It should be no less well understood that theta contacting smaller quantities of entheta converts the entheta into theta. This is a two-way conversion. Entheta, in proximity to theta, makes entheta out of it. From this we have the contagion of aberration. It was once thought that insanity was inherited. It is true that a genetic endowment in terms of structure or an endowment of too small a quantity of theta may predispose one person more than others to insanity, but only in the vicinity of entheta. Of course, there can be the insanity of malformed brains, where some of the perception and computation mechanisms are absent, but this type of insanity results only in inability to think, not in aberrated thinking. It is not true, then, that insanity is hereditary. Insanity, apparently, comes about wholly by contagion. An enturbulated culture or environment can keep an individual in a continuous state of turbulence, but, lacking engrams, that individual would cease to be enturbulated as soon as he removed himself from the source of the turbulence. People who are insane bring those around them markedly down on the tone scale and could be said to be responsible for all the existing insanity in the race. If one associates with badly aberrated individuals one will himself, in consequence, become badly aberrated, if only while in the vicinity of the badly aberrated associates.

There is an apparent family line of aberration. It was previously thought to be carried genetically, but this is evidently not the case. It is carried on the thought channel of the family. The confusions of domestic life get into the moments of physical injury of the child, and the child as a consequence becomes liable for the family aberrations and will manifest them.

The principle of the contagion of aberration is broad in scope. One can observe in any group of men that one or two may be much more aberrated than the others. One can make the simple experiment of removing the one or two aberrated Persons from the group, and he will then see that the general tone level of the group will rise, since the source of the group's main turbulence has been removed.

By examining the life of any preclear, his case history, and without examining any of the preclear's own aberrations, the auditor can make a good estimate of many of the preclear's aberrations simply by discovering what manner of people the parents were. It is an inexorable fact that these aberrations, one way or another, will manifest themselves in the preclear.

The auditor should fully understand the principle of contagion. Fortunately, the conversion works in both directions. Sanity is also contagious. Thus, by observing the auditor's code and providing a sane environ for his preclear, the auditor can bring some of the

entheta in the preclear's case back into the state of theta without any processing. This is particularly valuable in the treatment of psychotics.

There could be said to be three divisions of entheta. Basically, the only way entheta comes into being in any life form is through physical injury, but after the physical injury is present the entheta in it contagious into the theta involved in circumstances that approach or approximate those of the physical injury. When this happens we have another kind of entheta: locks formed by restimulation. The shocks of conscious moments, the griefs and sorrows, the fears and angers, the breaks of affinity, communication and reality which one has with life would be the third kind of entheta, which would be temporary entheta if it were not for the presence of physical injury and its entheta in the case. To make this plainer, first there is the engram. This is physical pain, enMEST and entheta held at a specific point on the time track. This might never become serious but for restimulation by the environment. When this engram becomes restimulated it makes much of the existing free theta in the organism turbulent. Some of this turbulence remains as additional frozen entheta, some of it un-enturbulates and becomes theta again.

The engram, a moment of physical pain, forms the basis for entheta, and having formed it, little by little, by contagion steals free theta from the individual and makes it into entheta "permanently" in the form of secondary engrams and locks. At the moment of restimulation, perhaps nearly all of the individual's theta becomes enturbulated, but this more or less rapidly un-enturbulates, or settles out, and becomes theta again.

One could, then, have a picture of a time track as a straight line from conception to present time. At some early point on this time track there is a moment of physical injury. A little later on the track this moment is approximated by the environment. This would be a key-in. Actually, the individual has to be more or less enturbulated by the general environment when the key-in takes place, which is to say he would have to be worried or tired or perhaps only annoyed about something.

This key-in now gives the engram more power and strength. The next time the engram is restimulated another lock is added and would be marked as a third point on the track. Then let us say that some loss takes place which approximates in some way or ways this original engram. If it were such a thing as the death of a loved one an enormous amount of enturbulence would take place. The turbulence by its very magnitude approximates the nature of physical pain. A very large amount of theta becomes trapped by the physical pain. This would be called a secondary engram. The difference between a secondary engram and a lock is the order of magnitude of the trapped theta, that is, entheta. Each time a secondary occurs the whole of the theta of the individual may be temporarily enturbulated, but only a small portion remains frozen as entheta, and the remaining enturbulated theta converts back into free theta. Thus one can see that as life progresses, more and more theta becomes fixed as entheta in locks and secondary engrams, and less and less theta is available to the organism for purposes of reason. This is called the dwindling spiral. It is so called because the more entheta there is on the case, the more theta will be turned into entheta at each new restimulation. It is a three-dimensional vicious circle which carries the individual down the tone scale. In a child, very few locks and secondaries have been formed and so the child's theta is free and the child's tone is high, yet even though this child receives no more engrams for several years, the engrams he already has may gradually be charged up by locks and secondaries until he has less free theta than entheta, at which time he would be very low on the tone scale.

It may also happen that some enormous success in life, an extremely happy marriage, or association with high-theta individuals will work on the reactive bank to convert it without processing, at least in part, back into free theta. Here is the calmness of the aberrated person who quits the turbulent world, for instance, and takes the vows of the church. In this new environment he has fewer approximations of his old locks and engrams, but more importantly, he is in the vicinity of far more theta, and he will as a consequence dis-enturbulate, and therefore rise on the tone scale.

Similarly, that person who is idle, without goal or direction, may find his accumulation of secondaries and locks is far greater, since his theta, being idle, is already slightly enturbulated. This individual may become very busy in the pursuit of some definite and worthwhile goal, and his theta, thus un-enturbulated, will rob his locks and secondaries of some of the entheta they contain.

An individual who in one environ may have been living under extremely unhealthy conditions may change his mode of existence so as to include exercise, sunshine and fresh air, and this change bringing about a better physical condition will itself un-enturbulate the individual to some degree.

Dianetic processing does simply this: It uses the theta of the preclear, as aided by the theta of the auditor, to disenturbulate the entheta contained in the preclear's locks, secondaries and engrams.

The goal of the auditor is to dis-enturbulate entheta, not necessarily to run engrams or to concentrate on locks or secondaries, one more than another. In various cases various conditions exist which make it necessary to address first one and then another of these three types of entheta. The auditor should thoroughly understand the anatomy of the engram, as well as that of the secondary and of the lock.

An engram comes about when the individual organism suffers an intense impact with MEST. This is actual physical pain. It may occur in any portion of the body and may be from simply too intense a reception of light or sound, erosion, as in chafing or sunburn, cuts, contusions, fractures, organic derangements, overdoses of poisonous substances, attacks by bacteria and viruses, or any usual or unusual cause of physical pain. Every moment of physical pains contains with it a partial or major shutdown of the analytical function of the mind. Consciousness may be interrupted for a moment or for days by physical pain, but regardless of the duration, physical pain always brings about lowered consciousness. One may not realize this completely until one has had erased from him an instant in which he burned his finger, or something equally inconsequential. He will learn that while he had supposed he knew everything that happened during that moment of pain, some data yet remained hidden concerning the incident. This missing data is the content of the reactive mind.

The engram contains all of the perceptions present during the period of its receipt. Before Dianetics, this was not realized. It was thought that an unconscious person was simply unconscious and that things which were said to him and that other perceptible entities which impinged upon him went unrecorded. No matter the depth of unconsciousness in the presence of physical pain, the reactive mind records fully and completely all the perceptions possible in the environ, including the physical pain. During an operation involving anesthesia, for instance, all the physical pain, the doctor's words, the smell of the ether, the nurse's footsteps, the feel of the table, and the functions of the internal organs, amongst other things, are recorded in full in the reactive mind of the individual, as an engram.

If one is acquainted with hypnotism, one can readily understand the compulsive or obsessive character of data which is out of sight of the conscious mind but which is yet forced upon it from below by the drive of physical pain. Hidden data and hidden pain cause identity thinking, so that the power to differentiate and thus to reason is reduced. An individual obeys engrams literally. When an engram is restimulated the individual may dramatize the engram, or go through the cycle of action demanded by the engram, if it can be dramatized. Dramatized or not, the engram, containing unconsciousness, reduces the analytical awareness of the individual, and a person who has many engrams in restimulation is ordinarily less than one-quarter analytically aware, and can still be considered normal.

The entheta of the engram makes it possible for locks to form. The engram is restimulated in the individual when he is less analytically alert than ordinarily, by reason of weariness or other non-optimum conditions. The engram may contain certain perceptics which are duplicated in the immediate environ of the individual. This approximation of the environ to

the engram brings about an identification of the exterior world with the interior world of engrams, and so brings about restimulation of the engram. This restimulation manifests itself in the enturbulation of the individual. The process of enturbulation fixes into the engram some of the individual's theta, "permanently" converting it to entheta. The first time an engram is restimulated (and one may lie dormant for forty years without being restimulated) is called a key-in. A key-in is merely a special kind of lock, the first lock on a particular engram.

The secondary engram takes place when the turbulence of the individual is very high. Anger, fear, grief, or apathy may be occasioned by the environment and if a physical pain engram underlies this situation and even vaguely approximates it in perceptics, enormous quantities of theta are trapped as entheta in the secondary. The secondary engram is enormously important. It is run exactly like a physical pain engram. The secondary stores such large quantities of entheta that remarkable results are often obtained by running one simple secondary engram. The auditor should understand thoroughly, however, that no secondary engram can exist unless a physical pain engram underlies it. In running a secondary engram the auditor may often discover that with it he is running also a physical pain engram.

Affinity, communication, and reality enforcements and breaks in a case are not specialized types of secondaries or locks but are only the component parts of secondaries and locks. Any physical pain engram is a break of affinity between theta and MEST and is, indeed, the basic affinity break. The break of affinity brings about reduction of communication since the theta no longer wishes to approach this type of MEST as avidly as before. And as the theta is not in harmonious agreement with MEST, the reality is reduced. Here we have, in affinity, communication, and reality breaks, the basic cause of trouble in any organism. The intent of theta is harmoniously to conquer MEST and when MEST reacts suddenly and without warning against the theta organism the basic impulse of that theta is thwarted. Thus, the engram could be said to be the basis of all aberration, and by observation and experience this postulate seems to be adequately confirmed.

The engram becomes charged up with entheta through the process of the individual's acquiring locks and secondaries. An engram which is too highly charged not only cannot be run but ordinarily cannot even be contacted, until secondaries and locks are reduced. Thus, in most cases the first address of the auditor is to locks and then secondaries and then engrams, with the treatment of more locks and secondaries to make available more engrams.

The whole purpose of the auditor is to change entheta to theta as rapidly and as efficiently as possible. Where he gets the entheta, whether out of engrams, secondaries, or locks, is of no basic concern. Theta is theta.

CHAPTER FOUR

The Dynamics of Existence

Behind Dianetics there is considerable technology concerning knowledge itself and general philosophies about thinking without which Dianetics could not have come into existence.

The major postulate of Dianetics is:

THE DYNAMIC PRINCIPLE OF EXISTENCE IS SURVIVE.

Theta (where its purpose is the conquest of MEST), life, and organisms have no other principle than survive as their motivation. The opposite to this motivation is succumb.

The failure to survive is to succumb.

Theta as an energy, insofar as we observe it in organisms which are partially MEST, survives or succumbs. MEST, in accordance with the most fundamental physical laws and the conservation of energy, survives or succumbs. It will be noted

Two basic axioms about knowledge are as follows: Axiom One: A datum is important as it is evaluated in terms of survive or succumb; Axiom Two; A datum can only be evaluated by data of comparable magnitude. The basic unit of both the theta and the MEST universes is Two, not One.

Dimaxian geometry, the three-dimensional mathematics of space, has comparable axioms and values, evidently, in the theta universe. The basic unit of One as a postulate is impossible, since it has nothing by which it can be evaluated; therefore, the basic unit of Two is necessary. Attempting to postulate anything on the basis of One as the basic unit brings about considerable disorder in thought. The Supreme Being, for instance, has as the second datum for evaluation the Devil. The Supreme Being is Survive. The Devil is Succumb. The basic postulate of Dianetics contains as an understood portion the fact that survive is matched by succumb.

In both cases that succumbing is apparently the conversion of the energy into another form. Theta converting into entheta travels from survive to succumb, but the energy is not lost, and death is one of the freeing mechanisms by which the theta is able to become momentarily independent of MEST and so combine again with MEST, forming another organism to carry along the generations. In the physical universe, energy survives but the forms the energy takes often succumb and change into other energy forms.

The chart of the tone scale divides at 2.0. Above this point the direction of dynamic action of the organism is toward survival. The organism will seek higher levels of survival, will try to live as long as possible and as well as possible, both of which are components of survival, since in general the more bountiful the existence, the better the potentials of survival.

Below 2.0, the dynamic action of the organism tends toward succumb. The individual may apparently engage upon survival activities but will do something to bring about a nonsurvival end, regardless of what activity the individual engages upon. Below 2.0, the individual will tend toward the death of himself, sex, the future, groups, or mankind. He is destructive toward life. He makes enMEST out of any MEST he may have at hand or can influence. He repels theta and attracts entheta. This is the band of the immoral, the promiscuous, the criminal, the Godless, the suicide, and other undesirables. Whatever action is taken by the individual who is acutely or chronically below 2.0 will tend toward the death of himself or anything with which he is association. His avowals may be entirely different, and he may even himself believe that he seeks higher survival levels, but the end product of his

actions, whether these actions apply to a business, to a marriage, to a friendship, to a group, or to a religion will be death or some undesirable non-survival situation, which of course itself tends toward death. It is not realized generally that the criminal is not only anti-social but is also anti-self. Anyone below 2.0 is a potential or active criminal, in that crimes against the pro-survival actions of others are continually perpetrated. Crime might be defined as the reduction of the survival level along any one of the eight dynamics.

Good can be considered to be any constructive survival action. It happens that no construction can take place without some small destruction, just as the tenement must be torn down to make room for the new apartment building. Good is further modified by the viewpoint of the individual. To be good, something must contribute to the individual, to his family, his children, his group, mankind, or life. To be good, a thing must contain construction which outweighs the destruction it contains. A new cure which saves a hundred and kills one is an acceptable cure. What is good from the viewpoint of one person may be bad for another person. In the case of A who gets a new job, this is good for A, but perhaps bad for B, who was released so that A could have the job. Good is survival. Good is being right more than one is wrong. Good The old adages about the forces of good and the forces of evil are amazingly apt when one studies men from the standpoint of the theta-MEST theory. In order to understand this further perhaps one should offer the dianetic axioms for good and for evil.

Police are continually baffled by the irrationality of the criminal. Since police officers are, ordinarily, rational men and tend themselves toward survival, they sometimes cannot readily comprehend that the criminal habitually takes the route of non-survival for himself and his group. No matter the criminal's I.Q. he will leave obvious clues on the scene. He will flee from crimes at a rate of speed calculated to attract the attention of any traffic officer. Trapped in a criminal act which has as its penalty as little as thirty days in jail, the criminal may attempt to use weapons against police, and thus commit suicide at the expense of some worthy officer's life. The most baffling thing in police work is an attempt to deduce motives using any kind of a rational yardstick upon the criminal. The only motive the criminal has is destruction along any one of the dynamics, including the first. It sometimes happens that if a criminal is promised non-survival in return for information he will gladly make the trade, where as he refuses to give information in return for liberty and continued good health. Those who aid criminals or deal with them know, to their sorrow, that the criminal ordinarily repays a helping hand with destructive actions. Parole boards are rendered particularly dismayed by the numbers of times their extension of liberty, on certain conditions, is repaid by destructive action. Police have for some time looked for a proper definition for a true criminal. Men should be removed from society only when they constitute a continual or occasional threat to that society. An answer to this problem may be found in the accompanying chart.

Good is being more successful than one is unsuccessful, along constructive lines. Things are good which complement the survival of the individual, his family, children, group, mankind, life, and MEST. Acts are good which are more beneficial than destructive along these dynamics, as modified by the viewpoint of the individual, the future race, the group, mankind, life, or MEST.

Evil is the opposite of good, and is anything which is destructive more than it is constructive along any of the various dynamics. A thing which does more destruction than construction is evil from the viewpoint of the individual, the future, group, species, life, or MEST that it destroys. When an act is more destructive than constructive, it is evil. When an act assists succumbing more than it assists survival, it is an evil act in the proportion that it destroys. A thing is evil which threatens more destruction than construction for the individual, future, group, mankind, life or MEST.

Good, bluntly, is survival. Evil is non-survival. Construction is good when it promotes survival. Destruction is bad when it inhibits survival. Construction is evil when it inhibits survival. Destruction is good when it enhances survival.

An act or conclusion is as right as it promotes the survival of the individual, future, group, mankind, or life making the conclusion. To be entirely right would be to survive to infinity.

An act or conclusion is wrong to the degree that it is nonsurvival to the individual, future race, group, species, or life responsible for doing the act or making the conclusion. The most wrong a person can be on the first dynamic is dead.

The individual or group which is, on the average, righter than wrong (since these terms are not absolutes, by far) should survive. An individual who is wronger than right, on the average, will succumb. All conclusions are modified by time, since one conclusion made wrong during an emergency can cause the non-survival of the individual or the group.

Individuals above 2.0 on the tone scale are more and more right in their actions and conclusions than they are wrong, as they rise up the tone scale. Individuals below 2.0 are, on the average, increasingly more wrong than they are right, in all fields, as they descend the tone scale.

Accepting these postulates and axioms, it can then be observed that one can predict to some degree what he may expect from individuals above or below 2.0 on the tone scale. A reasonable individual attempts to read into the acts of others some reason. An individual who is tending toward survival tends to evaluate the conduct of others in terms of efforts to survive. He may see in an individual below 2.0 what he thinks is merely an aberrated inaccuracy or an occasional mistake, but closer observation will demonstrate that the individual below 2.0 is aggregating numerous mistakes, even while being occasionally right, and is tending to bring about the non-survival of himself, of the future, of the group, and by contagion, the mankind of which he would like to be a part. Below 2.0 lies fatality. That fatality may be manifested on a gradient scale. It may only be nagging or forgetfulness or occasional gossip, but it is destructive and it is evil. In an older time a stern voice could have said that those who lie below 2.0 are the servants of evil and the minions of the devil. These few axioms should give the auditor some ability to predict actions and to know the reasons he should expect certain actions on the part of preclears.

Very little experimental evidence exists with regard to many aspects of the theta body or, as it might otherwise be called, the individual soul. It is distinct from cellular or genetic line and apparently has its own personality and follows in a continuing line along the various generations, possibly now and then advancing to a point where it separates itself from the race and joins the theta universe. The data accumulated would also seem to indicate that some entheta is carried forward along the line of the generations, since engrams in the theta body exist, if to a much lighter extent, specifically the death engram, where the theta body is very much in evidence -- so much so that if the auditor neglects to run the death engram of a past life when it is presented by the preclear, he will without fail bog down his case. There seems to be a distinct possibility that the theta body might begin, through the generations, to carry preponderance of entheta by being too continually in the lower area of the tone scale. It could be postulated that the theta body might become an entheta body entirely, and so drop out of the survival concatenations, to what destination one cannot surely say.

CHAPTER FIVE

General Description of Processing

Dianetic processing is relatively simple. The auditor usually assists the preclear, provided, with an easy chair and a couch. The preclear at first normally sits up and answers the questions of the inventory. This actually is the beginning of processing, although it may appear that the auditor is merely seeking information which he can later use. During the inventory, the interest of the auditor in the preclear builds up affinity between them. The discussion of the case increases communication. And the auditor's acceptance of the preclear's first evaluation of his own case builds up a sense of reality. The auditor can tear down these desirable ARC conditions by being bored, uninterested in his preclear, peremptory, demanding that less time be consumed, criticising the preclear in any way, or in general breaking the auditor's code.

The auditor then makes a test of the case, finding out whether or not the preclear can move on the track, finding out whether the preclear's memory is good, and estimating what level of the tone scale his preclear probably occupies.

CAUTION: THE AUDITOR UNDER NO CIRCUMSTANCES SHOULD TELL THE PRECLEAR WHERE HE THINKS THE PRECLEAR LIES ON THE CHART.

He should not be involved in any way into disclosing where he thinks the preclear lies on the chart, since a low value on the chart for the preclear is, in effect, an invalidation of the preclear himself. (The auditor does not have to disclose this information even by the way he starts his processing, for any case can expect to be given lock scanning and straight wire. A case may be actually well up the tone scale but so occluded that lock scanning and straight wire must be employed.) The auditor furthers his investigation of the case by asking the preclear to lie down on the couch and close his eyes. In the past there was some confusion about the condition called reverie. The only difference between being in reverie and being awake is actually being in or out of present time. Reverie is not even a cousin to hypnotism. The auditor, contrary to any early practice, does not count the preclear into a state of reverie or concentration. The moment he asks the preclear to close his eyes and the preclear complies, the auditor can consider the preclear to be in reverie. If the preclear does not move on the track, this is not caused by failure to be in reverie, but by being stuck in an engram or having a heavily charged case.

The auditor tests out the perceptics of the preclear by simply asking the preclear to go back to a recent meal he has eaten or a recent pleasure moment and having him recount this moment over several times, not as a concept of the moment, but as if he were right on the scene doing again the things which he did before. This is called testing or tuning the perceptics. The auditor here is attempting to discover whether or not the preclear can actually taste again a steak he has eaten, see again the scene he has viewed exactly as it was, feel again the knife and fork in his hands, hear again the conversation around him, feel again his weight upon the chair, and in general re-experience the incident. Running several such pleasure moments, it occasionally happens that some of the occluded perceptics tune up and turn on. In any event, running pleasure moments is very good for raising the tone of the preclear.

Having run a perceptic test, the auditor takes the preclear, merely by asking him to go to a moment when he was very slightly injured, to the point on the track where he has a somatic. The auditor runs the incident. The somatic, if felt at all, will ordinarily reduce. This should be a recent moment of physical pain and should be a very minor one such as a cut finger or a stubbed toe. This gives the preclear some idea of what he is expected to do. The auditor should pay particular attention to the fact that he is actually educating his preclear into track movement. The preclear may have to be coaxed several times before he gets the idea of being back in an incident and re-experiencing it. He may try to give merely the concept of the incident instead of perceiving it as though he were right there going through it again. He might try to free-

associate and so wander around all over the track getting odds and ends and bits of information which are relatively valueless.

After estimating the perceptics, the auditor should continue according to the chart, on which by this time he should have thoroughly located his preclear. (Questions of almost unlimited variety will have been asked by the auditor. Simply by using the data in various columns and levels on the chart, he can avoid a stereotyped approach and be sure of turning up the information he needs.) The most significant points on the test run are movement on the track and the ability of the preclear to feel somatics. The auditor continues processing according to the chart, occasionally checking the preclear for any rise on the tone scale, and if he finds a rise in tone he may use additional methods, as delineated on the chart. The auditor should be particularly chary of using on the preclear methods which are above his tone level. It is better to err by using methods below the preclear's tone level. Those individuals who are relatively low on the tone scale have so little free theta available for processing that it must be preserved and added to by the gentlest and lightest methods possible for some time until the preclear's tone rises.

Should the auditor discover that the preclear lies high in one column and low in another column he should take an average and by this discover the approximate position on the tone scale.

If the auditor is unable immediately to establish the preclear on the tone scale it is, in general, safe to use lock scanning without much investigation of the case. Even a case which is stuck on the time track can be lock scanned. If the preclear is scanned through his locks and sticks in one of these locks, the auditor can generally free him by running pleasure moments or scanning pleasure moments, if he does not want to run the incident in which the preclear is hung up. Even when stuck in an engram preclears usually can be lock scanned.

The auditor should not be beguiled or sent astray by the wide-open case. This case is a very peculiar thing, as discussed elsewhere. Sonic and visio can be on full from the top to the bottom of the tone scale, but trying to run engrams on a wide-open case, as engrams, when the case is at 0.5 or 1.1, will bring about a long and arduous course of processing in which the preclear will remain more or less static on the tone scale regardless of how many engrams are run out of the case. When such a case, or any case, is low on the tone scale, the running of engrams absorbs free theta. Further, the preclear will consistently combat running engrams, since when any preclear is below 2.0, his tendency is toward death, suicide, or further decline. No plans or hopes for the future, no coaxings, nothing will persuade this preclear to do anything very arduous to help himself. A preclear low on the tone scale may, however, be persuaded into some of the milder methods of processing, since they do not occasion much effort and actually do not seem to threaten his intended decline-since, make no mistake, the preclear below 2.0 will try one way or another, by knowing or unknowing intent, to bring about failures and consequent death to himself, his associates, and his group. The wide-open case must be established on the tone scale by columns other than visio and sonic. It is best located by its sense of reality, sexual behavior, other manifestations, and the condition of the somatics. The wide-open case which is low on the tone scale must be handled with great care, since here we have, unlike the occluded case, a persistence so low that the individual drifts at the command of any engram or changes course at the slightest pressure from the environment. The wide-open case low on the tone scale has no feelings of responsibility toward self, future, or group, save aberrated ones. Persistence is so slight that any auditing errors can cause the case to withdraw from processing. Here is an individual who climbs molehills as though they were mountains. This case can be the greatest trial to the auditor and will render, unfortunately, the most unsatisfying final results. The wide-open case can, of course, be low on the tone scale only temporarily, because of some environmental situation. If so, the auditor had better extend himself if he can to clear up this situation before he begins auditing.

This case is also a great liability to the auditor, when low on the tone scale, because of its vagaries of behavior. If a woman, she may offer herself freely to the auditor, disregarding her position in life, her husband, the future she may blast by doing so, the fate of any children she may have, or any other consideration. Woe betide the luckless male auditing such a case

who involves himself with this bundle of destruction, since as she would betray another so she will betray him; as she will be dishonest with another so she will be dishonest with the auditor. The dishonesty will extend not only to treachery and betrayal, wherein she may freely surrender to the auditor and then go directly to the police to have him arrested for seduction, and wherein she may promise the greatest secrecy around any liaison and yet strew all about evidence of that liaison, but she will also be dishonest when being run and will, for no other reason than to confuse the picture, deliver up the most twisted and perverted scenes of her own life. Raised amid riches, she will represent herself as having been a pauper. Raised a pauper, she will represent herself as a princess. She will normally have pride in her ability to act, and will commonly writhe and moan and weep over some incident that she quite consciously knows to be imaginary. The male wide-open case is no less difficult and trying. No trust of any kind can be placed in a wide-open case when it is below 2.0 on the tone-scale, and for that matter no trust can be put in an occluded case below 2.0 on the tone scale, but the wide-open case is far more deceptive and far more prone to wide vagaries in behavior and delusion.

The auditor will have his problems with preclears who want attention but not processing. These preclears are automatically classified as below 2.0. This is the quickest chart location which can be done. The preclear who wants no kind of processing whatsoever, even though he understands some of the principles involved and knows they will not be harmful, and the preclear who wants no processing but to be hovered over are both headed toward succumb and will do their best to pull the auditor with them. The auditor should employ his ingenuity, if he will continue processing them. He should use very light methods and a catfoot approach, and he may be able to raise his preclear enough above 2.0 to cause a continuing direction toward survival.

It should be borne in mind by the auditor when he is doing his inventory and when he is locating his preclear on the chart that people below 2.0 may not be immediately obvious. Their acceptance of processing may be only a method of securing attention. In some cases, the preclear's entire educational background may have to be lock scanned before the preclear can feel any genuine desire for improvement. Entheta ideas picked up in high school, college, the army or a political movement may sit squarely in the way of any rise on the tone scale.

The auditor should remember that the contest is between his own theta, his reasonableness, his serenity, and his persistence, and the entheta of the preclear, the preclear's locks, secondaries and engrams. The moment the auditor permits his own entheta to attack the preclear, turbulence is produced and a reduction of the preclear on the tone scale will ensue. Thus, becoming angry or critical toward the preclear reverses processing. The preclear is not responsible for his engrams.

The auditor, poor fellow, must retain his patience even under upbraidings from the preclear. The auditor must never justify himself when the preclear thinks he has made a mistake. For the auditor to explain how it was not a mistake is only further to enturbulate the situation.

The auditor is concerned with what has been done to the preclear, not what has been done by the preclear. The auditor should exhibit no morbid curiosity about the acts of the preclear. He should not inquire into the preclear's own doings unless he needs to find in the dramatizations of the preclear a clue to the engrams which caused the dramatizations.

When the preclear is returned to some point prior to present time at the auditor's request, the auditor should under no circumstances use more words than are absolutely necessary, and should at this time in particular be careful to observe the auditor's code, since the incident may contain anaten and the preclear may be receptive to hypnotic suggestions. This is also true of a boil-off. The auditor should not talk to the preclear during a boil-off, should not try to wrestle the preclear into alertness out of the feeling that the preclear is merely trying to go to sleep.

Sessions may be of whatever duration and frequency during the week are agreed upon by the auditor and preclear. Two-hour sessions are usually considered minimum, since it occasionally takes that long to contact and run out enough engrams or to do enough lock scanning to make the session worthwhile. Six hours of processing a day may be done without loss of efficiency, and this can be done seven days a week without harm to the preclear. It should be added that medical doctors advise that under such heavy processing a balanced vitamin ration be used by the preclear, who otherwise may suffer nightmares, since it is apparent that the running of engrams reduces the amount of vitamin B1 in the system.

Experience at the Foundation demonstrates some additional precautions which should be taken with preclears. The auditor should make sure that the Preclear is not audited when he is tired, that he is not audited late at night when by habit he would be sleeping, that he has adequate rest, and that he is not audited during periods when his present-time environment is intensely restimulative to him. Those preclears with whom the Foundation has had any trouble were found to have been audited late at night, having inadequate food and B1 intake, during intensely restimulative environmental circumstances (which might in any case have caused them to drop on the tone scale) and when they were physically weary. All of these people had psychotic histories. While such trouble has not been had by the Foundation to a tenth of a percent of that, proportionately, experienced by practitioners of non-dianetic methods, the Foundation has instituted a careful Programme to avoid such conditions and circumstances.

The general progress of the case would be to use straight wire, then use some lock scanning, then to run some secondary engrams to relieve some grief or fear, and then begin an erasure of the case by contacting this first moment of pain or discomfort in this lifetime, which is ordinarily found somewhere in the vicinity of conception. If enough entheta has been converted to theta on the case, the first engram will erase. If it will not erase, then too much charge still exists in secondaries and locks. When the first engram in the case, known as basic-basic, has been erased, the next consecutive engram should be contacted and erased in its turn, and so on up the bank toward present time. Somewhere up the line it will be found that grief has presented itself and it will be necessary to run out some more secondary engrams. When this has been done, the preclear is sent back again to the first moment of pain or unconsciousness which can then be found on the case. Basic area engrams will probably have presented themselves. These are erased consecutively toward present time until further trouble develops. Then more secondaries are run, more locks are scanned, and the preclear is returned again to the basic area, where an erasure is continued. Sooner or later this erasure will continue all the way forward to present time. Then, after running a few isolated missed engrams the auditor will have on his hands a clear, provided the auditor was far enough up the tone scale in the first place to encourage the de-enturbulation of this case to the point where it could run engrams.

The auditor may find an occluded case so heavily charged with engrams that the case can only boil off: This will appear to be a form of sleep, and the auditor may feel that he is being cheated of his opportunity to perform. In such a case, no matter how many hours of processing are consumed by this apparent sleep, the "sleep" must not be disturbed, but when the preclear comes out of it, the phrase on which he went into the boil-off should be repeated again, thus putting him back into the "sleep." In such a way, enormous quantities of anaten are unburdened from the case.

The auditor may find himself confronted with a preclear who will run only phrases and cannot seem to get a whole incident anywhere. Much lock scanning should be done with this preclear, but it is also of benefit to permit the preclear to run these fragments of aberrative phrases, since sooner or later one of them will cause the preclear to boil-off or suddenly to hit a grief charge.

No case of any kind should dismay the auditor. With these presented techniques of lock scanning, running secondaries, running engrams, boil-offs, straight memory, and even running disjointed phrases, any case which can be persuaded to work at all will resolve.

The auditor should be particularly wary of running his preclear into any heavily charged secondary unless the auditor intends to run the preclear through it again and again and again until the charge is reduced regardless of how much the preclear wants not to continue it and regardless of how much the preclear may use to get out of it. This sometimes requires much courage on the part of the auditor, since the terror and agony of the preclear or the extremity of the grief may cause the auditor, out of misguided sympathy, to relent in the face of such a secondary engram.

The auditor should be careful of running a heavily charged case into more than the case can handle. Processing should be as non-directive as possible, the auditor saying only enough to get the case running. Most auditors talk too much.

The auditor should never confuse his role with psychotherapy or with medicine. The medical doctor is important in the society. Bacteria are bacteria. Bruises, contusions, broken bones, and obstetrics will be with us for a long while. The auditor, because he can sweep aside with ease most of the manifestations which were formerly called psychosomatic illnesses, should not discount the reality of many kinds of physical disorders. The auditor is trying to bring the individual up the tone scale. Incidentally, this by-passes the individual around the majority of physical troubles and complexes and obsessions, but it does not obviate the occasional necessity of medical treatment for the preclear, and it unfortunately does not obviate the institutionalization of the obviously insane, no matter what Dianetics can do for these people. The auditor, then, should work in close union with medical doctors, helping them to understand what he is doing and helping them to understand Dianetics, and trying to educate medical doctors into planting-fewer and lighter engrams. The auditor should ignore the hundreds of conflicting psychotherapies and eschew any of their practices, since the auditor will learn, in the realm of experience, that giving advice to his preclear about how he should think about his engrams and other aberrative manifestations is highly detrimental to the mental health of the preclear.

The auditor should realize he is working in a relatively low-toned and unenlightened society. Dianetics will be invalidated to him continually, as with any constructive or creative activity. If the auditor simply goes forward, yanking cases up the tone scale, he will win his battle. He has in his hands tools more powerful than those which existed before. He should use them.

The auditor should not despair of any case. He can do something for any case which will even remotely give him its attention. There will be moments in the progress of any case when environmental circumstances hit a case hard or when an engram of unusual force is on its way to the surface, when the case will apparently go into a decline. The auditor should not despair because of this, since he only needs to revert to the types of processing marked out for lower levels of the tone scale, and so he may restore his preclear to the proper level. The auditor should appreciate that a case progresses upwards, not in a steady line, but by swoops and jerks, and that the average advance alone is steady. In days past, antiquated therapies occasionally triggered a manic engram. Not knowing about the cause of human aberration, the therapists were content to assume that this sudden elation of the patient was indicative of an advance. The auditor will learn that these sudden surges to new highs of well-being are simply symptomatic of an engram which has as its content some highly complimentary phrases. An auditor will often find his preclear claiming in high euphoria that he is now clear, only to have the case regress within two or three days to a depressed state. The auditor, by lock scanning or running out the causative engram, can remedy this. The auditor will behold in the progress of any case, while it is returned on the time track, some alarming manifestations. Running an engram which contains fever, the preclear's temperature will rise. Running engrams early in life, the preclear's facial structure will change. Running engrams which are very highly charged may cause the preclear to scream, to the point where the neighbors a block away will be phoning for the police. None of these manifestations should worry the auditor. The only way the auditor can harm the preclear is to refrain from running out what has been contacted. If the auditor becomes alarmed because the preclear's heart is beating at twice its normal speed, or because the preclear is moaning and weeping, and so tries to bring the preclear up to present

time, the auditor is inviting trouble. The manifestation of an engram while the preclear is returned may be slight. Brought to present time without the engram being reduced, the manifestation is many times increased. The somatic, at the point on the track where it occurred, may not be very great. In present time, the somatic is greatly intensified. Thus, the safest course is to run out whatever one contacts, even if one has to hold one's ears; even if one's observation of the preclear seems to demonstrate clearly that here is a person become very suddenly ill. The reduction of the engram or incident will bring about a complete revival of the preclear.

Above all else, the auditor should have faith in his tools. When he tells the preclear to go back to the time when he was five years of age, he should not then sit there and wonder whether the preclear has returned to that time. Certainly some portion of the preclear's mind has gone to five years of age. The auditor deals with certainties. The auditor does not wonder about the actions of the somatic strip and the file clerk. He takes what they give him. He runs whatever is necessary to resolve the case. He has complete confidence in his techniques and in his own ability. With this complete confidence, which is in itself a manifestation of theta, the auditor can produce marked and remarkable results. If the auditor dilly-dallies with the case, wonders whether or not Dianetics works, wonders what's happening, wonders whether he shouldn't read chapter sixteen again, then looks at the preclear and thinks perhaps these prenatal engrams are illusion or delusion, and begins to question people around the preclear, wondering if that was what happened to the preclear, and is in a high state of doubt about everything in general and the case in particular, he will not produce results.

Results are what are desired. Well, clear-thinking, strong individuals are highly necessary in this society at this time. They are so remarkably few.

CHAPTER SIX

COLUMN AB

Present Time

One of the primary concerns of the auditor is present time. By "present-time" is meant the current "now" on the time track. Actually the entire time track is only a consecutive progress of present times. When a preclear returns to an incident by going down the time track, he is returning to a present time which once existed. Because of action phrases such as groupers, bouncers, deniers, misdirectors, and because of the heavy charge which can be on a case it occasionally occurs that he is continuously in some past present time. Further, when one fails to reduce an incident a case may be difficult to return to current present time. For these reasons the auditor must understand clearly both the value of being in present time and the methods of returning the preclear to present time at the end of a session.

The value of present time has already been illustrated by the fact that if one went through a sanatorium and told patients one after the other "Come up to present time" a certain low percentage of the inmates would thereupon become sane. The simple fact of being in present time is in itself a factor of sanity. At a certain sanatorium, some doctors made this test with the patients, and one of these, who had been insane for a considerable period, who ordinarily refused to talk, and whose face was a mask of acne, responded to this command, and as a result of no other ministrations returned to present time and to sanity. That night according to report, she attended a sanatorium party and gave a speech about how glad she was to be there. Within three days the acne had disappeared from her face, and while her sanity was of course far from being a good risk, she manifested and was continuing to manifest sanity many weeks afterward.

There are, according to dianetic classification, two types of insane. The first type is the dramatizing psychotic. The second is the computational psychotic. The dramatizing psychotic goes through the engram in which he stuck, over and over and over. It is acutely or chronically in restimulation, and his reactive mind causes his vocal chords and his body to go through the dramatization demanded by the engram. He is generally imprisoned in two or three engrams and goes from one to another of them ceaselessly. Such a case, of course, is heavily charged, and it does not do much good to try to run out the engrams. It is necessary to take charge off the case and bring the case to present time. This is not very difficult if one can gain the psychotic's attention.

The other type of insanity is computational. Here, the engram has walled up a certain portion of the analyzer as captured territory, and a circuit causes this portion of the analyzer to be the whole of the being. The remainder of the analyzer is shut off, and the "I" of the individual is not in evidence. The paranoiac is usually computationally insane, which is to say he does not dramatize like a phonograph, but actually appears to think up things. The schizophrenic is an individual who has several portions of the analyzer segmented off by different circuits, which are actually valences, and who goes from one to another of these portions of the analyzer, only occasionally, if ever, becoming himself: Both the dramatizing psychotic and the computational psychotic have the bulk of the analyzer completely shut off by anaten and by being out of present time. Present-time perceptics are not rationalized, since they are entering upon an engram area. Probably the crux of the treatment of all psychotics is getting them into present time and stabilizing them there.

All psychotics have heavily charged cases, and it is necessary one way or the other to reduce this charge. While this may appear an oversimplification of the problem, it also might well be that the problem is simple. The most difficult thing in the treatment of the psychotic is establishing enough affinity, reality, and communication between the psychotic and the auditor to persuade the psychotic to do something to help himself. This can be done by mimicking the

psychotic, which is a form of establishing affinity, or by bringing the psychotic into some contact with the present world.

This short dissertation on the psychotic is given to illustrate the importance of present time. The auditor should not believe, however, that he can easily get his preclear out of present time and cause his preclear to go insane. The case would have to be a borderline psychotic in the first place, and the auditing would have to be in such flagrant violation of the chart that it could be presupposed that the "auditor" who would accomplish such a psychosis would himself be a moron or a psychotic.

Any preclear is less alert out of present time than he is in present time. People go through their whole lives far out of present time and never suspect it. If they should be returned to present time they would be far more able to cope with their problems and would be considerably happier, since evaluating the current environment in terms of, let us say, the environment of the age of five years is not conducive to good computation. The percentage of people who are chronically out of present time will astonish you if you will test it out. The test is a simple one and is, indeed, a standard mechanism used by the auditor when returning his preclear to present time. If you were to use this mechanism on a number of your friends you would find that many of them are stuck somewhere on the time track and are not in present time. You should find it relatively easy, if you are dealing with people above 2.0 to return anyone to present time whom you find out of it. The person need know nothing about Dianetics, and, indeed, this is an excellent way to introduce the subject to a stranger.

Discovering where the individual lies on the time track may be done in two or three ways. The first method is the age flash. To understand this, one should also understand something about the file clerk, a subject which will be covered in a later chapter. The first flash response, the first impression a person receives in answer to a question is called, in Dianetics, a "flash answer." This is assisted by the auditor's snapping of his fingers immediately after he asks the question.

The age flash is obtained, then, in the following fashion: The auditor says, "When I snap my fingers, an age will occur to you. Give me the first number that comes into your mind." He then snaps his fingers, and the preclear gives him the first number which comes into his mind. This may be the preclear's actual age, but in this current civilization, it usually is not. Sometimes it is a circuit response. The preclear has, through continual answering of this question, set up a circuit which replies instead of the file clerk. Such a person can be detected as running on such a circuit simply by asking the question whether or not at the beginning of every year he has difficulty putting down the date of the new year. If he carries over the past year into the new year for some days, or if he carries the past month into the new month, or if he simply has trouble in knowing what date it is, he can be considered to be out of present time; and if his flash answer is his current age, he can be considered to be running on a circuit. The circuit response can be set aside and another answer gained by another mechanism. Using the flash answer, one will discover at what point on the time track the preclear has most of his attention units.

The second mechanism by which the individual is discovered to be in or out of present time is the date flash. The auditor says to the preclear, "When I snap my fingers, a date will flash. Give me the first response which comes into your mind," (snap!). The preclear then gives the first date which comes into his mind. In all these flash answers a new preclear will ordinarily give the second or third answer which comes to him, and therefore the auditor must ask whether this was the first number. The preclear may give the present date, but on further questioning may admit that some earlier date flashed first and that he corrected it. This earlier date is where the bulk of the preclear's attention units are located on the time track.

Another method of detecting whether or not the individual is in present time is also on a flash answer basis, but this time one asks for a flash scene. The auditor says, "When I snap my fingers, the current scene will flash before your eyes," (snap!). A visio may then flash in the mind of the preclear and is quite often not the visio of present time but of a much earlier period.

It also happens occasionally that a preclear not too heavily charged with entheta will be stuck in an engram exactly on the point of the only sonic he will get on the track and the only visio he will get on the track. Merely by telling him to close his eyes and listen the auditor may get him to come up with a holder which is holding him out of present time. This is not general but happens often enough to be remarked.

There is yet another method of detecting whether or not the preclear is out of present time. This is by auditor observation. The preclear who holds on relentlessly to tokens of a certain period of the past is normally partially in that period, either because of a grief charge or some other type of entheta which holds him there. The old lady who surrounds herself with the trappings of 1910 and who wears an outmoded gown will usually be found on the time track at the moment of the death of her husband or son or some other loved one. The secondary engram is run out or enough entheta is converted elsewhere on the case, and the auditor can return her to present time, at which moment she will recognize, for the first time perhaps, that her keepsakes and her gown are a trifle out of the mode.

There is an additional auditor observation which establishes whether or not the preclear is out of present time. The auditor learns rather rapidly to observe the physiology of his preclear and judge from this where the preclear is stuck on the time track. At the period of birth, the baby is equipped to put on considerable fat and weight, and a person who is stuck in the birth engram is usually somewhat overweight and usually has some physiological characteristics which remind one of an infant. This is only one example of one period on the time track. The auditor will find preclears who look like twelve-year-old boys and who are actually stuck at twelve years of age in some operation such as a tonsillectomy or in some grief charge.

The auditor will find girls who appear to be four or five years of age although they are grown up and who retain some mannerisms and physiological characteristics of the earlier age. And then there are those people, not too lovely to look at, who are arrested in the prenatal period. They bear some slight hint of the period of life at which they are held. Their mouths and the condition of their skin seem to remind one of the condition of the embryo or foetus. Such people have a tendency to be formed in the curved position of the prenatal period, are round shouldered and are apt to draw up into a ball when they sleep. This condition becomes very pronounced in the insane, where a call-back in a prenatal engram has taken all the attention units of the individual and placed him exactly at and only at some portion of the prenatal period. There is no argument concerning the existence of prenatals. They have been known for the past thirty years, have been adequately proven by experiment at Rutgers University. The auditor who does not recognize prenatals will never have very well preclears, and the auditor who does not see in his potential preclear the symptoms of being stuck in the prenatal area may have a difficult time with his case.

There is the postulate of attention units. It could be considered that an attention unit is a theta energy quantity of awareness. Any organism is aware in some degree. A rational, or relatively rational organism is aware of being aware. Attention units could be said to exist in the mind in varying quantity from person to person. This would be the theta endowment of the individual. One person, if we assign merely arbitrary numbers, might have a thousand units and another person might have but fifty. If all of a person's attention units could be free in present time for recall, enjoyment, perception and direction of body activities and for computation, that person could be said to be most excellently cleared. People below the level of clear have fewer and fewer attention units in present time as they descend the tone scale. The percentile scale on the chart might be interpreted also as the number of attention units which the person has available in present time. The normal person probably has about twenty-five percent of his attention units in present time. In view of the fact that these attention units are what he enjoys with and thinks with and works with, this can be seen to be not quite optimum. The rest of his attention units are caught somewhere back down the time track in one incident or another in the form of entheta.

When an individual is out of present time, it can be said that he has more attention units existing at some past moment on the time track than he has existing in present time.

The auditor, by failing to reduce engrams or secondaries, can induce a momentary condition in his preclear of being out of present time. The preclear, after the session, if he is not in present time will look rather groggy, will not perceive very readily and will be, as a matter of fact, much more suggestible than when he is in present time. It is symptomatic of being out of present time that present time perceptions find no attention units to handle an evaluation of the perceptions, and so make a much deeper or unrationalized impression on the individual.

In every session the auditor, even when he is doing only straight wire, takes his preclear somewhat out of present time. It is the concern of the auditor to get the preclear back into present time. This is done best by running pleasure moments as though they were engrams. These moments of pleasure will assemble the attention units and un-enturbulate them, so they will easily return to present time and the preclear will stabilize in it. It is a general rule that the more entheta there is on a case, the more the individual is out of present time. It is possible for entheta itself to be in present time, but this is where the environment itself is enturbulative, where the individual is upset or angry because of contagion from the environment. Thus, all the attention units in present time can be seen to be not necessarily theta. But entheta on the time track is not itself in present time. In the absence of environmental restimulation, then, it can be seen that these attention units which should be in present time in a clear, but in a person lower on the tone scale are not, are actually entheta units wrapped up in locks, secondaries, and engrams.

When the preclear does not return to present time and cannot be persuaded by any coaxing or cajoling to return to present time easily, the auditor has either tied up too many attention units in some past moment -- a situation which will remedy itself in the course of a few hours, usually -- or there is so much charge on the case, which is to say so much entheta, that present time is unattainable. In cases below 2.0, the auditor has to be very careful how many attention units he send out of present time, how much he restimulates his case, as these cases are so heavily entheta that any existing theta will enturbulate swiftly, thus taking the preclear far from present time into dramatizations or engramic computations. In working the usual case, not the psychotic, one still must be aware of the methods by which one may stabilize the preclear in present time.

This rule can be applied to every case: the conversion of any amount of entheta to theta will increase the preclear's ability to come to present time and stabilize there. The auditor should work to convert entheta into theta until he can get his preclear into present time. He can do this by straight memory, by scanning locks, by running pleasure moments, or even by running an engram, on cases which are high on the scale.

There is no cause for panic because the individual is out of present time. Most of the society is out of present time. Any national army or navy, for instance, is so far out of present time that it is always ready to fight the war before the last. Moral codes are ordinarily two or three centuries out of present time. Governmental systems are usually a couple of thousand years out of present time. So, for an individual to be ten or fifteen years out is not very serious, unless the case as a whole is extremely serious. The auditor ordinarily finds his preclear out of present time and finds it necessary to leave him out of present time for the first few sessions, being unable to do enough processing during these few sessions to convert sufficient entheta to return his preclear to present time.

The auditor's first and primary concern in any case which he finds out of present time is to return that case to present time. He should work with light methods, session after session, concentrating only on one thing: getting the preclear back to present time. He does not attempt to drive the preclear to present time or command the preclear to present time, since driving and commanding will only turn theta into temporary entheta. Once he has his preclear in present time and has his preclear very stable in present time, the auditor can start worrying about

specific incidents and the vaster difficulties of the case. Trying to work somebody who will not come to present time or who cannot stay in present time once he is there should not be a trial to the auditor. The auditor should not run engrams on such a case since, obviously, any person who cannot stay in present time does not have enough free theta to work engrams.

Various manifestations take place concerning present time in preclears. The first manifestation, of course, is being chronically out of present time. The preclear is usually held in some operation, accident, or sorrow back on the track somewhere. Or the preclear comes to present time and then slumps back out of it because of some restimulated engram which one way or another, by literal command, contains a call-back, a phrase which says "Come back here" and which the preclear obeys by returning back down the time track right after the auditor has gotten him to present time. This indicates a rather heavily charged case, and it is the charge itself which should be addressed, which is to say simply converting entheta to theta rather than attacking the specific engram which is doing the calling back. Then there is the case which is all the way out of present time all the time. This case is not in contact with the environment in any way whatsoever and is, of course, psychotic. Then there is the case which is apparently "stuck in present time." One could not actually be stuck in present time but is stuck somewhere on the track in an incident which carries with it the illusion that it is present time. Christmas, for instance, is a time when presents are given, and as the preclear is brought back up the track he may hang up at any point on the track which contains the word "present." The habit of medical doctors during operations of saying "That's all for the present" will create the illusion of putting the preclear up in present time and making it difficult for the preclear to return. Then there is the preclear who is a chronic bouncer. Some engram in the case has in it a "get up" or "go up there," and the preclear is thus bounced to the extremity of his time track and even into the future of his time track. Obedience to such phrases indicates a heavily-charged case, and the auditor should address himself to the charge on the case rather than to the specific engram which is producing the manifestation.

There is the flash answer method of discovering the incident in which the preclear is located. The auditor asks a series of questions which will identify the incident and receives flash answers on a yes-no basis. The auditor says, "When I snap my fingers you will answer yes or no to the following question: "Hospital?" (snap!), and the preclear answers yes or no. Such a series of questions and answers might run as follows: "Accident?" "Yes." "Hospital?" "No." "Mother?" "Yes." "Outdoors?" "No." "Fall down?" "No." "Cut?" "Yes." "Kitchen?" "Yes." And suddenly the preclear may remember the incident or get a visio of the scene and remember or get a sonic recall of what his mother said to him, which might be something like, "You stay right here and hold on to it until I come back." If the case was not too heavily charged, remembering this might permit him to come to present time. In this way, using the names of people who might have been around the preclear and things which might have happened to the preclear, the auditor can, on a flash answer basis, bring enough data about the incident to light to allow the preclear to remember a hidden or forgotten engram or secondary, and simply by recalling it, to return to present time.

Getting the preclear to recall by straight memory the incident where he is stuck on the track is sometimes sufficient to get him to return to present time. One case was under processing many months, for an hour or two a week, by a very poor auditor. This case was hung up in a serious operation at the age of thirty-one. The auditor eventually became bright enough to inquire whether or not there was an earlier operation, and an almost duplicate operation was suddenly located by the preclear, at which moment he returned to present time.

In getting people to present time it is a necessity to understand the principle that the earlier the engram is the easier it is to reduce. Later engrams on a case contain their own force plus the force of all similar previous engrams on the case. Engrams exist in chains, and there may be anywhere from one to forty, or a hundred engrams on one chain. The preclear is quite ordinarily stuck, not in the first engram on the chain, but in some later engram. Thus, the identification of the point on the track where he is stuck is ordinarily insufficient to free him. An earlier moment of a similar nature must be discovered before he is able to return to present time. The use of straight memory to discover such an earlier moment is a simple operation.

As will be seen by an examination of the tone scale on the subject of present time, the more heavily charged the case, the more likely the preclear is to be out of present time or to stay out of present time. The whole question of returning the individual to present time is the question of converting entheta to theta. It would be a very simple thing if all one had to do was to run the engram in which the preclear was stuck and so get him to present time. This usually doesn't happen. The engram in which the preclear is stuck is quite ordinarily unreducible, in the existing state of the case. Thus, getting the preclear to present time necessitates running pleasure moments, scanning locks, running secondaries or simply making present time so thoroughly attractive that the preclear's attention units return there.

The auditor should not neglect the fact, nor should the preclear, that present time itself may be desirable or undesirable. The preclear, who is faced with a divorce or whose child has just died or whose wife has suddenly been discovered to be a harlot may find present time so thoroughly undesirable that attention units shun it just as, being theta, they would shun any other entheta area on the track. Engrams, secondaries, and heavy locks become buried and hidden from recall because they are entheta and, by theory, have a repelling effect upon theta. The area at the age of twelve in which the individual was told he was going crazy because he was discovered to be masturbating (along with the remainder of the human race) will be difficult to approach. The entheta of the scolding and upset will cause theta to shy away from the area. Other non-survival periods of one's life where one was down on his luck, where one found that college girls often make poor wives, where one discovered that one's husband, of an evening, liked to take off his shoes and read the paper rather than conquer dragons for his lady fair as he promised to do so often before the wedding, and other periods of great travail are quite normally shunned as the preclear goes back down the track. This is very well evidenced by the number of new incidents which turn up during lock scanning. At first there appear to be only one or two incidents on a lock chain, but when the preclear has been scanned through the chain many times it is discovered that there are several hundred incidents on the chain.

Entheta incidents, then, vanish so far as the theta of the conscious or analytical mind is concerned. One should not overlook the fact that present time can be such an area, and so may be shunned. The auditor should do what he can to remedy this situation by providing a friendly atmosphere, or even a refuge, for his preclear and so make present time, at least during the session, palatable. As a summary, then, the more entheta in ratio to theta there is on the case the less likely the preclear is to move on the track and to be in present time. The more entheta there is in present time the less likely the preclear is to enter it -- and this includes the fact that a cross or bossy auditor will make present time unpalatable to the preclear. A primary mission of the auditor is to get his preclear into present time.

The fundamental principle of getting the preclear to present time lies in improving the theta-entheta ratio of the case by straight wire, running or scanning locks, and in cases which are well up the tone scale, running secondaries or engrams. As is shown on the chart, the dianetic clear is highly stable in present time and does not leave it. All his perceptions are clear. This does not mean the clear cannot leave present time. With "I" in control of the entire analytical mind, instead of some circuit or telephone switchboard of circuits, the clear can run on his track entirely at will, but he almost never needs to do so, since his memory mechanisms can be counted on to furnish him with accurate data without recourse to return mechanisms. Here is the difference between memory and returning, where it is best manifested. Memory would be, for instance, sending two attention units to the standard memory bank to bring up information for the use of the analyzer, and returning would be sending fifty percent of the available theta back down the track for a full re-experiencing of the incident.

The clear ordinarily does not fully re-experience incidents, simply because he doesn't have to, and he ordinarily finds present time palatable. Theta units in present time offer a resistance to the entheta coming in from the environ. The impact of the environ is combatted by the theta unit reasoning and evaluation. If there is a great deal of entheta on the case and the present time environ is entheta, the present time perceptics will go toward the entheta and will restimulate it whether it be in the form of locks, secondaries, or engrams, and so enturbulate

the whole case. This does not happen to the clear. But that does not mean that the clear cannot be enturbulated. Given a very low-theta-endowment clear and a very heavy entheta environment, such as the slaughter of a thousand Christians, the clear will temporarily enturbulate. He does not, however, have large areas of frozen entheta on his track which would trap the temporarily enturbulated theta, and so he will completely dis-enturbulate the moment the entheta environ is no longer present. A clear is very definitely in present time.

The 3.5, the dianetic release, is quite stable in present time, and he is very alert to his environment. He gets the full beauty out of any scenery he observes, he is not disturbed by extraneous noise or upsets, but because he still has frozen entheta on his case he is susceptible to heavy enturbation if the present-time environment is enturbulative. Nevertheless, he is stable in present time.

The 3.0 has no definite difficulty in reaching, returning to, or maintaining himself in present time. He snaps back to present time very rapidly when he is being processed and is very alert when he gets there. However, he can be enturbulated to the point where he will hang up temporarily somewhere on the track and will possibly dramatize the point where he has hung up, if sufficiently hit by enturbation.

The 2.5 when once brought to present time will remain there easily until the next processing. He has perhaps thirty to forty percent of his theta in present time, as an ordinary rule, and an auditor has to be very careless to hang this preclear up on the track. However, this preclear can be hung up on the track, and the auditor will have to run pleasure moments at the end of the session and do some straight wire when he has had a very enturbulative session, in order to stabilize his preclear in present time.

The 2.0 requires considerable care on the part of the auditor in order to return him to present time and stabilize him there. Pleasure moments have to be run, if any can be found. Some lock scanning must be done. Some future pleasure moments may be run. But the 2.0 may respond to a call-back, and once brought to present time may slump back down the track to an earlier period. Dealing with 2.5's and 2.0's the auditor should always check at the end of the session at least twice to see whether the preclear is in present time, but ten minutes later the preclear may have slumped back down the track in answer to a call-back in some early period of entheta. Here we have a case where there is far more entheta on the case than theta, and the individual tends strongly to go toward the entheta of the past or the entheta of present time rather than toward theta. Theoretically, he would rather come up to present time for a fight than for anything else, however, this is not recommended as a processing procedure, and the auditor must use much skill in getting the preclear to present time.

The 1.5 is usually in some dominating valence somewhere out of present time. He is very difficult to get to present time and once in present time will almost always slump back. Here is the chronically angry case, and he goes toward entheta more readily than toward any theta in present time. The auditor will find efforts to bring this preclear to present time very difficult until he has raised this preclear's tone up above the 2.0 level.

At 1.1, the preclear stays out of present time most of the time. When he reaches present time he nearly always slumps back immediately. A tremendously inviting situation, covertly hostile, devious or perverted in present time will bring this preclear to present time but little else will. The balm and persuasion of an auditor's personality will not by itself do the trick. The auditor working a 1.1 should not worry if he cannot get the preclear to present time at the end of the session, since the preclear is usually out of present time anyway. Still, the auditor should be careful not to pull down any of the preclear's theta into entheta areas, since there is very little left to pull down. Very light processing methods should be used.

The 0.5 can always be requested to come to present time and sometimes will. But he slumps back immediately into some apathy incident. This case requires considerable skill on the part of the auditor, who is working with somebody so far out of present time all the time

that it is difficult for him to get the preclear's attention. If the auditor acts particularly sad, sometimes this preclear will come to present time.

At 0.1 the preclear's perceptics can, at best, be directed to present time concepts. One can ask him to observe a cup, a saucer, a bright colored object, some music, or an emergency situation. But here one is very lucky to be able to get the preclear merely to perceive something which exists in the present time environment. The auditor's primary concern with any case is whether or not the case is in present time.

CHAPTER SEVEN

COLUMN AC

Straight Memory

In Dianetics, straight memory is a specified technical process. It should not be confused with “free-association.”

Straight memory is also called straight wire. It is so called because the auditor is directing the memory of the preclear and in doing so is stringing wire, much on the order of a telephone line, between “I” and the standard memory bank, plowing through all occlusions and circuits.

There is something about straight memory which is very validating. Once a person really remembers something it seems real to him, and this sense of reality greatly promotes the ARC of the case. Straight memory thus has a certain advantage over lock scanning and running engrams. The preclear using straight memory very thoroughly associates the past event with the present-time environment, and he evaluates the past event in terms of the present-time environment. When the preclear is returned on the track he often evaluates the past event only in terms of its own environment, and while repeated recountings of the incident may bring about reduction of the entheta in it, the validation factor is still much lower than in straight memory.

Straight memory was developed in Dianetics on the basis that if one knew the fundamental mechanical cause of insanity one should be able to do better than was done in psychoanalysis, since it is known that “free-association” produces some minor alleviation of tension and anxiety. The mechanisms of why this came about were thus explored. It was found that the heightened reality of straight memory and the knowledge of why locks, the usual target of straight memory, were aberrative combined to make an orderly fast type of processing, valid in the ratio of several hundred to one over older methods. All by itself straight memory is an excellent method of processing. The busy doctor or consultant who has but a few minutes to spend with every patient can employ straight memory to great advantage. One specialist in Parkinson’s disease in New York City, although he did not understand very much about dianetic processing, used straight memory to achieve the alleviation of Parkinson’s disease at least temporarily in three cases out of five on which it was employed. The importance of straight memory should not be underestimated. Preclears low on the tone scale can sometimes support only straight memory. In the Foundation various people have become straight memory experts since straight memory has its own peculiar skills.

Straight memory can be used by anyone without any danger. It is a slightly directive process. The auditor does not permit his preclear to wander around and free-associate and generally waste time and energy. The auditor knows exactly what he wants and he directs the preclear’s attention to it. Thus, a straight memory expert must be able to sum up more or less what is wrong with the case. After he has summed this up he can do a very good job of resolving the case by straight memory.

Originally, straight memory required considerable perspicacity on the part of an auditor. However, in late 1950, recognizing the great skill necessary to a good straight memory auditor, I postulated what became inelegantly called “the hurdy-gurdy” system. The use of this system demands the minimum of the auditor and extracts the maximum of aberration from the preclear.

The first thing one should know about straight memory is the phenomenon of the human mind that a fact asked for today and not received may be received tomorrow or the next day. The mind, on facts long laid away, has a one to three day refresher period. If one were to give an examination on history to a number of forty-year-old men on Monday one might expect many low grades. But by giving another examination to this same group Wednesday one

would find higher grades were attained. The mind, in short, refreshes itself, and the repetitious request by the auditor for certain facts from the preclear's standard memory bank will eventually elicit those facts. The auditor, if he does not get the information he wants from the preclear on Monday, should ask the same questions on Tuesday, Wednesday, Thursday, and Friday, and he will find that the preclear will eventually remember.

Because so many people in our society seek to profit by the failure of others to remember, memory is a generally reduced quantity in the current culture. The mother who has many times attempted abortion upon her child is quite anxious that the child should not remember anything. The mother instinctively knows, although the culture has taught her the child could not possibly remember such early incidents, that she had better suppress any possible recall. Thus, mothers, by contagion, have encouraged bad memory.

There is something triumphant in having a better memory than the other fellow. This is based on the formulation that being right is to survive and being wrong is not to survive. By being right in memory one demonstrates the fact that one has a greater survival potential than the fellow who is wrong in memory. Memories come into conflict continually, and one will find unthinking people quarreling as to which one remembers the best and which is correct. This is an additional befuddlement in the society which suppresses memory.

There are cases on record, well authenticated, of individuals who have remembered back into their prenatal period. One eight-year-old girl who was under processing by a book auditor recently stunned her parents by remembering back to the third month after conception, when "Mama squeezed her tummy and hurt me." In the presence of non-dianetically oriented individuals, this memory would have been suppressed immediately, but in view of the fact that it agreed with memories of the parents, and in view of the fact that both parents had, to their benefit, experienced dianetic processing, the little girl was permitted to go on remembering, and straight wire into the prenatal bank was done with such profit that the child's school grades went up an average of fifty percent. Many instances are on record of straight memory back to birth, and it is too ordinary for comment for an individual to remember into infancy. The society of course, because of the contagion of aberration of mothers who have practiced extra-curricular sex relations and attempted abortions, holds such early memory in considerable question.

Memory of infancy does not depend upon memory of how to talk. Befuddled professors and practitioners in the past believed that the ability to talk had something to do with ability to remember, but this is not the case. There have been objections to prenatal engrams on the basis that "no one would be able to understand language before he was born," despite the fact that Sigmund Freud stressed traumatic prenatal incidents. The syllables, meaningless though they are, are recorded in a prenatal engram, along with all other perceptics. When they are keyed-in, in a person past two years of age who has learned to talk, they are evaluated in terms of the meanings the person has learned to give those syllables.

Forgotten incidents were postulated by Sigmund Freud, to whom through Commander Thompson, one of his students and the friend and mentor of my youth, I am much indebted, to be a considerable factor in human sanity. The release through recall of any incident which is forgotten or hidden and which contains considerable turbulence will produce a tone rise in the individual.

Many individuals undergoing processing -- in fact most individuals -cannot "remember" any earlier than eight years of age, much less into infancy. The more enttheta there is on a case, the less theta is available to the analyzer. The more enttheta there is along the time track, the harder it is for the existing theta to dis-enturbulate it enough to get the data out of it. The more aberrated the individual, the more enttheta there is on the case. Enttheta does not necessarily lie in childhood, but key-ins can ordinarily be expected to lie in childhood. The key-in is sometimes difficult to remember, but when remembered will produce the most marked change in the case. After a person has been processed for a while and considerable free theta exists for the use of the analyzer, straight memory back to very early periods is possible.

One can also get into early periods in a person's life by the use of repeater technique. This is not straight memory technique, but is an archaic technique of Dianetics independent of straight memory. Repeater technique has its uses, but anyone using repeater technique at random on a case will quite commonly find his preclear hung up in an engram which cannot be contacted and run out. Repeater technique causes trouble. But by the use of repeater technique, barring accidents, the preclear can be pulled back to a return into periods of infancy, if the auditor is lucky enough not to get the preclear into an engram. (Repeater technique on holders, such as "stay there," will almost certainly wind the preclear's attention up in engrams, attention which will not be freed until the auditing is scanned out). This should not be confused with straight memory. Straight memory consists of the preclear's staying in present time with his eyes wide open and being asked to remember certain things which have been said to him and done to him during his lifetime. He is not asked to return to these incidents. He is asked only to recognize their existence. He is not commanded to accept the fact that such incidents existed, and minimal aid should be given his memory mechanisms.

Some misunderstanding has resulted on the part of some individuals about repeater technique, what it is, and how it was used. In the handbook DIANETICS there is a discussion of repeater technique, but simply defined, it is this: The repetition of a word or phrase in order to produce movement on the time track into an entheta area containing that word or phrase. Repeating or "rolling" a phrase in an engram in order to de-intensify the phrase or reduce the engram is not repeater technique.

The auditor may get a preclear who has difficulty remembering yesterday, to say nothing of the time when he was two years of age. The auditor may be assured that when he has worked with this case long enough to restore a considerable amount of theta, converting it from entheta, the preclear will be able to remember things which he has never been able to remember before, since one of the first things to improve in dianetic processing is memory. When an auditor has a preclear who has difficulty remembering, the auditor should be careful to start with things that are rememberable. If the preclear says bluntly that he cannot remember things, it is up to the auditor to encourage and validate this preclear's memory. If the preclear says "I can't remember names," the auditor says, "Well, what is the name of your business associate?" The preclear says, "Oh, his name is Jones!" The auditor has proven to the preclear that the preclear can remember at least one name. If the preclear is in such bad condition that he cannot even remember this at will, the auditor says "What is my name?" The preclear having just heard the auditor's name may be able to remember it with ease. If he cannot, the auditor says "What is your own name?" The preclear tells him, and the auditor says "You see, you can remember one name. Now let's see if you can remember others." In such fashion, the preclear can be assisted to remember from the most obvious incidents or facts back to more and more obscure incidents. This is the common progress of straight memory. To begin by remembering the obvious and finally to be able to remember the aberrative.

A whole and entire method of processing can be made out of straight memory. Time spent on straight memory is usually time well spent. Straight memory might also be considered a pair of stilts by which the preclear, persuaded to remember incidents later and later in his life, can be brought back up to present time. That straight memory does free theta, or convert entheta to theta is beyond question. It is, however, a rather lengthy process, compared to lock scanning, for instance. Thus, straight memory should be used only as indicated on the chart, or to get the individual back up to present time, or by auditors who are so rushed for time that they have only a few minutes to attempt to rid a preclear of some specific somatic or aberration. The primary rule of straight memory is this: Whatever the preclear thinks is wrong with himself, his family, his group, or mankind, life or MEST, has generally been told to the preclear by somebody else at an earlier period of the preclear's life. This is modified by the fact, of course, that things can be wrong along these various dynamics which are perfectly rational observations. The auditor is looking for irrational beliefs about these things.

The second rule about straight memory is that the preclear, at least at this time, is surrounded by very aberrated individuals and has been so surrounded since conception. It is

symptomatic of any aberrated individual that he is acting upon his engrams and is dramatizing those engrams. Thus, there is a consistency of performance. The rough rule of thumb is that if an aberrated person says something once he will say it hundreds or thousands of times. Once you have isolated the fact that a certain individual in the preclear's past, for instance, complained about his stomach, you will have discovered a whole chain of such complaints, and a conversion of entheta to theta on this subject will take place.

By straight memory one can easily discover the dominant or the nullifying individuals in the preclear's family. From the dominant individuals, those who attempted to dominate and control the others around them, the preclear will have received the circuit phrases, which are the control phrases in his bank. From the nullifying persons he will have received the nullification phrases. The auditor, by locating these persons and their habitual statements, finds the preclear's circuits.

Those things which are found in the locks of a preclear are normally found in his engrams. Thus if one finds mama at the preclear's tenth year saying "Men are no good," one can expect to find mama shortly after the preclear's conception making the same remark in an engram. If one discovers the lock by straight memory, one can then find the engram.

Difficulties arise in straight memory in cases where the preclear has not been raised by his own parents. A preclear whose parents have died shortly after his birth does not have in his post-speech period the same phrases which are in his early engram. A lock must have an engram below it in order to exist, but here the auditor is confronted with a person whose locks do not, as far as phrases are concerned, match his engrams. This would appear at first glance to be a fortunate condition for the preclear, single the engrams would never be repeated as to voice tone or content later in the preclear's life.

But something else has been interrupted here which is very important to the preclear and that is parental care. There does not seem to be any substitute for the proximity and care of one's own parents. Preclears who have been raised by nurses and maids do not demonstrate the same alertness as those who have been raised by their own parents.

Preclears who have been raised by foster parents, no matter the quality of those foster parents, do not seem to be as well off as preclears who have been raised by relatively indifferent and unaffectionate parents of their own. There is more here than the biological production of new organisms, and the affinity of parent for child even when clouded by maltreatment of the child is apparently superior to non-parental care of the child even when this is near optimum. Thus, the severance of the parent-child relationship after birth is a

more solid break of affinity, reality, and communication than the summation of locks which would occur in the usual case later in life. This is not theory, but observation of many cases, since no case processed to date which had been raised by maids rather than parents was found to be as high on the tone scale as cases which had been raised by indifferent parents, much less those who had been raised by parents who loved them dearly. Russian pseudo-scientists to the contrary, there is more to man than biology and environment. Training women extensively in political economy, symbology, or the care and cleaning of rifles is not conducive to a forthcoming sane generation.

Straight memory, as a technique, strikes toward seven types of incidents: the enforcement of affinity, communication, and reality, by command; the implantation of circuits; and the inhibition of affinity, communication, and reality, by command.

Affinity, communication, and reality exist as they exist under the self-determinism of the individual. What is wrong with the preclear is what has been done to the preclear, not what he himself has done. Basically, man is intended to survive as an organism. An individual who has been subjected to enforced affinity, reality, and communication has an interrupted self-determinism. By enforced affinity, reality, or communication is meant the demand on the individual that he experience or admit affinity, reality, or communication when he has not felt

it. The child who has been forced to “love” a parent or guardian has been subjected, when he did not feel that love but was forced to admit it, to an enforced affinity. This is aberrative. The wife who has been continually subjected to demands from a lower-toned husband that she tell him she loves him, when she does not, and who yet accedes to this demand has been subjected to enforced affinity. People lower-toned than the preclear commonly command his affinity, and when affinity is given but not felt locks are formed which are quite enturbulative should engrams underlie such an enforcement.

What child is there who has not had reality forced upon him which he did not feel? He has been told that it was very important for him to go to school when he himself did not have sufficient reason to believe this. In the limited sphere of his experience, he sees that it is desirable to play, to get sunlight, to eat, sleep, have friends and to exist in harmony in the bosom of his family, but he does not see that it is necessary for him to study. Nearly all grammar school education is an enforced reality. The grown-up can see it is necessary for the child to have some slight command of the three R's, but the child has not agreed to this. Agreement has been forced upon him, and thus, aberrative locks are formed upon any existing engrams. School is very far from being the only enforced reality. Any time a person is made to agree by force or threat or deprivation, to another's reality and yet does not feel that reality himself an aberrative condition exists. When engrams are present which can be restimulated by this situation, a certain amount of theta is trapped as entheta. The most insidious of all these enforced realities is where the individual knows the truth or is told the truth and is then made to confess that what he knows to be the truth is a lie. He has said that such-and-such is the case and then he accedes to the demand that he deny this assertion. This very commonly happens to children and forms bad locks. Whenever an individual is forced to agree to something to which he would not agree it left to his own reason, a lock is formed, where underlying engrams exist.

Enforced communication is productive of all manner of aberration and physiological changes in the individual. Of course, any lock has to have an engram underlying it, but it is fairly certain that what the parent says in the lock has already been stated in an engram earlier in the case. Communication, of course, includes all perceptic as well as conversation and messages, and when an individual has been forced to look at something which his self-determination says he should not look at, his sight to some degree is impaired. When he is forced to listen to something to which he would not ordinarily listen if left to his own self-determinism, his hearing to that degree is impaired. When he has been forced to touch something which he would not ordinarily touch, his tactile is thus impaired. When he has been forced to talk when his self-determinism says he should remain silent, his speech communication is impaired. When he has been forced to write when he would not ordinarily write if left to his own devices, his ability to write or to communicate messages is thus impaired. These are enforced communications, and in the presence of engrams, become very aberrative locks.

Circuits occupy a later column. But any circuit is simply a control or nullification “you” phrase which makes the individual compute differently than he ordinarily would and which walls up a certain portion of the analyzer for use against the individual. A circuit, for instance, can be critical, so that thoughts that criticize him occur to the individual whenever he thinks or acts. The circuit “I've got to protect you from yourself” can wall up a large portion of the mind. The individual in this society is surrounded by people who would either dominate or nullify, and thus many locks are formed of the circuit variety, where people are by the “you” phrase attempting to dominate or nullify the individual. Locks can only exist, of course, when engrams exist, and so these are normally received in their most aberrative form from parents, guardians, and other individuals who have been around the early portion of the person's life, when the bulk of the engrams are received. Circuits are quite peculiarly resolvable by straight wire. When an auditor strikes a circuit during the running of an engram very occasionally the whole engram blanks out or a strange visio turns on. When the auditor strikes a circuit in an engram he can expect the preclear to go out of the auditor's control into the control of some past and even dead individual's phrases. Individuals who go around auditing themselves and running engrams and phrases ad infinitum are running because of circuits. Individuals whose banks cannot be entered in any way are in that condition because of circuits which bar the

auditor. By straight memory it is possible to discover the dominant or nullifying individuals in the family and so recover the dominant or nullifying circuits in the form of locks. Once these locks are "blown" the engrams containing these circuits are to some degree discharged. Further, the auditor is forewarned of what he might find in the engram bank of the individual. Every case is to some degree a control case, which is to say a case which has circuits of one kind or another. One of the best ways to find out what circuits the preclear has is to give him straight wire on the statements of the people by whom he was surrounded in very early life and childhood.

It is interesting to note, on the subject of circuits, that as one goes down the tone scale, from the top to the bottom, one finds that people on lower and lower levels are more surrounded by dominant and nullifying individuals. Thus straight wire becomes more and more indicated the lower one drops on the tone scale for the location and blowing of circuit locks. The inhibition of affinity, communication, and reality is no less serious than their enforcement. The inhibition of affinity comes about when a desirable similarity of the preclear to another person is denied or rejected or when the love and affection of the preclear is rejected. In the presence of underlying engrams considerable turbulence is created by these nullifications of affinity. The wife who is commonly answered with "You don't love me" every time she attempts to express her affection, is undergoing an inhibition of affinity. The individual who is told that nobody in the office likes him is undergoing an inhibition of affinity. The person who is rejected from a group because of some fault, or otherwise, experiences a major break of affinity. When such breaks of affinity overlies engrams, which they commonly do, they become highly aberrative and serve to charge up the engrams considerably. Straight wire reaching such incidents can unburden the case of considerable enturbulence. The individual who is not permitted to feel that he is loved or that he may love, the person who is denied any common ground with the universe, with man, with his group or family, or even with himself is experiencing an inhibition of affinity.

The inhibition of reality requires considerable attention. Left to his own devices and reasoning on his own data, the individual decides what is reality for him and with what he can agree. When he is informed that he cannot agree with those things he thinks he should agree with, he experiences an inhibition of reality. When engrams underlie this, these locks can be very serious and can tie up considerable theta on a case as entheta. One might say that this is the most serious influence in reducing the individual on the tone scale -- inhibition of the individual's reality. This is invalidation, and invalidation is the most serious break of the auditor's code. What a person, by his own observations, has come to believe real becomes then a part of the conclusions and observations which a person uses to guide his future actions and to evaluate himself with regard to his environment. A sudden challenge or denial of the reality of these conclusions comes as a severe shock to the individual, when it is underlain by engrams, and will shake his reality, in any event. The reality of an individual can be so thoroughly shaken that he will be doubtful of anything he does or says, since he is not sure of his conclusions. Reality together with affinity and communication, is a basic in the computations which an individual makes with regard to the courses he should take in the pursuit of his own survival. The reality of children is very ordinarily threatened or knocked to pieces by parents. The child has very little data with which to evaluate his current environ and to plot his future. In comparison to his conclusions that he should survive, that he needs food and clothing and shelter, and that he needs affection, the aberrated culture into which he is born is often a very strange reality to him. Grownups have agreed upon this culture, but this agreement is not ordinarily the most sensible one which could be made, and the child is often faced with realities which are to him, dealing in the basics in which children deal, quite unreal. Thus, children are being disagreed with continually. The little baby believes it should have its own control of MEST, that it should be permitted to crawl about at will, which is its command of space, that it should be able to take its own time about what it is doing, which is its conquest of time, and should be able to expend energy in whichever direction it desires, which is its control of energy, and should be able to pull about and do as it pleases with matter such as mud pies and precious vases on tables. The child does not know that these things are held to be otherwise valuable in the society, and so the child is continually denied its conquest of MEST. Nowhere is this denial as acute as in the denial of reality. None agrees, evidently, with the

child. And thus, very early in life a large number of locks begin to build up upon the basic engrams of the case. But disagreement with one's reality is not limited to childhood. Throughout life, the individual who has agreed with himself about certain realities is continually challenged in his reality by those about him, particularly those lower on the tone scale than himself, who seek to gain importance by reducing that individual's reality and therefore reducing the individual on the tone scale to a point where he can be more easily controlled. Statements, then, which tend to invalidate a person's conclusions about reality concerning his own relationship to the culture and environ are very aberrative.

Inhibitions of communication are very common. They most ordinarily manifest themselves in this society with spectacles, with hearing aids, with tactile anaesthesia, in stutterers, and in people who will not write letters or pass along messages. Communication breaks, on the inhibition side, stem from the denial of a person's ability to see, to feel, to hear, denial of a person's right to talk or listen -- in other words, denials of a person's right to communicate. These manifest themselves, when underlain by engrams, in terms of inhibited relations with one's fellows and a lowered position on the tone scale.

The hurdy-gurdy system of straight wire takes into account all of the above data, and puts into existence a method by which the auditor can exploit each person surrounding the preclear. We have already spoken of the triangle of Dianetics, affinity, reality, and communication. The auditor works on the principle that a datum desired from the preclear's memory today may not be forthcoming but if requested again in a day or two may be forthcoming, and if not then, may be available two or three days after that. The auditor makes a list of all the persons who surrounded the preclear: father, mother, aunts, uncles, guardians, nurses, grandparents, great-grandparents, teachers, brothers, sisters, employers, and subordinates, as well as mates. Two triangles and two circuit slots exist for each of these persons. The preclear does not need to know about this. The auditor can very simply draw up a plan of questioning which then permits him in his requests for memory of certain locks to cover the ground over and over and each time with new people repeating questions asked about people covered in sessions before. In other words, this is a tally sheet which the auditor could use in order to assay the case and blow, if possible, locks of enforced ARC, inhibited ARC, and circuits. For instance, the auditor draws one triangle and a slot, a straight line, for father and he labels these "enforced" and "dominating." Then he draws another triangle and another slot and labels these "inhibited" and "nullifying." Then he makes a similar graph for mother and for every person intimately related to his preclear's life.

His system of questioning then is to find out when papa enforced affinity, when papa enforced reality, when papa commanded higher communication, and when papa sought to dominate. He asks around the triangle and with the slot. He will discover that the preclear may or may not have certain immediate memories concerning father's conduct and favorite phrase. The auditor then proceeds to the inhibition triangle and nullification slot. He asks when father inhibited or refused affinity, when he inhibited or refused reality or agreement, when he inhibited or refused communication, and when and if father attempted to nullify the preclear. In the same session the auditor goes on to mother and to other people, with the same plan.

Because the preclear's memory can be refreshed by this procedure, the auditor does not abandon father after one session but carries father for three or four sessions on straight memory and asks a similar set of questions in the next session. When did father enforce affinity, demand that he be loved, demand that he have affection shown to him? When did father demand agreement? When did father demand communication? When did father attempt to dominate? When did father attempt to cut off or inhibit affinity? When did father attempt to cut off or inhibit reality? When did father attempt to cut off or inhibit communication? When did father attempt to nullify? The auditor then goes on to coverage of mother or some other person.

Systematized straight wire like this will turn up an enormous amount of material. The hurdy-gurdy system was created so that the auditor would not have to keep long sheets of questions.

This is the general plan of questioning. The questions need not be the same every time, but their general import should include this plan. In such wise, the most aberrative forms of entheta in locks can be contacted by straight memory, and session after session the preclear's material becomes fuller and his memory steadily improves.

The valence problem is also resolvable in terms of straight memory. It often occurs that the preclear is suffering some physical disorder which can be freed by straight memory, along the following lines. Should the preclear have dermatitis of the hands, one might discover that some person in the preclear's background had dermatitis or some ailment of or injury to the hand. This person may be located, and it may be discovered that some lock command exists which causes the preclear to be like the previously sick person. This is often found with a preclear who has lost an ally. Such a case is illustrative. When the preclear's grandmother died she had cancer of the hands. The preclear was suffering from dermatitis of the hands. It was discovered that many remarks had been made by relatives concerning how like his grandmother the preclear was. This likeness was so closely followed out by the preclear that he attempted to develop cancer of the hands, which manifested itself as dermatitis.

The whole problem of valences is one of allies and antipathies. The preclear very often may be in the valence of someone who is normally hated. He is forced by lock commands, people telling him things like "You're just like your father. You're growing more like him every day, and you'll grow up to be no good." Because of such commands the preclear may not be able to help hating himself since he is forced into the valence of a person who is hated and whom he hated. Straight memory can often resolve this problem merely by asking whom the preclear was most supposed to be like and what was the general attitude toward this person.

It is vital in straight memory to reach the actual context in the actual incident of every memory. The first stab of the preclear into his memory bank will be one of vague feeling that there was such an incident and that somebody said something like that. This is not good enough. The auditor must pin the preclear down to a specific incident and the words of that incident. If this is not possible in the first session, it will be possible in a succeeding session. Until it has been achieved, the lock will not be blown. A good trick to get a preclear to remember a specific incident is to ask the preclear if such an incident exists and then, when he vaguely asserts that it must, to ask him where he was sitting when he heard somebody say this or where he was standing. The preclear may quickly correct the auditor, saying that he was lying down or walking, and thus will have recovered data. There is a certain amount of challenge which the auditor can use in straight memory. He puts the preclear on his mettle. If this is not carried too far it acts as a very stimulating factor to the preclear.

It is quite remarkable how many "psychosomatic" disorders and how many aberrations straight memory can resolve after the auditor has had a little practice. He can actually get his preclear out of some chronic valence, rid him of some aberration, bring him up to present time, and generally raise him on the tone scale merely by asking the right questions.

The auditor should not confine himself to the hurdy-gurdy system of straight wire. This is only provided to relieve the maximum amount of entheta in the minimum amount of auditor time. The auditor can use his imagination considerably with regard to what must have been said or done to this preclear. The auditor can profitably open any session by asking "Well, what are you worried about today?" When the preclear tells him, the auditor wants to know who in the preclear's background might have thought that, and it sometimes results that the preclear can spot immediately what has been told in the past which compares to the worry which he now has, and if the two are cause and effect, the preclear will immediately rid himself of the worry. It is quite remarkable how swiftly this can be done. When the preclear recovers a lock which has considerable entheta on it he ordinarily chuckles or smiles. The preclear who does not react in this fashion may yet be getting a little bit of entheta off of the lock, but the possibility is that an earlier similar lock exists, when the preclear does not laugh. Thus, when the preclear is caused to remember some early incident, and yet does not experience any relief, although he should, from the nature of the incident and its hidden character, the auditor does well to try to discover some earlier incident than the one remembered, which is similar to it.

The principle here is to discover, if possible, the key-in, the first time the underlying engram was restimulated.

Straight memory is also used in order to discover a certain type of incident which can be lock-scanned. The preclear who is directed to a certain type of circuit command in his case may not experience much relief through straight wire. But now that the auditor knows this type of circuit is in existence he can cause the preclear to lock-scan the circuit, returning to the first time he can discover it and scanning up through all similar incidents to present time. Thus, straight memory is combined with lock scanning, which is actually a high speed memory rather than a return through locks. No auditor should feel uncomfortable about using any quantity of straight memory. It will happen, however, that an auditor will get relief in the preclear by straight memory, then return the preclear down the track to an incident which is then run, and after bringing him back up the track will find that the relief which had been achieved before is now apparently gone. This comes about because a present-time lock has been laid in by returning. Merely having the preclear remember his own act of running the incident, once he is back in present time, should restore his aplomb and equilibrium.

The benefits of straight memory are many. The duration of these benefits is in question. By straight memory of pleasure moments or of the first time one had a certain illness one can alleviate headaches, stomach aches, worries, and anxieties. This does not mean that the effect is permanent, as would be the case when the basic engram is run out. But straight memory is the parlour trick of the auditor. In any group of people he can always find at least one that he can make much happier simply by a few adroit questions. The auditor who uses straight memory for this purpose should also develop the technique of the marksman, who when he makes a bulls-eye is clever enough immediately to lay aside the gun. Once the auditor has achieved a spectacular effect by straight memory he should leave the case alone for that session -- unless, of course, he is engaged in a regular progress up the tone scale with his preclear.

Straight memory is a technique which should be studied and practised with considerable alertness as to the good it can do. No auditor should fall into the rut of believing that simply remembering the past can do very much for the preclear. Remembering specific, causative locks can, however, produce a marked change and improvement in an individual. Straight memory is not free-association and is not random mauldering; it is a precision technique and should be studied and used as such.

CHAPTER EIGHT

COLUMN AD

Pleasure Moments

The dianetic definition of pleasure is that the organism tending toward survival obtains pleasure by survival actions and the seeking of survival goals. In the organism below 2.0, tending toward death, a reactive pleasure is taken in the performance of acts which lead to succumbing on any of the dynamics. In other words, above 2.0 pleasure is survival, and below 2.0 pleasure is obtained only by succumbing or by bringing death to other entities, or by causing self or other entities to be suppressed on the tone scale.

True pleasure leads towards happiness. The “pleasure” which tends toward death is a reactive counterfeit, but seems intensely valid to those in the death bracket of the tone scale. Happiness could be said to be the overcoming of not unknowable obstacles toward a known and desirable goal.

This postulates that the greatest happiness is the nearest approach to immortality. A good job, skilled abilities, bountiful harvests, possessions; these are goals. There are very finite goals for the happy man in every day of the week, as well as the big goals toward which he directs his efforts. His happiness does not come from the attainment of the goals but from overcoming obstacles on the way to those goals.

Pleasure and immortality are near synonyms for individuals above 2.0 on the tone scale. There is a gradient scale of the types of pleasure enjoyed by those above 2.0. It seems evident that the person at 2.5 actually takes pleasure in being bored, but surges up toward higher levels when interest is concentrated on some goal not outside the understanding of the 2.5.

The 3.0 takes pleasure in reaching toward very clearly observable goals. The 3.0 accepts his pleasure cautiously and tentatively, but nevertheless enjoys it. His pleasures are apt to be routine and relatively unimaginative.

The 3.5 tends toward higher goals of survival and has confidence in reaching those goals. He can embrace more bountiful levels of survival. He can realize that survival as a bare necessity-level process is unsafe and intolerable and that if all computations demonstrate that he will require two bushels of wheat per month to eat, then he had better provide twenty bushels of wheat per month. His pleasure is wide and ambitious.

The 4.0 achieves considerable exhilaration. His concept of survival is so bountiful and he is yet so confident of his ability to reach such levels of survival, that he can take in a universe of goals and, within the limits of his skills and talents, accomplish them. Here we have a definite manifestation of attitudes toward goals, magnitudes of goals, and the ability to attain and enjoy pleasure. No man is happy without a goal, and no man can be happy without faith in his own ability to reach that goal. The highest form of security is confidence in one's self in the future, in the group, and in mankind. Without such confidence and without the will to make the various dynamics survive, an individual has no security. That person who measures his security in terms of a good job purposely short-sights himself as to the actual insecurity of his position. A man who works for an organization which may endure long or may be transient, according to popular indoctrination, is secure. And yet he may work to the period of his life when he is no longer adaptable and find himself of a sudden, without any job because of the simple sudden shift of a board of directors or because of the antagonism of a foreman. Security would consist of this man's being able to adapt himself to his environ, in his being prepared for any possible shift in the factors which influence his job, and in his being confident of his ability to meet and deal with any possible shifts. Security is not a static thing.

Security would lie only in a man's confidence in reaching his goals and, indeed, in his having goals to reach.

There are automatic goals inherent in the plan of life. The conquest of MEST, the survival of the theta body, faith in immortality and the Supreme Being are all high level automatic goals. They potentially exist in anyone, but the amount of entheta inherent in the theta body and accumulated within the generation may cause the individual or the group to fall far short of any realization of its ability to attain these goals. The more entheta existing in the theta body and accumulated in the generation, the lower or less reasonable will be the goals of the individual or group.

Without goals, hopes, ambitions, or dreams, the attainment of pleasure is nearly impossible. Many individuals do not realize this and even though capable of assigning to themselves goals and pursuing those goals, they permit lower-toned people around them not only to undermine their confidence in their own ability to attain security and survival but also to deny them the right to formulate and strive toward goals of a desirable magnitude.

At the lower levels of the tone scale one finds individuals who purposely enturbulate, upset, destroy, and with great ardour inhibit the goals, hopes, and dreams of those about them. Here we have the individuals from 2.0 down. These have goals which are themselves no less definite than the survival goals above 2.0 It is a pitiful and terrible thing that individuals above 2.0 expend vast amounts of coaxings and persuasions on mates, associates, and fellow group members below 2.0 in an effort to get them to go toward survival goals. Individuals who engage in this activity are immediately targets for those who exist from 2.0 down, since these see in the higher individuals a method of furthering their own goals -- and the goal of the 2.0 down is death.

An examination of the anatomy of death demonstrates that death can be a small or a great thing. Death is actually a gradient scale. Small mishaps and accidents can tend toward greater and greater accumulation of mishaps and accidents, until death of an ambition, death of an individual, death of a cause, or death of a group is attained. Here is the story: "For want of a nail the shoe was lost, for want of a shoe the horse was lost, for want of a horse the rider was lost, for want of a rider the battle was lost, and all for the want of a horseshoe nail." Death stems from small things and proceeds toward great things.

Death is a soft-footed thing. Today a man makes a flagrant error in bookkeeping. He makes it because his wife has nagged him the night before. Tomorrow his superior finds the error and marks it down that his bookkeeper is not always accurate. In itself this is nothing. But next month, when a bookkeeper has to be discharged, it is recalled that one made an error, and all other abilities being more or less equal amongst bookkeepers, the one who made the error is discharged. Out of a job, the bookkeeper finds himself even more enturbulated at home and spends little time finding new employment. He takes a job beneath his skill in an office where everything is hectic, and he makes more mistakes because he is now worried. This is a little bit of death.

There are those who talk about "lucky breaks" and who speak of the "hand of fate" in their undertakings, but a forthright examination of the field of man's activities will show that nearly all success is most adequately deserved. The head of an imposing institute of psychology in a major American city told me recently that when he first entered upon his profession he was to some degree convinced that the capitalist, the big industrial manager, the director of the great corporation had arrived where he was because of avarice and carelessness of the feelings of others.

In the course of the many ensuing years he had, however, either with his own hand or through his staff, done industrial psychometric testing of many organizations and with this work had an opportunity to test a great many of the capitalists, managers, directors, and industrial giants of America. He had found in every case that "those who were at the top very well deserved to be there." He had discovered that the endowment of these individuals included

a rich appreciation of life, a great feeling for their fellow men, an enormous persistence, an intelligence in planning and execution. He had discovered that the world is carried on the backs of a few desperate, but very big men. And he discovered that luck was not chance.

Individuals above 2.0 on the tone scale are uniformly lucky. There is something more to theta than quite meets the eye. Here are the men on whom God smiles.

Below 2.0 we have the unlucky. One could with some surety give to a person high on the tone scale a few dollars and expect him to come out a winner at Las Vegas. And one could expect that the same few dollars given to a person low on the tone scale would see him coming out of the game very much the loser. Above 2.0, the individual plays to win. Below 2.0, the individual uniformly plays to lose. And not only does the individual below 2.0 play to lose himself; he plays to lose for everyone else around him and for the future.

It is part of the mechanism of death that individuals below 2.0 talk as though they played to win, talk of the desperate need of saving and winning, talk of emergencies by which one is expected to win. This is all part of the trap. Given every opportunity and every facility and every circumstance by which they can win, people below 2.0 will inject into every plan the germ of death, and acting ever so reasonably will permit that germ to grow until death is attained for the individual, for his associates, for the future, or for his organization. A Hitler brays his anger at the world and hounds all Germany into action with the argument of glory and yet, through not very mysterious mistakes, brings the hopes of Germany to death. He makes a charnel house of Europe, slaughters thirty million human beings, brings suicide to himself, and extinction of the hopes of his nation. Yet many times in the course of Hitler's 1.5 activities he could have converted Germany into the glory of the world. As a matter of fact, before he began to manufacture nothing but munitions he had revived German science to a point where it was respected above the science of any other nation. By the simple and direct appeal that Germany had become vital to the survival of other nations Germany could have risen and become glorious. But at no time when Germany could have risen did Hitler take the turning toward survival. He chose instead the turning toward death.

This play is not enacted always upon the stage of nations. It happens in many households. It is a pathetic and terrible thing to find a man mated with an individual below 2.0. He does everything he can to succeed, and yet at every turn of his career he finds himself balked by some strange non-compliance, or some new enturbulation, and gradually little by little his energies decline until he himself is outward bound toward death and a new generation. A woman, mating herself to a man below 2.0, who is herself capable of a high level of survival, will find herself broken by little "misunderstandings," strange perversions, and quarrels at inopportune times, until at last her ambitions for a family and a future lie in the dust where so many dreams go. The man who takes unto himself a business partner below 2.0, who is himself well above that line, will find a strange concatenation of events building around him which brings about the destruction of that business regardless of the hopes with which it was founded and regardless of his own ability to carry it through. It would be better for an individual engaging in a marriage, a business, or a group action to inject himself with poison or virulent bacteria than to ally himself with anyone below 2.0 on the tone scale. If this seems strong, look around you at the blasted men, the blasted dreams, the stories never written, the songs never sung because someone out of some pap of sympathy or "obligation" allied himself with an individual below 2.0 on the tone scale. This is death -- death as certain as laying one's neck below the blade of a guillotine and hitting the trigger.

From 2.0 down, the individual takes a reactive but very definite pleasure in attaining the "goal" of death for himself for the future, and for individuals around him. Here is entheta seeking to separate theta from MEST to bring about death and to accomplish a new generation. In the vicinity of such people death may be silent and waiting, but ready to influence and pervert every action in the direction of succumb.

At 2.0, the individual finds a reactive "pleasure" in sending forth antagonisms, in carping, and nagging, and criticizing. Left at liberty he will not sink any further on the tone scale but will continue to "abreact his hostilities." He is dramatizing engrams. But should these

dramatizations be broken, he will descend on the tone scale, It is an actual fact that whatever pleasure he obtains is obtained through these dramatizations. He can, by processing or education or changed environment, be brought up the tone scale, but left where he is he will certainly drag others down it, since he is a point of turbulence, as are all people below 2.0. At 1.5, the individual finds reactive "pleasure" only in the venting of anger. He has no actual concept of pleasure, but he gains a feeling of dangerousness and therefore of "pleasure" in the dramatization of his dominating or angry engrams. If permitted to go on being angry, he will remain static, to some degree, on the tone scale, but if these dramatizations are balked or fought against, he will descend down the tone scale, since he is not permitted to experience the "pleasure" which he can attain by being angry. His goal is to achieve destruction of things or people. He has considerable joy in achieving that destruction. People who are only temporarily at the 1.5 level, which is to say who are being acutely 1.5, know well the satisfaction obtained in smashing something. The chronic 1.5 can rise no higher than the smashing of things. At times in the past it has been felt that the individual who threw things, who went into a rage, and who talked in desperately destructive terms was at the lowest possible depth of insanity. This is very far from true. Anger is the very high bracket of insanity. One should beware of those who are lower on the tone scale and who bring about destruction only by covert means, for there is no forewarning of what they will do. Any preclear whose reactive mind (and all reactive minds are below 2.0 on the tone scale) is coming up to ward a release will pass through the zone of anger reactively and will be furious with people who have done things to him and may even be furious at the world at large. This is a symptom of his getting well, not a symptom of his going mad. People are not easier to handle below the zone of anger. People below the zone of anger are much more dangerous, since they will take much more devious steps to bring about death. They do not bring about destruction in clean daylight as does the angry individual, but in the dark alleys and cesspools of humanity. The person who is chronically angry can be processed rather easily by Dianetics up into the higher tones, since he still retains his vitality. It is only necessary for him to discover those things about which he is really angry in order for him to centralize his attention, and he still has considerable theta with which to convert entheta. But, and never neglect it, this person's pleasure is in being angry, and in running pleasure moments one had best discover moments in which the individual could be unreservedly angry at something.

The 1.1 tends even more markedly toward death than the outspokenly angry individual. The 1.1 will make small slips and errors and bring about upset and turmoil in his vicinity with considerable aplomb. These are his joys. If the 1.1 is to experience any "pleasure" it will be in an act which is deviously and hiddenly destructive to himself, to the future, to mankind, to life itself, to theta, or even, although that is impossible, to the Supreme Being. It should be understood that an individual may have a 1.1 reactive mind and yet be quite analytically alert and only drop to 1.1 when he is enturbulated. This would be an acute

1.1. But such a person is still dangerous. With the smoothest possible face, the 1.1 can deny any and every destructive or death act which he or she has engaged upon. The 1.1 hides all destructive acts and quite commonly puts a face of construction upon these activities. The 1.1 finds "pleasure" in sex only if sex is engaged upon with many people and in strange and peculiar ways. (This does not contradict the fact that a man, like any male, may seek to own and impregnate as many females as possible -- not a 1.1 characteristic.) The 1.1 does not enjoy sex save only when it is hectic and enturbulative. Here is the satyr, the nymphomaniac. The 1.1 will injure or maim, animals or men for "pleasure." And in running "pleasure" moments on the 1.1 the auditor will find such moments existing around the injury of somebody's dreams or the body of some helpless being. Here "pleasure" is obtained not in the light of day, but clandestinely and often hideously. The 1.5 takes "pleasure" in bringing about the incapacity of a powerful enemy. The 1.1 takes "pleasure" in breaking his enemy's back while the enemy lies helpless. The 1.1 may appear appealing, he may make a great show of his powerlessness, but when the lights are dimmed the actions of this individual are directed energetically toward death, whether the death of a reputation, the death of a cause (even though the cause is apparently supported), or the death of himself (no matter how far he seems to think his actions are from suicide.) In the 1.1 band, by the way, we find the individual most blatantly insistent upon ethics and morals for others. The 0.5, being that much further toward

succumbing and dying, attempts to bring about the death of his family, associates and self by continual forthright enturbulence in terms of death. Truth is, of course, no consideration at any level below 2.0. The most flagrantly untruthful is the apathy level of 0.5. The individual at 0.5 obtains reactive “pleasure” in lying wildly but dolorously about the hopelessness and horribleness of life and what has been done to him. To run what any individual at an acceptable level of the tone scale would consider a pleasure moment on a person at 0.5 is, of course, all but impossible. But reactive “pleasure” can be obtained by the 0.5 in being as thoroughly 0.5 as possible.

The 0.1 can sometimes be coaxed into running a “pleasure” moment on the subject of how dead he is and how lacking in any dangerousness. If the auditor can contact him at all, it will be at this level where the “pleasure” moments can be found.

It is a general rule, then, that pleasure moments are run at the level where the individual finds himself on the tone scale. Do not expect the 2.5 to run moments of high exhilaration, since the enteta on his case prevents him from reaching such a level. Do not expect the 1.1 to run a moment when he was extremely angry, since his position on the tone scale makes overt anger a very dangerous thing to indulge in, and the fear implicit in his position may prevent him from showing it. The general rule is that, above 2.0, the auditor discovers constructive and creative acts of greater and greater triumph and magnitude as the preclear rises up the tone scale. And below 2.0, he finds greater and greater efforts toward death in the “pleasure” moments chosen by his preclear. In any case, it is overcoming obstacles toward the goal which is important to pleasure. Below 2.0 of course, the individual is overcoming “obstacles” which tell him to survive as he travels toward his “goal” of death. Death, to individuals below 2.0, is the only valid and obtainable “goal” -- whether for self, future, group, or mankind. Anything which interrupts this course toward the “goal” of non-survival will be fought by people below 2.0. Such avidity for extinction is commendable only for the thoroughness with which these individuals will struggle to die. Because one deals here with eight dynamics, one should not believe that the individual below 2.0 works only toward his own death. At 2.0 he works rather mildly toward the death of a very wide periphery but does not much desire death for himself. At 1.5, he works toward the death of other beings or life forms or other dynamics. He will, of course bring about death for self but he does not give heed to this. One cannot reduce the other dynamics without reducing the first dynamic, of self, and bringing about one’s own death. At 1.1, we get only an occasional conscious awareness that the individual is himself tending toward his own suicide. Death is intended, by devious means, for a lesser periphery. Where the 1.5 will seek the death of many, the 1.1 will seek, by covert means, the death of a few. The 0.5 seeks death in obverse ratio to the amount of attention he can give to his environ, and that attention is normally isolated in the first dynamic and may include only a few intimates in the environ. The 0.5, then, is the suicide, but before suicide can almost be counted upon to attempt the death of at least his closest associate, whether by murder or by enturbation via sympathy. Occasionally the 0.5 will include the murder of children as part of personal suicide. The intimate of a 0.5 stands, actually, in the gravest peril in which an individual can possibly stand. The general running of pleasure moments can accomplish a very great deal in a case. There is the case of an elderly woman who had no other kind of processing done on her for many weeks. She was at the beginning of this period, according to report, bedridden. An auditor with an experimental inclination spent two hours a day running pleasure moments with this person, petty triumphs, joyous meetings, moments of good health and well being, moments of pride in accomplishment or in loved ones. At the end of this period, the elderly woman was no longer bedridden and evidenced a considerable rise on the tone scale. Not a single lock, secondary, or engram was run on the case. This should give the auditor some idea of the value of pleasure as a target for processing.

There is also a case of a person who could run no grief until pleasure moments were scanned intensively on his case. Such contact with the fact that pleasure actually existed in his life enabled him to support, because of the free theta returned to him through the attraction of his attention to pleasure moments, contact with the moments of misemotion necessary to free his case.

Pleasure moments seem to say, first and foremost, that survival is possible. But below 2.0, “pleasure” moments give the encouragement that death is possible. In either case the tone is raised whether the preclear desires it or not.

The running of pleasure moments is done exactly as one would run an engram or a secondary engram. One requires the preclear to return to the moment when the pleasure was actually taking place and to contact all the perceptics of the incident, seeing and hearing and feeling the experience as fully as possible over and over. The preclear can run the incident many times before tiring of it, since at each running he should discover new instants and perceptics that had been hidden before. Running pleasure in this way seems markedly to increase the amount of free theta in the case. On lower levels of the tone scale, actual pleasure in a person’s life, moments of survival, particularly those of triumph, are not easily obtainable. However, the auditor, by having the preclear run possible pleasure moments as concepts and then, as they are contacted more closely, as actual incidents, can often demonstrate to the preclear that pleasure has existed and is available.

In view of the fact that obtaining pleasure is one of the primary goals of life, the running of pleasure moments can do a very great deal for a case. There have been cases which have had sonic and visio turn on merely by the running of pleasure moments. The case is most readily stabilized by the running of pleasure moments. In trying to bring a case up to present time one should run several pleasure moments, if the case is difficult to stabilize in present time. After running such moments the preclear often comes easily to present time, having recovered attention units from secondaries and engrams somewhat restimulated in processing.

Memory itself can be refreshed just by running on the track. One can, as an experiment, choose some specific date in the preclear’s lifetime. This date may be completely occluded. But the auditor insists that the preclear return to this date. The preclear may be completely in the dark as to what happened on, let us say, January 3, 1943. The auditor has the advantage over the preclear, since he knows that when he has told the preclear to go to a certain date, then the preclear has gone there whether the preclear knows it or not. The auditor then requires the recounting of the happenstances of, say, 3.30 A.M. on that date. The preclear may be able foggily to point out certain incidents in the year 1943. If the auditor is very patient and persistent in his address, he will gradually cause the “I” of the preclear to obtain the specific details of the date and moment, and he can then run this moment with its own actual perceptics. This is no less valid a technique than running pleasure moments. The mind has recorded everything, and the auditor knows that when he sends the preclear back to such-and-such a time, the preclear is there even though the “I” of the preclear may be barred from the perceptics of the incident by entheta on the case. With patience and persistence the auditor can always obtain the data which he requires.

Moments of triumph are, of course, pleasure moments. But one often finds preclears, particularly those below 3.0 on the tone scale, who run moments of triumph without experiencing any pleasure from them. The auditor may find the preclear winning a silver cup at a horse show, and the auditor may return the preclear to the incident and run him through it over and over, only to discover that the preclear felt he did not deserve to win the cup. This is the difference between the preclear’s concept of reality and the auditor’s concept of reality. By all reason, the preclear should have obtained pleasure in winning this silver cup at the horse show, but in accordance with the preclear’s tone no pleasure was obtained from the incident, since possibly it brought about too much notice and notoriety or it conflicted badly with some specific engramic computation of the preclear about winning or about hurting the other contestants by having won. This should not discourage the auditor; it should only point out to him that he is attempting to run pleasure moments too high up the tone scale for his preclear. In such a case, the auditor should go down the tone scale and find a time, perhaps, when the preclear was able to destroy the reputation of some dear friend by some lying gossip and run this as a pleasure moment. He will obtain in such wise, despite the auditor’s feeling that it is impossible, a rise in tone. The auditor should not neglect the fact that pleasure moments may be created and that a present-time pleasure moment is itself a point on the track and will tend to disinturbulate the preclear. This does not mean that the auditor should countenance the

“pleasure” that would be sought by some individuals low on the tone scale, pleasure which might consist of the destruction of the reputation, future, or health of some young woman or child. But it does mean that the auditor should encourage the preclear to provide himself with pleasure, as an assist to processing.

The auditor if he is advising pleasure should not fall into the old error of believing that pleasure is idleness and wastefulness. The greatest pleasure, for instance, that a composer can achieve is in composing. A genius in management achieves his greatest pleasure in overcoming obstacles to management. The best pleasure for an individual is in the attainment of happiness; the overcoming of not unknowable obstacles toward a known goal. The auditor may by adroit questioning discover for the preclear the fact that he has goals toward which he can proceed. It is a below-2.0 trick to take a creative and constructive individual and set him aside from the route of his greatest pleasure, which may be the pursuance of highly arduous goals. The auditor should not tell a mountaineer to go to the seashore for a rest but should encourage the mountaineer in the belief that he can conquer a much higher mountain than he has ever attained before, since if his mountaineer is ailing it is because some less-than-2.0 individual in his vicinity has brought him, by great and detailed discouragements, to the belief that he can climb no more mountains.

Pleasure whether for life or death is attainment or the overcoming of obstacles toward that attainment. When running pleasure moments or when encouraging his preclear to create and construct present-time pleasure moments to raise his level on the tone scale, the auditor should not overlook the fact that happiness is the overcoming of not unknowable obstacles toward a goal. He will find the majority of his preclears without any goal. The auditor, by questioning and without interfering with the self-determinism of his preclears, can help them to discover and clarify their goals. Or he can assist in the identification of obstacles toward any goal which the preclear already recognizes. Or the auditor can simply encourage the preclear to keep on overcoming the known obstacles toward his known goals. The auditor will discover preclears who are not particularly low on the tone scale, who have yet had insufficient opportunities to experience pleasure, and so have behind them a barren life. An auditor is justified in advising the preclear to go out and create and live through a pleasure moment, so that the auditor afterwards can run it, to the enhancement of the case. The living of it, of course, is more important than the running. The primary consideration is whether or not pleasure moments exist.

It is interesting to note that any society declines in exact ratio to the contempt in which it holds pleasure and advances in ratio to the respect it has for pleasure.

Above 2.0, pleasure contains more construction than destruction, more good than evil. Below 2.0, “pleasure” contains more destruction than construction, more evil than good. Immorality comes about when a thing contains more pain than it does pleasure. Societies have existed which found their pleasure in observing or inflicting more evil than good. The Roman circus is an example of this and marked a point in the decline of the Roman Empire which forecast an early death for that great political organization.

By true pleasure is meant acts which contain more good than evil.

Before one condemns pleasure, one should understand the kind of pleasure about which a person is talking. But there happens to have been, down through the centuries, such a revulsion toward what the Roman Empire called pleasure in the early Christian days that pleasure itself became inhibited. There are individuals and groups which consider the enjoyment of life a crime. This immediately and automatically spots these individuals and groups on the tone scale. They are below 2.0 and are headed toward succumbing. Yet the auditor will have to cope with people who have been indoctrinated into an inhibition of pleasure and who by education are unable to experience pleasure. The auditor should have ready his definitions of pleasure and an understanding of what pleasure actually is. From those who tell him that pleasure is evil he should gain a definition of what they think is enjoyable. This is the type of incident which can be run on the case as a pleasure moment. For those who tell him

that pleasure is good and then proceed to detail promiscuity and sadism the auditor should have at least an intellectual understanding.

Because of the various situations which exist in the life of any person, pleasure as survival and pleasure as death sometimes intermingle. It occasionally happens that some individual has lost, through the chicanery, treachery, or betrayal of others, his woman, his business, or his reputation, and his idea of pleasure is the painful extinction of those who have injured him. This does not immediately denote a low position on the tone scale, for the auditor may find that such an individual delves into death for only one circumstance. If the other circumstances of the individual are high on the scale, the auditor should recognize an immediate indication of where he should work in order to free considerable theta, which is tied up in plots of revenge and dreams of painful punishment for the enemy. Such an individual, however, can ordinarily run pleasure in other spheres of life. Even a low-toned individual can sometimes find some sphere of activity, if very isolated, which is constructive, and thus the auditor knows where to look for actual pleasure on the case and can use this particular incident or type of incident in order to free theta.

The whole subject of pleasure moments is allied intimately with survival, where true pleasure is concerned. The auditor however, should not overlook the fact that it is "pleasure" for the 0.5 to contemplate the most gruesome possible suicide or the most pathetic death of the nearest "loved one."

The auditor should not be critical of the type of pleasure which his preclear selects but should work continually to select the highest possible pleasure on the tone scale available to his preclear. In other words, for the 1.1 he should try to find 1.5 or 2.0 or 2.5 pleasures rather than persisting along the line of 1.1. The auditor is attempting to raise the preclear up the tone scale and in the process of doing so he will find that higher and higher levels of pleasure can be obtained not only in present time but in the past. The amount of pleasure of the true variety which the preclear can experience or run is symptomatic not only of his chronic position on the scale but of his progressive rise toward more desirable levels.

CHAPTER NINE

COLUMN AE

Imaginary Incidents

One of the social aberrations of America is that imagining things is a misconduct. "Imagining things" has been made equivalent to "insanity." It is a common derogatory statement to say that one is "imagining things." It is a nullifying criticism to say that one experiences delusion. The child is particularly subject to a bombardment of criticism for being imaginative.

The condemnation of imagination signifies a fear of departure from reality. But if imagination is so thoroughly condemned, then those who condemn it must have some basic fear that they themselves cannot hold on to a reality.

There is nothing wrong with imagination. There is a great deal wrong with the type of aberration which makes it impossible or at least difficult for the individual to differentiate between the imaginary and the actual. So long as the individual knows he is imagining when he is imagining, and knows he is dealing in fact when he is dealing in fact, imagination has a high validity.

There are three types of imagination. One is creative imagination, whereby in the field of aesthetics the urges and impulses of the various dynamics are interwoven into new scenes and ideas. The second type is the more or less practical type of imagination which comes about as a result of computation. Without this second type of imagination an individual could not forecast the future nor could he postulate a goal desirable in the future. This type of imagination is so vital to computation that the individual who lacks it can be seen to be definitely deficient analytically. The third type of imagination is delusory or hallucinatory. If the culture desires to make itself more sane, it would cease to apply the word "imaginary" to things which are delusory or hallucinatory. Delusion connotes a type of imagination which is not known by the individual to be imaginary. However, in engrams one commonly runs into the phrases "It's all your imagination," "It's all in your head," "You're just imagining things" and other command phrases which short-circuit the preclear's ability to differentiate between what we should now call the imaginary and the hallucinatory. The imagination becomes hooked in to the fact bank, and "I" receives data as fact which is actually the product of imagination. There are, one could say, four distinct sources of aberration. The first is occasioned by phrases in engrams which specifically dictate certain obsessions, compulsions, repressions, delusions, neuroses and psychoses. Such phrases, however, have command value on the analyzer, which does not know they exist below it in the reactive mind, only to the degree that the case is charged with entheta. Command phrases and action phrases become more and more obeyed by the analyzer the more the analyzer is shut down through cumulative aberration. Action phrases are effective more and more as the individual descends on the tone scale.

Therefore, there is a second type of aberration source which is simply the amount of charge there is on the case. This might be called mechanical aberration. It does not stem from specific commands but stems from mental inefficiency by reason of cumulative entheta. As the preclear descends down the tone scale, certain definite manifestations take place by reason of cumulative entheta. The whole chart around which this book is written is a result of the study of the effect of accumulating entheta on aberrated individuals. Entheta by itself can charge up a case to the point where the case will behave in certain definite ways regardless of the command content of the engrams.

The third kind of aberration is environmental and is the result of aberrated persons and situations in the individual's present-time environment. This is a normally temporary, but cumulative environmental entheta has a chronic effect in the case.

The fourth type of aberration is educational, being the cumulative enttheta of the culture in which the preclear was raised, the irrationalities and bad data he has received as a result of his education, by parents, in schools, and by experience.

There should be listed a fifth type of aberration and even a sixth and seventh type, but these are at this time of less concern to the auditor. The fifth type would be the cumulative aberration of the theta body through its many generations, which he may or may not have to address in the clearing of the case. The sixth type would be the pattern behavior inherited on the genetic line, of which very little is known, but it can be estimated that any organism has some pattern behavior of which some small portion might be considered incorrect for the environment and so, by a stretch of definition, could be considered aberration. The seventh type would be aberration due to missing or malformed portions of the human structure, either through genetic inheritance or through accident of psycho-surgery.

Thus, we see that imagination is valuable and vital both to creating tomorrow's realities in the society -- the invaluable contribution of the artist, writer, and composer -- and in the practical computations of everyday living, and that it should not be discounted in value in the rational human being.

Then we see that imagination by engramic command, which confuses the real with the unreal without proper evaluation, can introduce falsity into the thinking and execution of the individual.

Additionally we have imagination, by reason of charge on a case, beginning to supplant reality as the case descends down the tone scale. Imagination thus becomes mechanically more and more short-circuited into a supplantation of reality, as the position of the individual descends the scale. In the past it was thought that people imagined things willfully in order to "escape" reality. The old therapies never bothered to evaluate reality, but were very glib in demanding that people face it. "Escape" and "delusion" were epithets used in order to pound the patient into obedient subjugation. (The practice of telling the patient that his incidents are imaginary rapidly reduces the individual on the tone scale, since it destroys the patient's sense of reality, and is a practice definitely calculated to further incapacitate the patient. The fact of the matter seems to be that as an individual drops down the tone scale the cumulative charge on the case makes existence in its actual form more and more intolerable. What theta he has left, perhaps because of reversed polarity, cannot perceive into the enttheta of the reactive mind and the mostly shut-down analyzer. It is not that the person is unwilling to face reality; it is that he is incapable of facing reality. Said in another way, the individual is veered away from the things which have been done to him in life toward imaginary postulates which can serve him in lieu of fact. For example, the individual who cannot feel that he is a threat to the enemies in his environment, at least to some degree, is insane or becomes insane. Thus, as the individual descends on the tone scale he becomes, by imagination, first a threat to real things and then, by imagination, a threat to imaginary things, and finally no threat at all to anything, at which point he has reached pretended death. The individual departs further and further from reality, at first knowing that he is departing from reality, and then being unaware that he is departing from reality, at which point he could be considered to some degree insane.

A possible explanation for the short-circuiting of imagination by the mechanical means of cumulative charge on a case may be of interest to the auditor. There is no good description and, indeed, no accurate postulate or theory which accounts for the ability of the human mind to remember in the quantity that it does. The most recent attempt was made by a man who had dabbled in physical structure but who did not know his mathematics. He originated a punched-protein molecule theory, and stated that memory charges were stored in punched protein molecules. His theory holds up only so long as it takes one to work out by mathematics that if an individual recorded only the major perceptions of his environment day after day and stored them, by this theory of holes in molecules in which are stored memories, he would still have in storage capacity only enough, in the ten-to-the-twenty-first-power binary digits of cells the brain contains, to serve for three months of memory. Therefore, this theory of punched protein molecules is not valid.

A workable analogy on the subject of structure -- and it should remain an analogy only, since it does not do any more than help one to understand what is happening -- tells us that we may be dealing, in considering memory and the human computer, with a problem not unlike physical universe electrical charges surrounded by insulation. Certain things tear down this insulation, so that memory items begin to short-circuit one to another. This would account for the identification of one fact with another which occurs more and more as the tone scale is descended. Low on the tone scale, things are identified with other things which are actually widely different; but at the higher levels of the tone scale, where the mind is in good working condition and there is no great charge on the case, minute differences can be detected by the computer between one memory item and another. At the top of the scale, the mind is capable, for instance, of differentiating between two cigarettes which, though they appear identical and are of an identical brand, are different, if only to the degree that they occupy different units of space. At the bottom end of the tone scale, not only would these two cigarettes seem to be the same cigarette but these two cigarettes would also be tobacco, which would also be tobacco smoke, which would also be chewing tobacco, which would mean that chewing equaled a house on fire. At the top of the tone scale, at the highest levels of reason, one has sharp, high-level differentiation between facts, and at the lower end of the tone scale the most widely different facts and items are associated as equal. One could say that the equation of the reactive mind was "A equals A equals A equals A" regardless of what A stood for. In an engram, all things and remarks are equal to each other, are equal to the pain, are equal to the perceptics, and hearing equals vision and vision equals tactile, and a complete identification occurs. The analyzer when full on thinks in minute differences. The ability to think has to do with the ability to differentiate. Unthinkingness has to do with a lack of ability to differentiate and a compulsion to identify unlike things with each other as though they were not only like things but the same thing. In an insane person, the administration of sedation seems to bring about a momentary recurrence of sanity. As an analogy only, then, it could be said that entheta breaks down the structural insulation separating one memory item or unit from another and so causes identification. And it could be said that the presence of any euphoric would rebuild or reestablish this insulation to some degree and make rational thinking possible. The auditor who audits a preclear who is under sedation will discover that so long as the preclear is under sedation he appears to be responding to treatment, but the moment the sedation wears off all the auditing and most of the entheta which was thought to be turned into theta have now become short-circuited into brand new aberration.

Probably the most dangerous thing one can do to any aberrated mind is to place it under heavy sedation and try to treat it, or while it is under sedation place it in an atmosphere which is restimulative. Sedation of the insane is, shortly and abruptly, criminal, since it permits new perceptics to become entangled with an already confused mind under circumstances of perception which could not take place if the patient were not under sedation. It should be thoroughly understood that this analogy of insulation between memory units in the mind is, very definitely, an analogy and is used for illustration only, so that the auditor may know better what he is confronting. Entheta definitely seems to tear down and arc across any divisional and insulatory barriers in the mind. As a further analogy, it could be postulated that as the mind breaks down in its ability to differentiate and begins more and more to identify, the various units of the analyzer begin themselves to become too closely associated and begin to replace each other, so that that portion of the mind which is used for imagination becomes undifferentiated from that portion of the mind which is doing computation on fact.

This would also be an analogy which took place regarding valences, wherein the "I" which is the real individual, becomes obliterated in favor of other highly-charged sections of the analyzer. And here the analogy breaks down, since the valence walls between the different personalities of the individual grow more and more sharply defined as the individual descends on the tone scale, so that at last the heavily charged case goes from one valence to another so abruptly that one can almost hear the click as he crosses the valence wall. Of course, one could add to this analogy and say that the theta which has become entheta at last begins to form up insulation of its own, but this does not seem very likely. Certain it is, however, that the identification of incidents which are in no way even similar is symptomatic of the insane. The auditor should understand, then, as he confronts his preclear, that he may have before him an

individual who is incapable of facing any facts in his case. This may be limited to an inability to face facts in certain spheres of his life, such as failing to face facts concerning his wife. He may have such a thoroughly charged second dynamic that he can face no facts concerning his marital existence or his children, but will turn to imaginary "facts" which are, if untrue, still very safe. The auditor should not under any circumstances try to force or persuade his poor preclear to "face reality." The auditor should be perfectly willing to accept that in certain spheres of the preclear's life the actual facts of the case are so definitely entheta that what theta exists in the preclear's mind is unable, by reason of polarity, to encounter the real facts in the case. Almost any human being, in some sphere of activity, will deal in imaginary incidents, up to the level of 3.0 One, when he faces the idea of school, will detail imaginary incidents simply because his actual school experiences contained so much entheta that the theta veers away from it and turns to the imagination to be supplied with "facts." Another individual will deal in factual material throughout his field of activity except where religion is concerned. He may have so much entheta on the subject of religion that he veers away from actuality here and talks in terms of atheism, or may go in the other direction and become completely hallucinatory. But in this case, he is veering away from his MEST universe to the point where he is constructing an imaginary sphere of activity. (The individual who simply turns to the theta universe and perceives there certain visionary things is not necessarily aberrated at all but may be simply high on theta perceptics. The aberration which is cited above is of the variety of the sadistic zealot, who has been, is, and always will be so much trouble to the Church). Or the imaginary sphere which "I" believes to be wholly factual, may be the existence of lost gold mines. Here, so much entheta exists with regard to practical and workable means of living that he must deal in imaginary means.

Somewhere in every case you are going to find the preclear running imaginary incidents in lieu of real incidents. As an auditor you should not worry unless your case is running a majority of imaginary incidents in lieu of real incidents, for your case then is running delusion rather than fact, by reason of a very low position on the tone scale. Here is a problem for you. You dare not tell this preclear that he is running delusion. This would be a break of the auditor's code. But somehow you must persuade him to address present time or some locks long enough to free some theta so that he will have a theta-ability to face reality. On such a case you could actually blunder and run physical pain engrams, but you would only enturbulate the case further by trapping the existing free theta on the case into the existing entheta, and you would assuredly send the case down the tone scale rather than bring it up. Where the imaginary incident becomes generally preferred to the actual incident you can be quite sure that you are dealing with a low-tone preclear.

Now there are three ways of handling delusion. The first way is to electric-shock, or prefrontal-lobotomize or sedate the preclear into utter apathy and uselessness in the society and wreck him completely. This is not recommended.

The second way is to scan free or obtain in present time enough free theta to bring the individual up the tone scale to a point where he will run actual incidents rather than imaginary incidents. This is highly valid.

The third way is to coax the preclear into running avowedly imaginary incidents, and this is the crux of this particular technique of processing. By openly inviting the preclear to run imaginary incidents the auditor is breaking down the barrier of pretence which the preclear will unknowingly put up. The running of avowedly imaginary incidents is quite productive. Sometimes the preclear will run them, quite astonishingly, with somatics. But he is not being required to face any reality about them and the auditor is not insisting that any reality exists concerning them. In an astonishingly high percentage of times, however, he will be running actual incidents. So long as he does not have to admit that these incidents are actual he can do something about them. One might say that the auditor is thus validating the imagination mechanism of the mind and is strengthening it and is already beginning to put the general and broad segments of the mind into good working order by differentiating one from another with the preclear. Of course there is always the danger that the auditor's use of the word "imagine" will restimulate the preclear, because this preclear may have engrams which tell him that he

does not know true from false and that it is all imagination anyway. But this chance should be taken.

It should be understood that no amount of imaginary incidents can supplant the running of real incidents. The first value that this technique has -- the invitation to the preclear to run avowedly imaginary incidents in his past -is to build up the preclear's confidence in the auditor. The preclear begins to feel that he will not be censured for indulging in fantasy. In this great, wide, and undoubtedly rational culture, almost any preclear has been cut to ribbons as a child for indulging in fantasy. The child lacks data and makes up for this lack with a wild and rugged imagination. The child quite easily sees fairies and strange animals walking about, with his imagination. If he finds life dull and elders hard to shock into taking an interest in him, he may recount these things as valid. He is, of course, inevitably censured by the hard-headed, "practical", and "rational" elder and so accumulates a series of locks on any engrams he may have. Left to himself and his fantasies and imaginings, the child will eventually, of course, find out what is reality -that grim thing in our world of the twentieth century -- and what is fantasy. But the elder is apt to press the child into too early an acknowledgement of this "reality". Actually, of what absolute reality is neither you nor I have any notion, but we have agreed upon certain facts, and having agreed, we wish to remain friends, and so we continue this agreement. As a culture ages, these agreements are harder and harder to disturb, and are maintained not because they are true but because they are simple and easy and because no energy is required to maintain them. The child, fresh and new in the world, would like to see a little excitement in his reality. And the elder, worn and haggard by a combat with an environ which offers little in terms of security and much in terms of menace, fights back against these bright bubbles and dreams. Thus, any preclear you have on the couch is fairly certain to have experienced a confusion between what he wanted to think was reality and what he was told he would have to accept as reality. Thus, there was an invalidation of his reality, even though his reality was actually imagination. When the preclear on the couch discovers that he has an auditor who not only will listen to imagination but who encourages it, the affinity level rises, and the preclear's ability to differentiate in terms of reality will itself rise.

In the running of imaginary incidents, the auditor must never, after the incident has been run, then insist that the incident was real. This would be a break of faith. He and the preclear have entered into a contract that what is being run is pure imagination, and the auditor must not break his contact.

The running of imaginary incidents may consist of running imaginary pleasure moments, which is heightening in terms of theta, or it may consist of running imaginary moments of grief or physical pain, which makes available to the auditor more data on the case and may actually increase the theta on the case.

Here is a most interesting fact for the auditor. It may happen with an aberrated child that he has occasionally pretended injury or illness for the sake of accepting sympathy or interest from his parents, guardians, or mentors. The auditor would do well to discover the time in the life of the preclear when he feigned injury or illness knowingly in order to receive sympathy or interest from those about him. In the first place, when an individual will do this he is in fairly bad shape, for this is a form of pretended death. The environment wherein the preclear would do this must have been a highly restimulative environment which had the preclear low on the tone scale. (One should realize that in the course of a lifetime, environ to environ, an individual varies markedly on the tone scale.)

Those knowing pretenses are of interest to the auditor because they are invariably real as to their background. The preclear may have supposed at the time, in all confidence, that he was lying, but he was actually offering a sympathy engram to those about him, and the auditor can thus discover a highly aberrative engram on the case. Whether or not this case is in shape to run this engram is up to the judgement of the auditor, but he knows at least that it exists. The preclear who continually pretended an injury to his foot, for instance, may have supposed that he was lying and may have supposed that he had never had a foot injury, but in actuality

somewhere, earlier, hidden from his analytical mind, a foot injury exists for which the preclear received a great deal of sympathy.

Sympathy incidents are relatively hard to locate. The preclear will hold on to an incident in which he received sympathy much longer than one where he received only antagonism. The location of the allies of the preclear is thus rendered difficult to the auditor, but the mechanism of discovering the “imaginary” illnesses which the preclear offered to the world around him discovers the allies. (There is another method of discovering allies which is of interest. One finds an antagonistic personality in the preclear’s life and runs the preclear back through incident upon incident where this antagonistic personality was attacking him, until one finds a point where the preclear was being defended by someone. The person who does the defending is an ally or a pseudo-ally* of the preclear and incidents with this person should be followed backwards and forwards and cleaned out of the case, as one of the most aberrative elements of the case.)

The imaginary incident serves four purposes. First and foremost, it gives the auditor data about his preclear, since the imaginary incident which the preclear will recount has some basis in actuality.

The next point is that the recounting of an imaginary incident heightens the affinity between the preclear and the auditor. The preclear begins to find that the auditor must be somewhat compatible with him, since the auditor will accept the preclear’s evaluation of existence and seems thus to be in agreement with him and to be similar to him.

The next value of the imaginary incident is that it increases communication between the preclear and the auditor. Here, at least, we have the preclear talking about something and the auditor listening, and the preclear discovering that the auditor will listen, without interruption or criticism, to a recounting which may be quite wild and sensational.

The fourth value of the imaginary incident is that it finds the auditor non-insistent upon a high level of fact, and so will find the preclear more willing to deliver fact.

The imaginary incident could be said to be a testing ground. The auditor asks the preclear to run an imaginary incident. This is all right with the preclear, since they have agreed that the incident is to be imaginary, and thus the preclear cannot be censured for saying anything he pleases.

It will happen, in the running of imaginary incidents, that somatics will turn on. Or it will happen that the preclear is suffering certain somatics and yet is too low on the tone scale with regard to this particular subject to admit the actual cause of these somatics. By running off imaginary words and phrases, imagining what papa says, imagining what mama says, or imagining the year in which this happened or imagining the circumstances relating to this it may come about that the somatic disappears. One has actually run off an engram or a heavy lock and the case is thereby benefited.

The auditor does not cavil with the preclear about facts, in any case. Where the auditor has to use imaginary incidents to get any information of any kind out of the preclear, he is dealing with a preclear who has been invalidated very thoroughly by the people around him most of his life. The imaginary incident is a mechanism which actually repairs past invalidations. The preclear will not admit that an incident is actual, because those around the preclear have too often challenged his ability to recount actuality or to deliver forth facts. The auditor gets around these past invalidations by himself refusing to invalidate, by inviting an incident purely on the basis of imagination. The preclear is heartened. The auditor will receive data. And free theta may be liberated in the case. THE PRECLEAR AND AUDITOR AS A GROUP

It must be noted somewhere in this work, and may be noted here since the running of imaginary incidents is most productive of the result, that the preclear and the auditor form,

actually, a group. One need not know the high level of technology which is Group Dianetics to understand that two human beings make a group. Two is the basic unit not only of theta but of human beings in group terms. The group may number millions at its largest, but in its basic size it is at least two.

Occasionally the preclear will discover in the auditor an antagonistic personality. This comes about when the auditor reminds the preclear of some personality earlier in the preclear's life who did something non-survival to the preclear. The auditor who permits himself to go on in this imaginary role of a past antagonist will find that his task is greatly increased. It is of very great value to the auditor to clear himself and the preclear as a group, before he begins any serious auditing. In the optimum group, a high level of affinity, reality, and communication must exist. Between the auditor and the preclear ARC must be high.

There are various ways to clear groups. The auditor should not be as anxious to approve of the preclear as he should be to have the preclear approve of him. Nevertheless, it will take considerable strain off the case and the processing if this works both ways. One auditor in order to clear himself and the preclear as a group habitually requests the preclear to tell him what the preclear does not like about him. The preclear at first, through propitiation or social usage, will not admit that there is anything about the auditor he does not like, but on pressing the case, this auditor very shortly discovers for the preclear antipathetic individuals in the preclear's past of whom the auditor reminds the preclear. The first act of the auditor then is to clear up these bad associations by straight memory.

The establishment of affinity, communication, and reality between the preclear and the auditor is a vital concern if processing is to follow anywhere near an optimum course.

Where a co-auditing team is being formed, and the success of Dianetics is built upon co-auditing teams, a mutual clearance is required, whereby each unburdens himself to the other, and by straight memory, undesirable associations are cleared out of the relationship. It is remarkable that between any two human beings bad associations by reason of past existing personalities are almost inevitable. Individuals on the normal level of this social culture associate hidden past personalities with present personalities they meet. Straight wire can easily clear up this situation. The auditor mentioned above was having some difficulty with a woman preclear until he discovered that the way he cleared his throat reminded her of the first of her husbands, of which she had had three. The point here is that the auditor did not immediately forego his habit of clearing his throat merely because the preclear objected to it. The auditor went to work and caused her, by making her remember, to conceive a difference between himself and her first husband. The moment she did this, the auditor's habit of clearing his throat was no longer of any importance. The auditor should not change his habits and training pattern to match every preclear, but should use the effect of these upon the preclear to locate past antipathetic personalities. This in itself frees theta in the case.

The use of imaginary incidents acts to form a smoother relationship between the auditor and the preclear by establishing for the preclear the auditor's willingness to accept anything the preclear has to say. But it does more than this. It gives the auditor a valuable assessment of the preclear's position on the tone scale, for he can judge this rather easily by the type of incident which the preclear likes to imagine (see *Pleasure Moments*), and it tells the auditor what may be in highest restimulation in the present-time environment.

The auditor who will scorn imagination or condemn anything the preclear says as delusion, regardless of the auditor's inability to compare it with his own concept of reality, will inevitably bring about the destruction of the auditor preclear group. And they will not be able to work together.

The husband-wife team has been found in Dianetics to be the least compatible auditing group. A few husband-wife teams are successful, but the majority are not, and husbands and wives would do well to look outside the home for coauditors, for trouble in co-auditing can easily cause a shaky marriage to collapse.

CHAPTER TEN

COLUMN AF

Locks

Elsewhere we have the anatomy of entheta. Entheta could be said to be in four forms. There are probably more than that. By entheta we mean, of course, enturbulated theta. The first form is that which is the basic cause of entheta, the engram. Here, theta in its effort to conquer MEST has come into too heavy a collision with MEST. In an organism this causes physical pain.

Theta after it has become enturbulated with MEST can either by the mechanism of death or by dianetic processing be withdrawn from the MEST and bring with it an intelligence of the laws of MEST which it can then use in a further conquest of MEST on a more orderly and harmonious level. All things begin with a heavy impact and enturbulence, if anything is to be learned by theta about MEST. The first Foundation, for instance, in its year of existence smashed heavily into MEST, and if this delighted those who desired to preserve the status quo or those who had no use for an end of aberration, yet much was learned, so that Group Dianetics could come into being, and so that improvements could come about as a result of new data on the third dynamic which in turn resulted in improvements along the first dynamic and in the techniques of individual processing. The engram is a moment of physical pain and unconsciousness which is recorded in the reactive mind with all perceptions during the period of unconsciousness. It can be keyed-in by conscious-level experiences, it can be dramatized, and it can manifest itself either as mental aberration or as physical aberrations, which in the past were called psychomatic illness.

The engram consists of enMEST, which is the MEST of the organism enturbulated or disordered by impact, and entheta which is mingled with the enMEST.

Entheta can exist as temporary enturbulence in the individual's life force or reason when he is confronted by unreasonable or non-survival circumstances in his environment. This could be called temporarily enturbulated theta. However, in any situation in present time which is restimulative, a certain amount of entheta becomes fixedly entheta and is stored in the reactive mind and thereafter, save in those extraordinary circumstances wherein enormous quantities of free theta are in the environment of the individual, or but for dianetic processing; this fixed entheta remains fixed. The "permanently" fixed entheta remains in the reactive mind in the form of secondary engrams or in the form of locks.

The secondary engram will be described in its own turn, but is a low-tone-level experience of loss, or fear of loss, or anger because of threatened loss, or apathy because of accomplished loss. The lock has three variations. One of them is where the individual has been prevented from carrying out the commands of the engram which is restimulated by present-time environmental perceptics (broken dramatization). Another is merely where the perceptics of the engram are approximated by those of the present-time environment (restimulation). The third is caused by inhibitions and enforcements of ARC.

In order for a lock to be formed it is necessary for the analytical portion of the person's mind to be somewhat lowered in activity or alertness. Locks can be received only when an individual is weary, upset by reverses or is in a generally nonoptimum situation. These light approximations of engrams in the analytical present-time environ were believed in the past to be aberrative in themselves. Actually, they were not. The lock is only the surface manifestation of the basic environmental cause of aberration. Underlying any lock must be an engram. Ignorance of this fact was one of the main reasons for the failures of past therapies. A lock occurs also when the individual is attempting to carry out the irrational commands of the engram and is prevented by the society's or some individual's counter "reason" from accomplishing the dramatization.

Locks are analytical-level encystments of entheta.

The average case probably has several thousand engrams. Individuals are often questioned on the subject of how often they have been unconscious. A few of them will answer that they have never been unconscious in their whole life. As soon as they are sent back down the track, they begin to discover period after period when they have been injured or operated upon, and certainly every individual has been born, and birth above all other experiences is sufficiently arduous to bring about unconsciousness. Since the reactive mind registers upon a cellular level, and also upon a theta-body level if evidently to a lesser extent, the earliest moment when an engram can be received is certainly no later than conception. Engrams do not begin to receive locks, ordinarily, until well after birth, and usually well into the speech period, although babies will react to the uncomprehended sounds in the environment which are also included in their engrams. A lock is, then, a relatively light incident which betokens a restimulation of some engram on the case. There are in any case tens of thousands of locks. If one continued to address locks and only locks in a case, processing would be almost interminable. This is fortunately unnecessary. Locks have only to be addressed in a case until the preclear is up to a point where he can run engrams. After the preclear has run out engrams, the locks consequent to any engram or chain of engrams which he has run out can be scanned off with great speed.

Locks are interesting to the auditor mainly on the low-tone cases. On many cases the auditor will discover that locks have to be run as engrams. He will find a period where some preclear has as a young girl been forced to eat spinach, and this will seem to be a highly aberrative incident.

The preclear, if very low on the tone scale, may be responding to the action phrases or commands in the lock, yet this incident contains no physical pain of any kind, and still, once sent to the incident the preclear is unable to leave it until it is run, complete with action phrases. This would betoken a very low-tone preclear. The auditor should not think that the reason his preclear is aberrated is because she was made to eat spinach when she was eight years old. The auditor should understand that underlying this incident is an engram, or many engrams, whereby the preclear is dominated. But if the auditor discovers that the lock is in itself aberrative, he should understand that this is no time to run engrams, since this preclear must be unburdened of many locks and secondary engrams before she will be in shape to run engrams. Here is a very heavily charged case.

As one can read in the column on the tone scale chart, a 4.0 has all locks discharged. This is something overlooked by the ambitious auditor. A 4.0 is, by definition, one who has had all entheta in his current life converted to theta. This means that his engrams must have been erased, that his secondaries must have been discharged, and that his locks must have been scanned out. The 3.5 will blow locks almost as fast as the engrams underlying chains of locks are reduced. The 3.0 does not have to have locks addressed as individual incidents, but in order to clear up the case, scanning of locks is necessary.

The 2.5 can have locks treated with benefit as individual incidents. It will be found that moments when the 2.5 was criticized for stepping out of line at school or for being mean to sister will release some entheta. However, the auditor is to some degree wasting his time by treating, at this level on the tone scale, non-physical-pain and non-misemotion incidents as individual occurrences.

Around 2.0, locks begin to become important. The auditor can go into a moment in the preclear's past life when the preclear was consciously alert and had something happen to him which was productive of entheta, and yet discover that the incident will not reduce. This non-reduction of relatively simple incidents, as it proceeds from 2.0 down the tone scale, indicates a considerably charged case. Minimal physical discomfort in an incident, if the restimulative agents in the environment are high, can produce moments when the preclear was alert and awake which then refuse to reduce when addressed by the auditor.

The 1.5 is peculiarly susceptible to the type of lock which breaks the dramatization. Let us say that the 1.5 is being angry against something, and someone criticizes him for being angry or prevents him from carrying out the full cycle of his anger. A lock results which will be remarkably effective in reducing this person on the tone scale. Of course, any 1.5 receives a nearly countless number of such incidents, since the society generally frowns upon people being angry and would rather have them apathetic. On a 1.5 an auditor can run these broken dramatizations with benefit as individual incidents just as though they were engrams.

At 1.1, we begin to find locks extremely effective, particularly when they concern breaks of affinity, breaks of communication, and breaks of reality, or enforcements of ARC. The 1.1 lives in fear most of the time, fear of something, if only a nebulous anxiety. The remark of a 1.1's friend which leads the 1.1 to believe that he will not immediately see his friend again may produce a lock even though the 1.1 that very evening may dine with his friend. Here the enttheta is beginning to pile up at a very rapid rate. The auditor can run such incidents just as though they were engrams with some benefit to the case.

At 0.5, we begin to discover that locks must be handled gingerly, for locks in a 0.5 can be heavy enough to cause the preclear to hang up on the track, except of course in the wide-open case, which runs on the track even when completely insane. In the apathy case the loss of a glove or the mere receipt of a letter even though it is good news can cause a lock which has to be run as an engram by the auditor. A heavy lock where something really happens would be much too strong in enttheta for the preclear to attack, and the auditor should avoid incidents which would be productive of aberration at the 1.5 or even the 1.1 level. The 0.5 can be aberrated by a sneeze.

The 0.1, if the auditor can contact this individual, is so low in theta that incidents which would be pleasure moments to anyone else are the strongest and heaviest encystments which can be attacked. The only past moment which can be attacked in a 0.1 is an instance of the mildest variety, such as going for a ride in a car, or eating supper. Any incident of mental stress is to be avoided and any incident of physical stress is, of course, entirely out of the question, as it has been from 1.1 down the tone scale.

CHAPTER ELEVEN

COLUMN AG

Scanning Locks

The advent of lock scanning was the greatest single advance in techniques of application in Dianetics in the last six months of 1950.

Lock scanning was developed in an effort to convert the maximum amount of entheta into theta in the least possible time. It is a remarkable technique. It was discovered that individuals who were thoroughly stuck on the time track and heavily over-charged could send a few attention units earlier and later than the point where they were stuck and could in such a fashion actually emerge from a chronically fixed spot on the time track, and so come to present time.

The value of lock scanning can hardly be overestimated. The heavily occluded case can be lock-scanned. Auditing, bad and good, can be removed from a case by lock scanning. Invalidations of Dianetics, which reduce the preclear's ability to be processed, can be removed from the case. ARC locks in enormous quantity can be de-intensified. It is a technique with which the preclear can be moved swiftly up the tone scale. Lock scanning can produce sufficient change in a case to move the case two points on the scale in a single session. A case which has been audited inexpertly can be set to rights and boosted up the tone scale by lock scanning. Some cases on which many engrams have been run may yet not have risen on the tone scale, because the entheta of the processing has enturbulated present time and has created new locks. Lock scanning remedies this. With two to four hours of lock scanning these cases will rebound swiftly and attain a new level of activity.

The technique of lock scanning is a very simple one. All aberrative incidents are in types in series of a similar nature. All affinity breaks by a certain person on a case could be considered a chain. All affinity breaks by anyone in any environ at any time could be considered a very broad consecutive chain in the preclear's life. All affinity enforcements by a single person on the preclear could be considered a brief chain. And all affinity enforcements by all people could be considered a broad chain. Communication, talking, listening, seeing, not seeing, and all other perceptics, enforced and inhibited, make up their own chains. Reality enforcements and inhibitions make up their own chains of agreements and disagreements. The auditor can actually draw up a chart on which all possible chains of locks can be shown, in terms of affinity, reality, communication, and broken dramatizations.

Engrams also exist in chains, as will be covered later. The engram or chain of engrams provides the basic upon which locks can be accumulated. Hundreds and hundreds of incidents may be derived from an engram or chain of engrams. To run each one of these incidents as itself would require far too much time on the part of the auditor. But the preclear can readily be brought by the auditor to scan, slowly or rapidly, similar types of incidents, from the earliest to the latest, either with regard to one person or with regard to all persons or with regard to a period of time.

The commands necessary to permit the preclear to lock-scan are very simple. These can be made far more complex, since speeds of scanning can be demanded of the preclear. It is discovered, however, that the preclear will normally scan at his own speed. The auditor asks the file clerk if there is a type of incident which can be scanned in the case. The file clerk, at a snap of the auditor's fingers, answers yes or no. The auditor requests the name of the type of incident. The file clerk gives the name of the type of incident. The auditor then tells the preclear to go to the earliest available moment on this chain of locks and again asks the file clerk a question, as to whether or not this chain can be scanned without running through any engrams. Assured that it can be, the auditor tells the preclear to scan from this earliest moment to present time through all incidents of the type named. The auditor makes a drill of this, and

never varies his procedure. He sends the preclear back to his starting line, the earliest available lock of this type. He makes certain the preclear is there by asking "Are you there?" When the preclear assents, the auditor then says "Through this chain of incidents, avoiding all physical pain, begin scanning" (snap !). The final command, telling the preclear to begin scanning, is like the starter's gun. Slowly or rapidly, the preclear goes up through these various similar incidents. These incidents may consist of all the times when anybody stopped or interrupted him when he wanted to talk. Or they may consist of the times that a certain person, such as the preclear's mother or wife, demanded affection. But whatever the type of incident, the auditor must adopt a routine and not vary this routine. The auditor should always tell the preclear when to begin scanning. The preclear should not be encouraged to go to the earliest moment he can discover and then start forward without any further signal. The preclear should report to the auditor when he has reached the earliest available moment, if he is able to know this. And the auditor should instruct the preclear to report when he arrives at present time, so that no time will be wasted.

Scanning can be done either vocally or non-vocally. The preclear can give the auditor, each time he touches a new incident, the most aberrative phrase of that incident. This would be vocal scanning. Or the preclear can simply go through the incidents recognizing each one as he passes it, or racing through them so fast that they are merely a blur, without telling the auditor what he is contacting.

It will be discovered that the preclear ordinarily finds the most recent locks in his case the first which can be scanned. As he begins to scan chains of locks off his case, he will begin to find earlier and earlier chains of locks and portions of chains which he can scan. He should be encouraged to discover earlier and earlier moments in his life.

Any time a preclear starts to scan a chain of locks, he can be expected on the second or third time through to find earlier incidents of the same type which he previously missed. This is symptomatic of more and more theta being available to the case, so that earlier and earlier moments can be reached. The auditor should not bully the preclear, however. If the preclear cannot discover an earlier incident after the auditor has requested one, the auditor should not be insistent.

Any chain is scanned many times. It will be discovered that at first there are only one or two incidents on the chain. Further scanning brings forward five or ten incidents on the chain. Then the old incidents begin to drop out as unimportant and new incidents, hitherto unrecalled, begin to appear. The chain is, ordinarily, short during the first scan, then it appears to lengthen, and finally the preclear either becomes interested in his outside environment or in another chain or the chain becomes so short that it takes him only a moment to scan through many years of his life. The mechanism of scanning is this. One contacts an incident and recognizes it as a concept of an incident. Perhaps one has a phrase in the first incident. The auditor may ask the preclear to repeat that phrase or not, as the auditor desires. The preclear then goes forward from this incident to the next one of a similar type that he can recognize. The mind is intensely selective of types of incidents it can scan. It seems that there is a filing system in the mind which files according to topic. This is what is used in lock scanning.

If one wishes to be precise about lock scanning, there is vocal rate, in which the preclear scans pausing at each new lock up the chain only long enough to give the most aberrative phrase out of it. There is non-vocal scanning, in which the preclear recognizes the phrases as he goes by them, incident to incident, from early to late, but does not tell the auditor what phrases he is contacting. There is accelerated rate, which is merely a rapid glance at the incident, before the preclear goes on to the next, and in which the auditor is not told what the individual incidents are. And then there is maximum speed. Maximum speed can be so fast that the incidents are simply a blur. The preclear has no analytical recognition of what is happening beyond differences of position, flashes of faces and flashes of words.

Lock scanning frees theta from innumerable incidents and is highly instrumental in raising the tone of the preclear. It should not be confused with the chain scanning of engrams.

Chain scanning through moments of physical pain is not desirable in cases below 3.5 on the tone scale, since the engrams, by their physical pain, will snatch more free theta back into enturbulence than will be freed.

Theoretically, a case can be lock-scanned to a point where practically no aberration is manifested, but this is only theoretical, since only one of four types of entheta is being converted. The four types, of course, are entheta received because of the present-time environment, entheta encysted in the form of locks, entheta existing as charge in engrams, and entheta existing as engrams themselves.

The type of entheta which exists as charge in locks and in secondaries frees from late to early. Engrams run from early to late. Thus, one begins lock scanning very late in the case. One may find it necessary to scan out a marriage or a business relationship which exists near to present time before one can continue with anything else in the case.

It does not much matter to the auditor whether or not the preclear is in valence -- inside himself -- when he scans through these chains of locks. Lock scanning is a broad, sloppy technique. The preclear can be out of valence; he can scan imaginary incidents; he can scan concepts; he can scan even his own conclusions about life. He can scan anything from which entheta can be freed.

In order to get rid of the entheta on an education there is nothing that compares with lock scanning. One can also do this trick with lock scanning: he can refresh an education. An individual can be given an examination in, let us say, history, eighth grade. He can then be lock-scanned through the actual study of history in the eighth grade and given another examination. It will ordinarily be found that he will receive a higher grade after he has been lock-scanned through that educational period. And yet the lock scanning may not have required more than fifteen or twenty minutes. In this wise, lock-scanning is an excellent trick for those about to take an examination on academic subjects.

