you trust? This dilemma has provoked many to study the causes of betrayal and treason. It turns out that although many traitors on both sides of the Iron Curtain, particularly during the early years of the Cold War, were motivated by ideology, money has been the primary motivation of treason since the mid-1970s.[15] But if one examines secondary motives, that is, motives that led to ideological betrayal or selling out for monetary gain, the role of disgruntlement is growing. If one "considers those who, though not completely disgruntled, were not entirely 'gruntled' (to borrow from Oscar Wilde), then disgruntlement becomes a more prevalent motive" for treason.[16]

If the "trust assumption" aspect of counterintelligence theory is correct, then it may well be that a substantial part of the defense against treason in the future may be played by the human resources personnel in each intelligence agency. The ability to keep personnel satisfied with their employment may be one of the better defenses against treason, particularly against treason for financial gain. How to accomplish that is not the purpose of this chapter, however; enlightened and responsive leadership and management, collegial work conditions, the absence of cronyism in salary and advancement decisions, fair rewards for quality service, work equality, and employees who have bought into the mission of the agency for whom they work are certainly beginning points. Perhaps Andrew Roberts captured a glimpse of what was coming when he wrote in 1997, "Tomorrow's traitors are more likely to be driven to betray not from ideological convictions but from whining complaints about poor pension provisions or underfunded performance-related pay."[17]

SUMMARY AND CONCLUSION

This chapter began by defining intelligence, discussing how intelligence relates to national security, and then offered a brief review of three compatible and interrelated theories of intelligence. This was followed by a definition of

counterintelligence, a summary of the primary functions of counterintelligence, and a review of CI techniques. Following that, four assumptions about counterintelligence were presented. These four assumptions provide a basis for a counterintelligence theory. At a general level of activity, this theory explains the existence of the practice of counterintelligence in virtually all states. The level of both intelligence and counterintelligence activities, as Johnson argues, depends on the extensiveness of a state's global activities and obligations.[18]

The absence of trust within societies appears to be the primary assumption in the theory of counterintelligence. Were all people trustworthy, much counterintelligence work would be unnecessary. That being the case, those who guard government secrets need to devote more time and energy into developing and nurturing trustworthiness within their employees. At the same time, a related effort needs to be made to reduce the rather high levels of disgruntlement among the custodians of national secrets.

This is a difficult task when, of necessity, the functions of counterintelligence are dispersed and decentralized throughout the IC and when the very practice of counterintelligence tends to alienate some employees. Clearly, the counterintelligence staff in every agency needs to take their work more seriously. Both routine as well as random security investigations need to be standard procedure rather than something done only when a traitor has been revealed. Perhaps the advice of the Countess to Bertram in Act I, Scene I, of Shakespeare's *All's Well That Ends Well* ought to be followed: "Love all, trust a few, do harm to none."

Counterintelligence personnel need to be well trained. There is a tendency to assume that any intelligence professional can be moved in and out of counterintelligence without additional training. And counterintelligence needs to be done in the field as well as at the home office. CI officers need to be rewarded within their field of specialization. Many feel that they need to get out of CI and into better career tracks or even to leave their agency and work in private industry. Counterintelligence is taken seriously in the United States only after a traitor has been revealed. After FBI agent Robert Hanssen was caught, the FBI acknowledged that it did not take security seriously. After CIA officer Aldrich Ames was caught, CIA officials acknowledged the same.

Finally, counterintelligence is the most difficult of all intelligence work. It is a thankless task where practitioners are in a lose-lose situation. If spies are found within U.S. agencies, it is called a counterintelligence failure. If they are not found, it may also be called a counterintelligence failure. What is often called the Law of Invisible Phenomena must be kept in mind: The absence of evidence is not evidence of absence.

NOTES

I thank the following for their help at various stages of the writing of this chapter: Kara Norman, Eric Lindsay, and Victoria Taylor.

2

VENONA AND COLD WAR COUNTERINTELLIGENCE METHODOLOGY

NIGEL WEST

THE ROLE PLAYED BY VENONA IN COUNTERINTELLIGENCE operations conducted during the Cold War has been well documented since the decrypts were declassified and released to the public in July 1995. We now know, for example, that Alger Hiss was a Soviet spy, both Ethel and Julius Rosenberg were guilty of espionage, and such important figures in the Roosevelt administration as Harry Dexter White at the Treasury Department and Lauchlin Currie in the White House were part of a massive network directed from Moscow. VENONA proved to be the Holy Grail for British and American counterintelligence specialists to the extent that it provided leads to and offered links between hundreds of suspects. It also served to corroborate information from other sources, such as the testimony of Elizabeth Bentley, the NKVD (Narodnyy komissariat vnutennikh del, the Soviet foreign intelligence service) defector who was the catalyst for more than 100 FBI investigations following her statement made to special agents in September 1945.[1]

The attraction of VENONA is that in a sometimes murky counterespionage environment, it is as close to empirical evidence as can be found, but the paradox is that in legal terms the material was completely worthless and was never adduced in any criminal trial. The decrypts were, after all, the subjective application of cryptanalytical processes that could easily be refuted or undermined by defense counsel in any trial. In addition there was concern about maintaining secrecy of the nature of the source. At the time, the code breakers had narrowed the field of potential traitors to Klaus Fuchs and his friend the physicist Rudolf Peierls, who both appeared to fit the profile prepared by the mole hunters, VENONA remained an active source, with the Soviets continuing to rely on a compromised cipher system. Not surprisingly the Anglo-American teams working on the project were anxious not to alert their adversaries to the scale of the security breach, so even after the

source appeared to terminate, with the Soviet introduction of new procedures, there was a keen desire to keep what had been achieved thus far as secret as possible. We now know that the Soviets received at least three warnings that their communications had been jeopardized. First, there is the recollection from Bentley that Currie had conveyed a message from his post in the White House as early as 1944 alerting the NKVD to the fact that the Americans had broken some of their traffic. Then, in 1947, a VENONA text concerning Judith Coplon indicated that the Americans had learned some of the code names routinely used for certain Washington institutions, such as the FBI (HUT) and the State Department (BANK).[2]

How could they have learned this? The most probable source of the leak was William Wiesband, a Russian linguist employed at Arlington Hall as an interpreter who had been indoctrinated into the project in 1945, as had his wife. Because neither were ever charged with espionage, Wiesband's status as one of the most important spies of the twentieth century has gone largely unrecognized outside of the Allied signals intelligence community, where he is still regarded as the discipline's most damaging traitor. The extent to which his wife assisted him, consciously or unconsciously, is unresolved. However, KGB retirees, such as Yuri Modin, have acknowledged that Wiesband tipped them off to the breakthrough accomplished by the Armed Forces Security Agency.[3] And equally certainly, it is acknowledged by all concerned that Kim Philby received a briefing on the project before he left London to take up his liaison role in Washington, DC, in September 1949.[4]

Indeed, Philby boasted in his 1968 memoirs, *My Silent War,* that he had immediately conveyed a message to his Soviet contact about the lapse, although his version suggests Soviet censors had a hand in concealing the precise details, doubtless to avoid embarrassment by admitting the appalling blunder that had allowed their opponents a window of opportunity which had been exploited so successfully. Certainly VENONA played a key role in the identification of Klaus Fuchs, and although he was convicted and imprisoned in 1950, neither he nor his MI5 interrogator, Jim Skardon, knew anything about the cryptographic source that had compromised him. Skardon was never indoctrinated into VENONA and knew only that the physicist had definitely spied for the Soviets while working on the Manhattan Project during World War II. This absence of doubt gave him a significant advantage, as did Fuchs's naiveté (bordering on intellectual arrogance) in his belief that his actions had not been criminal. During several interviews conducted over three months, Skardon persuaded Fuchs to confess that he had passed classified information to his Russian contacts, and the scientist proved so cooperative that he had subsequently identified an FBI surveillance photograph of Harry Gold as his principal Soviet contact in the United States. Nevertheless, it was VENONA that had supplied the first clues to the existence of a spy at Los Alamos in 1944 code-named REST and CHARLES, and it had taken five years of investigation to narrow the suspects down to Fuchs.

The Fuchs case (known to and filed by the FBI as FOOCASE) raises an interesting issue because Philby kept abreast of the investigation as it closed in on

the physicist, and even before his departure for the United States he had sent a warning to the Soviets that the spy code-named CHARLES was in grave danger. He had been unable to deliver this vital message personally because his last meeting with his contact in London, Mikhail Shishkin, code-named ADAM, had taken place on September 21, before his indoctrination, so he had entrusted the information to Guy Burgess who, inexplicably, failed to pass it on for five months. When the news finally reached the London *rezidentura* on February 10, 1950, Fuchs had been under arrest for eight days. This was an astonishing lapse on the part of Burgess, then drifting in and out of an alcoholic haze, but it also served to suggest to the British and American mole hunters that the integrity of their source was intact, whereas in fact Moscow had made the necessary changes to their ciphers in 1949, unaware than Fuchs was already in dire peril. This all too human blunder on Burgess's part had the severest consequences, for as a result of Fuchs's arrest and confession, Harry Gold was identified, and thereafter the domino effect led to the electric chair for the Rosenbergs.

If, alternatively, Philby's warning had been relayed properly by Burgess, and Fuchs had been withdrawn before he could be interrogated, their subsequent history would have been very different indeed, with Gold and the Rosenbergs probably escaping, too. Understandably, this episode caused consternation in Moscow.

According to Philby's message to Burgess, the Americans had worked on the Soviet traffic for years, with minimal success, but the British Government Communications Headquarters (GCHQ) had achieved impressive results recently. Burgess later insisted that he had included Philby's tip in a personal note that had been photographed by Anthony Blunt, together with other documents, and then handed to Yuri Modin. Naturally, Moscow was alarmed by this news, particularly when Shishkin confirmed that Philby had said nothing about the decryption effort when they had met on September 21. Certainly Modin had received three rolls of film from Blunt on October 11, but when the pictures had been developed they had been found to be overexposed and out of focus. As for Burgess's personal note, it was re-examined in Moscow and found to say nothing about CHARLES.[5]

At their subsequent meeting, held on October 25, 1950, Burgess had promised to recopy the documents, and on December 7 had produced 168 documents, totaling 660 pages, but no personal note. Thus a combination of Blunt's camera error and Burgess's forgetfulness had ensured that the warning about Fuchs failed to reach Moscow. Burgess had said nothing to Modin, and Philby had been out of contact with his handlers while he had settled into his new post in America. Fuchs, of curse, could have been exfiltrated in September or even December 1949, and at the very least he could have been briefed on how to resist an MI5 interrogation, although the *rezidentura* had been out of direct touch with the spy since mid-1949. Although Fuchs seemed quite oblivious to the gravity of his situation and his imminent peril, there was actually no solid evidence against him, so his confession was vital to MI5. A simple, persistent denial would have stymied his adversaries.

According to Modin, reporting on their meeting on February 10, 1950, Burgess reacted with "calm and composure" to the news of the physicist's arrest but accepted that a mistake had been made. Soviet intelligence immediately suspended contact with Burgess and Blunt for six weeks, but Burgess failed to turn up at the next scheduled rendezvous on March 20, 1950, nor did he show up at any of the prearranged back-up meetings. However, at the beginning of April he left emergency signals for Modin and contact was restored on April 17. "Instead of YAN, PAUL came to the meeting without materials," reported the *rezidentura* (referring to Blunt and Burgess, respectively), which submitted a lengthy report on the crisis to Moscow by courier rather than cipher.[6]

Apparently Burgess had not attended the meetings in March because Philby (code-named STANLEY) had been summoned to London by the British Secret Intelligence Service (SIS) to discuss the Fuchs affair. Philby's account of the VENONA project, as he understood it, is illuminating:

> STANLEY asked to communicate that the Americans and the British had constructed a deciphering machine which in one day does "the work of a thousand people in a thousand years," Work on deciphering is facilitated by three factors: (1) A one-time pad was used twice; (2) Our cipher resembles the cipher of our trade organisation in the USA; (3) A half-burnt codebook has been found in Finland and passed to the British and used to decrypt our communications. They will succeed within six to twelve months. The CHARLES case has shown the counter-intelligence service the importance of knowing the past of civil servants. Although STANLEY is trusted, [Valentine] Vivian considers that STANLEY's past is not entirely clear. A role in establishing STANLEY's past may be played by his first wife who is somehow connected to the CHARLES case. STANLEY, PAUL and YAN consider that the situation is serious. A long meeting is needed to discuss it.[7]

The meeting was arranged for May 15, and Modin was instructed to calm Burgess and arrange a further meeting for him with the *rezident*, Nikolai Korovin, for June 4. Modin's meeting with Burgess was "businesslike" and he was "very calm, self-possessed, unhurried."

When Burgess offered to give Korovin at the next meeting a bundle of Foreign Office documents about the recent conference of the three foreign ministers, Modin forbade him. The second meeting with Korovin was held in a quiet suburban park and lasted six and a half hours. The marathon length was accounted for by the anxieties of the Cambridge spy-ring about the threat posed to them by the new menace, described as the "decryption machine," which was the latest generation of GCHQ's computers, then completely unknown to the wider public, that had only recently become aware of relatively primitive automated data processors and card sorters. Korovin admitted that mistakes had been made in the Soviet cipher procedures but tried to reassure Burgess that the errors had been limited and only occurred in wartime. He insisted that no "supermachine" existed capable of cracking the Soviet codes.

Korovin's reassurance is curious and raises the question of whether he was attempting to blithely calm the Cambridge Five or convey an informed message from Moscow. In fact, of course, the mole hunters were by then on the trail of both CHARLES and another quarry, code-named HOMER, who was revealed in April 1951 as Donald Maclean.

The most immediate worry in 1950 was Philby's safety. Burgess relayed to Korovin that Blunt had explained how, during the period in 1940 when the network had been out of direct contact with the *rezidentura*, their communications had been maintained through Edith Tudor-Hart, who had passed information to Bob Stewart of the Communist Party of Great Britain (CPGB). Blunt had recalled that during his conversations with Litzi Philby, she had mentioned the desirability of recruiting an atomic scientist, and he had gained the impression that she had found a suitable candidate. He was worried that if her nominee had been Klaus Fuchs, he might compromise her. It followed that if Fuchs exposed Litzi, the entire network would be put in jeopardy, but Korovin had assured Burgess that Fuchs was unconnected with Litzi. He subsequently submitted a report on the meeting for the *rezidentura*, which reached Moscow.

Before Burgess bade Korovin farewell, he returned to his preoccupation about exposure:

> Before leaving for the United States STANLEY asked PAUL to communicate to us his personal request for granting him political asylum in the USSR in case of obvious danger. PAUL added that essentially it was also a question of granting asylum to him, PAUL. YAN, like STANLEY and PAUL, was strongly alarmed by recent events but showed no signs of cowardice and made no hasty conclusions. In PAUL's opinion, if serious danger threatens, YAN will commit suicide. PAUL said that YAN's moral qualities are not like STANLEY's and PAUL's. STANLEY and PAUL think themselves politicians who have gone through the hard school of life, know what struggle is and know they should achieve their aim. PAUL considers YAN a good comrade, entirely devoted to our cause, but the spirit of an intellectual which is characteristic of YAN's profession is still firm in him, and this spirit makes him accept the inevitable and he doesn't mobilise for the struggle.[8]

Dismayed by Blunt's gloomy prognosis, Korovin asked Burgess to point out the senselessness of Blunt's frame of mind and persuade him to "abandon all thoughts of suicide." Burgess, Philby, and Blunt "can certainly count on our help," insisted Korovin, but when he announced that further personal meetings would have to be suspended, Burgess replied that he "saw no signs of danger" and that he was ready to resume passing documents, either originals, on film, or in the form of personal notes. Korovin declined the offer and provided a new procedure for establishing contact. He concluded the meeting on an optimistic chord: "PAUL was in a good mood. He came to the meeting sober. He thanked me for a long time for my conversation with him and asked to assure the Centre [Soviet intelligence] that everything was all right with him and that he would wait for instructions about passing over material to us."[9]

This meeting was something of a milestone, and it was not until July 1, 1950, that Ivan Chichayev (code-named ROSS) and Mikhail Shishkin had prepared "a summary of ROSS's talk with PAUL." Its conclusion, endorsed by the London rezidentura, was:

> Taking into account the absence of any dangerous signs concerning THE FIVE to conduct the prearranged meeting with PAUL in the first half of July at which to arrange for a meeting with YAN in a month's time for receiving materials. In future to receive documents from PAUL and YAN only on undeveloped film and at personal meetings. To give consent to the *rezidentura*'s suggestion about continuing work with PAUL and YAN and to receiving materials from them.[10]

On July 1, it was Burgess, not Blunt, that went to the arranged meeting and, in accordance with instructions, he arrived empty-handed. He gave an oral account of the war in Korea and said that he would be departing to the United States on July 28. At his next meeting, held on July 8, he passed over a film of Foreign Office papers and received instructions on how to establish contact with the Soviets in Washington, D.C.

Thus, as the mole hunters had disposed of Fuchs and were closing in on Maclean, the Soviets seemed oblivious to the escalating dangers posed by the VENONA project and more concerned about the security of personal meetings with rezidentura personnel. Fuchs had pleaded guilty to charges of breaches of the Official Secrets Act, so his trial had taken only a matter of hours for sentence to be pronounced, and no mention had been made of how MI5 identified him as a spy in the first place. In any event, the Soviets could not have harbored any illusions about how Fuchs had been caught, and their apparent complacency in letting the net narrow around Maclean is chilling. Philby had given what would prove to be a very accurate forecast of the progress that would be achieved by the cryptanalysts, yet his controllers seemed willing to allow both him and Burgess to remove themselves from London, where they might have been in a position to influence events or protect Maclean. It may be that the Soviets felt unable to intervene when their two best spies announced their new postings, and Philby's transfer from SIS's Istanbul station to Washington must have seemed to them like hitting the intelligence jackpot. Nevertheless, the ineptitude with which Soviet intelligence handled the deteriorating situation does seem breathtaking, especially when one considers that Philby hardly knew Maclean and had to guess for himself the true identify of the mole code-named HOMER.

From Philby's perspective, Burgess's arrival in Washington must have been quite a relief and at the very least a welcome opportunity to discuss the growing crisis with him privately. Burgess, of course, was the Cambridge Five's puppetmaster and knew the full ramifications better than anyone else. Alone, the two men would have been bound to consider their options, talk about the likelihood of Blunt's suicide, and debate tactics to save Maclean.

The Fuchs example demonstrated how easily a network could unravel and the skill of the FBI, which had zeroed in on Harry Gold and enabled the scientist

to identify him from a photograph when he had never learned his true name. Fuchs probably had not realized the likely consequences of this identification, and it is obvious he tried to protect his original contact, Ursula Kuczynski, whose true name was also unknown to him. She was, however, already familiar to MI5 as an espionage suspect because she had been denounced by Allan Foote in 1947 and had been interviewed by Jim Skardon on that occasion. The encounter had proved unproductive—she had denied any involvement in Soviet espionage in England, and at the time MI5 had no choice but to accept her denials. Nevertheless, she had fled the country as soon as Fuchs's arrest had been announced.[11]

If Maclean had cracked under questioning in the same way, what might he have disclosed? He knew nothing incriminating about Kim Philby or the other member of the Cambridge Five, John Cairncross, but apart from Burgess and Blunt he could have exposed Kitty Harris, his former lover and NKVD handler in prewar London and Paris. By 1951 Harris was safely back in the Soviet Union, having completed her last assignment as an illegal in the United states, so Maclean really only represented a threat to Burgess and Blunt, and of course his own wife, Melinda, in whom he had confided shortly before their marriage in France in 1940.[12]

While the mole hunters had been searching for CHARLES, other VENONA texts, eight in all, implicated Judith Coplon, who had appeared in the traffic with the code name SIMA. These intercepts made the FBI realize in 1948, as the first text of January 1945 had indicated, that a spy had been at work in the Justice Department in Washington. As soon as Special Agent Bob Lamphere extracted the vital date of the spy's commencement in her new post, February 15, 1945, on an internal transfer from New York, Coplon's identity was confirmed by Inspector Leo Lauchlin in consultation with the assistant attorney-general as SIMA, for she was the only person to have switched from the Justice Department's Economic Warfare section to Washington, as had been mentioned in the traffic.[13]

Preliminary inquiries into Coplon's background showed that her parents were living in Brooklyn, and she had graduated in 1943 from Barnard College, where she had been involved briefly with the Young Communist League. The question for the FBI was how she could be caught on a charge of espionage, bearing in mind that her position gave her access to files on the FBI's current investigations, which doubtless was why no prosecutions had resulted from the allegations made by Elizabeth Bentley. By the time the FBI had gone in pursuit of the members of Nathan Silvermaster's network, there was absolutely no incriminating evidence to be found, even in the extensive photographic laboratory discovered in the basement of his suburban home. Quite obviously, Coplon had allowed the NKVD to remain one step ahead of the FBI, tipping off the Soviets each time a new suspect came under the FBI's scrutiny, so the only action to be taken was the removal of suspects from their jobs. This had effectively eliminated the spy-rings headed by Silvermaster and Victor Perlo but had allowed their subordinate members to evade prosecution. As Coplon was routinely handling internal security dossiers at her office in the Foreign Agents Registration section of the Justice Department, her hand in their escape was all too obvious. The only

advantage to the FBI was to learn which personalities currently under investigation were of interest to the Soviets. In this way suspicion hardened against Joseph Bernstein, a courier whose name appeared on one of the FBI files compromised by Coplon.

Coplon was placed under discreet surveillance, which revealed that she was having an illicit affair with Harold Shapiro, a Justice Department attorney, and that she made two trips a month to New York to visit her parents. When she was followed to Manhattan on January 14, 1949, she was seen to meet a man for dinner who subsequently was identified as Valentin A. Gubitchev, an employee of the United Nations secretariat, and they were watched at two further meetings, on February 18 and March 4. At this latter rendezvous, both were arrested, and Gubitchev was found to be carrying an envelope containing $125, and Coplon's handbag revealed a wealth of classified data, including some documents that had been prepared by the FBI as a barium meal to test whether she gave them to her Soviet contacts.

At her trial, the FBI concealed the exact nature of the "confidential informant" that had led the investigation of Coplon, and she deployed the defense that her relationship with Gubitchev was entirely romantic and the information she had been carrying was nothing more than notes she had prepared for writing a novel. The prosecution neatly destroyed the "innocent liaison" ploy by disclosing details of her affair with Shapiro, so she was convicted and received a sentence of between forty months and ten years' imprisonment for conspiring to pass classified secrets to Gubitchev, who was also convicted.

Coplon's conviction was later overturned on appeal on the technicality that the FBI's telephone intercept had been unlawful. Because the clear impression had been left that the FBI had begun its investigation as a consequence of a wiretap on Coplon's office line, all the evidence that flowed from that source was deemed inadmissible. The alternative was to reveal that the FBI had been led to Coplon by VENONA, but that expedient was considered too high a price to pay, so she was freed to marry one of her lawyers, Albert H. Socolov, and settle in Brooklyn, where she opened several restaurants.

As well as losing Coplon, the FBI also missed Flora Wovschin, code-named ZORA, the daughter of Russian immigrants who had been responsible for Coplon's recruitment in the first place. She, too, had joined the Communist Youth League at Barnard College and later went to work for the Office of War Information in Washington. In 1947 she had resigned from the civil service to marry an Amtorg engineer, but by the time the FBI had started to look for her in 1949 she had moved to Moscow. No action was taken against her mother and stepfather, but the FBI did attempt to identify the other members of her network. The fact that Flora had continued to be active after the war was revealed in a VENONA text from Moscow dated March 11, 1945, marking Stepan Apresyan's appointment to be *rezident* in San Francisco, which designated Vladimir Pravdin (code-named SERGEI) as her controller, with a *referentura* clerk, Olga V. Khlopkova (code-named JULIA), responsible for processing her information:

[16 groups unrecoverable] in San Francisco the work of ALBERT's [Iskhak Akhmerov] office. The operational direction of ZORA [6 groups unrecovered] JULIA [Olga Khlopkova] will deal with his documents under SERGEI's [Vladimir Pravdin] direction.

The scale of Wovschin's activities can be judged by this cable, sent from Moscow two days later:

Your 203. ALAN—Ralph Bowen, works in the BANK [State Department] as assistant [3 groups unrecovered] economics. He and his wife Sue are acquaintances of ZORA and together with the latter were members of the GYMNASTIC organisation [Young Communist League]. In so far as ZORA works in the BANK, [5 groups unrecovered] with them the former friendly relations.

DROP—Philip E. MOSELEY. Up to 1943 worked in the Russian Section of the HUT [OSS]. Since 1943 has been in the BANK in the Division of Territorial Studies. In 1932–34 has [2 groups unrecovered] member of the staff of HARVARD University and [42 groups unrecovered] friend of BLERIOT. According to the latter's information is progressively inclined.

DUVER—our PROBATIONER [agent] in VADIM's office.

ROBERT—connected with the NEIGHBOURS.

OSWARD—Benjamin GERIG [6 groups unrecovered] in the BANK. We have no other data on [1 group unrecovered].

Whether Wovschin remained active until her departure for Moscow is uncertain, but her absence ensured the FBI made no further progress in its pursuit of her. According to the CIA, she participated in anti-American propaganda operations during the Korean War and died soon afterward.

The parallel cases against Fuchs and Coplon serve to illustrate the way in which the VENONA source fitted into the investigative jigsaw puzzle, and while offering an unrivaled glimpse into the adversary's activities, most certainly did not guarantee a criminal conviction or even ensure that espionage could be disrupted. In the example of Coplon, the central figure, Wovschin, was never even interviewed by the FBI, and some of the other personalities mentioned as her recruits were never identified.

The two best-known cases of Soviet espionage exposed by VENONA were those of Klaus Fuchs and Donald Maclean, although the latter defected to Moscow in May 1951 before he could be confronted. Other spies, who might have achieved similar notoriety, also escaped justice. Lauchlin Currie, Joel Barr, and Al Sarant moved abroad. Harry Dexter White died of a heart attack in 1948, and Laurence Duggan, formerly Roosevelt's aide, committed suicide. Although plenty of other spies were to emerge in the VENONA material, among them Ted Hall, Kim Philby, Morris and Lona Cohen, and Bill Wiesband, none of these names were broken by the cryptographers in time to ensure the mole hunters could take full advantage of the information. Indeed, Wiesband's identification as LINK was not made until the declassification process was under way, more than

two decades after his death in May 1967. Actually, the only VENONA traffic directly relevant to contemporaneous counterintelligence operations were the cables exchanged between Moscow and Canberra in 1948, which were read within days of their interception.

Close study of VENONA's counterintelligence value reveals that the raw texts were a component in a larger canvas constructed with contributions from defector testimony (mainly from Elizabeth Bentley, Whittaker Chambers, and Hede Massing), physical and technical surveillance conducted by the FBI, and confidential information extracted from informants whose identities are still protected. These bland categories give no clue to the dramas they concealed: the illicit wiretaps routinely carried out by FBI technicians; the black-bag jobs performed by teams of skilled burglars whose illegal activities were authorized at the highest levels of government; the vast photo libraries of espionage suspects that accrued during street investigations; the monitoring of the vehicle registration plates of cars parked in the vicinity of suspected subversive gatherings; the wholesale penetration of the Communist Party of the United States of America (CPUSA) by legions of paid informants. Only the tiny tip of this investigative iceberg ever surfaced, so it is hard to assess the precise proportion any one indicator gave in the identification of a VENONA code name. Some of the identities were obvious, with the cover names proving semi-transparent or the real name being referred to in plain text, whereas others were much more elusive, and some were demonstrably wrong. The best example of error is the famous blunder in which RELAY was named as Morton Sobell, whereas Professor Philip Morrison was the more likely candidate.

Unquestionably VENONA deserves its reputation as the keystone of Anglo-American counterintelligence investigations, and the fact that the project was not closed down until 1979 suggests its long-term utility, but its longevity conceals some stark realities: VENONA did not implicate Philby or Burgess until it was too late to exploit it. Only Klaus Fuchs was imprisoned as a direct consequence of the source, and his conviction could have been avoided if the Soviets had acted on the information that we now know was available to them at the time.

NOTES

1. Elizabeth Bentley's *Out of Bondage* did not include all the names of spies she identified in her November 1945 statement to the FBI, which has now been declassified.

2. Judith Coplon's prosecution is best described by Marcia and Thomas Mitchell in *The Spy Who Seduced America* (New York: Invisible Cities Press, 2002).

3. In his autobiogaphy *My Five Cambridge Friends* (London: Hodder Headline, 1995), Modin incorrectly identified the source of the NKVD's information about VENONA.

4. Kim Philby, *My Silent War* (London: McGibbon & See, 1968).

CATCHING SPIES IN THE UNITED STATES

KATHERINE A. S. SIBLEY

FROM THE MOMENT OF THE AMERICAN REVOLUTION, when plotters like Benedict Arnold and John André attempted to snuff out the nascent republic, through the aftermath of September 11, 2001, when terrorists' attacks on the World Trade Center and the Pentagon stunned Americans and created a crisis that is still unfolding, national anxiety over the domestic influence of foreign spies and conspirators has seldom disappeared from American political culture. Catching them has remained a high priority.

John André was perhaps the first spy to be executed by Americans. Sneaking through American lines holding a passport for "John Anderson," with Arnold's plans for the British to take West Point hidden in his stockings, André was intercepted by Continental troops, who turned him in rather than accept proffered bribes of his steed or his watch. André was sentenced to death and hanged on October 2, 1780. Yet despite some celebrated espionage cases in the next major American conflict, the Civil War—including that of Confederate spy Rose O'Neal Greenhow, a well-connected Southerner who infiltrated Northern elite circles, continued spying from prison, and was eventually deported back to the Confederacy—more than a century passed after André's execution before the U.S. government set up intelligence agencies to look for spies. During the 1880s, in response to a growing imperialist push abroad as well as the increased value placed on "professional expertise" at home, the Navy and the War Department both set up intelligence offices, the Navy's in 1882, and the War Department's in 1885. By 1889, the War Department's new Division of Military Information was sending military attachés to five countries. Still, its intelligence-gathering role was rather passive until the Spanish-American War, when Division staff assisted in furnishing information about Cuba and uncovering insurgent plots in

the Philippines. Afterward, this work once again was neglected as the Division suffered from a bureaucratic squeeze that banished it to a remote corner of the capital. Even so, the Justice Department went ahead and set up its Bureau of Investigation in 1909, which played a pivotal role in catching spies later.

For the military, another war was necessary for any revitalization of intelligence collection, and thus it was not until May 1917 that the indomitable Maj. Ralph Van Deman was able to overcome the resistance of top brass to create a newly powerful Military Information Section, despite his superiors being perfectly content with what intelligence the British and French deigned to share with the War Department. It was high time; espionage was already key to the U.S. war effort, thanks to the (British) discovery of the Zimmerman Telegram three months earlier, and its exposure of a German-Mexican plot against the United States. Van Deman also set up a Code and Cipher Bureau during the war to decode foreign cable traffic, which was led by Herbert Yardley and known as the Black Chamber.

The military's intelligence operation thus grew rapidly and included both positive and negative divisions: "positive," to gather information about other countries, and "negative," to stop them from picking up intelligence here. It was in the negative, or counterintelligence function that van Deman particularly excelled, setting up machinery to oversee both the armed forces and civilian populations, whom he deemed as riddled with subversive foreigners. Foreign agents were indeed active; as early as 1914, German military attaché Franz von Papen had organized a sabotage, espionage, and subversive campaign against the United States, which was discovered in 1915 when his agent, Dr. Heinrich Albert, foolishly left his briefcase—full of plans and money—on a train. Albert, von Papen, and other German and Austrian conspirators were soon thrown out of the country, but this did not prevent their successors from engineering the massive Black Tom explosion of 1916, blowing up millions of tons of munitions in northern New Jersey that were headed for Britain.

As the Army's efforts to find spies thus accelerated during the war, so did those of Congress. In 1917, it passed the Espionage Act, which included a $10,000 fine and twenty years' imprisonment for such acts as preventing the recruitment of armed forces personnel, refusing to enlist, or revealing information related to defense. The act sent nearly 1,000 Americans to prison in World War I, including Eugene Debs and Emma Goldman. (Debs was sentenced to ten years in 1918 for speaking out against the act and was pardoned by President Warren G. Harding in 1921; Goldman was sent to prison for opposing the draft, and was then deported to Russia in 1919.)

Van Deman's Military Information Section also officially encouraged private groups such as the American Protective League, also founded in 1917, to identify dissenters. Its thousands of members raided leftist groups like the International Workers of the World but unearthed few spies. Following the war, the Justice Department's Bureau of Investigation went on a massive raid of its own, otherwise known as the Red Scare, arresting more than 1,500 and sending nearly 250 back to Russia on the *Buford*.

A postwar cooling-off period followed the wartime hysteria, although this more relaxed atmosphere also permitted many spies to operate unheeded in the United States during the 1920s and 1930s. Ex-spy Whittaker Chambers believed that the 1930s were, in fact, the heyday of Soviet espionage: "To this period belongs the recruiting of the best Soviet sources. . . . The secret service rode along for almost a decade simply exploiting, and seldom seeking to amplify, this corps."[1] Chambers himself is best known for his filching of State Department documents supplied by Alger Hiss in the mid- to late 1930s, though he had contacts at numerous government departments. He even worked in military espionage, meeting a mathematician at the Aberdeen Proving Ground who supplied him classified materials on aircraft bombsights. Dwight D. Eisenhower later admonished his interwar predecessors for their largely nonexistent counterintelligence response to such practices and blamed it on domestic culture: "The American public has always viewed with repugnance everything that smacks of the spy."[2]

Yardley's outfit did continue for a time as part of the State Department; its most important achievement was spying on Japanese representatives at the Washington Naval Conference and thus learning their negotiating points. But much of the other intelligence work established by van Deman fell by the wayside, and the Black Chamber itself was abolished in 1929, owing in part to Secretary of State Henry Stimson's view that "Gentlemen do not read each other's mail." The Army was less scrupulous; in 1930, it set up the Signals Intelligence Service (SIS) to intercept signal traffic, break codes, and train cryptologists. It was this agency that began to collect secret Soviet communications in World War II, in a project code-named VENONA, which led to the later discoveries of atomic spies detailed below.

In 1930 Congress also conducted an investigation into communist activities, under the leadership of Hamilton Fish (R-NY). Upset by its findings, the Fish committee recommended that alien communists should be deported and Party members should be prevented from using the mails. In line with public opinion in this period, however, newspapers responded critically, arguing that Fish and company exhibited "symptoms of the sort of mental stampede that should be reined in by . . . long established American ideals."[3]

Despite the severe limitations on investigative activity in this era, spies were occasionally foiled. In 1931, William Disch, who designed firing control instruments for the Navy, met a man called Herb, posing as a German spy, who wanted to pay up to $2,000 for the technology. The Office of Naval Intelligence allowed Disch to supply Herb with obsolete blueprints. Bureau of Investigation agents soon spotted Herb taking the documents not into the German embassy but into Amtorg, the Soviet trading agency in New York. Even so, agents had no idea then about the far greater amounts of secret information being provided to Amtorg by Philadelphia chemist Harry Gold, who repeatedly raided the technology of his employer, Pennsylvania Sugar, preparing himself for a far more ambitious atomic espionage career in World War II. In this cautious era, not even J. Edgar Hoover,

director of the newly named Federal Bureau of Investigation (FBI), was ready to have his agenda expanded into investigating "Communistic inner circles," especially if it placed the Bureau in the light of "Agents Provocateur."[4]

As a result, not only Soviet but German agents as well had a field day. In the mid-1930s, Dr. Ignatz Griebl, a German-born Nazi sympathizer living in Manhattan, recruited some of his German patients to spy for the fatherland; they succeeded in garnering blueprints from the Bath Iron Works, the Boston Navy Yard, and the Douglas Aircraft Corporation, among others. Griebl's work was part of a larger ring associated with Guenther Gustave Rumrich, an American educated in Austria. Thanks to a tip from British military intelligence, in 1938 the FBI arrested Rumrich and his associates; however, fourteen of the men charged escaped, including Griebl. This botch was only one of the FBI's missteps in the disastrous persecution of the case, which culminated in the firing of its chief investigator for signing a publicity contract. Despite the errors, the FBI's crime-fighting profile had already been considerably enhanced in this era with its successes in the Lindbergh kidnapping case and several celebrated bank robberies. When Europe's turn to war in August 1939 put the country in a state of emergency, the agency took on a new role in counterespionage work.

Hoover was now no longer shy in packaging his agency as a bulwark against the threatening clouds from abroad. That summer, Franklin D. Roosevelt set up an Interdepartmental Intelligence Committee made up of the FBI, the War Department's Military Intelligence Division, and the Navy's Office of Naval Intelligence and pronounced that "no investigation . . . into matters involving actually or potentially any espionage, counterespionage, or sabotage" could be undertaken except by those three agencies.[5] But Hoover quickly and effectively gained sole jurisdiction over domestic espionage and sabotage outside military personnel. His agency would brook no rivals; armed with its mandate from the White House, the FBI was intent "to head the Nation's attack against foreign spies, saboteurs, and subverters," as Hoover told the American Legion.[6]

The Bureau grew accordingly. Between 1940 and 1945, FBI agents mushroomed from 900 to almost 5,000. And from 1933 to 1945 the Bureau's budget expanded from $2.7 million to $45 million. The ineffectiveness of other agencies (like the State Department) to hinder their own species of spy also expanded the Bureau's purview abroad; in 1940, following the arrest for espionage of Tyler Kent, a disgruntled code clerk at the American embassy in London, FBI undercover agent Louis Beck came snooping and found incredibly lax disposal of secret materials and disturbingly intimate relations between embassy staff and local prostitutes.

Another success for the FBI was its crafty handling of a Nazi ring revealed in 1940 by defector William G. Sebold, an aircraft mechanic who had spied for Germany. Sebold's organization had been gathering military-industrial information in the United States since the 1920s, including the Norden bomb sight and Goddard's rocket technology. With Sebold's able help, the Bureau actually managed the ring, supplying fake but appetizing information that the mechanic

radioed to his counterparts in Germany. When it was finally cashed in by the Bureau, the investigation brought thirty-three convictions and effectively ended German spying in the United States.

During the war, the heightened secrecy surrounding the atomic bomb made discoveries of Soviet espionage even more profoundly disturbing than the feckless attempts of the Germans. Indeed, as Hoover believed, during the war "American Communists . . . made their deepest inroads upon our national life."[7] Scholars have noted the heightened intensity of this wartime anti-Soviet campaign, but it has been judged a "counterintelligence failure" because the United States caught relatively few spies.[8] Yet FBI surveillance forced such Soviet representatives as Harry Gold's wartime handler Semyon Semyonov, NKVD agent Vassili Zarubin, and others to return to Russia, while U.S. officials effectively stymied such military-industrial spies as Clarence Hiskey, Andrei Shevchenko, Arthur Adams, Steve Nelson, and Joseph Weinberg. Soviet intelligence agents could ignore U.S. counterespionage activities only at their peril.

One of the first Soviet spies to be arrested was Gaik Ovakimian, an engineer who worked at Amtorg. Ovakimian was charged with being an unregistered representative of the Soviet government, but he was also known to be a spy; during his stay in the United States, he had paid handsomely for information on the production of gasoline- and on oil-refining processes. Yet after the German invasion of Russia, the State Department dropped the charges against Ovakimian, and he was allowed to return home in exchange for six others. While pursuing Ovakimian, FBI agents also bumped into Soviet master spy Jacob Golos, who had earlier also gotten in trouble as an unregistered foreign agent. The surveillance of Golos did lead the agency to a brief encounter with his lover and spy associate, Elizabeth Bentley, until she lost her pursuers in the Pennsylvania Station ladies' room.[9] Once the United States became firmly committed to helping the Soviet Union, surveillance of the couple ended. They, along with Julius Rosenberg's group of electrical engineers, Harry Gold's industrial and military contacts, Igor Gouzenko's revealed ring of radar and nuclear specialists in Canada, and of course, the large number of sources within the Manhattan Project itself, were largely unhindered participants in a huge haul of material for the Soviet Union in World War II.

Oblivious to all this, the government blundered even more strikingly with Gen. Walter Krivitsky, who actually presented himself as a source on Soviet espionage. Kritivsky, a senior GRU agent who had escaped to the United States in 1938, drew much interest in a series of articles he wrote for the *Saturday Evening Post*. Krivitsky told the State Department's Passport Office of the existence of hundreds of agents, but because there were as yet no procedures for handling defectors, little was done to delve seriously into his allegations. Hoover questioned Krivitsky's ideological leanings, and the Immigration and Naturalization Service was soon trying to deport him. He died in Washington in 1941 under mysterious circumstances. [10]

Krivitsky was not the only defector whose significance was overlooked. Whittaker Chambers had visited Assistant Secretary of State Adolf Berle in

September 1939 to tell him about a network in the State Department and other agencies involved in "Russian espionage." But Berle did not mention Chambers's story to the FBI until March 1940, and it took the Bureau another two years to even contact Chambers. Hoover, of course, could not pursue Soviet espionage to the extent he might have wished. As he told lawmakers, in his counter-espionage program "emphasis was placed upon control of Axis agents operating in the US and upon the penetration and study of the Axis intelligence system."[11] In this, he was effective; German espionage was nearly nonexistent during the war. The handful of inept Abwehr spies who washed ashore on the Eastern Seaboard in 1942 (Long Island, Florida) and 1944 (Maine) were either executed or given long sentences. Another rarity in the United States, a spy for Japan called Velvalee Dickinson, a doll saleswoman who wrote messages about U.S. Navy ships in doll-code, was also captured by the FBI in 1944 after some of her letters were traced. She was sentenced to ten years in prison.

Despite these successes, the far more expansive and effective Soviet espionage operation remained largely unmolested. American officials were hampered in grasping the full dimensions of it by strategic considerations, namely, the alliance with Russia against Nazi Germany. Nevertheless, in 1943 intelligence officials discovered the work of California communist leader Steve Nelson, a Soviet spy interested in developments at the Berkeley Radiation Laboratory, where Ernest O. Lawrence and J. Robert Oppenheimer were conducting early atomic research for the War Department. Nelson's home was already under surveillance when one of Oppenheimer's graduate students came to tell the party leader about his secret work in fall 1942. Then, on March 29, 1943, Nelson was overheard at his home securing "some highly confidential data regarding the nuclear experiments" at the Radiation Lab from another lab scientist, Joseph Woodrow Weinberg.[12] Weinberg provided Nelson a formula that concerned the calutron, a separator that would enrich uranium. Soon after this meeting, Nelson was spotted passing information to Soviet vice consul Peter Petrovich Ivanov. Then, on April 10, the man who headed NKVD activities in the United States, Vassili Zarubin, stopped to visit Nelson and paid him for additional information.

With less justification, intelligence officials were also monitoring J. Robert Oppenheimer during the war. Lt. Col. Boris T. Pash believed that the physicist was passing on material to persons who, in Pash's estimation, "may be furnishing . . . [it] to the Communist Party for transmission to the USSR."[13] As newly unearthed documents reveal, Oppenheimer was almost certainly a party member, but allegations of his involvement in espionage activity have never been convincingly demonstrated.[14] In August 1943, however, Oppenheimer told Army security officers of a breach at the lab. Sometime the previous winter he "had learned from three different employees of the atomic bomb project . . . that they had been solicited to furnish information, ultimately to be delivered to the USSR." None of the men had cooperated, according to Oppenheimer, so he refused to name them; nor, for some months, would he identify the man who had

solicited their espionage, whom he later divulged was Berkeley French professor Haakon Chevalier. That Oppenheimer did not get in more trouble over his reticence may be explained by his having "benefited from exceptional treatment," as one scholar has noted. Despite Oppenheimer's well-known left-wing past, it was only in the 1950s that he found himself subject to the security standards that had destroyed others, and his tale of the three contacts, which he later admitted he had invented, played a crucial role in the loss of his security clearance then.[15]

Occasionally, officials were able to successfully derail Soviet espionage during the war, as they did in their dealings with Soviet Purchasing Commission representative Andrei Shevchenko. On discovering his queries for secret documents, the FBI worked with a librarian and later an engineer at Bell Aircraft to give Shevchenko everything he had asked for on advanced airplanes in sanitized form.[16] The FBI was gratified to learn later that Soviet intelligence considered the doctored material supplied to Shevchenko "reliable." [17] But in December 1945, Shevchenko left the country with his wife and son. His escape had been facilitated not only by a tip from Moscow but also by the U.S. government's apparent reluctance to press charges in the wartime environment. Also departing that month, and for the same reason, was another longtime industrial spy, Arthur Adams.

The FBI had discovered Adams's meetings with Arthur Hiskey, a scientist in the Manhattan Project's University of Chicago laboratory, relatively late in the war. A break-in to Adams's dwelling on September 29, 1944, showed notes about the nuclear project, and these, the FBI declared, "reflect an intimate knowledge concerning highly secret phases" of the project. Indeed, Adams was "the most dangerous espionage agent yet discovered in the Comintern Apparatus."[18] At Chicago's Development of Substitute Materials Laboratory, Hiskey assisted in plans for plutonium production. To get him away from Adams, the Army drafted Hiskey in April 1944, sending him to the Yukon as property survey master or, as an army official put it, to "count underwear." At this remote posting, more notes on the atomic project were discovered in his effects.[19]

Yet a more dangerous spy than Nelson, Adams, or Hiskey was Klaus Fuchs, whom the FBI entirely missed. From the Los Alamos Laboratory, he provided Moscow with unparalleled information about the bomb project, including material on such topics as its construction, detonation, and the fission rates of certain types of plutonium. He continued to spy for the Soviets from Britain when he returned there after the war. The Atomic Energy Commission declared that Fuchs's information likely sped up Soviet atomic research by two years. Though the physicist's intelligence gathering at Los Alamos remained unknown until 1950, defector Igor Gouzenko revealed another significant espionage operation less than a month after the war ended. A clerk at the Russian embassy in Ottawa, Gouzenko secreted out 109 documents that illuminated Soviet successes in obtaining atomic, radar, and other military-industrial secrets, which he showed to British and American officials. One of the most active sources Gouzenko named was Allan Nunn May, a Cambridge-trained nuclear physicist, who gave the Soviets "a survey of the entire atomic bomb project." May made three trips to the

Chicago laboratory, from which he transferred uranium samples to Soviet military intelligence in 1944.[20]

Gouzenko's was not the only high-profile defection of 1945. Elizabeth Bentley walked into the FBI's arms that fall as well. After some initial disbelief at her allegations of high-level espionage within the U.S. government, the Bureau assigned twenty-five agents to her case, launching technical and physical surveillance of the eighty-odd individuals she named. Her defection had the effect of a *Titanic*-sized iceberg on Soviet operations in the United States, as the Soviet security agency, then known as the NKGB, stopped all communication with a number of agents and recalled others. Bentley told the FBI about sources like Nathan Gregory Silvermaster and William Ullman, among many additional spies, who supplied her with reams of material from the Pentagon and other departments beginning in 1941, much of it photographed in Silvermaster's basement.[21] Soviet cables, which identified her as "Good Girl," confirm this mass quantity; the material streamed in, on planes, munitions, and manpower, dwarfing the limited take of Chambers's earlier sources.[22] Unfortunately for the FBI, her testimony as an uncorroborated witness had very little value for prosecution purposes. Only one man, War Production Board staffer William Walter Remington, testified that he had given information to Bentley, and he claimed that he thought she was merely a journalist. Everyone else denied her charges or took the Fifth Amendment. Bentley sometimes exaggerated her story in ensuing congressional hearings, but the dearth of convictions does not reflect a lack of merit in her initial claims about Soviet espionage practices, which have been since demonstrated in both Soviet archives and American sources like VENONA.[23]

The government also had a hard time after the war prosecuting the atomic spies it had identified for the same reason. Released from his arctic purgatory, Hiskey claimed he had provided no secret information. Joseph Weinberg similarly denied his involvement in espionage, claiming he had never met Nelson or talked to him about the bomb. As for Nelson, he took the Fifth Amendment repeatedly. The wiretaps that confirmed these men's actual roles were not sufficient as courtroom evidence. Moreover, even where a willing eyewitness was available, espionage charges were difficult to prove. Whittaker Chambers, after waffling for some years about Alger Hiss's actual relationship with him, finally named Hiss as a former spy in 1948 after the latter tried to sue him for defaming Hiss as a communist. But the statute of limitations on Hiss's espionage had expired, and despite Chambers's possession of 1930s State Department documents connected with the former Foggy Bottom official, Hiss could only be charged with perjury for denying that he had known Chambers. Hiss served three and a half years in prison and the rest of his life trumpeting his innocence, garnering many believers.

The government did get significant help in identifying spies from the aforementioned VENONA project, the Army Security Agency's secret effort to decode wartime Soviet cables, although their secrecy and their hearsay nature prevented them from being of much value for legal purposes.[24] The first and only

"live" American spy to be caught by VENONA was Judith Coplon, a political analyst at the Justice Department, arrested in March 1949 as she was supplying material to her Soviet handler, Valentin Gubitchev. Her 25-year sentence was overturned on appeal, owing to the FBI's missteps, including wiretapping her communications with her attorney. More significant, though, in 1949 cryptanalyists decoded a World War II cable on "Fluctuations and the Efficiency of a Diffusion Plant, Part III," written by Klaus Fuchs.[25] He soon confessed his espionage to British authorities. After a massive FBI manhunt, agents found Fuchs's American courier, Harry Gold, but he did not initially cooperate until his interviewers fished out a map of Santa Fe from his closet.

His New Mexican adventures now evident, an abashed Gold broke down. He was charged with "conspiracy to commit espionage on behalf of the USSR" on May 23, 1950; he got a 30-year sentence for his illicit information gathering. His sources had included not only Fuchs but engineer Abraham Brothman, chemist Alfred Slack, and Los Alamos machinist David Greenglass. Greenglass, too, soon talked with authorities, recounting the role of his sister and brother-in-law, Ethel and Julius Rosenberg, in recruiting him. They, of course, never cooperated.

In 1951, a congressional committee declared that the espionage of Fuchs, Greenglass, and others had "advanced the Soviet atomic energy program by 18 months as a minimum . . . if war should come, Russia's ability to mount an atomic offensive against the West will be greatly increased." This dire outlook certainly helps explain the extraordinary severity of Julius and Ethel Rosenberg's sentences.[26] Physicist Theodore Hall, a much more important source who had spied at Los Alamos, was luckier. He escaped because corroborating evidence outside of the classified VENONA intercepts was not available. Hall fled to England, where he lived nearly another fifty years; he only publicly admitted his role in 1998.

Cryptanalysts also used VENONA to develop information about Julius Rosenberg's ring of engineers, including Joel Barr, Alfred Sarant, and William Perl. Sarant and Barr alone produced over 9,000 pages of documents on radar and other technology with military applications. Perl, meanwhile, was given a prize for the lode of aircraft information he furnished.[27] As soon as Gold and Greenglass were apprehended in 1950, Barr escaped to Czechoslovakia. Sarant fled there also, via Mexico. Another of Rosenberg's engineers, Morton Sobell, also left the United States for Mexico on the day of Greenglass's arrest. Seized by the Mexican police, Sobell resisted, but eventually had a ".38 caliber pistol butt" smashed on his head.[28] He ended up on trial with the Rosenbergs, named by his former friend and roommate, Max Elitcher; he got a 30-year sentence and served eighteen years, five of them at Alcatraz. This was certainly an unusually harsh penalty for industrial espionage. Sobell, who is still alive, has always denied his role in Rosenberg's ring.[29]

Perl, on the other hand, did not flee, but because officials had really only the secret VENONA materials as evidence against him, he could not be charged as a spy. Instead, he was convicted of perjury, for denying that he knew both Rosenberg and Sobell, his former classmates at City College, and received two

concurrent 5-year terms. Hoover, annoyed that Perl had not been charged with espionage, took cold comfort in his treatment at the New York Federal House of Detention, where the brilliant engineer was relegated to cleaning toilets.

The government didn't even get a perjury case against Steve Nelson. After the war, he was busy organizing immigrants in an unglamorous section of Pittsburgh. The House Un-American Activities Committee (HUAC), which was familiar with the FBI's wiretaps on Nelson, ordered him to appear in 1948 and 1949, but he refused to testify. Moreover, he flatly denied any role in espionage and continued to deny it for the rest of his life: "There may have been a Soviet espionage network operating in this country," Nelson wrote in 1981, "but common sense would dictate against recruiting prominent Party officials."[30] Congress charged him with contempt for his refusal to cooperate, but more troublesome for him was the Commonwealth of Pennsylvania's charge that he had violated a 1919 state sedition law. Authorities there sentenced him to twenty years in the ancient Blawnox workhouse, plus a fine of $20,000. After two appeals, he was finally vindicated by the U.S. Supreme Court in 1954; one could not be seditious to a state when the federal government had its own laws in the matter. Later in the decade, ironically, disgusted with Nikita Khrushchev's 1956 revelations about Josef Stalin, Nelson left the Communist Party.

By then, with only a few thousand members, this organization was riddled with FBI informants. Still, Hoover only planned to amplify his assault on the party through the COINTELPRO project. As one FBI staffer noted, "We were trying first to develop intelligence so we would know what they were doing [and] second, to contain the threat. . . . To stop the spread of communism, to stop the effectiveness of the Communist Party as a vehicle of Soviet intelligence, propaganda and agitation."[31] The 1956 COINTELPRO against the Communist Party proved such a successful model that the FBI set up similar efforts against organizations ranging from the Ku Klux Klan to the New Left in ensuing years.

The domestic party was unlikely to be doing much spying in the 1950s, of course, with the FBI's saturation of its ranks. Instead, Soviet agents bent on espionage focused increasingly on cultivating American spies overseas, especially men in uniform—an approach that proved successful throughout the Cold War and beyond. Of thirty-three U.S. espionage cases prosecuted between 1950 and 1975, fully twenty-three were either soldiers or civilians connected with the military abroad.[32] Though spy convictions abounded in the military sector, intelligence agency operatives who spied for Russia were seldom publicly revealed in this era. The CIA and the Justice Department had a pact, first signed in 1954, that allowed the intelligence agency to decide whether to send any of its agents suspected of illegal activities to Justice for prosecution. Not surprisingly, suspected personnel usually remained secret to the CIA for reasons of "national security."[33]

In 1957, the same year that the Soviet *Sputnik* satellite caught Americans off-guard, the United States was also surprised by a Russian spy living in Brooklyn, KGB illegal Rudolf Ivanovich Abel. Abel, who had been in the United States for almost ten years, was found guilty of conspiracy to obtain and transmit

defense-related information to the Soviet Union, as well as for being an unregistered foreign agent. Authorities were assisted in finding him by a defector, Reino Hayhanen, himself a former KGB spy, along with a newsboy's earlier puzzling find of a hollowed-out nickel containing a secret code. Abel (whose actual name was Willie Fisher) was sentenced to serve thirty years in prison. But in 1962, after U-2 pilot Francis Gary Powers was caught red-handed when his spy plane crashed in a Russian field, the United States let Abel go in exchange for the downed flyer.

In 1960, Powers's exposure led two disgusted Americans, National Security Agency (NSA) mathematicians Bernon F. Mitchell and William H. Martin, to defect to Russia with their cryptographic secrets. In a public attack from Moscow, Mitchell and Martin vilified American secret missions over Soviet airspace. HUAC, however, blamed the men's supposed homosexuality for their betrayal.[34] Another NSA employee who also spied in the early 1960s, Jack Dunlap, was never caught. After failing a polygraph test in 1963, Dunlap made several attempts to kill himself; he completed the deed before authorities could unearth what he had stolen from the NSA. The same year, even as Kennedy and Khrushchev signed a comprehensive atomic test-ban treaty, an Air Force employee was successfully apprehended for furnishing the KGB the secrets of the Strategic Air Command's communications technology. John Butenko received a 30-year sentence for his spying.

Unfortunately for the United States, efforts to recruit its own moles to penetrate Moscow's intelligence agencies in this era remained stillborn owing to the paranoia of James Jesus Angleton, head of the CIA's Counterintelligence Staff, who became convinced that working with Soviet double agents would only involve the CIA in a deceptive KGB "monster plot." Persuaded by a defector, Anatoly Golitsyn, that the agency had been already penetrated, Angleton's agency was hamstrung—and yet no mole was disinterred.

By the 1970s, the diplomatic environment of détente prevented much spy catching. Here the story of Valery I. Markelov is revealing. In 1970, Markelov, a UN KGB operative, met a Grumman engineer and told him that he was very interested in that company's F-14 fighter jet. The engineer then contacted the FBI, and the Bureau monitored the two men's meetings over the next two years; at their last meeting, in February 1972, the FBI arrested Markelov with confidential documents in his hands. Soon indicted for espionage, Markelov saw his indictment dismissed by the Nixon administration. Eager to use Moscow's assistance in extricating itself from Vietnam, it claimed letting him go "would best serve the national and foreign policy interests of the United States."[35]

By 1975, however, with the United States' ignominious rout from Vietnam and Communism seemingly on the march around the globe, the bloom had faded from the détente rose. That June, the FBI arrested Sarkis O. Paskalian, one-time director of performing arts at the Armenian General Benevolent Union and a longtime KGB agent, along with his cousin, Sadag K. Dedeyian, a former mathematician at the Johns Hopkins Applied Physics Laboratory, who had supplied Paskalian with information about NATO's strength. Paskalian was given a

22-year sentence, and Dedeyian, a three-year term. The arrests prompted FBI Director Clarence Kelley, sounding much like his predecessor Hoover, to declare that the United States was a "prime target" for Soviet intelligence collection.[36] In summer 1977, the FBI fought back with a so-called dangle operation, sending retiring Navy Lt. Cmdr. Art Lindberg to schmooze aboard the Soviet tourist vessel *Kazakhstan* en route to Bermuda. On the trip, Lindberg snared three men from the Soviet UN Mission who eagerly took his Navy-screened materials on anti-submarine warfare and advanced helicopters until the FBI arrested them in May 1978. Two were tried and sentenced to fifty years in prison, although they were later exchanged for five Soviet dissidents. Not all the spies arrested in this era were working for the Soviet Union, however; Ronald Humphrey of the U.S. Information Agency had earlier provided information to the North Vietnamese delegation at Paris, hoping to free his wife and family from the communists. Unfortunately for him, his go-between was a double agent under FBI supervision. Humphrey and an accomplice got a 15-year term.[37]

Another spy identified in the post-détente Carter administration was CIA official David Barnett, who for nearly $100,000 provided names of agents, materials on submarines and missiles, and other information to the KGB. He was sentenced to eighteen years in jail. As his treatment suggests, the CIA-Justice gag rule had been quashed; in the mid-1970s, Frank Church's (D-ID) Senate Select Committee to Study Government Operations with Respect to Intelligence Activities, which was investigating intelligence agencies' abuses in the post-Watergate era, saw it as an abuse of executive power. President Gerald Ford thus axed the rule, but counterintelligence officials did not entirely drop their resistance to prosecution. When William Kampiles, a disgruntled CIA trainee, stole a top secret manual for a KH-11 military surveillance satellite in 1977 and sold it to the Soviets for $3,000, both the CIA and the Defense Department opposed his going on trial. The CIA was embarrassed by the laxity that Kampiles's espionage case would demonstrate, and the Pentagon worried about maintaining the secrecy of the satellite. As a result, the trial included closed sessions and limits on access to the material in question. Similar measures were employed in the prosecution of Christopher Boyce, a TRW employee who sold defense secrets from his firm to Moscow in 1977, and such provisions were enshrined in the Classified Information Procedures Act of 1980.

Boyce was one of the most famous spies arrested in this era, owing in part to Robert Lindsey's book about his case, *The Falcon and the Snowman* (1979). Though he earned $20,000 for his work, Boyce seems to have been motivated most by a strong disagreement with American foreign policy, especially its unequal relationship with client-states like Australia, which provided bases to support satellite intelligence collection without being furnished full data. Given a 40-year sentence, Boyce escaped from jail three years later—some believed he had been sprung by the KGB—and survived outside for almost two years, helped by a sympathetic woman friend. He hardly laid low; instead, he participated in sixteen bank robberies while on the lam. Upon capture, he got another

twenty-eight years tacked on to his prison term. Boyce initially showed little remorse for his actions, telling an Australian TV audience in 1983: "I think that eventually the United States Government is going to involve the world in the next world war. And being a traitor to that, I have absolutely no problems with that whatsoever."[38] After being beaten up by members of the Aryan Brotherhood at Leavenworth prison, he was transferred to solitary confinement at Marion, Illinois, the federal system's most secure lock-up. This experience seems to have sobered him, for in 1985 he told the Senate Select Committee on Intelligence that espionage was "pretty dirty business . . . it is not what you see on television." Spies, he noted, are "bringing down upon themselves heartache more heavy than a mountain. There is no exit from it."[39] Boyce was released in March 2003.

Not long after Boyce's arrest, lawmakers had authorized more controversial methods to catch even more spies. The Foreign Intelligence Surveillance Act of 1978 (FISA) allowed investigators to wiretap or otherwise secretly monitor suspected terrorists and espionage agents without worrying about violating the Fourth Amendment's protection of criminal defendants from unlawful search and seizure. Under this act, a panel of judges reviews the government's requests for surveillance and almost always accepts them: In 2004, for instance, the panel approved every one of the 1,758 requests put before it for secret surveillance (wiretap authorizations are somewhat more sparingly approved). The requests are much more frequent now than they were before September 11, 2001, not surprisingly. Just days after those attacks, in fact, Congress passed the USA-PATRIOT Act, which makes it even easier for the government to conduct surveillance on Americans and allows agencies to share the results of wiretaps and grand jury proceedings if they relate to foreign intelligence or counter-intelligence. Nevertheless, the Bush administration drew an outcry when it began monitoring foreign phone calls of some Americans without FISA authorization in late 2005.[40]

With measures like FISA and the Classified Information Procedures Act in place, the 1980s saw a huge expansion in the number of espionage practitioners apprehended; authorities arrested sixty-two of them in the oft-named decade of the spy. Given the high-profile American defense buildup of this era, it is not surprising that much of the Soviet espionage at this time focused on military technology. It included, for example, the theft of radar at Hughes Aircraft in Los Angeles, the swiping of materials on the Minuteman Missile from Systems Control in northern California, and the pilfering of Stealth airplane technology at Northrop Advanced Systems. Declared FBI Director William Webster in 1984, "We have more people charged with espionage right now than ever before in our history."[41] Though the FBI deserves credit for cracking these cases, a good number of them originated with the revelations of defectors.

Even the hallowed halls of Congress were not immune from espionage in the 1980s. Randy Miles Jeffries, a stenographic messenger with a history of heroin abuse, twice supplied top secret materials from closed hearings of the House Armed Services Committee to Soviet military officials. He was arrested in 1985

on his third effort and was sentenced to serve from three to nine years. Jeffries, in fact, was the twelfth person charged with espionage in 1985, "the year of the spy." Among those apprehended that year also was Jonathan J. Pollard, a naval analyst who spied for Israel and remains in solitary confinement twenty-one years later. The exact information Pollard provided remains classified but included material on U.S. signals surveillance practices. His sentence was unusually harsh, similar to that meted out to top Soviet spy Aldrich Ames. As recently as February 2006, Pollard's attorneys had filed for the release of documents that would assist in a clemency petition; Pollard has been rejected, though, in every one of his appeals.

Another spy identified in 1985 who also got a life sentence was NSA communications specialist Ronald Pelton. He furnished Moscow agents information about Operation Ivy Bells, a top secret Navy program in which U.S. submarines placed bugging devices on Soviet undersea cables. Famed KGB defector Vitaly Yurchenko brought him to the FBI's attention. Yurchenko also identified CIA agent Edward Lee Howard, whom the agency, now freed from Angleton's anxieties, had hired in 1981 for the delicate task of managing Russians cooperating with the CIA inside the Soviet Union. Yet Howard, like Jeffries, had a history of substance abuse. Once fired, he began passing crucial information to the KGB, resulting in the death of at least one American agent. He averted arrest by escaping to the Soviet Union, the first CIA employee to do so. He died in Russia in 2002.

The most significant spy arrest in 1985 was that of John A. Walker Jr. Walker had first betrayed highly sensitive Navy codes in 1967, when he was a debt-ridden submarine officer, an unhappily married man with four children to support. The Soviets paid him $4,000 a month. Walker left the service in 1976, realizing he would not pass a background check if his ex-wife were interviewed. By then, he had firmly established his network by recruiting his friend Jerry Whitworth, a naval communications specialist, who supplied much cryptographic material. Walker also turned to his family, where his most productive source was his son Michael, a sailor on the U.S.S. *Nimitz* who stole numerous burn bags of classified information before they hit the ship's incinerator. Walker's arrest, too, was a family affair: His ex-wife turned him in.

Before it was rolled up, the Walker ring had provided a vast amount of information, including the codes needed to start nuclear weapons in war, keylists that allowed the Soviets to read naval messages, and the Navy's plans for possible war in Central America. Yurchenko contended that Walker's ring represented "the most important operation in KGB history," even more so than the World War II efforts to acquire nuclear secrets.[42]

Despite the discoveries, some notable new espionage operations began in 1985. It was then that FBI agent Robert Hanssen greatly accelerated his espionage work. It was also in that year that Aldrich Ames of the CIA's Soviet counterintelligence branch launched his nine-year career in Soviet service. While missing Ames, the CIA did discover in the 1980s that its own espionage

operations in Cuba had been compromised for twenty years; all of its Cuban agents actually worked for the Direccion General de Intelligencia (DGI), Castro's secret service!

As these cases indicate, during an era of often tense Soviet-American relations, most of those charged with espionage worked for Moscow and its client-states. There were exceptions: In 1986, Michael H. Allen, a clerk at an American naval air station in the Philippines, stole classified documents that he handed over to the Manila government in exchange for assistance to his businesses, including a cockfighting enterprise. He got eight years in prison. Douglas Tsou, an FBI agent who had escaped from communist China in 1949, was arrested in 1986; he had spied for Taiwan and got a 10-year sentence. In 1988, Thomas J. Dolce received a similar prison term for spying for South Africa at the Aberdeen Proving Ground. At the same time, two Beijing diplomats, Hou Desheng, a military attaché, and Zang Weichu, a consular official, were tossed out of the country for trying to get NSA materials in an FBI sting operation. Similarly stung and chucked out was a Soviet military attaché, Yuri Pakhtusov, who had tried to get secret information from a defense contractor.[43]

The end of the Cold War drew an expanding range of countries into espionage against the United States. During the Gulf War in the early 1990s, Joseph G. Brown, a former member of the Air Force, was arrested for spying for the Filipino government, providing materials on Iraq as well as on the activities of insurgents in the islands. His material came from one of his karate students, a CIA secretary named Virginia Baynes. Indeed, it was the chance to become martial arts teacher at Langley that enticed Brown to return to the United States, where he was arrested as he deplaned in 1992; he got six months in jail. Meanwhile, Ronald Hoffman, an employee of Science Applications International, sold four different Japanese companies the software for designing missiles and identifying rockets from their exhaust trails and received more than $750,000. When his secretary discovered what he was doing, Hoffman quit his job, but then recklessly sneaked in after hours to get more material—and was recorded on camera. A government sting (which proffered the opportunity to sell the technology to South Africa) led to his arrest in June 1990, and he received a 30-month sentence for violating not only the Arms Export Control Act but the Comprehensive Anti-Apartheid Act, too.

This was relatively light compared to the thirty-four years at hard labor meted out to Army artillery specialist Albert Sombolay, who was apprehended the following year for offering his services to the Jordanians and Iraqis. Not all military personnel faced such a stiff sentence for spying for Middle Eastern governments. U.S. Navy Lt. Cmdr. Michael S. Schwartz had passed classified material to the Saudi navy in the early 1990s while stationed in Riyadh. Arrested in May 1995, he professed to have done it in a zealous attempt to assist Saudi—U.S. relations during the Gulf War. He avoided jail, suffering only the loss of military benefits.

The fall of the Berlin Wall also allowed U.S. authorities to discover spies for the defunct East Bloc. One of these, Jeffrey Carney, a former Air Force

intelligence operative, had spied for East Germany since the early 1980s, defecting there in 1985. He continued to work for the Stasi on the other side, and was arrested in 1991 when the security service archive was opened; he was sentenced to thirty-eight years in prison, later reduced to twenty years. Another, more significant East Bloc case was the Lee Conrad spy ring, first cracked in 1988. Conrad, a U.S. Army sergeant in Germany, sold secrets to the Soviet bloc for thirteen years. Members of his extensive ring included Kelly Therese Warren, a secretary in the 8th Infantry Division headquarters in Germany. Arrested in 1997, she provided material to Conrad for Hungary, including NATO plans for the defense of Western Europe in case of a Soviet attack. For the mere $7,000 she'd earned, she got a 25-year sentence.

As these cases suggest, the military continued to be a prime recruiting ground for spies. But it had no monopoly on illicit intelligence gathering. John Lalas was a State Department officer who spied for the Greek government for more than a decade and a half before he was arrested in Virginia in 1993, after he had provided over 700 documents to Athens on everything from military strategy to the names of CIA agents. The United States was tipped off by the comments of a Greek embassy official, and Lalas got a 14-year sentence. Another State Department officer, Geneva Jones, was also arrested in 1993. With a top-secret clearance in the Bureau of Politico-Military Affairs, she gave thousands of secret State Department cables, mostly related to Somalia and Iraq, to a West African journalist named Dominic Ntube. The materials appeared in African magazines and got as far as the hideout of Liberian rebel leader Charles Taylor. She received a sentence of 37 months in prison for sneaking out documents (which she had wrapped up in grocery bags and newspaper) and "the unlawful communication of national defense information," a violation of the Espionage Act.

Government and military employees, though predominant, are hardly the only practitioners of espionage. Foreigners resident in the United States—like Jacob Golos, Andrei Shevchenko, and Arthur Adams earlier—still do their share. In 1993, an FBI sting caught Yen Men Kao, who along with other Chinese had tried to buy military technology that was illegal to export, including jet engines, jet radar, and plans for a Navy torpedo. He was deported, but not prosecuted, in the interest of preserving Beijing–Washington relations, leaving behind his family and two Chinese restaurants.

But certainly the most damaging clandestine information sharing in recent years has been carried out by employees of the nation's intelligence agencies—no surprise, given their privileged access. As head of the CIA's counterintelligence service in Europe, Aldrich Ames was officially charged with closely scrutinizing Soviet activities, and thus it is hard to think of a more valuable source for the Kremlin. He is reputed to have destroyed more than 100 U.S. anti-Soviet operations, as well as contributed to the deaths of 10 agents. The deaths were not hard to miss, and the CIA began a major effort to find their mole, soliciting the FBI's help for the first time. For too long, however, Ames's grandiose life style, supported by the $2.7 million he received from the Soviets, went unsuspected.

Finally nabbed in 1994, Ames got a life sentence with no chance of parole. His wife, Rosario, received five years for collaborating with him. Though the CIA fumbled here, the FBI itself took hundreds of agents out of counterintelligence operations in the late and post–Cold War era, deploying them instead in the fight against new threats such as drug-inspired violence. Such a focus allowed Soviet spies like Robert Hanssen to operate for years unsuspected within the Bureau.

The Ames arrest did spur Congress to pass the Violent Crime Control and Law Enforcement Act, which restored the death penalty for spying under certain conditions, including passing materials that resulted in the death of a U.S. agent. It also removed the 10-year statute of limitations on espionage. The Rosenbergs remain the only convicted U.S. spies to be executed, however. Prosecutors know that dead spies don't talk, and they have been loath to give up the opportunity to unearth details from them.

The new law allowed for the apprehending of espionage agents who had not been active for decades. In February 1996, the FBI arrested Robert Stephan Lipka in Millersville, Pennsylvania, after he was identified by Vasili Mitrokhin. As a 19-year-old NSA clerk thirty years earlier, Lipka had provided documents on communications intelligence to the Soviet Union and earned $27,000. With no statute of limitations in effect, Lipka received an 18-year sentence for this youthful malfeasance. A rather more impressive catch that year was Harold James Nicholson, former branch chief of the CIA's Counter-Terrorism Center, still the highest ranked CIA operative to be arrested. Between 1994 and 1996, he provided identities of CIA agents and sources, as well as everything else he could get from the CIA's secret computers. Nicholson agreed to cooperate, and his jail term was negotiated to 23½ years.

Though Jonathan Pollard remains the most famous, numerous spies have worked for allies of the United States, including Robert Chaegun Kim, a computer whiz at the Navy, arrested in 1996 for passing a large amount of classified military-intelligence material to South Korean naval attaché Baek Dong-Il. Kim, who apparently operated out of loyalty to his home country, got a 9-year sentence. Another man who attempted to spy for a friendly country was Jean-Philippe Wispelaere, who worked for the Australian Defense Intelligence organization, where he had access to highly classified U.S. materials derived from satellite spying. In 1999, he quit his job and tried to sell documents to the Singapore embassy in Thailand, whose staff told U.S. officials, enabling them to catch him in a sting. Flying into Dulles to receive his expected payment, he was arrested and ended up with a 15-year sentence.

Perhaps one of the more ambitious spy operations in the 1990s was orchestrated by Fidel Castro's government, itself the historic target of U.S. intelligence agents' sometimes obsessive plotting. Under the leadership of Cuban intelligence, the Red Wasp network, led by Gerardo Hernandez, infiltrated anti-Castro groups in Florida as well as U.S. defense installations like the Boca Chica Naval Air Station in Key West, in part to thwart possible U.S. attacks on Cuba. The group, which included both Cubans and Cuban Americans, was arrested in 1998;

three of the men got life sentences, though no secret information ever got back to Castro.

As this and other cases confirm, national loyalty continues to play a role in motivating spies. So, too, does ideology, as the case of Kurt Stand and his wife, Therese Marie Squillacote, suggests. Stand, a labor functionary, and his wife, who worked at the Department of Defense, were arrested with their friend James Clark in 1997 for spying for Russia and East Germany. Stand had been a spy for East Germany for twenty-five years, beginning in the early 1970s; all three had been leftist activists, even communists. Squillacote, who began her spying in 1980, indeed saw it as an "anti-imperialist" activity. Despite their political leanings, Stand earned $25,000. The FBI discovered them after Squillacote tried to offer her services to the South African Communist Party in 1995; the couple got lengthy sentences four years later.