People can lock-scan themselves with considerable ease, unless they are too low on the tone scale. They merely start at the earliest incident they can remember of a certain kind which may be troubling them and come forward through all similar incidents to present time. They do this over and over until they become interested in their present-time environment. The time to stop lock-scanning of any particular chain of locks is when the preclear is extroverted, which is to say interested in his present-time environment, or when the chain requires only an instant or two to scan. It can happen that a preclear is scanned through a chain of locks beyond the point when scanning this particular chain of locks should be stopped. The auditor will then find himself with a preclear who is running another set of locks. There is nothing particularly bad in this, but the auditor has lost control of the case for a moment. The auditor should, then, be alert as to how long it takes the preclear to scan each chain, and as to how the preclear feels each time he finishes scanning the chain, and he should ask questions about these points. Lock scanning is a highly unstimulative type of technique to the auditor. The preclear, unless he is running at vocal rate, is not uttering restimulative phrases, and he can go from early to late and pass through the most amazing array of incidents without the auditor's being aware of what is going on. Therefore, the auditor does not become restimulated. It happens, however, that an auditor running locks in chains on a preclear can become somewhat bored. He should not, no matter how much he would like to relieve his tedium, interrupt the preclear in any way until the preclear has finished scanning the chain. Each time, the auditor should let the preclear sweep forward to present time. As in any other case, the auditor should always check the preclear to find out if he is in present time at the end of each scan, unless the preclear is scanning a period of time which does not include present time.

One can scan locks in terms of time, let us say from the fifth to the tenth year of the preclear's life, or from the twentieth to the twenty-fifth year, or from the thirtieth to the forty-first year. Or he can scan between specific dates. Scanning can be done on one person on one subject. Scanning can be done on one type of activity. Scanning can be done on education or early training. Scanning can be done on the immediate environment of the preclear.

Lock scanning of auditing is a highly valuable procedure. The auditor, in every session, if his preclear can scan at all, should scan off all of the auditing. This is to say, send the preclear back to the moment when the session began and have him scan forward to present time. It does not, then, much matter how many engrams the preclear has restimulated or what has happened during the session; the preclear by scanning can de-stimulate the incidents which rise. The failure to reduce an engram was much more serious in the past than it is at this time. Lock scanning makes it possible to run the session in which the engram was restimulated. The restimulation of an engram without reducing it is merely the creation of a new lock. Lock scanning reduces this new lock. The auditor should never be critical of how carelessly the preclear may be scanning. Lock scanning is broad enough to include such proclivities.

Looking over the tone scale one discovers first that any 3.5 when he has had his engrams run out in their entirety has to be lock-scanned through all activities of life in order to qualify as a clear. This frees up all locks. Locks, of course, at this level of the tone scale are very easy to free, since they have few engrams underlying them. In the near-clear, they have no engrams underlying them, but locks can still exist on a case which has been cleared of engrams. Although these locks may work out in the next many months after the last engram is run, it is far easier to sit down to a systematic scanning of all the persons and circumstances of the preclear's past life.

The 3.0 can be lock-scanned with great profit and will scan through locks without hanging up in any of them. In this way, new series of engrams can be bared to view. The only reason engrams cannot be run is because too many locks exist on top of them, and lock scanning is the best method of getting off this enttheta in order to make the engram itself available.

The 2.5 has to be lock-scanned in order to get engrams to show up clearly. After lock scanning has taken place, an engram can be expected to come into view with all of the necessary perceptics. Lock scanning tunes up the 2.5 to a point where engrams can be cleanly run. In order to discover new engrams in the 2.5, new chains of locks should be scanned.

The 2.0 can be lock scanned, but the auditor should work with chains of locks given by the file clerk. Every chain which is contacted by the auditor on the 2.0 should be reduced, just as one would reduce engrams that were contacted. No chain should be left in restimulation at this level but should be run completely. If the session is too short for this, scanning of the session will probably cause the restimulation to fade out.

From 2.0 on down, lock scanning begins to develop a brief liability, but not a lessened workability. The preclear is apt, after he scans a certain chain of locks a few times, to hang up in one of the locks or to hang up in some minor secondary. It is then necessary to run whatever incident the preclear finds himself hung up in as an engram in itself although it may contain no physical pain.

The 1.5 will, as a common result of lock scanning, hang up in a lock. The auditor starts scanning locks and after a short time finds that the 1.5 is not moving on the track. He should always admonish the 1.5 to inform him when he stops on the track or when he appears to cease moving on the track. Otherwise, the 1.5 is likely to flounder around, wondering why he is not going forward to present time but not saying anything and so many minutes of auditing are wasted, until the auditor recognizes that something is wrong and does something about it. If the 1.5 hangs up in a lock and the auditor by running this lock as an engram cannot reduce it, then it is only necessary to start the 1.5 scanning another set of locks (gotten from the file clerk, of course). By scanning the new set, he drops out of the engram or lock in which he was stuck. This is the peculiar virtue of lock scanning. If one cannot reduce the engram or secondary or lock in which the preclear may hang up, it is only necessary to cause the preclear to scan a new chain of locks in order to release the preclear on the track. This as a mechanism which must be stressed, for it is very important. Whenever a preclear hangs up in a lock, and by running the lock just as though it were an engram the auditor finds that it will not

immediately reduce, all the auditor need do is consult the file clerk to discover another chain of locks which the preclear can scan or discover an earlier incident of the same type in which the preclear is locked up. Scanning the new set of incidents or contacting the earlier incident by straight memory will cause the preclear to become free on the track.

Below 1.5, a new mechanism is introduced into lock scanning. Actually, this is a combination mechanism.

At 1.1, or for that matter from 2.0 down, lock scanning can be combined with straight memory. By straight memory, a certain type of incident which is found to be aberrative in the preclear may be contacted. When this type of incident is contacted the auditor need not necessarily leave it at that but may direct the preclear to go back to that incident which was discovered and scan through all similar incidents. Very shortly, earlier incidents of the same type will show up, and so an enormous number of such incidents can be taken off the case. Lock scanning can actually be called a high speed straight wire. Straight memory combined with lock scanning can isolate certain circuit commands or domination commands or "control yourself" command which would remain hidden under ordinary lock scanning procedures.

The 1.1 can be expected to hang up in some lock after the auditor has started him scanning. The auditor, then, scans locks on the 1.1 in the full expectation that he will shortly find the 1.1 not moving on the track. Indeed, that 1.1, unless a wide-open case, will commonly or chronically be stuck on the track, as will be also a 1.5. Lock scanning brings into view, however, heavier locks. Entheta is converted to theta until the heavier lock will show up. The heavier lock, of course, was no less effective when hidden. Lock scanning bares it to view. The auditor then runs this new incident in which the preclear has stuck in order to free him, or failing to free him, finds another chain which can be scanned in order to free him. The scanning of a new chain to free the preclear from a point on the track where he is stuck can be overcomplicated by the auditor. Actually, it is only necessary to direct the preclear's attention to a new subject or to ask the file clerk for a new subject. The preclear might get so thoroughly involved with the lock in which he sticks that it would not occur to him that he could scan any other subject at the moment. It is up to the auditor to realize this and to direct the preclear's attention to another type of incident. Scanning the new type of incident, the preclear may free up from the incident in which he was stuck but hang up in a new lock. The auditor tries to reduce this lock as though it were an engram and failing that he goes on to a third type of chain.

The 0.5 cannot be lock scanned, with profit, since the 0.5 will inevitably hang up too thoroughly. But if the auditor does make the mistake of scanning a 0.5 through locks, he must remember that it is only necessary to use straight memory to free the 0.5.

The 0.1 should never be scanned through any locks.

One of the ways of freeing an individual who is being lock-scanned out of an engram or lock in which he has suddenly hung up is to give him straight memory. Straight memory acts as stilts by which he can be brought up again to present time. The scanning of locks can be combined with the running of single locks and with straight memory, with great facility. An individual who is stuck somewhere on the time track can be given straight memory or new chains of locks to scan.

The scanning of pleasure moments should not be overlooked as a valid technique for raising the tone of a preclear. When a preclear is particularly low, at the beginning of a session, or at the end of one if the auditor has made some mistake, it is necessary to raise his tone. Scanning of pleasure moments will very often permit enough free theta to come into existence either to make new incidents available or to end the session successfully.

It should be admonished again that when one scans locks one should work as closely as possible with the file clerk, consulting the file clerk as to what chain of locks should next be scanned on the case and then following as nearly as possible the file clerk's directions. In the absence of file clerk directions the auditor should use his own judgment or talk the subject over

with the preclear. It will very often happen in the process of lock scanning that the preclear goes into a boil-off. It should be remembered that boil-offs are highly beneficial and should not be interrupted for any cause whatsoever. When the preclear comes out of the boil-off, the auditor should ask him for the phrase which put him into the boil-off and should ask the preclear to repeat that phrase again. The preclear, repeating this phrase out loud or to himself several times, will ordinarily then go back into the boil-off. Boil-offs should be exhausted completely. They are a condition of somnolence which is sometimes indistinguishable from sleep, and a preclear should not be disturbed while he is in one. The removal of boil-off from a case is the removal of accumulated anaten, and is highly beneficial. Some cases can do nothing but boil-off.

The individual can lock-scan himself if he keeps in mind the fact that when he hangs up in a lock somewhere out of present time he must nudge himself into scanning another type of lock rather than trying to fuddle through the place where he is stuck.

It will also happen that the preclear will run into grief charges as a result of scanning locks. It may be that he gets grief on a single phrase. He may not know from what incident this phrase comes. If he is fairly low on the tone scale, he may have no conception whatsoever of what he is crying about, but the release of grief in any event is beneficial. It may occur that the only way the auditor can get grief off a case is by scanning certain chains of locks and then getting grief off a single phrase. An individual who has a chronically restimulated somatic which is giving him sinus trouble or a headache can be scanned out of it without any recognition of what was the source, in engramic terms, of the headache or other malcondition. In such an instance it is mainly beneficial to scan pleasure moments. This will almost always raise the preclear's tone.

The value of lock scanning, it may be repeated, is difficult to over-estimate. The auditor will do a great deal of it on any case. Any case, except the 0.5 and 0.1, will benefit from lock scanning. The auditor may make the serious mistake of believing that because the engram is the basic cause of aberration it is therefore the only thing or the main thing that he should contact. He should disabuse himself of this idea. With the high speed technique of lock scanning he can bring a case up to the point where running engrams will permit the case to proceed to clear. Without taking this charge off the case, he could run engrams for a thousand years and not bring his preclear up to clear. The auditor should use straight memory and lock scanning and the running of secondaries until the case has enough theta to run engrams.

It is possible to run actual engrams on a low-toned preclear session after session without raising his tone. This is because the running of engrams on such a case lays in auditing locks. The theta which is freed from the engram is immediately reenturbulated and the preclear's tone remains the same or sinks because of the enturbulation of more and more free theta in numerous auditing locks. Such a case should be lock-scanned.

The auditor should develop his technique of lock scanning and should be very patient in his use of it. He will find himself at times sitting silently for twenty or thirty minutes while the preclear scans one chain. The auditor should be content to sit there and let the preclear scan, until it becomes apparent to him that the preclear is not moving on the track or is in some difficulty. He should have a complete understanding with the preclear about what they are doing. The preclear should understand that the auditor, working with the preclear's file clerk, is the one who selects the chains of locks to be scanned. The preclear should understand that it is the auditor who starts him scanning, and that the auditor is still in control of the case. By lock scanning, the auditor will get the maximum amount of entheta on the case converted back to free theta, where it belongs.

CHAPTER TWELVE

COLUMN AH

Secondary Engrams

Probably the majority of entheta which accumulates in an individual becomes tied up in secondary engrams. A secondary engram can be defined as a period of anguish brought about by a major loss or a threat of loss to the individual. The secondary engram depends for its strength and force upon physical pain engrams which underlie it. Without a physical pain engram it is apparently impossible for a secondary engram to be formed.

The type of entheta which becomes trapped in a secondary engram is evidently a heavy reverse of polarity of theta. Emotion becomes misemotion. Affinity, reality, and communication components of theta, by the loss or threat of loss to the individual, convert to entheta and thereafter repel the affinity, reality, and communication components which yet remain in a state of theta. An engram is a moment of physical pain, such as an anaesthetic operation, an accident, an illness, or any condition producing unconsciousness. An engram can occur, however, and remain inactive. No engram is active until it is "keyed-in", which is to say until a moment when the environment around the awake but fatigued or distressed individual is itself similar to the dormant engram. At that moment the engram becomes active. It is keyed-in and can thereafter be dramatized. It will effect, by virtue of its commands, the processes of thought of the individual, creating obsessions, compulsions, neuroses, and psychoses below his conscious level. Or the physical pain component can create "psychomatic illnesses," which are in Dianetics more accurately called the "chronic somatics" of engrams.

Physical pain engrams can exist in large numbers on a case without being keyed-in and without being active. The key-in may be only a lock. The key-in and additional locks begin to give the engram more and more entheta, and it becomes more and more powerful in its effect upon the individual. It has to be, in short, "charged up" in order to affect the individual.

The heaviest and most abrupt charge which an engram can receive is a secondary engram. The physical pain in the physical pain engram makes it possible for large amounts of theta to be trapped when that theta is enturbulated by a present-time shock such as the loss or threatened loss of survival factors in the person's life. If the physical pain engram were not there to entrap the temporarily enturbulated theta, the theta, apparently, would simply unenturbulate and the individual would return to a fully rational state. In the presence of the physical engram, which contains some approximation of the loss or threatened loss, when a severe shock of loss or threatened loss occurs the turbulence of the individual is to a large degree trapped and a heavy charge enters the physical pain engram and remains there until dianetic processing removes it or until the theta and MEST of the individual are separated by death. The theta body has been discovered to contain amounts of entheta as secondary engrams, but the charges are not as heavy as those of the current life, according to observation.

A physical pain engram, once it has been charged up by secondary engrams, becomes inaccessible to the analyzer to such an extent that the individual trying to address this engram or series of engrams cannot, with the free theta available to him, penetrate the core of the physical pain. Hallucinatory impressions of the engram may occur. The engram may be run almost as a dream sequence. The somatics are light or non-existent. Content is markedly altered. The position of the engram on the time track may be seriously occluded. In short, the existence of secondary engrams above primary engrams makes it impossible for an individual to run physical pain off his case. A few minor secondary engrams on a case may only dull the sharpness of the perceptics, but the usual case has many heavy secondary engrams on it. The seriously occluded case is occluded because of the existence of secondary engrams.

The demarcation line between theta and entheta is 2.0 on the tone scale. The present time environment of the individual varies on the tone scale, just as the individual, from period to period in his life, may vary, although in the absence of processing the individual's course is a gradual decline. One could take any environment and judge its position on the tone scale. In other words, the individual can be located on the tone scale for his chronic position, or for a momentary position. A group can be located on the tone scale, for its chronic or temporary state. And the present-time environment can be located on the tone scale.

Today one's environment might be happy. This environment would assist one's tone, pulling one slightly up the tone scale. Or when the environment is very happy it has the occasional result of making the individual's activities and conduct momentarily those of a 4.0, even if he is ordinarily considerably aberrated. But where a 4.0 would have a resilience and would respond only partially to a present-time environment, a thoroughly aberrated person is almost a slave to the environment, and the lower the individual is on the tone scale the more seriously he is affected by low-tone environments. Thus the 1.1 might act like a 2.0 in a very happy and secure environment, but in an even slightly enturbulated environment the 1.1 might act momentarily like a 0.8.

Good news, sudden successes, the envisionment or attainment of new components of survival make for a pleasant and happy environment. This would be an environment above 2.0 on the tone scale, the tone of the environment rising in direct ratio to the potentiality of the environment for the survival of those in it. When an idea, a datum, a circumstance, a person, or the general environment is conducive to the survival of the person in question, it can be said to be on a tone scale level above 2.0.

Environmental circumstances which lie below 2.0 on the tone scale are entheta circumstances and are enturbulative to the individual. Ideas, news, associations, persons, or the general environment, in the band from anger down to pretended death restimulate the individual's existing entheta and enturbulate more of the free theta of the individual and so bring about a reduction of the individual on the tone scale. These are non-survival factors, factors which tend toward the death of the individual or the group, even though the tendency may not be in terms of actual death.

It should also be recognized in viewing this and in understanding secondary engrams that when one looks at the tone scale one is looking at both pitch and volume. In music, a note may be anywhere on the musical scale and yet not be loud. This would be a note of a certain pitch but small volume. A note can be of a certain pitch with a great deal of volume. Further, the note by harmonics and overtones may have timbre, or quality.

It is much the same on the tone scale of human reaction and behavior. The position on the tone scale of a momentary circumstance or of a chronic state tells us only the "pitch" of the individual's or the group's or the environment's tone. Volume is the second factor which must be studied in considering the tone scale. An individual may be bored but not, as the saying is, "to any degree." He is bored only a minor amount. He may at another time be bored a major amount. In the lower tones, he may be afraid, but only slightly afraid. Or he may be so greatly afraid that the fear is terror. The amount or volume of enturbulence might be read in another dimension, extending from the face of the chart out toward its peruser. There might be a little bit of grief or a great deal of grief but the position on the tone scale would be the same.

There is also the matter of quality of enturbulence. The quality of the fear or the anger or the quality of the happiness is important. But this would be a factor which would be different from pitch or volume on the tone scale.

The amount of free theta with which an individual is endowed is enormously important. The amount of free theta has a great deal to do with the persistence or reasoning force of the individual along any course. This would be the volume of a person. The quality of a person would be more a structural thing. To make this clearer, a person may have an enormous volume of endowed theta, and yet not have the structure with which to be intelligent. Or he

may have a quality index which is very high and yet not have sufficient endowment of theta to execute the plans which he can conceive. We have all known the individual who received A's in every course and yet who was never able to do anything with his education. And we have known the individual who received nothing in the way of grades and who, indeed, never seemed even to comprehend elementary subjects, and yet who, by power of personality, forged ahead to a high position in life. A study of this matter gives a useful evaluation of human potentiality and behavior. More importantly, it gives some understanding of what happens to the individual in the process of becoming aberrated. Aberration, considered as pitch or tone, is theoretically independent of quality (structure, probably) and volume (theta endowment). The factors of quality and volume would account in part for the individual differences which may be found in aberrated persons at similar levels of the tone scale.

Physical pain engrams are the major ARC break between theta and MEST. By our dianetic theory, theta and MEST have a certain native affinity for each other, but when the collision or impact of one against the other is too great or too sudden, a reversal of polarity takes place, and this affinity is changed to a lower-level manifestation. Theta and MEST coming together at 4.0 would be in complete harmony with each other. A working organism would result wherein the chemicals and compounds in space and time, running on MEST energy, would be motivated and animated by the ideas and experience of theta energy, and a high level of survival would be postulated. Given a little physical pain, however, a slight drop on the tone scale occurs, since the theta and MEST have lost some affinity for each other, are not in such good communication with each other, and thus cannot attain such harmonious agreement, or reality, as to their purposes. It is a mission of MEST to survive or succumb. It is a mission of theta to survive or succumb. The purposes have parallels between theta and MEST. When theta and MEST are in union on an harmonious level, one could say that the ARC of theta forms a nearly perfect and resonant chord with MEST. When physical pain occurs a slight amount of dissonance results. This dissonance is insufficient to cause a separation of theta and MEST, until 2.0 on the tone scale is reached. After this, the dissonance is so great that theta is antagonistic to MEST but still operating. At 1.5, an active and violent discord exists to separate the theta from the MEST. Lower, the dissonance grows wider. By the time 0.5 is reached a near null of dissonance has been descended to, which makes the theta almost inactive with MEST. At 0.1, this null has become so wide that the two are not existing together at all. and at 0.0, death is reached for the organism.

There is the overall life of the organism, which could be said to be the theta body. Then there is somatic life, or the life of cells. The life of cells persists below organism death, but as the basic organism life and the MEST have mutually rejected each other, somatic life, unless assisted by other organisms, as in the experiments of Alexis Carrel, dies away within the next few minutes or months, thus producing complete organism death and leaving in its place the MEST compounds which have been organized by the theta and which are themselves a sort of evolution of MEST.

It is at 2.0 (and the tone scale is somewhat arbitrary, though based on observation and workable) that loss of life has set in. Separation of theta from MEST is necessary, in the absence of processing, for the chronically enturbulated individual or group, from 2.0 down. Momentary enturbulation because of environmental circumstances brings about the same intention. This intention, when manifested as anger, is not immediately observable. But anger is destruction and death. From there on down, loss becomes more and more likely.

There is a direct parallel on the tone scale between the position of the individual, the condition of the theta, and the way MEST is handled by theta. At 4.0, theta is handling MEST with great adequacy. At 3.5, there is a little less certainty on theta's part in handling MEST. At 3.0, theta has, through learning it can lose MEST, become conservative in its handling of MEST. At 2.5, theta is handling MEST in a relatively lackadaisical fashion, since it is not well convinced that it can continue to do so. At 2.0, theta is unable to handle MEST adequately enough and so begins to reject MEST and to attempt to eject itself from MEST. At 1.5, theta is determined to reject MEST and to eject itself from MEST, but its determination is still directed at all the MEST surrounding it, and not so much at the organism in which it is contained. It is

attempting at this level to eject the organism from the environment by destroying the environment. At 1.1, the stratum of fear has been entered. The theta in the organism has to be very careful how it destroys the area around it, but the ejection of itself from the organism and the rejection of the environment is none the less certain. Here the organism has accepted the fact that the theta and MEST will separate and that the environment contains no survival factors but only non-survival factors. At 0.1, death has been accepted by the organism as a condition of a death environment.

A study of this demonstrates an evident third factor in the theta - MEST theory. The organism itself has an intention of survival, possibly, even when the theta and MEST composing the organism have determined to separate. Much theory can be postulated concerning this. What is interesting to us in processing is that below 2.0 the theta intention is toward separation from MEST, either the separation of the organism from MEST by the destruction of the environment, or the destruction of the organism itself. Theta has many choices in the way this can be accomplished.

Survival is often obtained by an organism through the agency of another organism. As the mistletoe lives upon the life of an oak, so may an individual exist by virtue of a powerful ally. Any child has, in his parents, allies which assist his survival. The child, if these parents materially assist his survival and yet deny him his self-determinism, begins to live almost as though he were the parents. The theta of the child becomes invested, one might say, in the theta of the parents.

It might be said that the theta of an individual, when it is suppressed from the control of its own organism, can commingle with the theta of other organisms. This is an unexplored observation. But this much is certain, that the theta of any individual may identify itself with the theta of the individuals around to such a degree that the death or even the illness of the surrounding individuals, one or more, may cause the same reduction on the tone scale of the dependent individual. This could be worked out on the basis of restimulation in the environment, but it seems to have deeper significance than that. The auditor will often find his preclear so thoroughly associated with another individual who is dead that his preclear upon going into a session may cross his hands upon his chest as though he were a corpse. Investigation of the situation demonstrates that this preclear has lost a powerful ally, such as his mother, grandmother, father, grandfather, or guardian, and that the preclear is stopped on the time track at the moment of death of this ally. This preclear's theta has become so thoroughly associated with the theta of another that when the other person died the preclear to all intents and purposes died himself but continued to live as an organism, though thoroughly interrupted as an identity.

This confusion of identities between one person and another is severely aberrative. By straight memory technique an auditor can begin to separate identities out of his preclear, discovering in the preclear habits and patterns of thought and action, and finding who in the past had these patterns of thought and action. The preclear may identify the person to whom these habits and actions really belonged and thus to that degree regain his own personal identity.

Personal identity is very important. It is a parallel to self-determinism. When the individual's identity has been absorbed to a great degree in the personality of another person, another way of saying the commingling of theta, a loss of personality ensues with a consequent reduction of analytical dynamic and ability to reason. It is very important for the auditor to cause the separation of these identities.

The secondary engram may consist of any misemotion from 2.0 down the scale. First, there is antagonism because of a threat of loss of survival components to the individual. Then there is anger toward the sources that threaten loss. Then there is fear that loss will occur, either loss of one's own life or loss of one's allies. Then there is the level of the accomplished fact of loss, whether of position, of persons, or of things. This is the level of grief. Next, there is the level where loss is not only accomplished but the individual thinks because of this

loss that he himself and all around him are lost. This is apathy. Finally, the loss is so thoroughly accepted that the environment and everything in it are renounced and life itself is renounced as lost. This is pretended death, only a decimal above actual death.

Here we have the dwindling spiral. All locks actually lie below 2.0 on the tone scale if they are themselves aberrative. These are the minor threats to survival, the introduction into the life of the individual of minor components which threaten his existence. There are many of these. They are of small volume, such as momentary incidents of fear and losses of small possessions. Other person's losses may form locks.

The secondary engram is a large volume affair. In the secondary engram one has, at 2.0, antagonisms felt because of major losses which are threatened. At 1.5, one has the anger because of a threatened major loss. At 1.1, one has the fear that a major loss will occur. At 0.5, one has the grief because a major loss has occurred, and an apathy resulting because of the apparent inability to recover what has been lost. At 0.1, we have such a magnitude of losses that life is unsupportable and the entire environment seems to the individual to have collapsed and become dead itself.

The secondary engram can, then, consist of a major antagonism, a major anger, a major fear amounting to terror, a major grief or a major apathy, or a major concept of nothing but death. Here we have a gradient scale of major threats of losses, losses, and results of losses. A child has many momentary or fleeting moments of fear or grief because of lack of data. Very little of this enturbulence is of lasting consequence, which is to say that it does not become trapped because the child has few engrams in restimulation, ordinarily. However, in the processing of children, one can run off many fear and grief incidents, since there is some residual lag in the enturbulence. The very major secondaries in an adult are normally quite few, but these consist of such violent impacts from the environment in terms of loss or threats of loss that, engrams being already restimulated, great quantities of theta are enturbulated and encysted in the form of secondary engrams.

The running of a secondary and its complete exhaustion from the case is of enormous importance. There are those who knowing that every secondary engram exists only by virtue of the physical pain engram which underlies it and who themselves are afraid of grief hopefully attempt to audit individuals by avoiding secondary engrams and attempting to run the physical pain engrams instead. The physical pain engrams, bluntly, will not exhaust unless the grief is run first.

The secondary engram is reduced by the physiological discharge of tears or possibly some other bodily fluids. Grief seems to be reducible only in terms of tears. Fear or terror, inelegantly seems to be reducible in terms of urine, sweat, and other bodily excretion. Anger seems to be reducible by certain physical excretion. Apathy is reducible simply by running the feeling of apathy, and this is accomplished by certain physiological symptoms.

A secondary engram is run exactly as one would run an engram. One starts at the earliest moment of the secondary that one can discover and proceeds, picking up all perceptics, to the end of the incident. One then goes back to the beginning and re-experiences it again. The auditor continues to have the preclear re-experience the incident until the preclear, with regard to this secondary engram, is at a high position on the tone scale. If the secondary engram is one of anger, the preclear will readily come up through boredom and commonly to false four. If it is fear, the preclear will come up through anger, boredom, and again to false four. If it is an apathy secondary it will proceed first through apathy, which is very hard going, then through grief then through fear, then through anger, then through boredom and to false four.

A pretended death engram is a much deeper apathy and much more difficult to run. Much theta must be accumulated from other portions of the case before a pretended death engram can be run. The auditor should never make the error of thinking that the concept is the engram. He should do his best to coax the preclear into every single perceptic as a secondary

or any other engram is run off. However, at the beginning of running a secondary only the vaguest concept of it or only some

It is worthy of notice that another column could have been added to this chart, which already contains so many columns. This would be the column of body odor. The body is normally sweet-smelling down to 2.0 but begins to exude chronically certain unpleasant effluvia from 2.0 down. Individuals from 2.0 down commonly have bad breath. Their feet may have a considerable odor. The musk glands are very active. The sweat has a peculiar smell. Sexual organs emit a repelling odor. And various body exhaust functions are not under very good control. The person may have to urinate or defecate under slight stresses or may weep easily for no apparent cause. This column has not been added to this chart because it has not been thoroughly explored but is only known in a general way. Any slightly or greatly repulsive physical odor from an individual does, however, indicate a tone scale position below 2.0. It is amusing to note that in the Orient wives are commonly selected by the sweetness of their perspiration. This is apparently a very reliable test for position on the tone scale. People who have bad breath as they are processed lose it when they are above 2.0 on the tone scale. People who are even temporarily suppressed below 2.0 commonly have bad breath. A small phrase out of it may be available. The auditor by causing the preclear to repeat this many times may be able to get more of the engram and so work it out until it lies there in its entirety and can be re-experienced, at which time the preclear will come up the tone scale.

Getting any misemotion off a case is beneficial to the case. It may be possible only to work out a secondary engram partly. But the auditor should never make the mistake of permitting a preclear to leave a secondary engram before it is exhausted of all possible misemotion. Every secondary should be brought as high up the tone scale as possible. The auditor, further, should not make the mistake of abandoning the engram at the point of antagonism. Occasionally the preclear, on recounting this experience all the way through with all possible perceptives, will get to the point where he is flippant about the circumstance. This flippancy is nearly always rendered in phrases which still remain in the secondary or the engram. The auditor may find a bit of resistance from the preclear at the antagonism level, but he will do well to continue running the engram. It will then come up to boredom. The preclear has to be persuaded to go through it again. He will ordinarily state that he is bored with it. This is not good enough. Further recounting is necessary to bring it up to the desirable tone level.

It must be remembered as it will not be remarked again, that misemotion is part of every physical pain engram. The misemotion will rise up the scale out of an engram just as it will rise up the scale out of a secondary.

Do not neglect the secondary engram's importance to the case. For example the newly-made widow of a very successful man one week after his burial had become physically ill, wore weeds, looked some ten years older, and could not face any portion of existence. An auditor worked with her for nine hours and ran out her husband's death completely. At the end of this time she looked younger than she had looked for some years, was able to dress and to meet life with considerable aplomb. The change was so remarkable after this nine hours of processing that one would not have been able to recognize her as the same woman who had entered the session under the duress of this secondary. A Minnesota Multiphasic test given to some individuals before and after the running only of secondary engrams showed these individuals, before the secondaries were run and discharged, to lie above the severely aberrated line, and after the secondaries had been run and discharged, to be well within the normal range. There is nothing more spectacular in the rise of a case on the tone scale than that which takes place after the discharging of one or more secondary engrams. This is particularly true of grief engrams, but others also produce beneficial effects. The reason for this seems to be that though it is the physical pain engram which makes possible secondary engrams and locks, it is the secondaries which entrap the majority of the theta on the case and keep it as enttheta in an encysted condition.

The auditor should pay very particular attention to his own attitude when he is attempting to run a secondary engram on the preclear. The present social order has a considerable compunction against crying or showing fear and a general inhibition of displays of misemotion and emotion. When these inhibitions lie in the form of circuits, as will be covered later, it is difficult to get the secondary engram to exhaust. However, if the auditor is demonstrating a high level of ARC, if he seems sympathetic, his work will be made much easier. The preclear cannot run secondary engrams in the presence of an auditor for whom he has antagonisms. The auditor, thus, must be compatible with the preclear and must have been cleared with the preclear as a group of two, if he expects to run any secondary engrams on this preclear.

The file clerk and somatic strip, as will be covered in the running of engrams, are not particularly reliable in the presence of secondary engrams. Here we have enormous quantities of entheta, and so theta entities such as the somatic strip and file clerk have difficulty approaching such areas. However, the recovery and conversion of considerable entheta from locks will bring the case up the tone scale to a point where the analytical mind will have enough free theta to attack the secondaries.

The primary reason why an individual is severely aberrated is, of course, secondary engrams. If the individual is well down the tone scale, one can assume as a matter of course that he has a large number of heavy secondary engrams, whether the individual is able to run these secondaries or not, for here we have the main deposits of entheta on a case.

Certain auditors, because of their sympathy and their ability to develop a high ARC with the preclear, become experts in the running of secondary engrams. Anyone to whom people will tell their troubles will be able to run secondary engrams. The process of running a secondary engram does not differ from running a physical pain engram. This is very important. The secondary engram is called secondary because it depends upon an earlier physical pain engram to exist, being itself occasioned by a conscious moment of loss. It is called an engram in order to focus the attention of the auditor on the fact that it must be run as an engram and that all perceptics possible must be exhausted from it. It occasionally will occur that after lock-scanning a preclear over a certain chain of locks, the auditor will suddenly find that the preclear is in a secondary engram. Perhaps some phrase will suggest itself, and the individual will cry or show fear. The auditor should cause this phrase to be repeated over and over. Perhaps neither the auditor nor the preclear knows the source of this phrase, but the exhaustion of it by itself may, in a heavily occluded case, bring about a considerable rise, if momentary, on the tone scale. It may occur that after lock scanning a whole secondary will lie ready to be run. The auditor should then run it.

The existence of circuits on a case, which is to say the existence of suppressors to secondary engrams or to any other entheta should not be exaggerated in importance. Scanning of locks and straight memory can either locate the locks of the circuit, or the circuit to some extent may be ignored. The circuit is a favorite alibi of the auditor. Nearly everyone who is low on the tone scale has been suppressed by the dominations or nullifications of persons or the environment. It must be remembered that the circuit derives from the engram and is charged up by entheta. The entheta can be to some degree converted into theta thus nullifying the circuit without discovering the engram in which this particular circuit is contained.

Secondary engrams or at least phrases from them can be discharged from any case, no matter how occluded. It is simply a matter of recovering enough free theta so that the individual has a sufficient quality of free theta to make the exhaustion of secondaries possible. It should be remembered that when a case is overburdened with entheta, light and catfooted methods can still bring to the preclear enough theta so that the entheta can be attacked. A secondary engram, being a very heavy deposit of entheta, will repel theta.

The auditor will occasionally discover a preclear who will run imaginary secondaries, with enormous affect in terms of terror, grief or apathy. He is dealing here with circuits (which will be covered later) which will furnish physical manifestations but will not exhaust engrams.

An individual can have a portion of the analyzer segmented off by charge and under the command of an engram statement to the effect that he must run grief. As a result the individual will manufacture grief incidents. An engramic command such as "You are always afraid and you imagine things to be afraid of" or any of a multitude of approximations, may cause the individual to manufacture and run fear incidents. The reality of such incidents is very low, but the individual will run them and manifest fear.

Unfortunately, these incidents do not produce any alleviation of aberration in the case. This is a manifestation of dub-in. It is very easily distinguished from real incidents, since the preclear hardly ever is able to repeat the same incident in the same way a second time, and since the preclear is anxious to sell the auditor on the idea that the incident is very real, although the auditor has made no suggestion that it might be unreal. The auditor uses as his yardstick the probability of the incident, but he is not particularly worried about one incident. A circuit has the habit of manufacturing the same type of incident over and over and over again but locating it at various points on the time track. The preclear, if he is very low on the tone scale, may himself be unaware of the unreality of this incident. But the auditor, knowing the preclear to be low on the tone scale, suspects the possibility of dub-in when the preclear runs five or ten incidents in which he is tied to a railroad track by his mother and is rescued at the last moment by his aunt. Here is delusion rampant. The preclear will manifest considerable relief after running the incident, but here is a circuit at work, and no matter how many times this incident is run, the condition of the preclear will not be bettered. The auditor, by giving credence to this incident and by continuing to run it, is actually validating the incident and strengthening the circuit. Such incidents are usually bizarre and sensational. Very often, however the auditor actually has on his hands incidents which are quite true and are bizarre and sensational, since the things done to human beings in this twentieth century are not always tame and routine.

The test of any secondary is whether or not exhausting it raises the individual up the tone scale. When the auditor discovers that he is running fear or apathy incidents because of some circuit, he should immediately be aware of the fact that he is trying to address much too heavy a form of entheta. He should not be running secondaries but should be running locks. A preclear who will run such dub-in misemotion is very very low on the tone scale. An estimate of this preclear on the chart would have told the auditor in the first place that the preclear was low on the scale. The auditor should, thus, be alert for dub-in. Dub-in misemotion is best handled not by running thirty consecutive incidents in which the preclear is placed in the washing machine by his father, or hoisted up a flagpole by his elder brother but by addressing the locks in the case, the nearer present time, the better. Very shortly the auditor will discover that the environment of this preclear is normally very restimulative and that individuals exist in the environment of this preclear who habitually lay in heavy locks. Further, the auditor will discover in lock scanning that this preclear will commonly hang up in locks after the chain has been scanned and that the locks themselves have to be run as incidents. Such a preclear should not be subjected to the mishandling of being run through heavy secondary engrams. Of course, in a wide-open case, on which few occlusions exist, actual secondaries might be run fairly early in the case, with an enormous rebound up the tone scale. It is in the occluded case that the auditor should expect to find circuits which produce misemotion at will. The auditor who is handling a preclear above 1.5 should not much worry about dubbed-in misemotion.

On the subject of secondary engrams the auditor, regardless of his own personal feelings about fear, grief or apathy, should keep firmly in mind the relief which is obtainable for the preclear and the rise which is possible on the tone scale by running secondary engrams. It is a theoretical truth that a case would become a release if the auditor could run off the case only the secondary engrams in their entirety. This is impossible in practice, since after a secondary has been run the auditor quite commonly finds that he is running a physical pain engram which underlies it. The auditor should not be surprised when he is running a secondary engram to find, after the exhaustion of a few tears, physical pain turning on as a consequence. Clears are produced by running all the physical pain engrams, secondaries, and locks off a case. But engrams quite ordinarily cannot be contacted until locks have been scanned and secondaries have been run off the case.

It is an adroit auditor who can elicit from some “hard-boiled and emotionless” denizen of our culture the tears or fear necessary to resolve his case. But the scanning of lock chains or the reduction of available physical pain engrams will place in the auditor’s hands, willy-nilly, discharge of secondary engrams. The auditor can convert the entheta of locks into theta to such a degree that secondary engrams will begin to discharge almost automatically. At such time as this happens the auditor must be careful to minimize his own conversation or comment, to minimize his auditing, simply sympathetically persuading the preclear to run the incident again, and then again, and then again, until it is exhausted. The auditor, by attacking secondary engrams as though they were game on which the state pays a bounty, such as jackals or crows, and using an approach too exhilarated or enthusiastic toward the preclear’s secondaries, can actually cut off the discharge of misemotion. Some experiments have been made with the use of sad music or other dolorous perceptics in the environ of the preclear to encourage the discharge of secondary engrams. Much work can be done on this. The work which has been done demonstrates, however, that individuals who are chronically very low on the tone scale respond to sad and mournful perceptics by simply running dub-in incidents, which does them no good, and that individuals above this level can commonly discharge secondaries whenever the proper amount of theta has been recovered for the case.

This does not discount the possible use of aesthetic perceptics in the encouragement of secondaries. In inventorying a preclear one should be careful to establish all the major losses and major threats of loss that have happened to the preclear in his lifetime. On each one of the losses or threats of loss, either of position or possessions or people, by departure or death, one will find an encystment of entheta. Where the child has been raised by nurses in the vicinity of relatively antagonistic parents, one may expect to find a secondary engram every time a nurse is discharged. In the “coffin case” who lies with arms folded, never assuming the foetal position when running prenatal engrams but always lying as though laid out for burial, one will certainly find the death of a major ally somewhere back on the track. Where the entheta surrounding such an accident is strong enough to paralyze the individual at this point of his life, the secondary engram responsible for the coffin case is ordinarily not contactable early in the case. The auditor should merely continue, alert to the fact that sooner or later he is going to encounter a very heavy charge on the death of an ally. In such a case, the amount of entheta in relation to the existing theta on the case is very heavy. Lock scanning, straight memory, and the running of locks, and even merely perception of present time may be the only processing which can be delivered to the case in its early stages. Sooner or later some secondaries will be discharged. No physical pain engram should ever be run on such a case. Imaginary incidents are peculiarly useful to the processing of such a case, as limited by the chart. The best skill an auditor can develop is the running of secondaries. Their discharge produces the most effective rise up the tone scale.

CHAPTER THIRTEEN

COLUMN AI

Engrams

The basic cause of all human aberration is apparently the engram. There may be other causes more fundamental than the engram, but certainly to date they have not been discovered. Psychotherapy found out about locks, but did not know they were locks, and did not know to what the lock owed its power. Psychotherapists did know that when an individual was able to remember certain mentally painful incidents in his life, he became to some minute degree better.

Sigmund Freud discovered the lightest type of entheta, and although he placed his probes no deeper, an entrance was made into the field of human behavior. The secondary was discovered, but not identified in any way. By sheer observation of numberless cases it was found that once in a while, when a

patient could be made to cry, the patient got better. The therapist did not know what the patient was crying about and neither did the patient, but the title of "release of affect" was assigned to this crying and much extraneous technology was developed around it. Psychodrama and other techniques were developed in order to make the individual "release affect." This was the second slight incursion into the field of human thought. It produced little beneficial result because secondaries were restimulated more often than they were relieved. Secondaries have to be run as engrams, with the preclear returning on the time track.

The leap which was made between psychotherapy and Dianetics did not gather force in psychotherapy but in an independent study of epistemology and thought as an energy. However, the basic teachings of Sigmund Freud, as relayed to me in the twenties by Commander Thompson, Medical Corps, U.S. Navy, who had studied with Sigmund Freud, considerably enhanced my desire for re-examination of thought in human behavior.

The existence of the engram was predicted, by derived computation, from other observations of thought. Investigation showed this existence to be actual. Anyone can discover an engram with great ease once he knows that it exists. Take an individual, tell him to close his eyes and go back to the last time he received some minor injury (do not ask for a major injury) and request that he re-experience the moment of injury. Cause him to recount and re-experience this moment of minor injury several times. If he cannot do so, he is fairly low on the tone scale and his somatics are shut off. Most normal people can re-experience these moments of injury. In causing an individual to do this, the experimenter will find that the injury is again felt and that the sights, sounds, smells, and other perceptics at the moment the injury was received recur to the experimental subject. Another phenomenon will be discovered by the alert investigator. It will be found that the individual on the first return to and recounting of this moment of minor injury, will conceive it to be shorter than it actually was. On recounting, he will discover during the instant of impact of the injury new perceptics showing up, things he did not notice at the time he was injured. Here is a moment when the analytical mind, even though the injury was slight, went out of circuit, and here is a moment of "unconsciousness" wherein the reactive mind was recording all the perceptics which were available in the environment. As these hidden perceptics are recovered, the additional perceptic of physical injury, which is called in Dianetics a somatic, will reduce in force and, unless the experimental subject is extremely aberrated, he will finally no longer be able to feel it, but all other perceptics which were recorded during that moment of physical pain and "unconsciousness" will be restored to the analytical mind as standard memory data.

In effect, this is a dianetic "assist." The auditor may take an individual who has been injured and run the injury as an engram even though it contains extensive unconsciousness. The last engram on the case has had relatively little chance to become charged up by locks and secondaries, and so is available for auditing regardless of the pre-existing engrams on the case.

The auditor can walk into a maternity ward and take over the case of some young mother who through an arduous birth has developed a post-partum psychosis and can audit out the birth in its entirety. Unless this young mother was extremely low on the tone scale in the first place, so that she cannot re-experience somatics, the discharge of the actual delivery, perceptic by perceptic, including the "unconsciousness" induced by anaesthesia, everything the surgeon (and let it be hoped that the surgeons of tomorrow will have learned to work in silence) said to the nurse and remarked in general. In the analytical mind's interpretation of the remarks made during this delivery the source of the post-partum psychosis will be discovered. Any late or recent injury can be run in such a fashion. The individual who is receiving this auditing will, according to observation, recover much more rapidly from the illness or accident, the healing will be cleaner, the incidence of infection will be less, and the seriousness of the injury and the shock contained in it will be greatly reduced by the reduction of the moment of injury itself. It is hoped that sooner or later an auditor will stand at the emergency entrance of some hospital simply to audit all accident victims who come in, and that the statistics of infection rate and mortality rate of this hospital's patients will be compared with those of other hospitals. Evidence indicates that the mortality rate will be much lower on those who have had the last injury audited out, that the incidence of infection will be less, and that the time of recovery of the patient will be greatly shortened by this dianetic assist.

The making of this experiment, on a slight scale, regardless of the dianetic assist, should demonstrate to the experimenter that physical pain at once inhibits consciousness, and that in the presence of physical pain all the perceptics of the environ, sight, smell, hearing, tactile, etc. are recorded elsewhere than in the analytical mind but that the running of the incident removes from the case the mental loginess caused by the unconsciousness itself that all aberrative effects of remarks made during the incident are removed, and that the physical pain is no longer stored, being a highly perishable quantity.

This is the anatomy of an engram. It contains physical pain. It contains all the perceptics of the environment in which the physical pain was received. It contains the physiological condition of the body, including endocrine balance at the time. It includes the age of the individual. It includes the misemotion or emotion contained in the incident, as manifested by persons around the injured person. It contains unconsciousness, in the form of anaten (analytical attenuation). And it contains the interruption of the computations the person was making at the time, which is the interruption of the theta creative cycle and is slightly aberrative. And it contains, additionally, all the locks and secondaries which, by contagion during the restimulation of the engram, it caused the person to receive while analytically awake, or conscious, at later times. These are the things which an engram contains. And these are the things which exhaust from an engram which is thoroughly erased.

When the engram is approximated in the environment, during a time when the individual, by reason of weariness or illness or stress of other kinds, is less analytically aware, various manifestations may occur by reason of the abovementioned contents of the engram. The individual who is under the stress of a restimulated engram will attempt to dramatize the engram. That is to say, he will say the things contained in the engram, and he will do the things dictated by the engram, or he will make the analytical computations demanded by the engram, and he will, generally, try to comply with the dictates of this moment of physical pain. If his environment makes it impossible for him to carry out this dramatization as dictated by the charged-up engram, then he is subjected to further charge by reason of not being able to do what the entheta of the engram commands him to do. An individual who has had his dramatizations broken time after time gradually descends the tone scale. Engrams are based on the non-survival circumstances of theta and MEST colliding too sharply together, with the attendant reversal of polarity.

All engrams, even those which are highly complimentary to the ability of the individual (such as hypnotic suggestions, which are a light form of engram and depend on early physical pain engrams) are non-survival. There is no such thing as an engram which assists an individual in his business of living. The engram merely uses some natural ability of the individual and may feverishly but inefficiently enforce it. This would be a manic engram.

Engrams dictate unalterable courses of action, without any regard to reason. Such a circumstance is, to a greater or lesser degree in every case, non-survival, since the survival of the individual depends upon his ability to adjust his action to the environment or to adjust the environment to him according to the circumstances. The engram is as set as a phonograph record. It dictates that a person do certain things in the presence of certain perceptions. In an unthinking organism, such as the lower forms of life, the engram does provide a certain method of thinking and acting, but in man, who depends upon reason as his chief weapon, the engram is non-survival in the extreme. The accumulation of engrams and their secondaries and locks brings the individual eventually to the point of death. Although his theta may, by continual enturbulation with MEST, be highly informed at the period of death with regard to MEST and may, according to some observations, be able in the next generation to accomplish a much better course of survival, in the existing generation the entheta never frees itself except by dianetic processing.

Yet, the auditor will continually discover preclears low on the tone scale who, by education or by the content of the engrams themselves, will seek to hold on to the engrams in the belief that they are an aid in the business of living. The auditor should thoroughly ignore this situation. In a very short time he will by his own experience see very clearly that the relief of engrams vastly increases the preclear's ability to meet life and to advance in the business of living. There are cases which contain engrams such as attempted abortions and which seek to retain the engram because it says, "If I lose it I'll die!" Many engrams contain phrases which seem to make the engram valuable. The engram is never valuable. Here is nonsurvival in the most basic known package.

The engram is the basic source of human aberration. There are usually hundreds, or even two or three thousand, engrams in the lifetime of any individual. Each and every one of these may have its own locks. The whole language of the individual may be contained in his engrams. Compulsive and obsessive phrases, circuit phrases which set up compulsive sections in the analyzer, "psychosomatic illnesses" (which are now known as chronic somatics) and aberrative forms of thought, to say nothing of reduced physical state and disabilities as represented on the tone scale chart, result basically from engrams.

It should be understood by the auditor, however, that although the basic source of human aberration is the engram, according to accumulated evidences, he should not therefore consider that the only thing he should touch in a case is an engram. Locks and secondaries, in low-tone cases, must be addressed long before he touches engrams. The moment of physical pain and unconsciousness is basic, but it is not the principal point of address in very aberrated cases.

Cases fairly well up the tone scale, however, have engrams available for running, and when these engrams are run, remarkable improvements in the habits, welfare, behavior, and physical health of the individual ensue.

Before the auditor runs engrams off a case there are certain definite things he should know. He need not be nearly so skilled to run locks as to run engrams. A very inexperienced auditor can successfully scan locks or even run minor secondaries, but an auditor should definitely know his tools and have confidence in them before he attacks engrams. In the first place, it is possible to enter a deceptively open but really heavily charged case and attempt to run engrams when the preclear is completely unable to perceive enough of the perceptics in the engram to bring about a reduction. Thus, the auditor leaves an engram in restimulation and does not much assist the preclear but on the contrary may turn some of the preclear's theta back into entheta by causing the engram to have a new lock by reason of auditing. While all auditing can be scanned off and this theta can be recovered, this is not improving the case.

Further, engrams in the hands of an inexperienced auditor are sometimes improperly evaluated, which is to say the auditor may attack one which is very late in life or very late on a chain of engrams, and work and worry on the thing until it merely goes into recession. Two or three days later this engram will reappear. This is because it has not been really reduced or

erased, because the auditor did not know enough to go earlier in the case in order to find the basic engram on the chain. Thus certain cautions must be observed in running engrams, but engrams can be run successfully if these cautions are observed.

To run engrams, the auditor must be aware of and have confidence in the tools of his trade. These consist of the somatic strip, the file clerk, the time track, and the perceptics. The file clerk is an extremely useful mechanism, not only for the running of engrams, but for the scanning of locks, the discovery of locks, and for obtaining data from the standard memory banks which would otherwise be excluded. The file clerk is a response mechanism which is instantaneous. One could postulate that the file clerk is a group of attention units with ready access to the reactive mind and to the standard memory banks and which in common mental operation forwards data through to "I" as memory. However, the charge on a case -- the amount of enttheta -- may be so very heavy that the file clerk is unable to force through the data desired by "I" and so "I," working all alone with the file clerk, sometimes finds it difficult to receive answers to his questions.

The auditor adds, with his demands and signals, what might be considered the additional power necessary to bring the file clerk answers through to "I." This process is extremely simple. The auditor asks questions, normally, which can be answered in terms of yes or no or numbers or dates. Then, at a sharp snap of the auditor's fingers, a sudden thought, a yes or no, occurs to the preclear, who tells the auditor what response he has received.

For example, the auditor may desire to know the place where the preclear is stuck on the time track, or whether or not the preclear is in present time. The auditor says, "Give me the first number that flashes into your mind. How old are you?" (snap!). An age flashes and the preclear tells the auditor. It may be that the preclear has developed a circuit which gives his chronological age in answer to the question, "How old are you?" A double check for the auditor, then, is to ask the question, "What is your age?" (snap!). He may or may not get the same answer as before, since the circuit may not be educated to the second question. Another method of establishing where the preclear is on the time track is to ask for the year, the month, and date. In addition to the location of the preclear on the time track or discovering the point in the preclear's life where a certain incident occurred, the flash answer mechanism will tell the auditor at the end of the session whether or not the preclear is in present time. The preclear should always be brought to present time, if possible, either by simply being told to "Come to present time," or by being scanned up to present time through pleasure moments, or "walked up" by straight memory questions. The auditor works with the file clerk. The auditor does not order the file clerk around. The auditor consults the file clerk. The file clerk will tell the auditor the name of the chain of locks which is to be scanned. The file clerk, questioned by flash answers, will identify types of incidents which are interrupting the case. In short, the file clerk is a consultant who answers with specific data any question asked with the flash answer mechanism. It is interesting that material completely unknown to the analyzer of the preclear can be discovered by questioning the file clerk.

The somatic strip is so called because it seems to be a physical indicator mechanism which has to do with time. The auditor orders the somatic strip. There is this difference between the file clerk and the somatic strip: he works with the file clerk but commands the somatic strip. On command, the somatic strip will go to any point of the preclear's life, unless the enttheta on the case is so heavy that the somatic strip is frozen in one place. The somatic strip goes to the point of return, but it is not the same as completely returning since the preclear's "I" can stay in present time and the somatic strip can be sent back to earlier periods of his life. This is a very useful mechanism. The somatic strip can be sent back to the beginning of an engram and will go there. The somatic strip will advance through an engram in terms of minutes counted off by the auditor, so that the auditor can say that the somatic strip will go to the beginning of the engram, then to the point five minutes after the engram began, and so forth. In such a way, observing the behavior of the preclear (who may be oblivious of what is taking place except by observing his own physical symptoms change), the auditor can send the

preclear through an operation minute by minute, or in larger increments, and the auditor can tell with certainty exactly how long that operation required.

The somatic strip can be sent to a certain date, hour, and minute in the preclear's life, and will go there. "I" in the preclear does not necessarily follow the somatic strip. Unless a case is very heavy with entheta, the somatic strip, for instance, can be sent by the auditor's command back to the moment when the preclear, as a baby, was being burped. Much to his own astonishment, the preclear might then burp. The auditor can send the somatic strip to a moment when the preclear was sunburned, and the sunburn somatic will turn on. The somatic strip, in short, can be sent all up and down the time track, both to pleasant moments and unpleasant ones, by the auditor, even though the preclear may be relatively unwilling to cooperate. This is definitely not power of suggestion, since the preclear is wide awake and alert. Further, the auditor in commanding the somatic strip can discover data, such as how long an operation took, which is evidently completely unknown to the preclear, although this use of the somatic strip is neither usual nor general, but is more of a stunt.

The main thing the auditor should do in using the somatic strip is to credit the somatic strip with obedience to the auditor's commands. The auditor does not send the somatic strip to the beginning of the engram and then wonder whether or not the somatic strip went there and ask questions as to whether or not it did. The auditor, with considerable confidence, should assume that the somatic strip has gone exactly where he said. If the preclear is unable to detect any difference, this is not the fault of the somatic strip, but is occasioned by the amount of entheta on the case. The somatic strip moves about the track at the auditor's command regardless of the quantity of entheta on the case, unless the somatic strip is itself thoroughly stuck in some engram.

The somatic strip and the file clerk are two of many mechanisms and entities discovered by Dianetics. There are many other phenomena in the mind, which are not at this time used by the auditor but which, nevertheless, exist. There are, possibly, such things as theta perceptics, which respond to auditor consultation. Very little is known about them, and it is felt that incorrect use of them or invalidation of them after they have been used is harmful to a case; so experimentation with them should be very carefully done. A book could be written which covered additional entities and phenomena of the human mind, but until these can be intimately associated with processing in such a way as to aid the auditor, a discussion of them in a book of processing is extraneous. Exactly to what extent these additional perceptics and entities influence human behavior has been far from thoroughly established. The time track, as covered elsewhere, is simply the consecutive moments of now which proceed in one lifetime, from conception or a few days before conception in the sperm and ovum sequence, up to present time. The time track is actually a cable, or bundle of perceptics, since all twenty-six perceptic channels register, when there is anything for them to perceive, and are in phase in a case which does not have an extremely heavy burden of entheta.

The individual can be sent by the auditor back from present time simply by being told to close his eyes and go to a certain moment in the past. He can be sent to a very precise moment on the track, since every instant of the preclear's past life is recorded on this track. Some of the recording, of course, is done in the reactive mind, when unconsciousness and physical pain are present. It is interesting that a preclear can be sent to January 3rd, 1936, a very random and obscure date, to the hour of eight-fifteen in the morning, and although the preclear may not realize he is there, requesting him to contact even hazy data about it will shortly place him at the instant, which if run several times just as though it were an engram, will begin to show up in considerable detail in most cases. For instance, if at eight-fifteen in the morning of January 3rd the preclear entered his office and began to open mail, he may not know at the beginning even if he had an office at that date, but after he has run the incident several times he will be able to read you the names and addresses off the envelopes as he opens them and sorts his morning mail. Because sense of time and ability to return are thoroughly discounted by social aberrations in this culture, these skills have remained hidden. When the preclear's sense of reality is very low, when he himself is very low on the tone scale, the preclear may have no confidence at all in any data which he brings up about his past. Knowing that the somatic strip,

the file clerk, and the ability of "I" to return are accurate, the auditor has the responsibility to encourage the preclear to credit his own senses.

Thus, we see that we have three things at work in the operation of going back from present time to an earlier incident. First, we have the file clerk. Next We have the somatic strip. And third, we have "I" or a large percentage of the attention units of the mind. And these three together are used by the auditor to work the preclear on his time track and discover and reduce or erase past moments of physical pain and unconsciousness or encysted areas of entheta.

The auditor consults with the file clerk as to the "incident necessary to resolve this case" or the "chain of locks necessary to be run at this time" or "Yes or no, should we run engrams at this time?" or "Is there a grief charge available at this time?" and after this consultation, asking "Can we scan this chain of locks at this time?" or "Is this engram susceptible to being run?"

One might say that the auditor and the file clerk are consultants over the case of the preclear as to the best method of raising the preclear on the tone scale. The file clerk's interest and participation in this is very large. The file clerk's ability to answer questions sometimes extends to suggestions as to how to run the case when these are required by the auditor. Now it is a strange thing that the file clerk always knows the type of entheta which can be run on the case. The file clerk also knows the next engram which can be reduced or erased. All the auditor has to do is request the file clerk to present the engram necessary to resolve the case, and the file clerk will do so, no matter where that engram lies on the track.

Engrams follow the general law that they must be reduced or erased from early to late, which is to say that the earliest engram on the chain must be the one first contacted. Engrams in the basic area are surprisingly early. The auditor will have to get used to the idea that physical pain and perceptics are recorded, if not understood, long before there is anything like an analytical mind in the organism. The file clerk is slightly sketchy on how early he must look for the engrain to resolve the case, and unless the auditor is occasionally insistent on the file clerk's presenting very, very, very early engrams, the file clerk may not look earlier than two or three or five years of age (late life, in Dianetics). With this single limitation, the choice of the file clerk as to the engram to be run should be considered primary above the auditor's or preclear's idea of what engram it is now necessary to address and reduce. The auditor cannot know this too thoroughly: that the file clerk's choice of engrams takes precedence over the desires of the preclear or the wishes of the auditor, and the file clerk will present the engram necessary to be run next in order to resolve the case.

Although engrams normally run from early to late, it sometimes happens that a relatively late life engram is so tenuously connected to the remainder of the bank that it can be run off and erased, almost as an independent entity. Although birth should always be approached by the auditor with caution, the file clerk may present birth, and if the file clerk does so, then birth should be run.

The auditor should be very careful of forcing his preclear into any engram which is not presented by the file clerk. Running late life engrams early in the case will as a general rule merely enturbulate the case, since these engrams will not reduce until earlier physical pain moments have been reduced or until a great deal of entheta is taken off the case by other means.

Once the file clerk has presented an engram -- and the auditor simply assumes that his request for the file clerk to do so has been complied with -the auditor then directs the somatic strip to go to the beginning of the engram. The somatic strip does this immediately and needs no further coaxing, and indeed, a failure to take this for granted has a tendency to invalidate the somatic strip and to render its response uncertain and the preclear confused as to what is taking place.

With the somatic strip at the beginning of the engram which the file clerk has presented there may still be no awareness of somatic or change so far as the preclear's "I" is concerned. It is now necessary for the auditor to get "I" in contact with the stage which has been set by the

file clerk and the somatic strip. The auditor does this with an additional request for a flash answer. Although it does not always happen that engrams contain conversation, it is a fairly safe assumption that any given engram contains conversation. In order to get "I" in contact with the engram and to turn the somatic on full so that the engram can be run, the auditor now asks for the first phrase in the engram, and snaps his fingers. A phrase occurs to the preclear, which at the first moment that it occurs may seem completely irrelevant. The preclear repeats this phrase two or three times and "I" is in contact with the beginning of the engram. The preclear becomes aware of the somatic and of other perceptics and, phrase by phrase, runs off the engram, re-experiencing it, feeling the generally modified version of the pain he once experienced, recounting all the conversation which he perceives to have taken place in the incident, getting rid of the "boil-off" which smothered the incident or yawning away the remaining anaten in the incident or experiencing the misemotion of the incident and, in short, reducing or erasing the engram. The auditor must be aware of the existence and importance of action phrases in engrams.

These phrases are actually commands in the engrams which take over as a sort of inner auditor, and before the auditor knows it these phrases are sending the somatic strip elsewhere up or down the track or mixing up the file clerk as to the next phrases. The auditor, if he notices any peculiarity in the running of this engram—that the somatic turned on once but will not turn on again, that sonic was nearly on but now doesn't exist -- and yet knows the engram is not yet reduced, suspects an action phrase and asks the file clerk whether or not a bouncer, denier, grouper, valence shifter, or holder is acting. He does this by saying, "Is there an action phrase present?" (snap!). The file clerk then says (through "I") that it is a bouncer, holder, grouper, misdirector denier or whatever. The auditor then says, "The phrase will now flash!" (snap!). The phrase flashes, the preclear repeats it and gets back into the engram from which he has been bounced, if it was a bouncer. Actually, a case is in very bad shape which has positive responses to action phrases and probably should not have engrams run on it at all. Cases further up the tone scale do not respond at all to action phrases, which is to say the file clerk and somatic strip have sufficient theta behind them to override even strong and energetic commands to do something other than work with the auditor in reducing or erasing the engram. The response value of the action phrases is, indeed, an index of where the preclear is located on the tone scale. Very noticeable response to action phrases indicates that some other type of entheta than engrams should be run off the case before engrams are reduced. If the auditor finds his preclear bouncing badly every time the phrase "get out" occurs in an engram, he should reduce if possible the engram on which he is working and then address his attention to other types of entheta, such as chains of locks and secondaries, rather than continuing to run engrams.

The auditor should understand that an engram does not always begin with a phrase and that the phrase he gets first may not begin the engram. He should further understand that the heaviest entheta in the engram, if the engram were occasioned by a blow, occurs at the beginning of the engram. Thus, the file clerk may present this beginning, and the somatic strip may try to go all the way to the beginning, but the entheta is heaviest right at the start. Thus the auditor should always check to find out whether there is an earlier phrase or an earlier somatic on the engram, before he works very hard to reduce the whole engram, since it is the earliest part of the engram which suppresses the remainder of the engram. Once you get the entheta out of the very beginning of an engram of the blow variety the rest may reduce as easily as a lock. Always get the earliest part.

There is another type of engram, in which unconsciousness sets in slowly and perhaps physical pain does not develop until after unconsciousness has begun to set in. This would happen in the case of loss of blood, or during an anaesthetic operation, where the anaesthesia is administered before the physical pain of the operation itself begins.

Then there is the combination of these types of engrams, where a blow or shock begins the engram, unconsciousness sets in and deepens, and then further blows and shocks occur during the course of the unconsciousness, again deepening it. The lightest phrases of unconsciousness will lift off an engram first. The deepest part of the unconsciousness or the

deepest point of physical pain will lift last. Thus, an auditor can run through an engram several times and consider that he has almost reduced it only to discover that several new phrases have appeared in the engram. This happens because some portions of the engram contain deeper unconsciousness and more severe pain than other portions, and these lift last. The engram can do three things: it can erase, it can reduce, or it can recess. The erasure of an engram takes place when it is either one of the first few engrams existing on the time track or when the engram is relatively independent of the remainder of the reactive mind. The phrases and other perceptics appear. The engram is recounted from the first moment of physical pain and unconsciousness to the last. And after a few recountings, the engram vanishes in yawns. The auditor can be fooled at times, by having the preclear bounce out of an engram, into believing that the engram has been erased or reduced, but in this case yawns do not come off. Yawns always mark the end of an erasure, since this is the last of the anaten (the physiological by-product of unconsciousness) which has pinned down the rest of the engram. The entire case, which is to say all the content of the reactive mind, will eventually erase. An erasure thoroughly done, simply by recounting all perceptics of the engram over and over with the preclear returned to that instant on the track, is final and complete. The engram is gone and will not return. The physical pain will not re-occur. The phrases are no longer aberrative in any way and are quite often gone so thoroughly that the preclear cannot even remember what the engram contained.

In view of the fact that the engram is the basic source of human aberration, these phrases which are enforced as hidden commands upon the analytical mind are the most productive of aberration, if the engram is charged up by later entheta on the case. If these commands cannot be obeyed or dramatized by the analyzer, then the engram attempts to force compliance by turning on physical pain which it contains. That portion of the body which was injured when this engram was received will become painful again, or will manifest some discomfort. This has been called psychosomatic illness. It is actually the somatic of some past moment of physical pain turning on again because of the overcharge of the engram by later entheta and the inability of the person to dramatize the verbal content of the engram. All these things are gone, the anaten which shuts down the analytical mechanism and power of the mind, the aberrative force of the commands of the engram which are accepted literally by the analyzer, and the physical pain of the engram which can become a chronic somatic, disappear and do not return when the engram is erased.

To be erased, an engram has to be early on its own chain of engrams, there must not be too many secondaries or other types of entheta charging up this engram, and the bulk of the perceptics must have been present while the engram was being run. The unobservant auditor who knows little of his subject may occasionally think he has erased an engram, only to discover a few days later that the engram, in some part, has returned. In order for this to happen, the engram must have been fairly late on a chain or there must have been considerable entheta above it. An earlier engram must be discovered, or entheta must be removed from the case in some other way.

A reduction is done exactly as an erasure, but the engram will not completely erase, remaining, after a few recountings, in a more or less static condition of low aberrative power and with no physical pain remaining in it. Early in the case the auditor obtains more reductions than he does erasures. When an erasure of the case begins the auditor feels very confident, for an erasure carries the preclear up the track to present time, and although another pass may be made to discover missed engrams, the auditor knows he is bringing the preclear through to clear. In the matter of a reduction, entheta is recovered from the incident, the preclear is made considerably more comfortable, but the engram remains there in a quiet state. Ordinarily, erasures and reductions require only seven to ten recountings or re-experiencings of the engram. The reduction is recognizable because the somatic in the engram, recounting by recounting, reduces a little further, and continues to reduce until the somatic is gone. A reduced engram does not build up again but remains in this quiet state and permits the auditor to go on to other engrams.

The recession is the third thing that will happen to an engram which is being processed. The recession is not desirable. A recession occurs only in engrams which are not early enough in the chain of engrams to be reduced or which are too charged. The file clerk will never present an engram which can only be recessed. A recession takes place when the auditor "knowing better" than the file clerk forces the preclear back down the track, uses repeater technique on some phrase the auditor has selected as being aberrative, and generally mishandles the case. A recession is evidenced by the failure of the somatic to reduce beyond a certain point. The engram will drop down to a certain volume of intensity, but no matter if it is recounted thirty, fifty or a hundred times, a somatic will still remain. During a recession the somatic of the engram first reduces slightly and then continues constant. In the reduction, the somatic, little by little each recounting, reduces. In a recession, the somatic remains steady. If a recession takes place, it means simply that an engram similar to the one which is being re-experienced is earlier on the case, or that a tremendous quantity of entheta in secondaries and locks exists above the engram that is being recessed. Recessions occur only where the auditor has not taken off enough entheta from the case in the form of locks and secondaries to permit engrams to be run. It is a premature address to engrams. Or it is caused by auditing in violation of the file clerk's data.

One would ordinarily suppose, for instance, that conception would be the earliest engram on the case. It sometimes happens that the auditor contacts conception and finds it will not reduce. Obviously, conception is very early. There may be some engrams before conception, on either the sperm or the ovum side. But unless one understands that a great deal of charge can exist which suppresses any engram, one may recount, for instance, a conception engram only into a recession. It should not surprise an auditor, if he demands that conception be run before conception is ready to be run, to have a recession take place. Perhaps no engram exists in current life before conception, but enough entheta in secondaries and locks above conception will cause its charge to be highly resistive.

There is a trick of reaching conception in a case. This trick should be used with caution, because of the entheta which may have charged up this early engram. The auditor asks the preclear to run a moment of sexual pleasure, and then when his preclear, who does not have to recount this moment aloud, appears to be settled into that moment, the auditor demands that the preclear go immediately to conception. The preclear will normally do so and conception can thus be found and run. But, as has been said, it may have too much charge to reduce or erase. This trick can be applied to any engram in the basic area. The auditor can require the preclear to run a moment when the preclear was angry, and when the preclear seems to be well settled into recounting his own near present time dramatization of being angry, the auditor merely tells him to go to the earliest engram in the bank which contains anger. The preclear, ordinarily will go there. This applies as well to fear, and to grief but it is far better to discharge the case well and have the file clerk in good working condition before one uses such a trick.

Conception is definitely an engram, in the majority of cases. Now and then, conception will be found to contain only a moment of unconsciousness in the sperm line and another in the ovum line and be otherwise unaberrative. But the usual conception contains considerable perceptics and physical pain. Great care should be used not to try to contact and run conception prematurely on a case. An individual who is fairly low on the tone scale, below 2.5, will usually have enough charge on conception so that it cannot be reduced. Running conception on an individual below 2.5 intensifies his aberrative manifestations. A borderline psychotic can actually be placed in a psychotic break if an auditor authoritarily slams him into conception and insists that he run it, on the theory that conception, being an early engram, should erase.

Because Dianetics has not at this time much explored structure, no slightest effort is made here to justify the existence of pre-conception sperm engrams or pre-conception ovum engrams or conception engrams or birth engrams. Actually, these have been found time and again in psychotherapy and abandoned only because they did not agree with the reality of the practitioner.

Recent experiments at Rutgers University validate the ability of the embryo to react to sounds and other stimuli. Books written as early as 1912 and 1914 mention these early recordings, labelling them, "cellular experiences," which in Dianetics we do not now know to be a correct label. The work of biologists in the field of embryology adequately validates the reaction capabilities of the embryo to stimuli. In Dianetics, engrams from the earliest periods have been checked with reality and have been found to have taken place.

Many a parent watching his child or teenager being processed has been startled to hear from engrams the names of maids fired long before the child was born, or circumstances surrounding the marriage which were not particularly complimentary to the devotion of the parents to the letter of morality, and other matters which would not be otherwise known to the preclear. Some mothers who may not have been as careful in their fidelity as their husbands expected may even sacrifice the health of the child, who could otherwise be processed into better mental and physical condition, rather than have their husbands learn of these infidelities which are unfortunately recorded word for word in the engrams of the child.

Knowledge that these recordings exist and are valid and actual will discourage a below-2.0 individual from permitting her children to be processed. The auditor should always be wary of a mother who is actively trying to invalidate Dianetics to the husband and children. Case after case has been accumulated in which this invalidation process took place for no other reason than to hide data which the parent did not wish to be known.

The only other reason an invalidation of Dianetics takes place, after an individual sees it operate and understands it, is that the aberrated condition of the mate or employee permits the invalidator to continue in control of that individual. This is highly discreditable, but will be found many more times than the auditor will like and will be a considerable problem to him. Those who oppose processing either have something to hide or suppose they gain in some way by continuing authoritarian control of the preclear in question. Because he is running moments when the preclear was sick, distressed, injured, or otherwise disturbed, the auditor can expect to find himself viewing almost any state of health, neurosis or psychosis at one or another stage of the preclear's advance to clear. These states will be very transitory, taking place only when the preclear is returned to an engram and during the period, usually a few minutes or an hour, required to run the engram. Unless one understands that re-experiencing engrams is re-experiencing the very stuff of which insanity is made, one can become alarmed about this. The only really dangerous thing about the running of engrams is simply becoming alarmed.

The preclear, sent back into the basic area, will roll into a foetal ball. The girl sent back to birth may get into mama's valence and scream loud enough time after time to disturb the neighbors a block away. The individual returned to when he had the mumps may be seen to have a very puffy face. The boy sent back to a severe sunburn may manifest redness and considerable discomfort, until the engram is reduced. The temperature of the preclear will rise markedly when he is sent back down the track to a moment when he had a high fever. Reduction of the engram reduces the fever and reduces the aberrative effects which the preclear felt for years after that illness. A medical doctor, observing dianetic processing for the first time, watches the preclear cheerfully lie down on the couch, listen to the auditor utter certain phrases, then sees the preclear become flushed and red, or otherwise apparently ill for a brief time. A medical doctor observing this is alerted by his impulse to heal by his own methods to a point where he will sometimes request that the session be stopped because this preclear may be running a temperature, or seems to have severe cramps, or is generally uncomfortable. The preclear will be the first one to try to reassure the doctor, for the somatic that the preclear is experiencing is highly transitory, and the preclear learning why, and getting rid of the reason why he has had, for instance, migraine headaches most of his life, will not mind these manifestations but indeed will rather welcome them, since they will shortly reduce. If the preclear is brought to present time before such an engram is reduced, the somatic and other manifestations, which were mild at the place on the track where they first occurred, will usually intensify. And if brought to present time by a poorly informed or cowardly auditor before the engram is reduced or erased, the preclear may experience some after-effects which are far less

pleasant than running the engram. There is a motto governing this: "The only way out of an engram is through it many times."

If the file clerk presented an engram, it will reduce or erase, or the basic on its chain will reduce or erase. Thus, it is up to the auditor to have confidence in his tools and to address his skill to the case, as detailed in this chapter. There is nothing very dangerous in running engrams except in failing to reduce them or to reduce the earliest engram on the chain -- or in invalidating them to the preclear, branding them delusion or some such thing. Anything which in a few moments can take a human being who is healthy and cheerful, run his temperature up three points, roll him up into a ball, or cause him to turn red all over is not something caused by delusion. You could even hypnotize a preclear (but don't ever let me catch you doing it) and tell him that he is going to manifest the very same things, and he will not manifest them. Thus, these are not by power of suggestion and there is no delusion mixed up in it. If you run a preclear back down the track into an engram, reduce the engram. Or if it starts to recess, demand the earliest engram on that chain and reduce that. If this earlier engram begins to recess, get an even earlier engram. Sooner or later you should get to the bottom of the chain, even when you have foolishly driven the preclear hard into a part of the bank the file clerk did not present.

Don't go in for the processing of engrams half-heartedly. You can be careless about running locks, without any casualty. You can even be somewhat careless about running secondaries without producing any serious condition in the preclear. But don't run the basic source, the engram, unless you mean to reduce it, or to reduce the basic on its chain, by recounting it, perceptic for perceptic, until it no longer bothers the preclear. Any new thing collects about it experimenters. But one should not experiment with the running of an engram; one should continue on until the engram is reduced. It is actually very easy to process an engram if you really mean to process it, and are not just trying to find out whether or not engrams exist. One gentleman was curious about engrams, and without any study of the subject of processing them, much less a course at the Foundation, told his wife to shut her eyes and go back to the time when she had the measles. Unthinkingly, because this sort of thing simply did not happen before 1950, the wife closed her eyes and very shortly felt the warmth of measles. She was quite surprised. So was her husband. But they were even more surprised one day later when she broke out with a rash. Her husband promptly took her to the doctor, who said, "I would swear she had measles, except that she hasn't any respiratory symptoms and she hasn't any temperature." Two days later her rash disappeared of its own accord, as engrams, placed into restimulation in such wise normally will settle out. What this husband should have done in the first place was inquire from the file clerk if there was an engram ready to be run, and then ask for the identification of the engram, and then run it by rote until it was reduced.

There is nothing that validates Dianetics to the preclear like being sent into a mass of somatics he did not suspect he had ever experienced. It is the person who is so heavily charged with entheta that he cannot experience somatics who most seriously questions the validity of Dianetics. But even these individuals, seeing the effect of Dianetics on people who are higher up the tone scale and able to experience somatics, will eventually concede. The person who does get somatics is most forcefully struck by the fact that this new thing, Dianetics, can do a thing which was never done before, namely, to change radically and at will the physical being of an individual. Not even in the days when witchcraft was rampant was one able to utter a chant and have immediate results follow. In Dianetics words which are simply the words of one ordinary human being addressed to another can roll the other individual up into a ball and turn on a fever or turn on a sunburn or blur his vision and create many other manifestations in the case which is fairly well up the tone scale. This is so marked, and the validity of Dianetics, if only in the terms of manifestation, is so strong that a physics professor at Columbia once came to the Foundation just to remark on the "diabolical accuracy of Hubbard's predictions of human behavior."

“Be surprised at nothing,” “Always ask the file clerk,” and “Always reduce every engram you contact, or the basic on the chain” are the three rules of processing engrams. Follow these, and you can’t get your preclear into very serious trouble.

Further, there now exists lock scanning, a technique developed in the Fall of 1950, which takes off the auditing that has thus been done. Theoretically, this permits the auditor to make almost any kind of blunder he wishes. After he has made some mistake, placed some engram into serious restimulation, wound his preclear up in a ball, found no way out of the situation, the auditor, theoretically, can lock-scan off the auditing and relieve the restimulation which he has occasioned. The word “theoretically” is used here advisedly since in cases which are below 2.0 on the tone scale, the auditor could place a preclear so thoroughly into an engram that no free theta would exist with which to scan off this auditing. This would be a very extreme case and would apply only when the preclear under treatment was a borderline or actual psychotic rather than a person with a great deal of free theta who is yet below 2.0 on the tone scale. Always finish any session by scanning off the auditing anyway, but don’t encourage yourself to make mistakes just because you can remedy them with lock scanning.

In order to lock-scan off auditing, one merely says “Can we now scan off the auditing?” (Snap!). If the preclear’s file clerk says no, the auditor should discover if some other chain has to be scanned before the auditing can be scanned off, and if this is the case he proceeds to have it scanned.

Ordinarily, the file clerk will say yes, and the auditor then directs the preclear to go back to the first moment of the session and to scan through the session to present time. He does this by requiring the preclear to tell him when he is at the beginning of the session and not permitting the preclear to start scanning until the auditor has said, “Begin scanning” (snap!). The preclear scans through the session at any speed he desires, contacting the consecutive events of the auditing, moment by moment, with his attention mainly directed to the exterior stimuli of the auditing session rather than to the engrams through which he has been run. This extroverts the preclear. Lock scanning of the session should be continued time after time, but only provided the auditor asks the file clerk after each sweep, “Should we scan the auditing again?” (snap!). The file clerk will usually reply yes to this two or three times, and will finally reply “No!” Then the auditor should ask the file clerk, “Can we end the session?” (snap!). Usually, the file clerk will reply yes. If the file clerk replies “No!” some earlier chain may have been accidentally thrown into restimulation which will have to be lock-scanned before the session can be ended in order for the preclear to be comfortable after the session, but this is rare.

This ritual, when followed, undoes any errors in the session unless as has been said above the auditor is dealing with a borderline or actual psychotic, in which case he should have identified the preclear as such on the tone scale chart in the first place and should have audited the preclear as directed by the chart. On such an individual, engrams must never be run, until the preclear is advanced up the tone scale by establishment of affinity, communication, and reality with the auditor, by establishment of contact with the environment, and by straight memory, light lock scanning, and the occasional running of a secondary. It should be remembered by the auditor that phrases in engrams are always literal. A phrase in an engram means exactly what it says, just as Simple Simon would have interpreted it the day he was so careful to step in every pie. For instance the phrase contained in an engram, “I can’t make it out,” does not mean to the preclear on his first contacts that he cannot understand it or see it -- it means simply that the preclear is unable to get out of the engram. The phrase “beat it” is not interpreted by the analytical mind at first glimpse as “get out” and is not a bouncer but merely an aberrative phrase which might cause the preclear to repeat several times. The auditor, particularly when he is running engrams, should make a considerable study of the literalness of language. This is the main trouble with an engram, that it has command value which is literally interpreted. “I see what you mean” will cause the preclear to get a picture rather than to feel that he understands. This is true of both ordinary aberrative phrases and action phrases.

The difference between an action phrase and an aberrative phrase is that the action phrase causes the preclear to go somewhere or stay somewhere, or not get in touch with

something, in terms of space and time. The aberrative phrase merely dictates conduct and is not nearly as serious to the auditor as the action phrase. The aberrative phrase has been inhibitive to the abilities of the preclear, but the action phrase is inhibitive to the auditor's ability to keep the preclear in this engram and run it. When action phrases are very active in engrams, causing the preclear to bounce or to come back to an engram, or to go later in the engram, or to become mixed up, or to find that the time track has collapsed around the engram, as would happen in the case of any grouper on a heavily charged case, the auditor should not be running engrams in the first place and is doing so only because he has failed to evaluate his preclear properly on the tone scale and to follow its directions about the case.

Theoretically, one could strip a case of locks and secondaries without touching any engrams; however, there are such things as circuits, as will be covered later, and sometimes it might be necessary to run engrams on a heavily charged case in order to attack a circuit, but this would be an extraordinary proceeding, and should only be done by a skilled auditor, as trained at the Foundation.

The engram is suppressed and out of sight of the analyzer. This is a primary characteristic. At the shock of physical pain or at the beginning of unconsciousness, the analyzer goes out of circuit and ceases to regulate bodily functions or record or think, to a greater or lesser degree. The analyzer can be partly on or nearly off or entirely off during an engram. In any case, the perceptions are recorded in the reactive mind. The reactive mind was once known as the "unconscious mind," but this terminology is highly misleading, because the reactive mind is the mind which is always conscious, and the "conscious mind" is the mind which shuts off or goes unconscious. The total content of the reactive mind, then, is entheta held down by physical pain engrams which form the basis that causes later enturbulated theta to be "permanently" trapped. Into the reactive mind, in the course of a lifetime, because of physical pain engrams, the bulk of a person's free theta disappears from conscious view and is no longer available for computation but reacts against the analyzer and "I" to disturb and enter hidden and arbitrary data and values into thinking. The physical pain in the reactive mind acts against the physical body of the preclear, and when the analyzer does not obey the engram commands, this pain turns on and aberrates the physical body.

The task of the auditor, it is repeated here, is to exhaust from the reactive mind the accumulated entheta by whatever means are indicated or possible and to convert that entheta into theta, by the simple expedient of bringing the entheta into memory or separating it from the physical pain which traps it. The task of the auditor is not simply to run engrams off a case. An auditor can make this mistake very easily because of his ambitiousness to create a clear. A clear, technically, is simply an individual from whom all physical pain engrams, all secondaries, and all aberrative locks have been erased. The clear can receive new engrams, but these must be of a very severe nature to be highly aberrative, because it is the early engrams on a case which produce the greatest aberration and effect on the individual. However, do not mistake the fact that heavy intentional engrams hammered by ferocious physical pain into a clear, should that clear have been basically low on endowment of free theta, may produce a psychotic break. But do not expect that engrams once erased and the entheta exhausted from the reactive mind will then return in some strange fashion. They will not, once they are properly addressed and converted. It takes new physical pain to produce more engrams in a clear. A clear will, however, become enturbulated by the environment, but will enturbulate temporarily only and will suffer no after-effect from the enturbulence, since there is nothing to trap the entheta. Taking the locks and secondaries off a case, and a few engrams in the course of accomplishing this, produces a dianetic release.

Thus, the auditor can understand his point of concentration on the case. The progress of any preclear is measured by the preclear's rise on the tone scale, not by the number of engrams which are reduced or erased in the preclear. Authoritarian auditing on a low-tone case can reduce engrams, and erase them, hour after hour for scores and scores of hours, but can leave the case in such turbulence that the rise on the tone scale is relatively slight. The physical pain brings about the "permanence" of entrapment, but the auditor will find his greatest store of entheta, which he can convert into theta, in secondaries and locks.

An engram which has many locks and secondaries above it is completely buried and out of sight and unavailable to auditing. An engram which has almost no secondaries and locks has in it all its perceptics, which is to say that the preclear, in recounting it, returned to that point on the time track, can see, hear, feel and experience motion, moisture and temperature, much as he did when he lived through the moment at the time it occurred. After the engram is keyed-in thoroughly and accumulates secondaries and locks, the sharpness of the perceptics begins to disappear out of it, so far as the returned preclear is concerned, in direct ratio to the amount of entheta which has charged this engram up. A very heavily charged engram, then, is not seen, heard, or felt by the preclear. An extremely heavily charged engram doesn't even exist as far as the preclear is concerned but its presence is indicated by the fact that heavy secondaries and locks occur along a certain line.

After these have been run and their entheta converted to theta by the standard processing techniques delineated herein, the engram itself will emerge and it or its chain, since engrams exist in chains, may only then be available for the auditor's address. But it should be understood that once this engram is thus available the bulk of the entheta which it contained has already been turned into free theta by lock scanning or the exhaustion of secondaries, and so the engram is relatively harmless save that it will accumulate new secondaries and new locks. Further, it still retains the physical pain, and its commands are still aberrative, and so it must be run. But the auditor should expect more change in the case from running locks and secondaries than from physical pain engrams, even though engrams are the basic source of human aberration. The engram is pinned down and hidden from view, of course, by entheta. Entheta has many forms. It could be said to exist on the case by virtue of enMEST, which is to say that for the entheta released on the case there will be a physiological reaction, whereby the physical side of the organism undergoes some chemical alteration or gives off some chemical product. Oxygenation apparently has a great deal to do with the release of entheta. Tears and urine, sweat, body odors, glandular products come off a case as the enMEST accompaniment to the entheta released, and physical energy as well. The auditor must not expect these enMEST manifestations only in engrams. They are most marked in the discharge of secondaries and locks. This subject will be further covered under another column.

Case accessibility is measured by the tone scale and is very important to the auditor. A case may be very low on the tone scale apparently and still may be accessible, which is to say, the preclear wants to get better. This denotes the existence of considerable endowment of free theta in the first place and of enough free theta, regardless of its low percentage in ratio to the amount of entheta on the case, for the preclear to desire a return in the direction of survival. Of course, the entheta on this case is descending in the direction of succumbing. This case could be considered an accessible case even though it lies below 2.0 on the tone scale. In processing it, the auditor should particularly respect the survival ambition of the remaining free theta and should be gentle with the case, removing entheta and converting it to free theta as lightly as possible. Such a case should never be run into engrams, since the restimulated engram will form a new lock and absorb some of the existing free theta. Above 2.0, cases are normally accessible, but occasionally due to education or environmental stigmata with regard to getting better or because of a peculiar type of engram command which prohibits contact, these cases will be inaccessible.

Accessibility, then, could be considered, generally, the desire of the individual to attain new and higher levels of survival and the betterment of mind and body. Accessibility is roughly proportional to the amount of free theta existing on a case, but this ratio may be interrupted by inhibitions, educational or engramic.

The wide-open case is peculiarly deceptive to the auditor. This case is a weathercock in the environment, and in the presence of high-level people and in a high-level environment may seem quite normal, but given an average environment this case is considerably below normal, and given a small amount of enturbulence this case begins to obey engramic commands whichever way they drive. Yet this case apparently has all perceptics available. Such a case, around 1.1, will even run engrams, but the somatic will probably be light even if the other

perceptics are apparently sharp. Here is the case which lacks, structurally probably, a mechanism by which to occlude charge. This case, below 2.0, is quite ordinarily inaccessible, unless assisted by manic engrams or a general feeling in the environment that being processed is the thing to do, for this case is often quite impressionable and follows the fashion of the environment easily. The inexperienced auditor may find such a case, may discover that sonic, visio, tactile exist and so decide, without beginning to look at his tone scale chart, that the case can run engrams. Somehow or other he persuades the case to begin processing and plunges the case down the track into moments of physical pain and unconsciousness. He will find this case resistive, quite ordinarily, or easily distracted in processing, but he may persist and discover only after he has done considerable processing that the case is not rising very remarkably on the tone scale.

Should the auditor be short-sighted enough to start running engrams on such a case, additional manifestations will tell him that he is doing wrong. The wide-open case will have, usually, some of the perceptics markedly missing. One of these is physical position. This case does not roll into a ball or otherwise change position even when apparently strenuous engrams are being run with full sonic and some other perceptics in the basic area. The reverse is occasionally true. This case may always roll into a ball and have sonic and visio, but will lack many of the other perceptics. The constant of this wide-open case low on the tone scale is that it has sonic and visio, that the somatics are light ordinarily, that the case does not progress rapidly up the tone scale despite the fact that engrams are evidently being erased or reduced. This is to say that the incidents never come up to laughter, but the case will run very soberly. This last denotes that the analyzer is not comparing conduct in the usual environment with what has been commanded by the engrams. Now and then one will find a low-tone wide-open case which laughs long and uproariously over everything which is contacted. The auditor should not be alarmed by or censure this but should be aware of the fact that he is running a great deal of what is called "line charge" off a very heavily charged case. Engrams can be reduced and erased in these low-tone wide-open cases, but the sense of reality about the incidents is commonly low and, as has been said, the rise up the tone scale is not very apparent. There are some of these wide-open cases which seem to have all their real somatics converted into physical distortion and without getting pain will go into various contortions. They will apparently reduce engrams by doing this.

Any wide-open case which is low on the tone scale should not have engrams run on it until a very great deal of entheta is converted to free theta by the discharge of secondary engrams and the scanning of locks, for this case will probably become less and less accessible to the auditor and will protest against being processed and will complain of no relief. This case is not being contrary. It is an actual fact that the case is experiencing no relief although the auditor, knowing engrams when he sees them, and seeing them erase or reduce, has another idea about how this case should be behaving.

A low-tone wide-open case, then, should be handled like an occluded low-tone case, which is to say that the address of the auditor should be toward secondaries and locks, as directed on the chart.

Accessibility is a considerable problem to the auditor. He must always work in the direction of increasing it. Of course, by accessibility is meant the willingness of the preclear to accept auditing and the ability of the auditor and the preclear to work as a team to increase the position of the preclear on the tone scale.

A case is as accessible as it is willing to cooperate and be audited. Some cases are completely inaccessible, and this inaccessibility is not confined to the sanatorium or should-be sanatorium case. Indeed, the only cases which arrive at sanatoriums are those which flagrantly seem to be a threat to their own lives, to the lives of others, or to property, although those who are a threat to property normally would wind up in a penitentiary, although they are usually no less psychotic. The low-tone case that is not obviously a suicide but is apparently able to cope in some routine fashion with the environment passes the notice of the heavily burdened state, which just now tries to cope with the problem of nineteen million obviously insane persons.

Unwillingness to improve in ability to think or act is overcome with considerable ease in persons above 2.5 merely by the auditor's demonstration of the workability and effects of Dianetics. Here is a problem the auditor solves by education. No one above 2.5 who sees some validation of Dianetics in terms of testing or who through a little lock scanning or straight memory picks up some material he thought he had forgotten and which has been troubling him, will refuse processing, unless there is a question of finance involved -- but this can be resolved by the formation of co-auditing teams. This is not just an optimistic remark; it is borne out by considerable experience. Of course, individuals above 2.5 can still be possessed of a very low theta endowment or may be to some degree structurally deficient in intelligence. But even these, if the auditor takes care with them, gather some understanding of the subject. Some of these are incompetent co-auditors, and thus must be assisted by others whom they will not assist in turn.

From 2.5 down, inaccessibility is a problem, but even here, individuals who have a high theta endowment or who are only temporarily at this level will cooperate. There are two types of cases which will baffle the auditor. The first is one who is passing for normal in the society because of some routine ability to cope with the environment, who is yet low on the tone scale, who is very trying to the people about him or her, yet who is confirmed in resistance to any aid or assistance. This type of case is not normally recognized as insane in view of the enormous numbers of insane who are dramatically so. Yet this inaccessible case, just as bacteria crawl through the society, is injuring and enturbulating mates, children, and friends, down the dwindling spiral. Such people are so "reasonable" as to why they are doing what they are doing and are usually so set in their enturbulative ways and have been so non-classifiable to one and all that they -- like the lepers who once begged through the streets of Paris, their threat to the social health misunderstood -- continue to plague the society with the justification of their engrams and their destruction of the dreams, minds, and health of this and the next generation. Here is the real problem for the auditor. The husband of such a woman may be a desperately driven man by the neglect he finds in his home, by the scoffing which meets his dreams, by the nagging or nullification or domination of his just as thoroughly driven children. He may come to the auditor or may himself undertake a study of Dianetics in an effort to remedy his situation. Dianetics can remedy that situation, but he will not be able to process his wife, for such husband-wife teams do not work, and if he tries to coax her to process him, he is placing into her hands a further weapon for his own destruction. In the hands of another auditor, she will be capricious or sullen or angry. And even if the auditor does achieve success with this case to the degree of recovering and converting some entheta he and the husband may discover this woman possessed of just enough more self-determination to run off with another man. The wife who has this same type of situation with her husband may have an even more difficult time. Dianetics is a remedy which will apply and achieve results but the auditor is quite commonly baffled when he encounters these "rational" inaccessible cases. He should lay aside his bafflement and treat these cases as he would treat the most inaccessible, obvious psychotic. Because such people can keep a flow of "reason" running along accepted or normal channels, the auditor need not be deceived into thinking them genuinely rational. Here is a case where affinity, reality, and communication must be built, where the preclear's perceptics must be directed to present-time objectives, and where the most gentle entrance into the entheta must be made. The fact that such cases do not wear a large sign which says "INSANE" and the fact that the death they deal to those around them is not sudden, swift and spectacular, but slow and creeping, are not reasons to audit them as though they were nearly clear. Methods of processing for these people should be those which the tone scale chart indicates. If an evaluation of them shows them to be at 0.5 or 1.1, then the appropriate methods should be used, no matter how "rational" the preclear is.

It should be remarked that individuals may be low on the tone scale and still have enough theta endowment to desire processing and receive it and make use of it. These are accessible cases but, of course, should have light methods used on them and should not be allowed to run engrams any more than the inaccessible person at this level.

The next type of case which will give trouble to the auditor is the obviously inaccessible psychotic. A psychotic is that person, according to dianetic definition, whose theta has become entheta completely, and who is either entirely locked up in an engram or chain of engrams and does nothing but dramatize them, or who is under the command of a control circuit and does some computation, if limited and unreasonable. The psychotic varies in manifestation, but the reason he is psychotic does not vary. There are psychotics who are completely entheta all of the time, psychotics who are only acutely so, under certain circumstances, and psychotics who become completely enturbulated during certain periods of the day, or of the week, or of the month. (The last type, which is restimulated cyclically is generally running on a time factor contained in the engram. The incident may have occurred on the twenty-fifth of the month and continued to the thirtieth, so this person becomes psychotic from the twenty-fifth to the thirtieth of every month. Or the incident may have occurred at ten o'clock at night, and the psychotic is only insane at ten o'clock every night. The cyclic psychotic is processed by the auditor only during periods when a small amount of free theta is available).

No engrams must be run on individuals who are below 2.0 on the tone scale whether they are accessible or inaccessible save in those rare instances when the file clerk insists on presenting an engram, and they must be run then only with the gravest caution, and they must not be run even then if the auditor considers himself inexperienced. With the inaccessible psychotic whose "reason" is so evasive and aberrated as to appear so even to the casual observer, and with the psychotic who is caught in some engram, the auditor should give his whole effort to establishing contact, even by mimicking the psychotic or by discovering some small interest the psychotic may have in his environ and directing his attention to the details of that thing. Perceptics may be encouraged and recovered by as mild a thing as additional contact with some object in the environ. This, after it has brought some recovery of affinity, communication, and reality, may be followed by straight memory. All this is included here because auditors, knowing the basic cause of aberration, are ambitious to treat cause. The basic cause of human aberration, however, is a deeper one than a physical pain engram. It is, by dianetic theory, an enturbulence and entrapment of theta. Free the theta. When the engrams are to be run, they will present themselves.

The patter of the auditor in running engrams is a very simple one. It is easy to overcomplicate the simplicity of processing. People have written demanding to know how reverie is obtained, saying that after twenty tries they still have not been able to accomplish reverie in their preclear. They evidently have reverie mixed up with hypnotism and consider it unusual merely because it has a name. One induces reverie simply by asking the preclear to close his eyes. One brings a preclear out of reverie simply by telling him to open his eyes. The patter of running an engram is as follows:

"The file clerk will present the engram necessary to resolve the case. The somatic strip will go to the beginning of the engram. When I count from one to five and snap my fingers the first phrase in the engram will flash. One, two, three, four, five." (Snap !)

The first phrase of the engram presents itself. The auditor causes the preclear to repeat it until a somatic turns on. Then the auditor tells the preclear to go to the next phrase in the engram and repeat that, and so on, phrase by phrase, until the engram is run, then to go back to the beginning. Above 2.5, the action phrases in the case may not be very forceful, and the preclear may without much auditor assistance, after the above patter of repeating the first phrase is done, run the engram consecutively, repeating each phrase only once. If the preclear begins to come out of the engram suddenly and move on up the track into locks or if he suddenly starts telling the auditor about locks, the preclear has bounced and is no longer in the engram but has struck a phrase which caused him to move out of the engram. If the preclear suddenly moves down into a lower engram, he has hit a downbouncer. In each case, the auditor working with the file clerk should procure the data necessary, asking if there is an action phrase, obtaining the action phrase, and causing the preclear to repeat that phrase until he is back in the engram he should be running. However, when action phrases are this active the auditor has no business running very many engrams on the case, regardless of his hurry to get his preclear clear. He will do it faster by addressing secondaries and locks. The command value of phrases in

engrams upon the preclear is shown by how well bouncers bounce the preclear out of the engrams, how well misdirectors misdirect him, how well deniers deny further content in the engram. This is a very important fact. When the auditor has discovered how active action phrases are, he will know better whether he should run further engrams on the case or not. When the entheta in locks and secondaries is unburdened, the command value of action phrases and all phrases in engrams will reduce markedly. An engram phrase depends for its strength upon secondaries and locks. You can run out of almost any preclear an engram which has just occurred and which therefore contains no locks, but even this has its exceptions. The fact that has no exception is that a phrase in an engram loses its potency when the entheta in secondaries and locks is removed from above the engram by lock scanning or running secondaries or by straight memory. Get rid of the charge, and the ability of the engram to aberrate the preclear is slight.

This does not gain say the fact that after you have run a few secondaries or scanned locks or done some straight memory on a preclear and regained some free theta, even though the preclear remains fairly low on the tone scale, an engram may come into view which will have to be run by the auditor. The engram is basic, evidently, because it is the basic collision between theta and MEST. It is important because it is a trap for future enturbulences. Any case may possess from hundreds to thousands of physical pain engrams. It is a dull, inexperienced, and skill-less auditor who will run engrams on a case without assigning the case to its proper position on the tone scale and being governed thereby.

CHAPTER FOURTEEN

COLUMN AJ

Chains of Engrams

Engrams exist in chains. Phrases exist in chains. Somatics exist in chains. Perceptics exist in chains. The mind files in terms of time and topic. It is an elaborate filing system which, though simple in concept, would stagger anyone who would attempt to duplicate it in purely mechanical ways.

All the injuries, for instance, to the right thumb lie in the reactive mind in a chain of injuries to the right thumb. The phrase "I love you" lies in a chain, wherever it appears, in the reactive mind and in another chain in the analytical mind, and in times of restimulation the two may become one chain. A smash on the right thumb which was accompanied by the words "I love you" would be a crossing of the right-thumb somatic chain and the I-love-you phrase chain. Thus, somatics and words can criss-cross each other up the bank. A time track exists, then, for every topic which can be indexed. This filing system is a highly complex interweaving, possible to compute mathematically but rather impossible to draw, so varied may it be.

When one speaks of a chain of incidents, one means usually a chain of locks or a chain of engrams or a chain of secondaries which have similar content. These incidents in chains may contain the same dramatic personnel, such as all secondaries which contain mother and father or all engrams which contain grandmother, or may be all locks which depend upon a certain unknown engram or chain of engrams for their existence but which can be identified by the file clerk as a chain of locks, or may be any incident or perceptic lying on the time track which is interrelated with other incidents or perceptics.

A single engram is a consecutive series of perceptics, which may or may not include consecutive phrases, having to do with one injury at one period on the time track. Because an aberree can be expected to say the same things at any time when a certain set of circumstances is approximated in his environment, one can expect the engrams of any person who was many times unconscious in the vicinity of that aberree to contain this same dramatization over and over again.

Any of these things cause a chain. The single engram could be considered to lie across the time track in one place, but a chain of engrams is a series running up the time track. Or a chain could be considered a series of recurrences of a certain phrase, each time perhaps with a different somatic, which ran up the time track.

It is possible to collapse the time track. In a very heavily charged case, a grouper, a phrase which pulls everything in toward it such as the phrase, "Everything happens at once" or "You're all against me," (the sure central engram phrase of the paranoid or paranoiac), can, when too thoroughly restimulated, crunch the time track together. This occasionally occurs simply in the business of living. An individual has an engram restimulated which contains a grouper and the case is so heavily charged that the entire time track collapses. The auditor will enter such a case and find everything mixed and scrambled, no time track in existence, the preclear befuddled, low on the tone scale, ordinarily physiologically malformed, and certainly in a highly aberrated mental condition. It would be very nice if this preclear could simply have this one grouper run out of him but all the elements of the case (entheta) act to smother this grouper. Thus, lighter methods of processing than running the engram itself have to be utilized. The grouper is the chief danger in any scanning of physical pain engrams. A grouper can be hit on a highly charged case which will collapse the time track. The auditor, if this happened, by acting quickly might get a flash on what the grouper was and get it repeated soon enough to keep it from being closed in upon. But if the time track will collapse on a grouper, it

means the action phrases on this case are extremely active and the auditor has no business whatsoever scanning engrams.

The scanning of engrams was originally developed and used on any and all cases, and while it produced alleviation in some cases (if not the erasure of engrams), in others it produced a marked deterioration. Here is a technique of limited use, which can be used only when the amount of charge on the case has been accurately estimated by the auditor. As will be seen on the tone scale chart, the scanning of engrams can never be undertaken with any safety below the level of 3.5. An individual can be scanned from 3.5 up to clear, but he can only be scanned when bouncers do not bounce, misdirectors do not misdirect, when the majority of the perceptics are very clear and when the bulk of the secondaries are gone from the case.

The scanning of engrams, then, offers a quick way to finish up a case which has already been raised to 3.5 by other auditing skills. Below the level of 3.5, chain scanning of engrams should not be adventured upon, since sooner or later the auditor will strike a grouper or some other action phrase and enturbulate the case enormously. This is a dangerous technique and should be used only when the auditor is absolutely certain that he is dealing with a 3.5.

The scanning of secondary engrams can sometimes be done, but again, only if the individual is at 3.5 on the tone scale, since all the grief on the case may enturbulate into a ball.

The scanning of locks can be done from 1.1 on up the tone scale, and cautions relating to the scanning of engrams do not apply to the scanning of locks. However, in the process of scanning locks one will occasionally find his preclear dropping into an engram. This is because entheta in being freed exposes an engram which is not suspected. In a case which is too low on the tone scale to have an engram run comfortably, the preclear may be set to boiling-off and then may be scanned on some other chain until he is out of this engram, but ordinarily, physical pain should be avoided. In lock scanning, the file clerk should be consulted as follows:

“Can this chain be scanned without contacting physical pain?” (snap). If the answer is yes, then the chain is scanned. But if the answer is no, then another chain is requested. In short, one should not scan through physical pain on any case below 3.5 on the tone scale.

There are many ramifications to this technique of chain scanning. At first glance, chain scanning appears to be an excellent way to sweep all the engrams out of a case hastily and have a clear, but this is not what happens. Even at the 3.5 level chain scanning leaves on the case many somatics which then have to be cleared up. It might be said that the top comes off the engrams during chain scanning of engrams. Engrams which are scanned lower than 3.5 on the tone scale reduce but little, and below 2.5 entrap more than is freed, according to observation.

One scans chains of engrams, when he is sure that his preclear is a 3.5, by consulting with the file clerk as to whether or not a chain of engrams can be scanned. On an affirmative response from the file clerk, the auditor tells the preclear to go to the first engram on the chain. When he is sure that the preclear is there, the auditor signals him to begin scanning, and the preclear scans to present time through all such engrams. The preclear can scan at a speed slow enough to permit him to vocalize the most aberrative phrases which he crosses, or he can scan slowly enough to recognize the phrases but not to vocalize them, or he can scan at a medium speed, getting concepts of the incidents he is passing on the time track or he can scan at maximum speed, knowing that he is passing through incidents only by the flicking on and off of somatics.

Lock scanning can remedy damage which has been done by chain scanning. In other words, if the auditor makes an error and chain scans, let us say, a 2.5 level preclear only to discover that action phrases are sufficiently strong to cause the preclear to hang up on the track, the auditor can then lock-scan off the last few minutes of auditing and lock-scan it off very thoroughly so the damage to that degree can be remedied. However, one should not always count upon this as possible.

CHAPTER FIFTEEN

COLUMN AK

Circuits

The circuit is caused by a special type of engram command which, sufficiently charged up by locks and secondaries, evidently compartments off some section of the analytical mind which thereafter, to a limited degree, acts as a separate entity or another personality. "You" phrases such as "I have to do all your thinking for you," "I'm going to tell you what to do and you've got to do it," which are said to the individual or near him when he is unconscious and in physical pain, bring about this phenomenon, according to theory and observation. In practice, these circuits resolve when the case is unburdened of charge or when the engram containing the circuit is erased or reduced.

Distinct from circuits is the valence compartmentation which takes place in the mind. As has been elsewhere discussed, the individual's survival may become so intricately concerned with that of another human being, particularly during the unconsciousness or illness of the individual, that the dramatizations, personal habits, and even factors of personal appearance of the imitated person seem to become set up as a segment of the analytical mind. The individual may have several valences by reason of this kind of association. A child quite commonly has the valence of his father and the valence of his mother and the valences of other people around him. Valence is an exaggeration of that basic of education, mimicry. A human being learns his first lessons, and most of his basic lessons thereafter, in habits, mannerisms and skills, by mimicry. Anything which can be aberrated in the mind has a specific use toward survival when unaberrated. A child learns how to talk by imitating sounds. It learns how to walk by imitating the steps of its elders. During moments of physical pain, unconsciousness and illness, this ability enters into the reactive mind, which thereafter forces or can force the analytical mind to pattern itself without any self-determinism in thinking or acting, after another human being. The valence is a representation of a whole individual. When a case becomes fairly well charged a person can or does get into a valence and thereafter demonstrates the mannerisms, habits and patterns of thought of that valence. A person has his own valence and, potentially, the valences of the people around him. A case which is very heavily charged goes into valences so completely that the person sharply and distinctly changes personality and appearance when shifted from one valence to another. The original definition of schizophrenic or "scissors personality" was in observation of this shift of identity. A case must be very highly charged indeed and, of course, well below 2.0 for these valence walls to become so well defined that they are actual compartments in the mind and have such distinct memory banks that when the individual shifts from one valence to another he may have no recollection of what he did when he was in another valence, or even that he was ever in another valence. An individual can have two, six, ten, or any number of valences, potentially. A psychotic may be, to an intensified degree, two or more people, changing from one to another without any recognition that another has existed.

Nearly everyone has some valence trouble, in that when he is confronted by different people he feels he is himself a different personality. A man may feel like a lion when playing golf with his friends and like a mouse when he is talking to his wife. With his friends he may possibly be in his own valence (the happiest condition) or in the valence of some jovial individual he has known, but confronted by his wife, whom, unknowingly, he married because she reminded him of his mother, he is forced into his father's valence, and his father may have been a badly intimidated man.

These valence compartments of the mind operate in an individual above 2.0 under the very close attention of "I." The "I" of persons above 2.0 could be said to be actually in control of each valence, but as the charge on the case increases "I" is less and less able to control these valences. And below 2.0, the charge is quite commonly such that the valence compartments of

the mind develop their own "I" or awareness of awareness center. Here the real "I" of the individual is relegated to the few remaining attention units which compose basic personality.

Self-control is an actual thing exerted by "I." So long as "I" has enough attention units to control or command the analyzer, self-determinism exists, and exists to that degree to which "I" is able to exercise this command or control.

In the matter of valences, the submergence of "I" into these valence compartments brings about a condition, as the individual descends the tone scale, wherein when he is in father's valence he controls himself as father would have, and when he is in mother's valence he controls himself as mother would have.

Valences could be said to have bouncers, groupers, deniers, and holders, just as does an engram. This is to say that the phrase known as the "valence shifter" may force the person to be in any or every valence (grouper), or may force him to be barred out of a valence (bouncer) so that he cannot imitate some human being such as father, who may have had very good qualities well worth imitating. Typical valence shifters are such phrases as "You're just like your father," "I'll have to pretend I'm somebody else," "You're just like your mother, and you grow more like her every day, and I hate you for it" (which would make a person be like his mother and hate his mother and thus hate himself). There is also the synthetic valence, which is an artificial person. Or the valence command which makes a person like every stage actor he sees. Valences commonly exist for household pets, and it is not uncommon for a little girl to be in the valence of her dog or her cat and express herself with imitated mannerisms. When this happens to a marked degree, this child has a valence shifter which shifts her into the valence of the pet, such as, "You're just like Bonzo!" Whenever mother is angry, the child becomes "like Bonzo."

The most obvious place to observe valences is during the running of an engram. An engram has a valence potential for every individual surrounding the unconscious person. If a doctor, a nurse and a parent are present, for instance, around a tonsillectomy, and if they talk during the operation (something which should never be done!), there is then a potential valence set up for the doctor, for the nurse and for that parent. Of course, such an engram requires very heavy charge before these valences can take over any section of the analyzer. In running a heavily charged engram the preclear will be found, quite commonly, to go into the valences of people around him in the incident. He will not get his own somatics but he will get somatics which are commanded by phrases in the incident. If he is in a prenatal and running in mother's valence, he will have his mother's stomach upset rather than the pressure which was on him at the time. He is, thus, out of valence. After the particular valence is discharged or the valence shifter is located, the preclear can then run in his own valence, and only in such wise does he experience much relief. The auditor should not be running engrams continually on a case so heavily charged that it gets command somatics and goes easily out of valence.

The circuit is different from the valence. The valence mechanism produces whole people for the preclear to be and will include habits and mannerisms that are not mentioned in engrams but are the results of the preclear's compulsion to copy certain people. The circuit is a mechanism which becomes an identity in itself, with its own "I" which takes a piece of the analyzer, walls it off with the charge, and thereafter dictates to the preclear. In olden times, these were called demons. Socrates, for instance, had a demon which dictated to him, although the Socratic demon might not have been the result of an engram but, instead, a theta perceptic.

People commonly have various types of circuits and are unaware of the fact that they do have circuits. An individual's vocalization of all his thoughts and problems is actually a circuit at work which tells him how to think or tells him how to act. Thinking is so rapid and complicated that one would never have a chance to vocalize it. When thinking becomes vocalized, it is usually at the dictation of a circuit. A preclear may have one circuit that criticizes him, one circuit that seems to order him around, another circuit that mocks or derides him when he does something wrong, and yet another which gives him imaginary pictures.

The preclear who has active circuits has a relatively highly charged case, and the case should be unburdened of charge before the auditor attempts to locate these circuits in engrams. It can happen when a circuit results from some dramatization of the parent, such as "You stay there and listen to me!" that straight wire can locate an awake incident in the life of the preclear when the parent was saying this to someone. The simple location of the actual dramatization and the identification of it, by straight wire, may nullify this circuit. Similarly, when the preclear commonly acts like his father and is ill with the same chronic somatics his father had (or approximations of them), it occasionally happens that the identification of the basic valence shifter, by straight memory, will cause the preclear to shift into his own valence. It also may happen that by straight memory one can locate a time when father was complaining about his stomach, with the result that the preclear, who has been having trouble with his stomach, suddenly ceases to have that trouble.

Ordinarily, however, cases have to be unburdened of entheta to a considerable extent before circuits and valences become inoperative, at which time the preclear's "I" regains its self-determinism and control of the organism which had been contested by artificial "I"'s resident in the engrams.

All circuits could be said to be control circuits, in that they are attempting to do something to the preclear in contest with the preclear's own "I." These control circuits are artificial controls and should not to any degree be confused with the desirable self-control of the individual. No control circuit is actually able to control the individual toward survival. Admonitions to a human being to control himself if he is awake, may perhaps stimulate "I" to assert "I"'s right to handle the body, but they may as easily restimulate a circuit and put the individual under the control of some command in an engram.

There is a specific type of control circuit which is quite remarkable for giving the auditor trouble. When an engram contains a very forceful phrase such as "Control yourself," the auditor, running that engram even though it is heavily charged, may suddenly find the preclear running "auto" and going here and there on the track without any further commands. Here an auditing circuit has suddenly taken over. It is necessary for the auditor to discover the identity of this phrase and then have it repeated. The file clerk is sometimes unable to deliver up a control circuit, and when the file clerk becomes suddenly inoperative, although he has been working well before, the auditor should suspect that a control circuit phrase has shown up.

Similar trouble is encountered in the valence shifter, but here sonic and the somatic may go off while the preclear is yet in the engram. The valence shifter asserts its control only to the point of changing the preclear into another identity rather than changing his position on the time track. This is not true of a control circuit. The control circuit may conduct itself as an interior entity which takes the preclear out of the auditor's hands. When preclears are very hard to handle, take the bit in their teeth and try to run their own cases despite anything the auditor may do (providing the auditor has been doing a fairly good job of it, for "I" will sometimes pull the case out of the auditor's hands if the auditor is doing a very bad job), they are running on control circuits, recorded commands which make the preclear misbehave under auditing. The case which will do this is very heavily charged, and one should not be running engrams on it.

Some further comment should be made on the case who begins to audit himself. Evidently a few isolated cases have been able to do self-auditing, without any damage and, indeed, in one case with considerable benefit. A case may begin to self-audit when there are factors in the case and in the environment which are unsolved by the preclear or the auditor. The moment the proper computation is struck on the case, the self-auditing ceases. While anyone can straightwire himself, and this is a very useful procedure, and while almost anyone can do lock-scanning by himself, the heavier forms of entheta are more and more difficult to attack unassisted. The person who feels the need to run grief over some specific incident should, of course, run it whether there is an auditor present or not. But the individual who deliberately forces himself into an engram and attempts to reduce it will, in ninety-nine cases out of a hundred, merely restimulate the engram and enturbulate himself into helplessness and

discomfort before he has gotten it beyond the first phrase. Self-auditing is really “doing it the hard way,” when carried beyond straight memory or light lock scanning. In almost every case, heavy self-auditing can be put down infallibly to the engrams’ defending themselves from real auditing by deceiving the befuddled preclear into running himself through irreducible or dub-in incidents.

Control circuits not only dominate and order the preclear about, but they also nullify him. The preclear may have a circuit of a defeatist variety which makes him believe that he is unable to do what is asked of him and decreases his tone by telling him continually that he will fail. Such a circuit might be worded, “I’m here to tell you that you’ll never amount to anything. You’re nothing. You’re nobody. You’ll never succeed. You’ll never be a success, and it’s time someone told you the truth.” This circuit, with a heavy charge on it, commands the preclear continually down into the lower ranges of the tone scale by discouraging him. But to be operative at all this circuit would have to be very heavily charged and, probably, restimulated by some other person in the environment who is from day to day echoing this same attitude toward the preclear.

There are such things as sonic-disturbance circuits and visio-disturbance circuits. Sonic circuits are very easily recognized, for they speak audibly inside the head of the preclear or give him faint sonic impressions. The sonic circuit may occasionally try to manufacture engrams for the preclear, but there is one characteristic about circuits which always permits the auditor to differentiate. Circuits are ordinarily stupid. They are also discourteous. The auditor should pay no attention to them once he detects them, for to pay attention to them is to validate them to some degree. Where he discovers a circuit of this character he should not try to hammer toward the circuit; he should take enough charge off the case so that the circuit will be inoperative. These sonic and visio manufacturing circuits are very limited in repertoire, and the auditor should not be upset when he encounters them, nor should he then think that what the preclear is running is always a result of such circuits. To have these circuits, the case must be well below 2.0 on the tone scale, and the data at this level is rarely properly interpreted by “I” anyway. The auditor is not interested in data in this area. Thus, the visio and sonic circuits should not worry him, since they will not impede getting charge off a case. The auditor is not trying to run engrams.

There is also the occlusion type of circuit, the circuit which drops curtains across certain pieces of information or may mask “I” from contact with the standard bank or the reactive bank. This circuit might be worded, “For your own good I have to protect you from yourself.” This may be very sympathetically uttered in some engram and may be uttered enough times thereafter by the same person in the preclear’s environ to give a thoroughly charged-up occlusion. This individual, because he is “protecting himself from himself” cannot get into any portion of his mind for anything like optimum operation. But, again, to be effective any of these occlusion circuits require a great deal of charge. Lock scanning and straight memory will do much to alleviate these circuits, but the occlusion circuit can persist, worded a thousand different ways, to such a degree that all entheta becomes more or less occluded.

Circuits are peculiarly vicious in inhibiting the release of emotion. Here the auditor has a real problem in the heavily charged case which is yet running on circuits which tell him not to cry, not to feel anything, to forget it, and so forth. The auditor may find his initial entrance into the case seriously impeded. The circuit makes it impossible for the preclear to discharge a secondary engram. But by straight memory and lock scanning the auditor, ordinarily, can bring the preclear up to an ability to run secondary engrams, even without discharging these inhibition circuits.

Circuits exist which either enforce or inhibit affinity, reality, and communication. “You never love anybody” inhibits affinity. “You have to love me” enforces affinity. “Nothing is real to you” and “You’ve got to believe everything you hear” inhibit and enforce reality. “You’ve got to listen to me” or “You never hear what I’m saying” enforces or inhibits communication.

Valence shifts also give the auditor trouble when he is trying to unburden a case of secondaries. A preclear can be in the valence of father, who was not an emotional man, and so be unable to shed tears. A person may be in the valence of mother, who wept all the time, and may be in that valence so thoroughly that he appears to be running secondaries but is in reality obeying commands or responding to an imitative urge to cry. The case is not unburdened in such wise of any secondary. The simple fact of being out of valence places him out of contact not only with his own pain but also with his own emotional charge. The pain and emotional charge are on the case very heavy but the preclear, shifted into another valence, is feeling command somatics or the pains of the other person and is weeping the tears and feeling the fears of that other person. An individual could go on doing this for some time without much improvement in the case. It should be understood that only below 2.2 can a case be heavily enough charged to shift the preclear out of his own valence to the point where he cannot feel his own pain and emotion on at least part of the track. When a preclear is out of valence this way, straight memory, lock scanning (in which the auditor never worries about whether the preclear is in valence or not) and the running of locks are alternated until enough charge is off the case so that the case comes naturally into its own valence and naturally runs its own physical pain.

Fortunately, a case, no matter how badly out of valence it is, and no matter how heavy the circuits are, releases its own anaten in the form of yawns or boil-offs, even though it may not release its own fear or tears. The valence sometimes has a relatively imperfect but nonetheless existing time track, and one can send a preclear who is in father's valence down father's time track, which will exist wherever father was in contact with the preclear. This track can actually be lock scanned, but this is a mechanism the auditor need not worry too much about.

The auditor should understand the mechanisms of valence and circuits to understand what may be holding up his case and to understand and evaluate human behavior but a study of this chapter should impress upon the auditor that a valence or a circuit has to be heavily charged in order to be highly operative and thus the resolution of cases which are chronically out of valence (such as the coffin case) or cases which are heavily control-circuited depends upon the resolution of charge. Charge can be gotten off a case in the form of locks and even secondaries by straight memory and lock scanning as well as by high affinity, reality and communication as a result of the association with the auditor or of strong present-time survival factors or pleasure or even of education, as will be witnessed in group discussions where the tone of a person quite often rises.

Early in Dianetics, a tremendous amount of knowledge and skill was necessary in order to handle circuits and valences. This was because engrams were being run before the case was sufficiently discharged to have engrams run upon it. Now that a better understanding can be communicated to the auditor of what he is doing, now that the auditor can understand better what is meant by charge and how to get rid of it, this enormous technology is not so necessary to the auditor. However, he should have an understanding of it, since there will be those cases which would resolve much more rapidly if the auditor understood that all the preclear was doing was crying mama's tears or obeying a circuit.

One of the most blunt manifestations of circuits and charge in a case is what is called "prenatal visio." There actually is a prenatal visio, but it is black: The blackness of the prenatal, when the individual is stuck in a prenatal engram, will actually blot out his visio. Because he is stuck in an engram, his sonic will be blotted out. But here in the matter of visio it should be understood that while cells and the theta body probably record light, there is no mechanism save that of the imagination which is known to produce the pictures that come about with "prenatal visio." "Prenatal visio" may consist of whole colored scenes, outside of mama. Or it may consist simply in seeing sudden pictures go and come. A control circuit will produce "prenatal visio." "Prenatal visio" is false and has no bearing upon reality and means simply that the case is heavily charged. It quite often happens that "prenatal visio" will turn on for a moment while a preclear is running an engram in the pre-natal period. The auditor should immediately ask for a control phrase when this momentary manifestation of visio occurs. He

will find some phrase such as “I see what you mean” or simply “Control yourself,” which somehow crosses the imagination into the factual bank.

“Prenatal ESP” is another manifestation of charge and circuits. A circuit may exist which says, “I know what you’re thinking about,” and when returned to its vicinity the preclear seems to get the thoughts of mother and father by ESP. Actually these “thoughts” are composites of phrases which occur in the reactive and standard banks of the preclear. There may well be extra-sensory perception, but “prenatal ESP” is false.

There is an additional type of visio which the preclear gets that the auditor should know about, and this is not unlike the mirage which appears on the hot desert. A heavy boil-off; or heavy areas of anaten, may cause the preclear to drift off out of contact with reality and see scenes and even hear voices. These scenes and voices are quite disconnected, ordinarily. The preclear should never be interrupted when doing this. This is a sure symptom of a boil-off. Shortly (usually) this phase will pass and other perceptics of the engram will turn on. The preclear must always be permitted to go through such boil-off uninterrupted, without being jogged or shaken or spoken to, because things which happen while he in this condition become recorded, since he is close to being unconscious.

Dreams seem to stem from this type of circumstance. The dream is usually an engram which reflects through the haze of anaten up to “I” by some by-pass route and is considerably distorted on the way. The dream makes a great deal of sense when one has the engram. It even may enable one to find an engram which he would not otherwise suspect. But ordinarily, this type of guess-work is unnecessary, since a case that dreams heavily is either low on Vitamin B1 or heavy with charge.

CHAPTER SIXTEEN

COLUMN AL

Condition of File Clerk

As elsewhere mentioned, there are apparently several entities or response mechanisms in the human mind. Chief among these for the auditor, if not of the highest rank, is the file clerk.

It is evident, upon examination, that the manifestations of aberration in general -- valences, circuits, abilities of the mind and their distortions -depend upon the fact that the construction of the analytical mind contains, basically, the mechanisms which are subject to aberration by engrams. The reactive mind does not have the operating mechanisms necessary to put engrams into effect beyond their content of entheta and physical pain. A person suffering from a manic engram which tells him he is the greatest streetcar conductor in the world may very well perform as a great streetcar conductor. But it is the analytical mind which could be said to contain the only potentiality for being a streetcar conductor. This potentiality is not increased by the engram, but only enforced by it, to the exclusion of other abilities of the individual. Relief of the engram makes it even more possible for the individual to be a great streetcar conductor, since the engram contains physical pain and unconsciousness, which reduce analytical ability and thus make a person less able to perform. The control circuit can exist as a manifestation of an engram command only because the analytical mind possesses natively the mechanism of control circuits. The "I," as a part of its usual thought procedures, sets up and knocks down these control circuits at will. A whole series of circuits are set up by any new learning pattern, and these in turn compute independently of "I," to drive an automobile, for example. "I" gives little or no attention to many of the routine acts of the body but provides, through learning, circuits to handle these. Furthermore, "I," in full control of the analyzer, subdivides and makes up or breaks down compartments of the analyzer to care for various reasoning processes. The salesman, for instance, sets up a circuit to sell his product. The "I" of the salesman may be paying very little attention to what the selling circuit is saying or doing while carrying out the routine sales talk. Thinking is so complex that circuits are very necessary to care for various things about thinking. The cook ordinarily has many circuits which direct what she does with various dishes, while her "I" goes on planning on higher echelon policy or being amused by the radio.

In the preceding chapter, the reason for valences was discussed.

The imagination can be exaggerated or inhibited by engrams or charge and can actually be crossed into compute circuits by engrams or charge, but the imagination has to exist as an analytical function, a native portion of the analytical mind, before an engram and entheta can aberrate it.

Apparently, the main function of the file clerk is taking perceptive data, old conclusions and imaginations, and other data from the standard memory banks and forwarding them to the lower echelon computers or to "I." There are probably many attention units back along the standard banks performing this function, since there are obviously many sub-computers operating in any well functioning mind.

The analytical mind that is in very good working order, which is to say, not misinformed by the arbitrary data in engrams or suppressed by the entheta in the reactive mind, gets most of its answers on a flash response basis. The "stream of consciousness" of the fiction writer or the useless maundering of the individual who has a circuit which tells him he has to "think things over very carefully" and who verbalizes endless conclusions to himself are usually the result of engrams and entheta. The file clerk, or his minions, still hand through to "I" that data which is valid and accurate. The transaction is done, ordinarily, in milliseconds. As the analytical mind becomes more and more shut down by entheta, more and more attention

units are tied up or smothered. As this condition progressively worsens, the file clerk has more and more difficulty passing data through to “I,” since he is beginning to have to send it through circuits, through valence walls, and on unlikely routes. Under such conditions the milliseconds stretch out not just to seconds or minutes but to as much as three days. In a mediumly aberrated person the file clerk has to receive the order and return the answer through so much entheta and over so many circuitous routes that one “has to think” to remember something and may, indeed, suddenly receive the data requested yesterday this morning at ten o’clock, completely unrelated to anything one is doing at the time.

As a case becomes even more suppressed by entheta and the analyzer even more compartmented from the same cause, the file clerk becomes only a faint echo. Memory is considered to be “very bad,” the individual reaches his conclusions very slowly.

When the individual has dropped below 2.0, not only does the file clerk, as such, cease to exist for the individual, but the data begins to be passed back and forth by substitute entheta file clerks. The real file clerk is still there, but he is so suppressed that his functions are usurped. Thus, the receipt of data and the conclusions of an individual below 2.0 on the tone scale may be astonishing, to say the least. Not only is his analyzer cut down to a point where it computes instinctively in the direction of succumbing even though that direction may be masked, but the data on which the computation is done is mis-selected and distorted by entheta engramic selectors and storers. One might even go so far as to say that the individual below 2.0 fished most of his data from his engram bank rather than from his standard memory bank.

It is remarkable that in even a heavily aberrated individual who is amnesia-tranced or heavily sedated (and don’t try these things in processing, since they would result in a much further enturbulence and aberration of the preclear) the calm and serene basic personality may be discovered, and the file clerk, deeply buried but now revealed, may be found to be still in good working condition. But so few attention units remain in basic personality, even though it contains the fundamentals of what this person would be if cleared, that this should be considered only as a comment and not as anything useful in processing. It is stated merely to bring home the fact to the auditor that the file clerk does not die or vanish even in the psychotic, even though the auditor may feel this when he is working with the severely aberrated.

The file clerk normally gives answers which contain specific data rather than answers which require computation. For instance, one can ask the file clerk any question which can be answered by yes or no with fair confidence, above 1.5, and receive the reply. Further, the file clerk will give data on time, in terms of days of the week, dates of the month, months or years, to locate the preclear or an incident on the time track. Furthermore, the file clerk will offer up the names of things or of people or of chains when they are asked for. Or the file clerk, if the conclusion exists elsewhere in the mind, will forward through to the auditor the worded conclusion as to what should be done with the case.

The ordinary use of the file clerk is very simple. The auditor merely asks, “yes or no: are you stuck in birth?” (snap!). The reply will be yes or no. The terms in which the auditor desires his reply should be stated first. Thus the auditor says “Yes or no” before he asks the question. He would also say “Date” before he names the occurrence. And each time he would follow the question with a snap. Common, careless mistakes consist of reversing this procedure, so that the file clerk receives the “yes or no” after the question. In an ordinarily aberrated person the file clerk may simply echo “yes or no.” Another but ridiculous error is to snap before the question is fully asked. The snap is the sound impulse which drives the answers through the circuits. To snap before the question is complete is to have no data to drive through the circuits.

The file clerk must be handled with complete regard to the auditor’s code. It actually occurs that the file clerk in a relatively heavily charged case may work perfectly for one auditor who has high ARC with the preclear but may not work at all with an auditor who has slightly lower ARC with the preclear. This applies, of course, only to those cases which are below 2.0.

The snap impulse seems necessary in most cases. There are cases which object seriously to the auditor snapping his fingers. These cases are restimulated by the sound of the snap, and a little straight wire usually finds the source of the objection. However, the auditor should not throw his hand toward the preclear when he snaps his fingers, as this is very restimulative to any preclear who has been slapped. The motion of the hand toward an individual, if done suddenly, is uniformly evaluated as a hostile gesture. Just as the auditor should keep his feet off the couch or bed or its baseboards, should refrain from touching the preclear save when the preclear in distress wishes to hold his hand, so should the auditor use all courtesy with regard to the file clerk.

The file clerk should never under any circumstances be invalidated. He should not be asked questions one way and then another, as though the auditor doubted the first reply. The exception to this is the low-tone case which has a built-in circuit that responds to age questions. This the file clerk can evidently appreciate. But a very questioning attitude on the part of an auditor may well silence the file clerk.

There is a great deal to be said on both sides of reality. The file clerk may be validated by interested and satisfied reception of his data by the auditor, and can be invalidated by raised eyebrows or shrugs on the auditor's part. The preclear, in the middle bands, quite commonly distrusts his file clerk and will do enough invalidating himself. But when the preclear discovers that the auditor is accepting these answers, the preclear ceases this practice.

Just as a general observation in the field of working with the file clerk and the preclear, an auditor can rush a case which is in the middle or low bands of the tone scale and begin to audit with such energy that the preclear is enturbulated and sometimes sinks considerably in tone. Similarly, the file clerk and the preclear become annoyed and restless in the presence of an apathetic or uninterested auditor, one who will doze when a long chain of locks is being scanned, or one who will ask questions of the file clerk only when the preclear himself demands it. Too furious an interest, then, and too small an interest affect not only the file clerk but the general working of the case. The auditor must learn to adjust himself and his mood not only to the type of incident the preclear is running and to the personality of the preclear but also to the position on the tone scale of the preclear. The lower on the tone scale the preclear is, the more gentle, patient, and understanding must be the auditor. Even low on the tone scale, a preclear may have a file clerk that occasionally works, and this occasionality can, by validation of the file clerk, be coaxed forth to a steady response. But if the auditor is less gentle and efficient than he should be, then the occasional workability of the file clerk will cease.

Nothing shuts off a file clerk or a preclear faster than ineptness. A few errors can be condoned, but continual fumbling and uncertainty can cause a file clerk to give up and can produce a similar reaction in the preclear.

Rather amusingly, in the Foundation there was a spell of deification of the file clerk and other entities that had been discovered in the mind. The overall result was that auditors started talking to these entities rather than to the preclear. This tended to invalidate the preclear as an individual. The preclear is entitled to his opinions and is the focus of attention. The file clerk and other entities are simply, one supposes, portions of the analytical function of the mind. At one time the auditor form of address became "Mr. File Clerk," and the file clerk was thanked for every flash answer.

This kind of courtesy is evidently not particularly needed by the file clerk, but now and then the auditor will find himself working with a response mechanism in the mind which is very insistent upon courtesy and protocol. The auditor is not in this instance working with the file clerk, since the file clerk is a rugged mechanism with little to say and a brief way of saying it. But this does not mean that another entity should not be accepted.

Now and then the auditor will become concerned as to whether he is talking to the file clerk or to a demon circuit. His preclear would have to be fairly low on the tone scale in order to make this confusion possible. Demon circuits will actually respond, but they do not respond

with the quick flash and simplicity of the file clerk. Now and then one will run into a real audio demon circuit which is highly insulting to the auditor, for demon circuits are both stupid and unmannerly. The moment the auditor finds himself addressing such a circuit he does well to pay it no further attention and accept no further replies from it, because additional attention to this enttheta form serves to validate it for the preclear, if not to strengthen the form itself: Even though these demon circuits are amusing, the auditor should limit his attention to them, since all address in this direction is wasted effort. The auditor should merely know that such a thing can happen so that he will not be surprised if, as it rarely occurs, a demon circuit gets in his way.

The sharpness and accuracy of a file clerk declines as the case descends the tone scale. Generally, the more enttheta there is on a case, the less reliable is the file clerk. This normally does not become serious until the case is down to 2.0. After that, the condition of the file clerk not only becomes poor, but manifestations of the file clerk around 1.1 and 0.5 are such that no credence can be placed in them by the auditor. One will now and then encounter a preclear who gives "file clerk" answers, according to the preclear. The auditor should already recognize where his preclear lies on the tone scale before he begins processing, but even so the auditor may now and then be surprised by a "file clerk" who gives very extraordinary responses. "File clerks" have been reported by preclears which gave their yes-and-no answers as visible traffic signals. On the flash response, the signal arm would rise with a yes or a no sometimes complete with red or green light. Or a "file clerk" may be reported by the preclear as a pair of hands that deal playing cards on which are written yes and no. Or as in one case the "file clerk" may be a toy railroad train which comes swinging by, stops and turns up a dump car with yes or no painted on the bottom. These "file clerks" are not file clerks at all but circuit mechanisms customarily found in very heavily charged cases which have a great deal of control circuitry.

There is something about this control circuitry that turns on visio. Possibly it is because the imagination runs on a relatively self-controlled basis and because a control circuit can switch on imagination. However that may be, these mechanical devices and other manifestations when the auditor wants an answer from the true file clerk are symptomatic of cases low on the tone scale. The answers of these mechanisms should not be trusted.

There are heavily enttheta'd cases in which the file clerk always responds "yes-no" or "no-yes." Here again too much charge inhibits the auditor's use of the file clerk.

Unless the auditor can get a clear and authentic, even if occasional, response from the file clerk, he should not attempt to work with the file clerk. Here is the most certain and automatic division of types of processing to be used which the auditor can have: Does the preclear have a working file clerk? If the preclear does, then straight memory, lock scanning and secondaries are usually workable.

If the file clerk does not respond, or responds unreliably or with some strange mechanism, the auditor should limit his processing as a general rule to straight memory, very light lock scanning, and possibly fear secondaries, but avoid grief or apathy. If the file clerk's response is strong and accurate, engrams can probably be run on the case.

These comments will give the auditor a quick, jackleg diagnosis, if for some reason he wishes to work with a case for a short time as a demonstration or an assist and yet does not have a chart at hand or the time to locate his preclear on the chart. The auditor should always locate his preclear on the chart as accurately as possible if he is taking on a case for any term of processing more than a short session.

CHAPTER SEVENTEEN

COLUMN AM

Hypnotic Level

It is pertinent to case estimation whether or not the preclear is highly suggestible or can be hypnotized.

Hypnotism is an address to the reactive mind. It reduces self-determinism by interposing the commands of another below the analytical level of an individual's mind; it enturbulates a case markedly, and materially aberrates human beings by keying-in engrams which would otherwise lie dormant. It is the sort of control mechanism in which an authoritarian individual, cult, or ideology delight. People who indulge in hypnotism may, only very occasionally, be interested in experimentation on the human mind to learn more about the mind. Genuine experimental hypnotism, strictly in the laboratory and never in the parlor, and done wholly in the knowledge that one is reducing the efficiency of the human being on whom one is experimenting and may do him permanent damage, and the use of hypnotism by a surgeon for an operation, but not in company with any other anaesthetic, should end the extension of hypnotism into the society.

Submission to being hypnotized is analogous to being raped, with the exception that the individual can, generally, recover from being raped. To any clear-thinking human who believes in the value of people as human beings, there is something gruesomely obscene about hypnotism. The interjection of unseen controls below the level of consciousness cannot benefit but can only pervert the mind. It does not matter if the hypnotist tells his subject that he is going to be better at his job or that he will be healthier. Whatever the apparent attempted beneficence may be, the individual who would permit himself to be hypnotized is, frankly, a fool. Hypnotism, in common use, is simply a dramatization of some individual desiring covert control over his fellow human beings.

Hypnotism, by an investigation of it and its uses in the society, has been demonstrated to be much more widespread than was ever before suspected, since prior to dianetic processing there was no method known to man by which the damage of hypnotism could be undone. It was thought by hypnotists that the mere remembering of these suggestions would relieve them, and that the power of the suggestion died out with time. These two ideas do not happen to be true. The hypnotic suggestion has to be run as a very heavy deposit of entheta, nearly as heavy as a secondary engram, and it is thoroughly permanent until relieved by dianetic processing and is subject to restimulation just like any engram or secondary.

Of course, the surgeon or dentist who permits any unnecessary conversation or perceptics to exist in the anaesthetized patient's environ is practicing a brand of hypnotism much more serious, long-lasting, and savage than ordinary hypnotism, which does not include physical pain or hypnotic drugs. In having dianetic processing demonstrated to them, surgeons who knew their patients were unconscious and knew that no recording was taking place are astonished when these same patients, under auditing, play back the conversation the surgeon well remembers having used, and describe in tremendous detail operations of which, lacking technical training, they could have had no knowledge. The medical doctor and dentist forget that anaesthetics came into general use only late in the last century and are definitely newcomers in the medical field and that not very much is known, or was known, about them. Considered in this light, it should be less astonishing that they did not know what was happening to a patient under anaesthesia, since neither has man had much data about anaesthesia itself.

The obstetrician whose patient after delivery suffers from a post-partum psychosis cringes when he discovers that it was his words, spoken over the obviously unconscious girl, which laid into her mind the command that causes her to abhor the child and to attempt to kill it ten days after delivery. It is difficult to get a human being to accept responsibility of this

magnitude since it is so appalling what can be done in the operating room. Obscene jokes, and crass, derogatory personal remarks about the patient are the common conversation in the operating theaters of America today. Surgery should not be censured for this, since dianetic processing and the knowledge of the consequences of noise and talking and even music around the anaesthetized patient were not released until last year (1950). More and more hospitals in the United States, now cognizant of the harm which can be done, are training their surgeons into silence around anaesthetized patients and offering severe penalties for any conversation in operating rooms. So medicine at least is trying. However, the individual who knows Dianetics should not be shy or fall back from invalidation by the doctor when a friend or loved one is going to lie on an operating table. For one can afford a few set-backs, invalidations or rebukes from some behind-the-times doctor if it means that one's friend or loved one will get well much more swiftly and will show no greatly increased level of aberration or descent on the tone scale because of the operation or exodontistry. You will yet live to see the time, not many years off, when a criminal charge will be placed against anyone speaking in the vicinity of an unconscious person. The regular intake of sedatives such as phenobarbital causes the individual to walk around in a light hypnotic trance. The drug itself may not be very harmful to the nervous system, but this light trance makes it possible for the person to be keyed in by anything and everything around him despite the fact that under sedation he does not apparently notice it. Sedation of the neurotic or psychotic is a very dangerous practice. If one must do something by way of drugs for these people, better effects, according to medical observation, can be achieved by the administration of stimulants such as benzedrine. For some reason or other, probably because in a low-tone society individuals under thorough control excite less fear, sedation is considered less harmful. The stimulant is somehow considered to be too energizing, and medical doctors seem to prescribe sedatives much more rapidly than they will prescribe stimulants. Investigation of literature and consultation with accurate medical observation demonstrate that the individual shows less active aberration under mild stimulants. Below a certain point on the tone scale, of course, sedatives are administered in the hope that the patient will then cause the doctor, nurse or others around him less trouble, and are not administered in any hope or belief that they will in any way aid the patient. Actually, a few hours of lock scanning on any case will do more for his "nervousness" than a barrel of phenobarbital.

There is another form of hypnotism which falls between the surgical operation and straight hypnotism without physical pain. This form of hypnotism has been a carefully guarded secret of certain military and intelligence organizations. It is a vicious war weapon and may be of considerably more use in conquering a society than the atom bomb. This is no exaggeration. The extensiveness of the use of this form of hypnotism in espionage work is so wide today that it is long past the time when people should have become alarmed about it. It required dianetic processing to uncover pain-drug-hypnosis. Otherwise, pain-drug-hypnosis was out of sight, unsuspected, and unknown.

Pain-drug-hypnosis is a wicked extension of narco-synthesis, the drug hypnosis used in America only during and since the last war.

Hypnotism has the virtue, at first at least, of requiring the consent of the hypnotic subject before the hypnotism is done. Further, hypnotism has an additional virtue over drug hypnosis and over pain-drug-hypnosis, in that an individual in a hypnotic trance will rarely perform an immoral act even though commanded to do so by the hypnotist, unless that individual would normally perform such acts.

Drug hypnotism does not have to be done with the individual's consent. An individual who is drugged can receive and will obey hypnotic commands given to him by the doctor or operator and will continue to obey these commands after waking from the drugged sleep. By using the method of dropping a heavy sedative such as chloral hydrate into an individual's drink, by suddenly muzzling him with a silk scarf from behind and injecting morphine into his arm, or by discovering the individual when he is drunk or shortly after he has been operated upon or during an operation, or during the administration of electric shock or sedation in an insane asylum, drug hypnosis can be induced. Thereafter, the operator works much as in

ordinary hypnotism. Drug hypnosis can be administered with such wording that the patient will not only forget what he has been told and yet perform it, but will also forget that he has ever been given drug hypnosis, if that command is included, and he may even be given data to account for the time during which he was given the hypnosis. Drug hypnotism, then, can be done without the consent of the subject and is commonly so done even by doctors in the normal course of practice. There is nothing new or strange about drug hypnosis. It occasionally fails to work as the operator intends, and it does not usually strike against the individual's normal moral tone save that, of course, it inevitably lowers him on the tone scale, thus bringing about a tendency to generally lowered morals. But pain-drug-hypnosis, due mainly to the intent of the operator, is a much more vicious procedure.

It has been discovered that a drugged individual when beaten and given orders would almost invariably obey those orders regardless of the degree to which they flouted his moral tone or his position or his best interests in life.

Before Dianetics, the widespread use of this practice was unsuspected, simply because there was no means by which one could even detect the existence of pain-drug-hypnosis. An individual might be given pain-drug-hypnosis on Tuesday night and wake up Wednesday morning without knowledge of the fact that he had been slugged when he stepped out of his car, given an injection, painfully beaten but not so as to leave any marks, and put quietly into his own bed. This individual does not know that anything unusual has happened to him nor will he suspect it even when he is confronted with the fact that his conduct is extremely changed along certain lines. This individual, if the criminal operator desired it, would actually obey the commands to the point of striking up a friendship with some person the operator indicated, thereafter conducting his business along lines suggested by this "friend."

The Foundation undertook some tests with regard to the effectiveness of pain-drug-hypnosis and found it so appallingly destructive to the personality and so unfailing in its action, save in cases of individuals with theta endowment far beyond that of the normal man, that a wider investigation was undertaken, to discover just how many people one could find within easy reach who had been given pain-drug-hypnosis. Pain-drug-hypnosis is so effectively destructive that the Foundation has ceased experimentation along this line, having already learned enough and refusing to endanger the sanity of individuals. Psychotherapists with whom the Foundation has dealt have been eager to plant an engram in a patient and have the Foundation recover it, to see how many of the perceptics are recoverable. The Foundation will accept no further experiments in this line and informs experimenters that they do this at their own grave risk. A much more natural and valid validation of engrams can be done without the use of drugs.

A knowledge of engrams and the fact that people can be aberrated into becoming insane or criminal by the existence of engrams should be validation enough for the fact that pain-drug-hypnosis can be done without the knowledge of the individual and can command him to do things which are not only counter to his own survival but highly immoral or destructive. The hypnotic level of these individuals is directly proportional to the ratio of entheta on the case. Hypnotism deals in entheta. not in reason. The implantation is made directly into the reactive mind. The more entheta or charge the reactive mind contains the more easily implantations may be made to work and the more easily the person may be hypnotized. Each hypnosis enturbulates to a slightly greater degree and entraps and encysts more theta into entheta in the mind of the hypnotic subject. Continual and repeated hypnotism, simply by continuing to convert more and more free theta into entheta, causes the individual to descend the tone scale. The manic effect of a manic hypnotic command has a limited duration, but the lowering of tone it produces is permanent, in the absence of dianetic processing.

Hypnotism further, acts as a key-in of many engrams and a restimulation of locks and secondaries, and thus increases the aberration of the hypnotic subject by approximating the words in engrams and secondaries, at a time of lowered or absent analytical awareness.

The auditor should realize, then, what hypnotism does to a case (1) so that he will not use hypnotism and (2) so that he will pick up out of the case all hypnotic commands as one of his first orders of business.

The patter of hypnotism goes somewhat as follows: "You are relaxing. You are sinking down, down, down (which sends the subject down the time track, although the hypnotist didn't know it). You are getting sleepier and sleepier. All you can hear now is the sound of my voice telling you to go to sleep (which installs a circuit). You want to believe everything I am telling you (which cuts down the ability of the subject to evaluate data). Everything I say to you will make a deep and lasting impression on you. When you wake up you will discover that you feel very light and airy. You will want to be kind to people. Any time in the future that I say the word 'Abracadabra' you will go into a hypnotic trance, no matter where you are or what you are doing. You want to do exactly as I tell you to do. I am your friend. I am the best friend you have. When you wake up and I touch my necktie, you will take off your left shoe. When I put my hands in my pockets, you will put your left shoe back on and explain your actions (the subject would, anyway; this is a post hypnotic suggestion, and the subject when he awakens will perform this act at the operator's signal). You will now forget everything I have said to you during this session. You do not want to remember. The harder you try to remember, the more you will forget. As I count from one to seven, your memory of this incident will grow less and less and finally will vanish. One, you are beginning to forget. Two, you are forgetting a little more. Three, you are forgetting more. Four, its more than half forgotten. Five, it is becoming very dim. Six, it is just a dim, dim dream. Seven, now shake your head and the facts will all fall out."

This is rather typical patter. It varies somewhat and the phrases are often repeated many times. The auditor who knows that hypnotic patter is more or less like this can, when he is reaching for it, cause the preclear to repeat these phrases, or phrases like them, or get the phrases from the file clerk -- which is the reliable way to do it -- and so, by knocking out the forgetter mechanism at the end, or knocking out an idiotic statement like "shake your head and the facts will all fall out," he may restore to the preclear considerable memory not only of the incident but of his life in general.

When drugs are added to hypnotism the amount of entheta is considerably increased, but the drug effect will come off in processing in the form of boil-off (which is covered under Relative Entheta on Case).

When an auditor finds his preclear unusually suggestive, he should be very careful what he says to the preclear. He may notice that a preclear after he closes his eyes will begin to flutter his eyelids. This is a symptom of the very lightest level of hypnotic trance. The auditor cannot avoid processing the case, but he should be careful to use language quite unlike hypnotic suggestions and be certain at the end of the processing session to scan off the auditing.

There is very little the auditor can do besides straight wire with a case which goes into an hypnotic trance each time a command is given to close the eyes. Returning back down the track slightly increases the suggestibility of any person. There is no harm in this except during boil-offs. During a boil-off, remarks which are made to the preclear may be forgotten and lost, thus becoming hypnotic suggestions. All sessions, therefore, should be scanned out with particular attention to any period when the preclear was boiling off. The auditor may find a preclear who insists on being drugged or hypnotized in order to be audited, as a dramatization of some past command. If this preclear insists on being hypnotized, the auditor can be certain that hypnotism exists in this case, whether or not the preclear has any recollection of it. Hypnotism is general in our society, and a request for hypnotism is a dramatization of hypnotism. Further, the percentage of people who remember that they have been hypnotized or how many times is very slight.

Hypnotism has been a parlor game, the tool of the pervert, the command assertion of the authoritarian, and is more general than one would immediately suspect, as the auditor will discover after he has processed a few cases. He should not be surprised at what he finds in a

hypnotic incident, since the facts may differ entirely from what the hypnotist told the subject had taken place. A motto one could use is “Never believe a hypnotist.”

In dianetic processing we used to use what was called a “canceller.” At the beginning of the session, the preclear was told that anything which had been said to him during the session would be cancelled when the word “cancelled” was uttered at the end of the session. This canceller is no longer employed, not because it was not useful but because lock-scanning provides the means of scanning off all the auditing. This is a far more effective and positive mechanism than the canceller. In scanning old auditing off cases, the auditor will occasionally find that the preclear cannot recover what the auditor said. The reason for this is that the canceller has acted as a forgetter mechanism and has closed off the auditor. Merely using repeater technique, which is to say the standard words of the canceller said over a few times, will bring the preclear into contact with the first canceller in the case, and the consequent cancellers will then have no great aberrative effect.

It should be remarked about hypnotism that the early hypnotic session is the more valid one, even if it is cancelled by a later hypnotic session. The mere command in a later hypnosis that the early hypnosis does not exist will do nothing to render the early hypnosis less effective, but it will only make the subject forget it more thoroughly. And the commands of the earlier incident will still be accepted over those of the later. This is the way all engrams work. However, in unburdening hypnotic sessions from a case, sometimes one has to start with the latest session and work back because of the amount of entheta entrapped in the last sessions, which, being the latest of a long line, will be found to be very aberrative to the case.

CHAPTER EIGHTEEN

COLUMN AN

Level of Mind Alert

It could be postulated that there are actually several levels of mind function. For purposes of analogy and the communication of the technology of processing, we use, generally, simply the reactive mind and the analytical mind. The analytical mind would be that part of the being which perceives when the individual is awake or in normal sleep (for sleep is not unconsciousness, and anything the individual has perceived while he was asleep is recorded in the standard memory banks and is relatively easy for the auditor to recover.) The standard memory banks, then, would be recordings of everything perceived throughout the lifetime up to present time by the individual except physical pain, which is not recorded in the analytical mind but is recorded in the reactive mind. The analytical mind would have, additionally, recordings of its conclusions at the time it perceived certain things in the environment. conclusions in the analytical mind are taken from observation and experiences and education adjusted to the environment of present time and the future. conclusions and perceptics are filed by time and topic. The computeive mechanism of the analytical mind works, evidently, on the basis of comparison of data and evaluation in terms of differences. The brightness of the analytical mind consists first of its ability to record perceptions in the environment; next, of its ability to recall them either to review memory or to bring about new computations; third, to compare and evaluate data for purposes of optimum survival along any or all of the dynamics; fourth, its ability to refile the conclusions so reached; fifth, its ability to summate and compare those conclusions as needed in further computation. The analytical mind would also contain the imagination, which either creates new realities out of whole cloth, or patches them together out of old bits and pieces of experience. The function of the imagination is to postulate goals, foresee obstacles toward them, and give definite shape to present and future environments. The analytical mind also records, in company with conclusions, all imaginings and compares and re-imagines these as an aid to optimum survival.

Uninfluenced by arbitrary data, the analytical mind theoretically is capable of perfect computation at all times. The data on which it computes may be erroneous, but the computer itself is right. An adding machine gets right answers so long as it is used, unless there is something wrong with the operator or with the machine itself. As the analytical mind is its own operator, in looking for errors, then, one must examine the sources of data. The standard memory banks have erroneous data in them only on an educational basis. Consider an adding machine which added an extra five into every column without the knowledge of the operator. Each time the operator added five to five he would get fifteen. When he added twenty to ten he would get thirty-five. In the case of a multiplying machine, if the machine multiplied by an additional five each time a product was required of it, the operator when he multiplied two times ten would get one hundred, when he multiplied one times five he would get twenty-five. In each case, the error in the machine is the addition of a hidden arbitrary. If one were doing subtraction, and the machine always subtracted five more than the operator called for, when five was subtracted from ten, the operator would get zero. When ten was subtracted from twenty, the operator would get five. In the case of division, if a machine divided by one more than the operator desired, when the operator punched out five into thirty, he would get a quotient of five. When he punched out three into twelve, he would get a quotient of three. Here, unseen and hidden errors, lying below the observable mechanical level of the machine and out of the operator's knowledge, would, by injecting hidden numbers into sums and multiplications, subtractions and divisions, produce wrong answers.

The analytical mind is continually subjected, in an aberrated individual, to these arbitrary data. The individual is unaware of the existence of these data since these data arrive into the reactive mind at a time when the analytical mind is unconscious. The analytical mind did not perceive or record the fact that the data came in and it is, then, not aware of the fact that

the data exists. Thus, the analytical mind can be subjected to hidden arbitrariness, which obsess or compel it or inhibit it from making correct conclusions.

The purpose of the analytical mind is to be right and never to be wrong. A person who is generally more right than wrong survives. A person who is more wrong than right succumbs. It is not until the analytical mind is almost completely shut down, as at 2.0 and below, that the direction toward succumbing is taken, since the analytical mind is not present in sufficient force to take the course of survival in the face of the arbitrary data forced upon it by the reactive mind.

The reactive mind is the composite of entheia on the case. The analytical mind would be the sum of reasoning theta. The total content of the reactive mind consists of locks, secondaries, and engrams. These contain phrases which are capable of considerably deranging computation and imagination. Enforced by the physical pain portion of the engram, these arbitrary data have command power on the analytical mind. The analytical mind, resisting this command power, will force the pain to turn against the body, producing chronic somatics, which compare to rheumatism, bad hearts, migraine headaches, malfunction of the endocrine system, and other undesirable characteristic chronic somatics. Theoretically the analytical mind has as part of its ability, when it is working freely, command over any part of the organism. This is true at least when the analytical mind works via the somatic mind. The somatic mind would be that mind which takes care of the automatic mechanisms of the body, the regulation of the minutiae which keep the organism running. Here is a vast system of valves and meterings. However, the reactive mind can work against the analytical and somatic minds to enforce and inhibit all these regulative functions and throw them out of adjustment, bringing about various non-optimum physical conditions.

As has been stated, other levels of mind can be postulated. One could consider as many as eight or ten mind levels. The somatic mind level would be that which concerned body cells. These seem to run on a theta-MEST union which gives to each cell an organism life of its own. Science for many years believed that the life of the whole organism was only the composite life of the cells. This is extremely unworkable, and the discovery of the point field of energy of the body by recent scientific workers gave the most precise kind of evidence as to the existence of an overall organism life. A body composed simply of cells, each one with a life of its own, would not have a point field. The overall organism, however, does have a point field. Here is a measurable aura which evidently is in addition to and, according to work in Dianetics, independent of the cellular life of the body. In other words, there is evidently a theta body, capable of its own independent survival, superimposed on the organism. The departure of this theta body marks the point of organism death. The organism, however, still contains life. The cellular organism survives, as concerns the least independent cells, eight to ten minutes, or as in the case of highly independent cells, upwards of a year. In other words, there is a separation of the organism body and the theta body, according to these postulates and observations, and then ensuing death to the cellular life of the organism body.

The somatic level could, then, be considered a low mind form, for these cells have certain responsive actions and habit patterns of their own, and their overall network of organization is below the level of rational thought. Next would be the reactive mind, that type of mind which predominates in most lower forms of life. The reactive mind learns by physical pain, and thinks in identities, and reacts by absolute authoritarian command. It carries the organism up to 2.0 on the tone scale. From 2.0 down on the tone scale, nearly all thinking is stimulus-response, the type of thinking which some authoritarians would have liked us to believe was all the thinking of which man was capable.

The analytical mind comes more and more into command of the organism as the tone scale is ascended. Of course, it occurs in all human beings, even those below 2.0, that some analytical activity remains. But from 2.0 down, this analytical activity is normally used for justification of the organism's reactive actions. From 2.0 up, the analytical mind is more and more in control of its own organism, and computes more and more along optimum levels of thinking, which is to say it becomes more and more reasonable. By the time 4.0 is reached, the

free theta with which the person is endowed is able to circulate freely through the thought structure possessed by the person (and by thought structure is not meant, necessarily, physical structure).

Many more mind levels apparently exist above the analytical level. There is, for instance, clear evidence that there is an aesthetic mind level, which is probably immediately above the analytical mind level. The aesthetic mind would be that mind which, by an interplay of the dynamics, deals with the nebulous field of art and creation. It is a strange thing that the shut-down of the analytical mind and the aberration of the reactive mind may still leave in fairly good working order the aesthetic mind. The aesthetic mind is not much influenced by the position on the tone scale, but as it evidently has to employ the analytical, reactive, and somatic minds in the creation of art and art forms, the amount of aberration of the individual greatly inhibits the ability of the aesthetic mind to execute. A person with a great deal of theta as an initial endowment may be potentially a powerful musician by reason of his aesthetic mind. The aesthetic mind, evidently, attempts to execute music through the existing media of the analytical and reactive minds, through both the analytical power of the individual and the aberrations of the individual. The more theta, whether in terms of free theta or entheta, an individual has, the more forceful will be his demonstration of all factors, both analytical and reactive. Because individuals who are very heavily endowed with theta seek to control enormous quantities of MEST and other organisms, they are fought hard by organisms exercising their own self-determinism. Thus, a person of great theta endowment picks up more numerous and heavier locks and secondaries than persons of smaller endowment. This is not because more theta is there to enturbulate, but because there is more counterattack against the individual. The aesthetic mind, according to theory, attempting to bring about art forms, uses all the theta.

It was once thought that it was absolutely necessary for an artist to be neurotic. Lacking the ability to do anything about neurosis, like Aesop's fox who had no tail and tried to persuade the other foxes to cut theirs off, frustrated mental pundits glorified what they could not prevent or cure. Silly little books on the subject of how fortunate was the crazy person were offered in justification of this defeatism and helplessness.

Aesthetics and the aesthetic mind are both highly nebulous so far as our present understanding of them is concerned. But this is known, that any creative artist, as he descends down the tone scale, becomes less and less able to execute creative impulses and at last becomes unable to contact his creative impulses. By dianetic processing, we take a currently successful but heavily aberrated artist and we bring him up the tone scale. We can observe that his ability to execute what he conceives and the clarity with which he conceives it both increase very markedly. His aesthetic ideas do not become conservative or humdrum but become often wider and more complex. He becomes more himself and better able to do what he can in the field of aesthetics. The only modification of this is that as he rises up the tone scale he adopts greater scope and robustness in his work. The art form with which he is working and his method of handling it might have demonstrated considerable aberration, as measured by the casual observer. His paintings might have been strange and creepy, or his music hauntingly morbid. His art form, as he rises up the tone scale, evidently alters little except to increase in force of execution and deftness of communication. The morbidity in his music, if it did not depend on how sad he was personally with life, does not disappear. But as he rises on the tone scale, he is no longer fixed at a position where he must paint strange and creepy paintings or write morbid music. His versatility increases. The author who can write only one book of one kind with one tone is not, frankly, much of an author.

The artist laughed himself into very short breath over the fumblings and mumblings of the many warring camps of mental therapy when they confronted aesthetics. Some of them even assumed that they could judge the mental state of an author by reviewing his writings. This is somewhat on the order of a snail giving his opinion of the Parthenon by crawling through its reliefs. As an illustration, any able composer or author can write in many aesthetic forms and can approximate with his work any level of the tone scale. No artist attempting to interpret life is worthy of being called an artist unless he can view almost in the same sweep both apathy and exhilaration. A good poet can cheerfully write a poem gruesome enough to

make strong men cringe, or he can write verses happy enough to make the weeping laugh. Any able composer can write music either covert enough to make the sadist wriggle with delight or open enough to rejoice the greatest souls. The artist works with life and with universes. He can deal with any level of communication. He can create any reality. He can enhance or inhibit any affinity. The aesthetics have very much to do with the tone scale and with the interweaving of the various dynamics and urges along these dynamics into harmonious patterns random enough and artful enough to accomplish what the artist intends to accomplish. The artist has an enormous role in the enhancement of today's and the creation of tomorrow's reality. He operates in a rank in advance of science as to the necessities and requirements of man. The elevation of a culture can be measured directly by the numbers of its people working in the field of aesthetics. A society which in any way inhibits, suppresses, or regiments its artists is a society not only low on the tone scale but most certainly doomed. A totalitarian state, following its usual line of perversion of truth, talks endlessly and raucously about its subsidization of the artist. But it subsidizes only those artists who are willing to work for the state exactly as the state dictates. It regiments the artist and prescribes what he will do and what he will write and what he will think.

This is in direct controversion to the function of the artist in a society. Because the artist deals in future realities, he always seeks improvements or changes in the existing reality. This makes the artist, inevitably and invariably, a rebel against the status quo. The artist, day by day, by postulating the new realities of the future, accomplishes peaceful revolution. It happens, however, that democracies and other forms of government are prone to overlook the role of the artist in the society. In the United States, for instance, the artist may write one great book or make a great motion picture or compose one great symphony and may achieve, all in a moment, the bulk of the gains of his lifetime. His whole dedication, from childhood, might have been toward the creation of this one great work, and yet democracy, avidly taxing its powerfully creative individuals into non-production, snatches from the artist any such fruits of victory and exacts an enormous penalty for the creation of any work of art. One of the greatest single moves which could be made to advance and vitalize a culture such as America would be to free, completely, the artist from all taxes and similar oppressions, and thus attract into the arts the most ambitious and able and invite them to pursue unchecked the creation of all the beauty and glory on which any culture depends if it would have material wealth. The artist injects the theta into the culture, and without that theta the culture becomes reactive.

This dissertation on the function of the artist is given at this place partly because it should be said and partly because the auditor should understand that the impulse to create and construct surmounts the merely rational and reactive fields of reason. Further, the auditor may occasionally have to defend Dianetics against the strange, neurotic belief that when an artist becomes less neurotic he becomes less able. Some artists, regrettably, have been educated to this belief and so, by this very education, seek to act in their private and public lives in an intensely aberrated fashion in order to prove that they are artists. The education to this effect is such that the auditor can commonly discover some young girl in the field of the arts living like a prostitute in order to convince herself and her friends that she is truly artistic.

In the early days of Rome, art was fairly good. The Christian revolted against Roman disregard for human life. When the Christian revolted he did the reactive computation that he was revolting against the Romans. He condemned everything that was Roman as bad, and for fifteen hundred years it was an evil thing to take a bath, because the Romans had bathed. Unfortunately, although the Catholic Church recovered early and began to appreciate the artist, this was not true of some of the early religions which came to America. These were still in full revolt against anything that was Roman. They revolted against pleasure, against beauty, against cleanliness, and against many other desirable things which are in themselves the glory of man. The artist then revolted against this declared unreasonableness and went on a course as thoroughly reactive as had been the course of Puritanism and Calvinism. Being artistic was commonly identified with being loose-moraled, wicked, idle and drunken, and the artist, to be recognized, tried to live up to this role. This feeling persists to this day and low-tone people often embrace the arts solely as an excuse to be promiscuous, unconventional and loose in morals.

One finds, hanging around the easel of the painter, women who are “artistic” but who are, so far as their actual conduct is concerned, seeking not to create anything but to escape the name which is rightly theirs. One finds some poor young fellow who could have been a fine architect educated into the Great-Art-Can-Only-Be-Done-By-Moral-Lepers School. These observations are brought to the attention of the auditor for just one reason: the individuals of greatest potential worth that he will process will probably be artists. He will do well to address thoroughly all the “education” and “artistic environment” of the artists and would-be artists, whether writers, composers, poets or painters, because here he will find the track strewn with entheta. If the auditor wishes to rehabilitate an aesthetic mind, he must address all the entheta which has accumulated around the subject of aesthetics. No more authoritarian field exists, since none of the principles of aesthetics have been accurately formulated, and it is an axiom of Dianetics that the less is accurately known about a field of the humanities the more authoritarian will be that field. Any field which has critics galore, wherein a thousand different schools of divergent opinion can exist, where opinion is listened to with open mouths in lieu of reason by which any man can reach a conclusion, is an authoritarian field. Aesthetics, unfortunately, abounds in these critics and opinions.

The whole field of arts is thus enturbulated, and the artistry of the culture is thereby greatly reduced. The rehabilitation of the art-ability of a culture is a tremendously valid undertaking, and will repay a thousand times any effort made in that direction. A culture is only as great as its dreams, and its dreams are dreamed by artists. When the level of existence of the artist becomes impure, so becomes impure the art itself, to the deterioration of the society. It is a dying society indeed into which can penetrate totalitarianism. The group aesthetic mind of that society must be almost wholly unable to operate. No society in which art was elevated and supported, in which the writer, the musician, the poet, or the architect had any stability or position, would tolerate the work-dog theory of man’s highest destination. For if the industry and commerce and material projects of a nation are carried on the backs of a few able, desperate men, then the honor and the glory of that society is carried and enhanced by the artist.

There may be many levels of mind above the aesthetic mind. It would be presumptuous to classify them if one did not understand but had only observed the possibility of their existence. Classification of or assignment of names to things which one does not encompass with one’s understanding is an authoritarian procedure and leads to nothing but confusion. A mental illness, for instance, should be classified with a designation which would lead to its alleviation. Simply classifying one introduces complexity without advancing understanding. It is quite common in authoritarian fields to advance a great many descriptive names for things based on partial or obscure observations of uninformed and unskilled observers. This makes for a vast amount of “technology” and gives a certain “dignity” (pomposity) to an “authority” in an authoritarian field. One would not in any sense consider a professor of English literature a creator of literature simply because the professor knows the names of the writers and all their works and the multitude of opinions critics have expressed about them. This cataloguing can very easily pass for “appreciation.” In a low-tone society, which will admit authoritarianism without much rebuke and bend before the thundering witless manifestos of some critic or practitioner who knows nothing more of his subject than an enormously complex vocabulary, one can expect the definition of a “cultured person” to be that person who can recite and give the standard opinion about numerous artistic works and humanitarian “ologies.” This makes it very simple for an individual to obtain “culture.” He must only memorize, without thinking about, the names of the great operas, the great books, the great paintings, and the humanitarian projects of the past. In a low-tone society, the universities perform this function ably, if raucously. In a low-tone society, institutions of “learning” are commonly deserted after a year or two by most persons who, through reason, wish to be of worth to their fellow men. In other words, in a low-tone society, education is denied, because it is education by classification, to most of the individuals who would actually help that society.

Thus, no attempt to classify any level of mind alertness above the level of the aesthetic mind will be made beyond stating that these mind levels more and more seem to approach an omniscient status. Somewhere, possibly on the fifth level, lies the functioning mind of the

spiritual or religious man who has passed over the border of a consideration of MEST or of organisms and is turned toward an understanding of and a co-operation with both the theta universe and the Supreme Being. What vast frontiers are opened by the scientific evidence which continues to accumulate in Dianetics, what these frontiers and the knowledge they embrace will do to alter or enhance man's culture cannot at this time be estimated. For example, even at this time in Dianetics one can prove, as science demands proof in terms of sensing, measuring, and experiencing, the immortality or near immortality of the individual. Oddly enough, or perhaps not so oddly, hardly any re-interpretation of scripture is necessary', save that the boldness and scope of past considerations about the human soul, God and the Devil, and Heaven and Hell are stabilized and made contactable. The importance and value of organism death is enormously reduced, should dianetic investigations and conclusions continue to be corollary to or concordant with man's great religions. Religions, fighting uphill against the oppressions of Godless ideologies, may gain new strength and meaning. The level of behavior of the individual, whether good or evil, would appear to have new significance. For those people who overcome the suppressors to their goodness, ethics, and honor, an upward surge toward spiritual immortality seems to be indicated. Those who succumb to the Forces of Evil and are unable to live more than evil and destructive lives would seem, should these conclusions be borne out on further investigation of a scientific nature, to be entered not only upon a dwindling spiral in one generation but upon a decline toward a final end of pain or non-survival as personal identities. Some of these partially observed and explored possibilities (or probabilities) would seem to give newer meaning to the cycles of societies and groups and their survival or death.

As one examines these upper levels of mind, when one examines the evidence of the theta body, and when one himself experiences, incidental to processing, the evidence of his own continuation into yesterdays and an evident guarantee of his tomorrows past his death in the current generation, one's orientation with regard to goals and purposes may undergo a considerable alteration. The biologist, revolting against churches which may or may not have considerably suppressed scientific research in the past, has sought to dream for man an origin out of mud and ammonia seas and a source for him independent of God, but springing only from material things. This reactive overreaching gave us no method of alleviating the unhappiness of man, even in the restricted fields of chronic somatics and mental aberration, and gave to us instead tremendous weapons of destruction without providing as well any sanity with which to use them.

Under the guidance of the material-blinkered scientist, whose greatest goal was a work-animal adjustment of man to a physical environment, whose end for the individual was six feet of ground and a coffin sometimes proof against worms, and whose goal for the group was an ant society wherein the smallest unit of life worthy of notice was ten thousand individuals, we have been led down dark and evil byways of destruction not only of the dreams, hopes, and ethics of men but of the MEST planet as well. Materialistic science, operating on the premise that man came from mud only, that the mind is a queerly erroneous stimulus-response mechanism, that the human soul is a delusion, that God was a myth of some aberrated Mesopotamian, has presented us at last with the immediate and real threat of man's extinction as a species. In view of the fact that this materialistic science led only, then, in the direction of death, even the unthinking should see the fact that something must be desperately wrong with the teachings of the Lysenkos, the Darwins, and my learned schoolmates, the atomic scientists who have given man at last for his gravespade the atomic bomb.

However, it was natural for man, as an organism heavily enturbulated with MEST, to bring to perfection something like the understanding of the laws of MEST before he looked about to see whether anything else might exist. The materialist scientist has enormously advanced man's control of MEST, even if he has by his doctrines considerably inhibited man's understanding of what in Dianetics we call theta. Francis Bacon, Newton, and the rest developed ways of thinking about thinking and ways of reasoning about reason which have been of considerable value to Dianetics and without which, indeed, Dianetics could not have been formulated. But Bacon and Newton did not espouse the materialist cause. Their disciples developed the doctrine that man came from mud and that man's destiny was mud. If Dianetics

does not come too late upon the scene, its investigation of higher mind levels, even at this low and undeveloped point, may be of assistance to a resurgence in man of something of his belief in a Divine Being and in himself as an entity partially divine. The basic principles of Dianetics demand that a fact, to be proven, must be sensed, measured, or experienced. When science thrust this onto the scene of thinking, man's willingness to accept a fact merely upon faith was in itself reduced. Caught unprepared before this new doctrine without which, so its espousers claim, nothing could be valid, the religions still attempted to hold at high value what was actually a vitally necessary part of man's social existence. But generation after generation of young men and women came off the assembly lines marked "educational courses," filled full of the doctrine that they must believe only what they could experience, and ground very fine in the mills of the materialist. These generations, actually, regardless of their ability to quote Hamlet or play Bach on the piano, to look into microscopes, to serve as executives in steamship offices, to shift and command and generally alter MEST, were nevertheless socially lost generations which had no concept of the value of themselves as individuals, which had no workable social order worth mentioning if the value of a social order is to be measured in terms of happiness. These generations were wrecked by divorce, inhibitions, purposelessness, sophistication, insecurity and general hopelessness. Representative of their feeling in the field of humanity were schools of thought which taught them that a man's highest goal was to become "adjusted to his environment" without once realizing that man's only advance depended on man's ability to adjust the environment to him as a species; which taught that genetic heredity alone was responsible for neurosis and insanity, and that filth and muck alone covered the entire problem of the human mind from top to bottom. This is a sad and piteous thing. No empire one has studied in any former day had ever become so depraved and Godless in its senility as the overall average of the societies of man in the world today.

It is no wonder that an ideology which holds that man, generation after generation, can be moulded into mindless machine parts, that there is no destiny for the individual beyond his place as an emotionless, rigidly-held cog in a dully, hopelessly grinding social wheel, commands of its minions the destruction and eradication from any society of the producer, the individuals, the thinker, or any noble man. The progress upward toward survival on higher levels is a progress as well toward God. The auditor will notice this in case after case. He will probably be struck by the fact that those atheists he processes soon cease to be atheistic in their inclinations and attain at least a tolerance for the idea that religion can exist and have a valid function in a social order. Scanning out some of the education of the individual simply as a step toward converting entheta along a very likely line, the auditor may be interested to note that the preclear begins to speculate on the possibility of a spiritual existence. Although he may embrace no doctrine, the preclear, when he is well up the tone scale, is apparently instinctively aware of some higher level of existence. He normally abandons his materialistic stand as he advances up the tone scale, since this stand happens to be compatible with individuals from 2.0 down.

One could postulate that from 2.0 down there is more MEST in an individual than there is theta, for individuals along these levels prefer to use MEST force, foot-pounds of energy, in order to accomplish their desires, rather than reason. Individuals on this level normally do not improve MEST but will make structures into enMEST. When individuals are enturbulated below the level of 2.0, they tend, as a general rule, to consider all life, all organisms as MEST and will in their handling of life and organisms reduce them down toward MEST. Oddly enough, this happens to compare with past ideas of missions of minions of the Devil. The forces of Evil reduced life down into materialism and death. Above 2.0, the tendency of the individual is to enhance life and organisms in their existence and to assist them to a harmonious control over MEST. This is strangely similar to what in the past have been considered good and Godly actions.

It should not be considered strange that the organism can go so much higher above 2.0 than it can go down below 2.0. 4.0 is so far short of the altitude evidently obtainable by whatever means, according to tentative observations, that one cannot but feel that man so far in his evolution of existence has been but slightly graduated from his animal cousins in comparison to the distance he has yet to travel to attain anything like an ultimate. To observe

that an entire social order such as America can drift around 2.5 and that the normal individual probably falls below 3.0 is to compare man's current state with that of the ugly duckling who will grow up to be a swan. But the comparison is not complete. There is something like an inevitability in an ugly duckling's growing up. It has to live to become a swan. Faced with the insanities of the world today, man's chances of reaching God are not that good.

CHAPTER NINETEEN

COLUMN AO

Relative Entheta On Case

As noted in the accompanying graph, an organism, by dianetic postulate and observation, is composed of theta and MEST and their altered form, entheta and enMEST.

By theta is meant, of course, thought energy, possibly existing as thought matter in thought space. By MEST is meant the physical universe of matter, energy, space, and time, as we know them in the physical sciences. It is postulated that these two energies combine, and that through the harmonious control of MEST by theta a life organism is formed. Theta plus MEST could be said, then, to compose life.

The formation of organisms and their development evidently comes about through four evolutionary tracks. First, there is the evolution of the theta body, of which we know little beyond the fact that it appears to exist, at least for human organisms, and to move forward in time, developing from generation to generation independent of the genetic line. The second evolution is, apparently, the evolution of organisms themselves, continuing along a protoplasmic line from generation to generation, each generation altering somewhat by virtue of the environment, by natural selection which weeds out the least fit or least adaptable, and by what appears to be planned construction based on computation for the future. The third evolution is the evolution in MEST. This may not be readily seen, but MEST is changed, ordered, disordered, and made more complex by the advancing generations of life forms: the intricate. During processing entheta is converted into theta, and enMEST is converted into MEST. It is postulated that this happens in the following way. EnMEST becomes MEST, part of which (A) is retained for use by the organism, and part of which (B) leaves the organism, to be replaced later (C) by new MEST. Entheta (a) becomes theta. It may also be postulated that entheta leaves the organism (b) and is replaced by new theta (c) complexity of bacterial by-products and the formation or destruction of mountains or machines is no less an evolution than that along the organism lines.

There is a fourth evolution which has been but slightly considered. This is the gradient scale in present time of growing complexity of life forms as they support themselves, in now, on MEST. The basic on this scale of complexity is, of course, those minute life forms which live on sunlight and inorganic chemicals alone and which convert rock and sand into soil, or in the sea, which provide food for the next highest vegetable form. The soil then supports a slightly higher plant form. This, in turn, makes better or more soil, or in the sea, better or more food, and an evolution of complexity then is observed in the higher and higher levels of the vegetable kingdom, then in the more simple animal and fish forms, and finally forms as complex as man. This last evolution is taking place continuously in present time. Here with us at this moment the lowliest forms are actively converting sunlight and minerals for the support of higher forms. The more MEST the form handles external to itself, the more complex are its requirements in terms of preprocessed MEST. This processing of MEST, then, for higher and higher form consumption is necessary as a staff of life. Theta could be said to exist across the MEST line of parade in time as a "now" band, just as the MEST universe probably lies in the continuous present time of the theta universe.

It seems to be a rule of theta and MEST that they form union only at a moment of heavy collision with each other. Although theta has a natural attraction for MEST and MEST has a natural attraction for theta, if MEST has any intention, this does not mean that the union is at first a harmonious one. The first moment of impact is a collision in which a considerable portion of the theta becomes tangled with the MEST, leaving some free theta and some useful MEST. The remainder changes wave length or polarity and becomes what we call enturbulated theta and enturbulated MEST, which in Dianetics we shorten to entheta and enMEST.

While some organization may be made in this first union it seems that the entheta and enMEST must separate in order for the theta to extract with it knowledge of the physical laws of MEST. Then a second collision is made, and a greater advance comes about, since theta has more knowledge of MEST and can make a more harmonious conquest. Continual repetitions of this bring theta more and more informations; and more and more ability in the handling of MEST brings about more complex forms and organizations. This is as true of the group as it is of the individual, and all group activities which will eventually result in learning begin with considerable turbulence. After the turbulence is over, greater advances are then made possible through a much greater understanding of the physical universe by theta. An illustration of this would be the scientific advances obtained in wars, which in the after peace serve men constructively. There is a limiting factor on this, however, in that all the theta must not become enturbulated, thus carrying the organism evolution downward.

Death is a name assigned to what is apparently the mechanism by which theta recovers itself and the bulk of its volume from the MEST, so as to be able to accomplish a more harmonious conquest of the MEST in a next generation. Species advance so long as the theta and the MEST can still separate, leaving free theta, but at last the theta apparently begins to enter the genetic line on a dwindling spiral, the species decays and dies out.

The tone scale does not represent the idea that everything above 2.0 is theta in pure form and everything below 2.0 is entheta in pure form, nor that in the organism everything above 2.0 is MEST well organized by theta, and that, sharply, everything below 2.0 is enMEST, or disorganized matter. In older ways of thinking, which permitted only two-valued logic, which is to say black and white or right and wrong with no in-between values, the tone scale and its usefulness would have been greatly decreased. In Dianetics, there is a new way of thinking about things which underlies a great deal of its technology. Instead of two-valued logic or three-valued logic we have infinity-valued logic. Here is a gradient scale which permits no absolute at either end. In other words there is not an absolute right and an absolute wrong, just as there is no absolute stillness and no absolute motion. Of course, it is one of the tenets of Dianetics that absolutes are not attainable but only approachable. Thus, We have gradient scales. Death is approached by degrees, in terms of failures, being wrong, accumulated sickness and accidents. An ascendancy upward toward life is an accumulation of minor successes which lead to higher and higher levels of survival, successes in organism growth and perfection and in education and in attaining goals. Actually, 2.0 on the tone scale is the place where the ARC of theta and the organism order in terms of MEST have each and intermingledly become sufficiently dissonant so that a slight discomfort exists. The enMEST is not very enMEST, and the entheta is not very entheta, but as the scale is descended this dissonance grows stronger and wider until it is finally so wide that it is almost a null, which is to say that very little inter-activity between entheta and enMEST exists and the components of enMEST are becoming so poorly organized as not even to be in conflict with one another, and the ARC of theta is almost entirely interrupted, dispersed and dissonant. The complete null point for the organism life is 0.0, where theta and MEST, so far as the organism is concerned, have so little in common with each other that they separate. This separation of the theta body from the MEST body ejects into being for further use in new organisms the MEST of the old body and releases into freedom for future conquest of organisms, according to present theory, the theta body.

If the auditor finds this too vastly technical, he should at least understand that in order to bring an organism up the tone scale he has to separate the enturbulations of theta and MEST, which exist as entheta and enMEST in the organism. Every moment of hard collision between the theta portion and the MEST portion of the body or between the organism and other organisms or MEST has formed a point of such intensity of entheta and enMEST that this point will thereafter enturbulate the theta and the MEST with which it comes into contact.

This is the engram, a moment of physical pain with its resultant unconsciousness and the perceptics entrapped therein. Entheta and enMEST from 0.1 up to 2.0 are seeking to separate and in so seeking enturbulate the existing theta and MEST. Any instant or area of physical pain, then, is trying itself to die, so that the entrapped entheta and enMEST can become free. In dianetic processing something new, in that it can be done thoroughly, in the

evolutions of organisms, the theta body and MEST, has been introduced. Processing separates entheta and enMEST without bringing about the death of the organism. These points of contagion, if unprocessed, sum up finally to organism death. Just as, apparently, the MEST body of the organism is replenished by other MEST, processes it, and gives off MEST, so is the theta body, possibly, replenished and so does it evidently give off theta. Beyond the fact of existence of and basic descriptions of theta, which are useful to the auditor, very little is known about theta at this time, although the recognition of its probable existence has enormously widened the scope of knowledge on the subject of the humanities, and the discovery of the theta body in terms that can be sensed, measured and experienced according to good scientific usage means a considerable advance, if it continues to be borne out by accumulating evidence.

Entheta, either over some by-pass route or directly, converts into organism theta or makes it possible for more theta to be attracted to the organism simply by, according to present theory, the address of theta itself to the vicinity of the entheta and enMEST. The mere proximity of a considerable quantity of theta, apparently, to an area of entheta causes the entheta to change wave length, vibration rate, or polarity and either to become theta or to discharge and leave an area into which fresh theta can penetrate. just as enough smoothly flowing water overcomes the turbulence of a disturbed area of flow so does theta introduced into the entheta area convert or smooth out the entheta. It happens that the conversion effect of theta on entheta can occur when the theta to be applied to the entheta, or brought to bear upon it, exists in another organism or in a group of organisms. There is something everywhere-coexistent about theta, and perhaps there are various forms and types of it, all having more or less the same basic components, just as there is a great difference in quality amongst ideas, which seem to be the matter of theta. From 2.0 up on the tone scale, the theta is less and less dissonant, or more and more compatible in its three components of affinity, reality and communication, but this does not mean that 4.0 is perfection of theta. Theta contained in organisms, from one organism to another, seems to have at least some of its factors more refined, and theta appears to assume other qualities above 4.0. Exactly how high these qualities go, whether or not the 2.0 to 4.0 range is highly personalized, where the band of true free theta is, if there is increasing power above these levels, are all questions subject at this time to considerable speculation. Only enough data exists to make it fairly certain that with the theta theory we are dealing with something much closer to natural law than man has widely accepted before in his attempts to understand life, human behavior and the humanities in general. Thus, it may be that as one proceeds on up the tone scale one discovers progressive advances in theta. MEST is considerably easier to understand, being an old idea which has been worked over by several generations, to say the least, of physical-universe-minded individuals. Yet here again, with Dianetics, there was a great deal more to learn, particularly where MEST was concerned as a component part of the organism.

However lightly the auditor wishes to study or regard the above data on the theta-MEST theory, this following data concerning MEST and enMEST is vital to processing, and the auditor who does not know this data will not be able to achieve very good results on a case. Much of this data is new and has not before been released, but it has resolved, by theory and application of the techniques, cases which hitherto were considered extremely difficult, such as the heavily occluded case, which not only "could not get out of present time" but did not even seem to benefit very greatly from processing. Any auditor who has difficulty with his preclear would do well to read this section over again.

During processing, the individual can be observed to have what may be considered increasing theta as fast as entheta is recovered and converted. There may be other manifestations of the release of entheta which have not yet been observed. If they exist and are observed, possibly processing may increase in technology.

The enMEST portion of conversion of exhaustion of charge on a case is considerably more obvious to the observer, possibly because at this time our knowledge of the material universe is so much greater and because we are trained to observe organism behavior.

The larger deposits of entheta and enMEST exist in secondaries, not in physical pain engrams. A physical pain engram acts as a sort of trap. It is the basic enturbulator. By contagion it can, in moments of loss or threatened loss, contain various misemotions. The secondary, primarily, charges up the physical pain engram to a point where it can assert its entheta side strongly against the analytical processes, or its enMEST side strongly against the physical part of the organism, creating chronic somatics, to which Dianetics attributes psychosomatic illnesses. A great deal of entheta, but not as much as can be trapped in secondaries, is contained in lock chains. Here gradually, day by day, little by little, theta is caught and converted into entheta, and the MEST at its level on the time track is converted into enMEST, to a slight degree. One should not ignore any deposit of entheta and enMEST. The whole task of processing confines itself to this conversion.

Contact with present time, if any part of that time can be demonstrably present to the preclear, has some tendency to disenturbulate some entheta. Straight memory, by bringing to bear the theta of the analytical mind on the past, particularly in areas which are occluded, since all those occlusions are entheta areas, brings into being some theta. The running of a lock through and through as though it were an engram can, in a low-tone case particularly, bring into being more theta. Lock scanning is a particularly efficacious technique in converting entheta. Sudden, severe secondaries can greatly charge up engrams which have been keyed in, and are heavy, extensive deposits. Engrams themselves have the basic entheta and enMEST and are able to enturbulate and hold to themselves considerable entheta, but it is interesting to note that the engram could be taken down to a level of entheta content approximating that which it had originally without running the engram. This is easily understood as soon as one runs out a near-present-time injury. This near-present-time injury has not been charged up. The last moment of physical pain and unconsciousness on a case can usually be run. After a time, which may extend from a few days even to years, this engram is keyed in, at which time it begins to link up and index itself with the reactive mind, in direct ratio to the amount of restimulation that it receives, which is to say in direct ratio to the number of times words and other perceptics contained in this engram are approximated in an enturbulated environment. The skill and ability of the auditor is, then, addressed to removing entheta by converting it, and anything which will do this is valid processing.

There are certain definite components in enMEST which manifest themselves during their release. Whenever entheta is converted to theta it is always done with an accompanying physiological manifestation. It is very easy for the auditor to aim for and achieve this physiological manifestation, for enMEST has certain definite components. In other words, when entheta is being converted to theta, the organism manifests certain signs. These can be divided into the four general classifications of gasses, liquids, solids, and physical energy. One should understand that the enMEST portion of charge is the physical suppressor of aberration and chronic somatics. One of the main manifestations in the organism, on the release of entheta and its conversion to theta as in the running of locks, secondaries or engrams, or occasionally even during straight wire, is gas. There is something about oxygenation which is not yet understood but which again, if understood, might speed up processing. When one erases an engram, for instance, the erasure is accompanied by yawns. This is a gaseous and energy manifestation. Something is coming off the case. In running locks the preclear occasionally yawns. Flatulence also occasionally accompanies the release of entheta.

Liquids are released by the body in several forms during the release of enMEST. The most obvious form is tears. When a secondary engram is reduced, on the grief level, it is reduced in tears. When tears occur, the secondary should be run until it is completely exhausted, or the phrase, if that is all that can be recovered, should be repeated by the preclear until it no longer occasions tears, since tears seem to be the primary manifestation of the exhaustion of the most harmful secondaries, those of grief. But tears are not the only manifestation. Fear seems to be released with accompanying sweat, sometimes of a peculiar odor. There are individuals who are chronically in such a state of fear that each present-time perceptic discharges itself through sweat. Apathy commonly discharges itself as panting or urine, but more work must be done to establish the discharge of apathy in physiological terms.

Solids are discharged on the level of fear as vomiting, and there also, and on lower levels, as excreta.

There is a peculiar manifestation in Dianetics known as boil-off. Boil-off has assumed tremendously important proportions in processing, since the case that is very heavily entheta'd has its charge held down by such quantities of anaten that the induction of boil-off seems to be the most efficacious way to unburden the case. In a boil-off, a preclear will go into an apparent sleep. This is not sleep, no matter how much it may appear to be, but is actually a release of unconsciousness which is extremely concentrated and heavy. The release of this permits the case to go forward much more rapidly, because under it will lie quantities of specific incidents which otherwise are masked by this heavy layer. It is possible that a preclear may boil off for twenty-five to fifty hours, if he is extremely heavily burdened with entheta. The boil-off has certain strange manifestations. The preclear may, when running an incident, suddenly begin to maunder and trail off, giving muttered accounts of strange pictures and unrelated events. This is a mirage effect, through boil-off, and peculiarly disconnected things will clutter up his attention at this time, but he does all this in a very sleepy, dazed condition and shortly after may go into an even deeper boil-off.

Early in Dianetics, it was thought necessary to keep the preclear more or less alert in a boil-off. This was an error. The preclear should never be disturbed in a boil-off, but should be permitted to continue in this state until the boil-off is exhausted. Further, it was once thought that the preclear could be brought up to present time during the boil-off and that the boil-off would continue automatically. This does not appear to be the case boil-off must be continued on the point of the track where it began to occur.

A boil-off may be boring for the auditor, for the preclear lies in a dazed state and may do so for many minutes or even one or two hours. Even so, the auditor should not interrupt the preclear. The efficacy of boil-off is demonstrated by the fact that when one is finished the preclear is alert and can run other forms of entheta, but that when one is interrupted the preclear will be in an unsatisfactory condition. When boil-offs are not permitted to be induced, the case will not progress rapidly, and in an occluded case may progress with remarkable slowness. Perhaps the boil-off's importance was minimized in the past because insufficient patience was devoted by the auditor to watching one continue through its full extent, which can be very long. A boil-off can be induced, and fade away, and be reinduced by a single phrase. The file clerk should be depended on by the auditor to give the phrase which will induce a boil-off. It has been commented upon that the boil-off occurs on circuit phrases and that it is actually the exhaustion of enormous quantities of anaten in a very concentrated form from the reactive mind from areas which have formerly been valence compartments or the location of demon circuits. This has not been adequately observed at this time for confirmation, for boil-off has been noted on phrases which were not circuit phrases. The auditor may ask the preclear's file clerk whether or not a boil-off can now be obtained, and then request the phrase. The preclear repeats this phrase a few times and suddenly goes into a boil-off. He may emerge from this boil-off very shortly, at which time the auditor requests him to repeat the phrase, and he goes back into the boil-off. This phrase is repeated by the preclear, to himself or to the auditor, each time the boil-off recedes, until there is no longer any boil-off on the repeating of this phrase. Then the auditor may procure from the preclear's file clerk another phrase on which boil-off can occur, and so on until a considerable amount of this apparently concentrated anaten has been exhausted. The case will show a very marked improvement.

Physical pain should not be overlooked as one of the factors which hold entheta in place. It may occur that the auditor has a case which cannot run engrams but which can occasionally get physical pain on the repetition of a single phrase. If the preclear has a new, not a chronic, somatic, the auditor may ask him for the phrase which will reduce this somatic, but only after he has ascertained from the file clerk whether or not the somatic will reduce. Such somatics, normally, are best reduced merely by scanning pleasure incidents, if they are bothering the preclear at the beginning of the session or at the end or it. The perceptics are contacted when the case is lock-scanned. The perceptics themselves seem to have an

entrapment of entheta. Thus, running all the perceptics out of an engram releases considerable entheta.

Additionally, there is body movement. The preclear may twist and turn while running fear, or may beat the bed with his fist while running anger, but in any event, by physical motion he exhausts energy. This is apparently beneficial, and the phrases and circumstances which cause the preclear to do this should be repeated. However, the auditor should not be deluded into wasting his time on a dramatization. The preclear must be in processing and, ordinarily, returned to a specific incident before any physical motion is of benefit.

There are probably numerous other manifestations of entheta and enMEST, and future observation should be devoted to their determination and their use in processing.

It is known that a good protein ration and certain vitamins assist the exhaustion and conversion of enMEST, and that a fairly stable present time, including a high-theta auditor, assists the exhaustion and conversion of entheta, and it is known that certain physiological manifestations accompany the conversion of enMEST; and possibly theta manifestations accompany the conversion of entheta, but these have not been determined or observed to the extent that they would assist processing.

In an occluded case, an auditor may very well find himself on this routine, and he should know this very well. At the beginning of the case he attempts a little straight memory or perhaps some lock scanning. He may discover that the preclear is induced to weep on a certain phrase or to be frightened by a certain phrase. The auditor should cause that phrase to be repeated and the incident with which it is connected, as nearly as possible, be given some further attention. Conversion has already begun when this occurs. Next, the auditor may find, while lock scanning or when asking specifically for a phrase which will induce it, that the preclear is going into a boil-off. The auditor, as the boil-off recedes, should discover the phrase on which the preclear is boiling-off, so that the boil-off can be continued until it is exhausted. More entheta has been converted and more incident has been made available. Additional lock scanning may then recover moments of physical tension or mental duress of the lock variety. These should then be scanned until thoroughly exhausted. At this time it may happen that an entire secondary engram will show up, and when this is run the case will rebound remarkably up the tone scale. But in the next day or two it may be discovered that another boil-off is ready or that another series of locks containing duress should be scanned. Thus, from boil-off to lock scanning to the running of secondaries with as many of the perceptics as are available, the auditor may find himself with a case coming swiftly up the tone scale.

In any event, the auditor should discover this to be taking place, and if it is not taking place, then the auditor is doing something wrong. By straight wire he stabilizes his case, and he may by straight wire get the case out of some incident which cannot be run. Here, he is converting entheta into theta. More theta is then available to attack more entheta, and so he may be able to scan locks or run a secondary engram or even an engram on a high-level case, or he may be able to get a boil-off. But each time, the auditor should be achieving some result. And each time he gains more theta for the preclear he should reinvest in a further and perhaps heavier attack upon entheta and enMEST. If he does this his case will continue on up the tone scale, not in a steady rise along an even line but along an uneven course in which the highs become always a little higher and lows not quite so low. Running engrams or slugging hard into the case may simply take the existing theta, place it in proximity with too large an amount of entheta, and enturbulate and entrap more of it, thus lowering the preclear on the tone scale instead of raising him.

With some preclears, the auditor can be quite non-directive, which is to say he can permit the preclear to run phrases and choose the next type of entheta to be attacked. The auditor, in any event, should consult with the file clerk as much as possible.

The auditor should not permit his preclear, however, to chain-scan engrams or go around running himself automatically on various phrases, as this results in the enturbulation of

the existing theta. The only time engrams can be chain scanned is when the preclear is up to about 3.5, constantly and unmistakably, and has so much free theta and so little enttheta that the effect of the theta on the enttheta is overpowering, even to the point of blowing out physical pain.

The auditor, if he wishes, may even put his preclear on free wheeling with a ration of Guk, between sessions. He will find that this has the efficacy of occasionally knocking out whole somatics and making the future job of processing easier. In any event, the Guk seems to promote the case. In free wheeling, where the somatic strip and file clerk are put into unison in the running of incidents but "I" is left in present time, the preclear may hang up in a holder or hit a bouncer and the free-wheeling may stop. It so happens, however, that repeating the action phrase while free wheeling does not free the preclear but acts as repeater technique and takes "I" down the bank to join the somatic strip. This may considerably enturbulate the case. The auditor, when the preclear is hung up while free wheeling, should ask the file clerk for the phrase and then cause the preclear to remember, by straight memory, when he has heard that phrase uttered. When the preclear recovers such an incident, any incident containing that phrase, the free wheeling seems then to continue. Apparently, the only danger in free wheeling is the use of repeater technique in connection with it. However, one should never believe a "file clerk" when the auditor asks, "Are you clear?" and the "file clerk" says "Yes!" For some reason or other "file clerks" are entirely too optimistic on this subject. The "file-clerk-clear" and the use of repeater technique threw free wheeling into disrepute. However, a person who has been free wheeling can and should have it scanned out by lock scanning, just as any session would be, and the free wheeling occasionally seems to benefit a case. To put a preclear into free wheeling it is only necessary to tell him to close his eyes and for the auditor to say, "The file clerk will furnish moments of physical pain or discomfort and the somatic strip will run them out, and this process will continue until I say 'cancelled'" or "until I tell the somatic strip to come to present time."

It should be remembered by the auditor that the circuit phrase is both recalcitrant and resistant to auditing. One of the main troubles with chain scanning is that the individual chain-scans out all manner of phrases but merely puts the circuit phrases into restimulation. Thus, the circuits seem to be activated, and we get a condition in chain scanning where the individual apparently has no more engrams, and yet by close processing, numbers of circuit phrases complete with somatics may be discovered on the case. Lock scanning also has this difficulty to a slight degree, but this can be remedied by finding all types of circuit phrases by straight memory. Circuit phrases sometimes will not even flash, even when the action phrases in the case are relatively low in power, but the auditor, by guessing and talking with the preclear may eventually discover types of phrases which are circuit phrases and which would more or less take over control of auditing from the auditor and from the "I" of the preclear. Straight memory recovers a specific moment when a phrase was uttered and the preclear can usually be lock-scanned through all similar moments, thus taking some of the charge off the basic engram which contains the circuit phrase and weakening or getting rid of the demon control circuit, which may have been giving the auditor considerable trouble.

There are probably numberless ways of converting enttheta to theta and of relieving the deposits of enMEST in the organism. These are simply the best ways known to date. These ways are proven and reliable. The auditor can discover on the tone scale chart the levels at which he can run various types of enttheta. This is a safeguard and will keep the auditor out of a great deal of trouble. There are several freak techniques around, such as getting a person automatically on chain scanning, which are almost certain to increase the enturbulation on the case. I tested one some time ago in which the individual was sent home at night to run out chains of secondaries in his sleep. This was rather unsatisfactory, but it was interesting to note that one who was set to running a chain of grief secondaries in his sleep woke up in the morning to find his pillow saturated with tears and yet had no knowledge of what he had been crying about. This is added here to demonstrate that there are not only many combinations of the known existing mechanisms of the mind, but that there are probably a great number of mechanisms not known.

Possibly a very fruitful field is the exploration of theta perceptics, for theoretically it might be possible for new resurgences of theta to be entered into a case with excellent results. Possibly this is what is happening when a person reaches toward a spiritual resurgence. This is very well worth investigating.

The auditor should keep in mind that cases, one to another, have different amounts of free theta endowment. He will find cases which are low on the tone scale and very occluded, which yet have great reasoning and constructive power, despite their tendencies toward succumbing. He will find these cases rising rather rapidly, but because the individual is here and there through the columns higher than the level assigned, the auditor should not therefore abandon the types of processing assigned for the general level where his preclear is located.

Likewise, it is a great temptation for the auditor when he finds a case which apparently has sonic and visio and some perception of pain to dive for the bottom of the case and start running engrams. After he has done this for a while he may find that his case is not making a very good rise on the tone scale and may only then check the chart, to discover that he has been working with a 0.8, much to his dismay. These low-level cases enturbulate rapidly, and the running of engrams on them, no matter how wide-open they are, may be done for hundreds of hours without any marked increase in the tone level of the case. This is because the auditor is too enthusiastically investing free theta into the running of physical pain engrams which are not yet exhausted of their secondary and lock entheta. The goal in any case is the freeing of theta, and by this the auditor should be guided.

CHAPTER TWENTY

COLUMN AQ

Tone Level of Auditor Necessary To Handle Case

This column is included as an estimate of optimum performance.

The auditor should be aware of the fact that the engrams of the preclear, his secondaries and locks, respond only in the presence of all available free theta. The theta of the auditor plus the remaining theta of the preclear are a sum which is directed at the entheta in the reactive mind of the preclear. It is a strange fact that the mere presence of an auditor makes it possible for the preclear to run incidents which he could not touch if no auditor were present, although there have been preclears who have successfully run out locks and some secondaries, alone. But self-auditing, normally, gets a case confused, and the presence of an auditor is very desirable.

Auditors who are below 2.0 on the tone scale tend unconsciously, and even consciously, in the direction of succumbing. They have a ratio in themselves of more entheta than theta. Auditors below 2.0 on the tone scale have accomplished something with cases from time to time, because Dianetics can be, in part, mechanically applied. But the preclear who places himself in the hands of an auditor below 2.0 is asking for unsuccessful processing, since auditor code breaks will inevitably ensue and the case will be unwittingly mishandled, regardless of the apparent intention of the auditor.

One can say, then, that 2.5 is the lowest level the preclear should accept in the auditor. And even this has some slight risk, since the interest of the 2.5 auditor in the preclear is apt to be lackadaisical and not to encourage any great or rapid advances in the case.

3.0 would be the lowest level of the auditor, for any truly successful auditing. At this level, the auditor will be interested, sympathetic, able to follow the auditor's code with no strain, will be quick to understand any trouble which the preclear encounters, and can ordinarily, if properly educated, be expected to carry out a good and responsible role as an auditor. Furthermore, any discreditable data on a case which an auditor at this level uncovers in the life of the preclear will not be used as conversational material by the auditor. This is certainly not the case with low-tone auditors.

When one is handling preclears from 1.5 down, one will normally discover that the preclear is very highly restimulative to the auditor, is apt to become angry or recalcitrant or insulting, has a great deal of trouble contacting some of the entheta, and is in general so highly charged that great patience and tolerance is required of the auditor. This means, simply, that the auditor must not be easily restimulated by his preclear. Those cases from 1.5 down are highly restimulative, on the average. Cases from this level down, which are chronically psychotic or psychotic at the time of processing, which is to say cases which have all of their free theta enturbulated, particularly require auditors on a high tone level, for auditors at lower levels are apt to consider the psychotic too critically, and a critical or restrictive attitude toward the psychotic denies him his recovery.

Further, the psychotic demands of the auditor a high courage level, a level certainly not found below 3.0, and guaranteed (given a good endowment of free theta and an education not contrary to courage) only at the 3.5 level. The psychotic, or persons who are on the tone band below 2.0 but who are easily enturbulated, has such a highly charged background in most cases that he may scream or express misemotion or dramatize to a frightening extent. A fully enturbulated paranoid may very well attempt to kill an auditor during the processing session, if the auditor suddenly reminds the paranoid of an enemy. Below 3.0, the reaction of the processor toward the psychotic may be irrational to the point of hastily giving the psychotic sedation or putting him in restraint or giving him electric shock or ordering a prefrontal lobotomy, or doing any of those things, in short, which express crawling fear of another

human being whose rationality cannot be trusted. A 1.5 trying to treat psychotics can think only in terms of punishment and nullification of the psychotic, and cannot possibly produce simply by his presence and the quality of his reasoning any alleviation in the case, but by his own fear further enturbulates the psychotic. Additionally, living in an environment filled with psychotics (such as an institution, with individuals dramatizing, screaming, being irrational or dully stupid) is intensely restimulating -- so much so that a considerable portion of the attendants and attending doctors of institutions themselves eventually find their way into the wards as patients. In short, it takes life and energy in an individual to bring into being life and energy in others. And conversely, that person low on the tone scale, in order to climb up the scale or even to exist at his level, pulls heavily upon the life and energy of those around him. The legends of vampires probably originated from an observation that some persons seem to have no life of their own but only express themselves in the vicinity of and at the expense of other individuals. Low-tone people commonly yearn to marry out of no other reason than that they can obtain from a mate the energy and life necessary to continue existence, or perhaps because here they have free theta to attack and desire to pull it down.

The auditor should be very cognizant of the fact that addressing entheta in a preclear is restimulative to the auditor. A certain amount of the auditor's free theta is going to become enturbulated when he processes preclears. New locks, at the very least, will be formed on his own chains. Thus the enturbulation is not wholly temporary, but a certain amount of the enturbulation will become "permanent," which is to say that it must be processed out. Auditors who are not themselves being processed are unsuccessful. A group of auditors processing preclears but not being processed themselves will become, in a relatively short time, a veritable snake-pit of entheta and, willy-nilly, will go down the tone scale.

The very least an auditor should do for himself if he is processing people is to keep the processing sessions he has done on other people scanned out of himself. He should consider that this is as necessary to him as eating and getting proper rest, for his own descent down the tone scale as a result of auditing will be so unobserved by himself that he will not know how low he has descended until he suddenly realizes that not only is he no longer taking any pleasure in auditing but he is facing the next session with considerable distaste. When this happens the auditor can be sure that through failure to observe the necessity of having these sessions lock-scanned he now needs processing fully as badly as his preclears. He should take, then, every possible measure to bring himself up the scale, and the most immediately indicated of these is having processing sessions scanned out. As the auditor descends lower and lower on the tone scale he tends more and more toward succumbing, and he will reach a point where he does not think he needs any processing. When this happens, he has become very enturbulated.

Dianetics provides effective means of bringing people into a higher level of reason, energy, and happiness and into a better state of physical well being. If Dianetics is to succeed widely, and it will whether it takes two years or the next twenty, that success depends upon the co-auditing team, where two people audit each other alternately. It has been publicized that Dianetics is simply a low-cost therapy. Aside from the fact that Dianetics is not a therapy, Dianetics provides a means for any two people who are intelligent and fairly well up the tone scale to lift themselves by their bootstraps into much more desirable levels of human existence. It has never before happened that people could do this. The formation of a co-auditing team should be done with some care. The two individuals should be somewhere near parity on the tone scale and should be, certainly, above 2.0 on the tone scale. A disparity will bring about the condition that one of them is doing all the auditing, and there is no mutual exchange.

Husband-wife teams do not, ordinarily, make good co-auditing teams. Whereas a few such teams have been successful, the bulk of them have after a short time broken up as unworkable, and the husband and the wife have had to look outside the home for other processors. Thus, at the very start it would probably be wise to obtain co-auditors outside the home. There are many reasons for this. In the first place, marital relations have a certain delicacy, and the introduction of dianetic processing between two individuals brings about another type of affinity. In a co-auditing team between husband and wife many auditor code

breaks may, indeed, break up the marriage. Looking outside the home, one can find coauditors, if the original co-auditing team proved to be unsuccessful. Additionally, there are certain information barriers between husbands and wives in most marriages. And where the wife cannot tell the husband all she knows, and where the husband cannot tell the wife all he knows, enough of a brake is put on communication to inhibit processing. At the recent level of teenage morals, there is usually much in any marital partner's background which he does not wish to communicate to his spouse. With a co-auditing partner outside the home one can freely communicate, and thus the affinity required for co-auditing can be established, which it rarely can between husbands and wives.

There is also the three-way team, in which three people coaudit. This has the advantage of keeping altitude for each auditor, since in the triangle, none is being processed by anyone he is auditing.

When the preclear has come up the tone scale to 3.0 he can be processed by nearly anyone educated in Dianetics who is not below 2.0, for he can stand up to considerable auditor code breaking or ineptness, but he should be aware of the fact that he will proceed faster, the higher the level of his auditor.

Any double or triangular co-auditing team should be careful to keep parity. No member of the team should be permitted to lag so that a disparity in tone level can result. This is quite important, since by permitting the disparity to occur, the auditor who is higher on the scale will himself be brought back down the tone scale.

According to theory, the best auditors would be clears, but people who have lost their own aberrations are quite likely to be interested in the activity dictated by their basic purpose. If their basic purpose happens to be to make individual fellow human beings happier, healthier and more reasonable, then they will remain in Dianetics, but ordinarily, they go very far afield.

CHAPTER TWENTY-ONE

COLUMN AR

How To Audit The Case

In this chapter we will take up cases at particular tone levels. It should be remembered that an individual can exist at any one of these tone levels and still be considered “rational” by the current society.

There is one very important caution an auditor should observe in starting a case. Either he evaluates the case on the chart with thoroughness and so knows the type of case he is addressing, or he uses, in the absence of chart evaluation, very light methods of processing such as straight memory or the scanning of minor lock chains. The auditor will not be able to determine rapidly where his preclear lies on the tone scale, unless he has the chart before him and has made a test of the somatic and general responses of his preclear.

Learning to use the chart and to locate the preclear on it may take the auditor some time, for the chart is complicated in that it contains several elements. There are at least five different ways that tone may be said to vary. The auditor is looking, mainly, for the chronic reactive tone of the preclear, in order to know at what level it will be safe to process him. Some high-theta auditors can successfully use methods on preclears which are above their chronic reactive tone level. They do this by bringing the preclear temporarily up the tone scale with very high ARC. But this is, unfortunately, an unusual ability, and the auditor who wishes to make sure that he will not enturbulate the preclear should be very careful not to use methods which are above the preclear's level on the tone scale. Five things which affect the tone manifestations which the preclear is showing are (1) the theta-entheta ratio on the case, the relative amount of “frozen” entheta in locks, secondaries, and engrams, (2) the present-time environment of the preclear, its tone and volume, (3) the tone of the particular engram in which the preclear happens to be stuck, if he is stuck, (4) the tone commanded by a particular engram command phrase or series of phrases which are in restimulation, either acute or chronic, (5) the general environmental background of the preclear, the tone of his education, family, group, and so on. It may be a somewhat difficult job for the auditor to separate these various elements in the preclear's manifested tone, in order to discover the one thing which is most important to the level of processing to be used on the preclear, namely the theta-entheta ratio on the case.

Straight wire on the present-time environment of the preclear, the events of the last two or three days or even hours, will give the auditor some idea of what effect present-time is having on the manifested tone.

Straight wire on the preclear's general background, during the taking of the inventory and after, will give the auditor a somewhat less clear estimate of the effect of this element on the preclear's manifested tone, since much of the material may be occluded or purposely hidden. An attempt at running a pleasure moment and a few flash answers will tell the auditor whether or not this preclear is badly stuck on the track and, therefore, whether this is an important factor in his manifested tone.

The effect of a chronically or acutely restimulated engram or chain of engrams will be, perhaps, the most difficult to track down and allow for. It is here that the manic case enters the picture, and this is the greatest danger that the auditor will encounter of rating his preclear too high on the scale: a wide-open case with a high manic in full restimulation. Because all these things complicate the problem, the auditor will find that his most reliable test of the theta-entheta ratio on the case will be the behavior columns on the tone scale chart -- after he learns to use them, and not to be deceived by the preclear's idea of what his own tone is. Subtle, patient questioning, perhaps over many hours, will be necessary before the auditor will be justified in feeling that he has truly discovered the chronic tone level of the preclear in each of these columns. For this reason, it might be said that every case, almost without exception, should be

started with many hours of straight wire. To ask the preclear, for instance, what his attitude is about children will gain for the auditor information on what the preclear thinks his attitude is, or what he wants the auditor to think it is, or, perhaps, what it really is. The preclear's gestures and voice tones in answering the question will tell the auditor much, and the questioning is in itself of benefit to the case. But the auditor will be sure of the preclear's attitude towards children only when he has straightwired the preclear on several incidents with children. There may be cases in which direct questions on these things will only serve to alert the preclear's secrecy computations and in which the auditor would be wise to use the chart thoroughly and exhaustively but not obviously, with direct questions. A direct question such as, "Do you like children?" may easily seem like probing or criticism to the preclear, if unconsciously so. A request to relate an incident with children may provide the auditor with invaluable data which he could not get with direct questions.

The tone scale chart is a delicate and somewhat complex tool. The auditor who, by practice and alert observation of results, learns to use it well will find both his abilities and his understanding immeasurably increased.

A case at 4.0, the dianetic MEST clear -- which is to say the current-life-organism clear, until we know more areas which can be processed -- can be considered to need no further Processing. The 3.5 case is very easy to process, but a case is almost never at this level when first addressed. When a case has reached this level through processing, it is relatively easy to bring the case up to clear. Almost anything can be done with this case in the way of running enttheta, and it is merely a question of how fast this individual can be brought to the state of clear rather than whether or not he will reach it, for he can almost audit himself to that point if he has attained 3.5. Here, engrams can be scanned, a process which is done much like lock scanning except that physical pain incidents, secondaries, and word chains which are surrounded by physical pain can be scanned. On the 3.5, however, just as on any other case, one should keep the auditing sessions scanned off the case. The 3.0 case should not be scanned through engrams. Scanning is a very attractive mechanism. It seems to be such a simple thing to start the individual at basic-basic and tell him to scan out all the engrams on the track to present time. But considerable enttheta exists on the 3.0 and the scanning mechanism will enturbulate him and bring him down the tone scale. Here, circuits are still active enough so that they will be activated by chain scanning and a "false clear" will result, which is to say the auditor will have a preclear whose circuits have been charged to the point where the auditor cannot find an engram and so assumes that he has a clear, when he does not. However, the 3.0 has nearly all of his engrams ready to be run as individual incidents. The auditor sends the 3.0 back to the earliest moment of pain or discomfort, picks up the earliest phrase and runs the engram on through.

Usually it is not necessary for the auditor to have the preclear repeat the Phrases, each one time after time, but the auditor can let the preclear run straight on through the engram from beginning to end and then run it through from beginning to end again. On an erasure, of course, the auditor has located the first moment of pain or discomfort and has reduced a great many of the secondaries. The earliest physical pain engram has been run out, and it is necessary then only to proceed up the bank, on the ladder of time, erasing each consecutive engram as contacted, from the first inception of the pain or unconsciousness in the engram to the last. In the 3.0, it will be found that engrams erase rather rapidly. One or two passes will result in yawns, and the next engram can then be reached. It must not be overlooked by the auditor, however, that in the progress of going up the bank from engram to engram each time taking the earliest one that can be found, secondary engrams may come to light which have to be discharged. An auditor can actually start up the bank and complete an erasure nearly to present time, and find then a new chain of secondary engrams which have to be released in terms of tears or other manifestations, and after this the auditor may discover that a new moment of physical pain or discomfort exists as early as conception. He must then return to this earliest engram. It is not difficult for the auditor to discover this, if he asks each time for the earliest moment of pain or discomfort existing on the case. The auditor remains very alert to the fact that the release of anaten, misemotion or physical pain brings into view new areas of anaten, misemotion or physical pain. By asking for the earliest moment of pain or discomfort

and staying alert to the fact that new secondaries may appear, the auditor continues with his erasure of the content of the reactive mind. But at 3.0 it is necessary for the auditor to keep the case thoroughly scanned off, not only as to auditing but as to near-present-time incidents which may be enturbulative to the preclear. At 3.0 and below, the auditor must at all times remember that he is bringing the case up the tone scale and that the simple erasure of engrams is not enough to cause the case to progress satisfactorily, but that the erasure of engrams all by itself can actually, if no other form of entheta is addressed, bring this case back down the tone scale again. particularly in the presence of a present-time restimulative situation which considerably enturbulates the preclear. The 3.0 level is definitely the area where an erasure is begun. Engrams do not ordinarily reduce at this level, but erase.

The 2.5-level case offers a little more concern to the auditor than the 3.0. This is so all the way down the bank, since the lower one goes on the tone scale, the more entheta one finds on the case and the greater care he must take in order to keep up the present-time tone of the preclear and to keep the preclear progressing up the tone scale. The 2.5 scans locks very easily; however he cannot, like the 3.5, scan secondaries. It is not advisable to scan a 2.5 through any moments of heavy misemotion, because the case will become restimulated and more theta will be absorbed into the turbulent areas than will be freed out of those areas by auditing. However, the 2.5 will run engrams as a routine matter, when they are addressed as single engrams, not as chains of engrams as in chain scanning. Moments of great sorrow, loss, anger, apathy, are run out as incidents, perceptic by perceptic, until they are reduced. New secondaries and new engram chains are recovered in the 2.5 by lock scanning. The only time the 2.5 requires straight memory as a processing technique is when the auditor desires to discover more about his case or to discover circuits. In the 2.5, the auditor locates circuits by straight memory, finding who in the preclear's environ tried to dominate or nullify him, and finding moments during the awake life of the preclear when these people made statements which were circuit-type statements, such as "Control yourself" or "Keep a good grip on yourself." At this level, the circuit is important. Here, considerable address should be made to circuits. The phrases should be located by straight memory and should then be lock-scanned out as phrases so as to discharge and de-intensify all circuit phrases contained in engrams; for here, and on down, a circuit can more or less take over from an auditor, so that the preclear will occasionally insist on running his own case. Or a circuit can bar off large quantities of entheta. The biggest trouble the 2.5 gives the auditor is the fact that the 2.5 normally considers himself to be in a fine state of health and is rather bored with processing. When the preclear has reached the level of 2.5 from a lower level, he would quite commonly just as soon forego further processing. It is at this point that the auditor must apply his own personality to the situation and coax his preclear through this rather stagnant area on the tone scale.

The 2.0 who is willing to work does not offer any particular problem to the auditor. Here the auditor can scan locks, he can run secondaries as individual moments of misemotion, but here the auditor may very well overestimate his preclear and decide to run, as routine, physical pain engrams. Here, the auditor can run physical pain engrams one after another, but he will tie up more free theta by creating new locks on the case through the running of these engrams than he gains out of the engrams. Any auditor is very ambitious for his preclear and is likely to begin running engrams long before the preclear is able to benefit from or even support running them. Nevertheless, particularly in the case where the preclear has received a drug-hypnosis or has had a recent operation, some physical-pain engram may present itself at this level and insist on being run. The file clerk is usually working at 2.0, and the file clerk should be very carefully consulted before any physical pain engrams are addressed. If physical pain engrams are run on the 2.0, the auditor should be very careful to scan off the session of auditing thoroughly, in order to knock apart the locks which are formed by the auditing itself.

The 1.5 responds to the scanning of locks, but the auditor will find that the 1.5 will sometimes hang up in individual locks. When this happens, the lock may have to be run like an engram, perceptic by perceptic, until it is reduced. After this, lock scanning can continue. This is of benefit to the case, since the scanning of locks brings the preclear closer to the most severe locks, which can then be contacted and run. These heavy locks remain out of sight until scanning brings to the preclear enough free theta to permit an address to heavy locks which are

holding up the progress of the case. On a 1.5, secondaries can be located best which are at the anger level. The auditor can discover a moment when the preclear was dramatizing anger and can ask the preclear to run through this moment or ask him to go back to an earlier moment when somebody was that angry with him. The preclear will discover an earlier lock where he himself was the recipient of the anger he later dramatized, and ordinarily he will run this early lock. The auditor should be very careful of any physical pain he runs on the 1.5. Here is a level where any physical pain is a thoroughly greedy trap. The engram in the 1.5 has so much authority that when free theta approaches it, that theta is itself enturbulated. Thus, the auditor should avoid running engrams at 1.5. The use of straight memory becomes very important at 1.5. Here a trick of straight memory becomes very important. The auditor should try to find an incident of an ARC break or enforcement variety which the preclear can credit with thorough and full reality. Actually, from this point on down the reality of the preclear can be confirmed and should be confirmed at every opportunity by straight memory contact with locks which the preclear himself and without any assistance from the auditor fully credits as actually having happened. This boosts the preclear up the tone scale more swiftly than any other method of processing which can be used from 1.5 on down.

Here, the auditor should be particularly careful to keep the auditing scanned off and should use any and every means to keep the free theta which he finds in the case as free as possible. Bad auditing and auditor code breaks at this level can cost the preclear in one session more theta than can be won in several sessions. The preclear at 1.5 commonly becomes angry with the auditor. He is still at a level where he seeks to dominate, and his method of domination is to express anger. This does not mean that the 1.5 is only angry or that he will not work smoothly for the auditor. Usually, only bad auditing will cause anger. There are 1.5's which are wide open and which deceptively invite the running of engrams. There are 1.5's which are thoroughly occluded. In either case exactly the same type of entheta is addressed and the same methods of handling it are used.

When one comes down to the 1.1, a great deal of care must be used because of the tremendous amount of entheta which exists on the case in proportion to the free theta. A 1.1 may have enough theta endowment originally to want to be processed. His desire to be processed, however, is very tentative and he is intensely critical of his auditor. He is afraid, and with good reason, for he has so little free theta left in comparison to the entheta on his case that bad auditing can bring about a much worsened condition. The 1.1 may not, however, be interested in processing and may consider himself in good condition, despite a very bad record in dealing with life. He is, quite commonly, chronically ill from one somatic or another. He may be diffident about his food. What free theta he has left is in such combat with the entheta, that he is continually on a border line. The auditor must recognize this. The auditor must recognize as well that a 1.1 can be insulting, can be sullen, can be thoroughly unwilling to be processed, and can be extremely trying. The patience of an auditor is easily exhausted when dealing with a 1.1, for the 1.1 may lie down on the couch and knowingly run complete imaginary incidents, reporting somatics and perceptics which he does not have. He may manufacture for the auditor an entire past life. Further, he may unknowingly advance data which is wrong. He may consider, for instance, and believe that he is telling the truth, that he was beaten a thousand times by his father, whereas his father laid hands on him but twice in his whole life. Or he may believe that he was treated royally by his parents, when actually they were extremely non-survival in their attitude toward him. The auditor must remember that in both the 1.5 and the 1.1, truth is not regarded as a very valuable commodity and is hard for the preclear to contact. Although the 1.1 may continually advance protests and evidences as to his honesty and open-heartedness, the auditor is dealing with a level where trickery is automatic. The auditor may actually succeed at this level in turning off chronic somatics, such as a migraine headache or ulcers, without decreasing the turbulence of the case. He has, evidently, merely turned an enMEST manifestation into an entheta manifestation, so that although the chronic somatic no longer troubles the 1.1 as physical pain, it troubles him exceedingly as mental aberration. Transfer of one somatic to another, or transfer of physical aberration to mental aberration can be expected to result if the auditor mistakes the preclear's level on the tone scale and attempts to use methods of processing that are above the 1.1's level. In a wide-open case, the auditor can be completely fooled, and can go on running the case with heavy

methods ad infinitum (until the preclear tires of processing and refuses it), more and more enturbulating the case, unless he pays careful attention to the preclear's behavior in locating the preclear on the tone scale chart.

Probably the chief characteristic of the 0.5 as far as the auditor-preclear relationship is concerned is the 0.5's complete helplessness. Even if the 0.5 wants to be audited, the auditor cannot depend upon his preclear for any responsibility about processing, or about anything else. This case requires an auditor of great patience and endurance. The auditor is faced with an individual to whom black is white, good is bad, and all is lost. His preclear may run hours of dub-in incidents if permitted, but the auditor has to be very careful how he steers the preclear toward real incidents, which should never be heavier than locks, preferably of the apathy variety, because the slightest disapproval or lack of acceptance of what the preclear is saying may enturbulate all of the preclear's meagre remaining theta. The 0.5 is only half a point above death. Any auditor who uses methods heavier than straight memory and the running of individual light locks on a 0.5 runs a risk of causing some death manifestation in the preclear, either suicide or (occasionally) murder, and most certainly will depress the 0.5 down toward pretended death. However, if the auditor keeps his own case well processed so that he can persevere in processing the 0.5 with the gentlest methods and so that he can preserve a very high ARC (which will depend entirely on the auditor) with the preclear, he will sooner or later have a preclear who is beginning to come up into the 1.1 band. This rise on the scale may not bring the auditor any relief since 1.1 is a very unpleasant level, but it will be a great relief to the preclear, although the auditor should not expect any thanks from the new 1.1. The average auditor will not be working with a 0.1 in the very near future, since most pretended death cases are in hospitals, sanatoriums, or institutions where they are out of contact with the society. However the circumstances of the 0.1 in the society at this time have no bearing upon the methods used to process a 0.1, and no auditor should think that the principles of mind operation change in any way in the case of the 0.1. The auditor who is invited to some private sanatorium by an alert but baffled medical doctor may find that he has just such a case to deal with. There are various methods of approaching the problem of the 0.1 case, but all of them add up to one thing: cause the preclear to be aware of present time perceptics, or at least of the idea that there is such a thing as present time. In all other levels it is necessary to establish and maintain high ARC between the auditor and the preclear, but here the main problem is to establish ARC between the preclear and anything in present time, including, of course, the auditor. How this may be done will depend upon the auditor's thorough understanding of the principles outlined in this book, for here is a case in which the theta might be considered to be ninety-eight percent enturbulated. It has been seen that as the tone scale was descended, gentler and gentler methods of processing had to be used. The auditor may feel, then, that there is no method of processing gentle enough for a 0.1, but the auditor should not overlook the fact that the mere presence of an auditor in the room with the preclear is, to some degree, processing. Starting from there, the auditor can begin to work to make present time interesting and attractive to the preclear. The auditor's presence for a few hours may build up enough affinity to make it possible for the auditor to call the preclear's attention to some object. When the preclear communicates with this object, by looking at it, the fact that the auditor is holding it, or also looking at it, will tend to establish an agreement about this object and some one thing in the world will then have a little reality for this preclear.

Future publications will deal more thoroughly with the processing of inaccessible psychotics, including the 0.1. But the principles which you have encountered while reading this book are the principles upon which future and more refined techniques will be based and any auditor who has the opportunity and the perseverance to process such a case will find that, simple as these basics are, they are far more powerful than any means man has had before to bring light where there is darkness, to bring order out of disorder, and to convert unreason into reason -- or entheta into theta.

UNBURDENING ENGRAMS

Recently I developed a technique called "Unburdening" which seems to have considerable possibilities. I have not had sufficient opportunity to test thoroughly its

potentialities or to locate it properly on the tone scale. I give it here for your information and would greatly appreciate hearing about whatever results you achieve with it.

Ordinarily the last engram on a case can be run providing it has not acquired too many locks. Further, any engram seems to depend, for its inaccessibility, on the locks it has accumulated.

The auditor occasionally finds it necessary to run an engram even though he cannot get all the perceptics which are contained in that engram. It would be valuable if he could obtain all the perceptics and reduce or erase them. Unburdening would be a technique designed to assist the auditor in running out all the perceptics.

The engram, in this technique, is run until everything in it which can be contacted is reduced. Then the auditor lock scans the preclear from the moment of the engram up to present time through all the locks of that engram. The auditor has the locks scanned one or more times, working with the file clerk. Then the auditor, using again standard procedure for engrams, runs that engram once more or twice more or until any additional material has been reduced. Then he has the preclear scan all the locks of that engram again. Then he once more runs the engram.

It is the charge in the locks which seals in the engram. By discharging the locks, through the technique of lock scanning, more and more perceptics should show up in the engram. Unburdening, then, would be the technique of thoroughly bringing to view everything contained in an engram by scanning its locks. Alternate running of the engram and scanning its locks should bring about a maximal release of entheta.

The practicality of this technique is certain. The extent of its usefulness has not been thoroughly explored.

It is completely assured that a physical pain engram underlies all misemotion and that when misemotion is run from a secondary, a physical pain engram is commonly exposed to view. Indeed, the preclear may dive into the physical pain engram and start running it while the auditor is still attempting to get a discharge from the secondary. It also happens that when an auditor is trying to run an engram his preclear may suddenly run into the misemotion of a secondary (which should then be run).

It also occurs commonly that the preclear, when the auditor is trying to run an engram, will soar up into the locks of that engram. This is the result, usually, of a bouncer in the engram. But bouncer or no bouncer, the locks are there and they are important. Thus, when an engram is reduced, the locks may be run, after which more perceptics may be found.

POSITIVE PROCESSING

A variation of technique which is of value to the auditor is "positive processing." This consists of addressing the theta on the case and bringing it to view. The auditor may become so engrossed in addressing entheta directly that he may overlook the fact that theta may be buried under the entheta. By looking for and bringing to view the theta, the auditor may improve the preclear's tone considerably.

Below many areas of entheta on a track there may be what we could call deposits of theta. The theta of the auditor and preclear addressed to such deposits of theta will disinturbulate the entheta which may overlie such moments.

Pleasure moments are, one could say, deposits of theta. Such deposits assist the conversion of entheta to theta. The running of pleasure moments then materially assists the raising of tone. One can use this in many ways and all these ways could be grouped under "positive processing." There are probably innumerable variations of positive processing. The running of a pleasure moment just as though it were an engram, until all perceptics are

recovered, is just one instance of positive processing. The scanning of chains of pleasure moments is another variation. The running of "future pleasure moments" ties in the imagination but is just another variation of positive processing.

Affinity, reality and communication can be used to excellent advantage in positive processing. The auditor, in this instance, is not looking for ARC locks when ARC was enforced or inhibited. He is looking for moments when they existed. By straight memory the auditor causes the preclear to recall moments when he actually felt he was receiving or giving affinity or communication, or actually experiencing reality. The preclear fairly well down the scale may have to search for some time before he can recall an instance when he actually felt affinity for something or some person or actually felt he was receiving affinity. Similarly, the preclear may have difficulty finding a moment of actual communication -- he may be in an audience or talking with a friend or even simply talking to a dog. Further, the auditor should remember that communication extends to perception and that actually seeing something or recalling that something was heard or felt may discover a theta deposit. Causing the preclear to recall something he knew was truly real or even recall somebody agreeing thoroughly with him is another instance of positive processing.

Straight memory on ARC positives is very valuable on low-tone cases. Further it is valuable in any case as a means of ending a session. The auditor will find sometimes that when he gives positive processing he will get yawns from the preclear. This is particularly true of scanning pleasure moments. These yawns indicate that the preclear has pleasure suppressors -- that something makes him feel guilty for experiencing pleasure. By some standards, not survival ones, pleasure is seen to be wicked and the engrams of the preclear will be found to contain admonitions against pleasure.

Occasionally the auditor will find a preclear breaking into tears under positive processing. Here, evidently (though several opinions could be advanced) the suppression of pleasure is such that the overlying entheta is of the same value as that in a secondary engram. The tears of relief signify the progress of the preclear up from apathy through grief in certain incidents. For any incident, irrespective of the preclear's tone, has its own position on the tone scale and, as it is reduced, comes up the scale in stages.

There was once a whole philosophy devoted to pleasure -- hedonism. Survival is pleasure, but idle satisfaction of the senses without plan or progress toward any goal is itself (like Aesop's grasshopper) destructive in the long run. It was this idle and purposeless gratification of the senses at which the moralist raged -- and with considerable justification. But better terminology should have been used. Pleasure is something neither man nor a civilization can do without -- its omission results in succumbing. In that happiness can be found to be the overcoming of not unknowable obstacles toward a known goal or the contemplation of goals, one can see that idle pleasure would have to be static or destructive sensual gratification. Pleasure is seldom idle in that sense, but it is as often lazy and relaxing as it is dynamic and constructive. Man cannot live without it. And the auditor, using positive processing will find it a helpful ally.

The goal of processing is to raise the individual on the tone scale. Part of this procedure is the running out of all engrams in order to make the rise permanent. But the important thing is the rise itself. The behavior of a 4.0, or even a 3.5 is so far superior to normal human behavior, the ability of these higher levels to provide happiness, accomplishment, creation, and joy in living is so great, that we tend to think of them as distant goals simply because they are so high. But they are not so distant. Even as this book is completed, new methods, new approaches to a case are developing which make the higher ranges of the tone scale easier to reach for more and more cases. The validation or positive approach to the case, the advent of dynamic straight wire (in which the effect of each dynamic on every other discovers all possible locks), the discovery of the fundamental nature of MEST locks and the development of MEST technique, are but some of the new things that are coming off the "drawing boards." Dianetics does not rest or stay, it does not flag or halt. As the auditor and preclear continue their progress up the tone scale, they may be encouraged not only by their own successes but also by the fact that as they approach the goal, it is approaching

them. A fact which has been forgotten in this time of war and spiritual pestilence is that there have been times in man's history and pre-history when he has succeeded. It has not all been gloom and hopelessness, else we would not be here today -- even as poorly as we are. Men have lived to conquer all other forms of life, from the mastodon to the microbe. Men have lived to build walls and roads and pyramids which have defied the elements for thousands of years. Men have lived to write music which has pleased the gods and lines which have made the angels sigh and the devil weep. This is a time for man to succeed again. Here is the word, the technology, the goal. The job is cut out: and its name is Survive!

THE AUDITOR'S CODE OF 1958

1. Do not evaluate for the preclear.
2. Do not invalidate or correct the preclear's data.
3. Use the processes which improve the preclear's case.
4. Keep all appointments once made.
5. Do not process a preclear after 10:00 p.m.
6. Do not process a preclear who is improperly fed or who has not received enough rest.
7. Do not permit a frequent change of auditors.
8. Do not sympathize with the preclear.
9. Never permit the preclear to end the session on his own independent decision.
10. Never walk off from the preclear during a session.
11. Never get angry with the preclear.
12. Always reduce every communication lag encountered by continued use of the same question or process.
13. Always continue a process as long as it produces change, and no longer.
14. Be willing to grant beingness to the preclear.
15. Never mix the processes of Scientology with those of various other practices.
16. Maintain two-way communication with the preclear.
17. Never use Scientology to obtain personal and unusual favors or unusual compliance from the preclear for the auditor's own personal profit.
18. Estimate the current case of your preclear with reality and do not process another imagined case.
19. Do not explain, justify or make excuses for any auditor mistakes whether real or imagined.

APPENDIX

Axioms and Definitions

Survive	The dynamic principle of existence is Survive. At the opposite end of the spectrum of existence is Succumb.
Dynamics	The dynamics are the urge to survive expressed through eight divisions. (1) self, (2) sex, and the future generation, (3) the group, (4) mankind, (5) life, (6) MEST, (7) theta, (8) the Supreme Being.
Immortality	Infinite survival, the absolute goal of survival. The individual seeks this on the first dynamic as an organism and as a theta entity and in the perpetuation of his name by his group. On the second dynamic he seeks it through his children, and so on through the eight dynamics. Life survives through the persistence of theta. A species survives through the persistence of the life in it. A culture survives through the persistence of the species using it. There is evidence that the theta of an individual may survive as a personal entity from life to life, through many lives on Earth.
Pleasure	Pleasure is the reward of survival activity along any of the dynamics. Successes bring pleasure and survival.
Succumb	Succumbing is the ultimate penalty on nonsurvival activity. This is pain. Failures bring pain and death.
Human Thought	A process of perceiving and storing data, computing conclusions, posing and resolving problems. The purpose of this is survival along all of the dynamics.
Intelligence	The ability to perceive, pose, and resolve problems. Intelligence and the urge to survive (the dynamic) are both necessary to continued existence. The quantity of each varies from individual to individual and group to group. The dynamics are inhibited by engrams which block their flow of theta, or life force, and disperse it. Intelligence is also inhibited by engrams, which enter false or improperly graded data into the analytical mind.
Happiness	The overcoming of not unknowable obstacles toward a known goal.
Analytical	That portion of the mind which perceives Mind and retains experience data to compose and resolve problems and direct the organism along the eight dynamics. It thinks in differences and similarities.
Reactive Mind	That portion of the mind which files and retains physical pain and misemotion and seeks to direct the organism solely on a stimulus-response basis. It thinks only in identities.
Somatic Mind	That portion of the mind which, at the direction of either the reactive or analytical mind, puts solutions into effect physically.
Training	A stimulus-response mechanism set up by the Pattern analytical mind to carry out activity of either a routine or an emergency nature. The training pattern may be said to be held in the somatic mind, but it can be changed at will by the analytical mind.
Habit	A stimulus-response mechanism similar to the training pattern but set up by the reactive mind out of the content of engrams. It cannot be changed at will by the analytical mind.
Aberration	Irrational behavior or computation (thinking). They are stimulus-response in nature and may be pro-survival or contra-survival. The engram is the basic source of aberrations.

PV=IDx	This formula expresses the Potential Value of an individual. I represents Intelligence, and D represents Dynamic. Worth. If an individual's PV is high and is aligned with the dynamics toward survival, his worth may be said to be very high. A person with a high PV, however, may be aberrated so that his PV is reversed in the direction of succumbing and his worth is low. This may be computed for any one of the eight dynamics or for all.
Theta	Thought, potentially independent of a material vessel or medium. Life force. Elan Vital.
Theta Universe	Thought matter (ideas), thought energy, thought space, and thought time, combining in an independent universe analogous to the material universe. One of the purposes of theta is postulated as the conquest, change, and ordering of
MEST.	MEST: Matter, Energy, Space, and Time. The physical universe.
Life	The harmonious conquest of MEST by theta in which a self-perpetuating organism is formed. Death is the withdrawal of theta from the organism.
Entheta	Theta which is enturbulated with MEST (enMEST) in an inharmonious combination.
EnMEST	MEST which has been enturbulated by enttheta or crushed too hard into theta and rendered less usable.
Pain	The alarm reaction to theta which has been crushed too severely into MEST. The penalty of non-survival activity.
Engram	An encystment containing enttheta and enMEST. A recording (possibly cellular) of a period of pain and unconsciousness (or anaten). Not available to the analytical mind as experience. The sole source of aberrations and "psychosomatic illnesses."
Lock	An analytical incident of greater or lesser enturbulence of theta which approximates the perceptics of an engram or chain of engrams and therefore becomes trapped due to the physical pain recorded in the engram and remains as an encystment of enttheta.
Secondary Engram Charge	A lock of such magnitude that it must be run as an engram in processing. A lock with great magnitude of enttheta. The accumulation of enttheta in locks and secondaries which charges up the engrams and gives them their force to aberrate.
Death	The withdrawal of theta from an organism, leaving only MEST, in order to conquer new MEST and form another organism which can better survive.
Life Cycle	The periodic conquest of, withdrawal from, and reconquest of MEST by theta. It is postulated that a given segment or entity of theta undergoes birth, growth, death, birth, growth, death, etc., each time learning more about the business of making MEST into successful organisms which can better survive.
Evolution	There are four evolutionary tracks, evidently. Organism evolution, through natural selection, accident, and (evidence suggests) outright planning. MEST evolution, brought about through the agency of life organisms. Theta evolution, a postulated process of learning in theta as a whole or as entities. And present-time ladder-of-support evolution, in which less complicated organisms support more complicated organisms. Theta Body The postulated theta entity. The soul. Evidence suggests that the theta body may, through many low-tone lives, become an enttheta body, but that such an enttheta body might be cleared by dianetic processing.
MEST Body	The physical body. The organism in all its MEST aspects.

Personality	A complex of inherited (MEST, organic, theta) and environmental (aberration, education, present-time environment, nutrition, etc.) factors.
Genetic	Personal characteristics and tendencies derived Personality from the three inheritance sources (MEST, organic line, theta). This might be said to be basic personality, or the core of basic personality.
Aberrated	The personality resultant from superimposition, on Personality the genetic personality, of personal characteristics and tendencies brought about by all environmental factors, pro-survival and aberrational.
Environmental	All conditions surrounding the organism from the first moment of present-life existence to death, including physical, emotional, spiritual, social, educational, and nutritional.
Education	All perceived data stored in the standard memory banks. This might also be extended to include all data stored in the banks, including conclusions and imaginings.
Nutrition	Support of the organism by organic and inorganic means (food, water, air, sunlight) during all of the present life, from conception or thereabouts to death. The nutrition of a genetic line, of course, would pass from parents to children in the forms of organic inheritance and gestation environment.
Culture	The pattern (if any) of life in the society. All factors of the society, social, educational, economic, etc., whether creative or destructive. The culture might be said to be the theta body of the society.
Time Track	A representation of the fact that a person exists during a period of MEST time. The present-life time track begins at the first moment of recording and ends at present-time, or at death, and it includes all consecutive moments of "now" and the perceptics of those moments.
Action Phrases	Words or phrases in engrams or locks (or at 0.1, in present time) which cause the individual to perform involuntary actions on the time track. Action phrases are effective in the low tone ranges and not effective in the high ranges. As a case progresses up the scale, they lose their power. Types of action phrases are Bouncer, Down Bouncer, Grouper, Denyer, Holder, Misdirector, Scrambler and the Valence Shifters corresponding to these.
Bouncer	Sends the preclear up the track toward present-time. (Get up, get out, don't touch me, leave me alone, I've got to get ahead.)
Down Bouncer	Sends the preclear earlier on the track. (Sit down, get down, it's underneath, you're early, held down, slide Kelly slide!).
Grouper	Collapses time track, brings many incidents together. (I have no time, put them all together, it's all up to me all the time, I have to do everything around here, you're all alike, I'll get even with you, solidarity forever!).
Denyer	Denies existence of phrase or incident. (No, don't, I won't, I can't tell, you mustn't, it's not here, never, impossible, unknown, unthinkable, you know (no) everything.)
Holder	Holds preclear at a point on the track. (Stay here, don't leave me, hold on to this, don't let go, keep quiet, take this it'll make you feel better.)
Misdirector	Sends preclear in the wrong direction. (Not that way, the other way, that's wrong, I don't know whether I'm coming or going you don't know up from down.) Scrambler Scrambles incidents and phrases. (I'm confused, I'll take mine scrambled, stir it up, it's all mixed up and I'm in the middle.)

Valence Shifter	(You're just like your father, don't be like Uncle Rudy, you're just like everybody else, you're exactly like Rover, you're nobody, you're not human, you're out-of-this-world, you can't ever be yourself, I'll just have to pretend I'm somebody else or I'll never be happy again.)
ARC	Affinity-Reality-Communication, the triagonal manifestation of theta, each aspect affecting the other two.
Affinity	The attraction which exists between two human beings, or between a human being and another life organism, or between a human being and MEST or theta or the Supreme Being. It has a rough parallel in the physical universe in magnetic and gravitic attraction. The affinity or lack of affinity between an organism and the environment or between the theta and MEST of an organism and within the theta (including entheta) of the organism brings about what we have referred to as emotions, in the past. The affinity scale includes most of the common emotions, apathy, grief, fear, anger, hostility, boredom, relief, contentment, enthusiasm, exhilaration, inspiration.]
Communication	Communication with the recorded past (through recall and memory), the present (through perception), and the future (through imagination and/or other mechanisms), communication between people by writing, talking, touching, seeing, etc. Also, Communication as in groups, and the technology thereof (Group Dianetics). There are emotions on the communication scale, but they have not commonly been named in our society.
Reality	Reality of the past ("I"'s reception of the past agrees with the recorded data, and "I" agrees that it does). Reality of the present ("I"'s reception of the present agrees with the data impinging upon the organism from the environment, and "I" agrees that it does). Reality of the future ("I"'s concept of the future agrees with past and present data, and "I" agrees that it does). Reality between two people (they agree on something). Reality in a group (the majority in agreement). Physical, "actual" reality -- the only kind considered by many people -- is merely agreement between MEST conditions or life conditions and some person's perceptions of those conditions. If these do not agree, we say that he does not know the reality (ours, that is, for we have only our own perceptions by which to judge the MEST conditions). There are emotions on the reality scale. One of them is shame.
Emotion	This word is re-defined in Dianetics and is given an opposite for comparison, "misemotion." Previously the word emotion was never satisfactorily defined. Now it is defined as an organism manifestation of position on the tone scale which is rationally appropriate to the present-time environment and which truly represents the present-time position on the tone scale. Rational affect. Misemotion An organism manifestation which pretends to be emotion (as defined above) but which is irrational, inappropriate to the present-time environment, or not representative of the true present-time position on the tone scale. Irrational affect. Misemotion is also entheta in the reactive mind, emotion which has been suppressed and which remains in the case in locks and secondaries.
ARC Locks	"Permanent" encystments of entheta resulting from the enturbulation of theta by enforcements or inhibitions of affinity, reality, or communication and the trapping of this enturbulated theta by the physical pain of some engram or chain of engrams whose perceptics are approximated in the present-time enturbulation. Locks are analytical experiences. If there were no

	physical pain to trap the enturbulated theta, it would disenturbulate, with a greater or lesser display of emotion. ARC locks of such magnitude that they must be run
Secondaries	as engrams in processing. Or, since locks are often run as engrams, ARC locks of great magnitude.
Restimulation	Locks in which the chief noticeable factor is Locks the approximation of engram perceptics in present time, rather than any particular break of ARC. These require a low level of analytical alertness, as in fatigue, to take place. Broken Locks in which the chief factor is that the Dramatization individual has been prevented from Locks completing the dramatization of a restimulated engram. These are most abundant at the 1.5 level.
Present Time	The point on anyone's time track where his physical body (if alive) may be found. "Now." The intersection of the MEST time track with the (postulated) theta time track.
Future	On the time track, that area later than present time. Perception of the future is postulated as a possibility. The creation of future realities through imagination is a recognized function.
Past	On the time track, everything which is earlier than present time.
Occlusion	A hidden area or incident on the time track. The existence of a curtain between "I" and some datum in the standard memory banks. Occlusions are caused by entheta.
Ally	A person recorded in the reactive mind of the preclear about whom the preclear makes the reactive computation that this person is necessary to the preclear's survival.
Perceptics	Specialized data from the standard memory or reactive banks which represent and reproduce the sense messages of a moment in the past. The sense messages of present time, also, (formerly, the word "Percepts" was used to mean the sense messages of present time, but usage has dropped this distinction.)
Theta	Communication with the theta universe.
Theta Perceptics	Such Perceptics may include hunches, predictions, ESP at greater and lesser distances, communication with the "dead," perception of the Supreme Being, etc.
MEST Perceptics	Common garden-variety sense data -- perceptions, new and recorded, of matter, energy, space, and time, and combinations of these. There are twenty-six postulated channels of MEST perception.
Sonic	The recall of something heard, so that it is heard again in the mind in full tone and strength.
Visio	The recall of something seen, so that it is seen again in the mind in full color, scale, dimension, brightness and detail.
Tactile	The recall of touch Perceptics.
Olfactory	The recall of perceptics of smell.
Kinesthesia	The recall of movement.
Thermal	The recall of temperature.
Joint Position	The recall of bodily attitudes.
Moisture	A recalled perceptic usually associated with the prenatal period.
Organic	The perceptions of the states of various organs,
Perceptions	pressures, well being, afflictions, etc.
Gradient	The tool of infinity-valued logic. It is a tenet
Scales	of Dianetics that absolutes are unattainable. Terms like good and bad, alive and dead, right and wrong are used only in conjunction with gradient scales. On the scale of right and wrong, everything above zero or center would be more and more right, approaching an infinite rightness, and everything below zero or center would be more and more wrong, approaching an

infinite wrongness. The gradient scale is a way of thinking about the universe which approximates the actual conditions of the universe more closely than any other existing logical method. Introduction of An arbitrary may be considered as a factor an Arbitrary introduced into a problem's solution when that factor does not derive from a known natural law but only from an opinion or authoritarian command. A problem resolved by data derived from known natural laws resolves well and smoothly and has a useful solution. When a problem is resolved by introducing arbitraries (factors based on opinion or command but not natural law) then that solution, when used, will ordinarily require more arbitraries to make the solution applicable. The harder one tries to apply the solution corrupted by arbitraries to any situation, the more arbitraries have to be introduced. This in government, laws passed which contain arbitraries create new problems which cannot be solved without more new arbitraries and thus, rapidly, a top heavy and unworkable structure of government comes into being which would be workable only if wholly re-designed in the light of known natural laws about government.

Evaluation	A datum is as understood as it can be related to Data and other data.
Value of Datum Comparable	A datum is as important or valuable as it relates to survival. A datum can only be evaluated by comparison Magnitude with another datum of comparable magnitude. This means that the basic unit must, therefore, be two.
Accessibility	The desire of the preclear to be raised on the tone scale by processing. (In a past publication, the word "accessibility" was used to mean not only the above but also the accessibility of enttheta on the case to various methods of processing. This last meaning is not used in the present work.) A case is considered accessible when it will work willingly with the auditor, no matter how occluded the case may be.
"T"	The awareness of awareness center. Organisms are aware of their environment. Higher organisms are aware, also, of this very awareness. The "T" of the human being may be said to be the center or monitor of this awareness of awareness.
Altitude	A prestige which the auditor has in the eyes of the preclear. A somewhat artificial position of the auditor which gives the preclear greater confidence and therefore greater ability to run than he would otherwise have. In the society in general, there are four kinds of altitude an individual may have.
Data Altitude	Signifying that the individual has a fund of knowledge gathered from books and records, or sometimes from experience, with which others are not familiar. The college professor has data altitude.
Computational	Signifying that the individual has an outstanding Attitude ability to think, to compute upon data. Albert Einstein had computational altitude.
Positional	Deriving from an arbitrarily assigned position. Military officers and bureaucrats often depend heavily upon positional altitude.
Personal Presence Altitude	The individual who leads or makes an impression upon others merely by his presence, by his example and the fact of his existence, has personal presence altitude. Ghandi had this to a very high degree.
Command Somatic	A somatic brought from a different part of the time track by some command phrase, such as "My arm hurts." The preclear may have this somatic while running a prenatal engram

False Four	although he was only three days conceived in the incident. Command somatics occur where the preclear is out of valence. The laughter and gaiety which the preclear exhibits when he has thoroughly exhausted an incident of charge. There is nothing really "false" about false four, except that it is often of very short duration.
Basic Purpose	Even at the age of two or three years an individual seems to know what his basic purpose is in life. Later this becomes corrupted by individual and social aberrations but is recovered in dianetic processing. Possibly past lives have something to do with forming basic purpose.
Basic Engram	The first engram on a given chain of engrams.
Basic Area	The time track from the first recording on the sperm or ovum track to the first missed menstrual period of the mother.
Basic-Basic	The first moment of pain, anaten, or discomfort in the current life of the individual.
Language	Locks in which the main aberrative content is in Locks terms of language. These may be considered symbolic restimulators of MEST locks, which are more fundamental.
MEST Locks	Locks which come about through the inhibition or enforcement of the individual's experience or control of matter or energy or space or time. It is postulated that the reduction of the MEST locks in which the individual was made to go up or not permitted to come down will make any bouncer phrases in the case inactive, and so on with all types of action phrases.
Validation Processing	in which the auditor, at least for one session, concentrates exclusively on the theta side of lock chains, not allowing the preclear to run any but analytical moments on any given subject. When the preclear encounters too much entheta on a given chain, the auditor takes him to analytical moments on another subject (which moments constitute, of course, a parallel chain to the locks on that subject) obtained from the file clerk. During this type of processing somatics will turn on and off, sometimes severely, but the auditor ignores them, and keeps bringing the preclear back to analytical (not necessarily pleasure) moments. Validation technique should not be mixed with entheta technique. MEST Straight wire, repetitive straight wire (slow, Technique auditor-managed lock scanning), and lock scanning on MEST locks. Language locks are found by straight wire only as a clue to the underlying MEST locks. MEST technique and validation technique may be combined and should be. (Other needed definitions may be found by referring to the index.)

Hubbard's Chart of Human Evaluation and Communication is a complex system of symbols and numbers used to evaluate human communication. It is based on the concept of the human mind as a complex system of energy and information. The chart is used to identify and understand the various components of human communication, such as the body, the mind, and the spirit. It is a powerful tool for self-discovery and personal growth.

SELF ANALYSIS

by

L. Ron Hubbard

A Simple Self-Help Volume of Tests and Processes
Based on the Discoveries Contained in Dianetics.

To those hundreds of thousands of ardent Dianetics supporters who have carried the guidon of sanity against the crumbling citadels of superstition and who have succeeded in rallying to their standard the hopes of Man.

Do not harken too well to he who would tell you this system will not work. He would not feel safe if people around him grew too strong. The wise man tests before he talks. The critic but follows the fad of a cynical and apathetic age. You have a right to your own opinion. This system works or it doesn't according to your experience. Not all the authorities in Christendom can alter natural law.

PREFACE

The simplicity of this volume is matched only by its effectiveness. It is not necessary to study the introductory chapters in order to get started in Self Analysis. The reader may turn at once to page 39 and follow the simple directions there and begin immediately upon self processing.

Or the reader may turn first to page 31 and take the first test and by it learn accurately his potentials and future and so be able to measure, by taking these tests from time to time, his improvement under the processing section.

Or he may begin at the beginning and find out such interesting things as the basic goal of life, the role language plays in existence, and the basics of human behavior as well as the mechanisms of the human mind.

This volume includes an explanation of the principles involved, a set of examinations which the reader administers to himself, a tone scale which delineates the classes of human personality into which all human beings fall, and the selfprocessing section.

Simply by answering the questions contained in the various processing sections, the concerns and worries of the individual's life resolve automatically.

A card is provided for the readers use which he rotates from question to question and which tells him what sense perception to give attention to in the memories revoked.

Self Analysis is simple and easy. Only a vast and complete understanding of the human mind such as that possessed by L. Ron Hubbard could evolve such a system. For although the reader may never be aware of it, an enormous amount of technical knowledge and experience underlies Dianetic Self Analysis.

In using Self Analysis the reader will experience things he had not thought possible. For anything as fundamental as this system, capable of producing the results it produces, could not be otherwise than powerful.

A system such as Self Analysis has never before been possible for the basic laws of human thought and behavior were not known until L. Ron Hubbard applied his brilliance and his training in the field of atomic and molecular phenomena to the field of human thought.

His discoveries and the results he has achieved with them have rocked the savants and old schools of thought to their roots, leaving Dianetics the only validated method of increasing sanity and happiness known to man.

It is not necessary for you to take anyone's statement for it. Apply Self Analysis for a short time and feel the results for yourself. If you are truly skeptical have yourself tested thoroughly by doctors and psychometrists, use the self-processing section for half an hour a day for a month and then cause the tests to be repeated. If you have been faithful to your task, the change in you should be sufficiently marked to cause a considerable stir. Things like this have simply never happened before—increased intelligence, faster reaction time, improved physical condition, a happier outlook on life and much more likely to be liked by your friends.

After their initial antagonism—understandable because Dianetics thoroughly invalidated their beliefs and teachings—leading authorities now admit that Dianetics accomplishes things never before possible in the humanities.

Self Analysis and its organization is in itself a triumph, for it gives the benefits of Dianetics to everyone. The scholarly and very intelligent reader can pursue the explanations and

axioms contained herein and explore the whole of Dianetics through more basic tests on the subject. But the reader who cares little for the technicalities and only wants results can benefit by following the simplest directions.

This volume and its system of Self Analysis is not intended for the severely neurotic or psychotic person but only for the reasonably stable individual, to increase his ability, efficiency, well-being and longevity.

THE EDITORS

INTRODUCTION

Self Analysis cannot revive the dead.

Self Analysis will not empty insane asylums or stop war. These are the tasks of the Dianetic Auditor and the Group Dianetic Techniaan.

But Self Analysis will conduct you on the most interesting adventure in your life. The adventure of you.

How efficient are you? What are your potentials? How much can you improve? Well, basically your intentions toward yourself and your fellow man are *good*. Basically, if sometimes clouded over with the not so pale cast of bad experience, your potentialities are a great deal better than anyone ever permitted you to believe.

Take your memory, a small part of your total assets. Is it perfect? Can you, at will, recall everything you have ever learned or heard, every phone number, every name? If you can't you can see that there is room for improvement. Now somebody, with a half glance at the title page of this book, will try to assume that Self Analysis simply improves memory. That is like saying that all a train can do is meet schedules. It does much more. But memory is a starter. If your memory were as accurate as an IBM card index system and even faster, you would be more efficient and more comfortable and it would certainly save writing those notes you have to make. Yes, you probably couldn't have *too* good a memory on things you've studied and things you need.

But there are a lot of things as important as memory. There's your reaction time. Most people react too slowly in emergencies. Let's say it, takes you half a second to pull your hand off a hot stove. That's many times too long a period to have your hand on that stove.

Or let's say you require a third of a second to see the car ahead stop and to start to put on your own brakes. That's too long. A lot of accidents happen because of slow reaction time.

In the case of an athlete, reaction time is a direct index as to how capable he may be in a sport. So it assists one in many ways to be able to react quickly.

Self Analysis speeds up reaction time. Here's a trick. Take a dollar bill, unfolded. Have somebody hold it vertically above your hand. Open your thumb and index finger just below the lower edge of the bill. Now let your friend let go. You try to close thumb and index finger on the bill. Did you miss it, snapping after it had gone all the way through? That's very slow reaction. Did you catch it by its upper edge when it was almost gone? That's much too slow. Did you catch it on Washington's face? That's fair. Or did you catch it on the lower edge, even before it really got started? That's the way it should be. Less accidents, greater general alertness. Well, barring actual physical damage to hand or arm, Self Analysis will speed that up for you.

Do you have trouble going to sleep or getting up? Do you feel a little tired a lot of the time? Well, that can be remedied.

As for what they call psycho-somatic illnesses—sinusitis, allergies, some heart trouble, "bizarre" aches and pains, poor eyesight, arthritis, etc., etc., etc., down through seventy per cent of man's ills, Self Analysis should be able to help markedly.

Then there's the matter of how young or old you may look. Self Analysis can make quite a change there.

And there's the matter of plain ordinary ability to be happy in life and enjoy things. And there Self Analysis shines brightly for it can raise your tone fast enough, usually, so that even you will agree things can be good.

As my boyhood hero, Charles Russell, the painter, once described a certain potion, "It'd make a jack rabbit spit in a wolf's eye". Now maybe Self Analysis doesn't always have this effect, but it happens regularly enough to be usual. Certain it is that the user often goes through such a period, much to the alarm of his friends. Self Analysis does have an effect as in the song: "I can lick that guy, I can kiss that girl,

"I can ride that bronc and make him whirl . . ."

The moral and caution is "Don't pick too big a wolf". At least not until you've been using this for a while and kind of get things in proportion again.

In short this is an adventure. How good can you get?

A lot depends on how good you are potentially—but you can be assured that that's a lot better than you ever supposed. And it's a cinch it's better than your friends would ever tell you.

Please don't be discouraged if you find yourself pretty low on the self-evaluation chart later on. All is not lost. The processing section can boost you up at a good rate if you keep at it.

And don't be surprised if you suddenly begin to feel uncomfortable while you're working on the processing section. You can expect that to happen every now and then. Just keep going. If it gets too bad, simply turn to the last section and answer those questions a few times and you should start feeling better very soon.

All I'm trying to tell you is this—adventures are dull if a little excitement doesn't crop up. And you can expect excitement—too much in some places.

You are going to know a lot about you when you finally finish.

All this is on your own responsibility. Anything as powerful as these processes can occasionally flare. If you are fairly stable mentally there is no real danger. But I will not mislead you. If you see somebody who isn't quite as stable as he thinks he is working with Self Analysis, coax it away from him. If he can barely stand mental chicken broth, he has no right to be dining on raw meat. Send him to see a professional auditor. And even if he does throw a wheel, a professional auditor can straighten him out. Just send for an auditor.

Don't then, disabuse yourself of the fact that Self Analysis can send the unstable spinning.

We're dealing here with the root stuff of why men go mad. If it isn't explained in the text, it will be found in a standard work on Dianetics. Even so, it is doubtful if Self Analysis could create as much madness in a year as an income tax blank from our thorough if somewhat knuckle-headed government.

Now to particulars. You'll find the tests further on. You can take the first one. It will give you a figure which will place you on the chart. Don't blame me if it's a low score. Blame your parents or the truant officer.

Next, it would probably interest you to read the text. It will give you a different viewpoint on things, possibly. It is regretted if it is too simple for the savant or too complex or something. It's simply an effort to write in American a few concepts about the mind based on a lot of technical material in Dianetics but made more palatable. You'll do better on the processing if you read the text.

The processing section has a large number of parts. You can simply work straight through or work over each one again, and again, until you feel you've sufficiently explored that part of your life. In any case you will go through every section many times.

To help you there is a two-sided disc in the back of the book. The directions are given later.

Thus you are prepared to go exploring into your own life. That's an interesting adventure for anyone. I've done what I could to make it easier. Don't be too harsh on me, however, if you get grounded up some long lost river and eaten by cannibals or engrams. The last section will help get you out. What's left of you, anyway.

Don't get faint hearted and slack off, though, when you find the going rough. It's easy to quit. And then you'd neva know just what you really are, basically.

Going to take the whole trip? You're a brave person. I compliment you.

May you never be the same again—

L. RON HUBBARD

CHAPTER ONE

Are you a friend of yours ?

Probably the most neglected friend you have is you. And yet every man, before he can be a true friend to the world must first become a friend to himself.

In this society, where aberration flourishes in the crowded cities and marts of business, few are the men who have not been subjected, on every hand, to a campaign to convince them that they are much less than they think they are.

You would fight anyone who said of your friends what is implied about you. It is time you fought for the best friend you will ever have—yourself.

The first move in striking up this friendship is to make an acquaintance with what you are and what you might become. “Know thyself !” said the ancient Greek. Until recently it was not possible to make a very wide acquaintance. Little was known about human behavior as a science. But atomic physics, in revealing new knowledge to man, has also revealed the general characteristics of the energy of life and by that a great deal can be known which was not before suspected. You do not need to know atomic physics to know yourself, but you need to know something of the apparent goal of life in general and your own goals in particular.

In a later chapter there are some questions you can answer which will give you a better insight into your capabilities as they are and what they can become—and do not be deceived, for they can become a great deal more than you ever before suspected.

Just now let’s talk about the general goal of all life. Knowing that, we can know something about the basic laws which motivate your own urges and behavior.

All problems are basically simple—once you know the fundamental answer. And this is no exception in life. For thousands of years men strove to discover the underlying drives of existence. And in an enlightened age, when exploration *of* the universes had already yielded enough secrets to give us A-bombs, it became possible to explore for and find the fundamental law of life. What would you do if you had this fundamental law ? How easily then would you understand all the puzzles, riddles and complexities of personality and behavior. You could understand conjurers and bank presidents, colonels, and coolies, kings, cats and coal heavers. And more important, you could easily predict what they would do in any given circumstance and you would know what to expect from anyone without any guesswork—indeed with a security diabolical in its accuracy.

“In the Beginning was the Word”, but what was the Word? What fundamental principle did it outline ? What understanding would one have *if* he knew it?

An ancient Persian king once made a great effort to know this Word. He tried to discover it by having his sages boil down all the knowledge of the world.

At his orders, every book written which could be obtained was collected together in an enormous library. Books were brought to that ancient city by the caravan load. And the wise men of the time worked for years condensing every piece of knowledge which was known into a single volume.

But the king wanted a better statement of the fundamental Word. And he made his sages reduce that volume to a single page. And he made them reduce it again to a sentence. And then, after many more years of study, his philosophers finally obtained that single Word, the formula which would solve all riddles.

And the city died in war and the Word was lost.

But what was it? Certainly its value, since it would make an understanding of Man possible, exceeded the riches of Persia. Two thousand years later, out of the studies of atomic and molecular phenomena, we can again postulate what that Word was. And use it. Use it to know ourselves. And to predict the actions *of* other men.

CHAPTER TWO

The dynamic principle of existence is: SURVIVAL!

At first glance that may seem too basic. It may seem too simple. But when we examine this Word, we find some things about it which make it possible for us to do tricks with it. And to know things which were never known before.

Knowledge could be represented by a pyramid. At the top we would have simple fact but a fact so widely embracing the universe that many facts could be known from it. From this point we could conceive descending down into greater and greater numbers of facts, represented by the broadening of the pyramid.

At any point we examine this pyramid we would find that as one descended he would find facts of wider and less related meanings. As one went up he would find greater and greater simplicities. Science is the process of starting low on the pyramid, much like the Persian king, and rising up in an effort to discover more basic facts which explain later facts. Philosophy could be said to be the operation of taking very basic facts and then leading them into explanations of greater and greater numbers of facts.

At the point of our pyramid, we have SURVIVAL !

It is as though, at some remarkably distant time, the Supreme Being gave forth a command to all life: "Survive!". It was not said how to survive nor yet how long. All that was said was "Survive !" The reverse of Survive is "Succumb". And that is the penalty for not engaging in survival activities.

But what of such things as morals, ideals, love? Don't these things go above "mere survival" ? Unfortunately or fortunately, they do not.

When one thinks of survival, one is apt to make the error of thinking in terms of "barest necessity". That is not survival. For it has no margin for loss.

The engineer when he constructs a bridge, uses something called a "factor of safety". If a bridge is to hold ten tons, he builds it to hold fifty tons. He makes that bridge five times as strong. Then he has a margin for deterioration of materials, overloading, sudden and unforeseen stress of elements, and any accident which may occur.

In life, the only real guarantee of survival is *abundance*. A farmer who calculates to need twelve bushels of grain for his food for a year and plants twelve bushels has cut back his chances of survival very markedly. The fact is, he will not survive, unless some neighbor has been more prudent. For the grasshoppers will take part of the wheat. And the drought will take some. And the hail will take some. And the tax gatherer will take some. And what will he do for seed wheat if he intends to use all he plants for food ?

No, the farmer who knows he has to eat twelve bushels of wheat in the coming year had better plant a hundred. Then the grasshoppers and internal revenue people can chew away as they will. The farmer will still be able to harvest enough for his own food—except of course in a Socialism where nobody survives, at least for very long!

An individual survives or succumbs in ratio to his ability to acquire and hold the wherewithal of survival. The security of a good job, for instance, means some guarantee of survival —other threats to existence not becoming too overpowering. The man who makes twenty thousand a year can afford better clothing against the weather, a sounder and better home, medical care for himself and his family, good transportation and, what is important, the respect of his fellows. All these things are survival.

Of course the man who makes twenty thousand a year can have such a worrisome job, can excite so much envy from his fellows and can be so harrassed that he loses something of his survival potential. But even a subversive will change his political coat if you offer him twenty thousand a year.

Take the man who makes ten dollars a week. He wears clothes which protect him very poorly. Thus he can easily become ill. He lives in a place which but ill defends him from the weather. He is haggard with concern. For his level of survival is so low that he has no margin, no abundance. He cannot bank anything against the day he becomes ill. And he cannot pay a doctor. And he can take no vacations. Even in a collective state his lot would be such, his regimentation so thorough that he could do little to protect his own survival.

Youth has a survival abundance over old age. For youth still has endurance. And the dreams of youth—good survival stuff, dreams—are not yet broken by failures. Youth has, in addition, a long expectancy, and that is important, for survival includes length of time to live.

As for ideals, as for honesty, as for one's love of one's fellow man, one cannot find good survival for one or for many where these things are absent. The criminal does not survive well. The average criminal spends the majority of his adult years caged like some wild beast and guarded from escape by the guns of good marksmen. A man who is known to be honest is awarded survival—good jobs, good friends. And the man who has his ideals, no matter how thoroughly the minions of the devil may wheedle him to desert them, survives well only so long as he is true to those ideals. Have you ever heard about a doctor who, for the sake of gain, begins to secretly attend criminals or peddle dope? That doctor does not survive long after his ideals are laid aside.

In short, the most esoteric concepts fall within this understanding of Survival. One survives so long as he is true to himself, his family, his friends, the laws of the Universe. When he fails in any respect, his survival is cut down.

The end of Survival, however, is no sharp thing. Survival is not a matter of being alive this moment and dead the next. Survival is actually a graduated scale.

CHAPTER THREE

Where does one cease to Survive and begin to Succumb? The point of demarkation is not death as we know it. It is marked by what one might call the death of the consciousness of the individual.

Man's greatest weapon is his reason. Lacking the teeth, the armor-plate hide, the claws of so many other life forms, Man has relied upon his ability to reason in order to further himself in his survival.

The selection of the ability to think as a chief weapon is a fortunate one. It has awarded Man with the kingdom of Earth. Reason is an excellent weapon. The animal with his teeth, with his armor-plated hide, with his long daws, is fixed with weapons he cannot alter. He cannot adjust to a changing environment. And it is terribly important, to survive, to change when the environment changes. Every extinct species became extinct because it could not change to control a new environment. Reason remedies this failure to a marked extent. For Man can invent new tools and new weapons and a whole new environment. Reason permits him to change to fit new situations. Reason keeps him in control of new environments.

Any animal that simply adjusts itself to match its environment is doomed. Environments change rapidly. Animals which control and change the environment have the best chance of survival.

The only way you can organize a collective state is to convince men that they must adjust and adapt themselves, like animals, to a constant environment. The people must be deprived of the right to control, as individuals, their environment. Then they can be regimented and herded into groups. They become owned, not owners. Reason and the right to reason must be taken from them, for the very center of reason is the right to make up one's own mind about one's environment.

The elements fight Man and man fights man. The primary

target of the enemies of Man or a man is his right and ability to reason. The crude and blundering forces of the elements, storms, cold and night bear down against, challenge and then mayhap crush the Reason as well as the body.

But just as unconsciousness always precedes death, even by instants, so does the death of Reason precede the death of the organism. And this action may happen in a long span of time, even half a lifetime, even more.

Have you watched the high alertness of a young man breasting the forces which oppose life? And watched another in old age? You will find that what has suffered has been the ability to Reason. He has gained hard won experience and on this experience he seeks, from middle age on, to travel. It is a truism that youth thinks fast on little experience. And that age thinks slowly on much. The Reason of youth is very far from always right, for youth is attempting to reason without adequate data.

Suppose we had a man who had retained all his ability to reason and yet had a great deal of experience. Suppose our greybeards could think with all the enthusiasm and vitality of youth and yet had all their experience as well. Age says to youth, "You have no experience!" Youth says to age, "You have no vision, you will not accept or even examine new ideas!" Obviously an ideal arrangement would be for one to have the experience of age and the vitality and vision of youth.

You may have said to yourself, "With all my experience now, what wouldn't I give for some of the enthusiasm I had once". Or perhaps you have excused it all by saying you have

“lost your illusions”. But you aren’t sure that they were illusions. Are brightness in life, quick enthusiasm, a desire and will to live, a belief in destiny, are these things illusions ? Or are they symptoms of the very stuff of which vital life is made? And isn’t their decline a symptom of death ?

Knowledge does not destroy a will to live. Pain and loss of self-determinism destroy that will. Life can be painful. The gaining of experience is often painful. The retaining of that experience is essential. But isn’t it still experience if it doesn’t yet have the pain?

Suppose you could wipe out of your life all the pain, physical and otherwise, which you have accumulated. Would it be so terrible to have to part with a broken heart or a psychosomatic illness, with fears and anxieties and dreads ?

Suppose a man had a chance again, with all he knows, to look life and the Universe in the eye again and say it could be whipped. Do you recall a day, when you were younger, and you woke to find bright dew sparkling on the grass, the leaves, to find the golden sun bright upon a happy world? Do you recall how beautiful and fine it once was? The first sweet kiss? The warmth of true friendship? The intimacy of a moonlight ride? What made it become otherwise than a brilliant world ?

The consciousness of the world around one is not an absolute thing. One can be more conscious of color and brightness and joy at one time of life more than another. One can more easily feel the brilliant reality of things in youth than he can in age. And isn’t this something like a decline of consciousness, of awareness ?

What is it that makes one less aware of the brilliance of the world around him. Has the world changed? No, for each new generation sees the glamour and the glory, the vitality of life—the same life that age may see as dull at best. The individual changes. And what makes him change? Is it a decay of his glands and sinews ? Hardly, for all the work that has been done on glands and sinews—the structure of the body—has restored little if any of the brilliance of living.

Ah, youth, sighs the adult, if I but had your zest again! What reduced that zest ?

As one’s consciousness of the brilliance of life declines, so has declined his own consciousness. Awareness decreases exactly as consciousness decreases. The ability to perceive the world around one and the ability to draw accurate conclusions about it are, to all intents, the same thing.

Glasses are a symptom of the decline of consciousness. One needs his sight bolstered to make the world look brighter. The loss of the ability to move swiftly, as one ran when he was a child, is a decline of consciousness and ability.

Complete unconsciousness is death. Half unconsciousness is half death. A quarter unconsciousness is a quarter of death. And as one accumulates the pain attendant upon life and fails to accumulate the pleasures, one gradually loses his race with

the gentleman with the scythe. And there ensues, at last, the physical incapacity for seeing, thinking and being known, as death.

How does one accumulate this pain? And if he got rid of it would full consciousness and a full bright concept of life return? And is there a way to get rid of it ?

CHAPTER FOUR

The physical universe consists of four elements—matter, energy, space and time.

According to nuclear physics, matter is composed of energy such as electrons and protons. And the energy and the matter exist in space and time. All this is actually very simple. And even then we need not go very far into it to understand that the universe in which we live is composed of simple things arranged and rearranged to make many forms and manifestations.

The concrete sidewalk, the air, ice cream sodas, pay checks, cats, kings and coal-heavers are basically composed of matter, energy, space and time. And where they are alive they contain another ingredient—life.

Life is an energy of a very special kind, obeying certain laws different from what we normally consider energy such as electricity. But life is an energy and it has some peculiar properties.

Life is able to collect and organize matter and energy in space and time and animate it. Life takes some matter and energy and makes an organism such as a monocoell, a tree, a polar bear or a man. Then this organism, still animated by the energy called Life, further acts upon matter and energy in space and time and further organizes and animates matter and energy into new objects and shapes.

Life could be said to be engaged upon a conquest of the physical universe. The primary urge of life has been said to be Survival. In order to accomplish Survival, Life has to continue and win in its conquest of the physical universe.

When Life or a Life form ceases to continue that conquest, it ceases to Survive and succumbs.

Here we have a gigantic action. The energy of Life vs. matter, energy, space and time.

Life vs. the physical universe.

Here is an enormous struggle. The chaotic, disorganized physical universe, capable only of force, resisting the conquest of Life, organizing and persistent, capable of Reason.

Life learns the laws of the physical universe matter, energy, space and time and then turns those laws against the physical universe to further its conquest.

Man has spent much time learning what he could of the physical universe as in the sciences of physics and chemistry but, more important even, of the daily battle of Life against the Universe. Do not think that a monocoell does not manifest a knowledge of Life's working rules, for it does. What cunning it takes to organize some chemicals and sunlight into a living unit ! The biologist stands in awe of the expertness of management of the smallest living cells. He gazes at these intricate and careful entities, these microscopic units of Life forms, and even he cannot believe that it is all an accident.

There is Life, then, a vital energy, not quite like physical Universe energy. And then there are Life forms. The Life form or the organism, such as a living human body, consists of Life *plus* physical Universe matter, energy, space and time. A *dead* body consists of physical universe matter, energy, space and time minus Life energy. Life has been there, has organized and has then withdrawn from the organism, an operation we know as the cycle of conception, birth, growth, decay and death.

Although there are answers as to where Life goes when it withdraws and what it then does, we need not examine that now. The important thing to a living organism is the fact that it is seeking to Survive, in obedience to the whole effort of all Life, and that in order to do so it must succeed in its conquest of the physical universe.

Stated simply, Life must first accumulate enough matter and energy to make up an organism—such as the human body— and must then ally the organism with friendly and cooperative organisms—such as other people—and must continue to procure additional matter and energy for food, clothing and shelter in order to support itself. Additionally, in order to Survive, it must do two specific things which, beyond the necessity of allies, food, clothing and shelter, are basically important.

Life must procure pleasure.

Life must avoid pain.

Life has an active thrust away from pain, which is nonsurvival, destructive, and which is death itself. Pain is a warning of non-survival or potential death.

Life has an active thrust toward pleasure. Pleasure can be defined as the action toward obtaining or the procurement of survival. The ultimate pleasure is an infinity of survival or immortality, a goal unobtainable for the physical organism itself (but not its Life), but toward which the organism strives.

Happiness then could be defined as the overcoming of obstacles toward a desirable goal. Any desirable goal, if closely inspected, will be found to be a Survival goal.

Too much pain obstructs the organism toward Survival.

Too many obstructions between the organism and Survival mean non-survival.

Thus one finds the mind engaged in computing or imagining ways and means to avoid pain and reach pleasure and putting the solutions into action. And this is all that the mind does: it perceives, poses and resolves problems relating to the Survival of the organism, the future generations, the group, Life and the physical universe and puts the solutions into action. If it solves the majority of the problems presented, the organism thus achieves a high level of Survival. If the organism's mind fails to resolve a majority of problems, then the organism fails.

The mind, then, has a definite relationship to Survival. And one means here the whole mind, not just the brain. The brain is a structure. The mind can be considered to be the whole being, mortal and immortal, the definite personality of the organism and all its attributes.

Hence, if one's mind is working well, if it is resolving the problems it should resolve and if it is putting those solutions into proper action, the Survival of the organism is well assured. If the mind is not working well, the Survival of the organism is thrown into question and doubt.

One's mind, then, must be in excellent condition if he is to best guarantee the Survival of himself, his family, future generations, his group and Life.

The mind seeks to guarantee and direct Survival actions. It seeks Survival not only for the organism (self) but seeks it for the family, children, future generations and all Life. Thus it can be selectively blunted.

A mind can be blunted concerning the Survival of self and yet be alive to the Survival of future generations. It can be blunted concerning groups and yet be very alive to its

responsibility for the organism (self). In order to function well, the mind must not be blunted in any direction.

To function well the mind must conceive itself able to handle the physical universe of matter, energy, space and time within the necessities of the organism, the family, future generations and groups as well as Life.

The mind must be able to avoid pain for and discover pleasure for the self, future generations, the family and the group as well as life itself.

As the mind fails to avoid pain and discover pleasure, so fails the organism, the family, future generations, the group and Life.

The failure of one organism in a group to properly resolve Survival problems is a failure, in part, for the whole group. Hence, "Do not send to find for whom the bell tolls; it tolls for thee!"

Life is an interdependent, cooperative effort. Each and every living organism has a part to play in the Survival of other organisms.

When it comes to a thinking mind such as Man's, the organism must be able to act independently for its own Survival and the Survival of others. In order to accomplish these Survivals, however, a mind has to be able to realize solutions which are optimum not only for self but for all other things concerned in its Survival.

Thus the mind of one organism must reach agreements with the minds of other organisms in order that all may Survive to the highest possible level.

When a mind becomes dulled and blunted, it begins to compute its solutions poorly. It begins to get confused about its goals. It is not sure what it really means to do. And it will involve and inhibit the Survival of other organisms. It may begin, for instance, to compute that it must Survive as self and that only self is important and so neglect the Survival of others. This is non-survival activity. It is highly aberrated.

A mind which begins to "survive" only for self and begins to diminish and control with force other organisms around is already better than half way toward its own death. It is a mind which is less than half alive. It has less than half its actual potential. Its perception of the physical universe is poor. It does not realize that it is dependent for Survival upon cooperation with others. It has lost its Survival mission. This mind is already outward bound toward death, has passed its peak and will actually take personal actions which lead to its own death.

Life, the large over-all Life, has a use for organism death. When an organism can no longer continue well, the plan of Life is to kill it and invest anew in a new organism.

Death is Life's operation of disposing of an outmoded and unwanted organism so that new organisms can be born and can flourish.

Life itself does not die. Only the physical organism dies. Not even a personality, apparently, dies. Death then, in truth, is a limited concept of the death of the physical part of the organism. Life and the personality, apparently, go on. The physical part of the organism ceases to function. And that is death.

When an organism reaches a point where it is only half conscious, where it is only perceiving half as well as it should, where it is functioning only half as well as it should, death begins. The organism, thereafter, will take actions to hasten death. It does this "unconsciously". But, in its aberrated state, such a mind will also bring death to other organisms. Thus a half conscious organism is a menace to others.

Here is the accident prone, the fascist, the person who seeks to dominate, the selfish and self-seeking person. Here is an organism outward bound.

When an organism reaches a point where it is only a third alive, a third conscious, it is perceiving only a third of what it might, Life even further hastens the death of this organism and those around it. Here is the suicide, here is the person who is continually ill, who refuses to eat.

Organisms which are outward bound toward death sometimes require years and years to die. For the organism experiences resurgences and still has some small desire to go on living. And other organisms help it to live. It is carried along by the tide of life even though its individual direction is toward death— death for others and death for self and death for the physical universe around it.

Society, the bulk of which is bent upon Survival, fails or refuses to recognize death or the urge of organisms toward it. Society passes laws against murder and suicide. Society

provides hospitals. Society carries such people upon its back. And society will not hear of euthanasia or “mercy killing”.

Organisms which have passed the halfway point will take extraordinary measures and means to bring about death for others and for things and for self. Here we have the Hitlers, the criminals, the destructively neurotic.

Give a person who has passed this point a car to drive and the car may become involved in an accident. Give him money and the money will go to purchase non-Survival things.

But we must not emphasize the dramatic and forget the important like the newspapers do. The action and urge toward death becomes noticeable only when it is very dramatic. It is most dangerous however in its undramatic forms.

A person who has passed the halfway point brings death to things and people on a small scale at all times. A house left dirty, appointments not kept, clothing not cared for, vicious gossip, carping criticisms of others “for their own good”, these are all enturbulences which bring failure and too many failures bring death.

And it should be not supposed that by half-way point one means halfway through life. It means half conscious, half alive, half or less perceiving and thinking. A child may be suppressed to this level by his parents and school. And indeed children quite ordinarily drop below the halfway point, so defeated do they become in their environment and in their contest with life. Age is no criterion. But physical health is. The surest manifestation that someone has passed the halfway point is his physical condition. The chronically ill have passed it.

If one is to have a secure society, then, if one is to rid a society of its death factors, one must have some means of either destroying the people who bring death to it, the Hitlers, the insane, the criminals, or he must have some means of salvaging these people and bringing them back into a state of full consciousness.

Full consciousness would mean full recognition of one’s responsibilities, his relationship with others, his care of himself and of society.

How can such a thing be achieved? If you could achieve it, you could raise a social order to hitherto unattainable heights. You could empty the prisons and insane asylums. You could make a world too sane for war. And people could be made well who have never had the means of it before. And people could be happy who have never truly known what happiness

was. You could raise the good will and efficiency of all men and all social orders if you could restore the vitality of these people.

In order to know how it can be restored, one has to know how the consciousness, the vitality, the will to live become reduced.

CHAPTER FIVE

An organism is suppressed toward death by accumulated pain.

Pain in one great sweeping shock brings about immediate death.

Pain in small doses over a lifetime gradually suppresses the organism toward death.

What is pain?

Pain is a warning of loss. It is an automatic alarm system built into Life organisms which informs the organism that some part of it or all of it is under stress and that the organism had better take action or die.

The signal of pain means that the organism is in the proximity of a destructive force or object. To ignore pain is to die. Pain is the whip which sends the organism away from hot stoves, sub-zero weather; pain is the threat of non-Survival, the punishment for errors in trying to Survive.

And pain is always loss. A burned finger means that the body has lost the cells on the surface of that finger. They are dead. A blow on the head means the death of scalp and other cells in the area. The whole organism is thus warned of the proximity of a death source and so attempts to get away from it.

The loss of a loved one is also a loss of Survival. The loss of a possession is also loss of Survival potential. One then confuses physical pain and the loss of Survival organisms or objects. And so there is such a thing as "mental pain".

But Life, in its whole contest with the physical universe, has no patience with failure. An organism so foolhardy as to let itself be struck too hard and so depressed into unconsciousness stays in the vicinity of the pain-dealing object. It is considered to be non-Survival if it fails so markedly to Survive.

Unconsciousness experienced as a result of a blow or an illness is a quick picture of what happens over a lifespan.

Is there any difference except time between these two things ?

A blow resulting in unconsciousness which results in death.

The accumulated blows over a life span resulting in a gradual lessening of consciousness resulting in eventual death.

One is slower than the other.

One of the basic discoveries of Dianetics was that unconsciousness and all the pain attendant upon it was stored in a part of the mind and that this pain and unconsciousness accumulated until it caused the organism to begin to die.

Another discovery of Dianetics was that this pain could be nullified or erased with a return to full consciousness and a rehabilitation toward Survival.

In other words, with Dianetics, it became possible to cancel out the accumulated unconsciousness and pain of the years and restore the health and vitality of an organism.

Accumulated physical pain and loss brings about a reduction of consciousness, a reduction of physical health and a reduction of the will to live to a point where the organism actively, if often slyly, seeks death.

Erase or nullify the physical pain, the losses of a lifetime, and vitality returns.

The vitality of living, of seeking higher levels of Survival, is life itself.

The human body was found to be extremely capable of repairing itself when the stored memories of pain were cancelled. Further it was discovered that so long as the stored pain remained, the doctoring of what are called psychosomatic ills, such as arthritis, rheumatism, dermatitis and thousands of others, could not result in anything permanent. Psycho-therapy, not knowing about pain storage and its effects, discovered long ago that one could rid a patient of one illness only to have another pop up—and psycho-therapy became a defeatist school because it could do nothing permanent for the aberrated or the ill even when it could do a little something to relieve it. Hence, all efforts to make men vital and well became suspect because the reason they were inefficient and ill had not been discovered and proven.

With Dianetics it became possible to eradicate aberration and illness because it became possible to nullify or eradicate the pain from the pain-storage banks of the body without applying further pain as in surgery.

Consciousness then depends upon the absence or the nullification or eradication of memories of physical pain, for unconsciousness is a part of that pain—one of its symptoms.

Arthritis of the knee, for instance, is the accumulation of all knee injuries in the past. The body confuses time and environment with the time and environment where the knee was actually injured and so keeps the pain there. The fluids of the body avoid the pain area. Hence a deposit which is called arthritis. The proof of this is that when the knee injuries of the past are located and discharged, the arthritis ceases, no other injury takes its place and the person is finished with arthritis of the knee. And this happens ten cases out of ten—except in those cases where age and physical deterioration are so well advanced towards death that the point of no-return is passed.

Take a bad heart. The person has pain in his heart. He can take medicine or voodoo or another diet and still have a bad heart. Find and eradicate or nullify an actual physical injury to the heart and the heart ceases to hurt and gets well.

Nothing is easier to prove than these tenets. A good dianetic auditor can take a broken-down, sorrow-drenched lady of thirty-eight and knock out her past periods of physical and mental pain and have on his hands somebody who appears to be twenty-five—and a bright, cheerful twenty-five at that.

Sure it's incredible. But so is an A-bomb, a few pennyweights of plutonium which can blow a city off the chart.

Once you know the basic tenets of Life and how it acts as an energy, Life can be put back into the ill, the de-vitalized, the would-be suicide.

And more important than treating the very ill, mentally or physically, one can interrupt the downward spiral in a man who is still alert and well so that he will not thereafter become so ill. And one can take the so-called “normal” person and send his state of being up to levels of brilliance and success not possible before.

Restore an individual's full consciousness and you restore his full Life potential.

And it can now be done.

CHAPTER SIX

The tone scale, a small edition of which is in this book plots the descending spiral of life from full vitality and consciousness through half vitality and half consciousness down to death.

By various calculations about the energy of Life, by observation and by test, this tone scale is able to give levels of behavior as Life declines.

These various levels are common to all men.

When a man is nearly dead, he can be said to be in a chronic *apathy*. And he behaves in a certain way about other things. This is 0.1 on the tone scale chart.

When a man is chronically in *grief* about his losses, he is in grief. And he behaves certain ways about many things. This is 0.5 on the chart.

When a person is not yet so low as grief but realizes losses are impending, or is fixed chronically at this level by past losses, he can be said to be *in fear*. This is around 1.1 on the chart.

An individual who is fighting against threatened losses is in *anger*. And he manifests other aspects of behavior. This is 1.5.

The person who is merely suspicious that loss may take place or who has become fixed at this level, is resentful. He can be said to be in *antagonism*. This is 2.0 on the chart.

Above antagonism, the situation of a person is not so good that he is enthusiastic, not so bad that he is resentful. He has lost some goals and cannot immediately locate others. He is said to be in boredom, or at 2.5 on the tone scale chart.

At 3.0 on the chart, a person has a conservative, cautious aspect toward life but is reaching his goals.

At 4.0 the individual is enthusiastic, happy and vital.

Very few people are natural 4.0's. A charitable average is probably around 2.8.

You can examine the chart and you will find in the boxes as you go across it, the various characteristics of people at these levels. Horribly enough these characteristics have been found to be constant. If you have a 3.0 as your rating, then you will carry across the whole chart at 3.0.

You have watched this chart in operation before now. Have you ever seen a child trying to acquire, let us say, a nickel? At first he is happy. He simply wants a nickel. If refused, he then explains why he wants it. If he fails to get it and does not want it badly, he becomes bored and goes away. But if he wants it badly, he will get antagonistic about it. Then he will become angry. Then, that failing, he may lie about why he wants it. That failing he goes into grief. And if he is still refused, he finally sinks into apathy and says he doesn't want it. This is negation.

And you have seen the chart in reverse. A child threatened by danger also dwindles down the scale. At first he does not appreciate that the danger is posed at him and he is quite cheerful. Then the danger, let us say it is a dog, starts to approach him. The child sees the danger but still does not believe it is for him and keeps on with his business. But his playthings "bore" him for the moment. He is a little apprehensive and not sure. Then the dog comes nearer. The child "resents him" or shows some antagonism. The dog comes nearer still. The

child becomes angry and makes some effort to injure the dog. The dog comes still nearer and is more threatening. The child becomes afraid. Fear unavailing, the child cries. If the dog still threatens him, the child may go into an apathy and simply wait to be bitten.

Objects or animals or people which assist Survival, as they become inaccessible to the individual, bring him down the tone scale.

Objects, animals, or people which threaten Survival, as they approach the individual, bring him down the tone scale.

This scale has a chronic or an acute aspect. A person can be brought down the tone scale to a low level for ten minutes and then go back up, or he can be brought down it for ten years and not go back up.

A man who has suffered too many losses, too much pain, tends to become fixed at some lower level of the scale and, with only slight fluctuations, stay there. Then his general and common behavior will be at that level of the tone scale.

Just as a 0.5 moment of grief can cause a child to act along the grief band for a short while, so can a 0.5 fixation cause an individual to act 0.5 toward most things in his life.

There is momentary behavior or fixed behavior.

How can one find an individual on this tone scale ? How can one find oneself?

If you can locate two or three characteristics along a certain level of this scale, you can look in the number column opposite those characteristics and find the level. It may be 2.5, it may be 1.5. Wherever it is, simply look at all the columns opposite the number you found and you will see the remaining characteristics.

The only mistake you can make in evaluating somebody else on this tone scale is to assume that he departs from it somewhere and is higher in one department than he is in another. The characteristic may be masked to which you object—but it is there.

Look at the top of the first column and you get a general picture of the behavior and physiology of the person. Look at the second column for the physical condition. Look at the third column for the most generally expressed emotion of the person. Continue on across the various columns. Somewhere you will find data about somebody or yourself of which you can be sure. Then simply examine all the other boxes at the level of the data you were certain about. That band, be it 1.5 or 3.0 will tell you the story of a human being.

Of course, as good news and bad, happy days and sad ones strike a person, there are momentary raises and lowerings on this tone scale. But there is a chronic level, an average behavior for each individual.

As an individual is found lower and lower on this chart, so is his alertness, his consciousness lower and lower.

The individual's chronic mood or attitude toward existence declines in direct ratio to the way he regards the physical universe and organisms about him.

There are many other mechanical aspects of this chart having to do with energy manifestations and observation of behavior but we need not cover them here.

It is not a complete statement to say, merely, that one becomes fixed in his regard for the physical universe and organisms about him, for there are definite ways, beyond consciousness, which permit this to take place. Manifestation, however, is a decline of

consciousness with regard to the physical environment of an individual. That decline of consciousness is a partial cause of a gradual sag down this chart, but it is illustrative enough for our purposes in this volume.

At the top of this chart, one is fully conscious of himself, his environment, other people and the universe in general. He accepts his responsibilities in it. He faces the realities of it. He deals with the problems within the limits of his education and experience.

Then something happens—his perception of the material universe is dulled. How does this come about?

The first and foremost way that a decline on the chart is begun is through being caused physical pain by the physical universe. It is one thing to gain experience and quite another to suffer physical pain. For any experience surrounded by actual physical pain is *hidden* by that pain. The organism is supposed to avoid pain to Survive. It avoids, as well, memories of pain if it is above 2.0 on the chart. It “relishes” pain memories below 2.0 as these lead to death. As soon as it can begin avoiding pain wholesale, although that pain is recorded, consciousness begins to decrease markedly. The perception of the physical universe begins to decrease and the caliber of one’s activities begin to decline.

One could say that there is an interior world and an exterior world. The interior world is the one of yesterday. The data it contains is used to judge the world of the exterior, of today and tomorrow. So long as one has all data available, one can make excellent computations. When the facts he has learned begin to be buried, one’s conclusions are apt to become wrong to just that degree.

As one’s confidence in the physical universe declines, so does one’s ability to handle it decline. One’s dreams and hopes begin to seem unattainable, one ceases to strive. Actually, however, one’s ability seldom diminishes—it only *seems* to diminish.

When the interior world tells of too much physical pain, the organism becomes confused. Like the child who finally says he doesn’t want the nickel, the organism says it wants nothing of the physical universe and so perishes—or lives a while in a twilight and then perishes all the same.

The goal is to win. When one has lost too much and too many times, the possibility of winning *seems* too remote to try. And it

loses. It becomes so accustomed to loss that it begins to concentrate on loss instead of forward advance. And it does this quite irrationally. Because one has lost two cars does not mean one may lose three, yet he who has lost two will actually be so prepared to lose three that he will actually, if unconsciously, take steps to lose the third. Thus it may be with people, with any object.

As an individual descends the tone scale, he first begins to lose his confidence in trying to reach the further rims of his environment, the further frontiers of his dreams, and becomes “conservative”. There is not much wrong with cautiousness, but there is something wrong with chronic conservatism for sometimes it takes a wild charge to win a Life.

As physical pain begins to mount up in the recording banks of the mind, the individual further confuses yesterday with today and further withdraws his confidence. He becomes a little frightened and poses as being bored—he says he didn’t want to reach so far anyway. Isn’t worth it. He makes fun of the things he really wants, makes fun of the dreams of others and acts, in general, like a reporter from the *New Yorker*. He is afraid to face a hopeful fact, much less a truly desirable object.

With a further increase of pain, he continues on down the scale until he is actually on his way out from Life.

The fact of the matter is, the older a person gets and the more experiences he has, the better able he should be to handle his environment. If he could stay fully conscious and rational about it, this would be true. But the mechanics of pain storage are such that he actually grows less and less conscious the more pain he has received, and so he cannot really use his experience at all. If he could gain experience without physical pain, his enthusiasm, his ability and dash, would remain very high. But man was a lesser organism, evidently, before he was a man. And a lesser organism can only react, it cannot think. Thinking is something new.

Until Dianetics, this looked like a hopelessly closed cycle. One had enthusiasm but no experience. So with enthusiastic rushes he attacked the environment with all the folly of youth and was ignominiously repelled. He gained pain with each repulsion. He gained experience, but he could not think about the experience without facing the pain so the experience did him no good. When he had enough experience he no longer had the dreams, energy and enthusiasm to carry home his attack upon his environment.

Processing such as the questions in the last section of this book or in Dianetic co-auditing broke the cycle. Youth could attack the environment and experience pain of repulsion. But the physical pain could be knocked out of the mind by Dianetics, leaving the experience standing there, with the enthusiasm.

There must be, at this writing, tens of thousands of people who have experienced Dianetics by now. A few, here and there, were unable to achieve full benefit because it formerly required considerable technical knowledge to process somebody. This book and Self Analysis were developed in order that an individual could gain at least the primary benefits of processing without any technical knowledge and without taking up the time of another person.

Wherever a person may be on the tone scale (unless he is very low and in the insane bracket, for this is also a scale of sanity) he can ascend that scale again by rehabilitating his ability to think about and know his environment. Now that one knows the rules it is rather easily done and one is astonished that it could not be done before.

Have you looked at the chart for yourself? Well, don't go looking for a cliff or an axe if you were below 2.0. Self Analysis can pull you up this chart so that even you will see that you have climbed.

Now, just beyond the chart there are some tests and graphs. You should answer these. They will help you to locate yourself. Then you will know much better why you are or aren't a good friend to yourself. You may find you don't care to have such a friend. Well, if he's that bad off, he really needs your help. So give him a hand. The whole last part of the book is filled with exercises which will make a better friend to have out of yourself if you just apply these exercises a half an hour a day.

I don't know how high you can get yourself up on this chart. You can raise yourself pretty far and Dianetic co-auditing can do the rest if you wish. Or you may get all the way and stabilize there.

Right now if you aren't being a friend of yourself, I'm your friend. I know by experience that you can climb the chart.

Man is basically good. Pain and social aberrations turn him away from high ethics, efficiency and happiness. Get rid of the pain and you'll be at the high level of the chart.

Now turn to the questions which will help you locate yourself. **BUT DON'T USE THIS CHART AS AN EFFORT TO MAKE SOMEBODY KNUCKLE UNDER. DON'T**

TELL PEOPLE WHERE THEY ARE ON IT. IT MAY RUIN THEM. LET THEM TAKE THEIR OWN EXAMINATIONS.

THE HUBBARD CHART OF HUMAN EVALUATION

This chart is a specialized form of the Hubbard Chart of Human Evaluation and Dianetic Processing.

A full description of each column on this chart (except the last six which are only in Self Analysis) will be found complete in *Science of Survival*.

The technical name of the questioning process used in this volume is Dianetic Straight Wire with emphasis on Validation MEST processing. This is actually not “self-auditing”. It is auditing done on the reader by the author. Actually, the reader is being audited by L. Ron Hubbard. Straight Wire processing is relatively safe on any case and is the most elementary process in Dianetics.

The position of an individual on this Tone Scale varies through the day and throughout the years but is fairly stable for given periods. One’s position on the chart will rise on receipt of good news, sink with bad news. This is the usual give and take with life. Everyone however has a *chronic* position on the chart which is unalterable save for processing.

Necessity level (lifting oneself by one’s bootstraps as in emergencies) can raise an individual well up this chart for brief periods.

By education, such as that given under pressure, the education itself has a position on the tone scale. A person could be relatively unaberrated actually but, by education, be at a lower position on the chart than he should be. The reverse is also the case. One can be educated, then, into a higher or lower level on the chart than his own aberrations call for.

One’s environment greatly influences one’s position on the chart. Every environment has its own tone level. A man who is really a 3.0 can begin to act like a 1.1 in a 1.1 environment. However, a 1.1 usually acts no better than about 1.5 in an environment with a high tone. If one lives in a low-toned environment he can expect, eventually, to be low-toned. This is also true of marriage—one tends to match the tone level of one’s marital partner.

This tone scale is also valid for groups. A business or a nation can be examined as to its various standard reactions and these

can be plotted. This will give the survival potential of a business or a nation.

This chart can also be used in employing people or in choosing partners. It is an accurate index of what to expect and gives you a chance to predict what people will do before you have any great experience with them. Also, it gives you some due as to what can happen to you in certain environments or around certain people, for they can drag you down or boost you high.