Many Americans were eager to spy for the East Bloc, both within and without the United States, and Russian diplomats continued to assist in this task. In December 1999, the FBI found and arrested Stanislav Gusev dawdling in front of the State Department. Gusev, an attaché at the Russian embassy, was remotely controlling a listening device that had been secretly installed in a seventh-floor conference room down the hall from the offices of Secretary of State Madeleine Albright. Paul Redmond, former head of counterintelligence at the CIA, was surprised by this evidence of interest in State Department meetings, because the United States and Russia were no longer enemies. He thought that technology would be a better target for them: "If I were in Moscow, what I'd want to know is what's Microsoft going to do? What's Sun going to do?"[44]

Overall, however, it was Americans, not Russians like Gusev, who did the most damage. The well-publicized arrest of Robert Hanssen in 2001 capped a 15-year hunt for an agent who was responsible for the deaths of numerous U.S. sources in Russia, and who had sent thousands of documents to that country over a 22-year career in espionage, earning $600,000 in cash. Hanssen was the supervisor of the FBI's intelligence division—a perfect place to prevent himself from being discovered. He handed over extensive U.S. analyses on such subjects as Soviet nuclear strength and the American ability to withstand a nuclear attack, as well as top secret documents on U.S. intelligence activity, from satellites to radar to a prospective tunnel under the new Soviet embassy in Washington. He also supplied Moscow with the identities of fifty sources, several of whom were executed because of his betrayal, including one of the United States' most important agents, Dmitri Fedorovich Polyakov, or TOPHAT, executed in 1988. The government paid well to seal Hanssen's fate; the defector who produced crucial evidence in the case—including a garbage bag of documents with Hanssen's fingerprints—received $7 million and a new life in the United States. This generous remuneration was a far cry from the agency's bungling treatment of Krivitsky sixty years earlier. Hanssen was sentenced to life without parole in 2002.

Despite the fame of Hanssen, Russia has hardly been the only nation interested in American military technology in recent years. Peter H. Lee, a physicist at

Los Alamos, provided secret nuclear information in lectures to Chinese scientists during a 1985 visit to the PRC. Over a decade later, when he worked at TRW, he made another trip to China and provided more information about his work. He confessed in 1998 and got one year in prison, as well as 3,000 hours of community service. But when another Chinese physicist at Los Alamos named Lee was arrested in 1999, it turned out to be an embarrassing mistake. The FBI had learned that the Beijing government had obtained information about a highly advanced atomic weapon, a miniaturized warhead called the W-88, and suspicion fell on Wen Ho Lee, whose downloading of classified documents onto his own computer and associations with suspected spies had also drawn their suspicion. Lee, however, claimed he was innocent. He was nevertheless placed in solitary confinement for nearly a year, partly based on false information. When the case began to fall apart, Lee was freed in return for agreeing to a lesser charge rather than espionage. This blunder, along with the Hanssen debacle, contributed to the resignation of FBI director Louis Freeh.

The FBI's stumbles here, of course, paled in comparison to the intelligence community's shock at the terrorist attacks of September 11, 2001, a catastrophe that is still being dissected. The attacks, too, had a significant impact on the fate of accused spies who had nothing to do with these events. Caught before the attacks early in 2001, Hanssen's case never went to trial; his lawyers, like Ames's, plea bargained for him. By contrast, Brian P. Regan, a National Reconnaissance Office employee who was arrested in August 2001 for offering to sell information to Iraq, China, and Libya, did go on trial, where he faced the very real possibility of the death penalty. As legal analyst John Parry noted at the time, "Giving things to the Russians is bad, but not threatening in the same way as giving things to irrational terrorists." Defense lawyers, however, argued that a letter to Saddam Hussein found on Regan's computer was part of his "fantasy" of espionage rather than evidence of genuine spying. Regan's lawyers got him life in prison. Five months later, his effort seemed less of a fantasy when shovel-wielding FBI employees unearthed 20,000 pages of documents, as well as CD-ROMS and videotapes, that Regan had buried in nineteen different digs in two state parks in Virginia and Maryland.[45]

Another case affected by the post–September 11 environment demonstrated, too, that ideology has not died as a motive in espionage, despite the typical cash basis of the practice. That very September, authorities apprehended Ana Belen Montes, a Defense Intelligence Agency Cuban analyst who had spied for Cuba since 1985. She pled guilty to espionage in March 2002, her work based inspired by her beliefs "that U.S. policy does not afford Cubans respect, tolerance and understanding." Montes was sentenced to twenty-five years in prison.[46]

Although espionage is normally associated with governmental or military intelligence gathering, in the post–Cold War era Americans grew increasingly alarmed about commercial spying as well. "The threat of economic and industrial espionage looms over the horizon of the business world like a gray cloud threatening a placid sea," warned Congresswoman Ileana Ros-Lehtinen (R-FL)

in 2000.[47] Congress had already taken action, passing the Economic Espionage Act in 1996. Within two years, the FBI had 700 economic espionage investigations in process; each field office, moreover, had a white-collar crime section to address this issue. Though some of the more notorious cases tried under this act involved foreign firms illicitly collecting American technology, most economic espionage continues to be conducted by employees.

One of the first cases tried under this law involved a Taiwanese firm, Yuen Foong Paper Manufacturing, in 1997, which had tried to gain technology for a treatment of ovarian cancer from Bristol-Myers Squibb. In a second case, also in 1997, another Taiwanese company, Four Pillars Enterprises, was discovered to have paid an employee of Avery Dennison for adhesive technology for nearly a decade, costing the company $50 million. But a recent case is more typical. In December 2005, Suibin Zhang, an ex-employee of Netgear, a Silicon Valley software company, was charged with stealing secrets from one of his former firm's vendors and providing them to his new employer across the Valley. He faces up to ten years in prison if convicted.

Despite the post-9/11 tightened security environment, military espionage cases have hardly disappeared in recent years. Indeed, this period has created a new enemy and potential perpetrator of espionage: Al Qaeda. In 2004, Ryan Anderson of the Washington State National Guard was arrested in an FBI sting operation for trying to sell military secrets to men he thought were Al Qaeda operatives, including information on how to kill his fellow soldiers inside Humvees. He had been discovered in an Islamic Internet chat room by another citizen monitoring these communications, on the eve of his guard unit's departure for Iraq in late 2003. His defense lawyers asserted that he was both autistic and manic depressive, but he still received a life prison term.

Along with the prospect of new enemies, old allies continue to spy on the United States. In October 2005, Leandro Aragoncillo, a member of Vice President Dick Cheney's staff, sent White House and FBI secret records to Filipino associates plotting a coup. The case's origination in the White House was notable, as the executive mansion has generally been free of spies. During that same month, the U.S. charged a Defense Department official, Lawrence A. Franklin, with spying for Israel. Franklin had provided secret materials to the American Israel Public Affairs Committee (AIPAC) as well as to an Israeli diplomat in hopes they would use it to affect U.S. policy. In a startling move, the government charged his AIPAC contacts with violating the Espionage Act because of their "unauthorized retention and transmission of national defense information." The lobbyists to whom Franklin spoke, Steven Rosen and Keith Weissman, are the first two people outside the government to be so indicted. A former Justice Department official, Viet D. Dinh, who himself assisted in drafting the USA-PATRIOT Act, condemned this action, declaring that it "presents a novel case because the listener has no [evidence] for knowing what relates to national defense."[48] Perhaps it is not so novel, considering how many were prosecuted for violating the espionage act in World War I for doing even less.

In sum, by the early twenty-first century, spies are drawing their motivation from more varied sources than ever, from political and ideological sympathies to nationalist inclinations to commercial gain. The countries involved are similarly diverse. Though the FBI no longer sees espionage as the country's "biggest threat," it is still the agency's second priority, after terrorism, as the Bureau's website indicates. No doubt only more unexpected challenges and crises await, and catching spies, especially in defense-related areas, is likely to remain a key government concern.[49]

THE SUCCESSES AND FAILURES OF FBI COUNTERINTELLIGENCE

ATHAN THEOHARIS

RELYING ON DEPARTMENTAL CONTINGENCY FUNDS, ON June 29, 1908, Attorney General Charles Bonaparte established by executive order a special investigative force within the Department of Justice, the Bureau of Investigation (formally renamed the Federal Bureau of Investigation, FBI, in 1935). Bonaparte's decision in effect contravened recent congressional actions of 1907–1908 that first rejected the attorney general's request to fund a special agent task force and then barred the Justice Department from contracting for the services of Secret Service agents. Because his decision violated the intent of these actions (although the 1870 statute creating the Department of Justice authorized it to prosecute "and detect" federal crimes), Bonaparte was forced to assuage congressional concerns. During January 1909 testimony before a House Appropriations Subcommittee, the attorney general emphasized the need for such a force, stressed that it would only investigate violations of federal statutes, and pledged to monitor its operations closely to ensure that agents would not violate privacy rights or monitor political beliefs. The size of this agent force (thirty-four in 1909) and Bonaparte's assurances deterred congressional opposition. Congress nonetheless approved appropriations in 1909 confining the Bureau of Investigation to "detection and prosecution of crimes against the United States."

Congress revisited this restriction in 1910, empowering the newly created Bureau to conduct "such other investigations regarding official matters under the control of the Department of Justice as may be directed by the Attorney General." This more permissive standard was triggered by the enactment that year of the Mann (or White Slave Traffic) Act criminalizing the transportation of women across state lines "for the purpose of prostitution, or for any other immoral purpose." Not only had Congress thereby expanded the definition of interstate

commerce crimes but a numerically larger force would be required with agents stationed outside Washington, D.C., subject to the supervision not of the attorney general but the bureau director.[1]

The belated (April 1917) U.S. military involvement in World War I did not fundamentally change the Bureau's role as a law enforcement agency. Its wartime investigations focused on alien residents, prominent antiwar critics, and radical activists. Those targeted included Socialist Party officials Charles Schenck and Eugene Debs, leaders of the radical Industrial Workers of the World Union, Senator Robert LaFollette, social reformer and pacifist Jane Addams, black nationalist leader Marcus Garvey, prominent Irish nationalist Eamon de Valera, and the anti-British and pro-Irish Hearst press and *Chicago Tribune*. The Bureau's most controversial actions, however, involved the arrests of hundreds of suspected "slackers" in New York City in 1918 and the arrests of 6,000–10,000 citizens and alien residents during dragnet raids of January 1920, the so-called Palmer raids. All were law enforcement operations, initiated on the suspicion that the targeted subject had violated either the Espionage Act of 1917, the Conscription Act of 1917, or the alien radical deportation provisions of the 1917 and 1918 immigration acts.[2]

Subsequent revelations that in the postwar years Bureau agents intensively monitored political and labor union activities and even investigated members of Congress instrumental in triggering a congressional investigation of the involvement of senior Harding administration officials in the Teapot Dome scandal, led President Calvin Coolidge to dismiss Attorney General Harry Daugherty in 1924. Harlan Fiske Stone, Daugherty's successor, in turn fired Bureau Director William Burns and issued a series of orders to preclude future FBI abuses. These included banning wiretapping and restricting investigations to violations of federal statutes. Investigations of political activities, though scaled back, were not wholly abandoned. Bureau Director J. Edgar Hoover (Burns's successor) encouraged concerned citizens to continue reporting on such activities while the FBI's agents were to report such information as coming not from their investigations but "sources." Bureau files on organizations such as the American Civil Liberties Union and the Communist Party (for a time during the 1920s renamed the Workers Party) continued to be developed.[3]

The real shift in the FBI's role occurred in the mid-1930s when it began to conduct intelligence investigations having no direct law enforcement purpose. The catalyst to this new role stemmed from twin domestic and international crises: the Great Depression at home and the international policies of Nazi Germany and the Soviet Union. The devastating economic crisis of the Great Depression caused many Americans to question the nation's economic and political institutions with some joining fascist and communist movements. Concurrently, as "subversive" powers committed to furthering their own international goals, German and Soviet officials sought to recruit American fascists and communists to conduct espionage.

President Franklin Roosevelt accordingly turned to the FBI to neutralize this perceived foreign-directed security threat. In May 1934, in a one-time response,

the president directed the FBI to conduct "an intensive and confidential investigation of the [American] Nazi movement with emphasis on anti-American activities having any connection with German government officials." Then, in August 1936, he met with Hoover to discuss "the question of subversive activities in the United States, particularly Fascism and Communism." Roosevelt was particularly concerned that "some [domestic] organizations would probably attempt to cripple our war effort through sabotage." No U.S. agency was acquiring "general intelligence information" about such "subversive activities," Hoover responded but then claimed that a 1916 appropriation statute would provide the authority allowing the FBI to conduct such investigations at the request of the State Department. Roosevelt orally concurred while emphasizing the need for secrecy (for domestic political as much as for security reasons).[4]

The sensitivity of intelligence investigations (which lacked any law enforcement purpose) ultimately posed a bureaucratic problem for FBI officials, because the 1916 statute required a State Department request to trigger them. In response to FBI pressure, on June 26, 1939, Roosevelt assigned to the FBI and military and naval intelligence sole responsibility for all such investigations. Then, in a series of delimitation agreements concluded with military and naval intelligence in 1940–42, the FBI acquired a monopoly over all domestic intelligence investigations—with military and naval intelligence investigations confined to military personnel and base security (which would include weapons programs such as the Manhattan Project).[5] FBI officials also expanded authorized investigative techniques. To anticipate espionage and sabotage, Roosevelt secretly authorized FBI wiretapping in May 1940 during "national defense" investigations—even though the 1934 Communications Act banned wiretapping and the Supreme Court ruled in 1937 that this ban applied to federal agencies and in 1939 required the dismissal of any indictment based on evidence obtained through wiretaps. On his own, Hoover authorized FBI break-ins of targeted individuals and organizations to install microphones or photocopy records, a series of mail-opening programs (to intercept and open mail transiting through the United States from identified foreign countries), and the cooperation of telegraph and cable companies access to cable traffic involving thirteen identified foreign countries transiting to and from the United States.[6]

Roosevelt's concerns that German agents might seek to exploit anti-Yankee sentiments in Latin and South America also led him to expand the FBI's counterintelligence role. Dating from 1940, FBI officials worked out with William Stephenson, the head of the British Security Coordination (BSC) stationed in New York City, a liaison relationship to ensure that German agents active in Latin and South America would be closely monitored. Then, on June 24, 1940, Roosevelt authorized the FBI to conduct "foreign intelligence work in the Western Hemisphere on the request of the State Department." In response, Hoover created a Special Intelligence Service (SIS) with FBI agents assigned as "legal attachés" to U.S. diplomatic missions in the capitals of eighteen nations in the region. The combination of the FBI-BSC liaison program and the FBI's SIS led to

the detection during World War II of 832 German espionage agents, the apprehension of 336, and the shutting down of 24 clandestine radio stations used by German agents to communicate with Berlin and with other agents in Latin America.[7]

In contrast to its successful counterintelligence role in Latin and South America, FBI counterintelligence operations within the United States had mixed results—striking successes and major failures.

In 1938 FBI agents arrested Guenther Rumrich and three other members of a German-directed espionage ring operating out of New York City (although another fourteen co-conspirators escaped arrest by fleeing to Germany). Dating from 1927, German intelligence operatives had recruited German American citizens and German alien residents to infiltrate defense plants (particularly those engaged in airplane and ship construction) and the U.S. military to obtain information about U.S. military technology and tactics, defense planning, and shipping operations in the port of New York. The acquired information was then relayed to Germany through couriers who were either passengers or employed in the shipping industry. In June 1941, moreover, FBI agents successfully shut down another German espionage operation, headed by Frederick Duquesne and involving thirty-three citizens and resident agents, that sought to relay sensitive defense information to Germany through a shortwave radio station in Centerport, Long Island. And in an even more dramatic success, FBI agents in 1942 arrested two four-man teams of German saboteurs, one that had landed in Amagansett, Long Island, and the second in Jacksonville, Florida. These teams' purpose was to sabotage American transportation and industrial facilities along the East Coast, an aluminum plant in Tennessee, and locks on the Ohio River.

The FBI's successes in the Rumrich, Duquesne, and German saboteur cases resulted more from good luck than FBI investigative prowess. In the Rumrich case, the original lead came in September 1935 when a customs officer apprehended William Lonkowski (a German agent sent to the United States in 1927) when boarding the liner *Europa* with film strips and letters concealed in a violin case. Alerted to German espionage plans, FBI officials received a further break when Rumrich blatantly attempted to obtain blank American passport forms in February 1938. Interviewed by military intelligence agents, Rumrich admitted his role. Military intelligence thereupon referred the matter to the FBI, and, in return for leniency, Rumrich identified the other participants in this operation. In the Duquesne case, German intelligence operatives had pressured William Sebold (an American citizen of German descent), during a family visit to Germany, to serve as a spy. When returning to the United States, however, Sebold contacted the FBI and agreed to participate in an elaborate sting operation. FBI agents assisted him in setting up a shortwave radio station to relay to Germany information obtained by their recruited spies. The apprehension of the German saboteurs was equally fortuitous, the byproduct of the inadvertent discovery of the landing of one of the four-man saboteur teams by Coast Guardsman John Cullen, when patrolling the beach near Amagansett. The saboteurs claimed to be fishermen

and paid Cullen a bribe. Having overheard them speaking German, a suspicious Cullen returned the next morning to discover the equipment and uniforms that the four men had buried in the sand. He immediately brought this discovery to the attention of the FBI. In the interim one of the four saboteurs, George Dasch, fearing discovery, approached the FBI and told agents the cover names and possible contacts of the other members of his team and the second team that had landed in Florida.[8]

Ironically, the most serious security threat was posed not by a wartime adversary, Nazi Germany, but a wartime ally, the Soviet Union. The FBI, however, failed to discover the scope of Soviet espionage activities during the prewar and wartime years. Dating from the late 1930s and continuing after the United States and the Soviet Union became military allies in 1941, FBI agents closely monitored Soviet embassy and consular officials stationed in the United States (as well as Soviets assigned to the wartime Soviet Government Purchasing Commission) and high-level American Communist Party officials. The scope and intensity of this counterintelligence effort cannot be fully documented either because relevant FBI documents remain classified or when released are heavily redacted. At a minimum the FBI wiretapped the Soviet embassy, the headquarters of the American Communist Party, and a host of radical labor union and political organizations; bugged meetings that Soviet officials or American communists attended; intercepted the mail of communist officials and activists; and broke into the offices and residences of prominent American communists and other radical activists. In these efforts, FBI agents sought to uncover activities "detrimental to the national defense of the United States with respect to espionage, propaganda activities and otherwise."[9]

Nonetheless, despite the intensity of FBI counterintelligence operations, the Bureau's agents failed to uncover the involvement of American communists and Soviet officials in espionage during the World War II era. These included the pilfering of FBI files by Judith Coplon, a communist employed in the Department of Justice; the atomic espionage activities of David Greenglass and Theodore Hall; and the pilfering of classified information for delivery to the Soviets by two rings of communists employed in various wartime agencies, one headed by Victor Perlo and the second by Nathan Silvermaster.[10]

The FBI, it must be emphasized, had not been deterred from seeking to learn about Soviet and American communist espionage activities by a Roosevelt administration indifferent to the employment of communists and motivated to sustain U.S.–Soviet cooperation, or because of the priority of German counterintelligence operations. In fact, Attorneys General Robert Jackson and Francis Biddle approved all FBI requests to wiretap the Soviet embassyand Communist Party headquarters and identified communist and radical activists. Furthermore, dating from 1940, FBI officials assured the White House that they had the situation in hand. In a 1941 report, for example, FBI Director Hoover claimed that the FBI's "active and intensive [counterintelligence] operations are carried on in keeping under observation and constant study the operations of the German,

Italian, Soviet and Japanese Agents. . . . The identification of all major representatives of the Governments specified are known and their activities are under constant scrutiny." Earlier in 1940, Hoover reported that FBI agents were able to "maintain a careful check against the channels of communication, the sources of information, the methods of finance, and other data relative to" Soviet, German, French, and Italian agents.[11]

Hoover's 1940 and 1941 reports had been prepared at a time when the United States was neutral and when the Soviet Union and Germany still adhered to a 1939 nonaggression pact. FBI surveillance of Soviet officials and American communists, however, did not abate and instead intensified after the United States and the Soviet Union became allies following the Pearl Harbor attack. Indeed, in post-1941 reports to the White House, the FBI Director emphasized the possibility of Soviet (and communist) subversion. Yet the only information that he reported about Soviet officials and American communists involved their efforts to influence either U.S. policy toward the Soviet Union, individuals of Baltic or Eastern European descent, or congressional legislation. Alternatively, Hoover cited communist efforts to influence labor union, youth, and civil rights movements.[12] This total failure to uncover the reality of Soviet espionage is documented by a December 1944 report on FBI "espionage and counter-intelligence operations" having "ramifications within the United States" that only cited the actions of German agents or double agents.[13]

Two cases in particular highlight this counterintelligence failure. The first is a massive FBI investigation of planned Soviet espionage activities and the second is the response of senior FBI officials to the defection of Victor Kravchenko, a Soviet official employed in the Soviet Government Purchasing Commission.

Through a wiretap of Communist Party headquarters, FBI officials learned that Communist Party leader Earl Browder had alerted a West Coast Communist Party activist, Steve Nelson, about a forthcoming sensitive initiative. Bugging Nelson's residence in Oakland, California, FBI agents intercepted Nelson's meeting with Soviet embassy official Vassili Zubilin in April 1943, at which time Zubilin gave Nelson a large "sum of money" for the express "purpose of placing Communist Party members and agents in industries engaged in secret war production in the United States so that information could be obtained for transmittal to the Soviet Union." Thus alerted to a planned Soviet espionage operation involving the recruitment of American communists, FBI officials benefited further with the receipt in August 1943 of an anonymous letter to Hoover that identified by name a number of Soviet officials who were purportedly involved in espionage (some employed in the Soviet embassy and others in Soviet consulates, the Soviet trading company Amtorg, or the Government Purchasing Commission).

In response, Hoover ordered a massive FBI counterintelligence operation, code named COMRAP (Comintern Apparatus), one that had the advantage of focusing on identified Soviet and Communist Party officials. FBI agents followed these individuals and from them followed those with whom they were in contact,

eventually totaling forty-six. Lasting two years, the FBI's COMRAP investigation (which extended beyond physical surveillance to include the extensive use of wiretaps, bugs, break-ins, and mail opening) failed to uncover a single instance of Soviet or American communist espionage. Indeed, a December 1944 report summarizing the results of this investigation claimed only that the suspects had distributed "pro-Russian propaganda" through the media and communist front groups to "influence the people and Government of the United States toward acceptance of Soviet foreign policy," to recruit new Communist Party members, to "collect political information of value to the USSR," to "secure information of value to the [Communist] Party," and to promote "the employment of Communists in Government work."[14]

This failure raises questions about FBI counterintelligence capabilities. In part, FBI efforts were neutralized by the safeguards adopted by Soviet officials, as trained professionals, to avert discovery. Equally important, FBI agents had focused on prominent communist leaders and not low-level functionaries (some of whom had severed contact with the Communist Party). FBI agents even failed to follow up on what could have been a promising lead—their discovery, through monitoring one of the COMRAP suspects, Louise Bransten, of her December 1944 meeting in Washington, D.C. with Nathan Silvermaster and Charles Flato. Silvermaster at the time was the subject of a Hatch Act investigation (authorizing the dismissal of any federal employee who was a Communist Party member). FBI officials first learned of Silvermaster's role as head of one of two Soviet espionage rings (and Flato's role as a contributing member) in November 1945 with the defection of the courier for these two rings, Elizabeth Bentley.[15]

A second FBI counterintelligence failure involved defector Victor Kravchenko. Alerted in February 1944 to Kravchenko's pending defection (formally announced in April 1944), FBI officials obtained Roosevelt's and Attorney General Francis Biddle's unqualified authorization to pursue this matter. (Hoover had sought such assurances in light of the potential impact on U.S.–Soviet relations.) Meeting with Kravchenko in March 1944, FBI agents learned that he was willing to brief them about the "espionage activity of Soviet representatives in the United States," about other "illegal conspiracies" between Soviet representatives and U.S. defense firms, about the "activities" of Soviet intelligence agents in the United States, and about the organization and plans of the Soviet Communist Party and the NKVD (the predecessor to the KGB). In return for this information, Kravchenko demanded personal protection (including transportation to a safe hiding place and a permit to carry a gun) and limited financial support (namely, "no monetary worries for about a year and a half"). Hoover immediately briefed Biddle about Kravchenko's demands. The attorney general again authorized the FBI Director to proceed as he saw fit. Biddle had concurrently secured Secretary of State Cordell Hull's approval, because this defection could adversely affect already delicate U.S.–Soviet relations. At first hesitant Hull concurred, convinced that this was a "matter of internal security and might involve sabotage," could provide insights into "what the Russians were

doing here," and could serve as a "convenient card" that he could use "when he next conferred" with Soviet officials.[16]

FBI officials, however, failed to exploit this opportunity to learn about ongoing and planned Soviet espionage activities. Instead, they launched an intensive investigation of Kravchenko and those Americans whom he contacted (all prominent anticommunists), suspecting that he "may be an agent" of the NKVD and thus "part of a NKVD scheme to check on the Bureau's activities and attempt to lay some predication for possible embarrassment of the Bureau." In this investigation that lasted until 1945, FBI agents used wiretaps extensively, conducted break-ins, and opened the mail of Kravchenko and his American contacts, in addition to monitoring their activities closely.[17]

The FBI's counterintelligence failures in part resulted from the difficulty of anticipating espionage, but just as important was the essentially political criteria employed to target suspected subversives. In guidelines issued in September 1936, Hoover ordered FBI agents to target "Maritime Industry, Government affairs, steel industry, oil industry, newspaper field, clothing, garment and fur industry, general strike activities, Armed Forces, educational institutions, general activities—Communist and Affiliated Organizations, Fascists, Anti-Fascist movements, and activities in Organized Labor organizations." This focus on radical labor union and political activists was not revised after U.S. military involvement in World War II. Among those targeted were the radical American Youth Congress (during a 1942 break-in of the organization's New York headquarters FBI agents photocopied Eleanor Roosevelt's correspondence with its leaders); Mrs. Roosevelt's contacts with the International Student Association (another radical youth group); anti-Nazi refugees from Germany (Thomas Mann, Bertolt Brecht, Hanns Eisler, Ruth Berlau, Leonhard Frank, Berthold Viertel), suspect because of their Marxist political views; and communists employed in the Hollywood film industry (targeted in 1942 under a code-named COMPIC program). Ironically, the catalyst to the COMPIC investigation was Hollywood's production of antifascist and pro-Soviet films (such as *For Whom the Bell Tolls* and *Mission to Moscow*), confirming that FBI officials' underlying concern was that communists could influence the popular culture.[18]

The reality of Soviet espionage became publicly known with Elizabeth Bentley's congressional testimony in August 1948, with the congressional and grand jury testimony of another communist defector, Whittaker Chambers, in August/December 1948, with the arrest in March 1949 and subsequent trial of Judith Coplon, and with the arrest in 1950 and subsequent trial of the Rosenbergs.

These publicized Soviet espionage activities had occurred three to six years earlier in 1944–45 (with the exception of Coplon, who remained a government employee at the time of her arrest). During the resultant investigations and media exposés, however, no question was raised about a seeming FBI counterintelligence failure. The FBI instead was credited with having ensured the convictions of Coplon, Alger Hiss, and the Rosenbergs. And although Coplon's conviction was reversed on appeal, owing to the failure of FBI agents to have obtained a

warrant and to having wiretapped her, even this reversal did not raise questions about methods or capabilities. The debate over Soviet espionage operations instead centered on the actions of the Roosevelt and Truman administrations, with the main accusation leveled by McCarthyites that these administrations' "softness toward Communism" had enabled disloyal communists to obtain federal employment and had also hamstrung the FBI from uncovering Soviet espionage.

This public debate was misplaced. In reality, the Roosevelt and Truman administrations had given FBI officials wide latitude to conduct counterintelligence operations (with Roosevelt authorizing FBI intelligence investigations as early as 1936, in 1940 secretly authorizing "national defense" wiretapping, and in 1942, reaffirmed by Truman in 1947, authorizing FBI investigations to effect the dismissal of disloyal federal employees). Ironically, the very cases that raised public doubts about these Democratic administrations and that had fostered a positive assessment of the FBI's investigative prowess underscore the Bureau's counterintelligence deficiencies.

The Bentley case indirectly documents this. Her November 1945 detailed account of her role as a courier for two wartime Soviet espionage rings, whose members she identified, first alerted FBI officials to this wartime Soviet espionage operation. The participants in this conspiracy had been able to retain their governmental positions despite a government screening program instituted in 1942 to preclude the employment of disloyal employees. (Under this program, an individual could be denied employment or dismissed should the FBI have uncovered evidence of "a reasonable doubt as to his loyalty to the Government of the United States.") The head of one of these two rings, Nathan Silvermaster, had escaped a Hatch Act firing and, in addition, Bureau agents did not launch an investigation to ascertain his involvement in espionage when learning of his (and Flato's) meeting with Bransten in December 1944.

Based on Bentley's disclosures in November 1945, FBI officials launched a massive investigation of those she identified as Soviet agents. A special squad of 200 agents intensively investigated her claims (concurrently urging her to renew her contact with her Soviet handler, Anatoly Gorsky). And because their main objective was to identify those involved in a suspected, ongoing espionage operation, FBI agents were authorized to employ a series of illegal investigative techniques: wiretaps, break-ins, and mail opening. Nonetheless, as recorded in a March 1970 FBI memorandum, despite having investigated Bentley's charges "over and over again," agents were unable to "substantiate and corroborate" them. An October 1946 report to the Truman White House, following up on the flurry of reports based on Bentley's November 1945 allegations that Hoover had sent to Truman administration officials between November 1945 and March 1946, offers further documentation of this failure. FBI officials then lamely justified their inability to corroborate Bentley's charges as due to the "time element," the alleged conspiracy having dated "back several years." This report continued, "The facts are strong in many instances and circumstantial in others principally because of the disparity in time between the date of these activities

and the actual report of these activities to the authorities."[19] The FBI's "facts," however, only involved the confirmation that the accused individuals knew and met with each other, whether socially, at public meetings, or through correspondence—but not that they engaged in espionage.

In the final analysis, the FBI's failure was the product of bad luck:Soviet officials had been alerted to Bentley's defection by Kim Philby, a secret Soviet agent employed in British intelligence. Apprised by Philby of Bentley's defection, Soviet officials first ordered their operatives in New York and Washington to "cease immediately their connection with all persons known to Bentley in our work," "to warn the agents about Bentley's betrayal," and to return to Russia before they could be interviewed by the Bureau. The recruited American spies were also instructed to deny any involvement in espionage but to admit to having known Bentley because the FBI might already have observed such contact. Although the FBI had failed to confirm the involvement of those named by Bentley in espionage, Justice Department officials convened a grand jury in 1948 hoping to break one of the participants into admitting his involvement and implicating the others. This strategy failed; none of those identified by Bentley was indicted.[20]

FBI officials' immunity from critical scrutiny recurred in what was contemporaneously seen to be its most brilliant counterintelligence success—the uncovering of a Soviet conspiracy to steal atomic bomb secrets. At various times during 1950, FBI agents arrested the participants in this operation—Julius and Ethel Rosenberg, David Greenglass, Harry Gold, and Morton Sobell. Yet despite the fact that this espionage operation had occurred in 1944–45, no question was then raised about this after-the-fact apprehension or about how this conspiracy was belatedly uncovered.

The identification of the participants in this Soviet espionage operation was the consequence not of FBI investigative efforts but a wartime military intelligence program, subsequently code-named VENONA. Military intelligence first intercepted Soviet consular messages sent from New York and Washington to Moscow during the years 1940–48 and successfully deciphered them (with the important breakthrough occurring in 1949–50). Because Soviet operatives had assumed that their communications to Moscow could not be deciphered, their reports at times included background information about their sources, which enabled military and FBI officials to identify the recruits (Greenglass, Rosenberg, Gold) even though these consular messages concealed their identities through code names. The FBI's principal contribution to the resultant prosecution of the Rosenbergs involved pressuring Greenglass, Gold, and Max Elitcher to admit their own involvement and implicating the Rosenbergs and then developing circumstantial information that corroborated their testimony in specific instances.

Military intelligence was responsible for vetting the individuals employed in the Manhattan Project. Nonetheless, under the wartime delimitation agreements, the FBI should have alerted military intelligence officials about all information that FBI agents had developed about the potential disloyalty of any of the Manhattan Project's employees. In this case, the FBI's failure was secondary.

The intercepted VENONA messages, however, pinpoint a more serious FBI counterintelligence failure. In contrast to the Los Alamos project, where Julius Rosenberg's role was indirect (recruiting his brother-in-law David Greenglass, a military recruit assigned to Los Alamos), the VENONA messages confirm that Julius Rosenberg had personally stolen and in addition had recruited two others, Joel Barr and Alfred Sarant, employed in defense-related industries to steal information about sensitive military technology for transmission to the Soviets. The classified information pilfered by these three included information about radar systems, jet engine designs, analog fire-control computers, and the proximity fuse. Barr and Sarant copied and transmitted 9,000 pages of secret documents relating to over 100 weapons programs and the entire 12,000-page design for a U.S. jet fighter while Rosenberg provided the design for the proximity fuse. Military intelligence was again responsible for vetting individuals employed in defense industries, butin this case the FBI failed to follow up when Barr and Sarant switched jobs when denied an earlier clearance. At no time, moreover, did FBI officials authorize investigations to ascertain whether either Rosenberg or Barr had engaged in espionage even when discovering their employment in defense-related work.[21]

Portrayed as the crime of the century at the time, the Rosenberg case was not the sole known instance of Soviet atomic espionage. The deciphered VENONA messages also documented that Theodore Hall (and his friend Saville Sax, who served as his courier to the Soviets) had similarly provided the Soviets with atomic bomb secrets. FBI officials learned of Hall's and Sax's roles at the same time as the Rosenberg-Greenglass-Gold operation. Without assessing the significance of the information that Greenglass had provided the Soviets (he was only a high school graduate), Hall was a particularly valued recruit, having graduated from Harvard College with a degree in physics at the age of eighteen. On receipt of his submissions, Soviet officials in Moscow characterized them as of "great interest" and encouraged further submissions.

Alerted by military intelligence in 1950 to Hall's and Sax's espionage activities, FBI officials launched a massive investigation that included checking files on communist activities compiled during the 1930s and 1940s, breaking into their residences and opening their mail, and monitoring their contacts and activities in 1950–51. Then, in 1951 FBI agents conducted aggressive separate interviews of Hall and Sax, hoping to break one or both of them to admit to their past conduct and implicate the other. In these interviews, FBI agents asked questions based on the documentation of their activities in the deciphered Soviet consular messages. Unlike Greenglass, Gold, and Elitcher, however, both Sax and Hall denied any involvement in espionage. Sax, moreover, brazenly explained why he had traveled to Albuquerque in 1945 (planning to apply for admission to New Mexico University) or why he had visited the Soviet consular office in New York in 1944 (to assist relatives in the Soviet Union through Russian War Relief). Because FBI agents could not break Sax or Hall, this investigation was closed in 1952. "All outside leads have been exhausted,"an FBI

official reported, and the "only indication we have" of Hall's and Sax's "espionage activity" came from VENONA and such information "cannot be disseminated outside the Bureau."[22]

The Bentley, Rosenberg, and Hall cases were not the FBI's sole counterintelligence failures. Another case, highly publicized during the Cold War era, involved former State Department employee Alger Hiss, indicted in December 1948 on two counts of perjury (for denying to a federal grand jury having given classified State Department documents to a known communist, Whittaker Chambers, in 1938). FBI officials first learned of this espionage operation not when it occurred in 1936–38 but when Chambers in November–December 1948 produced State Department documents that he claimed Hiss had given him.

Prior to this dramatic development, FBI officials had failed, first in 1941 and then in 1946, to pursue potential leads that could have uncovered the Hiss–Chambers relationship. In May–August 1941, an FBI informer, Ludwig Lore, told FBI agents of Chambers's "OGPU [Soviet intelligence] Activities in the United States" and his supervision of approximately seventy Soviet agents, and specifically of Chambers's contacts with two "private secretaries to Assistant Secretaries of State" and with another secretary employed by "one of the high officials of the Department of Commerce." Lore claimed that Chambers had obtained from the Commerce Department secretary "all necessary statistical data" and from the State Department secretaries "two extra copies" of the Roosevelt administration's diplomatic correspondence, which they had typed. FBI agents subsequently interviewed Chambers, who admitted only to having been in contact with an "underground group" of federal employees (identifying twenty, including Hiss but no secretaries) whose purpose was to influence government policy. FBI agents did not press him on the differences between his account and that of Lore–Chambers having endorsed their conception of the threat: communist influence on New Deal policy.

Then, in 1946, pressured by an FBI agent about his knowledge of Hiss's activities (the FBI had launched an investigation of Hiss in 1945 based on the suspicion that he might have engaged in espionage, during the course of which Hiss's phone was tapped and his mail opened), Chambers only claimed that Hiss was "favorably impressed with the Communist movement." When the interviewing agent asked Chambers if he possessed any documentary evidence that Hiss had been a Communist Party member, Chambers responded that he did not and then emphasized that he had "never purposefully held out any information and had always been forthright in relaying any information that he had in which the Bureau had shown an interest."[23] Ironically, much like Hiss himself, FBI officials were blindsided when Chambers produced in November–December 1948 documentary evidence (typed and handwritten documents and microfilm copies of State Department documents), which he only then admitted to having acquired from Hiss in 1938.

The FBI's principal contribution to Hiss's indictment, moreover, stemmed from the grand jury testimony of an FBI expert that the typed documents

produced by Chambers had been typed on the same typewriter owned by the Hisses. A further FBI effort to enhance Chambers's credibility to the grand jury (essential because he had abruptly changed his grand jury testimony between October and December 1948, in October denying any knowledge of espionage activity and then in December claiming that Hiss had regularly given him State Department documents since 1936) involved an attempt to identify the individual (known to Chambers only as Felix) who in 1936–38 had photographed the classified documents that Chambers claimed to have received from his government sources. The result was a fiasco—an alleged Felix, Samuel Pelovitz, was produced in December 1948 as a grand jury witness. During his testimony, Pelovitz denied knowing Chambers or to having any photographic skills. Prosecutors then called Chambers who at first identified Pelovitz as Felix but recanted this identification when called back before the grand jury, lamely explaining that Felix was not Jewish, but Pelovitz was. The FBI had produced the wrong man; Pelovitz coincidentally was a former communist and had resided (but not in 1936–37) on the same street (Callow) and city (Baltimore) as Chambers's Felix.[24]

The Hiss case highlights the centrality of luck for FBI counterintelligence successes—in this instance the fact that a communist defector had since 1938 maintained what he described as a "life jacket." The limits of FBI capabilities are further highlighted by another seemingly successful FBI counterintelligence operation—the apprehension of Justice Department employee Judith Coplon as a Soviet spy.

As in the Rosenberg and Hall cases, Coplon's recruitment as a Soviet spy was discovered through the VENONA project. The deciphered messages confirmed that she had been recruited in 1944–45 at the time of her employment in the Department of Justice. Coplon, however, had escaped discovery of her disloyalty whether in 1944–45 or with the inception of the Federal Employee Loyalty Program in 1947. Having first learned of her disloyalty in 1949, FBI and senior Justice Department officials sought to ascertain whether she continued her espionage activities and to identify her Soviet contacts. In the course of this intelligence investigation, Bureau agents wiretapped both her office and home phones (and those of her parents in New York, with whom she frequently visited). Bureau and Justice Department officials eventually decided to launch a sting operation to ensure her conviction for espionage by making available to her carefully selected FBI records that would command her attention but would not compromise the nation's security. Coplon bit, and she was arrested in March 1949 when attempting to deliver twenty-eight FBI records to Valentin Gubitchev, a Soviet intelligence operative assigned to the United Nations staff in New York.

Coplon's attorney petitioned the court during her first trial, demanding the submission of the twenty-eight FBI reports as evidence. When the judge so ordered, FBI officials recommended dropping the case rather than honoring this order—claiming that their public release would harm the nation's security. Justice Department officials rebuffed this proposal. The released records, though

not harming the nation's security, proved deeply embarrassing to FBI officials—confirming that agents monitored political activities and wiretapped extensively (fifteen of the reports were based on wiretaps). Coplon's attorney immediately demanded a hearing to ascertain whether his client had been tapped, a motion that the U.S. attorney prosecuting the case successfully rebuffed as a "fishing expedition." In Coplon's second trial, however, the presiding judge honored the defense's motion for a pretrial hearing resulting in the disclosure that Coplon's office and home phones had been tapped, that the FBI agent who denied any knowledge as to whether Coplon's phone had been tapped had in fact routinely received the results of these wiretaps, and that FBI officials had ordered the destruction of the Coplon wiretap logs "in view of the imminence of her trial." The combination of the revelations about FBI wiretapping activities and the failure of arresting agents to have obtained a warrant ultimately led to her conviction being overturned on appeal.[25]

The Coplon case underscores the problem of attempting to convict individuals when evidence had been illegally obtained through a counterintelligence operation. FBI and Justice Department officials were unwilling to disclose (in this case as in the cases of Hall and Sax) how they had learned of Coplon's espionage activities (and thus the reasonableness of the wiretaps and the failure to obtain an advance warrant). To do so would have publicly compromised the VENONA program.

These Cold War internal security cases had far-reaching political ramifications, lending support to a McCarthyite politics that blamed the Roosevelt and Truman administrations for Soviet espionage successes. Significantly, the McCarthyites never attempted to ascertain the reality of the FBI's responsibility and that FBI officials had been accorded broad latitude by both presidents. Just as important, Soviet recruitment of ideologically motivated federal employees had been foreclosed by the late 1940s owing to the stricter standards governing federal employment instituted by Truman in March 1947 under the Federal Employee Loyalty Program. Henceforth, Soviet officials were compelled to rely on their own agents or to recruit sources based on greed, not ideology.

Soviet officials also employed "illegals," that is, individuals not assigned officially to Soviet consular or embassy offices. One such was Rudolf Abel, a colonel in the Soviet Union's intelligence service, the KGB, who entered the United States from Canada in November 1948 on a false passport. The KGB's resident agent in New York, Abel was uncovered in 1957 due to the defection of another Soviet illegal, Reino Hayhanen. Recalled to the Soviet Union, Hayhanen interrupted his return upon arriving in Paris in May 1957, approaching the U.S. consulate and then advising a CIA officer of his role as a Soviet agent and how he had entered the United States in 1952 under a false passport. In return for a promise of resettlement, Hayhanen described Soviet intelligence activities, identified one of his recruits (Roy Rhodes), and provided background information that eventually led to Abel's apprehension. Hayhanen did not know Abel's cover name or residence but remembered meeting him in a photo studio in Brooklyn.

Based on this lead, FBI officials launched an intensive investigation that eventually led to Abel's arrest on June 21, 1957. Tried and convicted, Abel was released in 1962 in return for the Soviets' release of captured U-2 pilot Francis Gary Powers.[26]

Luck and solid investigation had led to Abel's apprehension. The same combination led to FBI uncovering another Soviet espionage ring headed by retired naval communications officer John Walker Jr., who dating from 1968 had provided the Soviets with sensitive information relating to naval communications. Walker's motives for spying were strictly mercenary; he was quite conservative politically—indeed his political beliefs and background as a private investigator and businessman enabled him to receive security clearances. Walker, moreover, recruited his brother (Arthur), son (Richard), and a friend (Jerry Whitworth) to pilfer classified information. FBI agents uncovered Walker's espionage activities and those of his ring fortuitously in 1984—their first awareness of possible espionage derived from an anonymous letter (written by Whitworth) to the FBI's San Francisco office and then from reports to the FBI's Boston field office from Walker's former wife, Barbara, and daughter, Laura. FBI agents were at first unable to identify the writer of the San Francisco letter and did not immediately follow up on Barbara's and Laura's reports on Walker's espionage activities. An intrepid FBI supervisor finally acted on these reports, triggering an intensive investigation that culminated in the arrests in May 1985 and resulting conviction of John, Arthur, and Richard Walker and Jerry Whitworth.[27]

If the Abel and Walker cases highlight the importance of luck to FBI counterintelligence successes, the FBI's delayed apprehension of Aldrich Ames was primarily the responsibility of officials in the Central Intelligence Agency (CIA). A career CIA officer, Ames was appointed in 1983 the head of the Agency's counterintelligence branch on the Soviet Union and then in 1990 was assigned briefly to the Agency's Counterintelligence Center. Disillusioned with the Agency and motivated by greed, in 1985 Ames approached the Soviets to sell secret information, particularly identifying Soviet officials whom the CIA had recruited as double agents. He continued thereafter, in return for large sums of money, to identify other double agents as well as providing sensitive CIA records. Troubled by the deaths (or disappearances) of these sources, CIA officials suspected a mole, although they did not focus on Ames until 1992 and only sought FBI assistance in 1991 to uncover the suspected spy—having ignored Ames's extravagant life style, sloppy work habits, and excessive drinking. When finally given free rein, the FBI's intensive investigation (including wiretapping and bugging Ames's residence, monitoring his credit card bills and trash, and following him) resulted in his arrest on February 21, 1994, and conviction.[28]

FBI officials experienced similar embarrassment owing to their failure over a 21-year period to uncover another U.S. intelligence official who had also identified to the Soviets the Russians whom the FBI and CIA had recruited as double agents. This spy, Robert Hanssen, was employed in the FBI's counterintelligence

division. After joining the FBI in 1976, Hanssen was assigned to the Bureau's counterintelligence division in 1979 and then in 1983 to that division's Soviet analytical unit, where he had access to sensitive information about FBI counterintelligence programs, the identities of fifty recruited Soviet double agents, and thousands of pages of classified FBI, CIA, and NSA documents. Dating from 1979 he provided much of this information to the Soviets in return for large sums of cash and diamonds. As the result of the death of one of the FBI's recruited double agents in 1986, Bureau officials launched an investigation to identify the mole. Nonetheless, Hanssen escaped detection until late 2000, in part because of the precautions he had taken as a skilled counterintelligence officer (including not disclosing his identity to his Soviet contacts and successfully diverting attention from himself). His arrest on February 18, 2001, was the byproduct of the November 2000 defection of a Russian intelligence officer who, in return for a $7 million payment, delivered to U.S. intelligence the Russian file on Hanssen. This file contained a tape of Hanssen's conversation with a Soviet official (enabling FBI agents to identify his voice) and a bag that he had used to provide documents to the Soviets that contained his fingerprints. Until acquiring this file, FBI investigators had focused on a CIA officer, Brian Kelley, as the suspected mole.[29]

This narrative does not recount the totality of FBI counterintelligence operations. Because of continued classification restrictions, it is impossible to ascertain whether these and other known counterintelligence operations are representative.[30] Nonetheless, the known history of FBI counterintelligence successes and failures permits some qualified observations.

First, FBI failures were not due to incompetence but to the difficulty of identifying carefully trained spies (or, for that matter, terrorists) who had an obvious interest in precluding discovery of their plans. The cases cited herein highlight the importance of luck (most notably the defection of Soviet intelligence operatives). These cases further confirm the impossibility of achieving absolute security. This is highlighted by the recent FBI investigation of the sender(s) of anthrax letters in October–November 2001. Despite the intensity of an FBI investigation that to date has lasted four years, the sender or senders of the anthrax letters remain unidentified. This failure occurred even though FBI investigators had three advantages: first, they knew that such letters had been sent (and did not need to anticipate this possibility); second, whoever sent the letters had to have access to a lab and the expertise to weaponize anthrax; and third, FBI agents had the vastly expanded surveillance authority provided by the 2001 USA-PATRIOT Act.[31]

The Ames and Hanssen cases further confirm the unreasonableness of an expectation of absolute security. Despite the repressive character of Soviet society, and although Soviet intelligence officials closely vetted potential recruits to ensure their ideological loyalty and were not constrained by a need to respect due process or privacy rights, FBI and CIA officials were nonetheless able to recruit Soviet intelligence officers to betray their nation's secrets.

Second, this history highlights that FBI agents either focused on the wrong suspects, ignored tantalizing leads, or (in the Kravchenko case) made unwarranted assumptions. The objective of anticipating espionage inevitably led to a form of profiling where suspects were targeted based on their politics and associations. This suspicion drove the COMRAP investigation, and, more recently, underpinned a recommendation of FBI agent Kenneth Williams.

In a report of July 10, 2001, recommending that FBI headquarters launch a nationwide investigation focusing on Middle Eastern alien residents attending flight schools, Williams cited in particular an Al Qaeda sympathizer, Zakaria Soubra. Soubra had come to Williams's attention because of his public role in organizing demonstrations and meetings against U.S. and Israeli policy in the Middle East, his militant beliefs that the resort to violence in defense of Islam was justified, and his advocacy of a unitary Islamist state. When interviewing Soubra, Williams discerned in his apartment photographs of Osama bin Laden and Chechnyan *muhahedeen*. The FBI's subsequent (post-9/11) investigation of Soubra (and others whom Williams had identified in his July communication) uncovered no evidence that they either had advance knowledge of the September attacks or were co-conspirators. That radical political activism does not predict violence and that anticipating terrorism based on public political activities is nonpredictive is confirmed by Williams's failure to have identified Hani Hanjour as a prospective terrorist. Hanjour had, off and on over the previous five years, attended flight schools in the Phoenix area; but he was not a known public exponent of Islamist views. Yet on September 11, 2001, Hanjour (not Soubra) piloted one of the four commandeered jets, American Airline Flight 77, into the Pentagon.

The *President's Daily Brief* of August 6, 2001, captioned "Bin Ladin Determined to Strike in the US," provides further evidence of the limitations of basing counterintelligence investigations on political criteria. The final paragraph of this document reported that the FBI was "conducting approximately 70 full field investigations throughout the US that it considers Bin Ladin related." None of these investigations, however, involved any of the nineteen terrorists who engineered the 9/11 attack. A July 2, 2001, communication from the FBI's Counterintelligence Division to federal, state, and local law enforcement agencies warning of possible terrorist attacks by groups "aligned with or sympathetic to Usama Bin Ladin [an alternative spelling of the Al Qaeda leader's name, often used by the U.S. government]," moreover, starkly admitted that "the FBI has no information indicating a credible threat of terrorist attack in the United States."[32]

Political (and as well ethno-religious) profiling has serious limitations—and carries the additional risk that such investigations could lead to violations of civil liberties and privacy rights. Indeed, one byproduct of the FBI's counterintelligence investigations of the World War II and Cold War years was the acquisition of information about the political and personal conduct of suspected subversives. Although this information could not be used for legitimate prosecution or

national security purposes, FBI officials in time (on the strict condition that recipients not disclose their actions) purposefully disseminated this information to "reliable" reporters, members of Congress, and congressional committees for the purpose of "influencing public opinion." These covert, and extensive dissemination practices proved crucial to the promotion of a McCarthyite politics.[33]

THE IDEA OF A EUROPEAN FBI

RHODRI JEFFREYS-JONES

THE IDEA THAT THE EUROPEAN UNION (EU) should create its own equivalent of the U.S. Federal Bureau of Information (FBI) has been in circulation for some years. Clearly, 21st-century terrorist attacks, such as those on September 11, 2001, the Madrid bombings of March 11, 2004, and the London bombings of July 7, 2005, have added zest to discussions of the issue. Attention has focused largely, if not exclusively, on the European Police Office, an EU agency founded in 1999, headquartered in The Hague, and universally known as Europol.

Although the phrase "European FBI" trips off tongues and keyboards with some frequency, the position is anomalous. Commentators are sometimes erudite on Europol and its history, but they have shown little knowledge of the FBI itself and of its suitability (or lack thereof) as a model for Europol. Officials in Europol or involved in its governance characteristically deny that any emulation is taking place. German Chancellor Helmut Kohl, a keen promoter of European police cooperation, apologized in 1997 for using the phrase "European FBI." Europol official Søren Kragh Pedersen noted in 2005 that there was no talk of the FBI at Europol headquarters, even if he hinted at some ambivalence because the FBI was "still a good brand name." Yves Joannesse, Europol desk officer at the European Commission, observed in the same year that some commentators were ignorant of Europol and designated the agency a European FBI only in a lazy act of "copy and paste."[1]

There are, then, several reasons for inquiring into the idea of a European FBI. One is simply a matter of originality: Such research has not previously been conducted in a rigorous fashion. Another is the need to explore the contradictions between popular rhetoric about a European FBI and the realities of Europol and the FBI, respectively. If misperceptions have occurred, the historian must dissect

them and suggest the reasons they arose. Still another reason for the inquiry might be curiosity about the processes by which ideas are, in general, transmitted across the Atlantic. Finally, and more assiduously pursued in this chapter, there is the less arcane issue of what the Americans would call "public history," that is, the utilization of history for public betterment and improved government. In other words, on the evidence of contemporary history, what lessons for Europol-led police cooperation can be adduced from studying the history of the FBI?

On the face of it, Europol is a small organization with less than one-twentieth of the personnel of the FBI and a larger population base to serve, so the comparison may seem strained. However, this essay does posit a number of lessons to be learned from the American experience (as well as some areas in which the FBI could learn from Europol). The history of the FBI over a century or more suggests a need for an expanded Europol with at least some federal laws to uphold, for parliamentary oversight, for ethnic and racial diversity, for commitment to the promotion of the Charter of Fundamental Rights of the EU, for proactive analysis to supplement responsiveness to member state police forces in the field of intelligence collection and analysis, and for liaison with member states' intelligence services in anticipation of the development of that would-be phenomenon, a European foreign intelligence service.

The sources for this chapter, as one might expect, are a blend of printed and digital sources on one hand and, on the other hand, primary sources such as unpublished documents detailing the deliberations of Europol's governing body, the EU's Council of Ministers, and, given Europol's recent provenance, oral history interviews. To round out this preamble with a methodological observation, it seems appropriate to note that one is comparing slow and fast history: The United States is much older than the European Union, and the FBI evolved over a substantially longer period than Europol. If Europol has become an incipient FBI, it will have been as the result of accelerated history.

It remains to examine, in turn, various dimensions of the problem of Europol considered as a European FBI. The administrative history of Europol will not be dealt with here because it has been adequately traced elsewhere.[2] The politics of Europol in individual member states and the way in which the FBI issue has played out in those nations is rich and intriguing (in the United Kingdom, for example, there have been calls for a "British FBI"),[3] but such matters are left to future students of history and government. Here, attention will be given successively to the historical background to the international transmission of police intelligence lessons, impediments to understanding, the reception of foreign ideas, the anatomy of European perceptions of the FBI, enumerated facets of actual FBI history and practice of possible relevance to EU/Europol history and development, and, in conclusion, lessons and cautions suggested by the American experience.

To say that American ideas may have migrated to Europe is hardly revolutionary. From Copernicus to Karl Marx, the intra-European transmission of thought has been a self-evident fact, and European ideas have also traveled

further afield. They have beaten a path to America, which, in being well trodden, has furnished a means for reverse intellectual migration. Just as the American founding fathers were recognizably creatures of the European Enlightenment, so the European Union, though largely a response to war and the product of local leadership, came about partly as the result of American encouragement of the idea of a "United States of Europe."[4]

European experiences of policing and intelligence inspired study and occasionally emulation in the United States. The FBI's precursor, the Bureau of Investigation, was established informally in 1908 and given its name the following year. It was also in 1909 that the British domestic security service, MI5, came into existence, but unaware of that, Congress looked to France and protested that the methods of Napoleon's police chief Fouché were being introduced to their country. Soon thereafter, the administration of President William Taft established a Commission on Industrial Relations that looked abroad for inspiration on how to police class violence, and its Research Division concluded that Germany provided the best model.

In the 1930s, FBI Director J. Edgar Hoover wanted to emulate Scotland Yard. According to one school of thought, the British model was the inspiration for the Office of Strategic Services (OSS, established in 1942) and its successor, the Central Intelligence Agency (CIA, established in 1947). In response to the 1960s race riots, a national commission sponsored work on international comparisons. Soon afterward, Princeton University initiated a study of the FBI that elicited comparisons with the Criminal Investigation Departments of British police forces. In the aftermath of September 11, 2001, there was a powerful agitation in the United States, still unsuccessful at the time of this writing, for the FBI to be scrapped in favor of an American equivalent of MI5 (principally on the ground that MI5 concentrates on intelligence work without the distraction of law enforcement duties). Meanwhile, Harvard University supported a study by Adrian Fortescue, formerly Director General for Justice and Home Affairs at the European Commission, on the new U.S. Department of Homeland Security, in which the author suggested that the "EU might learn, but also perhaps teach." Although Americans are prone to think of themselves as isolationist and anti-intellectual, they have been by no means incurious about intelligence and police practices in Europe.[5]

All this suggests a two-way highway. But the idea of a European FBI has provoked opposition. The citizens of member states have periodically suffered from bouts of xenophobia making them liable to oppose *any* foreign idea. Playing the role of big fish in little ponds, their leaders were prone to fight for the preservation of national sovereignty. Member state leaders like Chancellor Kohl had to curb their enthusiasm for European cooperation in police matters not just to appease their own citizens but also to preserve good diplomatic relations with their peers in other countries. They had to remember that it was only in 1991 that the Maastricht Treaty extended the EU's competences to create a legal basis for cooperation on justice and home affairs that included policy cooperation.

The cultural threat posed by the United States could raise hackles in non-Anglophone areas of Europe. The EU allocated funds to the preservation of minority languages like the author's own, Welsh, but there remained the problem of which language or languages should be used for official EU business. When the EU's Council of Ministers debated the first Europol convention, the working papers and minutes were mainly in English. The French lodged several objections. It is easy to see how people might unconsciously recoil from a policing solution that was pre-packaged in the English tongue and seemed to be modeled on solutions in a far-off English-speaking country.[6]

The issue of national sovereignty has been important in the debate. Not recognizing the analogy with state sovereignty in the United States, European federalists have tended to develop the view that the EU model for cooperation is unique, and perhaps instructive for the North American Free Trade Association (NAFTA) and other such entities. The European equivalent of what Americans call "exceptionalism" militates against receptiveness to the idea of a European FBI.

Other factors conspiring against the idea of a European FBI have been resentment of American power, and the unpopularity of the George W. Bush administration especially because of the Iraq war. Additionally, there is the problem of what one German scholar called the "not always glorious history" of Europol, which has had financial scandals. Perhaps even more damaging to the prospects of emulation were high-profile criticisms of the civil rights record of the FBI, and the concerted post-9/11 criticism of the FBI within the United States on the grounds that more than any other agency it had been responsible for failures in prediction and preemption in the months preceding the attacks on the Twin Towers.[7]

A profile of European perceptions of the FBI-Europol issue might appropriately start, then, with the denials of any link between the two agencies. One tendency has been denial by omission. For example, Europol Director Max-Peter Ratzel, in addressing the European chapter of the FBI National Academy in September 2005, circumspectly embraced the FBI as a partner, rather than as a model. Other denials have been more blunt. Willy Bruggeman, deputy director of Europol, stated in 2000, "Europol is *not* an FBI and is not intended to become a comparable instrument of the EU." In 2002, the sentiment found its way onto the frequently asked question section of the Europol website: "Is Europol a European FBI? No." Singly, it would be possible to take such statements at face value. Their frequent and emphatic repetition, however, brings to mind the words of the Danish prince: "The lady doth protest too much, methinks."[8]

That would certainly be the view of those who have opposed Europol outright on the grounds that it uses FBI practices that will lead Europe down the road to a police state. Prominent in this camp has been the British civil liberties group Statewatch. In 1995, Statewatch's Tom Bunyan greeted the adoption of the Europol convention with a pamphlet arguing that the new organization was the result of a 1980s conspiracy by British, German, and other police chiefs to

promote "the idea of a European-style FBI." The convention had been "drawn up in secret," the European Parliament had not been consulted, and there was no provision for parliamentary oversight. By the time Statewatch's Ben Hayes wrote an additional pamphlet on the issue in 2002, Europol was installed in its offices in The Hague and had started work. The line of attack remained the same, Hayes's tract being subtitled "towards an unaccountable 'FBI' in Europe" and a section in the Statewatch website was titled "EU-FBI surveillance plan."[9]

According to Niels Bracke, a senior official at the General Secretariat of the EU's Council of Ministers charged with Europol and antiterrorist liaison, Bunyan and his colleagues grossly overestimated the powers of Europol and saw abuses where none existed. But Statewatch's critique won a sympathetic hearing in at least one conservative quarter, *The Daily Telegraph* (as this reminds us, conservatives have a claim to the libertarian tradition). Commenting on Statewatch in the wake of a 45.9 percent boost in Europol's budget post-9/11, a Brussels correspondent wrote that Europol seemed to be developing into "a sort of joint FBI/CIA wrapped together in The Hague." It was further acquiring the kind of powers that had "allowed the FBI in Washington to gain the whip-hand over the U.S. state and city police forces." Members of the British contingent in Brussels worried that any hint of an aggregation in Europol powers would provoke stories in the populist press about the return of "jackboot" (fascist) practices in Europe.[10]

The penultimate observation suggests an equivalence between the states' rights issue in America and the national sovereignty issue in Europe. Member states were wary of police integration. For example, in spite of strong support from the British police for the creation of Europol, in 1995 the Home Office shrank from the prospect of operational cooperation. In the words of its spokesman, Peter Wrench, "the original proposal for Europol envisages a sort of European FBI and that idea has not gone away on the part of some countries, but a clear majority are against going in that direction in the foreseeable future." A House of Lords report warned of the need to be on guard against "great dangers to individuals."[11]

As in the case of the United States, one might argue, a plea for citizens' rights could be a fig leaf for assertions of states' rights/national sovereignty. The United Kingdom, ever the South Carolina of European politics, decided not to sign the additional Europol Protocol of 1996, whereby the European Court of Justice could rule on interpretations of the Europol Convention. The election of a new Labour government in 1997 seemed to promise more openness to European cooperation, with Foreign Secretary Robin Cook endorsing police cooperation at European level. But in 2003 the House of Lords (the forum for Britain's senior judges) issued a further report that was critical of the 2002 Europol/United States agreement facilitating the exchange of personal data, complaining that "the draft agreement was deposited very late, when it appeared that the text had already been agreed with the United States."[12]

Other objections to the idea of Europol becoming a European FBI hinged on the matter of constitutional impracticality, with a perception of the problem

having been compounded in 2005 by the failure of France and The Netherlands to ratify the new European Constitution.[13] The proposed constitution would have created European laws, ironed out local constitutional difficulties over the recently introduced European arrest warrant, increased parliamentary oversight, and improved police cooperation. Its defeat perpetuated what one academic study called a state of "legal limbo."[14] Early in 2006, the Austrian presidency emphasized the need to upgrade Europol as well as the general constitutional "architecture" of EU internal security.[15] But for a while, at least, the prospects for a more expansive role for Europol had looked bleak.

Fear of the unknown can be another factor, and here ignorance of the FBI plays a role. The dearth of studies that actually take account of the FBI's history in assessing its modularity for Europe is conspicuous. True, the field is not entirely barren. American political scientist John D. Occhipinti considered U.S.–Canadian police cooperation as a possible model; but what merits attention, surely, is not whether Canadian policemen can operate in the United States but the system whereby a policeman from Maine cannot arrest a suspect in New Mexico, whereas the FBI in a significant number of circumstances can. Another study, by Leuven-based law professor Frank Verbruggen, offered a valuable analysis of FBI–Drug Enforcement Agency (DEA) relations as a possible object lesson for Europol. However, neither scholar addressed the comparative history of police/intelligence federalism. In the absence of knowledge, copy and paste politics was too tempting.[16]

A further dimension of the profile of European perceptions of the FBI-Europol issue is, at least potentially, the paternity debate. After the Bay of Pigs debacle, President John F. Kennedy famously remarked "victory has a hundred fathers, and defeat is an orphan."[17] On the same principle, the stirrings of a debate over the paternity of an organization are one indication of that organization's rising prestige. There have been acute, even bitter disagreements over the origins of the CIA, and historians are beginning to think anew about the issue of whether the FBI originated in the presidency of Franklin D. Roosevelt, Theodore Roosevelt, or even Ulysses S. Grant. Just so, there are signs of dissent over the provenance of Europol.

Denials are legion of the assertion that the FBI fathered Europol. Malcolm Anderson, a pioneer of research into European police cooperation and Europol, reacted thus to the suggestion that following post-Hoover reforms in the previous decade, the FBI might have become an inspiring model for Europe by the 1980s: "It was Chancellor Kohl who launched the idea of a European FBI in the 1980s. It had nothing to with FBI reforms and was always used as a very vague label, given the very different circumstances of Europe and the USA."[18]

Kohl's role and the wider notion of German paternity have rightly attracted serious attention. Asserting "the Germans have always been the principal advocates of a reorganization of the police in the European Union," Verbruggen suggested some reasons. Germany's location at the heart of Europe bordering nine different countries together with its substantial immigrant population made

it vulnerable to international crime and keen on international policing. As a federal nation with its own federal police agency, the Bundeskriminalamt, Germany thought it could offer its own system as a model. It pressed its case with some urgency because it regarded adequate federal policing as a *safeguard* against any return to a Nazi past—an analysis that put it poles apart from the Statewatch argument that Europol would be a *threat* to liberties.[19]

But even before the Europol convention had been signed in July 1995, the paternity debate had broadened. According to a 1993 study by French security expert Jean-Claude Monet, the ancient Athenians invented modern policing. Systematic French policing goes back to the 13th century, and, in the 18th century, the French system was under discussion as a model for Europe. The French inspired the conference in 1914 that gave rise to Interpol. That organization is still headquartered in a French city, Lyon (in the 1980s, the U.S. Secret Service mounted the first serious challenge to French dominance of Interpol, perhaps one reason for the growth of French support for an American-proof Europol).[20]

Monet asserted that enthusiasm for European police cooperation was never so strong as when politicians were exploiting mass hysteria. Examples of the latter included the advocacy of border controls to curtail international crime, with populists pressing the panic button when Schengen loosened border restrictions—a process that they claimed gave the green light to international criminals. What made nonsense of their rhetoric, Monet continued, was the fact that international crime had already been rampant before the EU reduced its internal barriers. Colorful language about crime waves and gangster syndicates was just one of Monet's bêtes noirs. Among the other inappropriate justifications of police integration that he cited were the "fifth column" rhetoric associated with the German police and the anticommunism of the French intelligence services. Monet actually favored European police cooperation but did not want it to come about for the wrong reasons. For him, although the federal German and American models were significant, the origins of cooperative policing in Europe were multinational.[21]

An example of outright advocacy serves to round out this profile of European perceptions of the FBI-Europol issue. In 2004, member of the European Parliament (MEP) Bill Newton Dunn issued a pamphlet, bearing the insignia of the United Kingdom Liberal Democrats but conveying his personal views, called *Europe Needs an FBI*. Newton Dunn had left the Conservative Party to join the Liberal Democrats because of the Tories' anti-European stance, and, with his political ambitions and even survival in question, felt he was free to an unusual degree to speak his mind.[22]

Newton Dunn had watched the American scene. He both knew and exchanged views with Bob Heibel, a former FBI deputy chief of counterterrorism who, since his retirement, had taught at Mercyhurst College (Erie, Pennsylvania), an institution that helped train intelligence analysts. Newton Dunn's pamphlet did not deal with the FBI extensively, but it did show an awareness of the Bureau's weaknesses, such as its fraught relations with the CIA, and of its

tradition, such as leaving much of America's law enforcement to the local police. This last circumstance showed, Newton Dunn said reassuringly, that a European FBI would not "interfere in national policing."[23]

As his willingness to criticize reveals, Newton Dunn was no FBI dogmatist. Indeed, one development he urged was the creation of a European criminal assets bureau aimed at the confiscation of ill-gotten gains, an approach that the Irish government had pioneered. Much of his pamphlet was a litany of problems that needed to be tackled urgently, including cyber crime, trafficking in heroin and people, gangs, money laundering, car theft, currency forgery, and identity theft. In all these areas as well as in the realm of terrorism, criminals posing a threat to EU citizens were organized internationally, both within and outside Europe. European intelligence and policing could only succeed if organized on the federal principle. As this overview indicates, when Newton Dunn wrote of the FBI, he was using the term to describe both a specific phenomenon that might in some respects be emulated and a general need.[24]

Now I will discuss certain enumerated facets of actual FBI history and practice of possible relevance to EU/Europol history and development. In the manner of what the Americans would call the "public historian," the search will be utilitarian, a reflective exercise in the uses of history.[25] There are pitfalls here. In certain cases, lessons apparently transmitted or transmittable from America are not American at all, having been exported from Europe in the first place. In other cases, similar solutions may have arisen spontaneously and separately on each side of the Atlantic simply because the problems were similar, as was the cultural context within which problem solving took place. Nevertheless, while having due regard for such perils, it is possible to consider selected facets of FBI history, identify European equivalents offering appropriate comparisons, and identify lessons that have been or might be learned.

The constitutional and legal facets of FBI history are of special interest. In 2001 there were, according to one estimate, more than 3,300 federal crimes on the American statute books, with more in the offing as members of Congress saw political advantage in promoting "get tough" legislation.[26] Such a body of legislation gave the Bureau the legal basis for lots of work. It was, however, an outcome that had taken decades of effort and had come about not as a result of the founding fathers' plans, but *in spite of* their constitutional provision. After a period of loose confederation in the 1780s, the United States had adopted the Federalists' plan for a stronger Constitution. This contained at least a partial basis for the exercise of federal police powers. The federal government was charged with national defense, the preservation of the republican form of government in the several states, the protection of U.S. coinage, the administration of higher courts, and (Article 1, section 8) the regulation of commerce "among the several states." But in the compromise that allowed ratification of the Constitution, ten amendments were added, the American Bill of Rights. Here we have a potential complication in interpretation, because the U.S. Bill of Rights was partly based on the Magna Carta and the 1688 English Bill of Rights. However, the last of the

amendments was, in the analysis of law professor Bernard Schwartz, American in origin.[27] And it did have a particular resonance for any federal polity. It "reserved to the States respectively, or to the people," those powers not assigned to the federal government by the Constitution.

For the first seventy years of the new republic, one antifederalist crisis followed another, with both New England and South Carolina threatening to secede from the Union, and the (federal) Bank of the United States being dissolved in 1836. But when the Confederate States did secede in 1861, the Union Army settled the matter by force. With the Union sealed in blood, President Abraham Lincoln's last Cabinet meeting in 1865 authorized the creation of the U.S. Secret Service. In the aftermath of the war, its agents—America's first nationally organized federal police force—operated against counterfeiters of the new "greenback" federal currency, with clear-cut constitutional authority. In the 1870s, on loan as special agents to the Department of Justice (newly formed in 1870), they penetrated the Ku Klux Klan, contributing to its demise (this is the origin of the term "special agent" to designate an FBI detective).

President Theodore Roosevelt decided to create a new Bureau of Investigation within the Justice Department instead of having recourse to the continuous borrowing of special agents. But the corpus of laws for the new Bureau of Investigation to enforce expanded slowly. The 1911 Mann Act (also known as the White Slavery Act) empowered it to operate against those who operated the vice trade across state lines, the interstate commerce clause of the Constitution here coming into its own. In World War I, it displaced the Secret Service as the nation's chief counterespionage agency, a function that it performed again in World War II, the Cold War, and at least until the advent of the Department of Homeland Security, in the recent war against terror. The Bureau's repertoire expanded in other respects, too, at least in the case of interstate crimes. By the 1920s, it was investigating automobile thefts. By the 1930s, it was hunting down kidnappers.

There was still no federal crime of murder. "Jumping the fence" became a standard ruse for gangsters on the run—they would reach the state line (or even just the county line) and the cops in hot pursuit would skid to a halt, with the FBI unauthorized to offer help except by circuitous means. Al Capone went to prison for tax evasion, not homicide. The National Association for the Advancement of Colored People's (NAACP) interwar campaign for a federal antilynching law seems irrational (why make murder a double offense?) until one realizes that Southern states were not enforcing their murder laws when the victims were black. But the NAACP failed in its effort to create a special federal crime of murder. In the case of many other serious crimes, too, FBI special agents simply advised on the basis of their specialist expertise or assisted at the scene under local supervision.

Here, however, it is appropriate to take note of a view expressed in 1950 by Edward S. Corwin, a Princeton University professor emeritus who had served in the Department of Justice and was America's leading authority on the

Constitution. He argued that the emergencies of the Depression and World War II had boosted the powers of federal government not just directly but also as the result of the provision of federal assistance in local cases. In positing that in recent cases the Supreme Court had "definitely discarded" the "enumerated powers" doctrine behind the Tenth Amendment he was, perhaps, overly sanguine.[28] Furthermore, following the exposure of an array of abuses of power by the FBI, both Congress and Attorney General Edward Levi took steps in the 1970s to rein it in. But first President Ronald Reagan and then post-9/11 reformers removed many of the restrictions. In summary, few can doubt that the FBI's powers expanded as a result of the imperatives of modern federal government.

Whereas the FBI acquired the duty of enforcing many federal laws, Europol has had not a single such law to enforce, because there is no such thing as a European statutory crime. In the original debate over Europol's remit, the Greek presidency proposed that the new federal police agency would fight drug trafficking and other serious international crime only where such activities occurred "within the territories of at least two Member States," a provision that remains embedded in the Europol convention. There is a parallel with the U.S. interstate commerce provision here, but the Greek presidency proposal went further. Europol would function only in cases where "the form of crime is liable to prosecution in *all* Member States."[29]

These principles were to endure. Noting that the European Union remained "almost always one step behind" in combating organized crime, the Council in 1997 adopted an action plan with the goal of "harmonization of laws" in the member states.[30] When a new European constitution was under discussion in 2005, it was envisaged that a European Public Prosecutor's Office would have powers to deal with "serious crime having a cross-border dimension," but only after unanimous authorization by the EU Council of Ministers and after obtaining the consent of the European Parliament. The British opposed even this measure, and the reverses in the French and Dutch referenda brought the whole constitutional project to a halt. According to Europol's Pedersen, after the constitutional setback, harmonization of member state laws had to remain the goal.[31]

To make the American analogy, it was as if the FBI could operate only with the passage of uniform legislation in every state in the Union. It might be added that unanimous governance through the EU's Council of Ministers resembles the hypothetical situation whereby American law enforcement would be run by a gubernatorial conference with every governor having to agree to each activity. Little wonder that when further protocols were drafted expanding Europol's functions in minor ways, ratification by member states was spotty. A protocol adopted by the Council of Ministers in November 2003 was to be "adopted by the Member States in accordance with their respective requirements," and they were to remember to notify the Secretary-General of the EU if and when they did so. With member states picking and choosing which protocols they wanted to observe, MEP Newton Dunn complained it was difficult to establish who had ratified what. In the aftermath of the 2005 constitutional setback, he predicted that a core of

proactive member states would have to drive through police and intelligence cooperation, leaving the rest to join them later.[32]

On the constitutional front, the lessons of the American model might be separated from the lessons of American history, which are far from reassuring. It took a civil war to cement Lincoln's ideal of an "indissoluble union," and, lest that be considered a pessimistic reflection, let it be remembered that many Southerners still refer to the 1861–65 conflict not as the Civil War but as the war between the states. Hopefully, "member" states will not need that kind of transition. For those who believe that there must be an international solution to international crime and terrorism, the hope must be that European history will be both accelerated and peaceful. Perhaps some reassurance may be gleaned from an apparition of individuals wearing cagoules. These are marked "Europol," and their bearers now hover on the fringes of certain crime scenes and offer expert advice, for example, on the chemistry and likely provenance of new, synthetic narcotics.[33] As Corwin observed, the provision of local assistance can be a first step to greater federalization.

In 1954, J. Edgar Hoover concluded an article with the observation, "Local responsibility, recognized by our forefathers, remains the key to sound law enforcement."[34] Although this is testimony to the FBI director's recognition of the political need to continue to propitiate local sentiment, it belied significant developments over many decades in the powers and functions of American law enforcement. The Judiciary Act of 1789 had created the office of the attorney general, and President George Washington at that time appointed thirteen U.S. marshals, the first federal law officers. In 1870, the attorney general took responsibility for the newly formed Department of Justice, and, in enforcing law obedience in the turbulent South, had the support of U.S. marshals, U.S. district attorneys, and the U.S. Army, as well as the special agents on loan from Treasury. As the number of federal crimes increased, so did the powers of federal law enforcers—by the mid-1930s, special agents were able to make some types of arrest without requesting the presence of local sheriffs and, as all but the most sheltered will know, carried guns and used them.

The EU has no equivalent of federal marshals, federal attorneys, or a federal police force, and Europol staff can neither make arrests nor carry guns. According to Niels Bracke, there is no perception of any need for such practices, as the police forces of the EU member states are stronger and better organized than their equivalents in the states of the American Union. This is a topic that invites further research.[35]

One of the main features of U.S. intelligence history is boosterism. Ambitious agency leaders have been publicists. They converted America's woes into institutional blessings. Major augmentations in federal expenditure and responsibility followed in the wake of crises. It happened not just in the Civil War but in all subsequent wars, too. If no war was at hand, another crisis would suffice: the prostitution scare of 1911, the Red Scares of 1919 and the 1950s, the gangster scare of the 1920s/1930s, 1960s radicalism, crime waves, Chinese espionage

in the 1990s, and Al Qaeda, the latest "threat du jour" as one U.S. intelligence veteran put it.[36] Money was sometimes poured into the solution of problems that had already passed or had been simply invented by some canny booster.

None was better at publicity than the FBI's long-time director, J. Edgar Hoover. But by way of qualification, even Hoover failed, in spite of his many real achievements and in spite of his exceptional gift for public relations, to become a national intelligence czar. That notion has been debated since the 1940s, yet has triumphed only recently, when both the congressional and the independent inquiry into 9/11 recommended the idea.[37]

There have been some glimmerings of such facets of the FBI's past in the relatively brief history of Europol. Newton Dunn recalled the strategic assessment of Jürgen Storbeck, Europol's director until 2004. Storbeck believed that Europol would achieve take-off only after some great crisis, perhaps a financial scam that threatened the stability of European banking.[38]

The prospects for such a shock may be quite real, not least psychologically. As Monet observed, red scares and apocryphal crime waves are no strangers to European history. MEP Claude Moraes, like Newton Dunn an active member of the European Parliament's Committee on Civil Liberties, Justice and Home Affairs, observed that police politics is "fashion driven." After the Madrid bombings, European Commission President Romano Prodi promised to increase EU spending on security research to 1 billion annually by 2007, matching the spending of the U.S. Department of Homeland Security. On July 12, 2005, in the wake of the London bombings, the EU's Justice and Home Affairs Council met in emergency session. Within two months came the announcement that, in August alone, €15 million had been pumped into security-related research. A cynic might be moved to observe that over twelve months, that would yield just €180 million, far short of the €1 billion mentioned by Prodi. Even the €15 million was contingent on budget agreement by the member states, which turned out to be a contentious issue under the British presidency the following year.[39]

European leaders, then, may be susceptible to gesture politics. But Europol is not. Storbeck, an unassuming man who reminded Newton Dunn of the U.S. television detective Columbo, was not the kind of person to "invent" a crisis where none existed. Even if Storbeck had wanted to issue sensational press releases, he would have been deterred from doing so. When the Europol convention was under discussion in 1994, the German delegation urged that "press briefings or any other form of public communication on matters concerning Europol . . . shall not be engaged in without . . . the consent of the relevant Member State authorities." Ten years later, Europol still took care to inform and consult member state police forces before issuing press releases on sensitive issues.[40]

Europol is not entirely unconscious of its image. It has responded to approaches from the film industry. In 2003, *Den Tredje Vågen* (The Third Wave), a thriller directed by Anders Nilssen and based on Europol, was the most expensive Swedish movie ever made. Its $4.5 million budget did not, however, match Hollywood extravaganzas. In 2004, *Ocean's Twelve* was a Hollywood thriller

with a Europol dimension and featured a top-notch cast—Welsh actress Catherine Zeta Jones, together with Brad Pitt and George Clooney. Zeta Jones obligingly allowed herself to be photographed clad in a Europol T-shirt, and the portrait thereafter lifted the gloom in the corridors of Europol HQ. But *Ocean's Twelve* was a sequel movie made just to exploit the success of *Ocean's Eleven* and did not really succeed. Zeta Jones refused to allow her photograph to be used for publicity purposes. Staff at Europol HQ shook their heads and said real agents weren't like that, anyway. There was simply no comparison with the promotional impulse behind the G-men films Hoover encouraged in the 1930s, a genre that prompted a whole industry of FBI movies and even mutated, in a case of celluloid exceeding reality, into "The Postmodern G-Man," and "The New Age G-Man."[41]

Charismatic though Hollywood may be, the promotional lessons learned from America seem to have been mixed. Although European politicians can be opportunist, boosterism has not emanated from Europol directly. In 2004, New York–born Gijs De Vries, having served as Dutch deputy interior minister, was appointed to be what the BBC called Europe's new "terror tsar," and he did liaise through Bracke with Europol.[42] But this was hardly an outcome of long-term promotional activity orchestrated from The Hague. The lesson of American history is that overly robust agency promotion leads to distorted spending patterns with the money going to those gifted at publicity, not those who do their jobs well. The hard sell also led to mission distortion with resources being wasted on populist causes.[43] Boosterism is best avoided, and in this area the Americans would seem to have something to learn from Europe, not vice versa.

"Gestapo phobia" has been a further facet of FBI history of possible relevance to EU/Europol history and development. U.S. fear of the Gestapo is just one manifestation of a long trend—in the 20th century, Americans were deeply opposed also to manifestations of Fouché-style or NKVD/KGB-style political policing in their country. But in the immediate wake of Himmler's excesses, there were particular concerns, first that the OSS might become an American Gestapo, and then that the FBI might enact that role. The specter infused new life into American civil libertarianism. Of greater concern here, though, is the political administrative reaction. In spite of a dawning realization that poor intelligence coordination had contributed to America being caught unawares at Pearl Harbor, the Truman administration decided in 1947 to split the intelligence function, with the CIA being given the foreign job and prohibited from operating domestically and the FBI being stripped of its Latin American empire and restricted to domestic counterespionage and police work. The two agencies feuded, fought turf wars, and, in the run-up to 9/11, failed to exchange crucial data.

In Europe, too, there have been civil liberties concerns. Ironically, Statewatch depicted the FBI, at one time the victim of Gestapo-bogeyman politics, as a bogeyman in its own right. Monet complained about the lack of EU transparency in police matters. MEP Sarah Ludford and her civil liberties allies spoke out in 2002 against the dangers of personal data sharing between the Schengen

Information System (an internal EU crime data base) and Europol and between Europol and non-EU countries like Russia and the United States. It is here worth recalling the *Telegraph*'s complaint of Europol's being a "joint FBI/CIA wrapped together." Ludford continued to voice her concerns in 2005 warning about the dangers inherent in the retention of EU border-control personal details. But Ludford's fellow parliamentarian Claude Moraes reflected on the small size of Europol (just 535 staff in all categories in November 2005), which made it much too nonthreatening to be regarded as Gestapo-like. EU external intelligence work has also been relatively modest, with expenditure in 2000 running at approximately one-twentieth of the U.S. level.[44]

In December 2005, the European Parliament, Commission, and Council of Ministers agreed on a deal whereby intercepted telephone calls, text messages, and Internet connections could be retained for between six months and two years. U.K. Home Secretary Charles Clarke, who had been pressing for such a data retention measure, said he was "not so much offended by the use of the words 'police state' or drawing comparisons to Hitler or Stalin, I just regard them as absurd." Interviewees for this project concurred in the view that Europol was a most unlikely reincarnation of the Gestapo. It was partly modeled on modern German police practice, with German policemen prominent in its leadership—and one of the imperatives of postwar German policing had been to stamp out any semblance of Gestapo-like malpractices.

In the view of some of the interviewees, it was testimony to Europol's benign nature that the public had made little use of the EU freedom of information provision in regard to its activities. Also, there had been few complaints since the 1997 Amsterdam Treaty had made it possible for citizens to approach the European Ombudsman about maladministration at Europol. Between 1999 and 2003, for example, there were only eight complaints to the Ombudsman, most them about access to documents and staff issues and mostly upheld, but none of them particularly controversial in character.[45]

Bracke added a further type of rebuttal of the hypothetical Gestapo charge. Deprived, as it is, of arrest powers, Europol has been and remains an investigative, analytical intelligence agency. It does increasingly provide on-the-spot assistance in inquiries but otherwise leaves police operations to the forces in the individual member states.[46]

Europol, in short, is what the post-9/11 FBI is meant to aspire to: a coordinating intelligence agency. That is not to say that it has solved all the problems of analysis. For example, the challenge of recruiting intelligent and qualified analysts is as problematic in Europe as it is in America. The FBI has traditionally been staffed by brave men bearing guns, rather than by thinkers. Hoover wanted to offer measurable proof of the Bureau's efficacy, so he emphasized the need to make arrests and to secure convictions in court. This "arrest culture" often ran contrary to intelligence needs—should one arrest a terrorist suspect or follow him until he leads one to his controller? Post-9/11, the substitution of analysis for "getting a result" has been an uphill struggle.

The CIA, too, has had problems from its earliest days, as the 1950s Doolittle inquiry indicated. Talented members of the military did not want to waste part of their careers serving an agency lacking any power to promote them to a higher grade of general or admiral. Talented scholars shirked employment that would put their publications and academic promotion on hold and leave them tainted with a secret service stigma.[47]

Europol has had similar problems. Staff were seconded from the police forces of the member states, but when they returned to their own countries they found, like CIA agents, that they had marked time in terms of their careers and had to resume at their former ranks—this applied, for example, to Jürgen Storbeck on his return to the German police.[48] There was a danger that talented officers would be deterred from applying for Europol posts, and indeed Director Ratzel made a special plea at the January 2006 Council of Ministers in Vienna for Europol service to be recognized as a criterion for promotion in member state police forces.[49]

However, the fact that Europol has similar recruitment problems to the FBI and CIA does not detract from what many on both sides of the Atlantic would see as a structural superiority—there are no active police duties to contaminate its intelligence work. Though it seems unlikely that the FBI will ever give up its powers of arrest, perhaps here, too, the Americans can learn from Europol.

It is now time to turn to a further facet of FBI history and practice of potential relevance to EU/Europol history and development. The racial dimension of FBI history is notorious. For many years (1924–72), the Bureau was under the leadership of a racial conservative. Shortly after taking over, Hoover dispensed with the services of two of the few African American special agents in the FBI's employ, and thereafter he both resisted the hiring of blacks and persecuted leaders of the civil rights movement such as Martin Luther King Jr. More recently, questions have been asked about the FBI's apparent eagerness to investigate people of color and non-Christian faith and about its failure to recruit Arab American prospective agents in spite of a pressing need for diversity in the fight against terrorism.

But it must be emphasized that there is another side to all this. The first time the Justice Department hired special agents (in 1871), it was with the goal of suppressing Ku Klux Klan terrorism to the benefit of the African American population of the South. Again in the 1920s (and with Hoover playing a leading role), the Bureau moved effectively against the Klan. Between 1940 and 1952, special agents enforced the antilynching program of the Justice Department's new civil rights unit. In the 1960s, with Hoover still in charge, the FBI effectively (indeed ruthlessly) moved against what was a virtual reincarnation of the Klan, the White Hate movement. In making comparisons with Europe, then, both sides of the coin need to be considered.

In 2005, African Americans made up 9.7 percent of the U.S. House of Representatives—a shortfall in that they comprise 13.3 percent of the population. But the FBI was in a different league: blacks (as of 2003) composed just 5.5 percent of its special agent force.[50] Out of a total of 11,500 agents in the FBI in 2003, there were still only about 6 Muslims. The 2000 census listed 1.3 million Arab

Americans officially present in the United States, and the real number may have been three times as high. Yet a mere twenty-one agents were able to speak Arabic.

Europol, like the FBI and CIA, is composed of what one might call "officers" and "other ranks"—security guards, cleaners, secretaries, computer technicians, and so on. The equivalent of the FBI's "special agent" or the CIA's "intelligence officer" in Europol is the bold employee, so called because his or her job description is printed in bold, the requirement being that prior to joining Europol the holder of such a post must already be a policeperson in his or her own country. As of 2005, Europol did retain the nonbold services of multicultural Dutch citizens, a reflection of Netherlands legal requirements (in a visit to Europol headquarters, this researcher spotted two of the several people of color employed, a guard and a secretary). But the bold force was all white, with no Muslims. Following the EU's enlargement to the south and east, Europol was acquiring a capability in the new European languages, but there was much less emphasis on Arabic and Farsi, in spite of the importance of those languages to antiterrorist work.[51]

Europol (and its supporters) defended itself against the charge of prejudice on a number of grounds. Though it could advertise nonbold jobs in the local Dutch press, employees in the bold category were either seconded by the police forces in their own member states (in some cases being paid by their seconding employers) or successful applicants from police backgrounds in member states. Europol had no control over the hiring practices of those member state police forces. The suggestion was that, excepting the British police with its policy of proactive recruitment of minorities, the police forces of Europe were largely prejudiced against minorities, a circumstance that affected Europol's recruitment pool. Another defense, one of the type that is heard in America, too, is that a minority group applicant, for example, a Frenchman of Magreb ancestry, might be less qualified than a white candidate or less trustworthy because he would sympathize with Muslim terrorists. Such persons should not be appointed just because of political correctness.[52]

A further defense was that Europol is no worse than the EU's institutions as a whole, which are generally white and culturally Christian. This is true. I attended a plenary meeting of the Committee on Civil Liberties, Justice and Home Affairs. In an imposing and crowded committee room that would dwarf the entire parliaments of some nations, the back rows on that particular day were occupied by tourist groups from former European colonies, all black. A few rows in front of them sat privileged officials and observers, all white. The inner core consisted of committee members. Although the committee does contain MEPs of color (Claude Moraes and Saj Karim, a Muslim), the inner core, too, was on that day uniformly white. On that particular day, one could have been forgiven for thinking that the Third World had come to learn from its master.[53]

Both because of his concern for racial justice and because he thought jihadism was a real problem, Moraes has devoted thought to these problems and offered some additional reflections. Europol advertised posts, he thought, in places where ethnic minorities never looked. French postcolonial thinking prevailed—like

Spain and Portugal in their New World colonies, France maintained the fiction (even through the race riots of 2005) that every inhabitant of metropolitan France had equal citizenship and opportunity, regardless of ethnic or religious background. According to this mode of thought, actively seeking nonwhite bold appointments would have been illogical and quite unnecessary. For Moraes, the problem was not just a French one. In Eastern Europe with its newly acceded member states, there were ten million Roma (the gypsies that Hitler despised so much), but they were absent from the ranks of the local police and thus Europol. Why was there no agitation on such issues? Europol was a small organization that operated behind the scenes. It was because of this obscurity that its lack of diversity had not become a public symbol and remained less of an issue.[54]

Here is an instance where Europe can learn. Racial tolerance is a just goal in ethical terms. In social terms, it reduces divisiveness, and with it the likelihood of collective unrest, treasonable betrayal, and individual acts of terror. In functional terms, it enables police and intelligence agencies to recruit more widely, giving access both to a larger pool of talent and to people with special skills such as local knowledge or non-European languages and dialects. Post-9/11 investigations in the United States implicitly recognized such factors and recommended greater hiring diversity in the FBI and its sister agencies. The EU might consider a similar course of action.

Students of the drug addiction problem in America will be aware of another facet of FBI history having a potential bearing on Europol: the Two Prohibitions hypothesis. The prohibition of alcohol in the 1920s was then and is still regarded as having been an expensive failure. There are those, whether on the left of the political spectrum or neoconservatives like Milton Friedman, who would argue that the current narcotics prohibition is a mindless repetition of a historical error. Be that as it may, the American war on drugs fueled FBI expansion directly and, as Verbruggen noted, indirectly through the Bureau's absorption of the DEA.[55]

The parallel with Europol is plain, as the European Drugs Unit (established in 1994) preceded it. Other functions such as anticounterfeiting operations stimulated federal police work in Europe as they had in America, but the war against narcotics had a popular appeal that spread far beyond the banking fraternity. The new designer drugs penetrated suburbia and affected the offspring of politically influential middle-class parents. In the 1994 formative debate on Europol, the drug issue went from strength to strength. In March, the Greek presidency proposed that Europol should fight "1. Terrorism. 2. Other forms of crime." By May, the formula was "1. Terrorism. 2. Unlawful drug trafficking. 3. Other serious forms of international crime." Ten years later, Europol's annual report listed its crime priority as "drugs trafficking," followed by five other categories.[56]

Verbruggen saw the politics of drugs policing as playing a key role in the United States and Europe alike, with "Americanization" of European policing taking place and with the "over aggressive" crusade against drugs doing damage to police structures on both continents, even if Europol was "unlikely to become a European FBI." [57] However, another perspective might be that drug politics has

been the engine of police cooperation, perhaps not a desirable phenomenon in itself, but a means to an end. Politicians may never admit that prohibition has been a mistake with a happy outcome, but historians on both sides of the Atlantic are free to speculate in that regard.

This brings us to another facet of the American experience—parliamentary oversight and politics. To legislators' fury, Theodore Roosevelt set up the FBI's precursor during a congressional adjournment. But that was for a special reason—the president's determination to target and root out corruption on Capitol Hill had provoked congressional opposition to his plans. In more normal times, the Bureau has been subject to abundant congressional oversight. Congress has held the purse strings, giving the Appropriations Committees a powerful say, and the heavyweight House and Senate Judiciary Committees, established in 1813 and 1816, respectively, have jurisdiction—the House committee having the FBI specifically in its remit, and the Senate committee being responsible for matters of concern to the Bureau, including espionage, counterfeiting, civil liberties, federal courts, antitrust policy, and revisions of the criminal code.[58] In addition to this, the FBI is subject to the perusal of special investigative committees, such as the Church and Pike inquiries of the 1970s. These in turn inspired new permanent intelligence committees in both houses of Congress that oversaw relevant aspects of the FBI's work.

More than this, the FBI is subject to the scrutiny of the Department of Justice. The attorney general of the United States is appointed by a democratically elected official, the president, and confirmed in office by Congress. Attorneys general have periodically reformed or reshaped the FBI; in their different ways, Charles Bonaparte, Harlan Fiske Stone, Bruce Cummings, Frank Murphy, Edward Levi, and John Ashcroft played roles that could be said to have been of greater strategic significance than those of the Bureau's directors. The Department of Justice also appointed inspectors general to scrutinize particular aspects of FBI performance, and they have sometimes been very critical. For example, in 2002 Inspector General Glenn Fine delivered devastating remarks, based on his audit of the FBI's counterterror performance, to a subcommittee of the Senate Judiciary Committee.[59]

In 1964, journalist Fred Cook published a critical study of the FBI, noting that the Bureau had been "created in secrecy, by executive order, in defiance of the will of Congress." But he added that it had been two "liberal" presidents, Republican Theodore Roosevelt and Democrat Franklin D. Roosevelt, who had created the "all-powerful" FBI.[60] Notwithstanding the fact that recently neoconservatives have made the Bureau their own, the FBI was the outcome of a 20th-century liberalism that, unlike its 19th-century namesake, was statist and thus federalist.

Here, one can detect the glimmerings of a European comparison. Newton Dunn estimated that approximately 90 percent of British Tories opposed the idea of Europol. More liberal parties did not always brim over with enthusiasm, but at least they were not opposed in principle. Looking at the European Parliament, his colleague Claude Moraes estimated that the center-left was broadly in favor of

Europol, especially as it pursued wealthy drug traffickers instead of making petty arrests. The center right, with the exception of the British Tories, was also supportive, but the far right was less keen on police cooperation except on matters like immigration restriction through border controls. Political generalizations and labeling are often unreliable, and it must be conceded that civil libertarian critics of the FBI and Europol are usually liberal/left in orientation, but with those qualifications, it may be said that both the FBI and Europol are the creations of liberal federalists.

But parliamentary oversight is also generally a liberal phenomenon, and this is as conspicuous by its absence from the European scene as by its presence in the United States. The EU's Council of Ministers controls Europol directly and through a management committee. This applies to both Europol's budget and the scope of its activities. The European Commission, which can be seen as a powerful civil service, might be expected to have a strong role, but it is less active than in other realms of EU activity. Europol reports annually to the European Parliament, but on an information-only basis. Europol would like to answer to parliament, and its director has testified before the Committee on Civil Liberties, Justice and Home Affairs on a voluntary basis. The committee is glad to perform this role and would like to expand it. Its members have visited Europol's HQ in The Hague, where they have been welcomed. But in spite of proposals for greater parliamentary oversight, little has happened. Instead, member states have floated the idea that there should be joint oversight by member states' parliaments, as distinct from the federal European Parliament.[61]

In short, by comparison with the United States, the EU has a democratic deficit in regard to the oversight of its federal police. The internal politics of the EU make the Council of Ministers reluctant to allow the Parliament a greater role in oversight of Europol. But the restrictions come at a price. Iron control by the member states may offer a guarantee that Europol will never become an instrument of a European police state, but it cannot offer reassurance to the public of the type that encourages social confidence and willing cooperation with police inquiries. Only parliamentary oversight and investigation can bring that about.

Europol is not a clone of the FBI. There are, however, parallels between the agencies that need to be discussed more fully and candidly. The similarities are sufficient in number to suggest that several lessons might be learned.

In an area like drug policing, neither America nor Europe seems equipped to teach the other. In other areas, in spite of Europol's small size and short history, there already appear to be lessons for America to learn. To this point, Europol boosterism has been kept firmly under control, an achievement that America might profitably emulate in the case of the FBI. If American commentary is to be heeded, Europe would seem to offer another lesson, too. Although it may aspire to a wider role, Europol remains essentially an intelligence agency, something to which the feds—or, at least, their political masters—profess to aspire.

The American Gestapo phobia resulted in an unfortunate domestic/foreign intelligence dichotomy. In the absence of any serious concern about an EU police

state, there is a chance that Europe will be able to avoid this problem—early in 2006, for example, there was talk of an external role for Europol in the West Balkans.[62] Additionally, American mistakes would suggest the lesson that liaison with member state foreign intelligence services and with any EU equivalent that may develop should be a security prerequisite.

In other respects, though, the EU can learn from the FBI experience. While the diversity problem is still serious in America, present-day Europe faces a graver issue. The lack of diversity in policing in both member states and in Europol is an affront to Europe's sizable minority populations and a danger to Europe's whole self. Although Europol's liaison arrangements with member states remain essential, there does seem to be a need for direct hiring at bold level that is monitored according to diversity criteria.

American history offers many instances of the benefits of legislative oversight of intelligence functions, as well as examples of how lapses in oversight can cause things to go wrong. With the Council of Ministers monopolizing oversight, Europe has not yet dared to travel down that road, but should do so. On another didactic front, as the substantial corpus of federal criminal law attests, America has largely overcome the restrictions inherent in its constitutional doctrine of reserved powers. Europe may yet unravel that puzzle. However, a caution is appropriate here. Were the European Parliament to acquire greater powers and legislate in this way, it might give cause for Europol to expand from its intelligence function and become an agency with the power of arrest.

That is a dilemma that merits some thought. At some future point, it may be deemed appropriate for Europol officers to have the power of arrest in special cases, for example, where a local police force is failing in its duty. But there would appear to be a Euro-American convergence of viewpoint on the desirability of an agency that can concentrate on analysis and can cooperate with other intelligence and police agencies without being distracted by turf wars or the need to make frequent arrests to satisfy public opinion.

NOTES

Gwenda Jeffreys-Jones (Coreper Desk Officer, Secretariat General, European Commission) gave advice on this project as well as hospitality in Brussels. Terry F. Cole, a former colleague of the author's at the University of Edinburgh, helped with some German–English translation. EU officials and Members of Parliament, some credited by name in these notes and others anonymously, agreed to give interviews and advice. Staff at the EU Council Library, especially Rita Tuominen and (at the Transparency unit) Lino Liao, could not have been more helpful. A draft of this essay was delivered as a paper to the transatlantic seminar of the School of Social and Political Studies at the University of Edinburgh, where John Peterson and his colleagues offered valuable comments. Further advice came from academic colleagues Malcolm Anderson, Simon Duke, and Charles Raab and from Gustaaf Borchardt, director for Relations with the Council at the

Secretariat General of the European Commission. The United Kingdom's Arts and Humanities Research Council made an award to enable the author to undertake research both for a history of the FBI and for this project. The Leverhulme Trust awarded a Research Fellowship that defrayed the expense of overseas research trips. To all these individuals and institutions, the author is most grateful.

WASHINGTON POLITICS, INTELLIGENCE, AND THE STRUGGLE AGAINST GLOBAL TERRORISM

GLENN HASTEDT

Politics stops at the water's edge.
All politics is local.

NO GOLDEN RULE HAS YET BEEN FOUND that guarantees success in making American foreign and national security policy. Instead, we find the two competing imperatives presented in the epigraphs. According to the first, "politics stops at the water's edge," foreign and national security policy is made in response to events and forces beyond American borders. The nature of the situation confronting the United States, its internal logic and dynamics, and the actions of other international actors combine to establish the parameters of American foreign and national security policy. There is no room for partisan politics or bureaucratic infighting in shaping this policy. At best they are distracters that lessen the effectiveness of a policy; at worst they doom it to failure by injecting inconsistencies, unwarranted constraints, and contradictions into it. According to the second, "all politics is local," American foreign and national security policy is always made in response to domestic political considerations. It cannot be otherwise. Events beyond America's borders no more demand or dictate a certain policy response than do events inside it. Accordingly, foreign and national security policy does not operate according to a different set of political rules than does domestic policy. Success in each requires accommodating differences of opinion that are rooted as much in self-interest as in points of principle and building winning coalitions that are based on power considerations and not the elegance of an argument.

These two imperatives share an uneasy coexistence. They point in opposite directions, yet each contains elements of truth. Policy makers who fully embrace

the reasoning of one imperative to the neglect of insights offered by the other risk policy failure. Intelligence policy is no exception. Conceptualizing intelligence solely in terms of unmasking conditions and threats beyond American borders so that the proper response can be crafted will not by itself ensure success in the struggle against global terrorism. Intelligence also needs to be understood in the context of the political dynamics that shape the policy process in Washington.

Conventional accounts of intelligence comfortably reside within the confines of the first imperative. Intelligence is discussed as a value-neutral activity whose defining purpose is to help policy makers better understand a situation by furnishing them with analyzed information. The most heated debates have been over whether the intelligence community correctly understands the capabilities and intentions of America's external enemies, whether it be international communism, the Soviet Union, Al Qaeda, or global terrorism. The most frequently employed framework for understanding how such judgments are arrived at is the intelligence cycle.[1] It breaks intelligence down into a series of functionally related steps beginning with setting "needs to know" and ending with the production of intelligence for policy makers.

Less common are accounts of intelligence that build on the second policy-making imperative. Viewed from this perspective, the essence of intelligence is its ability to enhance the political power of those who possess it. The most heated debates here have been over whether intelligence has become politicized. Obtaining an understanding of intelligence's internal dynamics from this second perspective requires a different analytical framework. Rather than see it as composed of a series of functionally related steps that follow one after the other, intelligence can be broken down vertically into a series of different political games or contests that are continuously being played out. Not all of these games are equally visible to the public due to the level of secrecy that surrounds them, nor is the level of activity the same in each game. Some political contests may be relatively quiet and in a state of equilibrium, whereas others may be hotly contested.

In the following sections, four political games that are continuously played out within the intelligence policy area will be introduced. For each I discuss what is being contested and why; I also identify the key political actors. The struggle against global terrorism provides the necessary policy context for the discussion because as the first policy-making imperative correctly notes American foreign and national security policy is designed with an eye toward dealing with a problem. Policy problems and politics cannot be totally separated.

SYMBOLIC POLITICS

Words and images matter in politics. By setting and controlling the language of the political debate and the images that frame it, policy makers are able to provide an inherent advantage to certain policy options over others and favor certain political institutions and actors over others.[2] As such, the words and

images used in policy debates are often contested, but the political contest over symbols is not an even one. By virtue of their ability to command media attention, presidents possess an inherent advantage should they choose to use it. This is especially true in foreign and national security policy, where the president is looked on as the spokesperson for the nation and as the commander in chief. Entering into the arena of symbolic politics is not without risk. Words and images not only serve to control and direct political activity, they also raise expectations and can come to entrap policy makers that employ them.

Post-9/11 intelligence policy in the struggle against global terrorism has been shaped by symbolic politics in at least four different ways. First, it created a political context that favored aggressive collection policies. The George W. Bush administration moved quickly to define the terrorist threat as a war. Employing this imagery was easily understandable and well received by the American public. Both the location of the terrorist attacks of September 11, 2001, and the scale of the death and destruction they brought stunned Americans and produced a deep and palpable desire to reach out and punish those responsible for it. As natural as the war imagery seemed to most Americans, it was not the only way in which to symbolically frame the response to 9/11. Speaking of the British experience with terrorism in Northern Ireland, Michael Howard observed "a struggle against terrorism . . . is unlike a war against drugs or a war against crime in one vital respect. It is fundamentally a battle for hearts and minds. . . . Terrorists can be successfully destroyed only if public opinion, both at home and abroad, supports the authorities in regarding them as criminals rather than as heroes."[3]

From a political perspective, however, the war imagery offered something to the Bush administration that criminal imagery could not. It firmly centered decision-making power and authority on counterterrorism in the White House. It allowed the president to cast himself as a "war president" and in the process, at least for a time, politically disarmed his opponents who, in embracing the war imagery, were obliged to speak in the language of national unity. Just as significantly given the American approach to war, which sharply distinguishes periods of war and peace and favors unilateral action and is loathe to accepting restraints on the use of force, the war imagery allowed and perhaps encouraged the administration to think of intelligence activities in expansive terms. Wars are won or lost and presidents are held electorally accountable. Above all, winning the war on terrorism required preventing another attack on the American homeland, and to this end any and all information on the subject that could be collected needed to be collected.

Second, symbolic politics has been used extensively to reassure the public that the administration was in charge, all is well, and that progress in the war against terrorism was being made in the area of intelligence policy. Just nine days after the 9/11 terrorist attacks, Bush addressed a joint session of Congress and announced the creation of an Office of Homeland Security in the White House. Its director would report directly to the president and be advised by a Homeland Security Council. Tom Ridge, governor of Pennsylvania and a political confidante

of the president was named director. The Office of Homeland Security was to oversee and coordinate the development of a comprehensive national strategy to safeguard the United States against terrorist attacks and take the lead in responding to any that might occur. Positioning Homeland Security and its director in the White House put it out of the reach of Congress both in terms of approving personnel and budget and being able to compel individuals to testify. Such requests, which quickly came, were met with invocations of executive privilege.

Intent on defending its prerogatives, Congress challenged the Bush administration by putting forward legislation to create a Department of Homeland Security whose head would be approved by Congress and whose budget would be authorized by it. In keeping with the war imagery, Congress did not present its plan in terms of Beltway politics but as a necessary move to give those charged with protecting the American homeland the power and resources it needed to do the job.

The Bush administration and Congress became locked in a serious political dispute over Homeland Security. As the conflict progressed, the political advantage was going to Congress. The Office of Homeland Security had not gotten off to a strong start. Positions were unfilled, and press accounts suggested that Ridge was not being consulted by other bureaucracies in their decision making on terrorism. Congress was also set to begin hearings into the performance of the intelligence community leading up to the terrorist attacks of 9/11. The star witness was to be an FBI whistle-blower who charged that the Bureau mishandled warning intelligence about those attacks. This revelation strengthened the hand of those who were calling for a Department of Homeland Security. Just hours after these accusations were made and only days before the congressional hearing was to take place, the Bush administration switched directions and endorsed the general concept of a Department of Homeland Security. In introducing his new plan, Bush again turned to symbolism, asserting that his proposal represented the most extensive reorganization of the Federal government since the 1940s.[4] Significantly, as we shall see, FBI and CIA intelligence activities were left virtually untouched by this reorganization. The Department of Homeland Security would not incorporate any of their activities, nor would it receive raw intelligence from them.

President Bush used similarly expansive and symbolic language two years later in signing the Intelligence Reform and Terrorism Prevention Act of 2004 that created the position of director of National Intelligence, calling it the "most dramatic reform of our nation's intelligence capabilities since President Harry S. Truman signed the national Security Act of 1947. Under this law our vast intelligence enterprise will become more unified, coordinated, and effective."[5] Establishing the position of Director of National Intelligence (DNI) had been one of the principal recommendations of the 9/11 Commission. In reality the Bush administration had shown little interest in having it come into existence.

With its attention riveted on waging the war against terrorism first in Afghanistan and then in Iraq, the Bush administration showed little interest in

retrospective post mortems on how 9/11 came about. It preferred that such inquiries wait on the successful conclusion of the war on terrorism. Initially this position succeeded. It was only after victory in Afghanistan that in December 2001 Senators Joseph Lieberman (D-CT) and John McCain (R-AZ) introduced legislation to bring an independent investigatory commission into existence. The Bush administration argued this was unnecessary because the House and Senate had now agreed to their own separate investigations. Finding that the terms of reference to these investigations were too restrictive, the families of the victims of the terrorist attacks continued to lobby for an independent bipartisan investigation. On November 27, 2002, the Bush administration and the Republican-controlled Congress agreed. Of particular concern to the administration and its supporters was that the 9/11 Commission would issue a negative report in the midst of the 2004 presidential campaign. To prevent this occurrence, the administration set a May 2004 reporting date and followed a policy of noncooperation with the commission. Vigorous lobbying by the families of the 9/11 victims and negative press coverage compelled the administration into first cooperating more fully with the commission and then agreeing to its request for a two-month extension. When the commission's report and recommendations were made public in July 2004, Democratic presidential candidate John Kerry quickly endorsed all of them and urged rapid action, leaving Bush with little choice but to endorse the report as well. As was the case with establishing a Department of Homeland Security, however, we shall see that creating the position of Director of National Intelligence amounted to far less than the imagery and rhetoric of major reform suggested.

Symbolic politics is not a one-time affair. It requires constant attention and reaffirmation. It is thus no surprise that the imagery of a war against terrorism has been a constant feature of the Bush administration's rhetoric before, during, and after the 2004 presidential campaign. Here the symbolic need exists to reassure the public not only that the structure of the intelligence community has been strengthened but that progress is being made. Two symbolic moves were made in this direction in 2005. Both came on the heels of public reports issued by members of the 9/11 Commission criticizing the administration for failing to enact crucial reforms. In one move, President Bush sought to refocus attention on the war against terrorism by announcing that the United States and its allies had disrupted ten serious terrorist plots since 9/11. Bush mentioned Osama bin Laden by name five times in his speech and asserted that groups inspired by Al Qaeda were trying to "enslave whole nations and intimidate the world." In another move, in late October, Director of National Intelligence John Negroponte publicly released the new National Intelligence Strategy of the United States. In doing so he observed that this document "shows Congress and the public our commitment to building an intelligence community that is more unified, coordinated, and effective.[6] Ten goals were identified for the intelligence community, including bolstering the growth of democracy, countering terrorism, and preventing the spread of weapons of mass destruction. Previous versions of this document had been secret.

Third, symbolic politics was used by the Bush administration to deflect criticism for intelligence failures in the lead-up to the Iraq war, especially as they related to the charge that Iraq possessed weapons of mass destruction, a charge that was central to the administration's case for involvement. Central to this strategy was restricting the terms of reference given to bodies looking into these intelligence failures. The Senate Select Intelligence Committee investigated and reported its conclusions in July 2004 and stated that nearly every finding in the National Intelligence Estimate released prior to the war was wrong. As part of the agreement by Republicans and Democrats on the committee, the Senate's investigation was divided into two parts. Part I, reported here, dealt only with the quality of prewar intelligence. The investigation was not permitted to examine how intelligence was used by the Bush administration. The administration's handling of intelligence was to be Part II of the investigation. As 2005 ended, Part II had yet to begin, and Republicans and Democrats on the committee were sparring over the need to hear testimony from administration officials.

A second effort a deflecting attention from the administration to the intelligence agencies came with the terms of reference assigned to the Commission on the Intelligence Capabilities of the United States Regarding Weapons of Mass Destruction, also known as the Silberman-Robb Commission, after its co-chairs, Judge Laurence Silberman and former Senator Charles Robb (D-VA). Bush initially resisted efforts to establish such a commission. He changed his position in early February 2004 following the late January resignation of UN chief weapons inspector David Kay and his subsequent testimony to Congress that "we were almost all wrong" about Iraq's weapons program.[7] Bush had argued that creating a commission to look into this issue was premature and should wait on a more exhaustive search for weapons of mass destruction. But now fearful that the White House would lose control over the issue, Bush endorsed a commission but indicated that it would look at intelligence on weapons programs in Libya, Iran, and North Korea as well. He also indicated that he would appoint all of its members. This move angered congressional Democrats, who argued that the commission could no longer be considered independent.

Unlike the 9/11 Commission, whose deliberations the administration had failed to control, the Silberman-Robb Commission held closed-door hearings rather than public ones. It was also not authorized to examine how policy makers used the intelligence they received. The Commission released its report on March 31, 2005. Where the 9/11 Commission stated that President Bush saw repeated warnings about a potential terrorist attack prior to 9/11, the Silberman-Robb Commission concluded that the intelligence community was "dead wrong" in most of their assessments.[8] Press accounts describe Silberman and Robb standing next to Bush at the public release of the report looking like bodyguards. The report mentions the CIA 1,567 times, the White House eight times, and Vice President Dick Cheney twice.

Finally, symbolic politics can be used to place responsibility for future problems on others. Consumer safety alerts, foreign travel advisories, drug warning

labels, and the like all say to citizens that the government is doing its job and now you must do yours. This is very much the case with issuing warnings about terrorist attacks. Lawrence Freedman notes that by communicating threat warnings, governments are able to shift responsibility for dealing with the risk of terrorism from governments to citizens, who are then the ones who make the decision on whether to ride the subways, go to work, or open their mail.[9]

As examples of this tendency, we have the October 2005 decisions to place police officers on every train, to have major shows of force at transportation centers in New York City, and to close the Baltimore Harbor Tunnel. All decisions were made in the aftermath of the London terrorist bombings in 2005, and the intelligence used consisted almost entirely of tips that a terrorist attack was possible in the immediate future. In the Baltimore case, the tip was described as uncorroborated. In the New York case, the threat was dismissed by Department of Homeland Security officials almost as soon as the alert was announced. On a more general level we have the color-coded alert system put in place by the Department of Homeland Security. Six times between its introduction after 9/11 and the presidential election of 2004, the system went into an orange or elevated alert level. Although issuing warnings holds the potential for shifting responsibility away from policy makers, it also has risks, especially when threats fail to materialize. Under these circumstances, policy makers are again trapped by their own symbols and run the risk of being accused of politicizing a situation or alarmism.

For intelligence, three consequences follow from the policy makers' desire to at least at a symbolic level protect themselves from charges that they are not doing their jobs. First, policy makers will demand greater specificity from intelligence than is possible. They will want the intelligence community to engage in fortune-telling.[10] One can see this outlook in President Bush's comment that the August 6, 2001, President's Daily Brief titled "Bin Laden Determined to Strike in US" did not contain specific enough information to take action.[11] Second, in the absence of concrete intelligence, policy makers tend to place greater emphasis on worst-case speculation about potential vulnerabilities and what terrorists might do rather than on the limited intelligence on hand about what terrorists are doing or planning. Finally, it heightens the tendency to engage in "sweepstakes" intelligence where the rush to a bottom-line conclusion takes precedence over sound analysis.[12] Taken together, these three tendencies work against the credibility of intelligence warnings over terrorist attacks but address the political imperative of shifting blame.

RESOURCE POLITICS

By its very nature and purpose, symbolic politics is a highly visible enterprise. Far less visible is the second political game or contest played out in Washington, DC: resource politics. Where the president is the principal political player in the symbolic politics arena, Congress and bureaucratic forces dominate

resource politics. Successful symbolic politics actually provides a cover that shields this political game from public view by encouraging the general population to turn its attention to other matters because public statements, laws, investigations, or administrative reforms have taken place that have addressed the problem. The struggle against terrorism is no exception. Speaking of the 9/11 Commission's call to create a powerful Director of National Intelligence and locate the office in the White House, Congressman Jack Murtha (D-PA) commented in September 2004 that "public indifference will make Congress able to resist changes [to the intelligence community]."[13] Presidents traditionally have not been active players in these political arenas because they care less about reorganization than do legislators and bureaucrats and frequently employ them as bargaining chips.

Resource politics are concerned with the basic fiber of organizations: their structure, budgets, and areas of jurisdiction. All were key areas of contention in intelligence policy in Washington after 9/11 with the creation of the Department of Homeland Security and the post of director of National Intelligence.[14] As noted in the discussion of symbolic politics, they both were hailed as significant accomplishments in improving the quality of intelligence and winning the struggle against global terrorism. It bears noting, however, that as the reorganization process came to an end, no intelligence agency was abolished. Instead, the number of intelligence bureaucracies increased.

We can see the central role played by resource politics in setting up the Department of Homeland Security and the corresponding lack of importance of attached to intelligence concerns by the two struggles that began and ended this political contest. The policy debate began over whether a Cabinet-level Department of Homeland Security or an Office of Homeland Security in the White House should be created. This is a structural issue, and at its heart was the ability of Congress to influence how its funds were spent and who would run the department. A White House Office of Homeland Security would be beyond its reach, but not a Department of Homeland Security. The final policy debate was over the degree of civil service protection to be afforded to personnel assigned to the new department and the power of the Secretary of Homeland Security. Under Bush's proposal, the secretary would have the ability to reorganize the Department of Homeland Security without congressional approval as well as great flexibility in hiring and firing employees. It would have subjected only fourteen of twenty-eight senior officials to senatorial confirmation to hire and fire individuals and change their job responsibilities. The battle over implementing a new personnel system did not end with passage of the legislation creating the department. In August 2005, a U.S. District Judge argued that the system undermined employees' collective bargaining rights. Another judge issued a similar ruling in February 2006 over an attempt to extend such a system to the Defense Department.

As created, the Department of Homeland Security had three primary missions: (1) to prevent terrorist attacks within the United States, (2) to reduce the vulnerability of the United States to terrorism, and (3) to minimize the damage

and assist in the recovery from terrorist attacks that do occur here. To accomplish these objectives twenty-two different agencies with some 170,000 employees were brought together in the new department. When President Bush publicly embraced the concept of a Department of Homeland Security in spring 2002, many inside and outside the administration speculated that it would become the primary intelligence center for the war on terrorism. Even the language establishing it suggested a major intelligence role. "Except as otherwise directed by the president the secretary [of Homeland Security] shall have such access to all information including reports . . . and unevaluated intelligence relating to threats of terrorism."[15] The reality proved to be quite different on both accounts.

The FBI and CIA were largely unaffected by the establishment of the Department of Homeland Security. Also remaining outside the new unit were the National Security Agency, the Defense Intelligence Agency, and the Northern Command, which is charged with the defense of American territory.

From the very outset, FBI Director Robert Mueller and Director of Central Intelligence (DCI) George Tenet spoke out against any rapid, major overhaul of the intelligence community, as did senior active and retired intelligence officials. Their opposition and uncertainty in Congress over how to proceed led to a decision to postpone intelligence reorganization and focus on reorganizing other aspects of Homeland Security, such as border and transportation protection, immigration, and disaster preparedness.

With intelligence agencies not subject to reorganization, the Department of Homeland Security became confined to the status of a consumer of intelligence and not a producer. Both the FBI and CIA pressed for strict limits on the information they had to share with the new department. One Senate aide close to the reorganization process stated that "there is real friction among these agencies. A lot of people want to put Homeland Security in a little box and not share much with them."[16] By mid-July Tom Ridge, still in his capacity as director of the White House Office of Homeland Security, was saying that the new department would limit its intelligence work to preparing warnings and leaving the central task of collecting intelligence to the FBI, CIA, and the Department of Defense intelligence agencies. Homeland Security was to be a coordinating center with access to the analytical production and information-gathering capabilities of the federal government. By the end of 2002, the administration's position retreated to the point where Ridge, now Secretary of Homeland Security, would only have access to unevaluated raw intelligence when he could make a case for it under yet-to-be-determined procedures.

These institutional and procedural arrangements did little to address the problem of intelligence sharing that the 9/11 Commission identified as a major deficiency in its report. Not only was the Department of Homeland Security limited in its access to intelligence from key agencies, but several units incorporated into its structure, notably the Coast Guard, Secret Service, Customs Service, and Immigration and Naturalization Service, retained their intelligence collection divisions.

The 9/11 Commission issued its report on July 22, 2004. Its central recommendation was the establishment of the position of Director of National Intelligence. This individual would oversee all-source national intelligence centers, serve as the president's principal intelligence advisor, manage the national intelligence program, and oversee the component agencies of the intelligence community. Included in his powers would be the responsibility for submitting a unified intelligence budget, appropriating fund to the intelligence agencies, and setting personnel policies for the intelligence community. The Director of National Intelligence's office would be in the White House.

The proposal to create a Director of National Intelligence, or DNI, became part of the Intelligence Reform and Terrorism Prevention Act of 2004. The House and Senate passed different versions of the bill with the Senate bill more closely following the 9/11 Commission's call for a strong DNI. The House bill provided for a far less powerful director. Under the Senate bill, the CIA director "shall be under the authority, direction, and control" of the national intelligence director. In the House version, the CIA director would only "report" to the National Intelligence Director. The House bill also only gave the National Intelligence Director the power to develop budgets and give "guidance" to intelligence community members. The Senate bill stated that he or she would "determine" the budget. The Senate bill would also make the intelligence budget public, require that most of the Director's high-ranking assistants be confirmed by the Senate, and create a civil liberties panel to prevent privacy abuses. Were the House version to prevail, which it largely did, some senators warned that Congress and the president would be creating a Potemkin Director of National Intelligence.

By fall, the House and Senate were deadlocked. Key opposition came from House Republicans led by Duncan Hunter (R-CA), chair of the House Armed Services Committee, who was adamant that the Pentagon should not loose control over its intelligence budget and that the overall intelligence budget should remain secret. To the consternation of the families of the victims of the 9/11 attacks and in the face of their pubic calls for action, President Bush remained on the sidelines as the battle dragged on. In fact, the administration from the outset had shown little interest creating the position of the position of DNI as outlined by the 9/11 Commission and was opposed to placing this office in the White House. Though the president did not speak out against the 9/11 Commission's recommendations, some argue he moved quietly to blunt the intent of the reforms through the issuance of executive orders and memos that in some cases did little more than reaffirm the system as it existed, including the secretary of Defense's operational control over defense intelligence agencies and intelligence priorities and in other cases advanced the commission's recommendations to established bureaucratic interests in a nonthreatening manner.[17]

Visible bureaucratic opposition to the 9/11 Commission's version of a DNI emerged soon after its report was released. Ridge opposed the idea, stating, "We don't need an intelligence czar."[18] Along with Secretary of Defense Donald

Rumsfeld and National Security Advisor Condoleezza Rice, he cautioned against moving too quickly. He also echoed Rumsfeld's warnings about creating a new layer of intelligence bureaucracy. Rumsfeld reportedly "blasted" the 9/11 Commission's report in classified hearings and stressed that centralizing intelligence outside of the Pentagon's control might undermine the military's ability to conduct the war against terrorism by placing barriers between Washington and battlefield commanders. The chairman of the Joint Chiefs of Staff, Gen. Richard Myers, made the same point in a letter he sent to congressional leaders. He asserted that if the Pentagon were to lose control of its spy satellites, troops on the ground would be endangered.

To these arguments were added partisan political concerns. Many Republicans in the House remained angry over what they considered to be the hostile treatment that administration officials received by the 9/11 Commission and the platform it provided to Bush's critics.[19] Republican opposition led by Hunter forced Speaker of the House J. Dennis Hastert to hold a Republican-only meeting in November to try to salvage a compromise bill. He failed, with Hunter winning an agreement that any bill should contain language that "directs the president to write regulations that protect the chain of command" regarding intelligence gathering aircraft and satellites.

In its final version, the Intelligence Reform and Terrorism Prevention Act of 2004 passed by Congress and signed by Bush followed far more closely the restricted vision of the Pentagon and its allies than it did the 9/11 Commission in establishing the DNI. Title I of the act stipulated that the DNI not be located in the executive office of the President. It gave the DNI the power to "develop and determine" an annual budget for the national intelligence program based on budget proposals provided by the heads of intelligence agencies and departments. The DNI is to ensure the "effective execution" of the annual budget and "monitor the implementation and execution of the National Intelligence Program." After consulting with department heads, the DNI is authorized to transform or reprogram a maximum of $150 million and no more than 5 percent of an intelligence unit's budget in any one fiscal year, but he or she may not terminate an acquisition program. He or she is also given the power to develop personnel policies and programs in consultation with the heads of other agencies and elements of the intelligence community.

Resource politics does not end in Washington with the passage of legislation but continues on a daily basis. Its effects at the Department of Homeland Security came into clear focus with its response to Hurricane Katrina. From the outset, fears were raised that the Federal Emergency Management Agency (FEMA) would experience a reduction in its ability to cope with natural disasters in the United States as a result of being placed in an organization whose primary mission was counterterrorism. Intelligence is not immune from these problems. In January 2006, Secretary of Homeland Security Michael Chernoff filled the position of chief intelligence officer with CIA veteran Charles Allen. Prior to his appointment, the position was vacant for seven months. Some half a dozen candidates

turned down the position in 2003 when the Department of Homeland Security was set up. Moreover, the intelligence fusion center that was to bring together intelligence from all sources had been overtaken in importance by establishing the position of DNI and creating a National Counterintelligence Center in his office.

In April 2005, the Silverman-Robb Commission, now acting as a private watchdog organization over intelligence reform, warned Bush to expect existing intelligence agencies to try to undermine the authority of the new DNI. Modernization plans being put forward by the FBI and CIA were described as a "business as usual approach to intelligence gathering."[20] Evidence on this last point was not long in coming. In May 2005 it was revealed that the two army analysts whose work was key to the faulty argument that the aluminum tubes sought by Iraq were part of a nuclear weapons program had received job performance awards for the past three years. The Silverman-Robb Commission had criticized their work as a "serious lapse in analytic tradecraft" because they did not seek out confirming or disconfirming information from the Energy Department or other intelligence agencies on the matter. In October, new CIA Director Porter Goss announced that he would not hold any current or former agency officials, including former CIA Director George Tenet, responsible for pre-9/11 intelligence failures, despite a recommendation by the CIA's inspector general that he convene an accountability board to judge their performance.[21] He had supported such a review when he served as chair of the House Select Intelligence Committee but now cited a desire to avoid hurting the agency. Inspector generals in the State Department, Justice Department, and Defense Department conducted similar reviews and declined to take disciplinary action against anyone.

Other evidence surfaced in 2005 that supported the commission's fears. In June the FBI, under pressure from the White House and Congress, agreed to let DNI John Negroponte help select the FBI's intelligence chief. Veterans within the agency had resented this move as an unprecedented infringement on the FBI's independence. At the same time, press reports indicated that FBI Director Mueller had taken steps to prevent deeper changes at the FBI by undertaking a series or reorganization measures in thee areas of collection and intelligence analysis. For example, the FBI moved 96 percent of its intelligence budget into units not under the jurisdiction of the DNI.

September brought a public relations embarrassment to the CIA as Robert Richer, the second-highest ranking officer in the Directorate of Operations and a Goss appointee, resigned and testified before the Senate committee about morale problems within the agency and Goss's lack of leadership and vision. The next month it was announced that in spite of recommendations by the 9/11 Commission that responsibility for human intelligence be transferred to the DNI, the CIA would remain as the chief coordinator of overseas spying by intelligence agencies. A National Clandestine Service within the CIA was to be created under Goss. It would supervise and coordinate spying but not direct the espionage activities of the FBI or Department of Defense intelligence agencies. Though located at the CIA, the new National Clandestine Service and all overseas human intelligence

collection programs will be overseen in the DNI's office by his deputy, Mary Margaret Graham, a former CIA intelligence official who left the Agency because of Goss.

The Intelligence Reform and Terrorism Act allowed the DNI to transfer up to 100 people from other intelligence agencies, including those in the Pentagon, but only in consultation with relevant congressional committees. The agreement reached with Congress at the time was that consultation meant approval from these committees. In June 2005 it was agreed that the House Armed Services Committee would not have veto power over personnel transfers. Instead Negroponte agreed to meet personally with Hunter to discuss any moves involving Pentagon personnel.

Resource politics potentially also has a second but more varied impact on those who produce intelligence. Richard Stoltz, former head of the CIA's clandestine service, suggests that the process of adding more layers to the intelligence bureaucracy will lead to a wait-and-see and risk-averse attitude among intelligence officials.[22] These are precisely the traits that drew so much criticism from the 9/11 Commission and other studies. At the same time, the process of redirecting resources, creating new units, and seeking to imbue them with a sense of urgency and purpose to their mission may also embolden some to act in ways that transgress the bounds of permissible behavior. After 9/11, the CIA came under pressure to capture members of Al Qaeda and their supporters. Renditions, the process of secretly capturing a suspect and transferring them to another country for interrogation, became a favored tool in the war on terrorism. Identifying candidates for rendition involved collaboration between analysts and operations officers sifting through tips and other pieces of circumstantial information as to a person's politics or identity. An estimated 3,000 people were captured. Unfortunately, not all of them had a connection with terrorism. Mistakes were made because of the fear of missing a case. And, in the process, the vetting and evaluating information suffered. It was "the Camelot of counterterrorism."[23]

AGENDA POLITICS

Policy makers are attracted to intelligence out of self-interest. They want to succeed, and to the extent that intelligence helps them succeed, they seek it out and use it. As one former diplomat noted, "I could not afford to read intelligence papers because this or that intelligence agency was empowered to produce them. . . . I could only read intelligence products tailored to help me through my substantive schedule."[24] This basic truth holds several important implications for intelligence. First, intelligence does not determine policy. Intelligence professionals recognize this. It is one ingredient in the mix of factors that determine what U.S. foreign and national security policy will be. The struggle against global terrorism is no exception. As Lawrence Freedman notes in speaking of the Iraq war, "This was not an intelligence driven crisis. The [9/11] attacks changed the

terms of the security debate . . . [policy] drew on intelligence information but could rarely be refuted or confirmed in a definitive manner."[25]

Second, intelligence is not always welcomed. Often it is inconvenient.[26] Typically policy makers seek to keep options open as long as possible, but the logic of intelligence is to close off options. Particularly problematic is intelligence that questions the wisdom of a policy after policy makers have publicly committed themselves to it. Intelligence may also be discounted when it suggests that a potential problem exists at a time when policy makers are focused on other issues. Again the struggle against terrorism provides examples. Planning within the State Department, the CIA, and nongovernmental organizations suggested that the rebuilding and occupation of Iraq would not follow the model of Germany or Japan (as administration officials suggested) but would be more difficult and require a much larger military force that was being planned for. These warnings were shunted aside.[27] The same can be said for the administration's response to doubts within the intelligence community about the soundness of the intelligence on which its pre-war policy rested; because the incoming Bush administration's agenda did not include terrorism as a prominent concern, attempts by Clinton administration holdover Richard Clarke and others to warn the administration about Al Qaeda fell largely on deaf ears.[28] For that matter, terrorism was also not a major issue in the Clinton administration. Prior to 9/11, the most comprehensive National Intelligence Estimate on terrorism was published in July 1995.

Third, to the extent that policy makers disagree over policy intelligence will become contested and competitive. Not only will policy makers seek out intelligence that supports their policy positions or undermines that of rivals, they will also seek to control its distribution. In some cases this will mean denying rivals access to it. In other cases it will mean going public with intelligence. Efforts by Bush administration officials to seek out supportive evidence in the struggle against terrorism prior to the Iraq war are well chronicled. Vice President Dick Cheney regularly visited CIA headquarters and challenged analysts on their sources and conclusions. Retired CIA official Michael Scheuer comments that the CIA received repeated inquiries from Undersecretary of Defense Douglas Feith's office at the Pentagon about Iraq–Al Qaeda links, causing the CIA to review over 70,000 documents.[29] Rumsfeld and Feith established the Office of Special Plans within the Defense Department to provide an alternative source of intelligence that would support their position.

The administration also sought to control access to intelligence. Defending its Iraq policy in 2005, the Bush administration argued that Congress had seen the same intelligence it had prior to the war. Yet the administration had far more intelligence available to it and did not share all it possessed. Doubts within the intelligence community were not shared, such as those expressed by the National Security Council four days before President Bush's 2003 State of the Union address, where he made the case for war against Iraq. The NSC had called for additional intelligence to support the claim that Saddam Hussein possessed chemical, nuclear, or biological weapons. In contrast to Director of Central

Intelligence George Tenet, who called the case for war "a slam dunk," the national intelligence officer for strategic and nuclear programs called the case "weak."[30] Similarly, doubts raised by a Defense Intelligence Agency analysis of the reliability of the administration's principal source establishing a link between Al Qaeda and Iraq were not shared nor reflected in Bush's October 2002 statement that "we know Iraq and al-Qaeda have had high level-contacts going back a decade."

Beginning in August 2002 and continuing through to the eve of war, the administration began a sustained and well-orchestrated campaign to promote public support for war against Iraq.[31] Central to this campaign was the release of intelligence (or references to intelligence) that supported its case. That month Cheney asserted that he was convinced Saddam Hussein possessed weapons of mass destruction. In support he cited information from defectors, including Hussein's son-in-law. Also in August, a White House Iraq Group under the direction of Chief of Staff Andrew Cord was set up to ensure that a unified front was being given by the administration on the need for war. In September, President Bush made several public references to Iraq's effort to obtain nuclear material and intelligence support for that assertion. In October he announced that Iraq was reconstituting its nuclear weapons program and that satellite photographs support this conclusion. He also asserted that the United States had discovered through intelligence that Iraq has a growing fleet of unmanned aircraft that might be targeted on the United States. In his January 2003 State of the Union address, Bush stated that the British government had learned of Iraqi efforts to obtain significant quantities of uranium from Africa. The next month, Secretary of State Colin Powell told the United Nations that his presentation of Iraqi efforts to obtain nuclear weapons was based on "solid intelligence." Twice more before war began, in March 2003 President Bush asserted that the United States possessed intelligence that "left no doubt" about Iraq's threat.

The fourth implication for intelligence of policy makers approaching it in a self-interested fashion is that they tend to view intelligence as a tool or instrument of policy. Intelligence is not supposed to have policy views of its own. It exists to serve them. Their basic approach is that they want "more, better and faster."[32] But in reality, intelligence officials are no more united in their views than are policy makers. The dividing lines separating intelligence officials are not necessarily partisan in the sense of Republican versus Democrat or realist versus neoconservative although such differences do exist. They are more likely to be centered on questions of institutional perspectives, control over information, the proper analytical frameworks employed, and definitions of professionalism. Thus, just as with policy makers, it is often necessary to find common ground to advance policy. In the case of the struggle against global terrorism, this common ground was the charge that Saddam Hussein possessed weapons of mass destruction. As Paul Wolfowitz acknowledged, "only the WMD issue had legs."[33] It was the only issue around which the bureaucracy could agree.

The failure to recognize that intelligence is not by definition neutral in its origins or infinitely malleable in its uses but that it reflects the thinking of

individuals embedded in organizations that contain their own political dynamics can set the stage for a particularly bitter brand of agenda politics—one that pits the White House against the portions of the intelligence community. The primary weapons at the disposal of the disaffected segments of the intelligence community are leaks. The recipients of these leaks tend to be the media or members of Congress. Their purpose is to alter the complexion of the political landscape by bringing other groups into the political fray that might otherwise not be aware that a policy is being contested or even under discussion. In addition to principled disagreement over policy decisions, self-interest plays an important role in the decision to leak intelligence. Policy makers come and go, but intelligence agencies are permanent. Recalling the post-Vietnam experience of the American military, those who leak may fear that their agencies will bear the blame for policy failures, excesses, and illegalities long after the policy makers who ordered them have left Washington.

This is the pattern of Washington politics that emerged with the beginning of the occupation and reconstruction of Iraq. Leaks from the intelligence community and military personnel provided the impetus for revelations about Abu Ghraib prisons, the practice of secretly capturing and incarcerating suspected terrorist suspects abroad, the use of torture as an interrogation device, and electronic spying on American citizens in the United States. In each case, these revelations succeeded in widening the circle of those participating in the policy debate. Most notably it brought renewed attention to Senator McCain, a former prisoner of war and a potential Republican presidential candidate who opposed the use of torture. Leaks also brought European leaders into the policy debate as information about secret CIA renditions in Eastern European countries occurred on the eve of Secretary of State Rice's 2005 trip there.

For its part, the Bush administration continued to make secret intelligence public on a selective basis to further its position. DNI Negroponte released an inflammatory letter allegedly written by Ayman Zawahari just as President Bush was giving a speech on Iraq defending the administration's policy. In an October 6, 2005, news conference, Bush announced that ten unidentified Al Qaeda terrorist plots had been disrupted by the United States and allied intelligence agencies since 9/11. When pressed on the subject by reporters, the administration later released a list of those incidents. Intelligence officials commented off the record that the administration had overstated the gravity of those plots and that most were far from being in a position to be carried out.

ACCOUNTABILITY POLITICS

To whom is intelligence responsible? As we have just suggested, from the point of view of policy makers, intelligence is responsible to them. They expect intelligence organizations to provide them with information and assessments that will allow them to succeed. The conventional wisdom in Washington is that

Porter Goss was made director of the CIA in 2004 to bring it under control and end the series of anti-administration intelligence leaks emanating from it. Goss would not be the first Director posted to the CIA for that purpose. He brought with him highly partisan staffers from the House Select Intelligence Committee. In his first months in that position, between thirty and ninety senior CIA officials left, including some whom Goss had appointed to key positions, and someone who worked on the Bush-Cheney election campaigns was placed in charge of the CIA's public affairs unit. Goss also issued a memo to CIA employees (soon leaked) in which he stated "as agency employees we do not identify with support, or champion opposition to the administration or its policies."[34]

Intelligence officials are well aware that executive branch policy makers are not the only ones interested in the performance of the intelligence community. Congress though its powers of the budget, appointment, and oversight has a constitutionally defined role in evaluating and assessing its performance. The media is also interested in intelligence both for its ability to provide a good story and because of its fourth estate role as a watchdog for the people over governmental action. Also active in the area of oversight, but generally playing a much more limited role in holding intelligence agencies responsible for their actions, are private sector interest groups, such as the Electronic Privacy Information Center, which aggressively pursues national security–oriented freedom of information questions.

Secrecy is an obvious and major impediment to the ability of political actors, outside of the small group in the executive branch who make national security policy, to judge the performance of intelligence. But it is not the only factor affecting the ability and willingness of Congress, the media, or interest groups to scrutinize intelligence agencies and personnel and hold them accountable for their actions or inaction. Three other factors, all rooted in Washington politics, also play major if not more important roles. They are deference, partisanship, and self-interest.

The 9/11 Commission characterized congressional oversight of intelligence as "dysfunctional," a situation that can be traced to the three traits just noted.[35] Deference was long visible in the approach that Congress brought to oversight during early years of the Cold War. The national consensus focused on the need to combat communism, coupled with the widely held view that intelligence was an instrument of foreign policy to be exercised by the president at his discretion. During this period, congressional oversight served more to protect the CIA and other agencies than make them accountable for their actions. It was only in the mid-1970s, after revelations of CIA involvement in the coup to bring down Salvador Allende's government in Chile and spying on American citizens inside the United States, that congressional oversight became aggressive with the establishment of the Church and Pike Committees in the Senate and House, respectively. In the wake of the investigations carried out by these panels, each body established Select Intelligence Committees for purposes of continued oversight. They largely followed a model that stressed bipartisanship and

deference to the president and his use of intelligence, with investigations being restricted to a examining problems only after they occurred rather than engaging in anticipatory or preventive oversight.

Deference to the president began to lessen during the Reagan years as the administration talked of "unleashing" the CIA and its Central American policies increasingly divided Republicans and Democrats. During the Clinton presidency, Congress (with Republicans leading the way) forced unwanted programs on the administration in the form of appropriating money for covert action programs against Saddam Hussein. In both administrations, as well as during Carter's term, the opposition party openly and successfully challenged the president's nominee to head the intelligence community. Deference returned briefly in the wake of the 9/11 terrorist attacks but soon faded as the United States moved from war in Afghanistan to war in Iraq. Partisanship became particularly intense in the House. Porter Goss, who chaired the House Select Intelligence Committee and was himself a retired intelligence officer who served in the clandestine service, had long acted as a protector of the CIA. Now he moved aggressively to protect the president. He often described the CIA as a mismanaged bureaucracy. He publicly supported the administration's position on weapons of mass destruction, and he blocked investigations into pre-war intelligence and the treatment of prisoners at Abu Ghraib as well as belittled the notion of an investigation into the leaking of undercover CIA official Valerie Plame's name to the press (linked by a special prosecutor to Lewis "Scooter" Libby in Vice President Cheney's office). During the presidential campaign, Goss also criticized Kerry's stance on intelligence in a speech on the House floor.

The 9/11 Commission rejected calls for tinkering with the system and urged a wholesale change that would establish a strong oversight committee in each chamber or a single joint committee. Congress reacted warily to the proposed reforms even while making support public statements. Of particular concern to legislators was the notion of giving one committee power over both setting program priorities and budget authority. This would produce a reduction in influence of the Appropriations, Armed Forces, and Foreign Relations committees. Senate Appropriations Chair Ted Stevens (R-AK) commented on the thrust of the 9/11 Commission calls for centralizing congressional authority: "I don't think it will fly."[36] House Appropriations Committee Chair C. W. Young (R-FL) observed that combining spending and authorization powers in one committee "is not part of this proposal" in discussing the House's response to the 9/11 Commission's plans. A Republican aide stated more bluntly that any such plan "doesn't have a snowball's chance in hell" of taking effect.

The same three factors emerge in media oversight of intelligence. Deference can be seen in how the press reports on intelligence. What the public tends to focus on are the sensational headlines of domestic spying, renditions, and the treatment of prisoners. Less often noticed is that the media is frequently in contact with the administration about the details of these stories and is sensitive to its concerns. In a November 2005 story revealing the covert prison system set

up to hold and interrogate suspected terrorists outside of the United States without restrictions, the *Washington Post* agreed with a request from senior administration officials not to identify the Eastern European countries involved.[37] The next month, the *New York Times* reported on the program of domestic spying that President Bush had secretly authorized following the 9/11 attacks.[38] The paper reported that it had delayed publishing the story for one year after meeting with the White House and that some information that administration officials had argued could be useful to terrorists was omitted. When it was released, charges of partisanship were quickly raised. The story surfaced just as the Senate was nearly a final vote on extending the USA-PATRIOT Act. A compelling case for self-interest in the timing of the story can be made by pointing to competition between the *New York Times* and the *Washington Post* in breaking such stories and the imminent publication of a book on domestic spying by the article's author, James Risen.

For a brief period of time, one public affairs interest group played a key role in accountability politics. Its behavior deviated from the pattern of deference, partisanship, and self-interest exhibited by Congress and the media. After its report was issued on July 22, 2004, the members of the 9/11 Commission disbanded and formed a nonprofit organization, the 9/11 Public Discourse Project, to fulfill what they saw as the commission's original mandate of guarding against future terrorist attacks and promote a national debate on how future attacks can be prevented. To that end, the 9/11 Public Discourse Project issued a series of report cards from September to December 2005 on the extent to which the commission's recommendations had been acted on. While seeking to be nonpartisan, the negative tone of its evaluation (one A–, twelve B's, nine C's, twelve D's, five F's, and two incompletes) struck a partisan chord in Washington. The 9/11 Public Discourse Project ceased operation on December 31, 2005, with its ultimate impact on intelligence and the struggle against terrorism unclear.

CONCLUSION AND SYNTHESIS: DOMESTIC INTELLIGENCE GATHERING

To the casual observer, Washington politics frequently appears to be a game without rules, rhyme, or reason. It seems messy, unfocused, and unprincipled. On closer inspection, a different picture emerges. Reoccurring patterns to politics can be found. They are symbolic politics, resource politics, agenda politics, and accountability politics. National security policy is not exempt from these patterns. As discussed here, they are very much alive in intelligence policy. Not all of these political games or contests are equally visible. Each has its own inner dynamics and central set of political actors. These political games or contests are not self-contained. Activity in one feeds on and is influenced by the politics in the others. Washington politics becomes particularly intense and combative when simultaneous activity is occurring in all four political games or contests. Such

was the case in late 2005 to early 2006 in the dispute over domestic spying on Americans as a means of gathering intelligence in the global struggle against terrorism.

In this case, agenda politics first came into public view. Controversy erupted in mid-December 2005 when the *New York Times* reported, on the basis of information leaked to it, that in February 2002 President Bush signed a secret order authorizing the National Security Agency (NSA) to monitor phone calls and other communications (such as faxes and e-mails) inside the United States by Americans identified by the NSA as having some connection to Al Qaeda or potential terrorist activities.[39] Published estimates placed the number of Americans being eavesdropped on at any one time as up to 500 and that all told, the number of Americans spied on may have reached into the thousands. The NSA, in turn, provided information to the Defense Intelligence Agency and others for use in carrying out its surveillance of people inside the United States. President Bush reportedly was deeply involved in the oversight of the program, reviewing it every forty-five or sixty days and reauthorizing it some thirty-six times.

The *New York Times* story broke the day before the Senate was to vote on reauthorizing the USA-PATRIOT Act. A key point of debate was whether the provisions of this act went far enough in protecting the civil liberties of Americans. The story appeared to have a significant impact and many senators expressed concern about the warrantless wiretapping. The next day by a vote of fifty-two to four-seven, with four Republicans voting with all but two Democrats, the Republican-controlled Senate refused to end the filibuster, signaling a setback for the act. Just days before, in an effort to ensure its passage, the Bush administration reversed its position and endorsed McCain's bill to ban the cruel, inhumane, and degrading treatment of prisoners in its custody. After extensive debate in the new year, Congress passed the renewed USA-PATRIOT Act on March 9.

The controversy that raged was not primarily over the value of this intelligence-gathering effort, although such questions were raised by some. Recall that what investigations of pre-9/11 intelligence revealed was not a failure to obtain intelligence per se but the inability to integrate it so that a meaningful pattern could be deciphered. After 9/11, a 2002 Senate Select Intelligence Committee report commented that "only a tiny fraction of the daily intercepts are actually ever reviewed by humans,, and much of what is collected gets lost in the deluge of data."[40] Experts on terrorism noted that terrorists were already well aware of the risks of phone, e-mail, and fax communications. They were now relying on ground couriers and the World Wide Web. The public was not overwhelmingly alarmed over domestic spying on Americans in the United States. The USA-PATRIOT Act had already given the FBI broad new powers to gather information on Americans. A January 2006 *Washington Post*/ABC News public poll found that almost two-thirds of Americans believed that the government's antiterrorism efforts were intruding on the privacy of American citizens, but less than one-third felt that this was unjustified.[41]

At the core of the issue was President Bush's authority to authorize this program on his own. And this moved intelligence politics squarely into the arena of symbolic politics with the outcome determining in large part which side would have the upper hand in the overall political contest. The president defended the program on the grounds that it was "limited, "a vital tool in the war on terrorism," and "critical to saving American lives." Most significant, he also stated that it was "consistent with U.S. law and the Constitution."[42] In making this last assertion, Bush was echoing the position taken by then Attorney General John Ashcroft who signed a brief on September 22, 2002, stating that "the Constitution vests in the President inherent authority to conduct wireless intelligence surveillance of foreign powers or their agents and Congress cannot by statue extinguish that constitutional authority."[43] Ashcroft's argument made no distinction between U.S. citizens or suspected foreign agents. In 2005, Attorney General Alberto Gonzales asserted that the administration's domestic eavesdropping was derived from the September 14, 2001, joint resolution authorizing the president to use "all necessary and appropriate force" to defeat Al Qaeda and the president's inherent powers as commander in chief. The Justice Department continued this line of argument, stating that because espionage is "a fundamental incident in the use of military force," even though it was not specifically mentioned, it was authorized by the resolution.[44] As the controversy grew, Bush engaged in symbolic politics again when he sought to redefine the program as "terrorist surveillance" and publicly presented an account of an Al Qaeda plot to crash a commercial jetliner into a Los Angeles skyscraper after 9/11. The significance of the revelation was quickly countered by unnamed intelligence officials who questioned whether the plot was anything more than loose talk.

Opponents countered with an argument heavily rooted in symbolism as well: American civil liberties were being violated, the rule of law had been broken, and neither Congress nor the Constitution provided such powers to the president. The Fourth Amendment to the U.S. Constitution protects citizens from unreasonable searches and seizures and stipulates that warrants can only be issued with probable cause. Opponents of Bush's policy assert that this prohibition has been interpreted by the courts to require a warrant and probable cause. Moreover, the Supreme Court has rejected the argument that national security considerations override this requirement. Opponents also challenged the stated limited nature of this program. The National Counterterrorism Center maintains a list of international terrorism suspects or those who might be providing them with aid. In early 2006, 325,000 names were on that list. Duplicate entries may reduce the total number of individuals listed to some 200,000. The number of U.S. citizens on the list has not been revealed. Names are provided by the CIA, NSA, FBI, and others and are given to the Transportation Security Administration and other agencies.[45]

Opponents continued that the rule of law was violated by Bush's failure to obtain permission from the U.S. Foreign Intelligence Surveillance Court to conduct surveillance on Americans inside the United States. This eleven-judge body, all of whose members were selected by the late Chief Justice of the Supreme

Court William Rehnquist, was set up by the Foreign Intelligence Surveillance Act (FISA) that was passed in the 1970s after revelations of widespread spying on Americans by the military and the NSA in the name of rooting out communist influence on the anti–Vietnam War movement. According to the Justice Department, in 2004 the secret court approved 1,754 warrants. By one account it had received over 5,600 requests since 2001 and rejected only four.[46] Provisions of the act also allow for emergency wiretaps without the consent of the court for up to seventy-two hours. The Bush administration's position was that FISA was not relevant because the September 14, 2001, resolution constitutes a statute that by the terms of the act can override its provisions. One of the judges resigned in protest following revelations that the program existed and the presiding judge of the secret court requested a briefing on why it was not consulted. Finally, former Senate Majority Leader Thomas Daschle (D-SD) stated that the Bush administration had requested war-making authority from the Senate in discussions over the wording of the September 14, 2001, resolution and that it was rejected.