TONE SCALE	1 BEHAVIOR AND PHYSIOLOGY	2 MEDICAL RANGE	3 EMOTION
4.0	Excellent at projects, execution. Fast reaction time (relative to age)	Near accident-proof. No psycho-somatic ills. Nearly immune to bacteria	Eagerness, exhilaration
3.5	Good at projects, execution, sports	Highly resistant to common infections. No colds	Strong interest <hr/> Mild interest
3.0	Capable of fair amount of action, sports	Resistant to infection and disease. Few psycho-somatic ills	<hr/> Content
2.5	Relatively inactive, but capable of action	Occasionally ill. Susceptible to usual diseases	Indifference <hr/> Boredom
2.0	Capable of destructive and minor constructive action	Severe sporadic illnesses	Expressed resentment
1.5	Capable of destructive action	Depository illness (arthritis). (Range 1.0 to 2.0 interchangeable)	Anger
1.1	Capable of minor execution	Endocrine and neurological illnesses	Unexpressed resentment <hr/> Fear
0.5	Capable of relatively uncontrolled action	Chronic malfunction of organs. (Accident prone)	Grief <hr/> Apathy
0.1	Alive as an organism.	Chronically ill. (Refusing sustenance)	Deepest apathy <hr/>

4 SEXUAL BEHAVIOR ATTITUDE TO- WARD CHILDREN	5 COMMAND OVER ENVIRON- MENT	6 ACTUAL WORTH TO SOCIETY COMPARED TO APPARENT WORTH	TONE SCALE
Sexual interest high but often sublimated to creative thought <hr/> Intense interest in children	High self-mastery. Aggressive toward environ. Dislikes to control people. High reasoning, volatile emotions	High worth. Apparent worth will be realized. Creative and constructive	4.0
High interest in oppo- site sex Constancy <hr/> Love of children	Reasons well. Good control. Accepts ownership. Emotion free. Liberal	Good value to society. Adjusts environ to benefit of self and others	3.5
Interest in 'procreation' <hr/> Interest in children	Controls bodily func- tions. Reasons well. Free emotion still inhibited. Allows rights to others. Democratic	Any apparent worth is actual worth Fair value	3.0
Disinterested in procreation <hr/> Vague tolerance of children	In control of function and some reasoning powers. Does not desire much ownership	Capable of construc- tive action; seldom much quantity. Small value. "Well adjusted"	2.5
Disgust at sex; revulsion <hr/> Nagging of and nerv- ousness about children	Antagonistic and destructive to self, others, and environ. Desires command in order to injure	Dangerous. Any apparent worth wiped out by potentials of injury to others	2.0
Rape Sex as punishment <hr/> Brutal treatment of children	Smashes or destroys others or environ. Failing this, may destroy self. Fascistic	Insincere. Heavy liabil- ity. Possible murderer. Even when intentions avowedly good will bring about destruction	1.5
Promiscuity, per- version, sadism, irregular practices <hr/> Use of children for sadistic purposes	No control of reason or emotions, but apparent organic con- trol. Uses sly means of controlling others, especially hypnotism. Communistic	Active liability. Entur- bulates others. Apparent worth out- weighed by vicious hidden intents	1.1
Impotency, anxiety, possible efforts to reproduce <hr/> Anxiety about children	Barest functional control of self, only	Liability to society. Possible suicide. Utterly careless of others	0.5
No effort to procreate	No command of self, others, environ. Suicide	High liability, needing care and efforts of others without making any contribution	0.1

7 ETHIC LEVEL	8 HANDLING OF TRUTH	9 COURAGE LEVEL	
4.0	Bases ethics on reason. Very high ethic level	High concept of truth	High courage level
3.5	Heeds ethics of group but refines them higher as reason demands	Truthful	Courage displayed on reasonable risks
3.0	Follows ethics in which trained as honestly as possible. Moral	Cautious of asserting truths. Social lies	Conservative display of courage where risk is small
2.5	Treats ethics insincerely. Not particularly honest or dishonest	Insincere. Careless of facts	Neither courage nor cowardice. Neglect of danger
2.0	Below this point: authoritarian. Chronically and bluntly dishonest when occasion arises	Truth twisted to suit antagonism	Reactive, unreasoning thrusts at danger
1.5	Below this point: criminal. Immoral. Actively dishonest. Destructive of any and all ethics	Blatant and destructive lying	Unreasonable bravery, usually damaging to self
1.1	Sex criminal. Negative ethics. Deviously dishonest without reason. Pseudo ethical activities screen perversion of ethics	Ingenious and vicious perversions of truth. Covers lying artfully	Occasional underhanded displays of action, otherwise cowardly
0.5	Non-existent. Not thinking. Obeying anyone	Details facts with no concept of their reality	Complete cowardice
0.1	None	No reaction	No reaction

10 SPEECH: TALKS <hr/> SPEECH: LISTENS	11 SUBJECT'S HANDLING OF WRITTEN OR SPOKEN COMM. WHEN ACTING AS A RELAY POINT	12 REALITY (AGREEMENT)	SCALE SCALE
Strong, able, swift, and full exchange of beliefs and ideas	Passes theta comm., * contributes to it. Cuts entheta lines	Search for different viewpoints in order to broaden own reality. Changes reality	4.0
Will talk of deep-seated beliefs and ideas <hr/> Will accept deep-seated beliefs, ideas; consider them	Passes theta comm. Resents and hits back at entheta lines	Ability to understand and evaluate reality of others and to change viewpoint. Agreeable	3.5
Tentative expression of limited number of personal ideas <hr/> Receives ideas and beliefs if cautiously stated	Passes comm. Conservative. Inclines towards moderate construction and creation	Awareness of possible validity of different reality. Conservative agreement	3.0
Casual pointless conversation <hr/> Listens only to ordinary affairs	Cancels any comm. of higher or lower tone. Devaluates urgencies	Refusal to match two realities. Indifference to conflict in reality. Too careless to agree or disagree	2.5
Talks in threats. Invalidates other people <hr/> Listens to threats. Openly mocks theta talk	Deals in hostile or threatening comm. Lets only small amount of theta go through	Verbal doubt. Defence of own reality. Attempts to undermine others. Disagrees	2.0
Talks of death, destruction, hate only <hr/> Listens only to death and destruction. Wrecks theta lines	Perverts comm. to entheta regardless of original content <hr/> Stops theta comm. Passes entheta and perverts it	Destruction of opposing reality. "You're wrong." Disagrees with reality of others	1.5
Talks apparent theta, but intent vicious <hr/> Listens little; mostly to cabal, gossip, lies	Relays only malicious comm. <hr/> Cuts comm. lines Won't relay	Doubt of own reality. Insecurity. Doubt of opposing reality	1.1
Talks very little and only in apathetic tones <hr/> Listens little: mostly to apathy or pity	Takes little heed of comm. Does not relay	Shame, anxiety, strong doubt of own reality. Easily has reality of others forced on him	0.5
Does not talk <hr/> Does not listen	Does not relay. Unaware of comm.	Complete withdrawal from conflicting reality. No reality	0.1

TONE SCALE	13 ABILITY TO HANDLE RESPONSIBILITY	14 PERSISTENCE ON A GIVEN COURSE	15 LITERALNESS OF RECEPTION OF STATEMENTS
4.0	Inherent sense of responsibility on all dynamics	High creative persistence	High differentiation. Good understanding of all comm., as modified by clear's education
3.5	Capable of assuming and carrying on responsibilities	Good persistence and direction towards constructive goals	Good grasp of statements. Good sense of humor
3.0	Handles responsibility in a slipshod fashion	Fair persistence if obstacles not too great	Good differentiation of meaning of statements
2.5	Too careless. Not trustworthy	Idle, poor concentration	Accepts very little, literally or otherwise. Apt to be literal about humour
2.0	Uses responsibility to further own ends	Persistence towards destruction of enemies. No constructive persistence below this point	Accepts remarks of tone 2.0 literally
1.5	Assumes responsibility in order to destroy	Destructive persistence begins strongly, weakens quickly	Accepts alarming remarks literally. Brutal sense of humor
1.1	Incapable, capricious, irresponsible	Vacillation on any course. Very poor concentration. Flighty.	Lack of acceptance of any remarks. Tendency to accept all literally avoided by forced humor
0.5	None	Sporadic persistence towards self-destruction	Literal acceptance of any remark matching tone
0.1	None	None	Complete literal acceptance

16 METHOD USED BY SUBJECT TO HANDLE OTHERS	17 HYPNOTIC LEVEL	18 ABILITY TO EXPERIENCE PRESENT-TIME PLEASURE	TONE SCALE
Gains support by creative enthusiasm and vitality backed by reason	Impossible to hypnotize without drugs	Finds existence very full of pleasure	4.0
Gains support by creative reasoning and vitality	Difficult to trance unless still possessed of a trance engram	Finds life pleasurable most of the time	3.5
Invites support by practical reasoning and social graces	Could be hypnotized, but alert when awake	Experiences pleasure some of the time	3.0
Careless of support from others	Can be a hypnotic subject, but mostly alert	Experiences moments of pleasure. Low intensity	2.5
Nags and bluntly criticises to demand compliance with wishes	Negates somewhat, but can be hypnotized	Occasionally experiences some pleasure in extraordinary moments	2.0
Uses threats, punishment, and alarming lies to dominate others	Negates heavily against remarks, but absorbs them	Seldom experiences any pleasure	1.5
Nullifies others to get them to level where they can be used. Devious and vicious means. Hypnotism, gossip. Seeks hidden control	In a permant light trance, but negates	Most gaiety forced. Real pleasure out of reach	1.1
Enturbulates others to control them. Cries for pity. Wild lying to gain sympathy	Very hypnotic. Any remark made may be a "positive suggestion"	None	0.5
Pretends death so others will not think him dangerous and will go away	Is equivalent to a hypnotized subject when "awake"	None	0.1

TONE SCALE	19 YOUR VALUE AS A FRIEND	20 HOW MUCH OTHERS LIKE YOU	21 STATE OF YOUR POSSESSIONS
4.0	Excellent	Loved by many	In excellent condition
3.5	Very good	Well loved	In good condition
3.0	Good	Respected by most	Fairly good
2.5	Fair	Liked by a few	Shows some neglect
2.0	Poor	Rarely liked	Very neglected
1.5	Definite liability	Openly disliked by most	Often broken. Bad repair
1.1	Dangerous liability	Generally despised	Poor. In poor condition
0.5	Very great liability	Not liked. Only pitied by some	In very bad condition generally
0.1	Total liability	Not regarded	No realization of possession

22 HOW WELL ARE YOU UNDERSTOOD	23 POTENTIAL SUCCESS	24 POTENTIAL SURVIVAL	TONE SCALE
Very well	Excellent	Excellent. Considerable longevity	4.0
Well	Very good	Very good	3.5
Usually	Good	Good	3.0
Sometimes misunderstood	Fair	Fair	2.5
Often misunderstood	Poor	Poor	2.0
Continually misunderstood	Usually a failure	Early demise	1.5
No real understanding	Nearly always fails	Brief	1.1
Not at all understood	Utter failure	Demise soon	0.5
Ignored	No effort. Complete failure	Almost dead	0.1

TEST NUMBER ONE

Take this test before you begin on the processing section of Self Analysis.

Be fair and as honest as possible in your findings.

Use, as a basis, how you have been in the last year. Earlier conditions in your life do not count.

Open up Chart to Column One, Behavior and Physiology. Ask yourself how active you are physically. Locate the place in this column which most nearly seems to fit you.

Look on the Tone Scale for the number of the square you have found. Is it 3.0? Is it 2.5?

Take this number and go to the graph at right.

Under Column 1, as marked at the top of the graph, locate the number (3.0, 2.5 or whatever it was) and place an X in this square. This gives the same place on the graph that you found on the chart.

Go to Column 2 on the Chart, Medical Range.

Find the square which best describes your health. Note the number given in the Tone Scale column opposite the square you have chosen. (3.5, 2.0 or whatever it was.)

Turn back to the graph of Test 1. In Column 2 on the graph, put an X in Column 2 opposite the tone scale number you got from the Chart.

Carry through this process with all Columns until you have an X in each Column of the graph. Omit the last six.

Take a straight edge or ruler. Move it on the graph, holding it horizontally, until you have the level of the graph which contains the most X's. Draw a line through these X's all the way across the chart and out to the edge. This line will give you your position in the last six columns.

The horizontal line you have just drawn gives you your position on the tone scale. This level of the Chart is yours.

Leave this Graph in the book. Keep it so that you can compare it in a few weeks when you do Test 2.

Note that in Columns 4 and 10 the squares are divided in the same manner as the squares on the chart. You make two evaluations of yourself for these columns and you put an X in a half square, using two half squares for each column, even if one X falls at 3.0 and the other X falls at 1.1.

TONE SCALE	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	TONE SCALE

TEST NUMBER THREE

Use this test after you have been processing yourself two months.

Use as data how you have felt about things since taking the second test.

Use the same directions as given in Test One.

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	4.0	3.5	3.0	2.5	2.0	1.5	1.1	0.5	0.1

IMPORTANT

HOW TO USE THE DISC

A slotted disc is provided for the reader's use. The disc must be used. Without using the disc, the benefit of processing is cut more than eighty per cent.

The disc is placed over Question 1 of a list so that the question shows through. One recalls the incident desired.

Then one looks at the uppermost word on the disc itself. This says, for instance, "SIGHT".

One seeks to "see" in recall, the incident desired.

One tries then to recall another incident without moving the disc. He then seeks to "see" this incident in recalling it.

One tries to recall, then, the earliest incident of this kind he can and seeks to "see" this one.

Then one drops the disc one question, rotating it at the same time so that another "sense" appears at the top. He uses this sense particularly in recalling the incident.

Turn the disc over on each new page, so that a new set of perceptions come up.

It does not matter what "sense" you begin to recall with. It does not matter which side you first begin to use.

Eventually you should be able to get more and more perceptions on any one incident until, at last, you may recover all of them without strain.

If you lose the disc, the full list of perceptions on it are at the bottom of every page. Take a pencil and check them off one at a time just as though they were appearing on the disc.

A green disc and a white disc are provided. Use the one you like best.

IF YOU ONLY GET A VAGUE CONCEPT OF WHAT THE SENSE MUST HAVE BEEN LIKE, IF YOU DO NOT AT FIRST GET ACTUAL RECALL BY THE SENSE ITSELF, BE SURE THAT YOU AT LEAST GET A CONCEPTION OF IT.

DIANETIC PROCESSING

PROCESSING SECTION

Here begin the lists of questions by which the individual can explore his past and improve his reactions toward life. Dianetically speaking, this self-processing section could be called “straight wire”. It is not “auto processing”. The reader is actually being processed by the author.

In the full use of Dianetics these questions could be considered as preparatory to co-auditing. The auditor is assisted by these lists in that they open a case for the running of engrams and secondaries and raise the pre-clear on a tone scale. These question sections, so far as is known at this time, will not run out engrams and secondaries as such but will desensitize them to a marked extent with a consequent improvement in the mental and physical being of the individual.

An auditor, as the practitioner in Dianetics is called since he both listens and computes, can use these questions during a session with a pre-clear. Further, two people can work with these sections—one of them asking the questions of another who answers—or both of them reading the questions and both of them attempting to get a recall on such an incident as that one called for.

These lists are used repetitively; that is to say the individual goes over them again and again. There is no finite period to the work. The reason the recall of these questions is important is that they reveal and discharge locks which have formed above the basic engrams (moments of physical pain and unconsciousness) and secondaries (moments of acute loss as death of a loved one). The discharging of these locks renders engrams and secondaries relatively ineffective. A full dianetic clearing of the individual’s engrams and secondaries gives the highest possible attainable results, but these questions provide self-processing which prepares the case for such an action and are in themselves highly beneficial.

In the process of using these questions the pre-clear may discover many manifestations in himself. He may experience

considerable emotional release. He may become angry at the recollection of some of the things which have happened to him and he may even feel like crying over some of the losses he has sustained and indeed may very well cry. However, the intent of these questions is not to focus the self-processor’s attention upon the bad things which have happened to him but upon the good things which have taken place in his life. A concentration upon these happier circumstances tends to discharge the unhappy circumstances and render them far less forceful.

These questions are based upon the dianetic discoveries, axioms and postulates which have done so much toward amplifying the understanding of people, concerning the nature of existence and their roles in it. Life can be considered to have as its fundamental purpose Survival in the material universe. When one closely examines Survival he discovers that the concept embraces all the activities of an individual, a group, a state, life itself or the material universe.

The material universe is composed of matter, energy, space and time. Life can then be considered to be engaged upon the conquest of matter, energy, space and time, including other life forms, organisms and persons. If an organism or a group has been successful in handling other organisms, groups and the material universe, its survival potential is very great. If the organism has been unsuccessful, its survival potential is lower. Its moments of success, as its moments of pain, are highly charged. It is possible, by certain processes, to remove the charge from painful incidents. One of the ways of doing this is to lay the stress and concentration of the organism upon the times it has been successful in surviving.

With the invention of language man brought upon himself an unexpected source of aberration. While language itself is very far from the whole reason an organism is less successful than it might be, our current social order lays undue stress upon language. Words are only symbols which represent actions. A child learns these actions very early and learns the symbols which represent the actions. Later on he begins to mistake the action for the symbol and begins to believe the words themselves have force and power which they do not. If you believe that words have force and power, hold your hand in front of your mouth and say a few words. You will see how negligible is the force of utterance, no matter what words you use. Underlying this mistaken emphasis on the force of words lie actual physical actions of which the words are the symbols. The main point then is that words are not powerful but actions are. For example, when an individual has been told to hold still he obeys simply because he has experienced earlier in his life the action of being made to hold still by physical force.

For many reasons it is important for the organism to increase its mobility. The discovery of all the times the organism has been told to hold still and has obeyed has some therapeutic value but the discovery of actual incidents when the organism has been physically forced to remain motionless is much more important in restoring the mobility of the organism.

These lists, then, tend to devaluate the importance of language. This is only one of their many functions but an important one; therefore, the reading of these lists should direct the individual to moments action took place, not when somebody said it took place. Just as hearsay evidence is not admissible in a court of law, so are words and phrases given to the individual by others inadmissible in self-processing. For instance, when one is asked for a time when somebody went away one should not try to recall the time when somebody said somebody went away or the statement that somebody was going away, but the actual physical departure, regardless of what was said.

You will find that words are communicated through the physical universe to other organisms. Sounds, for instance, originate within the organism, are translated into sound waves and reach the other person as sound waves. The written word is made into symbols of ink which are then seen, the other physical fact, of light, by another organism. Whereas there may very well be such things as ESP, it is not aberrative.

There are many perceptions, which is to say channels, through which one can contact the physical universe. You are aware of the physical universe because of sight, sound, touch and other message systems. Therefore, each time you are asked to recall an incident of a certain kind you will be asked, after you have recalled it, to pay attention to a certain sense channel which was present during the time when you experienced the incident. The circular disc is provided for this purpose. You will notice the disc has two sides.

The perceptions or sense messages listed on one side are different from those on the other side. As you read the questions one after the other you should read them through a slot provided in the disc. Going to the next question you should rotate the slot once counterclockwise for each new question. This will give you a new perception. For instance the question may pertain to a time somebody went away from you. You will recall a time when this occurred, selecting the moment of actual physical departure. Undoubtedly you will get some perception of the scene and you may even get a very full perception of the scene. Many people see, feel, hear and otherwise perceive memories when they recall them. Some people are too occluded. These lists wipe away occlusion. As you recall the person walking away from you then, you are not supposed to recall merely the concept that somebody had walked away, but the moment when they actually did and get as many perceptions as possible of them doing so. The disc which overlies this question will have uppermost at random one particular perception. That perception may be *sound*—thus you should attempt to recover whatever sounds were present when this individual walked away as the particular emphasis of perception. *If you are unable to recover the sounds as such, hearing them again, at least recover the concept of what they may have been.*

If you will examine this disc, you will find that it lists six perceptions with which you have contacted the physical universe. Actually there are many more of these than six.

When the word “emotion” is uppermost above a question after you have recalled the incident suggested by the question, you then try to recall in particular and feel again, if possible, the emotion you felt at the time. When the next question is addressed the disc is rotated one turn counterclockwise. You will find that “loudness” is now uppermost. You should get an incident in recall suggested by the question and having perceived the incident you should then give your attention in particular to the loudness of the various sounds in the incident.

Going to the next question, you should rotate the disc once more counterclockwise. You will find that “body position” is now uppermost. You should read the question and recall some incident it suggests, perceive it as well as you possibly can and then give particular attention to the position your own body was in at the time the incident occurred. Going to the next question and rotating the disc once more you will find that “sound” is now uppermost. You should recall the incident the question calls for and then give particular attention to the sounds in that incident. Going to the next question and rotating the disc once more, you will find that “weight” is uppermost. In the incident you recall you should then give attention to the heaviness of things, including the pull of gravity on yourself and the weight of anything you may actually be supporting in the incident such as your clothes, a ball or any other thing which you are actually holding at the time the incident occurred.

Rotating the disc once more to the next question on the list, you will find that “personal motion” falls uppermost. When you have answered the question then you should give attention to the motion which you yourself were undertaking at the time the incident occurred.

Every time you go to a new page you should turn the disc upside down. You will find here a new set of perceptions. These, of course, are applied in such a way that when you go over the list a second time you will probably not have the same perception, as these things fall at random. Thus while you might have answered a question the first time about somebody coming towards you with attention to sound called for by the disc, the next time you reach this question, on going over the list again, you may find “emotion” uppermost. You should then contact any and all emotion on the second time, whereas you contacted the sound the first time. You will find on the reverse side of the disc the perceptions of *sight*, *smell*, *touch*, *color*, *tone* and *external motion*. *Sight* is what you actually saw at the time. A person whose perceptions are in good condition will see again what he has seen before when the incident actually occurred. Thus *sight* calls for what was seen while the incident called for was taking place. *Smell* requests the individual to recall any and all odors which were present during the scene he is recalling. *Touch* requests the recall of anything the individual was actually touching at the time with the sensation of touch, including pressure. One is always in contact with the material world in terms of touch, even if only the touch of his feet on the ground or the feel of his clothes upon him. The perception of *color*, when uppermost, should cause the individual to try to perceive again the color which was contained in the scene called for

When *tone* is requested the individual should attempt to contact the quality of the sound present when the scene occurred. When *external motion* is uppermost the individual, in recalling the incident called for by the question, should attempt to perceive in the incident recalled the movement contained in the incident, the motion of other people or objects or of energy.

As one goes over these questions then with the disc, he is exploring his own life and during that exploration is attempting to call into view with the highest possible level of reality those things he has perceived. The immediate result is a heightening of perception of his present-time world. Another result is a strengthening of his memory. Yet another result is the rearrangement and reevaluation of things which have happened to him. Another and more mechanical and fundamental result is the deintensification of unpleasant experiences—like

bringing them into the light. For a while one may feel it is better to forget unpleasant things. Forgotten, they have more force and destructive quality than when examined.

The individual will find himself, as he repeatedly uses a list, getting earlier and earlier incidents. It is not impossible for him to remember straight back to the earliest beginnings of his life, much less his infancy.

Again, and it cannot be emphasized too strongly, these questions are requesting actual physical actions, not statements about physical actions. It is perfectly legitimate to recall scenes which have been seen in the movies or read about in books, but when one recalls such scenes one should have full awareness, in the case of the movies, of the screen and the seat and where the incident is taking place and when. In the case of books one should get not the scene the author would like the reader to see but the actual scene of reading and the recall should be recaptured in terms of print and sitting in a chair, not in terms of imagining.

There is a great deal of technology out of sight back of these questions. All that is important is that this operation, continued persistently, going over one list and then another and recalling the things required, considerably improves the individual's thinking and acting abilities and his physical well being and considerably enhances his relationship with his present environment.

You will find the very last list is named the "End of Session List." This means that after you have worked a list, or worked as long as you desire to, during any one period of self-processing, you should turn to the "End of Session List" and answer the questions as a routine operation.

You will also find a list entitled "When Uncomfortable", which is placed next to the last in the book. If you find during a session of self-processing that you grow considerably uncomfortable or unhappy, you should then turn to the "When Uncomfortable" list. Using it should restore your good spirit swiftly.

If you find it is extremely difficult to recall any one question in these lists, simply pass over it and go to the next question. If you find you are having difficulty in answering any of these lists you will do better if some friend reads them to you.

If undergoing self-processing makes you extremely unhappy it is probable that your case should be given the attention of a dianetic auditor until such time as you are capable of handling this matter for yourself.

You can go over a list many times before going on to the next list or you can continue on through all of the lists consecutively without repeating any. You will probably find that going over each list many times before going on to the next will work better than going through the book consecutively. You will notice that after you have been over the same memory several times, even though it be an unpleasant one, that it will cease to have any effect upon you. This means its intensity is decreasing and that the energy which it contained and which was affecting your present time life is dissipating. If you can remember several incidents of the same kind, do so; and if they are troublesome to you, simply go over the things you remembered once more, one after the other, and then again. This, dianetically speaking, is called repetitive straight wire. It de-intensifies unpleasant memories. However, this list is aimed toward the recall of pleasant incidents. Pleasant incidents do not de-intensify as unpleasant ones do but, underneath the level of attention, deintensify unpleasant incidents when the pleasant incident is recalled.

All you really need to work these lists is to know that actions, not words, are required and that the disc should be used to give you the particular kind of recall you should have on the recollection called for. If you lose the disc you will note that the bottom of the page has a list of the perceptions for your reference. When using the bottom-of-the-page list you should merely

take the recalls, the perceptions, consecutively one after the other and use them the same way you used them with the disc.

Don't simply answer questions "Yes" or "No". Select an actual moment in your life called for by the question. Try to re-sense that moment with the perceptic called for on the disc.

If going over the questions makes you unhappy, simply continue with the list you are working, over and over. The unhappiness should "wear out" after unhappy incidents are recalled many times. The feeling will turn to one of relief.

Some people are frightened at the idea of persevering with these questions. Certainly you've got more nerve than that. The worst they could do is kill you.

Don't be surprised if you feel sleepy after using some of these questions. The sleepiness is only a symptom of relaxing. The very least the book can do for you is replace your sedatives!

If, while answering these questions, you begin to yawn, that is good. Yawning is a release of former periods of unconsciousness. You may yawn so much the tears come out of your eyes. That is progress.

Should you feel very groggy while answering these questions, that is only "boil-off", the manifestation of former periods of unconsciousness boiling off. Simply persist in recalling the incident or others like it and the feeling will pass away, leaving you more alert than before. If you interrupt this "boil-off" and stop your session, you may feel cross or irritable. This grogginess occasionally amounts to nearly complete unconsciousness, but it always goes away. That unconsciousness was what was keeping you from being high on the tone scale.

Occasionally vague or even sharp pains may turn on and off as you are answering questions. Don't try to find out where they came from. They will go away if you persist with these questions. Simply ignore them. They are the ghosts of what they used to call psychosomatic ills, former injuries restirnlated.

An individual is suppressed by these deposits of past pain and unconsciousness. Self Analysis makes such past moments pass away and de-intensify at least partially, without your having to find out what was in them.

A full description of these manifestations and their causes occurs in SCIENCE OF SURVIVAL, the popular text on Dianetics, which you will find on the book list in the back of this book.

Use Lists Many Times. Try for the earliest incident you can get for each question.

LIST 1

General Incidents

The purpose of this list is to give you practice in recalling things. Use the disc provided in the back of the book and look at the beginning of this section for instructions as to how this list is to be used.

Can you recall a time when:

1. You were happy.
2. You had just finished constructing something.
3. Life was cheerful.
4. Somebody had given you something.
5. You ate something good.
6. You had a friend.
7. You felt energetic.
8. Somebody was waiting for you.
9. You drove fast.
10. You saw something you liked.
11. You acquired something good.
12. You threw away something bad.
13. You kissed somebody you liked.
14. You laughed at a joke.
15. You received money.
16. You felt young.
17. You liked life.
18. You played a game.
19. You bested something dangerous.
20. You acquired an animal.
21. Somebody thought you were important.
22. You enjoyed a good loaf.
23. You chased something bad.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

24. You were enthusiastic.
25. You enjoyed life.
26. You went fast.
27. You owned something.
28. You felt strong.
29. Somebody departed.
30. Somebody helped you.
31. You gathered something good.
32. You measured something.
33. You took a pleasant journey.
34. You turned on a light.
35. You heard some good music.
36. You controlled something.
37. You destroyed something.
38. You mastered something.
39. You were lucky.
40. You felt peaceful.
41. You saw a pretty scene.
42. You poured something good.
43. You acquired something that was scarce.
44. You made an enemy scream.
45. You had a pleasant seat.
46. You handled something well. (actual physical handling)
47. You moved something.
48. You watched something fast.
49. You were together with friends.
50. You occupied a good space.
51. Somebody loved you.
***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

52. You enjoyed somebody.
53. You invented something.
54. You harnessed some energy.
55. You killed a bug.
56. You pocketed something.
57. You made progress.
58. You walked.
59. You saved something.
60. You stopped a machine.
61. You started a machine.
62. You had a good sleep.
62. You stopped a thief.
64. You stood under something.
65. You started a fire.
66. You went upstairs.
67. You were warm.
68. You went riding.
69. You were adroit.
70. You swam.
71. You stood your ground.
72. You lived well.
73. You were respected.
74. You won a race.
75. You ate well.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

LIST 2

Time Orientation

This list is intended to aid your general sense of time as applied to periods in your life. Everyone has a full recording of everything that happened to him during his life. It may be that he cannot immediately recall certain periods. These periods are said to be occluded. Working with these lists in general, such occluded periods will gradually disappear when one's life is in recall to the betterment of his mental and physical well being and his perception of his present-time environment- In Dianetics it is considered that everyone has a "time track". Everything which an individual has perceived throughout his life is recorded on this "time track" from the beginning to the end. It is dangerous to have occlusions since the data in the occluded area becomes compulsive and causes less than optimum conduct. This list is intended to straighten out the track in general. Do not be dismayed if you cannot recall the actual instant of the memory. Get the memory first. If you can answer the remaining questions, that is all to the good.

Can you recall an incident which happened:

1. A long time ago. (the year? the month? the hour ?)
2. Yesterday. (the hour? the date?.)
3. Last month. (position of the sun?.)
4. When you were very small. (clothes people wore? position of sun?.)
5. When you were half your present size. (the sizes of others at that time ?.)
6. When you were a third your present weight. (position of the sun?.)
7. When your mother looked younger. (her clothes ? position of the sun?.)
8. When you felt agile. (the year? the hour?.)
9. Last Christmas. (time of day ?)
10. Your fifth Christmas. (clothing of others?.)
11. Your eighth birthday. (furniture?.)
12. A birthday. (the appearance of others ? year ? position of sun?.)
13. This day last year. (the house you lived in? the date? the season?.)
14. At noon today.
15. At a banquet. (clothing of people present?)
16. At a marriage. (year? season ?)
17. At a birth. (season?.)
18. On a date with someone. (hairdo ?)

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

19. About a clock. (position of the sun?.)
20. About a wrist watch. (motion of second hand?)
21. With an animal. (when he was smaller ?)

Can you recall incidents which compare:

1. Clothing today and clothing when you were small.
 2. Hairdo today and hairdo when you were in your teens.
 3. Something which is now old when it was new.
 4. Something which was small which is now big.
 5. Something which is now old when it was young.
 6. The way the sun shines in the morning and in the afternoon.
 7. Winter with summer.
 8. Spring with winter.
 9. Fall with spring.
 10. Sunrise with sunset.
 11. A morning shadow and an evening shadow.
 12. Clothing now old when it was new.
 13. A house now standing where no house was.
 14. An open space which is now cut up.
 15. A long time and a short time.
 16. A cigarette when it was lighted and when it was put out.
 17. The beginning and the end of a race.
 18. Bedtime and getting up.
 19. School in the morning and getting out in the afternoon.
 20. Your size now and when you were little.
 21. A cloudy day and a sun- shiny day.
 22. Stormy weather and rainy weather.
 23. Something hot and when it got cold.
 24. Something young and something old.
- Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

25. A fast heartbeat and a slow heartbeat.
26. When you were over- heated and when you were chilly.
27. When you had lots of room and when you had little room.
28. When the light was bright and when it was dim.
29. When a fire burnt bright and when it down.
30. An object half built when it was started.
31. The same person when he was big with when was small.
32. When you felt little when you felt grown
33. Yesterday morning this morning.
34. A complete calendar and when it had its leaves torn off.
35. A stopped clock and a running clock.
36. The sun's motion and the moon's motion.
37. When you felt tired and when you felt energetic.
38. Cars then with cars now.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

LIST 3

Orientation of Senses

This list is arranged especially to call your attention to the existence of many of the channels by which you perceive yourself and the physical universe about you. While each of the questions listed pertains to a specific sense channel such as light or sound, the disc could still be used, for what is required are specific moments when you were using various senses and any specific moment includes many other sense messages than the one which is called for. Therefore, use the disc as in any other questions and after you have recalled a specific incident called for in the question then try recalling it with specific attention to that sense which happened to be uppermost on the disc at that time.

Time Sense

Anyone has a sense of time. This sense is apt to become aberrated. The existence of clocks at every hand seems to tell us that we need mechanical assistance in knowing what time it is. The first person that had an aberrated or dearranged time sense made the first clock desirable—but only for him. Clocks and calendars are artificial symbols representing time which is an actual commodity and which can be sensed directly by the individual. This section and almost every other section in these lists rehabilitates the sense of time. Time in most people's minds is confused with space. The words which describe time are also the words which describe space, which shows that man has an indifferent attention for his time sense. The organism measures time in many ways, but mostly in terms of motion and growth or decay. Change is the most striking symbol of time passage, but there is a direct sense of time which everyone has although it may be occluded by a society which, using clocks and calendars, seems to invalidate the fact that it exists no confusion of any kind about time.

Can you recall a time when:

1. It was very late.
2. You were early.
3. You had to wait.
4. You had to stand for some time supporting a weight.
5. You went very fast.
6. You covered a great deal of space.
7. You used a lot of time (when you really did, not when somebody said you did).
8. An object ran down (not a clock).
9. A long length of space.
10. A short length of space.
11. An object moving.
12. An animal moving.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

13. A clock hand moving.
14. A round object.
15. An object near an object.
16. A lightning bolt.
17. Breaking a watch. (did time stop'?)
18. A good time.
19. You were too late.

(Additional questions are in the second half of LIST 2)

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

Sight

There are several portions of the sense channel called sight. Light waves, coming from the sun, moon, stars, or artificial sources, reflect from objects and the light waves enter the eyes and are recorded as present time action or as memory for future reference. Light sources are also recorded. This is the sense perception called sight. It has subdivisions. First of these might be considered to be motion, wherein sight depends upon a time span to record a continuously changing picture. While one may see motion in present time, various aberrations of sight may cause him to recall only still pictures. Nevertheless, all the motions are still recorded and can be recalled as moving pictures. In this way all other senses have a dependence upon time in order to bring in the message of motion, since motion is also recorded by the other perceptions. More particularly, part of sight is color perception. There are people who are color blind in present time; that is to say, they can see color but are unable to perceive differences of shading. There are people who may see color in present time but in trying to recall what they have seen, recall only in black and white. This would be recall color blindness. The color is fully deleted. It is an aberration easily remedied when one recalls things he has seen in color as black and white or as still pictures.

Another part of sight is *depth perception*. Depth perception is observed in two ways. One is by seeing the difference in size of objects and so having a conception of the fact that one is further back than another or that the object itself is at a distance and the other is a "stereoscopic" effect occasioned by the fact is again remediable. An individual who could not perceive motion in present time and who additionally could not perceive color or depth would be a very bad risk as a driver; almost as bad is that individual who cannot recall what he has seen; depth perception in present time and yet, in recall, see pictures flat and without depth perception. This lack of depth perception is again remediable. An individual who could not perceive motion in present time and who additionally could not perceive color or depth would be a very bad risk as a driver; almost as bad is that individual who cannot recall what he has seen; or if he can recall it, cannot do so with depth perception, full color and motion. This part of this list is devoted to giving you a better insight into sight. All these perceptics are exercised over and over by these lists in general. If you cannot immediately see in recall what you have looked at some other time simply try to get a concept of how things looked at specific times.

Can you recall a sight which was:

1. Very bright.
2. Dark.
3. Green.
4. Vast.
5. Moving.
6. Flat
7. Deep
8. Colorful.
9. Swift.
10. Slow.

Sight, Smell, Touch, Color, Tone, External Motion, Emotion, Loudness. Body Position, Sound, Weight. Personal Motion

11. Pleasant.
12. Desirable.
13. Pretty.
14. Rare.
15. Remarkable.
16. Confused.
17. Mysterious.
18. Lazy.
19. Warm.
20. Cheerful.
21. Nearly invisible.
22. Blurred.
23. Sharply defined.
24. Lovable.
25. Passionate.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

Relative Sizes

The recognition of one's size in relationship to the scene in which he finds himself and the objects and organisms of that scene is, in itself, a sense message. It is particularly trying on children, and undoubtedly was on you when you were a child, to be surrounded with objects which are so large. When one is actually getting a good recall on a childhood incident he is quite often startled to see how big things appeared to him and how large were those giants, the adults, with which he was surrounded. The feeling of being small in the vicinity of large objects sometimes produces the feeling of inadequacy. It is even said that people who are smaller than the average feel less secure in their environment. This evidently stems from the fact that their grown up size has not reached the average and thus the feeling of smallness and inadequacy during childhood is in constant restimulation. It is not because the person, though smaller, is really inadequate. In such a way people who are taller than the average become aware of the fact, mostly because people smaller than themselves find ways and means of nullifying them because of their size. The perception of relative size is therefore an important perception to rehabilitate and a person who is larger than others on the average would do well to change the reading disc with which he is working these questions so that the word "loudness" on the disc is marked out and "relative size" is substituted.

Can you recall a time when:

1. You were bigger than an animal.
2. You were smaller than an object.
3. You were bigger than a person.
4. You were smaller than a person.
5. Things looked little to you.
6. Things looked big to you.
7. You were in a vast space.
8. You looked at the stars.
9. You were dwarfed by an object.
10. You saw a giant.
11. You scared somebody.
12. Somebody waited on you.
13. You chased somebody.
14. You licked a larger boy.
15. Furniture was too small for you.
16. A bed was too small for you.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

17. A bed was too big for you.
18. A hat didn't fit.
19. You had to be polite.
20. You bullied somebody.
21. Your clothes were too large.
22. Your clothes were too small.
23. The vehicle was too large.
24. The vehicle was too small.
25. A space was too big.
26. A table was too big.
27. Your arm was too big.
28. A cook was small.
29. You could reach something above you.
30. A ball was too small.
31. A daughter was smaller.
32. A desk was too small.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

Can you recall:

33. A big fork.
34. A small kettle.
36. A small fish.
37. A little flower.
38. A small doctor.
39. A tiny dog.
40. A small man.
41. A little child.
42. A small cat.
43. A little house.
44. A small machine.
45. Short legs.
46. A small face.
47. A small place.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

Sound

Sound consists of the perception of waves emanating from moving objects. An object moves rapidly or slowly, and sets into vibration the air in its vicinity which pulses. When these pulses strike the eardrum they set into motion the individual's sound recording mechanism and the sound is registered. Sound is absent in a vacuum and is actually merely a force wave. Sound in too great a volume or too discordant can be physically painful, just as light in too great a quantity can hurt the eyes. However, the amount of nervousness occasioned by sound, as by light, is mainly an aberration and it is not warranted, since the sound itself is not ordinarily damaging, and there are few incidents in anyone's life when a sound has had enough physical force to be physically damaging. Apprehension and anxiety about the physical universe and other persons can, however, cause the individual to be nervous about sound, as it is one of the most reliable warning mechanisms; but starting at every sound in a civilized environment, being afraid of voices of others, or even traffic noises is foolish, since men rarely live a tooth-and-claw existence which warrants such attention. As sound becomes intermingled with past pain, the individual mis-takes the moment and time he is hearing the sound, and so may associate it, as he may with other perceptics, with past pain. These lists permit an individual to rehabilitate his skill in telling the difference between one time and another or one situation . another.

Sound has several parts. The first is pitch. This is the number of vibrations per unit of time of any object from which sound, coming. The second is quality or tone which is simply the difference between a jagged or ragged sound wave and smooth sound wave as in a musical note. The third is volume which merely means the force of the sound wave, its loudness or quietness.

Rhythm is actually a part of the time sense, but is also ability to tell the spaces between sound waves which are pulse regularly, as in the beating of a drum.

Many people have what is called extended hearing, which is say they have too high an alertness to sounds. This accompanies quite ordinarily, a general fear of the environment or the people in it. There is also deafness by which the individual simply shuts out sounds. Some deafness is, of course, occasioned by entirely mechanical trouble with the recording mechanism, but most deafness, particularly when partial, is psychosomatic or caused by mental aberration. The individual may or may not be able, at first, to recall what he has heard and which has be recorded in the past, when he remembers it. In other words, it does not get a sound when he remembers that he heard a sound. This is an occlusion of sound recordings. Recalling a sound in hearing it again is called "sonic" in Dianetics and is a desirable circumstance which can be returned to the individual.

It is interesting to note that there is also a depth perception in sound. A person having two ears gets a "stereoscopic" effect on sources of sound so that he can tell how far they are from him and where they are located in relationship to him.

Can you recall a time when you heard:

1. A gentle wind.
2. A quiet voice.
3. A pleasant sound.
4. A pleasant voice.
5. A breeze.
6. A dog whining.
7. A bell.
8. A cheerful voice.
9. A musical instrument.
10. A door close.
11. Water running.
12. Liquid coming from a bottle.
13. Good food frying.
14. A ball rolling.
15. A wheel singing.
16. A car starting.
17. A child laughing.
18. A ball bouncing.
19. A sewing machine running.
20. A cat mewling.
21. A pen writing.
22. A child running.
23. A book page turning.
24. A newspaper being opened.
25. A kiss.
26. A stimulating sound.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

27. A smooth sound.
28. A rhythmic sound.
29. A happy sound.
30. A rubbing sound.
31. An enthusiastic sound.
32. A sigh.
33. An eager voice.
34. A revelry.
35. A band.
36. A silky sound.
37. Restful water.
38. A sound in a big place.
39. A wanted sound.
40. An endearing sound.
41. A domestic sound.
42. A busy sound.
43. A pleasant sound.
44. A far-off sound.
45. A nearby sound.
46. A number of sounds jumbled together.
47. A safe sound.
48. A sound that is very real to you.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

Olfactory

The sense of smell is evidently activated by small particles escaping from the object, which is thus sensed traveling through space and meeting the nerves. When one comes to think of it, this seems rather unpleasant at times, but there are also many very pleasant smells.

The sense of smell has four subdivisions which are mainly categories of the type of odor.

Taste is usually considered to be a part of the sense of smell.

Can you recall a time when you smelled the following:

1. Something sweet.
2. Something sharp.
3. Something oily.
4. Something pungent.
5. Something desirable.
6. Something burned.
7. Something stimulating.
8. Something cheerful.
9. A good person.
10. A happy person.
11. A warm person.
12. A friendly animal.
13. A pleasant leaf.
14. Cut grass.
15. Something passionate.
16. Something you wanted.
17. Something you threw away.
18. A bird.
19. Something exciting.
20. Something desirable.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

21. A child.
22. Face powder.
23. Perfume.
24. Lipstick.
25. Leather.
26. Pipe smoke.
27. Sweat.
28. Wool.
29. Clean sheets.
30. Fresh air.
31. A bouquet.
32. Money.
33. Paper.
34. Furniture.
35. A beautiful morning.
36. A party.
37. A pleasant odor that is very real to you.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

Can you recall a time when you tasted the following:

1. Soup.
2. Eggs.
3. Bread.
4. Biscuits.
5. Coffee.
6. Tea.
7. Milk.
8. Cereal.
9. Dumplings.
10. Fish.
11. Beef.
12. Chicken.
13. A steak.
14. Duck.
15. Stuffing.
16. Cheese.
17. A fillet.
18. Potatoes.
19. Water melon.
20. A cocktail.
21. Liquor.
22. A hot sandwich.
23. Jelly.
24. Ice cream.
25. Pudding.
26. Candy.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

27. Pickles.
28. Punch.
29. A vegetable.
30. An apple.
31. An orange.
32. A fruit.
33. Cake.
34. Something you really thought was well cooked.
35. Something you like to eat raw.
36. A cookie.
37. A cracker.
38. Meat.
39. Something cold.
40. Something warm.
41. Your favorite dish.
42. Something in a swanky place.
43. Something at a party.
44. Something in the open.
45. Something on a holiday.
46. Something when you were very hungry.
47. Something which was rare.
48. Something which made you feel good.
49. Something for which you were grateful.
50. Something you had waited for a long time.
51. Something you had not been able to get.
52. Something you stole.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

Touch

The sense of touch is that communication channel which informs the central control system of the body whenever some portion of the body is in contact with the material universe, other organisms, or the organism itself. Probably the sense of touch is the oldest sense in the terms of the central nervous system. It has four subdivisions.

The first of these is pressure; the second is friction; the third is heat or cold; and the last is oiliness. Just as an individual can be hard of hearing or have bad eyesight so can his sense of touch be dulled or even almost absent. This condition is known as anaesthesia. Just as in any other perceptic, the sense of touch can be pleasurable, unpleasant or painful. When an individual has been considerably harmed, as in accidents, illness or injury, he tends to cut communication with the physical universe and other organisms, just as he cuts communication by getting bad eyesight, becoming hard of hearing, etc.

Not only can the sense of touch be dulled in some people, but it can be too sensitive in others who have this sense channel aberrated until it seeks to contact danger more avidly than danger exists. One of the manifestations of the aberrated sense of touch is too high a sensitivity to sexual contact rendering it painful or anxious, or a dulling of this contact so that sensation can be nearly absent.

A sense of touch is very important. It is partially responsible for pleasure, as in sex and is to a large measure responsible for the sensation we know as physical pain. The sense of touch extends from the central nervous system to the skin surface and as such is intimately connected and most basically in contact with the physical universe. Sight and sound and the olfactory systems contact things usually at a distance, whereas touch is alert only to the closest proximity of actual contact.

Touch is partially responsible for the pleasure taken in food and crosses, to this extent, the sense of taste. As a demonstration of how poorly the sense of touch serves many people, try laying your hand in a friendly fashion on the shoulder of someone. All too many people will dodge or shrink away from the contact. An aberrated sense of touch is partially responsible for a dislike of food as well as impotency and antipathy for the sexual act.

The rehabilitation of the sense of touch goes a long way toward rehabilitating one's confidence in one's environment and considerably enhances survival by making it possible for the individual to obtain pleasure, where before there might only have been distaste.

Can you recall an incident when you felt/touched:

1. The pressure on your feet while you stood.
2. A fork.
3. A greasy surface.
4. The pressure of a movie seat.
5. A steering wheel.
6. A cat.
7. Another person.
8. Cool clothing.
9. Your hair.
10. A child.
11. Something you admired.
12. Something new.
13. An arm.
14. A ball.
15. An easy chair.
16. A collar.
17. A poker.
18. A musical instrument.
19. Something comfortable.
20. Something which gave you confidence.
21. Something bright.
22. A desk.
23. A girl.
24. A boy.
25. A fish.
26. A doll.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

27. Silk.
28. Velvet.
29. Your ear.
30. Your body.
31. Something which made you feel enthusiastic.
32. Something which delighted you.
33. Something you desired eagerly.
34. Someone who was faithful.
35. A happy child.
36. A generous hand.
37. A good machine.
38. A pleasant letter.
39. A newspaper containing good news.
40. A telephone when you received good news.
41. A hat.
42. A dear face.
43. A stair bannister.
44. A kind object.
45. A moving object.
46. An object you loved.
47. An enemy being hurt.
48. A polite person.
49. Something pretty.
50. Something which made you rejoice.
51. A food you liked.
52. Something you believed in.
53. Something you like stroke.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

54. A strong person.
55. A little person.
56. Water you enjoyed.
57. A shower.
58. An old person.
59. Something warm.
60. Something cold.
61. A wind.
62. A sleepy person.
63. A cool bed on a warm night.
64. Something which made you enthusiastic.
65. Something you touched this morning.
66. Something you are touching now.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,

Personal Emotion

There are many emotions. The principal ones are happiness, boredom, antagonism, anger, covert hostility, fear, grief, and apathy. Other emotions are usually simply greater or lesser magnitude than the ones listed. Terror, for instance, is a volume of fear. Sadness is a small volume of grief. Dejection is a small part of apathy. Love is an intensity of happiness addressed in a certain direction. These emotions form a gradient scale which make up in Dianetics the Emotion section of the tone scale. Happiness is the highest emotion and apathy is the lowest. A person can be chronically emotional along any level of this tone scale. An individual tends to move up or down this scale through these various listed emotions in the order of the first sentence.

Emotion monitors or regulates the endocrine system. The perceptions and the central nervous system call for certain emotional secretions to catalyse the body to meet the various situations in the environment. Emotion is one of the easiest things to aberrate. There are individuals who feel they must be perpetually sad, even when their circumstances should make them happy. There are individuals who believe they have to be happy regardless of their environment and who yet are very miserable. Most people are not emotional—they are mis-emotional, in that they do not react to the situations in their environment with the emotion which would be most rational to display. The social order has confused irrationality with emotionalism. Actually a person who is fully rational would be most able to respond to the stimulus of his environment. Being rational does not mean being cold and calculating. An individual who is rationally happy can be counted upon to make the best calculations. Without free emotion, an individual cannot appreciate as he should the pleasant things in his environment. Lack of appreciation for art or music comes about when the individual cannot be freely emotional. The person who feels he must be coldblooded in order to be rational is what is called in Dianetics a “control case”, and on examination will be found to be very far from as rational as he might be. People who cannot experience emotion because of their aberrations are ordinarily sick people. Well people can experience emotion.

Derangements in the endocrine system, such as the thyroid, the pancreas and other glands, come about because of aberrations concerning emotion. It has been conclusively tested and proven in Dianetics that function controls structure. To a man or a woman who is aberrated sexually, injections of hormones are of little or no avail in moving the mental aberrations which make injections ineffective. Removing emotional aberration rehabilitates the endocrine system so that the injections are usually not even necessary. When a person's emotional reaction becomes frozen, he can expect various physical difficulties such as ulcers, hypo-thyroid conditions, diabetes, and other ills which are more or less directly traceable to the endocrine system.

Inhibited or excessive mis-emotionalism is one of the most destructive things which can occur in the human organism. A person who is so aberrated is unable to experience happiness and so enjoy life. His physical body will not thrive.

Can you recall an incident when:

1. Somebody was angry.
2. Somebody wanted something.
3. You desired something.
4. You were happy.
5. You were pleased.
6. You won by being antagonistic.
7. You felt affectionate.
8. You admired something.
9. Something was amiable.
10. You were amused.
11. You approved of an object.
12. You were surprised by something pleasant.
13. You attacked something successfully.
14. You attacked someone.
15. You were “attached” to something.
16. You had to blush.
17. You felt bold.
18. You couldn’t be bothered.
19. You were energetic.
20. You found out you weren’t clumsy.
21. You were satisfied.
22. You cared for somebody.
23. You were confident.
24. You influenced somebody.
25. You were glad to be idle.
26. Somebody was patient.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

27. You enjoyed life.
28. You were joyful.
29. You laughed.
30. You were in love.
31. You received good news.
32. You enjoyed the music.
33. You thought it was pretty.
34. You were satiated.
35. You were passionate.
36. You prevented something.
37. You produced something.
38. You were glad to avoid a quarrel.
39. You were glad to hurt somebody.
40. You rejoiced.
41. You felt very safe.
42. You screamed with laughter.
43. You enjoyed the silence
44. You got to go to bed.
45. You found it was beautiful day.
46. You won the struggle.
47. You subdued a person.
48. You conquered something.
49. You obtained what you wanted.
50. You surprised somebody.
51. You contributed.
52. You were permitted to handle something.
53. You were glad you didn't have to be sorry.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

54. You found the anxiety was for nothing.
55. You discovered your suspicions were unfounded.
56. You finally got rid of it.
57. You stopped somebody from being terrified.
58. You were happy.
59. Somebody understood you.
60. Somebody listened you respectfully.
61. You felt energetic.
62. You were vigorous.
63. You knew it was well done.
64. You didn't have to watch any more.
65. You liked to watch.
66. You stopped somebody from weeping.
67. You wandered at will.
68. You felt free.
69. You helped somebody.
70. You felt young.
71. You won.
72. You were glad to be together.
73. You were glad to leave.
74. You liked emotion.
75. You enjoyed moving.
76. The motion gave you joy.
77. You caught sight of something you had been waiting for.
78. You received a present you liked.
79. You found something out.
80. You pushed something away.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

81. You pulled something to you.
82. You produced something.
83. You were proud of it.
84. You raised something high.
85. You prevailed.
86. You harnessed some energy.
87. You made the time pleasant.
88. You were glad to be with a friend.
89. You made something obey.
90. You were happy to give offence.
91. You realized your luck was good.
92. You overcame antagonism.
93. You found it was fun to leap.
94. You got out of work.
95. You didn't have to sit there anymore.
96. You realized it was the last day of school.
97. You were happy it was real.
98. You felt virtuous.
99. You knew you shown courage.
100. Your desire was gratified.
101. You succeeded in y deception.
102. You conquered dejection.
103. You were glad it over.
104. You waited eagerly.
105. You dispersed them
106. You could tell the difference.
107. Your parent was proud of you.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

108. Somebody was faith to you.
109. You escaped.
110. You found you had hidden without cause
111. You frightened so body.
112. You overcame conservatism.
113. You discovered a friend.
114. You were friendly.
115. You did something forbidden and got away with it.
116. You gave somebody the gate.
117. You healed something.
118. You acquired a pet.
119. It was a relief.
120. You found you we hurt.
121. You received a pleasant call.
122. Your income was increased.
123. You found you had influence.
124. You were ambitious.
125. You succeeded.
126. You found you didn't want it after all.
127. You conquered being poor.
128. Many were proud of you.
129. You were loved.
130. They rejoiced for you.
131. You were considered remarkable.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

Organic Sensation

Organic sensation is that sense which tells the central nervous system the state of the various organs of the body. Don't be alarmed if you feel groggy for a while or if you yawn prodigiously. These manifestations are good and they will pass away if you recall a certain additional number of recollections on the same question that made you feel strange.

Can you recall a time when:

1. You felt yourself to be in good physical condition.
2. You enjoyed yourself physically.
3. You had just eaten something you liked.
4. Your head felt good.
5. Your back felt good.
6. You felt very relieved.
7. You were excited.
8. You felt very much alive.
9. You were proud of your body.
10. Your body was competent.
11. Your heart was beating calmly.
12. You didn't have a single ache or pain.
13. You felt refreshed.
14. Everybody was having a good time.
15. Both of you enjoyed it.
16. Your back felt strong.
17. You stood very straight.
18. You liked your position.
19. You got a new position.
20. You made it right.
21. Your head felt clear.

Sight, Smell, Touch, Color, Tone, External Motion, Emotion, Loudness. Body Position, Sound, Weight. Personal Motion

22. It was good to breathe fresh air.
23. You got it up.
24. You got it out.
25. You felt strong again.
26. You had eaten a good dinner.
27. You were enjoying it.
28. You did it with ease.
29. You poured something out.
30. You were tense with excitement.
31. You were relaxed.
32. Your chest felt good.
33. Your throat felt good.
34. Your eyes felt good.
35. You weren't aware of your breathing.
36. Your ears weren't ringing.
37. Your hands did something competent.
38. Your legs served you well.
39. Your feet felt good.
40. You knew you looked good.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

Motion Personal

Amongst the various perceptions is that of personal motion. This is awareness of change of position in space. Many other perceptions assist this awareness of motion of self. This perception is assisted by sight, the feel of wind, changes in body weight, and by the observation of external environment. However, it is a perceptic in itself and in the following questions your attention is called simply to the internal awareness of yourself in motion.

Can you recall a time when:

1. You were running.
2. You were walking.
3. You enjoyed a stroll.
4. You overcame something.
5. You threw something away you didn't want.
6. You won a tug of war.
7. You skipped rope.
8. You rode.
9. You did something successful in sports.
10. You lay down.
11. You stood up.
12. You turned around and around.
13. You jumped.
14. You stood on something that moved.
15. You leaped up.
16. You won a race.
17. You did something were admired for physically.
18. You enjoyed moving.
19. You enjoyed stand still.
20. You pointed out something.
21. You showed your superior physically.

Sight, Smell, Touch, Color, Tone, External Motion, Emotion, Loudness. Body Position, Sound, Weight. Personal Motion

22. Your right hand something skilful.
23. Your left hand did something skilful.
24. You tamed an animal.
25. You bested another person.
26. You did something physical you enjoyed.
27. You stepped up.
28. You held something close to you.
29. You threw something away you didn't want.
30. You felt lazy.
31. You turned the page of a book you enjoyed reading.
32. You dressed.
33. You got up when you wanted to.
34. You enjoyed wrestling with somebody.
35. You handled a complicated object successfully.
36. You drove well.
37. You carried some weight
38. You gathered things together.
39. You packed.
40. You wouldn't let some thing go.
41. You enjoyed the morning.
42. You danced well.
43. You amused people cause you wanted to
44. You refused to do was wanted of you did what you wanted.
45. You were glad you you.
46. You were complimented on posture.
47. You shook hands with somebody you were glad to see.
48. You grabbed something you desired.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

Motion External

The observation of external motion is accomplished by mans sense channels. The ability to perceive motion in present time and the ability to recall things which have moved and perceive that they are moving are two different things. Inability to perceive well various motions occurring in one's environment is dangerous, but it is caused by the misapprehension that the movements one perceives are dangerous when they most ordinarily are not. For every dangerous motion in one's environment there are countless thousands of safe and friendly motions. Because motion has been dangerous in the past is no reason to conceive all motion is dangerous. Possibly one of the most aberrative actions above the level of unconsciousness is striking a person suddenly when he does not expect it. Slapping children, particularly when they are not alert to the fact that they are about to be slapped, tends to give an individual a distrust of all motion and even when they become of an age when a slap would be the last thing they would expect they still continue to distrust motion. In recalling motions you have seen externally, make an effort to see the actual movements which were around you.

Can you recall a time when:

1. Something pleasant moved very fast.
2. You saw somebody didn't like running away from you.
3. You enjoyed seeing rain come down.
4. You enjoyed seeing children play.
5. Trees rustled in a small wind.
6. A quiet brook flower.
7. You played ball.
8. You saw a kite flying.
9. You were exhilarated riding downhill.
10. You saw a bird fly gracefully.
11. You perceived the man had moved.
12. You scared an animal away from you.
13. You saw a graceful dancer.
14. You saw an accomplished musician.
15. You saw an excellent actor.
16. You watched a graceful girl.
17. You watched a happy child.

Sight, Smell, Touch, Color, Tone, External Motion, Emotion, Loudness. Body Position, Sound, Weight. Personal Motion

18. You started an object.
19. You stopped an object.
20. You broke something you didn't like.
21. You watched a graceful man.
22. You enjoyed watching a ferocious animal.
23. You were glad to see something fall.
24. You watched something going around and around.
25. You enjoyed bouncing something.
26. You were happy to see something shoot up in the air.
27. You watched a fast horse.
28. You heard something swift.
29. You saw a "shooting star".
30. You saw grass moving in the wind.
31. You watched the second hand of a clock.
32. You saw somebody you didn't like walk away from you.
33. You saw somebody you liked walk towards you.
34. Somebody ran up and greeted you.
35. You saw an animal chasing an animal.
36. You moved an object.
37. You lifted an object.
38. You threw an object down.
39. You watched a friendly fire.
40. You saw a light come on.
41. You saw something go into something.
42. You emptied something.
43. You pulled something out.
44. You heard a friendly movement.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

Body Position

One is aware of the position of one's body by special perceptions. These include joint position. With the following questions give particular attention in the incident you recall to the position of your body at the time the incident occurred.

Can you recall a time when:

1. You enjoyed just sitting.
2. You fought your way of a place where you didn't want to be.
3. You stood and enjoyed a view.
4. You put your toe in mouth.
5. You tried to stand your head.
6. You tried to see if could be a contortionist.
7. You drank something pleasant.
8. You ate an excel meal.
9. You drove a good car.
10. You were doing something you liked.
11. You enjoyed handling something.
12. You were competent in a sport.
13. You were admired.
14. You were happy.
15. You enjoyed a chance to sit down.
16. You enthusiastically stood up to go some place.
17. You got rid of something.
18. You watched a child being trained.
19. You wanted to stay and did.
20. You wanted to leave and did.

Sight, Smell, Touch, Color, Tone, External Motion, Emotion, Loudness. Body Position, Sound, Weight. Personal Motion

LIST 4

Standard Processing

One can consider that the missions of the energy of Life, or at least one of them, is the creation, conservation, maintenance, acquisition, destruction, change, occupation, grouping and dispersal of matter, energy, space and time, which are the component factors of the material universe.

So long as an individual maintains his own belief in his ability to handle the physical universe and organisms about him and to control them if necessary or to work in harmony with them, and to make himself competent over and among the physical universe of his environment, he remains healthy, stable and balanced and cheerful. It is only after he discovers his inabilities in handling organisms, matter, energy, space and time, and when these things have been sharply painful to him, that he begins to decline physically, become less competent mentally, and to fail in life. These questions are aimed toward the rehabilitation of his ability to handle organisms and the physical universe.

It was a pre-dianetic error that an individual was healthy so long as he was adjusted to his environment. Nothing could be less workable than this “adaptive” postulate and had anyone cared to compare it with actuality he would have discovered that the success of man depends upon his ability to master and change his environment. Man succeeds because he adjusts his environment to him, not by adjusting himself to the environment. The “adjusted” postulate is indeed a viciously dangerous one, since it seeks to indoctrinate the individual into the belief that he must be a slave to his environment. The philosophy is dangerous because the people so indoctrinated can be enslaved in that last of all graveyards, a welfare state. However, this postulate is very handy in case one wishes to subjugate or nullify human beings for his own ends. The effort in the direction of adjusting men to their environment by giving them “social training”, by punishing them if they are bad, and by otherwise attempting to subdue and break them, has filled the society’s prisons and insane asylums to the bursting point. Had anyone cared to look at the real universe he would have found this to be true: No living organism can be broken by force into an adjusted state and still remain able and amiable. Any horse trainer, for instance, knows that the horse must not be pushed or broken into submission if one wishes to retain his abilities, but, as they used to say in the army, mules were far more expensive than men, and perhaps it was not in the interest of pre-dianetic thought to preserve men in a happy state. However, one should not be too harsh on these previous schools of thought since they had no knowledge of the natural laws of thought and in the absence of these, criminals can only be punished and not cured and the insane can only be driven down into the last dregs of tractability. The nearer to death, according to those schools of thought, the better, as witness electric shock “therapy” and brain surgery—those efforts on the part of the mental medical men to as closely approximate euthanasia as possible without crossing the border into the legal fact of death. These past schools have now been taken under the wing of Dianetics, which embraces all fields of thought, and are being re-educated. It is found that they quickly desert the punishment- drive “therapies” as soon as they completely understand that they are not necessary, now that the natural laws of thought and behaviour are known. One cannot, however, wholly repress a shudder at the fate of the hundreds of thousands of human guinea pigs whose lives and persons were ruined by the euthanistic methods employed in the dark ages of unreason.

Your health depends almost entirely upon your confidence in your ability to handle the physical universe about you and to change and adjust your environment so that you can survive in it. It is actually an illusion that you cannot ably handle your environment, an illusion implanted by aberrated people in the past, during moments when you were unconscious and could not defend yourself or when you were small and were directed and misdirected and given pain and sorrow and upset, and had no way to effect your right to handle yourself in your environment.

On Lake Tanganyika the natives have a very interesting way of catching fish. There on the Equator the sun shines straight down through the clear water. The natives take blocks of wood and string them along a long rope. They stretch this rope between two canoes and with these abreast begin to paddle toward the shoal water. By the time they have reached the shoals, schools of fish are piled and crowded into the rocks and onto the beach. The blocks of wood on the rope made shadows which went all the way down to the bottom of the lake and the fish, seeing the approach of these shadows and the apparent solid bars which they formed in the water, swam fearfully away from them and so were caught.

A man can be driven and harassed and worked upon by aberrated people about him until he too conceives shadows to be reality. Should he simply reach out toward them, he would discover how thin and penetratable they are. His usual course, however, is to retreat from them and at last find himself in the shadows of bad health, broken dreams and an utter disownment of himself and the physical universe.

A considerable mechanical background of the action and peculiarities of the energy of thought make it possible for these lists to bring about the improved state of being that they do, when properly used; but over and above these mechanical aspects, the simple recognition that there have been times in one's life when he did control the physical universe as needful, when he was in harmony with organisms about him, validate the reality of his ability.

Caught up by the illusion of words, stressed into obedience when he was a child by physical means, man is subject to his greatest shadow and illusion—language. The words, forcefully spoken, "Come here !" have no actual physical ability to draw the individual to the speaker. Yet he may approach, although he may be afraid to do so. He is impelled in his approach because he has been made to "come here" by physical force so many times in the early period of his life, while the words "come here" were being spoken, that he is trained much like a dog to obey a signal. The physical force which made him approach is lost to view and in its place stands the shadow "come here"; thus, to that degree he loses his self-determinism on the subject of "come here". As life goes on, he makes the great error of supposing that any and all words have force and importance. With words, those about him plant their shadow cages. They restrict him from doing this; they compel him to do that and almost hour-by-hour and day-by-day he is directed by streams of words which in the ordinary society are not meant to help him but only to restrain him because of the fear of others. This Niagara of language is effective only because it substitutes for periods when he was physically impelled against his wishes to accept things he did not want, to care for things for which he actually had no use or liking, to go where he did not wish to go, and to do what he did not want to do. Language is quite acceptable when understood as a symbol for the act and thing, but the word "ash tray" is no substitute for an ash tray. If you do not believe this, try to put your ashes on the air waves which have just carried the words "ash tray". Called a "saucer" or an "elephant", the object intended for ashes serves just as well.

By the trick of language, then, and a magical wholly un-substantial trick it is, men seek to order the lives of men for their own advantage, and men caged about by the shadows observe and believe to their own detriment.

All languages derive from observation of matter, energy, space and time and other organisms in the environment. There is no word which is not derived and which does not have the connotation of the physical universe and other organisms.

Thus, when you answer these questions by recalling incidents which they evoke, be very sure that you do not evoke language incidents but action incidents. You do not want the time when you were told to do something—you want the time when you performed the action. You do not have to connect the language to the action in any way, but you will find as you answer questions on any of these lists that the value of language begins to depreciate considerably and that language strangely enough will become much more useful to you.

Can you recall a time when:

1. You moved an object.
2. An object moved you.
3. You threw an organism up into the air.
4. You walked down stairs.
5. You acquired something you wanted.
6. You created something good.
7. You felt big in a certain space.
8. You were proud to move something heavy.
9. You handled energy well.
10. You built a fire.
11. You lost something you didn't want.
12. You forced something on somebody.
13. You promoted survival.
14. You pleasantly expended time.
15. You closed in space.
16. You were master of your own time.
17. You opened up a space.
18. You handled a machine well.
19. You stopped a machine.
20. You raised an object.
21. You lowered yourself.
22. You destroyed something you didn't want.
23. You changed something for the better.
24. An organism you did not like moved away from you.
25. You obtained something you wanted.
26. You maintained a person.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

27. You brought somebody you liked close to you.
28. You left a space you didn't like.
29. You conquered energy.
30. You destroyed a bad organism.
31. You handled fluid well.
32. You brought a number of pleasant objects together.
33. You placed a number of objects into space.
34. You threw unwanted objects away.
35. You dispersed many objects.
36. You tore an unwanted object to pieces.
37. You filled a space.
38. You regulated another's time.
39. You held an object close that you wanted.
40. You improved an object.
41. You emptied a space you wanted.
42. You went a distance.
43. You let time go.
44. You did what you wanted to do yourself.
45. You won out over an organism.
46. You got out from under domination.
47. You realized you were living your own life.
48. You knew you didn't have to do it.
49. You escaped from a dangerous space.
50. You entered upon a pleasant time.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

LIST 5

Assists to Remembering

“Remember” is derived, of course, directly from action in the physical universe. How would a deaf mute teach a child to remember? It would be necessary for him to keep forcing objects or actions on the child when the child left them alone or omitted them. Although parents are not deaf mutes, children do not understand languages at very early ages, and as a consequence learn to “remember” by having their attention first called toward actions and objects, spaces and time. It violates the self-determinism of the individual, and therefore his ability to handle himself, to have things forced upon him without his agreement. This could be said to account, in part, for some of the “poor memories” about which people brag or complain.

Because one learns language at the level of the physical universe and action within it, he could be said to do with his thoughts what he has been compelled to do with the matter, energy, space and time in his environment. Thus, if these have been forced upon him and he did not want them, after a while he will begin to reject the thoughts concerning these objects, but if these objects, spaces, times and actions are forced upon him consistently enough he will at length go into an apathy about them. He will not want them very much but he thinks he has to accept them. Later on, in school, his whole livelihood seems to depend on whether or not he can remember the “knowledge” which is forced upon him.

The physical universe level of remembering then, is retaining matter, energy, space and time. To improve the memory, it is only necessary to rehabilitate the individual’s choice of acceptance of the material universe.

In answering these questions, particular attention should be paid to the happier incidents. Inevitably many unhappy incidents will flick through, but where selection is possible happy or analytical incidents should be stressed. This list does not pertain to asking you to remember times when you remembered. It pertains to acquiring things which you wanted to acquire.

Can you remember a time when:

1. You acquired something you wanted.
2. You threw away something you didn't want.
3. You abandoned something you knew you were supposed to have.
4. You did something else with the time which was otherwise appointed for you.
5. You went into a space you were not supposed to occupy.
6. You left the place you were supposed to be.
7. You were happy to have acquired something.
8. You happily defied directions you had been given.
9. You were sent to one place and chose to go to another.
10. You chose your own clothing.
11. You wore something in spite of what people would think.
12. You got rid of something which bored you.
13. You were glad to have choice over one of two objects.
14. You didn't drink any more than you wanted to.
15. You successfully refused to eat.
16. You did what you pleased with yourself.
17. You did what you pleased with a smaller person.
18. You were right not to have accepted something.
19. You gave away a present you had received.
20. You destroyed an object somebody forced upon you.
21. You had something you wanted and maintained it well.
22. You maliciously scuffed your shoes.
23. You didn't read the book you had been given.
24. You refused to be owned.
25. You changed somebody's orders.
26. You slept where you pleased.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

27. You refused to bathe.
28. You spoiled some clothing and were cheerful about it.
29. You got what you wanted.
30. You got back something you had lost.
31. You got the person you wanted.
32. You refused a partner.
33. You threw the blanket off the bed.
34. You had your own way.
35. You found you had been right in refusing it.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

LIST 6

Forgetter Section

It is generally conceded that the opposite to remember is to forget. People can easily become confused between these two things so that they forget what they think they should remember and remember what they think they should forget. The basic and underlying confusion between forget and remember has to do, evidently, with what has been done to the individual on a physical level and what has been forced on him or taken away from him in terms of matter, energy, space and time.

The word forget rests for its definition on the action of leaving something alone. How would a deaf mute teach a child to forget something? He would, of course, have to hide it or consistently take it away from a child until the child went into apathy about it and would have nothing further to do with it. If he did this enough, so that the child would abandon the object, a child could be said to have forgotten the object, since the child, or any person, will do with his thoughts what he has done with the matter, energy, space, time and organisms around him, thoughts being an approximation in symbological form of the physical universe. If a child has been forcefully made to leave alone or abandon objects, energy, spaces and times, later on when he hears the word forget, this means he must abandon a certain thought and if he is in apathy concerning the forced loss of objects or having them taken away from him in childhood, he will proceed to forget them very thoroughly.

It could be said that an individual will occlude as many thoughts as he has had to leave alone or those objects in life. Pain itself is a loss being uniformly accompanied by the loss of cells of the body. Thus the loss of objects, or organisms, by the individual can be misconstrued as being painful. Memories then can be called painful which actually contain no physical pain. But the individual must have had physical pain in order to understand that the loss means pain.

Punishment often accompanies, in child training, the times when the child is supposed to leave something alone. Thus, having to leave something alone is equivalent to being painful. Thus to remember something one is supposed to forget could be erroneously judged to be painful and indeed it is not.

There is a whole philosophy in existence that the best thing to do with unpleasant thoughts is to forget them. This is based securely upon an apathy occasioned by early training. A child when asking for an object will usually at first be cheerful and when he does not procure it will become angry; if he still does not procure it he may cry; and at last goes into apathy concerning it and says that he does not want it. This is one of the derivations of the dianetic tone scale and can be observed by anyone.

These questions, then, are an effort to overcome the times when one has had to leave things alone, when one has had to lose things, and when the loss has been enforced. Thus, when answering these questions, it would be very well to try to find several incidents for each, particularly a very early incident.

Can you recall an incident when:

1. You put something aside because you thought it was dangerous but it wasn't.
2. You acquired something you were not supposed to have and kept it.
3. You cheerfully got into everything you were supposed to leave alone.
4. You went back to something you had been pulled away from.
5. You found the caution to leave something alone groundless.
6. You cheerfully destroyed an expensive object.
7. You threw away something you wanted.
8. You played with somebody you were supposed to leave alone.
9. You were right in disobeying.
10. You read a forbidden book.
11. You enjoyed having things.
12. You acquired a dangerous object and enjoyed it.
13. You stole some food and were cheerful about it.
14. You ate exactly what you pleased.
15. You fixed some electrical wiring successfully.
16. You played with fire.
17. You successfully drove dangerously.
18. You touched something in spite of all warnings.
19. You got away with it.
20. She walked out on you.
21. You and some friends collected objects.
22. You touched a forbidden thing happily.
23. You got it anyway.
24. You went where you weren't supposed to and enjoyed it.
25. You owned something that was once forbidden.
26. He walked out on you.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

27. You threw away something you had had to accept.
28. You found something which had been hidden from you.
29. You acquired a habit you weren't supposed to have and enjoyed it.
30. You were right and they were wrong.
31. You enjoyed yourself in a forbidden space.
32. You weren't supposed to do it and you did.
33. People were glad they had been wrong about you.
34. You recovered something somebody had thrown away.
35. You bullied somebody into giving you something you wanted.
36. You kept on with this processing despite what was said.
37. You persisted in doing something until they agreed you had a right to.
38. You suddenly realized you could do anything you wanted with an object.
39. You did something dangerous and got away with
40. Your group finally got something they had been denied.
41. You found you didn't have to sit there anymore.
42. You realized you didn't have to go to school ever again.
43. You realized it was recess.
44. You played hooky.
45. You made something look like something else.
46. You found where an adult had made a mistake.
47. You discovered it wasn't what they said it was.
48. You found yourself master of all your possessions.
49. You discovered you didn't necessarily have to go to sleep at night.
50. Although you felt you had to eat it, you left it alone.
51. You ate something that wasn't good for you and enjoyed it.
52. You let yourself get mad and were glad of it.
53. You suddenly decided you couldn't be that bad.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

54. You opened a forbidden door.
55. You made it go very fast when it should have gone slow.
56. You stole some time.
57. You found some love you didn't know was there.
58. You abandoned somebody and were glad of it.
59. You refused to leave that time alone.
60. You sneaked off and built a fire.
61. You didn't realize it could be that good.
62. You found out it wasn't bad to play.
63. You couldn't see what was wrong with pleasure.
64. You left off doing something you were supposed to do to do something you enjoyed.
65. You acquired a space you once wouldn't have had.
66. You indulged yourself thoroughly.
67. They couldn't keep you back from it.
68. You successfully refused to come to the table.
69. You got burned anyway and didn't care.
70. You got rid of an object and acquired liberty.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

LIST 7

Survival Factors

In that the basic drive of life is Survival and in that good Survival must contain an abundance, the survival characteristics of people, organisms, matter, energy, space and time, from the viewpoint of an individual, are very important. The incentive toward Survival is the acquisition of pleasure. The thrust away from death is the threat of pain. High ideals and ethics enhance the potentialities of the individual and the group in surviving. The ultimate in Survival is immortality.

The factors which make up life can become contradictory in that one item can, in itself, assist survival and inhibit survival. A knife for instance is pro-survival in the hand, but contra-survival when pointed at the breast by somebody else. As a person advances in life, he becomes confused as to the survival value of certain persons, various objects, energy, space and time. The individual desires survival for himself, for his family, for his children, for his group, for life in general, and the physical universe. Confusing one thing with another and beholding an item which was once survival become non-survival, beholding non-survival entities taking on survival qualities, the ability of the individual to evaluate his environment in terms of whether it assists or inhibits survival deteriorates.

An individual, a family, a group best survives, of course, when pro-survival entities are in proximity and available and when contra-survival entities are absent. The struggle of life could be said to be the procurement of pro-survival factors and the annihilation, destruction, banishment of contra-survival factors.

Emotion is directly regulated by pro-survival and contra-survival factors in life. When an individual procures and has in his proximity a strong survival entity such as another person or animal or object, he is happy. As this pro-survival entity departs from him, his emotional reaction deteriorates in direct ratio to his belief in his ability to recover it. As it threatens to depart he becomes antagonistic and fights to keep it near him. If its departure seems certain, he will become angry and lest it become pro-survival for another life form and he is assured he has lost it, he will even destroy it. When he realizes what his own state may be or the state of his family, children or group with his pro-survival entity departed he experiences fear that its loss will be permanent. When he recognizes what he believes to be a nearly irretrievable absence of this pro-survival entity he experiences grief. When it is considered to be lost permanently he experiences apathy and in apathy he may even go to the point of saying he did not want it. Actually, from antagonism on down the tone scale of emotion all the way to grief, he is still fighting to get it back and only in apathy abandons it and negates against it.

In the case of a person, animal, object, energy, space or time which threatens the survival of an individual, his family, his children, or his group, the best survival can be accomplished when such an entity has been banished or destroyed or is as distant as possible from the individual, his family, his children, or his group. In the case of the mad dog, the greatest danger exists when he is nearest and the greatest safety exists when he is most distant or absent. With contra-survival objects, then, we have the tone scale in reverse. When the contra-survival object is present and cannot be put away, the individual experiences apathy. When the individual believes himself to be threatened or when he feels his family, his children or his group are threatened by a contra-survival object to a point where he cannot easily repel it, grief is experienced, for grief contains some hope of victory through enlisting the sympathy of one's allies. When a contra-survival entity is threatening to approach, fear is experienced, providing one feels that direct attack is not possible. If the contra-survival object is near, but the individual, his family, his children or his group feel that it can be conquered, even though it is already too close, anger results. If a contra-survival entity might possibly approach, antagonism is demonstrated. Above this level contra-survival objects may be more and more distant or easily handled up to the point where the individual can even be cheerful about them, at which time they are either absent or can be handled with ease. Individuals get into a fixed emotional state

about their environment when contrasurvival objects remain too statically in their environment or when prosurvival objects are too difficult to obtain and cannot be procured or brought near or seem inclined to leave. Mixed with these emotional states is the confusion occasioned by a dulled ability to differentiate between the pro and contrasurvival of an entity.

A parent is contrasurvival in that he punishes, is much too big, and cannot be contributed to, which lessens the survival potentialities of a child. On the other hand, the same parent furnishing food, clothing and shelter, and also, but not least, being an entity which loves and can be loved, is a prosurvival entity. The parent entirely absent, then, is not a satisfactory survival state. The parent present is not a satisfactory survival state. Hence an indecision results and the individual demonstrates anxiety toward the parent. But this anxiety exists because of many hidden situations extending back to the beginning of an individuals life. The following questions are designed so as to permit the individual to reevaluate the prosurvival and contrasurvival nature of persons, animals, objects, energies, space and time in general.

Can you recall a time when:

1. A person you disliked was about.
2. An individual you liked stood above you.
3. You finally accepted a person you liked.
4. You enjoyed accompanying a person you liked.
5. You were against a person you liked.
6. You acquired an individual you liked.
7. You and a person you liked engaged in a pleasant action.
8. Your action resulted in getting rid of somebody you didn't like.
9. You enjoyed seeing somebody you admired.
10. You advanced toward a person you liked.
11. You acquired an object which you adored.
12. You knew somebody felt affection for you.
13. You got away from a person of whom you were afraid.
14. You walked after a person you liked.
15. A person you liked aided you.
16. You and people you liked were all together.
17. You almost met somebody you disliked.
18. You were glad to be alone.
19. Somebody aided your ambition.
20. You were among people you liked.
21. You found somebody amiable.
22. A person amused you.
23. You finally didn't have to be anxious.
24. A person you liked appeared suddenly.
25. You had a good appetite.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

26. You approached somebody you honored.
27. Somebody approved of you.
28. A person you liked arose.
29. You were arrested by somebody's beauty.
30. You enjoyed an arrival.
31. You found out you didn't have to be ashamed.
32. Somebody you liked was asleep.
33. You assailed an enemy successfully.
34. A person you honored assisted you.
35. You enjoyed an associate.
36. You felt assured by a person you liked.
37. You were astonished to find out somebody respected you after all.
38. You attacked somebody you didn't like.
39. You were attached to a friend.
40. Somebody you liked gave you attention.
41. You were attractive to somebody.
42. You were awakened by somebody of whom you were fond.
43. You were glad to find somebody was bad.
44. You played ball.
45. You played a battle with children.
46. Somebody considered you beautiful.
47. You discovered you had become fond of someone.
48. Somebody you disliked begged you.
49. You began a friendship.
50. You discovered you didn't have to behave.
51. A person you disliked was behind you.
52. You were below somebody you liked.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

53. Somebody of whom you were fond bested you.
54. You were beside your favorite friend.
55. You discovered you were liked better than you thought.
56. You were between two friends.
57. You bit somebody you disliked.
58. You decided to be blind to a fault.
59. You liked somebody who was black.
60. Somebody asked you to blow hard.
61. Somebody's question made you blush pleasantly.
62. Somebody made you feel bold.
63. You were glad somebody had been born.
64. Nobody could bother you.
65. You had reached the bottom and started up.
66. You bowed to a friend.
67. You were in a box with a pleasant person.
68. You broke bread with somebody you liked.
69. You breakfasted with somebody you liked.
70. You liked somebody so much you could hardly breathe.
71. You brought somebody a present.
72. You brushed against somebody you liked.
73. Somebody helped you build something.
74. Somebody kissed a burn.
75. You were so happy you felt you would burst.
76. You buried something you didn't want.
77. You were too busy to see an enemy.
78. You stood by somebody.
79. You saw something you disliked in a cage.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

80. You answered a call from a friend.
81. You broke a cane.
82. You captured an enemy.
83. You no longer had to be careful.
84. You found somebody cared.
85. You enjoyed being careless.
86. A cat you didn't like walked away from you.
87. You discovered you weren't the cause.
88. They couldn't catch you and you realized it.
89. You were certain of a friend.
90. You discovered you had charm.
91. You enjoyed a child.
92. You found a church pleasant.
93. You discovered there were friends in the city.
94. You and others left the classroom.
95. Somebody believed you were clever.
96. You found an enemy was clumsy.
97. You didn't have to clothe yourself as directed.
98. You threw away a collar.
99. You didn't have to comb your hair.
100. You were comfortable with a person.
101. You saw an enemy coming and didn't meet him.
102. You could come as you pleased.
103. An enemy had to obey your command.
104. You found you were in command.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

LIST 8

Imagination

One of the most important parts of the thinking process is imagination. Imagination is actually a form of computation. Imagination gives calculated and instinctive solutions for the future. If an imagination is dulled, one's computation is seriously handicapped. Imagination is a good thing, not a bad thing. With daydreaming, for instance, a person can convert a not too pleasant existence into something livable. Only with imagination can one postulate future goals to attain.

Can you recall a time when:

1. You foresaw how son thing should be and arranged it.
2. You imagined something and constructed it.
3. You envisioned how place would look a went there.
4. You were forced to admit you lied when you had told the truth.
5. Somebody disarranged what was yours and you put it back.
6. You delighted in filling up space with imaginary things.
7. You did a masterpiece of creation.
8. You saw something come into actuality which you had imagined.
9. You imagined it there and destroyed it.
10. Your vision was complemented.
11. You planned what to with some time and did it.
12. You ignored interruptions and went on according to schedule.
13. You saw how some space could be bettered and bettered it.
14. You drew a plan and people followed it.
15. Things were smoother because you had thought of them that way.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

LIST 9

Valences

You may have noticed, as you were perceiving things which have occurred in the past, that you were sometimes apparently inside your own body and sometimes may have been observing yourself. There are people who are never out of their own body in recall and people who are never in it. There are many valences in everyone. By a valence is meant an actual or a shadow personality. One's own valence is his actual personality. Be assured, however, he can get into a confusion with other bodies and persons. If one is in one's own valence when he is recalling things, he sees what he has seen just as though he was looking at it again with his own eyes. This is a very desirable condition of affairs. The symptom of being out of one's own valence and in a shadow valence might be said to mean that one finds his own body too dangerous to occupy in thought. Being out of valence makes perceptions hard to contact in recall. You will find, as you continue these lists, repeating each one over and over, that it becomes easier and easier to see things again out of one's own eyes.

In the following list of questions and in any recall, one should make an effort to take the viewpoint of himself, which is to say, to see the scene and get the perceptions as he himself got them at the time.

Can you recall a time when:

1. You watched a person you didn't like doing something you liked to do.
2. You saw a person you liked doing something you didn't like to do.
3. You watched a person you liked doing something you liked to do.
4. You saw a person you disliked doing something you disliked to do.
5. You noticed somebody wearing something you wore.
6. You found somebody using a mannerism you used.
7. You adopted a mannerism.
8. You found yourself and a dog being treated alike.
9. You made faces at yourself in the mirror.
10. You decided to be completely different from a person.
11. You discovered you were like an object.
12. You were classified with an unfavourable person.
13. You were classified with a favorable person.
14. You found yourself dressed like many others.
15. You found you were different from somebody, after all.
16. You noticed the difference between yourself and others.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

17. You ate with somebody you liked.
18. You met a person who reminded you of another and noticed the difference between them.
19. You walked in step with somebody you liked.
20. You rode with somebody you admired.
21. You had to take the same position as somebody else.
22. You played a game with people you liked.
23. You found yourself doing something because somebody in your early youth did it.
24. You found yourself refusing to do something because somebody in your early youth did it.

Note that the word like is used to mean admire or feel affection for and also to be similar to. The effort of valences could be said to mean trying to be like one's friends and unlike one's enemies. Unfortunately in life one often has comparisons and similarities between himself and his enemies and has dissimilarities pointed out between himself and his friends. The adjustment of this is desirable so that one feels free to follow through any motion or action of any human being without associating the motion or action with either friend or enemy.

As an effort to straighten out one's associations and dis-associations regarding people, the following questions are appended as the second part of List 9.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

Recall:

1. A person who looks like you.
2. A person who has physical troubles similar to yours.
3. A person from whom you got a particular mannerism.
4. A person who reminds you of an animal you knew.
5. A person who compared you unfavorably to unfavorable persons.
6. A person who compared you favorably to favorable persons.
7. Two people whom you had confused with each other.
8. A person you knew long ago like a person you are living with.
9. A person whom you knew earlier who reminds you of a person with whom you are now connected.
10. Who you are most like? Who said so ?
11. Who used to be afraid of sentiment ?
12. Who didn't like to eat?
13. Who was never supposed to amount to anything?
14. Who associated with people too much?
15. Who made life miserable for everybody?
16. Who had bad manners?
17. Who did you know earlier that had the pain that bothers you?
18. Who would you most want to be like ?
19. Who would you most hate to be like ?
20. Who held that you amounted to nothing?
21. Who tried to keep you in line ?
22. Who flattered you?
23. Who fed you?

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

LIST 10

Interruptions

Slowness or uncertainty of speech, stage fright in part, slowness of computation, which is to say thinking, and hesitancy in taking directions stem mainly from being interrupted in physical actions during early youth.

The child, because he may bring danger upon himself, is continually interrupted in his physical actions. He reaches for something and is turned away from it, not simply by words, but by being himself removed from the object or having the object removed from him. He is kept out of spaces he wishes to enter by being pulled back. He is given one thing when he wants another. His self-determinism is continually interrupted thus in his efforts to explore, obtain or get rid of matter, energy, space or time. From these early interruptions the child builds up a long chain of experiences of interruption, not simply by speech but by barriers and obstacles in the physical universe. If he has not been thoroughly interrupted when a child, he can analytically assess later interruptions, but if he has been handled and denied so as to interrupt him when he is young, his power of decision is inhibited, to say nothing of his power of speech and thought.

Recalling special incidents as requested in this list brings them into the light and takes the power from these chains of interruptions.

Can you recall a time when:

1. An object resisted you and you overcame it.
2. You couldn't move and then succeeded in getting away.
3. Somebody took something out of your hands and finished it.
4. Your physical action was interrupted.
5. A machine did not start.
6. Somebody jumped at you unexpectedly.
7. You were told a ghost story.
8. You had to give up a career.
9. Somebody touched your mouth.
10. You tried to raise your hand and were blocked.
11. You found the road was closed.
12. You couldn't get something into something.
13. You were halted by a friend.
14. Your father showed you how it was really done.
15. Somebody made you take care of something.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

16. It was demonstrated you were putting it to the wrong use.
17. You were corrected “for your own good”.
18. You knew somebody who had a mania for using only the right word.
19. You were “helped” by having your sentence finished.
20. You couldn’t go at the last minute.
21. You knew somebody who corrected the words you used for songs.
22. You weren’t permitted to cry.
23. Noise got on somebody’s nerves.
24. You couldn’t finish it for want of time.
25. You had to be patient.
26. You couldn’t go just then.
27. You were going but you were stopped.
28. Somebody tried to stop you but you kept on anyway.
29. You used it just as pleased.
30. You had not been halted.
31. You got loose and continued.
32. You yelled anyway.
33. You completed it despite somebody.
34. You had to stop bolting your food.
35. You drank all you pleased.
36. You weren’t supposed fight.
37. Somebody checked a muscular reaction.
38. You were very enthusiastic and somebody cooled it quickly.
39. You went on in spite of weariness.
40. You broke a habit.
41. You found somebody wasn’t as strong as you had supposed.
42. You discovered you could have it after all.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

43. You found the real motive was selfishness.
44. You got out from under domination.
45. You discovered it wasn't for your own good after all.
46. You stopped yourself from interrupting somebody.
47. You found other people weren't wiser than you.
48. Everybody thought you were wrong but discovered you had been right.
49. You attained the goal anyway.
50. You discovered another person wasn't worth having.
51. You restrained an urge to destroy something.
52. You disobeyed the law and got away with it.
53. Lightning didn't strike you.
54. You fixed something.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

LIST 11

Invalidation

Aberrated individuals use two distinct and very aberrated methods of controlling others. The first consists of forcing the other person to do exactly what is desired with the mechanism of recrimination and denial of friendship or support unless instant compliance takes place. In other words, "You do exact what I say or I am no ally of yours". This is outright domination. Additionally, it seeks by anger and outright criticism, accusations, and other mechanisms to pound another individual into submission by making him less. The second method might be called domination by nullification. This is covert and quit often the person upon whom it is exerted remains unsuspecting beyond the fact that he knows he is very unhappy. This is the coward's method of domination. The person using it feels that he is less than the individual upon whom he is using it and has no the honesty or fortitude to admit the fact to himself. He the begins, much as termites gnaw away a foundation, as in California, to pull the other individual "down to size", using small carping criticisms. The one who is seeking to dominate strike heavily at the point of pride and capability of his target and yell if at any moment the target challenges the nullifier, the person using the mechanism claims he is doing so solely out of assistance and friendship, or disavows completely that it has been done. Of the two methods, the latter is far more damaging. A person using this method seeks to reduce another individual down to a point where he can be completely controlled and will not stop until he has reduced the target into a confused apathy. The lowest common denominator of nullification could be called "invalidation". The nullifier seeks to invalidate not only the person but the skills and knowledge of his target. The possessions of the target are said to be not quite as important as they might be. The experiences of the person being nullified a minimized. The target's looks, strength, physical capabilities and potentialities are also invalidated. All this may be done so covertly that it appears to be "in the best interest of" the target. The nullifier seeks to "improve" the person being invalidated.

The first question of this list should be, of course, how many people have you known who have sought consistently under the mask of seeking to aid you to tear you apart as a person, and reduce your future, your hopes, your goals, and the very energy of your life.

Can you recall a time when:

1. A person much smaller than you resented your size.
2. A person bigger than you made you feel inferior.
3. A person would not let you finish something.
4. An object was too much for you.
5. You found a space too big.
6. You were pushed back because you were too small.
7. You didn't make the team.
8. You found you were adequate.
9. You found somebody had lied about how bad you were.
10. You discovered you had been right, after all.
11. You found your decision would have been best.
12. You solved a problem nobody else could do.
13. You discovered there were homelier people in the world than you.
14. You found you could ignore somebody's opinion.
15. You found somebody else thought you really had done something good.
16. You were admired your looks.
17. You overcame a machine.
18. You accomplished arduous journey.
19. You discovered somebody who slurred was dishonest in other ways.
20. You found yourself bigger and more powerful than an animal.
21. You discovered your competence.
22. You bested somebody thoroughly.
23. An enemy cried quarter.
24. You drew blood somebody else.
25. You took the lion's share and kept it.
26. You made your weight felt.
***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
 Loudness. Body Position, Sound, Weight. Personal Motion***

27. You were too heavy for somebody.
28. You killed something.
29. You won.
30. You were able to get away from somebody who invalidated you.
31. You discovered you were right and the old man was wrong.
32. You found you could get better.
33. You got well when they had no hope for you.
34. You surprised yourself with your own endurance.
35. You discovered you did understand.
36. You did a job nobody believed possible.
37. You were proud of your self today.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

LIST 12

The Elements

Man's primary foe in his environment is the weather. Houses, stoves, clothes, and even food, in the degree that it furnishes body warmth and mobility, are weapons of defense against storm, cold, heat and night.

Can you recall a time when:

1. You bested a storm.
2. You enjoyed thunder.
3. You had fun in snow
4. You enjoyed the sun shine.
5. Everyone else said it too hot but you enjoyed it.
6. You bested an area of water.
7. The rain was soothing.
8. You were glad it was a cloudy day.
9. The wind excited you.
10. The night was soft.
11. You were glad to see the sun.
12. The weather was friendly.
13. You bested some surf.
14. The air was exhilarating.
15. You were glad of the season.
16. You got warm after being too cold.
17. A dawn excited you.
18. You felt you owned stars.
19. You were excited over a hailstone.
20. You discovered the temperature of snow flakes.
21. The dew was bright.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

22. A soft fog rolled.
24. It was terrible outside and you were snug in your house.
25. The wind felt good.
26. You lived through it.
27. You discovered you liked your own climate.
28. You were glad to see spring.
29. You felt you could best the winds of the world.
30. You admired a storm.
31. You enjoyed lightning.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

SPECIAL SESSION LISTS

If Recalling A Certain Thing Made You Uncomfortable

It may be, as you recall incidents in your life, that you are rendered uncomfortable. There are several ways of overcoming this. If actual physical pain is part of the situation you have recalled, do not try to force yourself further into it, but concentrate on later incidents which gradually get you back up to present time. These questions will assist you to do that.

1. Recall a pleasant incident which happened later.
2. Recall what you were doing this time last year.
3. Recall a moment when you were really enjoying yourself.
4. Recall what you were doing this time last month.
5. Recall what you were doing yesterday.
6. Recall something pleasant that happened today.

Recall these things consecutively again.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

If no physical pain was included but sorrow was, recall the following:

1. The next time after that you acquired something you liked.
2. Recall something you have now which you enjoy.
3. Recall something you wanted a long time and finally got.
4. Recall the time somebody was very nice to you.
5. Recall the last money you got.
6. Recall eating dinner last night.
7. Recall eating today.

Recall all of these incidents over again with all available perceptics.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

If you merely became uncomfortable without great sorrow or physical pain, but simply wanted to avoid the recollection, use the following list:

1. Recall the incident again in its entirety from first to last.
2. Recall the incident once more.
3. Recall an earlier incident similar to it.
4. Recall an incident earlier.
5. Recall the earliest incident that you can get like it.
6. Recall all these incidents, one after the other, in their entirety.
7. Recall all the incidents again, one after the other, from the earliest to the latest.
8. Recall all these incidents again.
9. Go over the chain of similar incidents and later ones on up to present time.
10. Recall a pleasant incident which has happened in the last few days. Get all possible perceptics on it.
11. Recall what you were doing an hour ago.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

This usually stabilizes any of the above conditions:

1. Recall a time which really seems real to you.
2. Recall a time when you felt real affinity for someone.
3. Recall a time when someone was in good communication with you.
4. Recall a time when felt deep affinity somebody else.
5. Recall a time when knew you were really communicating to somebody.
6. Recall a time when several people agreed with you completely.
7. Recall a time when you were in agreement with somebody else.
8. Recall a time within the last two days when you felt affectionate.
9. Recall a time in the last two days when somebody felt affection for you.
10. Recall a time in the last two days when you were in good communication with someone.
11. Recall a time in the last two days which really seems real to you.
12. Recall a time in the last two days when you were in good communication with people.

Recall several incidents of each kind.

***Sight, Smell, Touch, Color, Tone, External Motion, Emotion,
Loudness. Body Position, Sound, Weight. Personal Motion***

All Possible Aberrations

From a Lecture by
L. Ron Hubbard

The Central Dynamic of the individual is the urge toward survival. As the urge is influenced by outside forces it either becomes suppressed or alloyed with the purposes of other persons who are forcing their wills upon it, thus becoming, to some degree, enturbulated.

A large vertical arrow serves to represent this Central Dynamic. As the dynamic is cut back or entered upon by suppressing influences such as the lack of the necessities of life—food, clothing and shelter—the arrow becomes more and more bent and warped until it is headed toward succumb, in the opposite direction. This is the direction of death. When the arrow points toward death it does so in the same ratio that the dynamic is enturbulated, and when it points toward survival it does so in the ratio that the dynamic is clean and clear. When pointing toward survival it reaches up into the high ranges of the Tone Scale.

Suppose we inspect this dynamic through a “magnifying glass.” We find that the arrow is in reality composed of eight arrows, that the Central Dynamic is subdivided into eight parts; that is, SURVIVAL may be considered in terms of (1) Self, (2) Sex and Future Generations, (3) Groups, (4) Man as a Species, (5) Life (in any of its many forms), (6) MEST, the Physical Universe, (7) Theta (thought), and (8) The Creator.

The First Dynamic is man’s urge for survival for himself as an individual organism. Past philosophies were worked out on the basis that each man was a separate entity and that everything was done by him out of motives of selfishness, and that this First Dynamic was the only dynamic. Arranging everything in terms of receiving an individual reward for helping groups, mankind and life is a clumsy and unnecessary procedure.

The Second Dynamic is man’s urge toward survival as a future generation. Through sex he creates other individuals, expressing through children the urge to survive. Past therapies and philosophies dealt exclusively with the Second Dynamic, attributing every motive man had solely to sex. These philosophies and therapies decayed with the passage of time. Because they attributed all evil to sex and declared sex to be evil, their proponents did not procreate and so are not with us any more.

Then Marx propounded a theory that the only important thing is the group. Entire nations operate on this one dynamic alone. They do a thorough job of working out everything in terms of the Third Dynamic, but it leads to a rather unbalanced situation, wherein the individual has no importance and the family is absorbed by the state. Mankind is scheduled for annexation by the state. Life and MEST belong to the state, spirituality is denied by the state, and the Supreme Being is replaced by the state.

Currently there is in California a philosophy which teaches that everything is attributable to man as a species, the Fourth Dynamic. It advocates that nations, groups and sub-groups should not exist as such—only man should exist. It stresses that the only urge man has to survive is as a species.

Man’s urge to survive as Life and to cause all life to survive may be considered the Fifth Dynamic. He may erect bird havens, raise Pekinese dogs, or go to extraordinary lengths such as a certain cult in India which lives by the idea that the Fifth Dynamic is the only one. The members of this cult would never step on a cockroach because they believe the cockroach is Life, and that Life should never be subdivided into anything smaller.

The Sixth Dynamic embraces the urge to survive for the physical universe, or MEST. The “Cartoon Capitalist” falls into the category of a group believing that the most important thing in the universe is MEST. “Can I see it? Can I feel it? Can it be measured? Well, then it exists.” He holds that man exists solely by virtue of mud having one day become animated.

Such a materialist is often found in the scientific laboratory. He uses Boyle's Law, and can make tractors and atomic bombs and can even control the atomic bombs so precisely that when he pushes a button they go BANG! but somehow he has never learned how to control the thumb that pushes the button. The mud-to-man theory has been applicable solely to mud. The idea that structure controls function has failed to predict or control any function.

The postulate that function controls structure brings us to the Seventh Dynamic. This is the urge of the individual to survive as thought, or theta. Some day man may be able to start a flow of theta from one point to another, but even now it works well as a theory. Through use of the theta postulate human beings can be rather rapidly de-aberrated. Theta plus MEST equals life. Theta energy, whether from a divine Creator or from a battery somewhere in the sky, is not physical universe energy.

For a long time people have been talking about and fighting for and dying because of the Eighth Dynamic. Every Sunday morning people go to church to express their belief that the universe was created. Two or three thousand years ago the Greeks were talking about the Prime Mover, Unmoved. Every time the problem of the origin of the physical universe comes up we have to postulate a Creator or else have no answer to give.

These eight dynamics are all part of the Main Dynamic. The same thing can happen to each one of the divisions that can happen to the Main Dynamic. Just as the Main Dynamic can be hit, interfered with and suppressed until it changes polarity and goes toward Succumb, so may any one of the eight divisions be enturbulated and have less survival value. The eight dynamics are usually selectively aberrated. One's Second Dynamic can be pretty well out and his Fourth Dynamic practically nonexistent (but the rest of them functioning all right) and he'll get by. He could even have half of the First, Second and Third and all of the Fourth gone, and still pass for normal.

An individual has the urge to survive along each one of these lines. Life suppresses one after the other, and a changed pattern of overall survival appears. For example, suppose someone suddenly becomes afraid to own anything: he has had the Sixth Dynamic selectively suppressed. Another person believes that there is no divine Creator, and that life is just an accident: he is selectively blocked on the Eighth Dynamic.

Any of the dynamics may be suppressed in two ways. The first is the suppression which says "No!" A person who has been told since he was a child that he was worth nothing, that he was no good and that he would never be able to do anything is likely to have little or no First Dynamic. The First Dynamic changes polarity and starts pointing toward death. This person is capable of committing suicide, unless he is very strong on the Third Dynamic and can live for the group. He may, however, needlessly sacrifice his life for the group. This represents a suppression of the dynamic—the survival urge of the First Dynamic is not sublimated over into the Third; the Third is only more visible because the First has been suppressed toward death.

The second way of suppressing a dynamic is by enforcement: "You've got to be a good girl! You have to amount to something! We expect you to be a credit to your family!" After a few years of such commanding the girl who has been forced to be a great credit to her family is unable to do anything. She has been interfered with. Mama has entered her own dynamics into the dynamics of the child, with the resultant blunting of the child's dynamics. If any dynamic is inhibited, it enturbulates, and if it is enforced, it enturbulates. Either way, it is pushed toward death.

The principle of self-determinism, to be workable, dictates that a dynamic should neither be suppressed nor too thoroughly enforced. On a spectrum from *shut off completely* to *center* to *maximum enforcement*, self-determinism would be found at the center. The individual who is surviving best is exercising all possible rational self-determinism in an environment which allows a maximum of self-determinism. In Europe, for instance, there is much talk of liberty, but the environment has been for so long so suppressive on both the First and Third Dynamics that the European's idea of liberty is not nearly so expansive and all-inclusive as is ours. Self-determinism is a relative state of being—the more rational an individual is, the more self-determinism he will be able to exert and the more he must be allowed to exert within the limits of his environment. Of course, the more rational he is, the easier he will be to get along with and the better he will handle MEST. An individual whose dynamic has not been enturbulated is in full agreement and affinity with the world, and is in good communication with the MEST universe (sight, sound, smell, touch, etc.).

Anything that aberrates the individual's urge toward survival will aberrate his self-determinism. This is the basic form of aberration. But how many manifestations does the basic aberration have? To answer this it is necessary to examine the component parts of theta: affinity, communication and reality. Theta must remain in affinity with, communicate with, and have agreement with other theta in its vicinity. All three together make for understanding. Computation, understanding, thought and education all depend on affinity, reality and communication.

A graphic representation of aberration would be particularly valuable if it could be seen to contain all possible aberrations. To provide this representation a chart, based on the eight dynamics, is drawn with an A-R-C triangle below, floating at some point on the tone scale, and the eight dynamics with their A-R-C relationships listed above. Lines connect the lower triangle with the dynamics above, representing suppressions of the lower triangle down the tone scale.

By use of this chart, and by following the line of reasoning suggested by the statement that both *"inhibition"* and *"enforcement"* suppress a dynamic on the tone scale, the auditor can predict any possible aberration that a preclear might have. Any seven of the dynamics may suppress or enforce the remaining one in an individual. The technique which has evolved from the use of the chart is called Dynamic Straight Wire. *

* This is the next advance over Hurdy-Gurdy Straight Wire, which is outlined in *SCIENCE OF SURVIVAL: Simplified, Faster, Dianetic Techniques*.

Dynamic Straight Wire

Consider the suppression of the Second Dynamic by the Third Dynamic: what does the group think about sex? The first group which might come to mind is the family. The family's affinity on the Second Dynamic, when measured by the basic aberration that plagues society at the present time, is very low. Sex is not quite nice and certainly not to be considered as a communicable subject. Agreement within the family concerning attitude toward sex is rare indeed. What is it for? What is it like? When is it proper? Without agreement there can be little basis for reality.

If an individual has been or is a member of a church group which is selectively "thumbs down" on sex, he has been suppressed on the Second Dynamic by the Third. The auditor is interested in finding how a group affected this individual's Second Dynamic. He seeks to find incidents which enforced the dynamic, and incidents which inhibited it. "What did your family think about children?" It is not always necessary that an attack be made against an individual for

aberration to manifest—the statements and attitudes of the persons around the preclear might easily have upset him, even though they were not directly aimed at him.

If the preclear has served a term in the army the auditor will have a broad field for exploration of aberration along the Second Dynamic. “What did the army think about sex?” This one is always productive of results. “Did you ever go on a three-day pass and find an ‘off limits’ sign in the choicest section of the city?” There are few occupied cities which do not contain a rash of “off limits” signs. “Did you ever attend an army lecture about venereal disease?” Of course he did, and if the usual gentle and genteel service communications on venereal disease were given, the preclear will have many locks on the subject.

One case was opened by working with the Second Dynamic as it related to the group in this way: A young man had been raised in a very self-righteous family, and attended church from earliest childhood. As he grew older a very likeable preacher became the man he most wanted to emulate, and one of this preacher’s pet sermons was to call hellfire and damnation down upon the head of anyone who would think or talk about sex. When the young man went into the army he began to hear and see as a common occurrence those very things which his preacher had called down. The general attitude on sex in the army was so radically different from what he had been used to that the difference between the inhibition of one group and the enforcement of the other made him almost psychotic. The auditor used straight wire on both the enforcements and inhibitions on sex, and rapidly raised the young man’s reality and general tone.

Sometimes a girl tells her auditor how nice her dear little pussycats are, but that men and women are awfully nasty. She says that if men and women were only as nice and considerate as her little pets everything would be all right. Somebody in this girl’s vicinity has been talking about how bad people are, and demanding her agreement on the subject. Straight wire in search of such locks will soon relegate her pussycat to its rightful place in her life.

What of the suppressing effect of the First Dynamic on the Second? If an individual has been told that he doesn’t love anybody and can’t love anybody, he will have a hard time with his affinity for his children. If he has been told that he has to be right all the time and that he has to make other people do the right thing, his agreement with his children will come chronically down to 1.5 on the tone scale. He will dominate the children, or try to. If he has been told that he must talk, his children will have a hard time attracting his attention to their ideas. In considering the things in general that the preclear thinks about children and sex, the auditor is considering the suppressing effect of the entheta of the Second Dynamic on the theta of the Second Dynamic. He can in this way determine that the Second Dynamic is suppressing the Second Dynamic. With this in mind, the auditor immediately sees a set of questions to ask.

Suppression of the Second by the Fourth Dynamic is found in the teaching of sections of biology about man, what man is and what sex is in relation to man. Anthropological studies and the disagreements about children and sex in the societies studied may cause enturbulation.

As to the suppression of the Second by the Fifth Dynamic, a preclear from the farm has the subject of animal husbandry. One little girl had been standing unnoticed while her father was talking to a neighbor about breeding a prize cow. He was describing the procedure in great detail, when suddenly mama discovered that the little girl was there, listening. Mama violently scolded papa and sent the girl to bed. The girl was taken completely by surprise and utterly bewildered. Why should she be scolded and suddenly sent to bed and mama and papa have a fight? She worried over this for a long time, eventually becoming thoroughly frightened of animals. It was a relatively simple matter for the auditor to get considerable grief off the case concerning this one incident alone.

Suppression by the Sixth Dynamic is usually heavy because it is caused by MEST, producing engrams of physical pain, the basic cause of aberration. An engram is a break between Dynamic Seven and Dynamic Six, or theta hitting MEST too hard. Or it is a separation of Seven and Six, causing grief due to loss.

How does MEST influence the Second Dynamic? Many wealthy individuals have a prodigious amount of MEST under their control. The pretty girls who tag along with them advertise that MEST has an effect on the Second Dynamic. One of these individuals takes his beautiful admirers for rides in his automobile and has a wonderful time, but one day the automobile is stolen. There will be grief from this break between Six and Two. Or perhaps the same fellow wants children, but has lost his property and home. He feels that he can’t support

children without MEST, causing a break on the Second Dynamic. Physical injury affecting the Second Dynamic also comes in this category.

Communication comes in for a share of the breaks on Dynamic Two. One just doesn't talk about religion and sex in the same breath, for instance. Actually, in this society, communication about sex is inhibited in relation to every dynamic. Anyone who does not talk naturally and easily about sex has been inhibited, even if only by the general social aberrations on the subject. The use of Dynamic Straight Wire on the times a person has been cautioned not to speak of sex will uncover many suppressions of communication.

There are suppressions of the First Dynamic by the Third; for example the fellow who is self-conscious, who won't join a group because he feels uncomfortable in a group. This also works the other way, by suppressing his normal Third Dynamic by his First. Find out what this type of preclear has been told about groups. It might be that he had to form a group before he could even look at a woman. "You have to be married before you can go around with a woman," is a common example of the Third blocking the First.

The Third Dynamic may be blocked by the Third because other baseball teams beat the preclear's baseball team. Each time his ball team is defeated when he is a member of the team his Third Dynamic is enturbulated.

On the Fourth Dynamic, there are races in the world today which consider themselves suppressed by man. Somebody who had something to gain has convinced these groups that they are minorities, and as a consequence their ideas about the Fourth Dynamic are aberrating the Fourth.

An auditor processed a young Jewish boy by straight wire just on the basis of locks on the Third, Fourth and Fifth Dynamics. He came up the tone scale very markedly after running a few locks and secondaries from childhood in which somebody said, "I can lick you—you're a Jew, and Jews can't fight, and you don't belong to this club anyhow." His mother had taught him that he must get along with the rest of the human race, and that he must learn to be nice to people, and yet they delighted in kicking him around.

The Dynamic Straight Wire chart indicates every possible type of aberration that a human being can have. Each Dynamic can selectively aberrate every other Dynamic. Select each Dynamic in turn and place it at the bottom of the chart, and question the affinity, communication, and reality of each of the Dynamics in relation to the one at the bottom.

What would an auditor do about a preclear who is aberrated on the Eighth Dynamic? He would place Dynamic Eight at the bottom of the chart and find out how each of the dynamics has acted to influence the Eighth. To begin with, he inquires as to the affinity enforcement between One and Eight, the reality enforcement, and the communication enforcement; and then the affinity inhibition, reality inhibition, and the communication inhibition.

An auditor asks: "What is God going to do to you?" Answers appear such as, "God's going to take my soul."

Mama has said to him, "You know, dear, an angel will come to you in your sleep."

"He will?" the child answers. "Well. . . I don't know if I want to see an angel. What's this angel liable to do?"

"Oh, nothing, dear. All angels are good, except the ones that give you bad dreams."

"But I thought you said angels were good."

"Well, most angels are good, but some of them are bad," mama continues. "You know that angels exist."

"But Tommy says there aren't any angels, and Grandpa Dooley says there aren't any."

It is little wonder that there is considerable confusion between Dynamics Eight and One.

By using Dynamic Straight Wire a case may be unburdened of irrationalities and miscomputations which are aberrative, and be put into shape to run secondaries and engrams. It is a system for predicting all possible aberrations caused by the suppression of the Dynamics. Any Dynamic is capable of suppressing any other Dynamic. Many auditors have been restricting themselves to the effect of the First Dynamic aberrations on the First Dynamic, or the effect of the Third Dynamic aberrations on the First Dynamic, but these are only a small fraction of the aberrations which the preclear can have. All of the Dynamics in all of their combinations of aberration should be considered. Find enttheta wherever it is and convert it to theta. What papa and mama have said around baby is very important, but it is very very far from being the only thing in the case. The preclear has gone to school, has belonged to the Boy Scouts or been in the army; he has belonged to a church and he has suffered through a summer

camp. And often he has been hammered by some cynical atheistic fellow who tried to convince him that his religious beliefs are all wrong. All these things are discovered when using Dynamic Straight Wire. By using Dynamic Straight Wire an auditor can question a preclear on a much broader, more thorough basis than before.

SUPPLEMENT NO. 2 to *SCIENCE OF SURVIVAL*
September, 1951

From
The Hubbard Dianetic Foundation, Inc.
Wichita, Kansas

Validation Processing

L. Ron Hubbard

Past history of Dianetics has found too many auditors too often addressing the entheta or frozen theta on a case. Processing which should have been directed solidly toward the invalidation of aberrative experiences many times primarily validated them. As a matter of course the auditor neglected the analytical moments during the processing because he felt they were not important, that they would continue to exist. True, but by validating engrams and secondaries constantly the preclear sometimes becomes so introverted on the subject of engrams that he tries to run himself; he thinks about this phrase and that phrase, this enturbulating experience and that enturbulating experience until he is thoroughly restimulated. This is especially true of the low-tone case. Attacking entheta with too much entheta simply enturbulates, and nothing positive happens.

Theta has a peculiar characteristic of trying to attack enturbulated theta and disenturbulate it. The individual best survives when pleasurable experiences and pro-survival entities are brought into view. Hence tone rises, for preclears and cases move along more rapidly as theta moments are validated.

Let's suppose that for a while, without paying any attention to engrams and secondaries, the auditor addresses only the theta side of a lock chain. Can this make the preclear more reasonable and rational on a subject about which he is severely reactive? Could this validate his analytical mind?

As we know, an engram accumulates locks and secondaries which form in chains in the reactive mind. Before the engram was received the organism was potentially analytical on the subject of the content of the engram, and remained so even then until the engram was keyed in. Finally, however, after the addition of lock after lock piled on top of the secondary, the engram gained a greater force on behavior than the organism could reason around. Reason then became relatively impossible on the subject. How can we go about restoring reason on the subject contained in the engram without removing these locks and without running the engram?

Suppose the preclear has a certain chain of locks on the subject of women: one girl left without saying good-bye, another stabbed him in the back, and another ran off with his best friend, while another told him to his face that he didn't amount to anything. These locks all charge up the chain of engrams at the bottom which say bluntly: "Women are no good." Perhaps this preclear is very occluded, or the time available is simply not enough to enable running all the engrams on the subject, or the preclear is very low toned. How could he be made analytical on the subject of women?

The key lies on the same lock chain. Validate the analytical side of the ledger and neglect the reactive side. Run the subject of women as a chain of analytical moments and keep away from the reactive material.

"Do you remember anyone who gave you cookies?"

"Oh, yes. There was an old lady in our block that gave me cookies." (Aha, here is a woman who is some good!)

"Do you remember a teacher that you liked?"

"Yes, I remember a teacher who was pretty nice."

"Do you remember a girl you went with who was lots of fun?"

"Yes, there was one. I don't remember her name now and I don't know what she looked like, but I'm sure there was one."

Then go back over the same material again, picking up the old lady who lived down the block, the nice teacher and the times he had fun with the girl he liked, and contact these moments.

As the preclear is calmly restrained from attacking the entheta, he may begin to experience a somatic. The more pleasure or analytical moments he hits, the worse the somatic may become. It is demanding attention. The somatic is actually at least one of the engrams on the track having to do with "Women are no good." The auditor finds it difficult to resist the temptation of dropping down the track and running it. The auditor, too, is theta trying to attack entheta, but he must restrain himself. He must continue to run only the analytical moments on the subject, and suddenly the somatic will turn off again. There have not been a sufficient number of cases observed to date to see the permanency of the release, whether the somatic stays off permanently or merely goes out of restimulation. In the course of processing, however, the preclear becomes analytical on that chain, so there is some stability connected with this type of processing.

Some preclears go through two or three locks all right with validation technique, but suddenly dive into a reactive incident. The analytical mind, when asked to be analytical about a subject, begins to discharge the reactive mind. Keeping the preclear out of entheta on the chain may be illustrated by the conversation which occurred while running one case on validation:

"Oh, yes, I remember the nice old lady, and I remember my teacher. Gee, that first grade teacher—I certainly hated her . . . oh, she was terrible."

"Did you like your second grade teacher?"

"Oh, she was all right. I didn't have too bad a time."

"Did you ever go on a picnic with one of your teachers?"

"Sure, we went to a picnic, and we had lots of fun; but do you know, that darned eighth grade teacher was there and she was such an old cross-eye"

"Now, what did you have to eat at the picnic?"

It isn't easy to keep the preclear from dropping off into entheta; but what must be done is to validate the analytical mind. That thing which is validated grows stronger. Did you ever talk to a demon circuit while processing? If so, you know that after a short time the demon gets stronger.

Sometimes a chronic aberration is turned off by rote. Suppose this chronic aberration or somatic is "wearing of glasses":

"How many lock chains are there connected with eyes?"

"Five."

"Can you give me the names of these chains?"

"Yes."

"Give me the name of the first chain."

The preclear gives the name of each chain in turn. The auditor then starts with the first chain named and asks the preclear to scan vocally the analytical moments on that chain, unless the preclear is too far down the scale. If he is unable to scan, use Straight Wire or Repetitive Straight Wire. (Repetitive Straight Wire is done simply by remembering incident after incident on a chain, one at a time, and then doing the same thing again and again in the same order.) After he has run the first chain as long as he can on the analytical side of the ledger until he drops off into entheta, the auditor asks for the second chain. Although the chains are usually given out in the sequence that they should be run, the auditor might ask, instead of for the second chain, for the next chain necessary to resolve the chronic somatic.

Validation naturally makes vital use of present time also. The alert auditor will arrange plenty of present-time theta moments, particularly with the low-tone preclear; if not too many theta moments seem available in the past, these present-time moments can be reviewed. Environment for processing can be made pleasurable by perhaps a walk, coffee, sessions in the park. Also the auditor can draw out the preclear to feel he is making a contribution to the auditor as a person, even in meager ways, as asking advice about purchasing a toy for his child or even taking the preclear along on the shopping tour. Giving good present day is valid processing!

Validation technique seems to be of definite value as a tool for the auditor. It takes skill and ingenuity to use as does any tool, but you will enjoy its use.

Introduction

There are three points of address in any case. These are THOUGHT, EMOTION and EFFORT.

The use of these three is established by the estimation by the auditor of the preclear on the tone scale. In any relatively high-level case all three may be used interchangeably.

There are five types of cases. The types are high tone, normal, neurotic, dramatizing psychotic and computing psychotic. These are bracketed successively from 5.0 down the scale to below 2.0.

There are two case aspects. These are wide open; occluded.

Every case has one or more computations, one or more service facsimiles, one or more dramatizations, one or more sympathy exciters, one or more present-time problems, one or more future goals, and only one emotional curve since this is common to every case.

These data combine into any aspect of any case and solve any case.

An outline, definition and description of these data is the subject of this brief manual.

Self-Determinism Processing

The key to the processes outlined in this book lies in the self-determinism of individuals.

Man has arrived at a place where he is capable of controlling his environment to an extent much greater than he has ever realized.

The results of self-determined action and the action itself may be modified by the environment, which, by space, gravity and such matters, limits the action of the human being. BUT this does not alter the fact that the mind attempts full self-determinism and to a very marked extent achieves it.

Along each and every dynamic the mind makes a self-determined effort. Self-determinism is positive and strong in its native state.

The only thing which can actually alter self-determinism and reduce it is self-determinism itself. One can determine to be used or worked upon by the environ and its people but until one makes a determination to do so, one is not so affected.

Each and every aberration of the human mind and the human body has an initial postulate to be so aberrated. Engrams are effective only when the individual himself determines that they will be effective.

Every individual has what is called a service facsimile. This is actually part of a chain of incidents which the individual uses to invite sympathy or cooperation on the part of the environment. One uses engrams to handle himself and others and the environ after one has himself conceived that he has failed to handle himself, others and the general environ.

At first an individual is completely aware that he is using engrams. Then the use of them itself becomes a curtain to that awareness and proceeds toward an automatic (but nonetheless self-determined) use of the engrams.

When one fails as himself, he explains that failure even to himself by consciously, at first, choosing his service facsimile. Thereafter his own body and mental condition become subject to it.

The first self-determinism which leads to aberration is the decision to be human. The affinity, reality, and communication indulged in by a human being is necessary to being human. One determines to exert ARC. One then becomes subject to what he has determined. ARC with individuals in a very aberrated state is necessarily a very low ARC. It is not that ARC is bad but that ARC with low-toned individuals is bad.

Any individual under processing can be discovered to be using service facsimiles. Everything which is wrong with him he has selectively and particularly chosen to be wrong with him.

Every thought or computation has behind it a physical observation or effort or counter-effort. But there is also a free source of theta which is itself continually self-determining or is capable of being so. Thus it is not necessary to exhaust efforts and counter-efforts since the individual has FREE CHOICE in his use of those efforts or counter-efforts.

Every aberration, every service facsimile is non-survival. The individual evaluated a situation, found it necessary, in order to go on living to use a service facsimile. But the moment it was used he became ever afterwards subject to it.

In such wise an individual became the effect of his own causes.

It is the role of the auditor to discover, with the preclear, the moments when the preclear postulated conclusions of any kind on any subject. These conclusions are occasionally smothered by mis-emotion, such as sympathy, and by general ARC. They can also be smothered by physical pain.

The running of engrams is itself a therapy. Self-determinism processing and emotion processing are finer and more complete levels of processing since they reach all cases which can be gotten into present time communication. The engram is never effective until the individual chooses to use it.

It is interesting that choosing to use an engram on any dynamic also includes, when the operation fails, all other dynamics. Thus any non-survival wish or action, if it fails, recoils upon the user. One postulates a non-survival action for a group or for another person or a life form and, if it fails, is subjected to it himself: again by his own choice! Thus, trying to stop somebody from coughing by being annoyed will result, if the effort fails, in starting one coughing. Here is a mechanism interposed in the cycle of stimulus-response restimulation which demonstrates that whereas surface observation says that restimulation can occur, deeper study shows that an interim step of self-determinism is necessary for ANY restimulation to take place. Man is so aberrated at this date that it took considerable processing to discover this interim factor and to discover that the interim factor is far more important than the mechanism of restimulation and that restimulation ceases by picking up the inner postulate between a source of restimulation and being restimulated.

The extent of free choice is remarkable. The amount a case can be improved by self-determinism processing is even more remarkable.

It may be hard for one to realize at first that he wished himself ill. But recall the time when you tried to get out of school or work. In such a wise one wished all his ailments upon himself.

There is also, with self-determinism, the emotion of intention. That emotion with which one enters an incident greatly influences the effort and can be run as emotion. Running "determinism" as an emotion, whether to see or to get rid of a psychosomatic illness, produces broad results. Run the emotion of "determinism" off a lifetime and one picks up all non-survival courses. The effort itself falls away, untouched but cancelled. Justice

Human beings have a very high native sense of justice.

Justice could be called the adjudication of the relative rightness or wrongness of a decision or an action. (See Logic 7.)

Infinite rightness would be infinite survival. How wrong can a person be? Dead!

When the individual is small he cannot enforce justice except by using relatively low-scale ARC. Instead of forthright action, then (a thing which he will attempt but which will fail), he is capable of making the aberrated effort of gaining sympathy to prove his point.

All service facsimiles are used out of an effort to stay in ARC, however low scale. The individual, failing in his childish lack of strength to effect justice when he has been wronged, retains the facsimile of the injustice and everything consequent upon it as living proof of the wrong which has been done him. Thus one finds AA's and birth rather commonly in restimulation, but only after they have been called into play by the individual himself. Men recover from injuries but they do not recover, short of processing, from their own self-determinism.

The major service facsimile keys are then to be found in an area of injustice which is crass and blunt, and which is very much in the awareness of the preclear. They occur, these

key incidents, anytime from two to ten or even later. The individual answers the injustice by wishing off the injury or illness upon another. This failing, he takes it himself. Later sympathy for the purveyor of poor justice and general ARC self-determinism can occlude these service facsimiles of injustice.

The resolution of the service facsimile depends then upon getting up enough self-determined postulates and enough sympathy and other emotion to lay bare in clarity a part of the chain. Then one breaks up the chain.

The difference between homo sapiens and homo novis is that homo sapiens is uniformly using a service facsimile or the whole chain and does not realize that he is using it but explains it as disease or mental illness or psychosomatic illness, while homo novis is not using the service facsimile and knows what he can occasion with himself.

In relatively skilled hands it is a 25 to 50 hour process to advance a homo sapiens to a homo novis. This compares to a 200 to a 2,000 hour process of running engrams. The engrams do not need to be run but become ineffective when the determinism to have them is cleared away.

Justice and injustice should be kept in mind throughout the process.

The Role of the Auditor

The auditor is essentially a technician.

Existing techniques are such as to determine a scathing fact: An auditor who cannot achieve results does not know his tools.

Existing techniques are tools. Any tool requires intelligent handling and a deftness in application.

The user of any tool, whether it be a stone axe, an adze or a Geiger counter, must acquire confidence in that tool and confidence in his ability to use that tool.

An auditor is most successful when he has achieved an inexorable self-confidence in himself, in his tools, in his attitude toward the preclear and in the results he means and determines to achieve.

Any science is to some degree an art. The less variation in its results, the less it is an art. A perfect and "invariable" science still would contain the variable of its applicator. However, for the first time in the history of Man, we have achieved minimal variation of application for we can restore the native ability of the individual applicator to be self-confident. There is no argument about the exactness of our processes.

Nothing, tritely and truly, succeeds like success in auditing. Restored confidence in self aided by success in results markedly shortens for the auditor the time he will have to spend on any preclear and increases his level of success.

An auditor should attain personal and general self-confidence. He should then attain a good theoretical knowledge of his tools. He should have a period of application wherein he gains an excellent practical knowledge of those tools. He should then have several signal successes. If these steps are followed, an auditor's use of his science should be certain and broad.

The Evolution of Man

Man evidently began as a monocoell, without inter-cellular relation problems. He developed by counter-efforts to a degree which banded together many cells with one central control center. He joined then with a second control center and, dual, evolved organically into Man.

The problems of the monocoell by itself were strenuous but uncomplicated, having relationship only with the environment in its grossest form -- pure MEST. These problems included such phenomena as the explosion of cosmic rays.

The problems of a cellular colony under one control center were yet similar to those of the monocoell. The protagonist had but one personality and one antagonist -- MEST. Vegetable and invertebrate problems are found in this period.

The problems of the dual control stage began severely and continued in confusion.

Interpersonal relations, when in difficulty, have their foot in the elementary problems of the dual control problems wherein the current control center confuses its ancient problems with its partner center with the problems the organism may have with other individuals in the environment.

The evolution of Man presents many fascinating aspects but all have basic simplicities. There are, essentially, only two sets of problems: The problems between the control center of the mind and the elements; the problem of the control center of the mind with its alternate control center.

An auditor need only resolve, in any case, the essential basic confusions of the preclear in each of these two sets.

The evolution of Man is to date organic. At this date we have introduced another evolution level -- thought.

The auditor is causing any preclear he processes to evolve into a higher plane than was hitherto reached on the evolutionary scale. He is NOT re-establishing a past norm. His goal is the establishment of the potential control center as the self-determined center of control of the mind. The work of the auditor is not related to any past "ology" but to evolution itself. It is not medical nor biological nor psychological, no matter if these enter incidentally as by-products of processing. That which the auditor is doing has no past standards. But it has its own standard, its own operation, as precise as building any bridge. The goal must not be violated or lessened.

Advanced Procedure

The auditor and preclear are a group.

To function well a group must be cleared.

The clearing of a group is not difficult. It requires but little time.

The relationship of the auditor and preclear is not parity. The auditor lends himself to the group as the control center of the group until the preclear's sub-control center is established under his own control center's command. The role of the auditor ceases at that moment.

The auditor necessarily owns the preclear. He owns the preclear on a lessening basis until the preclear owns himself.

If the auditor wishes to successfully own, to the end of NOT owning the preclear, he must not use the preclear to the service of the auditor for this establishes and confirms the ownership and inhibits the preclear from owning himself.

THE FIRST ACT of the auditor concerns himself. He assesses the task rather than the preclear and assesses the matter within himself. He establishes whether or not he desires the preclear to become established under the preclear's own center of control. To do this the auditor may find it necessary to straight-wire himself for the removal of any reason why he does not want this preclear to be owned by the preclear. He then postulates to himself what he wants to happen with this preclear and postulates as well that he can do this task with this preclear. He must feel these postulates solidly. If he cannot he must discover why he cannot. Thus the first session's first minutes with the preclear are concerned with the auditor himself. He should take time out from the preclear until he himself is established in his task and then readdress the preclear.

THE SECOND ACT in addressing the preclear is to clear the preclear of past postulates which may have concerned some one with whom the preclear may have the auditor confused.

THE THIRD ACT consists of cleaning present time facsimiles for the preclear so that the environment is not confused.

THE FOURTH ACT is the establishment of accessibility of the preclear with himself. This may include a thorough address to past auditing and auditors. It includes PAST, PRESENT and FUTURE PROBLEMS.

No further action than these can be successfully accomplished until these have been accomplished.

In the case of psychotics, the second, third and fourth acts may be changed in their order but they are vital. They are so thoroughly vital that one might say that a psychotic case, computing or dramatizing, will be broken only by following out these four acts and, conversely, that the use of these four acts will themselves break a psychotic case.

Until these four acts are accomplished, and they must be accomplished with any case, no matter the tone of the case (save only in emergency use of "assists"), no further act is attempted. If a further act is attempted without first using the first four, the recovery of the case of his own control center will be prolonged or entirely inhibited.

It should be borne in mind that these considerations are of the highest mechanical practicality and are in no way tinged with any mystic quality. They rest on precision reasons of the same order as having to put water near a source of heat to get it to boil.

THE FIFTH ACT is the auditor's assessment of the preclear. The auditor categorizes the preclear in three echelons of classification as follows:

(A) What is the quality of the preclear's reasoning about himself and his environment, about people? This establishes, and seeks only to establish, the degree the preclear's thoughts are controlled by the environment including other people. Literalness of response to phrases, commands and sudden sounds establishes the preclear on the tone scale. What the preclear does about motion, the preclear's muscular tension and the preclear's reaction time all serve to establish the preclear's THOUGHT.

(B) What is the quality of the preclear's emotion? This is established by the response of the preclear to the auditor's mood, the voice quality of the preclear, the stability of the preclear's moods. What is the preclear's endocrine state?

(C) What is the state of the preclear's body? Here the auditor is looking for glaring defects in structure. What is the quality of the preclear's sight; of his hearing? What is the tonus of the skin and muscles? How are the limbs formed? Is there any chronic psychosomatic illness?

This assessment places the preclear on the tone scale. It tells the auditor whether he can use straight-wire, repetitive straight wire, lock scanning or full effort. It tells him as well what counter-efforts he is most likely to find.

THE SIXTH ACT consists of the establishment of the service facsimile chain. That service facsimile the auditor must necessarily release can be located by estimating how old the preclear appears to be. The last of the chain is at that age. Age flashes are requested and occlusions are scouted.

THE SEVENTH ACT consists of establishing whether or not the preclear is currently running on his genetic control center. (See the History of Man*.) In short, is this a left hander who has been made right handed? Fifty per cent of all human beings, roughly, are running on the wrong control center. By effort, emotion and thought processing the individual can be re-established in his right control center.

THE EIGHTH ACT consists of straight-wire of the times a person tried to start, stop, change or move other entities on all dynamics, or when he inhibited them.

THE NINTH ACT consists of running emotional curves until the preclear has the curve of one attempt-failure-engram cycle. This is done until the service facsimile is located; returned on track.

THE TENTH ACT consists of running out, by effort, emotion, and thought, the service facsimile.

THE ELEVENTH ACT consists of running out ALL sympathy on everyone and anyone in this lifetime, every dynamic. This is done by running the sympathy as a lock for its duration over and over until the sympathy is erased. This includes sympathy for self, for every part of the body, for children, for sexual partners, for each parent, for every member of the family, for every ally, or every friend, for every group, organization, state or country, for Man in general, for matter, for energy, for space, for time, for trees and any vegetable life, for bacteria, for cells including sperm, for dogs, cats, horses, cattle, pigs, sheep, game birds, game animals, for souls, spirits, idols, clairvoyants, saints, for the Supreme being.

THE TWELFTH ACT consists of running successively any and all emotion on all the dynamics one after the other. This includes happiness, fear, anger, boredom, grief (with or without a tear discharge) and apathy.

THE THIRTEENTH ACT consists of attempting, with thought, to clear the case of all postulates, evaluations, goals and judgments in the current lifetime.

THE FOURTEENTH ACT consists in rehabilitating the proper control center.

THE FIFTEENTH ACT consists of rechecking from the fifth up through the fourteenth acts in sequence.

It is apparent that the auditor, so far, has done minimal effort processing. It should also be apparent that most auditors are too ambitious to attack efforts. Experience should tell the auditor that the thorough eradication of the use of a service facsimile chain is not accomplished by nullifying one of the facsimiles on that chain. However, as an estimate, by the time the auditor has reached the tenth act, the chronic somatic of the case should be out of evidence and should stay out except for new problems and consequences in the environment.

It should also be apparent that with Act Fifteen we have not tapped the reservoirs of the genetic chain. We have not established full memory. We may not have established full perception. The auditor, by the time he has accomplished Act Fifteen, should find himself confronted with a better product than man has been before. It is definitely in the devotion of the auditor and within the limits of his time, whether or not he carries his preclear beyond Act Fifteen.

It should be noted that beyond Act Fifteen potentialities and techniques are either unknown or not established at this time. Up to Act Fifteen we are on very safe, proven, thoroughly workable ground.

A preclear thoroughly carried through these processes should be classified as a "Fifteen". A preclear carried through to a chronic somatic release should be known as a "Ten" solely for qualification.

THE ESSENCE OF ADVANCED PROCEDURE IS TO FOLLOW IT STEP BY STEP. DO NOT SKIP ANY ACT. DO NOT GO ON TO A FURTHER ACT UNTIL YOU ARE SATISFIED YOU HAVE ACCOMPLISHED THE ACT IN ACTION. DO EVERY ACT THOROUGHLY AND ONLY THEN ADVANCE TO THE NEXT ACT, THIS SHOULD BE SO THOROUGHLY ESTABLISHED THAT A PRECLEAR, KNOWING ADVANCED PROCEDURE AND FINDING AN ACT HAS NOT BEEN COMPLETED OR AN ACT SKIPPED, SHOULD JUDGE HIS AUDITOR A SUB-CENTER AT BEST AND GET ANOTHER AUDITOR. (Note: The control-center -- sub-control center relationship makes husband-wife teams highly inadvisable. Husbands and wives should appear to each other as inviolate personalities, not as auditor and preclear. Three-way teams are far more successful than two-way interchanging teams.) Precautions 1. Do not audit a preclear with a technique above his tone scale level. 2. Do not audit a preclear with broad techniques until you have resolved the inaccessibility that preclear may have. (This is covered in the accessibility section.) 3. Do not audit a preclear when he is very tired. 4. Do not audit a preclear who is hungry. 5. Audit preclears who are apparently deficient nutritionally only when you give the nutritional supplements. (This applies to straight-wire and any other process.) 6. Do not audit preclears late at night. 7. Do not evaluate your preclear's data for him. 8. Never back off from a process you have begun. 9. Never give a preclear a second order while he is still attempting the first you gave him. 10. Always be orderly and routine in your commands. 11. Never let your preclear control you. Always be at a level of force short of his objection point. 12. Act like a control center. Never be confused, doubtful or bewildered. Use a minimum of effort processing and then only on service facsimiles.

Thought

Thought is the phenomenon of combining, imagining or postulating theta facsimiles for the estimation of future physical efforts.

All thought is preceded by physical effort except prime thought, the decision moving the original potential being from the state of not beingness to the state of beingness.

Thought is modified by natural purpose.

Natural purpose may or may not be modified, in one lifetime, by past action and efforts. (In other words, thought obeys prime static in any one lifetime and can obey it at any moment in that lifetime. Thought is not necessarily stimulus-response.)

Prime thought occurs at the beginning of the genetic line.

Prime thought can occur at any moment during any lifetime, moving the individual from the state of not beingness to the state of beingness. A common name for this phenomenon is necessity level, although this term is incomplete.

Two broad general processes are indicated:

PROCESS ONE: Causing the preclear to rise, in present time, from the state of relative not beingness to the state of vital beingness;

PROCESS TWO: Clarifying sufficient emotion and effort as well as thought in the past to permit the individual to achieve a shift from the state of relative not beingness to the state of vital beingness.

In processing thought, several mechanical processes are used:

STRAIGHT-WIRE: (See other publications.)

REPETITIVE STRAIGHT-WIRE: Straight-wire to one incident done over and over until the incident is de-sensitized.

LOCK SCANNING: (See other publications.)

GOAL PROCESSING: (Covered elsewhere in this manual.) Emotion

Emotion is the control system used by thought to monitor effort.

The endocrine system stands between "I" and the existing or potential effort of the physical being.

The products of the endocrine system catalyze or inhibit the combustion of the carbon-oxygen motor system which is the physical organism.

Emotion is a direct index of the state of beingness.

When badly aberrated, the physical being gives the appearance of monitoring, through emotion, "I".

When in acceptable condition, the organism is monitored through the endocrine system by its control center.

Emotion was evolved by motion. Motion of the physical organism is monitored by emotion.

Emotion can be processed directly in its own echelon. During such processing the preclear strays into thought and effort.

Sympathy is commonly accepted to mean the posing of an emotional state similar to the emotional state of an individual in grief or apathy. This is a secondary reaction and has its own peculiarity but is nevertheless on the tone scale between 0.9 and 0.4. Sympathy follows or is based upon overt action by the preclear.

Sympathy can be mechanically considered as the posing of any emotion so as to be similar to the emotion of another. This, in view of popular usage, should have a special designation, comparitism.

The emotional curve is the drop from any position above 2.0 to a position below 2.0 on the realization of failure or inadequacy. It is easily recovered by preclears. It leads straight into service facsimiles. It should be handled as an emotion lock and run over and over until desensitized wherever it can be found.

The reverse curve is the emotional curve rising from below 2.0 to above 2.0. It happens in a short space of time. It is important because it locates allies.

Appreciation of existence depends upon the free use, by "I", of emotion. Emotional states, no matter how rapidly, should be postulated by "I".

Freeing the emotion on any case is a vital and necessary operation. The preclear does not have to be tripped into severe secondaries, into engrams or even computations to free his emotion.

Effort

Effort is divided into the effort of the individual himself and the efforts of the environment (physical) against the individual.

The individual's own effort is simply called effort. The efforts of the environment are called counter-efforts.

There is a physical effort behind every computation except prime thought.

The static of life handles motion. It is capable of starting, stopping and changing motion. These starts, stops and changes are each one physical efforts.

All the counter-efforts the body has ever received are evidently in store. Every physical effort of the organism has been at some time a counter-effort.

Counter-efforts are not necessarily inhibitive to survival.

To hold any counter-effort requires the self-determinism of the organism.

It is not the purpose of processing to exhaust all counter-efforts from the organism.

The purpose of processing is to rehabilitate the self-determinism of the organism about counter-efforts.

So long as an organism can employ in its survival a counter-effort, that counter-effort is not aberrative.

Counter-efforts become aberrated only when they have been chosen for non-survival usages by the organism or when the organism was unable to employ them for survival as in the genetic blueprint and experience.

Excess counter-efforts are those which have not been employed and could not be handled by the organism. These are not classed with death efforts as death efforts (counter-efforts) are primary genetic data all along the track.

Excess counter-efforts present themselves easily. They can be processed out. But they are of no primary concern to the auditor.

The only reason an auditor processes effort is to regain aberrative postulates.

The only efforts the auditor processes are in the service facsimile chain.

Effort Processing

It should be clear that there are three distinct levels of processing. The first is thought, the second is emotion, the third is effort. Each has its own particular skill.

Thought is done by straight-wire, repetitive straight-wire and lock-scanning and is directed towards concepts of conclusions or evaluations or actual precise moments where the preclear evaluated or concluded.

Emotion is done by straight-wire, lock scanning and lock and engram and secondary running, with the total address to emotion. A moment of sympathy, of determinism, of defiance, of agreement is run just as though the incident were an engram -- which is to say, the preclear is made to re-experience the emotion and, incidentally, a few perceptics over and over from beginning to end until the emotion is off the lock.

Effort processing is done by running moments of physical stress. These are run either as simple efforts or counter-efforts or as whole precise incidents. Such incidents as those which contain physical pain or heavy stress of motion, such as injuries, accidents or illnesses, are addressed by effort.

It should be seen, then, that we have three levels of operation. The most intimate is thought. An individual evaluates or concludes a certain thing. He is thereafter bound by his conclusion. He has caused an effect of which he is the recipient. If such a thought is recalled over and over until it is thoroughly de-sensitized, emotions and efforts resulting from such a postulate fall away. The individual lets go of the facsimile and it is no longer effective upon him if the postulate tended to use a facsimile to make it effective.

Thought communicates its decisions to body and environment by use of the emotion. Thought is intimately in contact with the trigger mechanisms of emotion and might be said to rule through emotion. Via emotion thought causes physical action and reaction to take place. To accomplish such physical action and reaction, thought uses earlier experiences -- facsimiles -- and utilizes their motion, effort and counter-effort to cause activity on the part of the body and environment.

Thus emotion is a bridge which is used by thought to effect effort. Take away or de-sensitize the emotion and one has again disconnected facsimiles, of any kind, from the organism, and the organism and its thought are not affected longer by the facsimile.

Thought can seem to be smothered in emotion in that it is necessary in most cases to unburden emotion from the case in order to discover many major and vital evaluations and conclusions. By unburdening the case of emotion, evaluations and conclusions long lost to view -- but still effective -- come to light and are de-sensitized. Thought, self-determined originally, may postulate conflictingly from time to time with resultant failures, sympathies and other mis-emotions. Mis-emotion then "smothers" the motor control panels and hides the postulates. Thus the running of emotion is done to lay bare past postulates and evaluations which are the actual sources of aberration and the suspended pain, which has been called in the past psychosomatic illness and is called, in Dianetics, chronic somatics, somatic meaning physical state.

A heavy, painful facsimile need not itself be exhausted for it is held in place primarily by the preclear's desire (past postulate, not agreeing with present environment) and this postulate is smothered by emotion. Run the emotion, discover and de-sensitize the postulate, and the facsimile ordinarily drops away and does not further concern the preclear. Further, he does not substitute another ache or pain for it because the original reason for the facsimile (past postulate) is gone.

Effort processing is applied to heavy facsimiles. It happens occasionally that the effort on a facsimile is so heavy that it occludes the emotion, which in turn occludes the thought. Thus, enough effort must be recovered to lay bare the emotion so as to get at the postulates and de-sensitize them. A heavy facsimile is thus treated by effort processing in order to free the emotion and thus the postulates. The facsimile is not treated to complete exhaustion but only to the point where the emotion and thought are reached. It then should fall into disuse, and it does not matter that effort is left on it.

The last thing which is done to the heavy facsimile is, of course, to pick up the preclear's agreement with the auditor to run it and the emotion of determinism involved in the running itself. Otherwise the facsimile may remain somewhat in force. This is done by lock running or lock scanning.

A heavy facsimile used to be known as an engram. In view of the fact that it has been found to be stored elsewhere than in the cells, the term heavy facsimile has now come into use. A heavy facsimile is an experience, complete with all perceptions, emotions, thoughts and efforts, occupying a precise place in space and a moment in time. It can be an operation, an injury, a term of heavy physical exertion, or even a death. It is composed of the preclear's own effort and the effort of the environment (counter-effort).

The emotion of a heavy facsimile is marked by the thoroughness with which the counter-efforts have overcome the preclear. Thus, total overcoming of the preclear's own effort by the counter-effort is apathy. Less thoroughly overcome, the preclear's own effort is in grief. Even less thoroughly overcome, the preclear is in fear. Even less counter-effort and more preclear effort results in anger. When the preclear's own effort is greater than the counter-efforts the emotion is antagonism. As the counter-effort is slighter and more diffuse but the preclear's effort is not punitive, boredom results as the emotion. When the preclear's own effort is punitive and successful against counter-efforts, we have varying degrees of happiness and effectiveness.

Thus the tone of any individual or any heavy facsimile is established by the response to the environmental effort and this response varies from no effort, all counter-effort to all effort, slight counter-effort. This is made up into a tone scale which goes from 0.0 for the lowest condition to 20 at optimum condition and then dwindling activity to 40 for a top static, the bottom static being death.

An individual may be so involved in combating a heavy facsimile which is chronically with him that he is chronically ill. Holding on to a chronic facsimile, the preclear has certain pattern responses and aberrations. In a facsimile where he is overwhelmed by motion he is listless and apathetic. In one where the forces balance he is in anger.

The auditor, in an occluded case, may find it is helpful to open the case by running effort. He looks at his preclear to discover some obvious physical aberration. This is held in place by a counter-effort. The auditor simply asks, "If your (head) were being pushed, which way would it be moving?" Or a leg or some deformed area. The counter-effort is right there, waiting. The preclear answers with a direction. The auditor then asks the preclear to feel his head moving against the counter-effort. A somatic will turn on. The auditor simply continues to ask for the various efforts and counter-efforts. Perceptions quite ordinarily fall out of the effort. A whole incident may come to view. This is the heavy facsimile and also the chronic facsimile. It is also a service facsimile. There is no sending the preclear around on his time track. He is right there in the heavy facsimile.

The facsimile thus uncovered is run until its emotion can be recovered. This is then scanned off until the postulates appear and these are then de-sensitized. The preclear's own thoughts and postulates are the aberration source. What is said to him is simply evaluation causing him, at times, to postulate. The auditor has no concern for what is said, for repeater technique or for perceptions save only in that they may slightly aid the recovery of the emotion.

There are many tricks in effort processing. An auditor can ask for the effort to do or be anything and the preclear can work it out. There is an automatic response mechanism which gives forth the proper effort for the question, an interesting and reliable phenomenon. An auditor could take a dictionary and simply begin asking for any and all efforts suggested to him by the dictionary. However, using effort to this extent is neither indicated nor even broadly useful.

Every effort is in a non-survival direction in that it was once a counter-effort.

One can get the effort within the effort within the effort and have his preclear back into the genetic line at a swift rate. For efforts and counter-efforts are the stuff of which the blueprint of the human body itself is made. These are two cellular lines going back from the shellfish stage, for at this stage two cell lines become a team. The ancestors of this stage, before this point, go back into two separate experience stages. One can take a preclear, all unsuspecting of anything but the "lived only once theory", and throw him back with efforts within efforts into some remarkable experiences. This is a biologist's dream, for he can look at original forms and trace genetic lines in individuals who may not even know of evolution. The genetic facsimiles of the whole evolution chain are on file and have thus been discovered. This should not be too surprising, for the blueprint had to be somewhere and, in efforts, it has been discovered and a trail blazed along its track. The problems of the initial photon converters, the "missing link" between the vertebrate and invertebrate stages, can be located, amongst other items of interest. The simple locating of efforts to make efforts throws anyone back down the long line. In ordinary processing this is vast beyond count, and contains the whole physical experience. The body is composed of efforts and counter-efforts. In theory, if they were all run out, the preclear would vanish. Fortunately this is not necessary for processing.

The basic efforts are not to be, to be. These resolve into the efforts to start, to stop, to change, not to start, not to stop and not to change.

The basic goals are to remain in a state of rest against counter-effort and to remain in a state of motion against counter-efforts.

Newton's laws would apply and we would have stimulus-response thinking except for the ability of the mind to interpose self-determined action and motion despite stimuli or disregarding it.

There are efforts to have affinity, efforts to have communication, efforts to have agreement and reality. There are efforts to see and not to see, to hear and not to hear. There are efforts to do or not to do anything.

When the preclear switches from his own valence to another valence, he is actually taking the position of a counter-effort against himself. In his own valence he exerts his own efforts. In a counter-effort valence, he exerts counter-effort against himself. By valence is meant identity. In a dental operation under general anesthetic, the preclear's own effort becomes so nulled that he takes the counter-effort. Then he recalls the incident out of valence (as the dentist or the nurse or, quite irrationally, even the dental tools or the bed) and hurts himself. (Self-auditing is done ordinarily out of valence and results in the preclear expending counter-efforts against himself. Thus he succeeds only in hurting himself.)

The no effort state is the state in which counter-effort is overwhelming the individual. Thus the auditor finds the case in apathy at a no effort point. Every heavy facsimile has points for any point on the tone scale and thus the preclear can hang up in a place where he can have no effort of his own. The auditor solves this by running out the counter-effort until it is sufficiently null to rehabilitate the preclear's own effort. Some testing still remains on this particular point of effort processing.

A service facsimile is very resistive to effort processing, ordinarily. The auditor must remember to run the emotion as soon as possible and get the matter into good recall so that the

postulates can be run. That should be the end of the service facsimile or at least one of its chain. Effort processing is not an end in itself, but an end toward recovering emotion so that one can recover thought. Effort processing should be thoroughly understood by an auditor and should then be minimally used.

A preclear who cannot re-experience an effort can be educated into the ability by causing him to make a present time effort and then recalling it. He will shortly discover that efforts can be re-experienced. Various efforts can then be run.

It is sometimes much easier to get a case to run emotion than to run effort. This should be done by all means, for emotion is closer to thought than is effort. Do not use efforts on low-toned preclears.

The only thing of value to recover from an engram is the effort; the only reason one recovers the effort is to recover the postulates the individual himself made during the engram and the only engrams one processes are on the service facsimile chain. It is not necessary to process any more of these than necessary to permit the preclear to let go of the chain.

If one sees an obvious deficiency in the preclear (glasses, deafness, baldness, thinness, etc.) he can request the effort the preclear must make to be deficient (have poor eyesight, hearing, baldness, etc.)

The only aberrative efforts are non-survival efforts.

Efforts exist within the efforts within the efforts within the efforts, much on the order of a picture of a picture within a picture within a picture, etc.

By calling for efforts to have efforts, the preclear can be taken all the way back on the time track to prime thought.

A preclear can be trained into feeling efforts by coaxing him to make one in present time and then to re-experience it.

The auditor must know about efforts and counter-efforts. He can do much with them, and much of what he can do is startling and bizarre. Efforts contain perceptics. If you run an effort long enough, you can recover perceptics from it in most cases.

You will find it difficult to run an effort against the postulate to keep the effort.

There are countless billions of efforts and counter-efforts in any case.

The main thing the auditor can do wrong about effort is to run too much effort, or to think effort is more important than thought, which it is not.

You cannot rehabilitate an organism chemically to any degree. You cannot rehabilitate it with effort; this is the wrong side of the board.

The only efforts are to start, stop and change, not to start, not to stop, not to change.

Happiness is applied individual effort. Apathy is no effort, all counter-effort. Other efforts and counter-efforts range the tone scale in the degree that the individual is handling the current effort in the service facsimile.

Postulates

A postulate is that self-determined thought which starts, stops or changes past, present or future efforts.

Postulates alone aberrate the individual.

By setting forth any postulate, the individual a moment later is being affected by his own case. The postulate becomes unworkable in a radically changed environment but may remain effective.

Old people are generally considered to be set in their ways. It would be more accurate to say that they were set in their own postulates.

The only reason an individual uses service facsimiles lies in his self-determined postulate to use them.

It is necessary to make postulates. To make postulates and handle them, it is necessary to handle past postulates.

A postulate may spring from past effort or prime thought.

A prime postulate is the decision to change from a state of not beingness to a state of beingness.

A prime postulate can occur at any time without regard to past or present effort since theta is always present in a non-facsimile condition.

Except for a very strong prime postulate, early postulates are effective over later postulates.

A prime postulate has the effect of cancelling not only past postulates but the past individual as well -- when it is strong.

A negative postulate is the postulate not to be. It cancels past postulates and it also cancels, in greater or lesser degree, the entire individual. The track, earlier than a negative postulate, is largely occluded. It is as virgin as a prime postulate.

An individual who has made a postulate on a subject experiences "failure" when he has to make an opposite postulate later. The opposite postulate has the effect of a negative postulate. The opposite postulate is distinguished from a negative postulate because it depends upon effort which a negative postulate does not necessarily have to do.

Any preclear can be quickly shown, when he has reached the fourth act, that he himself determined his own condition. This is not done accusatively.

The auditor can show the preclear in many ways that the preclear is capable of postulating himself into changed condition. The preclear ordinarily, at the very least, can recall when he postulated himself ill to get out of going to school or out of an engagement.

Postulates, whenever made, are responsible for the condition of the preclear, bad or good.

Because postulates are made in moments of physical stress at times and are very forceful when so made, engrams occasionally must be entered but because prime postulates occur it is not necessary to go too early to get effective postulates for this lifetime de-sensitized from a case.

Postulates made by a preclear are a pattern. It is necessary to reach the earliest postulates by touching the later ones and running them back with straight-wire.

Postulates surrender just like any other lock, or, in engrams, just like any other perception in an engram.

Auditing a preclear forcefully against postulates he has made to the contrary makes him subject to opposite postulate and drives him into apathy. Thus such postulates are a matter of first address. These include postulates not to be treated by doctors and postulates not to change.

Agreement to be processed is a postulate which must be picked up eventually.

Postulates are made and are effective on every dynamic.

Postulates are reduced systematically for every dynamic.

The postulates the auditor wants are those appertaining to the retention and use by the preclear of his service facsimile chain.

Postulates are made because of evaluations. Postulates ordinarily do not lift unless the reason why is also contacted. This is brief but very important.