The political battle over what symbolic reference points were to be used in judging the appropriateness of this intelligence-gathering policy set the stage for a renewed round of accountability politics. As noted above the Foreign Intelligence Surveillance Court was ignored. Only its presiding judge was informed, and she raised concerns in private that this program could undermine the secret court's work if information so obtained was later used to acquire warrants on terrorist suspects. In fact, twice since 9/11 the FISA court was told that information obtained by this program may have been improperly used to obtain wiretap warrants. Vice President Cheney informed leaders of both parties about the program after it started and later the administration informed key members of Congress. These congressional briefings are given to the Gang of Eight, the leadership of the House and Senate and the intelligence committees. Staff members are not present, and those briefed are prohibited from discussing the information with other members of Congress, including those who serve on the intelligence committees. The administration contends that with these briefings, Congress gave its approval to the domestic spying program. After it became public, John D. Rockefeller IV (D-WV), the ranking Democrat on the Senate Select Intelligence Committee, revealed that in 2003 he sent a letter to Cheney stating that the briefings were unsatisfactory. The letter stated, "Given the security restrictions associated with this information, and inability to consult staff or counsel on my own, I feel unable to fully evaluate, much less endorse, these activities."[47] House Minority Leader Nancy Pelosi (D-CA) expressed concerns about the legality of NSA domestic spying in a letter to Gen. Michael Hayden, who as head of the NSA in October 2001 briefed the House Select Intelligence Committee on its broadened domestic operations. She wrote, "I am concerned whether and to what extent the National Security Agency has received specific presidential authorization for the operations you are conducting."[48] Hayden's response remains classified, but an intelligence official indicated that he had not been referring to the new NSA domestic spying program.

Although the content of these briefings is the subject of debate, it is clear that congressional oversight was carried out with deference to the administration and far more in the spirit of putting out fires (which had not yet occurred) than patrolling for dangers. When the program became public, Congress quickly moved out of principle and self-interest to reassert its oversight powers as both Democrats and Republicans called for hearings and previously secret correspondence was made public. Partisanship was not completely absent, as many Republican members of Congress staunchly defended the program and the president's right to implement it. Cheney went so far as to suggest that the debate over spying on terrorists ought be an issue in the upcoming congressional campaign. The possibility that the NSA's domestic spying program might become an issue that Republicans could seize on led two leading congressional Democrats to acknowledge its importance in the war against terrorism while rejecting Bush's legal authority to act without congressional approval.

In additional to maintaining its right to conduct such a surveillance program, the administration also sought to deflect attention away from the question of presidential authority by returning to symbolic politics. Bush asserted that the story of the day was not the domestic intelligence-gathering program but the war in Iraq. The administration also called attention to the illegality of the leak and launched a Justice Department investigation into who leaked the information announcing in January 2006 that the NSA's inspector general would conduct an investigation into the matter. Critics observed that Bush had already maintained that the NSA's general counsel and inspector general had approved the domestic spying program, so little should be expected from this probe.

Lying beneath the surface of this controversy we can also find resource politics. During the Cold War, the NSA collected intelligence on the Soviet Union through electronic intercepts and controlled much of the intelligence community's secret budget. This mission no longer exists. The war on terrorism provided an opportunity for the NSA to reinvent itself, but doing so was not without challenges. As a former NSA director observed, "We've gone from chasing a slow-moving, technologically inferior, resource poor nation-state to chasing a communications structure in which an al Qaeda member can go into a storefront in Istanbul and buy for $100 a communications device that is absolutely cutting edge, and for which he has had to make no investment for development."[49]

The NSA has long been authorized to monitor international phone calls and e-mails of American citizens without a warrant when they originate overseas. Secret NSA intelligence gathering in the United States was limited to communications intercepts involving foreign embassies and missions and only then with a warrant. The major exception was when an individual was suspected of being an "agent of a foreign power" or a member of a terrorist group. Otherwise it generally fell to the FBI to carry out domestic eavesdropping operations. The expansion of the NSA's role after 9/11 was implemented with an eye to achieving results and not the imposition of controls. It was mid-2004 before voices of concern were raised. At that time, elements of the program were suspended and

others recast after concerns were raised by national security officials and the head of the Foreign Intelligence Surveillance Court.

This was not the only expansion in domestic intelligence-gathering activities after 9/11. Also in late 2005, it was revealed that the Defense Department's new counterterrorism agency, the Counterintelligence Field Activity (CIFA), had expanded its efforts from a coordinating and oversight body into one with operational responsibilities. Its Directorate of Field Activities became responsible for disrupting adversaries, running roving patrols around military bases, and conducting surveillance on potentially threatening people and organizations inside the Untied States. CIFA also manages data bases that include Talon reports that consist of raw and unverified information collected by the military on suspicious activities. Talon reports are known to include information on peaceful civilian protests and demonstrations. In November 2005, the CIFA was given authority to task the domestic U.S. investigations and operations of the military counterintelligence units.

As promised by Senator Specter, hearings on the NSA's domestic surveillance program began in February 2006 after Congress returned from its winter recess. An all-out White House lobbying campaign plus a late-found willingness to brief House and Senate committees on the programs slowed down the momentum that had built for an investigation. The Senate rejected a Democratic attempt to launch an investigation into the matter through a procedural maneuver, which allowed time for a Republican working group appointed by Majority Leader Bill Frist (R-TN) to explore ways of changing the law to accommodate NSA's policy. Democrats were quick to criticize the formation of an all-Republican committee.

White House spokesman Scott McClellan sought to further calm the waters by outlining a new White House position. He stated that the NSA program does not require "congressional authorization" but that the administration is "open to ideas regarding legislation."[50] Two competing ideas became the center of attention. One, endorsed by the White House, was sponsored by Representative Mike DeWine (R-OH). It would provide additional congressional oversight for the NSA's domestic spying program but exempt it from FISA oversight. Such oversight would most likely come from a subcommittee of the intelligence committee with the full committee restricting itself to a review and modernization of the FISA. The second, opposed by the Bush administration, was introduced by Specter. It would require the NSA to obtain prior permission from the Foreign Intelligence Surveillance Court.

THE INTELLIGENCE WAR AGAINST GLOBAL TERRORISM

RICHARD L. RUSSELL

AMERICANS WERE HORRIFIED THAT THEIR INTELLIGENCE COMMUNITY (IC) failed to detect and disrupt the Al Qaeda surprise attacks of September 11, 2001. They rightly ask, "How is it possible that the intelligence community, which costs American taxpayers tens of billions of dollars per year, so miserably failed in protecting citizens and the homeland?"

The IC should have better been prepared to warn of Al Qaeda operations because the terrorist organization had been waging a war against the United States for some time. Al Qaeda bombed the American embassies in Kenya and Tanzania in 1998 as well as attacked the U.S.S. *Cole* in Yemen in 2000. These attacks should have signaled loud and clear that Al Qaeda had declared war on the United States, but American naiveté fueled the view that terrorist attacks were more a problem for law enforcement than for the military. Both civilian policy makers and the military hierarchy resisted moving the United States to a war footing to take head on the threat posed by Al Qaeda.[1] In response to the African embassy bombings, the United States could only muster half-hearted retaliatory cruise missile strikes against Al Qaeda–affiliated positions in Afghanistan and Sudan, which did little to blunt the network's capabilities to strike again against the United States.

The CIA, too, had not moved to a wartime footing to tackle Al Qaeda. Director of Central Intelligence George Tenet had warned in a December 1998 memorandum to his key lieutenants in the IC that the United States was at war with Al Qaeda and that he wanted no resources spared for the fight.[2] But Tenet's bravado was not matched by resources. The team inside the CIA's Counterterrorism Center (CTC) in the run-up to 9/11 only had five analysts assigned to track global Al Qaeda operations.[3] A handful of analysts is hardly commensurate with Tenet's call

to "spare no resource." Within the CIA's Directorate of Operations (DO), responsible for collecting human intelligence, senior management believed that the Al Qaeda threat before 9/11 was being exaggerated and resisted assigning CIA resources to the problem, according to former White House official Richard Clarke.[4] The former head of the bin Laden unit in the CTC, Michael Scheuer, even believes that senior CIA officials "have made careers by keeping silent in the face of unfairness, avoiding risk, and refusing to make decisions."[5] The CIA's own inspector general has found senior CIA officials negligent for failing to competently orchestrate the Agency's resources against Al Qaeda prior to 9/11.[6]

But that, as they say, is all history. The challenge today for scholars, intelligence officers, policy makers, and the American public is to move beyond the blame game and take a hard, clear-eyed look at what went wrong. We need to find ways to sharpen the nation's intelligence capabilities for countering Al Qaeda—as well as loosely aligned affiliates and successor organizations that share a militant Islamic ideology and hatred of the United States, which they blame for most (if not all) of the failings of the Islamic world—in what regrettably promises to be a long-term struggle.

The term *terrorism* generates considerable debate and controversy, which sometimes boils down to the view that "one man's terrorist is another man's freedom fighter." Many observers in the United States tend to view operations conducted by terrorist groups against American military and diplomatic facilities and personnel as terrorist attacks, but they probably should be more accurately seen as insurgents using terrorist tactics to wage war. Today the news headlines are dominated by Iraqi insurgent use of terrorist tactics, especially roadside bombings, in their battle against American forces in Iraq. But in the past, other insurgent groups have used terrorist tactics against the United States, sometimes with nation-state sponsorship. Hezbollah, for example, benefited from Syrian and Iranian support in the 1980s in its bombings in Lebanon, which killed about 250 Marines and destroyed the American embassy in Beirut. The Saudi Hezbollah benefited from substantial assistance from Iran when it bombed the Khobar Towers in Saudi Arabia in 1996 and killed nineteen American servicemen.[7] In short, Al Qaeda is not the first militant Islamic movement to use terrorism against the United States, and they are not likely to be the last. To steer clear of that thicket of debate on the differences between terrorism and insurgency, this chapter views terrorism as the use of violence by transnational groups or organizations that is directed principally against civilians for political purpose.

The CIA has traditionally played the leading role in the IC along three major lines to support the president in the war on terrorism. First, the CIA runs human intelligence operations needed to penetrate the walls of secrecy behind which terrorists plot and plan against the United States. Second, the CIA performs analysis of terrorist groups to inform presidential decision making. And third, the CIA is also tasked to mount covert actions against terrorist groups to disrupt,

prevent, and preempt their operations. This chapter critically examines the CIA's past performance in each of these areas against the terrorist adversaries, draws some lessons learned, and makes recommendations for strengthening future performance. This chapter acknowledges that the CIA's traditional position as the premier intelligence service in the community has been eclipsed by the creation of the Director of National Intelligence (DNI) and will conclude with some thoughts on how the DNI should best orchestrate the reorganized IC.

STEALING THE TERRORISTS' SECRETS

The IC taps a wide and deep array of sources of information to understand international terrorism. The United States uses diplomats and defense attachés posted abroad to collect information. It relies on publicly available information, such as newspapers, periodicals, and websites to analyze terrorist group memberships, propaganda, recruitment, and ideology. The IC also is able to use satellite imagery to identify terrorist training camps and state support for terrorist groups. The United States, for example, in 1998 used many of these sources of intelligence to identify Al Qaeda training camps in Afghanistan for retaliatory cruise missile strikes for the bombing of the two embassies in Africa.[8] The IC also clandestinely acquires information on terrorist groups and their plans from human sources (human intelligence, or HUMINT) and from intercepting communications such as radio, telephone, and e-mail (signals intelligence, or SIGINT). The primary responsibilities for these HUMINT and SIGINT operations fall, respectively, to the CIA and the National Security Agency (NSA) in the IC.

The CIA's Directorate of Operations, which was recently renamed the National Clandestine Service (NCS), is charged with running human intelligence operations intended to collect strategic intelligence on American adversaries.[9] The CIA's core human intelligence collection mission is to steal secrets that adversaries want to hide from the United States, secrets that could adversely affect American national interests.

The CIA's operational tradecraft for running human operations was honed during the Cold War. The Agency's operational officers working abroad under cover had used a method of spotting, accessing, developing, and recruiting Soviet diplomats and military officers primarily by trolling the diplomatic cocktail circuit. Though this is a proven method of human collection, the CIA's human operations against the Soviet Union were, on balance, less than impressive. Before the entire stable of CIA spies in the Soviet Union were exposed to the Soviet KGB by traitor Aldrich Ames, the Agency only had about a dozen spies inside the Soviet Union.[10]

The method is now deeply ingrained into the institutional culture at the CIA, and it has been stubbornly difficult for the Agency to move toward contemporary international terrorists targets. A former CIA case officer who was in the Agency's training class as late as 1999, nearly a decade after the Cold War,

recalls that it was still focused on trolling the diplomatic cocktail party circuit.[11] Unfortunately, and quite obviously, members of Al Qaeda, Hezbollah, Hamas, Islamic Jihad, and their state sponsors in Syria and Iran do not regularly participate in diplomatic cocktail parties. Nor, for that matter, do the scientists and technicians with experience in weapons of mass destruction (WMDs) programs who might offer their talents to terrorist groups with or without the knowledge of their countries. Rogue Russian scientists trying to make a lucrative living are a particular problem on this score.

The CIA has done precious little to exploit alternative means of getting human intelligence information. Most notably, the Agency has a strong bureaucratic culture to run "agents in place" even though it has failed to do this with any consistency or reliability over a period of decades. The CIA and American security would much better off it the Agency were sparing no expense or effort to encourage defections from countries with pervasive and oppressive internal security apparatus, called "hard target" countries. The United States, for example, should be offering money and perhaps resettlement in the United States or the West for disaffected Al Qaeda and Hezbollah members and scientists and technicians laboring in North Korea's and Iran's suspected nuclear weapons programs, who all could offer significant intelligence to the United States. Dozens of defections would give CIA analysts snapshots of terrorist groups and plans, intentions, and capabilities, as well as disrupt WMD-related activities.

The CIA also significantly suffers in human operations against Middle East terrorist groups such as Al Qaeda and Hezbollah because it suffers from shortages of Arabic and Farsi speakers. Former CIA case officer Robert Baer lamented that he was one of only two Arabic speakers in the CTC when it was set up in the 1980s to track Hezbollah and Palestinian terrorist groups.[12] And judging from news reports today, the CIA is not gaining ground fast enough to address this gap. The chancellor of the University of California at Berkeley, for example, meet with CIA officials to discuss language capabilities and came away from the meeting with the understanding that "their needs are desperate."[13]

The CIA also is overly dependent on foreign intelligence liaison service information. Because the Agency lacks foreign language capabilities, it relies on foreign intelligence services, which do have hard languages such as Arabic and ethnic backgrounds needed to penetrate terrorists cells. The Senate-House investigation into 9/11 determined that the CIA is overly dependent on liaison reports and fails to deliver its own or "unilaterally" acquired human intelligence. It found that "the Intelligence Community depended heavily on foreign intelligence and law enforcement services for the collection of counterterrorism intelligence and the conduct of other counterterrorism activities. The results were mixed in terms of productive intelligence, reflecting vast differences in the ability and willingness of the various foreign services to target the Bin Ladin and al-Qa'ida network."[14] Unilaterally acquired intelligence is essential to compare and check against the information provided by foreign liaison services as well as other American sources of information.

There can be no gainsaying how important these liaison relationships are to human intelligence collection in the war on terrorism. But with that said, for all of the problems and shortcomings in the American intelligence community, they pale in comparison to the problems that plague many foreign liaison services. For example, these foreign services suffer from a deep subordination to vested policy interests, ingrained bureaucratic and cultural resistance to "speaking truth to power," personal fears of delivering bad news to their superiors, as well as worldviews—especially pronounced in the Middle East—that greatly hamper objective and critical analytic thinking and intelligence. There is also a significant risk that liaison services skew their human intelligence reports shared with the United States to influence the direction of American foreign policy. These tendencies all underscore the critical need for the CIA to acquire its own unilateral intelligence sources.

The NSA is charged with the responsibilities for intercepting the communications of terrorist groups. The United States has had better collection performance in strategic intelligence from the NSA than the CIA. Tragically, however, NSA operations against Al Qaeda appear to have suffered a major blow when word leaked by August 1998 that the United States was listening to Osama bin Laden's satellite telephone conversations, and he stopped using the satellite phone shortly after U.S. cruise missile strikes against his camps in Afghanistan in retaliation for the bombings of two American embassies in Africa.[15]

The NSA is now deeply embroiled in a domestic spying controversy with accusations that it was listening to American phone calls and e-mails domestically without the legal authority to do so.[16] Above and beyond today's news headlines, the NSA is up against the wall in reorienting its collection operations from the Cold War to the war on terrorism. Al Qaeda and other terrorist groups benefit enormously in the explosion in information and communication technology, and the NSA has not been able to keep pace. Al Qaeda can now purchase off-the-shelf encryption technology, making it difficult if not impossible for NSA to crack their communications. Al Qaeda can hide its communications in the billions of e-mails and cell phone calls made daily. And Al Qaeda operatives can easily and readily replace cell phones, making it extraordinarily difficult for the NSA to keep apace of small, nimble, and adaptive terrorist cells.

The shortcomings of CIA human operations and NSA communication interception operations were made painfully clear in the aftermath of the 9/11 attacks. The joint House-Senate investigation found that the CIA had no human agent placed inside Al Qaeda in a position to steal secrets on the 9/11 conspiracy.[17] Although the NSA did intercept some Al Qaeda communications related to the conspiracy, the intercepts were not sufficiently specific and not translated into English before the attacks because the NSA lacked the resources to translate all the communications it manages to intercept.[18] But even if these communications had been translated before 9/11, they would not have been sufficiently detailed to have allowed U.S. officials to wrap up the Al Qaeda cell that orchestrated the attack.

ANALYZING TERRORISTS INTENTIONS, PLANS, AND CAPABILITIES

Intelligence analysis does not hold the public's fascination nearly as well as human intelligence operations and covert action, which are the stuff of spy novels and adventure movies, but it plays no less a critical role in the war on terrorism. Even the best human intelligence and superb intelligence from other sources will come to naught if it not married with first-rate analysis.

The CTC has been the focal point for intelligence collection as well as analysis. The CTC was an exceptionally innovative organization that was created in the mid-1980s to grapple with the problems the United States was facing with Palestinian terrorism as well as Iranian-backed Hezbollah terrorism that was responsible for the bombings of the American embassy, the Marine Corps barracks in Beirut, and the kidnapping of American citizens, such as the CIA's station chief in the 1980s.[19] The creation of the CTC was a remarkable bureaucratic innovation because it located in one office both CIA case officers charged with running HUMINT operations with the CIA's Directorate of Intelligence (DI) analysts. The CIA had traditional fostered a bureaucratic barrier between case officers and analysts partly to protect disclosure of sources and methods, but the separation prevented the synergy of case officers working side by side with analysts. Analysts could identify blind spots and recommend avenues for case officers to gain access to individuals with access to information to fill intelligence gaps.

Despite these strengths, the CTC suffers from a lack of substantive analytic talent, a shortcoming that is a reflection of the CIA's entire analytic corps. The Senate-House inquiry discovered that "the quality of counterterrorism analysis was inconsistent, and many analysts were inexperienced, unqualified, undertrained, and without access to critical information. As a result, there was a dearth of creative, aggressive analysis targeting Bin Ladin and a persistent inability to comprehend the collective significance of individual pieces of intelligence."[20]

Notwithstanding these profound weaknesses, the CTC did indeed provide strategic intelligence warning to President Bush of the September 11 attacks. The CIA in its August 6, 2001, *President's Daily Brief*—a daily current intelligence document prepared for the president and his closest advisors—had warned Bush in an article titled "Bin Laden Determined to Strike in US."[21] The CIA's warning, however, was more a historical review than tactical intelligence needed to disrupt the conspiracy. In contrast, the FBI did have specific information coming from astute field offices in Arizona and Minnesota on suspected Al Qaeda members training on commercial aircraft, but Bureau headquarters lacked a robust analytic staff in Washington to "connect the dots."[22]

Although the strategic intelligence failure of 9/11 falls most heavily on the FBI, the CIA, for whatever reason, took the lion's share of public blame. As is the case with many reforms, the 9/11 Commission recommended changes that "threw the baby out with the bathwater" and recommended a new center under the auspices of the DNI for doing counterterrorism analysis, a recommendation

that President Bush accepted.[23] The new National Counterterrorism Center (NCTC), however, will likely be inferior to the old CTC because it will not benefit from shoulder-to-shoulder relationships with the CIA's case officers.

COVERTLY KILLING AND DETAINING SUSPECTED TERRORISTS

The collection of intelligence—via clandestine human sources, intercepted communications, and other means such as satellites and media monitoring—by far consumes the lion's share of the American intelligence community's budget, which now is running at $44 billion per year.[24] But public attention is captivated by covert action, which is designed to influence events abroad without exposing the hand of the United States, and special activities such as training foreign security services.[25]

These activities, which after many years tend to become publicly exposed, create political controversies in the United States and abroad. One of the largest covert action programs in the CIA's history was the military backing of the insurgency against the Soviet Union's occupation of Afghanistan during the Cold War. The CIA spent millions of dollars and provided tons of military arms and equipment to the Afghan insurgents over a period of years to substantially increase the costs of Soviet occupation and contributed to the Soviet decision to withdraw from Afghanistan. That less-than-covert war is heralded by CIA veterans as an exemplar of covert action that contributed to ending to the Cold War. Other commentators are not so sanguine and argue that the covert action program gave military training, expertise, and battlefield experience to militant Islamic extremists, who later went on to found Al Qaeda. The truth probably lies somewhere in between, but it is important to note that the United States never dealt directly with bin Laden during the Afghan war. Bin Laden's direct sponsors and benefactors were intelligence services of Saudi Arabia and Pakistan.[26]

Covert action has taken on an increasingly important role in the war on terrorism, which the public gets glimpses of by leaks. The CIA did a superb job in facilitating the U.S. Special Forces entry into Afghanistan in the 2001 war.[27] Covert actions such as the ones carried out in Afghanistan are carried out by the CIA and need to be authorized by a presidential order called a finding, which is shared with and approved by the House and Senate oversight committees to be legal in the American judicial system. Traditionally, the presidents have banned American assassination of foreign leaders under executive orders, a practice that has been perpetuated since President Ford's Executive Order 12333, which prohibited assassinations, a move to stem the tide of public criticisms against the CIA and the IC during a tumultuous period of history in American intelligence.[28] CIA Director Porter Goss recently told Congress in public testimony that the ban on assassinations by U.S. intelligence is still in force, but that it does not prohibit the CIA from killing terrorists.[29]

The CIA appears to be effectively using armed unmanned aerial vehicles (UAVs) to kill Al Qaeda operatives. The CIA has used armed UAVs to kill operatives in Yemen and Pakistan as well as in Iraq. "Several U.S. officials confirmed that at least 19 occasions since Sept. 11 on which Predators successfully fired Hellfire missiles on terrorist suspects overseas, including 10 in Iraq in one month last year [2005]. The Predator strikes have killed at least four senior Al Qaeda leaders, but also many civilians, and it is not known how many times they missed their targets."[30]

Some critics have faulted the CIA for falling to use the armed UAVs to target bin Laden or covert paramilitary operations to capture him prior to 9/11. The CIA's Directorate of Operations chief in 1998, for example, did not want to use his funds to sponsor a paramilitary operation to grab bin Laden from his farm in Afghanistan and "expressed concern that people might get killed" and that "the operation had at least a slight flavor of a plan for an assassination. Moreover, he calculated that it would cost several million dollars. He was not prepared to take the money 'out of hide,' and he did not want to go to all the necessary congressional committees to get special money."[31] Although civilians have been tragically killed in paramilitary operations, military strikes, or UAV attacks since 9/11, the strikes are probably still legitimate instruments of war—as long as there is a reasonable chance of killing Al Qaeda operatives and leaders who are sworn to kill as many American civilians and soldiers as they can as long as they live.

The CIA is also using covert teams to located suspected Al Qaeda operatives abroad—in areas where UAV attacks would not be politically viable options, such as in Europe—and in daring raids called renditions they sweep them off the streets and bring them to other countries for detention and interrogations. These operations have been embroiled in controversies. Italy, for example, is in a political uproar because a CIA team took a person off Italian soil.[32] Other European and Asian countries are in an uproar over the purported existence of a string of clandestine CIA detention facilities on their soil. The CIA also has been publicly condemned for blatant violations of the Geneva Conventions with the use of techniques that are commonly considered to be torture in its interrogations undertaken in U.S. military detention facilities in Afghanistan, Iraq, and Guantánamo Bay, Cuba.[33] These accusations include charges that the CIA is using a technique called water-boarding, which makes detainees believe they are drowning. Not only is this technique morally unacceptable, many professional interrogators judge that this technique produces bad intelligence because prisoners will say or make up anything to get interrogators to stop the water-boarding.[34]

The United States may have already fallen victim to this intelligence pitfall. According to journalist James Risen, the information the CIA got from debriefing one high-level Al Qaeda operational commander was fabricated because he wanted to stop water-boarding.[35] Another CIA detainee who was reported tortured after the CIA turned him over to Egyptian officials fabricated information on Iraq's links to Al Qaeda in the run-up to the 2003 Iraq war.[36]

STRENGTHENING INTELLIGENCE COLLECTION, ANALYSIS, AND COVERT ACTION FOR THE WAR ON TERRORISM

Lawyers could argue until the sun goes down whether water-boarding and other techniques the CIA is using constitute the legal definition of torture, but the average American using his or her common sense and moral compass would have little to no difficulty calling these techniques torture. And the American legalistic argument that Al Qaeda operatives are "enemy combatants" and not "prisoners of war" who are governed by the Geneva Conventions carries little weight with Americans and even less with the Middle Eastern populations, which the United States desperately needs to wean away from ideological support for Al Qaeda recruitment and operational support. Even the appearance of Geneva Conventions violations renders American calls for freedom and democracy in the Middle East as sheer hypocrisy and aids and abets our terrorist enemies by handing them ready-made justifications for their ruthless tactics, such as decapitating hostages. Even in its intelligence war on terrorism, the United States must uphold its own ethical standards and not stoop to those of the morally deprived barbarians it is fighting.

The CIA's use of paramilitary operations was a success story in the 2001 war in Afghanistan. But in the wake of the war, the 9/11 Commission recommended—on not very deep analysis or consideration—that these functions should all be controlled by the Pentagon and that CIA should get out of the business. The commission said, "Before 9/11, the CIA did not invest in developing a robust capability to conduct paramilitary operations with U.S. personnel. It relied on proxies instead, organized by CIA operatives with the requisite military training. The results were unsatisfactory."[37]

The recently announced Quadrennial Defense Review, which calls for a substantial beefing up of American Special Operations Forces, will likely work to further push the CIA out of paramilitary operations. The plan is to increase the number of special operations forces by 14,000 to about 64,000, the largest number since the Vietnam War, to fight small Al Qaeda cells dispersed across some eighty countries.[38] The Pentagon's new emphasis no doubt reflects in part the frustration of Defense Secretary Donald Rumsfeld over the lethargic response of the Special Forces to get into the 2001 Afghanistan war in comparison to the quick dispatch of CIA operatives into Afghanistan, which won high praise and respect from President Bush.[39] The push to remove the CIA from the paramilitary business will make sense as long as the Pentagon gives its Special Operations Forces room for operational ingenuity, a key ingredient of effective special operations. Unfortunately, creativity and ingenuity are often crushed by the weight of the Pentagon's bureaucracy.

The DNI, a post created by the president on the recommendation of the 9/11 Commission, will have his hands full trying to overcome the shortcomings of American strategic intelligence against terrorist groups. The DNI's activities so far have focused on recruiting a staff, leaving little time for substantive reforms

to address strategic intelligence shortcomings all too evident to the American public in the aftermath of 9/11. The DNI, not the director of the CIA, is now the president's principal intelligence advisor. The DNI has established the National Clandestine Service, the Open Sources Center, and centers under his wing for counterterrorism and counterproliferation, as well as named IC collection managers for Iran and North Korea.[40] There is little evidence to show that these steps are anything more than renaming old organizations, however, and adding some new ones to respond to calls for reform, while in practice doing little to qualitatively improve America's intelligence performance in the war on terrorism.

These bureaucratic fixes run the risk of creating a false impression that the United States has "corrected" of all its strategic intelligence shortcomings in the war on terrorism. But the real, root causes of past failures lie in the quality of human intelligence collection and analysis. The creation of the DNI and new national support offices do nothing directly to correct the bureaucratic culture and failed business practices that are stubbornly rooted at the grassroots level of the CIA. Until reforms and profound changes in managerial business practices change at this level, all the reorganizing and changing of the bureaucratic wiring diagrams at the senior most rungs of the U.S. intelligence community will amount to little more than rearranging the deck chairs on the *Titanic*.

INTELLIGENCE TO COUNTER TERROR

The Importance of All-Source Fusion

JENNIFER SIMS

FROM 1934 TO 1937, THE BRITISH GOVERNMENT collected suspicious communications from its monitoring station at Camberwell.[1] Peeling back the encryption with the help of a well-placed mole and several émigrés, the government discovered the existence of an illicit Soviet spying and covert action network operating on British soil. It appeared to involve senior politicians and established political organizations. Direction-finding equipment owned by the Army intercept station at Fort Bridgewoods, the Air Ministry at Waddington, and at the Royal Navy's receiver at Flowerdown established the location of the network's transmission sites. MI5 used this knowledge to begin surveillance of the broad-based network, penetrate it with human intelligence assets, and gain advance notice of illegal activities. These counterintelligence efforts eventually established that the illicit British cells were connected to Vienna, Shanghai, Prague, Copenhagen, Zurich, Paris, Spain, and the United States. All were directed by Moscow and coordinated through the operations of Comintern or Communist International. According to British historian Nigel West, this huge counterintelligence operation, which intercepted a total of 1,571 messages, disrupted Moscow's efforts to influence British elections "on a massive scale."[2]

This is the story of MASK—the code name for MI5's penetration of the Communist Party of Great Britain during the period between the world wars. Although the details of the story are worth rereading in the post–September 11, 2001, political context, just the facts summarized above suggest three truths about counterintelligence operations directed against networks: first, they involve intrusive domestic operations, often against domestically based groups designed to "disappear" within the societies in which they operate; second, they require patient accumulation of data over a lengthy period of time; and finally, they

depend on information fused from a variety of widely differing sources. These three ingredients, essential for such operations almost a century ago, are still important in the age of global, digitalized information flows and transnational threats. In fact, the new digital environment has made transnational crimes vastly easier to coordinate on a worldwide scale than was possible before World War II. It has also exacerbated a most serious challenge: governments (particularly democracies) attempting to stop terrorists are expected to do so without undermining the laws, representative principles, and informal confidences upon which a culture of democracy depends. Unfortunately, what Britain succeeded in doing against its domestic threat—to the satisfaction of the British public—was done even better within the militarized Nazi German state by Hitler's Gestapo and the Schutzstaffel, or SS ("Blackshirts"). If, as President Truman once promised the American people, we are not in the business of creating a Gestapo in this country, what are the proper limits of our counterintelligence business?

The purpose of this chapter is to examine the modern intelligence requirements for countering terror to appreciate this challenge in greater depth and develop a reasoned basis for balancing counterintelligence capabilities with civil liberties. What is meant by all-source data fusion in intelligence work, and how necessary is it against terrorists? How necessary are government-wide databases of digitalized information, and why does the idea of connecting them worry civil libertarians? If, as the post-9/11 commissions have suggested, one of the U.S. government's worst intelligence failures during this tragedy was the lack of adequate data fusion and analysis, what has been done about it, and can we do more without intolerable risks to our social and moral fabric?

To explore these questions, this chapter begins by considering the nature of the terrorists we face and the requirements for good intelligence operations against them. Historical examples will illustrate that there are lessons to be learned from the defeat of similar threats in the past, including the recurring ways in which challenges to civil liberties arise as democracies optimize intelligence in the name of security. Second, I run through the special opportunities and challenges modern technology presents. Third, I discuss an essential next step for democracies threatened by terrorists in their midst.

THE NATURE OF INTELLIGENCE AND COUNTERINTELLIGENCE IN THE AGE OF TERROR

As has been repeatedly pointed out, terrorism is a tool, not an adversary in and of itself. Yet adversaries who use this tool reveal much about themselves. They are ruthless, have strategies and tactics that require operational access to their victims, and they are able to organize in pursuit of their goals. Moreover, unless they are psychopathic, they use terror because they have no alternative that offers as much opportunity to win battles. Public access to national treasures and

freedom to organize are integral to Western democracies' most vital interests. Democracies intent on fighting adversaries who exploit openness to kill massively, risk undermining themselves. Countering such adversaries at the strategic level may require understanding their larger purposes to deflect, overcome, or undermine them. But to defeat them at the tactical level, one must deny them access, disrupt their ability to organize, or deny them their "victories" even if their tactics succeed. One must know what they are doing and either catch them at it or refuse to flinch—ideally, both. Intelligence, in any case, is essential.

The Role of Intelligence

Intelligence is best understood as the collection, analysis, and dissemination of information by parties in conflict or competition. What turns the simple pursuit of information into the business of intelligence is its purpose: gaining competitive advantage over adversaries.[3] This goal fuels the desire for specific, urgent, and often secret knowledge as well as a systematic way of obtaining it in time to win the contest. Given that the context is competition, such decision advantages can be acquired in two ways: by getting better information for one's strategy than one's opponents gain for theirs, or by degrading the competitors' decision making through denial, disruption, deception, and surprise.[4] This latter category of activity is called *counterintelligence*. More than just security, counterintelligence involves discovering what opponents think they need to know and then using this information to block, disorient, confuse, and ultimately beat them. In virulent or hostile competitions, increasing the speed of one's own decision making and the mobility of the decision makers may unbalance the opponent more than trying to discern and defend all the information believed to be critical to that opponent's strategy—a process that can actually slow decision making and cripple one's offense. Of course, the best way to protect an intelligence system is to own the adversary's intelligence system through the use of moles, double agents, and the like.

Gangs, bureaucrats, and football teams all use a form of intelligence to gain advantages over their competitors.[5] The more intense and lawless the competition, such as in international politics, the more secretive intelligence operations tend to become and the more decisive the potential advantages they offer. In fact, for states, intelligence can be more than a life or death enterprise; it can entail the end of nations and cultures.[6] For these reasons, secrecy is often viewed as a necessary component of national or transnational intelligence efforts. It is more accurate, however, to think of secrecy as an attribute of a relatively good intelligence effort—not an essential requirement for it. Some contestants' counterintelligence capabilities are so poor that they are not aware of what information they should protect to beat their adversaries. Or they believe their relative agility makes such protection unnecessary. Trying to defeat such opponents by only looking for secrets they protect would lead to failure. Intelligence must instead work to collect the information that provides the competitor with a decision

advantage over opponents—whether or not that information is secret—and to assume adversaries are doing likewise.

Arguably, a preoccupation with secrets cost the United States much before the devastation of 9/11. Although the terrorists' plans were indeed closely held, their operations were boldly open. Most used their true names when making airline reservations, used common addresses, and communicated on the Internet—not through privileged diplomatic pouches or hidden radios. The trick to catching them would have been to combine what we knew from the efforts of the Central Intelligence Agency (CIA) to track them overseas with what we could have known from the surveillance and unclassified information collected at home by the Federal Bureau of Investigation (FBI). Using classified sources to tip off the FBI and discern the unclassified information crucial for counterterrorist decision making is a critical part of the domestic intelligence enterprise.[7]

Traditionally, U.S. intelligence has used three types of collection to target opponents: technical intelligence (TECHINT), human intelligence (HUMINT), and open-source or unclassified intelligence (OSINT). TECHINT includes the collection of imagery, intercepted communications, electronic signals emitted by equipment, engineering data from captured electronics or weapons systems, and data from equipment or materials in the environment that leave signatures of their presence (such as radiation, effluent plumes, and noise) that trained analysts can discern using pre-existing data as reference.[8] The productivity of any of these collectors against a particular target will depend on that collector's access to the target's most vulnerable point. For example, if a network of spies uses wireless radios, picking up their electronic emissions (TECHINT) will be an effective way to find them; if they use couriers, human agents secretly opening the letters and packages (HUMINT) is likely to work best; if the adversary believes he is unobserved, collecting the names of those he visits from a phone book or the sites he visits while traveling as an ostensible tourist (OSINT) would be useful.

In any case, the best intelligence is obtained when the capabilities of all these collectors are quickly combined. Just as newspaper editors like to see multiple sources corroborating articles even from their best reporters, directors of national intelligence have greater confidence in intelligence that comes from multiple collectors. Better than simply hearing that Osama bin Laden has been sighted on a road in Pakistan would be seeing imagery of his convoy and receiving intercepts from his communications that each independently confirm the initial report.[9] As long as an opponent runs reasonably complex operations, some collectors will work best against certain aspects of those operations, whereas others will work best against the rest. Thus "all-source" collection can yield many pieces of a puzzle that analysts can then assemble, jumble up, and reassemble as the adversary moves, reacts to countermoves, and moves again.

Beyond corroboration, however, is the concept of collection boosting, in which the productivity of one collector depends on input from others.[10] The most obvious example of boosting within a single discipline is "direction finding" (DF), which may involve the use of multiple antennae to triangulate on a signal so that

it can be not only identified but also geo-located with some degree of precision.[11] During World War II, the SS paired up with the Gestapo and used DF to locate the wireless radios used by a network of Stalin's spies in Europe. To their great chagrin, these radios were found in Berlin—some next to the most sensitive government ministries.[12]

Of course, boosting also works among collection disciplines, such as the use of spies (HUMINT) to steal the codes of adversaries so that analysts working on intercepted communications (TECHINT) can overcome the encryption methods and read the content of the messages.[13] In fact, the more tightly integrated collectors are in the decision-making process, the more likely an adversary's spoofing of a collector will work to deflect or deceive one's own decision makers. Because securing collectors can be a costly and seemingly never-ending endeavor, one good way to compensate for inevitable vulnerabilities is to ensure collection is "constructively redundant"—that is, sufficiently all-source that one collector's vulnerability to spoofing will not lead to misperception or miscalculation.

This kind of constructively redundant all-source collection was a linchpin of the Allied strategy to defeat Hitler during World War II; it was employed, for example, to determine whether covert and clandestine collection operations had been compromised and specifically in the running of the famous British counterintelligence operation known as the Double Cross System.[14] But the history of Double Cross also alerts us to the inherent dangers of redundant collection systems: Because collectors improve the reliability of each other's products by offering independent corroboration, they depend on good system-wide counterintelligence so an adversary can't defeat or spoof one of them and thus sow ambiguity, uncertainty and confusion throughout an interlaced collection system. If systemic counterintelligence is weak, collectors have good reason not to share their "take" lest it become tainted. Poor counterintelligence can lead to system-wide failure even when the majority of collection endeavors are robust and productive.[15]

In some respects, then, the business of all-source data fusion for countering terrorism follows what has been done in a traditional sense against other intelligence targets. What makes the counterterrorism a particularly challenging endeavor is the terrorists' objective of committing stealthy crime—often on the victim's home soil. This means that law enforcement information, including information on U.S. residents or citizens living in close proximity to terrorists, may be important intelligence information that needs to be shared with decision makers at the federal level working to thwart terrorist activities on a nationwide scale. Law enforcement agents, dedicated to preserving the information for the purposes of arrest and prosecution, realize the need to pass the information over to these officials but do not always know the best and most secure ways to do so. At times, in fact, the most important decisions must be made very quickly by state and local officials if they are to prevent an impending attack. In these cases, circulating information to Washington for recycling into intelligence products could delay action rather than assist it. The problem thus becomes the very nontraditional one of fusing all-source intelligence for a cop on the beat.

Intelligence for Counterterrorism

In other words, what makes terrorists particularly difficult intelligence targets for traditional intelligence systems is that they organize as networks, insinuate themselves into open societies, and kill suddenly. Whereas traditional collectors were designed to penetrate governments located in state capitals or military deployments located on discrete battlefields, terrorists specialize in operating in small numbers and under the skins of their adversaries—that is, wherever they can do the most damage. They fashion themselves to look like their targets and burrow into society to lie in wait. In this sense they occupy the same moral space as assassins, but without an assassin's traditional limits on targeting. Deceit is part of terrorists' stock in trade, and innocents are their intentional victims. Often free of the vertical command structures of their more bureaucratic opponents, they achieve agility through compartmented operations, often using minimal communications. Their offensive operations are also crucial to their defense; by instilling fear and panic, terrorists create sufficient confusion to enable their swift escape. For many of these reasons, analysts have long argued that it takes a network to fight networked organizations, such as Al Qaeda.[16]

Unfortunately for democracies, counterterrorism requires gaining access to the enemy where he operates, including on one's own soil. And because terrorists do not operate against a national security establishment but against an entire society, they will not necessarily be focused on any particular city or on stealing secrets from traditional national security establishments. This means that it may be necessary but no longer sufficient to use forms of collection appropriate to the Cold War, when the enemy was a highly bureaucratized state, targeting Washington and using a command-and-control system stretching halfway around the world. To stop terrorists, information from traditional intelligence collectors will need to be combined with information collected by those disconnected to the traditional national security community. Hospitals may be the first to see a spike in disease associated with a biological weapons attack; police may be the first to bust a document forger or stop a car carrying explosives; customs agents at a port may be the first to notice discrepancies between the scan of a shipping crate and its official manifest; a landlord may be the first to notice his building's security system is detecting toxic gases; and a shopper may be the first to notice someone in a mall or store pushing a heavy baby carriage with no baby inside.

Against this kind of threat, time is of the essence, yet indications and warning may come from untrained people just doing their day jobs. The intelligence these domestic collectors acquire, moreover, will often need to be analyzed and provided back to them. After all, they are likely to be the decision makers best placed to stop the attack itself. The first 9/11 counterattack was, in fact, carried out by passengers on an airliner—once they knew from collecting intelligence over their cell phones what they were up against and what was at stake.

In the modern era of the Internet and the global reach of broadband communications, terrorists have new capabilities beyond the reach of any one country.

By piggybacking on this information system, bolstered by highly effective private encryption, transnational terrorist groups can communicate instantaneously and largely anonymously, even to the extent of sending sensitive information embedded in pictures on websites or in e-mails, a practice known as steganography. For this reason, the intelligence gained by other states and their private sector collectors may be as potentially valuable as intelligence collected unilaterally; much depends on the confidence a state has in its liaison relationships—confidence that should fluctuate more with the capabilities of that state's counterintelligence capabilities than with the number of its perceived friendships.

The overall picture, then, is of proliferating intelligence sources, increasingly complex all-source analysis, and a maddeningly contingent list of those decision makers who not only need the results but must get them in record time. Preparation of a terrorist attack might take years, but its execution or prevention may take only hours or minutes. As bad as this situation sounds, it is not all that new. As with today's terrorists, past plotters have threaded themselves through the fabric of the societies they planned to attack. Catholics, intent on overthrowing the Protestant Queen Elizabeth I and installing her Catholic cousin, Mary, Queen of Scots, were distinguishable from Elizabeth's loyalists only by their faith. Sir Walsingham, Elizabeth's Secretary of State and chief spymaster, nonetheless caught them.[17] Kaiser Wilhelm's saboteurs infiltrated German immigrant communities in the United States prior to World War I so that they would have cover for their mission to blow up weapons depots, warehouses, and storage facilities. They, too, were countered—this time by a network of British liaison officers and U.S. law enforcement personnel, assisted by the intermittent incompetence of the saboteurs themselves.[18] Successful counterterrorist intelligence operations such as these have generally employed well-known principles: collect multisource intelligence, tighten borders, tap liaison services, conduct deception operations, and enlist law enforcement to interdict and "turn" the criminals so frequently but superficially aligned with terrorists, such as forgers and money launderers.[19]

What makes the current, post-9/11 effort so much more difficult than in times past is the nature of modern technology. Technology has affected the counterterrorist mission in a number of ways. For example, experts have discussed at length how advances in weapons technologies have rendered the scariest forms of attack—biologically engineered germs, toxins, and nuclear explosive or radiological devices—feasible for small numbers of nonexperts to execute. Perhaps less well understood among the general population is the extent to which advances in communications technology permit terrorist networks to exchange messages and plan attacks on a worldwide basis and to do so almost instantaneously.

The development and widespread use of commercial surveillance technologies mean that information on a developing terrorist attack that is acquired by private citizens or local businesses can in theory be handed off rapidly to local and federal officials even though it is "owned" by others. Individuals outside the traditional national security community may therefore not only be the first to get

critical information about a coming terrorist attack but, with the proliferation of private surveillance technologies and personal communications capabilities, they could be empowered with the critical ability to decide what to do with it. Obviously, the national intelligence community has a stake in such decisions. But not surprisingly, the U.S. intelligence community has neither a roadmap for building the kind of domestic alliances that would facilitate such cooperation nor the deep and nuanced understanding of American political culture that makes such a task so difficult for the federal government to implement.[20]

Unfortunately, terrorists who recognize this trend in private sector surveillance and its potential connection to the nation's information infrastructure may use cyberattacks to facilitate their plans. According to James Gosler of Sandia Laboratory, these attacks are becoming increasingly feasible. His argument, in its simplest form, is that the distributed nature of the modern software and computer manufacturing industry makes modern information technologies inherently vulnerable.[21] Aware of both the threat in the private sector and its inherent vulnerability, the U.S. government decided after 9/11 to circumvent established procedures for domestic counterterrorist surveillance to permit rapid sampling of certain domestic communications as a counterintelligence measure.[22] This step at the federal level has proved highly controversial. Less controversial methods for improving domestic collection could involve building alliances with the private sector rather than simply tapping into it.[23]

DATA FUSION AND THE AGE OF TERROR: IMPLICATIONS FOR DEMOCRACY

The prominent role all-source intelligence and advanced technology have in countering terrorism presents special difficulties for democracies. Although the media have recently highlighted issues related to prisoner detention, rendition, and interrogation, these are not the only matters that trouble democracies fighting terrorists. Debates continue among civil libertarians, security officials and private citizens over the more obscure issues of domestic surveillance, data management and privacy. It is hard to promote freedom and liberty as antidotes for terror while at the same time encouraging allied governments to intrude more deeply into their own societies for the purpose of monitoring individuals and capturing fanatics before they act. Unfortunately, this is exactly the course that the US is now forced to take. Balancing security and pre-emption with restraint and freedom is difficult; terrorists likely hope the conundrum will prove paralyzing.

While some commentators have suggested that privacy may be one area where Americans may be willing to cede added power to authorities, others, including this author, have noted that suspicion of excess power in the hands of the federal government runs deep in American political culture. Although the issues prisoners' rights now before the courts are beyond the scope of this paper; these other issues of data fusion, control, and management are not.

The Domestic Context for Intelligence Collection and Data Fusion

Throughout the Cold War, the CIA, FBI, and certain military services were involved in domestic intelligence collection. When they over-reached, they were subjected to new legal constraints. By 1978, when the Foreign Intelligence Surveillance Act (FISA) was passed, the essential framework for domestic spying in the US had been established: on the one hand, the president's constitutional authority for the nation's defense gave him the prerogative to order domestic surveillance; on the other hand, his powers to spy on American citizens and residents were constrained by the requirement that the courts be convinced of these individuals' connections to foreign powers or terrorist causes in each case. It was understood, if not written into law, that information gathered in this secret way, that is, without the normal warrant process, was not to bleed into the criminal justice system to be used against citizens for other purposes—such as to convict them of a crime unrelated to espionage or terror. In this way, what has come to be called the "wall" between intelligence and law enforcement was deliberately and perhaps too impermeably erected.

After 9/11, lawmakers and national security experts criticized this framework as too tight a constraint on domestic intelligence gathering. While the president was secretly reasserting his perceived prerogatives to spy against domestic national security threats, Congress passed the Patriot Act. This act increased the FBI's ability to track and monitor terrorists using communications systems far more elaborate than those available when the original FISA law was passed. In addition, the "wall" between intelligence and law enforcement was torn down in the interests of intelligence sharing between agencies. The president also decided to consolidate within the Department of Homeland Security (DHS), those agencies responsible for border control, emergency response, and domestic security. While eschewing a new domestic intelligence gathering function, DHS began to consolidate databases and to generate related intelligence reports. The president created the Terrorism Threat Integration Center to fuse intelligence from all relevant agencies both inside and outside the formal intelligence community. Following the endorsement of the idea of data fusion centers by the 9/11 Commission, Congress passed legislation creating the National Counter Terrorism Center, the director of which gained authorities over overseas operations as well. Subsequently, its sister center was created under the new Director of National Intelligence to handle intelligence on weapons of mass destruction.

While these changes were under way at the highest levels in Washington, debate has continued on what appears to be a serious gap: Unlike Britain, the U.S. federal government continues to lack an institution specifically charged with conducting true domestic intelligence gathering and forging the kind of domestic alliances for intelligence networking already described. The FBI's expertise remains law enforcement and defensive counterintelligence—both arts involving the use of surveillance for arrests, not for strategic planning and the exploitation of decision advantages. The CIA and FBI—if not the NSA—have also remained

boxed within the 1978 framework and thus prohibited from even thinking about how to develop knowledge on domestic activities. Without a deep domestic intelligence capability and the domestic consensus necessary to institutionalize it, data fusion at the federal level may remain inadequate to the counterterrorism task.[24]

Unwilling to wait for a federal agency to take an aggressive lead, law enforcement officials in cities such as New York, Los Angeles, and Chicago have begun to expand their capabilities to investigate domestic groups; consolidate the data from global, national, and local sources; and thus organize new and improved intelligence systems themselves. Data fusion is becoming a grassroots business. For example, Los Angeles has pioneered the Terrorism Early Warning Group, which fuses intelligence and directs it to first responders.[25] And New York City has gone so far as to establish liaison offices overseas. In the wake of the collapse of a local cable company, Chicago's Mayor Richard Daley bought up its fiber optic network and hooked hundreds of video cameras to it. He has also encouraged private companies to dump the returns from their surveillance cameras onto the network so that, for a fee, crimes could be rapidly reported to the city's police department.

Of course, the establishments wired for commercial security are becoming Chicago's platforms for law enforcement surveillance of criminal and gang-related behavior. The city's operations center has become the hub of a network for surveillance and monitoring in the name of citizen protection against crime and, simultaneously, natural disasters and terrorist attack. Not surprisingly, Chicago's innovation has been replicated in at least 150 other cities to a greater or lesser degree. New York, which reportedly plans a network of 3,000 cameras, is defending its right to archive the video files indefinitely.[26] Baltimore, whose cameras may soon have the ability to "talk," intends to deter crime as much as counter terrorists with its electronic network.[27]

Other first responders are adopting similar methods for different purposes. Hospitals have begun wiring themselves to keep track of the conditions of patients and the scarce medical equipment they may need to ensure efficiency of care. When more than one hospital participates, ambulances can make better decisions about where to transport emergency cases to ensure the swiftest medical care at emergency rooms. A system such as this, or the one in Chicago, could have assisted New Orleans in its efforts to respond to the emergency following Hurricane Katrina. It holds the promise of gathering data swiftly and analyzing it appropriately in the event of a terrorist attack as well.

Although public protests of increases in domestic surveillance at the local level have been light and sporadic, this level of tolerance has not been apparent when federal surveillance has been involved. National attention more readily focuses on federal moves, hesitant though they may be, to increase domestic surveillance. For example, the president's expansion of the Defense Department's Counterintelligence Field Activity (CIFA), including its surveillance activities nationwide, has triggered protests, including at least one congressional intervention.[28] Although CIFA was created to protect military facilities and

personnel worldwide, it has significantly ramped up its domestic operations in recent years for the purpose of fusing intelligence, identifying and assessing threats, and retaining the results in a Pentagon database.

Perhaps even more notorious was the abbreviated effort to link databases at the federal level for similar purposes. In 2003 Adm. John Poindexter spearheaded an effort to link databases at the federal level for the purposes of querying them and drawing inferences about terrorists actions from their contents over time. The project, unfortunately dubbed Total Information Awareness (TIA), had an Orwellian quality that made many Americans' hair stand on end. Among them were a number of legislators who promptly killed the program. Along with it, they killed the only ongoing federally funded research in how to protect the privacy of citizens from advances in "inferencing" capabilities (discussed below), so crucial to anticipating, warning, and managing not just terrorist attacks but natural disasters and outbreaks of disease as well.

For reasons elaborated more fully elsewhere, Americans clearly have a particular distaste for federal government intrusion in their lives.[29] That the citizens of a small town in Vermont wire their streets with surveillance cameras or that Chicago and New York and Baltimore experiment in new law enforcement techniques does not mean that the American public will be willing to accept those kinds of domestic initiatives from the federal government. This attitude holds true even when the nation's security is arguably at risk. Although the relevant laws have been modified in the wake of 9/11, citizens are likely to demand that constitutional protections against unwarranted intrusion by the federal government stay intact even as they willingly cede these rights to commercial firms and local law enforcement.

WHAT IS TO BE DONE?

Britain's successful counterintelligence operation against communist infiltrators during the interwar period involved the use of domestic surveillance, communications intercepts, direction finding involving the military services, and the penetration of a domestic political party. Such an aggressive approach would be firmly resisted in the United States, constrained as it is by the electorate's deeply seated sense of domestic privacy and individual prerogatives. Yet without successful efforts to bring together all-source intelligence on domestic threats, a repeat of tragedy on the scale of 9/11 could bring the kind of domestic overreaction that leads to vigilantism and the undermining of the very constitutional protections that national security measures are meant to protect. So what can be done to balance the need for data collection and fusion with civil liberties?

Challenging as the technological political landscape seems, it also presents opportunities for domestic counterterrorist operations, provided secret breaching of democratically developed laws does not trigger public blowback. Terrorists have gained an advantage in operating within democracies because they have found

ways to use technological innovations, such as the Internet and commercially available programs for communicating, hiding, and ferreting out new recruits. This penetration of liberal societies through the hijacking of the technologies they excel at creating is crafty. After all, Americans entrepreneurs rapidly employ their best commercial innovations in critical infrastructure, protecting them as national assets even as adversaries exploit them.

But technology is, by its nature, neutral. It is also constantly changing. The American public has proved itself both adaptable and tolerant of efforts to fuse intelligence for the purposes of interdiction, at least when done at the local level. The issue is whether those officials countering terrorism can be quicker and more innovative than the terrorists in recognizing what must be done in binding innovation to mission and whether citizens and officials at the local, state, and federal levels can find ways to embrace such innovation without doing violence to civil liberties.

Pursuing Total Information Awareness?

Although no one would suggest that American citizens should embrace an Orwellian world in which the federal government monitors their every move, most Americans probably do understand and even value society's ability to remember them when their lives and livelihoods are at stake. Insurers and pharmacists keep track of medical records; credit card companies and banks track credit histories so that people can borrow money to buy homes or send their kids to college.

What is at issue is the government's ability to access and combine these pools of data to uncover patterns of activity. Though such pooling might lower the risks to society, it could have unfortunate consequences for individuals in specific instances: a personal medical history falling into the hands of prospective employers; fallacious patterns that seem to implicate an innocent person in the activities of a gang; or the confusion of a name and profile of a suspected terrorist with that of a law-abiding citizen. At the same time, failure to establish such patterns may allow terrorists free rein in a society increasingly wired for their purposes.

Two avenues are open for addressing this dilemma. First, research institutions can delve more deeply into the question of data mining and analysis and educate the public about their results. Public understanding of the uses and limits of government held databases is currently minimal. And although institutions such as the Center for Strategic and International Studies have begun important initiatives to raise public awareness of the true nature of the data-mining question, much more needs to be done.[30]

Second, the U.S. government can more proactively align itself with domestic initiatives to fuse data for crisis management in the private sector and for local law enforcement purposes. In return for encouraging and even subsidizing those initiatives that have found support among local citizenry, the federal government

could share federally researched techniques and standards for information processing and hand-off, while negotiating protocols for ensuring the threshold for federal access is appropriately restrictive.

Data Mining and Data Analysis: Thinking Ahead

An expert with the Center for Strategic and International Studies, Mary De Rosa, has conducted a carefully researched study of the data fusion and management problem confronting counterterrorism analysts.[31] Data mining has proved a particularly nettlesome area for domestic intelligence. In her published report, De Rosa makes important headway by drawing clear distinctions between data mining and data analysis. The former is a process that "uses algorithms to discover predictive patterns in data sets"; the latter "applies models to data to predict behavior, assess risk, determine associations or do other types of analysis."[32] Although both techniques simply exploit data that are already accessible, they also create new knowledge from these data faster and more accurately than human analysts can. Specifically, these techniques can help with the accurate attribution of records to individual people; establish connections between people, places, and things; and infer from existing data, using patterns of past illicit activities associated with known terrorist groups, the probable development of sleeper cells involving individuals with no known criminal records. What many of these systems do far less efficiently is discern data that no longer require archiving. The absence of such self-laundering systems means that inappropriate associations among data sets may linger. This means that innocent civilians may only notice that they have a problem when pulled out of lines at airports or encountering difficulties renewing their driver's licenses.

As these techniques are being developed in the private sector by commercial firms interested in increasing profits by understanding markets, the general public is intermittently outraged, perplexed, or delighted with the impact of these developments on their personal transactions. Most private citizens remain largely unaware of business and government investment in both data mining techniques and technologies designed to moderate their deleterious effects on privacy. De Rosa includes in her list of such advances anonymizing, auditing, and "permissioning" technologies. Investors are funding anonymizing techniques to allow data on individuals to be processed without using names. The second type of technology, auditing, allows those working on newly enabled data-processing techniques to be held accountable for their actions. Permissioning would ensure that rules established for handling data are fully respected.

Unfortunately, De Rosa concludes that even if the problems of inappropriate associations among data—that is, the problem of false positives—can be overcome, government mechanisms remain inadequate for controlling the use of the results. Among the issues that still need to be addressed are those related to mission creep, or the tendency to do more with information than the public has agreed to tolerate.

Enlisting the Private Sector: Smart Buildings?

It is not much of a stretch, given advances in data processing and the steps already taken in Chicago and New York, to see that in the event of a terrorist attack, the federal government would have potentially wide-ranging interest in information being generated in localities. Doctors, hospitals, and private surveillance cameras could become the new collectors in a nationwide intelligence effort to learn what the terrorists have done, where they have gone, and where they might attack next.

If such a system were developed and automated, the advantages would flow to both local crisis managers and the federal government. Doctors and hospitals could concentrate on care of the victims while an impersonal data hand-off of symptoms and geographic distribution could be provided to authorities responsible for determining if terrorists and biological weapons were involved. This would enable a quick, nationwide response. For example, if San Francisco, Houston, and Seattle were also equipped, the federal government would have instantaneous information from across the country should simultaneous attacks—the hallmark of terrorist groups such as Al Qaeda—occur. The capacity to learn about attacks and their nature early on would make the difference in the federal government's capacity to respond to such events.

Hospitals are not the only wired domains that might be lashed to such a nationwide 911 system. Indeed, technological innovations are moving swiftly toward a city landscape likely to differ greatly from the cities of today. Nanotechnology promises to offer micro-energy systems embedded in the skins of buildings that use solar power as energy for wireless sensing, lighting, and maintenance devices. Buildings already equipped with fiber optic cables of the kind laced through Chicago may soon have the ability to sense and control not only environmental conditions within them but the air quality and environmental conditions outside. In the event of disasters, these buildings may someday have the "sense" to seal themselves, control and clean air flows, and monitor the health, location, and well-being of their residents while sending this information to first responders and, if necessary, the federal government.

After all, the technologies that Chicago, New York, and now Baltimore are discovering turn on automated data analysis: "inferencing engines" that fuse sensor data from multiple inputs. These inferencing capabilities help assess not only what is happening at the moment but also what might be coming. In other words, by fusing lots of data simultaneously—far more data than a human analyst can cope with in a normal day—and applying sophisticated models, computers are able not just to see what has already happened but warn of coming events. From a counterterrorism standpoint, far better than hunkering down in buildings that protect their occupants from the effects of biological terrorism would be a system that sorts tremendous amounts of data and anticipates the attackers before they are able to act. This kind of data fusion for counterterrorism would permit consequence management as well as interdiction and protective actions prior to attack.

At the point where technology turns buildings into allies, the need to evacuate cities in the face of many kinds of disasters may pass. The trick, of course, would be to ensure that technology stays friendly and in the right hands. If technology is moving in this direction, and indications are that it is, the federal government needs to anticipate the wired society that is emerging and work to ensure that the protocols, access, and management of this information stays within the scope of tolerance for Americans not only protective of their families and well-being, but also of their freedoms and privacy as well. Such a legislative package would set the bounds for federal surveillance of domestic threats and the proper procedures for handing off information collected at local levels for civilian purposes, to the federal level in times of crisis or elevated threat.

CONCLUSION

In recognition of the rapid tempo of decision making so necessary for interdiction of terrorists—especially those possibly equipped with weapons of mass destruction—the intelligence community has organized centers for counterterrorism and nonproliferation that marry analysts with operators and technology specialists so that they can more rapidly fuse intelligence data, analyze it, and act. The military has employed a form of this approach since the first Persian Gulf War with its creation of National Intelligence Support Teams and now Joint Intelligence Operations Centers that fuse all collected data from tactical and national level sensors to support commanders' operations in the field.

What the federal government has been slower to do is to reach out to the private sector in support of initiatives such as those in Chicago and New York for the purpose of negotiating frameworks or protocols for the hand-off of information to the federal government under certain specified conditions.[33] Arguably, the best time to negotiate these solutions is now, before the next terrorist attack takes place and a spasm of reaction leads to measures not nearly as well thought out as the American polity deserves. At the same time, initial efforts to manage just the federally available information for such purposes has met with stunning political resistance from a poorly informed public. Burned once, the political will to bridge the Washington–locality divide may be hard to muster in the future.

To take these necessary steps, the United States needs to muster the will for a public debate on privacy—not seek to avoid it as a bothersome drag on the mission of law enforcement and counterterrorism experts. The need is now urgent. Between the great world wars of the last century, Britain succeeded in protecting its polity from the threats posed by an international network intent on penetrating and corrupting it. It did so by employing all-source data fusion—to include data from domestic sources still beyond the scope of what federal intelligence authorities are permitted under U.S. law. A great American debate awaits over the extent to which the federal government can ally with state and local governments and private industry to manage the new, secure information infrastructure that is

already emerging to enable domestic intelligence authorities to do their job, within the law, as Americans expect them to.

3. This argument on the nature of intelligence is expanded in my draft article, "Smart Realism: A Theory of Intelligence in International Politics," April 2006.

4. Surprise is properly understood as the extension of a counterintelligence effort because it involves learning how the opponent thinks and acts and then making a strategic or tactical move designed to exploit weaknesses in that decision-making process. Surprise can be achieved by simply getting inside the decision loop of the adversary: Even if intelligence provides warning, the victim cannot turn warning into effective action in time to stop his losses.

5. For more on the similarities of strategic decision making among gangs, mobs, and nation-states, see Thomas C, Schelling, *The Strategy of Conflict* (London: Oxford University Press, 1968), especially pp. 12–13.

6. I owe the insight on the connection between intensity of competition and the need for secrecy to enlightening discussions of intelligence theory with my friend and colleague Michael Warner, CIA historian, over the winter of 2005–2006. Getting any of this wrong is, of course, my responsibility, not his.

7. Most literature on open-source intelligence focuses on the role cheap, unclassified information can play in limiting the burden on precious, classified collection systems. But this leaves the comparative advantage for democracies partially unexploited and a fixation on the primacy of secrets intact. Speed may be more important than data source when stopping terrorists in our midst—and sifting huge quantities of data takes time. Intelligence managers should consider how classified information could be exploited to help target unclassified sources and databases to get the jump on an adversary. Creativity—and sloughing off old prejudices—is needed in thinking about the role of open sources in intelligence.

8. This last form of collection is known as measurement and signatures intelligence, or MASINT.

9. The importance of all-source collection for these purposes is discussed in Steve Coll, *Ghost Wars* (New York: Penguin Press, 2004), pp. 492–93.

10. The concept of boosting is discussed in greater detail in Jennifer E. Sims, "Smart Realism: A Theory of Intelligence in International Politics," paper presented to the Georgetown Intelligence Salon, April 2006. For more on this concept, see Michael Herman, *Intelligence Power in Peace and War* (London: Cambridge University Press, 1996), pp. 65–66.

11. This is a widely known technique for locating radio signals. In fact, amateurs engage in DF competitions under the sponsorship of the International Amateur Radio Union. For more on the term *DF*, see http://en.wikipedia.org/wiki/direction_finding.

12. For more on the Gestapo's efforts against Stalin's spies in Europe, including the use of DF against HUMINT cells, see V. E. Tarrant, *The Red Orchestra* (London: Wiley, 1996).

13. Michael Herman writes: "Espionage can also help other collection activities. Human sources are sometimes needed to plant bugging devices. Cipher-breaking has often been assisted by obtaining copies of codes and cipher material through human sources. Acquiring agents with this kind of cryptographic access was always one of the KGB's highest priorities." Herman, *Intelligence Power*, pp. 65–66.

17. See Stephen Budiansky, *Queen Elizabeth I, Sir Francis Walsingham, and the Birth of Modern Espionage* (New York: Penguin, 2005).

18. Jeffrey T. Richelson, *A Century of Spies: Intelligence in the Twentieth Century* (New York: Oxford University Press, 1995), pp. 27–30.

19. Unfortunately, law-abiding citizens sometimes suffered discrimination, undeserved punishment, and retribution in the process.

20. The point about local empowerment may have been dramatically illustrated by the decisions of individual Finns to use their Nokia cell phones during the immediate aftermath of the 2004 tsunami in the Indian Ocean. Empowered by their individual communications devices, which offered a direct link back to Helsinki, Finnish citizens were able to provide critical information for their government's decision-making process. (Based on author's informal interviews with officials and Nokia personnel in Finland during June 2005.) The notion that U.S. intelligence has poor appreciation of domestic cultural issues related to its profession should not be controversial. After all, intelligence systems have long been suspect elements of democracies and, in any case, have focused their attentions against adversaries, not on deepening knowledge of the societies in which they operate. This may be changing now. For lengthier discussion of the American cultural context for intelligence, see Jennifer E. Sims, "Understanding Ourselves," in *Transforming US Intelligence,* eds. Jennifer E. Sims and Burton Gerber (Washington DC: Georgetown University Press, 2005).

21. James Gosler, "The Digital Dimension," in *Transforming US Intelligence,* eds. Jennifer E. Sims and Burton Gerber (Washington DC: Georgetown University Press, 2005), pp. 96–114.

22. These procedures were established in 1978 when Congress passed the Foreign Intelligence Surveillance Act (FISA). This act limits the president's authority to conduct wiretapping for national security purposes by requiring federal intelligence and law enforcement authorities to get warrants for such surveillance from a secret court. Some legal experts argue that the act is unconstitutional because it involved one branch of government (Congress) circumscribing the constitutional authorities of another branch (the president). In any case, many observers noted that FISA had been widely regarded as settled law and that challenges to it should have been publicly debated in the context of,

for example, the USA-PATRIOT Act, which was meant to amend previous domestic surveillance laws to post-9/11 circumstances. Others argued that such open debate would have revealed too much of our counterintelligence capabilities to the adversary.

23. For more on the idea of domestic alliances for intelligence purposes, see Henry C. Crumpton, "Intelligence and Homeland Defense," in *Transforming US Intelligence,* eds. Jennifer E. Sims and Burton Gerber (Washington DC: Georgetown University Press, 2005).

WOMEN IN RELIGIOUS TERRORIST ORGANIZATIONS

A Comparative Analysis

KATHARINA VON KNOP

WOMEN HAVE BEEN ACTIVE IN VARIOUS TERRORIST groups throughout history. All of these women undermine the idea of who and what a terrorist is. What is generally not realized is the extent to which women are involved in terrorism.[1] The purpose of this chapter is to explore and analyze the multifaceted roles of women in religious terrorist organizations. My argument is that the role of women perceived by the world audience is one of a suicide bomber. However, the role of an ideological supporter and operational facilitator is even more important for the maintenance of operational capabilities, ideological motivation, and survival of a terrorist organization.

To verify these arguments, the chapter is divided in three parts. The first will look at what motivates women to participate in a terrorist organizations and what motivates a terrorist group to use women for its purposes. The second part will analyze the role of women in Palestinian terrorist organizations. Finally, the third part sheds light on the women of the global Salafi Jihad. For that purpose the female attacks of the global Salafi Jihad will be analyzed.

The findings of this chapter with regard to the involvement of women in Palestinian terrorist organizations and the Al Qaeda movement will bring us to conclude that women play a growing and essential role in these groups.

INTRODUCTION

The concept of terrorism, particularly against soft targets, is shocking enough to most liberal Western audiences; however, the use of female attackers exacerbates the already potent psychological effect of suicide terrorism. Women's

involvement in terrorist organizations is long and established. They have been active in various terrorist groups in various positions throughout history. One of the most famous instances of modern international terrorism, and the first that received global media coverage, was led by a Palestinian women, Leila Khaled. This senior Popular Front for the Liberation of Palestine (PFLP) operative was involved in the hijacking of an Israeli plane in 1969 and a second one in 1970.[2] There have been other famous female terrorists, such as Ulrike Meinhof from the Red Army Faction and Patty Hearst from the Symbionese Liberation Army (SLA). Cases such as these, in which women act as leaders of terrorist organizations, are rare, but they do exist. In Germany, the Red Army Faction and the Red Brigades had women leaders and cofounders. Khaled is a member in the Leadership Council of the PFLP.[3] The current chief of staff of the Basque separatist organization Euskadi Ta Askatasuna (ETA) is reportedly a woman. The Japanese Red Army has also had women leaders. In various Latin American organizations, such as Peru's Sendero Luminoso (SL), women accounted for as much as 20 percent of the fighting force.

Every terrorist group in Western Europe has used women combatants. Other organizations that are currently composed of large numbers of women include the Tamil Tigers of Tamil Elam (LTTE) and the Fuerzas Armadas Revolucionarias in Colombia (FARC) among others. The first "successful" female suicide bomber was a 17-year-old Lebanese girl named Sana Mahaydali, who was known as the "the Bride of the South." In 1985, she was dispatched by the PPS, a pro-Syrian Lebanese organization, to blow herself up near some vehicles carrying Israeli soldiers in Lebanon. "This paved the way for several other Lebanese women acting on behalf of other terrorist organisations. From Lebanon, the use of female suicide bombers spread to other countries and within few years was adopted by the LTTE and the Kurdish PKK."[4] The women of the LTTE are responsible for one-third of all suicide bombings in Sri Lanka, whereas the female PKK (Kurdish Workers Party) members have carried out two-thirds of that group's suicide bombings. What these groups have in common, however, is that they are or were leftist or nationalist-separatist oriented.

During the past few years we have seen many changes occur within religiousterrorist organizations. One of the most surprising developments has been the way suicide terrorism by religious groups has opened the stage for entry of female combatants, who are increasingly involved in what was once an exclusively male-dominated area.

Over the past few years, women have played a central role in the Chechen campaign of suicide bombings directed against Russia, and since 2002 female suicide bombers have become an established force in Palestinian terrorist organizations. In April 2003, as a predictable surprise, the first female suicide bombers blew up their car at a coalition checkpoint in Iraq. One of the two women was pregnant. Al Qaeda claimed responsibility for the suicide attack carried out by a woman on September 28, 2005, in Talafa in northern Iraq against a U.S. military recruitment center, with the statement: "A blessed sister . . . carried out a heroic

attack defending her faith. . . . May God accept our sister among the martyrs."[5] Even though the use of female suicide bombers in Iraq is still a relatively new trend, women will likely play a wider role in operations where terrorist groups mobilize an entire population.

For terrorist organizations as rational actors there are a number of operational advantages in the use of women as suicide bombers, supporters, and facilitators, because women undermine the idea of who and what a terrorist is. The intuitive assumptions presume that terrorists and terrorism is a man's domain. Most people still believe that women would not kill in such a barbaric and indiscriminate way that targets innocent people. This is why there is usually a public outcry of horror against women terrorists.

The function of women in religious terrorist groups and movements is multifaceted. The role that the world audience perceives is that of a suicide bomber; however, the role of an ideological supporter and operational facilitator is even more important for the maintenance of operational capabilities and ideological motivation. In sum, even when women are invisible to the world audience, they play an essential role in the short- and long-term survival of terrorist organizations.

THE MOTIVES OF THE WOMEN AND THE ORGANIZATION

Since 2002, female suicide attacks on behalf of religious terrorist organizations has been on the rise and is expected to increase in the future.[6] Though the personal motivations of female terrorists differ from the organizational motives for recruiting them, the two sides converge to produce an increased number of female terrorists. In these groups, the use of women in terrorist attacks is rare but not a new issue. Some of the most shocking recent incidents of female suicide terrorism have occurred during the current Israeli-Palestinian conflict. Suicide bombing, particularly during the present Intifada, has become one of the dominant features of the asymmetric campaign being waged against Israel by the Palestinian terrorists.

Female terrorism is increasing because women are motivated to engage in political violence and organizations are facing stronger incentives to recruit female operatives. To understand why female terrorism is on the rise, the societal, individual, and organizational motives must be explored. At this point, it should be mentioned that throughout history, women have played a relatively minor role in these terrorist groups.[7]

Media reporting has often suggested that most female suicide bombers, like their male counterparts, go eagerly to their deaths fueled by an unshakeable fervor; but the truth may be more complex. Although there are no concrete figures concerning the extent of women's current involvement, many commentators have observed that female participation in terrorism has significantly increased since 1976.[8]

The use of female suicide bombers could be found in many different kinds of terrorist organizations, but female terrorists share more then the use of terrorism as a fighting strategy. Female suicide bombings occur in the patriarchal societies from which these women originate and are the result of the deeply rooted values separating the women's roles from those of the men. Female terrorists are motivated by many of the same reasons men are, but the gender-based oppression they face creates additional motivation. Barbara Victor states that "the real reasons that motivate women, as opposed to the rational that creates male suicide bombers, are subtle and indicative of the second-class status of women in that part of the world."[9] All of the societies that have witnessed female suicide bombings are those where women are restricted to the private sphere. While women stay at home, men's tasks are conducted in the outer world. In traditional societies, gender defines acceptable activities and assigns particular roles to both men and women. Men hold a position of power and dominance, giving them full reign of the public domain. Women are relegated to the private sphere and are constrained in all areas of life. Rhiannon Talbot argues that women terrorists reject female roles and adopt the traditional male role of violent activity.[10] This violence occurs in the public realm from which women are otherwise excluded.[11] Female terrorists are thus able to pursue opportunities other than the limited ones available in traditional societies. This suggests that the existence of female subordination is linked to female participation in terrorism. As agents of violence, women are no longer defined according to their gender roles.

The PKK in Turkey also offered women an alternative to traditional gender roles and provided them access to the public domain. The Kurdish terrorist organization was the only structure that offered women a choice other than the traditional one of wife and mother. The group offered women the opportunity to be upgraded to the status of warrior. Within the organization, women would not be defined as a man's subordinate anymore, nor simply as wives or mothers.[12]

I argue that the scope of women's power interests are shaped by the society they live in. This scope in patriarchal society is normally the family. Encouraging and supporting the male relatives to participate in a terrorist organization gives women power and access to the public realm. Carrying out attacks allows women to fulfill traditional male duties: to carry out an political act and have the chance to be honored by the society they are living in. Talbot argues that this development is an act of female liberation and emancipation in these male-dominated societies. For instance, Yoram Schweitzer states: "The willingness of fundamentalist Islamic organisations to make use of women in their suicide operations contradicts the principle of religion as well as traditional social norms that preclude the involvement of women in 'masculine' activities that require close contact with men to whom they are not married."[13] I reject the argument that female suicide bombers in Islamist societies are acts of female liberation, because these women are recruited by men who are members of the terrorist organization. The explosives were provided by men, and the women were instructed by men on how to use them. This behavior is misinterpreted as female liberation or emancipation.

Being a suicide bomber is a learned behavior that results from the absence of other role models. Especially in Palestinian society, the only way to become a female hero is by carrying out a suicide attack.

However, in effect, being a suicide bomber amounts to total submission under a male-dominated terrorist organization. As mentioned, patriarchal societies, especially those that host terrorist groups, only offer two role models for women. The first is to be the mother of as many as children as possible, and the second is to be a suicide bomber. The only way to be honored by the society is to carry out a suicide attack in support of the ideology and the terrorist organization. The ideological goal and the struggle have priority over the battle of the sexes. These women adopt the masculine concept of Jihad for political reasons. Khaled brings it to the point: "So if this society doesn't mobilize all of its energy to face down the enemy, it can't achieve victory. A Palestinian woman is a Palestinian as well. As such, she has the same goals as the rest of our people."[14] This acceptance goes so far that religious leaders have found interpretations of the Koran to justify female suicide bombers and the supporting role of the women in this male-dominated ideology.

Attempts have been made to profile female suicide bombers in the hope of finding common threads in their backgrounds and motivations. However, it is very difficult to profile female suicide bombers or female facilitators and supporters because they come from very diverse educational, religious, social, and personal backgrounds.

Many women choose to join a terrorist organization to seek vengeance. Terrorism continues to be a male-dominated activity, and it is men who suffer the majority of casualties from counterterrorism, failed missions, and successful suicide bombing operations.[15] Faced with the loss of male family members, women are motivated to take up arms. This phenomenon is observable where women's participation in terrorism begins at a later stage than men's. In Chechnya, female terrorists are called Black Widows, and they are "prepared to kill and to die to avenge the deaths of fathers, husbands, brothers and sons at the hands of Russian troops in the current war or the one in the 1990s."[16] These female bombers are in part a direct reaction to Russian military tactics. The human rights group Memorial adds that another contributing factor is the routine rape of the Chechen women by the Russian soldiers. Although female participation was negligible throughout the 1990s, the Chechen groups suffered severe male casualties, and female suicide bombers have now become more common.[17] Women's active participation began in October 2002, and since that time Black Widows have been blamed for the deaths of over 200 people in nine attacks. These women are driven to terrorism by a desire to regain their personal or family honor.

As previously mentioned, women in traditional societies are governed by a strict set of social, cultural, and religious rules. In Palestine, for example, these rules prescribe the separation of men and women, and require women to be physically covered and chaperoned by a male family member when in public. If a woman breaks these rules, she is ostracized by society and brings shame on

herself and her family. As a result of this marginalization, women may seek refuge in a terrorist organization. These groups offer a double benefit to these women by accepting them when they no longer have options in mainstream society and by allowing them to regain their honor by committing a terrorist act. By participating in armed struggle, these women are able to gain the dignity in death that they lost in life.

In Sri Lanka, terrorism is often seen as a viable option for Tamil women who are survivors of sexual violence. Following a rape, Tamil women are considered damaged goods, and social customs prevent them from getting married or bearing children.[18] The shame brought on by sexual violation is thus magnified by the humiliation of being unable to fulfill childbearing duties and desires. Many of these women join the LTTE because, unlike mainstream society, it does not condemn or marginalize women who have been raped.[19] Societal expectations of procreation are so fierce that families of rape survivors have been known to actively encourage these women to join the LTTE.[20] Tamil culture encourages women to advance their children's interests at the expense of their own welfare, but female self-sacrifice for her community by engaging in terrorism can serve as an acceptable substitute.[21] Their participation compensates for their inability to give birth to future generations and restores their personal and familial dignity.

Even today, when women are playing an increasing role in violent organizations, they still represent a minority of the total membership. To understand the low scale and the rise of female terrorism, organizational motives for recruiting women must be explored. Women may want to become actively engaged in the conflict, but the evolution of the role of women from supportive to active is initiated at the organizational level. There is a great disparity between what motivates women to join a terrorist group and what encourages a group to recruit women.[22] Regardless of a woman's individual motives, terrorist groups are rational actors acting on the basis of cost-benefit calculation. The use of terrorist violence is part of a political strategy and represents "a willful choice made by an organisation for political and strategic reasons."[23]

Changes in targets, perpetrators, and tactics can be understood under this framework. The use of female operatives in a male-dominated activity represents a tactical change by terrorist organizations. These groups "tend to adapt to high levels of external pressure by altering their techniques and targets."[24] Women provide many benefits to terrorist groups, and organizations are increasingly recruiting them as a strategic choice. The use of women provides a new media dimension, which the terrorist group intends for the media to interpret as an indication of a worsening situation. Media images of women terrorists serve as powerful propaganda tools. As we all know, suicide bombers provide a low-cost, low-technology, low-risk weapon that maximizes target destruction and instils fear. Women are even more effective at this with their increased accessibility and media shock value. Female terrorists tend to garner more media attention than men because the "thought of those who bring forth life actually destroying it, is disturbing."[25] The idea of women acting as agents of violence runs completely

counter to expectations of femininity; images of female terrorists thus attract widespread publicity and disseminate the organization's message to a wider audience. Terrorism is a form of psychological warfare, and in this context, the use of women as terrorist operatives is simply a means of upping the ante.[26]

If organizations believe that increased female participation is advantageous, they are likely to encourage this participation in any way possible. Religious justifications, for example, have been manipulated to facilitate more women terrorists. Though the Islamic religious establishment has long opposed and actively condemned women's participation in violent struggles, it has dramatically changed its position more recently. Having seen the positive results and strategic benefits of allowing women's participation in terrorism, the religious establishment has gone so far as to provide an ex post facto justification for women's involvement in terror.

Finally, female terrorists have a greater capacity for mobilizing support than their male colleagues.[27] Female terrorists provide strong role models for other women who may then seek to emulate their heroine's actions. Female terrorism also increases male recruitment because men can be shamed into joining when women appear to be usurping their dominant role in conflict.[28] For example, following the first female Palestinian suicide attack in January 2002, the Egyptian Islamist weekly newspaper *Al-Sha'ab* taunted, "It is a woman, a woman, a woman who is a source of pride for the women of this nation and a source of honour that shames the submissive men with a shame that cannot be washed away except by blood."[29] In order to mobilise both men and women, female members are important for maintaining the recruitment mechanism of terrorist organisations.

Though terrorist organizations seek to achieve many goals, their primary objective is survival. Women are often recruited when membership is dwindling and there is a pressing need for more fighters to continue the struggle, for example, in protracted conflicts or following severe losses of male members. In Sri Lanka, for example, women have been actively involved in the LTTE since 1986, but the number of female fighters significantly increased after 1990. In June of that year, the LTTE suffered significant losses in the battle at Elephant Pass, and women were called to action to replace the losses.[30] The long-term survival of a terrorist group is often dependent on female participation to fill the ranks, either through direct involvement or by persuading men to join.

Female suicide bombers therefore provide many considerable advantages for terrorist organizations. First, they provide a tactical advantage: stealthier attack, an element of surprise, hesitancy to search women, and the stereotype of women as being nonviolent. Second, including women as suicide bombers increases the number of combatants. Third, this would increase the publicity of an attack and, finally, the psychological effect would be much higher.

Today, female participation in terrorist organizations is in its formative stages. But this development poses a challenge to national security services, because the participation of women in suicide bombings broadens the profile of who is considered to be a terrorist. Most counterterrorism measures focus on

men. Women are still less suspicious among security staff around a guarded target; to preserve a woman's decency, security staff is generally more reluctant to subject her to as thorough a body search as they would a man. Some groups, such as the LTTE or the PKK, have allowed women to participate at every level of group activity. It could be just a question of time until we see a similar development in other terrorist organizations.

PALESTINIAN FEMALE TERRORISM

Even though it is still an exception when women carry out attacks in the name of Al Qaeda, we are able to observe some noteworthy developments in other Islamist-based terrorist groups like Hamas and Tanzim.

The women involved in Palestinian terrorism support their male relatives in following the ideology of the terrorist groups; they facilitate operations on a preparatory level, and they also carry out suicide attacks themselves. Looking at the suicide attacks carried out by Palestinian women, we can clearly see how the phenomenon has grown, both in scope and in the type of attack. In 2004, fifty-nine women have attempted attacks against Israelis.[31]

It is hard for many Westerners to understand how Palestinian mothers could sacrifice or push their children to die for "the cause." Creating a supportive social environment for terrorists has been a critical factor in the Palestinian Authority's (PA) successful promotion of suicide terrorism. To this end, PA policy has been to honor terrorists as *shahids* (martyrs for Allah), and to teach Palestinian mothers to celebrate when their children die as terrorist shahids.[32]

On several occasions, these mothers have been shown on television rejoicing over the death of their children. For instance, on November 17, 2004, a mother of two suicide attackers said in an interview with PA TV: "No. We do not encourage our sons to die. We encourage them to shahada [death for Allah] for the homeland, for Allah. We don't say to the mothers of the shahids, 'We come to comfort you,' rather, 'We come to bless you on your son's wedding, on your son's shahada. Congratulations to you on the shahada.' For us, the mourning is a wedding. We give out drinks, we give out sweets. Praise to Allah, our mourning is a wedding."[33]

Nahed Habiballah argues that there are several factors that complicate the role of these mothers.[34] Most of them admit that they venture out to the streets looking for their children and tried several times to prevent them from going to confrontation areas where the Israeli Defense Force is present. Patriotism hinders their effort, however, and they are caught between two extremes: on the one hand, they want to protect their children and prevent their deaths, but, on the other hand, the Intifada is a quest for freedom, and loss of life is possible in such situations. What complicates things even more is the fact that martyrdom has become ingrained in the Palestinian culture over the past two decades, and women have found themselves trapped in a society that provides support for mothers of martyrs while demanding that these mothers become public figures of steadfastness and

pride. These mothers are unable to recover from their losses, because they are not allowed to grieve for their children. In Islam, martyrs are considered alive in heaven, and pious Muslims should not grieve the loss because, unlike the dead, these martyrs obtain the ultimate prize: being in heaven in the company of God and his prophets.

Al-Khansaa is considered the archetypal mother of shahids, a woman glorified by Palestinians for encouraging her sons to kill and die for Allah and rejoicing when they achieved their shahada deaths.[35] Promoting the Al-Khansaa ideal for Palestinians is a very powerful message for Muslims. This portrayal of the ideal Palestinian woman as one who willingly sacrifices her sons as shahids continues to represent official PA ideology. From a very young age, Palestinian girls are taught to adopt Al-Khansaa as a role model with her message of celebrating death in combat, which in contemporary Palestinian society includes death while committing acts of terror. A music video for children, broadcast hundreds of times over three years on PA TV, included the farewell letter of a child shahid, including the words: "Mother, don't cry for me, be joyous over my blood."

Here an additional point needs to be made: Palestinians have made their own cultural set of rules that markedly prescribe gender roles. These rules dictate the separation of the sexes and confine women to the private space of their homes. Their role as fertile mothers and reproducers of the nation marks their utility in the parameter of the conflict as a demographic war. The nationalistic discourse defines a Palestinian woman in terms of her reproductive capacity, thereby making her sexuality and fertility a patriotic and explicitly political issue. Their maternal sacrifice is a supreme political act that is translated into respect and prominent community stature.

The ideology becomes the tranquilizer: the assurance that their children did not die in vain. They died for their country and their ideology, and it is comforting for the mothers who struggle with the pain, loss, and the guilt of not being able to do more to protect their children. It seems that it is easier for mothers who have well-rooted faith to accept the fate that God has chosen for their children. According to the ideology, these mothers should be proud of their children because God chooses the purest people to be martyrs, as they are the ones who are privileged and worthy of his company.

The current trend in the use of Palestinian women as suicide bombers began in earnest in 2002. Wafa Idris, a 27-year-old Palestinian woman from the Al-Am'ari refugee camp near Ramallah, became the first female Palestinian suicide bomber on January 27, 2002, killing an Israeli civilian and wounding approximately 140 others. The military wing of Fatah, the Al-Aqsa Brigades, took responsibility for the attack three days later. This was the first female suicide attack in the Palestinian scene of the second Intifada. Until then, women were generally only employed to support and facilitate suicide operations. The ultimate honor of martyrdom was no longer reserved exclusively for men but had expanded to include women.

Several reasons for this development can be identified. During the current Intifada, as Israel's security forces enhanced their defensive measures against

terrorist attacks, Palestinian militant groups were forced to adapt their tactics, and despite cultural and religious taboos, they began to make increasing use of female recruits. However, a decision to use women in suicide terrorism required clerical sanction, and the tactic was not universally accepted by Islamic militant groups. Indeed, the willingness by some groups to allow women to engage in such activities prompted furious theological debate among radical Muslim clerics. Using women as suicide bombers poses conflict with some leaders's fundamental religious beliefs, while serving a tactical need for a stealthier weapon. In January 2002, Shaykh Ahmed Yassin, the spiritual leader of Hamas, "categorically renounced the use of women as suicide bombers."[36] In March 2002, after the second Fatah bombing, he reported that "Hamas was far from enthusiastic about the inclusion of women in warfare, for reasons of modesty."[37] That position dramatically shifted in January 14, 2004, when the first Hamas female suicide bomber struck. Yassin defended this change as a "significant evolution in our fight. The male fighters face many obstacles,"[38] so women can more easily reach the targets. He concluded his statement by noting that "women are like the reserve army—when there is a necessity, we use them."[39] In addition, Abd al-Asis al-Rantissi, a senior Hamas leader, stated at the end of August 2001 in an interview with Abu Tibi Television that "there is no reason that the perpetration of suicide attacks should be monopolized by men."[40] Isma'il abi Shanab, a Hamas leader in Gaza, was also eager to see women as one more weapon to inflict harm on the enemy. He stated: "Jihad against the enemy is an obligation that applies not only men, but also women. Islam has never differentiated between men and women on the battlefield."[41] The head of the Women's Activist Division of the Palestine Islamic movement Jamila Shanti argued, "Islam does not prohibit a woman from sacrificing herself to defend her land and her honour. It is she who was attacked, and she has the right to defend herself in any way. It is not puzzling that Muslim sisters have been carrying out heroic operations with Palestine since 1948. On the other hand it would be strange if the Palestinian woman had not done so, as Jihad is a personal imperative for her and no one can prevent her from waging it.[42] Some Palestinian Muslim clerics provided the religious justification for female suicide bombers.[43] Searching for new ways to resist the security complications, the Palestinians discovered that women could be an advantage and religiously backed their use.

The Palestinian Islamic Jihad (PIJ) began to launch a public campaign in 2003 to recruit women. It has focused its recruitment efforts in the northern part of the West Bank, especially in the Jenin region. Its first recruit was nineteen-year-old Heiba Daragmeh, a student at Quds Open University. Standing in from of a shopping mall in Afula on May 19, 2003, she detonated an explosive charge strapped to her body. Three civilians died in the attack and another eighty-three were injured.

Many of the Palestinian female terrorists share the experience of having lost a male relative by Israeli countermeasures. By mapping the biographies of the women who participated in the early history of the Palestinian terrorism, we could assert that some of these females were professional women with above-average

education and training, whereas others were young women with neither education nor career. Some of them were married and had children, others were single or divorced.

Two questions arise. Why did the women start to participate in the suicide bombing campaign at such a late point in time, and why are there so few females among the suicide bombers?

The answer for both questions is based partly on the generally patriarchal traditions of Muslim society, which as a whole does not promote the idea of females participating in warfare. Currently, Hamas and PIJ have enough male volunteers; and when these organizations have the chance to use a man for an attack, they prefer to do so.

It seems that Palestinian women in general have more rights and are allowed to choose political action. For instance, Rascha al-Rantissi, the widow of Hamas leader Rantissi, has run for office in Palestinian elections. Compared to other Muslim societies, Palestinian women have more opportunities and more freedom than their sisters in Iraq, Iran, Saudi Arabia, and other fundamentalist countries. They can vote, hold offices, drive cars, and own property. They also have equal access to universities. For decades, men have been fighting for the ideological goals of the terrorist organizations without having reached a substantial result. Every society has developed its identity over time and, in the Palestinian case, the concepts of a common enemy and the struggle have played a strong role in the construction of the Palestinian identity. Also, female Palestinians have learned to claim the full Palestinian identity even when that means carrying out a suicide attack. In the Muslim world, female suicide bombers have achieved immortality by becoming weapons against Israeli. When they were alive, the women who committed these actions were just women; however, from the moment they killed Israelis, they died as martyrs, achieving redemption. An important way to become a respected citizen in the Palestinian society is to kill and die.

The involvement of women in terrorism raises their awareness of the opportunities available outside the private domain. Women acquire a new understanding of their potential as political actors, and this can affect their demands within terrorist groups. Throughout the West Bank and Gaza, there are posters honoring female martyrs. Young girls no longer think of themselves as relegated to the private sphere; this in itself represents an important step toward female empowerment in Jihad.

Increased female terrorism affects women's personal and political development. Female terrorism demonstrates that traditional delineations along gender lines are unfounded and impermanent.

But this view is just one side of the coin. The phenomenon of the female suicide bomber is interconnected with a pathological misogynist culture in which young women are coerced and forced into suicide bombing in all kinds of violent and horrifying ways. Wafa Idris, for instance, couldn't bear children, and her husband divorced her. Discarded and shunned in a culture that sees a divorced barren woman as worthless, she became the obvious target of exploitation for

terrorist groups. Tahani Titit, a 24 year old Tanzim operative, explained that she desired to end her life not for nationalistic reasons but because of her father, who repeatedly beat her, and because of failed love affairs at university. Thawiya Hamour, twenty-six, from Jaba was arrested in Tulkarm on her way to perpetrate a suicide attack in Jerusalem. During her questioning, she mentioned that four months prior to her arrest she had met Mounir Halwa, who proposed marriage. Hamour's family refused this offer and, as a result, she had decided to commit a suicide terrorist attack. Titi's and Hamour's cases are classic examples of the cynical exploitation of unstable young women by terrorist organizations.

Anat Berko states, "Often wishing to clear her name, the female suicide terrorist will carry out the mission, thereby upgrading the status of her family, earning them honour and preventing their humiliation or even murder."[44] Blowing oneself up is a way to achieve respect, honor, and self-esteem in Palestinian Society. Nancy Kobrin states, "These women seek honour (sharaf) that they desire and they will never really achieve it because they are bound by female honour—*ird* which means pelvis."[45]

To conclude this section, when a Palestinian woman carries out a suicide attack or supports a terrorist organization or her male relatives, she does it for several diverse reasons. She is fighting a five-front war. These fronts are of an ideological, national, gender-based, social, and individual nature.

The incidence of female suicide bombers in Palestinian society is still in its formative stages and the foregoing analysis has shown that there is generally no single overriding motivation for a female bomber's action. Many interrelated motivations work together and create an explosive mixture that only needs some traumatic event to release all its hidden destructive energy. "A skilful terrorist operative can easily identify a candidate in this emotional state, and coolly manipulate her into becoming a weapon for his organization."[46] Palestinian women have proved to be a valuable and precious terrorism weapon as bombers and supporters.

THE WOMEN OF AL QAEDA

The roles of women in the movement of the global Salafi Jihad are similarly multifaceted. Female acts of suicide play a minor role in the Al Qaeda terrorist movement, but bin Laden's "roses" function importantly as operational facilitators, supporters of their male relatives, and ideological educators of children. Too few terrorist operations have taken place where females have been involved to derive generalizations or to identify a profile of a female Al Qaeda suicide bomber. The majority of Al Qaeda's women operate invisibly; nevertheless, they have had a strong impact on the current and next generation of terrorists. To understand their role, it is helpful to start with an analysis of Osama bin Laden's *fatawa* and other publications made by followers of the ideology. Afterward, female terrorist attacks, the concepts of sisterhood, and of the female Jihad will

be analyzed. Finally, the involvement of the women in the Al Qaeda–affiliated Jemaah Islamiah will be explained.

Until today, six *fatawa* have been identified that are allowing women to participate in martyrdom operations. The first one was issued by Yussuf al Qaradawi; three by faculty members at al-Azhar University Egypt; one by, Faysal al-Mawlawi of the European Council for Research and Legal Opinion based in Dublin; and one by Nizar Ábd al-Qadir Riyyam of the Islamic University of Gaza.[47] David Cook notes that it is significant that the more conservative Jordanian, Syrian, and Saudi religious leaders are completely absent from this list. "One can see that the question of women participating on suicide attacks has become associated with the Egyptian–Palestinian and consequently more progressive side of the Muslim world."[48]

But the ideology of the global Salafi Jihad has different functions for the women in mind than the one of a suicide bomber. The fatawa and some audiotapes of bin Laden express the role of women very clearly. In the fatwa "Declaration of War Against the Americans Occupying the Land of the Two Holy Places, Expel the Mushrikeen [infidels] from the Arabian Peninsula," he explains that women play an essential role as supporters, facilitators, and promoters in carrying out the Jihad.

> Our women had set a tremendous example for generosity in the cause of Allah; they motivate and encourage their sons, brothers and husbands to fight—for the cause of Allah in Afghanistan, Bosnia-Herzegovina, Chechnya and in other countries. . . . May Allah strengthen the belief—Imaan—of our women in the way of generosity and sacrifice for the supremacy of the word of Allah. . . . Our women instigate their brothers to fight in the cause of Allah. . . . Our women encourage Jihad saying: Prepare yourself like a struggler; the matter is bigger than the words.

However in the fatwa "Jihad Against Jews and Crusaders, World Islamic Front," published two years later, which became the manifesto of the full-fledged global Salafi Jihad, the role of women seems to be alleviated. They are mentioned once and then just addressed as being the victims of the United States and the Zionists. "Women and children, whose cry is: Our Lord, rescue us from this town, whose people are oppressors; and raise for us from thee one who will help!"

In the pledge of a training manual found by the Manchester Metropolitan Police during the search of an Al Qaeda member's home, women are also addressed as victims of the infidels: "To the sister believer whose clothes the criminals have stripped off. To the sister believer whose hair the oppressors have shaved. To the sister believer who's body has been abused by the human dogs." The ideology of the global Salafi Jihad says that a reason to carry out the defensive Jihad is when a Muslim woman is held by the *kufar* (infidels), to ensure her freedom is *fard* (duty) on the whole Muslim *ummah* (world Muslim community). But the women are also addressed as supporters "Covenant, O Sister . . . To make them desire death and hate appointments and prestige" and perpetrators

"Covenant, O Sister . . . to slaughter them like lamb and let the Nile, al-Asi, and Euphrates river flow with their blood."

In an audiotape broadcast on October 18, 2003 by Al Jazeera, bin Laden said: "Our prudent Muslim women are also expected to play their role."

A recently found document, "The role of women in the Jihad against Enemies,"[49] on a Jihadist message board written by Yussuf al-Ayyiri, who was one of the ideological leaders of the Saudi Arabian branch of Al Qaeda,[50] encourages women to take an active role in Jihad. This role does not involve active fighting, but it calls for women to encourage and support men in their active quest to join the Jihad. While explicitly stating that women should not actively engage in physical combat, the document emphasizes the power that women hold over men, reminding them that their role in Jihad is a vital necessity for the entire Muslim ummah. "The reason we address women . . . is our observation that when a woman is convinced of something, no one will spur a man to fulfill it like she will . . . The saying behind every great man stands a women was true for Muslim women at these times, for behind every great Mujahid stood a women."[51] He focuses on women as fighters, rather than in a supportive role, but he avoids making the revolutionary call of women to join in suicide operations. In the final paragraph he destroys two of the principal blocks against women actually fighting Jihad: that they would need the permission of their parents, and that women's Jihad is the performance on the *hajj* ritual.[52] As for the idea that the hajj supercedes Jihad, he cites a tradition that enumerates the importance of various activities and lists them in the following order: prayer, Jihad, and respect toward parents. "With these two comments he has laid the intellectual ground for the full participation of women in Jihad among radical Muslims."[53]

The online periodical *al-Khansaa*, which is addressed to women who share the ideology of Al Qaeda, also shows very obviously the importance of female support. This magazine says it is published by an organization called Women's Information Bureau of Al-Qaeda in the Arabian Peninsula and claims that Abdul al-Murqrin, the leader of Al Qaeda in the peninsula, and Issa Saad Mohammed bin Oushan are among the founders. Al-Khansaa bint Omar was a poetess of the pre-Islamic period who converted to Islam during the time of the Prophet Muhammad, and she is considered "the mother of the shahids." When her four sons died in the Battle of al Qadissiya, she did not mourn but thanked Allah for honoring her with their death. It was already mentioned that this archetypal picture of a mother of shahids also exists in Palestinian society. The choice of the name al-Khansaa for the magazine was not without reason. The magazine aims to motivate women to participate in Jihad by bringing up their children to be good Jihadis and by being supportive of their husbands, brothers, and sons. The magazine teaches that the goal of the woman is also to become a shahid. An editorial in the magazine states: "We love Allah and his Messenger. We march in a single path, the path of Jihad for the sake of Allah, and our goal is Shahada for the sake of Allah, and our goal is [to gain] the pleasure of Allah and His Paradise."[54]

The perception of the women is that they are standing shoulder to shoulder with their men, supporting them, helping them, and backing them up. An article titled "Obstacles in the Path of the Jihad Warrior Woman," written by Umm Badr, included indoctrination and guidelines for the women. "My noble sisters . . . The woman in the family is a mother, wife, sister and daughter. In society she is an educator, propagator and preacher of Islam, and a female jihad warrior. Mohamed Salah states that 'What is new here is the use of the medium of the Internet to recruit women.'"[55] It should be mentioned at this point that the whole ideology of the global Salafi Jihad is to build a revival of the golden age, which took place in the few years between 632 and 661. For that reason, it is not surprising that the argumentation for the role of women also derives from history. "My sister you might hear these stories and think that they have been fabricated . . . but once you will learn that even today there are women similar to those of the past, you will believe the stories about (the women in) the past."[56]

For centuries, Muslim women in different struggles and communities have joined men on the front lines of war and have died alongside with them. The most prominent example of an early Muslim in Jihad in Nusayba bint Káb, who fought in the Battle of Uhud with her husband and two sons and during the Caliphate of Abu Bakr. She joined the Muslim troops, suffered eleven wounds, and lost one arm.[57] The Prophet's own female relatives took part in Jihad. His wife Ayesha led the Battle of the Camel, and his granddaughter Zaynab bint Al fought in the Battle of Karbala. Other women were recognized for tending to the wounded, donating their jewelery for the Jihad, and encouraging their male family members to fight to ensure the survival of Islam. The involvement of the early Arab women in Jihad is celebrated today throughout the Muslim world, and they serve as icons and a precedent for the contemporary Muslim women who choose suicide operations, who have lost a family member in Jihad, or who support the ideology.

In the past, a Muslim woman was seen as the responsibility of her male relatives. Militant organizations could not recruit women directly without transgressing familial and societal honor codes that require women to seek permission for every action they take outside the family home. To secretly recruit a woman as a suicide bomber or even as a courier of messages and weapons would be seen as an insult to the family's male honor. Increasingly, this seems to be changing, as evidenced by the *al-Khansaa* article saying that women need not ask for permission to become a Jihadi because it is their duty to do so. In fact, *al-Khansaa* exploits the woman's traditional role in family and society as mother and nurturer of her children to get women to play a larger role in the Jihad.

Extremist Islamic websites are generous with advices on how women can and should participate in the Jihad. There are many suggestions on how they should bring up children to be good shahids, and what books they should read to their children to make them devout Muslims and brave fighters. These websites provide advice on how mothers, wives, and sisters of Jihadi fighters should be supportive of decisions made by their husbands to become a shahid; and how they

should provide food, shelter, and care for all shahids. That women must sacrifice their sons and husbands is a recurrent theme of much Jihadi literature.

Indeed, in some respects, females are considered to be the most effective and loyal supporters of terrorist organizations. When analyzing the women and their role in the Islamic organisation Hizb ut-Tahrir in Uzbekistan, an identical finding can be made.

Until today it has been difficult to profile female suicide bombers who have operated in name of the global Salafi Jihad, because very few cases have been observable, and there is not much known about theses women. The latest development of female suicide bombings started in Iraq in April 2003 under the command of Saddam Hussein's security forces. A car exploded in a terrorist attack at a U.S. checkpoint in western Iraq, killing three coalition soldiers. The Arabic TV station Al-Jazeera broadcast separate videotapes of the two female suicide bombers, one of them pregnant, each standing in front of the Iraqi flag, their right hands on the Korans placed on a table in front of them and their left hands brandishing automatic rifles. A woman who identified herself as "martyrdom-seeker Nour Qaddour al-Shammari" swore on the holy book of Islam "to defend Iraq . . . and take revenge from the enemies of the [Islamic] nation, Americans, imperialists, Zionists" and Arabs who have submitted to the foreigners. "We say to our leader and holy war comrade, the hero commander Saddam Hussein, that you have sisters that you and history will boast about," said the woman, who wore the red-checked *keffiyeh*, an Arab head scarf. In a separate video, another woman, who identified herself as Wadad Jamil Jassem, stood in a similar pose and declared, "I have devoted myself for Jihad for the sake of God and against the American, British and Israeli infidels and to defend the soil of our precious and dear country." The videotapes were similar to those distributed by Palestinian suicide bombers after attacks against Israelis.[58]

In September 2003, two 14-year-old girls named Imame and Sana Laghriff were arrested in Rabat, Morocco, and sentenced for terrorist offenses. According to various reports, the two were on their way to target a liquor store, with some sources suggesting this was a suicide attack plot. The twin teenagers were influenced by a branch of radical Islam advocates from a Salafia Jihadia cell.[59] It seems that the girls were highly manipulated by the male members of the cell.

Although there is little known about the other women and the intentions of their suicide attacks, the story of 19-year-old Uzbek woman, Dilnoza Holmuradova, who detonated explosives strapped to her body at Tashkent's Choru Market in March 2004, killing forty-seven people, illustrates her determination to participate in a suicide attack. Dilnoza came from a middle-class family and was an educated computer programmer and enrolled at the Tashkent police academy in 2001. She was able to speak five languages. In 2002 she began studying Islam with her elder sister, and both were greatly influenced by a meeting they had with teachers of the religion. They stopped wearing modern clothes, listening to music, and watching television. In January 2004, the sisters left their home with just two dresses and Islamic literature. Neither ever returned.[60] It is unclear when

they were recruited by the Islamic Jihad Group, a radical offshoot of the Islamic Movement of Uzbekistan.

May 2005 was the first time women were directly involved in a terrorist attack in Egypt. Two women were involved in a shooting on a tourist bus. Both were in their twenties and were related to the male perpetrator, Ihab Yassin. Negat Yassin was the suicide bomber's sister and Iman Ibrahim Khamis, his fiancée. Both women shot themselves before they could be arrested. It remains unclear if the two women intended to commit suicide or chose the tactic to evade arrest. The Abdallah-Azzam Brigades, an Al Qaeda–affiliated group, claimed responsibility for this attack.[61] The Al Qaeda–affiliated Malik Suicidal Brigades claimed responsibility for the suicide attack carried out by a women on September 28, 2005, in Talafa in northern Iraq against a U.S. military recruitment center. The group issued the statement: "A blessed sister . . . carried out a heroic attack defending her faith. . . . May God accept our sister among the martyrs."[62] In an Internet posting by Al Qaeda in Iraq, led at the time by Abu Musab Zarqawi, a Jordanian and the most feared and wanted terrorist in Iraq until he was killed by U.S. forces in 2005, said the bomber attacked the center because it was a gathering spot "of converted volunteers." Residents said the building used to be an Iraqi army recruiting center.[63] The attack seems to represent a new tactic by the terrorist groups in Iraq to use women, who are rarely searched at checkpoints because of religious and social traditions that grant women special treatment. Until recently, women have not been suspected by the security forces, and this is demonstrated by the fact that the woman who carried out the attack was dressed in men's clothing—a factor that did not lead the soldiers to pay attention to her.

On November 9, 2005, three Iraqi suicide bombers carried out attacks in Amman, Jordan, in the lobby of the Grand Hyatt Hotel, at a wedding party at the Radisson SAS Hotel down the street, and at the Days Inn. They killed fifty-six people, severely injuring ninety-three. The Jordanian security services were able to arrest Sajida Mubarark al-Rishawi. The 35-year-old Iraqi woman was the fourth suicide bomber, but her trigger cord failed and she fled the wedding reception at the Radisson. Her husband, Ali Hussein al-Shumari, also part of the suicide squad, killed himself in the bombing.[64] Her brother is Mubarak Atrous al Rishawi, at the time a senior aide to Zarqawi in western Iraq. During her confession, she gave no indication of why she wanted to carry out the attack, saying only that her husband brought her from Iraq to Jordan, showed her how to use the explosives belt and fit it onto her, telling her that it would be used to attack a hotel.[65] The Abu Musab al-Zarqawi group, the Al Qaeda in Mesopotamia, took responsibility for the blast.

In November 2006, Muriel Degauque was the first European converted Muslim woman to carry out a suicide attack. She was raised as a Roman Catholic in a suburb near Brussels in Belgium. Degauque, thirty-eight, rammed an explosives-filled vehicle into an American military patrol in the town of Baquba in Iraq on November 9, wounding one American soldier. Her story supports fears among many law enforcement officials and academics that converts to Europe's

fastest-growing religion could bring with them a disturbing new aspect in the war on terror. Women who marry Muslim men are now the largest source of religious conversions in Europe. Although a vast majority of those conversions are pro forma gestures for moderately religious in-laws, a small but growing number are women who willingly adopt the conservative comportment of their fundamentalist husbands or support them to follow the radical interpretation of Islam and join a terrorist organization belonging to the movement of Al Qaeda. French antiterrorism officials have been warning for several years that female converts represent a small but increasingly important part of the terrorist threat in Europe.

Degauque was born in the small suburb of Charleroi, a gritty coal and steel town where her father operated a crane at the sprawling smelter, according to neighbors and friends. Her parents sent her to the best local high school in the area at the time. The Belgian police say she became known as a drug user, though she was never arrested. Degauque's wayward streak took a decisive turn when her brother was killed in a motorcycle accident when she was twenty. Degauque said she should have died instead of her brother. She soon moved out of the house and began a troubled life in Charleroi. Degauque had several boyfriends after she was divorced. She eventually met an Algerian man who introduced her to Islam. She began appearing at the home of her parents wearing a head scarf. Her mother told neighbors that she was pleased because Islam had helped her daughter stop drinking and doing drugs. But her devotion became disturbing several years later after she met and married Issam Goris, the son of a Belgian man and a Moroccan woman. Goris with his long beard was already known to Belgian police as a radical Islamist. Degauque moved with him to Brussels and then to Morocco, where she learned Arabic and studied the Koran. When she returned, she wore not only a head scarf but the full-length robe. As she became increasingly rigid, she demanded that her parents follow Islamic customs when she and her husband visited.[66]

The Belgian police now say that Goris had fallen in with a group of Islamists focused on recruiting European Muslims to fight with Abu Musab al-Zarqawi's terrorist network in Iraq. The police had been monitoring the group for months when they intercepted phone calls from Goris indicating that he and his wife were already in Iraq. The police say the couple left Belgium by car and eventually entered Iraq from Syria. The Belgians didn't yet know the identities of Goris and Degauque, but they notified the United States and the Iraqi government that a Belgian couple was in the country intent on carrying out attacks. They turned over information on the telephone calls that would allow the Americans to find Goris, but Degauque struck before they found her. A day later, the Americans found Goris, who was also wrapped in explosives, apparently about to carry out an attack. They shot him before he could detonate his charges. Dismantling the network in Belgium that sent them to their deaths, police arrested another couple allegedly preparing to go to Iraq to become martyrs. The Belgian case has links to the youthful Dutch Hofstad group, a unique mix of extremist ferocity and modern European attitudes.

When analyzing these cases, it is difficult to profile female suicide bombers who operate under the banner of the global Salafi Jihad. What all these women have in common is that they were recruited and instructed by men. In three cases, the women carried out the attack shoulder to shoulder with a male relative. It could also be stated that the instance of female suicide bombers has increased over a relatively short period of time.

In addition, other findings support the observation that the involvement of women in terrorist operations is an emerging trend. In 2003, several factors led the Federal Bureau of Investigation (FBI) to prepare for the possibility that Al Qaeda might recruit women. In June 2003, the FBI started searching for a woman for the first time since the war on terror began: 31-year-old Aafia Siddiqui.[67] Along with her husband, she founded the Institute for Islamic Research and Teaching in 1999, and both were identified as suspected Al Qaeda agents. An additional indicator that the position of women is transforming is demonstrated by the warrant for a Tunisian woman, Bentiwaa Farida Ben Bechir. As a member of a cell in Italy, she was active in recruiting suicide bombers to be sent to Iraq.[68] As early as May 2003, France's famed antiterrorist investigating judge, Jean-Louis Bruguière, warned that European terrorist networks were trying to recruit Caucasian women to handle terrorist logistics, because they would be less likely to raise suspicion. On November 3, 2005, the Dutch police arrested a 21-year-old woman in Rijswijk, on suspicion of being involved in terrorist activities of the Islamist radical group Hofstad.[69] At the time of the arrest, she was on her way with her husband to kill a Dutch legislator, prominent Islam critical feminist Ayaan Hirsi Ali. The driver who brought both to the train station is also a women— a convert with cherubic Dutch looks and the former profession of police officer.[70] The women of the Dutch extremist network were new breeds of holy warriors on the front lines where Islam and the West collide. In the male-dominated world of Islamic extremism, they saw themselves as full-fledged partners in Jihad. The story of the Dutch network, fourteen members of which are on trial, reveals the increasing aggressiveness and prominence of female extremists in Europe. In a chilling trend in the Netherlands and Belgium, police are investigating the wives of militants, who are suspected of plotting suicide attacks with their husbands—or on their own. It looks like the primarily motivation of the women is to carry out a political act, and they do not follow their husbands blindly; they encourage them.

Women carry out the Jihad by educating, supporting, and encouraging their sons, brothers, and husbands. To reach this goal, they have to prepare themselves as strugglers. No less important for promoting the Salafi ideology is their role as the victims of the infidels, motivating their male relatives to carry out the Jihad. When a woman enters paradise, she will not find seventy-two male virgins waiting for her—she will sit beside her husband. A different interpretation says that the female martyr of the shahida is one of the seventy-two female virgins waiting for a male martyr. In the Shi'ite and Sunni tradition, the word *Jihad* is completely reinterpreted for the women; they might gain similar spiritual benefit for performing it, but the action performed is without topical connection to fighting.[71]

Marc Sageman discovered that 70 percent of the 400 terrorists he analyzed had been married. Every terrorist has a mother, and many of them at least one sister. Arranged marriages are a strong tradition in the Muslim world, and it would not be a mistake to assume that marriages in the global Salafi Jihad are arranged.

How intensive the women carry out the female Jihad is easy to see when analyzing the Al Qaeda affiliate Jemaah Islamiah. Sidney Jones from the International Crisis Group in Jakarta states that marriage alliances are the glue that holds Jemaah Islamiah together. "Oftentimes senior members of the organization will offer their sisters or sisters-in-law to new promising recruits so that they are not only drawn into the organization, but into the family as well." The result is that the members are much closer connected. In some cases they even had control of finances. They play a role as couriers in ensuring that, particularly after imprisonment, communication among different members of the organization is maintained. "It's not a role in actively taking part in bombing activities, the new way some of the women in Chechnya or in Sri Lanka have done. It's more ensuring that the organization stays solid."[72] The wife of the operational chief of the Jemaah Islamiah, Hambali, who was responsible for instance for the October 2002 Bali bombings, acted as his bookkeeper. The wife of Omar al-Faruk, also a key figure of the Jemaah Islamiah, translated and also acted as his bookkeeper. Both women played a crucial role in financing of the organization, as did Yazid Sufaat's wife.

Another insightful example is Malika Aroud. When her husband traveled to an Al Qaeda training camp in Afghanistan, Malika joined him. Two days before the September 11, 2001, attacks, her husband carried out a suicide bombing that killed Ahmed Shah Massoud, the leader of the north alliance in Afghanistan. Acquitted in the plot against Massoud, Malika moved to Switzerland, where she has been charged with operating a website that incited terrorism.

Women are often strongly involved in the financial issues of a terrorist organization. In the aftermath of the 9/11 attacks, the United States has closed several bank accounts of terrorist organizations or supporting institutions that were handled by women. The chance that the men will get arrested or die in combat or in an attack is much higher; so for the organization it makes sense that the individuals who take care of the financial issues have a stronger likelihood of survival. Dealing with the financial aspects could be done from home, the place where the women are usually restricted in these societies.

CONCLUSION

Over the past three years, religious terrorist groups have set the stage for the entry of female combatants. The role of women in terrorist organizations arises from the society in which they live. In patriarchal societies, women carry out attacks and support terrorist organizations as a way to have a chance to be honored by their society. But there are several motivations for women to carry out a

terrorist attack, and these reasons are interconnected. Women are motivated because they follow a violent ideology; they want to carry out a political act; look forward to regaining personal or family honor; have lost a family member;or have been manipulated in some way. There is not single rational reason that motivates female suicide bombers.

These motivations also come into play when they "just" support their male relatives in following the ideology of a terrorist organization or facilitating terrorist operations. This behavior is widespread in Muslim and Western countries. In this case, the motivation arises mainly from a process of socialization conducted in the society in which they are living, whereas in other cases they have become radicalized by themselves.

Attempts have been made to profile female suicide bombers in the hope of finding common threads in their backgrounds and motivations. It is very difficult to profile female suicide bombers or facilitators and supporters because they come from diverse educational, religious, social, and personal backgrounds.

Terrorist organizations use women as suicide bombers because they provide several considerable advantages. First, they offer a tactical advantage: stealthier attack, an element of surprise, hesitancy to search women, and the stereotype of females as being nonviolent. Second, the inclusion of women as suicide bombers increases the number of combatants. Third, this increases the publicity of an attack. Finally, women suicide bombers carry a much greater psychological impact. Suicide bombers provide a low-cost, low-technology, low-risk weapon that maximizes target destruction and instills fear. Women are even more effective with their increased accessibility and media shock value. Until today, women could rarely be found as part of the suicide bombers of the global Salafi Jihad; however, when terrorism groups find women useful in their operations, they will find or create something in the Islamic theology to justify it.

Personal and organizational motivations converge to produce an increased number of female terrorists. To the extent that these motivations persist over time, the increase in female participation in religious terrorist organizations can be expected to continue. There is a need to understand their role as operational facilitators, organizational and personal supporters, and ideological educators, as a means to develop long-term effective and efficient counterterrorism.

NOTES

1. As the meaning and usage of the word *terrorism* have changed over time to accommodate the colloquial political language and discourse of each successive era, terrorism has proved increasingly elusive in the face of attempts to find a consistent definition. Boaz Ganor provides a very fruitful definition, which will be used in this article: "Terrorism is a form of violent struggle in which violence is deliberately used against civilians in order to achieve political goals (nationalistic, socioeconomic, ideological, religious, etc.)." Boaz Ganor, *The Counter-Terrorism Puzzle: A Guide for*

Decision Makers (Somerset, NJ: Transaction, 2005), p. 17. The second phrase that needs to be explained is "global Salafi Jihad." This broad-based ideology of Al Qaeda has its roots in the Egyptian Salafi Jihad, and today it is articulated in the global Salafi Jihad. The fatwa "Jihad against Jews and Crusaders," written by Osama bin Laden and published on February 23, 1998, has become the manifesto of the full-fledged global Salafi Jihad. In this document, bin Laden extended his previous concept of jihad from a defensive to an offensive one. The global Salafi Jihad now carried the fight to the "far enemy" (the United States and the West in general), on its own territory or in third-country territory. Today, Al Qaeda is a movement of uncountable terrorist organizations, groups, and cells. The term *global Salafi Jihad* will be used to describe this movement.

APPENDIX A

CIA COUNTERINTELLIGENCE: AN EXCERPT FROM THE CHURCH COMMITTEE REPORT

IX. CIA COUNTERINTELLIGENCE

A. COUNTERINTELLIGENCE: AN INTRODUCTION

1. Definition of Counterintelligence

Counterintelligence (CI) is a special form of intelligence activity, separate and distinct from other disciplines. Its purpose is to discover hostile foreign intelligence operations and destroy their effectiveness. This objective involves the protection of the United State Government against infiltration by foreign agents, as well as the control and manipulation of adversary intelligence operations. An effort is made to both discern and decive the plans and intentions of enemy intelligence services. Defined more formally, counterintelligence is an intelligence activity dedicated to undermining the effectiveness of hostile intelligence services. Its purpose is to guard the nation against espionage, other modern forms of spying, and sabotage directed against the United States, its citizens, information, and installations, at home and abroad, by infiltrating groups engaged in these practices and by gathering, storing, and analyzing information on inimical clandestine activity.[1]

Source: "Counterintelligence," in *Foreign and Military Intelligence, Final Report,* Select Committee to Study Governmental Operations with Respect to Intelligence Activities (the Church Committee), Book I, U.S. Senate, 94th Cong., 2d Sess. (April 26, 1976), pp. 163–71, written by Committee staffers John T. Elliff and Loch K. Johnson.

[1] Counterintelligence may also be thought of as the knowledge needed for the protection and preservation of the military, economic, and productive strength of the United States, including the security of the Government in domestic and foreign affairs against or from espionage, sabotage, and all other similar clandestine activities designed to weaken or destroy the United States. (Report of the Commission on Government Security Washington, D.C., 1957, pp. 48–49.)

In short, counterintelligence specialists wage nothing less than a secret war against antagonistic intelligence services. "In the absence of an effective U.S. counterintelligence program," notes a counterintelligence specialist, "[adversaries of democracy] function in what is largely a benign environment."[2]

2. The Threat

The adversaries of democracy are numerous and widespread. In the United States alone, 1,079 Soviet officials were on permanent assignment in February 1975, according to FBI figures.[3] Among these, over 40 percent have been positively identified as members of the KGB or GRU, the Soviet civilian and military intelligence units. Conservative estimates for the number of unidentified intelligence officers raise the figures to over 60 percent of the Soviet representation; some defector sources have estimated that 70 percent to 80 percent of Soviet officials have some intelligence connection.[4]

Furthermore, the number of Soviets in the United States has tripled since 1960, and is still increasing.[5] The opening of American deepwater ports to Russian ships in 1972 has given Soviet intelligence services "virtually complete geographic access to the United States," observes a counterintelligence specialist.[6] In 1974, for example, over 200 Soviet ships with a total crew complement of 13,000 officers and men called at 40 deep-water ports in this country.

Various exchange groups provide additional opportunities for Soviet intelligence gathering within the United States. Some 4,000 Soviets entered the United States as commercial or exchange visitors in 1974. During the past decade, the FBI identified over 100 intelligence officers among the approximately 400 Soviet students who attended American universities during this period as part of an East-West student exchange program.[7] Also, in the 14-year history of this program, more than 100 American students were the target of Soviet recruitment approaches in the USSR.

Other areas of counterintelligence concern include the sharp increase in the number of Soviet immigrants to the United States (less than 500 in 1972 compared to 4,000 in 1974); the rise in East-West commercial exchange visitors (from 641 in 1972 to 1,500 in 1974); and the growing number of Soviet bloc officials in this country (from 416 in 1960 to 798 in 1975).[8]

Foreign intelligence agents have attempted to recruit not only executive branch personnel, but also Congressional staff members. The FBI has advised the Committee that there have been instances in the past where hostile foreign intelligence officers have used the opportunity presented by overt contacts to attempt to recruit members of Congressional staffs who might have access to secret information.[9]

[7] *Ibid*, 3/10/75.

[8] *Ibid.*

[9] FBI Memorandum for the Record, 10/30/75. Such recruitment approaches have been reported to the FBI by Congressional staff members. If the FBI otherwise learns of such recruitments, its policy is to report the facts to the appropriate Members of Congress.

The most serious threat is from "illegal" agents who have no easily detectable contacts with their intelligence service. The problem of "illegals" is summarized by the FBI as follows:

> The illegal is a highly trained specialist in espionage tradecraft. He may be a [foreign] national and/or a professional intelligence officer dispatched to the United States under a false identity. Some illegals [may be] trained in the scientific and technical field to permit easy access to sensitive areas of employment.
>
> The detection of . . . illegals presents a most serious problem to the FBI. Once they enter the United States with either fraudulent or true documentation, their presence is obscured among the thousands of legitimate emigres entering the United States annually. Relatively undetected, they are able to maintain contact with [the foreign control] by means of secret writing, microdots, and open signals in conventional communications which are not susceptible to discovery through conventional investigative measures.[10]

In several instances the FBI accomplished this most difficult assignment by carefully designed and limited mail opening programs which, if they had been authorized by a judicial warrant, might have been entirely proper. It is most unfortunate that the FBI did not choose to seek lawful authorization for such methods.[11]

This brief summary of the threat facing the American counterintelligence corps in this country is troubling enough, yet it does not take into account the worldwide scope of the problem. As an FBI counterintelligence expert states, hostile foreign intelligence services

> are alert for operational opportunities against the United States whether they occur within this country, abroad (in other countries) or in the home country itself. An operation might begin in the home country with recruitment of an American visitor; transfer to the United States with his return; and again, even later, might be transferred to a third country where the American agent may be met outside the normal reach of United States counterintelligence coverage. Regardless of the geographical location, the operation is still directed against the United States and can cause just as much damage from abroad as within our own borders.[12]

The espionage activities of the Soviet Union and other communist nations directed against the United States are extensive and relentless.[13]

To combat this threat, American counterintelligence officers have developed various sophisticated investigative techniques to (1) obtain information about foreign intelligence services, (2) protect our intelligence service, and (3) control the outcome of this subterranean struggle for intelligence supremacy. The task is difficult technically, and raises sensitive legal and ethical questions. As the CIA Deputy Director for Operations has testified, the

> U.S. counterintelligence program to be both effective and in line with traditional American freedoms must steer a middle course between blanket, illegal, frivolous and unsubstantiated

inquiries into the private lives of U.S. citizens and excessive restrictions which will render the Government's counterintelligence arms impotent to protect the nation from foreign penetration and covert manipulation.[14]

3. CI as Product: Information about "The Enemy"

Counterintelligence is both an activity and its product. The product is reliable information about all the hostile foreign intelligence services who attack the United States by stealth. To guard against hostile intelligence operations aimed at this nation, a vast amount of information is required. It is necessary to know the organizational structure of the enemy service, the key personnel, the methods of recruitment and training, and the specific operations.

This information must be gathered within the United States and in all the foreign areas to which U.S. interests extend. Within the intelligence service, this acquisitive activity is referred to as intelligence collection. The resulting product—pertinent information on the enemy intelligence service—is often called "raw" intelligence data. The efforts of intelligence services through the world to conceal such information from one another, through various security devices and elaborate deceptions, creates the counterintelligence specialist what James Angleton, former Chief of CIA Counterintelligence, calls a kind of "wilderness of mirrors."

4. CI as Activity: Security and Counterespionage

As an activity, CI consists of two matching halves: security and counterespionage. *Security* is the passive or defensive, side of counterintelligence. It consists basically of establishing static defenses against all hostile and concealed acts, regardless of who carries them out.

Counterespionage (CE) is the offensive, or aggressive, side of counterintelligence. It involves the identification of a specific adversary and a knowledge of the specific operation he is conducting. Counterespionage personnel must then attempt to counter these operations by infiltrating the hostile service (called penetration) and through various forms of manipulation. Ideally, the thrust of the hostile operation is turned back against the enemy. The security side of counterintelligence includes the screening and clearance of personnel and the development of programs to safeguard sensitive intelligence information (that is, the proper administration of security controls). The intelligence services try to defend three things: (1) their personnel, (2) their installations, and (3) their operations.

At the Central Intelligence Agency, the Office of Security is responsible for protection of personnel and installations, while actual operations are largely the preserve of the CI staff and the operating divisions. Among the defensive devices used for *information control* by intelligence agencies throughout the world are: security clearances, polygraphs, locking containers, security education, document accountability, censorship, camouflage, and codes. Devices for *physical security* include fences, lighting, general systems, alarms, badges and passes, and watchdogs. *Area control* relies on curfews, checkpoints, restricted areas, and border-frontier control.[15] Thus the security side of counterintelligence "is all that

[14] William Nelson testimony, 1/28/76, p. 5.

[15] Staff summary of interview, CIA security specialist, 8/20/75.

concerns perimeter defense, badges, knowing everything you have to know about your own people;" the counterespionage side "involves knowing all about intelligence services—foreign intelligence services—their people, their installations, their methods, and their operations. So that you have a completely different level of interest."[16] However, the Office of Security and the CI staff exchange information to assure adequate security systems.

5. The Penetration and the Double Agent

Several kinds of operations exist within the rubric of counterespionage. One, however, transcends all the others in importance: the penetration. A primary goal of counterintelligence is to contain the intelligence service of the enemy. To do so, it is eminently desirable to know his plans in advance and in detail. This admirable, but difficult, objective may be achieved through a high-level infiltration of the opposition service. As a Director of the CIA has written, "Experience has shown penetration to be the most effective response to Soviet and Bloc [intelligence] services."[17]

Moreover, a well-placed infiltrator in a hostile intelligence service may be better able than anyone else to determine whether one's own service has been penetrated. A former Director of the Defense Intelligence Agency (DIA) has observed that the three principal programs used by the United States to meet, neutralize, and defeat hostile intelligence penetrations are: (1) our own penetrations; (2) security screening and clearance of personnel; and (3) our efforts for safeguarding sensitive intelligence information.[18] The importance of the penetration is emphasized by an experienced CIA counterespionage operative, with mixed but expressive similes: "Conducting counterespionage with penetration can be like shooting fish in a barrel;" in contrast, "conducting counterespionage without the act of penetration is like fighting in the dark."[19]

Methods of infiltrating the opposition service take several forms. Usually the most effective and desirable penetration is the recruitment of an agent-in-place.[20] He is a citizen of an enemy nation and is already in the employ of its intelligence service. Ideally, he will be both highly placed and venal. The individual, say a KGB officer in Bonn, is approached and asked to work for the intelligence service of the United States. Various inducements—including ideology—may be used to recruit him against his own service. If the recruitment is successful, the operation may be especially worthwhile since the agent is presumably already trusted within his organization and his access to documents may be unquestioned. Jack E. Dunlap, who worked at and spied on the National Security Agency (NSA) in the 1960s, is a well-known example of a Soviet agent-in-place within the U.S. intelligence service. His handler was a Soviet Air Force attaché at the Soviet Embassy in Washington. Of course, a single penetration can be worth an intelligence gold mine, as were Kim Philby for the Soviet Union and Col. Oleg Penkovsky for the United States.

Another method of infiltration is the double agent. Double agents, however, are costly and time-consuming, and they are risky. Human lives are at stake. Double agents

[20] CIA/CI specialist, staff summary, 10/17/75.

also normally involve pure drudgery, with few dramatic results, as new information is checked against existing files. On top of this comes the difficulty of assuring against a doublecross.

Moreover, passing credible documents can be a major problem. The operations must be made interesting to the opposition. To make fake papers plausible, the genuine article must be provided now and again. Classified documents must be cleared, and this process can be painstakingly slow. Also, "this means letting a lot of good stuff go to the enemy without much in return," complains a CI officer with considerable experience.[21]

To accomplish each of these tasks, hard work, careful planning, and considerable manpower are necessary. The extraordinary manpower requirements of the double agent operation restricted the abilities of the British to run cases during the Second World War—approximately 150 double agents for the entire period of the war and no more than about 25 at any one time.[22] Moreover, their mission was eased greatly by the ability of the British to read the German cipher throughout most of the conflict.

6. The Defector

Almost as good as the agent-in-place and less troublesome than the whole range of double agents is the "defector with knowledge." Here the procedure consists of interrogation and validation of bona fides, as usual, but without the worrisome, ongoing requirements for a skillful mix of false and genuine documents and other logistical support. Though an agent-in-place is preferable because of the continuing useful information he can provide, often a man does not want to risk his life by staying in-place, especially where the security is sophisticated; his preference is to defect to safety. In other words, agents-in-place are harder to come by in systems like the Soviet bloc countries; defection is more likely.[23] In contrast, agents-in-place are more easily recruited in so-called Third World areas.

Within the United States, the interrogation of intelligence service defectors who have defected in the U.S. is primarily the responsibility of the FBI, though the CIA may have a follow-up session with the individual. Sometimes the bona fides of a defector remain disputed for many years.

CIA-recruited defectors abroad are occasionally brought to the United States and resettled. The FBI is notified and, after the CIA completes its interrogation, FBI may interrogate. CIA does not bring all defectors to the United States; only those expected to make a significant contribution. CIA generally handles resettlement not only of defectors from abroad, but also (at the request of the FBI) of defectors in the United States.

7. The Deception

The penetration or double agent is closely related to another important CE technique: the deception. Simply stated, the deception is an attempt to give the enemy a false impression about something, causing him to take action contrary to his own interests. Fooling

[21] Rocca deposition, 11/25/75, pp. 33–34.

[23] Bruce Solie, deposition, 11/25/75, pp. 26–27.

the Germans into the belief that D Day landings were to be in the Pas de Calais rather than in Normandy is a classic example of a successful deception operation in World War II.[24]

Deception is related to penetration because our agents operating within foreign intelligence agencies can serve as excellent channels through which misleading information can flow to the enemy. So double agents serve both as collectors of positive intelligence and channels for deception. However, there are opportunities for deception other than our own agents; in fact, "an infinite variety" exists, according to an experienced practitioner.[25] One example: the U.S. can allow penetration of its own intelligence service, and then feed false information through him.

8. Other CI Techniques

Other counterespionage operations include surreptitious surveillance of various kinds (for instance, audio, mail, physical, and "optical"—that is, photography), interrogation (sometimes incommunicado as in the case of one defector), and provocation. Decoding clandestine radio transmission and letters with messages written in secret ink between the visible lines is part and parcel of the CE trade, as is trailing suspected agents, observing "dead drops" (the exchange of material, like documents or instructions, between a spy and his handler), and photographing individuals entering opposition embassies or at other locations. At the recent funeral of CIA agent Richard Welch, two Eastern European diplomats were discovered among the press corps snapping photographs of CIA intelligence officers attending the burial ceremony.[26] Since the focus of offensive counterintelligence is disruption of the enemy service, provocation can be an important element of CE, too. It amounts, in essence, to harassment of the opposition, such as publishing the names of his agents or sending a defector into his midst who is in reality a double agent.

9. CI as Organization

Security at CIA is the responsibility of the Office of Security, a division of the Deputy Director for Administration. Counterespionage policy is guided by the Counterintelligence Staff of the Operations Directorate (Clandestine Service). Besides setting policy, the CI Staff sometimes conducts its own operations, though most CI operations emanate directly from the various geographic divisions as the CI field personnel—through the practice of the counterintelligence discipline—attempt to guard against enemy manipulation of espionage and covert action operations.

Structurally, counterintelligence services are usually composed of two additional sections which support Security and Operations. They are the Research and the Liaison sections. Good research is critical to a good counterintelligence effort, and it may take several forms. It can involve the amassing of encyclopedic intelligence on individuals, including American citizens associated—wittingly or unwitttingly—with hostile intelligence services. Specialists say that the hallmark of a sophisticated CI service is its collection of accurate records.[27] CI research personnel also produce reports on topics of interest

[24] Masterman, *Double Cross System.*
[25] CIA counterintelligence specialist (staff summary), 11/1/75.

[27] *Ibid*, 6/27/75.

to the specialty, including guidelines for the interrogation of defectors and current analyses on such subjects as proprietary companies used by foreign intelligence services and the structure of Soviet bloc intelligence services. CI researchers also analyze defector briefs and, in the case of compromised documents, help ascertain who had access and what damage was inflicted.

Liaison with other counterintelligence services, at home and abroad, is also vital since no effective counterintelligence organization can do its job alone. The various CI units at home are particularly important, as counterintelligence—with all its intricacies and deceptions—requires coordination among agencies and sharing of records. Unlike the totally unified KGB organization, the American intelligence service is fragmented and depends upon liaison to make operations more effective. Coordination between CIA and FBI counterintelligence units is especially critical since, in theory at least, the former has foreign jurisdiction and the latter domestic, yet they must monitor the movements of foreign spies in and out of these two jurisdictions. Sometimes this coordination fails dramatically. In 1970, for example, J. Edgar Hoover of the FBI terminated formal liaison with the CIA and all the other intelligence units in the Government because of a disagreement with the CIA on a question of source disclosure (the Thomas Riha case).[28]

Liaison with foreign intelligence services overseas can undergo strain, too. As one CI specialist has said: "There are no friendly services; there are services of friendly foreign powers."[29] Each service fears the other has been infiltrated by hostile agents and is reluctant to see national secrets go outside its own vaults. Nonetheless, cooperation does take place, since all intelligence services seek information and, with precautions, will take it where they can get it if it is useful.

The CIA will work with friendly services to uncover hostile intelligence operations, including illegals, directed at the government of the friendly service. For example, a CIA-recruited defector may reveal Soviet agents in a friendly foreign government. This information is shared with the friendly government, if there is proper protection of the source. Protection of the CIA source is paramount.

FBI counterespionage activities within the United States are supervised by the Counterintelligence Branch of the FBI Intelligence Division. The Branch is made up of four Sections, three of which direct field operations conducted by the Bureau's field offices. The fourth handles liaison with other agencies and supervises the FBI's Legal Attaches assigned to serve in the embassies in several foreign countries.

The formal structure for counterespionage coordination between the FBI and the military intelligence agencies was established in 1939 and embodied most recently in a "charter" for the Interdepartmental Intelligence Conference in 1964.[30] This formal body, chaired by the FBI Director and including the heads of the military intelligence agencies, has not played a significant decisionmaking role in recent years.

As late as 1974, some FBI officials took the position that the Bureau's counterespionage activities were not under the authority of the Attorney General, since the FBI was accountable in this area directly to the United States Intelligence Board and the National

[28] Staff summary of interview, former FBI liaison person with CIA, 8/22/75.

[29] Rocca deposition, 11/25/75, p. 43.

[30] Confidential memorandum from President Roosevelt to Department Heads, 6/26/39; memorandum from Attorney General Kennedy to J. Edgar Hoover, Chairman, Interdepartmental Intelligence Conference, 3/5/64.

Security Council. A Justice Department committee chaired by Assistant Attorney General Henry Petersen sharply rejected this view and declared

> There can be no doubt that in the area of foreign counterintelligence, as in all its other functions, the FBI is subject to the power and authority of the Attorney General.[31]

In recent years the FBI has taken steps to upgrade its counterespionage effort, which had been neglected because of the higher priority given to domestic intelligence in the late 60s and early 70s.[32] New career development and mid-career training programs have been instituted. FBI agents specializing in counterespionage begin their careers as criminal investigators and not as analysts; and Bureau officials stress that their role is accurate fact-finding, rather than evaluation. Nevertheless, counterespionage supervisory personnel have recently attended high-level training courses in foreign affairs and area studies outside the Bureau.[33]

Here, then, are the key elements of counterintelligence. Together they combine into a discipline of great importance, for the rock bottom obligation of an intelligence service is to defend the country; meeting this obligation is the very *raison d'être* of counterintelligence. The discipline also represents the most secret of secret intelligence activities—the heart of the onion. Its great importance and its ultra secrecy make counterintelligence an area of concern that cannot be ignored by policymakers and by those responsible for legislative oversight. As a review of current issues in CI attests, the discipline has several problems which demand the attention of those charged with the defense of the country and the reform of the intelligence community.

[31] Report of the Petersen Committee on COINTELPRO, pp. 34–35. The committee was especially concerned that the *ad hoc* equivalent of the U.S. Intelligence Board had approved the discredited "Huston Plan" in 1970. However, the committee complied with the FBI's request that it exclude from its review of domestic COINTELPRO activities the Bureau's "extremely sensitive foreign intelligence collection techniques." (Memorandum from FBI Director Kelley to Acting Attorney General Robert Bork, 12/11/73.)

[33] W. R. Wannall testimony, 1/21/76, pp. 18–22.

APPENDIX B

THE HUSTON PLAN

Editor's note: In 1970, the Nixon administration assigned a young White House aide, Tom Charles Huston, to write a report on youthful anti–Vietnam War protesters and how intelligence could be gathered about their activities. The result was a master spy plan to conduct espionage against the protesters: opening their mail, wiretapping their telephone, shadowing their every move—all without proper warrants and in violation of their first amendment rights to peaceful dissent. The major intelligence chiefs at the time approved the plan, including the DCI (Richard Helms), the FBI Director (the legendary J. Edgar Hoover), the NSA director, and the DIA director, even though the envisioned activities were in violation of the law. The plan was rescinded by President Nixon when Hoover finally decided it was too risky and complained to the President. Many of these operations went on anyway, culminating in the 1975 investigations into illegal domestic surveillance after word of the CIA's mail-opening operations leaked to the *New York Times* in 1974. The Huston Plan represents domestic counter-intelligence at the extreme, just as Iran-*contra* represents the overzealous use of covert action.

SPECIAL REPORT INTERAGENCY COMMITTEE ON INTELLIGENCE (AD HOC)[1]

CHAIRMAN J. EDGAR HOOVER

JUNE, 1970

[1] Under criteria determined by the Committee, in consultation with the White House, the Department of Defense, the Department of Justice, the Central Intelligence Agency, and the Federal Bureau of Investigation, certain materials have been deleted from those documents, some of which were previously classified, to maintain the internal operating procedures of the agencies involved, and to protect intelligence sources and methods. Further deletions were made with respect to protecting the privacy of certain individuals and groups. These deletions do not change the material content of these exhibits.

JUNE 25, 1970

This report, prepared for the President, is approved by all members of this committee and their signatures are affixed hereto.

Director, Federal Bureau of Investigation
Chairman

Director, Central Intelligence Agency

Director, Defense Intelligence Agency

Director, National Security Agency

PREFACE

The objectives of this report are to: (1) assess the current internal security threat; (2) evaluate current intelligence collection procedures; identify restraints under which U. S. intelligence services operate; and list the advantages and disadvantages of such restraints; and (3) evaluate current interagency coordination and recommend means to improve it.

The Committee has attempted to set forth the essence of the issues and the major policy considerations involved which fall within the scope of its mandate.

TABLE OF CONTENTS

PART ONE
SUMMARY OF INTERNAL SECURITY THREAT

I. Militant New Left Groups

A. ASSESSMENT OF CURRENT INTERNAL SECURITY THREAT

The movement of rebellious youth known as the "New Left," involving and influencing a substantial number of college students, is having a serious impact on contemporary society with a potential for serious domestic strife. The revolutionary aims of the New Left are apparent when their identification with Marxism-Leninism is examined. They pointedly advertise their objective as the overthrow of our system of government by force and violence. Under the guise of freedom of speech, they seek to confront all established authority and provoke disorder. They intend to smash the U. S. educational system, the economic structure, and, finally, the Government itself. New left groups do not have a large enough number of rank-and-file followers, nor dry they have a unity of purpose to carry out massive or paralyzing acts of insurrection. They do, on the other hand, have the will to carry on more militant efforts in local situations and an inclination to utilize more extreme means to attain their objectives.

1. *Student Protest Groups*. The Students for a Democratic Society (SDS) has, in the past year, split into several factions, including the Revolutionary Youth Movement (RYM), which has control over 30 chapters; and the Worker Student Alliance (WSA), which consists of 63 chapters. The WSA faction, dominated by the Progressive Labor Party (PLP), aims to build a worker-student movement in keeping with the PLP's aim of developing a broad worker-based revolutionary movement in the United States.

There are some 85 unaffiliated SDS chapters generally sympathetic to revolutionary tactics and goals. The trend of increased radical campus organizations is noticeable at campuses where recognition of SDS has been refused or rescinded and SDS members have banded together, with or without sanction, under a new title to attract student support. In addition, numerous ad hoc groups have been established on campuses and elsewhere to exploit specific issues.

The National Student Strike (NSS), also known as the National Strike Information Center, was formed following the entry of the United States forces into Cambodia and the deaths of four students at Kent State University. NSS, which helped to coordinate the nationwide student strike in May, 1970, has three regional centers and includes among its leadership SDS members and other New Left activists. The NSS has established a nationwide communications system of "ham" radio stations on campuses to encourage student demonstrations and disruptions. This communications capability may have a significant impact on campus stability in the coming school year.

The Venceremos Brigade (VB), established to send United States youth to Cuba to aid in the 1970 harvests, has continually received favorable publicity in Cuban propaganda media. To date, over 900 members of the VB have visited Cuba and another group of approximately 500 members are expected to follow suit. While in Cuba, VB members were individually photographed and questioned in detail about their backgrounds. Because of their contacts with Cuban officials, these individuals must be considered as potential recruits for Cuban intelligence activities and sabotage in the United States.

The greatest threat posed to the security of the country by student protest groups is their potential for fomenting violence and unrest on college campuses. Demonstrations have triggered acts of arson by extremists against war-oriented research and ROTC facilities and have virtually paralyzed many schools. There has been a growing number of noncampus, but student-related, acts of violence which increase tensions between "town and gown" and which constitute a marked escalation of the scope and level of protest activities. Few student protests are currently related to exclusively campus issues; virtually all involve political and social issues. Increasingly, the battlefield is the community with the campus serving primarily as a staging area.

The efforts of the New Left aimed at fomenting unrest and subversion among civil servants, labor unions, and mass media have met with very limited success, although the WSA and its parent, the PLP, have attempted through their "Summer Work-Ins" to infiltrate and radicalize labor. The inability of these groups to subvert and control the mass media has led to the establishment of a large network of underground publications which serve the dual purpose of an internal communication network and an external propaganda organ.

Leaders of student protest groups have traveled extensively over the years to communist countries; have openly stated their sympathy with the international communist revolutionary movements in South Vietnam and Cuba; and have directed others into activities which support these movements. These individuals must be considered to have potential for recruitment and participation in foreign-directed intelligence activity.

2. *Antiwar Activists*. The impetus and continuity for the antiwar movement is provided by the New Mobilization Committee to End the War in Vietnam (NMC) and the Student Mobilization Committee to End the War in Vietnam (SMC). The NMC is a coalition of numerous antiwar groups and individuals including communist "old left" elements. The SMC is under the control of the Trotskyist Socialist Workers Party (SWP).

The NMC and SMC have announced a policy of "nonexclusion" which places no limitation on the type of individuals allowed to participate in demonstrations. This policy opens the door for violence-prone individuals who want to capitalize on the activities of these groups. Both groups profess to follow a policy of nonviolence; however, the very nature of the protests that they sponsor sets the stage for civil disobedience and police confrontation by irresponsible dissident elements. Various individuals in NMC and SMC are calling for more militant protest activities, a subject to be discussed at national meetings by both groups in late June, 1970.

Although antiwar groups are not known to be collecting weapons, engaging in paramilitary training, or advocating terrorist tactics, the pro-Hanoi attitude of their leaders, the unstable nature of many NMC advocates and their policy of "nonexclusion" underscore the use of the antiwar movement as a conduit for civil disorder. This is further emphasized by the NMC leadership's advocacy of civil disobedience to achieve desired objectives.

There is no indication that the antiwar movement has made serious inroads or achieved any more than a slight degree of influence among labor unions, the mass media, and civil servants. One group, however, the Federal Employees for a Democratic Society (FEDS), offers a means of protest for recent radical graduates employed by the Federal Government.

The military and educational institutions are the prime targets of the anitwar movement. In addition to vandalism, arsons, and bombings of ROTC facilities, there has been

stepped-up activity to spread antiwar sympathy among American servicemen from within through sympathetic members in the military and from without through such programs as "GI Coffeehouses" and the proposed National GI Alliance. The increasing access by members of the military to the underground press, the establishment of servicemen's unions, and organizations which facilitate desertions, have contributed significantly to the increasing instances of dissent in the military services.

NMC and SMC leaders are constantly speaking before student groups and endeavoring to use student radicals to further the antiwar movement. They have called for an end to the ROTC and have demonstrated, often violently, to force universities to halt war-related research projects.

The NMC maintains close contact with the World Council for Peace and Stockholm Conference on Vietnam. A new organization dominated by NMC leaders, the Committee of Liaison with Families of Servicemen Detained in North Vietnam, emerged in January, 1970, after contacts with North Vietnamese representatives. It attempts to present a favorable picture of North Vietnamese treatment of American prisoners of war.

NMC leaders have frequently traveled abroad. It is therefore necessary to consider these individuals as having potential for engaging in foreign-directed intelligence collection.

The Central Intelligence Agency (CIA), in its analysis of bloc intelligence, is of the view that the Soviet and bloc intelligence services are committed at the political level to exploit all domestic dissidents wherever possible. This attack is being conducted through recruited agents, agents of influence, and the use of front groups. It is established bloc policy to deploy its forces against the United States as "the main enemy" and to direct all bloc intelligence forces toward ultimately political objectives which disrupt U. S. domestic and foreign policies.

3. *New Left Terrorist Groups*. The Weatherman terrorist group, which emerged from a factional split of SDS during the Summer of 1969, is a revolutionary youth movement which actively supports the revolutionary leadership role of the Negro in the United States. It has evolved into a number of small commando-type units which plan to utilize bombings, arsons, and assassinations as political weapons.

There has been evidence of Weatherman involvement in terrorist tactics, including the accidental explosion of a "Weatherman bomb factory" in New York City on March 6, 1970; the discovery of two undetonated bombs in Detroit police facilities on the same date; and the blast at New York City police installations on June 9, 1970.

While Weatherman membership is not clearly defined, it is estimated that at least 1,000 individuals adhere to Weatherman ideology. In addition, groups such as the White Panther Party, Running Dog, Mad Dog, and the Youth International Party (Yippies) are supporters of Weatherman terrorism but have no clearly definable ideology of their own.

Adherents to Weatherman ideology are also found within radical elements on campuses, among those living in off-campus communes, among New Left movement lawyers and doctors, and the underground press. Individuals who adhere to the Weatherman ideology have offered support and aid to hard-core Weatherman members, including 21 Weatherman members currently in hiding to avoid apprehension.

They identify themselves politically with North Vietnam, Cuba, and North Korea and consider pro-Soviet and pro-Chinese organizations as being aligned with imperialist

powers. In addition, some of the Weatherman leaders and adherents have traveled to communist countries or have met in Western countries with communist representatives.

Weatherman leaders and other members of terrorist groups are not known at this time to be involved in foreign-directed intelligence collection activity. The fugitive and underground status of many of these people, as well as their involvement in activities which would likely bring them to the attention of American authorities, would be a deterrent to contacts by foreign intelligence organizations.

B. ASSESSMENT OF CURRENT INTELLIGENCE COLLECTION PROCEDURES

1. *Scope and Effectiveness of Current Coverage.* Although New Left groups have been responsible for widespread damage to ROTC facilities, for the halting of some weapons-related research, and for the increasing dissent within the military services, the major threat to the internal security of the United States is that directed against the civilian sector of our society.

Coverage of student groups is handled primarily through live informants and it is generally effective at the national level or at major meetings of these groups where overall policy, aims, and objectives of the groups are determined.