Types of Cases Past, Present and Future

Every calculation of effort made by the mind is directed toward future.

The individual compares conditions in the past to observations in the present in order to calculate efforts in the future.

A high-tone individual thinks wholly into the future. He is extroverted toward his environment. He clearly observes the environment with full perception unclouded by undistinguished fears about the environment. He thinks very little about himself but operates automatically in his own interests. He enjoys existence. His calculations (postulations and evaluations) are swift and accurate. He is very self-confident. He knows he knows and does not even bother to assert that he knows. He controls his environment.

The so-called normal is used here to be at around 2.5 to 3.0 on the tone scale. He is partially extroverted, partially introverted. He spends considerable time with his calculations. He evaluates slowly even when he has the data, and then postulates without realizing too much about his postulation. He has much in the past which he does not care to recall. He has much in his present which gives him concern. His future goals are rather well nullified by future fears. He is homo sapiens. He is in terrible condition, taken from the viewpoint of homo novis. He is in excellent condition from the viewpoint of past "ologies". He controls some of his environment but is mainly controlled by that environment. He is somewhat of a liability in interpersonal relations, demanding ARC and feeling he cannot live without it. He understands that he understands some things.

The neurotic is considered to be below 2.5. The neurotic has thorough concern about the future to the degree that he has many more fears about the future than he has goals in the future. He spends much of his time pondering the past. He acts and then wonders if he has acted correctly and is sure he has not. Thoughts to him are as solid as MEST. He is overwhelmed by sudden counter-efforts. He is operating on a sub-control center which has been itself very blunted. He is ill much of the time to a greater or lesser degree. He has colds. He brings "bad luck" and disaster. He is homo sapiens at his "rational worst".

The dramatizing psychotic is not always looked upon as insane. Whether or not he is classified as insane depends upon whether or not he is of obvious menace to other homo sapiens. He is fixed in one facsimile which he plays over and over to the environment around him. He is controlled by his environment to the extent that anything in his environment turns on his dramatization. He is disastrous to have around. Inaccessible persons passing for normals are sometimes dramatizing psychotics who dramatize infrequently -- perhaps only once or twice a day. The dramatizing psychotic lives mainly in the illusion of his own facsimile with its surroundings, not actual surroundings. He is definitely not in present time at any time.

The computing psychotic passes quite commonly for a normal. Here the individual is taking dictation solely from a facsimile of some past moment of pain and is acting upon the advice of that "circuit" and is calling it thought. The psychotic personality is distinguished by its irrationality and its perversion of values. An inaccessible "normal" is usually a computing psychotic. Thoughts are MEST to the computing psychotic. To take away or relieve a computation is like removing physical matter from the person. The computing psychotic lives wholly in the past and has no future. He cannot be interested in future goals. Often he does not have future fears. His concerns are with past decisions but he cannot even make a decision for the past. Most computing psychotics are not in institutions or under any restraint. Only those computing psychotics who are obviously and dramatically dangerous to their fellow homo sapiens are labeled psychotic by past "ologies". Many esteemed and respected homo sapiens in many professions are yet computing psychotics who operate, puppet-like, on installed knowledge. The distinguishing characteristic of the computing psychotic is his utter inability to change his mind. He may even make a cult or a virtue out of consistency. The most common mistake an auditor can make in his evaluation of a preclear is to misdetermine a computing

psychotic as a normal. The clue that he has made a mistake is his discovery of the difficulty he has in getting the computing psychotic to get up any locks. Another clue is inaccessibility. Intelligence is no clue to the computing psychotic, neither is dress, manners nor learning, since these can also be used by the circuit. Inaccessibility and heaviness of locks are the main clues.

The degree of extroversion of the preclear and, with that, his ability to face future threats and reach toward future goals determine his height on the tone scale.

Above 2.5 the preclear thinks about the future. From there down to 1.0 he thinks mainly about the present and has some dread of both future and past. Below 1.0 he is wholly concerned with the past. During any one session the auditor runs a preclear all over the tone scale. He should leave him extroverted. Any lock chain, for instance, should be scanned only to extroversion on that chain -- scanning further drops the preclear into another chain, thus re-introverting him. The temporary extroversion and introversion is momentary and incidental. The auditor is principally concerned with chronic aspect as outlined above.

Wide Open and Occluded

There are two major subdivisions of cases wide open and occluded.

At this time it is imperfectly understood why there is such a difference. There are many clues and much data, but a static conclusion is not advisable at this time.

The wide open case is possessed of full perception except somatic, which is probably light even to the point of anesthesia. Wide open does not refer to a high tone individual but to one below 2.5 who should be easy to work but is often inaccessible and who finds it difficult to regain a somatic but simple to regain perception.

It is pointed out that perceptions are rather easily drained from facsimiles, leaving the effort still in place. It is also pointed out that the wide open case is often incapable of much effort in present time. Thus the perceptions of the wide open case may be, simply, curtailed in some fashion, from his effort. The wide open case can be a computing psychotic. This matter is dangerous to the auditor for he may think a wide open case is a high-tone case with full perception.

The wide open case can be stuck in an arduous facsimile and, by running heavy incidents, may be driven wholly psychotic. This is almost the only danger in this science.

The wide open case is handled by an address to thought and emotion, not to effort. It should be scouted carefully to find out if the case will lock scan. This is determined by the case of running one lock. An auditor can lock scan a wide open case into a heavy effort facsimile and stick him there.

The wide open case is very literal, as is any low-toned case, to words. Words and any other symbols are almost MEST. The wide open case often makes a fetish from symbols. This is an escape mechanism. "Dream therapy" and so forth are the dreams of low-toned cases.

The occluded case is fixed, most likely, in the effort of a heavy facsimile. Thought and emotion, rather than effort, are best applied to this case until a computation is reached.

The occluded case is using a service facsimile so heavily that it is in constant restimulation, and that service facsimile is occluded by heavy effort. In contrast, the service facsimile of the wide open case may be concentrated on perception with its effort avoided.

The occluded case complains of illness, ordinarily. The wide open case commonly insists upon how well he is. Both are errors.

Computations

Every homo sapiens is running on aberrated computations.

The computation technically is that aberrated evaluation and postulate that one must be consistently in a certain state in order to succeed. The computation thus may mean that one must entertain in order to be alive or that one must be dignified in order to succeed or that one must own much in order to live.

A computation is simply stated. It is always aberrated. It is commonly in conflict with basic goal.

Basic goal is that goal native to the personality for a lifetime. It is second only in importance to survival itself. It is incident to the individuation of the person. A child of two knows its basic goal. It is compounded from genetic generations of experience. It can be found and reduced in some long past heavy effort facsimile such as death. It is neither advisable nor inadvisable to tamper with it. Much experience aligns on it. De-sensitized, it would be supplanted by another basic goal.

A computation is generally a present lifetime affair, and it is intimately concerned with the service facsimiles of this lifetime.

Some computations are so thoroughly irrational that they vanish at a glance. These include "I have to be late to be early", "I have to be angry to people to be liked." They are contradictory.

A computation is as insidious as it pretends to align with survival -- or, in other words, as it seems to match the environment.

No computation is compatible with skill and data. A computation compatible with skill and data is basic goal.

A man whose every ability lies in a dignified and smooth area may yet have a computation that he must be a clown. One with the basic goal of entertaining may yet feel he must be dignified. Contradictoriness is essence in computations.

All computations are non-survival.

The computation lies in earlier postulates of this lifetime or this lifetime's post-basic goal. It is treated for the lifetime only in order to achieve a Fifteen.

Computations are established by noting activities or ideas of the pre-clear out of agreement with his skills and abilities.

Computations clarify by address to service facsimiles.

Computations are held in place wholly to invalidate others.

Service Facsimiles

The main goal of the auditor is to locate and release service facsimiles for this lifetime.

There is ordinarily but one actual service facsimile on a case but this one is accompanied by before and after heavy facsimiles and locks.

A service facsimile is that facsimile which the preclear uses to apologize for his failures. In other words, it is used to make others wrong and procure their cooperation in the survival of the preclear.

If the preclear well cannot achieve survival, he attempts an illness or disability as a survival computation.

The workability and necessity of the service facsimile is only superficially useful.

The service facsimile is an action method of withdrawing from a state of beingness to a state of not beingness and is intended to persuade others to coax the individual back into a state of beingness.

The service facsimile has a complete and explicit anatomy. It begins with an effort to control along any dynamic, with a failure to control, with a recognition of the failure, with a postulate to be ill, injured or unable, continues with an illness, injury or inability and may or may not end (short of processing) in days, weeks, years or an entire lifetime.

Hysterical deafness, blindness, colds, any chronic somatic, any aberrated behavior pattern are the content of service facsimiles.

The inception of the earliest service facsimile for this lifetime is usually between six months and three years of age. It has many locks.

It is located by running the emotional curve. It is then exhausted with complete processing which includes thought, emotion and effort. Its companions later on the chain are then similarly reduced.

All that is wrong with any case is a service facsimile. Discover and reduce the service facsimile and its chain, and the auditor changes the nature of man and promotes him. An individual who has no service facsimile will not accumulate facsimiles to his harm or become restimulated by others. The heart of auditing is the service facsimile.

DRAMATIZATIONS

The individual still possessed of service facsimiles dramatizes them. He may dramatize them in or out of valence.

A dramatization is like a record which can be played over and over.

Dramatizing is an apology for failure.

SYMPATHY EXCITERS

A sympathy exciter is any entity on any dynamic for which the individual has felt sympathy of the variety between 0.9 and 0.4.

Sympathy is an excellent occluder and valence shifter. It also involves and freezes the emotion of the individual.

The ordinary course of action leading to sympathy is action against the entity which will receive sympathy or action against an entity earlier than the sympathy exciter.

Sympathy is a non-survival apology for action against entities on any dynamic, which action has failed.

A sympathy exciter is easily located in any case. There are many in every case.

The auditor can enter the sympathy chain from many angles. One is to locate "to whom the individual has been mean". Another is, "When did you fail to control another by action?" Another is simply, "For whom have you felt sympathy?"

Sympathy exciters are most commonly parents, allies and pets.

Childhood stories are cunningly laid traps for sympathy and such stories, poems or songs affect a case strongly but are locks for actual control efforts (which have failed) on the part of the child against any entity on any dynamic. Sympathy should be run from such stories.

Sympathy is run as a heavy facsimile. It is run without verbalization. It is run without accompanying effort. It is always run with the reason one was sympathetic. It is run over and over until the preclear extroverts. It may be run from late to early or early to late wherever it can be found.

Sympathy must be taken wholly off the case.

PRESENT-TIME PROBLEMS

All cases have one or many actual present-time problems. It is most compatible with low-tone cases to "strip" a present-time problem as the first (Step Four) action in actual processing. The neurotic has most of his concentration on the present. He is afraid of it. His concentration is so heavily on the present that he cannot research the past, and he certainly cannot bear much of the future, either, as to its fears or goals.

The neurotic case is therefore entered with the mechanism of stripping a present-time problem at the point of Act Four.

Stripping present time is a simple operation. Once one has established communication with the preclear, he is invited to discuss his present time. All by itself this is "therapeutic". Simply permitting a man to tell you of his operations is "therapeutic" even if it compares in value with actual processing to collecting a grain of sand when one can sweep the Sahara.

The "confessional" is simply the address to present-time problems and, although the recipient of the confession does nothing more than assure that all is forgiven, the individual feels better. This, by the way, is the only cross between this science and past efforts at therapy.

The action of stripping is done by taking every aspect of every factor in the problem and running it back to the postulate the preclear made to be concerned about that aspect of the factor.

The auditor must beware being too monotonous with his "When did you first decide that _____." He should take pains to vary his patter. "Let's see if we can find some earlier material on this." "Did you ever know anyone who is like your wife?" Be human, even if human novis. The auditor is interested in the current travail of this homo sapiens.

The preclear will not unburden if he thinks the auditor will violate his confidence. He will not unburden if the auditor has no regard for the possible severity of the problem.

The auditor's main concern is adroitly preventing the preclear from wandering off the actual factors of the problem. The preclear is liable to ramble. The auditor should not fear to interrupt this rambling.

The auditor does not give advice or straighten out the preclear's present time. He makes the preclear's present time bearable by de-sensitizing the past it restimulates.

The cleverness of the auditor is devoted alertly to the calculation of the actual problem and leading the preclear into past similar concerns and his postulates to make it a problem.

The address to the present-time problem should be discontinued immediately when the preclear is obviously less concerned with it. The present-time problem will not wholly vanish. The auditor is simply using the mechanism to get the preclear into better swing of processing.

Addressing the present-time problem (problem, for short) is a therapy in itself, if we desire therapies. Get at the factors of real concern, get a postulate or two off about them, run a little emotion, use some MEST processing about the factors and prepare, thus, the case for the Fifth Act. Resolving the present-time problem makes a better homo sapiens. It does not much advance a case in view of how far that case can be advanced. However, a clever and quick auditor could probably make his fortune using only this technique and by it prevent divorces, cure colds, save jobs, decrease accidents and illnesses. It is only a very minor miracle and should be regarded as such.

Problem processing can be dwelt upon overlong by the auditor and should be used only long enough to prevent the preclear from being too distracted from the main task by his environment. Past Problems

The psychotic is suspended in a decision, unmade, about a past problem. The unwillingness to make this decision and the conflict of factors thus results in a confusion in the past severe enough to cause a failure in decision or an absence of postulate.

Here the problem is one of coaxing the preclear to make an evaluation on each of the factors involved in the past problem and then, finally, a conclusion on the problem.

This is very simple to resolve. It may not be simple to locate. Simple ARC is used until the problem presents itself.

The auditor does not advise an evaluation or a conclusion. When he does so he is locking on top of every other advice which the preclear has received. The auditor is simply trying to get the preclear to use his own computer. Computations are effected first by evaluation and then by conclusion. If the auditor does more than lead, the preclear has not used his own computer and has not resolved the problem. This in essence, by the way, is why hypnotism does not, never has worked as a therapy and never will work, since it is the environment (the hypnotist) making a series of decisions for the subject. Your preclear, when he is hung up in a past decision failure, is in an hypnotic state anyway, for he has to be that low on the scale to be so confused.

In handling men you can put them in an hypnotic, automaton state by posing rapidly a series of factors they then see they cannot of themselves evaluate, then getting them to a point where they are in an anxiety for you to make the decision. Depress them low enough in this wise and they obey like robots. Thus do not ruin your preclear. Future Goals

A man without future goals is a worried and sick man.

The reason an individual cannot approach a future goal or even strongly postulate one lies in his inability to resolve the present or to make a decision in the past.

The future goal may be cancelled by fears for the future.

A case can be worked by alternately seeking to discover the preclear's future goals and then locating the fears that these goals cannot be attained, and by locating and reducing the postulates and emotions which cause the fears.

A case which will not tell you at least in part a future goal or ambition is psychotic. Even a neurotic will have some fragments of future goals and will discuss them. A case which will not discuss future goals is hung up in a past decision conflict and should be worked in that area -- the past -- as the case isn't even in present time no matter how it may seem to conform or converse or "be charming".

The auditor who discovers this condition in a preclear can make the error of seeking to strip postulates which inhibit postulating future goals or create future fears. He can also err when confronted by this condition by trying to process present time. This preclear has enormous apparent present-time problems, certainly. They are all hung up on a past failure to decide.

The goalless case has shuddered so far away from decision that he is also departed from reality. He may believe he caused a death. He may believe he murdered someone although he cannot say who or how. It is the auditor's task to recover the past failure in decision.

The partially obstructed case on the subject of future goals can be helped by the auditor.

It is not the role of the auditor to postulate for the preclear. Postulating by the auditor results in a momentary upsurge and then a relapse. Encouragement is routine in life. It is not very therapeutic. Data on a new viewpoint can help evaluation, but this is the role of a teacher.

Future goals take care of themselves when the preclear moves out into beingness. The future is always full of traps. Where would we ever get randomness and adventure if it were not? It is a matter of facing the future confident and unafraid despite obstacles that distinguishes the superior being. The blunt question about how the preclear actually feels about dying tests his condition. If he does not care, he is a fool. If he doesn't want it but isn't afraid of it, he will do.

The Emotional Curve

If the auditor must know anything backwards, forwards, upside down, asleep or awake, it is the emotional curve.

The auditor can neglect everything and anything on a case. He may even use a past "ology" or indoctrinate his preclear into the worship of golden calves or professors. He can be pompous, idiotic or a homo sapiens. So long as he understands, uses and reduces the emotional curve he will succeed in accomplishing at least part of his mission.

Hence, attend! The emotional curve is that drop or rise on the tone scale caused by failure to control on any dynamic or the receipt of an ally on any dynamic.

The drop falls from above 2.5 down to apathy in a steep curve. It occurs in seconds or minutes or hours. The speed of its fall is an index of the severity of the failure.

Death of an ally is received as a failure to keep the ally alive. This is followed by entering into the facsimiles of the ally and trying to jar him into life again, which is a second failure and which occludes the ally because the preclear is now living as an ally.

The emotional curve is a period with an exclamation point to the past. One's own death would be an emotional curve.

The flight down the emotional curve is as follows: State of beingness, antagonism against not beingness, fear of not beingness, grief about not beingness, acceptance of not beingness. These consecutive steps may be so swift that they jam into a blur which seemed to contain only a sudden shift from beingness to not beingness.

Beingness is a supposed or actual control of the environment. Not beingness is an acceptance of control by the environment and abdication even of control of self.

An early curve was "I'll eat you", "I'm fighting you", "I'm losing", "I've lost. Eat me".

An earlier curve was "I'm alive", "I'm wiped out by MEST and therefore I am MEST".

The curve is addressed for this lifetime. It is located by getting the preclear to recall a time when he was happy and suddenly was made sad. He is then persuaded to re-experience this curve as an emotion. He is run through that incident until it is de-sensitized (which may be at once or after several runs). Another such curve is located. One after another curve incidents are taken from the case. Suddenly or gradually the service facsimile chain is in view and is run, one incident or another, until a whole service facsimile reduces. Then other service facsimiles of the chain are run until the preclear is clearly in possession of his own ability to postulate at will on his health or state.

Running the emotional curve will get the preclear into grief discharges, fear discharges or anger discharges. These can be run, verbalized or not verbalized, over and over, as emotion.

The auditor should prepare to be extremely thorough about the emotional curve.

Running the curve in reverse locates the false supports and identities the preclear has assumed. This is done by finding a time when the preclear was sad or apathetic and running up to a time when he was in control of his environment again. This recovers the arrivals of the U.S. cavalry and has given false value to that cavalry. The preclear will not get rid of emotional attachments or even disclose allies unless the reverse curve is run. A preclear who has been lifted up by such supports clings for ever afterwards to those supports and fetishes which remind him of those supports.

A typical reverse curve: Disobedience, punishment begun, intervention of grandma. Bawl out by non-com, rescue by officer. News of possible death, cancellation of news by word of survival.

When the emotional curve went down, the preclear considered himself dead and his own past occluded. When the emotional curve went up, the preclear considered himself part of the identity of the rescuer.

We want the preclear as a new self-determined self.

When the preclear is advanced to the Ninth Act the running of emotional curves is fast and simple. The preclear fairly flies into higher and higher self-possession.

When the running of emotional curves is concluded, the preclear should be well advanced toward being in valence and not caring whether he is or not. Perceptics should be on.

It should be noted that the rising curve follows the down curve when the rising curve exists.

A service facsimile is a down emotional curve, a counterfeit dying and a resurrection on a rising curve. An Analysis of Self-Determinism

The goal of the auditor with his preclear is not the release of a psychosomatic, not the improvement of appearance, not greater efficiency or better interpersonal relations. These are incidental. The goal of the auditor with the preclear is the rehabilitation of the preclear's self-determinism.

In order to understand this goal, let us examine some data and have a thorough understanding of what self-determinism is. Before Dianetics there were vague pushes in that direction but the state itself lacked definition and definitely had no bridge built to it.

Self-determinism is that state of being wherein the individual can or cannot be controlled by his environment according to his own choice. In that state the individual has self-confidence in his control of the material universe and the organisms within it along every dynamic. He is confident about any and all abilities or talents he may possess. He is confident in his interpersonal relationships. He reasons but does not need to react.

On the tone scale, we have at the optimum level, I am, at the lowest level, I am not. Between we have, from the optimum level down, varying degrees of I am and I am not. The lower one goes, the more I am not there is and the less I am. Here is the graph of the the state of beingness and the state of not beingness. Not beingness is death. This is a range from 20.0 down to 0.0.

Full self-determinism along every dynamic is found at 20.0. A complete other-determined individual is at 0.0. A gradient scale lies between.

There is a parallel column on the tone scale to the I am, I am not gradient scale. This is the I know, I know not scale. I know is at 20.0. I know not is at 0.0. Between these lie, as one descends, I understand, I am trying to understand, I will not understand, I am afraid to understand, I cannot understand, I know not.

Another parallel scale would be, I have trust at 20.0 and I trust nothing at 0.0. As one descends, one reaches less and less trust and more and more distrust until we have death.

The mystic for millenia has been talking about faith. He never built a bridge to it. He made a fundamental error in converting faith into have faith. When he said have faith he invited understanding, then confusion of understanding, because one does not understand faith. One is faith. The source, content of and contact with faith is you. The result of this mystic error -- and

it is a very gross error -- was to place individuals so far down the tone scale that "love" and propitiation became bywords and hocus pocus the order of the day. Here is a 1.1 religion. It is afraid to understand because it has to have faith, but it is not faith because faith is not understanding. Hence the general confusion at 1.1. A by-product of this is the fact that individuals who thus have faith are running too slow. You get esp, hypnotism, mixed-up facsimiles with others, martyrdom, physical illness and all manner of unwanted things at this slow speed. It is too close to the static of death at 0.0, and its people are awfully dead, ineffective and irrational.

People who are trying to have faith are not faith. Thus they fear (1.1) and propitiate (1.1) and are generally confused. One will not buy unreason at 20.0. They began by knowing faith and then became confused by having faith explained.

Because of spectacular successes (rare as rarity), the mystic continued to strive for something he already had because he had no way to get back to where he was. The enormously successful points of being faith in the sea of unsuccessful having faith kept the mystic striving. It is possible now to achieve faith, or regain what one has lost.

I am, faith, I know are at 20.0 on up. At 20.0 on the gradient scale they are at optimum unity with MEST (the physical universe) but as they rise from 20.0 they become less and less effective on MEST until top static is reached at 40.0. The scale is a circle. 40.0 and 0.0 are the same, so it is possible to go two ways towards death. One is less well off at 21.0 than he is at 20.0 since the MEST is dwindling away. The austere but spindly and weak mystic who dwells upon abstracts is less able to know. There is an entire scale above 20.0, which matches the scale below 20.0 in undesirability. The organism slows down above 20.0. The static is thoroughly unobtainable with one's body, evidently, for the static at the top in a pure state 40.0 is, for one thing, a -270 degrees C. A person who relaxes to not being in body is at first assailed by counter-efforts and then begins to chill. The various phenomena of mysticism are in the main explained by this scale. When one forsakes individuality on the way up, he, of course, can commingle with thoughts and other individualities. When he slows down below toward 0.0 he is again getting confused in his individuality, shifts valences easily, is hypnotic and is in a generally undesirable condition.

Another prime error has been made and is part of our culture, both religious and scientific, and that is the error of single source. At 1.1 single source looks to be the case. Also at 39.0. At neither point, however, is there any clear view. All life forms are not from a single source. The ideas of Nirvana, Valhalla, Adam, the original cell, each is now rather completely disproven. There is a source for every genetic line. By this is meant both a theta (thought static) and MEST form. There are as many sources as there are living organisms, each line distinct and individual. The similarity of form in a species is due to similar environments and age of the class, not single source. A negative proof lies in the finding that health, sanity and effectiveness exist where the greatest self-determinism can be rehabilitated. A positive proof is that, if it were single source, the discovery of the genetic line facsimiles, the blueprint of the body, should permit just one individual to go back and clear the original upsets for the whole human race. It has been tried several times. It affects none but the preclear. His source is the very model of self-determinism.

What then are you trying to do with your preclear? You are rehabilitating him from a state of partially I am not to I am, from understand to know, from distrust to trust.

If you only concentrated upon distrust in others of him and his distrust of others, his enforced faiths on others and the enforced faith of others on him, and with his trust and distrust on all dynamics, particularly self, and de-sensitized such facsimiles, your preclears would be at around Ten at least. Occluded cases may be only broken trust cases for the preclear cannot trust himself, thus cannot trust his recalls. Run trust-distrust, and enforced and broken "know" and "I am" and "faith" in Act Four.

Responsibility

In the Fourteenth Act, the proper control center is rehabilitated. This is done by an indoctrination of the principles of responsibility and the running of responsibility. An auditor, thus, must understand this subject thoroughly. The preclear will make his largest leap ahead with the Fourteenth Act.

DEFINITION: Responsibility is the ability and willingness to assume the status of full source and cause for all efforts and counter-efforts on all dynamics.

There is no compromise with full responsibility. It lies above 20.0 on the tone scale and is descended from in order to effect randomness but is descended from with the full knowledge of its assumptions. It means responsibility for all acts, all emotions on every dynamic and in every sphere as one's own. It includes such "disrelated" data as the death of an individual one has never met on a highway on which one has never travelled at the hands of a stranger no matter how culpable. One does not send to find for whom the bell tolls without full willingness to have tolled it and to have caused the cause of its tolling.

There is a scale of responsibility between full responsibility and full other-responsibility where the former is above 20.0 and the latter is at 0.0. Complete negation of responsibility is complete admission of being under the complete control of the environment. Assumption of full responsibility is a statement of control of the environment and persons within it without necessity of control.

There is a cycle of responsibility. One acts and seeks to negate his responsibility for such action by placing the "reason" at another's door. This works as long as one succeeds in making another accept responsibility for the action. The moment this action fails and another does not accept it, the entire action comes back at one. It is then a matter of fault and fixed (by another) blame and stirs the emotion of guilt. Before this cycle begins, there is no aberration, no matter what has been done, no matter what has happened to anyone. The action occurs but is no cause for discussion or justice until one seeks to shunt cause elsewhere than self.

This starts the cycle and eventually comes back as fault. Full responsibility is not fault; it is recognition of being cause.

Rationalization is wholly an attempt to shunt responsibility. Whatever occurs to one is actually his own responsibility, as the student will realize as soon as he re-evaluates the factors involved and as soon as he sees the enormous effect of this process.

The highest common denominator so far reached on occlusion is the responsibility factor. One is occluded on whatever he has tried not to be responsible for. He refuses responsibility for the incident, thus he has no control or responsibility for the facsimile of the incident. One can control nothing without assuming full responsibility for it.

Let us survey fundamentals. Self-determinism, self-confidence, I know, I am, lie along 20.0. All knowledge is known at source, as witness the theta manufacture of complex compounds not yet touchable by chemists. One, thus, by extrapolation, did not agree to survive. One had a free choice to survive, quite obviously. The agree viewpoint is occasioned by postulating obedience to the Supreme Being, which postulate is demonstrably not workable as it poses a low-scale point for the eighth dynamic which would drag down all the other dynamics at once to zero and would continue them there, and life would become impossible. Notwithstanding this point which may or may not be acceptable, there are points which are inexorable.

Overall life through all tracks is a continuous survival through many deaths. Succumb is only relative. Total succumb would be a discontinuance of the theta line, which demonstrably has not happened in any line on earth today and which, by extrapolation and by the nature of

the life static, will not happen tomorrow for only MEST has time. Theta changes the organism form by varying efforts and counter-efforts and natural selection and planned development in MEST.

Development of rationalization (negation of responsibility establishing conflict for development) establishes randomness; and randomness is apparently vital in order to effect a conquest of MEST (our closest approach to why survival, being a conquest of the material universe by theta).

One is obviously conceived after free choice. One obviously seeks and selects randomness on free choice.

Every individual is possessed of an urge for survival on every one of the eight dynamics. He can exercise free choice for the survival of every one of the eight. Indeed, since he has existed prior to any existing situation, he had the free choice to do something about it and thus had free choice about any existing situation. At least the problem resolves itself in this fashion. Its proof is that preclears soar up the tone scale on acceptance of full responsibility and the proposition is thus credited by its workability.

Running back any happenstance before the cycle of blame-failure-guilt is started will discover that the preclear had full responsibility for anything done to him or by him or, reaching far back, for anything done to anybody by anything or anybody. Full responsibility as AA's occurs if only in choosing conception. Anyone alive today had responsibility in creating our social order.

A soldier shot on the field of battle may "blame" the sniper, the Selective Service, the stupidity of government, but he nevertheless had full responsibility not only for being there and getting shot but for the sniper, Selective Service and the stupidity of government.

You may locate any rationalization cycle merely by finding any mis-emotion such as antagonism, anger, fear, grief or apathy on the part of the preclear for anything or anybody. You will find then a cycle wherein the preclear considered himself affected by environment, blamed environment (and environment contains all dynamics including self), failed to make the blame stick and received the consequences, thus losing self-determinism, thus getting controlled by environment, thus getting aberrated, thus getting and using the service facsimile.

The auditor is not seeking the point where the preclear accepts the harm which came to him as his fault. The auditor is seeking the point where the preclear decided it was not his responsibility and then the earlier point of refusal of responsibility. Get the fault acceptance point and you will find apathy since here is agreement with accusation -- wrong point. Get the first instant of rationalization and then the earlier generalization of negated responsibility and you will find the postulates which deny full responsibility. A postulate of illness so as not to attend school is not the primary postulate on the chain. The primary postulate on this chain is refusal of full responsibility for school.

Occlusions are resolved by full responsibility on the subject. This includes occluded persons.

Dub-in is resolved by a full responsibility resolution, for the dub-in is far more active in rationalization than an occluded case.

The preclear, understanding all this, may yet wonder when he discovers in his past a person who avowedly had full responsibility, is always right and yet made him unhappy. Let the preclear look in this person for the actuality of full responsibility and the person in question will be found to have suspicions, antagonisms and rationalizations and is thus discovered to be lacking in full responsibility after all.

The environment starts to control the individual the moment he rationalizes away his inherent full responsibility. The individual becomes “unable” to handle any facsimile of any incident for which he has not assumed full responsibility, thus he becomes subject to facsimiles “handling” him.

Attempting to invalidate someone is attempting to negate full responsibility for that person. The person who insists it is “your fault” is invalidated on a low-tone level by insisting it is not your fault. Thus, assuming “fault” seems to validate the accusation of the person so claiming. Assumption of full responsibility is also assumption of the accusative person as a responsibility.

For definition, the responsibility scale drops to its next level to “I am responsible and I must do something about it”. This dwindles down through “I won’t be responsible”, “I am afraid of responsibility for it”, “I don’t care, it’s no use being responsible”. The lowest rung is no responsibility for anything.

Past deaths are occluded because one does not take their responsibility, such deaths being contrary on a shadow level in an aberrated society, to survival. Thus past deaths are sometimes hard to explain to people for they would not have any responsibility on their own and therefore refuse it on the subject.

Using symbols for actuality is negating responsibility.

Several group experiments, including teaching every man on a naval vessel that he was responsible for everything, have been made which validated these postulates. A negative series was also made with opposite results, again demonstrating these postulates. How irresponsible can one be? Refusal of full responsibility for dying and its survival value. Cause and Effect

An individual is evidently designed to be cause. When one speaks of responsibility he means “the determination of the cause which produced the effect”.

The goal of full responsibility is not attained simply by making a new postulate. It is attained by discovering and reducing the preclear’s assignment of cause.

Ordinarily people call the assignment of cause “blame”.

If one assigns cause to something, he delivers to that entity power. This is not mystical. It is a new discovery of hitherto unknown phenomena. By its strange visios and occlusions resolve.

A swift survey of emotions demonstrates that a gradient scale from cause drops down to effect. Cause is the life static itself. Full Effect would be MEST, or a dead body.

An organism seeks to be cause without becoming effect.

Cause is above 20.0; effect is at 0.

The gradient scale goes downward in this wise: One is cause, he begins motion and is able to change it. He is committed to motion and becomes less able to change it. He comes into a range of being the effect of motion. He seeks to hold motion to keep from being an effect at 1.5. He is unable to hold motion and begins to fear motion at 1.1, propitiating it. He regrets anything about motion and is in grief as an effect at 0.5. He becomes and recognizes that he has become effect at 0.1.

A strange visio on a case will vanish if regret is scanned up from it. Occlusions will turn off if blame is scanned off the occluded object or person including self.

This operates on any of the eight dynamics. That which one blames becomes a power and is occluded as unexaminable including self. That which is in stationary visio is that which one regrets having caused.

There is a cycle on any chain on any dynamic as follows. One causes something. He fails. He postulates blame (1.5). He establishes sympathy and regrets. Each new blame thrusts him further, on that chain, into an apathy. Find a thing on any dynamic (including the first dynamic) which one blames and the auditor will discover at the bottom of the chain a cause and failure of magnitude. He need only scan blame and regret from the chain to recover the basic incident. Then he should exhaust from that incident its emotional curve. This recovers any computation on a case.

Effort can be run on cause and effect but the effect, of course, is apathy, and should probably be run as counter-effort.

Full responsibility resolves only in this wise.

Definitions, Logics and Axioms

These are the definitions, logics and axioms of this science. It should be borne in mind that these actually form epistemology, the science of knowledge. These cannot but embrace various fields and sciences. They are listed in this volume without further elucidation but will be found to be self-explanatory for the most part. Adequate phenomena exist to demonstrate the self evidence of these definitions, postulates, logics and axioms.

The first section, the logics, are separate from the axioms only in that from the system of thinking so evaluated, the axioms themselves flow. The word logics is used here to mean postulates pertaining to the organizational structure of alignment.

The Logics

- LOGIC 1. KNOWLEDGE IS A WHOLE GROUP OR SUB-DIVISION OF A GROUP OF DATA OR SPECULATIONS OR CONCLUSIONS ON DATA OR METHODS OF GAINING DATA.
- LOGIC 2. A BODY OF KNOWLEDGE IS A BODY OF DATA, ALIGNED OR UNALIGNED, OR METHODS OF GAINING DATA.
- LOGIC 3. ANY KNOWLEDGE WHICH CAN BE SENSED, MEASURED OR EXPERIENCED BY ANY ENTITY IS CAPABLE OF INFLUENCING THAT ENTITY.
- COROLLARY -- THAT KNOWLEDGE WHICH CANNOT BE SENSED, MEASURED OR EXPERIENCED BY ANY ENTITY OR TYPE OF ENTITY CANNOT INFLUENCE THAT ENTITY OR TYPE OF ENTITY.
- LOGIC 4. A DATUM IS A FACSIMILE OF STATES OF BEING, STATES OF NOT BEING, ACTIONS OR INACTIONS, CONCLUSIONS, OR SUPPOSITIONS IN THE PHYSICAL OR ANY OTHER UNIVERSE.
- LOGIC 5. A DEFINITION OF TERMS IS NECESSARY TO THE ALIGNMENT, STATEMENT AND RESOLUTION OF SUPPOSITIONS, OBSERVATIONS, PROBLEMS AND SOLUTIONS AND THEIR COMMUNICATION.
- DEFINITION -- DESCRIPTIVE
DEFINITION: ONE WHICH CLASSIFIES BY CHARACTERISTICS, BY DESCRIBING EXISTING STATES OF BEING.
- DEFINITION -- DIFFERENTIATIVE
DEFINITION: ONE WHICH COMPARES UNLIKENESS TO EXISTING STATES OF BEING OR NOT BEING.
- DEFINITION -- ASSOCIATIVE
DEFINITION: ONE WHICH DECLARES LIKENESS TO EXISTING STATES OF BEING OR NOT BEING.
- DEFINITION -- ACTION
DEFINITION: ONE WHICH DELINEATES CAUSE AND POTENTIAL CHANGE OF STATE OF BEING BY CAUSE OF EXISTENCE, INEXISTENCE, ACTION, INACTION, PURPOSE OR LACK OF PURPOSE.
- LOGIC 6. ABSOLUTES ARE UNOBTAINABLE.
- LOGIC 7. GRADIENT SCALES ARE NECESSARY TO THE EVALUATION OF PROBLEMS AND THEIR DATA. This is the tool of infinity-valued LOGIC: Absolutes are unobtainable. Terms such as good and bad, alive and dead, right and wrong are used only in conjunction with gradient scales. On the scale of right and wrong, everything above zero or center would be more and more right, approaching an infinite rightness, and everything below center would be more and more wrong, approaching infinite wrongness. All things assisting the survival of the survivor are considered to be right for the survivor. All things inhibiting survival from the viewpoint of the survivor can be considered wrong for the survivor. The more a thing assists survival,

the more it can be considered right for the survivor; the more a thing or action inhibits survival, the more it is wrong from the viewpoint of the intended survivor.

COROLLARY -- ANY DATUM HAS ONLY RELATIVE TRUTH.

COROLLARY -- TRUTH IS RELATIVE TO ENVIRONMENTS, EXPERIENCE AND TRUTH.

- LOGIC 8. A DATUM CAN BE EVALUATED ONLY BY A DATUM OF COMPARABLE MAGNITUDE.
- LOGIC 9. A DATUM IS AS VALUABLE AS IT HAS BEEN EVALUATED.
- LOGIC 10. THE VALUE OF A DATUM IS ESTABLISHED BY THE AMOUNT OF ALIGNMENT (RELATIONSHIP) IT IMPARTS TO OTHER DATA.
- LOGIC 11. THE VALUE OF A DATUM OR FIELD OF DATA CAN BE ESTABLISHED BY ITS DEGREE OF ASSISTANCE IN SURVIVAL OR ITS INHIBITION TO SURVIVAL.
- LOGIC 12. THE VALUE OF A DATUM OR A FIELD OF DATA IS MODIFIED BY THE VIEWPOINT OF THE OBSERVER.
- LOGIC 13. PROBLEMS ARE RESOLVED BY COMPARTMENTING THEM INTO AREAS OF SIMILAR MAGNITUDE AND DATA, COMPARING THEM TO DATA ALREADY KNOWN OR PARTIALLY KNOWN, AND RESOLVING EACH AREA. DATA WHICH CANNOT BE KNOWN IMMEDIATELY MAY BE RESOLVED BY ADDRESSING WHAT IS KNOWN AND USING ITS SOLUTION TO RESOLVE THE REMAINDER.
- LOGIC 14. FACTORS INTRODUCED INTO A PROBLEM OR SOLUTION WHICH DO NOT DERIVE FROM NATURAL LAW BUT ONLY AUTHORITARIAN COMMAND ABERRATE THAT PROBLEM OR SOLUTION.
- LOGIC 15. THE INTRODUCTION OF AN ARBITRARY INTO A PROBLEM OR SOLUTION INVITES THE FURTHER INTRODUCTION OF ARBITRARIES INTO PROBLEMS AND SOLUTIONS.
- LOGIC 16. AN ABSTRACT POSTULATE MUST BE COMPARED TO THE UNIVERSE TO WHICH IT APPLIES AND BROUGHT INTO THE CATEGORY OF THINGS WHICH CAN BE SENSED, MEASURED OR EXPERIENCED IN THAT UNIVERSE BEFORE SUCH POSTULATE CAN BE CONSIDERED WORKABLE.
- LOGIC 17. THOSE FIELDS WHICH MOST DEPEND UPON AUTHORITATIVE OPINION FOR THEIR DATA LEAST CONTAIN KNOWN NATURAL LAW.
- LOGIC 18. A POSTULATE IS AS VALUABLE AS IT IS WORKABLE.
- LOGIC 19. THE WORKABILITY OF A POSTULATE IS ESTABLISHED BY THE DEGREE TO WHICH IT EXPLAINS EXISTING PHENOMENA ALREADY KNOWN, BY THE DEGREE THAT IT PREDICTS NEW PHENOMENA WHICH WHEN LOOKED FOR WILL BE FOUND TO EXIST, AND BY THE DEGREE THAT IT DOES NOT REQUIRE THAT

PHENOMENA WHICH DO NOT EXIST IN FACT BE CALLED INTO EXISTENCE FOR ITS EXPLANATION.

LOGIC 20. A SCIENCE MAY BE CONSIDERED TO BE A LARGE BODY OF ALIGNED DATA WHICH HAS SIMILARITY IN APPLICATION AND WHICH HAS BEEN DEDUCED OR INDUCED FROM BASIC POSTULATES.

LOGIC 21. MATHEMATICS ARE METHODS OF POSTULATING OR RESOLVING REAL OR ABSTRACT DATA IN ANY UNIVERSE AND INTEGRATING BY SYMBOLIZATION OF DATA, POSTULATES AND RESOLUTIONS.

LOGIC 22. THE HUMAN MIND IS AN OBSERVER, POSTULATOR, CREATOR AND STORAGE PLACE OF KNOWLEDGE.

LOGIC 23. THE HUMAN MIND IS A SERVOMECHANISM TO ANY MATHEMATICS EVOLVED OR EMPLOYED BY THE HUMAN MIND. POSTULATE -- THE HUMAN MIND AND INVENTIONS OF THE HUMAN MIND ARE CAPABLE OF RESOLVING ANY AND ALL PROBLEMS WHICH CAN BE SENSED, MEASURED OR EXPERIENCED DIRECTLY OR INDIRECTLY.

COROLLARY -- THE HUMAN MIND IS CAPABLE OF RESOLVING THE PROBLEM OF THE HUMAN MIND. The borderline of solution of this science lies between WHY life is surviving and HOW life is surviving. It is possible to resolve HOW life is surviving without resolving WHY life is surviving.

LOGIC 24. THE RESOLUTION OF THE PHILOSOPHICAL, SCIENTIFIC AND HUMAN STUDIES (such as economics, politics, sociology, medicine, criminology, etc.) DEPENDS PRIMARILY UPON THE RESOLUTION OF THE PROBLEMS OF THE HUMAN MIND. The human mind by DEFINITION includes the awareness unit of the living organism, the observer, the computer of data, the spirit, the memory storage, the life force and the individual motivator of the living organisms. It is used as distinct from the brain, which can be considered to be motivated by the mind. NOTE: The primary step in resolving the broad activities of the man could be considered to be the resolving of the activities of the mind itself.

Hence, the LOGICs carry to this point and then proceed as axioms concerning the human mind, such axioms being substantiated as relative truths by much newly discovered phenomena. The ensuing axioms, from LOGIC 24, apply no less to the various 'ologies' than they do to de-aberrating or improving the operation of the mind. It should not be thought that the following axioms are devoted to the construction of anything as limited as a therapy, which is only incidental to the resolution of human aberration and such things as psychomatic illnesses. These axioms are capable of such solutions, as has been demonstrated, but such a narrow application would indicate a very narrow scope of view.

Axioms

- AXIOM 1. THE SOURCE OF LIFE IS A STATIC OF PECULIAR AND PARTICULAR PROPERTIES.
- AXIOM 2. AT LEAST A PORTION OF THE STATIC CALLED LIFE IS IMPINGED UPON THE PHYSICAL UNIVERSE.
- AXIOM 3. THAT PORTION OF THE STATIC OF LIFE WHICH IS IMPINGED UPON THE PHYSICAL UNIVERSE HAS FOR ITS DYNAMIC GOAL, SURVIVAL AND ONLY SURVIVAL.
- AXIOM 4. THE PHYSICAL UNIVERSE IS REDUCIBLE TO MOTION OF ENERGY OPERATING IN SPACE THROUGH TIME.
- AXIOM 5. THAT PORTION OF THE STATIC OF LIFE CONCERNED WITH THE LIFE ORGANISMS OF THE PHYSICAL UNIVERSE IS CONCERNED WHOLLY WITH MOTION.
- AXIOM 6. THE LIFE STATIC HAS AS ONE OF ITS PROPERTIES THE ABILITY TO MOBILIZE AND ANIMATE MATTER INTO LIVING ORGANISMS.
- AXIOM 7. THE LIFE STATIC IS ENGAGED IN A CONQUEST OF THE PHYSICAL UNIVERSE.
- AXIOM 8. THE LIFE STATIC CONQUERS THE MATERIAL UNIVERSE BY LEARNING AND APPLYING THE PHYSICAL LAWS OF THE PHYSICAL UNIVERSE.
- Symbol: The Symbol for the Life Static in use hereafter is the Greek letter Theta.
- AXIOM 9. A FUNDAMENTAL OPERATION OF THETA IN SURVIVING IS BRINGING ORDER INTO THE CHAOS OF THE PHYSICAL UNIVERSE.
- AXIOM 10. THETA BRINGS ORDER INTO CHAOS BY CONQUERING WHATEVER IN MEST MAY BE PRO-SURVIVAL AND DESTROYING WHATEVER IN MEST MAY BE CONTRA-SURVIVAL, AT LEAST THROUGH THE MEDIUM OF LIFE ORGANISMS.
- Symbol: The symbol for the physical universe in use hereafter is MEST, from the first letters of the words Matter, Energy, Space, and Time, or the Greek letter Phi.
- AXIOM 11. A LIFE ORGANISM IS COMPOSED OF MATTER AND ENERGY IN SPACE AND TIME, ANIMATED BY THETA.
- Symbol: Living organism or organisms will hereafter be represented by the Greek letter Lambda.
- AXIOM 12. THE MEST PART OF THE ORGANISM FOLLOWS THE LAWS OF THE PHYSICAL SCIENCES. ALL LAMBDA IS CONCERNED WITH MOTION.

AXIOM 13. THETA OPERATING THROUGH LAMBDA CONVERTS THE FORCES OF THE PHYSICAL UNIVERSE INTO FORCES TO CONQUER THE PHYSICAL UNIVERSE.

AXIOM 14. THETA WORKING UPON PHYSICAL UNIVERSE MOTION MUST MAINTAIN A HARMONIOUS RATE OF MOTION.

The limits of Lambda are narrow, both as to thermal and mechanical motion.

AXIOM 15. LAMBDA IS THE INTERMEDIATE STEP IN THE CONQUEST OF THE PHYSICAL UNIVERSE.

AXIOM 16. THE BASIC FOOD OF ANY ORGANISM CONSISTS OF LIGHT AND CHEMICALS.

Organisms can exist only as higher levels of complexities because lower levels of converters exist. Theta evolves organisms from lower to higher forms and supports them by the existence of lower converter forms.

AXIOM 17. THETA, VIA LAMBDA, EFFECTS AN EVOLUTION OF MEST.

In this we have the waste products of organisms on the one hand as those very complex chemicals which bacteria make, and, on the other hand, we have the physical face of the earth being changed by animals and men, such changes as grass holding mountains from eroding or roots causing boulders to break, buildings being built, and rivers being dammed. There is obviously an evolution in MEST in progress under the incursion of Theta.

AXIOM 18. LAMBDA, EVEN WITHIN A SPECIES, VARIES IN ITS ENDOWMENT OF THETA.

AXIOM 19. THE EFFORT OF LAMBDA IS TOWARD SURVIVAL.

The goal of Lambda is survival. The penalty of failure to advance toward that goal is to succumb.

DEFINITION: PERSISTENCE IS THE ABILITY TO EXERT CONTINUANCE OF EFFORT TOWARD SURVIVAL GOALS.

AXIOM 20. LAMBDA CREATES, CONSERVES, MAINTAINS, REQUIRES, DESTROYS, CHANGES, OCCUPIES, GROUPS AND DISPERSES MEST. LAMBDA SURVIVES BY ANIMATING AND MOBILIZING OR DESTROYING MATTER AND ENERGY IN SPACE AND TIME.

AXIOM 21. LAMBDA IS DEPENDENT UPON OPTIMUM MOTION. MOTION WHICH IS TOO SWIFT AND MOTION WHICH IS TOO SLOW ARE EQUALLY CONTRA-SURVIVAL.

AXIOM 22. THETA AND THOUGHT ARE SIMILAR ORDERS OF STATIC.

AXIOM 23. ALL THOUGHT IS CONCERNED WITH MOTION.

AXIOM 24. THE ESTABLISHMENT OF AN OPTIMUM MOTION IS A BASIC GOAL OF REASON.

DEFINITION: LAMBDA IS A CHEMICAL HEAT ENGINE EXISTING IN SPACE AND TIME MOTIVATED BY THE LIFE STATIC AND DIRECTED BY THOUGHT.

AXIOM 25. THE BASIC PURPOSE OF REASON IS THE CALCULATION OR ESTIMATION OF EFFORT.

AXIOM 26. THOUGHT IS ACCOMPLISHED BY THETA FACSIMILES OF PHYSICAL UNIVERSE, ENTITIES OR ACTIONS.

AXIOM 27. THETA IS SATISFIED ONLY WITH HARMONIOUS ACTION OR OPTIMUM MOTION AND REJECTS OR DESTROYS ACTION OR MOTION ABOVE OR BELOW ITS TOLERANCE BAND.

AXIOM 28. THE MIND IS CONCERNED WHOLLY WITH THE ESTIMATION OF EFFORT.

DEFINITION: MIND IS THE THETA COMMAND POST OF ANY ORGANISM OR ORGANISMS.

AXIOM 29. THE BASIC ERRORS OF REASON ARE FAILURES TO DIFFERENTIATE AMONGST MATTER, ENERGY, SPACE AND TIME.

AXIOM 30. RIGHTNESS IS PROPER CALCULATION OF EFFORT.

AXIOM 31. WRONGNESS IS ALWAYS MISCALCULATION OF EFFORT.

AXIOM 32. THETA CAN EXERT ITSELF DIRECTLY OR EXTENSIONALLY.

Theta can direct physical application of the organism to the environment or through the mind, can first calculate the action or extend, as in language, ideas.

AXIOM 33. CONCLUSIONS ARE DIRECTED TOWARD THE INHIBITION, MAINTENANCE OR ACCELERATIONS OF EFFORTS.

AXIOM 34. THE COMMON DENOMINATOR OF ALL LIFE ORGANISMS IS MOTION.

AXIOM 35. EFFORT OF AN ORGANISM TO SURVIVE OR SUCCUMB IS PHYSICAL MOTION OF A LIFE ORGANISM AT A GIVEN MOMENT IN TIME THROUGH SPACE.

DEFINITION: MOTION IS ANY CHANGE IN ORIENTATION IN SPACE.

DEFINITION: FORCE IS RANDOM EFFORT.

DEFINITION: EFFORT IS DIRECTED FORCE.

AXIOM 36. AN ORGANISM'S EFFORT CAN BE TO REMAIN AT REST OR PERSIST IN A GIVEN MOTION.

Static state has position in time, but an organism which is remaining positionally in a static state if alive, is still continuing a highly complex pattern of motion, such as the heart beat, digestion, etc. The efforts of organisms to survive or succumb are assisted, compelled or opposed by the efforts of other organisms, matter, energy, space and time.

DEFINITION: ATTENTION IS A MOTION WHICH MUST REMAIN AT AN OPTIMUM EFFORT.

Attention is aberrated by becoming unfixed and sweeping at random or becoming too fixed without sweeping. Unknown threats to survival when sensed cause attention to sweep without fixing. Known threats to survival when sensed cause attention to fix.

- AXIOM 37. THE ULTIMATE GOAL OF LAMBDA IS INFINITE SURVIVAL.
- AXIOM 38. DEATH IS ABANDONMENT BY THETA OF A LIFE ORGANISM OR RACE OR SPECIES WHERE THESE CAN NO LONGER SERVE THETA IN ITS GOALS OF INFINITE SURVIVAL.
- AXIOM 39. THE REWARD OF AN ORGANISM ENGAGING UPON SURVIVAL ACTIVITY IS PLEASURE.
- AXIOM 40. THE PENALTY OF AN ORGANISM FAILING TO ENGAGE UPON SURVIVAL ACTIVITY, OR ENGAGING IN NON-SURVIVAL ACTIVITY, IS PAIN.
- AXIOM 41. THE CELL AND VIRUS ARE THE PRIMARY BUILDING BLOCKS OF LIFE ORGANISMS.
- AXIOM 42. THE VIRUS AND CELL ARE MATTER AND ENERGY ANIMATED AND MOTIVATED IN SPACE AND TIME BY THETA.
- AXIOM 43. THETA MOBILIZES THE VIRUS AND CELL IN COLONIAL AGGREGATIONS TO INCREASE POTENTIAL MOTION AND ACCOMPLISH EFFORT.
- AXIOM 44. THE GOAL OF VIRUSES AND CELLS IS SURVIVAL IN SPACE THROUGH TIME.
- AXIOM 45. THE TOTAL MISSION OF HIGHER ORGANISMS, VIRUSES AND CELLS IS THE SAME AS THAT OF THE VIRUS AND CELL.
- AXIOM 46. COLONIAL AGGREGATIONS OF VIRUSES AND CELLS CAN BE IMBUED WITH MORE THETA THAN THEY INHERENTLY CONTAINED.
- Life Energy joins any group whether a group of organisms or group of cells composing an organism. Here we have personal entity, individuation, etc.
- AXIOM 47. EFFORT CAN BE ACCOMPLISHED BY LAMBDA ONLY THROUGH THE COORDINATION OF ITS PARTS TOWARD GOALS.
- AXIOM 48. AN ORGANISM IS EQUIPPED TO BE GOVERNED AND CONTROLLED BY A MIND.
- AXIOM 49. THE PURPOSE OF THE MIND IS TO POSE AND RESOLVE PROBLEMS RELATING TO SURVIVAL AND TO DIRECT THE EFFORT OF THE ORGANISM ACCORDING TO THESE SOLUTIONS.
- AXIOM 50. ALL PROBLEMS ARE POSED AND RESOLVED THROUGH ESTIMATIONS OF EFFORT.

- AXIOM 51. THE MIND CAN CONFUSE POSITION IN SPACE WITH POSITION IN TIME. (COUNTER-EFFORTS PRODUCING ACTION PHRASES.)
- AXIOM 52. AN ORGANISM PROCEEDING TOWARD SURVIVAL IS DIRECTED BY THE MIND OF THAT ORGANISM IN THE ACCOMPLISHMENT OF SURVIVAL EFFORT.
- AXIOM 53. AN ORGANISM PROCEEDING TOWARD SUCCUMB IS DIRECTED BY THE MIND OF THAT ORGANISM IN THE ACCOMPLISHMENT OF DEATH.
- AXIOM 54. SURVIVAL OF AN ORGANISM IS ACCOMPLISHED BY THE OVERCOMING OF EFFORTS OPPOSING ITS SURVIVAL.
- (Note: COROLLARY for other dynamics.)
- DEFINITION: DYNAMIC IS THE ABILITY TO TRANSLATE SOLUTIONS INTO ACTION.
- AXIOM 55. SURVIVAL EFFORT FOR AN ORGANISM INCLUDES THE DYNAMIC THRUST BY THAT ORGANISM FOR THE SURVIVAL OF ITSELF, ITS PROCREATION, ITS GROUP, ITS SUB-SPECIES, ITS SPECIES, ALL LIFE ORGANISMS, MATERIAL UNIVERSE, THE LIFE STATIC AND, POSSIBLY, A SUPREME BEING.
- (Note: List of dynamics.)
- AXIOM 56. THE CYCLE OF AN ORGANISM, A GROUP OF ORGANISMS OR A SPECIES IS INCEPTION, GROWTH, RE-CREATION, DECAY AND DEATH.
- AXIOM 57. THE EFFORT OF AN ORGANISM IS DIRECTED TOWARD THE CONTROL OF THE ENVIRONMENT FOR ALL THE DYNAMICS.
- AXIOM 58. CONTROL OF AN ENVIRONMENT IS ACCOMPLISHED BY THE SUPPORT OF PRO-SURVIVAL FACTORS ALONG ANY DYNAMIC.
- AXIOM 59. ANY TYPE OF HIGHER ORGANISM IS ACCOMPLISHED BY THE EVOLUTION OF VIRUSES AND CELLS INTO FORMS CAPABLE OF BETTER EFFORTS TO CONTROL OR LIVE IN AN ENVIRONMENT.
- AXIOM 60. THE USEFULNESS OF AN ORGANISM IS DETERMINED BY ITS ABILITY TO CONTROL THE ENVIRONMENT OR TO SUPPORT ORGANISMS WHICH CONTROL THE ENVIRONMENT.
- AXIOM 61. AN ORGANISM IS REJECTED BY THETA TO THE DEGREE THAT IT FAILS IN ITS GOALS.
- AXIOM 62. HIGHER ORGANISMS CAN EXIST ONLY IN THE DEGREE THAT THEY ARE SUPPORTED BY THE LOWER ORGANISMS.
- AXIOM 63. THE USEFULNESS OF AN ORGANISM IS DETERMINED BY THE ALIGNMENT OF ITS EFFORTS TOWARD SURVIVAL.
- AXIOM 64. THE MIND PERCEIVES AND STORES ALL DATA OF THE ENVIRONMENT AND ALIGNS OR FAILS TO ALIGN THESE ACCORDING TO THE TIME THEY WERE PERCEIVED.

DEFINITION: A CONCLUSION IS THE THETA FACSIMILES OF A GROUP OF COMBINED DATA.

DEFINITION: A DATUM IS A THETA FACSIMILE OF PHYSICAL ACTION.

AXIOM 65. THE PROCESS OF THOUGHT IS THE PERCEPTION OF THE PRESENT AND THE COMPARISON OF IT TO THE PERCEPTIONS AND CONCLUSIONS OF THE PAST IN ORDER TO DIRECT ACTION IN THE IMMEDIATE OR DISTANT FUTURE.

COROLLARY: THE ATTEMPT OF THOUGHT IS TO PERCEIVE REALITIES OF THE PAST AND PRESENT IN ORDER TO PREDICT OR POSTULATE REALITIES OF THE FUTURE.

AXIOM 66. THE PROCESS BY WHICH LIFE EFFECTS ITS CONQUEST OF THE MATERIAL UNIVERSE CONSISTS IN THE CONVERSION OF THE POTENTIAL EFFORT OF MATTER AND ENERGY IN SPACE AND THROUGH TIME TO EFFECT WITH IT THE CONVERSION OF FURTHER MATTER AND ENERGY IN SPACE AND THROUGH TIME.

AXIOM 67. THETA CONTAINS ITS OWN THETA UNIVERSE EFFORT WHICH TRANSLATES INTO MEST EFFORT.

AXIOM 68. THE SINGLE ARBITRARY IN ANY ORGANISM IS TIME.

AXIOM 69. PHYSICAL UNIVERSE PERCEPTIONS AND EFFORTS ARE RECEIVED BY AN ORGANISM AS FORCE WAVES, CONVERT BY FACSIMILE INTO THETA AND ARE THUS STORED.

DEFINITION: RANDOMITY IS THE MIS-ALIGNMENT THROUGH THE INTERNAL OR EXTERNAL EFFORTS BY OTHER FORMS OF LIFE OR THE MATERIAL UNIVERSE OF THE EFFORTS OF AN ORGANISM, AND IS IMPOSED ON THE PHYSICAL ORGANISM BY COUNTER-EFFORTS IN THE ENVIRONMENT.

AXIOM 70. ANY CYCLE OF ANY LIFE ORGANISM IS FROM STATIC TO MOTION TO STATIC.

AXIOM 71. THE CYCLE OF RANDOMITY IS FROM STATIC, THROUGH OPTIMUM, THROUGH RANDOMITY SUFFICIENTLY REPETITIOUS OR SIMILAR TO CONSTITUTE ANOTHER STATIC.

AXIOM 72. THERE ARE TWO SUB-DIVISIONS TO RANDOMITY: DATA RANDOMITY AND FORCE RANDOMITY.

AXIOM 73. THE THREE DEGREES OF RANDOMITY CONSIST OF MINUS RANDOMITY, OPTIMUM RANDOMITY AND PLUS RANDOMITY.

DEFINITION: RANDOMITY IS A COMPONENT FACTOR AND NECESSARY PART OF MOTION, IF MOTION IS TO CONTINUE.

AXIOM 74. OPTIMUM RANDOMITY IS NECESSARY TO LEARNING.

AXIOM 75. THE IMPORTANT FACTORS IN ANY AREA OF RANDOMITY ARE EFFORT AND COUNTER-EFFORT.

(Note: As distinguished from near-perceptions of effort.)

AXIOM 76. RANDOMITY AMONGST ORGANISMS IS VITAL TO CONTINUOUS SURVIVAL OF ALL ORGANISMS.

AXIOM 77. THETA AFFECTS THE ORGANISM, OTHER ORGANISMS AND THE PHYSICAL UNIVERSE BY TRANSLATING THETA FACSIMILES INTO PHYSICAL EFFORTS OR RANDOMITY OF EFFORTS.

DEFINITION: THE DEGREE OF RANDOMITY IS MEASURED BY THE RANDOMNESS OF EFFORT VECTORS WITHIN THE ORGANISM, AMONGST ORGANISMS, AMONGST RACES OR SPECIES OF ORGANISMS OR BETWEEN ORGANISMS AND THE PHYSICAL UNIVERSE.

AXIOM 78. RANDOMITY BECOMES INTENSE IN INDIRECT RATIO TO THE TIME IN WHICH IT TAKES PLACE, MODIFIED BY THE TOTAL EFFORT IN THE AREA.

AXIOM 79. INITIAL RANDOMITY CAN BE REINFORCED BY RANDOMITIES OF GREATER OR LESSER MAGNITUDE.

AXIOM 80. AREAS OF RANDOMITY EXIST IN CHAINS OF SIMILARITY PLOTTED AGAINST TIME. THIS CAN BE TRUE OF WORDS AND ACTIONS CONTAINED IN RANDOMITIES. EACH MAY HAVE ITS OWN CHAIN PLOTTED AGAINST TIME.

AXIOM 81. SANITY CONSISTS OF OPTIMUM RANDOMITY.

AXIOM 82. ABERRATION EXISTS TO THE DEGREE THAT PLUS OR MINUS RANDOMITY EXISTS IN THE ENVIRONMENT OR PAST DATA OF AN ORGANISM, GROUP OR SPECIES, MODIFIED BY THE ENDOWED SELF-DETERMINISM OF THAT ORGANISM, GROUP OR SPECIES.

AXIOM 83. THE SELF-DETERMINISM OF AN ORGANISM IS DETERMINED BY ITS THETA ENDOWMENT, MODIFIED BY MINUS OR PLUS RANDOMITY IN ITS ENVIRONMENT OR ITS EXISTENCE.

AXIOM 84. THE SELF-DETERMINISM OF AN ORGANISM IS INCREASED BY OPTIMUM RANDOMITY OF COUNTER-EFFORTS.

AXIOM 85. THE SELF-DETERMINISM OF AN ORGANISM IS REDUCED BY PLUS OR MINUS RANDOMITY OF COUNTER-EFFORTS IN THE ENVIRONMENT.

AXIOM 86. RANDOMITY CONTAINS BOTH THE RANDOMNESS OF EFFORTS AND THE VOLUME OF EFFORTS.

(Note: An area of randomness can have a great deal of confusion but, without volume of energy, the confusion itself is negligible.)

AXIOM 87. THAT COUNTER-EFFORT IS MOST ACCEPTABLE TO AN ORGANISM WHICH MOST CLOSELY APPEARS TO ASSIST ITS ACCOMPLISHMENT OF ITS GOAL.

- AXIOM 88. AN AREA OF SEVERE PLUS OR MINUS RANDOMITY CAN OCCLUDE DATA ON ANY OF THE SUBJECTS OF THAT PLUS OR MINUS RANDOMITY WHICH TOOK PLACE IN A PRIOR TIME.
- (Note: Shut-off mechanisms of earlier lives, perceptics, specific incidents, etc.)
- AXIOM 89. RESTIMULATION OF PLUS, MINUS OR OPTIMUM RANDOMITY CAN PRODUCE INCREASED PLUS, MINUS OR OPTIMUM RANDOMITY RESPECTIVELY IN THE ORGANISM.
- AXIOM 90. AN AREA OF RANDOMITY CAN ASSUME SUFFICIENT MAGNITUDE SO AS TO APPEAR TO THE ORGANISM AS PAIN, ACCORDING TO ITS GOALS.
- AXIOM 91. PAST RANDOMITY CAN IMPOSE ITSELF UPON THE PRESENT ORGANISM AS THETA FACSIMILES.
- AXIOM 92. THE ENGRAM IS A SEVERE AREA OF PLUS OR MINUS RANDOMITY OF SUFFICIENT VOLUME TO CAUSE UNCONSCIOUSNESS.
- AXIOM 93. UNCONSCIOUSNESS IS AN EXCESS OF RANDOMITY IMPOSED BY A COUNTER-EFFORT OF SUFFICIENT FORCE TO CLOUD THE AWARENESS AND DIRECT FUNCTION OF THE ORGANISM THROUGH THE MIND'S CONTROL CENTER.
- AXIOM 94. ANY COUNTER-EFFORT WHICH MIS-ALIGNS THE ORGANISM'S COMMAND OF ITSELF OR ITS ENVIRONMENT ESTABLISHES PLUS OR MINUS RANDOMITY OR, IF OF SUFFICIENT MAGNITUDE, IS AN ENGRAM.
- AXIOM 95. PAST ENGRAMS ARE RESTIMULATED BY THE CONTROL CENTER'S PERCEPTION OF CIRCUMSTANCES SIMILAR TO THAT ENGRAM IN THE PRESENT ENVIRONMENT.
- AXIOM 96. AN ENGRAM IS A THETA FACSIMILE OF ATOMS AND MOLECULES IN MISALIGNMENT.
- AXIOM 97. ENGRAMS FIX EMOTIONAL RESPONSE AS THAT EMOTIONAL RESPONSE OF THE ORGANISM DURING THE RECEIPT OF THE COUNTER-EFFORT.
- AXIOM 98. FREE EMOTIONAL RESPONSE DEPENDS ON OPTIMUM RANDOMITY. IT DEPENDS UPON ABSENCE OF OR NON-RESTIMULATION OF ENGRAMS.
- AXIOM 99. THETA FACSIMILES CAN RECOMBINE INTO NEW SYMBOLS.
- AXIOM 100. LANGUAGE IS THE SYMBOLIZATION OF EFFORT.
- AXIOM 101. LANGUAGE DEPENDS FOR ITS FORCE UPON THE FORCE WHICH ACCOMPANIED ITS DEFINITION.
- (Note: Counter-effort, not language, is aberrative.)
- AXIOM 102. THE ENVIRONMENT CAN OCCLUDE THE CENTRAL CONTROL OF ANY ORGANISM AND ASSUME CONTROL OF THE MOTOR

CONTROLS OF THAT ORGANISM. (ENGRAM, RESTIMULATION, LOCKS, HYPNOTISM.)

- AXIOM 103. INTELLIGENCE DEPENDS ON THE ABILITY TO SELECT ALIGNED OR MISALIGNED DATA FROM AN AREA OF RANDOMITY AND SO DISCOVER A SOLUTION TO REDUCE ALL RANDOMITY IN THAT AREA.
- AXIOM 104. PERSISTENCE OBTAINS IN THE ABILITY OF THE MIND TO PUT SOLUTIONS INTO PHYSICAL ACTION TOWARD THE REALIZATION OF GOALS.
- AXIOM 105. AN UNKNOWN DATUM CAN PRODUCE DATA OF PLUS OR MINUS RANDOMITY.
- AXIOM 106. THE INTRODUCTION OF AN ARBITRARY FACTOR OR FORCE WITHOUT RECOURSE TO NATURAL LAWS OF THE BODY OR THE AREA INTO WHICH THE ARBITRARY IS INTRODUCED BRINGS ABOUT PLUS OR MINUS RANDOMITY.
- AXIOM 107. DATA OF PLUS OR MINUS RANDOMITY DEPENDS FOR ITS CONFUSION ON FORMER PLUS OR MINUS RANDOMITY OR ABSENT DATA.
- AXIOM 108. EFFORTS WHICH ARE INHIBITED OR COMPELLED BY EXTERIOR EFFORTS EFFECT A PLUS OR MINUS RANDOMITY OF EFFORTS.
- AXIOM 109. BEHAVIOR IS MODIFIED BY COUNTER-EFFORTS WHICH HAVE IMPINGED ON THE ORGANISM.
- AXIOM 110. THE COMPONENT PARTS OF THETA ARE AFFINITY, REALITY, AND COMMUNICATION.
- AXIOM 111. SELF-DETERMINISM CONSISTS OF MAXIMAL AFFINITY, REALITY AND COMMUNICATION.
- AXIOM 112. AFFINITY IS THE COHESION OF THETA.
- Affinity manifests itself as the recognition of similarity of efforts and goals amongst organisms by those organisms.
- AXIOM 113. REALITY IS THE AGREEMENT UPON PERCEPTIONS AND DATA IN THE PHYSICAL UNIVERSE.
- All that we can be sure is real is that on which we have agreed is real. Agreement is the essence of reality.
- AXIOM 114. COMMUNICATION IS THE INTERCHANGE OF PERCEPTION THROUGH THE MATERIAL UNIVERSE BETWEEN ORGANISMS OR THE PERCEPTION OF THE MATERIAL UNIVERSE BY SENSE CHANNELS.
- AXIOM 115. SELF-DETERMINISM IS THE THETA CONTROL OF THE ORGANISM.
- AXIOM 116. A SELF-DETERMINED EFFORT IS THAT COUNTER-EFFORT WHICH HAS BEEN RECEIVED INTO THE ORGANISM IN THE PAST

AND INTEGRATED INTO THE ORGANISM FOR ITS CONSCIOUS USE.

AXIOM 117. THE COMPONENTS OF SELF-DETERMINISM ARE AFFINITY, COMMUNICATION AND REALITY.

Self-determinism is manifested along each dynamic.

AXIOM 118. AN ORGANISM CANNOT BECOME ABERRATED UNLESS IT HAS AGREED UPON THAT ABERRATION, HAS BEEN IN COMMUNICATION WITH A SOURCE OF ABERRATION, AND HAS HAD AFFINITY FOR THE ABERRATOR.

AXIOM 119. AGREEMENT WITH ANY SOURCE, CONTRA- OR PRO-SURVIVAL, POSTULATES A NEW REALITY FOR THE ORGANISM.

AXIOM 120. NON-SURVIVAL COURSES, THOUGHTS AND ACTIONS REQUIRE NON-OPTIMUM EFFORT.

AXIOM 121. EVERY THOUGHT HAS BEEN PRECEDED BY PHYSICAL ACTION.

AXIOM 122. THE MIND DOES WITH THOUGHT AS IT HAS DONE WITH ENTITIES IN THE PHYSICAL UNIVERSE.

AXIOM 123. ALL EFFORT CONCERNED WITH PAIN IS CONCERNED WITH LOSS.

Organisms hold pain and engrams to them as a latent effort to prevent loss of some portion of the organism. All loss is a loss of motion.

AXIOM 124. THE AMOUNT OF COUNTER-EFFORT THE ORGANISM CAN OVERCOME IS PROPORTIONAL TO THE THETA ENDOWMENT OF THE ORGANISM, MODIFIED BY THE PHYSIQUE OF THAT ORGANISM.

AXIOM 125. EXCESSIVE COUNTER-EFFORT TO THE EFFORT OF A LIFE ORGANISM PRODUCES UNCONSCIOUSNESS.

COROLLARY: UNCONSCIOUSNESS GIVES THE SUPPRESSION OF AN ORGANISM'S CONTROL CENTER BY COUNTER-EFFORT.

DEFINITION: THE CONTROL CENTER OF THE ORGANISM CAN BE DEFINED AS THE CONTACT POINT BETWEEN THETA AND THE PHYSICAL UNIVERSE AND IS THAT CENTER WHICH IS AWARE OF BEING AWARE AND WHICH HAS CHARGE OF AND RESPONSIBILITY FOR THE ORGANISM ALONG ALL ITS DYNAMICS.

AXIOM 126. PERCEPTIONS ARE ALWAYS RECEIVED IN THE CONTROL CENTER OF AN ORGANISM WHETHER THE CONTROL CENTER IS IN CONTROL OF THE ORGANISM AT THE TIME OR NOT.

This is an explanation for the assumption of valences.

AXIOM 127. ALL PERCEPTIONS REACHING THE ORGANISM'S SENSE CHANNELS ARE RECORDED AND STORED BY THETA FACSIMILE.

DEFINITION: PERCEPTION IS THE PROCESS OF RECORDING DATA FROM THE PHYSICAL UNIVERSE AND STORING IT AS A THETA FACSIMILE.

DEFINITION: RECALL IS THE PROCESS OF REGAINING PERCEPTIONS.

AXIOM 128. ANY ORGANISM CAN RECALL EVERYTHING WHICH IT HAS PERCEIVED.

AXIOM 129. AN ORGANISM DISPLACED BY PLUS OR MINUS RANDOMITY IS THEREAFTER REMOTE FROM THE PERCEPTION RECORDING CENTER

Increased remoteness brings about occlusions of perceptions. One can perceive things in present time and then, because they are being recorded after they passed Theta perception of the awareness unit, they are recorded but cannot be recalled.

AXIOM 130. THETA FACSIMILES OF COUNTER-EFFORT ARE ALL THAT INTERPOSE BETWEEN THE CONTROL CENTER AND ITS RECALLS.

AXIOM 131. ANY COUNTER-EFFORT RECEIVED INTO A CONTROL CENTER IS ALWAYS ACCOMPANIED BY ALL PERCEPTICS.

AXIOM 132. THE RANDOM COUNTER-EFFORTS TO AN ORGANISM AND THE INTERMINGLED PERCEPTIONS IN THE RANDOMITY CAN RE-EXERT THAT FORCE UPON AN ORGANISM WHEN RESTIMULATED.

DEFINITION: RESTIMULATION IS THE REACTIVATION OF A PAST COUNTER-EFFORT BY APPEARANCE IN THE ORGANISM'S ENVIRONMENT OF A SIMILARITY TOWARD THE CONTENT OF THE PAST RANDOMITY AREA.

AXIOM 133. SELF-DETERMINISM ALONE BRINGS ABOUT THE MECHANISM OF RESTIMULATION.

AXIOM 134. A REACTIVATED AREA OF THE PAST RANDOMITY IMPINGES THE EFFORT AND THE PERCEPTIONS UPON THE ORGANISM.

AXIOM 135. ACTIVATION OF A RANDOMITY AREA IS ACCOMPLISHED FIRST BY THE PERCEPTIONS, THEN BY THE PAIN, FINALLY BY THE EFFORT.

AXIOM 136. THE MIND IS PLASTICALLY CAPABLE OF RECORDING ALL EFFORTS AND COUNTER-EFFORTS.

AXIOM 137. A COUNTER-EFFORT ACCOMPANIED BY SUFFICIENT (ENRANDOMED) FORCE IMPRESSES THE FACSIMILE OF THE COUNTER-EFFORT PERSONALITY INTO THE MIND OF AN ORGANISM.

AXIOM 138. ABERRATION IS THE DEGREE OF RESIDUAL PLUS OR MINUS RANDOMITY ACCUMULATED BY COMPELLING, INHIBITING, OR UNWARRANTED ASSISTING OF EFFORTS ON THE PART OF OTHER ORGANISMS OR THE PHYSICAL (MATERIAL) UNIVERSE.

Aberration is caused by what is done to the individual, not what the individual does, plus his self-determinism about what has been done to him.

AXIOM 139. ABERRATED BEHAVIOR CONSISTS OF DESTRUCTIVE EFFORT TOWARD PRO-SURVIVAL DATA OR ENTITIES ON ANY DYNAMIC, OR EFFORT TOWARD THE SURVIVAL OF CONTRA-SURVIVAL DATA OR ENTITIES FOR ANY DYNAMIC.

AXIOM 140. A VALENCE IS A FACSIMILE PERSONALITY MADE CAPABLE OF FORCE BY THE COUNTER-EFFORT OF THE MOMENT OR RECEIPT INTO THE PLUS OR MINUS RANDOMITY OF UNCONSCIOUSNESS.

Valences are assistive, compulsive or inhibitive to the organism. A CONTROL CENTER IS NOT A VALENCE.

AXIOM 141. A CONTROL CENTER EFFORT IS ALIGNED TOWARD A GOAL THROUGH DEFINITE SPACE AS A RECOGNIZED INCIDENT IN TIME.

AXIOM 142. AN ORGANISM IS AS HEALTHY AND SANE AS IT IS SELF-DETERMINED.

The environmental control of the organism motor-controls inhibits the organism's ability to change with the changing environment, since the organism will attempt to carry forward with one set of responses when it needs by self-determinism to create another to survive in another environment.

AXIOM 143. ALL LEARNING IS ACCOMPLISHED BY RANDOM EFFORT.

AXIOM 144. A COUNTER-EFFORT PRODUCING SUFFICIENT PLUS OR MINUS RANDOMITY TO RECORD IS RECORDED WITH AN INDEX OF SPACE AND TIME AS HIDDEN AS THE REMAINDER OF ITS CONTENT.

AXIOM 145. A COUNTER-EFFORT PRODUCING SUFFICIENT PLUS OR MINUS RANDOMITY WHEN ACTIVATED BY RESTIMULATION EXERTS ITSELF AGAINST THE ENVIRONMENT OR THE ORGANISM WITHOUT REGARD TO SPACE AND TIME, EXCEPT REACTIVATED PERCEPTIONS.

AXIOM 146. COUNTER-EFFORTS ARE DIRECTED OUT FROM THE ORGANISM UNTIL THEY ARE FURTHER ENRANDOMED BY THE ENVIRON AT WHICH TIME THEY AGAIN ACTIVATE AGAINST THE CONTROL CENTER.

AXIOM 147. AN ORGANISM'S MIND EMPLOYS COUNTER-EFFORTS EFFECTIVELY ONLY SO LONG AS INSUFFICIENT PLUS OR MINUS RANDOMITY EXISTS TO HIDE DIFFERENTIATION OF THE FACSIMILES CREATED.

AXIOM 148. PHYSICAL LAWS ARE LEARNED BY LIFE ENERGY ONLY BY IMPINGEMENT OF THE PHYSICAL UNIVERSE PRODUCING RANDOMITY, AND A WITHDRAWAL FROM THAT IMPINGEMENT.

- AXIOM 149. LIFE DEPENDS UPON AN ALIGNMENT OF FORCE VECTORS IN THE DIRECTION OF SURVIVAL AND THE NULLIFICATION OF FORCE VECTORS IN THE DIRECTION OF SUCCUMB IN ORDER TO SURVIVE.
- COROLLARY: LIFE DEPENDS UPON AN ALIGNMENT OF FORCE VECTORS IN THE DIRECTION OF SUCCUMB AND THE NULLIFICATION OF FORCE VECTORS IN THE DIRECTION OF SURVIVE IN ORDER TO SUCCUMB.
- AXIOM 150. ANY AREA OF RANDOMITY GATHERS TO IT SITUATIONS SIMILAR TO IT WHICH DO NOT CONTAIN ACTUAL EFFORTS BUT ONLY PERCEPTION.
- AXIOM 151. WHETHER AN ORGANISM HAS THE GOAL OF SURVIVING OR SUCCUMBING DEPENDS UPON THE AMOUNT OF PLUS OR MINUS RANDOMITY IT HAS REACTIVATED. (NOT RESIDUAL.)
- AXIOM 152. SURVIVAL IS ACCOMPLISHED ONLY BY MOTION,
- AXIOM 153. IN THE PHYSICAL UNIVERSE THE ABSENCE OF MOTION IS VANISHMENT.
- AXIOM 154. DEATH IS THE EQUIVALENT TO LIFE OF TOTAL LACK OF LIFE-MOTIVATED MOTION.
- AXIOM 155. ACQUISITION OF PRO-SURVIVAL MATTER AND ENERGY OR ORGANISMS IN SPACE AND TIME MEANS INCREASED MOTION.
- AXIOM 156. LOSS OF PRO-SURVIVAL MATTER AND ENERGY OR ORGANISMS IN SPACE AND TIME MEANS DECREASED MOTION.
- AXIOM 157. ACQUISITION OR PROXIMITY OF MATTER, ENERGY OR ORGANISMS WHICH ASSIST THE SURVIVAL OF AN ORGANISM INCREASE THE SURVIVAL POTENTIALS OF AN ORGANISM.
- AXIOM 158. ACQUISITION OR PROXIMITY OF MATTER, ENERGY OR ORGANISMS WHICH INHIBIT THE SURVIVAL OF AN ORGANISM DECREASE ITS SURVIVAL POTENTIAL.
- AXIOM 159. GAIN OF SURVIVAL ENERGY, MATTER OR ORGANISMS INCREASES THE FREEDOM OF AN ORGANISM.
- AXIOM 160. RECEIPT OR PROXIMITY OF NON-SURVIVAL ENERGY, MATTER OR TIME DECREASES THE FREEDOM OF MOTION OF AN ORGANISM.
- AXIOM 161. THE CONTROL CENTER ATTEMPTS THE HALTING OR LENGTHENING OF TIME, THE EXPANSION OR CONTRACTION OF SPACE AND THE DECREASE OR INCREASE OF ENERGY AND MATTER.
- This is a primary source of invalidation, and it is also a primary source of aberration.
- AXIOM 162. PAIN IS THE BALK OF EFFORT BY COUNTER-EFFORT IN GREAT INTENSITY, WHETHER THAT EFFORT IS TO REMAIN AT REST OR IN MOTION.

- AXIOM 163. PERCEPTION, INCLUDING PAIN, CAN BE EXHAUSTED FROM AN AREA OF PLUS OR MINUS RANDOMITY, STILL LEAVING THE EFFORT AND COUNTER-EFFORT OF THAT PLUS OR MINUS RANDOMITY.
- AXIOM 164. THE RATIONALITY OF THE MIND DEPENDS UPON AN OPTIMUM REACTION TOWARD TIME.
- DEFINITION: SANITY, THE COMPUTATION OF FUTURES.
- DEFINITION: NEUROTIC, THE COMPUTATION OF PRESENT TIME ONLY.
- DEFINITION: PSYCHOTIC, COMPUTATION ONLY OF PAST SITUATIONS.
- AXIOM 165. SURVIVAL PERTAINS ONLY TO THE FUTURE.
- COROLLARY: SUCCUMB PERTAINS ONLY TO THE PRESENT AND PAST.
- AXIOM 166. AN INDIVIDUAL IS AS HAPPY AS HE CAN PERCEIVE SURVIVAL POTENTIALS IN THE FUTURE.
- AXIOM 167. AS THE NEEDS OF ANY ORGANISM ARE MET IT RISES HIGHER AND HIGHER IN ITS EFFORTS ALONG THE DYNAMICS.
- An organism which achieves ARC with itself can better achieve ARC with sex in the future; having achieved this it can achieve ARC with groups; having achieved this, it can achieve ARC with mankind, etc.
- AXIOM 168. AFFINITY, REALITY AND COMMUNICATION CO-EXIST IN AN INEXTRICABLE RELATIONSHIP.
- The co-existent relationship between affinity, reality and communication is such that none can be increased without increasing the other two and none can be decreased without decreasing the other two.
- AXIOM 169. ANY AESTHETIC PRODUCT IS A SYMBOLIC FACSIMILE OR COMBINATION OF FACSIMILES OF THETA OR PHYSICAL UNIVERSES IN VARIED RANDOMITIES AND VOLUMES OF RANDOMITIES WITH THE INTERPLAY OF TONES.
- AXIOM 170. AN AESTHETIC PRODUCT IS AN INTERPRETATION OF THE UNIVERSES BY AN INDIVIDUAL OR GROUP MIND.
- AXIOM 171. DELUSION IS THE POSTULATION BY THE IMAGINATION OF OCCURRENCES IN AREAS OF PLUS OR MINUS RANDOMITY.
- AXIOM 172. DREAMS ARE THE IMAGINATIVE RECONSTRUCTION OF AREAS OF RANDOMITY OR THE RE-SYMBOLIZATION OF THE EFFORTS OF THETA.
- AXIOM 173. A MOTION IS CREATED BY THE DEGREE OF OPTIMUM RANDOMITY INTRODUCED BY THE COUNTER-EFFORT TO AN ORGANISM'S EFFORT.

- AXIOM 174. MEST WHICH HAS BEEN MOBILIZED BY LIFE FORMS IS IN MORE AFFINITY WITH LIFE ORGANISMS THAN NON-MOBILIZED MEST.
- AXIOM 175. ALL PAST PERCEPTION, CONCLUSION AND EXISTENCE MOMENTS, INCLUDING THOSE OF PLUS OR MINUS RANDOMITY, ARE RECOVERABLE TO THE CONTROL CENTER OF THE ORGANISM.
- AXIOM 176. THE ABILITY TO PRODUCE SURVIVAL EFFORT ON THE PART OF AN ORGANISM IS AFFECTED BY THE DEGREES OF RANDOMITY EXISTING IN ITS PAST. (THIS INCLUDES LEARNING.)
- AXIOM 177. AREAS OF PAST PLUS OR MINUS RANDOMITY CAN BE READDRESSSED BY THE CONTROL CENTER OF AN ORGANISM AND THE PLUS OR MINUS RANDOMITY EXHAUSTED.
- AXIOM 178. THE EXHAUSTION OF PAST PLUS OR MINUS RANDOMITIES PERMITS THE CONTROL CENTER OF AN ORGANISM TO EFFECT ITS OWN EFFORTS TOWARD SURVIVAL GOALS.
- AXIOM 179. THE EXHAUSTION OF SELF-DETERMINED EFFORT FROM A PAST AREA OF PLUS OR MINUS RANDOMITY NULLIFIES THE EFFECTIVENESS OF THAT AREA.
- AXIOM 180. PAIN IS THE RANDOMITY PRODUCED BY SUDDEN OR STRONG COUNTER-EFFORTS.
- AXIOM 181. PAIN IS STORED AS PLUS OR MINUS RANDOMITY.
- AXIOM 182. PAIN, AS AN AREA OF PLUS OR MINUS RANDOMITY, CAN RE-INFLICT ITSELF UPON THE ORGANISM.
- AXIOM 183. PAST PAIN BECOMES INEFFECTIVE UPON THE ORGANISM WHEN THE RANDOMITY OF ITS AREA IS ADDRESSED AND ALIGNED.
- AXIOM 184. THE EARLIER THE AREA OF PLUS OR MINUS RANDOMITY, THE GREATER SELF-PRODUCED EFFORT EXISTED TO REPEL IT.
- AXIOM 185. LATER AREAS OF PLUS OR MINUS RANDOMITY CANNOT BE RE-ALIGNED EASILY UNTIL EARLIER AREAS ARE RE-ALIGNED.
- AXIOM 186. AREAS OF PLUS OR MINUS RANDOMITY BECOME INCREASED IN ACTIVITY WHEN PERCEPTIONS OF SIMILARITY ARE INTRODUCED INTO THEM.
- AXIOM 187. PAST AREAS OF PLUS OR MINUS RANDOMITY CAN BE REDUCED AND ALIGNED BY ADDRESS TO THEM IN PRESENT TIME.
- AXIOM 188. ABSOLUTE GOOD AND ABSOLUTE EVIL DO NOT EXIST IN THE MEST UNIVERSE.
- AXIOM 189. THAT WHICH IS GOOD FOR AN ORGANISM MAY BE DEFINED AS THAT WHICH PROMOTES THE SURVIVAL OF THAT ORGANISM.
- COROLLARY: EVIL MAY BE DEFINED AS THAT WHICH INHIBITS OR BRINGS PLUS OR MINUS RANDOMITY INTO THE ORGANISM,

WHICH IS CONTRARY TO THE SURVIVAL MOTIVES OF THE ORGANISM.

AXIOM 190. HAPPINESS CONSISTS IN THE ACT OF BRINGING ALIGNMENT INTO HITHERTO RESISTING PLUS OR MINUS RANDOMITY. NEITHER THE ACT OR ACTION OF ATTAINING SURVIVAL, NOR THE ACCOMPLISHMENT OF THIS ACT ITSELF, BRINGS ABOUT HAPPINESS.

AXIOM 191. CONSTRUCTION IS AN ALIGNMENT OF DATA.

COROLLARY: DESTRUCTION IS A PLUS OR MINUS RANDOMITY OF DATA.

The effort of construction is the alignment toward the survival of the aligning organism. Destruction is the effort of bringing randomness into an area.

AXIOM 192. OPTIMUM SURVIVAL BEHAVIOR CONSISTS OF EFFORT IN THE MAXIMUM SURVIVAL INTEREST IN EVERYTHING CONCERNED IN THE DYNAMICS.

AXIOM 193. THE OPTIMUM SURVIVAL SOLUTION OF ANY PROBLEM WOULD CONSIST OF THE HIGHEST ATTAINABLE SURVIVAL FOR EVERY DYNAMIC CONCERNED.

AXIOM 194. THE WORTH OF ANY ORGANISM CONSISTS OF ITS VALUE TO THE SURVIVAL OF ITS OWN THETA ALONG ANY DYNAMIC.

Glossary

ACCESSIBILITY:

The state of being willing to be processed (technical sense in this science). The state of being willing to have interpersonal relations (social sense). For the individual himself, accessibility with self means whether or not an individual can recontact his past experiences or data. A man with a "bad memory" (interposed blocks between control center and facsimiles) has memories which are not accessible to him.

ACT:

A stage of processing. Applies solely to the particular process in use at a certain case level.

ASSESSMENT:

An inventory, an examination, a calculation or evaluation of a case. ASSISTS:

The straight perception by perception running over and over of an incident until it is desensitized as a facsimile and cannot affect the preclear. The assist is used immediately after accidents or operations. It takes away shock and most of the harmful effects of the incident and promotes healing. It is done by starting the individual at the beginning of the incident, with the first awareness of the incident, just as though the preclear were living it all the way through again with full perception of sight, sound, etc., as nearly as they can be obtained. An assist run, for instance, immediately after a dental operation takes all the shock out of the operation. One concludes an assist by picking up the auditing as another incident and running through the auditing and the decision to be audited. An assist saves lives and materially speeds healing.

AUDITOR:

One who listens and computes. A technician of this science.

BROKEN:

Slang used in the wise of "breaking a case", meaning that one breaks the hold of the preclear on a non-survival facsimile. Used in greater or lesser magnitude such as "breaking a circuit" or "breaking into a chain" or "breaking a computation". Never breaking the preclear or his spirit, but breaking what is breaking the preclear.

CENTER OF CONTROL:

The awareness of awareness unit of the mind. This is not part of the brain but part of the mind, the brain being physioLOGICAL. The mind has two control centers possible, by DEFINITION, the right and the left. One is an actual, genetic control center, the other is a sub-control center subservient to the control center.

CLEAR (verb):

The act of desensitizing or releasing a thought impression or a series of impressions or observations in the past, or a postulate, an emotion, an effort or an entire facsimile. The preclear either releases his hold on the facsimile (memory) or the facsimile itself is desensitized. The word is taken from electronic computers or common office adding machines and describes an action similar to clearing past computations from the machine.

CLEAR (noun):

A much misunderstood state of being. The word has been used before with other meanings. It has been mistaken as an absolute. It is still used. It is used here as electronics slang and can apply to a chain, an incident or a computation.

COMPUTING PSYCHOTIC:

One who is running on a circuit, a circuit being a pseudo-personality out of a facsimile strong enough to dictate to the individual and BE the individual.

DRAMATIZING PSYCHOTIC:

One who dramatizes one type of facsimile only.

DYNAMICS:

The central drives of an individual. They are numbered from one to eight as follows: 1. Self survival; 2. Survival through children (includes sexual act); 3. Survival by groups including social and political as well as commercial; 4. Survival through Mankind as a whole; 5. Survival through Life including any species, vegetable or animal; 6. Survival through MEST; 7. Survival through theta or the static of Life itself; 8. (Written as infinity). Survival through a Supreme Being. Each individual is surviving for all eight. EFFORT:

The physical force manifestation of motion. A sharp effort against an individual produces pain. A strenuous effort produces discomfort. Effort can be recalled and re-experienced by the preclear. No preclear below 2.5 should be called upon to use effort as such as he is incapable of handling it and will stick in it. The essential part of a painful facsimile is its effort, not its perceptions.

EMOTION:

The catalyst used by the control center to monitor physical action. The relay system, via glands, interposed between "I" and self and, by thought, others. The main emotions are happiness in which one has confidence and enjoyment in his goals and a belief in his control of environment; boredom, in which one has lost confidence and direction but is not defeated; antagonism wherein one feels his control threatened; anger wherein one seeks to destroy that which threatens and seeks without good direction beyond destruction; covert hostility wherein one seeks to destroy while reassuring his target that he is not so seeking; fear wherein one is catalyzed to flee; grief in which one recognizes loss; apathy in which one accepts failure on all dynamics and pretends death. Other emotions are a volume or lack of volume of those named. Shame or embarrassment are emotions peculiar to groups or interpersonal relations and are on a level with grief, denoting loss of position in a group. Emotion is the glandular system parallel of motion and each emotion reflects action to gain or lose to motion. At a high level one is sending back motion, at a mid level one is holding motion, at a lower level, motion is sweeping through and over one.

ENVIRONMENT:

The surroundings of the preclear from moment to moment in particular or in general, including people, pets, mechanical objects, weather, culture, clothing or the Supreme Being. Anything he perceives or believes he perceives. The objective environment is the environment everyone agrees is there. The subjective environment is the environment the individual himself believes is there. They may not agree.

FACSIMILES:

A facsimile is a memory recording for a finite period of time. It is considered that memory is a static without wave length, weight, mass or position in space (in other words, a true static) which yet receives the impression of time, space, energy and matter. A careful

examination of the phenomena of thought and the behavior of the human mind leads one to this conclusion. The conclusion is itself a postulate used because it is extremely useful and workable. This is a point of echelon in research, that a facsimile can be so described. The description is mathematical and an abstract and may or may not be actual. When a thought recording is so regarded, the problems of the mind rapidly resolve. Facsimiles are said to be "stored". They act upon the physical universe switchboard called the brain and nervous and glandular system to monitor action. They appear to have motion and weight only because motion and weight are recorded into them. They are not stored in the cells. They impinge upon the cells. Proof of this matter rests in the fact that an energy which became a facsimile a long time ago can be re-contacted and is found to be violent on the contact. Pain is stored as a facsimile. Old pain can be re-contacted. Old pain, in facsimile form, old emotion in facsimile form, can re-impose itself on present time in such a wise as to deform or otherwise physically affect the body. You can go back to the last time you hurt yourself and find there and re-experience the pain of that hurt, unless you are very occluded. You can recover efforts and exertions you have made or which have been made against you in the past. Yet the cells themselves, which have finite life, are long since replaced although the body goes on. Hence the facsimile theory. The word facsimile is used as bluntly as one uses it in connection with a drawing of a box top instead of the actual box top. It means a similar article rather than the article itself. You can recall a memory picture of an elephant or a photograph. The elephant and the photograph are no longer present. A facsimile of them is stored in your mind. A facsimile is complete with every perception of the environment present when that facsimile was made including sight, sound, smell, taste, weight, joint position and so on through half a hundred perceptions. Just because you cannot recall motion or these perceptions does not mean they were not recorded fully and in motion with every perception channel you had at the time. It does mean that you have interposed a stop between the facsimile and the recall mechanisms of your control centers. There are facsimiles of everything you have experienced in your entire lifetime and everything you have imagined.

FIFTEEN (noun):

A designation to denote a finished case. Solely for case recording to designate a case advanced to current completion. This is a Foundation number system for preclears. A case is noted on record by the act number to which it has been advanced.

GENETIC:

By line of protoplasm and by facsimiles and by MEST forms the individual has arrived in the present age from a past beginning. Genetic applies to the protoplasm line of father and mother to child, grown child to new child and so forth.

LOCK SCANNING:

A process which starts the preclear from a point in the past with which he has made solid contact up through all similar incidents without verbalization. This is done over and over, each time trying to start at an earlier incident of the same kind, until the preclear extroverts on the subject of the chain. BOIL-OFF often results wherein the preclear seems to go to sleep. Avoid boil-off for it is not therapeutic and will eventually result in reduced tone. BOIL-OFF is a lazy auditor's excuse to be idle and facsimiles in such severe conflict that they will not resolve without resolving postulates first. Lock scanning is a standardized drill, started on signal and ended with the preclear saying he is again in present time. It can be done on any subject. ABOVE 2.0 only.

MEST:

A compound word made up of the first letters of MATTER, ENERGY, SPACE and TIME. A coined word for the PHYSICAL UNIVERSE. THETA IS NOT CONSIDERED AS PART OF THE PHYSICAL UNIVERSE BUT IS NOT CONSIDERED ABSOLUTELY AS NOT PART OF THE PHYSICAL UNIVERSE. PAST POSTULATES:

Decisions or conclusions the preclear has made in the past and to which he is still subjected in the present. Past postulates are uniformly invalid since they cannot resolve present environment.

PERCEPTIONS:

By means of physical waves, rays and particles of the physical universe, impressions of the environment enter through the "sense channels" such as the eyes and optic nerves, the nose and olfactory nerves; the ears and aural nerves; inter-body nerves for inter-body perceptions, etc., etc. These are all perceptions up to the instant they record as facsimiles at which moment they become recordings. When recalled they are perceptions again, being again entered into sense channels from the recall side. There are over half a hundred separate perceptions all being recorded at once.

POSTULATE (verb):

To conclude, decide or resolve a problem or to set a pattern for the future or to nullify a pattern of the past.

POSTULATE (noun):

A conclusion, decision or resolution made by the individual himself on his own self-determinism on data of the past, known or unknown. The postulate is always known. It is made upon the evaluation of data by the individual or on impulse without data. It resolves a problem of the past, decides on problems or observations in the present or sets a pattern for the future.

PSYCHOSOMATIC ILLNESS:

A term used in common parlance to denote a condition "resulting from a state of mind." Such illnesses account for about seventy percent of all ills, by popular report. Technically, in this science, a chronic or continuing painful facsimile to which the preclear is holding to account for failures. Arthritis, bursitis, tendonitis, myopia, astigmatism, bizarre aches and pains, sinusitis, colds, ulcers, migraine headaches, toothache, poliomyelitis deformities, fatness, skin malformations are a few of these legion of chronic somatics. They are traceable to service facsimiles.

PSYCHOTIC:

An individual who is out of contact to a thorough extent with his present time environment and who does not compute into the future. He may be an acute psychotic wherein he becomes psychotic for only a few minutes at a time and only occasionally in certain environments (as in rages or apathies) or he may be a chronic psychotic, or in a continual disconnection with the future and present. Psychotics who are dramatically harmful to others are considered dangerous enough to be put away. Psychotics who are harmful on a less dramatic basis are no less harmful to their environment and are no less psychotic. PRECLEAR:

One who has entered processing enroute to becoming a fifteen.

RECOVERY:

Recovery of one's own ability to determine one's existence.

RELEASE (verb):

The act of taking the perceptions or effort or effectiveness out of a heavy facsimile or taking away the preclear's hold on the facsimile.

REPETITIVE STRAIGHT-WIRE:

Attention called to an incident over and over amongst other incidents until it is desensitized. Used on conclusions or incidents which do not easily surrender.

SERVICE FACSIMILE:

A definitely non-survival situation contained in a facsimile which is called into action by the individual to explain his failures. A service facsimile may be one of an illness, an injury, an inability. The facsimile begins with a down emotional curve and ends with an upward emotional curve. Between these it has pain. A service facsimile IS the pattern which is the chronic "psychosomatic illness." It may contain coughs, fever, aches, rashes, any manifestation of a non-survival character, mental or physical. It may even be a suicide effort. It is complete with all perceptions. It has many similar facsimiles. It has many locks. The possession and use of a service facsimile distinguishes a homo sapiens.

SERVICE FACSIMILE CHAIN:

The entire chain of similar incidents which comprise the total repertoire of the individual who is explaining thus failure and thus seeking support.

STRAIGHT-WIRE:

A process of recalling, from present time, with some perception or at least a concept, a past incident. The name straight-wire derives from the MEST communications process of connecting two points of a communications system. It is essentially memory work. It is applied to postulates, evaluations, incidents, scenes, emotions, or any data which may be in the storage banks of the mind without "sending the preclear" into the incident itself. It is done with the preclear sitting up, eyes open or shut. The auditor is very alert. Straight-wire is done rapidly. The preclear is not permitted to wander or reminisce. He responds to questions on the part of the auditor. MANY PRECLEARS DISLIKE BEING QUESTIONED. THE AUDITOR MUST THEN FIRST RESOLVE THE POSTULATES AGAINST BEING QUESTIONED; this would be called "clearing for broad straight-wire."

TEN:

A case advanced to the point of released service facsimile.

THETA:

The mathematical symbol for the static of thought. By THETA is meant the static itself. By "facsimile" is meant THETA which contains impressions by perception.

THOUGHT:

The facsimiles one has recorded of his various environments and the facsimiles he has created with his imaginings, their recombination and evaluations and conclusions for the purpose of determining action or no action or potential action or no action. THOUGHT is used also to mean a progress treating awareness level recordings as distinct from non-awareness level recordings.

HANDBOOK FOR PRECLEARS

By

L. Ron Hubbard

PUBLISHER'S NOTE: 1951

This volume, Handbook for Preclears, is a popularized application of certain discoveries contained in a new organization of epistemology which is an apparently successful effort to align epistemology into a complete and workable science.

Epistemology is the philosophic term of "knowledge." The identification of the basic laws of knowledge and the discovery of some two hundred new phenomena concerning thought open new portals for the investigator in any science, since all sciences are basically dependent upon epistemology or knowledge itself. Sciences resolve and become workable in the degree that knowledge itself, as a subject is resolved.

Man's advances into the phenomena of the physical universe have been accomplished by the isolation of new ways to think. Man's progress is measured not by phenomena converted into understood data but by the organization of new methods of discovering phenomena. Mathematics, until this new science was organized and proofs of it well established, was chiefly a method of thinking about things. The amount of phenomena discovered by mathematics is evidenced everywhere in the civilized world and culminated in atomic fission.

Whatever the future of this new science in the field of epistemology may portend, it has produced evidence that it may be a forceful new tool in the hands of the biologist, the anthropologist, the political scientist, and, in short, most branches of science. It forms a bridge amongst these sciences and calls them back from their highly specialized aspects into new units of knowledge and will probably make easier the work of those scientists operating in those fields.

Almost incidentally, this new science resolves many of the problems of the human mind and human body which have been resistive. The human mind, as a computer and storage bin of knowledge receives considerable attention in this new science. But it should not be thought that this new science is a therapy although it poses one. It is rather a new codified understanding of such things as interpersonal relations and constructive action. A few of the many phenomena newly discovered by this science resolve, however, the problems of mental and psychosomatic disorder in a percentage of cases not previously attained.

This small self-help volume is offered to the intelligent layman for his use and to qualified practitioners in the field of the human mind for a quick understanding of the potentialities contained in the new science. Tests so far conducted demonstrate that this volume is capable of producing complete and lasting results in 88 per cent of the cases to which it is applied as compared to the temporary results now being obtained by mental practitioners in 22 per cent of their cases.

HOW TO USE THIS BOOK

IMPORTANT NOTE: In studying Scientology be very, very certain you never go past a word you do not fully understand.

The only reason a person gives up a study or becomes confused or unable to learn is that he or she has gone past a word or phrase that was not understood. If the material becomes confusing or you can't seem to grasp it, there will be a word just earlier that you have not understood. Don't go any further, but go back to BEFORE you got into trouble, find the misunderstood word and get it defined.

For unfamiliar words in this book there is a Glossary beginning on page 73 to assist you.

This volume of self processing is designed for use in any of four ways:

1. As a workbook to be used wholly by the auditor on the pre-clear; or
2. As a homework book to be given the pre-clear for use between sessions; or
3. As a process done by the pre-clear himself with only occasional auditor help; or
4. As a processing manual used wholly by the pre-clear without an auditor.

The last use is possible, particularly when the pre-clear knows considerable about this science from other sources. But it is possible, by reading this book alone, and with considerable stamina, to carry straight on through.

If this book is given to you by an auditor, he expects to be consulted concerning any difficult points and he expects to run out your service facsimile when the time comes by effort processing.

The intention of this book is to decrease your reaction time, improve your efficiency and well being, to extend your life. This book is not intended for the people who would usually seek help by reason of severe aberration, neurosis or insanity.

The optimum individual to which this book would be addressed for total self use would be a person capable of considerable action such as a member of the armed services, a jet pilot, an artist, a musician desiring to speed his playing time and increase his ability. The address of this volume is to the person who, though normal enough would like to excel physically and mentally. An engineer, for instance, using this volume, could increase his ability to calculate and perform many times over.

DON'T CONFUSE THIS SCIENCE WITH PSYCHOTHERAPY, PSYCHOSIS OR NEUROSIS. JUST BECAUSE IT HANDLES THESE EASILY FOR THE FIRST TIME IN HISTORY IS NO REASON IT IS DEVOTED TO THE LAME, THE HALT AND THE ABERRATED. THIS SCIENCE HAS AS ONE OF ITS BRANCHES THE IMPROVEMENT OF HUMAN ABILITY ABOVE WHAT IT HAS BEEN. THIS BOOK WAS WRITTEN TO IMPROVE THE ABILITY OF THE ABLE.

Anyone using this volume as written can increase his skills, rehabilitate his goals and improve himself considerably above his fellows. We need people like that if we are going to have a better world.

Use this book as written. Don't try to combine it with old time mumbo-jumbo. Gasoline and alcohol, this book and psychotherapy mix similarly. Use this book as written and no harm can come to you unless you are a case that badly needs an auditor. Good luck in your voyage to YOU.

ON THE STATE OF MAN

Man started his journey to present time some countless eons thence. Through blood and slaughter, earthquake and tidal wave, through muck and parching sand, through misery and strivings, grief and happiness he has progressed, generation by generation into the master of the world and the lord of all kingdoms.

What is the ideal state of this animal Man? What are his goals ? What are his limitations ? What is there about him that is good and what is bad ?

In the course of his adventures, Man made one very important discovery—and it has worried him ever since. He found that he had a mind. He found that he could think. Finally he understood that his mind was his best weapon. And he found that privation and injury or perhaps demons could deprive him of the full use of that weapon—his mind.

Through ages of philosophers, shamans and priests, he has attempted to resolve this primary worry and thus resolve a primary problem. Man wants to know what there is wrong with his mind, if anything, and he wants to know what might be the ideal state of his mind, if such a state exists.

He has wandered into countless strange by-paths in a quest for answers to these problems. He has seated himself on mountain tops and in caves for whole lifetimes just to ponder the riddle of himself. He has gone to war, he has starved, he has worked and reviled and written just to solve these two mysteries.

And now, as these words are written, his terribly perplexing mind has given birth to an idea and his hands have given form to a weapon which may resolve Man forever by destroying all civilization. Thus he **MUST** solve the two principal mysteries of his mind.

Can the nature of Man be changed before the works of Man vanish forever under the thud of Man's most powerful product, the atom bomb?

Can the nature of Man be changed at all?

Indeed there is nothing more plastic than Man's ability to think and believe. At one time or another in one part of the world or another Man has accepted or believed things wilder than anything contained in philosophic books. His capacity for change is almost unlimited. It is no idle postulate, then, that Man's nature, across the whole world, might change entirely in a span of a few years. One has but to study his history to find such shifts of viewpoint and alterations of character. The inertia of populaces is a myth. For instance, the coming of St. Paul to Rome, almost two thousand years ago, changed the nature of all Roman slaves with a firelike swiftness. The appearance of a monk in England at the beginning of the millennia just ending altered the insularity of that island in a few months and sent hordes thundering off to the Crusades filled with a piety and zeal which, before his arrival, were markedly absent. And in the last quarter of a century the idea of collectivism has flooded out from a desperate band of revolutionaries to change the customs and methods of living of nearly a majority of the population of the world.

If Man can alter in such numbers, the alteration of an individual would seem to be relatively simple. And so it is. With new knowledge and with many of his past and present problems suddenly resolved, an individual in a few weeks can present a face to his fellows which has markedly changed.

Man is accustomed to change. The severity of his aberration is normally due to a feeling that he must protest against change. For his environment, all down through his evolutionary life, through any lifetime, has changed almost day by day.

Man is successful. That is evident because he is here today after eons of trial and error, good and bad planning. And he is successful because he can change.

The conquest of his environment had been his own engrossing purpose. Each time he has failed to conquer and control his environs, he has made wide changes in form and methods and has again returned into his kingship.

Man does NOT adapt to an environment He adapts the environment to himself. And in that lies his success. When he fails to adapt the environment, when he lags in his complete control of that environment, he has altered himself or his ideas until he could again change the environment.

Amongst the many things Man has done, in his worries about his mind and his state of being, in his effort to control others, is the adoption of slave philosophies. Each person who invents or uses such a philosophy more or less tends to be, himself, exempt from the slavery thus imposed and to hold, by the invention, the force of others nullified. This is a trick of very limited workability for it leads eventually into the entrapment of the user himself. It is a demonstrable law, not an opinion, that he who would enslave his fellows becomes himself enslaved. A “therapy” which teaches that Man should adapt himself to his environment rather than adapt the environment to him is such a slave philosophy and is not workable only because it is quite the reverse from truth.

Each Man of the species seeks one way or another to rise superior to all else. In that is his salvation, and, in terms of his societies, his downfall.

Attempts at enslavement arise primarily from fear. Fear comes about with the loss of confidence in one’s ability to make his way. Thus is posed a world where self-confidence is sought by robbing others of theirs. This cannot succeed in a complex society.

Man’s problem today is not new. It is only more urgent of solution. What is wrong, if anything, with his mind ? What is his ideal state?

AN IDEAL STATE OF BEING

Before one can determine what is wrong with a state of being, one should have some idea what an ideal state of being might be. In other words, before one can repair, for instance, a radio, one must have some knowledge of what the radio is supposed to do and how well it could play in a good state of repair.

What, it should have been asked a few millennia ago, is an ideal state of being for Man? In what state of mind does he best prosper? What is a well man? What is a happy man? What are the goals of Man? In what state of mind and body does Man live longest and fare best? What does Man want to do? What is he trying to do? What is he?

Before one could presume to advance libido theories and pre-frontal lobotomies and magic healing crystals, one should have had some idea of the goal of his efforts.

The engineer in repairing a bridge, has to have some idea of what a bridge is supposed to do, what loads it is supposed to carry, how strong it has to be and what might be expected to wreck it again. This is simple reasoning. The engineer does not look at this bridge he is supposed to repair, sigh, say the problem is too complicated, bicker with several other "authorities" on bridges, put some dynamite in the wrong place and blow it up and then wonder why there isn't any bridge left and begin to explain to passers-by that he was called too late, that was all, that bridges aren't much good anyway.

Yet one fears this has been the method of address to the problem of the human mind and body.

To begin a rehabilitation of a human mind and body, one should know something about their optimum state. That would be the beginning of the answer as to how the mind and body could be rehabilitated. Further, it would be the beginning of an answer as to what environment and conditions best favor the human body and the human mind. After that, one could devise means of achieving an optimum condition.

In this new science there are over two hundred axioms which, one to the next, form a logical structure concerning the mind and body, which structure is demonstrated to be workable by the discovery of many new phenomena. This structure also predicts where phenomena might be found—and when one looks to see if the prediction was true, finds that it is. Accomplishments which people are calling miracles come about because of the logic and phenomena of these axioms.

The goal of Man here on this earth is apparently "SURVIVAL." And by survival is meant everything necessary to survival including honor and morals and idealism and other things which make life bearable. A Man survives as long as he can in one lifetime at the highest level he can attain in activity and happiness. When he can no longer attain to some hope of this ideal, he succumbs. And although one is chary of exciting incredulity, the fact is so easily demonstrated in so many ways with such machine-like scientific consistency, it should be known that Man apparently dies in body only and gets born to live another day. The value of death is not small since without death Man would still be an algae in the sea, without death Man would be forced to live in a body which no longer fitted the environment. Your auditor can show you such an incident as an earlier death unless you are very occluded. Death has lost its sting in this new science and is seen to be rather practical after all.

Physically, on the evolution chain, Man is attempting a greater and greater control of his environment. The environment does not control a healthy Man. He controls the environment. The surroundings of a sick Man, a neurotic or insane Man have a tendency to control him. One sees this clearly as one advances, by this new science, into happier states of mind. One's health and ability rises directly as one asserts greater and surer control over his surroundings.

Conversely, one asserts better and better control of his surroundings as he becomes healthier and happier.

Thus there is a second goal. Man is evidently surviving to attain a higher and stronger control of the physical universe. The physical universe is composed of matter, energy, space and time. The coined word for the physical universe in this new science is "MEST." That is easy to remember because it is composed of the first letter in each of the four words, "Matter," "Energy," "Space" and "Time."

Of course Man may have other goals outside of the physical universe, but we note that he is most concerned here on earth with a conquest of MEST. Naturally he is concerned about his fellows and living organisms in general for he is in a sort of brotherhood with all life.

Life in general is engaged upon this conquest and Man is the highest form of Life on earth. Without this cooperative effort of all life, a conquest of the physical universe or even survival on a barest necessity basis would be impossible. Man is sufficiently complex as a mechanism that he must live upon lower orders of life which only in their turn can take sunlight and chemicals and evolve complex foods such as proteins.

Now one hopes that his reader is not engaging upon that trick common to many readers—people often search and recall only items which validate their old ideas. Pick up a book on philosophy which has been read by a reader who underscores with a pencil and one will find that the most utter banalities have been noticed; only things which AGREED with the old ideas of the reader were noted. One often wonders why such a fellow reads at all. The data in this new science aren't isolated opinions but a structural whole and with that whole one can accomplish an occasional miracle and can almost always effect a marked improvement in an individual. This has never been done before with any consistency, and so one hopes that these data are being studied a little for themselves, not for how well they may agree with old ideas. For they don't agree with old ideas—and old ideas produced unhappiness, starvation, quick death, wars, insane asylums and much other unwanted bric-a-brac. This is not just a plea for understanding. If you want to get better than you ever could have been before, let's try these on for size and wear them until we clearly see their workability. If, after a thorough trial, you find they do not work, then you have every right to discount them. One can say this to you without any fear that you'll discover otherwise—too many miracles have been happening in this new science.

The list of axioms in the back of this book will give you definitions for pain, pleasure, anxiety and other such things in case you are curious. Here we are only treating the ideal state of being in the framework you will need to pursue the exercises in this volume.

The first item in the ideal state is I AM. Shakespeare was quite correct with his question, "To be or not to be?" When a Man is trying to make a decision, that decision breaks down into a matter of choosing one of two courses: to be or not to be. The highest level of the desirable state is I AM. No doubts of the advisability of being, no qualms about the future. The lowest level on a survival course would be I AM NOT. In between we have the doubts and writhing and indecision's of the weary, the angry, the frightened. When a Man has made up his mind as to a course he is only then comfortable. So long as he hangs in a maybe on any decision he is uncomfortable. In any course there are just two decisions possible, to assume a state of beingness or to assume a state of not-beingness.

Included in these pages is a tone scale which is fronted with its own descriptive data. The ideal state of being is to be found across the top of that scale. The states of death or not-beingness are found across the bottom of the scale.

And here we have the matter of gradient scales. Successes are little bits of living. Failures are little bits of death. Like the battle that was lost all for the loss of a horseshoe nail, a small failure can begin a series of failures which end in actual death. Not that death is very

important, besides being painful, but that one tends, then, to give a very heavy weight to failures.

The ideal state of being could be said to be wholly successful in all things. This is opposed by being so unsuccessful that one is dead.

The next point in the ideal state of being is I KNOW, opposed by I KNOW NOT. Doubts, worries, grinding efforts at study, all these are simply gradients between I KNOW and I KNOW NOT. What Man does not quiver a trifle when confronted with the Unknown?

The next point in an ideal is SERENE. This drops away and, at the bottom rung, having gone downwards through Exhilaration, Enthusiasm, Cheerfulness, Antagonism, Anger, Fear, Grief and Apathy is DEAD.

TRUST is the ideal point on the scale of TRUST DISTRUST. The most distrustful one can become is, again, dead.

The ideal point of longevity would be ALWAYS in a perfect body. The bottom of that scale would again be *dead*.

FULL RESPONSIBILITY would be in an ideal, opposed by NO RESPONSIBILITY as an undesirable state.

And finally, but not least, there is CAUSE and EFFECT. The subject of CAUSE and EFFECT is so important that it will be mentioned several times in the exercises themselves. One's ideal state is to be the CAUSE. The least desirable state would be EFFECT. The ultimate in being EFFECT is death.

Thus we have a brief statement of what an ideal state might be. Only a few of the points have been given but they will serve.

Ideally, one would be fully aware of being and would *be*. That is I AM. One would be entirely SUCCESSFUL. One would KNOW. One would be SERENE. One would TRUST. One would be in perfect HEALTH physically. One could assume FULL RESPONSIBILITY. And one would be CAUSE without being unwilling to be CAUSE.

Of course, it would be not entirely desirable to attain these ultimates since one would then lack for action. But attaining them as nearly as possible would be a desirable condition.

The odd part of it is, when one drops on any one of these things he drops on all the others, so interactive are these portions of life.

This volume and its exercises and auditing seek to assist the individual upwards toward this state of being which one could call ideal. How closely the individual may attain such a state depends largely upon his own willingness to work at the matter rather than the validity of the tenets themselves.

An ideal state of being, it goes without remark, would not include illnesses and inability to control oneself or his environment. Control of oneself and one's environment depend upon his attainment toward the ideal state of being.

THE GOALS OF MAN

The goal of life in the finite universe may be easily and generally defined as an effort to SURVIVE as long as possible and attain the most desirable state possible in that survival and, in accomplishing this, to conquer the physical universe.

The cycle of survival is Conception, Growth, Attainment, Decay, Death, Conception, Growth, Attainment, Decay, Death, over and over again. This is the major cycle.

There is an inner cycle in a lifetime which has to do with emotion or action. This is Action, Attempt, Success, Attempt, Failure. Happiness, down to Failure is the emotional cycle. But these are only part cycles. Just as every death begins new life, so does every failure eventually challenge forth new attempt until death itself is reached. Actually both failure and death alike are transient. They are educational building blocks on a much longer road. Occasionally however, an individual becomes so overwhelmed that even successive attempts at life decline.

There is undoubtedly a much, much higher goal which prompts this effort to survive and to conquer. There is probably reason above that level. In this new science we are interested in HOW life is surviving, not WHY. Perhaps we know much of WHY right now. Perhaps we will know all of it someday. At the moment it is enough to know HOW life is surviving.

What is embraced in the survival and actions of one Man ? We see clearly that animal and vegetable efforts are necessary for Man's survival. We can see that living is teamwork on the part of all Life. How much of this teamwork is included in the activities of one individual?

We have what we call DYNAMICS. Dynamics, in Life, resemble somewhat effort in physics. A dynamic is the urge to survive along a certain course. A dynamic is the persistence in living. It is the effort to live.

Very low on the tone-scale, in the psychotic or neurotic band, individuals think they survive for themselves alone. This, of course, would not be possible. As one rises up the tone scale into better states of being, he expands his sphere of interest and action. But no matter what he thinks in a low tone state, he is still surviving on the many dynamics, even if in a limited state.

There are eight dynamics. These embrace all the goals of survival an individual has. They embrace all the things for which he survives.

None of these dynamics is more or less important than another. And, oddly enough, when one is blunted or shortened, so blunt or shorten all the rest. When one offends against one he automatically offends against all the others. These dynamics are very easy to demonstrate.

The FIRST dynamic is SELF. This is the effort to survive as an individual, to be an individual. It includes one's own body and one's own mind. It is the effort to attain the highest level of survival for the longest possible time for self.

The SECOND dynamic is SEX. This dynamic has two sections, 2s and 2c. The first section is sex itself, the sexual act, anything relating to the physical action of sex. The second section is the urge for survival through children, the product of sex. This dynamic also includes a portion of family since the family as a unit affects the rearing of children.

The THIRD dynamic is GROUP. This is the effort to survive through a group such as a community, a state, a nation, a social lodge, friends, companies, or, in short any group. One has a definite interest in the survival of a group.

The FOURTH dynamic is MANKIND. This is the effort to survive as a species. It is the interest in the species as such.

The FIFTH dynamic is LIFE FORMS. This is the effort to survive for any and every form of life. It is the interest in life as such.

The SIXTH dynamic is MEST. This is the effort to survive as the physical universe and is the interest in the survival of the physical universe.

The SEVENTH dynamic is LIFE SOURCE. This, in this new science, is separate from the physical universe, and is the source of life itself. Thus there is an effort for the survival of life source.

The EIGHTH dynamic is SUPREME BEING. This is written with the figure eight turned on its side, meaning infinity ∞ . It is the postulated ultimate Creator of All and the effort to survive for the Supreme Being.

When one has a problem which embraces many of the subjects in these dynamics, the optimum solution of that problem lies in benefiting the largest possible number of dynamics. Solutions which injure one dynamic for the benefit of another dynamic result in eventual chaos. However, optimum solutions are almost possible to attain and human thinking seeks at its highest level only to bring the greatest order and the least chaos. At low levels on the tone scale an individual will stress one or two dynamics at the expense of the rest and so lives a very disorderly existence and is productive of much chaos for those around him.

The soldier, flinging away his life in battle, is operating on the third dynamic (his company, his nation) at the expense of his first dynamic, the fourth and all the rest. The religionist may live on the eighth, seventh, fifth, and fourth at the expense of the first and sixth. The "selfish" person may be living only on the first dynamic, a very chaotic effort.

There is nothing particularly wrong with bad emphasis on these dynamics until such emphasis begins to endanger them broadly as in the case of a Hitler or a Ghengis Khan or the use of atomic fission for destruction. Then all Man begins to turn on the destroyers.

The goal of an individual is to be, as much as possible, CAUSE or partner of CAUSE on all these dynamics at once without becoming EFFECT or partner of EFFECT on any of them. He cannot do this completely. But the degree of his success depends upon how closely he can approximate CAUSE and how little he can be an EFFECT on each.

The whole of SURVIVAL is a dynamic, the only dynamic. But SURVIVE breaks down into these eight.

Philosophies in the past have laid emphasis on one or another of these dynamics to the exclusion of others and so such philosophies had but limited workability. Psychotherapies have stressed this or that dynamic independent of the others and so did not achieve very great results. Freud, for instance, laid very heavy emphasis on the second dynamic, sex. There is some reason to give this a lion's share in therapy but only because of the peculiarities of CAUSE and EFFECT and the sexual aberrations of the general culture, not because 2s is more important as an urge or drive than any of the others.

Not one of these dynamics will "drive one mad" when one fails more than another dynamic. But it is quite true that failure or impedance on any one of these dynamics causes impedance on all the rest. Fear on one becomes fear on all. Offense on one is offense on all. Success on one is success on all. Defense on one becomes defense on all.

The proofs of the existence of these dynamics are contained in the workability of the processes which develop from them. It happens that when one thinks of an individual as running wholly on the first dynamic and tries to make a workable therapy on that supposition,

the individual does not lose his psychosomatic ills and he does not improve. When one tries to treat the second dynamic exclusively as a therapy, the individual does not improve. When one uses all these dynamics in resolving his problems, one obtains marked and startling results. Perhaps the authoritarian will argue that just because a thing works is no reason one should use it. Authoritarians do not achieve any results beyond their own satisfaction—which is not reason enough for the student or technician who wishes to get things done.

The goals of Man, then, stem from the single goal of survival through a conquest of the material universe. The success of his survival is measured in terms of the broad survival of all. One man, working hard to save the first dynamic, might short-sightedly destroy all the others. Where then would be the first dynamic?

THE HUMAN MIND

It is common to think of the human mind as something which just happened in the last generation or so. The mind itself is actually as old as the organism. And according to earlier guesses and proofs established by this new science, the organism, the body, is rather old. It goes back to the first moment of Life's appearance on Earth.

First there was a physical universe which happened, we know not how. And then, with the cooling planets there appeared in the seas a speck of living matter. That speck became eventually the complicated but still microscopic monocell. And then, as the eons passed, it became vegetable matter. And then it became jellyfish. And then it became a mollusk and made its transition into crustacea. And then as a land animal this particular track of Life which became Man evolved into more and more complex forms, the tarsus, the sloth, the anthropoid, and finally Man. There were many intermediate steps.

A very materialistic Man, seeing only the material universe, becomes confused and vague about all this. He tries to say that living organisms are simply so much clay, wholly a part of the material universe. He tries to say that after all it is only the "unending stream of protoplasm," generation to generation by sex that is important. The very unthinking Man is likely to make many mistakes not only about the human mind but the human body.

We discover now that the science of life, like physics, is a study of static's and motion. We find that Life itself, the living part of Life, has no comparable entity in the physical universe. It isn't just another energy or just an accident. Life is a static which yet has the power of controlling, animating, mobilizing, organizing and destroying matter, energy and space, and possibly even Time.

Life is a CAUSE which acts upon the physical universe as an EFFECT. There is overwhelming evidence to support this now. In the physical universe there is no true static. Every apparent static has been discovered to contain motion. But the static of Life is evidently a true static. The basic text of axioms of this new science demonstrates this conclusively.

Life began with pure CAUSE evidently. With the first photon it engaged in handling motion. And by handling motion ever afterwards accumulated the experience and effort contained in a body. Life is a static, the physical universe is motion. The effect upon motion of CAUSE produced the combination which we see as the unity of a live organism. Thought is not motion in space and time. Thought is a static containing an image of motion.

Thus one can say that with its first impingement upon motion, the first thought about the physical universe began. This static, without volume, wave length, space or time yet records motion and its effects in space and time.

This is, of course, analogy. But it is a peculiar analogy in that it sweepingly resolves the problems of mind and physical structure.

A mind, then, is not a brain. A brain and the nervous system are simply conduits for physical universe vibrations. The brain and nerve trunks are much like a switchboard system. And there is a point in the system where the vibrations change into records.

An organism is motivated by continuing, timeless, spaceless, motionless CAUSE. This cause mirrors or takes impressions of motion. These impressions we call "memories" or more accurately, *facsimiles*.

A facsimile, as you know, is a simple word meaning a picture of a thing, a copy of a thing, not the thing itself. Thus, to save confusion and keep this point before us in this new science, we say that the perceptions of the body are "stored" as facsimiles.

Sights, sounds, tastes, and all the other perceptions of the body store as facsimiles of the moment the impression was received. The actual energy of the impression is not stored. It is not stored if only because there is insufficient molecular structure in the body to store these energies as such. Physical universe energy is evidently too gross for such storage. Further, although the cells perish, the memories go on, existing, evidently, forever.

A facsimile of yesterday's hurt toe can be brought back today with the full force of the impact. Everything which occurs around the body, whether it is asleep or awake, is recorded as a facsimile and is stored.

There are facsimiles of anything and everything the body has ever perceived—seen, heard, felt, smelled, tasted, experienced—from the first moment of existence. There are pleasure facsimiles and bored facsimiles, facsimiles of sudden death and quick success, facsimiles of quiet decay and gradual struggle.

Memory usually means recalling data of recent times; thus we use the word facsimile, for while it is the whole of which memory is a part, the word memory does not embrace all that has been discovered.

One should have a very good idea of what a facsimile is. It is a recording of the motions and situations of the physical universe plus the conclusions of the mind based on earlier facsimiles.

One sees a dog chase a cat. Long after dog and cat are gone one can recall that a dog chased a cat. While the action was taking place one saw the scene, one heard the sounds, one might even smell the dog or cat. As one watched, his own heart was beating, the saline content of his blood was at such and such a point, the weight of one's body and the position of one's joints, the feel of one's clothing, the touch of the air upon the skin, all these things were recorded in full as well. The total of all this would be a unit facsimile.

Now one could simply recall the fact that one had seen a dog chase a cat. That would be remembering. Or one could concentrate on the matter and, if he was in good mental condition, could again see the dog and the cat, could hear them, could feel the air on his skin, the position of his joints, the weight of his clothing. He could partially or wholly regain the experience. That is to say he could partially or wholly bring to his consciousness the "memory," the unit facsimile of a dog chasing a cat.

One does not have to be drugged or hypnotized or have faith in order to do this. People do variations of this recall without any knowledge of this science and suppose that "everybody does it." The person with a good memory is only a person who can regain his facsimiles easily. A little child in school learns, today, by repetition. It isn't necessary. If he gets good grades it is usually because he simply brings back "to mind," which is to say, to his awareness, the facsimile of the page of text on which he is being examined.

As one goes through Life he records twenty-four hours a day, asleep and awake, in pain, under anesthetic, happy or sad. These facsimiles are usually recorded with all perceptics, which is to say, with every sense channel. In the person who has a missing sense channel such as deafness, that portion of the facsimile is missing.

A full facsimile is a sort of three-dimensional color picture with sound and smell and all other perceptions plus the conclusions or speculations of the individual.

It was once, many years ago, noticed by a student of the mind that children had this faculty of seeing and hearing in memory what they had actually seen and heard. And it was noted that the ability did not last. No further study was made of the matter and indeed, so obscure were these studies that I did not know about them during the early stages of my own work.

We know a great deal about these facsimiles now—why they are not easily recovered by most people when they grow up, how they change, how the imagination can begin to re-manufacture them as in hallucination or dreaming.

Briefly, a person is as aberrated as he is unable to handle his facsimiles. He is as sane as he can handle his facsimiles. He is as ill as he is unable to handle his facsimiles. He is as well as he can handle them.

That portion of this new science which is devoted to the rehabilitation of the mind and body deals with the phenomena of handling these facsimiles.

A person ought to be able to pick up and inspect and lay aside at will any facsimile he has. It is not a goal of this new science to restore full recall perception, it is the goal to rehabilitate the ability of a person to handle his facsimiles.

When a person CANNOT handle his facsimiles, he can pull them into present time and discover himself unable to get rid of them again.

What is psychosomatic illness ? Demonstrably, it is the pain contained in a past experience or the physical malfunction of a past experience. The facsimile of that experience gets into present time and stays with the person until a shock drops it out of sight again or until it is processed out by this new science. A shock or necessity, however, permits it to come back.

Grief, sorrow, worry, anxiety and any other emotional condition is simply one or more of these facsimiles. A circumstance of death, let us say, causes one to grieve. Then one has a facsimile containing grief. Something causes the individual to bring that facsimile into present time. He is unaware of it, is not inspecting it, but it acts against him nevertheless. Thus he is grieving in present time and does not know why. The reason is the old facsimile. The proof that it is the reason lies in processing. The instant the facsimile is discharged of its painful emotion, the individual recovers. This is processing in one of its phases.

The human mind is only a phase of the continuing mind. The first spark of life which began animating matter upon Earth began recording facsimiles. And it recorded from there on out. It is interesting that the entire file is available to any mind. In previous investigations I occasionally found facsimiles, which were not hallucination or imagination, which seemed to go back much earlier than the present life to the pre-clear. Having by then the tool of effort processing, it was possible to “turn on” a facsimile with all perceptics at will and so it was possible to examine the earliest periods possible. The genetic blueprint was thus discovered and I was startled to have laid bare, accessible to any future investigator, the facsimiles of the evolutionary line. Many auditors have since accomplished the same results and thus the biologist and anthropologist come into possession of a mine of fascinating data.

There are those who know nothing of the mind and yet who get amply paid for it who will talk wisely about illusion and delusion. There happen to be exact and precise laws to delusion. An imaginary incident follows certain patterns. An actual incident is entirely unmistakable. There is a standard behavior in a facsimile of an actual experience: It behaves in a certain way; the individual gets the efforts and perceptions with clarity and the content of the incident expands and remains fairly constant on several recounting. An imaginary incident contracts in content ordinarily and the individual seeks to keep up his interest then by embroidering it. Further, it has no constant efforts in it. Those who cannot take time to establish the actuality of facsimiles before becoming wise about “delusion” are themselves possibly quite delusory people.

The human mind, as the present mind of mind, differs not at all from the most elementary of minds, that of the monocell, except in the complexity of brain appendage. The human being is using facsimiles to evaluate experience and form conclusions and future plans on how to survive in the best possible manner or how to die and start over again.

The human mind is capable of very complex combinations of facsimiles. Further, it can originate facsimiles on the basis of old facsimiles. Nothing goes wrong with the mind except its abilities to handle facsimiles. Occasionally a mind becomes incapable of using a facsimile as past experience and begins to use it in present time continually as an apology for failure. Then we have aberration and psychosomatic illness. A memory of pain contains pain and can become present time pain. A memory of emotion contains emotion and can become present time emotion.

THE CONTROL CENTER

Every mind may be considered to have a *control center*. This could be called the “awareness of awareness unit” of the mind, or it could be called simply “I.”

The control center is CAUSE. It directs, through emotional relay systems, the actions of the body and the environment. It is not a physical thing. Here is a diagram of the control center, “I,” in relation to the emotions and the body and environment.

The total function of “I” is the estimation of effort. It thinks and plans and resolves the problems or future effort.

When “I” has estimated a needful effort and puts it into action, its impulses impinge against the glandular system switchboard. The glandular system is a relay unit. It turns the emotional impulse into action.

The motor switchboard is a complex set of physical circuits and these go to various parts of the body and channels of perception in order to coordinate physical action at the direction of the glandular system.

On a return circuit, the environment or the body, through the nerve channels of perception and the channels in the body itself, an impulse from the environment or the body goes into the switchboard and is directly recorded by “I” facsimile. The emotional system, in a mind in good condition, is bypassed on an incoming impulse unless “I” directs it expressly into the glandular system.

The physical body is a carbon-oxygen motor. It has been built out of the eons of experience, the summaries and conclusions of “I.” Its internal motions and actions can be placed by “I” in the category of “automatic response.” Thus the heart beat and circulatory system are automatic in action. Thus many other motions of the body are automatic. But, as can be demonstrated, any of these motions can be altered by “I.”

The glandular system is quite complex as such, but its function is simple. It is the translation medium, evidently, for thought. The system is partially physical and partially thought.

Thought is definitely comparable to nothing in the universe of matter, energy, space or time, having no wave length, weight, mass or speed and being, therefore, a zero which is an

infinity or, in short, a true static. Thought, thinking and life itself are of the same order of being. Demonstrably they have no wave length, therefore contain neither time nor space. Thought only appears to have time because in it is recorded physical universe time. There is obviously an “action” in thought but, as obviously, it is not action in this universe. (To see the proofs of this character of thought, see the axiomatic text.)

EMOTION

As the operating mechanism between thought and action, EMOTION should be well understood.

Emotion exists to monitor motion. Thought itself seems to have an emotional impulse which is free of physical universe waves. This is studied in various ways, but it is only important to us in the resolution of the problems of the human mind.

Various emotions produce various actions. Anger, for instance, is the catalyst for attack. Fear is the signal to withdraw. Grief is the signal to be quiet and initiate nothing. Apathy is the signal to be dead or to faint death so that a marauder will go away. Various glandular compounds are injected into the system to produce these results. Fear and grief, for instance, have an added compound to make the flesh taste bad—for Man is but recently a food animal.

There is an entire scale of emotions to produce certain motions. And there is a herd reaction, as witnessed in mass hysteria, whereby emotion acts upon others mechanism developed in the control of hunting packs whereby the entire pack could feel afraid and run or feel angry and attack without any other command. This shows up additionally in any modern leadership. The leader is that one who emotionally affects others most strongly toward positive action.

In interpersonal relations, emotion plays an enormous role. In this new science we have what is called COUNTER EMOTION. Incidents quite often will not reduce until the pre-clear is made to feel the emotion of others toward him. But quite aside from this manifestation as an ethereal something, there is the real mechanism of sympathy. One person shows grief in order to get support from the other. The other shows sympathy and gives the support. Man is so interdependent and the physical universe so occasionally rigorous that all interpersonal relations are built upon this dependency or its denial.

The broad field of the dynamics indicates the generalized character of emotion.

The test of these conclusions is their workability. You will discover in processing the enormous importance of emotion. The emotion of an individual can be frozen by some facsimile he once wanted but now does not want, and he thereafter handles motion according to that emotion. Thus a person can be chronically angry or chronically in apathy and his behavior on all dynamics is the behavior of that emotion. By knowing this and the activities of any level on a tone scale of emotion, one can predict completely the actions of any given individual or handle him with ease.

The ideal state is fully self-determined emotion. Only then can one be happy and successful.

PROCESSING

The effort in processing is devoted to the goal of raising the individual on the tone scale. This involves rehabilitating his ability to handle his own facsimiles.

Processing may necessitate the reduction of a number of facsimiles by thought, emotion or effort processing.

It is a peculiarity of a facsimile that no matter how violent may be the efforts and counter-efforts of its content, no matter how sad or terrible may be the situation it involves, once that facsimile is processed by impressing it against reality several times, it no longer has any power, force, effort or thought content. There are many ways of accomplishing this. In earlier works cruder and longer methods were used but they accomplished the same purpose.

A memory, a facsimile, contains a record of everything that happened in the actual incident—sight, sound, taste, pain, emotion, efforts of the individual, efforts of the environment against the individual. The individual moves it into present time and keeps it for various reasons and then believes he is unable to rid himself of it. It produces strange compulsions or obsessions or aberrations in general and it can produce, with its efforts, its original physical pain.

A facsimile so held by the individual can make him ill. It can even kill him. Such facsimiles produce over seventy per cent of the illness of Man and make him weak enough to fall prey to the diseases and accidents which account for the other thirty. Sinusitis, arthritis, eye trouble, liver difficulties, ulcers, migraine headaches, polio after-effects and so on down the long, long list surrender if one reduces the facsimile causing the trouble. Whether or not the facsimile is reduced depends to some degree upon the skill of the auditor. For instance, in my first book on this new science, I was guilty of overestimating the ability of my fellow man and have had to work hard since to simplify the techniques and theory so as to make the success of processing much more certain. It is now in the miracle class, so they say. But even now and then, someone is too old or too inaccessible for the skill of the auditor working upon him and so only an alleviation occurs rather than an eradication of the trouble.

The end goal of processing has no finite end. The auditor simply tries to raise his pre-clear up the scale as far as possible in the time allowed and to eradicate the most evident psychosomatic. There are levels of the tone scale which have not been attained but which seem attainable. These unattainable levels—at this time—are so far above anything ever attained by any Man before this that the pre-clear need not worry about being lifted only a little way.

The pre-clear generally starts with the environment in rather heavy control of him. The modern educational system, various laws and parental authority all seek to cause the pre-clear to be an effect of the environment rather than a CAUSE of environmental effects. When he has come to a level where he can be self-determined on the majority of the dynamics, his case is considered closed. This book assists him to attain the goal.

PROCESSING SECTION (THE FIRST ACT)

The processing section of this volume is divided into fifteen acts. Each one of these covers a certain phase of a case. If the individual is working with an auditor then he will find that the auditor is piloting him through these same fifteen acts and that this book is being used supplementary to auditor checking. If the individual has given himself the task of going through this volume by himself, he follows the same procedure and each section is of necessity to be taken up in turn.

Each act is begun by a description of what the process means and how it is applied and the end it is intended to accomplish.

It is not necessary to BELIEVE what you find in this volume for the material to work. If you begin processing as in the doubtful class, you will find your doubts resolving as you proceed.

Another can read these processes to you. You can read them yourself. You can do them between sessions with an auditor. You can get an auditor to do all the work for you.

You will find included a chart of attitudes toward life. This might be called a "button chart" for it contains the major difficulties people have. It is also a self-evaluation chart. You can find a level on it where you agree and that is your level of reaction toward life. This chart complements the HUBBARD CHART OF HUMAN EVALUATION but is specially prepared for this volume and for this type of processing. Your use of the chart in your processing is described later.

You will also find a disc included with this book. The disc is employed whenever there is a long list of questions. Its use is described where it is first used in the section.

You may find these processes too difficult for you and would therefore desire some assistance. There are many professional people all over the United States qualified in the application of the processes of this new science. By writing to the publisher of this book you may obtain the name and address of the professional auditor nearest you.

This new science has moved very rapidly and new developments have cut down the number of hours required in processing to below 100 with the new techniques. You should count on spending at least a hundred hours with this present book including any effort processing you may receive from an auditor.

This book, by itself, will do more for you than professional processing could have done in June of 1951, much less June of 1950. Into it has gone an additional two years of intensive work and investigation. Anywhere that this text or these processes disagree with books or data earlier than December of 1951, this book, not the earlier work, is correct. The line of advance has been very consistent but sometimes a superficial student cannot follow the logical advance line.

While an individual does not have to understand this new science if he is being audited, one who is working this volume by himself should have a fairly good understanding of basic theory.

It will save time if you will review the text of this volume up to this point and understand it. Then answer the following questions. Write in the book with a pencil.

What is the goal of life?

What is life trying to accomplish ?

How many fields is the life organism interested in?

What is a facsimile?

What is the purpose of the human mind?

What is meant by CAUSE and EFFECT?

Is a facsimile permanent?

How does “memory” or “remembering” differ from reexperiencing facsimiles?

THE SECOND ACT

The anatomy of the static of Life demonstrates it to have three interdependent characteristics. Each one of these three is as important as the other two. They are Reality, Affinity and Communication.

Reality itself could be considered that on which Man agrees to be real. There is an old, moth-chewed philosophic concern about perception. Are things real only when we see them? Or are things real? In other words, is there *any* reality. Well, desks and chairs seem very real to me. And they seem very real to you. Thus we agree that there are desks and chairs and people and cars and a world and the stars. Sane men have a very solid agreement on reality. They agree that things are real. Insane people have hallucinations. Hallucinations are imagined realities with which nobody else agrees. When an individual does not agree with the rest of the race upon the reality of matter, energy, space and time, the rest of the race locks him up. Ideas are not matter, energy, space or time and so there can be disagreement on ideas and agreement upon the reality of matter, energy, space and time. This agreement upon MEST, then, is reality. Reality could be said to be agreement above 2.0 on the tone scale, agreement not so much with people but with MEST's actuality. This is one corner of our triangle.

The next corner is affinity. The physical universe has what is known as cohesion. Matter stays together. This is, in the life static as it operates on matter, AFFINITY. Affinity is love above 2.0. Love, as a word, has too many meanings, and so we use an old, old word, affinity, as meaning the feeling of love or brotherhood from one dynamic to another.

The third corner of the triangle is communication. Communication is actually done via the sense channels. One sees a rock. By sight he is communicating with the rock. He feels a blade of grass. He is then communicating, via a sense channel, with the blade of grass. When one talks to another person he is sending an impulse from "I" to the vocal cords which set up physical universe sound waves which reach the ears of the other person, are translated into nerve impulses and so convert into an impingement upon "I" of the other person. Communication by talk, then, goes from Life to Life via the physical universe. It is the same with touch. One person touches another. This is communication via the physical universe persons. There may be direct, non-physical universe communication channels from "I" to "I." The most tangible of these is emotional impact.

One cannot have affinity without agreement. One cannot have agreement without some form of communication. One cannot have communication without agreement. One cannot have agreement without affinity. One cannot have communication without affinity. This inevitable triangle may be at any level on the tone scale, high or low. If communication is destructive, the affinity drops to anger and agreement is violent disagreement.

At 0.0, which is death, Affinity, Communication and Reality are wholly physical universe for the body and are the cohesion's, the connections and the aspects of the physical universe.

At 1.0, which is fear, the Affinity is poor, being fearful, the Communication is twisted and consists of lies, the reality is poor and is agreed upon for covert purposes.

At 2.0, which is antagonism, the Affinity is broken into hostility, the Communication is nagging or disagreeable, the Reality is contradictory to others just to contradict and is therefore poor.

At 3.0 which is above the normal person, Affinity is love, it is present but reserved, the Communication is conservative, the Reality is cautious but is agreed upon after being proven.

At 4.0 which is cheerfulness, Affinity is affectionate, Communication is free and constructive, Reality is good and agreement is general.

Above 4.0 we have many levels but ARC (Affinity, Reality and Communication) are getting above a physical universe aspect. Out of ARC we can derive any understanding. In fact, logic evolves out of ARC. At 4.0 we have lower level understanding and understanding increases to complete knowledge when a very high band is reached—above 20.0.

ARC are actually the interplay's of Life active in the physical universe.

When you communicate with an antagonistic person, you have to enter into an “affinity” and a reality of 2.0. When you show affinity for 1.0, which is FEAR, you inherit the communication and agreement level of the 1.0. An individual, to escape this inevitable transaction, has to be above 4.0 on the tone scale.

In order to have an understanding of yourself, you must have good ARC with yourself.

It is NOT evil to like yourself or love yourself. It is very low toned not to be fond of yourself.

All the dynamics are interactive. If you love others you will love yourself. If you hate others you will hate yourself. If you hate men, you will hate along the other dynamics even when you cover it with “sympathy” as you will discover in a later act.

A healthy state of being is to be a friend to yourself. If you have few friends, if you don't like friends, you won't like yourself either.

If you are afraid of people, you won't trust yourself and will be afraid of what you might do.

If you are afraid of animals you will also be afraid of possessions and sex and people and anything else.

Occasionally people have special fears. These are only concentrations upon one thing. A person, without admitting it, will also be afraid on the other dynamics, but will not have recognized it.

It is not enough to suddenly determine to LOVE everybody. That is forcing affinity on yourself.

Affinity is enforced from 2.0 down to near 1.0. Around 1.0 we have “propitiation,” buying people off, pretending affection. From here on down affinity is inhibited.

Thus we see that enforced, demanded ARC is aberrative. And we see that inhibited ARC is also aberrative.

Let's put this to test. Do you recall a person you had to kiss? Well, did you feel agreeable toward this person? Did you want to touch (communicate with) or talk to this person?

And another test. Do you recall a person who pushed you away when you felt affectionate? What was your immediate communication reaction? What was your agreement?

And another one. Do you recall a person who demanded that you talk to them? What was your level of affinity? What degree of agreeableness did you feel?

And yet another. Do you recall a person who demanded that you agree with him against your wishes? What was your level of affinity? What was your level of communication?

And still another. Do you recall a person who continually corrected you? This is inhibited agreement. What was your reaction level on affinity ? What was your reaction as to communication ?

Do you recall a person who was afraid of anything and everything? What was your affinity? What was your agreement ?

A person high on the tone scale reacts down toward but does not necessarily reach the level of the person he addresses. However, he tends to reach toward that level. And if he stays in the proximity of a lower toned person long enough he will eventually become chronically in that tone.

Do you know somebody who affects you badly after you have been in his company for awhile? Does this person like people? Does he tell the truth? Does he communicate easily? Do you agree with his views ? Here is ARC in action in present time.

After you have been in the vicinity of somebody who insists you talk, insists you agree, insists you feel as he feels, what is your own tone level toward him?

After you have associated with a person who won't let you talk, won't agree with you, won't let you feel as you want to feel, what is your reaction ? Where is this person on the tone scale? This is an inhibited ARC person or below 1.0. This person is afraid or apathetic. This person has endocrine ills. This person lies. This person hides things. This person is physically and mentally maladjusted.

It happens that anyone on a given level of the tone scale seeks to pull everyone else to that level of the tone scale. A low level individual is pulled up a bit by a high level individual and then the high level individual comes down a bit.

Low toned people work toward succumb. Below 2.0 the effort is toward death, one way or another, covertly or overtly, toward succumb. The angry person, failing to destroy others, will destroy himself. The apathetic person is almost dead. The activity of persons below 2.0 is directed toward the gaining of sympathy. They try to make higher toned people sympathetic and thus destroy them. Sympathy for low toned cases is a social aberration. It is deadly.

No low toned person can be "helped." Try to help a person below 2.0 and the result is ingratitude plus in the end. For the goal of that person is to succumb. Higher toned individuals don't need help.

Low toned persons can be audited to above 2.0 however after which they will seek to survive along all dynamics. If you suppose you lie below 2.0 and have persevered this far, you don't.

There is, by the way, very practical present time use of this data about ARC. If you want a person to agree with you, address him at his obvious tone level and you will go into communication with him and he will feel affinity for you. If you want affinity from a person, use his methods of communication to others with him and go into agreement with him on his concept of the other dynamics. A salesman can sell a 1.5 (anger case) anything if that thing is shown to be destructive to other dynamics.

This is why the government, a rather 1.5 affair, buys atomic fission as a weapon rather than a means to send Man to the stars.

Here, then, is the second act. First achieve an understanding of the factors in understanding—ARC—contained in this section. Then answer these questions.

List the persons in your present time environment who enforce affinity on you.

List the persons in your present time environment who enforce agreement upon you.

List the persons in your present time environment who demand that you communicate with them.

List the persons in your present time environment who refuse your affection.

List the persons in your present time environment who won't let you communicate with them.

List the persons in your present time environment who refuse to let you agree with them.

Now go back and put a tone scale number after each name as an estimate. Where is each one on the chart of triangles earlier in this section?

Don't worry about your accuracy. This is only to give you an estimate of the kind of reaction your environment might have on you. And to promote your understanding of these people.

Now take the first person you listed and go to the chart of attitudes which accompanies this volume. From the number you assigned the person, go across the big chart at that level. If you assigned somebody to 2.0, follow 2.0 across the big chart. Read each attitude on the 2.0 line horizontally across the chart. This should give you some understanding of that person. And it should tell you what his effect might be on another.

Take the next person with your assigned number across the chart. Follow on through with each person you listed.

You probably duplicated several listings with the same number.

With this exercise complete, let us delve a little into the past.

List persons in the past who *insisted* they were your friends. This is a variety of enforced affection.

List persons in the past who insisted you agree with them.

List persons in the past who insisted you communicate with them.

List persons in the past who would not show you affection.

List persons in the past who refused to communicate with you.

List persons in the past who would not let you agree on things.

INCLUDE ALL YOUR PARENTS AND RELATIVES HERE AND AS THEY COME INTO THESE CLASSIFICATIONS.

Assign a tone scale number to each one.

Check each one for attitudes across the big chart.

What effect do you suppose all these attitudes, past and present, have on you?

THE THIRD ACT

With the help of the CHART OF ATTITUDES let us take a look at your present day environment.

You may have realized, while inspecting this chart, that you yourself were not quite at the top. You need not worry particularly if you discovered this. Unlike some witch doctors in modern dress, this book is making no effort to condemn you. There were various reasons why you permitted yourself to be lowered on this tone scale—for you had to give your permission to have anything serious happen to you (a matter which we will cover under SELF-DETERMINISM in a later section of this volume).

Let us make an assessment of how you regard things in your today. Write the answers. (See the chart for the data in each column given.) USE PHRASES AND WORDS OF CHART IN YOUR ANSWERS. WRITE TONE SCALE NUMBER OF PHRASE.

What is your most common emotion?

How do you feel about survival?

How right are you about what you do?

What responsibilities are you willing to shoulder ?

How do you feel about possessions?

Do you feel you are anybody?

Do you think most about the past, the present or the future?

How does motion affect you ?

How do you handle truth?

Do you trust or distrust?

Do you know or are you doubtful ?

Do you want to cause things or be an effect ?

What is your “state of beingness” (next to last column)?

Turn back to the SECOND ACT and look over the people you have listed. Do any of your reactions match theirs? In other words, are you comparable to any of those persons listed ?