The antiwar movement's activities are covered through the FBI by live informants in all organizations of interest. This is supported by information furnished by all members of the intelligence community and other Federal, state, and local agencies. Key leaders and activists are afforded concentrated and intensified investigative coverage on a continuing basis and, in situations where there are positive indications of violence, electronic surveillances have been implemented on a selective basis. Informant and electronic coverage does not meet present requirements.

Although several SDS chapters on college campuses which adhere to Weatherman ideology have been penetrated by live informants, there is no live informant coverage at present of underground Weatherman fugitives. There is electronic coverage on the residence of a Weatherman contact in New York City and on the residence of an alleged Weatherman member in San Francisco; however, no information has been developed concerning the whereabouts of the 21 Weatherman fugitives.

2. *Gaps in Current Coverage.* Established, long-term coverage is not available within student protest groups due to the fact that the student body itself changes yearly, necessitating a constant turnover in the informants targeted against these groups. His idealism and immaturity, as well as thee sensitive issues of academic freedom and the right to dissent, all serve to increase the risk that the student informant will be exposed as such.

Generally, day-to-day coverage of the planned activities of student protest groups, which are somewhat autonomous and disjointed, could be strengthened. Advance notice of foreign travel by student militants is particularly needed. Campus violence is generally attributable to small, close-knit extremist groups among radical students. Coverage of these latter groups is minimal.

The antiwar movement is comprised of a great many organizations and people which represent varied political, moral and ethnic beliefs. Current manpower commitments preclude optimum coverage of all antiwar activities on a day-to-day basis.

Existing coverage of New Left extremists, the Weatherman group in particular, is negligible. Most of the Weatherman group has gone underground and formed floating,

commando-type units composed of three to six individuals. The transitory nature of these units hinders the installation of electronic surveillances and their smallness and distrust of outsiders make penetration of these units through live informants extremely difficult.

Financially, the Weatherman group appears to be without a centralized source of funds. Wealthy parents have furnished funds to some of these individuals, including those in a fugitive status. Many members have also been involved in the thefts of credit and identification cards, as well as checks, and have utilized them for obtaining operating expenses.

3. *Possible Measures to Improve Intelligence Collection.* To establish effective coverage of student protest groups would require the expansion of live informant coverage of individual campus chapters of these organizations. This would entail extensive use of student informants to obtain maximum utilization of their services for the periods of their college attendance.

Because of the great number of individuals and groups in the antiwar movement, an increase in the manpower assigned to these investigations would facilitate more intensive coverage. In addition there are several key leaders involved in virtually all antiwar activities, including international contacts, against whom electronic surveillances and mail covers would be particularly effective.

Improvement of intelligence gathering against New Left terrorists depends on a combination of live informant coverage among key leaders and selective electronic surveillances. Because of the nature of the Weatherman groups, live informant coverage will most likely result through the defection of a key leader.

Extensive efforts have been undertaken which should produce of live informant capable of furnishing information as to the location of Weatherman fugitives and planned terrorist acts. In the event a commune is located, prompt installation of electronic coverage should produce similar results. Utilization of additional resources to expand and intensify this collection would be beneficial.

II. Black Extremist Movement

A. ASSESSMENT OF CURRENT INTERNAL SECURITY THREAT

1. *Black Panther Party*. The most active and dangerous black extremist group in the United States is the Black Panther Party (BPP). Despite its relatively small number of hard-core members—approximately 800 in 40 chapters nationwide—the BPP is in the forefront of black extremist activity today. The BPP has publicly advertised its goals of organizing revolution, insurrection, assassination and other terrorist-type activities. Moreover, a recent poll indicates that approximately 25 percent of the black population has a great respect for the BPP, including 43 percent of blacks under 21 years of age.

The Panther newspaper has a current circulation of approximately 150,000 copies weekly. Its pages are filled with messages of racial hatred and call for terrorist guerrilla activity in an attempt to overthrow the Government. The BPP has been involved in a substantial number of planned attacks against law enforcement officers, and its leadership is composed in large part of criminally inclined, violence-prone individuals.

Weapons are regularly stockpiled by the Party. During 1968 and 1969, quantities of machine guns, shotguns, rifles, hand grenades, homemade bombs, and ammunition were uncovered in Panther offices.

2. *New Left Support for BPP*. The BPP has received increasing support from radical New Left elements. During 1970, the BPP formed a working relationship with radical student dissenters by injecting the issue of Government "repression" of Panthers into the antiwar cause. Students for a Democratic Society (SDS) supported the BPP in a 1969 "united front against fascism." The probability that black extremists, including the BPP, will work closely with New Left white radicals in the future increases the threat of escalating terrorist activities. It would be safe to project that racial strife and student turmoil fomented by black extremists will definitely increase.

3. *BPP Propaganda Appearances*. Despite its small membership, the BPP has scored major successes in the propaganda arena. In 1969, BPP representatives spoke at 189 colleges throughout the Nation, while in 1967 there were only 11 such appearances. Although no direct information has been received to date indicating that the BPP has initiated any large-scale racial disorders, the year 1970 has seen an escalation of racial disorders across the Nation compared to 1969. This fact, coupled with an increasing amount of violent Panther activity, presents a great potential for racial and civil unrest for the future.

4. *Appeal to Military.* The BPP has made pointed appeals to black servicemen with racist propaganda. High priority has been placed on the recruitment of veterans with weapons and explosives training. The BPP has also called for infiltration of the Government. These activities, should they achieve even minimum success, present a grave threat.

5. *BPP Philosophy and Foreign Support.* The BPP relies heavily on foreign communist ideology to shape its goals. Quotations from Mao Tse-tung were the initial ideological bible of the BPP. Currently, the writings of North Korean Premier Kim II-sung are followed and extensive use of North Korean propaganda material is made in BPP publications and training. The Marxist-oriented philosophy of the BPP presents a favorable environment for support of the Panthers from other communist countries.

BPP leaders have traveled extensively abroad including visits to Cuba, Russia, North Korea, and Algeria. International operations of the BPP are directed by Eldridge Cleaver, a fugitive from United States courts. Cleaver has established an international staff in Algeria, from where communist propaganda is constantly relayed to the BPP headquarters in Berkeley, California. He has also established close ties with Al Fatah, an Arab guerrilla organization, whose leaders have reportedly extended invitations to BPP members to take guerrilla training during 1970. Cleaver, in a recent conversation, indicated that North Koreans are conducting similar training for BPP members. Radical white students in Western Europe and the Scandinavian countries have organized solidarity committees in support of the BPP. These committees are the sources of financial contributions to the Party and provide outlets for the BPP newspaper.

6. *Other Black Extremist Groups.* The Nation of Islam (NOI) is the largest single black extremist organization in the United States with an estimated membership of 6,000 in approximately 100 Mosques. The NOI preaches hatred of the white race and advocates separatism of the races. The NOI as a group has, to date, not instigated any civil disorders; however, the followers of this semi-religious cult are extremely dedicated individuals who could be expected to perform acts of violence if so ordered by the NOI head, Elijah Muhammed. When Muhammed, who is over 70 years of age, is replaced, a new leader could completely alter current nonviolent tactics of the organization. For example, Muhammed's son-in-law, Raymond Sharrieff, now among the top hierarchy of NOI, could rise to a leadership position. Sharrieff is vicious, domineering, and unpredictable.

There are numerous other black extremist organizations, small in numbers, located across the country. There is also a large number of unaffiliated black extremists who advocate violence and guerrilla warfare. One particular group, the Republic of New Africa (RNA), headquartered in Detroit, Michigan, calls for the establishment of a separate black nation in the South to be protected by armed forces. These groups, although small, are dedicated to the destruction of our form of government and consequently present a definite potential for instigating civil disorder or guerrilla warfare activity.

7. *Black Student Extremist Influence.* Black student extremist activities at colleges and secondary schools have increased alarmingly. Although currently there is no dominant leadership, coordination or specific direction between these individuals, they are in frequent contact with each other. Consequently, should any type of organization or cohesiveness develop, it would present a grave potential for future violent activities at United States schools. Increased informant coverage would be particularly productive in this area. Black student extremists have frequently engaged in violence and disruptive activity on campuses. Major universities which made concessions to nonnegotiable black student demands have not succeeded in calming extremist activities. During the school year 1969–70, there were 227 college disturbances having racial overtones. There were 530 such disturbances in secondary schools compared with only 320 during the previous school year.

8. *Foreign Influence in the Black Extremist Movement.* Although there is no hard evidence indicating that the black extremist movement is substantially controlled or directed by foreign elements, there is a marked potential for foreign-directed intelligence or

subversive activity among black extremist leaders and organizations. These groups are highly susceptible to exploitation by hostile foreign intelligence services.

Currently the most important foreign aspect of the black extremist movement is the availability of foreign asylum, especially with regard to black extremists subject to criminal prosecution in the United States. Some foreign countries, such as Cuba, provide a temporary safe haven for these individuals. Information has been received that passports and funds for travel have also been furnished by countries such as Cuba, North Korea, [still-classified section missing here] and Communist intelligence services do not, at present, play a major role in the black extremist movement; however, all such services have established contact with individual black militants. Thus, the penetration and manipulation of black extremist groups by these intelligence services remain distinct possibilities. Communist intelligence services are capable of using their personnel, facilities, and agent assets to work in the black extremist field. The Soviet and Cuban services have major capabilities available.

B. ASSESSMENT OF CURRENT INTELLIGENCE COLLECTION PROCEDURES

There are some definite gaps in the current overall intelligence penetration of the black extremist movement. For example, although there appears to be sufficient live informant coverage of the BPP [still-classified section missing here] additional penetration [still-classified section missing here] is needed. High echelon informant coverage could conceivably prevent violence, sabotage, or insurrection if such activity was planned by BPP leadership. Insufficient coverage of [still-classified section missing here] BPP is offset to some extent by technical coverage [still-classified section missing here]. Penetration of leadership levels has been hindered in part by current BPP policies which prevent rank-and-file members from advancing to leadership roles.

Improvement in coverage of BPP financial activities could be made, particularly with regard to sources of funds and records. Information received to date indicates that financial support for the BPP has been furnished by both foreign individuals and domestic sources. Thus, a deeper penetration and correlation of foreign and domestic information received is essential to a full determination of BPP finances. Coverage of BPP finances has been hampered by fact that BPP leaders handle financial matters personally.

In view of the increased amount of foreign travel and contacts by BPP leaders abroad, there is a clear-cut need for more complete coverage of foreign involvement in BPP activities.

1. *Other Black Extremist Organizations.* Informant coverage of the NOI is substantial, enabling its activities to be followed on a current basis. Coverage of militant black student groups and individuals is very limited because of the sensitive areas involved. An effective source of such coverage would be reliable, former members of the Armed Forces presently attending college. Live informant coverage, particularly with respect to the activities and plans of unaffiliated black militants, needs to be increased. More sources both in the United States and abroad in a position to determine the amount of foreign involvement in black extremist activities need to be developed. Maximum use of communication interceptions would materially increase the current capabilities of the intelligence community to develop highly important data regarding black extremist activities.

III. Intelligence Services of Communist Countries

A. ASSESSMENT OF CURRENT INTERNAL SECURITY THREAT

The threat posed by the communist intelligence services must be assessed in two areas: (1) direct intervention in fomenting and/or influencing domestic unrest; (2) extensive espionage activities.

Taken in complete context, these services constitute a grave threat to the internal security of the United States because of their size, capabilities, widespread spheres of influence, and targeting of the United States as "enemy number one." The largest and most skilled of these services is the Soviet Committee for State Security (KGB) which has roughly 300,000 personnel of whom some 10,000 are engaged in foreign operations.

1. *Intervention in Domestic Unrest.* There have been no substantial indications that the communist intelligence services have actively fomented domestic unrest. Their capability cannot, however, be minimized and the likelihood of their initiating direct intervention would be in direct relationship to the deterioration of the political climate and/or imminence of hostilities. The ingredients for a first-rate capability are present, including both the personnel and the ingrained philosophy and know-how for using such tactics.

Communist intelligence has shown a real capability to foment disorder in a number of trouble spots. The dissidence and violence in the United States today present adversary intelligence services with opportunities unparalleled for forty years. While fostering disorder and rebellion through communist parties and fronts is a potent weapon in the communist arsenal, their past success has been evident in clandestine recruitment efforts on campuses during times of unrest. H. A. R. (Kim) Philby, Guy Burgess, and Donald Maclean were all students at Cambridge during the depression period of the 1930's and were in the vanguard of what was then the New Left. Their recruitment and cooperation with Soviet intelligence wreaked havoc on British intelligence, and also compromised U. S. security in those sectors where they had authorized access.

[still-classified section missing here] For instance, about 900 members of the Venceremos Brigade, a group of American youths, recently completed a round trip to Cuba. This travel was financed by the Cuban Government. While in Cuba, they were exhorted to actively participate in United States revolutionary activities upon their return to the United States. [still-classified section missing here]

A sabotage manual, prepared in [still-classified section missing here] turned up in the hands of individuals responsible for recent bombings [still-classified section missing here]. While the potential for widespread, well-organized incidents of violence generated and controlled by the Cuban intelligence service is considered minimal, isolated occurrences of this nature must be considered probable. The [still-classified section missing here] services appear to have assumed the passive roles of observers and reporters.

The communist intelligence services maintain contacts and exert influence among a variety of individuals and organizations through the exploitation of ideological, cultural, and ethnic ties. Most of these liaisons are maintained with some degree of openness with individuals associated with the Communist Party, USA, various of its front groups, other pro-Soviet organizations, nationality groups, and foreign-language newspapers. These contacts are exploited as sources for and propaganda outlets of communist intelligence services. Regarded individually, these efforts cannot be considered a major threat to our

internal security; however, in total, they represent a sizable element of our population which can be influenced in varying degrees by communist intelligence service operations.

2. *Intelligence Operations.* Persistent and pervasive intelligence operations which have their inspiration and direction supplied by communist intelligence services represent a major threat to the internal security.

B. ASSESSMENT OF CURRENT INTELLIGENCE COLLECTION

1. *Scope and Effectiveness.* The scope of overall intelligence efforts is encompassed in the threefold goals of penetration, intelligence, and prosecution. Domestic implementation of these goals is delimited by agreement among United States intelligence agencies. Intelligence components of the United States military services are immediately concerned with protecting the integrity of their personnel and installations. [still-classified section missing here]

Methods used in these endeavors, employed in varying degrees by U.S. intelligence agencies dependent upon their specific tasks are: penetrations; defectors; double agent operations; physical, technical, and photographic surveillances; examination and analysis of overt publications; information supplied by friendly intelligence services; and COMINT.

2. *Gaps in Current Coverage* [still-classified section missing here]

IV. Other Revolutionary Groups

A. ASSESSMENT OF CURRENT INTERNAL SECURITY THREAT

1. *Communist Party*. The Communist Party continues as a distinct threat to the internal security because of its extremely close ties and total commitment to the Soviet Union. There are many thousands of people in the United States who adhere to a Marxist philosophy and agree with the basic objectives of the Communist Party although they do not identify themselves specifically with the organization. The Party receives most of its finances from the Soviet Union, adheres to Soviet policies explicitly, and provides a major outlet for Soviet propaganda. The Party will without question continue to implement whatever orders it receives from the Soviets in the future.

There is little likelihood that the Communist Party, USA, will instigate civil disorders or use terrorist tactics in the foreseeable future. Its strong suit is propaganda. Through its publications and propaganda it will continue its efforts to intensify civil disorders, and foment unrest in the Armed Forces, labor unions, and minority groups. The Party is on the periphery of the radical youth movement and is striving to strengthen its role in this movement and to attract new members through a recently formed youth organization, but it does not appear this group will achieve any substantial results for the Party in the future.

2. *Socialist Workers Party and Other Trotskyist Groups.* These organizations have an estimated membership of [still-classified section missing here] The major Trotskyist organization, the Socialist Workers Party, has attained an influential role in the antiwar movement through its youth affiliate, the Young Socialist Alliance, which dominates the Student Mobilization Committee to End the War in Vietnam and which has more than doubled its size on college campuses in the past year. Trotskyist groups have participated in major confrontations with authorities both on and off campuses and have consistently supported civil disorders. At this time they do not pose a major threat to instigate insurrection or to commit terrorist acts. The propaganda of these groups, while emphasizing student unrest, is also aimed at creating dissatisfaction in labor organizations and in the Armed Forces. The Trotskyist organizations maintain close relations with the Fourth International, a foreign-based worldwide Trotskyist movement.

4. *Puerto Rican Nationalist Extremist Groups.* The radical Puerto Rican independence movement has spawned approximately ten violently anti-American groups committed to Puerto Rican self-determination. Revolutionary violence is a major aim of the estimated [still-classified section missing here] members of these groups and if sufficiently strong, they would not hesitate to mount armed insurrection. Since July, 1967, some 130 bombings in Puerto Rico and in the New York City area have been attributed to these extremists. American-owned businesses have been the main targets, but there has been a recent upsurge of violence against U.S. defense facilities in Puerto Rico.

B. ASSESSMENT OF CURRENT INTELLIGENCE COVERAGE

1. *Scope and Effectiveness*. Coverage of the Communist [still-classified section missing here]

Coverage of theTrotskyist and [still-classified section missing here] groups [still-classified section missing here]

Current live informant coverage can furnish information on the general activities of these groups and it should serve to warn of policy changes in favor of insurrection or sabotage.

Informant penetration of the Puerto Rican independence groups provides information on the objectives of most of these organizations as well as the identities of their members. However, these sources have limited ability to provide advance information regarding violence committed by these groups or by individual members.

2. *Gaps in Current Coverage.* [still-classified section missing here]

Closer coverage at the policy-making levels of the Puerto Rican independence groups is needed to obtain more comprehensive information on persons involved in terrorist activities. The small memberships of many of these organizations is a major reason for the limited coverage.

3. *Possible Measures to Improve Intelligence Collection.* The selective use of electronic surveillances would materially enhance the intelligence coverage of the policy-making levels of these organizations. A particular benefit of electronic surveillance in the Puerto Rican field could be the development of information identifying persons involved in terrorist activities. Communications intelligence coverage and travel control measures could be improved to provide greater awareness of the travel and other activities of individuals of security interest. Through the establishment of additional informant coverage on college campuses, the involvement of these organizations in the radicalization of students could be assessed with increased accuracy.

PART TWO
RESTRAINTS ON INTELLIGENCE COLLECTION

The Committee noted that the President had made it clear that he desired full consideration be given to any regulations, policies, or procedures which tend to limit the effectiveness of domestic intelligence collection. The Committee further noted that the President wanted the pros and cons of such restraints clearly set forth so that the President will be able to decide whether or not a change in current policies, practices, or procedures should be made.

During meetings of the Committee, a variety of limitations and restraints were discussed. All of the agencies involved, Defense Intelligence Agency (DIA), the three military counterintelligence services, the Central Intelligence Agency (CIA), the National Security Agency (NSA), and the Federal Bureau of Investigation (FBI), participated in these considerations.

In the light of the directives furnished to the Committee by the White House, the subject matters hereinafter set forth were reviewed for the consideration and decision of the President.

I. Specific Operational Restraints

A. INTERPRETIVE RESTRAINT ON COMMUNICATIONS INTELLIGENCE

Preliminary Discussion

Nature of Restriction

Advantages of Maintaining Restriction

Advantages of Relaxing Restriction
[still-classified section missing here]

B. ELECTRONIC SURVEILLANCES AND PENETRATIONS

Preliminary Discussion

The limited number of electronic surveillances and penetrations substantially restricts the collection of valuable intelligence information of material importance to the entire intelligence community.

Nature of Restrictions

Electronic surveillances have been used on a selective basis. Restrictions, initiated at the highest levels of the Executive Branch, arose as a result of the condemnation of these techniques by civil rights groups, Congressional concern for invasion of privacy, and the possibility of their adverse effect on criminal prosecutions.

Advantages of Maintaining Restrictions

1. Disclosure and embarrassment to the using agency and/or the United States is always possible since such techniques often require that the services or advice of outside personnel be used in the process of installation.

2. [still-classified section missing here]

3. Certain elements of the press in the United States and abroad would undoubtedly seize upon disclosure of electronic coverage in an effort to discredit the United States.

4. The monitoring of electronic surveillances requires considerable manpower and, where foreign establishments are involved, the language resources of the agencies could be severely taxed.

Advantages of Relaxing Restrictions

1. The U. S. Government has an overriding obligation to use every available scientific means to detect and neutralize forces which pose a direct threat to the Nation.

2. Every major intelligence service in the world, including those of the communist bloc, use such techniques as an essential part of their operations, and it is believed the general public would support their use by the United States for the same purpose.

3. The President historically has had the authority to act in matters of national security. In addition, Title III of the Omnibus Crime Control and Safe Streets Act of 1968 provides a statutory basis.

4. Intelligence data from electronic coverage is not readily obtainable from other techniques or sources. Such data includes information which might assist in formulating foreign policy decisions, information leading to the identification of intelligence and/or espionage principals and could well include the first indication of intention to commit hostile action against the United States.

5. Acquisition of such material from COMINT without benefit of the assistance which electronic surveillance techniques can provide, if possible at all, would be extremely expensive. Therefore, this approach could result in considerable dollar savings compared to collection methods.

DECISION: Electronic Surveillances and Penetrations

_____ Present procedures should be changed to permit intensification of coverage of individuals and groups in the United States who pose a major threat to the internal security.

_____ Present procedures should be changed to permit intensification of coverage [still-classified section missing here].

_____ More information is needed.

NOTE: The FBI does not wish to change its present procedure of selective coverage on major internal security threats as it believes this coverage is adequate at this time. The FBI would not oppose other agencies seeking authority of the Attorney General for coverage required by them and thereafter instituting such coverage themselves.

C. MAIL COVERAGE

Preliminary Discussion

The use of mail covers can result in the collection of valuable information relating to contacts between U. S. nationals and foreign governments and intelligence services. CIA and the military investigative agencies have found this information particularly helpful in the past. Essentially, there are two types of mail coverage: routine coverage is legal, while the second—covert coverage—is not. Routine coverage involves recording information from the face of envelopes. It is available, legally, to any duly authorized Federal or state investigative agency submitting a written request to the Post Office Department and has been used frequently by the military intelligence services. Covert mail coverage, also known as "sophisticated mail coverage," or "flaps and seals," entails surreptitious

screening and may include opening and examination of domestic or foreign mail. This technique is based on high-level cooperation of top echelon postal officials.

Nature of Restrictions

Covert coverage has been discontinued while routine coverage has been reduced primarily as an outgrowth of publicity arising from disclosure of routine mail coverage during legal proceedings and publicity afforded this matter in Congressional hearings involving accusations of governmental invasion of privacy.

Advantages of Maintaining Restrictions

Routine Coverage:

1. Although this coverage is legal, charges of invasion of privacy, no matter how ill-founded, are possible.
2. This coverage depends on the cooperation of rank-and-file postal employees and is, therefore, more susceptible to compromise.

Covert Coverage:

1. Coverage directed against diplomatic establishments, if disclosed, could have adverse diplomatic repercussions.
2. This coverage, not having sanction of law, runs the risk of any illicit act magnified by the involvement of a Government agency.
3. Information secured from such coverage could not be used for prosecutive purposes.

Advantages of Relaxing Restrictions

Routine Coverage:

1. Legal mail coverage is used daily by both local and many Federal authorities in criminal investigations. The use of this technique should be available to permit coverage of individuals and groups in the United States who pose a threat to the internal security.

Covert Coverage:

1. High-level postal authorities have, in the past, provided complete cooperation and have maintained full security of this program.
2. This technique involves negligible risk of compromise. Only high echelon postal authorities know of its existence, and personnel involved are highly trained, trustworthy, and under complete control of the intelligence agency.
3. This coverage has been extremely successful in producing hard-core and authentic intelligence which is not obtainable from any other source. An example is a case involving the interception of a letter to a [still-classified section missing here] establishment in [still-classified section missing here] The writer offered to sell information to the [still-classified section missing here] and enclosed a sample of information available to him. Analysis determined that the writer could have given [still-classified section missing here] information which might have been more damaging.

DECISION: Mail Coverage

_____ Present restrictions on both types of mail coverage should be continued.
_____ Restrictions on legal coverage should be removed.

_____ Present restrictions on covert coverage should be relaxed on selected targets of priority foreign intelligence and internal security interest.

_____ More information is needed.

NOTE: The FBI is opposed to implementing any covert mail coverage because it is clearly illegal and it is likely that, if done, information would leak out of the Post Office to the press and serious damage would be done to the intelligence community. The FBI has no objection to legal mail coverage providing it is done on a carefully controlled and selective basis in both criminal and security matters.

D. SURREPTITIOUS ENTRY

Preliminary Discussion [still-classified section missing here]

Nature of Restrictions

Use of surreptitious entry, also referred to as "anonymous sources" and "black bag jobs," has been virtually eliminated. [still-classified section missing here]

Advantages of Maintaining Restrictions

1. The activity involves illegal entry and trespass.
2. Information which is obtained through this technique could not be used for prosecutive purposes.
3. The public disclosure of this technique would result in widespread publicity and embarrassment. The news media would portray the incident as a flagrant violation of civil rights

Advantages of Relaxing Restrictions

1. Operations of this type are performed by a small number of carefully trained and selected personnel under strict supervision. The technique is implemented only after full security is assured. It has been used in the past with highly successful results and without adverse effects.
2. Benefits accruing from this technique in the past have been innumerable [still-classified section missing here].
3. In the past this technique, when used against subversives, has produced valuable intelligence material.

DECISION: Surreptitious Entry

_____ Present restrictions should be continued.

_____ Present restrictions should be modified to permit procurement

_____ Present restrictions should also be modified to permit selective use of this technique against other urgent and high priority internal security targets.

_____ More information is needed.

NOTE: The FBI is opposed to surreptitious entry [still-classified section missing here]

E. DEVELOPMENT OF CAMPUS SOURCES

Preliminary Discussion

Public disclosure of CIA links with the National Student Association and the subsequent issuance of the Katzenbach Report have contributed to a climate adverse to

intelligence-type activity on college campuses and with student-related groups. It should be noted that the Katzenbach Report itself does not specifically restrain CIA from developing positive or counterintelligence sources to work on targets abroad.

Restrictions currently in force limit certain other elements of the intelligence community access to some of the most troublesome areas: campuses, college faculties, foreign and domestic youth groups, leftist journalists, and black militants. It is recognized that these are prime targets of communist intelligence services and that the opportunity for foreign communist exploitation increases in proportion to the weakness of a U.S. counterintelligence effort.

Nature of Restrictions

The need for great circumspection in making contacts with students, faculty members, and employees of institutions of learning is widely recognized. However, the requirements of the intelligence community for increased information in this area is obvious from the concern of the White House at the absence of hard information about the plans and programs of campus and student-related militant organizations. At the present time no sources are developed among secondary school students and, with respect to colleges and universities, sources are developed only among individuals who have reached legal age, with few exceptions. This policy is designed to minimize the possibility of embarrassment and adverse publicity, including charges of infringement of academic freedom.

Advantages of Maintaining Restrictions

1. Students, faculty members, and others connected with educational institutions are frequently sensitive to and hostile towards any Government activity which smacks of infringement on academic freedom. They are prone to publicize inquiries by governmental agencies and the resulting publicity can often be misleading in portraying the Government's interest.

2. Students are frequently immature and unpredictable. They cannot be relied on to maintain confidences or to act with discretion to the same extent as adult sources.

Advantages of Relaxing Restrictions

1. To a substantial degree, militant New Left and antiwar groups in the United States are comprised of students, faculty members, and others connected with educational institutions. To a corresponding degree, effective coverage of these groups and activities depends upon development of knowledgeable sources in the categories named. In this connection, the military services have capabilities which could be of value to the FBI.

2. Much of the violence and disorders which have occurred on college campuses have been of a hastily planned nature. Unless sources are available within the student bodies, it is virtually impossible to develop advance information concerning such violence.

3. The development of sources among students affiliated with New Left elements affords a unique opportunity to cultivate informant prospects who may rise to positions of leadership in the revolutionary movement or otherwise become of great long-range value.

4. The extraordinary and unprecedented wave of destruction which has swept U. S. campuses in the past several months and which in some respects represents a virtual effort to overthrow our system provides a clear justification for the development of campus informants in the interest of national security.

5. Contacts with students will make it possible to obtain information about travel abroad by U. S. students and about attendance at international conferences.

DECISION: Development of Campus Sources

_____ Present restrictions on development of campus and student-related sources should be continued.

_____ Present restrictions should be relaxed to permit expanded coverage of violence-prone campus and student-related groups.

_____ CIA coverage of American students (and others) traveling abroad or living abroad should be increased.

_____ More information is needed.

NOTE: The FBI is opposed to removing any present controls and restrictions relating to the development of campus sources. To do so would severely jeopardize its investigations and could result in leaks to the press which would be damaging and which could result in charges that investigative agencies are interfering with academic freedom.

F. USE OF MILITARY UNDERCOVER AGENTS

Preliminary Discussion

The use of undercover agents by the military services to develop domestic intelligence is currently limited to penetration of organizations whose membership includes military personnel and whose activities pose a direct threat to the military establishment. For example, although the Navy has approximately 54 Naval ROTC units and numerous classified Government contract projects on various campuses across the country, the Naval Investigative Service conducts no covert collection on college campuses. The same is true of the other military services.

Nature of Restrictions

The use of undercover agents by the military investigative services to develop domestic intelligence among civilian targets is believed beyond the statutory intent of the Congress as expressed in Title 10, U. S. Code, and in current resource authorizations. The Delimitations Agreement (1949 agreement signed by the FBI, Army, Navy and Air Force which delimits responsibility for each agency with regard to investigations of espionage, counterespionage, subversion and sabotage) reflects the current missions of the FBI and the military services. Further, there is a lack of assets to undertake this mission unless essential service-related counterintelligence missions are reduced. There is also concern for morale and disciplinary reactions within the services should the existence of such covert operations become known.

Advantages of Maintaining Restrictions

1. If the utilization of military counterintelligence in this mission is contrary to the intent of the Congress, discovery of employment may result in unfavorable legislation and further reductions in appropriations.

2. Lacking direct statutory authority, the use of the military services in this mission could result in legal action directed against the Executive Branch.

3. The use of military personnel to report on civilian activities for the benefit of civilian agencies will reduce the ability of the military services to meet service-connected intelligence responsibilities.

4. If expansion of the mission of the military services with regard to college campuses is to provide coverage of any significance, it will require corollary increases in resources.

5. Prosecutions for violations of law discovered in the course of military penetration of civilian organizations must be tried in civil courts. The providing of military witnesses will require complicated interdepartmental coordination to a much greater extent than the present and will serve, in the long run, to reduce security.

6. Disclosure that military counterintelligence agencies have been furnishing information obtained through this technique to nonmilitary investigative agencies with respect to civilian activities would certainly result in considerable adverse publicity. The Army's recent experience with former military intelligence personnel confirms this estimate. Since obligated service officers, first enlistees and draftees are drawn from a peer group in which reaction is most unfavorable, morale and disciplinary problems can be anticipated.

Advantages of Relaxing Restrictions

1. Lifting these restrictions would expand the scope of domestic intelligence collection efforts by diverting additional manpower and resources for the collection of information on college campuses and in the vicinity of military installations.

2. The use of undercover agents by the military counterintelligence agencies could be limited to localized targets where the threat is great and the likelihood of exposure minimal. Moreover, controlled use of trusted personnel leaving the service to return to college could expand the collection capabilities at an acceptable risk.

3. The military services have a certain number of personnel pursuing special academic courses on campuses and universities. Such personnel, who in many instances have already been investigated for security clearance, would represent a valuable pool of potential sources for reporting on subversive activities of campus and student-related groups.

DECISION: Use of Military Undercover Agents

_____ Present restrictions should be retained.

_____ The counterintelligence mission of the military services should be expanded to include the active collection of intelligence concerning student-related dissident activities, with provisions for a close coordination with the FBI.

_____ No change should be made in the current mission of the military counterintelligence services; however, present restrictions should be relaxed to permit the use of trusted military personnel as FBI assets in the collection of intelligence regarding student-related dissident activities.

_____ More information is needed.

NOTE: The FBI is opposed to the use of any military undercover agents to develop domestic intelligence information because this would be in violation of the Delimitations Agreement. The military services, joined by the FBI, oppose any modification of the Delimitations Agreement which would extend their jurisdiction beyond matters of interest to the Department of Defense.

II. Budget and Manpower Restrictions

The capability of member agencies, NSA, CIA, DIA, FBI, and the military counterintelligence services, to collect intelligence data is limited by available resources, particularly in terms of budget and/or qualified manpower. For some agencies fiscal limitations or recent cutbacks have been acute. Budgetary requirements for some agencies, other than the FBI, are reviewed and passed upon by officials who, in some instances, may not be fully informed concerning intelligence requirements.

The military services noted that cuts in budget requirements for counterintelligence activities have the effect of severely hampering the ability of these services to accomplish missions relating to coverage of threats to the national security. Budgetary deficiencies have occurred at a time when investigative work loads are increasing significantly.

Manpower limitations constitute a major restriction on the FBI's capabilities in the investigation of subversive activities. The problem is further complicated by the fact that, even if substantial numbers of Agents could be recruited on a crash basis, the time required to conduct background investigations and to provide essential training would mean several months' delay in personnel being available for use against the rapidly escalating subversive situation.

In the event, as a result of this report, additional collection requirements should be levied on the agencies involved, it would be necessary to provide for essential funding. For example, [still-classified section missing here]

DECISION: Budget and Manpower Restrictions

_____ Each agency should submit a detailed estimate as to projected manpower needs and other costs in the event the various investigative restraints herein are lifted.

_____ Each agency must operate within its current budgetary or manpower limitations, irrespective of action required as result of this report.

_____ More information is needed.

PART THREE
EVALUATION OF INTERAGENCY COORDINATION

I. Current Procedures to Effect Coordination

There is currently no operational body or mechanism specifically charged with the overall analysis, coordination, and continuing evaluation of practices and policies governing the acquisition and dissemination of intelligence, the pooling of resources, and the correlation of operational activities in the domestic field.

Although a substantial exchange of intelligence and research material between certain of the interested agencies already exists, much remains to be done in the following areas: (1) the preparation of coordinated intelligence estimates in a format useful for policy formulation; (2) the coordination of intelligence collection resources of the member agencies and the establishment of clear-cut priorities for the various agencies; and (3) the coordination of the operational activities of member agencies in developing the required intelligence.

II. Suggested Measures to Improve the Coordination of Domestic Intelligence Collection

It is believed that an interagency group on domestic intelligence should be established to effect coordination between the various member agencies. This group would define the specific requirements of the various agencies, provide regular evaluations of domestic intelligence, develop recommendations relative to policies governing operations in the field of domestic intelligence, and prepare periodic domestic intelligence estimates which would incorporate the results of the combined efforts of the entire intelligence community.

Membership in this group should consist of appropriate representatives named by the Directors of the Federal Bureau of Investigation, the Central Intelligence Agency, the National Security Agency, the Defense Intelligence Agency, and the counterintelligence agencies of the Departments of the Army, Navy, and Air Force. In addition, an appropriate representative of the White House would have membership. The committee would report periodically to the White House, and a White House staff representative would coordinate intelligence originating with this committee in the same manner as Dr. Henry Kissinger, Assistant to the President, coordinates foreign intelligence on behalf of the President. The chairman would be appointed by the President.

This interagency group would have authority to determine appropriate staff requirements and to implement these requirements, subject to the approval of the President, in order to meet the responsibilities and objectives described above.

DECISION: Permanent Interagency Group

_____ An ad hoc group consisting of the FBI, CIA, NSA, DIA, and the military counterintelligence agencies should be appointed and should serve as long as the President deems necessary, to provide evaluations of domestic intelligence, prepare periodic domestic intelligence estimates, and carry out the other objectives indicated above. The ad hoc group should be tasked to develop a permanent organization to carry out the objectives of this report.

_____ A permanent committee consisting of the FBI, CIA, NSA, DIA, and the military counterintelligence agencies should be appointed to provide evaluations of

domestic intelligence, prepare periodic domestic intelligence estimates, and carry out the other objectives indicated above.

_____ No further action required.

_____ More information is needed.

NOTE: The FBI is opposed to the creation of a permanent committee for the purpose of providing evaluations of domestic intelligence, however, the FBI would approve of preparing periodic domestic intelligence estimates.

APPENDIX C

THE SENATE SELECT COMMITTEE ON INTELLIGENCE REPORTS ON THE ALDRICH AMES COUNTERINTELLIGENCE FAILURE, 1994

CONCLUSIONS AND RECOMMENDATIONS

Over the months since his arrest, it has become clear that Aldrich Hazen Ames caused more damage to the national security of the United States than any spy in the history of the CIA. Ten Soviet sources of the CIA and the FBI were executed as a result of Ames' treachery and others were imprisoned. Ames has admitted to compromising over 100 intelligence operations of the CIA, FBI, military departments, and allied governments, and there are likely others he does not specifically recall. Literally thousands of classified documents—on subjects ranging from U.S. defense capabilities to international narcotics trafficking—were turned over by Ames to his KGB handlers. Although the formal assessment of the damage cased by Ames has yet to be completed, his betrayal stands as the most egregious in American history.

Obviously, something went terribly wrong. For a CIA officer to carry on espionage activities without detection for almost nine years indicates, on its face, a failure of the system. As the Committee began to look into this failure, we found a bureaucracy which was excessively tolerant of serious personal and professional misconduct among its employees, where security was lax and ineffective. And we found a system and a culture unwilling and unable—particularly in the early years of Ames' betrayal—to face, assess, and investigate the catastrophic blow Ames had dealt to the core of its operations.

The system which permitted Ames' prolonged betrayal must be changed. The country cannot afford such calamities in the future, and the CIA cannot afford further erosion of the public's confidence. In the wake of the Cold War, the CIA still has an important mission to

perform—a mission that is vital to the national security of the United States. Like all government agencies, the CIA ultimately depends upon the support of the American people and the Congress to carry out its unique functions and maintain its unique capabilities. To restore that confidence, the CIA must deal effectively with the serious deficiencies highlighted by the Ames case.

In the discussion which follows, the Committee sets forth where we believe the system failed and what we believe should be done to correct it. In its action on the Intelligence Authorization Act for Fiscal Year 1995 (P.L. 103–359), the Committee undertook legislative remedies for many of these shortcomings by requiring coordination of counterintelligence matters with the FBI and by providing authorized investigative agencies with new authority to obtain access to financial information and travel records of federal employees who have access to classified information. While these legislative initiatives are an important beginning, far more is needed to correct the deficiencies evident in the Ames case than legislation alone can achieve.

In the end, regardless of what the Committee may recommend or what Congress may enact, fundamental change will come only if the Director of Central Intelligence, supervisors at all levels, and the employees of the CIA bring it about. The Committee intends to monitor the Agency's progress in this regard, but the leadership must come from within.

The Committee undertook its inquiry not for the purpose of assessing individual blame—which is the exclusive responsibility of the Executive branch—but rather to learn what had gone wrong and to evaluate the institutional lessons to be learned from the Ames case. Nevertheless, the Committee believes that the recent actions taken by the Director of Central Intelligence, R. James Woolsey, against past and current CIA officials implicated in the Ames case warrant comment.

On March 10 of this year, Director Woolsey appeared before the Committee in closed session to outline his interim responses to the Ames case. One area for reform which was cited by the Director was "management accountability." According to the Director: "[T]o my mind, this is very much at the heart of the entire matter." The Committee strongly shares this view.

Despite the CIA Inspector General's recommendation that 23 current and former CIA officials be held accountable for the Agency's failure to prevent and detect Ames espionage activities, Director Woolsey chose only to issue letters of reprimand to 11 individuals—7 retired and 4 current Agency employees. None of the individuals cited by the Inspector General was fired, demoted, suspended or even reassigned as a result of this case. In response to what was arguably the greatest managerial breakdown in the CIA's history, the disciplinary actions taken by the Director do not, in the collective experience and judgment of the Committee, constitute adequate "management accountability."

All Committee Members believe that the Director's disciplinary actions in this case are seriously inadequate and disproportionate to the magnitude of the problems identified in the Inspector General's report. It is clear, given the immense national security interests at stake, that there was "gross negligence"—both individually and institutionally—in creating and perpetuating the environment in which Ames was able to carry out his espionage activities for nine years without detection.

The Committee is concerned about the message that Director Woolsey's mild disciplinary actions will send to the overwhelming majority of CIA employees who are dedicated, conscientious, patriotic, and hard-working professionals, many of whom are exposed daily to risk and hardship. For the current employees who were faulted by the Inspector

General for their role in the Ames case to remain in their grades and positions falls far short of the level of accountability expected by the Committee. Indeed, in the wake of the Director's decision, many professionals within the Intelligence Community have contacted the Committee to register the same sentiment.

As this report documents, the failures evident in the Ames case were numerous and egregious. While it might be argued that the majority of individuals cited by the Inspector General were guilty of acts of omission rather than commission, the seriousness of these omissions cannot be overstated. The failures of the individuals cited by the Inspector General led to the loss of virtually all of CIA's intelligence assets targeted against the Soviet Union at the height of the Cold War. Ten of these agents were executed. The inability of the CIA to get to the bottom of these losses in a timely way was itself a significant management failure.

If there is not a higher standard of accountability established by DCIs, then a repeat of the Ames tragedy becomes all the more likely. Management accountability within the Intelligence Community should be no less than the highest levels found elsewhere in the Executive branch. Director Woolsey's actions do not meet this standard.

Having noted in strong terms the magnitude of CIA's failures, the Committee would be remiss not to point out what went right. A traitor, responsible for heinous acts of espionage, was identified and convicted. He has been imprisoned for life. In the end, this was accomplished by the work of a small group of CIA and FBI personnel who took part in what became a long and arduous inquiry—for some, lasting almost nine years. At least one member of this group appears to have pushed from the very beginning to get to the bottom of the 1985 compromises. It was his impetus that eventually put the investigation back on track in 1991. Over time, the scope and pace of the investigation had taken many twists and turns, some caused by the KGB and some by internal factors beyond the control of the investigators themselves. The commentary which follows is not intended to diminish in any way what was ultimately accomplished by this dedicated group of investigators and analysts.

Finally, the Committee notes that its recommendations are based upon the situation that pertained through early 1994. Director Woolsey has promulgated some new policies since then and has announced his intention to institute still others. While the Committee believes in general that stronger measures are needed, it is too early to pass judgment on the Director's recent actions.

THE FAILURE TO "FIX" PAST COUNTERINTELLIGENCE PROBLEMS

The counterintelligence function at the CIA is weak and inherently flawed. Despite repeated internal and external reports which have recognized a longstanding cultural problem with the counterintelligence function, CIA managers have, judging from the Ames case, failed to fix it.

In particular, the Committee was struck by the number of internal and external studies undertaken after 1985—which became known as the "Year of the Spy" following the exposure of spies John Walker, Ronald Pelton, Edward Lee Howard, and Jonathan Pollard—which pointed out the systemic and deeply-rooted problems in the CIA's conduct of counterintelligence.

As summarized by the recent report of the CIA Inspector General, these internal and external reports over the years focused on common themes:

That a counterintelligence career was held in low esteem at the CIA and did not attract high caliber officers. This was, in part, because officers gained promotions by agent recruitments, not by analyzing problems in recruitment operations;

That there was an ambiguous division of responsibility for counterintelligence among CIA offices;

That counterintelligence information was not being shared properly among CIA components; and

That CIA was reluctant to share counterintelligence information fully and in a timely manner with the FBI. (IG Report, pp. 16–22)

The poor state of counterintelligence at the CIA in the mid-1980s can be explained in part by the reaction to the so-called "Angleton era." James Angleton had been the head of the Counterintelligence Staff of the CIA from 1954 until 1974 (when he was involuntarily retired by DCI William Colby). He became convinced that the KGB had penetrated the CIA. Accordingly, Angleton was suspicious of virtually every Soviet agent who was recruited by the CIA and suspicious of every CIA officer responsible for such recruitment. On occasion, his suspicions led to CIA officers being fired without adequate justification.

While several of the officers who had been unjustly fired were later compensated, the counterintelligence function was effectively undermined by the negative reaction to Angleton's relentless pursuit of spies, particularly within the Soviet-East European (SE) Division of the Directorate of Operations, which had the principal responsibility for recruiting Soviet agents for the CIA.

In addition, there appears to have been an excessive focus within the Directorate on the recruitment of intelligence sources to the exclusion of counterintelligence concerns. Few officers wanted to go into counterintelligence because promotions and recognition came from successful recruitments, not from questioning, or identifying problems with, ongoing operations. Further, there was an image of a "corporate elite" constructed among these officers which led them to dismiss too readily the possibility of a spy among them.

By all accounts, these attitudes were prevalent within the Directorate of Operations at the time Ames sabotaged the Agency's Soviet operations in the summer of 1985, and they greatly contributed to management's failure to focus upon the CIA employees who had had access to the compromised cases (as explained in detail below).

The CIA made some efforts to address these shortcomings after "the Year of the Spy," In 1988, the head of the counterintelligence staff was made an "Associate Deputy Director" in the Directorate of Operations, and was double-hatted as the head of a new Counterintelligence Center (CIC). The CIA and FBI also signed a new Memorandum of Understanding (MOU) in 1988, which provided, at least on paper, for improved sharing of information in counterintelligence cases.

But these new bureaucratic "trappings" for the counterintelligence function did not overcome the fundamental problems which continued to be cited in reports issued in the 1990s. Despite the formation of a "lead office" for counterintelligence and the 1988 MOU with the FBI, the sharing of counterintelligence information between CIA components and with the FBI continued to be a serious problem, as was clearly evident in the Ames case.

In conclusion, the Committee finds that, despite repeated internal and external reports which recognized a longstanding cultural problem in the counterintelligence function, the CIA failed to implement adequate solutions. Indeed, the Committee believes the fundamental problems persist.

Recommendation No. 1: The Director of Central Intelligence should revise the CIA's strategy for carrying out the counterintelligence function. The Director should institute measures to improve the effectiveness of counterintelligence to include (a) establishing as a requirement for promotion among officers of the Directorate of Operations, service in a counterintelligence or counterintelligence-related position during their careers; (2) establishing incentives for service in a counterintelligence position; (3) instituting effective and comprehensive counterintelligence training for all officers of the Directorate of Operations and for appropriate officers assigned elsewhere in the CIA; and (4) ensuring adequate access to ongoing foreign intelligence operations by those charged with the counterintelligence function. The Committee will make this a "special interest area" for purposes of oversight until it is satisfied the weaknesses noted above have been adequately addressed.

THE FAILURE TO DEAL WITH SUITABILITY PROBLEMS

As the Ames case all too clearly demonstrates, the CIA Directorate of Operations is too willing to dismiss, deny, or ignore suitability problems demonstrated by its officers.

From the outset of his career at the CIA, Ames demonstrated serious suitability problems which, over the years, should have led his supervisors to reassess his continued employment. These problems included drunkenness, disregard for security regulations, and sloppiness towards administrative requirements. In the years immediately before he began to commit espionage and during the rest of his career, his supervisors were aware of his personal and professional deficiencies, but did not make his problems part of his official record, nor act effectively to correct them. Despite his recognized unsuitability, there is little evidence that his assignments, activities, or access to sensitive information were in any way limited as a result.

Prior to Ames's assignment to the counterintelligence staff of the SE Division in 1983, his supervisor in Mexico City sent a message to CIA headquarters recommending that Ames be counseled for alcohol abuse when he returned. While Ames's supervisor recognized a chronic problem, the message to headquarters apparently stemmed from an incident which occurred at an official reception at the U.S. Embassy where Ames was drunk and became involved in a loud argument with a Cuban official. On another occasion, Ames was involved in a traffic accident in Mexico City and was so drunk he could not answer police question nor recognize the U.S. Embassy officer sent to help him. In fact, based upon recent interviews with his colleagues, Ames was notorious for long, alcoholic lunches, often slurring his speech when he returned to the office. None of this behavior prompted any serious effort to correct the problem while Ames was overseas, or when he later returned to CIA headquarters.

In April 1983, when CIA headquarters asked Ames's supervisors in Mexico City whether Ames qualified for a staff position in another Latin American country, they recommended against it, citing his alcohol problem, his failure to do financial accountings, and his generally poor performance. Nevertheless, six months later, when a former supervisor of Ames requested him to fill a position in the SE Division at headquarters—the most sensitive element of the Directorate of Operations—there is no indication that Ames' alcohol problem or poor performance were ever noted. Indeed, Ames was placed in a position which provided him access to the identities of virtually all of the Soviet intelligence officers by the CIA without his new supervisors being aware of the problems he had had in Mexico City.

The alcohol abuse counseling that Ames ultimately did receive upon his return to headquarters amounted to one conversation with a counselor, who, according to Ames, told him that his case was not a serious one when compared to many others in the Directorate of Operations.

In 1983, during the assignment in Mexico City, Ames also began an extra-marital relationship with a Colombian national, Rosario Casas Dupuy (hereinafter "Rosario"), herself a recruited asset of the CIA. Over time, the seriousness of their relationship became apparent to several of Ames's colleagues, but this never led to any action by Ames's supervisors, despite the fact that CIA regulations prohibit sexual relationships with recruited assets and require that reports of "close and continuing" relationships with foreign nationals be submitted by employees. Despite the security implications of this relationship, the violation of Agency regulations was ignored.

In fact, Ames did not file an official report concerning his relationship with Rosario until April 1984, four months after she came to the United States to live with him. Indeed, it appears that until their marriage in August 1985, Ames (still married to his first wife) and Rosario continued to live together, without any perceptible concern being registered by the CIA. While the counterintelligence staff recommended in February 1985, that in view of the anticipated marriage, Ames, be moved to a less sensitive position, nothing changed. Ames continued in the same position.

While his alcohol problem abated during this assignment to the SE Division—at least as a matter of attracting official attention—it resurfaced during his assignment in Rome. He was known among colleagues for his long, alcoholic lunches, for sleeping at his desk, for often slurred speech, and generally as a marginal performer. On one occasion, after an Embassy reception, he was so drunk that he passed out on a street and awakened in a hospital. While his supervisor was unhappy, this incident did not become part of Ames' record, nor does it appear that this episode led to counseling or any serious reevaluation of Ames' fitness for continued service. Indeed, the same supervisor extended Ames' tour in Rome for a third year.

Over his career, Ames repeatedly demonstrated carelessness and disdain for security requirements. In 1975, while on his way to meet a CIA source in New York, Ames left a briefcase of classified materials identifying the source on a subway train. Although the briefcase was ultimately recovered, it might well have compromised the source's relationship with the CIA. In the fall of 1984, he brought Rosario to CIA housing where CIA undercover officers were staying, in violation of security regulations. In August 1985, he took her to the safe house where the Soviet defector Yurchenko was being debriefed, again in violation of security procedures. In Rome, he was known to prepare classified reports at home. During his assignments at CIA headquarters between 1989 and 1994, he was occasionally found in other CIA offices where he had no reason to be, and with materials he had no reason to have.

He was equally negligent throughout his career in complying with the administrative requirements imposed on officers of the Directorate of Operations, such as submitting financial accountings for the cases he was handling.

Despite these and other incidents, Ames never received a single official reprimand during his 31-year career at the CIA. Indeed, most of the incidents and shortcomings which have come to light since Ames was arrested were never made a matter of official record. Once on board, his fitness to serve in the Directorate of Operations was never reevaluated.

The Committee appreciates that intelligence officers of the Directorate of Operations are often placed in jobs and situations with stresses and strains that far exceed those of the average government employee. But these positions also demand self-control and personal discipline. Particularly in overseas assignments, it may be impossible to separate an intelligence officer's private life from his or her public, official one. A single misstep can prove his undoing or that of other officers.

It is the Committee's perception, which the Ames case confirms, that the Directorate of Operations has been far too willing to dismiss or ignore flagrant examples of personal misconduct among its officers. Excessive drinking and extra-marital relationships with sources have all too often been seen as part of the job, rather than as indicators of problems. Security concerns are too often dismissed as the bureaucratic whining of small-minded administrators. All too often an officer who has been through training, gone through the polygraph examination, and had an overseas assignment, is accepted as a "member of the club," whose fitness for assignments, promotions, and continued service becomes immune from challenge.

Director Woolsey, in a recent speech, said that the "culture" of the directorate must be changed. The Committee shares that view. Such change will not come solely by changing regulations or personnel. It will come only when supervisors at every level of the directorate take seriously their responsibilities as managers. Personal misconduct should be documented. Officers who do not meet acceptable standards of personal behavior should not be assigned to personal behavior should not be assigned to sensitive positions nor qualify for supervisory positions. Personal shortcomings should be factored into consideration of promotions and bonus awards. While officers with personal problems should be given an opportunity, as well as appropriate assistance, to rehabilitate themselves, failing that, their employment with the directorate, if not with the Agency itself, should be terminated.

Recommendation No. 2: The Director of Central Intelligence should ensure that where evidence of suitability problems comes to the attention of supervisors, it is made a matter of official record and factored into the consideration of assignments, promotions, and bonus awards; that efforts are made to counsel and provide assistance to the employee where indicated, and, if the problem persists over time, the employment of the individual is terminated. The Committee will make this a "special interest area" for purposes of oversight until it is satisfied these policies have been instituted and are being observed within the Directorate of Operations.

Recommendation No. 3: The Director of Central Intelligence should, in particular, take prompt and effective action to deal with what appears to be a widespread problem of alcohol abuse by ensuring that CIA employees experiencing such problems are identified and are put into effective counseling and/or treatment. During this period, these employees should be suspended from their duties until they have demonstrated to a qualified professional their fitness to return to service. Should their problems continue, their employment should be terminated.

Recommendation No. 4: The Director of Central Intelligence should institute, consistent with existing legal authority, an "up or out" policy for employees of the CIA, similar to that of the Foreign Service, without waiting for the report required by section 305 of the Intelligence Authorization Act for Fiscal Year 1995, pertaining to the Intelligence Community as a whole. Chronically poor performance should be grounds for dismissal from the Agency. If the Director decides not to institute such a policy and does not provide a

persuasive rationale to the Committee for his decision, the Congress should enact legislation requiring such a policy during the next Congress.

Recommendation No. 5: The Director of Central Intelligence should review and revise the performance appraisal reporting system of the CIA, to include a review of the factors upon which employees are rated and the grading system which now exists, to institute a system which reflects more accurately job performance. Where supervisors are concerned, their rating should include an assessment of how well they have supervised the performance and development of their subordinates.

THE FAILURE TO COORDINATE EMPLOYEES' OPERATIONAL ACTIVITIES

The Ames case providers a striking example of CIA supervisors failing to critically evaluate the contacts of an operations officer—with known personal shortcomings and in an extremely sensitive position—with Soviet officials in 1984 and 1985. Further, the fact that Ames virtually ceased submitting reports of such contacts, in violation of standard Agency procedures, never became known to his SE Division supervisors or made part of his official record.

In 1984, while occupying a position within the SE Division which gave him access to the identities of Soviet agents working with the CIA and FBI, Ames, with the approval of his immediate supervisor, began making contacts with Soviet Embassy officials in Washington, D.C. According to testimony received by the Committee, it was not infrequent that Directorate of Operations Officers at CIA headquarters were asked to "help out" other CIA elements that had responsibility for establishing relationships and maintaining contacts with foreign individuals located in the Washington area.

The Committee has been advised that Ames's senior supervisors in the SE Division were unaware that he was having these meetings and would have disallowed them had they known.

In any event, to permit a person in Ames's position, and someone with the personal and professional shortcomings already noted, to meet alone with Soviet Embassy officials substantially increased the risk of the disaster that eventually occurred. It provided Ames with an opportunity that he otherwise may not have had, or may have had difficulty in contriving on his own.

After June 1985, after his espionage activities had begun, Ames repeatedly failed to submit reports of his contacts with Soviet officials. While his failure prompted complaints from the FBI, the CIA element that Ames was supporting failed to bring this to the attention of his supervisors in the SE Division, nor was it reflected in his official record. Again, had Ames' SE Division supervisors been aware of his failure to file these reports, it may have alerted them to a possible problem. Since the advancement of Directorate of Operations officers depends upon their official reporting, the failure to file such reports should have suggested something was amiss.

A similar failure occurred during his assignment in Rome. While his supervisor was aware that he was meeting along with Soviet officials in Rome (one of whom was Ames' KGB contact), Ames explained his failure to file reports of such meetings on the basis that he had obtained little worthwhile information. This apparently was enough to satisfy the supervisor.

Recommendation No. 6: The Director of Central Intelligence should revise the policies and procedures governing the operational activities of CIA officers to ensure that these activities are better supervised, controlled, coordinated, and documented.

THE FAILURE TO APPLY A STRUCTURED METHODOLOGY TO THE INVESTIGATION OF INTELLIGENCE COMPROMISES

The most puzzling deficiency in the Ames case was the failure, in the wake of the 1985–86 compromises, to aggressively investigate the possibility that CIA had been penetrated by a KGB spy.

Certainly by the fall of 1986, the CIA was aware that it had suffered a disaster of unprecedented proportions which was not explained by the defection of Edward Lee Howard. Within a matter of months, virtually its entire stable of Soviet agents had been imprisoned or executed. In the days of the Cold War, Soviet operations represented the Agency's principal *raison d'etre.* There were no operations which had greater importance to its mission. The CIA was left virtually to start from scratch, uncertain whether new operations would meet the same fate as its old ones.

To be sure, these compromises involved extremely sensitive agents. There was a need for discretion in terms of how the matter was handled. But this does not explain or excuse the Agency's tentative, tepid response. Initially, some CIA officers could not believe that the KGB would "roll up" all of CIA's sources at once if the KGB had a source in the CIA who was still in place. Taking some comfort that new operations appeared to be surviving, some believed the problem had gone away. But this in no way explains the seeming lack of urgency to get to the bottom of what had gone so drastically wrong.

The obvious place to begin would have been with the CIA employees who had had access to the information which had been compromised. At least one official in the SE Division made a strong plea to his supervisors at the time that they needed to "investigate it, not study it." But this did not happen. The CIA task force created in October 1986, undertook what was largely an analytical review of the compromised cases. The task force did oversee an Office of Security review of personnel who had served in Moscow, but no broader examination was made of all CIA officers who had had access to the compromised cases. No systematic effort was made to identify and investigate problem employees and their activities, as was eventually done in 1991–92.

Later, the CIA came to suspect that the KGB was running ploys against them, purposely suggesting reasons for the compromises other than a penetration of the CIA itself. Even then, however, any sense of urgency was lacking. CIA analysts waited for things to happen, for more information to surface. They continued to analyze and conjecture. There was no clear sense of purpose, no clear methodology, and no clear sense of what was required to get to the bottom of the compromises.

In a related counterintelligence investigation of a report suggesting that the KGB may have recruited a source in a particular office in the CIA, a CIA investigator conducted a systematic investigation of over 90 employees who were assigned to that office. The inquiry took more than year. But investigators did not conduct the same type of inquiry of the CIA employees who had had access to the information that was actually compromised in 1985 until 1991–1992.

The FBI was officially brought into the case in October 1986, when the CIA learned that two sources recruited by the FBI had been compromised. But the two agencies worked

their investigations separately, despite the likelihood that the compromises were caused by the same source (whether it be human or technical).

While the FBI and CIA task forces regularly exchanged information on the compromises and on the progress of their respective analyses, they never performed a systematic assessment, together, of the CIA employees who had had access to the compromised information, until mid-1991.

Why CIA management during the 1986–1991 period did not attach more importance or urgency to getting to the bottom of the 1985 compromises is incomprehensible to the Committee. While CIA Director William Casey and Deputy Director for Operations (DDO) Clair George, who were in office at the time the compromises occurred, reportedly regarded them as "a huge problem," the Agency's response was to create a 4-person team to analyze the problem. No one believed there was a basis for bringing in investigators from the FBI at this juncture, apparently because CIA was unable to pin responsibility on a particular CIA employee.

While Casey and George became deeply enmeshed in the Iran-contra scandal in the fall of 1986 and spring of 1987, this circumstance does not explain, in the view of the Committee, why a problem so close to the heart of the CIA's mission was not given more attention by senior management. Indeed, once Casey and George departed the scene, it does not appear that their successors—either as DCI or as DDO—gave the inquiry any particular emphasis or priority. DCI William Webster, his deputy Robert M. Gates, and the new DDO Richard Stolz were briefed on the compromises in 1988, but did not delve deeply into either the nature of the problem (which was now several years old) or what the Agency was doing to resolve it.

Due to the extraordinary sensitivity of this inquiry, there was only one junior investigator from the Office of Security assigned to the case from 1985 until 1991. He was responsible for investigating all counterintelligence leads and reports coming in which involved CIA employees. After he began to develop information regarding Ames' unexplained affluence in the fall of 1989, he was diverted from this investigation for a nine-month period, first for training and then to handle other leads. There was no one else assigned to pick up the Ames leads. Nor was consideration given to having the FBI pick up the leads, despite the fact that the information now focused upon a particular CIA employee within the United States.

While the Committee believes that the investigator in question made a good faith effort to work the leads he was given, he was essentially self-trained and, because of the compartmented nature of the investigation, was given very little help and guidance. Overworked and overloaded, he did not use all of the investigative techniques he might have utilized to get at Ames' financial situation. Indeed, the statutory authority invoked by the CIA in 1992 to obtain access to Ames' bank records was available to the Agency in 1989. Had this authority been utilized at the time information was received concerning Ames's unexplained affluence, in might well have led to his detection at a much earlier stage. The investigator also apparently made no effort to develop information regarding Ames's unexplained affluence during his assignment in Rome. Efforts to verify the financial condition of Ames's in-laws in Bogota were shoddy and ineffective, producing inaccurate information which supported rather than exposed Ames's contrived explanation.

The Committee does not think it fair to hold the investigator assigned to the case solely responsible for these failures. CIA managers simply failed to assign enough investigators

to such an important task and failed to provide them with sufficient legal and administrative support to ensure that all appropriate avenues would be explored and all appropriate investigative authorities utilized. Since the professional investigative expertise of the FBI was effectively spurned during this period, insufficient resources and expertise were brought to bear on the case.

The Committee believes that those in charge of the CIA during the 1986–1991 period—Director William Casey, Acting Director and later Deputy Director Robert Gates, Director William Webster, and Deputy Director and later Acting Director Richard Kerr—must ultimately bear the responsibility for the lack of an adequate investigative response to the 1985 compromises. Whatever they may have personally understood the situation to be, they were in charge. It was their responsibility to find out what was being done to resolve the 1985 compromises. Based upon the information available to the Committee, they failed to do so.

Their failure is especially disheartening when one realizes that the information developed in August 1992, which finally focused the investigation on Ames—correlating his bank deposits in 1985 and 1986 with his meetings with Soviet officials—was available to investigators since 1986. Unfortunately, no one asked for it, even when alerted to Ames's unexplained affluence in October 1989.

Although the 1985–86 compromises represented a unique situation for the CIA, the Ames case demonstrates the lack of a clear *modus operandi* for dealing with situations where intelligence sources are known to have been compromised.

Recommendation No. 7: The Director of Central Intelligence should establish procedures for dealing with intelligence compromises. At a minimum, these procedures should entail a systematic analysis of all employees with access to the relevant information and, if suspects are identified, provide an investigative methodology to determine whether there is evidence of unexplained affluence, unreported travel, unreported contacts, or other indicators of possible espionage. This type of systematic analysis should begin when a known compromise occurs, not after CIA has eliminated the possibility of a technical penetration, or after CIA has narrowed the range of possible suspects to one or two employees. Analysis and investigation should be undertaken on the basis of access and opportunity, and should not be delayed waiting for evidence on culpability.

Recommendation No. 8: Pursuant to section 811 of the Intelligence Authorization Act for Fiscal Year 1995, the FBI should be notified immediately of any case where it is learned that an intelligence source has been compromised to a foreign government, regardless of whether the CIA believes at the time that there is a basis for an FBI counterintelligence or criminal investigation of a particular employee or employees. The CIA should also coordinate with the FBI subsequent investigative actions involving employees potentially involved in the case in order not to prejudice later criminal or counterintelligence activities of the FBI and in order to benefit from the investigative assistance and expertise of the FBI.

Recommendation No. 9: The Director of Central Intelligence should require that all employees assigned as counterintelligence investigators have appropriate training, experience, and supervision which ensures, at a minimum, such investigators will be familiar with, and know how to utilize, the investigative authorities available to the CIA and the FBI.

Recommendation No. 10: CIA management must ensure that adequate analytical and investigative resources are assigned to counterintelligence cases, and that other kinds of staff assistance (e.g., legal support, administrative support) are made available. In turn,

those involved in these cases must ensure that their needs are communicated to their supervisors. The Inspector General of the CIA should periodically assess the counterintelligence cases of the CIA to ensure that adequate resources are being afforded to particular cases.

Recommendation No. 11: The status of significant counterintelligence investigations must be regularly briefed to senior Agency officials, including the Director of Central Intelligence. Such briefings should include an explanation of the resources and expertise being brought to bear upon a particular case.

THE FAILURE TO EXPEDITE THE INQUIRY AFTER 1991

The period after the CIA and FBI decided to join forces in June 1991—compared with the period between 1985 and 1991—was relatively intense and focused. For the first time, investigators conducted a systematic review of the CIA employees who had had access to the compromised information, and there was an intensive, productive effort to link Ames and other priority suspects to the compromises.

Yet even during this phase, the investigation took an inordinate amount of time and was plagued by past inefficiencies. The joint investigative unit still had only four people (two from each agency); and there was still a lone CIA investigator working with them. While members of the joint investigative unit did obtain support from the CIA Office of Security and the FBI Washington Metropolitan Field Office, they were still but a few people carrying an extraordinarily demanding workload.

In August 1991, the joint investigative unit developed a list of 29 CIA employees for priority scrutiny. Ames was at the top of the list.

Yet the first letters to go out to financial institutions requesting access to Ames's financial records did not go out until June 1992, almost 10 months later.

In August 1992, when investigators correlated the records of Ames's bank deposits with what was known about Ames's 1985 meetings at the Soviet Embassy, the joint investigative unit suspected they had their man. When they learned in October of Ames's Swiss bank accounts, their suspicions were confirmed.

But according to the Inspector General's report, this crucial information was not presented to FBI headquarters until January 1993. It was explained to the Committee that the joint investigative unit was looking at possible suspects in addition to Ames. But this still does not explain why significant information pertaining to Ames was not passed contemporaneously to the FBI, particularly given the presence of two FBI agents on the joint investigative unit.

On the basis of the work of the joint investigative unit—which culminated in the March 1993 Skylight/playactor report—the FBI assembled an investigative team and tasked the team members to acquaint themselves with the facts. The FBI began an intensive investigation of Ames shortly thereafter. The Committee was advised in the course of its investigation that FBI headquarters had determined that the earlier information developed on Ames by the joint investigative unit did not meet the standards for an intensive FBI investigation. The Committee believes, however, that there was ample evidence by October 1992, to reasonably suggest that Ames was acting in 1985 (and thereafter) as an agent of the Soviet Union. The FBI's hesitation resulted in a six-month delay before the FBI began to apply the full array of its investigative capabilities against Ames. Once applied, they produced impressive results. Indeed, the FBI investigative team from the Washington

Metropolitan Field Office, together with the CIA, did a superb job in bringing the investigation to a successful conclusion.

Recommendation No. 12: The Director of the FBI should ensure that adequate resources are applied to counterintelligence cases involving the CIA and other federal agencies, and that FBI headquarters is apprised immediately of significant case developments which could form the basis for the FBI's opening an intensive counterintelligence investigation.

Recommendation No. 13: The Attorney General and the Director of the FBI should review the FBI's guidelines for the conduct of counterintelligence investigations to determine whether clearer guidance is needed in determining whether a subject of a counterintelligence inquiry is acting as an agent of a foreign power.

FAILURE TO RESTRICT THE ASSIGNMENTS AND ACCESS TO SUSPECTS IN COUNTERINTELLIGENCE CASES

The Ames case reveals glaring weaknesses in the CIA's procedures for dealing with the career assignments of employees who are under suspicion for compromising intelligence operations. The CIA failed to restrict Ames's assignments and access even after information surfaced in 1989 which indicated Ames was a possible counterintelligence problem.

In September 1989, after a poor tour in Rome, which was known to the managers in the SE Division, his SE superiors allowed Ames to return to the SE Division and assigned him to the office supporting to all Soviet and East European operations in Europe, a position affording him broad access to sensitive information. He remained assigned to the SE Division until August 1990. During this period, investigators learned about Ames's unexplained affluence and developed information regarding several large bank deposits and a particularly large currency exchange. Yet none of this appears to have had any bearing on Ames's continued assignment or access during this period.

In fact, at the end of this assignment, notwithstanding his own poor performance record (he was then ranked 3rd from the bottom among 200 officers in his rating group), Ames was appointed to serve on a promotion board for mid-level CIA operations officers. This assignment gave him access to the personnel records of an entire class of mid-level CIA operations officers.

In October 1990, SE Division managers reassigned Ames to the Counterintelligence Center (CIC) because he had performed poorly and they wanted him out of the Division. Apparently, supervisors in the CIC knew Ames was a poor performer and were aware that questions had been raised about his unexplained affluence. Yet they believed they could manage the problem. After his arrest, these officials recognized that Ames' position had given him access to data which identified virtually every double agent operation controlled by the United States. It is unclear how or why this access was permitted. It is clear that despite the security concerns raised about Ames, his CIC supervisors did not ascertain or evaluate the extent of his access at the time.

In April 1991, while Ames was assigned to the CIC, the Office of Security carried out an updated background investigation of Ames. The results of this investigation were evaluated and shared with the investigator assigned to the special task force. Reflecting interviews with his co-workers in Rome and his Arlington, Virginia neighbors, the investigation produced information that Ames had frequent contacts in Rome with Soviet and

East European officials not fully explained by his work requirements, frequently violated security regulations by leaving his safe open and doing classified work at home, and lived far beyond his CIA salary in both Rome and Arlington. (One of those interviewed went so far as to say that he would not be surprised if Ames were a spy.)

Inexplicably, the CIA security officer who reviewed the investigative report evaluated it as "raising no CI concerns," and the task force investigator assigned to the case did not regard the report as providing any new information. Ames retained his security clearance and his job in the Counterintelligence Center, and no further action was taken to follow-up on the information developed in this report. Indeed, the special task force members viewed the investigative report, together with the favorable results of the April 1991, polygraph, as giving Ames "a clean bill of health."

In September 1991, despite having been "booted out" of the SE Division a year earlier, and despite the special task force inquiry then underway, Ames was allowed to return to the SE Division to conduct a special study of the KGB. While the study itself did not call for particularly sensitive access, Ames once again was given access to the personnel and records of the SE Division.

In December 1991, he was assigned to the Counternarcotics Center (CNC) where he remained until his arrest in 1994. This apparently was the first assignment made on the basis of the security concerns about Ames. But due to the sensitivity of the investigation into the 1985–86 compromises, CNC senior managers were not told of the investigation or the suspicions about Ames until the beginning of the FBI's intensive investigation in 1993. Even then, there was little or no effort made to evaluate and control the extent of Ames' access to classified information. Indeed, investigators later learned that Ames had computer access to a vast range of classified information that did not pertain to counternarcotics. Moreover, when a computer upgrade was installed in November 1993, it provided Ames with the capability to "download" vast quantities of information onto computer discs which he could take out of the building. Fortunately, Ames was arrested before he was able to pass these discs to his KGB handlers. But the fact that he was provided this capability at all at a time when his arrest was imminent is indicative of the CIA's lack of attention to this security problem.

Recommendation No. 14: The Director of Central Intelligence should establish procedures to inform current and prospective supervisors about employees under suspicion in counterintelligence cases. While the need to protect the secrecy of the investigation is essential, as well as the need to protect the employees themselves from unfair personnel actions, the assignment of employees under suspicion without frank consultations at the supervisory level increases the likelihood of serious compromises and leads to conflict between CIA elements.

Recommendation No. 15: The Director of Central Intelligence should issue procedures to require, in any case in which an employee is under suspicion for espionage or related activities, that a systematic evaluation be made of the employee's access to classified information, and that appropriate and timely actions be taken to limit such access. While care must obviously be taken to ensure that such actions do not tip off the employee that he or she is under suspicion, the failure to evaluate the access of an employee in these circumstances may eventually result in damage that might have been prevented.

Recommendation No. 16: The Director of Central Intelligence should establish more stringent criteria for CIA employees serving on promotion and assignment boards, which,

among other things, prevent the appointment to such panels of employees with poor performance records or records of suitability problems.

DEFICIENCIES IN SECURITY PROCEDURES

The Ames case demonstrated numerous deficiencies in the CIA's use of the polygraph, its control over classified documents and materials, and its coordination of security and counterintelligence functions.

THE POLYGRAPH

Ames was able to pass polygraph examinations in 1986 and 1991 with relative ease. Although deeply involved in espionage activities, he was able to answer questions such as whether he worked for a foreign intelligence service, or had contacts with foreign nationals which he failed to report, without showing signs of deception.

The CIA Inspector General's report faults the 1986 examination, finding that the examiner was "too chummy" with Ames. When Ames showed a slight reaction to a question asking whether he had ever been "pitched," i.e., asked to work for a foreign intelligence service, the examiner appeared to readily accept his explanation that he was concerned about being "pitched" in his upcoming assignment in Rome.

The 1991 polygraph examination, according to the Inspector General's report, was deficient in that the examiners (there were two separate sessions) were not sufficiently familiar with the existing information on Ames' unexplained affluence, or with the information developed in the April 1991, background investigation of Ames. The examination was also deficient in that the investigator assigned to the special task force had not participated directly in the examination process, and there had been no prior planning in terms of how the CIA would handle the situation if Ames suddenly made damaging admissions.

According to Ames's debriefings, he did not take drugs or use any particular technique to pass the polygraph examinations. Acting on the advice of the KGB, he tried only to be cooperative and stay as calm as he could. Since he was acquainted with how polygraph examinations were conducted, he also was able to manipulate the process to prevent a "problem" from arising.

If Ames's account is true, it seems to indicate problems beyond those cited by the Inspector General's report, i.e. that examiners should be better informed and prepared. Indeed, it suggests that the CIA's reliance on the results of polygraph examinations needs to be far more circumspect than in the past.

Recommendation No. 17: The Director of Central Intelligence should tighten polygraph procedures to make the polygraph more useful. Such procedures should include random examinations instead of exams at regular intervals, with little or no prior notice, and variations in the polygraph technique. These procedures should also ensure that polygraph examinations involving employees under suspicion are carefully planned and constructed, and that appropriate prior notification is made to the Federal Bureau of Investigation if such cases have potential criminal implications. In addition, the Director should review the policies applicable to the training, supervision, and performance appraisal of polygraph examiners to ensure that polygraph examinations are conducted in a professional manner and produce optimum results.