You should be able to discover that you are carrying, in present time, the past attitudes of others. In present time you should be YOU. The phrases you listed in this THIRD ACT actually don't describe YOU. They describe those parts of YOU which you have turned over to other people in the past. You are carrying on attitudes of people who are probably departed long since. They are not very survival.

A little bit or a great deal of YOU is described up along the 16.0 to 40.0 band of the chart. Our job is to get all of you as high as possible on the chart and leave the parts of “you” which rightly belonged to others behind us.

Human beings, operating along all the dynamics, are actually rather heroic and noble characters. They see cruelty or suffering and they, particularly in their youth and strength, take it on to spare the world. They see someone, even themselves, perform a cruel act or have an unhappy experience, and they regret it. Then they discover that they themselves can fail. They then blame others for their plight. It is a cycle of nobly accepting something and then, to save one's own being, trying to get rid of it in time. Youth is so high on the chart innately that it accepts the evil of the world with open arms in an effort to make it a better world. Then, staggering under the burden, finding none to share it, they fight to give it away either by being evil or being sick.

This will become much clearer before we have finished here. And you will be a lot higher on the chart.

Let's assess your present time now.

What phrases on the whole chart best describes your attitude toward life in general right now?

Can you recall a specific instant when somebody else uttered that phrase? Where were you at the time? Outdoors or indoors ? Standing or sitting ? Can you recall an earlier time you heard it?

When did you first tell yourself that phrase? And don't tell it to yourself again because you are the firmest influence upon YOU. What you say to YOU sticks.

Go straight across the list and, column by column, pick out your attitude toward the world in which you are now living. Write these down in the space below.

Now trace each one of these phrases back to the earliest time you heard somebody else use it. Get the exact moment if possible. Get a visio (a view in memory) of the person saying it. Get as many as you can of each phrase and the earliest time it was uttered. FOR THIS USE YOUR DISC. Put the disc over the phrase you wrote and recall the incident with the perception of it called for on the disc or the emotion as requested by the disc.

You can see now that your present time concerns are to some degree the worries and concerns of somebody else in the past.

The value of past experiences lies in the estimation of the future. Past experiences are not nearly as valuable as one might suppose. There is an enormous emphasis on the value of experience. Go to make out an application form for a job and you will find that they are mostly concerned with experience. It is a sort of trap to enslave people, giving their experiences such value. Actually a snapping bright mind and an alert body are worth a hundred thousand years of "experience" behind some dusty desk or counter and an ability to do a "quick study" of a subject is so much more valuable than an education—complete with a hundred A's—in that subject that one might be led to suppose that maybe "education" as it is laughingly called might possibly be over stressed. Check your history and you will discover that the men whose marble busts adorn the modern halls of learning did not themselves have a formal education: Bacon, Spencer, Voltaire, etc., etc., etc., down the whole list; two or three exceptions prove the rule. Not even long study has as much value as people might have wanted you to believe. Your life, from any instant in it, can be free of all past experience and your carbon-oxygen motor would continue to run and you could pick up what you needed to know in a couple of months, even change your name and yet survive handsomely. If you won a Nobel prize last year, that's tough: you will try madly to keep the experience and be a Nobel prize winner instead of trying to be enthusiastic enough in the tomorrow's to win another prize. The getting is the sport, the having is a defensive action and makes you a platoon pinned down by enemy fire. Thus with experience as with MEST.

So let's look at present time.

And let's be blunt.

What are you trying to hide in present time?

What would happen to you if it were discovered?

How many things like this are there in present time?

Don't bother to list them. If other people found these things out they would probably blink, maybe they'd chatter over fences. You might get fired or divorced. But I'll tell you a secret about secrets. No single person to whom you uttered the confidence would NOT have a similar list to hide. They've all masturbated and had clandestine affairs and a lot of them venereal diseases. They've stolen money and maybe some have even left a cold dead body in a culvert. They've lied and cheated and done blackmail. And the funny part of it is, only those who have a long, long list of things to hide would even begin to reprimand you.

And another thing. Anyone who punished you would someday regret it. A dean in college who threatened to flunk me for writing a bit of truth in what was the longest sentence in the English language (500 words without colons or semicolons) had it weigh upon his mind to such an extent that he wrote me, years afterwards, when he had retired and was nearly dead, the most astonishing apology.

You are treating yourself in present time much as you were treated by others in the past. And you punish yourself far more than anyone would ever punish you. The suicide is simply self-executioner, having been found guilty by his own court.

Next, how hard and to whom are you trying to be RIGHT in the face of anything and everything including facts?

What responsibilities are you shirking? Why?

What are you doing with your possessions? Why?

What do you think of yourself? Why?

Is the future or the past receiving your most intense thought ? Why ?

Do you flinch at motions? Why?

How closely do you stay to truth in present time ? Why not ?

Do you trust your environment? Why not?

What don't you KNOW ? Why not?

What are you trying to cause? Why?

What are you trying to make affect you ? Why ?

Who are you trying to blame in present time ? Why ?

What are you blaming yourself for in present time? Why?

Do you like your work ? Why?

Is your sex life satisfactory? Why?

What threatens your present security? Why?

Self-confidence alone is security. Your ability is your security. There is no security but you. Let's make the best possible you we know how. Almost all the things you thought of in the above list can be remedied by your own action without consulting for a moment the permission of anything or anyone. Innately, deep down, you know this. Actually you are a giant tied down with cotton lint. You tied the knots and furnished the string and said where you'd lie. The only trouble you might have in processing is refusing for some strange but discoverable reason, having to do with concern for others, to burst these light strands and stand up. Fortunately this volume offers more than such inspiration, but the cold, basic truth is that you are a vital and necessary part of this world and anything that is wrong with you, you have assumed in an effort to be what has passed for "human."

THE FOURTH ACT

You will note on the edge of the CHART OF ATTITUDES that from 0.0 to 1.5 is considered to be severely aberrated. That from 1.5 to 2.8 is considered to be neurotic. That from 2.8 to 10.0 is considered acceptable.

When these figures were first calculated it was thought that normal was about 2.8. It isn't. That is generous beyond generosity. Normal is well below that according to amassed data since the first computations. The reason for this seems to be in two distinct fields. The first is the environment, the second is education.

Education, continued long enough in the usual school and college, depresses the individual toward 0.3 or apathy. The person being "educated" is, day after day, immobilized, made into an effect by instructors and denied original thought. He becomes an habitual "effect" and ceases to cause. He begins to respond automatically according to a pattern of manners given him by the home and the school system. This is the primary reason why the modern college has yet to turn out an artist from an arts major. An artist must be a cause and continue to be cause. Majoring in writing, for instance, is a sure route to being an editor, or worse, a critic, rather than a writer. All the editors and critics, according to writers, are failed writers. They are also arts majors for the most part, with wonderful grades. The writers revolted early. This is no criticism of modern education or educators, it is a small signpost pointing toward the source of low tone.

Education is also done in the home. The level of that education is the level of the home. The goal of most parents is obedience. Obedience is apathy. Most BAD children become good the moment you let them up the tone scale.

The general society today may be commented upon by a review of the front pages of the newspapers. The "public" buys the news it wants. The newspapers, being an expanded version today of the old house-to-house advertising handout, print news to sell papers. The tone range of the usual front page today is from 1.5 down to 0.1. A man could invent something that would feed all the starving people in the world with ease and get a news notice one inch high near the obituary column. The blood-soaked and sordid front pages of the world's newspapers tell you that Man has sunk pretty far down. His newspaper is the modern American's Roman Circus, his government is becoming his corn. Bluntly, the normal is a very sick man.

There are three valid therapies. The first is processing. The second is education. The third is environment. We find the first two in this new science. The third must sometimes be changed for a pre-clear may be in such a vigorously painful environment that his gains in processing are lost in his struggle against his surroundings. Very fast processing is one answer to the environmental problem. Wives have been known to practically murder husbands who dared try to get up out of apathy via processing. Apathy is a very docile and obedient, if sick, state of not beingness. Husbands have been known to react similarly when their wives tried to get well. And in the past some mental practitioners have gone raving insane when one of their patients started to climb into well being via processing.

The chief difference between the severely aberrated, the neurotic and the "acceptable" bands is concerned with TIME.

The severely aberrated gives his attention mainly to the past. The neurotic is giving his attention mainly to the immediate present. The "acceptable" is giving his attention to the future.

By forcing attention into the present (raising necessity level) one can raise a severely aberrated person into a neurotic level. The AAs do this with alcoholics, persuading them to live for the present only. Your alcoholic, of course, is still trying to untangle the past—with a forgetter known as alcohol, just as your drug addict is shutting off the agony of yesterday with an anesthetic.

However, almost anyone is giving more attention than necessary to the past, reserves his living in the present and restrains his planning for the future. Your 1.5, for instance, considers it bad taste to be enthusiastic about the future. "Don't hope too much." For the 0.5 both present and future are unthinkable

Attention is a remarkable thing in that it must be at optimum sweep for a person to be happy. When attention is too fixed on one thing, if that thing is a survival threat, it tends to remain fixed. If a threat to survival is understood to be present and yet cannot be located, attention swings endlessly without fixing. This is "fear of the unknown." Fixed and unfixed attention, when given to dangerous problems, tend to remain that way unless the problem is solved.

The human mind's basic purpose in operation is the posing and resolving of problems it observes as related to survival along any of the dynamics. A problem is resolved when it is answered YES or NO. A problem such as SHOULD I GO ? must be answered YES or NO if the mind is to file it as a conclusion. If it continues as MAYBE, the problem stays in the computer and influences the next solutions. Did you ever know a person who had a lot of trouble reaching decisions ? Recall a specific time ? Well, somewhere in that person's past was a problem which was not answered YES or NO but only maybe. A very "serious" sort of a problem comes up with WAS IT MY FAULT ? When that one lands on MAYBE the computer tends to jam. (The answer by the way is that nothing is anybody's fault.)

Problems do not solve for two reasons: The first is lack of data; the second is an earlier unsolved problem on the same subject.

One has to evaluate data in order to resolve problems. When one fixes his attention on something dangerous he is probably over evaluating the data. When one is unable to fix his attention it is because he cannot find data to evaluate.

This will become clearer to you when you have completed the following exercise. Do it with your pencil.

LIST FIVE PROBLEMS, WITH PEOPLE OR OBJECTS OR CIRCUMSTANCES, WHICH YOU ARE NOT SOLVING IN THE PRESENT.

- 1.
- 2.
- 3.
- 4.
- 5.

NOW LIST WHAT YOU WISH YOU KNEW ABOUT EACH ONE OF THE PROBLEMS ABOVE. (THE MISSING DATA YOU WISH YOU HAD.)

- 1.
- 2.
- 3.
- 4.
- 5.

NOW LIST HOW IMPORTANT YOU NOW FEEL THESE PROBLEMS ACTUALLY ARE OR WHETHER OR NOT THEY ARE NOW SOLVED.

- 1.
- 2.
- 3.
- 4.
- 5.

IF ANY OF THE FIVE PROBLEMS REMAIN UNSOLVED, LIST WHAT YOU WOULD HAVE TO DO TO SOLVE THEM.

- 1.
- 2.
- 3.
- 4.
- 5.

Now let us take a glance at the past. There are several problems, undoubtedly, which you feel you did not solve.

LIST FIVE PROBLEMS, WITH PEOPLE OR OBJECTS OR CIRCUMSTANCES, WHICH YOU FEEL YOU DID NOT SOLVE IN THE PAST.

- 1.
- 2.
- 3.
- 4.
- 5.

NOW LIST WHAT YOU WISH YOU HAD KNOWN ABOUT EACH ONE OF THE PROBLEMS ABOVE.

- 1.
- 2.
- 3.
- 4.
- 5.

NOW LIST HOW IMPORTANT THESE PROBLEMS ACTUALLY ARE TO YOUR PRESENT CIRCUMSTANCES.

- 1.
- 2.
- 3.
- 4.
- 5.

IF ANY OF THE ABOVE PROBLEMS STILL BOTHER YOU, WHAT WOULD YOU HAVE TO DO OR KNOW IN ORDER TO RESOLVE THEM?

- 1.
- 2.
- 3.
- 4.
- 5.

Let us now take a look at the problems of the future.

LIST FIVE PROBLEMS, WITH PEOPLE OR OBJECTS OR CIRCUMSTANCES WHICH YOU THINK YOU WILL HAVE TO SOLVE IN THE FUTURE.

- 1.
- 2.
- 3.
- 4.
- 5.

NOW LIST WHAT YOU WILL HAVE TO DO NOW TO SOLVE THESE PROBLEMS IN THE FUTURE.

- 1.
- 2.
- 3.
- 4.
- 5.

NOW LIST HOW VITAL THESE PROBLEMS MAY BECOME TO YOUR EXISTENCE.

- 1.
- 2.
- 3.

- 4.
- 5.

IF ANY OF THE ABOVE PROBLEMS WORRY YOU, IT IS BECAUSE YOU HAVE NOT DECIDED UPON YOUR COURSE OF ACTION. TRY TO LIST YOUR COURSE AS IT WILL PROBABLY BE TAKEN.

- 1.
- 2.
- 3.
- 4.
- 5.

In this same act, we should take up goals. Some poet once said that a man's dreams were important and that when the last of a man's dreams were dead, dead was the man. He didn't know about this new science.

Dreams, goals, ambitions, these are the stuff Man uses for fuel. SURVIVAL is nothing but the effort to accomplish action. There is the broad goal of all survival. There is the small goal of a good action. SURVIVAL, action and goals are inseparable.

Happiness could be defined as the emotion of progress toward desirable goals. There is an instant of contemplation of the last goal in which one is content. But contentment becomes boredom immediately that new goals do not come to view. There is no more unhappy thing than a man who has accomplished all his ends in life. Gibbon, for instance died immediately after finishing his great work. It is doubtful if men die when they have great goals ahead of them, save perhaps in the violent action of some attempted attainments. It is doubtful if it would take more than a flick with a feather to kill somebody who has no goals. The Filipino irregular of 1901, battling for an independent state, would charge seventy-five yards and kill his man AFTER that man had put a Krag-Jorgenson bullet through the *heart* of the Filipino. A neurotic without goals catches a harmless bug, sneezes and dies. Or sneezes and dies without a bug getting near him.

People always begin with goals. They often fail. When they have failed often enough they stop thinking about the future and start worrying over the present. When the present hands them a few failures they start worrying about the past. They go "out of present time." If you were simply to walk through an insane asylum and tell each inmate, "Come up to Present Time" a small percentage would immediately become sane and stay sane. The order would unfix their attention from a past maybe or fix their attention on the present. It has been tried and has succeeded.

More happily, let's examine your goals and fears.

IN THIS COLUMN LIST FIVE GOALS YOU HAD IN THE PAST.

- 1.
- 2.
- 3.
- 4.

5.

IN THIS COLUMN LIST WHAT HAPPENED TO THE FIVE GOALS IN THE PAST.

1.

2.

3.

4.

5.

IN THIS COLUMN LIST FIVE FEARS WHICH YOU HAVE IN YOUR PRESENT.

1.

2.

3.

4.

5.

IN THIS COLUMN LIST FIVE FEARS WHICH YOU MIGHT EXPECT TO ENCOUNTER IN THE FUTURE.

1.

2.

3.

4.

5.

Now go back over your lists and for each item in the goals columns, see if you can find some person in your past or present who might have these goals or who might have had them. Some person other than yourself.

Now go down the past and present and future fears column and see if you can find some person in your past who might have had these fears other than yourself.

When you have noted down these people or one person, answer the following:

IS THAT PERSON DEAD ? ARE THOSE PEOPLE DEAD? DID THEY FAIL?

You should be able to sort out your own goals from “dead men’s goals.” And you should be able to sort out your own fears from “dead men’s fears.”

It’s a “very peculiar thing” that you may be seeking a life continuation and life realization from people no longer amongst us in that precise identity.

Out of nobility and grief, so does one take on the burdens of those who have laid down their burdens. This includes pets.

There may be one dead person or half a dozen. One dead pet or two or three. List briefly the goals of each dead person you have loved. Then briefly list the goals of each pet.

You may have wept doing this. If so, come up to present time. Now recall the last good time you had in the fullest detail. Be very precise in trying to reexperience this good time.

Better?

Let's see now if you can recall the following for each person and pet you may have listed.

1. The precise moment you first decided you had affection for them. Any moment you decided you had affection for them.
2. Any moment you decided you were like them. The first moment you decided you were like them.
3. Any time you regretted something you had done to them. The first time you regretted something you had done to them.

“Magic drugs” such as penicillin depend upon the ability of the body, not the drug.

With this much background failure the world has been in apathy about the body. It was born, it grew, it died. Surgery and drugs could stem the tide of time a brief moment. But that was all. This dramatic struggle for knowledge of the human body was a struggle against time. Time's scythe in the hands of that grim gentleman, Death, won every contest.

Now and then a mystic would rise in the world and with a few passes of the hand cause the crippled, the sightless, the faltering to bloom with life once more. Then the mystic, the adept, the master would vanish and Man would struggle on with attention to their relics but without many repetitions of the miracles.

That faith or thought could do such astonishing things in the hands of a master or adept brought men like Freud into heavy ambition to resolve the human body's ills by resolving the ills of the mind. The medical profession of his day ostracized Freud. Today psychoanalysis and psychologists speak with contempt of Freud—perhaps they owe him too much. But Freud is the grand old man of psychosomatic healing. He popularized the idea that something could be done about human unhappiness via treatment of the mind and that human ills might be handled by handling the “ego,” the “id” and the other mental entities Freud thought he had discovered. Freud has many pupils Jung, Adler and others who decided only they themselves could see the light and so went sailing off into further and further incredibles. Of all these it now seems evident that Freud himself was the only one of them who had even started toward the straight and narrow road to complete physical rehabilitation of the body via the human mind.

In my boyhood I studied Freud second hand. His brilliant student, the late Commander Thompson of the U.S. Navy, had just left Freud and Vienna when he saw fit to dazzle a young mind with the idea that perhaps the riddle of thought could be resolved. Studying Freud tenth hand, through his books and what people thought people had said about what Freud said, the psychoanalysis and psychiatric world had broken cleanly with Freud years before I even came to a university. There was no studying Freud in any college. They did not teach Freud. He had been abandoned by the professional cliques.

In the meanwhile a new subject had risen in the world. Nuclear physics they call it now—“atomic and molecular phenomena” they called it then. No atoms had been split effectively, but from Newton to Halley to Einstein, men had been studying the physical universe and had now encoded the subjects of matter, energy, space and time. Here was a new field of knowledge. It was so new that those of us who studied in it were known as the “Buck

Rogers boys,” a comic strip character of the day who sailed off to Mars or Venus and had incredible adventures. We experimented with rockets and the doppler effects and later found employment difficult to achieve except as orthodox engineers. Although it was my father’s ambition that I become one of these orthodox engineers, bless him, I found that with all this new knowledge, transits were dull. In order to pursue studies in this field I had to write for any magazine that would buy. Many of us, in the decade of the thirties, were “Buck Rogers boys” in earnest, writing “science fiction” for a growing audience of fans. Then came Hiroshima and “Buck Rogers boys” started to have such importance to the governments of the world that they are almost prisoners. Having escaped offered employment by Russia and the United States, I continued my work in the field where I had started, the human mind, from the viewpoint of mathematics and nuclear physics. As late as 1950 I was still acting fast to keep out of U.S. Government research laboratories.

Culmination of research in what is popularly known as this new science and more correctly known as “Scientology” has yet to occur. But in 1948 a thesis was written and submitted to the medical professions which demonstrated that workability of alleviating physical ills by an address to mental problems.

You as a personal identity are the composite of all your experience PLUS an initial decision TO BE and occasional decisions NOT TO BE. YOU do not die as an identity or a personality or an individual. YOU and the MEST body “separate” and the MEST body gets a funeral. YOU then link into the protoplasm line with your genetic blueprint—the plans of construction of a new body in the orthodox manner of conception, birth and growth. You depend upon some inherent abilities of protoplasm but you, as experience and identity, monitor that protoplasm’s ability and modify it. There is a family line, then, from generation to generation, modified by YOU as experience. YOU are not necessarily part of that family line. Every child, for instance, distrusts his identity as a family member. And there are numerous cases of record wherein a child, up to the age of three or five, recalled entirely who he had been—but forgot it under the pummeling of his “imagination” by adults. Perhaps you take off after some lifetime and go to heaven. Nobody can argue successfully about that. But YOU are the source of yourself with regard to various generations. Now this, by effort processing, becomes so irrefutable, so clear and unmistakable that if it can be disproven, then the laws of heat and fission can be disproven as well. We are on solid ground about immortality and all the rest of it for the first time in history.

YOU are evidently quite eternal as a personal identity. You get snarled up in the modern social aberrations about only living once and play the game as though you would never get another chance—which you will get as certainly as the sun will rise tomorrow.

Now if you can handle a body in construction you can certainly modify one in growth and form. And so you do. You can modify it to the degree of going blind or getting arthritis and being bed-ridden or having migraines or putting any other imperfection on yourself. You, as CAUSE, are continually shouldering the ills of the world and modifying yourself accordingly.

Once having taken on such an ill to “help” another, you may be very reluctant to give up the infirmity. Evidently it doesn’t help the other very much but you, with your social aberration that a person lives only once and never again, take the illness or demise of another very seriously. Much too seriously. And so there you are with somebody’s arthritis. Of course, it isn’t his. It’s an old injury of your own—your own facsimile—which you are holding in place for him. People will give up any illness or infirmity which is theirs—their very own—with immediate ease and no qualms. But they are quite tenacious of the ills they have shouldered for others. This caused old workers in the field of the mind to suppose that people simply refused to get well. No, people simply refuse to give up the illness of others for whom they have made themselves responsible until they clearly see that holding the illness will not bring back or restore the health of that other. It’s a wonderful world. Man has condemned Man for selfishness for eons and here we find Man only gets lastingly crippled or lame to “help” another.

Once it was said that if people knew the world was going to end tomorrow, the communication lines of the world would be jammed with calls from people seeking to say they loved one another. It is probably quite true.

In the field of illness, however, once one realizes how little it helps, one can give up another's aches and pains and resume his own health. It is quite a decision but one which processing itself assists. You may find that you will be trying to make that decision. The other day a totally blind man under processing stopped the session on the abrupt realization that he would see wholly and clearly for the first time in years. Just an instant before his sight turned on, he balked. Why? His trouble with sight had to do with the death of his brother. His brother had been injured and was blinded in an automobile accident. The moment the brother died, this pre-clear had taken on the burdens of his brother.

WHICH YOU WISH YOU COULD ATTAIN IN THE TOMORROW'S, SUCH AS PHYSICAL BEAUTY OF STRENGTH, WHETHER YOU THINK YOU CAN ATTAIN THEM OR NOT. GET AS WILD AS YOU LIKE.

- 1.
- 2.
- 3.
- 4.
- 5.
- 6.
- 7.
- 8.
- 9.
- 10.

NOW LET'S BE CRITICAL. LIST FIVE THINGS WHICH YOU THINK MAY BE WRONG WITH YOUR

PRESENT PHYSICAL BEING. LIST THEM WITH THE THOUGHT THAT THEY MIGHT BE REMEDIED. SUCH THINGS AS FREQUENT COLDS, ETC.

- 1.
- 2.
- 3.
- 4.
- 5.

NOW LIST THE PERSONS OR PETS WHO HAVE FAILED OR ARE DEAD WHO HAD THINGS WRONG WITH THEM. THERE MAY BE MORE THAN ONE WITH EACH. TAKE THE FIRST ERROR YOU LISTED ABOVE AS NUMBER ONE AND WRITE THE NAME OF THE PERSON WHO MIGHT HAVE HAD THAT ILL AFTER NUMBER ONE

BELOW AND SO ON. YOU MAY NOT BE ABLE TO ACCOUNT FOR SOME OF THE CONDITIONS. THAT IS ALL RIGHT.

- 1.
- 2.
- 3.

THE SIXTH ACT

The subjects of effort and counter-effort, emotion and counter-emotion are very new in the knowledge of Man. In continuous investigation of mental and physical phenomena, I chanced upon these manifestations and put them to work immediately. Such was their reach and significance that auditors from coast to coast, within sixty days, were “cracking cases” which they had found hitherto “uncrackable.” Thus you can see that it is well to know something about them.

Let us take EFFORT. Your mind is continuously at work estimating efforts. When you go to open a door, your mind estimates the effort necessary to turn the knob and, via emotion, puts that effort into action. It estimates the effort necessary to pull the door back and puts that into action. If the door handle turned as desired and the door opened as desired, your estimation of effort was correct.

Your mind calculates efforts for the present and for the future. It puts efforts into action now or in the future. Or it simply estimates them and holds them back and never applies them. Your mind estimates the efforts of the environment, how fast cars go, how hard tea cups have to fall to break. And it even estimates efforts when it “day-dreams,” which is to say that it thinks of the efforts involved in that and that without even desiring to put them into action. Thinking of a goal is putting something into the future to which one can build by effort. An attained goal is a summation of efforts.

If you calculated the door properly, you opened it smoothly. If you calculated wrong and the door stuck, you were wrong. Did you ever have a door or a drawer stick on you consistently? After a while you became angry with it. Then you began to avoid it. For the mind which survives well, estimates efforts well. It is *right*, which is to say, it estimates efforts rightly.

The author writing a story estimates many, many efforts. If he is right, it is an interesting story and sells. If he is wrong it is not an interesting story and it doesn't sell.

The mind all through evolution was subjected to countless efforts on the part of the environment. The wind, sea, sun and other organisms all had efforts to throw at the organism. The organism that handled these *counter-efforts* well, survived well. It came to use these very counter-efforts as its own efforts. The evolution of efforts is from counter-effort to employed effort.

Effort means force and direction. Your life is a contest between your own efforts and environmental efforts.

Any psychosomatic illness you have is some counter-effort, some past effort of the environment, you aren't handling or using right. The facsimile of the effort itself is in the facsimile. Facsimiles are recordings of effort. Perception is the recording of physical universe efforts and your thoughts, conclusions and efforts about them as well as your emotion.

Effort processing is easily done. One finds where the facsimile of an effort is against the pre-clear and gets the pre-clear's effort against it. A pain or pressure turns on and, by constant reexperiencing, turns off. But effort processing is something which should be done by any auditor and although it can be done by a pre-clear on himself, must be thoroughly understood by that pre-clear. There is not enough data in this volume to permit a pre-clear to effort process himself. To do that he would have to study the main body of this science, preferably at the Foundation Auditor's School, or at least through the basic texts.

Emotion and counter-emotion are something else. The pre-clear should be able to handle these.

You know what your own emotion is. Anger, fear, grief, apathy. You have experienced these things. They are part of facsimiles now. Grief is very important as a blocker in one's life. Grief takes place where one recognizes his loss and failure as in the death of somebody he loved and tried to help.

A facsimile which contains chiefly emotion is called, in this science, a SECONDARY ENGRAM. This would be a unit of assay with ease. They are flattened simply by re-experiencing them and getting four old conclusions out of them.

A word of caution. Don't try to run yourself around somebody who may be even faintly critical. And don't argue with somebody about it. The wife, mother, father, the husband, may get into a terrible dither about your effort to feel stronger. They may even have an interest in keeping you down so they can "take better care of you." Run one of these secondaries around such a person and you'll really fix yourself up.

And by the way, be very suspicious of somebody who doesn't think you ought to indulge in this new science. Auditors are always running into situations where they have a son or a daughter in good condition and well on the road to recovery when the parents step in and with every argument in the book, with every "good intention" knock the poor pre-clear into limbo again. Such people want the pre-clear under control and instinctively realize that the pre-clear is getting very independent. The pre-clear who argues back simply gets himself snarled up again. Best to be calm and do your work in private. Then when you are nine feet tall, do your arguing.

And don't plead with a wife or a husband or a friend to study this new science against his or her will and use it on you. They will manage one way or another to turn the processes around and wreck you. You may have an impulse to use your facsimiles to get sympathy from such a person. It is quicker and easier just to blow out your brains. The result will be the same. For when you force somebody to "help you" and "be sympathetic" who has an interest in keeping you sick, they will manage to make you sick in earnest. Out of their good knowledge and intentions, of course. There is, for instance, a very sick woman who could be straightened out by an auditor in about fifteen hours. Yet her husband, hovering like a mother hen, is violent about letting her be helped: He knows nothing of this new science except that it is successful. She has had three unsuccessful operations for her condition. He is seeing to it that she is going to get a fourth which will probably kill her. These are desires to help—out of a frame of reference which doesn't work. "Keep him calm. Operate on him. Control him. Mama knows best" are the sources of the attitude.

Further, you have always had and use what is known as a SERVICE FACSIMILE. Every time you fail, you pick up this facsimile and become sick or sadly noble. It's your explanation to yourself and the world as to how and why you failed. It once got you sympathy. Sympathy will turn it on again. It may contain the basic condition of being which is now passing for a common cold or sinusitis or a game leg. You fail at something, then you use the facsimile. And you get sympathy from somebody. Well, heaven help you if you are around somebody who doesn't get the line signals. You use the facsimile and then they don't sympathize. You use the facsimile harder. And they are still stone cold. Then you really turn it on. Maybe it was measles that founded this facsimile. Maybe it was when you broke your leg. Well, you'll use it to a point where you'll get all the symptoms again if you don't get sympathy for it. You have two choices: Run out this service facsimile and the reasons for its use as per the remainder of these acts or get yourself a new associate or partner. For that service facsimile will get you by and by. You didn't believe it yourself the first time you decided to use it. Then the use of it became automatic. And now you "wonder what caused it." You did.

We remark on the SERVICE FACSIMILE at this place, not to have it run in this act, but to acquaint you with its existence. For you may hit it in running a secondary and be very loath to part with it. It is simply a time when you tried to do something and were hurt or failed and got sympathy for it. Then afterwards when you were hurt or failed and wanted an

explanation you used it. And if you didn't succeed in getting sympathy for it, you used it so hard it became a psychosomatic illness.

Let's take a summary of your body. Maybe we can discover what you are using for a SERVICE FACSIMILE. Everybody has one or more than one.

LIST ANYTHING WHICH GETS WRONG

WHAT FAILURES SINCE HAVE TURNED THESE ON?

WHO DOESN'T SYMPATHIZE WITH THEM?

WHO DID?

WHAT IS THE SIMILARITY BETWEEN THE PERSON WHO DID AND THE PERSON WHO DIDN'T OR DOESN'T ?

WHAT ARE THE DIFFERENCES BETWEEN THE PERSON WHO DID SYMPATHIZE AND THE PERSONS WHO DIDN'T OR DON'T?

WHO DID YOU BLAME?

WHO DO YOU BLAME ?

Having and using a service facsimile does not make you a hypochondriac. It simply makes you human.

The facsimile might release right here. If it doesn't, there's a lot of book left.

ONE WORD OF CAUTION ABOUT ALL THIS. PROCESS YOURSELF AT SPECIFIC TIMES, NOT ALL THE TIME. CHOOSE A PROCESSING TIME AND USE IT. THEN WHEN IT IS OVER, WAIT UNTIL THE NEXT TIME. DON'T GO AROUND SELF AUDITING.

In the pictures you get of old incidents, you may be seeing yourself "outside of yourself," not seeing the scene as you saw it then. This is being "out of valence." Simply move in valence to run the incident. Running it outside yourself won't do very much for you. But if you run it very many times, you'll be inside yourself in the scene.

Being outside oneself is the cause of "self-auditing." In an operation or somewhere, you slid out. When you self-audit, you may be in the role of somebody who hurt you (a counter effort) and you'll just keep on hurting yourself. The section on counter-emotion, later, clears up this condition if it begins.

You should know this so that you will not be alarmed on several counts. The first is temporary "euphoria" where you stay happy for two or three days and then get sad again. That's a temporary shift, evidently. The second is physical unbalance which can occur as a temporary affair, where you get a toothache or a headache on one side and the other side seems numb. Another is a shift of interests.

You won't contract amnesia but this shift of centers may be responsible for amnesia. A sudden shift of centers occludes present time experience and then may shift back. It doesn't happen in processing.

There is also a whole set of "pseudo-centers," the personalities of people whom you've tried to help and have failed. These are "valences." A person can have two or ten dozen of these "valences," can be one personality to Joe and another to Agnes, can change at a certain period

of life into an “entirely new person.” This is simply a manifestation of the life continuation manifestation discussed earlier. All these are relieved by getting rid of mis-emotion.

The ideal state of affairs is the attainment of a super-center. Right and left centers are always sub-centers. A “super-center” is acquired on discharging all the sympathy and regret on a case or, in short, the mis-emotion.

Think this over carefully. The incidents are marked by sudden changes in physical health, old illnesses disappearing, new illnesses appearing. Falling in love may shift centers. A bump on the head may shift them. Any emotional shock might do it. In particular, incidents which diminish one’s concept of his ability to handle his surroundings and people may shift centers. A sudden drop, because of an experience, of one’s importance, may shift centers.

A death, a severe loss, a realization of one’s unimportance, may shift these centers. Each incident listed should be run. If it is difficult to run as a facsimile, wait until later in the volume when you have learned how to chain scan yourself and then refer back to this list. If possible use the technique for secondaries as of the sixth act to accomplish the purpose.

WRITE DOWN THE NUMBER OF TIMES, WITH APPROXIMATE DATES, WHEN YOU MIGHT HAVE SHIFTED CENTERS.

WRITE DOWN, BRIEFLY, THE SHOCK OR LOSS WHICH MIGHT HAVE OCCASIONED THESE SHIFTS.

THE EIGHTH ACT

Done by yourself, without an auditor's assistance, you may find this processing rather heavy for you and again you may not, depending on how much life endowment you have.

But here is a technique which is relatively simple. It does things for you quickly. In the fall of 1951 I developed this technique from one called chain-scanning, an effort to non pain in wholesale quantities from a case, which did not work. This is lock-scanning. It does work.

Take your pencil and draw a line, a vertical line on the space to the right. Make the line about five inches high.

Now, at the bottom of this line, mark it *conception*.

An inch above the bottom, draw a horizontal line and mark it *birth*.

At the top of the line, mark it *present time*.

Now just above birth, draw a VERY heavy horizontal bar about an inch long.

At intervals of every quarter or half an inch, irregularly, above the heavy bar, draw a light line horizontally, half an inch long. There should be a dozen or two of these light lines.

Now mark the heavy horizontal bar PAINFUL INCIDENT.

Now mark the light bars above it, each one, LOCK. Here is a picture of a TIME TRACK. That is the long vertical line. It is a way to plot your facsimiles, experiences in life, against time. Actually these facsimiles can be sorted around at will by you. But stretching them all out this way, they can be conceived as a track of time through which you have lived.

Now during this lifetime, on this TIME TRACK, various things happened to you. Some were good and some were bad. Up to your teens you had the big goal of growth and after that you had other goals.

This track is a continuous facsimile. But it is made up of a lot of facsimiles, particular experiences which either stand out or remain hidden.

PAINFUL INCIDENT is any incident which was painful: a death, an operation, a big failure, big enough to render you unconscious such as an accident. You've had many of these but we are graphing just one to show you what happens to any of them.

LOCKS occur when you decide that the environment is similar to the PAINFUL INCIDENT. LOCKS occur when an individual is tired or has had a minor failure in life which reminds him, perhaps, of the major failure.

The technique known as LOCK SCANNING starts off from an early lock of the painful incident but not the painful incident itself. One doesn't pay any attention to that: it is more or less inflated by the locks and can be handled as an incident just like any other facsimile, which is to say, put aside at will. But sometimes the locks have to be cared for before the PAINFUL INCIDENT slips away. Of course the painful incident itself can be run by effort processing but that's pretty heavy to do by yourself. Further, these locks have to be scanned anyway.

A lock, then, can be treated by LOCK SCANNING.

To LOCK SCAN, one contacts an early lock on the track and goes rapidly or slowly through all such similar incidents straight to present time. One does this many times and the whole chain of locks becomes ineffective in influencing one.

Now more work with the pencil. Number the locks. Mark the first one above PAINFUL INCIDENT, 1, the next 2, and so on.

When you start to lock scan, you will find an incident of the type required. You will scan yourself through all such similar incidents to present time. Maybe the earliest one you found on this scan was lock 8 and you scanned from there through the remaining locks to present time.

On your next scan, try to find an earlier lock. The first scan made an earlier one accessible to you. This new start may be lock 5. Scan from lock 5 to present time through all similar incidents.

On your next scan you may find an even earlier lock. Scan from there to present time through all similar incidents.

You do this scanning on any one chain until you are “extroverted” about it, which is to say, until you find yourself in present time thinking about something else, your tone probably up.

If you continue to lock scan after you have “extroverted” you will “drop through” into another chain on some other subject. This isn’t bad but you want to stop scanning when you are extroverted. One more scan will find you scanning another chain.

It can happen that during scanning you hit what is known as a “boil-off.” This means that you become groggy and seem to go to sleep. This is evidently caused by old unconsciousness coming off. It hasn’t much benefit and apparently occurs when two facsimiles conflict with each other. Actually you could lock scan yourself into a great deal of “boil-off.” You could probably spend five hundred hours lock scanning this and that and boiling off. That’s the slow road. **THE OBJECT OF LOCK SCANNING IS NOT BOIL-OFF. BOIL-OFF MEANS TOO MANY SECONDARIES, TOO MUCH GRIEF AND TOO MUCH REGRET. IF YOU FIND YOURSELF BOILING OFF TOO MUCH (A LITTLE IS QUITE IN ORDER) RUN REGRET AND BLAME AS IN A LATER SECTION.**

This technique has to be known and understood if your processing is to go swiftly.

To show you what happens, here’s some work with an eraser. Take the graph you made. Run your eraser from lock 7 to present time. Some of the lines lightened. Now run the eraser from lock 5 to present time. Now from lock 1 to present time. Now pass the eraser from 1 up many times until the lines are almost erased. That is what happens to the facsimiles you lock scan.

It is possible for you to “hang-up” in lock scanning. You start to run a chain of incidents and find yourself “stuck” halfway to present time. Don’t flounder around or get alarmed. You’ve hit a POSTULATE, a decision you have made not to get rid of something or never to get over that incident. You’ve hit something you yourself thought which keeps you from going on by the incident. Possibly it is regret. Feel the feeling of regret and you may become unstuck. Or feel the feeling of blaming you or somebody else for the incident. Or simply feel the counter-emotion, which will be covered in a moment and is a ripe subject for scanning. It’s expected you’ll finish reading all this before you try it.

You can lock-scan at various speeds. You can scan so fast you don’t even know what the incidents are. That’s MAXIMUM. Or you can scan so slowly that you know every word said. That’s VERBAL. Or you can scan speeds in between. You may have been living with somebody who insisted you hear every word they said and you may find yourself scanning at a

speed which might, facetiously, be called “turtle.” That is too slow. Most scanning is done at ACCELERATED, which simply gives one a glimpse and concept of each successive incident.

Light emotion, counter-emotion, blame, phrases, people, anything can be scanned.

One of the most important things to scan is COUNTER EMOTION which was mentioned but not explained in act seven.

Have you ever walked into a room and known that people had been talking about you or fighting just before your entrance? The “atmosphere” seems charged. When somebody stands and bawls you out, do you feel the anger?

You have emotion which you discharge at people. You try to make them enthusiastic or make them see the seriousness of something or you show them your contempt. Well, they sense it not so much as words but as emotion.

A good orator is one who can throw out a great deal of emotion and so thrill or energize an audience. The same thing could be done with mis-emotion, anger, grief, etc.

Mass hysteria is a well known phenomena. One person in a crowd is panicky. The whole crowd becomes panicky without even knowing what is wrong. This is a built up manifestation of “herd instinct.” Man traveled in packs. It was safer to run or to charge instantly than it was to dawdle around for verbal orders. Thus, mass emotion. This is a survival instinct.

More than that, emotion is the relay between thought and action. Emotion is the glue in facsimiles.

There is THOUGHT, EMOTION and EFFORT. Thought is one fringe of emotion. Effort or physical action is the other fringe of emotion.

Efforts and counter efforts have been mentioned. Somebody hits you. That is a counter-effort. You resist the blow. That is the effort. You use two kinds of effort, the effort to remain at rest and the effort to remain in motion. There are two counter-efforts which you can experience. One which moves against you and one which refuses to move. You can see this very easily. Right now you are making a tiny effort to hold up this book while the counter-effort of gravity is pulling it down. Every day the counter-effort of gravity makes a person shrink during his waking hours, about three-quarters of an inch. At night he gains it back.

EMOTION and COUNTER-EMOTION are similar to EFFORT and COUNTER-EFFORT. You have two goals with emotion. Thought, via emotion, seeks to stop action, self or exterior. Thought, via emotion, seeks to start action, self or exterior. Anger, for instance, seeks to stop exterior action. Fear seeks to start self-action to get away.

Now emotion is emotion whether it is yours or another's. Live around a person who is continually angry and you will begin to emotionally react toward that anger, for the anger seeks to stop you whatever you do. Live around a person who is afraid and you will pick up their fear and try to counteract it with emotion of your own, usually seeking to stop their flight. Or you can get into the unhappy state of duplicating their counter-emotion with your emotion. You do this whenever you agree with somebody. (The chief hole in light books which seek to win friends and influence people. They also make people ill eventually because of agreement on emotion.) Agree with an angry man and you'll get angry too. Agree with an afraid man and you'll get afraid. Agree with a man in grief and you'll feel your own grief. And so on as covered in ARC in an earlier act.

You can feel your own emotion and the counter-emotion when examining a facsimile. Or you can feel simply your own emotion. Or you can feel the counter-emotion only. You can

take what you want out of a facsimile. The trick is to take what is essentially aberrative out of it.

Now let's see what happens to a counter-effort. This, let us say, is that pressure you sometimes feel in your stomach. That's just a facsimile of an old blow but it is sometimes very uncomfortable. How do we get rid of that facsimile? Well, we can lock scan all the times it ever bothered you. And we can lock scan it until it won't bother you again. That's one way. It's around a lot so we can run it as a service facsimile by effort (or an auditor can run it, which is best when effort is in question). Or we can run a grief charge off grandfather's death, grandfather having had a stomach that bothered him. Or we can run off the counter-emotion. We have a dozen ways to handle that stomach trouble.

Let's see how the fastest way. That may be COUNTER EMOTION SCANNING.

If it's a pressure or a pain, it is a facsimile of some pain that happened before and which still exists "in memory" as a facsimile. Obviously it eludes our control of it or it wouldn't hurt. What makes it elude our own control of it? Well, after the blow was struck or whatever the counter-effort was, somebody in the environment began to throw emotion at that very spot. That is counter-emotion to you. The counter-emotion took over that facsimile of the counter-effort and it is being held there by somebody else's counter-emotion. That's the way the pressure or pain in the stomach may add up.

Don't let's try to get complicated about this. It's simple. George has been hit in the stomach by a baseball. Later his mother is sympathetic. That makes it a "good facsimile" so George holds on to it. Then one day he gets married. His wife, a 1.5, begins to nag him about eating. She gets angry at him. He wants sympathy instead so he holds up this facsimile for sympathy and it doesn't work. Her counter-emotion, anger, alters the baseball in the stomach somatic and puts anger on it. Now George doesn't control it any more. It is controlled by his wife and her counter-emotion of anger. In processing, George starts to run his wife's anger. The old baseball facsimile turns on strongly and then goes away, never to return.

Where the emotion of others is concerned, an ache or a pain is fair game. But oddly enough, one has to have loved or felt sympathy for another in order for that person's counter emotion to have much effect.

The cycle is then as serious a blow or a pain becomes a facsimile. Facsimile is used by individual. Or isn't handled well by him. Somebody close to him gets angry at him or fearful or sad. That emotion (counter emotion) turns on the old blow or pain. If the counter-emotion is heavy, not even effort processing can touch that old facsimile until the counter emotion is removed from it.

The process is this: You have an ache or a pain. You can't get rid of it simply by identifying its source or other light means. You locate a time when somebody you loved threw counter-emotion at that particular spot. You scan, by lock scanning, all the counter-emotion thrown at that spot, whether it was sympathy or anger or fear. It doesn't matter what you do about your own emotion.

One of two things will happen: You will find the old facsimile and throw it away or you will find counter-emotion from a great many people, run that off by scanning, and then discover a big secondary which will have to be run or a PAINFUL INCIDENT which has to be run by effort processing and is the service facsimile.

Whatever happens, you won't go wrong by running any and all counter-emotion you can find.

Every atmosphere in which you have lived has an "emotional quality." You will find that emotion doesn't come from humans only. You will find times in your life when you ran away from an atmosphere alone, not for any other reason than that you did not like the "feel" of

it. You will find you have avoided people, certain persons, certain groups, because you did not like the counter-emotion. You may discover that that vague blur which you recalled as your education was thrust out of sight just because you hated the school atmosphere, its counter-emotion.

Primarily and foremost, you will find counter-emotion sitting around by tar bucketsful whenever you failed. This is a mixture of counter-emotion and your own emotion or regret and blame.

Counter-emotion has been thrown at you, your thoughts, specific parts of your body and, in particular, that great or slight infirmity which you carry around.

Don't be alarmed if, in scanning counter-emotion, some chronic pain begins to turn up like a five-alarm fire. Don't run for a water bucket. Just run more counter-emotion. It's doubtful if it will kill you for you see, you didn't die before when you actually experienced it.

These are just facsimiles. If the real thing didn't ruin you the facsimile probably can't. If you have a very weak heart, however, or some such infirmity which means razor-edge between life and death, USE MEMORY ONLY FROM PRESENT TIME, DON'T LOCK SCAN, ON COUNTER-EMOTION. In two years these processes in the hands of the public, an often careless public, have never lost a pre-clear by reason of a weak heart or some such hair-trigger infirmity but I must state that that doesn't mean it can't occur. See a doctor and an auditor but don't let the doctor talk you out of the auditor. Doctors always tell people with weak hearts to slow down—that's what's wrong with the individual. He's too slow already.

The assignment of the eighth act is first a thorough study of lock scanning. Then a thorough study of counter-emotion. Then, finally, testing out lock scanning and counter-emotion separately and then as one process. Do the following practice exercises.

LOCK SCAN EVERYTHING YOU HAVE EVER HEARD ABOUT THIS SCIENCE, GOOD AND BAD, UNTIL YOU EXTROVERT ON THE SUBJECT.

LOCK SCAN EVERYTHING YOU HAVE EVER HEARD OR READ ABOUT L. RON HUBBARD, GOOD OR BAD, UNTIL YOU EXTROVERT ON THE SUBJECT. IF YOU HAVEN'T HEARD ANYTHING—FINE.

LOCK SCAN EVERY CONCLUSION OR POSTULATE YOU MAY HAVE MADE ABOUT THE SCIENCE AND EVERY DECISION ABOUT IT.

IF YOU HAVE EVER BEEN AUDITED BEFORE BY OLD STANDARD PROCEDURE, LOCK SCAN ALL SESSIONS OF THAT AUDITING.

IF YOU HAVE EVER BEEN AUDITED BEFORE, PICK UP EVERY TIME YOU AGREED TO CONTACT AN INCIDENT.

IF YOU HAVE EVER ASKED TO BE AUDITED, LOCK SCAN EVERY TIME YOU ASKED SOMEBODY TO AUDIT YOU.

When you have completed this, do this further exercise:

IF YOU HAVE EVER BEEN AUDITED, LOCK SCAN THE COUNTER-EMOTION OF YOUR AUDITOR

AND THE ENVIRONMENT. Get the way his emotion might have felt to you. If you haven't any contact on it, don't worry. You didn't like him.

PICK UP SOMEBODY IN YOUR LIFE OF WHOM YOU WERE FOND. LOCK SCAN ALL THE TIMES WHEN YOU WERE SYMPATHETIC TO HIM OR HER. BUT

CONCENTRATE WITH YOUR SCANNING ON THE EMOTION FROM THAT PERSON WHEN HE WAS IN TROUBLE OR IN PAIN. SCAN UNTIL YOU EXTROVERT ON THE SUBJECT.

LOCK SCAN THROUGH ALL THE TIMES YOU HAVE TRIED TO HELP PEOPLE IN MINOR WAYS. DO IT IN GENERAL WITHOUT ANY ATTENTION TO COUNTER-EMOTION.

NOW LOCK SCAN THROUGH ALL THE COUNTER EMOTION OF PEOPLE YOU HAVE TRIED TO HELP. THEIR EMOTION TOWARDS YOU BEFORE AND AFTER THE AID OR OFFER WAS EXTENDED.

These are exercises. The last action, however, is a very effective process. Now follow with these effective processes:

GO TO THE SECOND ACT (ARC) WHERE YOU MADE A LIST OF PEOPLE WHO ENFORCED AND INHIBITED AFFINITY, COMMUNICATION AND REALITY ON YOU. LOCK SCAN THE COUNTER EMOTION OF THESE PEOPLE OF THE PRESENT AND OF THE PAST IN EVERY INCIDENT OF ENFORCED AND INHIBITED ARC. CHECK OFF EACH NAME WRITTEN IN THE SECOND ACT. SCAN UNTIL YOU EXTROVERT ON EACH ONE.

When you have completed everything to this point and in particular, the scanning of all people mentioned in the second act, continue with the following:

IN THE THIRD ACT YOU LISTED YOUR ATTITUDES TOWARD THE WORLD IN WHICH YOU ARE LIVING. LOCK SCAN EACH AND EVERY TIME YOU MADE A DECISION OR FELT THE ATTITUDE LISTED. TAKE EACH PHRASE YOU WROTE AND SCAN EVERY TIME YOU FELT THAT WAY. THEN GO TO THE NEXT PHRASE.

WHEN YOU HAVE FINISHED THIS SCANNING,
SCAN OFF THE COUNTER-EMOTION IN ALL SUCH INCIDENTS.

WHEN YOU HAVE COMPLETED COUNTER EMOTION IN EVERY INCIDENT RECALLED AROUND YOUR ATTITUDE GO TO THE BIG CHART.

START AT THE BOTTOM PHRASE OF COLUMN ONE OF THE BIG CHART. SCAN EVERY TIME YOU FELT THAT WAY TOWARD THE WORLD, TOWARD YOURSELF, TOWARD GROUPS, TOWARD ANIMALS, TOWARD THE SUPREME BEING.

(In this process most but not all phrases may have been applied.)

TAKE THE NEXT HIGHER PHRASE IN COLUMN ONE AND SCAN FOR ALL DYNAMICS.

TAKE THE NEXT HIGHER PHRASE IN COLUMN ONE AND SCAN FOR ALL DYNAMICS.

PROGRESS ALL THE WAY TO THE TOP OF COLUMN ONE, SCANNING EACH LINE FOR EACH DYNAMIC.

START AT THE BOTTOM OF COLUMN TWO AND TAKE THE LOWEST PHRASE. SCAN EACH TIME YOU TOLD YOURSELF OR THE WORLD THIS PHRASE. SCAN FOR EVERY DYNAMIC.

TAKE THE NEXT HIGHER PHRASE IN COLUMN TWO AND SCAN FOR EACH DYNAMIC.

CONTINUE ON UP COLUMN TWO, SCANNING PHRASE IN TURN FOR EACH DYNAMIC.

SCAN EACH PHRASE FROM BOTTOM TO TOP IN EVERY COLUMN FOR EVERY DYNAMIC UNTIL YOU HAVE SCANNED EVERY PHRASE ON THE BIG CHART.

THE NINTH ACT

In this act we handle emotion and counter-emotion with even more understanding.

The technical background of this is simplicity, but it is a simplicity which took twenty years to discover. All things are complex when they are poorly understood. The evolution of knowledge is toward simplicity, not complexity. An evolution toward complexity is an evolution toward authoritarianism and pomposity—"you couldn't possibly understand this, therefore I, who pretend to, am important" is the attitude which mires learning. The only claim science has on anyone's attention or interest is the ability of a science to make phenomena workable and align that phenomena for better understanding. A body of data which does not accomplish this is not only not a science, it is a pretense and a humbuggery. Thus, if you are working with any idea that the human mind "is too complex to understand" you are taking the stand of those who failed. The problem of resolving the human mind was enormously difficult. The solution of the operation and difficulties of the human mind is very simple.

We have three levels of operation. They are THOUGHT, EMOTION AND EFFORT. Thought produces motion or action through the medium of emotion. Motion and effort in general produce thought directly but also through the medium of emotion.

THOUGHT is without time. It is instantaneous. Emotion, where its band rests in THOUGHT is also without TIME. EFFORT, ACTION CONTAIN TIME. A motion is a change of position in space. A change of position requires time. The common partner of time and space is motion. To have motion we have to have space and time. To have EMOTION we do not need time. And there is no time what ever in thought. This is the theoretical background. It doesn't much matter whether it is clearly understood or not.

An individual is a collection of "memories" going back to his first appearance on earth. In other words, he is the composite of all his facsimiles plus his impulse TO BE. Individuality depends upon facsimiles. The very character and shape of the body, its genetic blueprint which says whether one has one head or two, is a composite of facsimiles, according to theory and evidences.

The facsimiles which occasion behavior were initially counter-efforts. All facsimiles contain counter-efforts. The body and personality are actually old counter-efforts which "I" has turned into efforts. Thoughts are timeless. You can close your eyes and see, in thought, some item which you well know is since vanished in the MEST universe. You have it as a facsimile still. You can in thought, go back and be a small child. You cannot go back in body and change the past. That you can go back in thought tells us that the thought must be right here in present time too. In other words you as mind can handle yesterday as thought. Thought is timeless. Thoughts are FILED by your concept of when they happened. As long as you know the time tab of any thought, it is yours completely. When you do not know the time tab of a thought, you no longer control it.

People are very fond of saying they have "bad memories." They use this as a social excuse and to avoid recalling failures. The memory by these processes repairs rapidly until a person can recall things at will. His ability to recall things depends upon his ability to read the time tabs on his facsimiles, so to speak. In other words, so long as he recalls accurately, he is in control of the facsimile. When he cannot recall accurately, he is not in control of the facsimile.

At the Foundation we repair psychotics, the despair of thousands of years of civilized man, in a relatively short period of time. For two thousand years they have been giving psychotics shocks, restraints and operations—there has been no change. Freud alone suggested a change but he didn't have the reason why nor the effectiveness and today, in major institutions, these antique methods pass for "modern" treatment. Out of our present body of knowledge we are restoring the sanity and effectiveness of psychotics, a thing which has never

before been done with regularity or a guarantee of success. We even restore psychotics who have been given “modern” treatments, shock and the rest of it. How is this done ?

Handle it this way: an insane person cannot reason or control himself. That means he cannot handle his facsimiles. By a series of precise steps the auditor gives the psychotic back the control of the Facsimiles. These steps are as follows:

1. By mimicry (a form of communication), tactile (the most direct communication) and by general ARC we get the psychotic into communication with one human being, the auditor. This is sometimes long and difficult and is the most arduous step. It can be assisted by giving the psychotic MEST —time and space and removing restraints.
2. The auditor then works to get the psychotic into contact with present time. He calls attention to objects and the general environment until the psychotic sees that these are real. When the auditor knows the psychotic knows the reality of beds and walls, he turns attention to the psychotic himself as a being. He establishes the fact with the psychotic that the psychotic controls his own hands and feet and body.
3. At this stage the auditor may introduce the psychotic into association with other people and a wider environment. This is again more present time. The auditor NEVER evaluates anything for the psychotic. The psychotic is insane because of too much EVALUATION by others and will slump if somebody starts thinking for him again.
4. The next step is to get the psychotic to evaluate something. This may be as mild as whether or not hamburgers are good to eat. The psychotic decides on an evaluation. Then many evaluations in present time.
5. Now the psychotic is asked to make minor decisions in present time plus action on those decisions. This includes getting him to decide to accept something and to decide to throw something away, for the handling of MEST is not unlike the handling of thoughts and to a psychotic thoughts are as solid as MEST.
6. The next step is to get the psychotic to recall something no matter how general about his past. He is asked to recall things until he strikes an incident he REALLY KNOWS IS REAL. It is real to him. It is a real memory. This is another up point in his tone as each of these steps listed are. But it is the big point. He has recognized as real one of his facsimiles. He isn't coaxed into admitting it is real. He recalls and knows that it really happened. He is then made to recall many such incidents. HE IS NEVER INVALIDATED OR ARGUED WITH ABOUT WHAT HE THINKS IS REAL. THE AUDITOR SIMPLY IGNORES THE HALLUCINATIONS AND ACCEPTS A REAL MEMORY AT LAST.
7. The succeeding step is to get the psychotic to recall a past evaluation, a time when he made up his mind about the character or quality of something. The specific moment of evaluation is attained. Then the psychotic is made to recall a decision he has made in the past. Many evaluations and decisions are thus recalled.
8. The psychotic is now questioned about the times he has helped people. If possible heavy failures are avoided. When he has recalled times when he has helped people and knows each incident recalled is real and actually happened, one goes to the next step.
9. The auditor now tries to locate the decision, the exact instant, with all perceptions possible, when the psychotic decided to go crazy. There may be many such decisions. These are recalled many times each.
10. The psychotic is now questioned on the subject of departed or failed relatives or friends until one is discovered who went mad. This is the location of a goal continuation for another.

11. Now the psychotic is worked on the subject of sympathy, what he has had to do to get sympathy, what sympathy he has given others. Probably a grief charge will come into view and can be run.

The individual about step eight is no longer classifiable as very psychotic, by step ten he is at worst neurotic. And he can be processed by counter-emotion, regret and other techniques.

This is outlined to give you some sort of an idea of what psychosis is and how sanity is restored. It is the condition of being unable to handle one's facsimiles. Sanity is restored by restoring an individual's ability, little by little, to handle his facsimiles.

But by what mechanism does an individual become unable to handle his memories? There are several answers but the main one is COUNTER-EMOTION.

Counter-Emotion is felt as the "atmosphere" around a person or place. Ask anyone to recall the "feel" of the "atmosphere" of an area or a person and he can reexperience it at least in part.

Emotion according to present theory, can be laid down by anyone against anyone. The emotions of A can be infiltrated into the facsimiles of G. The thoughts of A, similarly, can be infiltrated into the thoughts of B but so far as we are concerned at this writing, the mechanisms of thought and counter-thought are not well known. Emotion and counter emotion are easily established.

How does one human being control another? High on the tone scale it is by letting the individual control himself as thoroughly as possible. Below 2.0, in the mis-emotion band, a human being seeks to control or destroy another by COUNTER-EMOTION and COUNTER-THOUGHT.

The atmosphere surrounding a mis-emotion person is easily sensed. When one advances a facsimile to a mis-emotion person, mis-emotion is immediately thrown into that facsimile. Effort is transferred by physical contact. Emotion is simply transferred by anger, fear, argument, sympathy, etc. from a mis-emotion person into a facsimile of another. You may have noticed how you become less sure of yourself or uneasy around people who are embarrassed or uneasy or afraid. This is a simple mechanism. You are getting your facsimiles "colored" by a foreign emotion.

Every facsimile you advance, with argument or persuasion, toward a mis-emotional person gets counter-emotion thrown into it. **THAT COUNTER-EMOTION TAKES YOUR FACSIMILE OUT OF YOUR OWN CONTROL AND PUTS IT INTO THE CONTROL OF THE MIS-EMOTIONAL PERSON.**

Nothing is easier to prove. You have noticed probably, in lock scanning, that certain persons were "occluded" or that the whole track was occluded. That occluded person was mis-emotional. The facsimiles you displayed around that person have their emotion on them, not yours. Your thought, then, has ceased to control such facsimiles. They do not come to view when called for by you. They are "occluded." The facsimiles aren't owned by you any longer but by the misemotional person.

One by one your facsimiles can be taken out of your control by mis-emotional persons. The end result is no further ownership of your facsimiles or you. The end result is control by the environment, not self control, mis-emotion instead of self-confidence. Doubt and fear of acting. In short, reactions such as those which appear along the lower band of the big chart. Slowed reaction time and illnesses and chronic pains result from these facsimiles which are no longer under your control. Mis-emotion has swamped them, occluded them and so they can hurt you.

There is another, even simpler subject in COUNTER THOUGHT. You think one thing, somebody else thinks another. Their thought is counter to your thought. Live awhile around somebody low on the scale and your thoughts get swamped by counter-thought. This is rehabilitated simply by running the ideas of another and the moment they expressed them.

Counter-emotion and counter-thought can become sufficiently serious so as to give you the illusion of having the facsimiles of another. This is a last extreme. This is hallucination.

Take a person who is normally occluded in your memory. Think back to a time when this person told you a story or an incident. You may have no view of that person telling the story but instead, a view of the activity in the story. This is a dub-in occasioned by their mis-emotion. The end product of this is to have the time track of some mis-emotional person with fake perceptions upon it. This is hallucination complete.

A mis-emotional person can become occluded not only in recall but also in present time. Such a person blurs out. When they come into the room, one has the illusion of the light failing slightly.

We all have the ambition to see a bright world. The thing which makes it unbright, in the main, is the mis-emotion we carry on our facsimile from the atmospheres of mis-emotion in which we have dwelt.

Here is an exercise:

GO TO A PLACE ON THE TRACK WHERE THERE IS AN OCCLUSION. NOW TRY TO FEEL THE MISEMOTION WHICH MIGHT BE IN THE ATMOSPHERE. EXPERIENCE THIS COUNTER-EMOTION BY RUNNING THROUGH THE INCIDENT SWIFTLY MANY TIMES.

A pain might have turned on. If so, continue to run this counter-emotion until the pain is gone. You probably are not running the full length of the incident.

New data appeared to you from that occluded area. Your own thoughts and feelings in the area began to brighten. You knew what you were thinking about and saying after you had run it a few times. This exercise is the one necessary to restore recall perception on occluded people and areas.

Another exercise:

GO TO A PLACE IN RECALL WHERE A NORMALLY OCCLUDED PERSON IS TELLING YOU A STORY OR AN INCIDENT. FIND AN AREA WHERE YOU ARE GETTING THE PICTURE OF THE STORY, NOT THE PICTURE OF THE PERSON TELLING IT. RUN THE COUNTER-EMOTION OF THE PICTURE SEVERAL TIMES UNTIL YOU GET A VIEW OF THE PERSON TELLING YOU THE INCIDENT.

This is how people get occluded. A mis-emotional person specializes in telling people what to think and what the people think. Occlusion of childhood and hallucinatory pictures of childhood are occasioned by telling the child what happened to him often and in detail. This knocks out the facsimile of the child and substitutes either occlusion or a false picture.

Run the mis-emotion or any counter-emotion of times when you were told what had happened to you. Run these until the occlusion vanishes or the picture goes away. Don't necessarily go back to the incident being talked about.

LIST FIVE PEOPLE WHO ARE OCCLUDED ON YOUR TRACK.

1.

- 2.
- 3.
- 4.
- 5.

RUN THE ATMOSPHERE AROUND THESE OCCLUSIONS UNTIL EACH ONE APPEARS IN VIEW. IF PICTURES OF WHAT THEY SAY TURN UP, RUN THE PICTURES UNTIL THE PERSON TURNS UP INSTEAD.

WARNING: YOU WILL HIT SYMPATHY AND A "DESIRE" FOR SYMPATHY FROM EVERY ONE OF THESE PERSONS. DON'T STOP LOCK SCANNING IN A BURST OF CONTRITION AND FLY TO OR WRITE

THESE PEOPLE IF THEY ARE STILL ALIVE. YOUR MIND WILL CHANGE ABOUT THEM.

LIST FIVE PEOPLE IN YOUR LIFE WHO HAD DIFFERENT IDEAS ABOUT THINGS THAN YOURSELF.

- 1.
- 2.
- 3.
- 4.
- 5.

NOW LOCK SCAN THROUGH ALL INCIDENTS OR COUNTER-IDEAS FOR EACH PERSON LISTED. PICK UP THEIR THOUGHT AND THEN YOUR THOUGHT IN EACH INCIDENT.

LIST THE NAMES OR LOCATIONS OF ALL THE SCHOOLS YOU ATTENDED.

- 1.
- 2.
- 3.
- 4.
- 5.

NOW LOCK SCAN THE ATMOSPHERE OF EVERY CLASSROOM AND TEACHER OF EACH SCHOOL IN TURN AS COUNTER-EMOTION.

NOW LOCK SCAN THE PUPILS, FRIENDS AND ENEMIES, OF EACH SCHOOL IN TURN AS COUNTER-EMOTION.

NOW LOCK SCAN THE TEACHERS AND SCHOOLS AS COUNTER-THOUGHT TO YOUR THOUGHT, EACH ONE IN TURN.

NOW LOCK SCAN THE PUPILS, ENEMIES AND FRIENDS, AS COUNTER-THOUGHT TO YOUR THOUGHT, EACH ONE IN TURN.

LIST FIVE PERSONS WHOM YOU CONSIDER TO HAVE WRONGED YOU.

- 1.
- 2.
- 3.
- 4.
- 5.

LOCK SCAN EACH TIME YOU SAW EACH WITH ATTENTION TO COUNTER-EMOTION.

LOCK SCAN EACH TIME YOU COMMUNICATED OR SAW EACH WITH ATTENTION TO COUNTER THOUGHT.

Let us now consider another phenomena about emotion. This is the EMOTIONAL CURVE.

On the tone scale you will find a difference of height between various emotions and mis-emotions. The EMOTIONAL CURVE is the drop or rise from one level of emotion to another.

Can you find a time when you were happy and suddenly became sad ?

This is easy. Experience or get a concept of how you would feel if you were happy and then how you would feel if you became sad. Then experience the change from happiness to sadness. Now find a situation where you were happy and became sad. RUN THIS CURVE.

Who was present ? Run the drop in tone as your own emotion. Then run the drop in tone as counter-emotion, the atmosphere change.

Run the emotional curve from happiness to sadness several times until you have full recovery on your own ideas and counter-thought. What did you think? What did the other say .

There are two emotional curves. One is the emotional curve you experience directly in yourself. The other is the counter emotional curve where you feel a change in tone in the atmosphere.

This is an auditor tool and is used to locate the SERVICE FACSIMILE of the pre-clear.

THE TENTH ACT

For the auditor, if you are being audited part time or full time, the tenth act is the running out by **THOUGHT, EFFORT** and **EMOTION** of the **SERVICE FACSIMILE**. He will discover it from the data you have already written in this book, by looking you over for mal-function and by running **EMOTIONAL CURVES** until you run into the front end of the incident.

An individual with a very thorough knowledge from additional texts on this science might be able to run the service facsimile itself. But several things militate against it, the first of them being that the pre-clear will try to run it out of valence, (as somebody else), the second, that he considers it valuable and so doesn't want to lose it, the third being that it takes a pre-clear so very much longer to run his own service facsimile than it takes an auditor.

THE ELEVENTH ACT

This entire act is addressed to the subject of SYMPATHY.

Probably you could kill a man with sympathy. It has been done. There are three levels of healing: the first is to do something efficient about the condition, the next, if the first can't be done, is to make the patient comfortable, the third, if he can't be made comfortable, is to give him sympathy. That is in accordance with old medical practice. However, sympathy is a terrible thing but is considered to be a very valuable thing.

The survival value of sympathy is this: When an individual is hurt or immobilized, he cannot fend for himself, get himself good, defend himself. If he is to survive he must count upon another or others to care for him. His bid for such care is the enlistment of the sympathy of others. This is practical. The cheerful good-fellowship of the weak, crippled or ill is part of this mechanism. If men weren't sympathetic, none of us would be alive.

The non-survival value of sympathy is this: An individual fails in some activity or effort to help. He then considers himself incapable of surviving by himself. Even though he isn't sick actually he makes a bid for sympathy. When a person, not actually ill or immobilized by injury, is making a bid for sympathy, he considers that he has failed so badly that he cannot by himself continue on in life. His self-confidence is undermined. He is not able to handle himself well. Counter emotion and counter-thought have garbled his facsimiles. He feels he has to have sympathy to get along. And he displays an illness or disability to gain sympathy. This is mechanical and is not to be disparaged: the person is actually in need of help. And almost every human being is prone to this error. Almost every one will make a bid for sympathy by holding out some old facsimile. A psychosomatic illness is at once an explanation of failure and a bid for sympathy. That does not make the sympathy, when received, less sweet. And it does not make the ill any less painful.

One is peculiarly liable to sympathy bids around his parents and family. The worst case an auditor can encounter is one which wants auditing only for the auditor's sympathy and wants to retain the SERVICE FACSIMILE because it is a sympathy source. The answer to this is to get the pre-clear far enough up the tone scale so that he is sufficiently self-confident not to need any sympathy. Only then, in some cases, will the SERVICE FACSIMILE (the technical term for the facsimile the pre-clear uses to gain sympathy) surrender to auditing.

The purpose of this act is to pick up sympathy facsimiles.

In other works on this science you will find in detail the role of self-determinism. We are all self-determined, natively. NOTHING which we do is beyond self-determined action.

When you made a decision, it is MADE.

A later part of this processing deals thoroughly with this.

Nobody ever became ill without wanting to be ill at some earlier moment in his life. Here is a polio case, in bed two years. She became ill because she felt sorry for another little girl who got polio and so decided to get it herself. It was a clear-cut decision, followed by two years in bed.

If you doubt that you ever wished to be ill, what about school? Didn't you ever beg off by a plaint of being sick? How many times have you done this?

SCAN THROUGH EACH AND EVERY TIME YOU DECIDED TO GET SICK.

SCAN THROUGH ALL THE REASONS YOU DECIDED TO BE ILL.

When you have completed this exercise until you have extroverted on the subject, begin on the following:

LOCATE A MOMENT WHEN YOU FELT SYMPATHY FOR SOMETHING. SCAN THROUGH THIS MOMENT OVER AND OVER UNTIL IT IS DE-SENSITIZED.

SCAN NOW THE COUNTER-EMOTION TO YOUR SYMPATHY IN THAT SAME INCIDENT.

SCAN THE SYMPATHETIC THOUGHT IN THAT INCIDENT.

SCAN THE COUNTER-THOUGHT IN THAT INCIDENT IF ANY.

These four steps are a pattern for single incidents. After you have scanned just so many of these incidents you will find that sympathy all up and down the track seems to be resolving.

On the same subject, take up the following people.

SCAN EVERY INCIDENT YOU CAN FIND CONTAINING SYMPATHY BY YOU FOR THEM ON THE ABOVE PATTERN.

(Omit any you did not have.)

MOTHER. FATHER. GUARDIAN. FATHER'S GRANDMOTHER. FATHER'S MOTHER. FATHER'S GRANDFATHER. FATHER'S FATHER. MOTHER'S GRANDMOTHER. MOTHER'S MOTHER. MOTHER'S GRANDFATHER. MOTHER'S FATHER. AUNTS. GREAT AUNTS. UNCLES. GREAT UNCLES. PLAYMATES. MARITAL PARTNERS. TEACHERS. DOGS. CATS. HORSES. GOLDFISH. CHILDREN. DOLLS. TOYS. ANIMALS. BIRDS. POSSESSIONS. SCENES. HOUSES. BEDS.

SCAN NOW THE FOLLOWING STORY CHARACTERS FOR SYMPATHY OR OTHER EMOTION. (Omit any you were not acquainted with but be sure you didn't know them). TINY TIM. LITTLE ORPHAN ANNIE. ANY EUGENE FIELD POEM. ANGELS. LITTLE NEL. ANY OTHER STORY CHARACTER.

Now we will reverse the process.

SCAN ANY SYMPATHY GIVEN YOU BY ANY OF THE LIST OF RELATIVES AND PEOPLE ABOVE. SCAN EACH INCIDENT IN DETAIL. THE INCIDENT MAY INCLUDE SICKNESS, IF SO SCAN IT UNTIL ANY SYMPTOMS YOU PICK UP VANISH AGAIN.

(By scanning emotion and counter-emotion facsimiles drop off.)

SCAN SELECTIVELY ON SYMPATHY AND COUNTER-EMOTION, THE FOLLOWING: YOURSELF. I OR YOUR EYES. FOR YOUR MOUTH. FOR YOUR EARS. FOR YOUR HEAD. FOR YOUR ARMS. FOR YOUR HANDS. FOR YOUR INTERNAL ORGANS. FOR YOUR STOMACH. FOR YOUR LEGS. FOR YOUR FEET. FOR YOUR BACK. FOR THE GENITALS. FOR YOUR LIFE.

SCAN SYMPATHY AND COUNTER-EMOTION FOR EACH OF THE FOLLOWING: EVERY GROUP. EVERY STATE OR NATION. EVERY POPULATION. I OR MAN IN GENERAL. FOR THE WORLD.

SCAN SYMPATHY AND COUNTER-EMOTION FOR EACH OF THE FOLLOWING: TREES. CHRISTMAS TREES. ANY LIFE FORM. THE SUPREME BEING.

Now review all this analytically. You will discover the following. Before you felt sympathy, you offended in some way. You did something. Then you were sorry for it. This

offense may have taken place years before your sympathy came about or only minutes. This is the emotional curve of sympathy. It goes from antagonism or anger down to sympathy.

You know now where and on what dynamic you felt the greatest sympathy. Was it for mother? All right? let's find out where we first offended mother, hurt her in fact.

SCAN EVERY SUBJECT OF SYMPATHY EARLY ENOUGH TO FIND WHERE YOU OFFENDED. SCAN OUT THE OFFENSE. IF IT DOESN'T COME CLEAR, SCAN REGRET AS AN EMOTION UNTIL IT DOES COME CLEAR. IF YOU ENCOUNTER A BRIEF CHARGE RUN IT AS A STRAIGHT INCIDENT AS CONTAINED IN AN EARLIER ACT.

LIST NOW THE CHIEF OBJECTS OF SYMPATHY.

CHECK EACH ONE AGAIN AND SCAN IT AGAIN.

This used to be called a "guilt complex." This process undoes them.

THE TWELFTH ACT

It is time that we took another glance at “buttons.” There are several things in particular that each human being finds aberrative and has in common.

BY LOCK SCANNING, RUN EACH ONE OF THE FOLLOWING WITH ATTENTION TO COUNTER EMOTION AND COUNTER THOUGHT.

HIDING THINGS. HIDING THINGS FROM SELF. HIDING THINGS FROM PARENTS. HIDING THINGS FROM EMPLOYERS. HIDING THINGS FROM TEACHERS. HIDING THINGS FROM THE PUBLIC.

TALKING. THE FEELING THAT PEOPLE WILL TALK THE FEAR THAT YOU MAY TALK. THE SECRETS YOU DARE NOT TELL. THE SECRETS YOU PROMISED NOT TO TELL. BEING TALKED TO. FEAR OF TALKING TO SOMEBODY. FEAR OF TALKING TO CROWDS. TALKING BEHIND PEOPLE’S BACKS. METHODS OF AVOIDING BEING TALKED TO. BEING TALKED INTO THINGS.

ENDURING. ENDURING CONVERSATION. ENDURING SITUATIONS. WAITING.(AVOID PHYSICAL PAIN INCIDENTS.)

KEEPING THINGS. KEEPING PETS. KEEPING TOYS. KEEPING POSSESSIONS. YOUR DECISIONS TO KEEP THINGS. YOUR FAILURE TO KEEP THINGS. KEEPING PEOPLE.

LOSING THINGS. LOSING PETS. LOSING POSSESSIONS LOSING PEOPLE. BEING LEFT. (AS A COMMON NOT A FINAL OCCURRENCE.)

TAKING THINGS SERIOUSLY. TAKING TASKS SERIOUSLY. TAKING PEOPLE SERIOUSLY. REGARDING SITUATIONS AS SERIOUS. REGARDING WORK AS SERIOUS. WHY YOU REGARDED THESE THINGS SERIOUSLY. MONTHS WHEN YOU DECIDED TO TAKE THINGS SERIOUSLY.

NOT TAKING THINGS SERIOUSLY. EFFORTS NOT TO TAKE THINGS SERIOUSLY. EFFORTS TO GET OTHERS NOT TO TAKE THINGS SERIOUSLY. BEING TOLD TO TAKE THINGS SERIOUSLY. REFUSING TO TAKE THINGS SERIOUSLY. REGRET AT NOT TAKING SOMETHING SERIOUSLY.

TRYING TO STOP THINGS. STOPPING PEOPLE. STOPPING SITUATIONS. STOPPING MECHANICAL THINGS. (YOU MAY FIND YOU HAVE TRIED TO STOP TIME OFTEN. THAT’S WHEN YOU GET A FIXED VISIO. SIMPLY RUN OFF THE REGRET.)

STARTING THINGS. STARTING PEOPLE. STARTING SITUATIONS. STARTING MECHANICAL THINGS. STARTING CHILDREN.

CHANGING THINGS. DECISIONS NOT TO CHANGE THINGS. DECISIONS TO CHANGE SELF. DECISIONS TO CHANGE OTHERS. EFFORTS TO CHANGE OTHERS. CHANGING DIRECTIONS OF THINGS.

MOVING THINGS. MOVING PEOPLE. MOVING HEAVY OBJECTS. MOVING YOURSELF. RESISTING BEING MOVED OUT OF BED. YOUR ENTIRE LIFETIME.

OWNING THINGS. EFFORTS TO OWN THINGS. EFFORTS TO KEEP OTHERS FROM CONTROLLING WHAT YOU OWN. EFFORTS NOT TO OWN THINGS.

CARE FOR CLOTHING. TIMES YOU COULDN'T SELECT CLOTHING. TIMES YOU WERE FORCED TO CARE FOR CLOTHING. TIMES WHEN YOU COULDN'T WEAR CLOTHING YOU OWNED. TIMES WHEN YOU COULDN'T HAVE CLOTHING.

CARE OF PERSON. TIMES WHEN YOU WERE FORCED TO CARE FOR PERSON. TIMES WHEN SOMEBODY ELSE FORCED CARE ON YOU. TIMES WHEN YOU DECIDED NOT TO TAKE CARE OF YOURSELF.

TO BE: TIMES WHEN YOU DECIDED TO BE SOMETHING. TIMES WHEN YOU DECIDED YOU COULDN'T BE SOMETHING. TIMES WHEN YOU DECIDED TO CHANGE BEING WHAT YOU WERE.

NOT TO BE: TIMES WHEN YOU DECIDED TO QUIT. DECISIONS TO STOP BEING WHAT YOU WERE.

HABITS: TIMES WHEN YOU FIRST DECIDED TO HAVE ANY HABIT YOU HAVE. TIMES WHEN YOU DECIDED NOT TO HAVE THE HABITS. TIMES WHEN YOU DECIDED TO HAVE THE HABITS YOU HAVE.

KNOWING: TIMES WHEN YOU DECIDED YOU KNEW.

NOT KNOWING: TIMES WHEN YOU DECIDED YOU DID NOT KNOW.

DOUBTS: TIMES WHEN YOU DOUBTED YOURSELF. TIMES WHEN YOU DOUBTED OTHERS. DECISIONS THAT YOU COULD NOT TRUST. DECISIONS THAT YOU COULD TRUST.

WRONG: TIMES WHEN YOU DECIDED YOU HAD BEEN WRONG. TIMES WHEN YOU WERE AFRAID YOU WERE WRONG. TIMES WHEN ANOTHER SAID YOU WERE WRONG. TIMES WHEN EVIDENCE TURNED UP THAT YOU HAD BEEN WRONG.

RIGHT: TIMES WHEN YOU HOPED YOU WEREN'T RIGHT. TIMES WHEN YOU FOUND YOU WERE RIGHT. FEAR THAT YOU WOULD NOT BE RIGHT.

TIME: INCIDENTS WHERE YOU DECIDED YOU DIDN'T HAVE ANY TIME. TIMES WHEN YOU SAID YOU DIDN'T HAVE TIME. TIMES WHEN SOMEBODY ELSE DIDN'T HAVE TIME. TIMES WHEN YOU TRIED TO GET OUT OF SOMETHING BY SAYING YOU DIDN'T HAVE TIME. TIMES WHEN YOU FELT IT WAS TOO LATE TO START BUT THAT IT SHOULD HAVE BEEN DONE.

THE PAST: TIMES WHEN YOU DECIDED TO PUT ALL THE PAST BEHIND YOU. TIMES WHEN YOU DECIDED THE PAST WAS TOO TERRIBLE.

THE PRESENT: YOUR DECISIONS ABOUT THE PRESENT, GOOD OR BAD.

THE FUTURE: TIMES WHEN YOU DECIDED THE FUTURE WAS DOUBTFUL. TIMES WHEN YOU WANTED THE FUTURE TO BE LIKE THE PAST. TIMES YOU WERE AFRAID OF THE FUTURE. TIMES WHEN YOU FEARED DYING. TIMES WHEN YOU WANTED TO DIE. TIMES WHEN YOU WERE GLAD TO HAVE A BRIGHT FUTURE. TIMES WHEN YOUR PLANS FOR THE FUTURE HAD TO BE VIOLENTLY CHANGED. TIMES WHEN SOMEBODY ELSE PLANNED YOUR FUTURE. TIMES WHEN YOU PLANNED ANOTHER'S FUTURE. HOPELESSNESS ABOUT THE FUTURE. HOPE FOR THE FUTURE. THE HOPELESSNESS OF ANOTHER ABOUT THE FUTURE. THE HOPES OF ANOTHER FOR THE FUTURE. FAILURE TO MEASURE UP TO WHAT ANOTHER HOPED FOR YOUR FUTURE.

AGREEMENT: TIMES WHEN YOU WERE FORCED TO AGREE BUT DIDN'T WANT TO. TIMES WHEN

YOU FORCED OTHERS TO AGREE. TIMES WHEN YOU WERE PREVENTED FROM AGREEING. TIMES WHEN YOU PREVENTED OTHERS FROM AGREEING. TIMES WHEN YOU WERE GLAD TO AGREE.

COMMUNICATION: TIMES WHEN YOU WERE FORCED TO COMMUNICATE. TIMES WHEN YOU WERE PREVENTED FROM COMMUNICATING. TIMES WHEN YOU FORCED OTHERS TO COMMUNICATE. TIMES WHEN YOU PREVENTED OTHERS FROM COMMUNICATING. TIMES WHEN YOU WANTED TO COMMUNICATE.

AFFINITY: TIMES WHEN YOU WERE FORCED TO LIKE SOMEBODY. TIMES WHEN YOU WERE PREVENTED FROM LIKING SOMEBODY. TIMES WHEN YOU FORCED ANOTHER TO LIKE YOU. TIMES WHEN YOU PREVENTED ANOTHER FROM LIKING YOU. TIMES WHEN YOU DECIDED YOU LIKED SOMEBODY.

INDIVIDUALITY: TIMES WHEN YOU FELT YOU WEREN'T YOURSELF. TIMES WHEN YOU DECIDED NOT TO BE YOURSELF. TIMES WHEN YOU WERE FORCED TO BE YOURSELF. TIMES WHEN YOU WERE INHIBITED FROM BEING YOURSELF. TIMES WHEN YOU TRIED TO CHANGE ANOTHER PERSON. TIMES WHEN YOU DECIDED NOT TO CHANGE SOMEBODY ELSE.

TRUTH: TIMES WHEN YOU DECIDED TO LIE. THE REASONS WHY YOU DECIDED TO LIE. TIMES WHEN YOU FELT BETTER LYING. TIMES WHEN LYING GOT YOU INTO TROUBLE. TIMES WHEN YOU DECIDED NEVER TO LIE AGAIN.

FAITH: TIMES WHEN YOU DECIDED TO HAVE FAITH IN THE SUPREME BEING. TIMES WHEN YOU DECIDED NOT TO HAVE FAITH IN THE SUPREME BEING. TIMES WHEN YOU DECIDED NOT

TO HAVE FAITH IN YOUR GOVERNMENT. TIMES WHEN YOU DECIDED TO HAVE FAITH IN YOUR GOVERNMENT. TIMES WHEN YOU DECIDED TO HAVE FAITH IN YOURSELF. TIMES WHEN YOU DIDN'T HAVE FAITH IN YOURSELF. TIMES WHEN ANOTHER DID NOT HAVE ANY FAITH IN YOU.

ANGER: ALL THE TIMES YOU HAVE BEEN ANGRY WITH ATTENTION TO YOUR EMOTION AND COUNTER-EMOTION AND THE REASONS YOU WERE ANGRY.

FEAR: ALL THE TIMES YOU HAVE BEEN AFRAID WITH ATTENTION TO YOUR EMOTION AND THE ATMOSPHERE IN WHICH YOU WERE AND REASONS WHY YOU WERE AFRAID. SCAN THE FIRST TIMES YOU DECIDED TO BE AFRAID.

COWARDICE: SCAN ALL THE TIMES YOU CONSIDERED YOURSELF A COWARD. SCAN THE TIMES YOU CONSIDERED OTHERS COWARDLY.

EMBARRASSMENT: SCAN ALL THE TIMES YOU HAVE BEEN EMBARRASSED. SCAN THE TIMES YOU HAVE BEEN EMBARRASSED FOR OTHERS.

SHAME: SCAN ALL THE TIMES YOU HAVE BEEN ASHAMED. SCAN THE TIMES YOU HAVE BEEN ASHAMED FOR OTHERS.

GRIEF: SPOT AND RUN EVERY GRIEF CHARGE ON YOUR CASE. LIST THEM IN THE BLANK BELOW, THEN RUN THEM. RUN COUNTER-EMOTION AND REGRET UNTIL CHARGE COMES INTO VIEW. THEN RUN IT AS A SINGLE INCIDENT.

APATHY: SCAN EVERY PERSON AROUND YOU WHO HAS EVER BEEN IN APATHY. SCAN EVERY TIME YOU YOURSELF FELT APATHY. SCAN THE TIMES WHEN YOU

SOUGHT TO LIFT OTHERS OUT OF APATHY. SCAN THE TIMES WHEN OTHERS SOUGHT TO LIFT YOU OUT OF APATHY.

SCAN ALL THE TIMES WHEN YOU HAVE BEEN SUPREMELY HAPPY. SCAN THE TIMES YOU HAVE MADE OTHERS HAPPY.

RUN EMOTIONAL CURVES ON THE TIMES WHEN YOU TRIED TO ENTHUSE OTHERS AND FAILED.

RUN THE TIMES YOU ENTHUSED OTHERS AND SUCCEEDED.

THE THIRTEENTH ACT

The subject of blame and regret is an interesting one. Blame of self and blame of others produce interesting results in recalls. Facsimiles can become clouded with blame and regret.

This is the subject of CAUSE and EFFECT.

An individual natively desires to be cause. He tries not to become a bad effect.

You try to help people and people try to help you because you and they want to be CAUSE. When something bad happens, neither one wishes to be cause.

You want to be an effect. Then you find the effect bad. You try not to be an effect. And then you blame something or somebody.

Blaming yourself or others for being a cause is to deny yourself full control of your facsimiles. You say somebody caused something. You make them RESPONSIBLE. They are then CAUSE. This is a powerful position. It ends up with your having given them control over a facsimile or many facsimiles. If you blame somebody hard enough and long enough you have kept on electing them as CAUSE until they are much more powerful than yourself.

If you blame your mother, for instance, you make your mother CAUSE and must then obey her. And your facsimiles relating to her or to your whole life are out of your control. If you blame yourself, this is an admitted failure and again you have facsimiles out of control.

You blame somebody, you elect them as cause. This makes you an effect of the cause. As an effect you are thus placed well down the tone scale.

You desire to be an effect in some quarter and thereafter you may continue to be an effect and will go down the scale to a point where you may develop psychosomatic ills.

There are certain main spheres where one wishes to be an effect. Here we have the importance of aberration on the second dynamic, SEXY You wish to have the pleasure of sex. This is yourself electing yourself an an effect. As an effect you can then be given pain on the second dynamic.

You wish to be pleasantly an effect in eating. You elect yourself an effect. You can thereafter be effected by pain in the food department. The basis of ulcers or any stomach trouble including constipation is the original desire to eat.

You wish to be amused and entertained. Thus amusement channels, sight, sound, rhythm, can become aberrated by pain.

It is natural law that one cannot be aberrated without one's own consent. One must wish to be an effect before he can become an effect. If he becomes an effect then he can later become "effected" unpleasantly by counter-efforts.

If you want to be an effect of your marital or sexual partner, or any sexual act, you open the door to being an unpleasant effect.

Examine the column of the big chart between CAUSE and EFFECT. This is a gradient scale of causes and effects.

Freud was right in selecting sex as being very aberrative. Before him thousands of years of mystics knew they had to abstain from material or physical pleasures and sex in order to remain high and saintly. They did not know the mechanism at work. We now do. The

moment they wanted to be an effect, they could become, in that channel, an unpleasant as well as a pleasant effect and so go down the tone scale.

There are several conditions relating to this. One is the desire not to be a cause. One is the desire not to be an effect. One is the desire to prevent something or somebody else from being a cause. One is the desire to prevent somebody or something else from being an effect.

In sex one may not desire to be the cause of children. This would be for either a man or a woman. Children, in this society, can be embarrassing or expensive. One desires at the same time to cause a sexual partner pleasure. Here is desire not to be a cause fighting with the desire to be a cause. The result is conflict, aberration, impotence, sex punishment and irregular practices.

In sex, again, one desires greatly to be an effect for the sake of pleasure. One wishes to experience the pleasure of sex. He does not want to experience the pain of childbirth for himself or his partner nor does he wish the effect of disease. Nor does he wish to be the effect of public antagonism toward sexual practice. Thus his desire to be effect comes in conflict with his desire not to be effect and the result is aberration, impotence, glandular interruption, marital breakdowns, divorces, suicide and sudden death.

In food, cause and effect work similarly to sex. One wishes to be pleasantly effected by the flavor of substance of food. He may not want to have the effect of the work he has to do to eat or the propitiation he has to give to eat. He wants to be cause. He is running a carbon-oxygen engine which has to have the effect of food. People low on the tone scale use this sure route to making a person into an effect by denying food or forcing people to eat food. The society uses this effect to get work done.

Low scale mothers are very strict with their children about food. This is a sure method of control. By forcing the child to be a non-self-determined effect about food, the mother can control the child in many other ways. All low scale control is done by forcing the individual to be an effect where the individual naturally has to be an effect. Where a naturally desired effect can be enforced by command, the enforcer can gain a wide control simply by continual demonstration that the target individual is an effect, not a cause.

The sexual sphere is peculiarly liable to cause and effect action because of the communication. Tactile is the most direct method of sensory communication. It is much more effective than talk. A close communication with a low scale person brings down as well the affinity and the reality levels. If a sexual partner is demanding or insatiable, that partner elects the other into being an unwilling cause and denies his right to the effect and then makes ruin of a personality. An individual aberrated enough about sex will do strange things to be a cause or an effect. He will substitute punishment for sex. He will pervert others.

Homosexuality comes from this manifestation and from the manifestation of life continuation for others. A boy whose mother is dominant will try to continue her life from any failure she has. A girl whose father is dominant will try to continue his life from any failure he has. The mother or the father were cause in the child's eyes. The child elected himself successor to cause. Break this life continuum concept by running sympathy and grief for the dominant parent and then run off the desires to be an effect and their failures and the homosexual is rehabilitated. Homosexuality is about 1.1 on the tone scale. So is general promiscuity.

The facsimiles of an individual can become considerably scrambled by masturbation. Practically all the ape family and Man masturbate. Masturbation is a prohibition result. It couldn't drive anyone crazy. But it can make the individual pull old sex facsimiles into present time for self-stimulation and opens the door for him to desire facsimiles to be in present time. After awhile he will be pulling pain facsimiles into present time.

These are the exercises of CAUSE and EFFECT processing:

SCAN THROUGH EVERY TIME YOU DESIRED NOT TO BE A CAUSE SEXUALLY.
SCAN THROUGH EVERY TIME YOU REGRETTED BEING A SEXUAL CAUSE.
SCAN THROUGH EVERY TIME YOU DESIRED NOT TO BE AN EFFECT SEXUALLY.
SCAN THROUGH EVERY TIME YOU REGRETTED BEING AN EFFECT SEXUALLY.
SCAN THROUGH EVERY TIME YOU DESIRED TO BE A SEXUAL CAUSE.
SCAN THROUGH EVERY TIME YOU DESIRED TO BE A SEXUAL EFFECT.

Don't forget that scanning is done until you are extroverted on the subject.

SCAN EVERY TIME YOU CALLED UP AN OLD SEXUAL EXPERIENCE FOR YOUR AMUSEMENT.
SCAN EVERY TIME A SEXUAL PARTNER WAS DEMANDING.
SCAN EVERY TIME A SEXUAL PARTNER REFUSED SEX.
SCAN EVERY FAILURE CONCERNING SEX.
SCAN EVERY TIME YOU OBEYED A SEXUAL PARTNER ABOUT ANYTHING.
SCAN EVERY TIME YOU RESENTED SOMEBODY'S SEXUAL CONVERSATION.
SCAN EVERY TIME YOU ENJOYED SOMEBODY'S SEXUAL CONVERSATION.
SCAN EVERY TIME YOU TRIED TO HIDE SOMETHING ABOUT SEX.

Now let us repeat these operations on the subject of food:

SCAN EVERY TIME YOU DESIRED FOOD.
SCAN EVERY TIME YOU WERE FORCED TO EAT.
SCAN EVERY TIME YOU WORRIED ABOUT FOOD.
SCAN EVERY TIME YOU BLAMED FOOD FOR AN ILLNESS.
SCAN EVERY FEELING OF QUEASINESS ABOUT FOOD UNTIL ANY PHYSICAL SENSATION IS GONE.

Now let us go into entertainment.

SCAN EVERY TIME YOU TRIED TO ENTERTAIN SOMEBODY AND FAILED.
SCAN EVERY TIME YOU WANTED TO BE ENTERTAINED AND WEREN'T.
SCAN EVERY TIME SOMEBODY WANTED TO BE ENTERTAINED AND YOU DIDN'T WANT TO.
SCAN EVERY TIME YOU WERE BORED WITH ENTERTAINMENT.
SCAN EVERY TIME YOU WANTED TO RETAIN THE SENSATION OF HAVING BEEN ENTERTAINED.

Now let us go into perceptions in general.

SCAN EVERY TIME YOU DID NOT WANT TO BE TOUCHED.

SCAN EVERY TIME YOU WERE FORCED TO TOUCH SOMETHING.

SCAN EVERY TIME YOU WANTED TO TOUCH SOMETHING AND COULDN'T.

SCAN EVERY TIME YOU TOUCHED A SEXUAL PARTNER.

SCAN EVERY TIME YOU DIDN'T WANT TO LOOK.

SCAN EVERY TIME YOU WANTED TO BE PLEASED BY LOOKING.

SCAN EVERY TIME YOU WISHED THINGS LOOKED AS GOOD AS THEY USED TO.

SCAN EVERY REGRET YOU'VE EVER HAD ABOUT SIGHT.

SCAN EVERY TIME YOU DECIDED YOU COULDN'T SEE WELL.

SCAN EVERY TIME YOU WERE TOLD YOU COULDN'T SEE.

SCAN EVERY TIME YOU AGREED YOU COULDN'T SEE.

SCAN EVERY TIME YOU DIDN'T WANT TO LISTEN.

SCAN EVERY TIME YOU WANTED TO HEAR AND COULDN'T.

SCAN EVERY TIME YOU WANTED TO HEAR SOMETHING PLEASANT.

SCAN EVERY TIME YOUR EARS RANG.

SCAN EVERY TIME YOU DECIDED SOMETHING WAS WRONG WITH YOUR HEARING.

SCAN EVERY TIME YOU TASTED SOMETHING BAD.

SCAN EVERY TIME YOU TASTED SOMETHING GOOD.

SCAN EVERY TIME YOUR MOTHER PUSHED YOU AWAY.

SCAN EVERY TIME YOU WANTED A GOOD EFFECT IN YOUR STOMACH AND FAILED.

SCAN EVERY TIME YOU LOOKED WITH FAVOR ON A BOTTLE. (Get way back early on this one.)

SCAN EVERY TIME YOU TOLD SOMEBODY YOU WERE TIRED.

SCAN EVERY TIME YOU TOLD SOMEBODY YOU DIDN'T FEEL WELL.

SCAN EVERY TIME YOU FELT SYMPATHY FOR A BLIND MAN.

SCAN EVERY TIME YOU FELT SYMPATHY FOR A DEAF MAN.

SCAN EVERY TIME YOU SMELLED SOMETHING BAD AND THE COUNTER-EMOTION.

SCAN ALL THE TIMES YOU SMELLED SOMETHING GOOD.

SCAN ALL THE TIMES YOU HID THE FACT THAT SOME EFFECT PLEASED YOU.

SCAN ALL THE TIMES YOU WANTED TO BE CAUSE.

SCAN ALL THE TIMES YOU CONCLUDED YOU WERE IMPORTANT.

SCAN ALL THE TIMES YOU CONCLUDED YOU WERE NOT IMPORTANT.

SCAN ALL THE TIMES YOU CONCLUDED YOU WERE NOBODY.

SCAN ALL THE TIMES YOU CONCLUDED YOU WERE SOMEBODY.

SCAN ALL THE TIMES YOU THOUGHT YOU WERE NOT VALUABLE.

SCAN ALL THE TIMES YOU THOUGHT YOU WERE VALUABLE.

SCAN ALL THE TIMES YOU TRIED TO CONVINCING SOMEBODY YOU WERE IMPORTANT.

SCAN ALL THE TIMES YOU TRIED TO CONVINCING SOMEBODY YOU WERE SOMEBODY.

SCAN ALL THE TIMES YOU TRIED TO CONVINCING SOMEBODY YOU WERE VALUABLE.

SCAN ALL THE TIMES YOU TRIED TO STOP SOUND DURING SEX.

SCAN ALL THE TIMES YOU STOPPED OR INTERRUPTED SEX.

SCAN ALL THE TIMES YOU STARTED SEX AND FAILED.

SCAN ALL THE TIMES YOU WANTED TO HEAR SOUNDS DURING SEX.

SCAN ALL THE TIMES YOU WANTED SEXUAL CONVERSATION TO AFFECT YOU.

SCAN ALL THE TIMES YOU RESENTED SEXUAL CONVERSATION.

SCAN ALL THE TIMES YOU RESENTED "DIRTY JOKES."

SCAN OFF THE COUNTER-EMOTION OF EACH EXERCISE ABOVE EACH IN TURN.

As you have read here before and as you have come to suspect in your processing, your own decisions and evaluations are the most important items in the entire process.

What you decide is LAW to you. What you evaluate is evaluation to you.

SELF-CONFIDENCE is nothing more than belief in one's ability to decide and in one's decisions.

MOST PEOPLE THINK THEY HAVE UNCONSCIOUS MINDS OR BACKGROUNDS OF MOTIVATION SIMPLY BECAUSE THEY HAVE REFUSED THEIR OWN POWER TO DECIDE.

Negation of decision, refusal of decision, letting others decide are the most powerful sources of aberration. They apply to any and all subjects.

This section is devoted to picking up each and every postulate you can now reach in your whole lifetime. A postulate is a decision you make to yourself or to others. You make one, then afterwards conditions change and you make a second one. This makes the first one

wrong. You make a postulate as cause and then, by having lived through some instants of time, become an effect of your own cause.

A computer could not work if you kept leaving its totals on the calculator for the next problem. That is what you do with decisions. They have to be made. Sweep them up before making more. It is a new method of thinking and one that keeps you happy. No need to be afraid of making decisions. Simply sweep up old decisions. You make New Year's resolutions. And you make them into the teeth of old resolutions and you tell yourself you are weak-willed. You aren't weak willed, you are simply obeying yourself as of yesterday.

Emotion and effort cover up these postulates. They should be free and clear by now and indeed should blow at a glance. There are two parts to every postulate. There is the evaluation of data and the decision itself.

When you pick up an old decision, also pick up the reason you made it. They "blow" very quickly.

SCAN THROUGH EVERY DECISION, WITH ITS REASON WHY, YOU HAVE MADE ABOUT WOMEN.

SCAN EVERY DECISION ABOUT MEN.

SCAN EVERY DECISION ABOUT YOURSELF.

SCAN EVERY DECISION ABOUT THE WORLD.

SCAN EVERY DECISION ABOUT DOGS.

SCAN EVERY DECISION ABOUT CATS.

SCAN EVERY DECISION ABOUT HORSES.

SCAN EVERY DECISION ABOUT FISH.

SCAN EVERY DECISION ABOUT FOOD.

SCAN EVERY DECISION ABOUT SEX.

SCAN EVERY DECISION ABOUT CLOTHING.

SCAN EVERY DECISION ABOUT SHOES.

SCAN EVERY DECISION ABOUT HOUSES.

SCAN EVERY DECISION ABOUT CARS.

SCAN EVERY DECISION ABOUT SCENERY.

SCAN EVERY DECISION ABOUT CRIMINALS.

SCAN EVERY DECISION ABOUT NEWSPAPERS.

SCAN EVERY DECISION ABOUT YOUR MOTHER

SCAN EVERY DECISION ABOUT YOUR FATHER.

SCAN EVERY DECISION ABOUT PHILOSOPHY.

SCAN EVERY DECISION ABOUT PSYCHOLOGY.

SCAN EVERY DECISION ABOUT EDUCATION.

SCAN EVERY DECISION ABOUT MONEY.

SCAN EVERY DECISION ABOUT WORK.

SCAN EVERY DECISION ABOUT LIFE.

SCAN EVERY DECISION ABOUT GOD.

SCAN EVERY DECISION ABOUT FIGHTING.

SCAN EVERY DECISION ABOUT SIN.

SCAN EVERY DECISION ABOUT OBEYING.

SCAN EVERY DECISION ABOUT MAKING OTHERS OBEY.

SCAN EVERY DECISION ABOUT GOVERNMENT.

SCAN EVERY DECISION TO APOLOGIZE.

SCAN EVERY DECISION TO BE JEALOUS.

SCAN EVERY DECISION TO BE ANGRY.

SCAN EVERY DECISION TO HELP.

SCAN EVERY CONCLUSION THAT YOU HAVE FAILED.

SCAN EVERY DECISION THAT YOU HAVE SUCCEEDED.

SCAN EVERY DECISION THAT YOU ARE A GOOD SEXUAL PARTNER.

SCAN EVERY DECISION THAT YOU ARE A POOR SEXUAL PARTNER.

SCAN EVERY DECISION THAT ANY OTHER IS A GOOD SEXUAL PARTNER.

SCAN EVERY DECISION THAT ANY OTHER IS A BAD SEXUAL PARTNER.

SCAN EVERY DECISION TO REGRET SOMETHING.

SCAN EVERY DECISION TO ENJOY SOMETHING. SCAN EVERY TIME A CONTRIBUTION HAS BEEN REJECTED.

SCAN EVERY TIME A CONTRIBUTION HAS BEEN ACCEPTED.

SCAN EVERY DECISION TO RESENT CRITICISM. SCAN EVERY DECISION TO WORK FOR PRAISE.

SCAN EVERY DECISION TO QUIT.

SCAN EVERY DECISION TO START.

SCAN EVERY DECISION TO STOP.

SCAN EVERY DECISION TO CHANGE.

SCAN EVERY DECISION TO WAIT.

SCAN EVERY DECISION TO MOVE.

SCAN EVERY CONCLUSION THAT YOU ARE ILL. SCAN EVERY CONCLUSION THAT YOU ARE WELL.

SCAN EVERY DECISION TO RESENT SOMETHING.

SCAN EVERY DECISION TO BE HUMAN.

THE FOURTEENTH ACT

First review the earlier data about control centers. Then do the following:

WRITE DOWN EVERY TIME YOU CONSIDERED YOURSELF TO HAVE HAD A MAJOR FAILURE.

RUN EACH SINGLE INCIDENT CONSECUTIVELY FROM THE MOMENT YOU PLANNED THE ACTION THROUGH THE MOMENT YOU REALIZED YOU HAD FAILED THROUGH THE POSSIBLE RESULTING ILLNESS AND TO THE MOMENT WHEN YOU FELT CHEERFUL AGAIN. GO THROUGH EACH INCIDENT IN COMPLETE DETAILS WITH COUNTER-THOUGHT, COUNTER-EMOTION AND BLAME AND REGRET WITH ALL AVAILABLE PERCEPTICS UNTIL THE ENTIRE INCIDENT IS IN TONE 4.0. THAT TONE IS LAUGHTER. DO NOT QUIT IN BOREDOM: THATS ONLY PART WAY THERE.

SCAN OFF ALL LOCKS FROM EACH FAILURE.

Now the next step.

RUN EVERY DEATH OF EVERYONE YOU HAVE KNOWN IN THIS LIFETIME. RUN REGRET AND BLAME OF SELF OR OTHERS UNTIL THE DEATH SHOWS UP IN COMPLETE DETAIL. RUN THE DEATH COMPLETELY OUT. IF YOU HAVE DIFFICULTY RUN EVERY TIME YOU OFFENDED THE DEAD PERSON, EVERY TIME YOU FELT SYMPATHY FOR THE DEAD PERSON UNTIL THE INCIDENT IS IN FULL VIEW. THEN RUN IT COMPLETELY. REMEMBER TO FIND AND RUN ANY

DECISION TO TRY TO MAKE THIS PERSON LIVE OR ANY REGRET THAT YOU DIDN'T MAKE THIS PERSON LIVE.

RUN OFF THE DEATH OF EVERY PET SIMILARLY TO PEOPLE.

This should rehabilitate all control centers for this lifetime.

THE FIFTEENTH ACT

This is a review act and is very necessary to a completion of processing.

Turn back to the beginning of the book and read all the text up to the processing section. That text will mean a great deal more to you now than it did before.

NOW TAKE THE SECOND ACT AND REVIEW EVERYTHING YOU DID IN IT. THERE WILL BE MUCH MORE DATA FOR IT AND MUCH MORE UNDERSTANDING.

TAKE EACH ACT CONSECUTIVELY AND DO THE COMPLETE ACT AGAIN. READ THE TEXTS FOR THE ACTS AND REPEAT ALL THE EXERCISES. NEW DATA WILL BE FOUND ALL UP AND DOWN THE LINE.

WHEN YOU REACH THIS POINT AGAIN, *AFTER* THE COMPLETE REVIEW, FILL OUT THE FOLLOWING. IT MAY HELP OTHERS. THEN MAIL IT.

To: THE EDITOR
Publications Department
2723 W. Temple St.
Los Angeles, Calif. 90026

Gentlemen: I have completed the processing handbook. My comments on the book are as follows:

My suggestions for its improvement are as follows:

My current state of health (physical) was as follows before I used this book.

My state of health is now:

My chronic complaint was and (has been) (has not been) alleviated.

My current feeling of well being is as follows:

I was (greatly assisted by) (poorly assisted by) (did not use) MARK OUT TWO an auditor in my processing. (If an auditor was used) The name and address of my auditor is as follows.

(You have my permission) (You do not have my permission) to use my case in publications. MARK OUT ONE. Date begun: Date ended: My address is:

GLOSSARY

ACCESSIBILITY. The state of being willing to be processed (technical sense in this science). The state of being willing to have interpersonal relations (social sense). For the individual himself, accessibility with self means whether or not an individual can recontact his past experiences or data. A man with a “bad memory” (interposed blocks between control center and facsimiles) has memories which are not accessible to him.

ACT. A stage of processing. Applies solely to the particular process in use at a certain case level.

ASSESSMENT. An inventory, an examination, a calculation or evaluation of a case.

ASSISTS. The straight perception by perception running over and over of an incident until it is desensitized as a facsimile and cannot affect the pre-clear. The assist is used immediately after accidents or operations. It takes away shock and most of the harmful effects of the incident and promotes healing. It is done by starting the individual at the beginning of the incident, with the first awareness of the incident, just as though the pre-clear were living it all the way through again with full perception of sight, sound, etc., as nearly as they can be obtained. An assist run, for instance, immediately after a dental operation takes all the shock out of the operation. One concludes an assist by picking up the auditing as another incident and running through the auditing and the decision to be audited. An assist saves lives and materially speeds healing.

AUDITOR. One who listens and computes. A technician of this science.

BROKEN. Slang used in the wise of “breaking a case,” meaning that one breaks the hold of the pre-clear on a nonsurvival facsimile. Used in greater or lesser magnitude such as “breaking a circuit” or “breaking into a chain” or “breaking a computation.” Never breaking the pre-clear or his spirit, but breaking what is breaking the pre-clear.

CENTER OF CONTROL. The awareness of awareness unit of the mind. This is not part of the brain but part of the mind, the brain being physiological. The mind has two control centers possible, by definition, the right and the left. One is an actual, genetic control center, the other is a subcontrol-center subservient to the control center.

CLEAR (verb). The act of desensitizing or releasing a thought impression or a series of impressions or observations in the past, or a postulate, an emotion, an effort or an entire facsimile. The pre-clear either releases his hold on the facsimile (memory) or the facsimile itself is desensitized. The word is taken from electronic computers or common office adding machines and describes an action similar to clearing past computations from the machine.

CLEAR (noun). A much misunderstood state of being. The word has been used before with other meanings. It has been mistaken as an absolute. It is still used. It is used here as electronics slang and can apply to a chain, an incident or a computation.

COMPUTING PSYCHOTIC. One who is running on a circuit, a circuit being a pseudo-personality out of a facsimile strong enough to dictate to the individual and BE the individual.

DRAMATIZING PSYCHOTIC. One who dramatizes one type of facsimile only.

DYNAMICS. The central drives of an individual. They are numbered from one to eight as follows: 1. Self survival; 2. Survival through children (includes sexual act); 3. Survival by groups including social and political as well as commercial; 4. Survival through Mankind as a whole; 5. Survival through Life including any species, vegetable or animal; (I. Survival through MEST; 7. Survival through theta or the static of itself; 8. (Written as infinity). Survival through a Supreme Being. Each individual is surviving for all eight.

EFFORT. The physical force manifestation of motion. A sharp effort against an individual produces pain. A strenuous effort produces discomfort. Effort can be recalled and re-experienced by the pre-clear. No pre-clear below 2.5 should be called upon to use effort as such as he is incapable of handling it and will stick in it. The essential part of a painful facsimile is its effort, not its perceptions.

EMOTION. The catalyst used by the control center to monitor physical action. The relay system, via glands, interposed between "I" and self and, by thought, others. The main emotions are *happiness* in which one has confidence and enjoyment in his goals and a belief in his control of environment; *boredom*, in which one has lost confidence and direction but is not defeated; *antagonism* wherein one feels his control threatened; *anger* wherein one seeks to destroy that which threatens and seeks without good direction beyond destruction; *covert hostility* wherein one seeks to destroy while reassuring his target that he is not so seeking; *fear* wherein one is catalyzed to flee; *grief* in which one recognizes loss; *apathy* in which one accepts failure on all dynamics and pretends death. Other emotions are a volume or lack of volume of those named. *Shame* or *embarrassment* are emotions peculiar to groups or interpersonal relations and are on a level with grief, denoting loss of position in a group. *Emotion* is the glandular system parallel of *motion* and each *emotion* reflects action to gain or lose to *motion*. At a high level one is sending back *motion*, at a mid level one is holding *motion*, at a lower level, motion is sweeping through and over one.

ENVIRONMENT. The surroundings of the pre-clear from moment to moment in particular or in general, including people, pets, mechanical objects, weather, culture, clothing or the Supreme Being. Anything he perceives or believes he perceives. The objective environment is the environment everyone agrees is there. The subjective environment is the environment the individual himself believes is there. They may not agree.

FACSIMILES. A facsimile is a memory recording for a finite period of time. It is considered that memory is a static without wave length, weight, mass or position in space (in other words, a true static) which yet receives the impression of time, space, energy and matter. A careful examination of the phenomena of thought and the behavior of the human mind lead one to this conclusion. The conclusion is itself a postulate used because it is extremely useful and workable. This is a point of echelon in research, that a facsimile can be so described. The description is mathematical and an abstract and may or may not be actual. When a thought recording is so regarded, the problems of the mind rapidly resolve. Facsimiles are said to be "stored." They act upon the physical universe switchboard called the brain and nervous and glandular system to monitor action. They appear to have motion and weight only because motion and weight are recorded into them. They are not stored in the cells. They impinge upon the cells. Proof of this matter rests in the fact that an energy which became a facsimile a long time ago can be re-contacted and is found to be violent on the contact. Pain is stored as a facsimile. Old pain can be re-contacted. Old pain, in facsimile form, old emotion in facsimile form, can reimpose itself on present time in such a wise as to deform or other wise physically affect the body. You can go back to the last time you hurt yourself and find there and re-experience the pain of that hurt, unless you are very occluded. You can recover efforts and exertions you have made or which have been made against you in the past. Yet the cells themselves, which have finite life, are long since replaced although the body goes on. Hence the facsimile theory. The word facsimile is used as bluntly as one uses it in connection with a drawing of a box top instead of the actual box top. It means a similar article rather than the article itself. You can recall a memory picture of an elephant or a photograph. The elephant and the photograph are no longer present. A facsimile of them is stored in your mind. A facsimile is complete with every perception of the environment present when that facsimile was made including sight, sound, smell, taste, weight, joint position and so on through half a hundred perceptions. Just because you cannot recall motion or these perceptions does not mean they were not recorded fully and in motion with every perception channel you had at the time. It does mean that you have interposed a stop between the facsimile and the recall mechanisms of your control centers. There are facsimiles of everything you have experienced in your entire lifetime and everything you have imagined.

FIFTEEN (noun). A designation to denote a finished case. Solely for case recording to designate a case advanced to current completion. This is a Foundation number system for pre-clears. A case is noted on record by the act number to which it has been advanced.

GENETIC. By line of protoplasm and by facsimiles and by MEST forms the individual has arrived in the present age from a past beginning. Genetic applies to the protoplasm line of father and mother to child, grown child to new child and so forth.

LOCK SCANNING. A process which starts the pre-clear from a point in the past with which he has made solid contact up through all similar incidents without verbalization. This is done over and over, each time trying to start at an earlier incident of the same kind, until the pre-clear extroverts on the subject of the chain. **BOIL-OFF** often results wherein the pre-clear seems to go to sleep. Avoid boil-off for it is not therapeutic and will eventually result in reduced tone. **BOILOFF** is a lazy auditor's excuse to be idle and facsimiles in such severe conflict that they will not resolve without resolving postulates first. Lock scanning is a standardized drill, started on signal and ended with the pre-clear saying he is again in present time. It can be done on any subject. **ABOVE 2.0** only.

MEST. A compound word made up of the first letters of **MATTER, ENERGY, SPACE** and **TIME**. A coined word for the **PHYSICAL UNIVERSE**. **THETA IS NOT CONSIDERED AS PART OF THE PHYSICAL UNIVERSE BUT IS NOT CONSIDERED ABSOLUTELY AS NOT PART OF THE PHYSICAL UNIVERSE**.

PAST POSTULATES. Decisions or conclusions the pre-clear has made in the past and to which he is still subjected in the present. Past postulates are uniformly invalid since they cannot resolve present environment.

PERCEPTIONS. By means of physical waves, rays and particles of the physical universe, impressions of the environment enter through the "sense channels" such as the eyes and optic nerves, the nose and olfactory nerves; the ears and aural nerves; inter-body nerves for inter-body perceptions, etc., etc. These are all perceptions up to the instant they record as facsimiles at which moment they become recordings. When recalled they are perceptions again, being again entered into sense channels from the recall side. There are over half a hundred separate perceptions all being recorded at once.

POSTULATES (verb). To conclude, decide or resolve a problem or to set a pattern for the future or to nullify a pattern of the past.

POSTULATE (noun). A conclusion, decision or resolution made by the individual himself on his own self-determinism on data of the past, known or unknown. The postulate is always known. It is made upon the evaluation of data by the individual or on impulse without data. It resolves a problem of the past, decides on problems or observations in the present or sets a pattern for the future.

PSYCHOSOMATIC ILLNESS. A term used in common parlance to denote a condition "resulting from a state of mind." Such illnesses account for about seventy percent of all ills, by popular report. Technically, in this science, a chronic or continuing painful facsimile to which the pre-clear is holding to account for failures. Arthritis, bursitis, tendonitis, myopia, astigmatism, bizarre aches and pains, sinusitis, colds, ulcers, migraine headaches, toothaches, poliomyelitis deformities, fatness, skin malformations are a few of these legion of chronic somatics. They are traceable to service facsimiles.

PSYCHOTIC. An individual who is out of contact to a thorough extent with his present time environment and who does not compute into the future. He may be an acute psychotic wherein he becomes psychotic for only a few minutes at a time and only occasionally in certain environments (as in rages or apathies) or he may be a chronic psychotic, or in a continual disconnection with the future and present. Psychotics who are dramatically harmful to others

are considered dangerous enough to be put away. Psychotics who are harmful on a less dramatic basis are no less harmful to their environment and are no less psychotic.

PRE-CLEAR. One who has entered processing enroute to becoming a fifteen.

RECOVERY. Recovery of one's own ability to determine one's existence.

RELEASE (verb). The act of taking the perceptions or effort or effectiveness out of a heavy facsimile or taking away the pre-clear's hold on the facsimile.

REPETITIVE STRAIGHT-WIRE. Attention called to an incident over and over amongst other incidents until it is de-sensitized. Used on conclusions or incidents which do not easily surrender.

SERVICE FACSIMILE. A definitely non-survival situation contained in a facsimile which is called into action by the individual to explain his failures. A service facsimile may be one of an illness, an injury, an inability. The facsimile begins with a down emotional curve and ends with an upward emotional curve. Between these it has pain. A service facsimile IS the pattern which is the chronic "psychosomatic illness." It may contain coughs, fever, aches, rashes, any manifestation of a non-survival character, mental or physical. It may even be a suicide effort. It is complete with all perceptions. It has many similar facsimiles. It has many locks. The possession and use of a service facsimile distinguishes a homo sapiens.

SERVICE FACSIMILE CHAIN. The entire chain of similar incidents which comprise the total repertoire of the individual who is explaining thus failure and thus seeking support.

STRAIGHT-WIRE. A process of recalling, from present time, with some perception or at least a concept, a past incident. The name straight-wire derives from the MEST communications process of connecting two points of a communications system. It is essentially memory work. It is applied to postulates, evaluations, incidents, scenes, emotions, or any data which may be in the storage banks of the mind without "sending the pre-clear" into the incident itself. It is done with the pre-clear sitting up, eyes open or shut. The auditor is very alert. Straight-wire is done rapidly. The pre-clear is not permitted to wander or reminisce. He responds to questions on the part of the auditor. **MANY PRE-CLEARs DISLIKE BEING QUESTIONED. THE AUDITOR MUST THEN FIRST RESOLVE THE POSTULATES AGAINST BEING QUESTIONED;** this would be called "clearing for broad straight-wire."

TEN. A case advanced to the point of released service facsimile.

THETA. The mathematical symbol for the static of thought. By THETA is meant the static itself. By "facsimile" is meant THETA which contains impressions by perception.

THOUGHT. The facsimiles one has recorded of his various environments and the facsimiles he has created with his imaginings, their recombination and evaluations and conclusions for the purpose of determining action or no action or potential action or no action. **THOUGHT** is used also to mean a progress treating awareness level recordings as distinct from non-awareness level recordings.

NOTE

Terms and definitions in this glossary are retained unchanged from the original.

Some of the terms and wages are not final. Development leading from Handbook for Preclears 1951, to completion by L. Ron Hubbard of Scientology technology in 1965, have further defined and amplified many terms. Some wages are for this book only and were not carried forward.

For books covering the fantastic advance of Scientology from its beginning in Dianetics to completion of the route to *Total Freedom* and the exact technology, see the list of books by L. Ron Hubbard in the back of this book.

EDITORS

DEFINITIONS, LOGICS AND AXIOMS

These are the definitions, logics, and axioms of this science. It should be borne in mind that these actually form epistemology, the science of knowledge. These cannot but embrace various fields and sciences. They are listed in this volume without further elucidation but will be found to be self explanatory for the most part. Adequate phenomena exist to demonstrate the self-evidence of these definitions, postulates, logics and axioms.

The first section, the logics, is separate from the axioms only in that from the system of thinking so evaluated, the axioms themselves flow. The word *fogies is* used here to mean postulates pertaining to the organizational structure of alignment.

THE LOGICS

LOGIC 1—KNOWLEDGE IS A WHOLE GROUP OR SUB-DIVISION OF A GROUP OF DATA OR SPECULATIONS OR CONCLUSIONS ON DATA OR METHODS OF GAINING DATA.

LOGIC 2—A BODY OF KNOWLEDGE IS A BODY OF DATA, ALIGNED OR UNALIGNED, OR METHODS OF GAINING DATA.

LOGIC 3—ANY KNOWLEDGE WHICH CAN BE SENSED, MEASURED OR EXPERIENCED BY ANY ENTITY IS CAPABLE OF INFLUENCING THAT ENTITY.

COROLLARY—THAT KNOWLEDGE WHICH CAN NOT BE SENSED, MEASURED OR EXPERIENCED BY ANY ENTITY OR TYPE OF ENTITY CANNOT INFLUENCE THAT ENTITY OR TYPE OF ENTITY.

LOGIC 4—A DATUM IS A FACSIMILE OF STATES OF BEING, STATES OF NOT BEING, ACTIONS OR INACTIONS, CONCLUSIONS OR SUPPOSITIONS IN THE PHYSICAL OR ANY OTHER UNIVERSE.

LOGIC 5—A DEFINITION OF TERMS IS NECESSARY TO THE ALIGNMENT, STATEMENT AND RESOLUTION OF SUPPOSITIONS, OBSERVATIONS, PROBLEMS AND SOLUTIONS AND THEIR COMMUNICATION.

DEFINITION—DESCRIPTIVE DEFINITION: ONE WHICH CLASSIFIES BY CHARACTERISTICS, BY DESCRIBING EXISTING STATES OF BEING.

DEFINITION—DIFFERENTIATIVE DEFINITION: ONE WHICH COMPARES UNLIKENESS TO EXISTING STATES OF BEING OR NOT BEING.

DEFINITION—ASSOCIATIVE DEFINITION: ONE WHICH DECLARES LIKENESS TO EXISTING STATES OF BEING OR NOT BEING.

DEFINITION — ACTION DEFINITION: ONE WHICH DELINEATES CAUSE AND POTENTIAL CHANGE OF STATE OF BEING BY CAUSE OF EXISTENCE, INEXISTENCE, ACTION, INACTION, PURPOSE OR LACK OF PURPOSE.

LOGIC 6—ABSOLUTES ARE UNOBTAINABLE.

LOGIC 7—GRADIENT SCALES ARE NECESSARY TO THE EVALUATION OF PROBLEMS AND THEIR DATA.

This is the tool of infinity valued logic: Absolutes are unobtainable. Terms such as good and bad, alive and dead, right and wrong are used only in conjunction with gradient scales. On the scale of right and wrong, everything above zero or center would be more and more right, approaching an infinite rightness, and everything below center would be more and more wrong approaching infinite wrongness. All things assisting the survival of the survivor are considered to be right for the survivor. All things inhibiting survival from the viewpoint of the survivor can be considered wrong for the survivor. The more a thing assists survival, the more it can be considered right for the survivor; the more a thing or action inhibits survival, the more it is wrong from the viewpoint of the intended survivor.

COROLLARY—ANY DATUM HAS ONLY RELATIVE TRUTH.

COROLLARY—TRUTH IS RELATIVE TO ENVIRONMENTS, EXPERIENCE AND TRUTH.

LOGIC 8—A DATUM CAN BE EVALUATED ONLY BY A DATUM OF COMPARABLE MAGNITUDE.

LOGIC 9—A DATUM IS AS VALUABLE AS IT HAS BEEN EVALUATED.

LOGIC 10—THE VALUE OF A DATUM IS ESTABLISHED BY THE AMOUNT OF ALIGNMENT (relationship) IT IMPARTS TO OTHER DATA.

LOGIC 11—THE VALUE OF A DATUM OR FIELD OF DATA CAN BE ESTABLISHED BY ITS DEGREE OF ASSISTANCE IN SURVIVAL OR ITS INHIBITION TO SURVIVAL.

LOGIC 12—THE VALUE OF A DATUM OR A FIELD OF DATA IS MODIFIED BY THE VIEWPOINT OF THE OBSERVER.

LOGIC 13—PROBLEMS ARE RESOLVED BY COMPARTMENTING THEM INTO AREAS OF SIMILAR MAGNITUDE AND DATA, COMPARING THEM TO DATA ALREADY KNOWN OR PARTIALLY KNOWN, AND RESOLVING EACH AREA. DATA WHICH CANNOT BE KNOWN IMMEDIATELY MAY BE RESOLVED BY ADDRESSING WHAT IS KNOWN AND USING ITS SOLUTION TO RESOLVE THE REMAINDER.

LOGIC 14—FACTORS INTRODUCED INTO A PROBLEM OR SOLUTION WHICH DO NOT DERIVE FROM NATURAL LAW BUT ONLY FROM AUTHORITARIAN COMMAND ABERRATE THAT PROBLEM OR SOLUTION.

LOGIC 15—THE INTRODUCTION OF AN ARBITRARY INTO A PROBLEM OR SOLUTION INVITES THE FURTHER INTRODUCTION OF ARBITRARIES INTO PROBLEMS AND SOLUTIONS.

LOGIC 16—AN ABSTRACT POSTULATE MUST BE COMPARED TO THE UNIVERSE TO WHICH IT APPLIES AND BROUGHT INTO THE CATEGORY OF THINGS WHICH CAN BE SENSED, MEASURED OR EXPERIENCED IN THAT UNIVERSE BEFORE SUCH POSTULATE CAN BE CONSIDERED WORKABLE.

LOGIC 17—THOSE FIELDS WHICH MOST DEPEND UPON AUTHORITATIVE OPINION FOR THEIR DATA LEAST CONTAIN KNOWN NATURAL LAW.

LOGIC 18—A POSTULATE IS AS VALUABLE AS IT IS WORKABLE.

LOGIC 19—THE WORKABILITY OF A POSTULATE IS ESTABLISHED BY THE DEGREE TO WHICH IT EXPLAINS EXISTING PHENOMENA ALREADY KNOWN, BY THE DEGREE THAT IT PREDICTS NEW PHENOMENA WHICH WHEN LOOKED FOR WILL BE FOUND TO EXIST, AND BY THE DEGREE THAT IT DOES NOT REQUIRE THAT PHENOMENA WHICH DO NOT EXIST IN FACT BE CALLED INTO EXISTENCE FOR ITS EXPLANATION.

LOGIC 20—A SCIENCE MAY BE CONSIDERED TO BE A LARGE BODY OF ALIGNED DATA WHICH HAS SIMILARITY IN APPLICATION AND WHICH HAS BEEN DEDUCED OR INDUCED FROM BASIC POSTULATES.

LOGIC 21—MATHEMATICS ARE METHODS OF POSTULATING OR RESOLVING REAL OR ABSTRACT DATA IN ANY UNIVERSE AND INTEGRATING BY SYMBOLIZATION OF DATA, POSTULATES AND RESOLUTIONS.

LOGIC 22—THE HUMAN MIND* IS AN OBSERVER, POSTULATOR, CREATOR AND STORAGE PLACE OF KNOWLEDGE.

* The human mind by definition includes the awareness unit of the living organism, the observer, the computer of data, the spirit, the memory storage, the life force and the individual motivator of the living organism. It is used as distinct from the brain which can be considered to be motivated by the mind.

LOGIC 23—THE HUMAN MIND IS A SERVOMECHANISM TO ANY MATHEMATICS EVOLVED OR EMPLOYED BY THE HUMAN MIND.

POSTULATE—THE HUMAN MIND AND INVENTIONS OF THE HUMAN MIND ARE CAPABLE OF RESOLVING ANY AND ALL PROBLEMS WHICH CAN BE SENSED, MEASURED OR EXPERIENCED DIRECTLY OR INDIRECTLY.

COROLLARY—THE HUMAN MIND IS CAPABLE OF RESOLVING THE PROBLEM OF THE HUMAN MIND.

The borderline of solution of this science lies between *why* life is surviving and *how* life is surviving. It is possible to resolve *how* life is surviving without resolving *why* life is surviving.

LOGIC 24—THE RESOLUTION OF THE PHILOSOPHICAL, SCIENTIFIC AND HUMAN STUDIES (such as economics, politics, sociology, medicine, criminology, etc.) DEPENDS PRIMARILY UPON THE RESOLUTION OF THE PROBLEMS OF THE HUMAN MIND.

NOTE: The primary step in resolving the broad activities of man could be considered to be the resolving of the activities of the mind itself. Hence, the logics carry to this point and then proceed as axioms concerning the human mind, such axioms being substantiated as relative truths by much newly discovered phenomena. The ensuing axioms, from Logic 24, apply no less to the various “ologies” than they do to deaberrating or improving the operation of the mind. It should not be thought that the following axioms are devoted to the construction of anything as limited as a therapy, which is only incidental to the resolution of human aberration and such things as psychosomatic illness. These axioms are capable of such solution, as has been demonstrated, but such a narrow application would indicate a very narrow scope of view.

AXIOMS

AXIOM 1—THE SOURCE OF LIFE IS A STATIC OF PECULIAR AND PARTICULAR PROPERTIES.

AXIOM 2—AT LEAST A PORTION OF THE STATIC CALLED LIFE IS IMPINGED UPON THE PHYSICAL UNIVERSE.

AXIOM 3—THAT PORTION OF THE STATIC OF LIFE WHICH IS IMPINGED UPON THE PHYSICAL UNIVERSE HAS FOR ITS DYNAMIC GOAL, SURVIVAL AND ONLY SURVIVAL.

AXIOM 4—THE PHYSICAL UNIVERSE IS REDUCIBLE TO MOTION OF ENERGY OPERATING IN SPACE THROUGH TIME.

AXIOM 5—THAT PORTION OF THE STATIC OF LIFE CONCERNED WITH THE LIFE ORGANISMS OF THE PHYSICAL UNIVERSE IS CONCERNED WHOLLY WITH MOTION.

AXIOM 6—THE LIFE STATIC HAS AS ONE OF ITS PROPERTIES THE ABILITY TO MOBILIZE AND ANIMATE MATTER INTO LIVING ORGANISMS.

AXIOM 7—THE LIFE STATIC IS ENGAGED IN A CONQUEST OF THE PHYSICAL UNIVERSE.

AXIOM 8—THE LIFE STATIC CONQUERS THE MATERIAL UNIVERSE BY LEARNING AND APPLYING THE PHYSICAL LAWS OF THE PHYSICAL UNIVERSE.

SYMBOL: The symbol for the *life static* in use hereafter is the Greek letter THETA.

AXIOM 9—A FUNDAMENTAL OPERATION OF THETA IN SURVIVING IS BRINGING ORDER INTO THE CHAOS OF THE PHYSICAL UNIVERSE.

AXIOM 10—THETA BRINGS ORDER INTO CHAOS BY CONQUERING WHATEVER IN MEST MAY BE PRO-SURVIVAL AND DESTROYING WHATEVER IN MEST MAY BE CONTRA-SURVIVAL, AT LEAST THROUGH THE MEDIUM OF LIFE ORGANISMS.

SYMBOL: The symbol for the *Physical Universe* in use hereafter is *MEST*, from the first letters of the words Matter, Energy, Space, and Time, or the Greek letter *Phi*.

AXIOM 11—A LIFE ORGANISM IS COMPOSED OF MATTER AND ENERGY IN SPACE AND TIME, ANIMATED BY *THETA*.

SYMBOL: Living organism or organisms will hereafter be represented by the Greek letter *LAMBDA*.

AXIOM 12—THE *MEST* PART OF THE ORGANISM FOLLOWS THE LAWS OF THE PHYSICAL SCIENCES. ALL *LAMBDA IS* CONCERNED WITH MOTION.

AXIOM 13—*THETA* OPERATING THROUGH *LAMBDA* CONVERTS THE FORCES OF THE PHYSICAL UNIVERSE INTO FORCES TO CONQUER THE PHYSICAL UNIVERSE.

AXIOM 14—*THETA* WORKING UPON PHYSICAL UNIVERSE MOTION MUST MAINTAIN A HARMONIOUS RATE OF MOTION. The limits of *Lambda* are narrow, both as to thermal and mechanical motion.

AXIOM 15—*LAMBDA IS THE INTERMEDIATE STEP IN THE CONQUEST OF THE PHYSICAL UNIVERSE.*

AXIOM 16—*THE BASIC FOOD OF ANY ORGANISM CONSISTS OF LIGHT AND CHEMICALS.*

Organisms can exist only as higher levels of complexities became lower levels of converters exist. Theta evolves organisms from lower to higher forms and supports them by the existence of lower converter forms.

AXIOM 17—*THETA, VIA LAMBDA, EFFECTS AN EVOLUTION OF MEST.*

In this we have the waste products of organisms on the one hand as those very complex chemicals which bacteria make and, on the other hand, we have the physical face of the earth being changed by animals and men, such changes as grass holding mountains from eroding or roots cawing boulders to break, buildings being built, and rivers being dammed. There is obviously an evolution in *MEST* in progress under the incursion of *THETA*.

AXIOM 18—*LAMBDA, EVEN WITHIN A SPECIES, VARIES IN ITS ENDOWMENT OF THETA.*

AXIOM 19—*THE EFFORT OF LAMBDA IS TOWARD SURVIVAL.*

The goal of *Lambda is* survival. The penalty of failure to advance toward that goal is to succumb.

DEFINITION: PERSISTENCE IS THE ABILITY TO EXERT CONTINUANCE OF EFFORT TOWARD SURVIVAL GOALS.

AXIOM 20—*LAMBDA CREATES, CONSERVES, MAINTAINS, REQUIRES, DESTROYS, CHANGES, OCCUPIES, GROUPS AND DISPERSES MEST. LAMBDA SURVIVES BY ANIMATING AND MOBILIZING OR DESTROYING MATTER AND ENERGY IN SPACE AND TIME.*

AXIOM 21—*LAMBDA IS DEPENDENT UPON OPTIMUM MOTION. MOTION WHICH IS TOO SWIFT AND MOTION WHICH IS TOO SLOW ARE EQUALLY CONTRA-SURVIVAL.*

AXIOM 22—*THETA AND THOUGHT ARE SIMILAR ORDERS OF STATIC.*

AXIOM 23—*ALL THOUGHT IS CONCERNED WITH MOTION.*

AXIOM 24—*THE ESTABLISHMENT OF AN OPTIMUM MOTION IS A BASIC GOAL OF REASON.*

DEFINITION: *LAMBDA IS A CHEMICAL HEAT ENGINE EXISTING IN SPACE AND TIME MOTIVATED BY THE LIFE STATIC AND DIRECTED BY THOUGHT.*

AXIOM 25—*THE BASIC PURPOSE OF REASON IS THE CALCULATION OR ESTIMATION OF EFFORT.*

AXIOM 26—*THOUGHT IS ACCOMPLISHED BY THETA FACSIMILES OF PHYSICAL UNIVERSE, ENTITIES OR ACTIONS.*

AXIOM 27—*THETA IS SATISFIED ONLY WITH HARMONIOUS ACTION OR OPTIMUM MOTION AND REJECTS OR DESTROYS ACTION OR MOTION ABOVE OR BELOW ITS TOLERANCE BAND.*

AXIOM 28—*THE MIND IS CONCERNED WHOLLY WITH THE ESTIMATION OF EFFORT.*

DEFINITION: MIND IS THE *THETA* COMMAND POST OF ANY ORGANISM OR ORGANISMS.

AXIOM 29—THE BASIC ERRORS OF REASON ARE FAILURES TO DIFFERENTIATE AMONGST MATTER, ENERGY, SPACE AND TIME.

AXIOM 30—RIGHTNESS IS PROPER CALCULATION OF EFFORT.

AXIOM 31—WRONGNESS IS ALWAYS MISCALCULATION OF EFFORT.

AXIOM 32—*THETA* CAN EXERT ITSELF DIRECTLY OR EXTENSIONALLY.

Theta can direct physical application of the organism to the environment or through the mind, can first calculate the action or extend, as in language, ideas.

AXIOM 33—CONCLUSIONS ARE DIRECTED TOWARD THE INHIBITION, MAINTENANCE OR ACCELERATIONS OF EFFORTS.

AXIOM 34—THE COMMON DENOMINATOR OF ALL LIFE ORGANISMS IS MOTION.

AXIOM 35—EFFORT OF AN ORGANISM TO SURVIVE OR SUCCUMB IS PHYSICAL MOTION OF A LIFE ORGANISM AT A GIVEN MOMENT IN TIME THROUGH SPACE.

DEFINITION: MOTION IS ANY CHANGE IN ORIENTATION IN SPACE.

DEFINITION: FORCE IS RANDOM EFFORT.

DEFINITION: EFFORT IS DIRECTED FORCE.

AXIOM 36—AN ORGANISM'S EFFORT CAN BE TO REMAIN AT REST OR PERSIST IN A GIVEN MOTION.

Static state has position in time, but an organism which is remaining positionally in a static state if alive, is still continuing a highly complex pattern of motion, such as the heart beat, digestion, etc.

The efforts of organisms to survive or succumb are assisted compelled or opposed by the efforts of other organisms, matter, energy, space and time.

DEFINITION: ATTENTION IS A MOTION WHICH MUST REMAIN AT AN OPTIMUM EFFORT.

Attention is aberrated by becoming unfixed and sweeping at random or becoming too fixed without sweeping.

Unknown threats to survival when sensed cause attention to sweep without fixing.

Known threats to survival when sensed cause attention to fix.

AXIOM 37—THE ULTIMATE GOAL OF *LAMBDA* IS INFINITE SURVIVAL.

AXIOM 38—DEATH IS ABANDONMENT BY *THETA* OF A LIFE ORGANISM OR RACE OR SPECIES WHERE THESE CAN NO LONGER SERVE *THETA* IN ITS GOALS OF INFINITE SURVIVAL.

AXIOM 39—THE REWARD OF AN ORGANISM ENGAGING UPON SURVIVAL ACTIVITY IS PLEASURE.

AXIOM 40—THE PENALTY OF AN ORGANISM FAILING TO ENGAGE UPON SURVIVAL ACTIVITY, OR ENGAGING IN NON-SURVIVAL ACTIVITY, IS PAIN.

AXIOM 41—THE CELL AND VIRUS ARE THE PRIMARY BUILDING BLOCKS OF LIFE ORGANISMS.

AXIOM 42—THE VIRUS AND CELL ARE MATTER AND ENERGY ANIMATED AND MOTIVATED IN SPACE AND TIME BY *THETA*

AXIOM 43—*THETA* MOBILIZES THE VIRUS AND CELL IN COLONIAL AGGREGATIONS TO INCREASE POTENTIAL MOTION AND ACCOMPLISH EFFORT.

AXIOM 44—THE GOAL OF VIRUSES AND CELLS IS SURVIVAL IN SPACE THROUGH TIME.

AXIOM 45—THE TOTAL MISSION OF HIGHER ORGANISMS, VIRUSES AND CELLS IS THE SAME AS THAT OF THE VIRUS AND CELL.

AXIOM 46—COLONIAL AGGREGATIONS OF VIRUSES AND CELLS CAN BE IMBUED WITH MORE *THETA* THAN THEY INHERENTLY CONTAINED.

Life Energy joins any group whether a group of organisms or group of cells composing an organism. Here we have personal entity, individuation, etc.

AXIOM 47—EFFORT CAN BE ACCOMPLISHED BY *LAMBDA* ONLY THROUGH THE COORDINATION OF ITS PARTS TOWARD GOALS.

AXIOM 48—AN ORGANISM IS EQUIPPED TO BE GOVERNED AND CONTROLLED BY A MIND.

AXIOM 49—THE PURPOSE OF THE MIND IS TO POSE AND RESOLVE PROBLEMS RELATING TO SURVIVAL AND TO DIRECT THE EFFORT OF THE ORGANISM ACCORDING TO THESE SOLUTIONS.

AXIOM 50—SMALL PROBLEMS ARE POSED AND RESOLVED THROUGH ESTIMATIONS OF EFFORT.

AXIOM 51—THE MIND CAN CONFUSE POSITION IN SPACE WITH POSITION IN TIME.

(Counter-efforts producing action phrases.)

AXIOM 52—AN ORGANISM PROCEEDING TOWARD SURVIVAL IS DIRECTED BY THE MIND OF THAT ORGANISM IN THE ACCOMPLISHMENT OF SURVIVAL EFFORT.

AXIOM 53—AN ORGANISM PROCEEDING TOWARD SUCCUMB IS DIRECTED BY THE MIND OF THAT ORGANISM IN THE ACCOMPLISHMENT OF DEATH.

AXIOM 51—SURVIVAL OF AN ORGANISM IS ACCOMPLISHED BY THE OVERCOMING OF EFFORTS OPPOSING ITS SURVIVAL.

(Note: Corollary for other dynamics).

DEFINITION: DYNAMIC IS THE ABILITY TO TRANSLATE SOLUTIONS INTO ACTION.

AXIOM 55—SURVIVAL EFFORT FOR AN ORGANISM INCLUDES THE DYNAMIC THRUST BY THAT ORGANISM FOR THE SURVIVAL OF ITSELF, ITS PROCREATION, ITS GROUP, ITS SUBSPECIES, ITS SPECIES, ALL LIFE ORGANISMS, MATERIAL UNIVERSE, THE LIFE STATIC AND, POSSIBLY, A SUPREME BEING.

(Note: List of dynamics.)

AXIOM 56—THE CYCLE OF AN ORGANISM, A GROUP OF ORGANISMS OR A SPECIES IS INCEPTION, GROWTH, RE-CREATION, DECAY AND DEATH.

AXIOM 57—THE EFFORT OF AN ORGANISM IS DIRECTED TOWARD THE CONTROL OF THE ENVIRONMENT FOR ALL THE DYNAMICS.

AXIOM 58—CONTROL OF AN ENVIRONMENT IS ACCOMPLISHED BY THE SUPPORT OF PRO-SURVIVAL FACTORS ALONG ANY DYNAMIC.

AXIOM 59—ANY TYPE OF HIGHER ORGANISM IS ACCOMPLISHED BY THE EVOLUTION OF VIRUSES AND CELLS INTO FORMS CAPABLE OF BETTER EFFORTS TO CONTROL OR LIVE IN AN ENVIRONMENT.

AXIOM 60—THE USEFULNESS OF AN ORGANISM IS DETERMINED BY ITS ABILITY TO CONTROL THE ENVIRONMENT OR TO SUPPORT ORGANISMS WHICH CONTROL THE ENVIRONMENT.

AXIOM 61—AN ORGANISM IS REJECTED BY *THETA* TO THE DEGREE THAT IT FAILS IN ITS GOALS.

AXIOM 62—HIGHER ORGANISMS CAN EXIST ONLY IN THE DEGREE THAT THEY ARE SUPPORTED BY THE LOWER ORGANISMS.

AXIOM 63—THE USEFULNESS OF AN ORGANISM IS DETERMINED BY THE ALIGNMENT OF ITS EFFORTS TOWARD SURVIVAL.

AXIOM 64—THE MIND PERCEIVES AND STORES ALL DATA OF THE ENVIRONMENT AND ALIGNS OR FAILS TO ALIGN THESE ACCORDING TO THE TIME THEY WERE PERCEIVED.

DEFINITION: A CONCLUSION IS THE *THETA FACSIMILES* OF A GROUP OF COMBINED DATA.

DEFINITION: A DATUM IS A *THETA FACSIMILE* OF PHYSICAL ACTION.

AXIOM 65—THE PROCESS OF THOUGHT IS THE PERCEPTION OF THE PRESENT AND THE COMPARISON OF IT TO THE PERCEPTIONS AND CONCLUSIONS OF THE PAST IN ORDER TO DIRECT ACTION IN THE IMMEDIATE OR DISTANT FUTURE.

COROLLARY: THE ATTEMPT OF THOUGHT IS TO PERCEIVE REALITIES OF THE PAST AND PRESENT IN ORDER TO PREDICT OR POSTULATE REALITIES OF THE FUTURE.

AXIOM 66—THE PROCESS BY WHICH LIFE EFFECTS ITS CONQUEST OF THE MATERIAL UNIVERSE CONSISTS IN THE CONVERSION OF THE POTENTIAL EFFORT OF MATTER AND ENERGY IN SPACE AND THROUGH TIME TO EFFECT WITH IT THE CONVERSION OF FURTHER MATTER AND ENERGY IN SPACE AND THROUGH TIME.

AXIOM 67—*THETA* CONTAINS ITS OWN *THETA UNIVERSE* EFFORT WHICH TRANSLATES INTO *MEST* EFFORT.

AXIOM 68—THE SINGLE ARBITRARY IN ANY ORGANISM IS TIME.

AXIOM 69—PHYSICAL UNIVERSE PERCEPTIONS AND EFFORTS ARE RECEIVED BY AN ORGANISM AS FORCE WAVES, CONVERT BY FACSIMILE INTO *THETA* AND ARE THUS STORED.

DEFINITION: RANDOMITY IS THE MIS-ALIGNMENT THROUGH THE INTERNAL OR EXTERNAL EFFORTS BY OTHER FORMS OF LIFE OR THE MATERIAL UNIVERSE OF THE EFFORTS OF AN ORGANISM, AND IS IMPOSED ON THE PHYSICAL ORGANISM BY COUNTER-EFFORTS IN THE ENVIRONMENT.

AXIOM 70—ANY CYCLE OF ANY LIFE ORGANISM IS FROM STATIC TO MOTION TO STATIC.

AXIOM 71—THE CYCLE OF RANDOMITY IS FROM STATIC, THROUGH OPTIMUM, THROUGH RANDOMITY SUFFICIENTLY REPETITIOUS OR SIMILAR TO CONSTITUTE ANOTHER STATIC.

AXIOM 72—THERE ARE TWO SUB-DIVISIONS TO RANDOMITY: DATA RANDOMITY AND FORCE RANDOMITY.

AXIOM 73—THE THREE DEGREES OF RANDOMITY CONSIST OF MINUS RANDOMITY, OPTIMUM RANDOMITY AND PLUS RANDOMITY.

DEFINITION: RANDOMITY IS A COMPONENT FACTOR AND NECESSARY PART OF MOTION, IF MOTION IS TO CONTINUE.

AXIOM 74—OPTIMUM RANDOMITY IS NECESSARY TO LEARNING.

AXIOM 75—THE IMPORTANT FACTORS IN ANY AREA OF RANDOMITY ARE EFFORT AND COUNTER-EFFORT. (Note: As distinguished from near-perceptions of effort.)

AXIOM 76—RANDOMITY AMONGST ORGANISMS IS VITAL TO CONTINUOUS SURVIVAL OF ALL ORGANISMS.

AXIOM 77—*THETA* AFFECTS THE ORGANISM, OTHER ORGANISMS AND THE PHYSICAL UNIVERSE BY TRANSLATING *THETA FACSIMILES* INTO PHYSICAL EFFORTS OR RANDOMITY OF EFFORTS.

DEFINITION: THE DEGREE OF RANDOMITY IS MEASURED BY THE RANDOMNESS OF EFFORT VECTORS WITHIN THE ORGANISM, AMONGST ORGANISMS, AMONGST RACES OR SPECIES OF ORGANISMS OR BETWEEN ORGANISMS AND THE PHYSICAL UNIVERSE.

AXIOM 78—RANDOMITY BECOMES INTENSE IN INDIRECT RATIO TO THE TIME IN WHICH IT TAKES PLACE, MODIFIED BY THE TOTAL EFFORT IN THE AREA.

AXIOM 79—INITIAL RANDOMITY CAN BE REINFORCED BY RANDOMITIES OF GREATER OR LESSER MAGNITUDE.

AXIOM 80—SUB AREAS OF RANDOMITY EXIST IN CHAINS OF SIMILARITY PLOTTED AGAINST TIME. THIS CAN BE TRUE OF WORDS AND ACTIONS CONTAINED IN RANDOMITIES. EACH MAY HAVE ITS OWN CHAIN PLOTTED AGAINST TIME.

AXIOM 81—SANITY CONSISTS OF OPTIMUM RANDOMITY.

AXIOM 82—ABERRATION EXISTS TO THE DEGREE THAT PLUS OR MINUS RANDOMITY EXISTS IN THE ENVIRONMENT OR PAST DATA OF AN ORGANISM, GROUP OR SPECIES, MODIFIED BY THE ENDOWED SELF-DETERMINISM OF THAT ORGANISM, GROUP OR SPECIES.

AXIOM 83—THE SELF-DETERMINISM OF AN ORGANISM IS DETERMINED BY ITS *THETA* ENDOWMENT, MODIFIED BY MINUS OR PLUS RANDOMITY IN ITS ENVIRONMENT OR ITS EXISTENCE.

AXIOM 84—THE SELF-DETERMINISM OF AN ORGANISM IS INCREASED BY OPTIMUM RANDOMITY OF COUNTER-EFFORTS.

AXIOM 85—THE SELF-DETERMINISM OF AN ORGANISM IS REDUCED BY PLUS OR MINUS RANDOMITY OF COUNTER-EFFORTS IN THE ENVIRONMENT.

AXIOM 86—RANDOMITY CONTAINS BOTH THE RANDOMNESS OF EFFORTS AND THE VOLUME OF EFFORTS.

(Note: An area of randomness can have a great deal of confusion but, without volume of energy, the confusion itself is negligible).

AXIOM 87—THAT COUNTER-EFFORT IS MOST ACCEPTABLE TO AN ORGANISM WHICH MOST CLOSELY APPEARS TO ASSIST ITS ACCOMPLISHMENT OF ITS GOAL.

AXIOM 88—AN AREA OF SEVERE PLUS OR MINUS RANDOMITY CAN OCCLUDE DATA ON ANY OF THE SUBJECTS OF THAT PLUS OR MINUS RANDOMITY WHICH TOOK PLACE IN A PRIOR TIME.

(Note: Shut-off mechanisms of earlier lives, perceptics, specific incidents, etc.)

AXIOM 89—RESTIMULATION OF PLUS, MINUS OR OPTIMUM RANDOMITY CAN PRODUCE INCREASED PLUS, MINUS OR OPTIMUM RANDOMITY RESPECTIVELY IN THE ORGANISM.

AXIOM 90—AN AREA OF RANDOMITY CAN ASSUME SUFFICIENT MAGNITUDE SO AS TO APPEAR TO THE ORGANISM AS PAIN, ACCORDING TO ITS GOALS.

AXIOM 91—PAST RANDOMITY CAN IMPOSE ITSELF UPON THE PRESENT ORGANISM AS *THETA FACSIMILES*.

AXIOM 92—THE ENGRAM IS A SEVERE AREA OF PLUS OR MINUS RANDOMITY OF SUFFICIENT VOLUME TO CAUSE UNCONSCIOUSNESS.