Recommendation No. 18: The Director of Central Intelligence should institute a fundamental reevaluation of the polygraph as a part of CIA's security program. As the Ames case demonstrates, the polygraph cannot be relied upon with certainty to detect deception. This necessarily puts far more reliance on other aspects of the security process, e.g., background investigations, supervisory reporting, psychological testing, financial reporting, etc. The DCI's review should also include a reevaluation of the use of inconclusive polygraph test results. Even where the polygraph does indicate deception, such information is often useless unless damaging admissions are also obtained from the subject. The Committee believes that if an employee with access to particularly sensitive information does not make such admissions but continues to show deception to relevant questions after adequate testing, there should be additional investigation of the issues in question to attempt to resolve them. Should such investigation fail to do so, the CIA should have the latitude, without prejudice to the employee, to reassign him or her to less sensitive duties.

CONTROL OF CLASSIFIED DOCUMENTS AND MATERIALS

The Ames case also demonstrated gaps in the control of sensitive classified information. Ames was able—without detection—to walk out of CIA headquarters and the U.S. Embassy in Rome with bags and envelopes stuffed with classified documents and materials. Many of the classified documents he passed to his KGB handlers were copies of documents that were not under any system of accountability. Ames did not even have to make copies of them. In his last job in the Counternarcotics Center at the CIA, Ames was able to "download" a variety of classified documents onto computer discs and then simply remove them to his home. When he attended a conference in Turkey in 1993, he brought a lap-top computer to do work in his hotel room. This apparently raised no security concern among those familiar with the incident. He was also able to visit offices he had no reason to be in, and gain access to information he had no business seeing.

In the late 1970s, the CIA instituted a policy calling for random and unannounced spot-checks of personnel leaving Agency compounds. But the policy was discontinued soon thereafter due to the inconvenience caused to those subject to such searches.

Ames recounted later that his KGB handlers were amazed at his ability to gain access to sensitive operations and take large bundles of classified information out of CIA offices without arousing suspicion, a sad commentary on the laxness of security at the CIA.

Recommendation No. 19: The Director of Central Intelligence should reinstate the policy making persons leaving CIA facilities subject to random searches of their person and possessions, and require that such searches be conducted unannounced and periodically at selected locations. Such searches should be conducted frequently enough to serve as a deterrent without unduly hampering the operation of the facilities involved.

Recommendation No. 20: The Director of Central Intelligence should institute computer security measures to prevent employees from being able to "download" classified information onto computer diskettes and removing them from CIA facilities. In addition, existing policies for the introduction, accountability, dissemination, removal, and destruction of all forms of electronic media should be reevaluated. The ability of the CIA's security managers to "audit" specific computer-related functions in order to detect and monitor the actions of suspected offenders should be upgraded.

Recommendation No 21: The Director of Central Intelligence should institute a policy requiring employees to report to their supervisor any instance in which a CIA employee

attempts to obtain classified information which the CIA employee has no apparent reason to know. In turn, supervisors should be required to report to the CIA Counterintelligence Center any such case where a plausible explanation for such a request cannot be ascertained by the supervisor.

Recommendation No. 22: The Director of Central Intelligence should institute new policies to improve the control of classified documents and materials within the CIA. In particular, the Directorate of Operations should undertake an immediate and comprehensive review of its practices and procedures for compartmenting information relating to clandestine operations to ensure that only those officers who absolutely need access can obtain such information. Further, the Directorate should establish and maintain a detailed, automated record of the access granted to each of its employees.

COORDINATION OF SECURITY AND COUNTERINTELLIGENCE

The Ames case demonstrated a serious division between security and counterintelligence activities in the CIA. Even though an investigator from the Office of Security (OS) participated in the investigation of the 1985–86 compromises under the auspices of the Counterintelligence Center (CIC), he failed to coordinate properly with OS with respect to Ames' 1991 polygraph examination. OS had initiated a background investigation of Ames in March 1991, but went ahead with the polygraph in April without the benefit of the background investigation. As it turned out, the background investigation provided significant information about Ames that was largely ignored by the investigator assigned to the CIC in light of Ames's passing the polygraph examination.

Citing senior security officials, the Inspector General's report noted there had always been a "fault line" in communications between the CIC and its predecessors, and the OS. The CIC had not always shared information regarding its counterintelligence investigations and had failed to make use of OS's investigative expertise. Indeed, the search to find the cause of the 1985 compromises might have moved more quickly from analysis to investigation if there had been better coordination between security and counterintelligence.

The Inspector General's report also found "a gradual degradation" of the resources and authority given the security function since 1985, concluding that "this degradation has adversely affected the Agency's ability to prevent and deter activities such as those engaged in by Ames. . . ." The Committee shares the view that this decline has been too great too precipitous. The Committee had recommended an increase in personnel security funding for the CIA and other agencies for Fiscal Year 1995, but was unable to sustain its initiative due to the lack of interest shown by the agencies involved.

Responding to the continuing problem of CIA offices failing to share pertinent information on CIA personnel with one another, Director Woolsey recently created a new Office of Personnel Security that combines elements of the old Office of Personnel, the Office of Medical Services, and the Office of Security. While this consolidation may facilitate the sharing of information regarding suitability problems, it may also hamper the exchange of counterintelligence information from the CIC and may further dilute the security function, particularly the expertise of security investigators.

The Committee believes that the personnel security function should be preserved with a separate office. Routine monitoring of Agency employees from a security perspective remains an important function and one that must be accomplished without carrying a presumption that persons are under suspicion. An effective personnel security program

would deter potential traitors, limit the burden on counterintelligence investigators and result in faster, more effective counterintelligence investigations.

Recommendation No. 23: The Director of Central Intelligence should reexamine the decision to combine the Office of Security with the other elements of the CIA's new personnel center, and should ensure sufficient funding is provided to the personnel security function in Fiscal Year 1995 and in future years. The Director should also clarify the relationship between security and counterintelligence, specifying their respective functions and providing for effective coordination and cooperation between them.

FAILURE TO ADVISE THE OVERSIGHT COMMITTEES

The CIA failed to notify the congressional oversight committees in any meaningful way of the compromises of 1985–1986, as required by applicable law.

Indeed, in the hearings held annually on counterintelligence matters and in numerous staff briefings on the subject from 1985 until 1994, the massive compromises of 1985–86 were never once mentioned by representatives of the CIA or the FBI.

Based upon the recollections of individuals, there were two occasions when the 1985–86 compromises were alluded to in discussions with Members or staff of the Senate Select Committee on Intelligence (SSCI). The first mention came during a staff visit to Moscow in December 1988. The second occurred in 1992 during a visit to Moscow by two Members of the Committee. But on each occasion, the information provided was fragmentary and anecdotal and did not specifically address what was being done by the CIA about the problem. Informal staff efforts to follow-up on each of these conversations were put off by the CIA.

The Committee strongly believes that both the CIA and the FBI had an obligation to advise the oversight committees at the time of the 1985–86 compromises. Section 502 of the National Security Act of 1947 specifically requires intelligence agencies to report to the oversight committees "any significant intelligence failure." The compromises of 1985–86 resulted in a virtual collapse of CIA's Soviet operations at the height of the Cold War. According to the SE Division officer's memorandum of November, 1986, the evidence was at that point "overwhelming" and clearly indicated a problem of disastrous proportions. The oversight committees were responsible for funding the activities of the Directorate of Operations. They should have been formally notified pursuant to section 502 of the National Security Act of 1947.

THE NEED FOR CONTINUED FOLLOW-UP

Many of the problems identified by the Committee are deep-seated and pervasive, and will not be solved easily or quickly. Yet these problems are too important and too integral to the functioning of an agency with important national security responsibilities not to merit continuing and intensive scrutiny by both CIA managers and the congressional oversight committees.

While the Committee intends to make the CIA's response to this report an area of "special oversight interest" in the years ahead, the Committee also directs the Inspector General of the CIA to provide the Committee, through the Director of Central Intelligence, with a report no later than September 1, 1995, and annually thereafter, on the CIA's progress in responding to the recommendations contained in this report and to the continuing counterintelligence and security challenges that the CIA faces.

APPENDIX D

COUNTERTERRORISM, INTELLIGENCE, AND THE HART-RUDMAN COMMISSION, MARCH 2001

Editor's note: Former Senators Gary Hart (D-CO) and Warren Rudman (R-NH) led a Department of Defense study in the months before the 9/11 attacks that concluded the United States was vulnerable to just such a calamity. Reproduced here are the Commission's central thoughts on intelligence reform to strengthen America's antiterrorist stance.

ROAD MAP FOR NATIONAL SECURITY: IMPERATIVE FOR CHANGE

THE PHASE III REPORT OF THE U.S. COMMISSION ON NATIONAL SECURITY/21ST CENTURY MARCH 15, 2001

F. The Intelligence Community

The basic structure of the U.S. intelligence community does not require change. The community has implemented many of the recommendations for reform made by other studies. This Commission's focus is on those changes in intelligence policy, operations, and resources needed for the full implementation of recommendations found elsewhere within this report.

While the intelligence community is generally given high marks for timely and useful contributions to policymaking and crisis management, it failed to warn of Indian nuclear tests or to anticipate the rapidity of missile developments in Iran and North Korea. U.S.

Source: *Road Map for National Security: Imperative for Change*, U.S. Commission on National Security/21st Century (the Hart-Rudman Commission), Phase III Report (March 15, 2001), pp. 82–86.

intelligence has, at times, been unable to respond to the burgeoning requirements levied by more demanding consumers trying to cope with a more complex array of problems. Steep declines in human intelligence resources over the last decade have been forcing dangerous tradeoffs between coverage of important countries, regions, and functional challenges. Warfighters in theater are often frustrated because the granulated detail of intelligence that they need rarely gets to them, even though they know that it exists somewhere in the intelligence system.

It is a commonplace that the intelligence community lost its focus when the Berlin Wall fell. Since then, three other problems have compounded its challenges. First, the world is a more complex place, with more diffuse dangers requiring different kinds of intelligence and new means of acquiring them. Second, its resources—personnel and monetary—have been reduced. Third, the dangers of terrorism and proliferation, as well as ethnic conflicts and humanitarian emergencies, have led to a focus on providing warning and crisis management rather than long-term analysis.

The result of these three developments is an intelligence community that is more demand-driven than it was two decades ago. That demand is also more driven by military consumers and, therefore, what the intelligence community is doing is narrower and more short-term than it was two decades ago. Given the paucity of resources, this means that important regions and trends are not receiving adequate attention and that the more comprehensive analytical tasks that everyone agrees the intelligence community should be performing simply cannot be done properly.

This Commission has emphasized that *strategic planning* needs to be introduced throughout the national security institutions of the U.S. government. We have also emphasized the critical importance of *preventive diplomac*y. Both require an intelligence community that can support such innovations, *but current trends are leading in the opposite direction.*

This Commission has also stressed the increasing importance of diplomatic and especially economic components in U.S. statecraft. The intelligence community as a whole needs to maintain its level of effort in military domains, but also to do much more in economic domains. In a world where proprietary science and technology developments are increasingly the sinews of national power, the intelligence community needs to be concerned more than ever with U.S. technological security, not least in cyberspace. And here, too, the trends within the intelligence community point not toward, but away from, the country's essential needs. Resources devoted to handling such economic and technical issues are not increasing, but declining.

To respond to these challenges, some recommend strengthening the Director of Central Intelligence (DCI) through organizational changes, such as vesting greater budgetary authority in him and giving him greater control over community personnel. We believe, however, that current efforts to strengthen community management while maintaining the ongoing relationship between the DCI and the Secretary of Defense are bearing fruit. We recommend no major structural changes, but offer certain recommendations to strengthen the DCI's role and the efficiency of the process.

The National Security Act of 1947 gave the National Security Council responsibility for providing guidance with respect to intelligence functions. In practice, however, administrations have varied widely in their approach to this function—sometimes actively setting priorities for intelligence collection and analysis and sometimes focusing simply on coordinating intelligence response in times of crisis.

To achieve the strategy envisioned in our Phase II report, and to make the budgetary recommendations of this section most effective, more consistent attention must be paid to the setting of national intelligence priorities. To do this, we recommend the following:

36 The President should order the setting of national intelligence priorities through National Security Council guidance to the Director of Central Intelligence.

In recommending this, we echo the conclusion of the Commission on the Roles and Capabilities of the United States Intelligence Community (the Brown-Rudman Commission). While we do not want to dictate how future Presidents might use the National Security Council, we believe this is a crucial function that must be filled in some way. The President's authority to set strategic intelligence priorities should be exercised through continuous NSC engagement with the DCI, from which the DCI can establish appropriate collection and analysis priorities. Such an approach would ensure consistent policymaker input into the intelligence effort and, if policymakers come to feel a part of the intelligence process, it should enable greater support for the intelligence community, as well. We believe that this function would be best fulfilled by a true strategic planning staff at the NSC—as discussed in our recommendation 14. *The point is that policy and strategic guidance for intelligence should be formulated in tandem.*

We have emphasized the importance of securing the homeland in this new century and have urged, specifically in recommendation 4, that it be a higher intelligence priority. Making it so means greatly strengthening U.S. human intelligence (HUMINT) capability. This involves ensuring the quality of those entering the community's clandestine service, as well as the recruitment of foreign nationals as agents with the best chance of providing crucial information about terrorism and other threats to the homeland.

Along with the National Commission on Terrorism, we believe that guidelines for the recruitment of foreign nationals should be reviewed to ensure that, while respecting legal and human rights concerns, they maximize the intelligence community's ability to collect intelligence on terrorist plans and methods. We recognize the need to observe basic moral standards in all U.S. government conduct, but the people who can best help U.S. agents penetrate effectively into terrorist organizations, for example, are not liable to be model citizens of spotless virtue. Operative regulations in this respect must balance national security interests with concern for American values and principles. We therefore recommend the following:

37 The Director of Central Intelligence should emphasize the recruitment of human intelligence sources on terrorism as one of the intelligence community's highest priorities, and ensure that operational guidelines are balanced between security needs and respect for American values and principles.

The DCI must also give greater priority to the analysis of economic and science and technology trends where the U.S. intelligence community's capabilities are inadequate. While improvements have been made, especially in the wake of the Asian financial crisis, the global economic and scientific environments are changing so rapidly and dramatically that the United States needs to develop new tools merely to understand what is happening in the world. The Treasury Department has made important strides in this regard, but it has a

long way to go. Treasury and CIA also need to coordinate better efforts in this critical area. We therefore recommend the following:

38 The intelligence community should place new emphasis on collection and analysis of economic and science/technology security concerns, and incorporate more open-source intelligence into analytical products. Congress should support this new emphasis by increasing significantly the National Foreign Intelligence Program (NFIP) budget for collection and analysis.

In order to maintain U.S. strength in traditional areas while building new capabilities, the President and the Congress should give priority to economic and science/technology intelligence. We need to increase overall funding in these areas significantly and the DCI needs to emphasize improvement in the collection and analysis of this intelligence. This will require, in turn, a major investment in the community's long-term analytical capacities, but these capacities are crucial in any event to supporting the strategic planning that we have emphasized throughout this report.

Better analysis in non-military areas also means ensuring that open-source intelligence is a vital part of all-source analysis. Many new challenges, but especially economic, scientific, and technological ones, call for greater attention to the wealth of openly available information. Analyses of the failure of the community to anticipate India's nuclear tests, when clear indications were available in open-source publications, demonstrate that this capability has relevance for traditional security issues as well.

We thus urge the strengthening of HUMINT capabilities, the broadening of analytical efforts across a range of issues, and the incorporation of more open-source information into all-source analysis. Meeting the nation's future intelligence needs, however, will also require changes in the community's technological capabilities.

Technological superiority has long been a hallmark of U.S. intelligence. Yet some agencies within the National Foreign Intelligence Program spend as little as three to four percent of their budget on all aspects of research and development, and as little as one percent on advanced research and development. This reflects a decline in overall intelligence expenditures in real terms, while salaries and benefits for intelligence personnel have been on the rise. Concerted effort is needed to ensure that research and development receive greater funding.

At the same time, the intelligence community must think about its technological capabilities in new ways. During the Cold War, the National Security Agency (NSA) and other agencies derived a great wealth of information through signals and communications intelligence. In today's Internet age, global networks, cable, and wireless communications are increasingly ubiquitous, with attendant improvements in encryption technologies. Together these trends make signal intelligence collection increasingly difficult. The United States must possess the best platforms and capabilities to ensure that it can collect necessary information consistent with respecting Americans' privacy. It must also have high-quality technical and scientific personnel able to respond to future challenges.

To achieve these ends, ***we recommend that the DCI should provide the President a strategic assessment of the effectiveness of current technical intelligence capabilities to ensure the fullest range of collection across all intelligence domains, particularly as they relate to cyberspace and new communications technologies.***

Should the U.S. intelligence community lack a full-spectrum capability either in collection or analysis, the United States would forfeit the depth of intelligence coverage

it enjoyed during the Cold War. Maintaining this edge will require greater funding and expertise in the information and communication sciences. We must also pursue innovative approaches with the private sector to establish access to new technologies as they become available.

This Commission, in sum, urges an overall increase in the NFIP budget to accommodate greater priority placed on nonmilitary intelligence challenges. Military intelligence needs also remain critical, however, so a simple reallocation of existing resources will not suffice. To ensure the continuing technological strength of the community, and to build cutting-edge intelligence platforms, there is no escaping the need for an increase in overall resources for the intelligence community.

APPENDIX E

THE 9/11 COMMISSION RECOMMENDATIONS ON INTELLIGENCE AND COUNTERTERRORISM, 2004

Editor's note: The 9/11 or Kean Commission (led by Republican former governor of New Jersey, Thomas H. Kean) reported in 2004 on its findings regarding the Al Qaeda terrorist attacks against the United States on September 11, 2001. Following are the Commission's main findings on how to organize the government differently to deal with the terrorist threat.

12 WHAT TO DO? A GLOBAL STRATEGY

12.1 REFLECTING ON A GENERATIONAL CHALLENGE

Three years after 9/11, Americans are still thinking and talking about how to protect our nation in this new era. The national debate continues.

Countering terrorism has become, beyond any doubt, the top national security priority for the United States. This shift has occurred with the full support of the Congress, both major political parties, the media, and the American people.

The nation has committed enormous resources to national security and to countering terrorism. Between fiscal year 2001, the last budget adopted before 9/11, and the present fiscal year 2004, total federal spending on defense (including expenditures on both Iraq and Afghanistan), homeland security, and international affairs rose more than 50 percent, from $354 billion to about $547 billion. The United States has not experienced such a rapid surge in national security spending since the Korean War.[1]

This pattern has occurred before in American history. The United States faces a sudden crisis and summons a tremendous exertion of national energy. Then, as that surge

transforms the landscape, comes a time for reflection and reevaluation. Some programs and even agencies are discarded; others are invented or redesigned. Private firms and engaged citizens redefine their relationships with government, working through the processes of the American republic.

Now is the time for that reflection and reevaluation. The United States should consider *what to do*—the shape and objectives of a strategy. Americans should also consider *how to do it*—organizing their government in a different way.

Defining the Threat

In the post-9/11 world, threats are defined more by the fault lines within societies than by the territorial boundaries between them. From terrorism to global disease or environmental degradation, the challenges have become transnational rather than international. That is the defining quality of world politics in the twenty-first century.

National security used to be considered by studying foreign frontiers, weighing opposing groups of states, and measuring industrial might. To be dangerous, an enemy had to muster large armies. Threats emerged slowly, often visibly, as weapons were forged, armies conscripted, and units trained and moved into place. Because large states were more powerful, they also had more to lose. They could be deterred.

Now threats can emerge quickly. An organization like al Qaeda, headquartered in a country on the other side of the earth, in a region so poor that electricity or telephones were scarce, could nonetheless scheme to wield weapons of unprecedented destructive power in the largest cities of the United States.

In this sense, 9/11 has taught us that terrorism against American interests "over there" should be regarded just as we regard terrorism against America "over here." In this same sense, the American homeland is the planet.

But the enemy is not just "terrorism," some generic evil.[2] This vagueness blurs the strategy. The catastrophic threat at this moment in history is more specific. It is the threat posed by *Islamist* terrorism—especially the al Qaeda network, its affiliates, and its ideology.[3]

As we mentioned in chapter 2, Usama Bin Ladin and other Islamist terrorist leaders draw on a long tradition of extreme intolerance within one stream of Islam (a minority tradition), from at least Ibn Taimiyyah, through the founders of Wahhabism, through the Muslim Brotherhood, to Sayyid Qutb. That stream is motivated by religion and does not distinguish politics from religion, thus distorting both. It is further fed by grievances stressed by Bin Ladin and widely felt throughout the Muslim world—against the U.S. military presence in the Middle East, policies perceived as anti-Arab and anti-Muslim, and support of Israel. Bin Ladin and Islamist terrorists mean exactly what they say: to them America is the font of all evil, the "head of the snake," and it must be converted or destroyed.

It is not a position with which Americans can bargain or negotiate. With it there is no common ground—not even respect for life—on which to begin a dialogue. It can only be destroyed or utterly isolated.

Because the Muslim world has fallen behind the West politically, economically, and militarily for the past three centuries, and because few tolerant or secular Muslim democracies provide alternative models for the future, Bin Ladin's message finds receptive ears. It has attracted active support from thousands of disaffected young Muslims and

resonates powerfully with a far larger number who do not actively support his methods. The resentment of America and the West is deep, even among leaders of relatively successful Muslim states.[4]

Tolerance, the rule of law, political and economic openness, the extension of greater opportunities to women—these cures must come from within Muslim societies themselves. The United States must support such developments.

But this process is likely to be measured in decades, not years. It is a process that will be violently opposed by Islamist terrorist organizations, both inside Muslim countries and in attacks on the United States and other Western nations. The United States finds itself caught up in a clash *within* a civilization. That clash arises from particular conditions in the Muslim world, conditions that spill over into expatriate Muslim communities in non-Muslim countries.

Our enemy is twofold: al Qaeda, a stateless network of terrorists that struck us on 9/11; and a radical ideological movement in the Islamic world, inspired in part by al Qaeda, which has spawned terrorist groups and violence across the globe. The first enemy is weakened, but continues to pose a grave threat. The second enemy is gathering, and will menace Americans and American interests long after Usama Bin Ladin and his cohorts are killed or captured. Thus our strategy must match our means to two ends: dismantling the al Qaeda network and prevailing in the longer term over the ideology that gives rise to Islamist terrorism.

Islam is not the enemy. It is not synonymous with terror. Nor does Islam teach terror. America and its friends oppose a perversion of Islam, not the great world faith itself. Lives guided by religious faith, including literal beliefs in holy scriptures, are common to every religion, and represent no threat to us.

Other religions have experienced violent internal struggles. With so many diverse adherents, every major religion will spawn violent zealots. Yet understanding and tolerance among people of different faiths can and must prevail.

The present transnational danger is Islamist terrorism. What is needed is a broad political-military strategy that rests on a firm tripod of policies to

- attack terrorists and their organizations;
- prevent the continued growth of Islamist terrorism; and
- protect against and prepare for terrorist attacks.

More Than a War on Terrorism

Terrorism is a tactic used by individuals and organizations to kill and destroy. Our efforts should be directed at those individuals and organizations.

Calling this struggle a war accurately describes the use of American and allied armed forces to find and destroy terrorist groups and their allies in the field, notably in Afghanistan. The language of war also evokes the mobilization for a national effort. Yet the strategy should be balanced.

The first phase of our post-9/11 efforts rightly included military action to topple the Taliban and pursue al Qaeda. This work continues. But long-term success demands the use of all elements of national power: diplomacy, intelligence, covert action, law enforcement, economic policy, foreign aid, public diplomacy, and homeland defense. If we favor one tool while neglecting others, we leave ourselves vulnerable and weaken our national effort.

Certainly the strategy should include offensive operations to counter terrorism. Terrorists should no longer find safe haven where their organizations can grow and flourish. America's strategy should be a coalition strategy, that includes Muslim nations as partners in its development and implementation.

Our effort should be accompanied by a preventive strategy that is as much, or more, political as it is military. The strategy must focus clearly on the Arab and Muslim world, in all its variety.

Our strategy should also include defenses. America can be attacked in many ways and has many vulnerabilities. No defenses are perfect. But risks must be calculated; hard choices must be made about allocating resources. Responsibilities for America's defense should be clearly defined. Planning does make a difference, identifying where a little money might have a large effect. Defenses also complicate the plans of attackers, increasing their risks of discovery and failure. Finally, the nation must prepare to deal with attacks that are not stopped.

Measuring Success

What should Americans expect from their government in the struggle against Islamist terrorism? The goals seem unlimited: Defeat terrorism anywhere in the world. But Americans have also been told to expect the worst: An attack is probably coming; it may be terrible.

With such benchmarks, the justifications for action and spending seem limitless. Goals are good. Yet effective public policies also need concrete objectives. Agencies need to be able to measure success.

These measurements do not need to be quantitative: government cannot measure success in the ways that private firms can. But the targets should be specific enough so that reasonable observers—in the White House, the Congress, the media, or the general public—can judge whether or not the objectives have been attained.

Vague goals match an amorphous picture of the enemy. Al Qaeda and its affiliates are popularly described as being all over the world, adaptable, resilient, needing little higher-level organization, and capable of anything. The American people are thus given the picture of an omnipotent, unslayable hydra of destruction. This image lowers expectations for government effectiveness.

It should not lower them too far. Our report shows a determined and capable group of plotters. Yet the group was fragile, dependent on a few key personalities, and occasionally left vulnerable by the marginal, unstable people often attracted to such causes. The enemy made mistakes—like Khalid al Mihdhar's unauthorized departure from the United States that required him to enter the country again in July 2001, or the selection of Zacarias Moussaoui as a participant and Ramzi Binalshibh's transfer of money to him. The U.S. government was not able to capitalize on those mistakes in time to prevent 9/11.

We do not believe it is possible to defeat all terrorist attacks against Americans, every time and everywhere. A president should tell the American people:

- No president can promise that a catastrophic attack like that of 9/11 will not happen again. History has shown that even the most vigilant and expert agencies cannot always prevent determined, suicidal attackers from reaching a target.

- But the American people are entitled to expect their government to do its very best. They should expect that officials will have realistic objectives, clear guidance, and effective organization. They are entitled to see some standards for performance so they can judge, with the help of their elected representatives, whether the objectives are being met.

12.2 ATTACK TERRORISTS AND THEIR ORGANIZATIONS

The U.S. government, joined by other governments around the world, is working through intelligence, law enforcement, military, financial, and diplomatic channels to identify, disrupt, capture, or kill individual terrorists. This effort was going on before 9/11 and it continues on a vastly enlarged scale. But to catch terrorists, a U.S. or foreign agency needs to be able to find and reach them.

No Sanctuaries

The 9/11 attack was a complex international operation, the product of years of planning. Bombings like those in Bali in 2003 or Madrid in 2004, while able to take hundreds of lives, can be mounted locally. Their requirements are far more modest in size and complexity. They are more difficult to thwart. But the U.S. government must build the capacities to prevent a 9/11-scale plot from succeeding, and those capabilities will help greatly to cope with lesser but still devastating attacks.

A complex international terrorist operation aimed at launching a catastrophic attack cannot be mounted by just anyone in any place. Such operations appear to require

- time, space, and ability to perform competent planning and staff work;
- a command structure able to make necessary decisions and possessing the authority and contacts to assemble needed people, money, and materials;
- opportunity and space to recruit, train, and select operatives with the needed skills and dedication, providing the time and structure required to socialize them into the terrorist cause, judge their trustworthiness, and hone their skills;
- a logistics network able to securely manage the travel of operatives, move money, and transport resources (like explosives) where they need to go;
- access, in the case of certain weapons, to the special materials needed for a nuclear, chemical, radiological, or biological attack;
- reliable communications between coordinators and operatives; and
- opportunity to test the workability of the plan.

Many details in chapters 2, 5, and 7 illustrate the direct and indirect value of the Afghan sanctuary to al Qaeda in preparing the 9/11 attack and other operations. The organization cemented personal ties among veteran jihadists working together there for years. It had the operational space to gather and sift recruits, indoctrinating them in isolated, desert camps. It built up logistical networks, running through Pakistan and the United Arab Emirates.

Al Qaeda also exploited relatively lax internal security environments in Western countries, especially Germany. It considered the environment in the United States so hospitable that the 9/11 operatives used America as their staging area for further training

and exercises—traveling into, out of, and around the country and complacently using their real names with little fear of capture.

To find sanctuary, terrorist organizations have fled to some of the least governed, most lawless places in the world. The intelligence community has prepared a world map that highlights possible terrorist havens, using no secret intelligence—just indicating areas that combine rugged terrain, weak governance, room to hide or receive supplies, and low population density with a town or city near enough to allow necessary interaction with the outside world. Large areas scattered around the world meet these criteria.[5]

In talking with American and foreign government officials and military officers on the front lines fighting terrorists today, we asked them: If you were a terrorist leader today, where would you locate your base? Some of the same places come up again and again on their lists:

- western Pakistan and the Pakistan-Afghanistan border region
- southern or western Afghanistan
- the Arabian Peninsula, especially Saudi Arabia and Yemen, and the nearby Horn of Africa, including Somalia and extending southwest into Kenya
- Southeast Asia, from Thailand to the southern Philippines to Indonesia
- West Africa, including Nigeria and Mali
- European cities with expatriate Muslim communities, especially cities in central and eastern Europe where security forces and border controls are less effective

In the twentieth century, strategists focused on the world's great industrial heartlands. In the twenty-first, the focus is in the opposite direction, toward remote regions and failing states. The United States has had to find ways to extend its reach, straining the limits of its influence.

Every policy decision we make needs to be seen through this lens. If, for example, Iraq becomes a failed state, it will go to the top of the list of places that are breeding grounds for attacks against Americans at home. Similarly, if we are paying insufficient attention to Afghanistan, the rule of the Taliban or warlords and narcotraffickers may reemerge and its countryside could once again offer refuge to al Qaeda, or its successor.

Recommendation: The U.S. government must identify and prioritize actual or potential terrorist sanctuaries. For each, it should have a realistic strategy to keep possible terrorists insecure and on the run, using all elements of national power. We should reach out, listen to, and work with other countries that can help.

We offer three illustrations that are particularly applicable today, in 2004: Pakistan, Afghanistan, and Saudi Arabia.

PAKISTAN

Pakistan's endemic poverty, widespread corruption, and often ineffective government create opportunities for Islamist recruitment. Poor education is a particular concern. Millions of families, especially those with little money, send their children to religious schools, or madrassahs. Many of these schools are the only opportunity available for an education, but some have been used as incubators for violent extremism. According to Karachi's

police commander, there are 859 madrassahs teaching more than 200,000 youngsters in his city alone.[6]

It is hard to overstate the importance of Pakistan in the struggle against Islamist terrorism. Within Pakistan's borders are 150 million Muslims, scores of al Qaeda terrorists, many Taliban fighters, and—perhaps—Usama Bin Ladin. Pakistan possesses nuclear weapons and has come frighteningly close to war with nuclear-armed India over the disputed territory of Kashmir. A political battle among anti-American Islamic fundamentalists, the Pakistani military, and more moderate mainstream political forces has already spilled over into violence, and there have been repeated recent attempts to kill Pakistan's president, Pervez Musharraf.

In recent years, the United States has had three basic problems in its relationship with Pakistan:

- On terrorism, Pakistan helped nurture the Taliban. The Pakistani army and intelligence services, especially below the top ranks, have long been ambivalent about confronting Islamist extremists. Many in the government have sympathized with or provided support to the extremists. Musharraf agreed that Bin Ladin was bad. But before 9/11, preserving good relations with the Taliban took precedence.
- On proliferation, Musharraf has repeatedly said that Pakistan does not barter with its nuclear technology. But proliferation concerns have been long-standing and very serious. Most recently, the Pakistani government has claimed not to have known that one of its nuclear weapons developers, a national figure, was leading the most dangerous nuclear smuggling ring ever disclosed.
- Finally, Pakistan has made little progress toward the return of democratic rule at the national level, although that turbulent process does continue to function at the provincial level and the Pakistani press remains relatively free.

Immediately after 9/11, confronted by the United States with a stark choice, Pakistan made a strategic decision. Its government stood aside and allowed the U.S.-led coalition to destroy the Taliban regime. In other ways, Pakistan actively assisted: its authorities arrested more than 500 al Qaeda operatives and Taliban members, and Pakistani forces played a leading part in tracking down KSM, Abu Zubaydah, and other key al Qaeda figures.[7]

In the following two years, the Pakistani government tried to walk the fence, helping against al Qaeda while seeking to avoid a larger confrontation with Taliban remnants and other Islamic extremists. When al Qaeda and its Pakistani allies repeatedly tried to assassinate Musharraf, almost succeeding, the battle came home.

The country's vast unpoliced regions make Pakistan attractive to extremists seeking refuge and recruits and also provide a base for operations against coalition forces in Afghanistan. Almost all the 9/11 attackers traveled the north-south nexus of Kandahar–Quetta–Karachi. The Baluchistan region of Pakistan (KSM's ethnic home) and the sprawling city of Karachi remain centers of Islamist extremism where the U.S. and Pakistani security and intelligence presence has been weak. The U.S. consulate in Karachi is a makeshift fortress, reflecting the gravity of the surrounding threat.[8]

During the winter of 2003–2004, Musharraf made another strategic decision. He ordered the Pakistani army into the frontier provinces of northwest Pakistan along the Afghan border, where Bin Ladin and Ayman al Zawahiri have reportedly taken refuge. The army is confronting groups of al Qaeda fighters and their local allies in very difficult terrain.

On the other side of the frontier, U.S. forces in Afghanistan have found it challenging to organize effective joint operations, given Pakistan's limited capabilities and reluctance to permit U.S. military operations on its soil. Yet in 2004, it is clear that the Pakistani government is trying harder than ever before in the battle against Islamist terrorists.[9]

Acknowledging these problems and Musharraf's own part in the story, we believe that Musharraf's government represents the best hope for stability in Pakistan and Afghanistan.

- In an extraordinary public essay asking how Muslims can "drag ourselves out of the pit we find ourselves in, to raise ourselves up," Musharraf has called for a strategy of "enlightened moderation." The Muslim world, he said, should shun militancy and extremism; the West—and the United States in particular—should seek to resolve disputes with justice and help better the Muslim world.[10]
- Having come close to war in 2002 and 2003, Pakistan and India have recently made significant progress in peacefully discussing their longstanding differences. The United States has been and should remain a key supporter of that process.
- The constant refrain of Pakistanis is that the United States long treated them as allies of convenience. As the United States makes fresh commitments now, it should make promises it is prepared to keep, for years to come.

Recommendation: If Musharraf stands for enlightened moderation in a fight for his life and for the life of his country, the United States should be willing to make hard choices too, and make the difficult long-term commitment to the future of Pakistan. Sustaining the current scale of aid to Pakistan, the United States should support Pakistan's government in its struggle against extremists with a comprehensive effort that extends from military aid to support for better education, so long as Pakistan's leaders remain willing to make difficult choices of their own.

Afghanistan

Afghanistan was the incubator for al Qaeda and for the 9/11 attacks. In the fall of 2001, the U.S.-led international coalition and its Afghan allies toppled the Taliban and ended the regime's protection of al Qaeda. Notable progress has been made. International cooperation has been strong, with a clear UN mandate and a NATO-led peacekeeping force (the International Security Assistance Force, or ISAF). More than 10,000 American soldiers are deployed today in Afghanistan, joined by soldiers from NATO allies and Muslim states. A central government has been established in Kabul, with a democratic constitution, new currency, and a new army. Most Afghans enjoy greater freedom, women and girls are emerging from subjugation, and 3 million children have returned to school. For the first time in many years, Afghans have reason to hope.[11]

But grave challenges remain. Taliban and al Qaeda fighters have regrouped in the south and southeast. Warlords control much of the country beyond Kabul, and the land is awash in weapons. Economic development remains a distant hope. The narcotics trade—long a massive sector of the Afghan economy—is again booming. Even the most hardened aid workers refuse to operate in many regions, and some warn that Afghanistan is near the brink of chaos.[12]

Battered Afghanistan has a chance. Elections are being prepared. It is revealing that in June 2004,Taliban fighters resorted to slaughtering 16 Afghans on a bus, apparently for no

reason other than their boldness in carrying an unprecedented Afghan weapon: a voter registration card.

Afghanistan's president, Hamid Karzai, is brave and committed. He is trying to build genuinely national institutions that can overcome the tradition of allocating powers among ethnic communities. Yet even if his efforts are successful and elections bring a democratic government to Afghanistan, the United States faces some difficult choices.

After paying relatively little attention to rebuilding Afghanistan during the military campaign, U.S. policies changed noticeably during 2003. Greater consideration of the political dimension and congressional support for a substantial package of assistance signaled a longer-term commitment to Afghanistan's future. One Afghan regional official plaintively told us the country finally has a good government. He begged the United States to keep its promise and not abandon Afghanistan again, as it had in the 1990s. Another Afghan leader noted that if the United States leaves, "we will lose all that we have gained."[13]

Most difficult is to define the security mission in Afghanistan. There is continuing political controversy about whether military operations in Iraq have had any effect on the scale of America's commitment to the future of Afghanistan. The United States has largely stayed out of the central government's struggles with dissident warlords and it has largely avoided confronting the related problem of narcotrafficking.[14]

Recommendation: The President and the Congress deserve praise for their efforts in Afghanistan so far. Now the United States and the international community should make a long-term commitment to a secure and stable Afghanistan, in order to give the government a reasonable opportunity to improve the life of the Afghan people. Afghanistan must not again become a sanctuary for international crime and terrorism. The United States and the international community should help the Afghan government extend its authority over the country, with a strategy and nation-by-nation commitments to achieve their objectives.

- This is an ambitious recommendation. It would mean a redoubled effort to secure the country, disarm militias, and curtail the age of warlord rule. But the United States and NATO have already committed themselves to the future of this region—wisely, as the 9/11 story shows—and failed half-measures could be worse than useless.
- NATO in particular has made Afghanistan a test of the Alliance's ability to adapt to current security challenges of the future. NATO must pass this test. Currently, the United States and the international community envision enough support so that the central government can build a truly national army and extend essential infrastructure and minimum public services to major towns and regions. The effort relies in part on foreign civil-military teams, arranged under various national flags. The institutional commitments of NATO and the United Nations to these enterprises are weak. NATO member states are not following through; some of the other states around the world that have pledged assistance to Afghanistan are not fulfilling their pledges.
- The U.S. presence in Afghanistan is overwhelmingly oriented toward military and security work. The State Department presence is woefully understaffed, and the military mission is narrowly focused on al Qaeda and Taliban remnants in the south and southeast. The U.S. government can do its part if the international community decides on a joint effort to restore the rule of law and contain rampant crime and narcotics trafficking in this crossroads of Central Asia.[15]

We heard again and again that the money for assistance is allocated so rigidly that, on the ground, one U.S. agency often cannot improvise or pitch in to help another agency, even in small ways when a few thousand dollars could make a great difference.

The U.S. government should allocate money so that lower-level officials have more flexibility to get the job done across agency lines, adjusting to the circumstances they find in the field. This should include discretionary funds for expenditures by military units that often encounter opportunities to help the local population.

Saudi Arabia

Saudi Arabia has been a problematic ally in combating Islamic extremism. At the level of high policy, Saudi Arabia's leaders cooperated with American diplomatic initiatives aimed at the Taliban or Pakistan before 9/11. At the same time, Saudi Arabia's society was a place where al Qaeda raised money directly from individuals and through charities. It was the society that produced 15 of the 19 hijackers.

The Kingdom is one of the world's most religiously conservative societies, and its identity is closely bound to its religious links, especially its position as the guardian of Islam's two holiest sites. Charitable giving, or *zakat,* is one of the five pillars of Islam. It is broader and more pervasive than Western ideas of charity—functioning also as a form of income tax, educational assistance, foreign aid, and a source of political influence. The Western notion of the separation of civic and religious duty does not exist in Islamic cultures. Funding charitable works is an integral function of the governments in the Islamic world. It is so ingrained in Islamic culture that in Saudi Arabia, for example, a department within the Saudi Ministry of Finance and National Economy collects zakat directly, much as the U.S. Internal Revenue Service collects payroll withholding tax. Closely tied to zakat is the dedication of the government to propagating the Islamic faith, particularly the Wahhabi sect that flourishes in Saudi Arabia.

Traditionally, throughout the Muslim world, there is no formal oversight mechanism for donations. As Saudi wealth increased, the amounts contributed by individuals and the state grew dramatically. Substantial sums went to finance Islamic charities of every kind.

While Saudi domestic charities are regulated by the Ministry of Labor and Social Welfare, charities and international relief agencies, such as the World Assembly of MuslimYouth (WAMY), are currently regulated by the Ministry of Islamic Affairs. This ministry uses zakat and government funds to spread Wahhabi beliefs throughout the world, including in mosques and schools. Often these schools provide the only education available; even in affluent countries, Saudi-funded Wahhabi schools are often the only Islamic schools. Some Wahhabi-funded organizations have been exploited by extremists to further their goal of violent jihad against non-Muslims. One such organization has been the al Haramain Islamic Foundation; the assets of some branch offices have been frozen by the U.S. and Saudi governments.

Until 9/11, few Saudis would have considered government oversight of charitable donations necessary; many would have perceived it as interference in the exercise of their faith. At the same time, the government's ability to finance most state expenditures with energy revenues has delayed the need for a modern income tax system. As a result, there have been strong religious, cultural, and administrative barriers to monitoring charitable spending. That appears to be changing, however, now that the goal of violent jihad also extends to overthrowing Sunni governments (such as the House of Saud) that are not living up to the ideals of the Islamist extremists.[16]

The leaders of the United States and the rulers of Saudi Arabia have long had friendly relations, rooted in fundamentally common interests against the Soviet Union during the Cold War, in American hopes that Saudi oil supplies would stabilize the supply and price of oil in world markets, and in Saudi hopes that America could help protect the Kingdom against foreign threats.

In 1990, the Kingdom hosted U.S. armed forces before the first U.S.-led war against Iraq. American soldiers and airmen have given their lives to help protect Saudi Arabia. The Saudi government has difficulty acknowledging this. American military bases remained there until 2003, as part of an international commitment to contain Iraq.

For many years, leaders on both sides preferred to keep their ties quiet and behind the scenes. As a result, neither the U.S. nor the Saudi people appreciated all the dimensions of the bilateral relationship, including the Saudi role in U.S. strategies to promote the Middle East peace process. In each country, political figures find it difficult to publicly defend good relations with the other.

Today, mutual recriminations flow. Many Americans see Saudi Arabia as an enemy, not as an embattled ally. They perceive an autocratic government that oppresses women, dominated by a wealthy and indolent elite. Saudi contacts with American politicians are frequently invoked as accusations in partisan political arguments. Americans are often appalled by the intolerance, anti-Semitism, and anti-American arguments taught in schools and preached in mosques.

Saudis are angry too. Many educated Saudis who were sympathetic to America now perceive the United States as an unfriendly state. One Saudi reformer noted to us that the demonization of Saudi Arabia in the U.S. media gives ammunition to radicals, who accuse reformers of being U.S. lackeys. Tens of thousands of Saudis who once regularly traveled to (and often had homes in) the United States now go elsewhere.[17]

Among Saudis, the United States is seen as aligned with Israel in its conflict with the Palestinians, with whom Saudis ardently sympathize. Although Saudi Arabia's cooperation against terrorism improved to some extent after the September 11 attacks, significant problems remained. Many in the Kingdom initially reacted with disbelief and denial. In the following months, as the truth became clear, some leading Saudis quietly acknowledged the problem but still did not see their own regime as threatened, and thus often did not respond promptly to U.S. requests for help. Though Saddam Hussein was widely detested, many Saudis are sympathetic to the anti-U.S. insurgents in Iraq, although majorities also condemn jihadist attacks in the Kingdom.[18]

As in Pakistan, Yemen, and other countries, attitudes changed when the terrorism came home. Cooperation had already become significant, but after the bombings in Riyadh on May 12, 2003, it improved much more. The Kingdom openly discussed the problem of radicalism, criticized the terrorists as religiously deviant, reduced official support for religious activity overseas, closed suspect charitable foundations, and publicized arrests—very public moves for a government that has preferred to keep internal problems quiet.

The Kingdom of Saudi Arabia is now locked in mortal combat with al Qaeda. Saudi police are regularly being killed in shootouts with terrorists. In June 2004, the Saudi ambassador to the United States called publicly—in the Saudi press—for his government to wage a jihad of its own against the terrorists. "We must all, as a state and as a people, recognize the truth about these criminals," he declared, "[i]f we do not declare a general mobilization—we will lose this war on terrorism."[19]

Saudi Arabia is a troubled country. Although regarded as very wealthy, in fact per capita income has dropped from $28,000 at its height to the present level of about $8,000. Social and religious traditions complicate adjustment to modern economic activity and limit employment opportunities for young Saudis. Women find their education and employment sharply limited.

President Clinton offered us a perceptive analysis of Saudi Arabia, contending that fundamentally friendly rulers have been constrained by their desire to preserve the status quo. He, like others, made the case for pragmatic reform instead. He hopes the rulers will envision what they want their Kingdom to become in 10 or 20 years, and start a process in which their friends can help them change.[20]

There are signs that Saudi Arabia's royal family is trying to build a consensus for political reform, though uncertain about how fast and how far to go. Crown Prince Abdullah wants the Kingdom to join the World Trade Organization to accelerate economic liberalization. He has embraced the *Arab Human Development Report*, which was highly critical of the Arab world's political, economic, and social failings and called for greater economic and political reform.[21]

Cooperation with Saudi Arabia against Islamist terrorism is very much in the U.S. interest. Such cooperation can exist for a time largely in secret, as it does now, but it cannot grow and thrive there. Nor, on either side, can friendship be unconditional.

Recommendation: The problems in the U.S.-Saudi relationship must be confronted, openly. The United States and Saudi Arabia must determine if they can build a relationship that political leaders on both sides are prepared to publicly defend—a relationship about more than oil. It should include a shared commitment to political and economic reform, as Saudis make common cause with the outside world. It should include a shared interest in greater tolerance and cultural respect, translating into a commitment to fight the violent extremists who foment hatred.

12.3 PREVENT THE CONTINUED GROWTH OF ISLAMIST TERRORISM

In October 2003, reflecting on progress after two years of waging the global war on terrorism, Defense Secretary Donald Rumsfeld asked his advisers: "Are we capturing, killing or deterring and dissuading more terrorists every day than the madrassas and the radical clerics are recruiting, training and deploying against us? Does the US need to fashion a broad, integrated plan to stop the next generation of terrorists? The US is putting relatively little effort into a long-range plan, but we are putting a great deal of effort into trying to stop terrorists. The cost-benefit ratio is against us! Our cost is billions against the terrorists' costs of millions."[22]

These are the right questions. Our answer is that we need short-term action on a long-range strategy, one that invigorates our foreign policy with the attention that the President and Congress have given to the military and intelligence parts of the conflict against Islamist terrorism.

Engage the Struggle of Ideas

The United States is heavily engaged in the Muslim world and will be for many years to come. This American engagement is resented. Polls in 2002 found that among America's

friends, like Egypt—the recipient of more U.S. aid for the past 20 years than any other Muslim country—only 15 percent of the population had a favorable opinion of the United States. In Saudi Arabia the number was 12 percent. And two-thirds of those surveyed in 2003 in countries from Indonesia to Turkey (a NATO ally) were very or somewhat fearful that the United States may attack them.[23]

Support for the United States has plummeted. Polls taken in Islamic countries after 9/11 suggested that many or most people thought the United States was doing the right thing in its fight against terrorism; few people saw popular support for al Qaeda; half of those surveyed said that ordinary people had a favorable view of the United States. By 2003, polls showed that "the bottom has fallen out of support for America in most of the Muslim world. Negative views of the U.S. among Muslims, which had been largely limited to countries in the Middle East, have spread. . . . Since last summer, favorable ratings for the U.S. have fallen from 61% to 15% in Indonesia and from 71% to 38% among Muslims in Nigeria."[24]

Many of these views are at best uninformed about the United States and, at worst, informed by cartoonish stereotypes, the coarse expression of a fashionable "Occidentalism" among intellectuals who caricature U.S. values and policies. Local newspapers and the few influential satellite broadcasters—like al Jazeera—often reinforce the jihadist theme that portrays the United States as anti-Muslim.[25]

The small percentage of Muslims who are fully committed to Usama Bin Ladin's version of Islam are impervious to persuasion. It is among the large majority of Arabs and Muslims that we must encourage reform, freedom, democracy, and opportunity, even though our own promotion of these messages is limited in its effectiveness simply because we are its carriers. Muslims themselves will have to reflect upon such basic issues as the concept of jihad, the position of women, and the place of non-Muslim minorities. The United States can promote moderation, but cannot ensure its ascendancy. Only Muslims can do this.

The setting is diffcult. The combined gross domestic product of the 22 countries in the Arab League is less than the GDP of Spain. Forty percent of adult Arabs are illiterate, two-thirds of them women. One-third of the broader Middle East lives on less than two dollars a day. Less than 2 percent of the population has access to the Internet. The majority of older Arab youths have expressed a desire to emigrate to other countries, particularly those in Europe.[26]

In short, the United States has to help defeat an ideology, not just a group of people, and we must do so under difficult circumstances. How can the United States and its friends help moderate Muslims combat the extremist ideas?

Recommendation: The U.S. government must define what the message is, what it stands for. We should offer an example of moral leadership in the world, committed to treat people humanely, abide by the rule of law, and be generous and caring to our neighbors. America and Muslim friends can agree on respect for human dignity and opportunity. To Muslim parents, terrorists like Bin Ladin have nothing to offer their children but visions of violence and death. America and its friends have a crucial advantage—we can offer these parents a vision that might give their children a better future. If we heed the views of thoughtful leaders in the Arab and Muslim world, a moderate consensus can be found.

That vision of the future should stress life over death: individual educational and economic opportunity. This vision includes widespread political participation and contempt for

indiscriminate violence. It includes respect for the rule of law, openness in discussing differences, and tolerance for opposing points of view.

Recommendation: Where Muslim governments, even those who are friends, do not respect these principles, the United States must stand for a better future. One of the lessons of the long Cold War was that short-term gains in cooperating with the most repressive and brutal governments were too often outweighed by long-term setbacks for America's stature and interests.

American foreign policy is part of the message. America's policy choices have consequences. Right or wrong, it is simply a fact that American policy regarding the Israeli-Palestinian conflict and American actions in Iraq are dominant staples of popular commentary across the Arab and Muslim world. That does not mean U.S. choices have been wrong. It means those choices must be integrated with America's message of opportunity to the Arab and Muslim world. Neither Israel nor the new Iraq will be safer if worldwide Islamist terrorism grows stronger.

The United States must do more to communicate its message. Reflecting on Bin Ladin's success in reaching Muslim audiences, Richard Holbrooke wondered, "How can a man in a cave outcommunicate the world's leading communications society?" Deputy Secretary of State Richard Armitage worried to us that Americans have been "exporting our fears and our anger," not our vision of opportunity and hope.[27]

Recommendation: Just as we did in the Cold War, we need to defend our ideals abroad vigorously. America does stand up for its values. The United States defended, and still defends, Muslims against tyrants and criminals in Somalia, Bosnia, Kosovo, Afghanistan, and Iraq. If the United States does not act aggressively to define itself in the Islamic world, the extremists will gladly do the job for us.

- **Recognizing that Arab and Muslim audiences rely on satellite television and radio, the government has begun some promising initiatives in television and radio broadcasting to the Arab world, Iran, and Afghanistan. These efforts are beginning to reach large audiences. The Broadcasting Board of Governors has asked for much larger resources. It should get them.**
- **The United States should rebuild the scholarship, exchange, and library programs that reach out to young people and offer them knowledge and hope. Where such assistance is provided, it should be identified as coming from the citizens of the United States.**

An Agenda of Opportunity

The United States and its friends can stress educational and economic opportunity. The United Nations has rightly equated "literacy as freedom."

- The international community is moving toward setting a concrete goal—to cut the Middle East region's illiteracy rate in half by 2010, targeting women and girls and supporting programs for adult literacy.
- Unglamorous help is needed to support the basics, such as textbooks that translate more of the world's knowledge into local languages and libraries to house such materials. Education about the outside world, or other cultures, is weak.

- More vocational education is needed, too, in trades and business skills. The Middle East can also benefit from some of the programs to bridge the digital divide and increase Internet access that have already been developed for other regions of the world.

Education that teaches tolerance, the dignity and value of each individual, and respect for different beliefs is a key element in any global strategy to eliminate Islamist terrorism.

Recommendation: The U.S. government should offer to join with other nations in generously supporting a new International Youth Opportunity Fund. Funds will be spent directly for building and operating primary and secondary schools in those Muslim states that commit to sensibly investing their own money in public education.

Economic openness is essential. Terrorism is not caused by poverty. Indeed, many terrorists come from relatively well-off families. Yet when people lose hope, when societies break down, when countries fragment, the breeding grounds for terrorism are created. Backward economic policies and repressive political regimes slip into societies that are without hope, where ambition and passions have no constructive outlet.

The policies that support economic development and reform also have political implications. Economic and political liberties tend to be linked. Commerce, especially international commerce, requires ongoing cooperation and compromise, the exchange of ideas across cultures, and the peaceful resolution of differences through negotiation or the rule of law. Economic growth expands the middle class, a constituency for further reform. Successful economies rely on vibrant private sectors, which have an interest in curbing indiscriminate government power. Those who develop the practice of controlling their own economic destiny soon desire a voice in their communities and political societies.

The U.S. government has announced the goal of working toward a Middle East Free Trade Area, or MEFTA, by 2013. The United States has been seeking comprehensive free trade agreements (FTAs) with the Middle Eastern nations most firmly on the path to reform. The U.S.-Israeli FTA was enacted in 1985, and Congress implemented an FTA with Jordan in 2001. Both agreements have expanded trade and investment, thereby supporting domestic economic reform. In 2004, new FTAs were signed with Morocco and Bahrain, and are awaiting congressional approval. These models are drawing the interest of their neighbors. Muslim countries can become full participants in the rules-based global trading system, as the United States considers lowering its trade barriers with the poorest Arab nations.

Recommendation: A comprehensive U.S. Strategy to counter terrorism should include economic policies that encourage development, more open societies, and opportunities for people to improve the lives of their families and to enhance prospects for their children's future.

Turning a National Strategy into a Coalition Strategy

Practically every aspect of U.S. counterterrorism strategy relies on international cooperation. Since 9/11, these contacts concerning military, law enforcement, intelligence, travel and customs, and financial matters have expanded so dramatically, and often in an ad hoc way, that it is difficult to track these efforts, much less integrate them.

Recommendation: The United States should engage other nations in developing a comprehensive coalition strategy against Islamist terrorism. There are several multilateral institutions in which such issues should be addressed. But the most important policies should be discussed and coordinated in a flexible contact group of leading coalition governments. This is a good place, for example, to develop joint strategies for targeting terrorist travel, or for hammering out a common strategy for the places where terrorists may be finding sanctuary.

Presently the Muslim and Arab states meet with each other, in organizations such as the Islamic Conference and the Arab League. The Western states meet with each other in organizations such as NATO and the Group of Eight summit of leading industrial nations. A recent G-8 summit initiative to begin a dialogue about reform may be a start toward finding a place where leading Muslim states can discuss—and be seen to discuss—critical policy issues with the leading Western powers committed to the future of the Arab and Muslim world.

These new international efforts can create durable habits of visible cooperation, as states willing to step up to their responsibilities join together in constructive efforts to direct assistance and coordinate action.

Coalition warfare also requires coalition policies on what to do with enemy captives. Allegations that the United States abused prisoners in its custody make it harder to build the diplomatic, political, and military alliances the government will need. The United States should work with friends to develop mutually agreed-on principles for the detention and humane treatment of captured international terrorists who are not being held under a particular country's criminal laws. Countries such as Britain, Australia, and Muslim friends, are committed to fighting terrorists. America should be able to reconcile its views on how to balance humanity and security with our nation's commitment to these same goals.

The United States and some of its allies do not accept the application of full Geneva Convention treatment of prisoners of war to captured terrorists. Those Conventions establish a minimum set of standards for prisoners in internal conflicts. Since the international struggle against Islamist terrorism is not internal, those provisions do not formally apply, but they are commonly accepted as basic standards for humane treatment.

Recommendation: The United States should engage its friends to develop a common coalition approach toward the detention and humane treatment of captured terrorists. New principles might draw upon Article 3 of the Geneva Conventions on the law of armed conflict. That article was specifically designed for those cases in which the usual laws of war did not apply. Its minimum standards are generally accepted throughout the world as customary international law.

Proliferation of Weapons of Mass Destruction

The greatest danger of another catastrophic attack in the United States will materialize if the world's most dangerous terrorists acquire the world's most dangerous weapons. As we note in chapter 2, al Qaeda has tried to acquire or make nuclear weapons for at least ten years. In chapter 4, we mentioned officials worriedly discussing, in 1998, reports that Bin Ladin's associates thought their leader was intent on carrying out a "Hiroshima."

These ambitions continue. In the public portion of his February 2004 worldwide threat assessment to Congress, DCI Tenet noted that Bin Ladin considered the acquisition of

weapons of mass destruction to be a "religious obligation." He warned that al Qaeda "continues to pursue its strategic goal of obtaining a nuclear capability." Tenet added that "more than two dozen other terrorist groups are pursuing CBRN [chemical, biological, radiological, and nuclear] materials."[28]

A nuclear bomb can be built with a relatively small amount of nuclear material. A trained nuclear engineer with an amount of highly enriched uranium or plutonium about the size of a grapefruit or an orange, together with commercially available material, could fashion a nuclear device that would fit in a van like the one RamziYousef parked in the garage of the World Trade Center in 1993. Such a bomb would level Lower Manhattan.[29]

The coalition strategies we have discussed to combat Islamist terrorism should therefore be combined with a parallel, vital effort to prevent and counter the proliferation of weapons of mass destruction (WMD).We recommend several initiatives in this area.

STRENGTHEN COUNTERPROLIFERATION EFFORTS.

While efforts to shut down Libya's illegal nuclear program have been generally successful, Pakistan's illicit trade and the nuclear smuggling networks of Pakistani scientist A.Q. Khan have revealed that the spread of nuclear weapons is a problem of global dimensions. Attempts to deal with Iran's nuclear program are still underway. Therefore, the United States should work with the international community to develop laws and an international legal regime with universal jurisdiction to enable the capture, interdiction, and prosecution of such smugglers by any state in the world where they do not disclose their activities.

EXPAND THE PROLIFERATION SECURITY INITIATIVE.

In May 2003, the Bush administration announced the Proliferation Security Initiative (PSI): nations in a willing partnership combining their national capabilities to use military, economic, and diplomatic tools to interdict threatening shipments of WMD and missile-related technology.

The PSI can be more effective if it uses intelligence and planning resources of the NATO alliance. Moreover, PSI membership should be open to non-NATO countries. Russia and China should be encouraged to participate.

SUPPORT THE COOPERATIVE THREAT REDUCTION PROGRAM.

Outside experts are deeply worried about the U.S. government's commitment and approach to securing the weapons and highly dangerous materials still scattered in Russia and other countries of the Soviet Union. The government's main instrument in this area, the Cooperative Threat Reduction Program (usually referred to as "Nunn-Lugar," after the senators who sponsored the legislation in 1991), is now in need of expansion, improvement, and resources. The U.S. government has recently redoubled its international commitments to support this program, and we recommend that the United States do all it can, if Russia and other countries will do their part. The government should weigh the value of this investment against the catastrophic cost America would face should such weapons find their way to the terrorists who are so anxious to acquire them.

Recommendation: Our report shows that al Qaeda has tried to acquire or make weapons of mass destruction for at least ten years. There is no doubt the United States

would be a prime target. Preventing the proliferation of these weapons warrants a maximum effort—by strengthening counterproliferation efforts, expanding the Proliferation Security Initiative, and supporting the Cooperative Threat Reduction program.

Targeting Terrorist Money

The general public sees attacks on terrorist finance as a way to "starve the terrorists of money." So, initially, did the U.S. government. After 9/11, the United States took aggressive actions to designate terrorist financiers and freeze their money, in the United States and through resolutions of the United Nations. These actions appeared to have little effect and, when confronted by legal challenges, the United States and the United Nations were often forced to unfreeze assets.

The difficulty, understood later, was that even if the intelligence community might "link" someone to a terrorist group through acquaintances or communications, the task of tracing the money from that individual to the terrorist group, or otherwise showing complicity, was far more difficult. It was harder still to do so without disclosing secrets.

These early missteps made other countries unwilling to freeze assets or otherwise act merely on the basis of a U.S. action. Multilateral freezing mechanisms now require waiting periods before being put into effect, eliminating the element of surprise and thus virtually ensuring that little money is actually frozen. Worldwide asset freezes have not been adequately enforced and have been easily circumvented, often within weeks, by simple methods.

But trying to starve the terrorists of money is like trying to catch one kind of fish by draining the ocean. A better strategy has evolved since those early months, as the government learned more about how al Qaeda raises, moves, and spends money.

Recommendation: Vigorous efforts to track terrorist financing must remain front and center in U.S. counterterrorism efforts. The government has recognized that information about terrorist money helps us to understand their networks, search them out, and disrupt their operations. Intelligence and law enforcement have targeted the relatively small number of financial facilitators—individuals al Qaeda relied on for their ability to raise and deliver money—at the core of al Qaeda's revenue stream. These efforts have worked. The death or capture of several important facilitators has decreased the amount of money available to al Qaeda and has increased its costs and difficulty in raising and moving that money. Captures have additionally provided a windfall of intelligence that can be used to continue the cycle of disruption.

The U.S. financial community and some international financial institutions have generally provided law enforcement and intelligence agencies with extraordinary cooperation, particularly in supplying information to support quickly developing investigations. Obvious vulnerabilities in the U.S. financial system have been corrected. The United States has been less successful in persuading other countries to adopt financial regulations that would permit the tracing of financial transactions.

Public designation of terrorist financiers and organizations is still part of the fight, but it is not the primary weapon. Designations are instead a form of diplomacy, as governments join together to identify named individuals and groups as terrorists. They also prevent open

fundraising. Some charities that have been identified as likely avenues for terrorist financing have seen their donations diminish and their activities come under more scrutiny, and others have been put out of business, although controlling overseas branches of Gulf-area charities remains a challenge. The Saudi crackdown after the May 2003 terrorist attacks in Riyadh has apparently reduced the funds available to al Qaeda—perhaps drastically—but it is too soon to know if this reduction will last.

Though progress apparently has been made, terrorists have shown considerable creativity in their methods of moving money. If al Qaeda is replaced by smaller, decentralized terrorist groups, the premise behind the government's efforts—that terrorists need a financial support network—may become outdated. Moreover, some terrorist operations do not rely on outside sources of money and may now be self-funding, either through legitimate employment or low-level criminal activity.[30]

12.4 PROTECT AGAINST AND PREPARE FOR TERRORIST ATTACKS

In the nearly three years since 9/11, Americans have become better protected against terrorist attack. Some of the changes are due to government action, such as new precautions to protect aircraft. A portion can be attributed to the sheer scale of spending and effort. Publicity and the vigilance of ordinary Americans also make a difference.

But the President and other officials acknowledge that although Americans may be safer, they are not safe. Our report shows that the terrorists analyze defenses. They plan accordingly. Defenses cannot achieve perfect safety. They make targets harder to attack successfully, and they deter attacks by making capture more likely. Just increasing the attacker's odds of failure may make the difference between a plan attempted, or a plan discarded. The enemy also may have to develop more elaborate plans, thereby increasing the danger of exposure or defeat.

Protective measures also prepare for the attacks that may get through, containing the damage and saving lives.

Terrorist Travel

More than 500 million people annually cross U.S. borders at legal entry points, about 330 million of them noncitizens. Another 500,000 or more enter illegally without inspection across America's thousands of miles of land borders or remain in the country past the expiration of their permitted stay. The challenge for national security in an age of terrorism is to prevent the very few people who may pose overwhelming risks from entering or remaining in the United States undetected.[31]

In the decade before September 11, 2001, border security—encompassing travel, entry, and immigration—was not seen as a national security matter. Public figures voiced concern about the "war on drugs," the right level and kind of immigration, problems along the southwest border, migration crises originating in the Caribbean and elsewhere, or the growing criminal traffic in humans. The immigration system as a whole was widely viewed as increasingly dysfunctional and badly in need of reform. In national security circles, however, only smuggling of weapons of mass destruction carried weight, not the entry of terrorists who might use such weapons or the presence of associated foreign-born terrorists.

For terrorists, travel documents are as important as weapons. Terrorists must travel clandestinely to meet, train, plan, case targets, and gain access to attack. To them, international travel presents great danger, because they must surface to pass through regulated channels, present themselves to border security officials, or attempt to circumvent inspection points.

In their travels, terrorists use evasive methods, such as altered and counterfeit passports and visas, specific travel methods and routes, liaisons with corrupt government officials, human smuggling networks, supportive travel agencies, and immigration and identity fraud. These can sometimes be detected.

Before 9/11, no agency of the U.S. government systematically analyzed terrorists' travel strategies. Had they done so, they could have discovered the ways in which the terrorist predecessors to al Qaeda had been systematically but detectably exploiting weaknesses in our border security since the early 1990s.

We found that as many as 15 of the 19 hijackers were potentially vulnerable to interception by border authorities. Analyzing their characteristic travel documents and travel patterns could have allowed authorities to intercept 4 to 15 hijackers and more effective use of information available in U.S. government databases could have identified up to 3 hijackers.[32]

Looking back, we can also see that the routine operations of our immigration laws—that is, aspects of those laws not specifically aimed at protecting against terrorism—inevitably shaped al Qaeda's planning and opportunities. Because they were deemed not to be bona fide tourists or students as they claimed, five conspirators that we know of tried to get visas and failed, and one was denied entry by an inspector. We also found that had the immigration system set a higher bar for determining whether individuals are who or what they claim to be—and ensuring routine consequences for violations—it could potentially have excluded, removed, or come into further contact with several hijackers who did not appear to meet the terms for admitting short-term visitors.[33]

Our investigation showed that two systemic weaknesses came together in our border system's inability to contribute to an effective defense against the 9/11 attacks: a lack of well-developed counterterrorism measures as a part of border security and an immigration system not able to deliver on its basic commitments, much less support counterterrorism. These weaknesses have been reduced but are far from being overcome.

Recommendation: Targeting travel is at least as powerful a weapon against terrorists as targeting their money. The United States should combine terrorist travel intelligence, operations, and law enforcement in a strategy to intercept terrorists, find terrorist travel facilitators, and constrain terrorist mobility.

Since 9/11, significant improvements have been made to create an integrated watchlist that makes terrorist name information available to border and law enforcement authorities. However, in the already difficult process of merging border agencies in the new Department of Homeland Security—"changing the engine while flying" as one official put it[34]—new insights into terrorist travel have not yet been integrated into the front lines of border security.

The small terrorist travel intelligence collection and analysis program currently in place has produced disproportionately useful results. It should be expanded. Since officials at the borders encounter travelers and their documents first and investigate travel facilitators, they must work closely with intelligence officials.

Internationally and in the United States, constraining terrorist travel should become a vital part of counterterrorism strategy. Better technology and training to detect terrorist travel documents are the most important immediate steps to reduce America's vulnerability to clandestine entry. Every stage of our border and immigration system should have as a part of its operations the detection of terrorist indicators on travel documents. Information systems able to authenticate travel documents and detect potential terrorist indicators should be used at consulates, at primary border inspection lines, in immigration services offices, and in intelligence and enforcement units. All frontline personnel should receive some training. Dedicated specialists and ongoing linkages with the intelligence community are also required. The Homeland Security Department's Directorate of Information Analysis and Infrastructure Protection should receive more resources to accomplish its mission as the bridge between the frontline border agencies and the rest of the government counterterrorism community.

A Biometric Screening System

When people travel internationally, they usually move through defined channels, or portals. They may seek to acquire a passport. They may apply for a visa. They stop at ticket counters, gates, and exit controls at airports and seaports. Upon arrival, they pass through inspection points. They may transit to another gate to get on an airplane. Once inside the country, they may seek another form of identification and try to enter a government or private facility. They may seek to change immigration status in order to remain.

Each of these checkpoints or portals is a screening—a chance to establish that people are who they say they are and are seeking access for their stated purpose, to intercept identifiable suspects, and to take effective action.

The job of protection is shared among these many defined checkpoints. By taking advantage of them all, we need not depend on any one point in the system to do the whole job. The challenge is to see the common problem across agencies and functions and develop a conceptual framework—an architecture—for an effective screening system.[35]

Throughout government, and indeed in private enterprise, agencies and firms at these portals confront recurring judgments that balance security, efficiency, and civil liberties. These problems should be addressed systemically, not in an ad hoc, fragmented way. For example:

what information is an individual required to present and in what form?

A fundamental problem, now beginning to be addressed, is the lack of standardized information in "feeder" documents used in identifying individuals. Biometric identifiers that measure unique physical characteristics, such as facial features, fingerprints, or iris scans, and reduce them to digitized, numerical statements called algorithms, are just beginning to be used. Travel history, however, is still recorded in passports with entry-exit stamps called cachets, which al Qaeda has trained its operatives to forge and use to conceal their terrorist activities.

how will the individual and the information be checked?

There are many databases just in the United States—for terrorist, criminal, and immigration history, as well as financial information, for instance. Each is set up for different purposes

and stores different kinds of data, under varying rules of access. Nor is access always guaranteed. Acquiring information held by foreign governments may require painstaking negotiations, and records that are not yet digitized are difficult to search or analyze. The development of terrorist indicators has hardly begun, and behavioral cues remain important.

WHO WILL SCREEN INDIVIDUALS, AND WHAT WILL THEY BE TRAINED TO DO?

A wide range of border, immigration, and law enforcement officials encounter visitors and immigrants and they are given little training in terrorist travel intelligence. Fraudulent travel documents, for instance, are usually returned to travelers who are denied entry without further examination for terrorist trademarks, investigation as to their source, or legal process.

WHAT ARE THE CONSEQUENCES OF FINDING A SUSPICIOUS INDICATOR, AND WHO WILL TAKE ACTION?

One risk is that responses may be ineffective or produce no further information. Four of the 9/11 attackers were pulled into secondary border inspection, but then admitted. More than half of the 19 hijackers were flagged by the Federal Aviation Administration's profiling system when they arrived for their flights, but the consequence was that bags, not people, were checked. Competing risks include "false positives," or the danger that rules may be applied with insufficient training or judgment. Overreactions can impose high costs too—on individuals, our economy, and our beliefs about justice.

- A special note on the importance of trusting subjective judgment: One potential hijacker was turned back by an immigration inspector as he tried to enter the United States. The inspector relied on intuitive experience to ask questions more than he relied on any objective factor that could be detected by "scores" or a machine. Good people who have worked in such jobs for a long time understand this phenomenon well. Other evidence we obtained confirmed the importance of letting experienced gate agents or security screeners ask questions and use their judgment. This is not an invitation to arbitrary exclusions. But any effective system has to grant some scope, perhaps in a little extra inspection or one more check, to the instincts and discretion of well trained human beings.

Recommendation: The U.S. border security system should be integrated into a larger network of screening points that includes our transportation system and access to vital facilities, such as nuclear reactors. The President should direct the Department of Homeland Security to lead the effort to design a comprehensive screening system, addressing common problems and setting common standards with systemwide goals in mind. Extending those standards among other governments could dramatically strengthen America and the world's collective ability to intercept individuals who pose catastrophic threats.

We advocate a system for screening, not categorical profiling. A screening system looks for particular, identifiable suspects or indicators of risk. It does not involve guesswork about who might be dangerous. It requires frontline border officials who have the tools and

resources to establish that people are who they say they are, intercept identifiable suspects, and disrupt terrorist operations.

The U.S. Border Screening System

The border and immigration system of the United States must remain a visible manifestation of our belief in freedom, democracy, global economic growth, and the rule of law, yet serve equally well as a vital element of counterterrorism. Integrating terrorist travel information in the ways we have described is the most immediate need. But the underlying system must also be sound.

Since September 11, the United States has built the first phase of a biometric screening program, called US VISIT (the United States Visitor and Immigrant Status Indicator Technology program). It takes two bioretric identifiers—digital photographs and prints of two index fingers—from travelers. False identities are used by terrorists to avoid being detected on a watchlist. These biometric identifiers make such evasions far more difficult.

So far, however, only visitors who acquire visas to travel to the United States are covered. While visitors from "visa waiver" countries will be added to the program, beginning this year, covered travelers will still constitute only about 12 percent of all noncitizens crossing U.S. borders. Moreover, exit data are not uniformly collected and entry data are not fully automated. It is not clear the system can be installed before 2010, but even this timetable may be too slow, given the possible security dangers.[36]

- Americans should not be exempt from carrying biometric passports or otherwise enabling their identities to be securely verified when they enter the United States; nor should Canadians or Mexicans. Currently U.S. persons are exempt from carrying passports when returning from Canada, Mexico, and the Caribbean. The current system enables non-U.S. citizens to gain entry by showing minimal identification. The 9/11 experience shows that terrorists study and exploit America's vulnerabilities.
- To balance this measure, programs to speed known travelers should be a higher priority, permitting inspectors to focus on greater risks. The daily commuter should not be subject to the same measures as first-time travelers. An individual should be able to preenroll, with his or her identity verified in passage. Updates of database information and other checks can ensure ongoing reliability. The solution, requiring more research and development, is likely to combine radio frequency technology with biometric identifiers.[37]
- The current patchwork of border screening systems, including several frequent traveler programs, should be consolidated with the US VISIT system to enable the development of an integrated system, which in turn can become part of the wider screening plan we suggest.
- The program allowing individuals to travel from foreign countries through the United States to a third country, without having to obtain a U.S. visa, has been suspended. Because "transit without visa" can be exploited by terrorists to enter the United States, the program should not be reinstated unless and until transit passage areas can be fully secured to prevent passengers from illegally exiting the airport.

Inspectors adjudicating entries of the 9/11 hijackers lacked adequate information and knowledge of the rules. All points in the border system—from consular offices to immigration services offices—will need appropriate electronic access to an individual's file. Scattered units at Homeland Security and the State Department perform screening and data mining: instead, a government-wide team of border and transportation officials should be working together. A modern border and immigration system should combine a biometric entry-exit system with accessible files on visitors and immigrants, along with intelligence on indicators of terrorist travel.

Our border screening system should check people efficiently and welcome friends. Admitting large numbers of students, scholars, businesspeople, and tourists fuels our economy, cultural vitality, and political reach. There is evidence that the present system is disrupting travel to the United States. Overall, visa applications in 2003 were down over 32 percent since 2001. In the Middle East, they declined about 46 percent. Training and the design of security measures should be continuously adjusted.[38]

Recommendation: The Department of Homeland Security, properly supported by the Congress, should complete, as quickly as possible, a biometric entry-exit screening system, including a single system for speeding qualified travelers. It should be integrated with the system that provides benefits to foreigners seeking to stay in the United States. Linking biometric passports to good data systems and decisionmaking is a fundamental goal. No one can hide his or her debt by acquiring a credit card with a slightly different name. Yet today, a terrorist can defeat the link to electronic records by tossing away an old passport and slightly altering the name in the new one.

Completion of the entry-exit system is a major and expensive challenge. Biometrics have been introduced into an antiquated computer environment. Replacement of these systems and improved biometric systems will be required. Nonetheless, funding and completing a biometrics-based entry-exit system is an essential investment in our national security.