AXIOM 93—UNCONSCIOUSNESS IS AN EXCESS OF RANDOMITY IMPOSED BY A COUNTER-EFFORT OF SUFFICIENT FORCE TO CLOUD THE AWARENESS AND DIRECT FUNCTION OF THE ORGANISM THROUGH THE MIND'S CONTROL CENTER.

AXIOM 94—ANY COUNTER-EFFORT WHICH MISALIGNS THE ORGANISM'S COMMAND OF ITSELF OR ITS ENVIRONMENT ESTABLISHES PLUS OR MINUS RANDOMITY OR, IF OF SUFFICIENT MAGNITUDE, IS AN ENGRAM.

AXIOM 95—PAST ENGRAMS ARE RESTIMULATED BY THE CONTROL CENTER'S PERCEPTION OF CIRCUMSTANCES SIMILAR TO THAT ENGRAM IN THE PRESENT ENVIRONMENT.

AXIOM 96—AN ENGRAM IS A *THETA FACSIMILE* OF ATOMS AND MOLECULES IN MISALIGNMENT.

AXIOM 97—ENGRAMS FIX EMOTIONAL RESPONSE AS THAT EMOTIONAL RESPONSE OF THE ORGANISM DURING THE RECEIPT OF THE COUNTER-EFFORT.

AXIOM 98—FREE EMOTIONAL RESPONSE DEPENDS ON OPTIMUM RANDOMITY. IT DEPENDS UPON ABSENCE OF OR NON-RESTITUTION OF ENGRAMS.

AXIOM 99—*THETA FACSIMILES* CAN RECOMBINE INTO NEW SYMBOLS.

AXIOM 100—LANGUAGE IS THE SYMBOLIZATION OF EFFORT.

AXIOM 101—LANGUAGE DEPENDS FOR ITS FORCE UPON THE FORCE WHICH ACCOMPANIED ITS DEFINITION. (Note: Counter-effort, not language, is aberrative.)

AXIOM 102—THE ENVIRONMENT CAN OCCLUDE THE CENTRAL CONTROL OF ANY ORGANISM AND ASSUME CONTROL OF THE MOTOR CONTROLS OF THAT ORGANISM.

(Engram, Restimulation, locks, hypnotism.)

AXIOM 103—INTELLIGENCE DEPENDS ON THE ABILITY TO SELECT ALIGNED OR MIS-ALIGNED DATA FROM AN AREA OF RANDOMITY AND SO DISCOVER A SOLUTION TO REDUCE ALL RANDOMITY IN THAT AREA.

AXIOM 104—PERSISTENCE OBTAINS IN THE ABILITY OF THE MIND TO PUT SOLUTIONS INTO PHYSICAL ACTION TOWARD THE REALIZATION OF GOALS.

AXIOM 105—AN UNKNOWN DATUM CAN PRODUCE DATA OF PLUS OR MINUS RANDOMITY.

AXIOM 106—THE INTRODUCTION OF AN ARBITRARY FACTOR OR FORCE WITHOUT RECOURSE TO NATURAL LAWS OF THE BODY OR THE AREA INTO WHICH THE ARBITRARY IS INTRODUCED BRINGS ABOUT PLUS OR MINUS RANDOMITY.

AXIOM 107—DATA OF PLUS OR MINUS RANDOMITY DEPENDS FOR ITS CONFUSION ON FORMER PLUS OR MINUS RANDOMITY OR ABSENT DATA.

AXIOM 108—EFFORTS WHICH ARE INHIBITED OR COMPELLED BY EXTERIOR EFFORTS EFFECT A PLUS OR MINUS RANDOMITY OF EFFORTS.

AXIOM 109—BEHAVIOR IS MODIFIED BY COUNTER-EFFORTS WHICH HAVE IMPINGED ON THE ORGANISM.

AXIOM 110—THE COMPONENT PARTS OF THETA ARE AFFINITY, REALITY AND COMMUNICATION.

AXIOM 111—SELF-DETERMINISM CONSISTS OF MAXIMAL AFFINITY, REALITY AND COMMUNICATION.

AXIOM 112—AFFINITY IS THE COHESION OF THETA.

Affinity manifests itself as the recognition of similarity of efforts and goals amongst organisms by those organisms.

AXIOM 113—REALITY IS THE AGREEMENT UPON PERCEPTIONS AND DATA IN THE PHYSICAL UNIVERSE.

All that we can be sure is real is that on which we haven agreed is real. Agreement is the essence of reality.

AXIOM 114—COMMUNICATION IS THE INTER CHANGE OF PERCEPTION THROUGH THE MATERIAL UNIVERSE BETWEEN ORGANISMS OR THE PERCEPTION OF THE MATERIAL UNIVERSE BY SENSE CHANNELS.

AXIOM 115—SELF-DETERMINISM IS THE *THETA* CONTROL OF THE ORGANISM.

AXIOM 116—A SELF-DETERMINED EFFORT IS THAT COUNTER-EFFORT WHICH HAS BEEN RECEIVED INTO THE ORGANISM IN THE PAST AND INTEGRATED INTO THE ORGANISM FOR ITS CONSCIOUS USE.

AXIOM 117—THE COMPONENTS OF SELF-DETERMINISM ARE AFFINITY, COMMUNICATION AND REALITY.

Self-determinism is manifested along each dynamic.

AXIOM 118—AN ORGANISM CANNOT BECOME ABERRATED UNLESS IT HAS AGREED UPON THAT ABERRATION, HAS BEEN IN COMMUNICATION WITH A SOURCE OF ABERRATION, AND HAS HAD AFFINITY FOR THE ABERRATOR.

AXIOM 119—AGREEMENT WITH ANY SOURCE, CONTRA OR PRO-SURVIVAL, POSTULATES A NEW REALITY FOR THE ORGANISM.

AXIOM 120—NON-SURVIVAL COURSES, THOUGHTS AND ACTIONS REQUIRE NON-OPTIMUM EFFORT.

AXIOM 121—EVERY THOUGHT HAS BEEN PRECEDED BY PHYSICAL ACTION.

AXIOM 122—THE MIND DOES WITH THOUGHT AS IT HAS DONE WITH ENTITIES IN THE PHYSICAL UNIVERSE.

AXIOM 123—ALL EFFORT CONCERNED WITH PAIN IS CONCERNED WITH LOSS.

Organisms hold pain and engrams to them as a latent effort to Prevent loss of some portion of the organism. All loss is a loss of motion.

AXIOM 124—THE AMOUNT OF COUNTER-EFFORT THE ORGANISM CAN OVERCOME IS PROPORTIONAL TO THE *THETA* ENDOWMENT OF THE ORGANISM, MODIFIED BY THE PHYSIQUE OF THAT ORGANISM.

AXIOM 125—EXCESSIVE COUNTER-EFFORT TO THE EFFORT OF A LIFE ORGANISM PRODUCES UNCONSCIOUSNESS.

COROLLARY: UNCONSCIOUSNESS GIVES THE SUPPRESSION OF AN ORGANISM'S CONTROL CENTER BY COUNTER-EFFORT.

DEFINITION: THE CONTROL CENTER OF THE ORGANISM CAN BE DEFINED AS THE CONTACT POINT BETWEEN *THETA* AND THE PHYSICAL UNIVERSE AND IS THAT CENTER WHICH IS AWARE OF BEING AWARE AND WHICH HAS CHARGE OF AND RESPONSIBILITY FOR THE ORGANISM ALONG ALL ITS DYNAMICS.

AXIOM 126—PERCEPTIONS ARE ALWAYS RECEIVED IN THE CONTROL CENTER OF AN ORGANISM WHETHER THE CONTROL CENTER IS IN CONTROL OF THE ORGANISM AT THE TIME OR NOT.

This is an explanation for the assumption of valences.

AXIOM 127—ALL PERCEPTIONS REACHING THE ORGANISM'S SENSE CHANNELS ARE RECORDED AND STORED BY *THETA FACSIMILE*.

DEFINITION: PERCEPTION IS THE PROCESS OF RECORDING DATA FROM THE PHYSICAL UNIVERSE AND STORING IT AS A *THETA FACSIMILE*.

DEFINITION: RECALL IS THE PROCESS OF REGAINING PERCEPTIONS.

AXIOM ALBANY ORGANISM CAN RECALL EVERYTHING WHICH IT HAS PERCEIVED.

AXIOM 129—AN ORGANISM DISPLACED BY PLUS OR MINUS RANDOMITY IS THERE AFTER REMOTE FROM THE PERCEPTION RECORDING CENTER.

Increased remoteness brings about occlusions of perceptions. One can perceive things in present time and then, because they are being recorded after they passed theta perception of the awareness units they are recorded but cannot be recalled.

AXIOM 130—*THETA FACSIMILES* OF COUNTER EFFORT ARE ALL THAT INTERPOSE BETWEEN THE CONTROL CENTER AND ITS RECALLS.

AXIOM 131— ANY COUNTER-EFFORT RECEIVED INTO A CONTROL CENTER IS ALWAYS ACCOMPANIED BY ALL PERCEPTICS.

AXIOM 132—THE RANDOM COUNTER-EFFORTS TO AN ORGANISM AND THE INTERMINGLED PERCEPTIONS IN THE RANDOMITY CAN RE-EXERT THAT FORCE UPON AN ORGANISM WHEN RESTIMULATED.

DEFINITION: RESTIMULATION IS THE REACTIVATION OF A PAST COUNTER-EFFORT BY APPEARANCE IN THE ORGANISM'S ENVIRONMENT OF A SIMILARITY TOWARD THE CONTENT OF THE PAST RANDOMITY AREA.

AXIOM 133—SELF-DETERMINISM ALONE BRINGS ABOUT THE MECHANISM OF RESTIMULATION.

AXIOM 134—A REACTIVATED AREA OF THE PAST RANDOMITY IMPINGES THE EFFORT AND THE PERCEPTIONS UPON THE ORGANISM.

AXIOM 135—ACTIVATION OF A RANDOMITY AREA IS ACCOMPLISHED FIRST BY THE PERCEPTIONS, THEN BY THE PAIN, FINALLY BY THE EFFORT.

AXIOM 136—THE MIND IS PLASTICALLY CAPABLE OF RECORDING ALL EFFORTS AND COUNTER-EFFORTS.

AXIOM 137—A COUNTER-EFFORT ACCOMPANIED BY SUFFICIENT (ENRANDOMED) FORCE IMPRESSES THE FACSIMILE OF THE COUNTER-EFFORT PERSONALITY INTO THE MIND OF AN ORGANISM.

AXIOM 138—ABERRATION IS THE DEGREE OF RESIDUAL PLUS OR MINUS RANDOMITY ACCUMULATED BY COMPELLING, INHIBITING, OR UNWARRANTED ASSISTING OF EFFORTS ON THE

PART OF OTHER ORGANISMS OR THE PHYSICAL (MATERIAL) UNIVERSE.

Aberration is caused by what is done to the individual, not what the individual does, plus his self-determinism about what has been done to him.

AXIOM 139—ABERRATED BEHAVIOR CONSISTS OF DESTRUCTIVE EFFORT TOWARD PRO-SURVIVAL DATA OR ENTITIES ON ANY DYNAMIC, OR EFFORT TOWARD THE SURVIVAL OF CONTRA SURVIVAL DATA OR ENTITIES FOR ANY DYNAMIC.

AXIOM 140—A VALENCE IS A FACSIMILE PERSONALITY MADE CAPABLE OF FORCE BY THE COUNTER-EFFORT OF THE MOMENT OR RECEIPT INTO THE PLUS OR MINUS RANDOMITY OF UNCONSCIOUSNESS.

Valences are assistive, compulsive or inhibitive to the organism.

A CONTROL CENTER IS NOT A VALENCE.

AXIOM 141—A CONTROL CENTER EFFORT IS ALIGNED TOWARD A GOAL THROUGH DEFINITE SPACE AS A RECOGNIZED INCIDENT IN TIME.

AXIOM 142—AN ORGANISM IS AS HEALTHY AND SANE AS IT IS SELF-DETERMINED.

The environmental control of the organism motor-controls inhibits the organism's ability to change with the changing environment, since the organism will attempt to carry forward with one set of responses when it needs by self-determinism to create another to survive in another environment.

AXIOM 143—ALL LEARNING IS ACCOMPLISHED BY RANDOM EFFORT.

AXIOM 144—A COUNTER-EFFORT PRODUCING SUFFICIENT PLUS OR MINUS RANDOMITY TO RECORD IS RECORDED WITH AN INDEX OF SPACE AND TIME AS HIDDEN AS THE REMAINDER OF ITS CONTENT.

AXIOM 145—A COUNTER-EFFORT PRODUCING SUFFICIENT PLUS OR MINUS RANDOMITY WHEN ACTIVATED BY RESTIMULATION EXERTS ITSELF AGAINST THE ENVIRONMENT OR THE ORGANISM WITHOUT REGARD TO SPACE AND TIME, EXCEPT REACTIVATED PERCEPTIONS.

AXIOM 146—COUNTER-EFFORTS ARE DIRECTED OUT FROM THE ORGANISM UNTIL THEY ARE FURTHER ENRANDOMED BY THE ENVIRON AT WHICH TIME THEY AGAIN ACTIVATE AGAINST THE CONTROL CENTER.

AXIOM 147—AN ORGANISM'S MIND EMPLOYS COUNTER-EFFORTS EFFECTIVELY ONLY SO LONG AS INSUFFICIENT PLUS OR MINUS RANDOMITY EXISTS TO HIDE DIFFERENTIATION OF THE FACSIMILES CREATED.

AXIOM 148—PHYSICAL LAWS ARE LEARNED BY LIFE ENERGY ONLY BY IMPINGEMENT OF THE PHYSICAL UNIVERSE PRODUCING RANDOMITY, AND A WITHDRAWAL FROM THAT IMPINGEMENT.

AXIOM 149—LIFE DEPENDS UPON AN ALIGNMENT OF FORCE VECTORS IN THE DIRECTION OF SURVIVAL AND THE NULLIFICATION OF FORCE VECTORS IN THE DIRECTION OF SUCCUMB IN ORDER TO SURVIVE.

COROLLARY: LIFE DEPENDS UPON AN ALIGNMENT OF FORCE VECTORS IN THE DIRECTION OF SUCCUMB AND THE NULLIFICATION OF FORCE VECTORS IN THE DIRECTION OF SURVIVE IN ORDER TO SUCCUMB.

AXIOM 150—ANY AREA OF RANDOMITY GATHERS TO IT SITUATIONS SIMILAR TO IT WHICH DO NOT CONTAIN ACTUAL EFFORTS BUT ONLY PERCEPTION.

AXIOM 151—WHETHER AN ORGANISM HAS THE GOAL OF SURVIVING OR SUCCUMBING DEPENDS UPON THE AMOUNT PLUS OR MINUS RANDOMITY IT HAS REACTIVATED. (NOT RESIDUAL).

AXIOM 152—SURVIVAL IS ACCOMPLISHED ONLY BY MOTION.

AXIOM 153—IN THE PHYSICAL UNIVERSE THE ABSENCE OF MOTION IS VANISHMENT.

AXIOM 154—DEATH IS THE EQUIVALENT TO LIFE OF TOTAL LACK OF LIFE-MOTIVATED MOTION.

AXIOM 155—ACQUISITION OF PRO-SURVIVAL MATTER AND ENERGY OR ORGANISMS IN SPACE AND TIME MEANS INCREASED MOTION.

AXIOM 156—LOSS OF PRO-SURVIVAL MATTER AND ENERGY OR ORGANISMS IN SPACE AND TIME MEANS DECREASED MOTION.

AXIOM 157—ACQUISITION OR PROXIMITY OF MATTER, ENERGY OR ORGANISMS WHICH ASSIST THE SURVIVAL OF AN ORGANISM INCREASE THE SURVIVAL POTENTIALS OF AN ORGANISM.

AXIOM 158—ACQUISITION OR PROXIMITY OF MATTER, ENERGY OR ORGANISMS WHICH INHIBIT THE SURVIVAL OF AN ORGANISM DECREASE ITS SURVIVAL POTENTIAL.

AXIOM 159—GAIN OF SURVIVAL ENERGY, MATTER OR ORGANISMS INCREASES THE FREEDOM OF AN ORGANISM.

AXIOM 160—RECEIPT OR PROXIMITY OF NONSURVIVAL ENERGY, MATTER OR TIME DECREASES THE FREEDOM OF MOTION OF AN ORGANISM.

AXIOM 161—THE CONTROL CENTER ATTEMPTS THE HALTING OR LENGTHENING OF TIME, THE EXPANSION OR CONTRACTION OF SPACE AND THE DECREASE OR INCREASE OF ENERGY AND MATTER.

This is a primary source of invalidation, and it is also a primary source of aberration.

AXIOM 162—PAIN IS THE BALK OF EFFORT BY COUNTER-EFFORT IN GREAT INTENSITY, WHETHER THAT EFFORT IS TO REMAIN AT REST OR IN MOTION.

AXIOM 163—PERCEPTION, INCLUDING PAIN, CAN BE EXHAUSTED FROM AN AREA OF PLUS OR MINUS RANDOMITY, STILL LEAVING THE EFFORT AND COUNTER-EFFORT OF THAT PLUS OR MINUS RANDOMITY.

AXIOM 164—THE RATIONALITY OF THE MIND DEPENDS UPON AN OPTIMUM REACTION TOWARD TIME.

DEFINITION: SANITY, THE COMPUTATION OF FUTURES.

DEFINITION: NEUROTIC, THE COMPUTATION OF PRESENT TIME ONLY.

DEFINITION: PSYCHOTIC, COMPUTATION ONLY OF PAST SITUATIONS.

AXIOM 165—SURVIVAL PERTAINS ONLY TO THE FUTURE.

COROLLARY: SUCCUMB PERTAINS ONLY TO THE PRESENT AND PAST.

AXIOM 166—AN INDIVIDUAL IS AS HAPPY AS HE CAN PERCEIVE SURVIVAL POTENTIALS IN THE FUTURE.

AXIOM 167—AS THE NEEDS OF ANY ORGANISM ARE MET IT RISES HIGHER AND HIGHER IN ITS EFFORTS ALONG THE DYNAMICS.

An organism which achieves ARC with itself can better achieve ARC with sex in the future; having achieved this it can achieve ARC with groups; having achieved this, it can achieve ARC with mankind, etc.

AXIOM 168—AFFINITY, REALITY AND COMMUNICATION CO-EXIST IN AN INEXTRICABLE RELATIONSHIP.

The co-existent relationship between affinity, reality and communication is such that none can be increased without increasing the other two and none can be decreased without decreasing the other two.

AXIOM 169—ANY AESTHETIC PRODUCT IS A SYMBOLIC FACSIMILE OR COMBINATION OF FACSIMILES OF *THETA* OR PHYSICAL UNIVERSES IN VARIED RANDOMITIES AND VOLUMES OF RANDOMITIES WITH THE INTERPLAY OF TONES.

AXIOM 170—AN AESTHETIC PRODUCT IS AN INTERPRETATION OF THE UNIVERSES BY AN INDIVIDUAL OR GROUP MIND.

AXIOM 171—DELUSION IS THE POSTULATION BY THE IMAGINATION OF OCCURRENCES IN AREAS OF PLUS OR MINUS RANDOMITY.

AXIOM 172—DREAMS ARE THE IMAGINATIVE RECONSTRUCTION OF AREAS OF RANDOMITY OR THE RE-SYMBOLIZATION OF THE EFFORTS OF *THETA*.

AXIOM 173--A MOTION IS CREATED BY THE DEGREE OF OPTIMUM RANDOMITY INTRODUCED BY THE COUNTER-EFFORT TO AN ORGANISM'S EFFORT.

AXIOM 174—*MEST* WHICH HAS BEEN MOBILIZED BY LIFE FORMS IS IN MORE AFFINITY WITH LIFE ORGANISMS THAN NON-MOBILIZED *MEST*.

AXIOM 175—ALL PAST PERCEPTION, CONCLUSION AND EXISTENCE MOMENTS, INCLUDING THOSE OF PLUS OR MINUS RANDOMITY, ARE RECOVERABLE TO THE CONTROL CENTER OF THE ORGANISM.

AXIOM 176—THE ABILITY TO PRODUCE SURVIVAL EFFORT ON THE PART OF AN ORGANISM IS AFFECTED BY THE DEGREES OF RANDOMITY EXISTING IN ITS PAST. (This includes learning.)

AXIOM 177—AREAS OF PAST PLUS OR MINUS RANDOMITY CAN BE READDRESSSED BY THE CONTROL CENTER OF AN ORGANISM AND THE PLUS OR MINUS RANDOMITY EXHAUSTED.

AXIOM 178—THE EXHAUSTION OF PAST PLUS OR MINUS RANDOMITIES PERMITS THE CONTROL CENTER OF AN ORGANISM TO EFFECT ITS OWN EFFORTS TOWARD SURVIVAL GOALS.

AXIOM 179—THE EXHAUSTION OF SELF-DETERMINED EFFORT FROM A PAST AREA OF PLUS OR MINUS RANDOMITY NULLIFIES THE EFFECTIVENESS OF THAT AREA.

AXIOM 180—PAIN IS THE RANDOMITY PRODUCED BY SUDDEN OR STRONG COUNTER EFFORTS.

AXIOM 181—PAIN IS STORED AS PLUS OR MINUS RANDOMITY.

AXIOM 182—PAIN, AS AN AREA OF PLUS OR MINUS RANDOMITY, CAN RE-INFLICT ITSELF UPON THE ORGANISM.

AXIOM 183—PAST PAIN BECOMES INEFFECTIVE UPON THE ORGANISM WHEN THE RANDOMITY OF ITS AREA IS ADDRESSED AND ALIGNED.

AXIOM 184—THE EARLIER THE AREA OF PLUS OR MINUS RANDOMITY, THE GREATER SELF PRODUCED EFFORT EXISTED TO REPEL IT.

AXIOM 185—LATER AREAS OF PLUS OR MINUS RANDOMITY CANNOT BE: RE-ALIGNED EASILY UNTIL EARLIER AREAS ARE RE-ALIGNED.

AXIOM 186—AREAS OF PLUS OR MINUS RANDOMITY BECOME INCREASED IN ACTIVITY WHEN PERCEPTIONS OF SIMILARITY ARE INTRODUCED INTO THEM.

AXIOM 187—PAST AREAS OF PLUS OR MINUS RANDOMITY CAN BE REDUCED AND ALIGNED BY ADDRESS TO THEM IN PRESENT TIME.

AXIOM 188—ABSOLUTE GOOD AND ABSOLUTE EVIL DO NOT EXIST IN THE *MEST* UNIVERSE.

AXIOM 189—THAT WHICH IS GOOD FOR AN ORGANISM MAY BE DEFINED AS THAT WHICH PROMOTES THE SURVIVAL OF THAT ORGANISM.

COROLLARY: EVIL MAY BE DEFINED AS THAT WHICH INHIBITS OR BRINGS PLUS OR MINUS RANDOMITY INTO THE ORGANISM, WHICH IS CONTRARY TO THE SURVIVAL MOTIVES OF THE ORGANISM.

AXIOM 190—HAPPINESS CONSISTS IN THE ACT OF BRINGING ALIGNMENT INTO HITHER TO RESISTING PLUS OR MINUS RANDOMITY. NEITHER THE ACT OR ACTION OF ATTAINING SURVIVAL, NOR THE ACCOMPLISHMENT OF THIS ACT ITSELF, BRINGS ABOUT HAPPINESS.

AXIOM 191—CONSTRUCTION IS AN ALIGNMENT OF DATA.

COROLLARY: DESTRUCTION IS A PLUS OR MINUS RANDOMITY OF DATA.

The effort of construction is the alignment toward the survival of the aligning organism. Destruction is the effort of bringing randomness into an area.

AXIOM 192—OPTIMUM SURVIVAL BEHAVIOR CONSISTS OF EFFORT IN THE MAXIMUM SURVIVAL INTEREST IN EVERYTHING CONCERNED IN THE DYNAMICS.

AXIOM 193—THE OPTIMUM SURVIVAL SOLUTION OF ANY PROBLEM WOULD CONSIST OF THE HIGHEST ATTAINABLE SURVIVAL FOR EVERY DYNAMIC CONCERNED.

AXIOM 194—THE WORTH OF ANY ORGANISM CONSISTS OF ITS VALUE TO THE SURVIVAL OF ITS OWN *THETA* ALONG ANY DYNAMIC.

NOTE Although this chart is written in static terms, it is dynamic and is in any dynamic.

5203C03 HCL-1 Introduction to Scientology: Milestone One Wichita HPC-1

“Science” has gotten to the point where it is just a study of piles of data. It has drawn away from being a body of knowledge and consists now of unevaluated facts. The “natural history” of science is:

1. A push out into the unknown.
2. Collecting data.
3. Align data around a few theories.
4. At the end, it becomes stultified. It is capable of producing an effect in the physical universe, but that’s about all.

Dianetics was mainly interested in aberration. It was not intended to be all-embracing. Scientology is a study of knowledge, not therapy. However, we must now get back into the mind again. Although the goal is not a therapy, how can you teach knowledge to an imperfect computer?

The mind would come close to perfection except for certain things which prevent perfection. The mind can know without letting itself know. The task of the processor is to get better working methods for others, then let them help him. The blind leading the blind, however, may fail when the blind are too blind. Therefore, scientology could only be applied by the very sane; it is concerned with the able. Sanity is an absolute perfection in reason that would resolve problems to the optimum good of all those concerned. Absolutes are not obtainable. Even if you were absolutely sane, you would still lack data. Milestone 1 is complete ability. This is a necessary condition to handling the world. Rehabilitation of the insane will be accomplished as an automatic spin-off from self-improvement and improving the able.

Scientology could be defined as knowledge and its application in conquering the physical universe.

The iron cover is off what we already know; we have the complete anatomy of the iron cover: Fac One. Everything else is a lock. You can start any processes off this first engram, using the E-meter. We have a very careful map of Target One. It is booby-trapped, but when you know the booby trap, you can walk right through it.

Scientology is exact; there are no maybe’s up to the point of thought creating physical motion.

There is very little self-determinism up to the point of milestone one. When you do get there you will be free of LRH and scientology too. Even what we call a clear is not there yet.

When you have arguments with yourself, you have different personalities in yourself arguing. These may exist in different areas, e.g. the stomach area. Anyone will show up on the meter as having at least three different personalities. If you see two arguing, there is a third which is kind of noble; it’s adjudicating or it’s sound asleep. Then there may be a fourth one. These are circuits, but they are personalities; they are always in the same place in the same people. If you shift from the left side to the right to the center, you get a somatic in the center of the forehead. Could this be the third eye? You as an individual? An engram? The proper thing to do is to run it. The point is to become one person. You have to run this thing before you can be you. It was done by supersonic waves. The engram thus created says not to know.

A basic problem with anyone’s understanding of scientology is not knowing the words. A word is just a code. The semanticists ran off the road by saying that there was such a thing as an undefinable. This is not the case in the realm of the knowable.

5203C03 HCL-2 Introduction to Scientology: Outline of Therapy HPC-2

Use light tech to get to a heavy incident, then run it out using thought, emotion, and effort processing. The goal is to be able to run Fac One.

The mind is an entity. So is the physical universe. Thought is beingness. It has no wavelength; it is a true static. There is no limit of capacity; no limit of time. It can record the physical universe and use it against itself. It can animate and control the physical universe. It is not in the physical universe since it has not the properties of the physical universe. It is like a mirror in which a room is reflected: there is no real room there. Thought can pick up energy and matter in space and time and mobilize it. Thought takes the laws it has learned and turns it against the physical universe, like a mirror. The brain is to translate thought into action. The mind looks at this. The brain does not contain purpose. Thus the mind is necessary. It stores past recordings of the physical universe. It is the purpose or beingness that can exist without a body to handle the physical universe. It is hard to accomplish things in the physical universe without a body. The mind stores pictures of energy. It can project an image into the physical universe and cause an effect. Pictures have effort in them in addition to perceptions. The mind continuously makes conclusions from old pictures to estimate the future, according to its purposes. It tells answers and puts them into action. It also stores conclusions -- another bundle of old pictures. On top of this is the purpose and beingness of the person that is making him do this.

Steps the mind takes:

1. It has a thought to be.
2. Takes pictures.
3. Combines these.
4. Records efforts.
5. It takes pieces of the physical universe and combines these to make a body.
6. The body can then do things in the physical universe.

The mind's purposes:

1. to be
2. to conquer the physical universe.

Thus we have three echelons:

1. The physical universe
2. Thought
3. Who told you to survive?

The physical universe is characterized by motion, which is matter changing in space, this being the definition of time. This gives you MEST. Physics has a problem with a circular definition of space and time, in that these are defined against each other. Physics' view of the universe is that it consists mainly of motion. This is an incomplete view.

Thought is a static of unlimited capabilities that has no wavelength, no space or time. It is impinged upon a physical universe that has matter, energy, space, and time. The mission of thought is survival in the physical universe, and in order to do this, it is effecting a conquest of

the physical universe. Mysticism is in the second echelon. The fundamental of physics is not complex, but the use of it can be complex. Similarly with the human mind. The mind is neither in nor out of the MEST universe. At any rate, it is not in the physical universe. The mind has an effect on the body: one reason the body is sub-optimal is because of the mind's considerations about it. The E-meter, while it does not measure the mind, measures the physiological effect of the mind's operation.

The third echelon is anything and everything that might lie north of the above. It would answer the question, "Who told you to survive? You get into questions like, "Why is nothing nothing? If nothing is nothing, then it's motion."

In handling these echelons, one must go on a gradient, getting to the top of one problem before starting on the next one. We must finish one before two and two before we get into three. People effectively commit suicide by starting on echelon three from the bottom of one. You have to handle your aberrations first; otherwise you lose your marbles.

In Scientology, we try to find an effective way to handle facsimiles and memory. You can eliminate them or you can file them accurately. A truly self-determined person is unlikely to be affected by facsimiles. In fact, only one incident was strong enough to do this: Fac One. A person is as sane as he can handle memories and plan for the future.

FOREWORD

This is a cold-blooded and factual account of your last sixty trillion years.

The test of any knowledge is its usefulness. Does it make one happier or more able? By it and with it, can he better achieve his goals ?

This is useful knowledge. With it the bond again see, the lame walk, the ill recover, the insane become sane and the sane become saner. By its use the thousand abilities Man has sought to recover become his once more.

Like all useful knowledge it was hardly won. I began search into the back track of Mankind some years ago. There was no actual knowledge of it in existence. There were numberless superstitions, countless guesses, as many theories in favour of one thing as in favour of another. People believed, some of them, that Man had lived before. They had no proof. Others believed that Man was born innocent and died and went to a place called Hell. Most believed that when you had lived once, that was all, fellow.

Such a number of conflicting theories must have truth in them. It became my business to discover, against considerable odds, that truth.

In the first place, there was something wrong with Man. An animal such as a cat, even a reptile, a lizard, had habit patterns which carried him through his early days. Not Man. Why not? As usual, a lot of vagueness answered this. The very schools of 'thought' that said Man was just another animal bogged utterly on why it was that babies, the young of this very intelligent animal, are much more stupid than kittens. That was only one thing wrong with Man that wasn't explained .

The further one investigated, the more one came to understand that here, in this creature Homo Sapiens, were entirely too many unknowns. People who suddenly, out of no observable training, begin to speak foreign tongues, men who 'seem to remember having been here before,' strange yearnings in people for various parts of the country or the world or the stars of which they have no actual knowledge, such things are routine puzzles.

And there was a much more important thing at work than mere curiosity. Now and then, in my auditing, I would discover a case which would be extremely reluctant to recover and then would recover only partially so long as I used data from the current lifetime of the preclear; but as soon as I used the whole span of the time track— about sixty trillion years—I could obtain immediate response.

One must be very impartial, even brutal, in investigation. The last series of cases I audited, twenty in number, chosen at random from various life strata and suffering from mental and physical ills which were extremely varied, were audited to demonstrate finally to myself one thing only—Can an auditor obtain a swift recovery by auditing the current lifetime only? I used the most modern of techniques— 1952—and did a standard auditing address to the current lifetime of each one. I obtained mediocre results, partial recoveries, slight betterment in attitude. Then I audited each case addressing only past track, prior to this lifetime: the results were swift and spectacular. Thus I validated, for myself, the reality that in auditing the whole track, one can obtain excellent results, that in auditing the current lifetime, one can obtain slow and mediocre results. From this series came this conclusion: **THE AUDITOR WHO INSISTS ON AUDITING THE CURRENT LIFETIME ONLY WHEN HE HAS THE WHOLE TRACK TECHNIQUE AVAILABLE, IS WASTING TIME AND EFFORT AND IS, IN FACT, SWINDLING HIS PRECLEAR.**

I announced "whole track" techniques to a large number of auditors. I found the better auditors quite willing to use them, and these immediately began to obtain "miracle level" results. A very few held back, were very cautious, would not employ the whole track, clung to

this lifetime, invalidated the E-meter, invalidated what they erroneously called “past lives”, were scathingly critical of my employing such data. So I investigated the auditors.

Several of these were given sessions by me. I found several noteworthy similarities about them: they were so low in tone it was almost impossible to get them to register on an old style Mathison, their cases were utterly bogged, they generally made a practice of refusing any auditing, their general record with preclears was very poor, their own lives were running badly, they not only fought “past lives” as they called “whole track,” but they fought any technique evolved since the summer of 1950 or used later techniques poorly, they would not run any overt acts even in this lifetime, they needed, so far as their cases were concerned, the most careful auditing. I found two people not auditors, who objected violently to “past lives” and who were “wide-open” cases. Both were in the inaccessible band, both had unsavoury social records, both protested being audited in any incident of any kind. I concluded, therefore, that the relatively sane are capable of accepting evidence and the insane are not.

Occasionally people have told me that I should not release the data contained in this volume because there would be a repercussion throughout the country which would ruin Dianetics forever. Oddly enough, I’ve been unable to discover this repercussion. I have found people alert and friendly toward this data. “Whole track” is evidently much more acceptable than the idea of a prenatal. And witness a recent READER’S DIGEST, even the medical profession is accepting prenatals.

Further, it is very hard to argue with a miracle. Today, Eleanor has arthritis. She is audited “whole track” with 1952 techniques. Tonight she doesn’t have arthritis. Miracles, using “whole track” are plentiful. By using this data an auditor can obtain a MEST clear rather easily.

But the best argument which can be advanced for “whole track” is that it is factual. By using this knowledge, more is obtained than auditing results. A preclear suddenly recovers the ability carefully learned eighty years ago, to play a piano; an electronics engineer, doing poorly before suddenly wraps up formulae that would puzzle Einstein and which may get man off Earth; and a thousand details in a hundred sciences become clear.

The search of this track began some years ago and was conducted sporadically on many preclears. Various instruments such as the electroencephalograph and the police lie-detector, were used to further this search, but these were inadequate and limited for my purposes. Finally, Volney Mathison applied his electronic genius to the problem and invented the Electropsychometer. This instrument had a range and ability greatly in excess of anything before known; it compares to itself only in the field of physioelectrical mensuration and to existing devices as the electronic microscope compares to looking through a quartz stone. As soon as this instrument was turned loose on the problem, the problem ceased to exist. By adding up and checking probabilities on scores of persons, the character, extent and content of the whole track was mapped.

Once the E-meter gave reliable data, the main problem became the estimation of intentions, of sources, of the reasons behind the reasons. Most of this work has been done.

It comments poorly on Man’s dullness that this project was impeded and slowed greatly by lack of funds and by very active efforts on the part of some to acquire and own the copyrights of Dianetics— may the ill of the world forgive them. Thus the map is not as complete in this issue as it might be.

This work is honest research, done with considerable care. And it will bear up under survey by any competent auditor or investigator. The most amusing aspect of the “whole track” is that this work bears up under the onslaught of police lie-detector experts: these, hard-eyed and uncompromising, become startled half out of their wits to discover that some of the crimes they find on their machines were committed two or three “lives” ago by the criminal under test, and that, most alarmingly, the crimes so discovered are discoverable again to the last detail in the police archives. This is very upsetting to these operators, to be informed so bluntly that

Man lives many years, not three score and ten, and that today's lifer may again be on their hands tomorrow as a juvenile delinquent !

Gravestones, ancient vital statistics, old diplomas and medals will verify in every detail the validity of "many lifetimes." Your E-meter will tell you.

L. RON HUBBARD,

1951.

CHAPTER ONE

There are two general problems in processing preclears. The first is HOW to audit, the second is WHAT to audit. The present volume presupposes that the skill necessary to the First problem has been mastered: and there is good reason why this should be the case. For the present techniques of Dianetics are far from difficult. SCIENTOLOGY 8-8008 to all patents and purposes. putting the finishing touches on the knowledge necessary to handle thought.

A study of HOW to audit embraces thought, emotion and effort. counter-thought, counter-emotion and counter-effort, and three actions of energy, the behaviour of attention units, the anatomy of maybe and a general knowledge of the background of Dianetics. Elementary group courses exist which, coupled with book study and, if possible study with a college associate, give one all the insight and skill necessary to accomplish results.

WHAT to audit is covered in some degree in other literature such as THE SCIENCE OF SURVIVAL and the first volume of Dianetics: DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH, as well as ADVANCED PROCEDURE AND AXIOMS. The current work is, however, the first coverage of all categories. It is written to be used in connection with ELECTROPSYCHOMETRIC AUDITING and the INDIVIDUAL TRACK MAP, companion pieces of this present volume.

There are four general fields of incidents. four areas of past. embraced in this work. These are:

1. Present life, from pre-conception to present time;
2. The genetic line, being the evolutionary chain on Earth;
3. Large, specialised segments of the whole track;
4. The theta body line or "whole track".

Of the four only the last is actually capable of producing the clear with any rapidity. However, the auditor should be familiar with all these lines. They are taken, one by one in the above order in this volume.

All incidents in this volume should be detected and audited with the assistance of an E-meter. If it were not for the E-meter these incidents would have remained undetected except in the haziest state. Without an E-meter, they cannot be audited with security or even safety for the preclear

How to audit and What to audit together deserve considerable study. Certainly they deserve more study than one would give American history or English or arithmetic, for they deliver a greater dividend to the individual.

Studying these incidents may be discovered to be restimulative to the student. If so, he would find auditing them as restimulative. However, such restimulation is very easily resolved and, unless he feels close to the end of tolerance, he should not be shy of auditing or studying the track.

In SCIENTOLOGY 8-8008, we have seen that creative processing is far superior to any other type of processing. Creative processing does not address the facsimiles as such, it breaks agreement on the power of the facsimiles. In order to audit a preclear however, one should have a very good acquaintance with what the facsimiles contain. If he has this information, it is relatively simple for him to give the preclear "mockups" which approximate the material in facsimiles without telling the preclear why such mock-ups are being given to him; the facsimiles yet will themselves desensitize. The mock-ups should be parallel to the

incidents which are given here, but should not be close enough to bring the preclear into the actual incident. For instance, in the matter of "FAC 1," the preclear should be made to handle black boxes, cameras, things with handles on them and should handle them in any environment he chooses, but not the environment of FAC 1 itself. All the various conditions of FAC 1 can be approximated, preferably very widely until the preclear is no longer interested. In the matter of "FAC 1," the auditor will find that, as soon as the preclear is given a black box on a tripod to handle, he may have a tendency to set it on a throne and have large numbers of people bow to it, or have the contraption he has mocked-up chasing him. Do not in any case let him get an actual FAC 1 "coffee-grinder". This will become clearer as one audits. If the auditor knows of the existence of these incidents, and if he finds them in the preclear with an E-meter assessment, then he should use some solid geometry parallel of the material in the actual incident, such as a light bulb for a thetan, etc.

The auditor will soon find that he can tell at a glance in many cases what incidents his preclear is sitting in. This requires experience. For instance, people who wear thick horn-rimmed glasses and are thin are generally in the monitor valence of FAC 1 and will flip into the incident with great suddenness if it is even closely approached; as FAC 1 accounts for Tuberculosis in most cases, it will be seen, then, that this creative processing of whole-track incidents is of considerable value. The auditor should not, however, run the actual incident, but should study SCIENTOLOGY 8-8008 to discover how to approximate the incident with mock-ups.

CHAPTER TWO

SEVERAL TARGETS PRESENT THEMSELVES IN A CASE and any one of them can be audited with some profit.

The complexity of the problem of human behaviour was a complexity of factors. not an unresolvable mass of twine. Once these factors are each one known and identified. very little trouble is experienced .

THOUGHT, EMOTION EFFORT, COUNTER-THOUGHT, COUNTER-EMOTION, COUNTER-EFFORT, motivator ATTENTION UNITS, overt ATTENTION UNITS, ded ATTENTION UNITS and their manifestation on the various tone scale charts are the sum and total of factors to be audited out of any one target. Each and every auditing target contains these factors, is audited in the same way has the same basic behaviour pattern and succumbs to such auditing It does not matter what target one is addressing in a case he will not discover wild or unexplained manifestations in HOW he audits that target. Each one in short, is made up of the same woof and warp. Each one is basically theta. Theta behaves and manifests in a constant manner, no matter what form it takes. Thus the auditor should quiet any apprehension he has that something he is auditing is behaving differently than a standard item. Variables, so far as has been discovered do not exist in theta since the discoveries of Dianetics.

There are several targets for the auditor. If he understands thoroughly what they are, his chances of mistaking one kind of incident for another are much reduced. They are in their order of magnitude, not their importance.

CELLULAR INJURIES comprise the first target. A cell is a living animal all by itself. The most necessary auditing on CELLULAR INJURIES is the emergency assist wherein the auditor repairs an accident, a burn, an incident which has just occurred. The auditor will find that, in auditing a cellular injury which has just occurred, the somatics are very sharp and far more painful than when auditing a standard facsimile. CELLULAR INJURIES are audited no differently than any other kind of incident. However, it must be remarked that individual cells have "past lives", the easiest manifestation of past lives to check. An auditor can follow a particular cell throughout its own generations within the body and, as part of the evolutionary line, discover many injuries to it. Further, in going back on the evolutionary line and auditing an injury to a single cell, the future positions of that cell are easily located in the body from there to the present, for the future injuries blow off like small sparks of pahl when the basic injury is released. The migrations of a single cell throughout the body are very ease to track in this fashion and ordinarily check against standard suppositions in the field of physical biology. The pulp of a tooth, for instance, tracks back, cell by cell, to early engrams; when these are relieved a "toothache" in that tooth becomes almost impossible, no matter how many "nerves" are exposed, a matter which brings about quite a revolution he dentistry. CELLULAR INJURIES do not require any special kind of auditing and they comprise no special kind of injury nor are there psycho-somatics which demand that the cells alone be audited.

GENETIC ENTITY, the "GE", is the second area of address. This is the entity which carries forward from the earliest formation of the MEST body. It is this entity which has the "genetic line" engrams. It is located more or less in the centre of the body the stomach but it is actually a composite of all the cellular experience on the line. It has the manifestation of a single identity. It was formerly referred to as the SOMATIC MIND (see DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH). Out of all the past experience of the MEST body it makes up a form, a working carbon-oxygen engine. It has no real personality it is not the "I" of the body. It has a record in many cases, of the entire experience forward until the last life. The GE has the record of past deaths. Auditing it alters physical structure, eradicates physical malformations. But these can be otherwise changed by auditing the theta being. The GE facsimiles include a transfer of somatics from past theta beings, for it is not common for a GE to have the same theta being twice. The GE is the constant and continual workhorse of the theta body. It regulates the heartbeat, takes care of all such responses, acts as a

stimulus-response mind to avoid pain and discover pleasure and keeps the body running in general. A GE departs from the body much later than the theta beings abandon one, sees it through the death to the end and only then leaves to join the line once more some two or three days before conception. This is the “mind” of an animal, a dog or a cat or a cow.

INJECTED ENTITIES are the third class of target. These are actually synthetics. They are ridges that “think”. They form a very complex pattern. They have geographical areas in the body. These areas are standard, preclear to preclear. These areas answer up on an E-meter like actual minds rather than compartments of a mind. The areas are the CENTRE (forehead and down), the RIGHT INSIDE (from the edge of the jaw halfway out to the shoulder), the RIGHT OUTSIDE (from halfway to the shoulder to the point of the shoulder) the LEFT INSIDE (opposite from the right inside), the LEFT INSIDE (opposite from the right inside), the LEFT OUTSIDE (opposite from the right outside), the STOMACH ENTITY (located in the area of the solar plexus), plus various other entities held in by these basic entities. These entities run off their own past deaths, on other tracks, hold sections of the body paralysed, bar areas from being audited, withhold information from “I” and do other mischief. They are actually the basis of “demon circuits” (as covered in DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH) and they mirror the personality of persons antipathetic to the preclear. They are entirely stimulus-response. Each one has, from preclear to preclear, the same personality in the same body position. The RIGHT INSIDE, for instance, answers up to the name of “crew chief”. They are male and female. Their source is probably a “softened-up” theta being and they disappear when electronic incidents are audited. Prior to their disappearance, they can exhibit a wonderful and awesome role in confusing the preclear. The auditor can move the attention of the preclear into one of these and audit it through a death or painful experience and so bring it up to present time. In view of the fact that auditing basic electronic incidents eradicates them, little attention need be paid to them by the auditor beyond knowing that they are there, that they are the “mysterious voices” in the heads of some preclears, that they make critical or commanding remarks to him and serve, in general, as a fine source of aberration. Paralysis, anxiety stomachs, arthritis and many ills and aberrations have been relieved by auditing them. An E-meter shows them up and makes them confess their misdeeds. They are probably just compartments of the mind which, cut off, begin to act as though they were persons. Here is an inexhaustible source of study and speculation which I leave to another, having located the method of wiping them out without paying any attention to them.

THETA BEINGS are the fourth and only really important target for the auditor. The theta being is the “I”, it is WHO the preclear is. If all the entities and beingnesses of the preclear were hydrogen balloons locked up inside him and each had a name and identity, the auditor might be confused and the preclear IS confused as to who “I” is. But if the preclear were suddenly opened and the balloons let loose, the “I” balloon would float free clear and unmistakable and that “I” balloon would be the theta being, it would be who the preclear always thought he was anyway. All others are simply modifiers. The theta being does not get lost. It does not go away, it cannot be stolen. If it went away, the preclear would be with it and be it. The vagueness of personal identity is caused by the confusion of the theta being, not its “inextricable” tanglement with other identities.

The theta being can be confused in itself, it can be hypnotised, it can go to sleep. It can experience emotions. It can think. It can feel pain. It is immortal in that it cannot die—but it could possibly become so burdened with facsimiles that it could not continue along with bodies. It does not need a body to think, make facsimiles, experience emotions, remember or perceive.

The theta being seems natively capable of producing considerable MEST energy. Facsimiles alone inhibit this ability. Whereas it has come to feel, in association with the bad company of genetic entities and the MEST universe, that it is a stimulus-response thing, it is quite capable of generating thought independently of previous effort, counter effort or experience.

The preclear is not guarding or harbouring or hiding his theta being— he IS his theta being. A relaxed understanding of this will prevent a considerable confusion on the part of the auditor and preclear. If the preclear is responding rationally, he is the theta being responding.

As the theta being can be “put to sleep”, it is possible to bring then to the surface a GE or another entity which using the motor controls of the body, can talk or experience. But the individual himself is not usually aware of what happened then. The various strange multi-personality manifestations of the mind are occasioned by valences and their basics, the entities; ordinarily, unless the preclear is obviously insane, these sub-personalities are not distinctly units in themselves but only colour the activities of the theta being.

Hypnotism is the process of bringing into being the GE or other entity by putting the theta being into unconsciousness. Self hypnosis is the process of the theta being hypnotizing GE or other entity and setting up a compulsive or inhibitive circuit with it.

The auditor must know that the existence of a MEST body within the fields of the theta being is incidental and even unfortunate processing which, in the absence of a body, goes much faster.

The theta being is both outside and inside the MEST body. It is not just inside. The only reason it is inside at all is that any field would penetrate the MEST body. The MEST body should not be thought of as a harbour or vessel for the theta being. A better example would be a sliver inserted unwantedly in the thumb where the thumb would be the Theta being, the MEST body the sliver. MEST bodies are good identification tags, they generate exuding emotions, they are fun to operate at times, but they are no end of existence.

A theta being with its alertness restored is capable of remoulding the human bods within its field, taking off weight here, restoring it there, changing appearance and even height. The body can also be altered by auditing cells or the GE. All in all, bodies are very easy to handle where their condition is concerned. The question is rather, are they practical? The theta being can evidently manufacture bodies or a reasonable facsimile thereof which, while they do not labour, neither do they have to be fed.

To a society quite mad on the subject of MEST bodies, very aberrated on “care of the body”, the foregoing may seem a trifle strange and one might think the writer had, to be short, slipped a cable or two he his wits. Indeed, it is very probable that critics may say so. For their reality is entirely outraged by such sudden statements. But this matter has been under investigation for a year and a half as witness “THETA CLEAR” on the SCIENCE OF SURVIVAL tone-scale chart which I drew in January 1951. It states that the capabilities of a theta clear were unknown. Now they are not so unknown and while there is much to learn about them still, much can be stated concerning them as clear fact. Back of these statements is a two year public record of making statements which, under gruelling investigation by others, turn out to be exactly what they were said to be. Before turning away from the above, try SCIENTOLOGY 8-8008 and learn again what it is to be truly FREE. An hours auditing will prove it.

CHAPTER THREE

THE PRESENT LIFE is always of considerable interest to the preclear.

In the first place, he is continuing to live in the environment and society, usually, in which he is being audited. He must still face situations which the auditor will discover. The *dramatis personae* of this period is, to some extent, still living or their artifacts are yet in plain view.

In the second place, the preclear is still connected to these incidents by the identifying label of his present life name and he is continually called by this label and has it confused with himself.

In the third place, these facsimiles have not been invalidated by the shock of a death and the “helpful hands” of the “between lives” crew and so are normally visible.

Fourthly, in this life we have the combination of the current GENETIC BEING and the current THETA BEING and their struggle to even the harsh roadway of living and their divergence of goals.

Present life or any life that comes to view should be to some extent, cleared up for the preclear. Lives are, to some degree, units in themselves. This is caused by the fact that each life while the preclear has been “with body” is lived with a different basic team: the GENETIC BEING carries on through the evolutionary line, parallel with the protoplasmic line, generation to generation, usually on the same planet—in this case, EARTH. The THETA BEING comes into the line from various quarters and each time usually enters an entirely different GE line. Any one life then, is lived with a different GE. The preclear is always and always was and always will be the THETA BEING. But the THETA BEING has, life to life, a different GE. The character and quality of the MEST body then is different in each lifetime, the past of the MEST body in each lifetime is different from the viewpoint of the theta being. Thus the theta being has variation of experience which is not always, life to life, the same pattern. Thus when lives come to view they should be explored and audited as above, a few hours spent in this can materially assist a recovery.

The PRESENT LIFE is important out of proportion to the small fraction of total age of the theta being; the auditor will find himself, in most cases, compelled to spend many hours upon it. But he should-not audit any heavy incidents in the present lifetime. These have basics which reduce much more swiftly, and these basics are always earlier by many ages.

The time spent on the present life earlier in Dianetics was very great. It required scores or hundreds of hours of auditing to achieve optimum results, and then only with great cunning could the auditor achieve his goal. Swifter techniques made present life much easier to audit, cut down the time required and increased the results, but the same results can be achieved much more swiftly with much less skill and cunning when one audits WHOLE TRACK, meaning the track of the theta being.

Just as “medical science” has accepted PRENATAL EXPERIENCE according to their best heralds, the popular magazines such as CORONET and READER’S DIGEST, prenatsals fade into the obscurity of *curiosa* in Dianetics. Great as the results were which occurred when one audited prenatsals, results in the same time are now so incomparably greater in auditing the whole track or even in using TECHNIQUE 80, that one need know very little about prenatsals. In the first place, it has been discovered that prenatsals happen to the GE, not the theta being. These recordings are so phonograph-record-like because they are wholly in the somatic mind (the GE). They deeply affect the current MEST body structure in many ways but this structure can be otherwise repaired.

The GENETIC ENTITY apparently enters the protoplasm line some two days or a week prior to conception. There is some evidence that the GE is actually double, one entering on the sperm side, one entering on the ovum side. If the matter were still important, some time could be spent determining this, for the GE answers dually in present time.

The GE continues as the guiding genius throughout prenatal life, building, regulating the heartbeat and attending to complex structural matters. It records every perception present, asleep or awake, conscious or unconscious (in knock-out or drugged sense), to the number of the (about) fifty perceptions present. Just as the doctor quite often hears a baby in a womb cry, just as he can hear its heartbeat with his stethoscope, so can the child hear what is occurring outside his mother. This is a very important datum from the standpoint of PREVENTIVE DIANETICS for by knowing it, one can easily forecast the health and mental poise of a child after birth by making certain that it has a good prenatal existence. Psychotics often DRAMATIZE (re-enact) these prenatal engrams and a trip through a sanatorium will show an auditor many prenats in full play, running oft like records, ending and starting again endlessly.

Here is the list of prenats. They can be any combination of action known to the business of living, but these are the common ones.

Prenatal Incidents

All incidents in any environment are prone to be repeated. Thus these incidents commonly appear in long chains, many incidents in each, each incident much the same as the last. To audit the chain one should get the basic on that chain:

COITUS CHAIN, FATHER
 COITUS CHAIN, LOVER
 CONSTIPATION CHAIN
 ORDINARY BOWEL CHAIN
 DOUCHE CHAIN
 SICKNESS CHAIN, mother's illness
 SICKNESS CHAIN, another member of the family's illness
 WORK CHAIN, mother's heavy activities at work
 EXERCISE CHAIN, mother's activity in sports or calisthenics
 MORNING SICKNESS CHAIN
 CONTRACEPTIVE CHAIN
 FIGHT CHAIN, family quarrels
 FIGHT CHAIN, outside the home
 HIGH BLOOD PRESSURE CHAIN, mother's high blood pressure
 DOCTOR EXAMINATION CHAIN, punching mother
 ALCOHOLIC CHAIN, mother's drinking
 ACCIDENT CHAIN, mother's falls and bumps
 ATTEMPTED ABORTION, SURGICAL
 ATTEMPTED ABORTION, DOUCHE
 ATTEMPTED ABORTION BY PRESSURE
 ATTEMPTED ABORTION BY EXERCISE OR JUMPING
 COUGH CHAIN, mother's coughing
 COUGH CHAIN, other members of family
 HICCOUGH CHAIN
 MASTURBATION CHAIN, mother's masturbation
 CRYING CHAIN, mother's crying

Pre-sperm recordings are quite ordinary. The sperm sequence itself is worthy of note for it is a race of which the sperm is very conscious. His travails in reaching the ovum are many. There is a "visio" which is quite standard, of the race. There is quite often a light, a

spark, in this sequence. The sperm reaches the ovum and merges. This merging is another incident, conception.

Pre-ovum sequences are on record but are not common. The rolling of the ovum down the tube is commonly recorded.

Conception and the impulses generated answer the conditions for one type of cancer, embryonic.

Mitosis is an incident. Cellular division, once or many times, is on common record. Mitosis answers the conditions for the other type of cancer—malignant cell.

Cancer has been eradicated by auditing out conception and mitosis.

The theta being apparently joins the track immediately prior to birth. Its sequence, for itself, is DEATH, BETWEEN-LIVES, BIRTH, all in a few minutes according to some findings, a sequence which is quite aberrative.

The theta being's joining is called the STARTER. The theta being sometimes fights away another theta being, sometimes considers this an overt act.

You may audit an entire prenatal bank without getting as much rise in the preclear's tone as auditing one STARTER for the theta being, after all, is the preclear.

BIRTH is a very aberrative affair and a difficult or complicated birth can aberrate the entire lifetime of the MEST body. But this means that birth should be without conversation, in a darkened and quiet room with high humidity and without draughts, not that you should audit births. In other words, one should know how aberrative birth is, but one should not audit birth as a practice. One "Facsimile One" has as many as eighty-thousand births on it as locks. Birth presents itself to be audited much of the time because Mother, complaining of how difficult the preclear's birth was, makes it into an overt act. This overt act had birth as a motivator. Thus, preclears are anxious to have their birth engram audited.

INFANT and CHILDHOOD ILLNESS are important because in them the theta being loses much of the control of the body. The incidents of degradation which precede these, however, are a more important target for the auditor.

Most preclears are stuck somewhere on the present life track. The E-meter will tell the auditor where if the auditor asks in terms of years. It is rarely where the preclear thinks it is. Operations, accidents, illnesses are all more or less routine. The auditor should take them as he is given them by the E-meter or symbols or both, but he should not audit them as such unless he is strongly forced to do so: the incidents on which they depend are so much earlier, so much more aberrative.

For every motivator in the present life there is an overt or a ded. Thus it behooves the auditor to pay much more attention to using TECHNIQUE 80* than it does to find new and strange present life incidents to audit. It should not require more than a score of hours to clean up the present life until heavy incidents in the past can be audited: this is true for the neurotic and relatively sane only, it is not true for the psychotics: for them it may be necessary to audit prenatals or use other techniques and to spend perhaps hundreds of hours of ARC processing to make them entirely sane and stable.

Present life incidents, by test, cannot quickly resolve any case. Audit present life only until one can audit theta line material with safety.

* Additional data in "Scientology 8-80" by L. Ron Hubbard.

CHAPTER FOUR

THE GENETIC LINE consists of the total of incidents which have occurred during the evolution of the MEST body itself. The composite of these facsimiles has the semblance of a being. This being would be called the GENETIC ENTITY or the "GE".

The GE is not an actual individual but a composite of individualities assumed in the single lives along the evolutionary track.

The discovery of the GE makes it possible at last to vindicate the theory of evolution proposed by Darwin and to discover the various missing connections in the line as well as to explore the characteristics, goals and developmental urges of organisms on the evolutionary line. Further, the discovery of the GE makes it possible to adjust hitherto contrary material in the theory of evolution.

Darwin and others proposed some scores of years since that an animal body was developed by necessity into successive organisms, each one better adjusted to its environment. The organisms began in simplicity and graduated through successive aeons into complexity. Darwin proposed that natural selection was the guiding principle and that protoplasm, genes, etc., were alone capable of modifying the organism. Later workers proposed ingenious theories of electronic mutation. Prior to these discoveries of Darwin and others Earthmen accepted various impossibilities as the explanation of the variety of animal forms. The Vedic theories persisted until the early A.Ds. when a new cult arose in the Middle East (30° N. Lat. 30° to 80° E. Long. Earth) and proposed that animals had been created suddenly from mud by a Creator and that this included Man. The Vedic peoples had proposed much earlier that a sort of evolution was responsible for the various forms. Darwin and his co-workers picked up this theory after the Vedic hymns had been translated to Europe, about a century earlier, concurrent with the French English conquest of India. Considerable turmoil resulted from the introduction of the Darwinian theories as these were then in direct contrast with the existing superstition. A trial of a school teacher who dared teach the theory of evolution in a backwoods area of the United States resulted in a victory for the superstition, the school teacher standing convicted. But evolution received so much publicity over the world as a result that it is now the generally taught theory in schools.

However, one should not think of evolution as a standard or precise theory. It is a sprawling and contradictory mass of poorly compiled data taken from ancient swamps and tar pits, and there are many schools of evolution. These are taught un-uniformly in biology classes. Biology is based on "cytology" or the study of cells. Existing theory in cytology is quite contradictory to various tenets of evolution. In other words, the field is poorly integrated and badly understood and not overly gifted with data. The discoveries in Scientology can be addressed to these sciences of biology and cytology with considerable profit. By auditing previously uninformed preclears up this evolutionary line, the results are similar if not identical.

The most direct address to altering the shape and form of the MEST body of the preclear is the auditing of the evolutionary line. Many illnesses, aches and pains are residual in the body line itself. These are restimulated by the environment or the thoughts and actions of the theta being and, once restimulated, alter the physical condition of the body. However, the body is responsive in present time to the command of a re-strengthened theta being and the shape and condition of the body can be otherwise changed than by solely addressing the GE.

Single or multiple cells respond each one as though it had its own GE. Very early on the time track, in the area of the photon converter or the "helper", the GE and the cell entity are the same, for here the incidents are single cell incidents.

The theory of the epicentres applies very particularly along the MEST evolutionary line. This theory holds that in any given generation on the evolutionary line, the sum of its counter-efforts will form, in the next generation, the new command post. Every central relay

point of the nerve system has been, at some time or another on the evolutionary line, a command post or a sub-command post of the organism. As the organism develops these command posts each one is subjected to new counter-efforts which forms the area of the new command post. Thus the body has many old command posts from which the “somatic mind” (or GE) controlled all the responses of the body. The “funny bone” in the elbow is an old sub-command post, an old epicentre. Any point of reflex response in the body was an old command post or sub-command post. These epicentres stand along the nerve channels of the body and are like switchboards. They still command their immediate areas and, independently of the central command post in the brain, can cause reaction in their area. The best example of this and the most important point for the auditor is the fact that two separate lines once merged (mollusc) and thereafter worked together as a team. These lines each one now has its own command post, its own memory bank. These two lines are the right and left brain lobes. The one in ascendancy ordinarily commands the one in subjugation. The right side of the brain controls the left side of the body. The left side of the brain controls the right side of the body. Malcoordination of the two halves of the body can be traced to imbalance or confusion or outright warfare between these two control centres. Half-paralysis, stroke, anaesthised areas can be traced in part to this mal-coordination of the present lifetime epicentres. Each one of these goes back as itself along the same track, generation to generation, sharing the same experiences, until one reaches the mollusc or bivalve state where each one has a prior and independent and separate history. Either one is capable of controlling the whole body. In the bivalve state one finds them at war with each other in an effort to attain sole command of the entire bivalve.

Right- and left-handedness are caused by these malcoordinations of the two lines. Actually one should be neither right-handed nor left-handed but ambidextrous: An entire technique, complete within itself, was worked out some months ago when I first encountered these phenomena. This technique has been working so well for some auditors that they wonder why any newer data is introduced. The technique consists of obtaining optimum communication amongst all epicentres in the body with the result of a complete unity of action by the body. This does a great deal for timing and coordination in general and has been known to eradicate severe psycho-somatic ills. Theta line techniques, being addressed to “I” rather than to the MEST body, produce swifter results.

Here is a wealth of material for the investigator. The principal incidents and circumstances on this line have already been located and were located before this data was released the first time. But innumerable structural puzzles are resolved with this data and few are the preclears whose bodies do not react vigorously to the suggestion that some of these incidents may exist, so violent is the charge contained in these incidents. An E-meter has been known to drop as many as twenty dials on the auditor’s faint hint of the existence of the “helper” or the “weeper”.

Life on the evolutionary line is grim, very tooth and claw. So overpoweringly awesome has been life on this line that the violence pervaded the social theory of psychology for decades and, indeed, has underlain the most basic philosophies of Man’s behaviour. Here, at the very least, is the explanation for so many theories in the past.

It should not be overlooked that on this GE line one finds what the uninitiated call “past lives”. This continuous living on the part of the somatic mind does not end with the ape. It continues right on through to present time. The GE contains enormous amounts of data about recent times and past times.

The GE in America seems to have followed the track of the western civilizations. This accounts in part for the strange fact that our histories give us enormous treatises on Greece and nothing on Persia, great tomes on Rome and little on Egypt, enormous writings on that small continent Europe and very little on Asia. A correct track of civilization is not from Phoenicia, through Greece, Rome and Europe to America; it is from China through Chaldea, through Babylonia through Persia, through Achea and minorly through Greece, Rome and Europe since these last form a decline from civilizations at various times and periods. It usually passed

through Greece and Rome and Europe, which accounts for our fixation on these minor empires and inferior societies. The point here is that a study of history is very restimulative to the GE and produces body alterations for which the theta being, not having been there usually, cannot account.

YOU as a theta being, may or may not have seen Greece or Rome. Your MEST GE has probably activated a body there, just as it has been, (in accordance with Darwin and his Russian copyist, one of the patron saints of the current slave state of Russia, Lysenko) an anthropoid in the deep forests of forgotten continents or a mollusc seeking to survive on the shore of some lost sea.

By the way, if you cannot take a warning, your discussion of these incidents with the uninitiated in Scientology can produce havoc. Should you describe “the clam” to some one, you may restimulate it in him to the extent of causing severe jaw hinge pain. One such victim, after hearing about a clam death could not use his jaws for three days. Another “had to have” two molars extracted because of the resulting ache. The clam and all these incidents are very much present in the GE and can be restimulated easily. So do not be sadistic with your describing them to people— unless, of course, they belligerently claim that Man has no past memory for his evolution. In that event, describe away. It makes believers over and above enriching your friend the dentist who, indeed, could not exist without these errors and incidents on the evolutionary line!

The auditor should know about this line for it sometimes crosses the theta line, which is to say, it is “coexperienced” in places by the theta being. This is simple to unravel. Also, the preclear may have a GE incident in such forceful restimulation that the auditor has no choice but to audit it. When one says GE incident, he means, of course, anything on the entire evolutionary line including “past lives”. One must not forget that the theta being has also shared, with another (not present) GE some of these past life experiences. One can discover when the theta being first came to Earth, when it first had a Mest body on Earth, and so discover its first contact with some MEST body line—it has co-experienced with a GE in every life where it has had a MEST body.

There are extra-terrestrial GEs, perhaps GEs which evolved elsewhere and which are still elsewhere. These GEs would be on the evolutionary line of some other planet. They would not cross into this evolutionary line. But the theta being, where it has had a MEST body on some other planet may have had it in company with a GE there which had its own peculiarities. One almost never audits such a thing, but it is remarked that it can be there.

The following incidents are audited with the usual tools of Dianetics and Scientology, with due attention to TECHNIQUE 80. One may wonder what a clam might consider an overt act. The best way to find out is to put it on the E-meter and ask. Every one of these, when in evidence to be audited, is part of a motivator-overt combination. When they do not react on a meter, when they do not present themselves to be audited, don’t bother to go looking for them. If they are to be audited, they will react with violence, as much as a five or twenty dial drop on an E-meter. If they drop in such a fashion there is a companion incident, which is to say that they have motivators where they are overt acts and overt acts where they are motivators. Such a drop means that they are being used in present time as motivators or overt acts.

The Atom

Lucretius said that each atom was life. This may or may not be true. But the first incident one finds in the GE behaves as though the preclear were an atom, complete with electronic rings. This incident audits very poorly until it is located as a companion to some overt act.

There seems to be a “hole in space” immediately ahead of the Atom. Just after this hole is a condition of motion, with the preclear in the centre, with rings of motion travelling around him.

Characteristic of this incident is a state of mind wanting no A-R-C, neither to receive A-R-C, nor to give A-R-C, wanting NO A-R-C give or take. This is a comfortable aloneness. The preclear usually perceives from this his later necessities for ARC on a MEST level.

The Cosmic Impact

As physicists tell us, cosmic rays enter the body in large numbers and occasionally explode in the body. Very early on the track the impact of a-cosmic ray and its explosion is very destructive to the existing organism. One is “accepting” rays and suddenly one explodes. Sometimes one is accepting one while another explodes elsewhere. This has been found fairly basic on an anxiety stomach, on acceptance-rejection confusions. Remember that in all early incidents there is a GE line for the left side of the body and one for the right side and either one can affect the whole body when it is run. Thus, there are ATOMS for the right and left and COSMIC RAYS for the right and left sides both.

The Photon Converter

All early life is fixated on converting photons to energy. One finds the algae and the plankton taking their living from photons from the sun and minerals from the sea.

Because at night there is no sunlight the photon converter sinks into an apathy which aeons later becomes the MEST body’s craving for sleep. This is a basic problem of no energy received, very little storage for energy.

All photon converter incidents are concerned with light and dark. the storms of the sea, the fight to keep from rolling into the surf. The fear of and combat with the merciless surf is characteristic of all early incidents until well after the “weeper”. Sending the ill to the seashore to listen to surf is a guaranteed restimulator.

There are many types of these incidents. A basic one is concerned with fear of sinking, effort to rise, for the photon converter must stay afloat.

Past deaths as a photon converter are common. For only by dying and knowing how one died could the GE utilize the chief counter efforts which menaced. A chain of experience which did not include death would not be able to build efficient organisms and would be unprofitable. Death on the GE line has a very great value and marks progress. Death on the theta line is so much wasted time. Hence the quarrel between the GE and the theta being.

The Helper

THE HELPER is one of the most powerful incidents in terms of charge on the early track. It is actually mitosis or cell splitting.

The GE carries along a tiny cell, mobile and swimming. Suddenly it decides to divide. It starts to split in half. There is usually an enormous struggle in this splitting. One side wants to split, the other usually does not want to split. Having split, one side is energetic and starts to go about its business. Then it sees that the other side is limp and falling toward the mud below the water. The energetic side turns and dives and tries to nudge the other up to the surface, tries to revive it. The failing side may revive. In the incidents you will find there will be one of two outcomes: the failing side fails despite the other’s efforts; the failing side revives and now, all

energetic, swims away leaving to his fate the other that helped it and who is now too weak to live and so sinks and dies.

There are two sides to the HELPER. The whole sequence of the losing side is present, the whole sequence of the winning side is present. The confusion lies in the fact that each is itself, but a moment ago was the other. There are whole squads of HELPERS. It is a confusing area for the GE which therein has much cause for misidentification.

The Clam

A variety of incidents may intervene between the HELPER and the WEEPER. These are the evolution chain which includes jellyfish, seaweed and some other forms. It is interesting that immobile states are most liable to have heavy incidents. It is also interesting that bulbous seaweed, uprooted and cast shore by storms, gave Man some of his early experiences with sunlight in the absence of water. A distinct somatic of drying and itching is felt by preclears when they encounter this incident, a restimulation of the drying outer skin of the dying seaweed. It is also interesting that bulbous seaweed is an early pattern of Man's later general form. Jellyfish incidents are quite remarkable for their occasional aberrative force; the jellyfish sometimes drifts into a cave or grotto and is pressed against the stone by rising tide and waves, thus gaining the first facsimiles which later become a shell as in the clam. Here is an example of the principle of counter-effort moulding the physical shape and necessities of forms.

THE CLAM is a deadly incident but mostly when restimulated on purpose. Although this area of the track is called the CLAM, it is improbable that the actual animal was a clam such as our razorbacks. Visios on this seem to indicate that it is a scalloped-lip, white-shelled creature. The clam was, of course, quite thoroughly fixed to the rocks and the state is very static. The clam had many troubles. The first of these troubles is the double-hinge problem. One hinge wishes to stay open, the other tries to close; thus conflict occurs. Here we have two control centres, both of them more or less equal in power, having no internal communication.

In the jellyfish we have the first third dynamic engrams where the goal is to hold together at all costs. As soon as the hinges are formed in the clam, we have our first efforts to be completely contrary and internally at war. The solution occurs when one hinge goes into apathy and the other assumes complete control.

The hinge epicentres later become the hinges of the human jaw. Should you desire to confirm this, describe to some uninitiated person the death of a clam without saying what you are describing. "Can you imagine a clam sitting on the beach, opening and closing its shell very rapidly?" (Make a motion with your thumb and forefinger of a rapid opening and closing. The victim may grip his jaws with his hand and feel quite upset. He may even have to have a few teeth pulled: At the very least he will argue as to whether or not the shell stays open at the end or closed. And he will, with no hint of the death aspect of it, talk about the "poor clam" and he will feel quite sad emotionally.

The clam had an astonishing number of adventures for so minor a creature. It would get things into its shell and be unable to vet them out. It would get its shell stuck open and be unable to shut it. And it would come loose from its rocks under the surface of the water and get tossed into the broil of the surf. And it would become deserted by the tide and left to bake under a frying sun, a quite uncomfortable situation which restimulates sometimes in a sunburn.

There was or is a spore method of procreation used by the clam. The spore was put on the inside of the lip and permitted to grow. Eventually it became large enough to become a clam on its own and would depart. There is a guardian-emotion on the part of the clam for these spores and a sadness on their departure. But there is more to the spore than this. The spore was like a barnacle. When the clam was cast ashore, these spores were still alive in the shell. The sun would kill the inner cells of the "barnacle" while the outer shell cells still lived. The dead inner cells would form a gas which, under the heat, would explode violently to the agony of the

living barnacle shell cells. This bursting was sudden and painful. These spores gave incidents which permitted the human teeth to have a pattern. The ancient bursting engrams are still dramatized by the teeth which, under stress, burst or feel like bursting. Running out some of these bursting incidents will take the ache out of a tooth rapidly. The “fifth nerve channel” is around the mouth and is heavy out of all proportion. A nerve channel is as heavy as it has to conduit pain away from the area. Thus I deduced that there must have been much pain in this area and that the “fifth channel” is the oldest main conduit and so it is. Audit all such incidents for all teeth and you have permanently taken the pain out of toothache and cut down decay. By the way, a barnacle, because of this bursting possibility, at length developed a “blow-out area” a cap which would blow easily. And teeth have such an area. It gives way and makes cavities.

The clam had many, many deaths. A scan across its deaths locates the one in restimulation. You will be amazed to find the clam sufficiently advanced as a cellular-somatic mind to have postulates, to think thoughts.

THE CLAM is actually a group of incidents rather than a single one.

The Weeper

After leaving the sea, the GE spent a half a million years on the beach. It had already known about air as a plankton, had known about the beach as seaweed and dying clam. But it nevertheless required some half a million years, according to the evolutionists, for the creature to learn to use the land.

The plights of THE WEEPER are many and pathetic. Still obtaining its food from the waves, it yet had to breathe. Waves are impetuous and often irregular. The WEEPER would open up to get food from the water and get a wave in the shell. It would vigorously pump out the water and try to get some air and then, before it could gulp atmosphere, be hit by another wave. Here was anxiety. Being still a shell animal, the mobility of the WEEPER is poor. It could not withdraw rapidly nor advance rapidly. Tides went out and left it to bake and thirst. The sand got into it. And it had to pump water swiftly in order to continue to live.

The WEEPER is so-called because it had to pump salt water. It was deduced that crying in a human being is very unnatural. Why is it that a human has to pump out some salt water in order to feel better— which is to say, why does crying out a grief charge produce such a change in a case ? The incident must be one of pumping out salt water.

And this is practically the total activity of the WEEPER which, living perilously on the edge of the surf, had to pump to eat and to breathe. The creature had two pumping tubes. These later became, because they were furthest toward the light, the eyes of the human being. These tubes had very rough treatment, getting full of sand, being battered by surf.

The inability of a preclear to cry is partly a hang-up in the WEEPER. He is about to be hit by a wave, has his eyes full of sand or is frightened about opening his shell because he may be hit. An occluded case is sometimes merely a case of “shell-shut”.

Get the preclear to imagine that his eyes are in his mouth, looking out. Get him to scan through such a situation. You will find the weeper which he has in restimulation.

If you make a preclear go through all the physical notions of sobbing convulsively, no matter what his emotion may be, he may connect with the weeper. Belching, gasping, sobbing, choking, shuddering, trembling, are all manifestations of emotional dramatization of the weeper.

The weeper (originally called “the Grim Weeper” or the Boohoo) had trillions of misadventures. Scanning over these, the auditor will find the one or two which have remained in restimulation and which are open to auditing.

The Volcanoes

Earth was undergoing volcanic upheavals during the days of life on the beach. Possibly it was this volcanic action which served the chain of evolution for there is a lack of real reason why this evolution should not be continuing on even today. The progress of evolution was cut at the beach, possibly, because the beach is peculiarly subject to violence during volcanic upheavals, sea and land being in clash. Now and then the auditor will find a volcanic upheaval incident in restimulation with its palls of choking sulphurous smoke. It has been suggested that smoking tobacco is a sort of dramatization of volcanoes which, at the least, were spectacular.

The Birds

Occasionally the creatures of the beach, still shell animals, had their troubles with birds which had become so earlier. Birds of a very crude construction developed a taste for clams. Clams had no adequate defence against them. If a clam opened its shell, the bird would thrust in a beak or a claw. If the clam then closed, the bird would fly up into the air. The clam would let go, drop on a rock and become bird food. If the clam didn't close, it became bird food anyway.

Falling sensations, indecision and other troubles go with the BIRDS.

Sometimes a preclear will come up with an incident where he was a bird or even a bat. The auditor should be very careful about what he would call dub-in. For this one belongs not in the GE but most likely in the theta line with the preclear taking over the body or form of a bird or bat. The incident is quite valid. It does not, however, belong on the GE line.

Theta line incidents occasionally restimulate and group with GE incidents. Auditing brings them apart easily. Thus it is in the case of the BIRDS. For theta beings can fly.

Being Eaten

In that so many fish and animals were equipped with so many teeth, it is inevitable that somebody somewhere on the track would have been eaten. And so it is, for there are a great many "being eaten" engrams. These minor circumstances are, of course, motivators. The auditor should realise that the GE itself did some eating and thus there are many of these eating engrams which are motivators. Diet faddists, people who will not eat meat are hung in maybes on the subject of digesting and being digested. Many strange psychosomatic ills and skin manifestation may be traced to these incidents.

Anyone who knows TECHNIQUE 80 knows that dispersal of energy is a difficult condition to run. The GE about to be eaten by a fish, suddenly recognizes the fact. And his attention units disperse. In fact, he may disperse right off the couch. Few auditors, in the absence of TECHNIQUE 80, have been able to run "being eaten" incidents. Knowing about the dispersal of attention units and knowing that this is fear may permit an auditor at last to run and reduce these "being eaten" incidents.

There is a strange compliance on the part of the GE, in some cases, to be eaten. Later on this may take on the form of compliance in being beaten or abused. Masochism on the GE line may have its seat in such incidents. There is an "emotion" of being able to at least assist the survival of another body by letting it be fed.

Auditing an "eating" incident consists of requiring the preclear to locate the dispersal of his attention units and the centre of that dispersal. The attention units may be located far behind the GE in the "eating" incident and should be traced from there back to the preclear until they are reduced.

The Sloth

There are many steps and incidents between the BIRDS and the SLOTH. However they are most of them mobile and few of them are found in high restimulation. With the SLOTH we again find the GE in a state which is not very mobile, not easily defensible, in a world where the evolutionary line has produced more developed and more carnivorous beings.

Man's line is not very pugnacious. The GE is smarter in Man's line than the GEs in other lines, but Man's current intelligence comes from an entirely different quarter than evolution. The SLOTH shows Man's nature well, so far as GEs are concerned. "Leave me alone and I'll leave you alone" is the philosophy here. But the sloth was slow and easily attacked and he had bad times falling out of trees when hit by snakes, falling off cliffs when attacked by baboons. And the sloth was trying to THINK. The most pitiful painful efforts at thinking are found in this series.

THE SLOTH is a chain of incidents and misadventures, mostly showing up fear of snakes and of falling.

The Ape

When Man had advanced as far as the APE he was agile and intelligent. The APE is usually an area of overt acts against animals and incidents of protecting young.

The Piltdown Man

Man's first real Manhood is found in the PILTDOWN, a creature not an ape, yet not entirely a Man. It is so named not because it is accurately the real Piltdown Man but because it has some similarity.

The PILTDOWN contains freakish acts of strange "logic," of demonstrating dangerous on one's fellows, of eating one's wife and other somewhat illogical activities. The PILTDOWN teeth were ENORMOUS and he was quite careless as to whom and what he bit and often very much surprised at the resulting damage.

Obsessions about biting, efforts to hide the mouth and early familial troubles can be found in the PILTDOWN. It is a wonderful area in which to locate GE overt acts.

The Caveman

Keeping women at home for men and keeping a man from keeping one at home for women can be found in the CAVEMAN. Here one crippled one's woman to keep her there or poisoned one's man for having kept her there. Marital malaction often goes back to the CAVEMAN. Any condition of interpersonal relationships can be found in this area. Jealousy and overt acts around it, strangling, smashing in heads with rocks, quarrels about homes, tribal rebukes pack instincts can be found in THE CAVEMAN.

Past Deaths

It must be kept in mind that past deaths happened to the GE and to the theta being. Any GE has a regular line of past deaths, coming on forward chronologically.

The auditor may have some difficulty locating GE deaths in the last few thousand years because deaths are also registered on the theta line. The GE under processing may have had hundreds of theta beings in command of it down the centuries. There is a matter known as the "second facsimile" or "duplicate facsimile." A theta being takes a picture of the memory of a

GE and carries it as a record. A GE takes a picture of the memories of theta beings and carries those. Thus there can be many “second facsimiles” of past deaths for the same period of time. One should not be surprised at “discovering” five past deaths all occurring in the same span of years. Some will be second facsimiles, a maximum of two for that period will be actual incidents. One death happened to the theta being using another GE line, the other happened to the GE. They will be in different places at different times.

Second facsimiles are “photographs” of the memories of another. They are still pictures usually. Their characteristic is that they show up with only two or three pictures of some long situation. As they are “pictures” of change and age and everything else, they will show up on an E-meter as charged incidents. But when one tries to audit them, they change into the basic incident, the actual one, the “pictures” vanishing. The existence of a real facsimile in the GE or the theta being

will restimulate and hold as locks, pictures taken from former theta beings and GEs. Any death registering, or any incident registering on an E-meter for a certain period in the GE line tells you that there is a real incident in that area. Hunting for the real one, you may find some of these second facsimiles. These usually evaporate when touched and the actual incident is quickly found.

This matter is mentioned because auditors are sometimes puzzled by shifting dates on an E-meter or incidents simultaneously occurring where they should not. An auditor, merely by pursuing the matter, automatically sorts out the second facsimiles which may be there and finds the actual facsimiles which must be audited.

Contact between a theta being and a GE must be very intimate for a photograph to be taken of the other’s facsimiles. Or two beings must be in almost hypnotic rapport for the matter to occur. The facsimiles themselves do not shift from one to the other. One being simply sees, then makes a “picture” of the facsimile of another when that other has the facsimile in restimulation. Any auditor has “seen” his preclear’s incidents.

Assumptions

ASSUMPTION is the name given to the act of a theta being taking over a MEST body. This is occasionally found to be part of the record of the GE strong enough to be audited. It is the sensation of being taken over thoroughly, sometimes contains the shock of contact. The ASSUMPTION takes place in most cases just prior to birth for every GE generation.

Evidently theta being ASSUMPTION is recent on Earth. It is rare to find a theta being coming to Earth 35,000 years ago, rarer to find one earlier. 70,000 years ago is the present earliest arrival of a theta being on Earth. In a great many cases, the preclear (for the awareness of awareness of the preclear IS the theta being) will be found to have arrived on Earth for the first time only a few hundred years ago. E-meter reaction occurs in the GE line on these ASSUMPTIONS and the auditor should be careful to differentiate whether he is reading for the GE or the preclear himself.

The GE takes a poor outlook on ASSUMPTIONS but in reality it is not much different to the GE to be taken over by a theta being than by a new epicentre developed in the past generation.

There is a smothering peculiar to ASSUMPTION from the viewpoint of the GE which is followed by a fear of being caught, a desire to hide, a wonderingness at this nothingness which hit him and wrapped him up.

The main thing wrong with any preclear is that he cannot disentangle *himself* from entities and somatic entities, from demon circuits and MEST bodies. He wants to know WHO he is and WHERE he is.

A common complaint from a preclear is that somebody won't let him be himself. The joke of this is that the preclear doesn't know who HIMSELF is, much less why he can be allowed to be HIM.

Take any preclear and, using concept running, motivator, overt and DED and you will find him instantly in the midst of dozens of engrams if you ask him to run the concepts, "I am myself," "You are yourself," "What is my name?" "Who am I?" and similar concepts which attempt to single out his identity.

The only reason why a person becomes aberrated about other people is that he cannot distinguish between himself and others. You find preclears—and auditors too—who go around thinking themselves burdened with facsimiles of others, who become restimulated and then try to run the engrams of others to cool the restimulation.

IDENTIFICATION OF THE REAL "I" is the sure cure for IDENTIFICATION OF SELF WITH OTHERS AND OTHERS WITH OTHERS.

WHO is the preclear ? He is the theta being.

How does one really de-aberrate and clear a preclear ? By clearing the theta being.

By running genetic entity incidents, by cleaning up present life, by running "past deaths," the auditor can get rid of psychosomatics by the bale for the preclear. The auditor can practically rebuild the body.

He can clarify thought by taking away pains restimulated by thinking. He can do a thousand marvels never before possible here on Earth—or anywhere else for that matter.

But when he has done all these things, often at great labour, what does he have? He has a composite being, good enough to be called Homo Novis—a theta-animated MEST body possessed of new and desirable attributes. That doesn't mean he has the preclear cleared. That doesn't mean that he has located the preclear for the preclear and restored an ultimate self-determinism. It means the auditor has done well. The auditor has made what we are calling a MEST clear, a good, sane, rational MEST being about a skyscraper higher than Homo Sapiens. But in that Homo Sapiens is a pretty horrible thing to be, this isn't good enough, not nearly good enough.

This Homo Novis is limited in his self-determinism by all the economic and social restrictions of an aberrated society. He is not free of food, clothing or shelter. He dies when you get him too cold, he perishes when the oxygen content drops too low. He is living in a tolerance band which keeps him cramped to the face of one second-rate planet in a tenth-rate system, prey to all the ill will that blows. Is this being free or self-determined ? Maybe he is good enough to overlord his fellows into a security for himself never before possible. But that is his only real route towards security. He must fight and command for his three squares, he must use police protection in order to keep himself free of bullet holes and bumper marks. Compared to a Homo Sapiens, Homo Novis is very high and godlike. Compared to a truly self-determined being, Homo Novis is an ant ready to die under anybody's mis-step.

This universe is a rough universe. It is a terrible and deadly universe. Only the strong survive it, only the ruthless can own it. Given one weak spot a being cannot long endure it for this universe will search it out and enlarge it and fester and probe it until that weak spot is a festering wound so large that the being is engulfed by his own sores.

Fighting this battle for survival, and fight it he must, a being in the MEST universe cannot seem to afford decency or charity or ethics; he cannot afford any weakness, any mercy. The moment he does he is lost—for he is surrounded by chilled, coarse rock and molten energy which, no matter the state of aberration of his social surroundings, will engulf him instantly that he ceases to obey the very least laws of MEST.

This is a universe of force. It is not a universe of reason. Brutal, unthinking, without decency or mercy, MEST force awaits with punishment any being with any weakness.

The possession of a MEST body is a liability for through that body the being can be given pain, can be regimented by the routine demands of eating and care from harm until at the very, very highest he can be but a puppet dancing to the spin of some unthinking planet under the strong glare of a remote and careless sun. Under these conditions a being burdened with care and liability of a body, made uncertain by an unknowingness, bows to strange and non-existent gods, resorts to terrible make-shifts in lieu of justice,- cringes before the mightier bomb, the sharper blade.

You have examined an engram. A standard engram is simply the collision of the body with the MEST universe with sufficient impact to produce the confusion of attention known as “unconsciousness.”

Should you care to make a test, just run “care of the body” as a total therapy. You will discover that by running out the postulates of a preclear about his body and its care and his injunctions and insistences to others that they care for their bodies, you can produce soaring changes in tone. An entire book can be written concerning this therapy. An entire book has been written about it—the first in Dianetics. This therapy could be styled, “The efforts of a theta being to reconcile the frailty of a MEST body with the ethics of a theta being.” They do not reconcile, these two. Schopenhauer, Zeno and names without number in philosophy have been trying to make this reconciliation for aeons. One says, “Defeat it all and die, for only by dying can you defeat it.” Another says, “You can’t win, therefore the only victory is in refusing to try to win.”

Christianity and a million other unities have struggled with this problem and the result is a pot-pourri of answers, none of which reconcile the problem. You have a soul—it goes off somewhere, you don’t know about it. You are a soul, you don’t know about it.

Today we live in a vast cult called “Worship the body”. Medical doctors, school teachers, parents, traffic officers, the whole society unites into this war-cry, “Care for the body.” This stems from the ignorance that the body is all that one has, that he will have just one body, that his total devotion is the care of that body.

A body is a vegetable. It is not even a sentient vegetable for it lacks perception in the whole theta range. Like any vegetable it grows from seed and has habit patterns which help it survive. And, like any vegetable, one way or another, it gets used by others.

Early theta beings saw MEST bodies acting and being as though they were self-motivated. This was a curiosity. The early theta being did not know that these MEST bodies depended wholly for their wits under the guidance of a decayed theta being. The bodies looked like entities of considerable force and skill. The theta beingness of them was hidden and unapparent. Thus even theta beings have been fooled by MEST bodies.

A MEST body, whether it belongs to the race of Man or the race of ants is yet but an animated vegetable. Given a theta being to guide it, it becomes part of a composite such as Homo Sapiens: here we have a theta being, decayed into unknowingness, devoted to the care of a MEST body. The “I” of this body, the actual volition of it, all its wits and skills are theta things derived from the guidance of a theta being. By itself the body would live, walk around, react, sleep, kill, and direct an existence no better than that of a field mouse or a zombie. Put a theta being over it and it becomes possessed of ethics and morals and direction and goals and

the ability to reason; it becomes this strange thing called Homo Sapiens, a being above animals and yet an animal.

Give this MEST body a psychotic theta being and you get a sort of Frankenstein's monster. Give this MEST body a nearly unconscious theta being and you get a zombie.

The body is a carbon-oxygen engine which runs at 98.6° F. The theta being is the engineer running this engine in a Homo Sapiens. There is already an entity running this engine, the GE, but there is here only a total devotion to avoiding pain, seeking survival factors of the meanest sort, begetting new MEST bodies. Every cell in that body has its own theta, the GE is theta. A THETA BEING is something else entirely.

In the first place, the theta being came into being without the need of a MEST body, without the need of motors. It is close to a perpetual motion picture machine in that it can create energy and impulses. It thinks without facsimiles, it can act without experience, it can know simply by being. When we have talked of optimum performance in Dianetics or Scientology, we have talked about the actual top level capabilities of the theta being, not the capabilities of the MEST being. Early work in Dianetics treats of the composite called Homo Sapiens and treats that composite for what it is, an identity of several parts which act in greater or less coordination. You can go right on treating this composite being as a unit, you can go right on treating him and getting results for which you will be praised. But you must know that you are not treating the actual identity when you treat the MEST body—you are furthering a composite and actually you are subscribing to the International Cult called "Care of the Body."

You can, at your own choice, go on living with and processing this composite known as Homo Sapiens and create Homo Novis. You can use Dianetics to make hitherto impossible strides. But be advised that in this choice you are living with paradoxes which no philosopher in all the ages ever reconciled—the injustice of death, the depravity of human beings as in Plato, the penalty of assisting another, the impossibility of having good ARC and survival too, the liability of being kind and merciful and every "unanswerable" religious paradox known. You, by persisting in yesterday's reality are persisting then in problems which have never been resolved with the factors accepted. You are demanding of a MEST-theta composite that he be self determined when every zephyr from a hard universe contains death for him and can turn him like a top; you are demanding that he be "careful" when his only salvation is to be carefree, you are saddling him with all the unanswered riddles of an aberrated life in an aberrated world. And you are condemning a preclear to the dwindling spiral—for the theta being as part of the composite decays fast and soon dies forever in the rigid apathy of MEST.

Thus this data is given you. In lieu of this data the only thing which could be given Man is the answering salute to the gladiators—they who are about to die.

As an auditor, the choice is yours to make—the paradoxes or the answer. I would not give you this data unless it can be demonstrated on any preclear with ease. And I would not give it to you unless you needed it.

Here it is.

CHAPTER FIVE

THE CAPABILITIES OF THE THETA BEING cannot at this time be set down in a full sweep of data. In the first place, it would be unfair to tomorrow to detail in writing the exact constitution of a theta being, for by just that much could he be predicted and brought again into a low state. The auditor does not have to know too much of these full capabilities. The preclear will discover them for himself in processing.

But there are a few data necessary to auditing and these are set forth:

A theta being is capable of emitting a considerable electronic flow. This is not done by using facsimiles but is actually a creation of motion which we now know as “electricity”. A theta being produces considerable voltage and amperage, enough to give somebody a very bad shock, to put out his eyes or cut him in half.

The theta being, on his own, can instill anything on the emotional range into another being for each emotion is a wave length and wave characteristic.

A theta being does not use facsimiles to think or act. He does “mockups” of the situation and by examining the “mock-up” knows how something works or what should be done with a situation. His memory is by pervasion—which is to say by pervading again the area of the data or by approximation. He is not stimulus response.

Facsimiles are accumulated by a theta being at will, discarded at will much as a man collects stamps.

Theta beings can rip chains of facsimiles away from other theta beings. This is not done as a therapy but as an outright prankish theft.

The identity of a theta being is not based on his memory of events but on an actual knowledge of identity.

A theta being can be rendered unconscious by wave action; he can be hypnotized; he can be made to sleep; he can be made to possess facsimiles and use them. He can be aberrated in such fashion so as to forget his identity. He is subject to all the laws and rules of thought emotion and effort as described in Dianetics and Scientology—with the difference that, fairly clear, he has enormous choice in their use.

A theta being can be de-aberrated by ridding him of his chains of facsimiles and restoring to him his knowledge of identity.

A theta being can enjoy existence and emotional impact, he can plan and act. His activities lie about 8.0 on the tone-scale. He is very high aesthetically and devotes most of his time to aesthetics.

Theta beings associate socially with theta beings and have a high sense of justice.

A theta being can be made visible by certain electronic flows; he can be pinned down by certain flows. The wave lengths of these flows are not known to Homo Sapiens at this time and methods of emission of them have not been invented on Earth.

MEST beings of the class of Homo Sapiens are composite beings motivated by a theta being, entities, the GE and the environment. MEST beings, fallen away from being theta beings, incapable of regaining a theta state in the absence of Dianetics, dislike theta beings (whom we will call THETANS from here on, meaning a theta being who has not been forced to have a MEST body). MEST beings, trying to inhabit an area of THETANS are commonly balked and fought by the thetans and the MEST beings then begin to trap and harass the thetans

and will use them to motivate new bodies when the thetans have been reduced to little or nothing in power. The THEY which you will discover in incidents are MEST beings. The current Homo Sapiens is a THEY. Theta beings (amnesia and a MEST body) attack thetans who menace him. Thetans can kill MEST bodies by throwing a charge at them. Thus a war develops between thetans and MEST beings. Given electronics and hitherto unconquered thetans, MEST beings can and have won.

Thetans communicate by telepathy. They can move material objects by throwing an energy flow at them. They can travel at very high speeds. They are not bound by atmospheres or temperatures.

Thetans quarrel with each other by showing each other facsimiles or throwing energy flows at each other, but they are not very quarrelsome.

Thetans do not die. They grow in that there are young and old thetans. Decaying, they obtain MEST bodies and eventually pass out in the form of a solid, apathetic slumber.

A thetan can feel pain. He can be crippled and dismembered, but this requires force which would blow half a town off the map.

Thetans live on some planets. They consider these to be “outside the MEST universe” by which they mean outside areas inhabited by the composite beings, the “races” which use electronics and need bodies.

A thetan, brought low enough to have a MEST body, may consider that he has been trapped by “time warps” or that his universe is another dimension or some such thing. This is not the case. Thetans live in the same time stream with the difference that they can alter concepts of time and get future or past at will—it is THE THETAN who is altering his concept, not the time that is changing. So don’t go off on wild chases after fourth and fifth dimensions, time warps and other time-space universes: teleportation makes it look like these exist for the thetan. There is more to this but you don’t really need it in processing.

There are two states of “theta clear.” One of these is a CLEARED THETAN, from whom all incidents would be removed; the other is the THETAN cleared of a necessity to have a MEST body. When we say “theta clear” we mean the latter.

A THETAN is somewhat bound-in here on Earth because of the existence of other system forces. Probably, with a few THETANS active, this planet will be much less calm and orderly. Probably Homo Sapiens will use electronics some day to re-trap thetans who are bothering him but if Homo Sapiens has the techniques for getting free himself, some miracle might avert this. Possibly a handful of thetans will someday become alarmed at the worries and efforts of Homo Sapiens and try to throw the remaining race into a super-controlled slavery. All that is speculation but it is not a speculation that life will become much more interesting on this planet. It is doubtful if the thetans will pull off the ultimate trick—simply knocking out the atmosphere of the planet—that “clears” everybody after a fashion. There is nothing as wild in the books of Man as will probably happen here on Earth. And it will happen and be allowed to happen simply because all this is so incredible that nobody will even think of stopping it until it is far, far too late. Its incredibility is its best safeguard, so you needn’t bother to convince anybody who doesn’t want to believe it. It took the medical profession two and a half years to catch on to prenatales. People getting cleared of bodies don’t need any such time lag. And so, may I make this simple request—don’t get spectacular until a few of the boys make it. You don’t want to be lonesome—and you’ll need reinforcements if a war gets declared on thetans here. The preclear may think he can do it alone if he gets cleared of a body—he’ll need more help and company than he thinks. So, again, as a final note on this chapter, let’s not go upsetting governments and putting on a show to “prove” anything to Homo Sapiens for a while- it’s a horrible temptation to knock off hats at fifty yards and read books a couple of countries away and get into the rotogravure section and the Hearst Weeklies—but you’ll just make it tough on somebody else who is trying to get across this bridge. Let sleeping Sapiens

snore in the bulk for yet awhile. Then meet some place and decide what to do about him and his two penny wars, his insane and his prisons. Tell people who want to invalidate all this, "Your criticism is very just. It's only fantasy." Cure up the lame and halt and the incompetent with whatever display of technique you need. Protect theta clearing until there are a few.

CHAPTER SIX

THE HISTORY OF THE THETA LINE is long and interesting. All you really want to know of it, however, is how much of it applies to your preclear. You will be pleased to discover that this is relatively little, a snap of the fingers in time compared to what could be.

The whole track seems to begin about seventy trillion years ago.

Thetans like facsimiles just like a Homo Sapiens likes TV. A thetan can take a facsimile and inspect it. He likes to collect them like a bibliophile collects books. Any thetan has purloined packages of facsimilies from other thetans just like schoolboys take pictures of champions away from each other. Thus your thetan has two things; he has his own record of real experience, of things which actually happened to him; and he has whole banks of "second facsimiles" or photographs he has taken from other thetan banks.

Second facsimiles are complete pictures. They will show up with charge on an E-meter because they also contain the "charge notation". But the moment you locate the fact that the whole bank of second facsimiles was taken from another being, the preclear stops using them as experience and they no longer show up on the E-meter. The characteristic of the second facsimile on the E-meter then is to show up for a short time, and then, identified as from a "borrowed bank" not register any more.

The best way to knock out second facsimile banks is to run out of the preclear incidents of "borrowing" facsimiles. He'll have many of these.

A preclear, needing a motivator for some overt act he has done, will start to use a second facsimile as the motivator. It will even give him somatics. A preclear may have as many as eight banks he is using. Identify seven of them as "borrowed" banks and you have him operating then on his own bank. This is the stop necessary to get him running on his own actual track.

Sometimes you may find that he has used a second facsimile so much that it has to be run. Run, it shows up as two or three still pictures, not as a moving picture.

The only truly important facsimiles are those which actually happened to the thetan himself, not what he borrowed.

You can plot out as you wish the whole track. Incidents given here in this volume or variations of them will be found on this track.

A common history of the theta line as applied to your preclear starts with his "Separation from the Main Body of Theta", continues through "Home Universe", runs into his entrapment by MEST beings and then through life as we know it with its cycle of birth, MEST body living, death, between lives wipe-out and birth again.

The thetan lives his life in segments: the largest segment is composed of "spirals"; as he goes through the MEST universe he is involved in a series of spirals each one less in terms of years, ordinarily, than the last. The first spiral which occurred 70 or 74 trillion years ago, might have been as long as a trillion years but the next spiral after that was a little shorter. Succeeding spirals each one shortened. The present spiral for most people is about 40,000 years long, although, many are on a longer spiral than this, and not a few are on a very short spiral. The length of this spiral might serve to indicate how much longer the thetan can continue. By a spiral would be meant a more or less continuous cycle of action. A life in a MEST body is a variety of cycles- it is not a spiral, for the preclear's knowingness often extends to earlier bodies. The first big cycle would be at its probable longest 76 trillion years. This would be sub-divided into spirals, any one of which might comprise more than one lifetime. Spirals could be subdivided into "lives", such as the current life which is only one

division of the current spiral. A whole spiral can get into restimulation in some earlier period just as a past life can get into restimulation in this life. The incidents contained in that whole spiral, then, would be quite important. Sometimes a spiral has ended suddenly and earlier than scheduled for a preclear. This has remained to him as a very bad shock. It would be like a past death but of a very great magnitude. The beginning of this spiral finds the being thinking he is new with universes to conquer and the end of the spiral finds him practically expiring, even as a thetan.

The overt acts of the thetan are “nipping” by which he harasses other thetans, “nipping” MEST beings—which usually kills them dead much to the thetan’s surprise, blanketing of MEST bodies for sexual thrill and other purposes, trapping other thetans after one has become a MEST being and the usual variety of overt acts common on Earth.

None of this is very complicated as a history. It is made to LOOK complicated by the existence of “borrowed” banks, entities and “cover-up” actions by the preclear. The main task of the auditor is to get the preclear to identify himself as himself and to identify the actual track of himself. The rest is easy.

CHAPTER SEVEN

THE TYPES OF INCIDENTS found on the theta line are somewhat different than the auditor has been accustomed to running in present life processing. The elements contained in those incidents are the same—thought, emotion, effort, counter thought, counter-emotion, counter-effort, attention Units and counter-units. The emphasis, however, is upon attention units and counter-units. The reason for this is rather obvious.

How would you go about nearly killing an almost immortal being? It would require about the heaviest force possible. The tone scale above two contains perception, below two there is little or no perception beyond attention units. Here is the occluded case. The individual himself may be running on a higher harmonic of his occluded tone—but the incidents which must be run to restore his perception in incidents are all too heavy to contain much in the way of perception. Hence, the tracking of attention units and the skills necessary to that are the requisites in running theta track incidents. Further, so heavy are these facsimiles that even when using “mock-ups”, one must be very conversant with TECHNIQUE 80, for the incidents hang up when the motivator is run too long or when the overt or DED are run too long. (Old time incidents were said to go into recession. This is because they had an overt motivator opposite from them which had to be run.)

The auditor never really understands apathy, fear or anger until he has run the heavy facsimiles of the theta line. It is not that they affect the preclear more strongly—they do not. It is that they are so heavy they can be like so much glue or hardwood. Reversing to the opposite incident, to the overt from the motivator, from the motivator to the overt alone makes it possible to run theta line.

One might have known for a very long time how far back this theta line went and how serious were the incidents upon it. But it would have done him no good to know about these incidents for, without attention unit running, which I developed only a short time ago, the incidents would not be runnable at all.

There were two ways of running a case: one was to unburden it until the natural resurgence of the individual keyed out the lower, heavier incidents, the other was to run the incidents no matter how heavy they were. The theta line, then, could not be audited at all until attention unit running and overt acts had been developed and refined for auditor application. The first method of unburdening is the one which auditors have been doing wholly whether they realized it or not. The other one of cleaning up the incidents themselves, the very bottom basics of the chains has not been in use because it couldn't be. Thus Dianetics was kept to one life until such time as the entire mechanical aspect of the lower track could be examined and techniques developed for resolving it. Of course, these techniques, if they resolve heavy incidents, resolve lighter ones as well, and so a revolution in processing can be announced which, if you MUST process only the current life, will resolve it in most cases in five or ten hours of processing. If it doesn't resolve, then the auditor simply doesn't know 8-8008 and that's all there is to it.

Despite the fact that they are heavy, that they are strange, theta line incidents are easy to audit IF the auditor knows 8-8008. If the incidents are very hard to run, then the auditor DOESN'T know 8-8008.

There is just one warning about theta line-incidents: you are auditing the theta “body”, not the MEST body. It is theoretically possible to run an incident out of the theta being which is too much for the MEST body. A MEST body which has a weak heart had better be audited in this lifetime only until his heart condition entirely vanishes. Some of the theta line incidents kick back so hard against the MEST body that the preclear is sure he will not live through them. If the auditor doesn't balance the overt against the motivator in 80, if he runs one side too strongly and heavily and really drives in the somatic, he may be embarrassed by making a theta clear before his time—the body still lying about but not breathing.

The incidents themselves contain some things the auditor should know about. One doesn't have to be a nuclear physicist to understand these incidents, but the incidents are actually in the realm of nuclear physics.

The auditor must only know the following:

1. Strong electrical currents produce in the vicinity of their flow what are called MAGNETIC FIELDS. If you wrap an electrical wire around a bar of iron and run current through the wire, you have a magnet. When you put a new piece of iron near this magnet, the FIELD of the magnet snaps the piece of iron up against the magnet.
2. In the vicinity of any strong current a wide FORCE FIELD exists. If this is intensified (by using great quantities of current) the FORCE FIELD may extend for hundreds of feet or even miles. A radio station is a sort of FORCE FIELD in that it reaches hundreds or thousands of miles out from it. It takes a radio set to pick up or contact this field strongly enough to get a good reaction out of it but actually, this instant, thousands of stations throughout the world are sending force fields through your body. They are too minute to be measured or detected without receiving sets but they are force fields just the same, wave impulses generated from a central point and extending far out from that point. If a station could generate a billion times the normal current a station uses, you would be able to contact that field physically, it would be so strong.
3. It is possible for a wave to act as a RETRACTOR. That is to say, it is possible for certain waves to pull back instead of push out. You turn a hose on somebody. This pushes him back. There can exist a wave which, if it were a hose, would pull you up to the nozzle instead of pushing you away. Thetans can put out such a retractor wave.
4. It is possible to rig up two or three—or one—standing poles which are then activated with a current which will apply a very strong field to anyone in their vicinity. It is then possible to vary these fields to get various patterns of fields or to shift from one field to another to get various angles of attack on an object. A thetan sitting amongst such a field pattern can be very thoroughly battered and rendered unconscious. It is also possible to rig up a post which would have a retractor wave coming out of it and which would pull a thetan into the post and pin him there.
5. A field is not always visible. "Black band" waves are the destructive waves. These are not visible and they light up nothing.

It may occur to the auditor that some of these incidents, as he hears them being run, are very reminiscent of the material which is commonly found among the insane in sanatoria. These people are quite given to chattering about fields and secret waves and telepathy and things being after them with electronic devices. The past ignorance consisted of treating anything an insane person had to say as non-factual data. Today may even say that one is insane to give thought to any circumstances as occur on the theta line. An experienced auditor knows that to make the insane sane it is necessary to run the incidents the insane person is dramatizing. In a brilliant flash of insight someday those in charge of sanatoria may see that the reason the insane chatter about electronics is that electronics are peculiarly adapted to tailor-making insanity and that electronics have been used for unthinkably long times to handle and control beings. Electronics alone can make a truly slave society. Those in charge of sanatoria, in view of the fact that their own figures show that electrical shocks do NO good and have NO beneficial effects upon patients, may someday wonder why they themselves are so violently psychotic on the subject of insisting that the insane be given electronics. Ah, you have it! Those in charge are doing a crude and ineffective dramatization of theta line incidents. Electronics make slaves. If some of these electricity obsessed but electrically ignorant chaps who so gently shepherd our insane really WANT results, I can show them not just how to make a patient tractable, I can show them how to give him total amnesia so that he can then be taught like a child and may become useful in a few months. You can REALLY wipe people out with electronics. Electric shock is so stupid and so childish that one wonders, one wonders.

So heavy is the concentration on electronics in the theta line, so closely connected with energy behaviour is the anatomy of a theta being that only one trained in nuclear physics could have cracked this riddle. And with the data on this theta line, human treatment and the treatment of any life passes entirely into the hands of the electronics experts and out of the hands of the meddlers with minds whose training in electronics ends with knowing how to turn on an electric light and who yet have at this writing the only legislative passports into the craniums of the ill. The era has just begun. Using theta line data, data accumulated from preclears about electronics, wave lengths, practices and social customs, a handful of electronics experts could bring entire nations into their command with very little work—and those trained in yesterday would be completely powerless to stop or even detect that pervasion of command. This is regrettable, perhaps. Maybe all societies go this way. The atom bomb is a toy compared to a device which would turn into soul-less slaves an entire city, an entire nation, an entire world. But instead of hiding this information, one should bring it to light, for if it goes underground only then can it completely have its sway. One does not look for such an enslavement to occur, for you are reading the pages and the technologies which can and will defeat it.

Thus, in running your preclear, keep in mind that he has been, in the PAST, part of societies which had electronics down to a very fine point, which could control the very breathing of their subjects. Recall that he may have been part of a town, for instance, in which any revolutionary, lazy or non-survival thought, if thought would bring him, without will, to the steps of the local thought police station. Remember in processing your preclear that for thousands of years he has played the game of enslaving and being enslaved, and the depths of control were such, the acts in that control were such as to out-soar any mere imaginings from modern literature. Modern science-fiction, even that, is a weak piker compared to the data of the past from which these writers of the future took their plots. A public couldn't stomach what really went on before Earth. Your preclear isn't able to stomach it—that's why he's forgotten it.

What does it take to aberrate a thetan ? Thousands and thousands of volts, thousands of amperes, poured into destructive wave lengths and thrown straight in his face. What does it take to get him into a position where he can be aberrated ? Trickery, treachery, lies.

Running electronics incidents is not difficult, not if you know 80. But there is a datum which must be repeated here even though it belongs in HOW TO AUDIT.

The definition in Dianetics of INVALIDATION:

INVALIDATION IS ANY THOUGHT, EMOTION OR EFFORT, OR COUNTER-THOUGHT, COUNTER-EMOTION OR COUNTER-EFFORT WHICH DENIES OR SMOTHERS THE THOUGHT, EMOTION OR EFFORT OF THE INDIVIDUAL.

By this definition, a man is invalidated by being struck by anything. If he is run into by a car, he is "invalidated". Any accident invalidates him. Any force which he cannot conquer or oppose invalidates him.

Turn to the chart in your HANDBOOK FOR PRECLEARS. Here you see on the CHART OF ATTITUDES, "I KNOW," "I AM," "FAITH," etc. The more the force of an individual is cancelled out by counter-forces, the lower he drifts on this chart. Hit by strong forces, he conceives that he "isn't."

FAITH at the top of the chart turns to DISBELIEF at the bottom.

Turn a preclear loose into a heavy theta line incident and what reaction do you get? You get BOTTOM CHART REACTIONS. That is to say, the force is such in the incident that he is utterly unable to combat it, thus he conceives himself utterly invalidated. In such a wise he comes to express in the incident BOTTOM SCALE attitudes. He can't believe it, he isn't there, etc., etc. Run any theta line incident with its heavy impacts and your preclear will immediately

start to discredit it. Keep him at it, waive aside all his lacks of belief and other comments and soon the tone band will rise a notch or two. Keep the tone rising, using overts and motivators, and you eventually get perception and concepts.

Why do you think these theta line incidents got lost? Why can't a man who has undergone a between-lives battering recall that he lived before? Invalidation by force is the answer. The chart of attitudes will give you your guide.

There is another thing you should know about these incidents and the emotional state of the preclear: he has become in his own eyes so degraded by force invalidation that he has devoted himself to this vegetable thing, the MEST body, as the last ditch effort to control some part of the environment. HE is invalidated to nothing. So the BODY has to be something.

And there is something else, a scale you should have of invalidation:

CRITICISM AND COUNTER-CRITICISM are the overt and motivator invalidations on the thought level. MISEMOTIONALISM AND COUNTER MISEMOTIONALISM are the overt and motivator invalidations on the emotion level.

PHYSICAL FORCE AND COUNTER-PHYSICAL FORCE are the overt and motivator invalidations on the effort level.

In current or recent lives thought, emotion and effort hang up on the early theta line incidents. If you can't get a theta line incident of the electronics type to unburden, run criticism and counter criticism in the current life.

In general you will find the preclear has been subjected, as a theta being to enormous invalidation of all his force, power and natural attributes. The rise in tone potential in running the theta line is such that you can expect the preclear to go from low to high on the E-meter after only one or two heavy electronics incidents have been run—but make sure they are theta line and that they happened to the thetan who is the preclear before you.

The intent of other beings was to make this preclear into a willing or unwilling but at least obedient slave or to get him out of the area and keep him running away thereafter or to nail him into complete useless immobility. They wanted him to have good

reaction to police threats (and most psychotics go psychotic immediately after a police interview, no matter how innocent it was). They wanted him to leave MEST bodies alone and respect them.

On his part your preclear was part and parcel of many societies, took his role in efforts to conquer thetans after he had been conquered. He wanted MEST bodies to be respected now that he had one. He wanted his slaves to be obedient. He wanted beings he didn't like to start running and keep on running or, barring that, to be immobile MEST thereafter. Your preclear has been guilty himself of any crime or action he protests occurred to him—for by his worry he confesses that whether or not it happened to him, he did it to others.

Your preclear was basically good, happy, ethical and aesthetic before the contagion of the MEST universe got him. Then, still a thetan, he wasn't very good but he was still trusting and ethical. Finally, when he had a body—well, look around.

CHAPTER EIGHT

The SPECIFIC INCIDENTS YOU MUST RUN ON THE THETA LINE are directed solely, at this stage, toward attaining a voluntary and controlled separation between the MEST body and the theta body. This is much easier to do than you would at first believe, and the incidents necessary to accomplish it are relatively easy to comprehend and locate.

Remember that to create a “theta clear,” it is only necessary to bring the being up to a point where it can leave and return upon a MEST body. A cleared theta clear would be a fully cleared thetan, something so much higher on the tone scale than a MEST clear or theta clear that it is difficult to comprehend. A theta clear however, is not difficult to attain. Neither does it guarantee the release of all possible aberrations. A theta clear, some tones higher than anything known before, is yet subject to some aberration and will be until he attains the state of a cleared theta clear. (Thus don’t invalidate somebody as a theta clear just because he doesn’t act like a saint—he might even be more devilish than ever!)

Separation from the body! How the mystics have striven for this one! India and “join Nirvana” has given us “techniques” WHICH ARE GUARANTEED TO GLUE A THETAN TO A BODY AS THOUGH RIVETED AND TIED WITH IRON BANDS. So beware of mysticism and its techniques and yogism. Your hardworking author has been over the jumps and through the hoops of more mysticism than is even suspected and on the ground where mysticism first hit Earth— India, and I can guarantee you that these practices and hopes are a sort of theta trap to keep men in their bodies, in apathy, ill and tied to superstition.

Theta clearing is about as practical and simple as repairing a shoe-lace. It is nothing to do with hypnotism, voodooism, charlatanism, monkeyism or theosophy. Done, the thetan can do anything a stage magician can do in the way of moving objects around. But this isn’t attained by holding one’s breath or thinking “right” thoughts or voting Republican or any other superstitious or mystic practice. So, which is the reason I’ve brought it up, rule out, auditor, any mumbo jumbo of mysticism or spiritualism or religion. Rule out anything but good, solid, contactable incidents which are run wholly and entirely with the mechanical techniques of Dianetics with particular attention to 80.

The key chart of theta clearing is THE CHART OF ATTITUDES which you will find in the HANDBOOK FOR PRECLEARS. All the straight wire is done from that chart.

Here are some incidents, more or less in the order that the auditor will find them and run them.

THE JACK-IN-THE-BOX: Here we have an invader trick, a method of trapping thetans. It is a facsimile scrambler. It is very early, not the earliest, only the earliest invader trick. The thetan area is invaded by MEST beings. The thetans bother the MEST beings, nipping them, etc. The MEST beings use theta traps. One of these is to give to thetans pretty little boxes. These boxes contain a stack of pictures. As thetans are disposed to gather facsimiles, these pictures are very acceptable. The thetan looks over the pictures. He finds they are quite similar one to another. They show, each one, a picture of a box of pictures. When he replaces the lid, the box explodes violently. He instinctively tries to dampen the explosion. He gets his aura of beingness full of pictures which are extremely confusing, being pictures of boxes of pictures. The running of this incident is simple. One keeps the preclear’s attention on the point of explosion, out from him. Of course this point slams back at him every time he puts his attention on it. You will find a preclear with this in restimulation to be very curious about cereal boxes which have pictures of boxes of cereal which have pictures of boxes of cereal. There may be several such incidents including being near such explosions.

THE OBSESSION: This incident is the incident which gives one the feeling he HAS to have facsimiles in order to know. Actually one doesn’t need facsimiles. One thinks in concepts, approximations, pervasion A fine control trick is to make one think he has to have facsimiles.

This aberrates him and makes him easy to handle. Educational systems are locks on this. The incident is an electronic incident, very strong, and sometimes includes a great many source points of energy directed against one's back. Just before it, one KNOWS. The force of the waves themselves, depressing one of the CHART OF ATTITUDES stops one from knowing. This incident gives one an obsession to have facsimiles, to steal facsimiles, to do anything to get facsimiles. One is actually trying to find what one lost in the incident and that was lost by force alone.

WARNING: Don't ever try to run words or other perceptions out of any electronic incidents. Words are seldom included in them. Communication in such an era was usually by though transfer, not by words. This is very important.

BORROWING: Thetans hold facsimiles very loosely. A high scale thetan can pick up and discard facsimiles at will. Further, a thetan often steals the facsimile chains of another thetan (as a result of the OBSESSION). Thus we will find, as the primary source of occlusion, the BORROWERS. A thetan puts a retractor beam on another thetan and starts to drag out his facsimiles. The victim feels like he is going to pieces. He, the victim, puts up a black screen to halt the outflow of his facsimiles. The borrower counters by throwing a cone of force above and below his victim pinning him between these two cones as though to squeeze him out. The black protecting screen usually can be held in place but the facsimiles, like smoke, trickle out around the black screen and to the borrower. The most remarkable thing about this incident is the SLOWNESS with which facsimiles seem to run out. Each facsimile has its own time tab. No matter how rapidly they are leaving these time tabs give the ILLUSION of a very long time. Running up and down one's time track often gives this illusion. Thus, although the outflow from the victim may be done in seconds, it may seem to take years. The preclear often protests against running this incident because "It takes too long." Actually, it takes very little time.

Naturally, on the borrower, the overt act must be got as well as the motivator as in all incidents run. If you don't get the reverse to what you are running, incidents hang up. In the borrower, the overt is the same as the motivator, as the incidents are very similar but with the reverse action. Run the preclear as the borrower and the victim both, one after the other, back and forth, in order to get up the whole of each.

This incident is the source of fear of losing one's facsimiles, the source of occlusion and the collapse of time tracks.

NIPPING: Nipping is a practice much beloved by thetans. They send out two energy streams, like hands, and slap both sides of a victim's head. This mildly shocks a thetan to which it is done. It can kill a MEST body. This slap is notable for causing ringing in the ears. This predates any invader. It is very early. It also postdates invaders. In running NIPS one is running something very important, for it is a basic on holding on to a MEST body. As in all incidents, when you run the motivator, run the overt afterwards, or vice versa.

BLANKETING: This incident consists of throwing oneself as a thetan over another thetan or over a MEST body. Blanketing is done to obtain an emotional impact or even to kill. It is strongest in sexual incidents where the thetan throws two MEST bodies together in the sexual act in order to experience their emotions.

This sexual lust comes from THE HALVER. It is very, very strong and is very restimulative in the running. Here is where the second dynamic becomes abated. There is considerable frenzy in these incidents. This is also basic on fastening on to a MEST body or holding a MEST body or protecting MEST bodies. It is an overt act. It has DED'S later than it in almost any sexual activity on the part of the preclear. At times a thetan will blanket a MEST body, and hold it so that it can be attacked by another MEST body motivated by another thetan. Later the thetan, having committed this overt act, will start protecting MEST bodies from attacks by thetans. This gives a person great antipathy toward seeing men and women together, lays in a basic on jealousy, etc.

There is a steep emotional curve in blanketing. First there is the high excitement, then orgasm, then, for the bodies, contentment or apathy as the case may be. This drop affects the thetan strongly and he gets fastened to the bodies and it takes some while to separate himself at times. These incidents make the future fixation on MEST bodies possible. Thus Freud had something when he blames sex, but sex is far from the whole story.

The basic error a thetan made was in considering a MEST body something very special, unmotivated by thetans. He did not realise that any MEST (human) body is run by a decayed thetan. In thirsting to run MEST bodies and in contacting them he thought he was contacting a cellular body whereas he was actually contacting a thetan and a body. He desired to go into ARC, without knowing it, with a decadent thetan who had a MEST body. That every MEST (humanlike) body had a decayed thetan on it was unknown to thetans until now. This accounts for the enormous “kick-back” received by a thetan when he nips a MEST body or blankets one. The body never did have that power. The decayed thetan did. Respect of MEST bodies, then, was entirely misplaced. This is the primary error thetans made.

THE HALVER: Don’t think thetans were only abused. When MEST bodies tried to invade and take over an area they usually wound up enslaved to the thetans in that area. And the thetans used them horribly. The invader sometimes came in with electronics his only defence against a thetan. The thetan quite ordinarily took the electronics over and used them on the MEST bodies. One of the processes thetans used on MEST bodies was a half-light, half-black gun which shot out a wave. Half of this wave, usually the black, hit the right side of the victim’s body, the other half, in the same explosion, usually the light side, hit the left side of the victim. This had the effects of causing him to be two people. It is also the basic on half-paralysis such as strokes. There was not always regularity in this incident. Sometimes it was the practice to shoot the victim one way and then turn him around and shoot him the other, sometimes the sides and head as well.

The halver was rigged up with religious symbols and it truly lays in religion. There is a devil on one side, a symbol carried in the light, angels on the other side. Sometimes it was very fancy and was complicated with dolls in the shape of nudes, angels, devils, strung on wires to slide and dance.

It did terrible things to the victim: it gave him a conflict, one side with the other, one being good; the other being bad. It gave him sexual compulsion all mixed up with religious compulsion so that an overdose of indulgence would send him to church, sometimes into a life of crime. It was a control factor used to keep the community fighting itself.

The halver lies as a basic under sexual malpractice, under religious fervour. It shows up in almost every preclear as being in chronic restimulation. It is the one the auditor runs as an overt act when the preclear has a sexual or religious motivator.

Remember that the restimulation of a motivator when one does an overt act is not natural but a consequence of having a body and implants about bodies. You will find some of this “you do wrong, you’ll get it right back” in the halver and similar incidents.

FACSIMILE ONE: This incident is in everyone’s bank, either as a second facsimile or as an original. Only in the latter case should it be run. It is called “Facsimile One” because it is the first proven-up whole track incident which, when audited out of a long series of people, was found to eradicate such things as asthma, sinus trouble, chronic chills and a host of other ills. It has a verbal content in most cases. It is quite varied when found as an original—for in this case, it happened to the preclear in the last ten or twenty thousand years. It was originally laid down in this Galaxy about one million years ago.

The “Coffee-grinder” (which might be an alternative name for it) is levelled at the preclear and a push-pull wave is played over him, first on his left side, then on his right and back and forth from side to side, laying in a bone-deep somatic which cannot be run unless you

recognize it as a vibration, not the solid board it seems to be. When this treatment is done, the preclear is dumped in scalding water, then immediately in ice water. Then the preclear

is put in a chair and whirled around. He was quite swollen after the pummeling of the waves and was generally kept in a badly run (but quite modern) hospital for a few days. Sometimes he was given several and after the first one would report back 011 schedule for the next.

FAC ONE was an outright control mechanism, invented to cut down rebel raids on invader installations. It was probably designed by the Fourth Invader and used by him in its original state and “ritual” for a considerable time. It gave him a nice, non-combative, religiously insane community. THE MOST IMPORTANT PART OF FAC ONE APPERTAINS TO ITS “SUMMONS TO COURT.” This was a sick quiver installed in the stomach area by the “coffee-grinder” during the first part of the incident. The coffee-grinder laid in “baps” on the pineal and other points but almost knocked out the pineal potential forever and relegated its actions to the pituitary. It knocked in every other glandular point. And these same “baps” were used against the vagus nerve to give what everyone knows as all “anxiety stomach,” uncontrolled bowel action, etc., etc. The header wanted people to report when sent for. Thus the context (WHICH MUST NEVER BE DONE UNTIL THE EMOTION AND EFFORT ARE REDUCED) when the vagus area was “bapped” concentrates on getting the preclear to report quickly when summoned and makes him terrified of arrest, of courts, of other legal hocus-pocus. Thus criminal action against individuals, or sometimes any legal action, interrupts the glandular system, gives an anxiety reaction which has no equal anywhere else on the track. Experienced police know this sudden hitherto inexplicable collapse of the criminal and his feeling that he would rather be dead than simply arrested: one cannot exaggerate the effect of FAC ONE in the legal department. A check on psychotics recently showed five, taken at random, to have been “triggered” by a threat of arrest a short time before the psychotic break occurred. This is FAC ONE at work.

The “coffee-grinder” is a two-handled portable machine which, when turned, emits a heavy push-pull electronic wave in a series of stuttering “baps”. It is violently restimulated by what construction companies call “widow-makers”—pneumatic drills of the kind used to tear up pavements, the sound is not dissimilar. FAC ONE, not silicosis, is responsible for the mortality of workers assigned to these drills on construction projects.

In the original version, the invaders operated these machines while wearing hoods and goggles, not unlike “hot papa” suits used today on aircraft carriers. The victim was placed behind a black gauze curtain but, in running FAC ONE, the preclear usually catches glimpses of the “coffee-grinder” and the users. Some people who wear horn-rimmed glasses are found to be solidly in the operator valence in FAC ONE. Such people are lean and hectic. Some persons whose faces are “swollen” and who have a “dumpy” build, who are given to asthma, are found solidly in the victim valence.

The invader gratuitously left these machines around for the yokels. Believing that the treatment was vital to get to heaven or some such thing, the yokels practiced on each other, found new victims and generally spread the implant around. Trouble with the machines the invader left around was that they “backfired” while they were working, sending out a ray into the chest of the operator to restimulate him, the yokel operator not suspecting that the machine was hitting anything else but his victim. And the yokel operator had neither goggles nor a “hot papa” suit. One of these unskilled operators lasted sometimes as long as forty victims before he collapsed from restimulation himself. The “back-fire” characteristic of the machine left around also inhibited the local people from using electronic hand guns and “rifles”, thus killing off guerrillas who sought to attack the invader, for electronic weapons have a flash back against the user.

FAC ONE deteriorated down the years, became quite varied and with the colonisation of Earth about thirty-five thousand years ago (or up to seventy thousand in a very few cases),

when used FAC ONE was quite non-standard. But it has been used on Earth against some preclears.

About a hundred and some thousand years ago the HALVER was substituted for FAC ONE as much more efficient, much quicker and less destructive of personnel and more creative of slave-like devotion. Thus the preclear is certain to have the HALVER as an original; you will also get an E-meter drop on FAC ONE. Be sure to ask if it is original or a borrowed facsimile. And don't forget its overt act is FAC ONE being given by the preclear to a victim.

BEFORE EARTH: There is a BEFORE EARTH and a BEFORE MEST UNIVERSE in all banks. The incidents are not dissimilar. They consist of the preclear being summoned before a council, being frowned down, being sent elsewhere than where he was. The odd part of these incidents, to the preclear, is that he is not usually guilty of anything, not aware of having offended. He is simply recruited, is brought in, is sentenced to be transported and goes to

a new area. The only thing remarkable about these BEFORE incidents is that they are a very definite degradation and condemnation of the preclear. They are best run by scanning the preclear backwards on each column of the CHART OF ATTITUDES, from for instance, "I KNOW NOT" to "I KNOW," etc., for the council's intent is to reduce the person down scale in order to get a more obedient colonist.

THE JOINER: There are three major JOINERS on the track most of them found will be second facsimiles and do not need to be run. Here is the basic on entities. A person is "packed-in" with other souls by electronics. Actually these entities are synthetic. Very early on the track, two more entities were "added" to the victim. They were, the three, placed in a ring and hammered by electronics to get them to fuse. There is an empty spot in the centre. A later joiner adds two more "souls". These incidents are responsible for the preclear being "softened-up" to a point where he can be influenced by having a hypnotized soul thrown at him. You will find the marks of these souls on every preclear. They are the basics on demon circuits. An entity favours the environment, not the preclear, and treats the preclear just like somebody in the environment treated the preclear. If you ask the entities questions, the areas (having demon circuits in them) will respond. If you ask the entities why they are there, they will tell you that they were the crew of the thetan, who is asleep, that they will not work, that they were all bundled together and sent here. The thetan response is that he made twelve errors, eventually could not control his crew, went into ARC with them, became like an entity, was bundled up, thetan, crew and all and shipped down here to work matters out. The entities seem to be most interested in keeping data away from the thetan, convincing him he has done wrong. Each entity claims to have had a function that was very specialized. Insane people are found to be running on their entities, not their thetans. This is a very bad condition, betokening very solid valence walls. Every entity can be audited independently of the others. Past deaths can be run out of them with the relief of many somatics. Each has a body, so they say, in pawn elsewhere. Here is a wealth of data and detail. Fortunately none of it is very important to us at this time except in understanding the behaviour of Homo Sapiens. For these entities, regardless of auditing, work overtime on the preclear. However, in auditing the theta line one is interested only in auditing the thetan and this is very easy to do with the incidents given above and below. One ignores the entities. They may be simply borrowed banks. They do not interfere with auditing for their incidents all run like second facsimiles and, although they register at first on an E-meter, they drop out the moment the auditor asks if the incident comes from a "borrowed bank". If we had to audit through the complexity and aberration of the entities, we would not have a very easy time of it. Fortunately it is not generally necessary to even think or know about entities in order to audit the thetan. The JOINERS, so far as I can establish at this time, can be ignored. If an entity pops up and won't be ignored, just make your preclear move into him and audit out where the entity is stuck on the track (psychotic) and the trouble stops. Considerable time was spent on entities in these investigations. There was a great deal of data about them yet to learn when they were by-passed in the discovery of direct methods of auditing the thetan who, after all, IS the preclear. A case of paralysis, however, was partially remedied by bringing the entity who governed that side up to present time and putting the thetan in charge of the area again. Experiment with them for your own information if you like; you'll

find entities lie, cheat. hold out data and act generally neurotic or psychotic. Here is your “circuit case.” As the thetan loses control over his environment and his body, these entities move in on area. Rehabilitate the thetan and the entity problem vanishes. Start auditing entities and they increase in power. These questions are at this time not answered satisfactorily: Are entities sub-beings or are they simply electronic installations? Are they very decadent thetans who have been blanketed by the preclear ? Have they simply decayed until they follow the GE line? Are they control factors from “between-lives”? This question has been answered: Is it necessary to audit entities? And the answer to that is, No.

THE ICE CUBE: Here is an intriguing incident which, if your preclear demands, should be audited. This is evidently a method of transportation of beings to a new area. The being is packed in ice, is taken to the new area and is usually dumped in the ocean. Your preclear, if he has this one in restimulation, has very cold hands and feet chronically. A thetan responds to hypnosis, pain, force and other factors. He also responds to being frozen in ice. You may wonder how the being, if the ice-cube is used or is necessary at all can get into the between lives area so easily—in other words, if he can be transported between lives with ease, why should he be dumped originally in the form of an ice-pack. Possibly the answer lies in two invader crews at work- an old invader, already in command of an area but rather down scale, controls by between-lives; a new invader crew with more ambition plants beings in the same area. These beings then fall into the between-lives routine which exists unbeknownst to the new crew. The new crew in the area is later much surprised to find that their planted beings, so carefully dumped in the sea from a saucer, are being picked up between-lives and given “treatment” by an old, established invader whose methods of political control are long since established. When such a discovery is made, the new crew may very likely knock out some of the old crew installations and upset the routine.

THE ICE-CUBE is quite authentic.

BETWEEN-LIVES: At death the theta being leaves the body and goes to the between-lives area. Here he “reports in”, is given a strong forgetter implant and is then shot down to a body just before it is born. At least that is the way the old invader in the Earth area was operating.

The implant is very interesting. The preclear is seated before a wheel which contains numbers of pictures. As the wheel turns, these pictures go away from him. He is moved aside to the right, the left, the back. A mirror arrangement shows him still sitting there before the pictures. A force screen hits him through the pictures. The pictures dim out. The whole effect is to give him the impression that he has no past life, that he is no longer the same identity, that his memory has been erased. The force screen flattens his own vitality, thus invalidating his existence, thus installing, by force alone, a forgetter. The pictures, by the way, are simply generalized views, stills of vacant lots, houses, back yards, of a recent Earth period and they could apply to anybody. They are not the facsimiles of the preclear. The incident contains such force that the preclear, at first quite closely in contact runs it willingly. As the force cuts down his past identity he begins to disbelieve the incident, then himself. If left in restimulation he has a difficult time remembering things for some days.

Gradually through a life-time this **BETWEEN LIVES** incident keys in. At first it engulfs childhood, then later and later years. Finally, with age, the preclear starts to cycle through it automatically and goes into a “second-childhood,” which is to say, he anticipates the coming implant, conceives it to have done if he lives beyond a normal life span for him. (If it usually happened that he died at sixty, should he now live to seventy, he will get a feeling in the last ten years that it has been done to him—a routine time restimulation effect.)

Preclears do not always report; to have been implanted once is to get a restimulation on dying which will wipe out the past life. Some preclears have one, some have five, some more of these implants.

The life to life forgetter would follow as a natural course of events from the fact that the preclear identifies himself and is identified by others as a MEST body; further he identifies everyone else as a MEST body. Also he would rather start, if he must be a MEST body, with a clean slate and a new body. Also he has many overt acts of convincing others they should forget their entire pasts, for by that he can train them for a better future for him. NO IMPLANT WOULD EVER SUCCEED unless there was a natural cause and reason for the implant to magnify.

The report area for most has been Mars. Some women report to stations elsewhere in the Solar System. There are occasional incidents about Earth report stations. The report stations are protected by screens. The last Martian report station on Earth was established in the Pyrenees.

Entities have between-life incidents independent of the thetan. These are not necessary to run.

There are many types of between lives earlier on the track, about ten different periods of the entire track being devoted to a practice of keeping a thetan in a body, working and in an area. These show up as second facsimiles and are not necessary to run. But the data is there in the secondary banks and it is very "wonderful" data on how to keep races enslaved.

THE EMANATOR: Now and then your preclear is found "stuck" in the EMANATOR. This is a large, glowing body of radioactive material which hangs magically in thin air, a sort of a god, an all knower. Its outpulse puts one into a trance.

The story usually starts with the preclear "volunteering" to come to Earth and do good. He walks into the presence of the emanator and that is that. He has volunteered, perhaps, simply out of curiosity, wondering what is contained in that big building. His "agreement" is of course enforced. He is told that they will keep his body safe for him. He "agrees" to go help out and is transported by hypnotic transference.

It never occurs to the preclear to question the safety of his body. He reports back to it between lives. The body is preserved and can stay that way for some thousands of years. But bodies do not last forever. One day the preclear dies on Earth and reports back dutifully to find no body. After that he conceives himself to be lost. He is given no new goals between lives, he is ignored. The next life may find him knocking on the door of a psychiatrist for he is very "lost" and "homeless" and generally bewildered. Running the emanator sequence and loss makes all right again.

The EMANATOR trick as a recruiting device is very old. You will find many second facsimiles about it in the preclear's bank.

THE DOUBLE-BODY: With one body in a trance in one place and another body here on Earth, trouble occasionally occurs. A preclear during an operation may switch bodies. Pain, an anaesthetic or a serious accident cause him to change to the other area with a shocking impact on the other body. The other body quite commonly dies or is deranged by the sudden impact. The preclear wakes up from unconsciousness on Earth and tells (or represses) the fact that he has died. Obviously, as the surgeon or doctor will attest, he didn't die for the heart of the patient kept beating. Actually the patient flicked into the other body, transferred the shock and pain and killed it, then came back here and awakened.

This incident leaves a patient very, very badly disturbed. The surge into the between-lives area is so obviously not a death that attendants there, if attracted, will knock the body there out with commands to forget, to not let anyone know in order to "protect" the mystery. Everyone particularly mental doctors, has in the past accounted for this circumstance of the patient thinking he died with wild theories about the effects of anaesthetics and delusion. But no patient so treated ever recovered by being informed that it is all anaesthetic nightmare

and delusion and they do recover immediately if the incident is run out. Nitrous oxide is very vicious in this regard, for it does not dull any pain, it simply “drowns” the patient.

Patients wake up after such a double-body incident with the feeling that they have just learned the secret of the universe, but they can't quite recall it. They have, to some extent. They've learned they're kept and implanted elsewhere.

It IS important for an auditor to know that a DOUBLE-BODY may have happened some lifetimes ago during an accident. To a preclear who doesn't know of the past life, much less the DOUBLE-BODY, the result is quite alarming.

To run a DOUBLE-BODY, run the operation or accident on Earth, then run the incident as from the other body in pawn. Then run going “under” on Earth and waking in the other body and then waking on Earth. Then run being in the other place and appearing on Earth. Run the DOUBLE-BODY until it is very thoroughly reduced, running the overt acts on it as well—which will be what the preclear says they are.

THETA TRAPS: There is no subject more interesting than that of THETA TRAPS. It is of vast interest to any invader. It is of vaster interest to your preclear. How can you trap a thetan? By curiosity, by giving him awards and prizes (of an implant), by retractor screens, by mock-ups, by ornate buildings which he will enter unsuspectingly only to be electroniced down; by many such means the thetan is reduced from KNOWING to a colonist, a slave, a MEST body.

All theta traps have one thing in common: they use electronic force to knock the thetan into forgetting, into unknowingness, into effect. Their purpose is to rid the area of those nuisances, the thetans who cannot be policed, and gain personnel—always the former, not always the latter.

The thetan feels himself, in some traps, being drawn up to a post. He fights it with his force. It cannot be successfully fought. He succumbs. A day or a hundred years later, he is picked off and otherwise used.

A thetan can sustain many implants of this character without becoming obsessed about having a body. But he becomes obsessed very easily about having facsimiles.

THE JACK-IN-THE-BOX is a variety of theta trap.

THE BODY BUILDER: Sometimes a thetan is taken off a theta trap and put into a field which makes him fight again with his attention units. The purpose of this field is to make him resist its force and to resist it so as to mould him. Out of his attention units he “builds” a body. Later he is given sharp shots through the places where joints are supposed to be and is generally tailored into a body.

There were many of these on the whole track. In your preclear they are probably second facsimiles.

The body builder used some fifty million years ago was very precise. Although it has degenerated and is less formalized and although it is doubtful if you will find it in more than a second facsimile, the original version is given here:

After he was caught in some kind of theta trap, the thetan was handled as follows:

THE JIGGLER: Placed over a post, the thetan was moved up and down rapidly and eccentrically for some time. He would try to hold onto and stop the post, would go into apathy and finish by being entirely invalidated as himself and would think of himself as the post, that having become cause.

THE WHIRLER: The thetan was placed on a platform which whirled eccentrically, jerkily to the left and right until he would turn as the post turned.

THE BOUNCER: The thetan was bounced up and down eccentrically until he had a facsimile which fixed him, it would appear, on his time track.

THE SPINNER: A chair device was used to spin the thetan until he had no orientation. This is the probable source of the slang term, spinning, meaning going insane.

THE ROCKER: This swung or teetered the thetan to the left and right, slowly and quietly. This incident is dramatized today by mystics who, not being low enough on the scale to die, finish the job by picking up old electronic implant motions and practising them until they have “control of the body”—which they mean to mean without meaning to mean it, complete body control of “I”.

THE BOXER: This incident is a cousin to the “FLY-TRAP.” Its purpose was to make the thetan into a complete stimulus-response mechanism. He was hit from every angle by a device not unlike a boxing glove. He would be forced to kick back against it with his force. At length he would be psychotic enough to return every motion he received. This is actually aberration itself. It is the psychologist’s definition, though vaguely put, of a “well adjusted human being,” one who stimulates and responds without thought.

THE FALLER: This installs fear of falling, also fixes the thetan in the incident on the track. He is dropped again and again and again to different drops and at varied intervals until he is jammed.

THE EDUCATION: After all these, the thetan was given a complete education. This was of a hypnotic, stimulus-response variety. It was the type of education which makes a file card system out of a thinking being. It is dramatized today in universities as it requires no skilled instruction.

THE FLY-TRAP: Very, very early on the track, a long time before any of the present populace came into being, there was a theta trap called the FLY-TRAP. It was of a gummy material. The thetan who got into it punched and fought at this material until he was psychotic enough to react to the physical universe laws of responding to motions. He was taken out of this trap by a crew of do-gooders who had caught him for his own good and who trained him in religious sweetness and syrup until they considered him fit to be part of their group. The attitude of these people was SO good, their manners SO understanding that the thetan usually ran away as soon as possible. Sunday school sometimes brings this, even as a second facsimile which it nearly always is, into heavy restimulation.

Remember, auditor, that a second facsimile doesn’t have to be audited but will blow when the preclear sees that he “borrowed” it from somebody. But that doesn’t mean he won’t use it. Lacking a motivator, your preclear guilty of some overt act will go back into his “borrowing” and pick out any second facsimile which looks vicious enough to justify his own action and he will use it to the hilt. Thus you may find your preclear stuck in incidents of great rage and fury. You may find him with Arsclycus in full bloom (where they spent ten thousand lives labouring on the same job, were stuffed like snakes every few weeks to feed them, where they returned after death because a piece of their own body was held in pawn) and unable to work and given to a weariness beyond description. Located as a second facsimile the entire incident tends to depart. Or, locating the overt act the preclear actually did himself, the second facsimile goes without auditing. If a preclear holds hard to a second facsimile, he is guilty of more overt acts than he is telling the auditor, or the incident is something else than it appears to be. Ask your E-meter.

CHAPTER NINE

GENERALIZED INCIDENTS would include anything the preclear has done which is an opposite motion to the incident in which he is “hung-up”. The opposite motion is what hangs the incident up.

A MOTIVATOR is an incident which happens to the preclear and which he dramatizes.

AN OVERT ACT (which may also be covert or accidental) is an incident which the preclear does to another dynamic.

A DED is an incident the preclear does to another dynamic and for which he has no motivator—i.e., he punishes or hurts or wrecks something the like of which has never hurt him. Now he must justify the incident. He will use things which didn’t happen to him. He claims that the object of his injury really deserved it, hence the word, which is a sarcasm.

A DEDEX is an incident which happens to a preclear AFTER he has a DED. It is always on the same chain or subject, is always after the DED. It means THE DED EXPOSED. It is covered guilt. Its effect on the preclear is all out of proportion to the actual injury to him. One would think he was murdered by the harsh word or the scratch. He will explain violently how terribly he has been used. Whenever you have a preclear who has been too abused for words and keeps on giving you incidents which tend to fix their guilt on the family or women or some such thing, the auditor can recognize these as DEDEXs and know that he must look for the DED. The preclear is usually quite unwilling to give up the DED but the E-meter will find it. It is on the same subject as the DEDEXs—if he has many incidents about things his mother did to him and these seem fairly routine, there is a previous incident about his mother or some earlier life mother where with an unmotivated cruelty he executed a DED.

A MISASSIST is an incident wherein the preclear has tried to help on some dynamic and failed. These are very aberrative. The incident may be short and harsh or it may be a large number of small incidents. The MISASSIST is a failure to assist either by omission or commission. It is always preceded by a MOTIVATOR-OVERT situation lock-up or a DED-DEDEX situation. The preclear, having injured some dynamic has come into the state of protecting that dynamic out of all proportion to the other dynamics. Perhaps he has many times succeeded in his protection and such incidents are not aberrative. But one day he tries to assist and fails, or he should have assisted and didn’t and the result is the straw added to the weight of an earlier facsimile hang-up.

A DEGRADER is an incident or chain of incidents whereby a low-toned person seeks to bring down the tone of a higher-toned person. The actual intent of the low-toned person is to get another low enough so that the latter can be helped. The low-toned person believes he cannot be of assistance to anything higher on the scale than himself. Therefore he will attempt to reduce the tone of another and then, when he has him well down by degrading him, he will be unable to assist, becomes sympathetic and conducts himself properly until, of course the person is up again. The preclear will, if very low-toned, try this on the auditor. Any low-toned person will do it. The preclear may have many DEGRADERS he has done. Or he may have had many DEGRADERS happen to him. IF THE PRECLEAR IS PRONE TO DEGRADERS HE HAS A DED-DEDEX SITUATION on the same dynamic he permits to DEGRADE him. If he accepts criticism from women, he has a DED-DEDEX on women. If he claims it was father who got him down, who invalidated him, he has a DED DEDEX on his own father or some past father or man who looks like his father. If you find a DEGRADER situation, look for the DED-DEDEX on the same subject. If the preclear is given to invalidating he has a DEGRADER chain he has done. The dynamic he DEGRADES has a prior DED-DEDEX.

CHAPTER TEN

THE TRANSFER is the single most important phase of TECHNIQUE 88.

It is a circumstance rather than an incident. It is a specific action of the thetan with regard to a MEST body. It is the swing of the thetan from out of the body where he belongs into the body where he is thereafter in trouble. THE TRANSFER is the action of going into the MEST body.

Except in deaths or severe accidents or operations you won't find a transfer out. Your task in auditing is to find and run all the transfers into bodies in order to achieve a self-determined, fully alive transfer out.

WHERE is the thetan? Contrary to any past practice, his second best place is just outside the MEST body monitoring it with direct contact on the MEST body's motor controls on either side of the head. His very best place of course, is out of contact with the MEST body entirely and fully alive as "I." His worst place is inside the MEST body.

The thetan, in most cases, is behind and above the MEST body. In many cases he shifts position rather often even in one incident. Now and then he is found to run the body from in front of it. This causes a direction reversal on the part of the person so that he doesn't know right from left—people can teach him continually but he will still say his right is his left and his left is his right, and so it is, for "I" in this person is the thetan and the thetan is in front, facing the MEST body and right is the thetan's right, of course.

There are cases where the thetan is barely or hardly ever in contact with the body. These cases can be considered quite aberrated, the thetan seeing the body from across the room or the street, convinced that he is the body but unable to do anything about it. There are cases where the thetan is inside the body continually but this is to say that he isn't a thetan at all but degenerated into an entity—and we find this is in those low-tone wide open cases, full on but raving psychotics or nearly so.

A thetan is pretty bad off if he thinks all he can do is run a MEST body. This alone is a half-transfer. He hasn't gone into the body yet forever thereafter, perhaps, to be an entity, but he has achieved the level of degradation where he thinks the MEST body is more important than he is and that he IS the MEST body; he has become propitiative toward the body to a point where he is a servant, where it becomes him in his eyes.

A full transfer occurs many times in the span of a thetan, but it is not permanent until he enters the body to stay in there from there on.

In doing a DED a thetan catches the sorrow waves of the body he is wronging, feels sorry for it and then, for one reason or another, merges into it. This is a temporary transfer. But after a few of these he will become obsessed with being the monitor of a MEST body and will devote all his time to it. Then he will suppose that his only method of perceiving is through MEST perceptics, his only method of emoting is through MEST emotions. And he comes way on down the scale, becomes a servant, feels so degraded that he is himself nothing and the MEST body everything and so tends it continually. Eventually he will merge with it in a permanent transfer and that is probably the end of the thetan, the genetic entity and company thereafter perhaps running from within, perhaps in the next life being picked up by a new thetan. Thetans are continually being pumped into the MEST line. They do not last very long. The "I" of the individual is the thetan.

The foregoing paragraph contains steps which the auditor must know. This is the cycle he is trying to work out of the case.

You will find many conditions occurring in the TRANSFER. There is another type of transfer, the switch transfer wherein a thetan, to protect the body he has assumed changes in sudden moments his control to a person startling or attacking the thetan's property. This can become very bad and very involved. It happens in families and amongst friends and when they part or somebody dies, the thetan is suddenly bereft of some of the property he was controlling and so carries on as if MEST was important.

The CONTROL TRANSFER is a specialized kind of transfer wherein the thetan, having devoted himself to a MEST body now begins to control the environment and other people for his body much as he controls the body. Having forgotten his skills and having many brands of aberration, whereby he will transfer permanently, at least some of his control, he yet adventures to reach out energy-wise and start to control other people than his own body and also attempt to control MEST objects and motions. He is at first very capable in this but, having aberrations which cause him to stick on things, his control of the environment becomes too extended. When he loses some of the environment he conceives that he has lost some of his ability to control. We get then a dwindling of control along all the dynamics MEST body but only some small part of it. A thetan without aberration could safely enter into and control the whole environment, lose widely and reassume control. A thetan very aberrated will get restimulated when he loses some control of the environment and won't thereafter try to control that type of thing or person again. These control transfers and their losses will be found widely in any case and are almost as important as auditing control of the first dynamic.

As you run facsimiles you will find that there are those seen by the preclear as though within himself and those seen by the preclear as though outside himself. Audit the latter to audit the thetan. Audit the former and you audit only entities.

CONFUSION OF IDENTITY is a primary problem with preclears. Now that WHO the preclear is can be established and WHERE he is can be seen by the preclear as he runs facsimiles, this confusion can be resolved. But do not expect to solve it for the preclear rapidly. And do not expect to be right yourself the first time.

TECHNIQUE 88 is an E-meter technique. It can be run without an E-meter but this permits all manner of dodging and evading. And there are usually six or ten entirely different banks in any preclear beside his own—lots of places to dodge into. But SCIENTOLOGY 8-8008 solves all this for you.

The entities all have banks. Now these are either stolen banks (from some other thetan long ago as in BORROWING) or they are the identity of this entity. We aren't much interested in auditing entities except when auditing one can reduce rapidly a physical somatic or physical ill—easily done for the entities hold these in present time and they will audit in present time. A thetan high enough to be outside the body to a normal control distance is not going to hold a facsimile in restimulation just to hurt or injure his body. Only an entity will do this or a thetan who has transferred all the way into the body—which makes him an entity and thereafter he will behave like one (no work, high ARC with groups in order to upset them covertly, etc., etc.)

You will find an understanding of your thetan's goals a little helpful in making sure you are auditing the thetan. He was quite old when he first fixated on the idea of controlling MEST bodies. That was not too long ago if he is still operating just outside the body (about arm's length). One of the reasons he fixated on a MEST body was because he was terribly bored.

There is a considerable liability to being a thetan from the standpoint that one is quite immortal. Even death cycles will look good to a thetan whose aberrations have reduced him down from the goals and hopes he once had. Now he begins to have hopes for a MEST body. This body will grow and die but at least it will change. Aberrations cut this thetan down to a point where he couldn't see any change possible, could not see his own goals would ever be attained; so he fixated on a MEST body, became involved in the pure mechanics of operating and caring for one, became more aberrated by contagion from the entities in that body and the

uncertainty of life in a mortal being, lost his goals as a MEST body, finally became pretty sordidly sick of the whole thing.

Now, magically, you uncover for this thetan six or eight banks full of seventy trillion years or less of incident. The thetan is a wizard at liking to act at being somebody else. That got him into believing he himself was a MEST body. Well, it will also get him into believing he is any one of the entity banks you uncover. And he will let you audit these things until doomsday. Vicarious existence, better than a motion picture.