Exchanging terrorist information with other countries, consistent with privacy requirements, along with listings of lost and stolen passports, will have immediate security benefits. We should move toward real-time verification of passports with issuing authorities. The further away from our borders that screening occurs, the more security benefits we gain. At least some screening should occur before a passenger departs on a flight destined for the United States. We should also work with other countries to ensure effective inspection regimes at all airports.[39]

The international community arrives at international standards for the design of passports through the International Civil Aviation Organization (ICAO). The global standard for identification is a digital photograph; fingerprints are optional.We must work with others to improve passport standards and provide foreign assistance to countries that need help in making the transition.[40]

Recommendation: The U.S. government cannot meet its own obligations to the American people to prevent the entry of terrorists without a major effort to collaborate with other governments. We should do more to exchange terrorist information with trusted allies, and raise U.S. and global border security standards for travel and border crossing over the medium and long term through extensive international cooperation.

Immigration Law and Enforcement

Our borders and immigration system, including law enforcement, ought to send a message of welcome, tolerance, and justice to members of immigrant communities in the United States and in their countries of origin. We should reach out to immigrant communities. Good immigration services are one way of doing so that is valuable in every way—including intelligence.

It is elemental to border security to know who is coming into the country. Today more than 9 million people are in the United States outside the legal immigration system. We must also be able to monitor and respond to entrances between our ports of entry, working with Canada and Mexico as much as possible.

There is a growing role for state and local law enforcement agencies. They need more training and work with federal agencies so that they can cooperate more effectively with those federal authorities in identifying terrorist suspects.

All but one of the 9/11 hijackers acquired some form of U.S. identification document, some by fraud. Acquisition of these forms of identification would have assisted them in boarding commercial flights, renting cars, and other necessary activities.

Recommendation: Secure identification should begin in the United States. The federal government should set standards for the issuance of birth certificates and sources of identification, such as drivers licenses. Fraud in identification documents is no longer just a problem of theft. At many entry points to vulnerable facilities, including gates for boarding aircraft, sources of identification are the last opportunity to ensure that people are who they say they are and to check whether they are terrorists.[41]

Strategies for Aviation and Transportation Security

The U.S. transportation system is vast and, in an open society, impossible to secure completely against terrorist attacks. There are hundreds of commercial airports, thousands of planes, and tens of thousands of daily flights carrying more than half a billion passengers a year. Millions of containers are imported annually through more than 300 sea and river ports served by more than 3,700 cargo and passenger terminals. About 6,000 agencies provide transit services through buses, subways, ferries, and light-rail service to about 14 million Americans each weekday.[42]

In November 2001, Congress passed and the President signed the Aviation and Transportation Security Act. This act created the Transportation Security Administration (TSA), which is now part of the Homeland Security Department. In November 2002, both the Homeland Security Act and the Maritime Transportation Security Act followed. These laws required the development of strategic plans to describe how the new department and TSA would provide security for critical parts of the U.S. transportation sector.

Over 90 percent of the nation's $5.3 billion annual investment in the TSA goes to aviation—to fight the last war. The money has been spent mainly to meet congressional mandates to federalize the security checkpoint screeners and to deploy existing security methods and technologies at airports. The current efforts do not yet reflect a forward-looking strategic plan systematically analyzing assets, risks, costs, and benefits. Lacking such a plan, we are not convinced that our transportation security resources are being allocated to the greatest risks in a cost-effective way.

- Major vulnerabilities still exist in cargo and general aviation security. These, together with inadequate screening and access controls, continue to present aviation security challenges.
- While commercial aviation remains a possible target, terrorists may turn their attention to other modes. Opportunities to do harm are as great, or greater, in maritime or surface transportation. Initiatives to secure shipping containers have just begun. Surface transportation systems such as railroads and mass transit remain hard to protect because they are so accessible and extensive.

Despite congressional deadlines, the TSA has developed neither an integrated strategic plan for the transportation sector nor specific plans for the various modes—air, sea, and ground.

Recommendation: Hard choices must be made in allocating limited resources. The U.S. government should identify and evaluate the transportation assets that need to be protected, set risk-based priorities for defending them, select the most practical and cost-effective ways of doing so, and then develop a plan, budget, and funding to implement the effort. The plan should assign roles and missions to the relevant authorities (federal, state, regional, and local) and to private stakeholders. In measuring effectiveness, perfection is unattainable. But terrorists should perceive that potential targets are defended. They may be deterred by a significant chance of failure.

Congress should set a specific date for the completion of these plans and hold the Department of Homeland Security and TSA accountable for achieving them.

The most powerful investments may be for improvements in technologies with applications across the transportation modes, such as scanning technologies designed to screen containers that can be transported by plane, ship, truck, or rail. Though such technologies are becoming available now, widespread deployment is still years away.

In the meantime, the best protective measures may be to combine improved methods of identifying and tracking the high-risk containers, operators, and facilities that require added scrutiny with further efforts to integrate intelligence analysis, effective procedures for transmitting threat information to transportation authorities, and vigilance by transportation authorities and the public.

A Layered Security System

No single security measure is foolproof. Accordingly, the TSA must have multiple layers of security in place to defeat the more plausible and dangerous forms of attack against public transportation.

- The plan must take into consideration the full array of possible enemy tactics, such as use of insiders, suicide terrorism, or standoff attack. Each layer must be effective in its own right. Each must be supported by other layers that are redundant and coordinated.
- The TSA should be able to identify for Congress the array of potential terrorist attacks, the layers of security in place, and the reliability provided by each layer. TSA must develop a plan as described above to improve weak individual layers and the effectiveness of the layered systems it deploys.

On 9/11, the 19 hijackers were screened by a computer-assisted screening system called CAPPS. More than half were identified for further inspection, which applied only to their checked luggage.

Under current practices, air carriers enforce government orders to stop certain known and suspected terrorists from boarding commercial flights and to apply secondary screening procedures to others. The "no-fly" and "automatic selectee" lists include only those individuals who the U.S. government believes pose a direct threat of attacking aviation.

Because air carriers implement the program, concerns about sharing intelligence information with private firms and foreign countries keep the U.S. government from listing all terrorist and terrorist suspects who should be included. The TSA has planned to take over this function when it deploys a new screening system to take the place of CAPPS. The deployment of this system has been delayed because of claims it may violate civil liberties.

Recommendation: Improved use of "no-fly" and "automatic selectee" lists should not be delayed while the argument about a successor to CAPPS continues. This screening function should be performed by the TSA, and it should utilize the larger set of watchlists maintained by the federal government. Air carriers should be required to supply the information needed to test and implement this new system.

CAPPS is still part of the screening process, still profiling passengers, with the consequences of selection now including personal searches of the individual and carry-on bags. The TSA is dealing with the kind of screening issues that are being encountered by other agencies. As we mentioned earlier, these screening issues need to be elevated for high-level attention and addressed promptly by the government. Working through these problems can help clear the way for the TSA's screening improvements and would help many other agencies too.

The next layer is the screening checkpoint itself. As the screening system tries to stop dangerous people, the checkpoint needs to be able to find dangerous items. Two reforms are needed soon: (1) screening people for explosives, not just their carry-on bags, and (2) improving screener performance.

Recommendation: The TSA and the Congress must give priority attention to improving the ability of screening checkpoints to detect explosives on passengers. As a start, each individual selected for special screening should be screened for explosives. Further, the TSA should conduct a human factors study, a method often used in the private sector, to understand problems in screener performance and set attainable objectives for individual screeners and for the checkpoints where screening takes place.

Concerns also remain regarding the screening and transport of checked bags and cargo. More attention and resources should be directed to reducing or mitigating the threat posed by explosives in vessels' cargo holds. The TSA should expedite the installation of advanced (in-line) baggage-screening equipment. Because the aviation industry will derive substantial benefits from this deployment, it should pay a fair share of the costs. The TSA should require that every passenger aircraft carrying cargo must deploy at least one hardened container to carry any suspect cargo. TSA also needs to intensify its efforts to identify, track, and appropriately screen potentially dangerous cargo in both the aviation and maritime sectors.

The Protection of Civil Liberties

Many of our recommendations call for the government to increase its presence in our lives—for example, by creating standards for the issuance of forms of identification, by better securing our borders, by sharing information gathered by many different agencies. We also recommend the consolidation of authority over the now far-flung entities constituting the intelligence community. The Patriot Act vests substantial powers in our federal government. We have seen the government use the immigration laws as a tool in its counterterrorism effort. Even without the changes we recommend, the American public has vested enormous authority in the U.S. government.

At our first public hearing on March 31, 2003, we noted the need for balance as our government responds to the real and ongoing threat of terrorist attacks. The terrorists have used our open society against us. In wartime, government calls for greater powers, and then the need for those powers recedes after the war ends. This struggle will go on. Therefore, while protecting our homeland, Americans should be mindful of threats to vital personal and civil liberties. This balancing is no easy task, but we must constantly strive to keep it right.

This shift of power and authority to the government calls for an enhanced system of checks and balances to protect the precious liberties that are vital to our way of life. We therefore make three recommendations.

First, as we will discuss in chapter 13, to open up the sharing of information across so many agencies and with the private sector, the President should take responsibility for determining what information can be shared by which agencies and under what conditions. Protection of privacy rights should be one key element of this determination.

Recommendation: As the President determines the guidelines for information sharing among government agencies and by those agencies with the private sector, he should safeguard the privacy of individuals about whom information is shared.

Second, Congress responded, in the immediate aftermath of 9/11, with the Patriot Act, which vested substantial new powers in the investigative agencies of the government. Some of the most controversial provisions of the Patriot Act are to "sunset" at the end of 2005. Many of the act's provisions are relatively noncontroversial, updating America's surveillance laws to reflect technological developments in a digital age. Some executive actions that have been criticized are unrelated to the Patriot Act. The provisions in the act that facilitate the sharing of information among intelligence agencies and between law enforcement and intelligence appear, on balance, to be beneficial. Because of concerns regarding the shifting balance of power to the government, we think that a full and informed debate on the Patriot Act would be healthy.

Recommendation: The burden of proof for retaining a particular governmental power should be on the executive, to explain (a) that the power actually materially enhances security and (b) that there is adequate supervision of the executive's use of the powers to ensure protection of civil liberties. If the power is granted, there must be adequate guidelines and oversight to properly confine its use.

Third, during the course of our inquiry, we were told that there is no office within the government whose job it is to look across the government at the actions we are taking to protect ourselves to ensure that liberty concerns are appropriately considered. If, as we

recommend, there is substantial change in the way we collect and share intelligence, there should be a voice within the executive branch for those concerns. Many agencies have privacy offices, albeit of limited scope. The Intelligence Oversight Board of the President's Foreign Intelligence Advisory Board has, in the past, had the job of overseeing certain activities of the intelligence community.

Recommendation: At this time of increased and consolidated government authority, there should be a board within the executive branch to oversee adherence to the guidelines we recommend and the commitment the government makes to defend our civil liberties.

We must find ways of reconciling security with liberty, since the success of one helps protect the other. The choice between security and liberty is a false choice, as nothing is more likely to endanger America's liberties than the success of a terrorist attack at home. Our history has shown us that insecurity threatens liberty. Yet, if our liberties are curtailed, we lose the values that we are struggling to defend.

Setting Priorities for National Preparedness

Before 9/11, no executive department had, as its first priority, the job of defending America from domestic attack. That changed with the 2002 creation of the Department of Homeland Security. This department now has the lead responsibility for problems that feature so prominently in the 9/11 story, such as protecting borders, securing transportation and other parts of our critical infrastructure, organizing emergency assistance, and working with the private sector to assess vulnerabilities.

Throughout the government, nothing has been harder for officials—executive or legislative—than to set priorities, making hard choices in allocating limited resources. These difficulties have certainly afflicted the Department of Homeland Security, hamstrung by its many congressional overseers. In delivering assistance to state and local governments, we heard—especially in New York—about imbalances in the allocation of money. The argument concentrates on two questions.

First, how much money should be set aside for criteria not directly related to risk? Currently a major portion of the billions of dollars appropriated for state and local assistance is allocated so that each state gets a certain amount, or an allocation based on its population—wherever they live.

Recommendation: Homeland security assistance should be based strictly on an assessment of risks and vulnerabilities. Now, in 2004, Washington, D.C., and New York City are certainly at the top of any such list. We understand the contention that every state and city needs to have some minimum infrastructure for emergency response. But federal homeland security assistance should not remain a program for general revenue sharing. It should supplement state and local resources based on the risks or vulnerabilities that merit additional support. Congress should not use this money as a pork barrel.

The second question is, Can useful criteria to measure risk and vulnerability be developed that assess all the many variables? The allocation of funds should be based on an assessment of threats and vulnerabilities. That assessment should consider such factors

as population, population density, vulnerability, and the presence of critical infrastructure within each state. In addition, the federal government should require each state receiving federal emergency preparedness funds to provide an analysis based on the same criteria to justify the distribution of funds in that state.

In a free-for-all over money, it is understandable that representatives will work to protect the interests of their home states or districts. But this issue is too important for politics as usual to prevail. Resources must be allocated according to vulnerabilities. We recommend that a panel of security experts be convened to develop written benchmarks for evaluating community needs. We further recommend that federal homeland security funds be allocated in accordance with those benchmarks, and that states be required to abide by those benchmarks in disbursing the federal funds. The benchmarks will be imperfect and subjective; they will continually evolve. But hard choices must be made. Those who would allocate money on a different basis should then defend their view of the national interest.

Command, Control, and Communications

The attacks on 9/11 demonstrated that even the most robust emergency response capabilities can be overwhelmed if an attack is large enough. Teamwork, collaboration, and cooperation at an incident site are critical to a successful response. Key decisionmakers who are represented at the incident command level help to ensure an effective response, the efficient use of resources, and responder safety. Regular joint training at all levels is, moreover, essential to ensuring close coordination during an actual incident.

Recommendation: Emergency response agencies nationwide should adopt the Incident Command System (ICS). When multiple agencies or multiple jurisdictions are involved, they should adopt a unified command. Both are proven frameworks for emergency response. We strongly support the decision that federal homeland security funding will be contingent, as of October 1, 2004, upon the adoption and regular use of ICS and unified command procedures. In the future, the Department of Homeland Security should consider making funding contingent on aggressive and realistic training in accordance with ICS and unified command procedures.

The attacks of September 11, 2001 overwhelmed the response capacity of most of the local jurisdictions where the hijacked airliners crashed. While many jurisdictions have established mutual aid compacts, a serious obstacle to multi-jurisdictional response has been the lack of indemnification for mutual-aid responders in areas such as the National Capital Region.

Public safety organizations, chief administrative officers, state emergency management agencies, and the Department of Homeland Security should develop a regional focus within the emergency responder community and promote multi-jurisdictional mutual assistance compacts. Where such compacts already exist, training in accordance with their terms should be required. Congress should pass legislation to remedy the long-standing indemnification and liability impediments to the provision of public safety mutual aid in the National Capital Region and where applicable throughout the nation.

The inability to communicate was a critical element at the World Trade Center, Pentagon, and Somerset County, Pennsylvania, crash sites, where multiple agencies and multiple jurisdictions responded. The occurrence of this problem at three very different

sites is strong evidence that compatible and adequate communications among public safety organizations at the local, state, and federal levels remains an important problem.

Recommendation: Congress should support pending legislation which provides for the expedited and increased assignment of radio spectrum for public safety purposes. Furthermore, high-risk urban areas such as New York City and Washington, D.C., should establish signal corps units to ensure communications connectivity between and among civilian authorities, local first responders, and the National Guard. Federal funding of such units should be given high priority by Congress.

Private-Sector Preparedness

The mandate of the Department of Homeland Security does not end with government; the department is also responsible for working with the private sector to ensure preparedness. This is entirely appropriate, for the private sector controls 85 percent of the critical infrastructure in the nation. Indeed, unless a terrorist's target is a military or other secure government facility, the "first" first responders will almost certainly be civilians. Homeland security and national preparedness therefore often begins with the private sector.

Preparedness in the private sector and public sector for rescue, restart, and recovery of operations should include (1) a plan for evacuation, (2) adequate communications capabilities, and (3) a plan for continuity of operations. As we examined the emergency response to 9/11, witness after witness told us that despite 9/11, the private sector remains largely unprepared for a terrorist attack. We were also advised that the lack of a widely embraced private-sector preparedness standard was a principal contributing factor to this lack of preparedness.

We responded by asking the American National Standards Institute (ANSI) to develop a consensus on a "National Standard for Preparedness" for the private sector. ANSI convened safety, security, and business continuity experts from a wide range of industries and associations, as well as from federal, state, and local government stakeholders, to consider the need for standards for private sector emergency preparedness and business continuity.

The result of these sessions was ANSI's recommendation that the Commission endorse a voluntary National Preparedness Standard. Based on the existing American National Standard on Disaster/Emergency Management and Business Continuity Programs (NFPA 1600), the proposed National Preparedness Standard establishes a common set of criteria and terminology for preparedness, disaster management, emergency management, and business continuity programs. The experience of the private sector in the World Trade Center emergency demonstrated the need for these standards.

Recommendation: We endorse the American National Standards Institute's recommended standard for private preparedness. We were encouraged by Secretary Tom Ridge's praise of the standard, and urge the Department of Homeland Security to promote its adoption. We also encourage the insurance and credit-rating industries to look closely at a company's compliance with the ANSI standard in assessing its insurability and creditworthiness. We believe that compliance with the standard should define the standard of care owed by a company to its employees and the public for legal purposes. Private-sector preparedness is not a luxury; it is a cost of doing business in the post-9/11 world. It is ignored at a tremendous potential cost in lives, money, and national security.

NOTES

1. For spending totals, see David Baumann, "Accounting for the Deficit," *National Journal*, June 12, 2004, p. 1852 (combining categories for defense discretionary, homeland security, and international affairs).

2. White House press release, "National Strategy for Combating Terrorism," Feb. 2003 (online at www.whitehouse.gov/news/releases/2003/02/20030214-7.html).

3. "Islamist terrorism is an immediate derivative of *Islamism*. This term distinguishes itself from *Islamic* by the fact that the latter refers to a religion and culture in existence over a millennium, whereas the first is a political/religious phenomenon linked to the great events of the 20th century. Furthermore Islamists define themselves as 'Islamiyyoun/Islamists' precisely to differentiate themselves from 'Muslimun/Muslims.' . . . Islamism is defined as 'an Islamic millitant, anti-democratic movement, bearing a holistic vision of Islam whose final aim is the restoration of the caliphate.' " Mehdi Mozaffari, "Bin Laden and Islamist Terrorism," *Militaert Tidsskrift*, vol. 131 (Mar. 2002), p. 1 (online at www.mirkflem.pup.blueyonder.co.uk/pdf/islamistterrorism.pdf). The Islamist movement, born about 1940, is a product of the modern world, influenced by Marxist-Leninist concepts about revolutionary organization. "Islamists consider Islam to be as much a religion as an 'ideology,' a neologism which they introduced and which remains anathema to the ulamas (the clerical scholars)." Olivier Roy, *The Failure of Political Islam*, trans. Carol Volk (Harvard Univ. Press, 1994), p. 3. Facing political limits by the end of the 1990s, the extremist wing of the Islamist movement "rejected the democratic references invoked by the moderates; and as a result, raw terrorism in its most spectacular and destructive form became its main option for reviving armed struggle in the new millennium." Gilles Kepel, *Jihad: The Trail of Political Islam*, trans. Anthony Roberts (Harvard Univ. Press, 2002), p. 14.

4. Opening the Islamic Conference of Muslim leaders from around the world on October 16, 2003, then Malaysian prime minister Mahathir Mohamad said: "Today we, the whole Muslim *ummah* [community of believers] are treated with contempt and dishonour. Our religion is denigrated. Our holy places desecrated. Our countries are occupied. Our people are starved and killed. None of our countries are truly independent. We are under pressure to conform to our oppressors' wishes about how we should behave, how we should govern our lands, how we should think even." He added: "There is a feeling of hopelessness among the Muslim countries and their people. They feel that they can do nothing right. They believe that things can only get worse. The Muslims will forever be oppressed and dominated by the Europeans and Jews." The prime minister's argument was that the Muslims should gather their assets, not striking back blindly, but instead planning a thoughtful, long-term strategy to defeat their worldwide enemies, which he argued were controlled by the Jews. "But today the Jews rule the world by proxy. They get others to fight and die for them." Speech at the Opening of the Tenth Session of the Islamic Summit Conference, Oct. 16, 2003 (online at www.oicsummit2003.Org.my/speech_03.php).

28. Testimony of George Tenet, "The Worldwide Threat 2004: Challenges in a Changing Global Context," before the Senate Select Committee on Intelligence, Feb. 24, 2004.

29. U.S. Department of Energy Advisory Board report, "A Report Card on the Department of Energy's Non-proliferation Programs with Russia," Jan. 10, 2001, p. vi.

30. For terrorists being self-funding, see United Nations report, "Second Report of the [UN] Monitoring Group, Pursuant to Security Council Resolution 1390," Sept. 19, 2002, p. 13.

31. For legal entry, see White House report, Office of Homeland Security, "The National Strategy for Homeland Security," July 2002, p. 20 (online at www.whitehouse.gov/homeland/book/index.html). For illegal entry, see Chicago Council on Foreign Relations task force report, *Keeping the Promise: Immigration Proposals from the Heartland* (Chicago Council on Foreign Relations, 2004), p. 28.

32. The names of at least three of the hijackers (Nawaf al Hazmi, Salem al Hazmi, and Khalid al Mihdhar) were in information systems of the intelligence community and thus potentially could have been watchlisted. Had they been watchlisted, the connections to terrorism could have been exposed at the time they applied for a visa or at the port of entry. The names of at least three of the hijackers (Nawaf al Hazmi, Salem al Hazmi, and Khalid al Mihdhar), were in information systems of the intelligence community and thus potentially could have been watchlisted. Had they been watchlisted, their terrorist affiliations could have been exposed either at the time they applied for a visa or at the port of entry. Two of the hijackers (Satam al Suqami and Abdul Aziz al Omari) presented passports manipulated in a fraudulent manner that has subsequently been associated with al Qaeda. Based on our review of their visa and travel histories, we believe it possible that as many as eleven additional hijackers (Wail al Shehri, Waleed al Shehri, Mohand al Shehri, Hani Hanjour, Majed Moqed, Nawaf al Hazmi, Hamza al Ghamdi, Ahmed al Ghamdi, Saeed al Ghamdi, Ahmed al Nami, and Ahmad al Haznawi) held passports containing these same fraudulent features, but their passports have not been found so we cannot be sure. Khalid al Mihdhar and Salem al Hazmi presented passports with a suspicious indicator of Islamic extremism. There is reason to believe that the passports of three other hijackers (Nawaf al Hazmi, Ahmed al Nami, and Ahmad al Haznawi) issued in the same Saudi passport office may have contained this same indicator; however, their passports have not been found, so we cannot be sure.

33. Khallad Bin Attash, Ramzi Binalshibh, Zakariya Essabar, Ali Abdul Aziz Ali, and Saeed al Ghamdi (not the individual by the same name who became a hijacker) tried to get visas and failed. Kahtani was unable to prove his admissibility and withdrew his application for admission after an immigration inspector remained unpersuaded that he was a tourist. All the hijackers whose visa applications we reviewed arguably could have been denied visas because their applications were not filled out completely. Had State visa officials routinely had a practice of acquiring more information in such cases, they likely would have found more grounds for denial. For example, three hijackers made statements on their visa applications that could have been proved false by U.S. government records (Hani Hanjour, Saeed al Ghamdi, and Khalid al Mihdhar), and many lied about their employment or educational status. Two hijackers could have been denied admission at the port of entry based on violations of immigration rules governing terms of admission—Mohamed Atta overstayed his tourist visa and then failed to present a proper vocational school visa when he entered in January 2001: Ziad Jarrah attended school in June 2000 without properly adjusting his immigration status, an action that violated his immigration status and rendered him inadmissible on each of his six subsequent reentries into the United States between June 2000 and August 5, 2001. There were possible grounds to deny entry to a third hijacker (Marwan al Shehhi). One hijacker violated his immigration status by failing to enroll as a student after entry (Hani Hanjour); two hijackers overstayed their terms of admission by four and eight months respectively (Satam al Suqami and Nawaf al Hazmi). Atta and Shehhi attended a flight school (Huffman Aviation) that the Justice Department's Inspector General concluded should not have been certified to accept foreign students, see DOJ Inspector General's report, "The INS' Contacts with Two September 11 Terrorists: A Review of the INS's Admissions of Atta and Shehhi, its Processing of their Change of Status Applications, and its Efforts to Track Foreign Students in the United States," May 20, 2002.

34. John Gordon interview (May 13, 2004).

35. For a description of a layering approach, see Stephen Flynn, *American the Vulnerable: How the U.S. Has Failed to Secure the Homeland and Protect Its People from Terrorism* (HarperCollins, 2004), p. 69.

36. The logical and timely rollout of such a program is hampered by an astonishingly long list of congressional mandates. The system originated in the Illegal Immigration Reform and Immigrant Responsibility Act of 1996 and applied to all non-U.S. citizens who enter or exit the United States at any port of entry. Pub. L. No. 104–208, 110 Stat. 3009 (1996), § 110. The Data Management Improvement Act of 2000 altered this mandate by incorporating a requirement for a searchable centralized database, limiting the government's ability to require new data from certain travelers and setting a series of implementation deadlines. Pub. L. No. 106–215, 114 Stat. 337 (2000), § 2(a). The USA PATRIOT Act mandated that the Attorney General and Secretary of State "particularly focus" on having the entry-exit system include biometrics and tamper-resistant travel documents readable at all ports of entry. Pub. L. No. 107–56, 115 Stat. 272 (2001), § 1008(a). In the Enhanced Border Security and Visa Entry Reform Act, Congress directed that, not later than October 26, 2004, the attorney general and the secretary of state issue to all non-U.S. citizens only machine-readable, tamper-resistant visas and other travel and entry documents that use biometric identifiers and install equipment at all U.S. ports of entry to allow biometric authentication of such documents. Pub. L. No. 107–173, 116 Stat. 543 (2002), § 303(b). The Act also required that increased security still facilitate the free flow of commerce and travel. Ibid. § 102(a)(1)(C). The administration has requested a delay of two years for the requirement of tamper-proof passports. Testimony of Thomas Ridge before the House Judiciary Committee, Apr. 21, 2004 (online at www.dhs.gov/dhspublic/display?theme=45&content=3498&print=true). Program planners have set a goal of collecting information, confirming identity, providing information about foreign nationals throughout the entire immigration system, and ultimately enabling each point in the system to assess the lawfulness of travel and any security risks.

37. There are at least three registered traveler programs underway, at different points in the system, designed and run by two different agencies in the Department of Homeland Security (outside the U.S.VISIT system), which must ultimately be the basis for access to the United States.

38. For the statistics, see DOS report, "Workload Statistics by Post Regions for All Visa Classes" June 18, 2004. One post-9/11 screening process, known as Condor, has conducted over 130,000 extra name-checks. DOS letter, Karl Hofmann to the Commission, Apr. 5, 2004. The checks have caused significant delays in some cases but have never resulted in visas being denied on terrorism grounds. For a discussion of visa delays, see General Accounting Office report, "Border Security: Improvements Needed to Reduce Time Taken to Adjudicate Visas for Science Students and Scholars," Feb. 2004. We do not know all the reasons why visa applications have dropped so significantly. Several factors beyond the visa process itself include the National Security Entry-Exit Registration System, which requires additional screening processes for certain groups from Arab and Muslim countries; the Iraq war; and perhaps cyclical economic factors. For the cost to the United States of visa backlogs, see National Foreign Trade Council report, "Visa Backlog Costs U.S. Exporters More than $30 Billion Since 2002, New Study Finds," June 2, 2004 (online at www.nftc.org/newsflash/newsflash.asp?Mode=View&articleid=1686&Category=All).

39. These issues are on the G-8 agenda. White House press release, "G-8 Secure and Facilitated Travel Initiative (SAFTI)," June 9, 2004 (online at www.whitehouse.gov/news/releases/2004/06/20040609-51.html). Lax passport issuance standards are among the vulnerabilities exploited by terrorists, possibly including two of the 9/11 hijackers. Three models exist for strengthened prescreening: (1) better screening by airlines, such as the use of improved document authentication technology: (2) posting of border agents or inspectors in foreign airports to work cooperatively with foreign counterparts; and (3) establishing a full preinspection regime, such as now exists for travel to the United States from Canada and Ireland. All three models should be pursued, in addition to electronic prescreening.

40. Among the more important problems to address is that of varying transliterations of the same name. For example, the current lack of a single convention for transliterating Arabic names enabled the 19 hijackers to vary the spelling of their names to defeat name-based watchlist systems and confuse any potential efforts to locate them. While the gradual introduction of biometric identifiers will help, that process will take years, and a name match will always be useful. The ICAO

should discuss the adoption of a standard requiring a digital code for all names that need to be translated into the Roman alphabet, ensuring one common spelling for all countries.

41. On achieving more reliable identification, see Markle Foundation task force report, *Creating a Trusted Information Network for Homeland Security* (Markle Foundation, 2003), p. 72 (online at www.markle.org).

42. General Accounting Office report, *Mass Transit: Federal Action Could Help Transit Agencies Address Security Challenges*, GAO-03-263, Dec. 2002 (online at www.gao.gov/new.items/d03263.pdf).

13 HOW TO DO IT? A DIFFERENT WAY OF ORGANIZING THE GOVERNMENT

As presently configured, the national security institutions of the U.S. government are still the institutions constructed to win the Cold War. The United States confronts a very different world today. Instead of facing a few very dangerous adversaries, the United States confronts a number of less visible challenges that surpass the boundaries of traditional nation-states and call for quick, imaginative, and agile responses.

The men and women of the World War II generation rose to the challenges of the 1940s and 1950s. They restructured the government so that it could protect the country. That is now the job of the generation that experienced 9/11. Those attacks showed, emphatically, that ways of doing business rooted in a different era are just not good enough. Americans should not settle for incremental, ad hoc adjustments to a system designed generations ago for a world that no longer exists.

We recommend significant changes in the organization of the government. We know that the quality of the people is more important than the quality of the wiring diagrams. Some of the saddest aspects of the 9/11 story are the outstanding efforts of so many individual officials straining, often without success, against the boundaries of the possible. Good people can overcome bad structures. They should not have to.

The United States has the resources and the people. The government should combine them more effectively, achieving unity of effort. We offer five major recommendations to do that:

- unifying strategic intelligence and operational planning against Islamist terrorists across the foreign-domestic divide with a National Counterterrorism Center;
- unifying the intelligence community with a new National Intelligence Director;
- unifying the many participants in the counterterrorism effort and their knowledge in a network-based information-sharing system that transcends traditional governmental boundaries;
- unifying and strengthening congressional oversight to improve quality and accountability; and
- strengthening the FBI and homeland defenders.

13.1 UNITY OF EFFORT ACROSS THE FOREIGN-DOMESTIC DIVIDE

Joint Action

Much of the public commentary about the 9/11 attacks has dealt with "lost opportunities," some of which we reviewed in chapter 11. These are often characterized as problems of "watchlisting," of "information sharing," or of "connecting the dots." In chapter 11 we explained that these labels are too narrow. They describe the symptoms, not the disease.

In each of our examples, no one was firmly in charge of managing the case and able to draw relevant intelligence from anywhere in the government, assign responsibilities across the agencies (foreign or domestic), track progress, and quickly bring obstacles up to the level where they could be resolved. Responsibility and accountability were diffuse.

The agencies cooperated, some of the time. But even such cooperation as there was is not the same thing as joint action. When agencies cooperate, one defines the problem and seeks help with it. When they act jointly, the problem and options for action are defined differently from the start. Individuals from different backgrounds come together in analyzing a case and planning how to manage it.

In our hearings we regularly asked witnesses: Who is the quarterback? The other players are in their positions, doing their jobs. But who is calling the play that assigns roles to help them execute as a team?

Since 9/11, those issues have not been resolved. In some ways joint work has gotten better, and in some ways worse. The effort of fighting terrorism has flooded over many of the usual agency boundaries because of its sheer quantity and energy. Attitudes have changed. Officials are keenly conscious of trying to avoid the mistakes of 9/11. They try to share information. They circulate—even to the President—practically every reported threat, however dubious.

Partly because of all this effort, the challenge of coordinating it has multiplied. Before 9/11, the CIA was plainly the lead agency confronting al Qaeda. The FBI played a very secondary role. The engagement of the departments of Defense and State was more episodic.

- Today the CIA is still central. But the FBI is much more active, along with other parts of the Justice Department.
- The Defense Department effort is now enormous. Three of its unified commands, each headed by a four-star general, have counterterrorism as a primary mission: Special Operations Command, Central Command (both headquartered in Florida), and Northern Command (headquartered in Colorado).
- A new Department of Homeland Security combines formidable resources in border and transportation security, along with analysis of domestic vulnerability and other tasks.
- The State Department has the lead on many of the foreign policy tasks we described in chapter 12.
- At the White House, the National Security Council (NSC) now is joined by a parallel presidential advisory structure, fhe Homeland Security Council.

So far we have mentioned two reasons for joint action—the virtue of joint planning and the advantage of having someone in charge to ensure a unified effort. There is a third: the simple shortage of experts with sufficient skills. The limited pool of critical experts—for example, skilled counterterrorism analysts and linguists—is being depleted. Expanding these capabilities will require not just money, but time.

Primary responsibility for terrorism analysis has been assigned to the Terrorist Threat Integration Center (TTIC), created in 2003, based at the CIA headquarters but staffed with representatives of many agencies, reporting directly to the Director of Central Intelligence. Yet the CIA houses another intelligence "fusion" center: the Counterterrorist Center that played such a key role before 9/11. A third major analytic unit is at Defense, in the Defense Intelligence Agency. A fourth, concentrating more on homeland vulnerabilities, is at the Department of Homeland Security. The FBI is in the process of building the analytic capability it has long lacked, and it also has the Terrorist Screening Center.[1]

The U.S. government cannot afford so much duplication of effort. There are not enough experienced experts to go around. The duplication also places extra demands on already hard-pressed single-source national technical intelligence collectors like the National Security Agency.

Combining Joint Intelligence and Joint Action

A "smart" government would *integrate* all sources of information to see the enemy as a whole. Integrated all-source analysis should also inform and shape strategies to collect more intelligence. Yet the Terrorist Threat Integration Center, while it has primary responsibility for terrorism analysis, is formally proscribed from having any oversight or operational authority and is not part of any operational entity, other than reporting to the director of central intelligence.[2]

The government now tries to handle the problem of joint management, informed by analysis of intelligence from all sources, in two ways.

- First, agencies with lead responsibility for certain problems have constructed their own interagency entities and task forces in order to get cooperation. The Counterterrorist Center at CIA, for example, recruits liaison officers from throughout the intelligence community. The military's Central Command has its own interagency center, recruiting liaison officers from all the agencies from which it might need help. The FBI has joint Terrorism Task Forces in 84 locations to coordinate the activities of other agencies when action may be required.
- Second, the problem of joint operational planning is often passed to the White House, where the NSC staff tries to play this role. The national security staff at the White House (both NSC and new Homeland Security Council staff) has already become 50 percent larger since 9/11. But our impression, after talking to serving officials, is that even this enlarged staff is consumed by meetings on day-to-day issues, sifting each day's threat information and trying to coordinate everyday operations.

Even as it crowds into every square inch of available office space, the NSC staff is still not sized or funded to be an executive agency. In chapter 3 we described some of the problems that arose in the 1980s when a White House staff, constitutionally insulated from the usual mechanisms of oversight, became involved in direct operations. During the 1990s Richard Clarke occasionally tried to exercise such authority, sometimes successfully, but often causing friction.

Yet a subtler and more serious danger is that as the NSC staff is consumed by these day-to-day tasks, it has less capacity to find the time and detachment needed to advise a president on larger policy issues. That means less time to work on major new initiatives, help with legislative management to steer needed bills through Congress, and track the design and implementation of the strategic plans for regions, countries, and issues that we discuss in chapter 12.

Much of the job of operational coordination remains with the agencies, especially the CIA. There DCI Tenet and his chief aides ran interagency meetings nearly every day to coordinate much of the government's day-to-day work. The DCI insisted he did not make policy and only oversaw its implementation. In the struggle against terrorism these distinctions seem increasingly artificial. Also, as the DCI becomes a lead coordinator of the

government's operations, it becomes harder to play all the position's other roles, including that of analyst in chief.

The problem is nearly intractable because of the way the government is currently structured. Lines of operational authority run to the expanding executive departments, and they are guarded for understandable reasons: the DCI commands the CIA's personnel overseas; the secretary of defense will not yield to others in conveying commands to military forces; the justice Department will not give up the responsibility of deciding whether to seek arrest warrants. But the result is that each agency or department needs its own intelligence apparatus to support the performance of its duties. It is hard to "break down stovepipes" when there are so many stoves that are legally and politically entitled to have cast-iron pipes of their own.

Recalling the Goldwater-Nichols legislation of 1986, Secretary Rumsfeld reminded us that to achieve better joint capability, each of the armed services had to "give up some of their turf and authorities and prerogatives." Today, he said, the executive branch is "stovepiped much like the four services were nearly 20 years ago." He wondered if it might be appropriate to ask agencies to "give up some of their existing turf and authority in exchange for a stronger, faster, more efficient government wide joint effort."[3] Privately, other key officials have made the same point to us.

We therefore propose a new institution: a civilian-led unified joint command for counterterrorism. It should combine strategic intelligence and joint operational planning.

In the Pentagon's Joint Staff, which serves the chairman of the joint Chiefs of Staff, intelligence is handled by the J-2 directorate, operational planning by J-3, and overall policy by J-5. Our concept combines the J-2 and J-3 functions (intelligence and operational planning) in one agency, keeping overall policy coordination where it belongs, in the National Security Council.

Recommendation: We recommend the establishment of a National Counterterrorism Center (NCTC), built on the foundation of the existing Terrorist Threat Integration Center (TTIC). Breaking the older mold of national government organization, this NCTC should be a center for joint operational planning *and* joint intelligence, staffed by personnel from the various agencies. The head of the NCTC should have authority to evaluate the performance of the people assigned to the Center.

- Such a joint center should be developed in the same spirit that guided the military's creation of unified joint commands, or the shaping of earlier national agencies like the National Reconnaissance Office, which was formed to organize the work of the CIA and several defense agencies in space.

  NCTC—Intelligence. The NCTC should lead strategic analysis, pooling all-source intelligence, foreign and domestic, about transnational terrorist organizations with global reach. It should develop *net* assessments (comparing enemy capabilities and intentions against U.S. defenses and countermeasures). It should also provide warning. It should do this work by drawing on the efforts of the CIA, FBI, Homeland Security, and other departments and agencies. It should task collection requirements both inside and outside the United States.
- The intelligence function (J-2) should build on the existing TTIC structure and remain distinct, as a national intelligence center, within the NCTC. As the government's principal knowledge bank on Islamist terrorism, with the main responsibility for strategic analysis and net assessment, it should absorb a significant

portion of the analytical talent now residing in the CIA's Counterterrorist Center and the DIA's Joint Intelligence Task Force—Combatting Terrorism (JITF-CT).

NCTC—Operations. The NCTC should perform joint planning. The plans would assign operational responsibilities to lead agencies, such as State, the CIA, the FBI, Defense and its combatant commands, Homeland Security, and other agencies. The NCTC should *not* direct the actual execution of these operations, leaving that job to the agencies. The NCTC would then track implementation; it would look across the foreign-domestic divide and across agency boundaries, updating plans to follow through on cases.[4]

- The joint operational planning function (J-3) will be new to the TTIC structure. The NCTC can draw on analogous work now being done in the CIA and every other involved department of the government, as well as reaching out to knowledgeable officials in state and local agencies throughout the United States.
- The NCTC should *not* be a policymaking body. Its operations and planning should follow the policy direction of the president and the National Security Council.

Consider this hypothetical case. The NSA discovers that a suspected terrorist is traveling to Bangkok and Kuala Lumpur. The NCTC should draw on joint intelligence resources, including its own NSA counterterrorism experts, to analyze the identities and possible destinations of these individuals. Informed by this analysis, the NCTC would then organize and plan the management of the case, drawing on the talents and differing kinds of experience among the several agency representatives assigned to it—assigning tasks to the CIA overseas, to Homeland Security watching entry points into the United States, and to the FBI. If military assistance might be needed, the Special Operations Command could be asked to develop an appropriate concept for such an operation. The NCTC would be accountable for tracking the progress of the case, ensuring that the plan evolved with it, and integrating the information into a warning. The NCTC would be responsible for being sure that intelligence gathered from the activities in the field became part of the government's institutional memory about Islamist terrorist personalities, organizations, and possible means of attack.

In each case the involved agency would make its own senior managers aware of what it was being asked to do. If those agency heads objected, and the issue could not easily be resolved, then the disagreement about roles and missions could be brought before the National Security Council and the president.

NCTC—Authorities. The head of the NCTC should be appointed by the president, and should be equivalent in rank to a deputy head of a cabinet department. The head of the NCTC would report to the national intelligence director, an office whose creation we recommend below, placed in the Executive Office of the President. The head of the NCTC would thus also report indirectly to the president. This official's nomination should be confirmed by the Senate and he or she should testify to the Congress, as is the case now with other statutory presidential offices, like the U.S. trade representative.

- To avoid the fate of other entities with great nominal authority and little real power, the head of the NCTC must have the right to concur in the choices of personnel to lead the operating entities of the departments and agencies focused on counterterrorism, specifically including the head of the Counterterrorist Center, the head of the FBI's Counterterrorism Division, the commanders of the Defense Department's Special Operations Command and Northern Command, and the State Department's coordinator for counterterrorism.[5] The head of the NCTC should also work with the director of the Office of Management and Budget in developing the president's counterterrorism budget.
- There are precedents for surrendering authority for joint planning while preserving an agency's operational control. In the international context, NATO commanders may get line authority over forces assigned by other nations. In U.S. unified commands, commanders plan operations that may involve units belonging to one of the services. In each case, procedures are worked out, formal and informal, to define the limits of the joint commander's authority.

The most serious disadvantage of the NCTC is the reverse of its greatest virtue. The struggle against Islamist terrorism is so important that any clear-cut centralization of authority to manage and be accountable for it may concentrate too much power in one place. The proposed NCTC would be given the authority of planning the activities of other agencies. Law or executive order must define the scope of such line authority.

The NCTC would not eliminate interagency policy disputes. These would still go to the National Security Council. To improve coordination at the White House, we believe the existing Homeland Security Council should soon be merged into a single National Security Council. The creation of the NCTC should help the NSC staff concentrate on its core duties of assisting the president and supporting interdepartmental policymaking.

We recognize that this is a new and difficult idea precisely because the authorities we recommend for the NCTC really would, as Secretary Rumsfeld foresaw, ask strong agencies to "give up some of their turf and authority in exchange for a stronger, faster, more efficient government wide joint effort." Countering transnational Islamist terrorism will test whether the U.S. government can fashion more flexible models of management needed to deal with the twenty-first-century world.

An argument against change is that the nation is at war, and cannot afford to reorganize in midstream. But some of the main innovations of the 1940s and 1950s, including the creation of the Joint Chiefs of Staff and even the construction of the Pentagon itself, were undertaken in the midst of war. Surely the country cannot wait until the struggle against Islamist terrorism is over.

"Surprise, when it happens to a government, is likely to be a complicated, diffuse, bureaucratic thing. It includes neglect of responsibility, but also responsibility so poorly defined or so ambiguously delegated that action gets lost."[6] That comment was made more than 40 years ago, about Pearl Harbor. We hope another commission, writing in the future about another attack, does not again find this quotation to be so apt.

13.2 UNITY OF EFFORT IN THE INTELLIGENCE COMMUNITY

In our first section, we concentrated on counterterrorism, discussing how to combine the analysis of information from all sources of intelligence with the joint planning of operations that draw on that analysis. In this section, we step back from looking just at the

counterterrorism problem. We reflect on whether the government is organized adequately to direct resources and build the intelligence capabilities it will need not just for countering terrorism, but for the broader range of national security challenges in the decades ahead.

The Need for a Change

During the Cold War, intelligence agencies did not depend on seamless integration to track and count the thousands of military targets—such as tanks and missiles—fielded by the Soviet Union and other adversary states. Each agency concentrated on its specialized mission, acquiring its own information and then sharing it via formal, finished reports. The Department of Defense had given birth to and dominated the main agencies for technical collection of intelligence. Resources were shifted at an incremental pace, coping with challenges that arose over years, even decades.

We summarized the resulting organization of the intelligence community in chapter 3. It is outlined below.

Members of the U.S. Intelligence Community

Office of the Director of Central Intelligence, which includes the Office of the Deputy Director of Central Intelligence for Community Management, the Community Management Staff, the Terrorism Threat Integration Center, the National Intelligence Council, and other community offices

The Central Intelligence Agency (CIA), which performs human source collection, all-source analysis, and advanced science and technology

National intelligence agencies:

- National Security Agency (NSA), which performs signals collection and analysis
- National Geospatial-Intelligence Agency (NGA), which performs imagery collection and analysis
- National Reconnaissance Office (NRO), which develops, acquires, and launches space systems for intelligence collection
- Other national reconnaissance programs

Departmental intelligence agencies:

- Defense Intelligence Agency (DIA) of the Department of Defense
- Intelligence entities of the Army, Navy, Air Force, and Marines
- Bureau of Intelligence and Research (INR) of the Department of State
- Office of Terrorism and Finance Intelligence of the Department of Treasury
- Office of Intelligence and the Counterterrorism and Counterintelligence Divisions of the Federal Bureau of Investigation of the Department of Justice
- Office of Intelligence of the Department of Energy
- Directorate of Information Analysis and Infrastructure Protection (IAIP) and Directorate of Coast Guard Intelligence of the Department of Homeland Security

The need to restructure the intelligence community grows out of six problems that have become apparent before and after 9/11:

- *Structural barriers to performing joint intelligence work.* National intelligence is still organized around the collection disciplines of the home agencies, not the joint mission. The importance of integrated, all-source analysis cannot be overstated. Without it, it is not possible to "connect the dots." No one component holds all the relevant information.By contrast, in organizing national defense, the Goldwater-Nichols legislation of 1986 created joint commands for operations in the field, the Unified Command Plan. The services—the Army, Navy, Air Force, and Marine Corps—organize, train, and equip their people and units to perform their missions. Then they assign personnel and units to the joint combatant commander, like the commanding general of the Central Command (CENTCOM). The Goldwater-Nichols Act required officers to serve tours outside their service in order to win promotion. The culture of the Defense Department was transformed, its collective mind-set moved from service-specific to 'joint," and its operations became more integrated.[7]
- *Lack of common standards and practices across the foreign-domestic divide. The* leadership of the intelligence community should be able to pool information gathered overseas with information gathered in the United States, holding the work—wherever it is done—to a common standard of quality in how it is collected, processed (e.g., translated), reported, shared, and analyzed. A common set of personnel standards for intelligence can create a group of professionals better able to operate in joint activities, transcending their own service-specific mind-sets.
- *Divided management of national intelligence capabilities.* While the CIA was once "central" to our national intelligence capabilities, following the end of the Cold War it has been less able to influence the use of the nation's imagery and signals intelligence capabilities in three national agencies housed within the Department of Defense: the National Security Agency, the National Geospatial-Intelligence Agency, and the National Reconnaissance Office. One of the lessons learned from the 1991 Gulf War was the value of national intelligence systems (satellites in particular) in precision warfare. Since that war, the department has appropriately drawn these agencies into its transformation of the military. Helping to orchestrate this transformation is the under secretary of defense for intelligence, a position established by Congress after 9/11. An unintended consequence of these developments has been the far greater demand made by Defense on technical systems, leaving the DCI less able to influence how these technical resources are allocated and used.
- *Weak capacity to set priorities and move resources.* The agencies are mainly organized around what they collect or the way they collect it. But the priorities for collection are national. As the DCI makes hard choices about moving resources, he or she must have the power to reach across agencies and reallocate effort.
- *Too many jobs.* The DCI now has at least three jobs. He is expected to run a particular agency, the CIA. He is expected to manage the loose confederation of agencies that is the intelligence community. He is expected to be the analyst in chief for the government, sifting evidence and directly briefing the President as his principal intelligence adviser. No recent DCI has been able to do all three effectively. Usually what loses out is management of the intelligence community, a

difficult task even in the best case because the DCI's current authorities are weak. With so much to do, the DCI often has not used even the authority he has.

- *Too complex and secret.* Over the decades, the agencies and the rules surrounding the intelligence community have accumulated to a depth that practically defies public comprehension. There are now 15 agencies or parts of agencies in the intelligence community. The community and the DCI's authorities have become arcane matters, understood only by initiates after long study. Even the most basic information about how much money is actually allocated to or within the intelligence community and most of its key components is shrouded from public view.

The current DCI is responsible for community performance but lacks the three authorities critical for any agency head or chief executive officer: (1) control over purse strings, (2) the ability to hire or fire senior managers, and (3) the ability to set standards for the information infrastructure and personnel.[8]

The only budget power of the DCI over agencies other than the CIA lies in coordinating the budget requests of the various intelligence agencies into a single program for submission to Congress. The overall funding request of the 15 intelligence entities in this program is then presented to the president and Congress in 15 separate volumes.

When Congress passes an appropriations bill to allocate money to intelligence agencies, most of their funding is hidden in the Defense Department in order to keep intelligence spending secret. Therefore, although the House and Senate Intelligence committees are the authorizing committees for funding of the intelligence community, the final budget review is handled in the Defense Subcommittee of the Appropriations committees. Those committees have no subcommittees just for intelligence, and only a few members and staff review the requests.

The appropriations for the CIA and the national intelligence agencies—NSA, NGA, and NRO—are then given to the secretary of defense. The secretary transfers the CIA's money to the DCI but disburses the national agencies' money directly. Money for the FBI's national security components falls within the appropriations for Commerce, Justice, and State and goes to the attorney general.[9]

In addition, the DCI lacks hire-and-fire authority over most of the intelligence community's senior managers. For the national intelligence agencies housed in the Defense Department, the secretary of defense must seek the DCI's concurrence regarding the nomination of these directors, who are presidentially appointed. But the secretary may submit recommendations to the president without receiving this concurrence. The DCI cannot fire these officials. The DCI has even less influence over the head of the FBI's national security component, who is appointed by the attorney general in consultation with the DCI.[10]

Combining Joint Work with Stronger Management

We have received recommendations on the topic of intelligence reform from many sources. Other commissions have been over this same ground. Thoughtful bills have been introduced, most recently a bill by the chairman of the House Intelligence Committee Porter Goss (R-Fla.), and another by the ranking minority member, Jane Harman (D-Calif.). In the Senate, Senators Bob Graham (D-Fla.) and Dianne Feinstein (D-Calif.) have introduced reform proposals as well. Past efforts have foundered, because the president did not support them; because the DCI, the secretary of defense, or both opposed them; and because some

proposals lacked merit. We have tried to take stock of these experiences, and borrow from strong elements in many of the ideas that have already been developed by others.

Recommendation: The current position of Director of Central Intelligence should be replaced by a National Intelligence Director with two main areas of responsibility: (1) to oversee national intelligence centers on specific subjects of interest across the U.S. government and (2) to manage the national intelligence program and oversee the agencies that contribute to it.

First, the National Intelligence Director should oversee *national intelligence centers* to provide all-source analysis and plan intelligence operations for the whole government on major problems.

- One such problem is counterterrorism. In this case, we believe that the center should be the intelligence entity (formerly TTIC) inside the National Counterterrorism Center we have proposed. It would sit there alongside the operations management unit we described earlier, with both making up the NCTC, in the Executive Office of the President. Other national intelligence centers—for instance, on counterproliferation, crime and narcotics, and China—would be housed in whatever department or agency is best suited for them.
- The National Intelligence Director would retain the present DCI's role as the principal intelligence adviser to the president. We hope the president will come to look directly to the directors of the national intelligence centers to provide all-source analysis in their areas of responsibility, balancing the advice of these intelligence chiefs against the contrasting viewpoints that may be offered by department heads at State, Defense, Homeland Security, Justice, and other agencies.

Second, the National Intelligence Director should manage the national intelligence program and oversee the component agencies of the intelligence community. (See diagram.)[11]

- The National Intelligence Director would submit a unified budget for national intelligence that reflects priorities chosen by the National Security Council, an appropriate balance among the varieties of technical and human intelligence collection, and analysis. He or she would receive an appropriation for national intelligence and apportion the funds to the appropriate agencies, in line with that budget, and with authority to reprogram funds among the national intelligence agencies to meet any new priority (as counterterrorism was in the 1990s). The National Intelligence Director should approve and submit nominations to the president of the individuals who would lead the CIA, DIA, FBI Intelligence Office, NSA, NGA, NRO, Information Analysis and Infrastructure Protection Directorate of the Department of Homeland Security, and other national intelligence capabilities.[12]
- The National Intelligence Director would manage this national effort with the help of three deputies, each of whom would also hold a key position in one of the component agencies.[13]
  - foreign intelligence (the head of the CIA)
  - defense intelligence (the under secretary of defense for intelligence)[14]
  - homeland intelligence (the FBI's executive assistant director for intelligence or the under secretary of homeland security for information analysis and infrastructure protection)

Other agencies in the intelligence community would coordinate their work within each of these three areas, largely staying housed in the same departments or agencies that support them now.

Returning to the analogy of the Defense Department's organization, these three deputies—like the leaders of the Army, Navy, Air Force, or Marines—would have the job of acquiring the systems, training the people, and executing the operations planned by the national intelligence centers.

And, just as the combatant commanders also report to the secretary of defense, the directors of the national intelligence centers—e.g., for counterproliferation, crime and narcotics, and the rest—also would report to the National Intelligence Director.

- The Defense Department's military intelligence programs—the joint military intelligence program (JMIP) and the tactical intelligence and related activities program (TIARA)—would remain part of that department's responsibility.
- The National Intelligence Director would set personnel policies to establish standards for education and training and facilitate assignments at the national intelligence centers and across agency lines. The National Intelligence Director also would set information sharing and information technology policies to maximize data sharing, as well as policies to protect the security of information.
- Too many agencies now have an opportunity to say no to change. The National Intelligence Director should participate in an NSC executive committee that can resolve differences in priorities among the agencies and bring the major disputes to the president for decision.

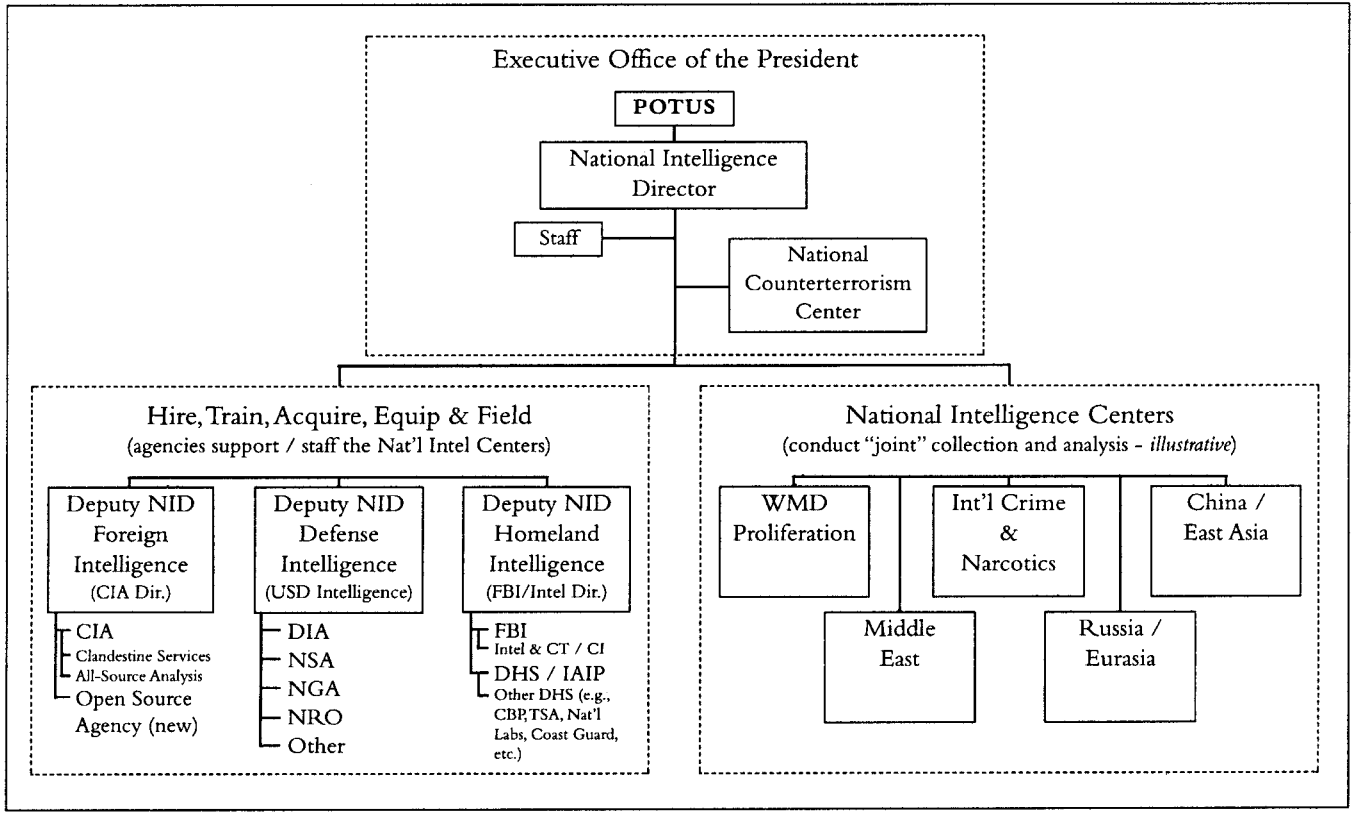
The National Intelligence Director should be located in the Executive Office of the President. This official, who would be confirmed by the Senate and would testify before Congress, would have a relatively small staff of several hundred people, taking the place of the existing community management offices housed at the CIA.

In managing the whole community, the National Intelligence Director is still providing a service function. With the partial exception of his or her responsibilities for overseeing the NCTC, the National Intelligence Director should support the consumers of national intelligence—the president and policymaking advisers such as the secretaries of state, defense, and homeland security and the attorney general.

We are wary of too easily equating government management problems with those of the private sector. But we have noticed that some very large private firms rely on a powerful CEO who has significant control over how money is spent and can hire or fire leaders of the major divisions, assisted by a relatively modest staff, while leaving responsibility for execution in the operating divisions.

There are disadvantages to separating the position of National Intelligence Director from the job of heading the CIA. For example, the National Intelligence Director will not head a major agency of his or her own and may have a weaker base of support. But we believe that these disadvantages are outweighed by several other considerations:

- The National Intelligence Director must be able to directly oversee intelligence collection inside the United States. Yet law and custom has counseled against giving such a plain domestic role to the head of the CIA.



Unity of Effort in Managing Intelligence

- The CIA will be one among several claimants for funds in setting national priorities. The National Intelligence Director should not be both one of the advocates and the judge of them all.
- Covert operations tend to be highly tactical, requiring close attention. The National Intelligence Director should rely on the relevant joint mission center to oversee these details, helping to coordinate closely with the White House. The CIA will be able to concentrate on building the capabilities to carry out such operations and on providing the personnel who will be directing and executing such operations in the field.
- Rebuilding the analytic and human intelligence collection capabilities of the CIA should be a full-time effort, and the director of the CIA should focus on extending its comparative advantages.

Recommendation: The CIA Director should emphasize (a) rebuilding the CIA's analytic capabilities; (b) transforming the clandestine service by building its human intelligence capabilities; (c) developing a stronger language program, with high standards and sufficient financial incentives; (d) renewing emphasis on recruiting diversity among operations officers so they can blend more easily in foreign cities; (e) ensuring a seamless relationship between human source collection and signals collection at the operational level; and (f) stressing a better balance between unilateral and liaison operations.

The CIA should retain responsibility for the direction and execution of clandestine and covert operations, as assigned by the relevant national intelligence center and authorized by the National Intelligence Director and the president. This would include propaganda, renditions, and nonmilitary disruption. We believe, however, that one important area of responsibility should change.

Recommendation: Lead responsibility for directing and executing paramilitary operations, whether clandestine or covert, should shift to the Defense Department. There it should be consolidated with the capabilities for training, direction, and execution of such operations already being developed in the Special Operations Command.

- Before 9/11, the CIA did not invest in developing a robust capability to conduct paramilitary operations with U.S. personnel. It relied on proxies instead, organized by CIA operatives without the requisite military training. The results were unsatisfactory.
- Whether the price is measured in either money or people, the United States cannot afford to build two separate capabilities for carrying out secret military operations, secretly operating standoff missiles, and secretly training foreign military or paramilitary forces. The United States should concentrate responsibility and necessary legal authorities in one entity.
- The post-9/11 Afghanistan precedent of using joint CIA-military teams for covert and clandestine operations was a good one. We believe this proposal to be consistent with it. Each agency would concentrate on its comparative advantages in building capabilities for joint missions. The operation itself would be planned in common.
- The CIA has a reputation for agility in operations. The military has a reputation for being methodical and cumbersome. We do not know if these stereotypes match current reality; they may also be one more symptom of the civil-military

misunderstandings we described in chapter 4. It is a problem to be resolved in policy guidance and agency management, not in the creation of redundant, overlapping capabilities and authorities in such sensitive work. The CIA's experts should be integrated into the military's training, exercises, and planning. To quote a CIA official now serving in the field: "One fight, one team."

Recommendation: Finally, to combat the secrecy and complexity we have described, the overall amounts of money being appropriated for national intelligence and to its component agencies should no longer be kept secret. Congress should pass a separate appropriations act for intelligence, defending the broad allocation of how these tens of billions of dollars have been assigned among the varieties of intelligence work.

The specifics of the intelligence appropriation would remain classified, as they are today. Opponents of declassification argue that America's enemies could learn about intelligence capabilities by tracking the top-line appropriations figure. Yet the top-line figure by itself provides little insight into U.S. intelligence sources and methods. The U.S. government readily provides copious information about spending on its military forces, including military intelligence. The intelligence community should not be subject to that much disclosure. But when even aggregate categorical numbers remain hidden, it is hard to judge priorities and foster accountability.

13.3 UNITY OF EFFORT IN SHARING INFORMATION

Information Sharing

We have already stressed the importance of intelligence analysis that can draw on all relevant sources of information. The biggest impediment to all-source analysis—to a greater likelihood of connecting the dots—is the human or systemic resistance to sharing information.

The U.S. government has access to a vast amount of information. When databases not usually thought of as "intelligence," such as customs or immigration information, are included, the storehouse is immense. But the U.S. government has a weak system for processing and using what it has. In interviews around the government, official after official urged us to call attention to frustrations with the unglamorous "back office" side of government operations.

In the 9/11 story, for example, we sometimes see examples of information that could be accessed—like the undistributed NSA information that would have helped identify Nawaf al Hazmi in January 2000. But someone had to ask for it. In that case, no one did. Or, as in the episodes we describe in chapter 8, the information is distributed, but in a compartmented channel. Or the information is available, and someone does ask, but it cannot be shared.

What all these stories have in common is a system that requires a demonstrated "need to know" before sharing. This approach assumes it is possible to know, in advance, who will need to use the information. Such a system implicitly assumes that the risk of inadvertent disclosure outweighs the benefits of wider sharing. Those Cold War assumptions are no longer appropriate. The culture of agencies feeling they own the information they gathered at taxpayer expense must be replaced by a culture in which the agencies instead feel they have a duty to the information—to repay the taxpayers' investment by making that information available.

Each intelligence agency has its own security practices, outgrowths of the Cold War. We certainly understand the reason for these practices. Counterintelligence concerns are still real, even if the old Soviet enemy has been replaced by other spies.

But the security concerns need to be weighed against the costs. Current security requirements nurture overclassification and excessive compartmentation of information among agencies. Each agency's incentive structure opposes sharing, with risks (criminal, civil, and internal administrative sanctions) but few rewards for sharing information. No one has to pay the long-term costs of over-classifying information, though these costs—even in literal financial terms—are substantial. There are no punishments for *not* sharing information. Agencies uphold a "need-to-know" culture of information protection rather than promoting a "need-to-share" culture of integration.[15]

Recommendation: Information procedures should provide incentives for sharing, to restore a better balance between security and shared knowledge.

Intelligence gathered about transnational terrorism should be processed, turned into reports, and distributed according to the same quality standards, whether it is collected in Pakistan or in Texas.

The logical objection is that sources and methods may vary greatly in different locations. We therefore propose that when a report is first created, its data be separated from the sources and methods by which they are obtained. The report should begin with the information in its most shareable, but still meaningful, form. Therefore the maximum number of recipients can access some form of that information. If knowledge of further details becomes important, any user can query further, with access granted or denied according to the rules set for the network—and with queries leaving an audit trail in order to determine who accessed the information. But the questions may not come at all unless experts at the "edge" of the network can readily discover the clues that prompt to them.[16]

We propose that information be shared horizontally, across new networks that transcend individual agencies.

- The current system is structured on an old mainframe, or hub-and-spoke, concept. In this older approach, each agency has its own database. Agency users send information to the database and then can retrieve it from the database.
- A decentralized network model, the concept behind much of the information revolution, shares data horizontally too. Agencies would still have their own databases, but those databases would be searchable across agency lines. In this system, secrets are protected through the design of the network and an "information rights management" approach that controls access to the data, not access to the whole network. An outstanding conceptual framework for this kind of "trusted information network" has been developed by a task force of leading professionals in national security, information technology, and law assembled by the Markle Foundation. Its report has been widely discussed throughout the U.S. government, but has not yet been converted into action.[17]

Recommendation: The president should lead the government-wide effort to bring the major national security institutions into the information revolution. He should

coordinate the resolution of the legal, policy, and technical issues across agencies to create a "trusted information network."

- No one agency can do it alone. Well-meaning agency officials are under tremendous pressure to update their systems. Alone, they may only be able to modernize the stovepipes, not replace them.
- Only presidential leadership can develop government-wide concepts and standards. Currently, no one is doing this job. Backed by the Office of Management and Budget, a new National Intelligence Director empowered to set common standards for information use throughout the community, and a secretary of homeland security who helps extend the system to public agencies and relevant private-sector databases, a government-wide initiative can succeed.
- White House leadership is also needed because the policy and legal issues are harder than the technical ones. The necessary technology already exists. What does not are the rules for acquiring, accessing, sharing, and using the vast stores of public and private data that may be available. When information sharing works, it is a powerful tool. Therefore the sharing and uses of information must be guided by a set of practical policy guidelines that simultaneously empower and constrain officials, telling them clearly what is and is not permitted.

"This is government acting in new ways, to face new threats," the most recent Markle report explains. "And while such change is necessary, it must be accomplished while engendering the people's trust that privacy and other civil liberties are being protected, that businesses are not being unduly burdened with requests for extraneous or useless information, that taxpayer money is being well spent, and that, ultimately, the network will be effective in protecting our security." The authors add: "Leadership is emerging from all levels of government and from many places in the private sector. What is needed now is a plan to accelerate these efforts, and public debate and consensus on the goals."[18] . . .

13.5 ORGANIZING AMERICA'S DEFENSES IN THE UNITED STATES

The Future Role of the FBI

We have considered proposals for a new agency dedicated to intelligence collection in the United States. Some call this a proposal for an "American MI-5," although the analogy is weak—the actual British Security Service is a relatively small worldwide agency that combines duties assigned in the U.S. government to the Terrorist Threat Integration Center, the CIA, the FBI, and the Department of Homeland Security.

The concern about the FBI is that it has long favored its criminal justice mission over its national security mission. Part of the reason for this is the demand around the country for FBI help on criminal matters. The FBI was criticized, rightly, for the overzealous domestic intelligence investigations disclosed during the 1970s. The pendulum swung away from those types of investigations during the 1980s and 1990s, though the FBI maintained an active counterintelligence function and was the lead agency for the investigation of foreign terrorist groups operating inside the United States.

We do not recommend the creation of a new domestic intelligence agency. It is not needed if our other recommendations are adopted—to establish a strong national

intelligence center, part of the NCTC, that will oversee counterterrorism intelligence work, foreign and domestic, and to create a National Intelligence Director who can set and enforce standards for the collection, processing, and reporting of information.

Under the structures we recommend, the FBI's role is focused, but still vital. The FBI does need to be able to direct its thousands of agents and other employees to collect intelligence in America's cities and towns—interviewing informants, conducting surveillance and searches, tracking individuals, working collaboratively with local authorities, and doing so with meticulous attention to detail and compliance with the law. The FBI's job in the streets of the United States would thus be a domestic equivalent, operating under the U.S. Constitution and quite different laws and rules, to the job of the CIA's operations officers abroad.

Creating a new domestic intelligence agency has other drawbacks.

- The FBI is accustomed to carrying out sensitive intelligence collection operations in compliance with the law. If a new domestic intelligence agency were outside of the Department of Justice, the process of legal oversight—never easy—could become even more difficult. Abuses of civil liberties could create a backlash that would impair the collection of needed intelligence.
- Creating a new domestic intelligence agency would divert attention of the officials most responsible for current counterterrorism efforts while the threat remains high. Putting a new player into the mix of federal agencies with counterterrorism responsibilities would exacerbate existing information-sharing problems.
- A new domestic intelligence agency would need to acquire assets and personnel. The FBI already has 28,000 employees; 56 field offices, 400 satellite offices, and 47 legal attaché offices; a laboratory, operations center, and training facility; an existing network of informants, cooperating defendants, and other sources; and relationships with state and local law enforcement, the CIA, and foreign intelligence and law enforcement agencies.
- Counterterrorism investigations in the United States very quickly become matters that involve violations of criminal law and possible law enforcement action. Because the FBI can have agents working criminal matters and agents working intelligence investigations concerning the same international terrorism target, the full range of investigative tools against a suspected terrorist can be considered within one agency. The removal of "the wall" that existed before 9/11 between intelligence and law enforcement has opened up new opportunities for cooperative action within the FBI.
- Counterterrorism investigations often overlap or are cued by other criminal investigations, such as money laundering or the smuggling of contraband. In the field, the close connection to criminal work has many benefits.

Our recommendation to leave counterterrorism intelligence collection in the United States with the FBI still depends on an assessment that the FBI—if it makes an all-out effort to institutionalize change—can do the job. As we mentioned in chapter 3, we have been impressed by the determination that agents display in tracking down details, patiently going the extra mile and working the extra month, to put facts in the place of speculation. In our report we have shown how agents in Phoenix, Minneapolis, and New York displayed initiative in pressing their investigations.

FBI agents and analysts in the field need to have sustained support and dedicated resources to become stronger intelligence officers. They need to be rewarded for acquiring informants and for gathering and disseminating information differently and more broadly than usual in a traditional criminal investigation. FBI employees need to report and analyze what they have learned in ways the Bureau has never done before.

Under Director Robert Mueller, the Bureau has made significant progress in improving its intelligence capabilities. It now has an Office of Intelligence, overseen by the top tier of FBI management. Field intelligence groups have been created in all field offices to put FBI priorities and the emphasis on intelligence into practice. Advances have been made in improving the Bureau's information technology systems and in increasing connectivity and information sharing with intelligence community agencies.

Director Mueller has also recognized that the FBI's reforms are far from complete. He has outlined a number of areas where added measures may be necessary. Specifically, he has recognized that the FBI needs to recruit from a broader pool of candidates, that agents and analysts working on national security matters require specialized training, and that agents should specialize within programs after obtaining a generalist foundation. The FBI is developing career tracks for agents to specialize in counterterrorism/counterintelligence, cyber crimes, criminal investigations, or intelligence. It is establishing a program for certifying agents as intelligence officers, a certification that will be a prerequisite for promotion to the senior ranks of the Bureau. New training programs have been instituted for intelligence-related subjects.

The Director of the FBI has proposed creating an Intelligence Directorate as a further refinement of the FBI intelligence program. This directorate would include units for intelligence planning and policy and for the direction of analysts and linguists.

We want to ensure that the Bureau's shift to a preventive counterterrorism posture is more fully institutionalized so that it survives beyond Director Mueller's tenure. We have found that in the past the Bureau has announced its willingness to reform and restructure itself to address transnational security threats, but has fallen short—failing to effect the necessary institutional and cultural changes organization-wide. We want to ensure that this does not happen again. Despite having found acceptance of the Director's clear message that counterterrorism is now the FBI's top priority, two years after 9/11 we also found gaps between some of the announced reforms and the reality in the field. We are concerned that management in the field offices still can allocate people and resources to local concerns that diverge from the national security mission. This system could revert to a focus on lower-priority criminal justice cases over national security requirements.

Recommendation: A specialized and integrated national security workforce should be established at the FBI consisting of agents, analysts, linguists, and surveillance specialists who are recruited, trained, rewarded, and retained to ensure the development of an institutional culture imbued with a deep expertise in intelligence and national security.

- The president, by executive order or directive, should direct the FBI to develop this intelligence cadre.
- Recognizing that cross-fertilization between the criminal justice and national security disciplines is vital to the success of both missions, all new agents should receive basic training in both areas. Furthermore, new agents should begin their careers with meaningful assignments in both areas.

- Agents and analysts should then specialize in one of these disciplines and have the option to work such matters for their entire career with the Bureau. Certain advanced training courses and assignments to other intelligence agencies should be required to advance within the national security discipline.
- In the interest of cross-fertilization, all senior FBI managers, including those working on law enforcement matters, should be certified intelligence officers.
- The FBI should fully implement a recruiting, hiring, and selection process for agents and analysts that enhances its ability to target and attract individuals with educational and professional backgrounds in intelligence, international relations, language, technology, and other relevant skills.
- The FBI should institute the integration of analysts, agents, linguists, and surveillance personnel in the field so that a dedicated team approach is brought to bear on national security intelligence operations.
- Each field office should have an official at the field office's deputy level for national security matters. This individual would have management oversight and ensure that the national priorities are carried out in the field.
- The FBI should align its budget structure according to its four main programs—intelligence, counterterrorism and counterintelligence, criminal, and criminal justice services—to ensure better transparency on program costs, management of resources, and protection of the intelligence program.[19]
- The FBI should report regularly to Congress in its semiannual program reviews designed to identify whether each field office is appropriately addressing FBI and national program priorities.
- The FBI should report regularly to Congress in detail on the qualifications, status, and roles of analysts in the field and at headquarters. Congress should ensure that analysts are afforded training and career opportunities on a par with those offered analysts in other intelligence community agencies.
- The Congress should make sure funding is available to accelerate the expansion of secure facilities in FBI field offices so as to increase their ability to use secure email systems and classified intelligence product exchanges. The Congress should monitor whether the FBI's information-sharing principles are implemented in practice.

The FBI is just a small fraction of the national law enforcement community in the United States, a community comprised mainly of state and local agencies. The network designed for sharing information, and the work of the FBI through local joint Terrorism Task Forces, should build a reciprocal relationship, in which state and local agents understand what information they are looking for and, in return, receive some of the information being developed about what is happening, or may happen, in their communities. In this relationship, the Department of Homeland Security also will play an important part.