But ask this thetan to confront the existence which he shudderingly forsook ? Never! It was boring. He's been through all that. He actually knows what happened to him but it was bad enough to make him wish to forget it until he forgot it. He'll say he's this entity or that. He'll be happy, in preference to facing his own past, to just go on and perish as a MEST body.

There are two remedies for this. The first is the E-meter. That is an unequalled remedy. You can find out the identity of every bank in the preclear and know that the thetan isn't any one of them. You can find out the first to last transfers. You can discover the location of every incident the thetan should run.

Now in using the E-meter you will discover something strange with regard to the thetan. At first the meter will be much more active on the entities than on the thetan himself. For one thing, the thetan should be OUTSIDE the body. For another, the thetan would rather look over and shove into view incidents he himself has never before seen. He'll help you audit these entities endlessly.

People who keep running incidents without any recourse to an E-meter will achieve much with the body, very little with the thetan— hence there is no rise in tone although the auditing hours continue to stretch out. In people who continually self-audit without direction, the thetan is just being very propitiative toward MEST bodies and is giving the entities a wonderful work-out. The body gets better sometimes. The thetan never gets better. And he is "I."

The behaviour of the thetan in the past was often copied after something he took from the entities. He found an entity role would

restimulate, he became the actor and performed the role. He left his own bank alone and neglected although there were aberrations to dramatize there too. (And by the way, you will find the thetan occasionally trying to stop the body from dramatizing out of entity banks).

The thetan bank, the one you want, will give you less active needle response than the entity banks when you first start auditing. This is a sort of negative sorting. But you may have to audit an entity or two because of the way the entity has the body stuck on the track.

The point is to find the thetan bank and audit it. The conflict in this person derives from the ambitions of the thetan being balked by the laziness and stupidity and desire for death and destruction on the part of the entities. You can audit any side of this conflict you want. But by simply making the thetan sufficiently strong, the entities become cowed and won't act up or even drop out and leave.

The other answer is to clean up present life with attention to all transfers in it, all switch transfers, all control transfers. Audit the thetan handling the body until you have the current life well up.

You will find that you will have to start by giving the preclear a drill to locate where the thetan is. Simply run him up and down the track through various incidents, with good attention to attention unit running, each time locating the thetan outside the body and handling it. The preclear will get a dim concept of the handling but he will get a good concept of the location of

the thetan. Now, in the current lifetime, locate the thetan being distracted from his task by noises or arguments in the environment.

Run the sympathy of the thetan for the body, the refusal of the thetan to feel sympathy at times. And run in particular antagonisms or angers from the body at other bodies, from the other bodies at the thetan's body. Get all the DED-DEDEX computations out of the way and then audit the thetan entrance somewhere around the time of birth. It isn't an entrance, it's a possession of the motor controls.

When you have this thetan in good shape for this lifetime he will be strong enough, usually, to tackle NIPS, BLANKETINGS, BORROWINGS. But don't be amazed when you run your first of these to find that the thetan has been using an entity bank. Any borrowing, however, is good to run. Any blanketing on the second dynamic shows your preclear once and for all that he IS a theta being without a body by showing him an incident to that effect.

If the case is incapable of finding the thetan in current life, then take the youngest entity and audit it.

It generally is the thetan but transferred inside the body.

How long it will take you to audit a preclear to theta clear one cannot say. The route reaches high very quickly. Using this know-how and 80 you will attain a MEST clear in a very short time. Aside from inaccessible persons and psychotics in general, most cases should become MEST clear in a few weeks of hard auditing.

What is Scientology?

L. Ron Hubbard

“Scientology” is a new word which names a new science. It is formed from the Latin word *scio*, which means *know*, or *distinguish*, being related to the word *scindo*, which means *cleave*. (Thus, the idea of differentiation is strongly implied.) It is formed from the Greek word *logos*, which means *the word*, or *outward form by which the inward thought is expressed and made known*; also, *the inward thought or reason itself*. Thus, *Scientology* means *knowing about knowing, or science of knowledge*.

A science is not merely a collection of facts, neatly arranged. An essential of a science is that observations give rise to theories which, in turn, predict new observations. When the new observations are made, they, in turn, give rise to better theories, which predict further observations.

A science grows. Its most important growth is not in numbers of facts but in the clarity and prediction-value of its theories. Many fields which call themselves sciences substitute fact-collecting for theorizing, others substitute theorizing for observation. Without both, there is no science.

The “exact” sciences contradict each other daily. This is not because their observations are wrong, but because they cling to old theories that conflict instead of finding the newer, simpler theories.

Scientology has introduced new simplicities of theory into the field of human thought and has brought the study of human thought up to a level at which it begins to embrace all thought and all life, not only of man, but of all organisms.

Scientology is not a therapy for the sick, although from Scientology such a therapy may be derived.

Thought is the subject matter of Scientology. It is considered as a kind of “energy”- which is NOT PART of the physical universe. It controls energy, but it has no wavelength. It uses matter, but it has no mass. It is found in space, but it has no position. It records time, but it is not subject to time. The Greek word (and letter θ) *Theta* is used as a symbol for thought as an “energy.”

The Handling of Arthritis

L. Ron Hubbard

The disability commonly called arthritis is actually a chronic somatic of the depository type.

Calcium or other minerals become deposited in the joint structures or on the bones of the body, and there, impeding circulation and often causing swelling, occasion considerable pain.

Joint limitation of motion is often marked, and quite commonly progresses to a point where the individual must use crutches or a wheel chair. The arthritic may have any joint or area of his bone structure so impeded that the ailment may be manifested by claw hands, or hunched back, or stiffened knees.

Characteristic of the disability is a certain immobility of the body and muscles. This stillness is strongly contrasted to the spastic's twitching motions.

The sufferer from arthritis generally is subject to endocrine failure. The thyroid is deteriorated, the estrogen or androgen glands are relatively inactive. The glands which monitor the calcium in the body and its solution in the bloodstream are evidently particularly inactive.

Calcium in solution in the blood becomes deposited in areas having restricted, or sluggish, flow. In Scientology, it can be demonstrated that a restriction of circulation is present in those areas which have suffered previous injury. The injury, although perhaps forgotten, or suppressed, nevertheless can become active, thus placing a mental block over the area to become affected and inhibiting normal mental communication and physical functioning with and in that area.

The damage to joints in any arthritic can be demonstrated easily by testing the individual on an E-Meter where it will be discovered that the area affected indeed has been injured.

Arthritis, then, is structurally a deposit of calcium, or other mineral, in an area which has been restricted by an old injury. The injury is held in suspension and in place in the area by restimulation of the environment which contains some of the factors present when that area was injured. It is a condition of such an injury, in order to be in suspension sufficiently to cause arthritis, that the sufferer himself must have administered a like injury to another person.

The processing of the chronic arthritic may be pleasant or difficult. This depends upon where the individual may be found on the tone scale.

Arthritis occurs at three places on the tone scale. The first is .375, an area of extreme apathy where motionlessness in general makes it easy for deposits to occur. The second is its harmonic, .75, the area of grief, where the suppression of losses of allies or possessions causes a rigidity, a belated effort to hold that which already has departed. The third is the next harmonic, 1.5. This is the band of anger.

The .375 often is easy to process, but the apathetic state of the individual occasionally denies the auditor cooperation, even though it appears to be present. The .75 is best relieved by a discharge of grief, where this can be obtained; but grief in a chronic .75 is quite often occluded. The processing of the 1.5 is best effected by running anger, both the anger of others toward the preclear and the preclear's anger toward others.

All three levels of arthritis can be affected interestingly by running sympathy for persons who are in a motionless position, such as the ill, and by running sympathy of others for the preclear when he has lain in a motionless position, as in illness. The next most

important thing to run is waiting, or enduring, both on the part of the preclear, or others, and when they have waited, or endured for him, or on his account. These incidents by themselves have commonly produced an alleviation of arthritis.

The complete and entire reduction of arthritis, so as to inhibit its return at any time in the future, depends on the running of electronic incidents by Technique 80, in particular its famous black and white process.

There are many things which can be done for the arthritic, many processes which can be used. It is impossible in this short space to give one of the many case histories of arthritis, under process, or to give all the techniques, or complications of cases concerning it.

Of all the ills of man which can be successfully processed by Scientology, arthritis ranks near the top. In skilled hands, this ailment, though misunderstood and dreaded in the past, already has begun to become history. Twenty-five hours of Scientology by an auditor who fairly understands how to process arthritis can be said to produce an invariable alleviation of the condition. Some cases, even severe ones, have responded in as little as two hours of processing, according to reports from auditors in the field.

The discovery and increase of life energy in the genus Homo Sapiens

by

L. Ron Hubbard

1952

*To my good friend, the late
Commander "Snake" Thompson (MC) USN
and his friend and teacher,
Sigmund Freud*

EDITORIAL NOTE

1952

L. Ron Hubbard was one of the first students of nuclear physics in the United States.

In 1932 he believed that Life and its behavior obeyed natural laws of the same order as electrons and other particles of motion. He began a study and search which led him through many fields of science and across many continents.

In 1948 he published the "Original Thesis" on his findings for the medical and psychiatric professions. In 1950 he permitted a popular work to be published and was considerably astonished that it became a best seller quickly. Since 1950 he has worked constantly upon the original project of discovering and conducting the source of Life Energy and with this work announces the attainment of that fact.

This volume is a detail of the discovery, its formula, and the factors necessary to bring the fact into application.

For three years, scientific controversy has raged around L. Ron Hubbard's work. The most degrading attacks and flowery praise have greeted his activities from every quarter, lay and scientific. He has given the acceptance of his work and the attacks and praise alike little thought but has continued to follow his route of discovery. His issuance of these findings caps a scientifically stormy career. It is doubtful if the storm will grow calmer in the face of the calm announcement that one has discovered and isolated life and provided the techniques for its use and conducting.

Careful testing by many persons already has assured the truth and usefulness of this work. It is not experimental but has been applied scientifically and confirmed in many quarters.

FOREWORD

WHAT IS SCIENTOLOGY?

“Scientology” is a new word which names a new science. It is formed from the Latin word, “scio”, which means KNOW, or DISTINGUISH, being related to the word “scindo”, which means CLEAVE. (Thus, the idea of differentiation is strongly implied.) It is formed from the Greek word “logos”, which means THE WORD, or OUTWARD FORM BY WHICH THE INWARD THOUGHT IS EXPRESSED AND MADE KNOWN: also, THE INWARD THOUGHT or REASON ITSELF. Thus, SCIENTOLOGY means KNOWING ABOUT KNOWING, or SCIENCE OF KNOWLEDGE.

A science is not merely a collection of facts, neatly arranged. An essential of a science is that observations give rise to theories which, in turn, predict new observations. When the new observations are made, they, in turn, give rise to better theories, which predict further observations.

A science grows. Its most important growth is not in numbers of facts but in the clarity and prediction-value of its theories. Many fields which call themselves sciences substitute fact collecting for theorizing, others substitute theorizing for observation. Without both, there is no science.

The “exact” sciences contradict each other daily. This is not because their observations are wrong, but because they cling to old theories that conflict instead of finding the newer, simpler theories.

Scientology has introduced new simplicities of theory into the field of human thought and has brought the study of human thought up to a level at which it begins to embrace all thought and all life, not only of man, but of all organisms.

Scientology is not a therapy for the sick, although from Scientology such a therapy may be derived.

Thought is the subject matter of Scientology. It is considered as a kind of “energy” which is NOT PART of the physical universe. It controls energy, but it has no wave length. It uses matter, but it has no mass. It is found in space, but it has no position. It records time, but it is not subject to time. The Greek word (and letter), THETA, is used as a symbol for thought as an “energy”.

Technique 8-80 is a specialized form of Scientology. It is, specifically, the electronics of human thought and beingness. It is basic in answering the riddles of life and its goals in the MEST universe.

The goal is *Survival*. The means to survival for life is the handling and use of energy.

The “8-8” stands for “Infinity-Infinity” upright, the “O” represents the static, theta.

A new student of this subject is referred to the logics and Axioms and the basic processes of thought, counterthought, emotion, counter-emotion, effort, counter-effort, attention units, and counter-units.

Technique 8-80 appends but does not amend or replace any earlier material. It does the work of Scientology more quickly if used against an understanding of the basic subject.

SCIENTOLOGY: 8-80

CHAPTER ONE

This book is started with the Auditor's Code, for any experimentation with these phenomena must be done in full awareness of this code. An "auditor" is one who "listens and computes", and is a practitioner in Scientology. Experiments done without strict adherence to this code will fail.

The auditor who does not know, or practice at all times, the Auditor's Code, is ignoring one of the basic tenets of Scientology. This code has been called "the code of how to be civilized". Much more important than knowing mechanical techniques is knowing well the attitude one should have toward a preclear. This is not for courtesy but for efficiency. No preclear will respond to an auditor who does not adhere to the Auditor's Code.

Breaking the Auditor's Code, at first glance, may not appear to be a very great sin. But an auditor has undertaken to aid a fellow man, and his dedication to that purpose must be sincere to the point of sacredness.

The following points, taken from *Science of Survival*, should be as much a part of an auditor's thinking and attitude as his knowledge of reading and speaking. Unless one feels he can adhere to this code, he should not, under any circumstances, attempt to audit anyone:

The auditor conducts himself in such a way as to maintain optimum Affinity, Communications, and Agreement with the preclear.

The auditor is trustworthy. He understands that the preclear has given into the auditor's trust his hope for higher sanity and happiness, and that the trust is sacred and never to be betrayed.

The auditor is courteous. He respects the preclear as a human being. He respects the self-determinism of the preclear. He respects his own position as an auditor. He expresses this respect in courteous conduct.

The auditor is courageous. He never falls back from his duty to a case. He never fails to use the optimum procedure regardless of any alarming conduct on the part of the preclear.

The auditor never evaluates the case for the preclear. He abstains from this, knowing that to compute for the preclear is to inhibit the preclear's own computation. He knows that to refresh the preclear's mind as to what went before is to cause the preclear to depend heavily upon the auditor and so to undermine the self-determinism of the preclear.

The auditor never invalidates any of the data or the personality of the preclear. He knows that in doing so he would seriously enturbulate the preclear. He refrains from criticism and invalidation no matter how much his own sense of reality is twisted or shaken by the preclear's incidents (past experiences) or utterances.

The auditor uses only techniques designed to restore the self-determinism of the preclear. He refrains from all authoritarian or dominating conduct, leading, always, rather than driving. He refrains from the use of hypnotism or sedatives on the preclear no matter how much the preclear may demand them out of aberration. He never abandons the preclear out of faint-heartedness about the ability of techniques to resolve the case, but persists and continues to restore the preclear's self-determinism. The auditor keeps himself informed of any new skills in the science.

The auditor cares for himself as an auditor. By working with others he maintains his own processing at regular intervals in order to maintain or raise his own position on the tone scale despite restimulation of himself through the process of auditing others. He knows that failure to give heed to his own processing, until he himself is a "release" or a "clear" in the

severest meaning of the terms, is to cost his preclear the benefit of the auditor's best performance.

The goal of the auditor is to rehabilitate the selfdeterminism of his preclear, to bring back his hope and power, to get his preclear up to where the preclear, all of his own, KNOWS.

The preclear has to take very little on faith with these techniques. He simply runs what he is told.

The auditor should not bully his preclear or evaluate for him.

Most important, the auditor should choose for his preclear a person worth salvaging, who will in his turn help another. We have so much to do!

CHAPTER TWO

Life is a static, according to the Axioms. A static has no motion. It has no wave length. The proofs and details of this are elsewhere in Scientology.

This static has the peculiarity of acting as a “mirror”. It records and holds the images of motion. It even can create motion and record and hold the image of that. It records also space and time in order to record motion which is, after all, only “change in space through time”. Played against motion as a kinetic, the static can produce live energy.

In a mind, any mind, the basic beingness is found to be a static on which motion can be recorded, and which, acting against motion, produces energy.

A memory is a recording of the physical universe. It contains—any memory—a time index (when it happened) and a pattern of motion. As a lake reflects the trees and moving clouds, so does a memory reflect the physical universe. Sight, sound, pain, emotion, effort, conclusions, and many other things are recorded in this static for any given instant of observation.

Such a memory we call a “facsimile”. The mind, examining a facsimile it has made, can see it, feel it, hear it, re-experience the pain in it, the effort, the emotion.

There are billions of facsimiles available to any mind. Billions of billions. These facsimiles can be brought into present time by the environment, and “unseen” or “unknown” by the awareness of awareness of the mind, can reimpress their pains, efforts, and aberrations upon the being, thus making one less liable to survive. All unknowingnesses, confusion’s, aberrations, psychosomatic ills are traceable to facsimiles.

One believes he can use *any* facsimile he has ever received. He has been hurt. He uses the facsimile of being hurt to hurt another. But since one survives as well as everything else survives, to hurt another is *wrong*. One *regrets* the injury, seeking to turn back time (which 25 regret). Thus the facsimile he used becomes interlocked with his facsimile of trying to use it and both facsimiles “hang up” and travel with present time. One even gets the *pain* he seeks to inflict on another, this being the action against him of the facsimile he sought to give, by action, to another. It startles the preclear, when run through a boyhood fight, wherein he hit another boy in the eye, to feel the pain in his *own* eye at the instant of the blow. And so it is with *all* inflicted injuries.

This is a simple matter of the interaction of the pictures of energy.

This is a “maybe”, indecision, inaction. This is aberration—trying to do unto others what was done to you—good or bad.

An interplay of static against motion or between two classes of motion, one relatively static to the other, can and does produce active electrical energy in beings of different characteristics and potentials. This makes a living being an electrical field more capable of high potential and varieties of waves than are known to nuclear physics, of which Scientology is a basic.

This created energy played lightly over a “facsimile” reactivates it and causes it to bear upon a being once more. This is an activity of thinking.

A “facsimile” brought into play by a moment of intense activity may afterwards, when the being is again producing only normal energy output, “refuse” to be handled by the lower energy. This facsimile then can trap the energy of a being and turn upon him the pain, emotion, and other things recorded in the facsimile. The facsimile thus can absorb energy and give pain,

especially when the being holding it has forgotten it or does not perceive it. This is restimulation.

By concentrating a live energy flow upon a facsimile directly, the being can erase, disintegrate, or “explode” or “implode” it.

As heavy facsimiles are the hidden source of human aberration and psychosomatic illness, their erasure or better handling by the being is intensely desirable.

The remedy of human aberration and illness is a minor goal of Scientology. Its discoveries make this possible.

CHAPTER THREE

If Life—or theta, as it is called in Scientology (q)—is a mirror and a creator of motion which can be mirrored, it follows then that mirror-wise, the whole of the laws of motion, magnetism, energy, matter, space and time can be found in thought, and behavior and even thinking partake of the physical universe laws regarding matter, energy, space and time. Thus even the laws of Newton can be found operative in thought. Fortunately all this is beyond the need of an auditor's immediate grasp of the subject for if it were not, an auditor would have to be first a nuclear physicist before he could begin to make the lame well and the able more able.

Some understanding of the matter is, however, desirable—otherwise some very weird philosophies would develop which would benefit none. Man has been ridden to death by philosophies which, unproven by any result, yet achieved enough prominence to spoil many a society (Schopenhauer or Nietzsche, for example). And many a scientific effort has fallen into disrepute because of philosophic misrepresentation.

Kant and Hegel all but ruined any hope nuclear physics or the humanities had by wild misinterpretation (in resounding language) of Indian philosophy and other early efforts to resolve the riddle of existence. So let us see how very basic and simple are the reasons why we audit what we audit.

Life can create motion or use motion or mirror motion.

Motion is a change in space. Any change involves time. Conversely, for there to be time, there must be change. If no change occurs we have the illusion of a static again.

The main trouble with facsimiles is that they “hang up” in time, then become timeless and then give the concept of “no change”. Our preclear, desiring to change for the better, cannot change because he is “hung up” in a memory which he “can't” change. The auditor wants change. Timelessness or forgiveness prevents change and these unwelcome conditions come about when a facsimile “hangs up” in present time. This makes the preclear feel he is unable to change. No matter what you do for him, if you do not get him “into present time” or (the same thing) get the facsimiles *out* of present time, you have “no change”.

Thus we had better know what makes a facsimile “hang up”, and, “hung Up”, act upon the preclear.

We see that a facsimile is a mirror of old motions. It is undone and gotten out of present time by dropping out its “motion”.

Only the mind can put the “motion” of a facsimile back into motion in the physical universe.

The facsimile is “made” by the mind's ability to duplicate the wave or motion patterns of the physical universe.

A “live” attention unit operates only in present time. A facsimile is composed of “dead” attention units, a pattern once made by “live” units in some past present time. For example, one sees a man. His attention units could be said in that instant to make up the pattern of what he sees. A moment later, he has a facsimile made up of “dead” attention units. He can “see” this man again simply by throwing *live* units at patterns of *dead* units. The facsimile can come “alive” and active only when *scanned* by live units. Then, it can stay “alive” so long as live units are fixed on it. It will not “run out” or dissipate unless a large number of live units are played on it. Thus, a facsimile can “hang up”. This is an analogy, but it will do for an auditor.

An auditor can “see” his preclear as a mind which is surrounded by old facsimiles which are given just enough attention to keep them “in present time”. It is the task of the auditor

to drop *all* facsimiles into an inactive state. It is a grim fact that one really doesn't think with these heavy facsimiles. *One could survive quite well if he had no facsimiles!*

Thought can pervade an area or approximate a situation and *know*. The mind thinks with light facsimiles, or no facsimiles at all.

Thus there is a compulsion early on the track to have facsimiles. Then, as one ceases to "know", one is at length no longer in control of his facsimiles but is their victim. Given enough facsimiles, a man dies; a theta being decays until it can't even be a Man.

How, then, does one strip away facsimiles from the present time of the preclear? The auditor would have to audit billions of them to erase all the facsimiles the preclear has made or "borrowed" and which now act heavily upon him, giving him illness, degradation and aberration—as well as amnesia as to his actual past.

We can rehabilitate the preclear by raising his ability to create energy, and thus bring him to a "speed" which has sufficient output for him to overcome facsimiles. We do this by erasing or reducing certain facsimiles, and, in doing so, retrain our preclear to produce a higher energy potential.

CHAPTER FOUR

A wave length is a characteristic of motion. Many motions are too random, too chaotic to have orderly wave lengths. An orderly wave length is a flow of motion. It has a regular repeated distance between its crests. Take a rope or a garden hose and give it a flip. You will see a wave travel along it. Energy, whether electrical, light, or sound, has some such pattern.

This is a smooth flowing wave. Its length is between crests. It is measured in units of length such as centimeters or inches or feet.

A flow can have many patterns.

These still have wave length. We are not much interested here in patterns or characteristics. We are interested in lengths.

Here are some rough estimates of wave lengths which produce reactions on the mind, a tone scale of wave lengths. (Accurate lengths not given here.)

		Wave Length
tone	_____	• or 0.0
39.0	_____	.00000000000000000000000002 c m.
8.0	_____	.0000002 c m.
1.5	_____	.024 c m.

Note how gross is emotion, how tiny is the wave producing aesthetics (art).

A wave length is not the *power* of a wave. A small length, given enough volume, is deadlier or stronger than a gross wave.

Now we see that a facsimile can have a mirrored set of wave lengths which match any wave in the physical universe. Actually, theta can create waves. Thus a facsimile can contain heavy effort or emotion and throw that back at the preclear. A facsimile, restimulated by the preclear's attention units, can contain enough force to bow his back out of shape, scar his flesh, give him actual electrical shocks, or make him hot enough to run a fever, to say nothing of changing his ideas.

Theta can be forced to have a facsimile it did not create. Hit a man, operate on him, beat him, give him a shock—he then will have a facsimile which can reactivate when his attention units, later on, accidentally sweep over it.

However, theta, to be made to have and hold any facsimile, must be “built down”. *The only reason theta will hold to a facsimile, the only mechanical way it can hold any facsimile, is by having it attached to theta itself.*

We can see that facsimiles are unnecessary, restrictive, and in short, are control mechanisms. To control anyone, it is necessary to do one of two things:

- (1) Give him a basic facsimile strong enough to put him in pain if he fails to obey it;
- (2) Build on such heavy facsimiles.

For example, a dog is beaten for barking and told to be quiet. Afterwards it is only necessary to tell him to be quiet. This is both operations in one.

In the case of a man—much sturdier stuff than a dog—it requires a *very* heavy facsimile as a basic, and facsimiles such as operations, accidents, beatings have to have as a basic facsimiles so strong their counterpart cannot as yet be duplicated on Earth. The basic facsimile must answer a very important condition: its wave lengths must have, at least in part, a near approximation of theta itself.

What wave most closely approximates theta? It would be one of nearly infinite smallness, and that wave is found to be aesthetic, the wave length of the arts.

Reason, analytical waves, are too coarse to attain theta's zero or infinity “wave length”. Art alone may do so.

The proof of all this is its workability. And it works. We have, then:

Aesthetics
Reason
Emotion
Effort

To make theta hold a facsimile of emotion or effort, or even reason, the facsimile itself must contain an aesthetic wave. The last alone can hold the recordings of pain, grief, exhaustion, aberration and force in upon theta.

If we had to take the emotion, effort, and reason or mis-reason off the whole track, we would have a long task. If we remove the *compulsions* toward aesthetics, we have cut away the only bridge by which heavy facsimiles can be appended to theta. Theta *manufactures* aesthetics. Implanted aesthetic waves, then, if strong enough, could obsess theta into acting on enforced aesthetics.

This *does not* say aesthetics are bad. It says *enforced* aesthetics are bad. You can't beat a woman into being beautiful. You could beat her into being obsessed about beauty.

That which you see as beautiful of your free will gladdens you. Out of an obsessive aberration, all beauty becomes hideous even when the aberration cries out how lovely it is.

Just as we have enforced and inhibited ARC, we have enforced and inhibited aesthetics. These, processed, drop off the heavy facsimiles which are thus tied to theta. Process aesthetics and occlusions vanish and current life can be cleared in a few hours.

But what manner of incident is held by an aesthetic wave and how is it processed? It is so simple.

CHAPTER FIVE

Neither you nor a preclear need accept “whole track” or the identity of the thetan as described fully in *What to Audit (A History of Man)*. Not to begin. You’ll very rapidly make up your own mind about it when you start the process “Black and White”.

To audit an “assist”, a grief charge, an engram, see earlier works. These items are still with us. That “Black and White” solves engrams and locks wholesale does not mean single incident running is not effective and that it should not be known. But these and their techniques have no place here in “8-80”.

Single incident processing, effort processing, the running of secondaries all are replaced by “Black and White”. Straight wire, lock scanning, valence shifting all are replaced by “concept processing”. The wide-open case, however, is processed on single incidents and concepts as necessary, for the wide-open case does not see white except in an actual electronic.

The reason for this is that “Black and White” and “concept running” make clears, MEST and theta, in a very short time *and* they are so simple that one cannot mistake any of his moves. While an auditor can get complete results with them, they do not try his wits. They are 1, 2, 3 processes.

Concept processing and “Black and White” mean the goals of Scientology will be reached very soon. They mean that none in Scientology should be other than a MEST clear.

As for “whole track” and thetans, I wouldn’t dare say a word if “Black and White” didn’t show them up with alarming velocity. A preclear can soar so in tone on “whole track” and “Black and White” that his capabilities so acquired cannot be ignored even by the bitterest foe of truth and freedom.

As detailed in *What to Audit*, there are many electronic implants on the whole track. In other words, any preclear has, in the last few thousand years, been placed in an electronic field and rendered null, void and obsessed by heavy “electrical” currents.

The object was slavery, a compulsion to be good and obedient, and to have a MEST body.

As one makes a dog tame by beating him, one has been made to obey by being beaten with force fields.

A heavy blow gives amnesia. A heavy force field can utterly nullify the entire personalness of a being.

You will not be long in the processing before you finally discover to your own joy that you are you, not a perishable MEST body.

You will find electronic incidents very vicious and so heavy that they push one down scale to a not-beingness which is summed up by “I am not”, “I know not”. Disbelief, distrust, and many other low scale concepts rise as you run these heavy incidents.

Somatics of great conviction, however, await your first contact with “Black and White”.

The electronic fields are ready to be run. They are in “present time”. They contain heavy effort and emotion. *And they also contain an aesthetic band. The aesthetic waves alone pin these facsimiles to theta. You run out the aesthetic wave band and you have run the incident.*

CHAPTER SIX

The running of “Black and White” is very simple: simple to do, easy to audit.

The best auditing and the fastest by far is done with the E-Meter. The meter practically runs the case. Most important, it spares the auditor from too close a concentration on his preclear’s reactive mind, the only aberrative thing about auditing.

“Black and White” can be self-audited, but in this case the E-Meter becomes quite vital.

Tell any preclear to “see” if he can find a “white area” around him. He will perceive, clearly or weakly, a blackness or a spotty black-whiteness, a grayness, or a whiteness around him, above him, or below him. It may be in patterns or there may be color in it. You *don’t want ANYTHING but WHITENESS.*

Tell the preclear to “turn it all white”. He will find that if he puts his attention in the center of the sphere, or if he pushes or pulls a little, he can get the field white.

Tell him to keep it white. He will have to change and shift his attention around in the field but he can do it. If his attention keeps slipping off, the field will turn black on him. Keep telling him to put his attention back on the place that turns the area around him white.

If you have him on a meter, as you should, you will be able to “read” exactly what is happening.

If the needle steadily climbs to the left (rises), he is keeping the field white. The incident is running out.

If the needle stops or is “sticky”, he has a large section of black in the field he must make white. The incident, with black in it, is *not* running out.

If the needle rises and jerks suddenly to the right(drops), he has just gotten a somatic and the suddenness and amount of the drop measure the amount of pain.

To audit, all you do is make him keep the field white. Black spots will appear just before the somatic hits. Theoretically, the entire incident could be run without somatics simply by keeping it white.

The aesthetic wave is all you want out of the incident. This gone, the rest vanishes. It is like having a heavy curtain hanging by a thin strip. Cut the strip and you cut down the whole curtain.

Run the aesthetic band only. The incident is gone. Run out the heavy electronic incidents and all heavy facsimiles go, for only an electronic can keep a thetan aberrated and form a base “sticky” enough to cause other incidents and locks to stay in present time or restimulate.

When the preclear cannot get the field, an electronic flow is bouncing him. Get his attention to the flow source and keep putting it back every time it bounces until he can manage it. Or, unburden the case with concept running, for if he cannot get white, you must take off some of the “upper” burden of locks by concept running.

What of boil-off???

Boil-off, that sinking into grogginess or even unconsciousness, cannot be permitted. It wastes time and does no good.

How to stop it? Your pc is sending or receiving a white flow. If he stays at it until after he should have reversed it, it goes black and he will start to boil. By quickly shifting the flow of attention or direction of motion in the incident, whiteness returns and the tendency to “boil-off” vanishes.

Hence, by discovering the source of boil offs and how to stop them, we save much time.

CHAPTER SEVEN

What do we mean by aesthetic?

We mean solely, and only, *Beautiful*.

Beauty is theta. Any wave close to theta is taken by theta for beauty. A harmony of wave motion is evidently a lower harmonic of beauty. A disharmony of wave motion, no matter how high the wave length, is ugliness. But ugliness is also a wave, a disharmony with the wave length of beauty* but very close to it.

Light and dark waves, as they appear to attention units, go in harmonics all the way down the scale from .0000000000000000000000002 centimeters to the bottom.

It must be remarked that this is an approximation, a rough analogy, for the auditor, not the engineer.

Do NOT get beauty entangled here with LOVE or anything else but beauty. Beauty is a wave length closely resembling theta or a harmony approximating theta. Ugliness is a disharmony in wave discord with theta.

Theta will stop ugliness or disharmony or try to stop it; that is to say, the wave of ugliness will disrupt theta.

This may sound quite poetic. It is, in fact, very “hard boiled” engineering. It is just a matter of wave lengths, apparently.

Thus an incident *must* have a beauty factor if it is to append itself to theta. Or it must be underlain by an incident with such a beauty factor.

The “beauty” in this case, and where we will find it to audit, is actually a counterfeit of theta, an obsessive beauty which enforces beauty and forbids ugliness. Theta, left alone, will seek beauty and fight or shun ugliness. It would have to be able to if it could be aberrated into an obsession about beauty. That this obsession is present, an auditing test leaves no doubt.

If your preclear will run the concept of beauty in the white of an electronic incident and the concept of ugliness on the black if it *insists* on coming in, the incident will run out.

Direct the preclear’s attention to the white and have him get the concept that it is beautiful. He will not have to employ much effort to keep it white if he keeps this concept.

If the black keeps encroaching, have him run the concept of ugliness on it. It will lose force.

Some preclears are so badly aberrated that black has become the only desirable shade. Here is the criminal. The preclear can run how beautiful black is. He won’t do it for long.

The original incidents when they were laid in were designed to be obsessive. Most have the beauty-ugly motive. This makes the victim obsessed to keep all calm and not fight.

There are even scenes—“hot facsimile” pictures made of raw energy—to show him beauty. As if theta had no concept.

The other twin which a preclear gets in some incidents is good-evil. Good is a rational level wave, a harmonic on beauty, much lower. It evolves into beauty when run and should to get the incident free. Evil, of course, is as black as white is good. Religious obsessive incidents (complete with religious scenes) come in easily and run when the white is run with the concept “good”. This soon goes up scale to beauty.

All electronic incidents run out on “black and white” with the concept of beauty and with a placing of attention so that the white turns on as bright as possible.

These incidents were intended to be confusing, the better to make a slave obey (they thought). By running half the waves one way and half the other, a beauty-ugly conflict was created.

One side appears to go black when the other is run. Just get the concept of beauty and follow the waves and the concept runs out the confusion.

*Honor, gallantry, purity are lower wave lengths. They can be run until beauty is found.

CHAPTER EIGHT

Concept running is easily done. The preclear “gets the idea” of knowing or not being and holds it, the while looking at his time track. The concept runs out, or the somatic it brings on runs out, and the concept itself is run. It is not addressed at individual incidents but at hundreds.

A concept is a high wave thought, above perception or reason or single incidents. Thus as concepts are run, many incidents may tumble into view.

Concepts can be “in-run” or “out-run”. This would be somebody having the concept of the preclear or the preclear having the concept himself. If the preclear runs a concept and starts to boil-off, have him reverse the flow. If he was running it as his own, have him run it as another’s and he will immediately cease the boil-off.

You can have a concept of anything, even a concept of confusion. The top and bottom points on the scales of the Chart of Attitudes (See *Handbook for Preclears*) make good concept material.

BUT, the only concepts we have to use in running out locks or whole lives, knocking away scores of incidents at a time, are:

- Beauty
- Ugliness
- Cause of ugliness
- Cause of beauty
- No-sympathy
- Sympathy
- Good
- Evil

Wherever there is an occlusion on a case, make the preclear run these on it. Whenever the scenery or people are too bright or fixed, have him run these on it.

That’s all.

- (Start, Stop, Change, Attainment, Inability to reach.)

CHAPTER NINE

You can run beauty and ugliness on parts of the body, on persons in the preclear's past, and on the current and former bodies of the preclear.

When you do the last, you will find this pattern showing up in his current body:

Each line on the vertical is a ridge left by some past body. The ridges, turned white bring a visio of a former body.

The preclear, as a thetan, diminished in size as time went on. The first impression seems like a very small person, about down to the thighs from the level of the mouth.

The preclear had bodies further away than this.

Decreasing Control Distance

If No. 2, as an engram, is in restimulation, the preclear will think he is at Position A behind himself, whereas he is frozen solidly by aberration into his own MEST body.

To separate the preclear from bodies and discover why he thinks he is only the current body, run this about bodies, particularly on old facsimiles of bodies a few feet in front of him:

1. Non-sympathy for body
2. Sympathy for body
3. Propitiation for body
4. Being a body

Here he will recover rapidly the sensation of his becoming nothing and the body everything. Run beauty - ugliness on all bodies he ever had.

CHAPTER TEN

The patterns of attention, or wave, flows are:

SOURCE

Simple Flow.
Fix Attention on Source.

Explosion.
Sphere or disc. Out from center. Fix attention on center, then on the surface, collapsing it.

Implosion.
Imploding into center. Fix attention on center, then on surface, getting out from it.

Retractor Wave.
Put attention on both directions at once.

Work on all flows until they turn white.

For everything that you find happened to the preclear, he did something like it to another.

Run any incident until it seems “sticky”. Then run the opposite. Back and forth as required. Incidents run, then, first the Motivator or DEDEX, then the overt, or DED.

For every inflow there is an outflow in all present time locked facsimiles. Any flow run until it goes black will turn white or erase when the direction of flow is reversed.

When any part of the body puts out in a single direction only, or too long, it will aberrate.

The thetan puts the wave of beauty into bodies, gets back low level or sex (just below beauty). The thetan doesn't get a beauty wave back from bodies. Putting out too long, the thetan keys in the “beauty” counterfeit of a facsimile. Thus, electronic incidents come into play. Run the thetan putting out, or failing to put out, beauty into bodies and situations.

CHAPTER ELEVEN

While the auditor can do much solely by reducing facsimiles, he soon will find that his preclears are not always able to erase facsimiles easily. He will find occasionally that he often has a difficult time when a particularly heavy facsimile is in restimulation and, do what he will, the auditor may find his preclear's tone remains unchanged and that the preclear's attitudes have not evolved to a better high.

We now come to "The Governor", mentioned in a lecture in the Autumn of 1951. The speed of a preclear is the speed of his production of *energy*.

The most important step in establishing a preclear's self-determinism, the main goal of the auditor, is the rehabilitation of the preclear's ability to produce energy.

A being is, apparently, an energy production source. How does he produce live energy without mechanical means, cellular activity, or food?

The basic principle of energy production by a being has been copied in electronics. It is very simple. A difference of potential of two areas can establish an energy flow of themselves. Carbon batteries, electric generators, and other producers of electrical flows act on the principle that a difference of energy potential in two or more areas can cause an electrical impulse to flow between or amongst them.

The preclear is static and kinetic, meaning he is no-motion and motion. These, interplaying, produce electrical flow.

A preclear as a static can hold two or more energy flows of different wave lengths in proximity and between them obtain a flow.

A preclear can hold a difference of flow between two waves and a static so long (and arduously) that the effect of a discharging condenser can be obtained. This can "explode" a facsimile.

The preclear flows electrical currents of command at the body. These hit pre-established ridges (areas of dense waves) and cause the body to perceive or act. The preclear takes from the body perception with tractor beams. He holds the body still or braces himself against it by wrapping a tractor (pulling) beam around it while he places a pressor (pushing) beam at his back to command himself into action. (You can almost break a preclear's spine by asking him to contract his own tractor around his body and yet withhold the pressor against his spine.)

All an auditor really needs to know about this is the elementary method of using a difference of potential. That creates energy.

The only thing wrong with a preclear with an aged MEST body is that he has too many facsimiles of his tractors and pressors handling his own MEST body and the rickety state of the body feeds back "slowness" so that he thinks his energy is low—and until worked with some method such as this, facsimiles do not reduce.

Any difference of potential played one against the other creates energy. Aesthetic waves against a static produce energy. Aesthetic waves against analytical waves produce energy. Analytical waves against emotional waves produce energy. Emotional waves against effort waves produce energy. Effort against matter produces energy.

The last is the method used on Earth in generating electrical current for power. The others are equally valid and produce even higher flows. This is a gradient scale of beingness, from the zero-infinity of theta to the solidity of matter.

The differences of potential most useful are easy to run.

This is, actually, alternating current running. There can be DC running or chain fission running but these are very experimental at this writing.

AC is created by the static holding first one, then the other, of a dichotomy of two differences of potential. A flow is run in one direction with one of the pair, then in the other direction with the other.

The dichotomies are:

- | | |
|------------------|----------------------------|
| 1. Survive | 16. Future |
| Succumb | Past |
| 2. Affinity | 17. Everyone |
| No affinity | Nobody |
| 3. Communication | 18. Owns all |
| No communication | Owns nothing |
| 4. Agree | 19. Responsible |
| Disagree | Not responsible |
| 5. Start | 20. Right |
| Stop | Wrong |
| 6. Be | 21. Stay |
| Be not | Escape |
| 7. Know | 22. Beauty |
| Know not | Ugliness |
| 8. Cause | 23. Reason |
| Effect | Emotion |
| 9. Change | 24. Emotion |
| No change | Effort |
| 10. Win | 25. Effort |
| Lose | Apathy |
| 11. I am | 26. Acceptance |
| I am not | Rejection |
| 12. Faith | 27. Sane |
| Distrust | Insane |
| 13. Imagine | 28. No-sympathy |
| Truth | Sympathy |
| 14. Believe | 29. Sympathy |
| Not believe | Propitiation |
| 15. Always | And the state of Static, |
| Never | a motionlessness sometimes |
| | necessary to run. |

How are these used?

One asks the preclear to flow agreement, then disagreement. He flows a feeling, a thought (*NEVER THE PHRASE!*) of “agreement” out or in, in the direction he chooses relative to himself. He lets this flow until it turns smoky gray or white, then black. Then he changes the direction of flow and gets the thought or feeling of “disagreement”. He runs this until it turns gray or white, then black. When this has turned black or dark, he again runs “agreement” in its direction until he gets gray or white, then again black. Now he reverses the flow and flows the thought “disagreement” until he gets gray or white, then blackness. And so on and on.

It will be noted that at first it may take some little time for a flow to run from black through white to black. As the preclear continues to run, after minutes or many hours, he begins to run faster, then faster and faster until at last he can keep a flow blazing and crackling.

A method of aberrating beings was to give them white and black energy sources in their vicinity. These show up on a very low tone occluded case as blazing white and shining white. That is an electronic incident, not his own energy flow. These run blazing white *in one direction* for minutes or hours before they go black. They then run the other way, blazing white, almost as long.

WHEN BLACK PREDOMINATES IN SUCH INCIDENTS THEY DO NOT DIMINISH OR REDUCE. ASK THE PRECLEAR IN SUCH A CASE TO DO WHAT HE "HAS TO DO" TO GET THE INCIDENT ALL WHITE.

As the preclear runs, he finds the speed of the change of flow changes more and more rapidly until it runs like a vibration. This vibration, theoretically, can increase to a strong current which becomes so great it is well to *ground* your preclear by using an E-Meter or letting him hold a wire in each hand which is connected to a bare water pipe or radiator. Otherwise, his MEST body may be damaged by the flow.

Run a dichotomy only against its mate. Run in alternating directions until the flow turns black.

Don't run a black "flow". It doesn't flow or run out.

CHAPTER TWELVE

Self-determinism is whiteness and self-made energy to the preclear. The energy looks white to him.

Self-determinism
Other-determinism

is the basic dichotomy. The self-determinism looks white, other-determinism looks black.

Electronic incidents are a mockery of this. They made the preclear think his own determinism had *other* determinism it must fight. White beauty must fight black ugliness. White good must fight black evil.

You will sometimes see your preclear is fighting, *pushing, struggling* instead of getting flows. He has encountered a black mock-up which he thinks he has to fight. This is the aberration—that one is not Eighth Dynamic Cause but is only First Dynamic Cause. To become free he must be Cause as nearly as possible on eight dynamics. He cannot be fully responsible—and thus responsible for his facsimiles—unless he is *Cause*. If he is not responsible for his facsimiles, he then can be injured by them, can be the Effect of *their* Cause.

One requires the preclear, in such a case of fighting, to run the dichotomy, not just strain at the black. He may protest, saying he “cannot accept it”; ask him to run acceptance anyway, or get him into something lighter.

At first your preclear may be unable even to find gray. In such a case, get him to pretend somebody is before him saying something to him. Ask him to run the flow of his own agreement. Then ask him to run his own flow of disagreement. Shortly he will sense how long he must run each. Even if he runs only on this conceptual level, he will improve markedly in tone and, of course, energy potential.

Your preclear must be able to recognize a *tractor*, a pulling wave, and realize that it has two directions of flow. As you point out that he has a tractor-pressor combination on his MEST body, he probably can find it. You can point out that other persons have put them on his body and that he has put them on others. He will find how to make them flow, for the tractor is just a holder so that a pressor can be used, or a puller to make someone fall, or stop somebody or something from falling.

The only one he would not find for himself is the tractor he gives others to make them want things from him and tractors they have extended to him to make him want things from them. These last lead straight into art and the second dynamic.

The most important dichotomies to run are:

Agree	Beauty
Disagree	Ugliness

But all those listed are useful. However, do not force him to use and try to prevent him from using:

Emotion	Effort
Effort	Matter

These fall away of themselves evidently when the others are run.

CHAPTER THIRTEEN

There are certain emotional concepts which are very effective and should be used.

One *holds* one of these concepts and agrees and disagrees with it. He holds the concept and gets the flow on it by agreeing and disagreeing on the concept to subjects to keep them gray or white.

The concept of beauty is run by holding the idea of a beautiful state of affairs and then agreeing and disagreeing (to keep gray or white) on the locks and flows which turn up.

Similarly, one handles the following concepts:

Ugliness
Beautiful sadness
Degradation
No-sympathy
Sympathy
Propitiation
Making amends
Guilt
Hiding
Exhibitionism
Beautiful cruelty
The beautiful sadness of losing
The beautiful sadness of any dichotomy
The beauty of winning
The beauty of any dichotomy
The desire of any dichotomy
The inhibition of any dichotomy

One runs things as close to thought as possible and as far from effort.

One runs things in *brackets*.

The word “bracket” is taken from the artillery, meaning to enclose within a salvo of fire.

A bracket is run as follows:

First, one gets the concept as *happening to the preclear*.

Then, one gets the concept of the preclear making it happen (or thinking or saying it) to another.

Then one gets the concept as being directed by another at others.

Then, one uses all these on the other side of the dichotomy.

A bracket on “Beauty of being an individual” would be as follows:

“Get how beautiful it is for you to be an individual. “

When he has run this for awhile, keeping it gray or white by agreeing or disagreeing with the flows, “Get how beautiful it is for others to be an individual”. He runs this until he isn’t very interested, changing its flows by agreeing or disagreeing, and then:

“Get how beautiful people think it is for others to be individuals”. Again he holds the concept and runs the agreement and disagreement to get flows.

Now:

“Get how ugly it is to be an individual.” He holds this concept and gets the flows as they come, agreement and disagreement.

“Get how ugly it is for another to be an individual.”

“Get how ugly people think it is for people to be individuals. “

This is a full bracket. It can be done with any dichotomy. The standard bracket, the one you will use most, is based on beauty and ugliness with agree and disagree as the flow concepts and with the other dichotomies as the varied thought.

If your preclear can get no concept on beauty, have him run the tone scale on it as follows, having him agree and disagree to get a flow:

Apathy about beauty (motionless)

Grief about beauty

Fear of beauty

Resentment of beauty

Anger at beauty

Antagonism toward beauty

Boredom about beauty

Conservatism about beauty

Enthusiasm about beauty

Exhilaration about beauty

Run this scale wherever he can get it and then continue to run it on the others until he has at last become able to get the feeling of beauty. He will get being taught what is beautiful or trying to understand beauty and many other concepts.

Your preclear may run into a heavy electronic incident. These are covered fully in *What to Audit*. If he does, you can run it by getting him to “turn it white” and “keep it white”. If he can’t, get him into lighter material.

CHAPTER FOURTEEN

The manifestations of energy are three in number. These are: flow, dispersal and ridges.

Utilizing flows, dispersals and ridges, there are several patterns of life energy. These include pressor beams, tractor beams and screens. The screen is actually a ridge that is formed for a special purpose of protection.

Any line of flow, whether contracting or lengthening, is called a flow. A common manifestation is seen in an electric light wire.

A dispersal is formed by a source emanating. This may or may not be an explosion. Any source with a multiple direction emanation can be called a dispersal.

A ridge is caused by two energy flows coinciding and causing an enturbulence of energy which, on examination, is found to take on a characteristic which in energy flows is very like matter, having its particles in chaotic mixture.

A particular type of dispersal is a reverse dispersal, or an implosion.

As an illustration, a beam of sight would be emanating from a source point and flowing toward something to be seen. Striking a reverse flow, it can form a ridge. Striking a solid object, it would form, on the face of that object, a ridge.

All energy behaviors are manifestations of these characteristics of energy.

Energy is subdivisible into a large motion, such as a flow, a dispersal, or a ridge, and a small motion which is itself commonly called a "particle" in nuclear physics.

Agitation within agitation is the basic formation of particles of energy, such as electrons, protons and others. These are not, as their Greek name "atom" once told us about the atom, indivisible. Energy flows have many forms, and each form is reducible to a smaller vibration.

The characteristic of any vibration is that it contains the manifestations of a static and a kinetic. A static is something with no motion, no particle and no wave length; and a kinetic is something which has considerable motion. The interplay between the static and one or more kinetics causes energy interchanges.

The entire principle of alternating currents, as drawn in most books on electricity, is in error. This shows a positive terminal and a negative terminal, discharging one against the other, rotationally so as to create an alternating current flow. As part of Scientology, it is originated that the principle is in error by the fact that the negative terminal must have a plus negative, and the positive terminal must have a negative positive to form such an interchange. Past technology, in describing the alternating current flow, and the describing of all energy manifestations and manufactures, forgets continually the base. This is represented in an electrical generator by the base of the generator itself. The solid iron base of the generator fastened to a floor or table imposes time and space upon the two terminals. Without this imposition of time and space, no energy could be possible. A great deal of mechanical motion must be put into an electrical generator because an electrical generator is discharging between the dichotomy of effort and matter, a lower range dichotomy. In the higher ranges, the static is furnished by the individual, and the mathematical symbol for this near-ultimate is theta.

Self-determinism is entirely and solely the-imposition of time and space upon energy flows. Imposing time and space upon objects, people, self, events and individuals is Causation. The total components of one's self-determinism is the ability to impose time and

space. His energy is derived from the discharge of high and low, or different, potentials to which he has assigned time and space. Dwindling sanity is a dwindling ability to assign time and space. Psychosis is a complete inability to assign time and space. This is, as well, will power.

In life one finds the static operating against the kinetic of the material universe which itself has motion. A static takes pictures of the motion which it can place and reactivate at will. It uses these pictures of motion as terminals. The types of motion in the terminals discharge one against the other in accordance with the experience desired by the life force.

Relative speeds determine potential.

The speed of light is not a constant of energy speed. The shorter the period of emission of energy from a source, which is to say, the shorter the wave length of the energy, the greater is the speed of that energy. As one ranges up the tone scale one comes into the near instantaneousness of thought. And very high on the tone scale one finds thought so close to the static that the static is capable of assigning the thought with the time into the past and into the future without regard to the time factor imposed upon the MEST universe, also evidently by some such static.

Far from some mystic concept, the static and kinetic principles of energy interchange can be fundamental to nuclear physics. "Attention units" are actually energy flows of small wave lengths and definite frequency. These are measurable on specially designed oscilloscopes and meters. No special particle is involved, but one can designate the particle of such flows as "corbitrons"*; if one desires to be technical.

The constant of light has been a sort of scientific ridge locking scientific thought. Within the spectrum of light itself there is a measurable difference of speed, and in the higher spectrum of reason and aesthetics, the speed of light is very fast. The speed of emotion, on the other hand, which is a gross wave, is evidently quite slow.

One can conceive of an ultimate static which would be theta, and an ultimate motion which would be MEST. The interplay to create energy, however, can be much narrower. One has observed preclears try to run pleasure and find only pain. He has observed them run pain and find pleasure, but less often. The direct current and condenser discharges are determined by wave characteristic. One can create a pleasure facsimile and discharge pain into it, a primary function of imagination.

The life source itself IS energy. The energy potential of beings can be varied slightly within one being and is quite different from individual to individual as a basic quality.

The life source of the individual is interior in most persons because it has built up, with its earlier flows, ridges which themselves have the same wave length as the life source of the person. The life source, then, cannot distinguish between himself and these ridges. These ridges are facsimiles, or pictures, of motion. They are used by the life source to turn the body into a stimulus-response, or automatic, mechanism. By means of such ridges, the life source can turn the body into an automaton which will operate for him. However, as the life source goes down tone scale, it itself can become enturbulated and less able to impose time and space upon his facsimiles. He cannot distinguish between himself and a ridge which is an apparent identity.

The name given to this life source is "thetan". It is the individual, the being, the personality, the knowingness of the human being.

The state of the human being is artificial, the thetan using the body for his own pleasure and convenience. A thetan, having done so, ordinarily forgets he is doing so, and in order to increase his randomness initially, suppresses the fact that he is separate from the body. He then

becomes identified with the body to such a degree that should the body die, he abandons to it, he supposes, but not actually, all the facsimiles which have been accumulated for that body.

If the preclear refers to "his thetan", he has not identified himself, since he supposes his thetan to be something else, or elsewhere. He is the thetan, and when he is in a state of knowingness, he knows where he is. If he is in a state of unknowingness, which is to say identified with the body, he does not know where he is.

When a thetan has come down tone scale to the minus scale, he no longer believes himself capable of the production of power, he cannot select facsimiles for interchanges, and he becomes an unknowingly motivating portion of the person, but all the person ever will be is the thetan.

The genetic entity is of very little concern.

These manifestations of energy, and the life source, can be discovered easily by the technique which has now been developed.

The formula of the energy of life source which has been tentatively advanced is:

$$\text{Life} = (E * I / -R) * (-f)$$

If:

- E = Energy Potential
- I = Energy Flow
- R = Negative Resistance
- f = Negative Frequency

The theory of the counter-elasticity of flow is easily observed on an oscilloscope and is possibly the negative frequency. An energy line will flow, whether in space or in a confined conduit, just so long before it accumulates sufficient enturbulence to stop. It requires, then, an enormous forcing potential behind it to continue its flow. This is resistance, and is, indeed, the resistance in electrical wires, and is one of the main reasons why power has to be furnished to a generator. The flow, when it has gone to the limit of the elasticity of the particles it contains, will then discharge backwards against its direction of flow, and if agitated, will do so. A flow must flow in one direction and then in the reverse direction, and within the limits of the elasticity of flow, in order to create an energy which does not require heavy potentials to keep it in flow.

While the conservation of energy is a useful principle, in basic physics and elementary nuclear physics, such as those used in the creation of the atom bomb, and in the formulas of Lorentz-Fitzgerald, its practical application is demonstrable only between effort and matter on the tone scale, and is useful within the bounds of mechanical motion and activity in the material universe only. That thought may be seen occasionally to violate the conservation of energy does not immediately cancel the fact that thought is part of the material universe and is as much energy as electrons, protons and electric lights. Thought is self-perpetuating so long as it operates in the bands above emotion. When it falls below the band of emotion, it ceases to perpetuate itself.

There is much technology here which has been discovered with relationship to energy and the material universe and these principles are applicable to such things as the creation of weapons which will cancel, or explode at a distance, the force of an atom bomb, or which will themselves, at a cost of two or three hundred dollars, make automatic firing blasts on the level of an atomic explosion. Nuclear physics has been in its infancy and a great deal of pioneer work has been possible in the field. It should not be considered that nuclear physics has invaded the field of life, any more than the humanities have invaded the field of physics. Energy manifestations have a single applicable pattern. And those patterns apply as well to

thought as they apply to electrical flows. It is simply that we have advanced a technology toward a logical conclusion and have obtained logical results.

These results are revealed, at this time, only because they can be demonstrated easily, with oscilloscopes, with groundings, with the manufacture of energy, and in the field of humanities most importantly with the restoration of life energy and vitality to human beings, with according enhancement of sanity and activity.

*The term suggested by John Robinson and Dillard Eubank.

CHAPTER FIFTEEN

The reason your preclear is fixed to a MEST body lies in his inability to produce energy enough to know and to get away from one.

His career with bodies is as follows:

He hurt them by accident first.

Then he hurt them without understanding they hurt by using their sexual emotion.

Then he blamed them and said and felt he would have no responsibility for them.

Then he felt the emotion of no-sympathy for them.

Then he felt sympathy.

He began to propitiate.

He wanted to make amends.

He *was* a MEST body. *

Run the beauty and ugliness of these.

The cycle of no-sympathy-equals-sympathy is inevitable. That for which we declare no-sympathy today will receive our sympathy tomorrow.

If you have a preclear sight some old body well before him and feel no-sympathy for it, he then will feel no-sympathy, sympathy, propitiation, and suddenly, he IS the body.

One runs facsimiles on the body partly because the body is an electrical ground, partly because it has been assigned responsibility.

The thetan assigning responsibility to the body then *becomes* the body. This is a general principle. One *becomes* that to which he assigns responsibility too often and too long. He makes it *Cause* and, at last, to be Cause himself, he must be the thing.

People imagine they are in bodies because they are hiding from something and many other reasons. But these are not important. The important thing is that bodies were handy to have, once. They were fun.

This process, as itself, as simple as it is, will eventually detach one from his body. After that he can use it or not as he chooses.

The thetan is no fairy tale. Try these techniques for fifty hours and find out. Try them on a preclear who has never heard of facsimiles, electronics, or “whole track” and in fifty or one hundred hours he will be outside wondering what he was doing in “that thing”! You may have intended only to increase his sanity or happiness. You do it best by processing the thetan on 8-80.

*The cycle no-sympathy, sympathy, propitiation, make-amends, beingness IS the cause and cycle of the life CONTINUUM. It accounts in part for the transfer of somatics in an overt act or DED. It is a therapy in itself. It is run by itself but better with the concepts of beauty and ugliness, with agree and disagree on each level of the cycle. You could give this to a practitioner by itself and he would become quite famous for relieving aches and pains, for it solves valences, the acquirement of family difficulties from parents, and a thousand other things. The cycle sometimes runs anger, no-sympathy, fear, sympathy, propitiation, make-amends, beingness. The anger factor is the holder in the incident (and has tractors with it) and the fear is a bouncer. Fear of punishment is largely the fear in this cycle during the actual act, not afterwards because of police. No-sympathy is an emotion and an action. One puts a black curtain before himself to prevent his feeling affinity with that which he is hurting. This is a motionlessness which turns gray and runs out on agree and disagree from the victim and the punisher. No-sympathy can be an occlusion for the whole track. No-sympathy is also, of course, counter-no-sympathy in many incidents.—L.R.H.

CHAPTER SIXTEEN

Below zero on the tone scale is applicable only to a thetan.

It has been quite commonly observed that there are two positions for any individual on the tone scale. This occurs because there is a position for the composite of the thetan plus his MEST body operating in a state of unknowingness that he is not a MEST body, and behaving according to social patterns, which give him some semblance of sanity. The other position on the tone scale is the position of the thetan himself, and it is necessary for us to demonstrate a negative scale in order to find the thetan at all.

For the thetan you will find the scale as follows :

This sub-zero tone scale shows that the thetan is several bands below knowingness as a body and so he will be found in the majority of cases. In our homo sapiens he will be discovered to be below zero on the tone scale. The zero to four plus tone scale was formulated on, and referred to, bodies and the activity of thetans with bodies. In order, then, to discover the state of mind of the thetan, one must examine the sub-zero scale. He has some trained patterns as a body which make it possible for him to know and to be. As himself, he has lost all beingness, all pride, all memories, and all self-determined ability, but yet has an automatic response-mechanism in himself which continues furnishing his energy.

EACH ONE OF THE ABOVE POINTS ON THE SCALE IS RUN AS POSITIVE AND NEGATIVE. Example: The beautiful sadness of needing bodies. The beautiful sadness of NOT needing bodies. The beauty of being responsible for bodies, the beauty of NOT being responsible for bodies. Each one is run as itself and then as the reverse with the addition of NOT.

The sub-zero to 40.0 scale is the range of the thetan. A thetan is lower than body death, since it survives body death. It is in a state of knowingness below 0.375 only when it is identifying itself as a body and IS, to its own thinking, the body. The BODY-PLUS-THETAN scale is from 0.0 to 4.0 and the position on this scale is established by the social environment and education of the composite being and is a stimulus-response scale. The preclear is initially above this 0.375 on the BODY-PLUS-THETAN RANGE. Then, on auditing, he commonly drops from the FALSE TONE of the BODY-PLUS-THETAN scale and into the true tone of the thetan.

This is actually the only self-determined tone present— the actual tone of the thetan. From this sub-zero he quickly rises up scale through the entire range as a thetan and generally settles at 20.0 and in command of the body and situations. The course of auditing then takes the preclear, quite automatically, down from the FALSE TONE of the BODY-PLUS-THETAN SCALE to the actual tone of the thetan. Then the tone of the thetan rises back up the scale level by level.

It is not uncommon to find the preclear (who IS the thetan) quite raving mad under the false “vener” of social and educational stimulus-response training and to discover that the preclear, while behaving quite normally in the BODY-PLUS-THETAN state, becomes irrational in the course of auditing. BUT DESPITE THIS, the preclear is actually being far more sane and rational than ever before and the moment he discovers himself as himself, as THE source of energy and personality and beingness of a body, he becomes physically and mentally better. Thus the auditor must not be dismayed at the course of tone, but should simply persevere until he has the thetan up into rational range. A raving mad thetan is far more sane than a normal human being. But then, as you audit, observe it for yourself.

CHAPTER SEVENTEEN

THETAN is the word given to the awareness of awareness unit, the life source, the personality and the beingness of homo sapiens. It is derived from the symbol *theta*, a Greek letter. It is NOT somebody else, a thing one has, a soul, a spirit. It IS the person. One does not speak of MY thetan. This would be a circuit. One would speak of ME. ME means to aberrated persons the BODY-PLUS-THETAN. ME should mean THETAN ONLY.

The THETAN is a glowing unit of energy source. He seems to himself to be anything from a quarter of an inch to two inches in diameter. His capability is KNOWING and BEING. He exudes and uses energy in many forms. He can perceive and handle energy flows easily.

The thetan enters sometime in early infancy. This may be before, during, or following birth.

He comes in a state of personal unknowingness, desiring to have an identity which he considers that he has not without a body.

He throws capping beams at the genetic entity, takes over the body.

He now does a life continuum for the body. His taking it over is an overt act he afterwards hides even from himself.

This incident must be run.

The thetan in most preclears is within the skull. It shifts on auditing (which is to say the PC shifts) from behind to in front of the head. But it is always itself. On many preclears the thetan has so many ridges around him that he disperses all through them. This dispersion is done along communication lines. When the dispersion is audited out, the thetan is a unit as above.

Standing behind the body, the thetan can adjust and change any error in the body at will. He sees these as black spots. To get rid of them one has only to get the flows necessary to make and keep them white. Some thetans immediately gain the ability to discharge energy at will. When a thetan discharges energy, another person may feel hot.

The thetan collapses into the body when the body feels pain. This was how he got trapped. Auditing must resolve this.

A thetan can get partly outside himself on a ridge. Then the preclear seems to be inside himself and yet outside. The answer in this case is to work the thetan from inside the head, getting him to blow out ridges with beams. Just on straight beauty and ugliness on the sub-zero scale, getting concepts and feelings, the thetan eventually will come outside—but this may take a very long time, even as much as two or three hundred hours. The techniques of the next chapter are faster. Bring the thetan outside and work him; then he has his own identity.

The thetan IS the preclear. The body-plus-thetan is no increase of personality. The body is a sort of vegetable run by the genetic entity.

The thetan can clean up and heal his own body and those of others at will.

The thetan is usually either blind or very dim sighted at first. He gradually regains his ability to perceive as he comes up the tone scale. He passes a band of dub-in above zero and below 2.0. He attains clear, brilliant sight higher on the scale.

One does not audit engrams with the thetan. He blows ridges to which are fastened thousands of engrams. This is very fast auditing. Ridges are blown by locating them and

turning them white. If they don't blow at first glance, get the flow in and the flow out from the thetan, alternating it, until the ridge is continually gray or white and, by shifting flows, keep it so until it is gone. After flowing gray or white in one direction for a short time, a ridge goes black. Then the flow is reversed and the ridge goes white or gray again. If it then turns black, once more reverse the flow. The ridges can act like beings when sprayed with energy or when permitted to give off energy. These are the "demon circuits of the mind".

CHAPTER EIGHTEEN

The summary technique of the running of the thetan is very simple and quick. The thetan is in apathy; therefore, like a child who will no longer ask for that which will not be given him, he negates as his fastest response.

The entire technique consists of getting the thetan out of the body immediately, unburdening some of the sympathy for the body, and by running brackets, using the sub-zero tone scale, bringing him up to complete self-determinism at which time he can handle the body with great ease.

As far as psychosomatic illnesses are concerned— derangement's of the body, malformations, malfunctions— the thetan can care for these with great ease once he has been brought up the tone scale. He will care for them automatically and put the body into excellent condition.

That most thetans, the moment they find themselves out of the body, desire to have nothing further to do with it, is an aberrated condition, just as it is an aberrated condition for a thetan to be fixed on having nothing to do with anything but bodies. One runs each point of the sub-zero scale as a dichotomy, which is to say, punishment-no punishment, owning-not owning, controlling-not controlling, being-not being. He runs these as concepts. He runs them most opportunely with the thetan outside the body, for the thetan then is not enturbulated by all the facsimiles and ridges which he finds in his vicinity.

The technique is as follows:

The preclear is asked to be or not be a short distance behind his head. From this position, he is then asked to feel a very little bit of sympathy for the body. (Feeling too much may make the preclear feel as though his head were being torn off.) The person is then asked to scan out the small action of moving out of the body and into the body, and scan it out while out of the body. The next steps are repetitions of these, but it will be found that the dichotomies and the beautiful sadness of each dichotomy must be run to bring the thetan up into a state of knowingness.

The thetan about half the time will respond to a negative command where he will not respond to a positive command. ¹

Occasionally a person must be audited by running facsimiles before he can be placed in a situation where he can leave the body, but in most cases, this will not be necessary. It, however, is necessary on occasion for the auditor to run facsimiles. And in any event, he should know all he can discover about facsimiles, manifestations of the body, entities, and other matters contained in the body of Scientology, or otherwise he will find phenomena which he will, possibly, misconstrue.

The facsimiles in the body are fastened onto ridges. These ridges generally appear black to the thetan. They will turn white if the individual is asked to find out what the ridge is saying and then the individual is asked to own it, or remove it, and the ridge or black spot will turn white and disappear, often with a considerable somatic. These ridges are discovered in the vicinity of the motor controls, or may be all through the body.

During the process of getting the thetan out of the body (and remember, this is getting the preclear out of his body) the thetan is not, repeat *not* something else or somebody else but is the preclear; and if the preclear doesn't know that this is himself out of his body and that he is out of his body, he will have to be run on sub-zero tone scale concepts until he can at last accomplish, under an auditor's direction, departure from the body. During processing it is a good practice to have the thetan repair any nerve lines, or other matters which he finds to be antipathetic to him in the body.

The rehabilitation of the thetan is up through the sub-zero range where beautiful sadness and degradation are the two concepts used, into the band of the plus scale where beauty and ugliness are used as the feeling.

The feeling differs from the concept and one can have a feeling and a concept at the same time.

An individual who cannot get out of his body immediately can look around inside his head and find the black spots and turn them white much in the same fashion.²

The technique is simple, but it is most simple to an individual who has a thorough command of the entire subject. The rehabilitation of the thetan consists of his being able to sever communications with the body at will, and consists of making it possible for the thetan not to have a collapsed tractor every time the body is hurt, plus snapping him into the body.

Protection of the body, need of the body, the body getting credit, the feeling that one must have identification, the beautiful sadness of bodies dying—are the various concepts which are used in this process.

When the thetan is securely out of the body, he can look around him and find any area of enturbulation, and do whatever he pleases about it. He can find vibrations and do what he likes with those.

The sight of a thetan is very bad—as would be the sight of anything below the level of death—for the MEST body, and the memory of the thetan for himself is extremely poor. These gradually rehabilitate until the thetan can perceive and recall as himself. His rehabilitation consists mainly of changing his own postulate, rather than running facsimiles.

Wherever possible, avoid running any emotion or effort with the thetan beyond sympathy and those indicated above. These are low scale manifestations and will fall away.

It is possible for the thetan to pick up whole packages of facsimiles and throw them away at will.

The test of this technique is that in from two to twenty-five hours of processing, an individual can expect to be far above the level of MEST clear.

The true knowingness and the true beingness of homo sapiens is his life source. In almost all persons to be processed, it will be discovered that this life source is in very poor condition.

If any difficulties are discovered in utilizing this process, it is recommended that one contact an Associate School of the Hubbard Association of Scientologists.

Care should be utilized in picking up the areas inside the body which have built-up energy on them. This energy is actually the thetan's own energy. It is in ridges. It has individualities because the ridges, being covered with facsimiles, seem to be able to think, and when they are pulled away too rapidly, terrible somatics can result. *Some* somatics can be *expected* to result.

A theta clear is one who can get in and out of his body at will. A cleared theta clear is one who has full recall of everything and full ability as a thetan.

¹ This fact was established by Evans W. Farber, Fellow of Scientology.

² E-therapists and others experimenting with internal awareness occasionally fell accidentally into this manifestation.

FOREWORD

The work contained in this book is the result of 25 years' investigation of electronics as they apply to knowledge and human thinking by L. Ron Hubbard.

In his youth, Hubbard had the good fortune to know Commander Thompson (M), U.S.N., who had studied with Sigmund Freud in Vienna. Stimulated by Freud's investigatory spirit and by the encouragement of the late Commander Thompson, and equipped with considerable personal experience in the Orient with phenomena not generally known in the Western World, Hubbard bent the exactitudes of Occidental engineering to the investigation and practical application of such data to the human mind.

His studies of the subject were extremely broad and varied. They included such things as expeditions to investigate the ethnology of twelve widely-separated primitive cultures, an intensive survey of the endocrine system, the study of early writers and philosophers on the subject of mankind and epistemology, also the direct study of his forte, nuclear physics, as it might be found to apply to the human intellect.

In addition to Sigmund Freud and Commander Thompson, he has credited the following persons as source material:

Anaxagoras	Thomas Jefferson
Aristotle	Jesus of Nazareth
Roger Bacon	Count Alfred Korzybski
Buddha	James Clerk Maxwell
Charcot	Mohammed
Confucius	Lao Tze
Rene Descartes	Van Leeuwenhoek
Will Durant	Lucretius
Euclid	Isaac Newton
Michael Faraday	Thomas Paine
William James	Plato
Socrates	The Vedic Hymns
Herbert Spencer	Voltaire

L. Ron Hubbard's work has excited interest and comment throughout the world, and its more elementary forms are today taught in at least two leading universities. Some of his earlier discoveries have become accepted fact by the medical profession and his methodology is now in use in several institutions.

Some think of his work as the only significant enlargement of the field of the mind since Freud's papers in the late 19th century; others think of it as the Western world's first workable organization of Eastern philosophy. It has been called by two of the leading writers in America: "The most significant advance of mankind in the 20th century."

Many lay writers have sensationalized these developments in the extreme, and others have levelled against this work the bitterest of condemnations: whether bad or good, no development in the field of the mind for many centuries has excited as much interest.

L. Ron Hubbard is himself a man of considerable energy and of extremely wide interests. He has written fiction under many of his pen-names; and, indeed, financed and supported his own investigations (which have cost in the hundreds of thousands of dollars) with his own pen. His interests do not lie in the field of practice but in the field of continued investigation.

Probably no philosopher of modern times has had the popularity and appeal of Hubbard or such startling successes within his own lifetime. And mankind has had no better friend.

THE EDITOR

THE FACTORS

(Summation of the considerations and examinations of the human spirit and the material universe completed between A.D. 1923 and 1953.)

1. Before the beginning was a Cause and the entire purpose of the Cause was the creation of effect.
2. In the beginning and forever is the decision and the decision is TO BE.
3. The first action of beingness is to assume a viewpoint.
4. The second action of beingness is to extend from the viewpoint, points to view, which are dimension points.
5. Thus there is space created, for the definition of space is: viewpoint of dimension. And the purpose of a dimension point is space and a point of view.
6. The action of a dimension point is reaching and withdrawing.
7. And from the viewpoint to the dimension points there are connection and interchange. Thus new dimension points are made. Thus there is communication.
8. And thus there is light.
9. And thus there is energy.
10. And thus there is life.
11. But there are other viewpoints and these viewpoints outthrust points to view. And there comes about an interchange amongst viewpoints; but the interchange is never otherwise than in terms of exchanging dimension points.
12. The dimension point can be moved by the viewpoint, for the viewpoint, in addition to creative ability and consideration, possesses volition and potential independence of action; and the viewpoint, viewing dimension points, can change in relation to its own or other dimension points or viewpoints. Thus comes about all the fundamentals there are to motion.
13. The dimension points are each and every one, whether large or small, solid. And they are solid solely because the viewpoints say they are solid.
14. Many dimension points combine into larger gases, fluids or solids. Thus there is matter. But the most valued point is admiration, and admiration is so strong its absence alone permits persistence.
15. The dimension point can be different from other dimension points and thus can possess an individual quality. And many dimension points can possess a similar quality, and others can possess a similar quality unto themselves. Thus comes about the quality of classes of matter.
16. The viewpoint can combine dimension points into forms and the forms can be simple or complex and can be at different distances from the viewpoints and so there can be combinations of form. And the forms are capable of motion and the viewpoints are capable of motion and so there can be motion of forms.

17. And the opinion of the viewpoint regulates the consideration of the forms, their stillness or their motion, and these considerations consist of assignment of beauty or ugliness to the forms and these considerations alone are art.
18. It is the opinion of the viewpoints that some of these forms should endure. Thus there is survival.
19. And the viewpoint can never perish; but the form can perish.
20. And the many viewpoints, interacting, become dependent upon one another's forms and do not choose to distinguish completely the ownership of dimension points and so comes about a dependency upon the dimension points and upon the other viewpoints.
21. From this comes a consistency of viewpoint of the interaction of dimension points and this, regulated, is TIME.
22. And there are universes.
23. The universes, then, are three in number: the universe created by one viewpoint, the universe created by every other viewpoint, the universe created by the mutual action of viewpoints which is agreed to be upheld -- the physical universe.
24. And the viewpoints are never seen. And the viewpoints consider more and more that the dimension points are valuable. And the viewpoints try to become the anchor points and forget that they can create more points and space and forms. Thus comes about scarcity. And the dimension points can perish and so the viewpoints assume that they, too, can perish.
25. Thus comes about death.
26. The manifestations of pleasure and pain, of thought, emotion and effort, of thinking, of sensation, of affinity, reality, communication, of behavior and being are thus derived and the riddles of our universe are apparently contained and answered herein.
27. There is beingness, but Man believes there is only becomingness.
28. The resolution of any problem posed hereby is the establishment of viewpoints and dimension points, the betterment of condition and concourse amongst dimension points, and, thereby, viewpoints, and the remedy of abundance or scarcity in all things, pleasant or ugly, by the rehabilitation of the ability of the viewpoint to assume points of view, and create and uncreate, neglect, start, change and stop dimension points of any kind at the determinism of the viewpoint. Certainty in all three universes must be regained, for certainty, not data, is knowledge.
29. In the opinion of the viewpoint, any beingness, any thing, is better than no thing, any effect is better than no effect, any universe better than no universe, any particle better than no particle, but the particle of admiration is best of all.
30. And above these things there might be speculation only.
And below these things there is the playing of the game.

But these things which are written here Man can experience and know. And some may care to teach these things and some may care to use them to assist those in distress and some may desire to employ them to make individuals and organizations more able and so give to Earth a culture of which we can be proud.

Humbly tendered as a gift to Man by

L. Ron Hubbard,

April 23, 1953.

THE BEINGNESS OF MAN

Any study of knowledge could not but be intimately connected with the beingness of Man and the earliest axioms of Scientology began to predict and the later developments eventually discovered the highest level data so far obtained on the identity and capability of life.

The well-beingness and, indeed, the continued survival of mankind depend upon an exact knowledge of his own capabilities; and thus, more particularly, of his own relationship to knowledge itself.

The basic goal of Man which embraces all his activities is apparently survival. Survival might be defined as an impulse to persist through time, in space, as matter and energy.

The impulse to survival is found to contain eight sub-impulses. These are, first, the urge to survive as self; second, the urge to survive through sex in the procreation of children; third, the impulse to survive as a group; fourth, the impulse to survive as mankind itself; fifth, the urge to survive as animal life; sixth, the impulse to survive as the material universe of matter, energy, space and time; seventh, the impulse to survive as a spirit; and eighth, the impulse to survive as what may be called Supreme Being.

The above sub-impulses are called dynamics; combined, they form the overall urge towards survival, but each one of itself plays its important role, both in the individual and in the wider sphere named as a part of each impulse. Thus we see the interdependency of the individual with the family, with the group, with the species, with life-forms, with the material universe itself, with spirits, and with God; and we see the dependency of each one of these entities upon the individual as a part of it.

The human mind might be conceived to be the recorder, computer and solver of problems relating to survival.

Scientology introduces new and more workable ways of thinking about things. It has found that an absolute is unobtainable; neither zero nor infinity are as themselves discoverable in a real universe but, as absolutes, may be posed as symbols for an abstraction which could be supposed to exist but which does not exist in fact. Therefore, there would be no absolute good and no absolute evil. A thing to be "good" would depend on the viewpoint of the observer, and the same condition would exist for "bad."

Several new concepts germane to the fields of science and humanities almost independent of its own work have been introduced by Scientology. The first of these is the proper definition of a static. The next is the first actual definition of zero and its differentiation from infinity in terms of mathematics. Another is the basic definition of space which hitherto was omitted from the field of physics except in terms of time and energy.

An optimum solution to any problem would be that solution which brought the greatest benefits to the greatest number of dynamics. The poorest solution would be that solution which brought the fewest benefits to the least number of dynamics. And here a benefit would be defined as that which would enhance survival. Activities which brought minimal survival to a lesser number of dynamics and damaged the survival of a greater number of dynamics could not be considered rational activities.

While there could be no absolute right or absolute wrong, a right action would depend upon its assisting the survival of the dynamics immediately concerned; a wrong action would impede the survival of the dynamics concerned.

Thought is subdivisible into data. A datum would be anything of which one could become aware, whether the thing existed or whether he created it.

Creativeness could be found to exceed existence itself; by observation and definition it is discoverable that thought does not necessarily have to be preceded by data, but can create data. Imagination can then create without reference to pre-existing states, and is not necessarily dependent upon experience or data and does not necessarily combine these for its products. Imagination could be classified as the ability to create or forecast a future or to create, change or destroy a present or past.

Cause is motivated by the future.

Scientology as it applies to life is seen as a study in statics and kinetics, which is to say a study of the interplay between no motion and all motion, or less motion and more motion.

In thought itself at its highest range, we discover the only true static known. In physics a static is represented as a body at rest but it is known in physics that a body at rest is yet an equilibrium of forces and is itself in motion if only on the level of molecular motion. A true static would contain no motion, no time, no space and no wavelength. To this static in Scientology is assigned the mathematical symbol theta. This designation means solely a theoretical static of distinct and precisely defined qualities with certain potentials.

The all-motion or more-motion kinetic is termed MEST. This word represents the material universe, or any universe. It is combined from the first letters of the four words: matter, energy, space and time.

The interplay between theta and mest results in activities known as life, and causes the animation of living life forms. In the absence of an interplay, the life form is dead.

The beingness of Man, by which is meant homo sapiens, derives its impulse toward thought and action from theta and takes its material form in mest.

Man, homo sapiens, is a composite being of four distinct and divisible actualities: these parts are termed the thetan, the memory banks, the genetic entity and the body.

The thetan, which will be described later in greater detail, has the impulse of theta itself and can exist in matter, energy, space and time, but derives its impulse from the potential of theta itself and has certain definite goals and behavior characteristics of its own.

The standard memory banks and the reactive memory banks compose the memory banks of homo sapiens. These, in the analogy of an electronic computer, are the file system. The standard banks can be said to contain data of which Man is easily and analytically aware and the reactive banks are those which contain stimulus-response, in other words experience the action of which is below the level of his awareness. The content of the reactive banks was received during moments of lessened awareness such as the unconsciousness of early life in times of weariness, severe pain or heavy emotional stress, such data operating automatically thereafter to command the person without his consent. The standard memory banks are those in which experience is stored for use in the estimation of the effort necessary for survival and are concerned with analytical thought. There is an additional storage of memory itself in a purer form than in these banks, but this memory is contained in the capabilities of the thetan.

The genetic entity is that beingness not dissimilar to the thetan which has carried forward and developed the body from its earliest moments along the evolutionary line on earth and which through experience, necessity and natural selection, has employed the counter-efforts of the environment to fashion an organism of the type best fitted for survival, limited only by the abilities of the genetic entity. The goal of the genetic entity is survival on a much grosser plane of materiality.

The body itself is a carbon-oxygen engine which runs at a temperature of 98.6 Deg. F. on low combustion fuel, generally derived from other life forms. The body is directly

monitored by the genetic entity in activities such as respiration, heart-beat and endocrine secretions; but these activities may be modified by the thetan.

The human mind could be said to be the primary activity of the thetan with his own memory and ability plus the analytical standard memory banks, modified by the reactive memory banks of the genetic entity, and limited by the mechanical abilities and adaptabilities in action of the body itself.

These four parts of homo sapiens are detachable one from the other.

The personality and beingness which actually is the individual and is aware of being aware and is ordinarily and normally the "person" and who the individual thinks he is, is the thetan; and this awareness can continue, is clarified and is not interrupted by a detachment from the body which is accomplished by standard processing.

The thetan is immortal and is possessed of capabilities well in excess of those hitherto predicted for Man and the detachment accomplishes in the sober practice of science the realization of goals envisioned but questionably, if ever, obtained in spiritualism, mysticism and allied fields.

The anatomy of the beingness of Man is one of the lesser studies of Scientology where the beingness relates only to homo sapiens, for the detachment of the thetan by standard operating procedure is in common practice a simplicity, and it is therefore unrewarding to explore to much greater depths the remaining combination of the standard and reactive banks, the genetic entity and the body, since the last three are a specialized combination. Nevertheless the development of the technology necessary to bring about a complete state of beingness of that which a man actually is found to be, has provided considerable data and technology in the field of memory recordings, the peculiarities of energy behavior around and about the body, the history of the evolutionary line, the identity of the genetic entity and much of the construction of the body itself, as well as the construction of the real universe. The bulk of the data which concerns homo sapiens, other than the beingness of the thetan, has been covered adequately earlier and elsewhere.

In earlier efforts to better his state of beingness, Man has considered homo sapiens as an inseparable unit which was either alive or dead. Further, Man has thought it necessary, when he thought about it at all, to address and reduce the inroads of the past before the individual could assume any high level of beingness in the present.

In Dianetics it was found that the mind was sub divisible into two parts, the first was the analytical mind which did the actual thinking and computing for the individual but which, in the present civilized state of Man, was almost submerged.

The second was the reactive mind. The reactive mind was considered to be a stimulus-response mechanism which derived and acted upon the data of experience without thought. The content of the reactive mind was found to be the accumulated bad experiences of the organism not only in its current lifetime, but in the other lifetimes which it apparently had led in order to accomplish the task of evolution and to arrive at its present state of structural beingness. The reactive mind was the blueprint but it was also the stimulus-response dictator of action. The formula which described the reactive mind was that everything is identified with everything.

Dianetics accomplished a great deal in the elevation of beingness by reducing the most violent incidents in the reactive mind by a process known as the erasure of engrams.

An engram was a period of momentary or long pain and unconsciousness such as would occur in an injury, operation or illness. Such incidents could be reduced simply by "returning" the individual to the moment of the accident and then going over the accident step by step, perceptic by perceptic, as though it was happening again. After this had been done several times, the accident was found to have no more command value upon the individual.

The reduction of the command value of the reactive mind was found to be necessary to a proper resolution of aberration. Understand that the reduction of the command value of the reactive mind was the goal, not merely the reduction of the reactive mind. When one is addressing the problems of an individual or group of men, the reduction of the command value of the reactive mind is still the goal where Scientology is used as a process to eradicate aberration.

But two other methods are available for reducing this command value.

The first of these lies in the removal of the analytical mind from proximity to the reactive mind and the increase then of the potential of the analytical mind until it can command and handle any reactive mind with ease.

The second is simply the rehabilitation of the analytical mind by permitting it to use its creative ability in the construction of a universe of its own.

It was found that there was no purpose in reducing incidents out of the reactive mind beyond the point where the analytical mind could step apart from the reactive mind, and then command it. Dianetics is a science which addresses itself directly to the reactive mind to reduce the command value of that reactive mind. Scientology is an embracive subject, much wider in application. It has as its goal the beingness that can exist without an energy or matter, which is to say, without time, whether homo sapiens or not. Dianetics was an evolutionary step, a tool which had use in arriving at a higher level of knowledge; its use, however, produced slower results and much lower goals.

Further, Dianetic processes were limited in that they could not be applied more than a few hundred hours without the reactive mind assuming a very high command level over the analytical mind due to the fact that the reactive mind was being validated continually in the process, whereas the better process was to validate the analytical mind.

Medicine and psychology, as practiced today, have absorbed and are using many of the principles of Dianetics without caring to be aware of the later developments in the field of the mind as represented here. Thus, the society absorbs and very often misunderstands knowledge.

The beingness of Man is essentially the beingness of theta itself acting in the mest and other universes in the accomplishment of the goals of theta and under the determination of a specific individual and particular personality for each being.

Scientology is the science of knowing how to know.

Scientology is the science of knowing sciences. It seeks to embrace the sciences and humanities as a clarification of knowledge itself.

One studies to know a science. His study is without avail when he does not know the science of study.

One lives and learns of life but life is not comprehensible to him, no matter how much he lives, unless he knows the science of life itself.

One studies the humanities. If he does not know how to study the humanities he often fails.

The physicist and the fission bomb expert know physics but not the humanities. They do not conceive the relationship and thus physics itself fails.

Into all these things -- biology, physics, psychology and life itself -- the skills of Scientology can bring order and simplification.

One lives better with Scientology since life, understood and controlled, becomes liveable.

A civilization could fare better with Scientology since that would not be pock-marked with unknowns and rendered null with chaos.

The only richness there is is understanding. That is all that Scientology has to give.

THETA-MEST THEORY

Scientology is essentially a study of statics and kinetics. If anything, it is more exact than what are called the physical sciences, for it is dealing with a theoretical static and a theoretical kinetic which are at the opposite ends of a spectrum of all motion.

One of the most valuable contributions of Scientology to knowledge is the definition of a true static. A static has no motion; it has no width, length, breadth, depth; it is not held in suspension by an equilibrium of forces; it does not have mass; it does not contain wavelengths; it has no situation in time or space. Formerly a static was defined only as a motionless object which definition is not adequate, since an object -- or a state of rest for an object -- is attained only by an equilibrium of forces and all objects have in themselves, if only on a molecular level, motion, and exist in space which is itself an integral portion of motion. Hence we see we are dealing with a higher level static.

The capabilities of the static are not limited.

The static interacts with the kinetic which is considered to be the ultimate of motion.

In Scientology, the static is represented by the mathematical symbol theta; the kinetic is called MEST.

Theta can be the property or beingness of any individual and is, for our purposes, considered to be individualistic for each individual.

MEST stands for matter, energy, space and time, and is a composite of the first letter of each. The word MEST appearing all by itself denotes the physical universe. MEST with a designation word after it designates another's universe.

The original of the Theta-MEST theory may be found in Science of Survival 1951. After the concept of the true static was reached, problems of processing began to solve much more rapidly, and the main proof of the Theta-MEST theory is its workability and the fact that it predicted an enormous amount of phenomena which, when looked for, were found to exist and which, when applied, resolved cases rapidly.

It is now considered that the origin of MEST lies with theta itself, and that MEST, as we know the physical universe, is a product of theta.

The physicist has adequately demonstrated that matter seems to be composed of energy which has become condensed in certain patterns. It can also be demonstrated adequately in Scientology that energy seems to be produced by and to emanate from theta. Thus it could be considered that theta producing energy, condenses the space in which the energy is contained, which then becomes matter. This theory of condensation is borne out by an examination of a state of aberration of many preclears who have been found to have descended down the tone-scale to the degree that their own space was contracted and who were found to be surrounded by ridges and who are thus "solid" to the degree that they are aberrated. Further, they can be found to be an effect in the ratio that they are so solidified. Further, a psychotic treats words and other symbols, including his own thoughts, as though they were objects.

Time

It is stated in the 1951 axioms that time could be considered to be the single arbitrary, and might thus be the single source of human aberration. A further investigation and inspection of time has demonstrated it to be the action of energy in space, and it has been found that the duration of an object roughly approximates its solidity.

Time could be considered to be a manifestation in space which is varied by objects. An object could be considered to be any unit manifestation of energy including matter.

It can be readily established that an individual loses his self-determinism in the ratio that he possesses objects and utilizes force.

Time could be considered to be an abstract term assigned to the behavior of objects. It can be found to be regulatable by postulates.

The desire, enforcement and inhibition in the possession, giving and receiving of objects can be found to establish a time-track.

Time in the field of behavior and experience becomes having. Having and Not Having form between themselves the interchanges which become survival.

If the auditor processes having, giving and receiving, energy and items, he will discover that he is processing time directly and has processed into a higher level the time sense and reaction of the preclear.

The primary manifestation of this is found in criminality, where the individual is unable to conceive the investment of energy to attain an object. He will not “work.” The criminal in particular wishes to collapse and render without time, desiring and having; whereas this may be possible in one’s own universe, it is not possible in the MEST universe. The MEST universe is so planned as to make work necessary in order to have, thus establishing a gradient scale of having. The criminal has not made the distinction between his own universe which he possibly once had and where he could attain things instantaneously, and the MEST universe. He thus has no “respect for property”. The identification of his own universe with the MEST universe is so marked as to be in itself a highly aberrated identification, thus rendering his conduct destructive to himself and causing him to fail.

Space

Space is creatable by a thetan. He may also conserve, alter and destroy space.

Space is the first condition necessary to action. The second condition necessary is energy. The third condition is possession or not possession.

For the purposes of processing, and possibly for many other purposes, space can be considered to be the equivalent in experience of beingness. One is as alive as he has space and as he can alter and occupy that space.

The workable definition of space is “viewpoint of dimension”: there is no space without viewpoint, there is no space without points to view. This definition of space remedies a very great lack in the field of physics, which defines space simply as that thing in which energy acts. Physics has defined space as change of motion or in terms of time and energy. Time has been defined in terms of space and energy; energy has been defined in terms of space and time only. These definitions, thus interdependent, made a circle out of which there was no exit unless one had a better definition for one of those items: time, space or energy. In such a way was the science of physics limited.

Space is the viewpoint of dimension. The position of the viewpoint can change, the position of the dimension points can change. A dimension point is any point in a space or at the boundaries of space. As a specialized case those points which demark the outermost boundaries of the space or its corners are called in Scientology anchor points. An anchor point is a specialized kind of dimension point. Any energy has as its basic particle a dimension point. The dimension point can be of different kinds and substances. It can combine in various ways, it can take on forms, become objects. It can flow as energy. A particle of admiration or a particle

of force are alike dimension points. Dimension points, by shifting, can give the viewpoint the illusion of motion. The viewpoint, by shifting, can give the dimension points the illusion of motion. Motion is the manifestation of change of viewpoint of dimension points.

Viewpoints are not visible, but viewpoints can have dimension points which are themselves visible. The basic hidden influence is then a viewpoint, A material of the universe cannot exist in any universe without something in which to exist. The something in which it exists is space, and this is made by the attitude of a viewpoint which demarks an area with anchor points.

Rather than existing on theory in common with other principles of Scientology this manifestation of created space can be experienced by an individual, who discovers that space can be made coincidentally with any other space. Space then, is not an arbitrary and absolute but it is creatable or uncreatable by a viewpoint.

Any being is a viewpoint, he is as much a being as he is able to assume viewpoints. Thus in any society we would inevitably have a statement of the infinity of viewpoint such as "God is everywhere." Beings instinctively assign the most beingness to that thing which would be everywhere and when Man desires to assign an unlimited power or command to anything he says that it is everywhere.

Energy

The basic unit of energy is the dimension point. A specialized kind of dimension point is the anchor point which demarks space, but this is again the basic unit of energy. Dimension points are created, controlled or uncreated by the thetan.

The qualities of energy are three in number: the first is its existing characteristics; the second is its wavelength; the third is its direction of flow or absence of direction of flow.

The characteristics can be divided into three classes in their turn. These are flows, dispersals and ridges. The flow is a transfer of energy from one point to another, and the energy in a flow can have any type of wave from the simplest sine-wave to the most complex noise-wave. Flowingness is simply the characteristic of transferringness. A dispersal is a series of outflows from a common point. A dispersal is, primarily, a number of flows extending from a common center. The best example of a dispersal is an explosion. There is such a thing as an in-dispersal. This would be where the flows are all travelling toward a common center. One might call this an implosion. Outflow and inflow from a common center are classified alike under the word "dispersal" for handy classification. The third type of energy characteristic is the ridge. A ridge is essentially suspended energy in space. It comes about by flows, dispersals or ridges impinging against one another with a sufficient solidity to cause an enduring state of energy. A dispersal from the right and a dispersal from the left colliding in space with sufficient volume create a ridge which then exists after the flow itself has ceased. The duration of ridges is quite long.

Wavelength is the relative distance from node to node in any flow of energy. In the MEST universe, wavelength is commonly measured by centimeters or meters. The higher the frequency the shorter the wavelength is considered to be on the gradient scale of wavelengths. The lower the frequency the longer the wavelength is considered to be on a gradient scale. Radio, sound, light and other manifestations, each has its place on the gradient scale of wavelengths. Wavelength has no bearing upon wave characteristic, but applies to the flow or potential flow. A ridge has potential flow which, when released, may be supposed to have a wavelength. The various perceptions of the body and the thetan, each one is established by a position on the gradient scale of wavelengths. They are each one an energy flow.

Direction of flow, relative to the thetan, is of primary interest in energy study. There would be outflow and inflow. There could be outflow and inflow for a source point exterior to the thetan and caused by that source point, and there could be outflow and inflow by the thetan himself.

Matter

Matter is a condensation of energy. The more energy condenses, the less space it occupies and the greater its endurance becomes. A flow of energy has a brief duration. Flows of energy meeting and causing ridges obtain greater solidity and longer duration.

The solidification of matter is found to be itself duration or time. Energy becomes matter if condensed. Matter becomes energy if dispersed.

The manifestations of energy are essentially at long length the manifestations of matter; one cannot consider matter without also considering energy.

In processing, no differentiation is made between matter and energy beyond labelling the freer-flowing and more instantaneous forms “action” and the more solid and enduring forms “having.”

In order to have matter, one must have space, must have had energy, and must have.

In order to have space, it is necessary to have a viewpoint and the potential in the viewpoint of creating anchor points. Thus, in order to view matter, much less control or create it, it is necessary to have a viewpoint.

AFFINITY, COMMUNICATION AND REALITY

In human experience, which is probably an experience senior to and creative of such a thing as the material universe, space, energy and matter become beingness, doingness and havingness.

Beingness is space regardless of energy and matter; doingness requires both space and matter; and havingness requires space and energy.

We have a gradient scale from space to matter which starts at the arbitrary number of 40.0 for our purposes and goes down to 0.0 for the purposes of homo sapiens and to -8.0 for the purposes of estimating a thetan. This gradient scale is called the tone scale.

Space is found to be a broad characteristic from top to bottom of the scale and necessary to each part of it, but it is discovered that one has less and less space the more the scale is descended. If one were to attain zero space for himself, he would attain, even as a thetan, zero. That the body has space and the thetan apparently, to himself, does not have space, is responsible mainly for the feeling of not-beingness on the part of the thetan which causes him to forget his own identity.

On this tone-scale, we have a theoretical point of no energy at 40.0, and a point where energy begins to be solid around 0.0; well below this level we have matter formed of the type known in the material universe. Thus one can see that this tone-scale is a gradient scale of energy, and that the energy is free toward the top of the scale and becomes less free and more fixed as one descends the scale.

A very important triangle in Scientology is the triangle called ARC. This stands for Affinity, Reality and Communication. It was used for some time before its relation to energy was understood.

Affinity is wave characteristic and is the range of human emotions. Human emotions manifest themselves in energy flows, dispersals and ridges. As the emotions drop down from high on the scale to low on the scale, they are found to follow a cycle of dispersals, flows and ridges. Each dispersal has a harmonic on the scale, each flow has a harmonic and each ridge has a harmonic. Looking up the scale from zero one finds death as a ridge and, in human emotion, an apathy. Apathy reaches up some extent from death but at this end the harmonics are very close together and there are two unnamed human emotions immediately above apathy. One of them, next above apathy, is a flow; immediately above that there is a fearlike dispersal. The next named emotion above apathy is grief. Grief is a ridge and is occasioned by loss. Immediately above grief there is a flow. The next named emotion, however, is the next level, the dispersal called fear which is a drawing away. There is a flow immediately above this called covert hostility. Above covert hostility is anger which is a solid ridge. Between anger at 1.5 and antagonism at 2.0 there is a dispersal -- unnamed but visible in behavior. At 2.0 we have the flow outgoing called antagonism. Above this at 2.5 there is an idle dispersal known as boredom. Above boredom at 3.0 is a ridge called conservatism. At 4.0 we have another flow called enthusiasm. Each one of these points is a harmonic of a lower point. The characteristic of energy whether a flow, dispersal or ridge, expresses itself in human emotion in terms of affinity. Affinity is the cohesiveness of human relationships, and can be acceptance or rejection of such relationships. Affinity as here used is a degree of emotion. Its equivalent in the MEST universe is the cohesion and adhesion or revulsion from matter and energy itself as found in positive and negative currents, and in forms of matter.

Communication is an interchange of energy from one beingness to another; in the thetan and in homo sapiens communication is known as perception. It is not solely talk, which is a symbolized form of communication which sums ideas which are themselves either a product of the tone-scale or are above the tone-scale as the case may be. Sight, of course, is at the wavelength of light. Sound is recorded as hearing. Tactile and smell are low-level wave types

of the particle variety. And all other perceptions can be found on this gradient scale of wavelengths, modified by the wave characteristic in terms of type, whether sine or more complex. The auditor must realize that communication is essentially directed or received energy and is inhibited by the willingness or unwillingness of the preclear to take responsibility for energy or forms of energy. Where responsibility is low, perception is low.

Reality is established by wave direction or lack of motion.

As one ascends the tone scale from 0.0 he finds the realities are strongest at the points of flow and are weakest at the points where there are ridges on the scale.

The reality of apathy, grief and anger is very poor, but in the immediate vicinity of these there are more intense realities. Reality is established by agreement or disagreement or no opinion. Agreement is an inflow to the individual; disagreement is outflow from the individual; no opinion can be established by the proximity of the individual to the center of a dispersal or by a ridge.

Because of its wealth of energy and energy forms, the thetan finds himself ordinarily outdone in energy emanation by the Mest universe. Thus he is the target of an almost continuous inflow which causes him to have a consistent and continual agreement with the MEST universe. He seldom disagrees with the MEST universe, and the best processing one can do is to break this agreement and turn it into an opposite flow, for only in this wise can a preclear's ability to handle energy and be responsible for it be re-established. If you ask a preclear to get the concept of agreeing, he will find himself experiencing an inflow upon himself.

Hypnotism is performed by causing a subject to receive a continuous rhythmic or monotonous flow from the operator. After this flow has continued the subject will accept any reality which the operator cares to deliver unto him. It is in this case, evidently, with the MEST universe, and the solidity of the MEST universe is completely dependent upon one's acceptance of it in terms of agreement.

Reality in essence is agreement or disagreement. When one speaks of reality, he speaks in terms of the MEST universe. The MEST universe, according to any computation one cares to make upon it, is found to consist of a high-level agreement amongst us. Those who disagree with the MEST universe are punished by the MEST universe.

From the standpoint of the MEST universe, the greatest reality would be had by matter itself and this seems to be its evident goal toward the thetan, to make him into solid energy. The reality on one's own universe is poor because he is in a comatose state of agreement with the MEST universe. It is found on processing, however, that a preclear is in poor condition in direct ratio that he has accepted and agrees and complies with the MEST universe, and is in good and active condition in direct ratio to the degree he can break this flow of agreement and establish his own flows and thus create his own universe. One's appreciation of the MEST universe is almost uniformly the energy which one himself places upon the MEST universe, in other words his illusions. When he loses his hopes and dreams (his illusions), it is because he has lost his ability to emanate energy back at the MEST universe and is dependent upon the energy the MEST universe thrusts at him.

ARC thus form a tone-scale. This tone-scale at any level finds a comparative state in affinity, in the reality and the communication abilities of the preclear. Thus, by testing the preclear and discovering his chronic emotion, his chronic state of agreement or disagreement, and his ability to communicate or not communicate, one establishes a level on this tone-scale.

ARC form a triangle the corners of which are all at a single level. Thus if one wishes to create an increase of tone for the preclear -- and one must do that to increase his self-determinism -- he will find that he cannot raise the emotional state of the preclear without also addressing the reality and communication of the preclear. He cannot raise the reality of the

preclear without addressing his affinity and communication problems. He cannot raise communication with the preclear without addressing his reality and affinity problems. The worst mistake an auditor can make is to undervalue this triangle in processing. A more or less complete tone-scale can be found in Science of Survival, and Book I of that volume is devoted entirely to an evaluation of the tone-scale and people.

There are two positions on the tone-scale for the preclear when he is still a homo sapiens. The composite known as homo sapiens is considered to be dead at 0.0 and can rise on the tone-scale to slightly above 4.0. Thus homo sapiens has this as his range. The thetan, however, who, in homo sapiens, is below the level of awareness of self in terms of space and energy, has a wider range; and, as the thetan is basically the preclear and the beingness and identity of the preclear in actuality, this second range is even more important. This second range goes from -- 8.0 to 40.0 on the tone-scale. The optimum position for the thetan is considered to be 20.0 which is the point of optimum action. A homo sapiens as such could not attain this level of the tone-scale because of his physical limitations.

Identity Versus Individuality

The most common confusion on the part of a preclear is between himself as an identified object and his beingness. One's beingness depends upon the amount of space which he can create or command, not upon his identification or any label. Identity as we know it in the MEST universe is much the same as identification, which is the lowest form of thought. When one is an object and is himself an effect, he believes that his ability to be cause is dependent upon his having a specific and finite identity. This is an aberration; as his beingness increases his individuality increases, and he quickly rises above the level of necessity for identity for he is himself self-sufficient with his own identity.

The first question a preclear undergoing theta clearing asks himself is quite often: "How will I establish my identity if I have no body?" There are many remedies for this. The worst method of having an identity is having a body. As his individuality increases and his beingness expands -- these two being almost synonymous -- he is less and less concerned with this problem; that he is concerned with the problem tells the auditor where he is on the tone-scale.

One of the control mechanisms which has been used on thetans is that when they rise in potential they are led to believe themselves one with the universe. This is distinctly untrue. Thetans are individuals. They do not as they rise up the scale, merge with other individualities. They have the power of becoming anything they wish while still retaining their own individuality. They are first and foremost themselves. There is evidently no Nirvana. It is the feeling that one will merge and lose his own individuality that restrains the thetan from attempting to remedy his lot. His merging with the rest of the universe would be his becoming matter. This is the ultimate in cohesiveness and the ultimate in affinity, and is at the lowest point of the tone-scale. One declines into a brotherhood with the universe. When he goes up scale, he becomes more and more an individual capable of creating and maintaining his own universe. In this wise (leading people to believe they had no individuality above that of MEST) the MEST universe cut out all competition.

Beingness

Space is not necessary to the beingness of a thetan when the thetan is above the tone level of 40.0 and can create space at will. He creates space to have specific beingness. At 40.0 space and beingness can be considered to be interchangeable. Beingness can exist without any energy or matter, which is to say, without time.

However, in this universe, in order to achieve a state of beingness, which is more to our point here, it is necessary to have a viewpoint from which dimension points can be created or controlled. One has as much viewpoint as he has space in which to view in relationship to

other viewpoints having space in which to view, thus one has a condition of relative beingness.

Doingness

Action requires space and energy manifestations, and the definition of action could be doingness directed toward havingness. In order to accomplish action, a preclear must be able to handle energy.

Doingness with energy and objects as found in the MEST universe is very far from the only method of producing existence. This is a specialized form of behavior and may exist in any universe but is very peculiar to the MEST universe.

Havingness

Time is an abstract manifestation which has no existence beyond the idea of time occasioned by objects, where an object may be either energy or matter. Time can be defined as change in space, but where one attempts to define motion as change in space, the definition lacks usefulness since one does not define what is changing in space; there must be something there to change in space in order to have the illusion of time.

As was earlier discovered in Scientology, the single arbitrary is time. This is because time did not exist as such but stemmed from havingness. When Man experiences "time," he is experiencing havingness or not-havingness.

Time is summed up as "had," "have," and "will have." Goals in the MEST universe are summed uniformly under the heading of "will have." One engages in action in order to have.

This is one of the most important points of processing. The individual has made a postulate to have and has then gained something he did not want at every single point on the time track where you find him stuck. He desired to have a castle. He may have been engaging in an action which would gain for him a castle and was stopped and killed by an explosion which destroyed a wall before him. The explosion caught him with a postulate that he would have and gave him something he did not want. Struggling with the facsimile afterwards, the auditor will find that the incident began with the postulate to have and is now in a state of indecision since the explosion is unwanted.

Bluntly, any and all aberrative incidents to be discovered in a preclear are a reversal of havingness where the preclear did not want something and had to have it or wanted something and could not have it or wanted something and got something else.

The entire problem of the future is the problem of goals. The entire problem of goals is the problem of possession. The entire problem of possession is the problem of time.

Time is impossible without possession of objects.

Thus is resolved one of the weightier problems of the human mind. The auditor may find it difficult to encompass this principle, since time may continue to exist for him as an entity, an unknown and hovering thing. If he will use the principle that the past is had or did not have, that the present is has or does not have and that the future is will have or will not have, and that past, present and future are divided and established entirely by desire, enforcement and inhibition of havingness, he will find his preclear recovering swiftly.

Universes

A universe is defined as a “whole system of created things.” There could be, and are, many universes, and there could be many kinds of universes: we are for our purposes here interested in two particular universes. The first of these is the Mest universe, that agreed upon reality of matter, energy, space and time which we use as anchor points and through which we communicate. The other is our personal universe which is no less a matter of energy and space.

These two universes are entirely distinct and it could be said that the principal confusion and aberration of the individual stems from his having confused one for the other. Where these two universes have crossed, in the mind of the individual, we find a confusion of control and ownership for the reason that the two universes do not behave alike.

Whereas each one of these universes was apparently founded on the same modus operandi as any other universe, which is to say, the creation of space by putting out anchor points, the formation of forms by combinations of dimension points, the Mest universe and one’s own universe do not behave similarly for him.

One’s own universe is amenable to instantaneous creation and destruction, by himself and without argument. He can create space and bring it into a “permanent status.” He can create and combine forms in that space and cause those forms to go into motion and he can make that motion continuously automatic or he can regulate it sporadically or he can regulate it totally, and all by postulate. One’s envisionment of one’s own universe is intensely clear. The reality of one’s own universe is sharper and brighter, if anything, than his reality on the Mest universe. We call one’s attitude towards his own universe “actuality,” and his attitude towards the Mest universe, since it is based upon agreement, “reality.”

Unless an individual is at a very high operating level, he conceives it necessary to use physical force and to apply MEST universe forces to MEST universe forces in order to get action, motion and new forms. His activity in the MEST universe is an activity of handling energy and his ability to exist in the Mest universe is conditional upon his ability to use force. The MEST universe is essentially a force universe, a fact which is, incidentally, antipathetic to most thetans. One’s ability to handle the MEST universe is conditional upon his not abdicating from his right to use force, right to give orders, his right to punish, his right to administer personal justice, and so forth. We are presented in the MEST universe with a crude and brutal scene wherein gigantic forces are in pressure against gigantic forces and where the end of all seems but destruction. Paradoxically, in the MEST universe, destruction of form only is possible, since by the law of the conservation of energy, the destruction of actual material objects is impossible, only conversion being attainable.

In the MEST universe ethics seem to be a liability, honesty is all but impossible save when armed with force of vast magnitude. Only the strong can afford to be ethical, and yet the use of strength begets but the use of strength. In the MEST universe we are confronted with paradoxes upon paradoxes where behavior is concerned, for behavior in the MEST universe is regulated by stimulus-response and not by analytical thought or reason. The MEST universe demands of us complete and utter obedience and agreement on the penalty of extermination, yet when one has agreed entirely with the MEST universe he finds himself unable to perceive it with clarity.

In one’s own universe, on the other hand, honesty, ethics, happiness, good behavior, justice, all become possible.

It is one of the operations of the MEST universe that it is a jealous universe and those who are thoroughly imbued with the principles of the MEST universe have even as their best efforts the goal of eradicating one’s own universe. A control operation begins early in the life of almost every man, whereby his imagination is condemned. His own universe is not imaginary, but it may be said to be so and if his imagination is condemned, then he loses his ability to garnish the hardness and brutality of the MEST universe with hopes and dreams. When he loses this he becomes a slave of the MEST universe, and as a slave he perishes. His

road to immortality lies, then, in another direction than in the complete subservient agreement with the MEST universe and the handling and conversion of its forces. This is a matter which has been subjected continuously to test and it is intensely surprising to people to discover that the rehabilitation of their creative ability, their own space, their own images, rehabilitates as well their ability to confront the MEST universe with a strong and ethical face.

Creative processing, especially where it divorces all thought from thought of the MEST universe and follows out along a line of the rehabilitation of one's own universe without attention to the MEST universe, is one level of processing which produces magnificent results and which is a standby in any case, no matter how difficult.

On the other hand, the rehabilitation of the MEST universe itself, in the concept of the individual, accomplishes a very great deal in processing, and could be said to compare with the rehabilitation of one's own universe; but the rehabilitation of one's ability to perceive the MEST universe is dependent upon his ability to perceive present time and the rehabilitation of that ability. Dwelling upon the MEST universe past or its future is fruitless, thinking about the MEST universe, attempting to predict the MEST universe, planning to reorganize and handle the MEST universe, all defeat one's ability to handle the MEST universe. When he simply begins to perceive the MEST universe in present time and to examine that which he sees, with the idea that he can be what he sees, he loses all fear of the MEST universe.

There is a differentiation process in one's own universe, a differentiation process exclusively for the MEST universe and a differentiation process which pulls apart one's own universe and the MEST universe.

The first of these processes simply goes about reconstructing one's own universe with no attention to the MEST universe. The second causes the individual to contact the MEST universe present time and to observe that present time continuously. The third differentiates between the MEST universe and one's own universe and consists of "mocking-up" one's own universe duplicate of every MEST universe object he can perceive, and then actually comparing these one against the other.

Creating space and mocking-up items in it is the rehabilitation of one's own universe and is a primary process.

Differentiating between two similar objects in the MEST universe such as two books, two chairs, two spaces, with one's MEST eyesight, accomplishes much in being able to face and handle the MEST universe.

The mocking-up of MEST universe duplicates, which is to say constructing a universe parallel to the MEST universe, is the mechanism by which facsimiles (following) are made and this process brings under control the mechanisms which make facsimiles.

The original definition of Scientology 8-8008 was the attainment of infinity by the reduction of the apparent infinity and power of the MEST universe to a zero for himself, and the increase of the apparent zero of one's own universe to an infinity for oneself. This is an ideal and theoretical process, it is not necessarily attainable in actuality or reality but it very well may be. It can be seen that infinity stood upright makes the number eight: thus, Scientology 8-8008 is not just another number, but serves to fix into the mind of the individual a route by which he can rehabilitate himself, his abilities, his ethics and his goals.

Terminals

At every turn in the examination of the MEST universe we discover that it is a two-terminal universe. In the manufacture of electricity it is necessary to have two terminals. In order to have an opinion evaluated, it is necessary to have an opinion against which the first can be evaluated. A datum can be understood in the MEST universe only when it is compared to a

datum of comparable magnitude. This is two terminals operating in terms of thought. Two MEST universe terminals which are similar, placed side by side will discharge to some degree against each other. This is observable in gravity as well as in electricity.

A primary difference between the MEST universe and one's own universe is that one's own universe is not a two-terminal universe necessarily. One can mock up in one's own universe two terminals which will discharge against each other, but he can also at will mock up two terminals which are identical which will not discharge against each other.

There are a number of processes which could include double terminals. One terminal made to face another terminal (in terms of mock-up) can be discharged one against the other in such a way as to relieve aberration connected with things similar to the terminal thus mocked up. However, these two terminals do not furnish a double terminal of a communication line. A communication line is more important than a communication point. Thus, if one wished to discharge anything, he would desire to discharge the communication line. The MEST universe is intensely dependent upon communication lines rather than communication terminals. One takes two pairs of such terminals then, and standing them in relationship to each other, discovers that he has now four terminals but these four terminals furnish only two lines. These two lines will discharge one against the other.

This, as a limited process, should not be continued very long. It is of greatest interest in rendering assistance after an accident where it is only necessary to mock up the accident twice, or indeed, to mock up something similar to an injured limb, to have the pain and discomfort and aberration discharged. Should one burn one's fingers, it is necessary only to mock up his fingers twice side by side and then twice again, making four mock ups with two communication lines, to have the pain in the finger subside. The mock-ups discharge at the same time as one's injured finger re-experiences the incident. This manifestation is the manifestation of the MEST universe, it is not a manifestation of one's own universe and if practiced over a long period of time is essentially an agreement with the MEST universe, a thing which should be avoided; thus it is a limited process.

A terminal is, in essence, any point of no form or any form or dimension from which energy can flow or by which energy can be received. A viewpoint then, is a sort of terminal, but a terminal must have a particle in order to do automatic interchanges and one finds that a viewpoint can be affected by the MEST universe only when the viewpoint has identified itself with some MEST universe article, such as a body. The rehabilitation of the viewpoint's ability to be, or not be, at will is essential in order that a viewpoint be self-determined about what is affecting him and what is not affecting him. This depends, of course then, upon what a viewpoint identifies himself with and depends upon the ability of the viewpoint to unidentify himself rapidly.

Terminals are anywhere in the MEST universe and can be manufactured, of course, in one's own universe. The difference is that any bit of solid, even on the level of an electron in the MEST universe, is, willy-nilly, a terminal; it is affected in certain ways, whether it likes it or not. Any particle in any object or any flow of energy is in itself a terminal. A terminal can be affected by any other terminal or can affect, to some degree, other terminals.

This cross-relationship of terminals in the MEST universe is MEST universe communication. In one's own universe a flow is not necessary for the production of energy or potentials.

It is one of the sources of aberration that the scarcity of things in the MEST universe causes one to own only one of things; this is aberrative, since that one can gather into itself charges which are not discharged since there is nothing immediately similar to it. If one owned two of everything he had and if these two things were nearly identical, he would find that his worry and concern about these objects was greatly decreased. A child, for instance, should have two dolls alike, not simply one doll. The reason for this is that two terminals will discharge, one against the other. The thetan is capable of mocking himself up to be exactly like

everything he sees. As a matter of fact, whatever a thetan can see, he can be. Thus, the thetan makes himself into a terminal for everything he sees whenever there is an absence of a duplicate. Thus the thetan is in the danger of having everything in the MEST universe discharging against him the moment he alters his relationship to the MEST universe. This fixes him in the belief that he cannot alter his relationship to the MEST universe. Actually he is rather rapidly disabused of this conception by processing. It is rather interesting to “double-terminal” in mock-up form the childhood toys of an individual. He will find there is an enormous amount of charge simply in the fact that these toys were made out of MEST. The favorite doll has a gravitic influence upon him.

Completely aside from the terminals one finds in an electric motor and which produce so much current by reason of being separated by the base of the motor, the subject of terminals goes into behavior and explains in a great measure behavior on a stimulus-response basis in the MEST universe. Indeed, it could be said that the MEST universe came into being by one terminal demanding attention from another terminal and these two terminals thereafter facing each other continuing a discharge one to the other. With very aberrated people, one cannot long discuss things with them without getting the manifestation of terminals, for the very aberrated fix on a terminal easily.

It could be said that the MEST universe is the average of agreement amongst viewpoints and that the laws of the MEST universe, no matter how physical, are the result of this agreement; and, indeed, this definition suffices for those conditions which are supposed to be “reality.” The MEST universe is very real, but any hypnotist can instruct a hypnotized subject into the construction of a universe which has tactile, sight, sound and any other manifestation possessed by the MEST universe, and who is to say then, that the hypnotized subject is not perceiving a universe? For one’s own perception of the MEST universe consists of his placing an object in proximity to or against another object, and both of these objects are found to be objects of the MEST universe. This is overlooked by individuals when they, for instance, strike a desk with their fist. It is the favorite declaration of the materialist (that individual who is in a frantic state of insistence upon the existence of the MEST universe) that “this is real.” The effects he is creating are being created by a hand that is made out of MEST on an object which is MEST. The individual has overlooked the fact that the hand with which he is doing the pounding is itself MEST and that his knowledge of that hand is actually no more than his perception of it. This is a problem in two terminals.

Behavior of Universes

It could be said, then, that the difference between the microcosm (one’s own universe) and the macrocosm (the MEST universe) is the difference between commanding it and agreeing about it. One’s own universe is what he would construct for a universe without the opposition or the confusion of other viewpoints. The MEST universe is that upon which one agrees in order to continue in association with other viewpoints. This may very well be the sole difference between these two universes.

This is exemplified by one’s behavior-attitude in his own universe as compared with his behavior-attitude in the MEST universe. In one’s own universe, the individual expansively plans and devises (once he is fairly confident of it) along the lines of beauty and happiness. In the MEST universe, even when one has been rehabilitated to some degree, one’s attitude still must consist of a certain amount of watchfulness and co-operation.

One’s universe is an unthwarted sway, the MEST universe is a compromise. When one has compromised too long and too often, when he has been betrayed and ridiculed and is no longer able to create what he believes to be desirable, he descends down to lower levels and in those levels, he is still more compelled to face the MEST universe, and as such, loses much more of his ability to handle the MEST universe. When an individual’s ability to create his own universe is rehabilitated it will be found, strangely enough, that his ability to handle the MEST

universe has been rehabilitated. In fact, this is the most secure route as represented in 8-8008 as a road.

By actual experiment it can be demonstrated that one's ability to mock-up a universe of his own and the resulting improvement of his perceptions to that universe bring about an ability to perceive the MEST universe. Indeed, it might be inferred as something like a proof that the MEST universe in itself is an illusion based upon agreement in view of the fact that the rehabilitation of the ability to view illusion rehabilitates the ability to view the MEST universe.

Thought Emotion and Effort

Thought is the highest level attainable. It is of two varieties; one is clear thought established by will which is from 10.0 up on the tone-scale, to well above 40.0; the other is thought established by counter-efforts as in homo sapiens and governed entirely on a stimulus-response basis. The first could be called self-determined thought; the second could be called reactive thought.

Self-determined thought expresses itself as will and consists of the making of postulates based on evaluations and conclusions. Will does not exist in time when it is at this level. Homo sapiens' will, as Schopenhauer once remarked, is stubbornness taking the place of the intellect. Will-power in homo sapiens is most ordinarily demon-circuit power. Free from the body and its ridges which themselves contain stimulus-response thought, the thetan can change his postulates by making new evaluations and conclusions, and can express his will directly. It is very difficult for a thetan inside the head and confronted by the stimulus-response ridges of the body, to do other than obey these stimulus-response flows in agreement with the MEST universe.

Ideas are invariably and inevitably senior to force and action, if those ideas stem from self-determined thought. Ideas born out of stimulus-response thought bear at times an almost indistinguishable similarity to self-determined ideas, but are occasioned by associative logic. In homo sapiens, it is quite common for the person to believe himself incapable of originality. This is because the MEST universe will brook no competitor. Operating on a highly self-determined plane, originality is a simple thing to attain. What is called will-power, then, could have two manifestations: the first would be actual self-determined thought; the second would be a result of an enforced or inhibited thought. When homo sapiens attempts to exercise his will-power, he normally brings into flow the ridges around the body and is nullified by them and is pressed into aberrated behavior.

Ideas, when in the form of self-determined thought, exist above the level of 40.0 on the tone-scale and extend down into the action band.

Ideas of the stimulus-response variety are occasioned by experience as held and contained in facsimiles and are actually dictated to homo sapiens by circuits.

Postulate processing is that processing which addresses the postulates, evaluations and conclusions of the preclear at the level of self-determined thought, yet postulate processing has some value when addressed to stimulus-response ideas. Postulate processing is the primary and highest method of processing a thetan. With creative processing, it constitutes Scientology 8-8008.

Emotion, as known to homo sapiens, extends from slightly above 4.0 down to 0.0, and depends upon the wave characteristic.

Effort is an even lower level manifestation than emotion.

Matter would be the lower effort band.

Facsimiles

The best description of facsimiles is to be found in Electropsychometric Auditing. A facsimile is an energy picture which can be reviewed again.

Facsimiles can disperse or flow when addressed by new energy, either exterior to the thetan or from the thetan. Thus the environment can set a facsimile into action or the thetan can set it into action. Homo sapiens is most normally controlled by directing energy at his facsimiles and setting them into action so as to cause him to dramatize facsimiles and training patterns.

Facsimiles are normally found to be fixed in large number upon ridges.

A facsimile contains more than fifty easily identified perceptions. It also contains emotion and thought.

There are many methods of processing facsimiles.

Assist Processing

An “assist” is the processing given to a recently injured human being or thetan in order to relieve the stress of live energy which is holding the injury in suspension. The direct running-out of the energy contained in the recent facsimile is done by continually running through the incident as though it were just that moment happening to the preclear and recovering from it all his desire to have it and to not have it. And when this has been done to an extent where the energy is desensitized and the injury less painful, the preclear is led to handle it as energy, placing it in different places and times and reversing it and doing other things with it.

The assist is very important, as it can cause an injury to resolve or a person to recover in a fraction of the time which would otherwise be required and, in many cases, it may save the life of the individual and has done so many times in the past. The auditor must know facsimile processing primarily to run an assist and in order to know more about the anatomy of the human mind.

As noted earlier under Terminals, an assist can be rendered by mocking-up the injured part or the scene of injury as two terminals and holding or recreating these mock-ups until the injury abates. While doing this it will be noted particularly that the mock-ups are at first uncontrollable in most cases and then become much more easily controlled. The uncontrollable factor of the mock-ups is answered by this; whenever a pair of mock-ups or a single mock-up misbehaves, which is to say, acts without the specific command of the person getting the mock-up, the person doing the mock-up should simply abandon the pair or single mock-up and put into its place again one which is doing what he wants it to do; in other words, a disobedient mock-up or pair of mock-ups is either put away or moved to the right or left or forced into control, and in its place the individual simply puts a mock-up which is obedient to his control. An auditor should be careful on this point, for an individual getting mock-ups will strain and worry and eventually discover, he thinks, that it is impossible for him to control his mock-ups.

Using effort to control one’s mock-ups is of little avail; one simply creates them. Where mock-ups are absent, one will appear if the individual will simply keep putting the thought forward that it will appear. If he puts forward the thought often enough and long enough, he will get such a mock-up. Where he can get only one of a pair of mock-ups, if he will keep putting the second one in it will eventually appear. What one is facing in double terminalling here is so much charge on a single subject that the charge dissipates the mock-up before the mock-up can be adequately perceived. No matter how briefly, when an individual has said a

mock-up will be there a mock-up has appeared; that it has disappeared promptly does not mean that he cannot put a second mock-up there. Particular attention should be given to this in assists because an assist is essentially dealing with an injured member or a scene which contains pain.

In double-terminalling assists it will be found that the preclear becomes ill or in pain in spite of how innocent he may feel it is to hold two terminals out in front of him. The remedy for this is simply to hold the two terminals (or replace them if they disappear or misbehave) until the illness or feeling has abated.

One can handle worries in this fashion. One simply puts up one worry and then duplicates it facing itself out in front of him and the thought discharges against the thought until the worry and the emotion connected with the worry disappear. Thought, emotion, and effort can be dissipated by double-terminalling in this fashion. It is again remarked that this is a limited technique and should not be continued endlessly as an end in itself. Thirty or forty hours of double-terminalling is much more than enough. The route pointed out by Scientology 8-8008 is a better route than double-terminalling. Double-terminalling is relegated to the level of assist and changing one's state of mind. Double-terminalling doubt against doubt undermines and gets at the bottom of every circuit; thus, it, as a technique, should not be entirely neglected.

Cycle of Action

A cycle of action is dependent for its magnitude upon a cycle of havingness. Because it is a cycle of havingness and beingness and doingness, it is generally viewed as a cycle of time, but, as we have seen, time is an abstract term to describe havingness.

The beginning and ending of a cycle depends upon the state of havingness. A cycle starts with not-havingness, continues through increased havingness, continues then in changed havingness and ends with no-havingness. These conditions of havingness bring about an illusion of time. Where a person does not possess anything, he does not conceive himself to have any time. Thus earlier parts of the track are lost to an individual since he has no time in them, for he has no possession in them.

The most basic description of this should be in terms of havingness, but the cycle can also be stated more abstractly in terms as follows: creation, growth, conservation, decay and death or destruction. This would be the cycle of any object; it would also be the cycle of action as it pertained to an object in the MEST universe.

A cycle of action is not necessarily fixed for all universes.

It is common to the MEST universe. There is no reason why in some universe the cycle should not run from decayed havingness into growth, but in the MEST universe it never does, except through the point of not-havingness, death or destruction.

A cycle of action can also be stated in another way, and this in terms of energy action. Motion is characterized by only three conditions, and all motion is part of the gradient scale of these three conditions. These conditions are: start, change and stop. This compares to creation, alteration and destruction in terms of experience.

In the "last 76 trillion years" the preclear has lived through "spirals." These spirals were at first very long and then shortened each time until the present spiral for most is about 40,000 years as compared with the initial spiral of 100 million years. Thus one can also plot the magnitude of havingness of the individual for each one of these spirals. A spiral is not unlike a life. A life is lived in a cycle of action. A past life is generally obscured because one does not have the body of that life and conceives himself to have now another identity and is not connected to the last life by a havingness. He is, however, definitely connected to his last lives by the facsimiles of those lives which he now ignores.

Past havingness, present havingness and future havingness mark past beingness, present beingness and future beingness and also past action, present action and future action. The past, present and future are established by havingness, but havingness, doingness and beingness alike should be processed as intimately connected in this cycle of action.

The condition of the body itself and its position on the cycle of action as applied to the current life establishes to a large degree the preclear's attitude toward processing. He will react toward processing much in the manner dictated by the condition of the body and its position on the cycle. The body goes through the stages of creation, growth, conservation, decay and death.

A person in his middle years desires no change and may be difficult to process for that reason, since the auditor is seeking to attain change. A person in the later cycle area will run only succumb material and will actually make an effort to succumb through processing. His incidents are commonly those of grief and loss since these are the manifestations of havingness in decay. He has no hopes of having before him and all of his havingness ordinarily no longer with him from the past.

The thetan going on the wider cycle of the spiral is discovered early on the spiral to be in a high state of creativeness, a little later to be intent upon a growth of havingness, a little later attempting to change to avoid conserving, a little later to be conserving, and then to be intent only on decay and dying, and finally upon death itself. The auditor should differentiate very sharply between the cycle of the spiral as applying to the thetan and the cycle of a lifetime. He may find a very young person who is yet on the later part of a spiral. The body of the young person is still in the state of growth and apparently the person's life should be hopeful of much having. Yet the behavior of the person in general is directed almost uniformly towards succumbing. When the thetan is exteriorized from the body, he is found to be listless and certain of the approaching end. He believes that he will be finished entirely at the end of this spiral. He is not normally aware of the fact that he will have another spiral after this; or, if he is, he thinks it will be a shorter spiral -- which it will be; but this can be remedied by postulate processing.

Related Experiences

There is a table of relationships which the auditor must have. These are divided into three general columns. Any one of the columns may be addressed first, but all three columns must be addressed on any subject. The vertical levels of the columns can be considered to be terms which are synonymous.

40.0	20.0	0.0
Start	Change	Stop
Space	Energy	Time
Beingness	Doingness	Havingness
Positive	Current	Negative
Creation	Alteration	Destruction
Conception	Living	Death
Differentiation	Association	Identification

ARC applies to each column or for any one of the above statements of experience.

All eight dynamics apply to each column and thus to any of the above statements of experience.

DIFFERENTIATION, ASSOCIATION AND IDENTIFICATION

A special condition of start, change and stop manifests itself in the very woof and warp of the MEST universe and can be plotted on the tone-scale.

Differentiation is at the top of the tone-scale and is a condition of the highest level of sanity and individuality. Association or similarity is a condition which exists from the upper to the very low range of the scale. And identification is at the bottom of the scale.

The condition of the preclear can be established readily by his ability to associate. He can, however, associate much too well. Association is the essence of logic. Logic is the gradient scale of relating facts one to another. As logic reaches the lower part of the scale, this relationship becomes finer and finer until at last identification is reached and thought could be expressed in terms of $A = A = A = A$.

An excellent rendition of this -- although one not related workably to experience and which did not have with it a truly workable therapy -- is to be found in general semantics in the book *Science and Sanity* by Alfred Korzybski. Insanity is the inability to associate or differentiate properly. Experience itself becomes ungovernable at the lowest depth of identity. The more fixed the identity of the person may be, the less the experience of which he is capable. Fame has at its end a completely fixed identification which is timeless, but which unfortunately is matter and which equally unfortunately, is inaction.

The widest possible differentiation exists at the moment of creation. At this moment, one is committed to a cycle of action which, as it continues, is less and less governable by himself and is more and more governed by his environment. As his degree of havingness increases, he is increasingly governed by what he has had and what he has, and this determines what he will have which, of course, is less freedom, less individuality and more havingness.

Association expresses itself in the preclear in terms of the way he thinks. When he reaches a low level of association, he supposes himself to be thinking connectedly, but is actually thinking in a completely disassociated fashion, for he identifies facts with other facts which should not be identified. The actions of a man about to die or in extreme fear are not sane. Identification brings as its manifestation a solidity to all things including thought. The auditor who processes a preclear very low on the tone-scale who is neurotic or psychotic will readily discover that thoughts are objects to this preclear and that time itself is a matter of enormous concern to the preclear in many cases. Thoughts and incidents and symbols are objects. This is commonly seen in the society in the matter of over-concern about words. A person who has sunk low enough on the tone-scale so that words have become objects and must be handled as such, and exist without any real relationship to ideas, will stop a flow of ideas by an outrage of his word sense which, if he is low on the tone-scale, is easily outraged.

Differentiation, association and identification belong, rightly, on the tone-scale, and can be processed as part of the scale above. But they are a close gauge of thought itself and of ideas. An adequate tone-scale can be drawn for any individual using only the above three words.

The auditor will very often find an individual who is intensely logical and quite brilliant who is yet very difficult to process. This person has agreed with the MEST universe to such a degree that his association has assumed the proportions of near-solidity; the facsimiles and ridges of this individual have become much too solid and are consequently quite difficult to process. This condition of solidity may refer only to the body of the preclear which itself is old, and it may be found that the thetan -- the preclear himself -- is quite vital and capable of wide differentiation, but that this differentiation is being grossly limited by the ridges and facsimiles which surround the body. Such bodies have a heavy appearance. It requires an enormously powerful thetan to handle them in spite of the solidity of the ridges surrounding the body.

Mathematics could be said to be the abstract art of symbolizing associations. Mathematics pretends to deal in equalities but equalities themselves do not exist in the MEST universe, and can exist only conceptually in any universe. Mathematics are a general method of bringing to the fore associations which might not be perceived readily without their use. The human mind is a servo-mechanism to all mathematics. Mathematics can abstractly form by their mechanics coincidences and differences outside the field of experience in any universe and are enormously useful. They can best be used when considered to be a shorthand of experience and in the light that they can symbolize what is beyond actuality. The essence of mathematics lies in differentiation, association, identification, which is to say, equalities must not be viewed as fixed in the real universe. Absolutes are unobtainable in experience but may be symbolized by mathematics.

Logic

Logic is a gradient scale of association of facts of greater or lesser similarity made to resolve some problem of the past, present or future, but mainly to resolve and predict the future. Logic is the combination of factors into an answer. The mission of the analytical mind when it thinks, is to observe and predict by the observation of results. Easily the best way to do this is to be the objects one is observing: thus, one can know their condition completely. However, if one is not sufficiently up the scale to be these objects it is necessary to assume what they are. This assumption of what they are, the postulating of a symbol to represent the objects and the combination of these symbols when evaluated against past experience or “known law,” bring about logic.

The genesis of logic may be said to be an interchange of two viewpoints, via other dimension points by which one of the viewpoints holds the attention (one of the most valuable commodities in the universe) of the other viewpoint by being “logical” about why that viewpoint should continue to look. The basis of logic is “it is bad over there” or “there is a hidden influence which you cannot estimate but which we will try to estimate,” “therefore, you should continue to look towards me.” At its best, logic is rationalism, for all logic is based upon the somewhat idiotic circumstance that a being that is immortal is trying to survive. Survival is a condition susceptible to non-survival. If one is “surviving,” one is at the same moment admitting that one can cease to survive, otherwise one would never strive to survive. An immortal being striving to survive presents immediately a paradox. An immortal being must be persuaded that he can not survive or that he is not or might become not, before he would pay any attention to logic. By logic, he can then estimate the future. Probably the only reason he would want to estimate the MEST universe, aside from amusement, is to keep alive in it, or to maintain something in a state of life in it.

Logic and survival are intimate, but it must be remembered that if one is worried about his own survival and is striving for his own survival, he is striving for the survival of an immortal being. Bodies are transient, but bodies are an illusion. One could bring himself up the tone-scale to a point where he could create an imperishable body with ease.

It is interesting that those people who are the most logical are those people who in processing have to know before they are. When they are sent somewhere, they want to know what is there before they get there. There would be no point in going there if they knew, and if everyone knew what was there before they went there. Yet they will attempt to predict what is going to happen there and what is there by knowing. This knowingness is in terms of data and should not be confused with knowingness in terms of actual beingness.

Logic is the use of data to produce knowingness; as such it is very junior to knowing something by being it.

If you were to double-terminal an individual who is customarily very logical, his body facing his body in terms of mock-up and each of the terminals being very logical, a surprising violence of interchange would take place. This is because logic is mainly aberration. The work

which lies before you is a discussion of beingness and is the track of agreement which became evidently the MEST universe. Therefore this work appears to be logical but it appears also to be the central thread of logic.

Apparently, these conclusions were reached by logic; they were not, they were reached by observation and by induction. That when tested they proved themselves in terms of behavior demonstrates not that they are logical, but that they are, at least to a large extent, a discussion of beingness. Scientific logic and mathematical logic have the frailty of trying to find out what is there before one goes there. One cannot ever be, if he has to know a datum about the beingness first. If one is afraid to be, one will become, of course, logical. This is no effort to be abusive upon the subject of logic or mathematics, it is only necessary at this point to indicate a certain difference between what lies before you and a logical arrangement of assumption.

Patterns of Energy

Energy forms into many patterns. The geometry of this formation would make an intensely interesting study. The patterns, however, are formed by postulates and have no other existence.

The patterns of energy are viewed by the thetan in terms of pressors, tractors, explosions, implosions, pressor ridges, tractor ridges, pressor-tractor ridges, and balls and sheets.

The pressor is a beam which can be put out by a thetan which acts as a stick and with which one can thrust oneself away or thrust things away. The pressor beam can be lengthened and, in lengthening, pushes away.

A tractor beam is put out by a thetan in order to pull things toward him. The tractor beam is an energy flow which the thetan shortens. If one placed a flashlight beam upon a wall and then, by manipulating the beam, brought the wall closer to him by it, he would have the action of a tractor beam. Tractor beams are used to extract perceptions from a body by a thetan. Pressor beams are used to direct action. Tractors and pressors commonly exist together, with the tractor as a loop outside the pressor. The two together stabilize one another.

An explosion is an outflow of energy usually violent but not necessarily so, from a more or less common source point.

An implosion could be likened to the collapse of a field of energy such as a sphere toward a common center point, making an inflow. It can happen with the same violence as an explosion, but does not necessarily do so.

A pressor ridge would be that ridge formed by two or more pressor beams operating against each other in conflict.

A tractor ridge would be that ridge formed by two tractor beams in conflict operating against each other.

A pressor-tractor ridge would be a combination of pressor-tractor flows in sufficient collisions as to form a solidification of energy.

A ridge is a solid body of energy caused by various flows and dispersals which has a duration longer than the duration of flow. Any piece of matter could be considered to be a ridge in its last stage. Ridges, however, exist in suspension around a person and are the foundation upon which facsimiles are built.

Two explosions operating against each other may form a ridge.

Two implosions operating away from each other may form a ridge. An explosion and an implosion operating together -- or many explosions and implosions operating together -- may form a ridge.

These manifestations of energy are used in handling energy, either in processing or in action.

Black and White

Black and white are the two extreme manifestations of perception on the part of the preclear.

The thetan perceives best his own energy, but when he perceives energy he desires to perceive it in white or in color. Color is a breakdown of whiteness. Seeing whiteness or color, the thetan is able to discern and differentiate between objects, actions and spatial dimensions.

Energy can also manifest itself as blackness. A space containing black energy would be black, but a black space may be a space existing only without energy in it. This point of identification is quite aberrative, and drills to permit the thetan to handle blackness are mandatory in processing. If one remembers one's fear of blackness when a child, and that evil is represented as blackness, one will see the necessity for doing this. Blackness is the unknown, for it may contain energy or it may be empty or may be black energy.

Black energy flows are common on the tone-scale of wavelengths. There is, for instance, what is known as the black band of sound.

Some thetans will not perceive anything at all because they conceive themselves to be surrounded by blackness and are not sure whether the blackness has substance or is simply empty, and they have a timidity to discover which. Such a case is resolved by making the case drill with blackness until blackness can be turned on and off and located in time and space. Although this is briefly mentioned, it is a point of the largest importance.

Black and white running and black and white aesthetic running were old processes which are not necessarily vital today to processing. However, white energy runs easily, and where the preclear has a black spot of energy somewhere on an organ or somewhere in the environment of the body, the auditor asks him to turn it white in order to let it flow away. It may not flow away if it is black, either because it does not belong to the preclear (in which case he would see it as black) or because it is simply a spot of space with which he is not familiar. By turning it white he is able to handle it for he now knows it to be filled with his own energy.

One can run own determinism, other determinism, as concepts. In this case the preclear runs the one as long as he gets an area white and then runs the other to continue its whiteness. In such a way all the energy in the area is drained away.

The most common manifestation of a ridge is to have one side of a ridge white and the other side black. This is because the preclear conceives one side of it to have on it his own energy and the other side to have on it energy belonging to another. By running the concept that it is his own and then running the concept that it is another's, one runs both sides of a ridge, if he is running ridges.

Although live energy is generally conceived to be white, it can also be black. In running a preclear with an E-meter, it will be discovered as long as a flow is white and as long as a flow is running, that the needle will gradually rise. When a point of blackness appears in the field, the needle will halt and either will not rise again or will flick as the preclear gets a somatic. This flick is characteristic of the somatic. The stuck needle is characteristic of a black field. The auditor can sit watching a needle and be able to tell the preclear whenever the preclear has had a black area appear in the field. It is notable that somatics only occur in the presence of a black patch. This means that the unknown characteristic of the blackness is something the preclear

has been holding away from him so as not to have it or that black wave energy is that energy used to impress pain. The latter case is the more probable although a great deal of work must be done upon this to establish beyond doubt the manifestation of blackness.

A preclear who cannot see color in his facsimiles, cannot see it because he is unable to use energy with which to perceive. He will see things in terms of blackness or whiteness.

He may be able to get black and white or he may be able to get only blackness. In the latter case he finds blackness in some way profitable and desirable; and running the concept of havingness, will have and have had blackness, and using drills in handling blackness -- moving it from space to space in the environment and moving it into yesterday and tomorrow -- will bring about control of blackness on the part of the preclear.

Perception

The entire subject of perception is the subject of energy. As the preclear goes down the tone-scale, he is less capable of differentiation and is thus less and less capable of handling energy and is more and more subject to energy, until at last he will not emanate or handle energy. Even in the higher ranges of this descent his perception begins to diminish.

The rehabilitation of perception is essentially the rehabilitation of force. Force is rehabilitated by rehabilitating the control of energy. This is done by ARC processing and in many other ways. The chief way in which this is done is by establishing the preclear's ability, by creative processing, to handle blackness.

An entire science called perceptics can easily be constructed and is mentioned in the original thesis (1948).

The rehabilitation of sight in the blind, hearing in the deaf, the ability to speak, anaesthesia of the body or body areas or the genital organs, depends upon the rehabilitation of the preclear's ability to handle energy. Creative processing, with particular attention to handling blackness, is essential in this process.

Force

In the axioms, force is defined as random effort. Effort is defined as directed force.

Force is essentially measured effort. It is quite common for individuals to be so protesting at what the MEST universe is doing that they abandon any and all force and, if asked to reassume force or use it, suppose that one is asking them to condone and assume punishment and destruction since these in the MEST universe are done with heavy quantities of force. There is, however, a gradient scale of force, for any energy manifestation may be called force. Even matter contains force.

For the purposes of processing, in order to avoid upsetting the preclear, who usually has very bad connotations with the word force, the auditor stresses instead the "handling of energy."

The use of energy would encompass any activity having to do with energy or matter.

Responsibility

The responsibility level of the preclear depends upon his willingness or unwillingness to handle energy. That preclear who is protesting against energy in any direction is abandoning responsibility in greater or lesser degree.

One obtains randomness (see Axioms) by abandoning responsibility in some sphere. He will then find himself in conflict in that sphere.

The gradient scale of responsibility is as follows: at 40.0 responsibility manifests itself as will and can be so pervasive that there is no randomness. This would be full responsibility.

At 4.0 responsibility would manifest itself in terms of action where roughly half one's environment or space had been selected for randomness and for which one would take no responsibility. At 20.0 responsibility would be 50 per cent of the total energy existing.

At 4.0 we find homo sapiens in his narrow environment disagreeing by using the emotion of enthusiasm with an existing state of affairs and directing energy toward the righting of that state of affairs. Even so, responsibility is low at this level.

At 2.0 blame enters the tone-scale as a major factor. This is the level of the tone-scale where fault is envisioned for the first time. Above this level there is sufficient breadth of understanding to see that interdependencies and randomities can exist without fault and blame. At 2.0, with the emotion of antagonism, an individual is assigning blame for lack of responsibility rather than trying to enforce responsibility.

At 1.5 blaming is almost the sole activity of the individual, and, while taking no real responsibility himself, yet he blames all on his environment and does so with violence.

At 1.1 one pretends to take some responsibility in order to demonstrate that others are at fault but one has no real responsibility.

At 0.9 or around the level of fear, one does not think in terms of responsibility but is willing to accept all blame in an effort to escape all punishment.

At 0.75, grief, the individual blames himself, and accepts the fault for what has occurred.

At 0.375, apathy, there is no question of either blame or responsibility. At this level one has become MEST.

On the tone-scale in Science of Survival one will find what might be expected to happen to materiel and communication and persons in the vicinity of those below 2.0 on the tone-scale. This stems normally from responsibility, or rather, its lack.

The keynote of responsibility is the willingness to handle energy. The rehabilitation of the thetan in the handling of energy brings about a rise in responsibility. If a person is low on the tone-scale and still exhibits responsibility, then his energy activity initially must be enormous for any segment of responsibility to exist low on the scale.

The processing of responsibility is one of the most vital processes. If one processes responsibility itself, he can expect sooner or later a theta clear. He would process it by brackets.

There is a condition known as the "glee of insanity." This is essentially a specialized case of irresponsibility. A thetan who cannot be killed and yet can be punished, has only one answer to those punishing him, and that is to demonstrate to them that he is no longer capable of force or action and is no longer responsible. He therefore states that he is insane, and acts insane and demonstrates that he cannot possibly harm them as he lacks any further rationality. This is the root and basis of insanity. Insanity is the only escape possible besides death.

Death has the value of convincing others that one can no longer be punished or feel. As long as one has a body, which can die, there is a limit to the amount he can be hurt. When there

is no body, and there is no limit to the amount he can be hurt, his only answer is this plea of complete irresponsibility which is the “glee of insanity.” This is found as an actual energy manifestation in the vicinity of sanatoria and can be felt as an emanation from the insane.

If the preclear is unable to conceive of “being happy about being insane” (which he usually cannot), get him to get the feeling of anticipation for a vacation. This is irresponsibility in one sense and in actuality, when deepened, becomes the “glee of insanity.”

Happiness is the overcoming of not insurmountable obstacles toward the known goal of havingness. Stepping away from this track, feeling that one’s work is too hard, these are forsakings of responsibility. A common method employed by low-toned people to reduce the power and ability of an individual and so place him under control is to convince him that he is tired and overworked. If they can so convince him, they can then get him to take a vacation. An examination of an individual who has been subjected to this will show that he was happiest when he was working and that before he “needed a vacation” many people worked on him to convince him that he should not work so hard, and thus turned what was actually play to him into work. Society almost demands that a man consider whatever he is doing as work and demands that he consider work as an unhappy thing. In looking around the society at those who gain easily, one finds only people who take a great deal of joy in working and who never think in terms of a vacation.

To run the bracket on responsibility, one would run the desire on the part of the preclear to be responsible, his desire not to be responsible, times when he has been forced to be responsible, times when he has been forced not to be responsible, times when he has been restrained from being responsible, times when he has been restrained from being not-responsible, times when he has been sympathized with because of his responsibilities and then all this as a bracket, the preclear doing it to others and others doing it to others. This run round and round as brackets produces marked results.

The joy of responsibility and the joy of irresponsibility should also be run in terms of brackets.

This becomes most effective when run in terms of responsibilities of having, the irresponsibilities of having, the responsibilities and irresponsibilities of having had, and of will have.

Before this has been run very long on some individuals, the glee of insanity will manifest itself and it must be very thoroughly run out. It is often a hectic, uncontrolled laughter. This should not be confused with line-charge laughter to which it is a cousin; a preclear who starts laughing over the serious things of his past is breaking locks, and can be made to laugh in this fashion for many hours if the chain reaction is started. The laughter which accompanies the “glee of insanity” has no mirth in it whatever.

Peculiar to this is what might be called the attitude of MEST. MEST is not responsible for anything. That preclear who has as his goal complete irresponsibility has also as his goal being complete MEST.

MEST has no space of its own, it causes no action except when acted upon, and it owns nothing but is itself owned.

Slaves are made by giving them freedom from responsibility.

The thetan high on the scale can make space or own space, has wide choices of action, and can create, change or destroy anything he wishes.

The Chart of Attitudes

In order to do rising-scale processing (as covered later), the auditor should know very well his Chart of Attitudes and the reasons underlying each column.

Survives	Right	Fully responsible	Owns All
Dead	Wrong	No responsibility	Owns nothing
Everyone	Always	Motion source	Truth
Nobody	Never	Stopped	Hallucination
Faith	I know	Cause	I am
Distrust	I know not	Full effect	I am not
Win	Start	Difference	Being
Lose	Stop	Identification	Had

This chart on the upper line in each of the above represents from 27.0 to 40.0. The lower line under each one represents 0.0.

Each one of these is a gradient scale with many intermediate points. In rising-scale running, one seeks the attitude of the preclear nearest to the lowest end of this scale and asks him to do a rising-scale to see how high he can change his postulate toward the upper end of the scale.

The last line is, of course, a repeat without the intermediate position of the earlier interdependencies of experience.

Survival

One of the first principles in the MEST universe, and that principle which, when discovered, resolved the problems of the mind, is the lowest common denominator of all MEST universe existence; the goal of life in the MEST universe is survival and only survival.

Survival equates behavior in homo sapiens or in any life form. It also covers the wide field of ethics. The principle of survival was never intended to embrace theta itself for this has, of course, immortality and does not even necessarily move in MEST time.

Survival is nothing if not dependent upon havingness, action and beingness. It is most ordinarily viewed as the attempt in a life form to persist in a state of existence as long as possible.

Right -- Wrong

Rightness is conceived to be survival. Any action which assists survival along the maximal number of dynamics is considered to be a right action. Any action which is destructive along the maximal number of dynamics is considered to be wrong. Theoretically, how right can one be? Immortal! How wrong can one be? Dead!

After a certain point on the tone-scale is reached by the preclear, he will tend instinctively to seek out and do right actions, but ordinarily homo sapiens is thoroughly engrossed in being wrong. Social politeness, with its violation of the Code of Honor, is quite non-survival. It might also be said, How wrong can one be? Human!

The accident prone and no-responsibility case in general is so intent on being wrong that he is incapable of conceiving right.

All jurisprudence is built upon the principle that sanity is the ability to differentiate right from wrong. Jurisprudence does not, however, give a definition of either rightness or

wrongness. Thus, for the first time with this principle, rules of evidence and other matters in law can be established with some accuracy.

Absolute rightness, like absolute wrongness, is unobtainable. Rightness and wrongness are alike relative states.

Responsibility

(See text above.)

Ownership

In view of the fact that time can be conceived to be havingness and in view of the fact that time itself is one of the most puzzling concepts which homo sapiens has ever sought to master, the whole question of ownership is subject to grave error, particularly on the part of homo sapiens.

Discussions in the above text demonstrate that individuality depends upon high-tone level and freedom, whereas identity, as such, would be at a complete level of reduction, a condition analogous to MEST.

It has long been recognized that “a rich man may as well try to get into Heaven as a camel through the eye of a needle.” The auditor will suddenly discover this truth when he tries to process many rich and successful men. These have carried ownership to such an extent that they are themselves thoroughly encased in energy which is solidifying into MEST itself. Instead of having things, they themselves are had by things. Their freedom in motion is enormously reduced, although they have tricked themselves into believing that possession will increase that freedom.

The auditor will find his preclear upset nowhere on the tone-scale as he will on the subject of ownership. A childhood, for instance, is intensely upset by the subject of ownership since the child is given to understand that he owns certain things and is then commanded in every action he takes with those items. A child cannot have possession, free and clear, of anything in the average family. He is given shoes and is told to take care of them and is punished if he does not take care of them although he apparently owns them. He is given toys and is harassed whenever he abuses them. He finally becomes convinced that he owns nothing and yet he is in a state of anxiety about owning things. Therefore he will try to possess many things and will completely overestimate or underestimate the value of what he has. The auditing of childhood ownership is a fruitful field for the auditor.

That preclear who is upset on the subject of time, even faintly, is, and has been, enormously upset on the subject of ownership, since havingness and its manifestations are themselves the MEST universe trick of giving us an illusion of time.

Everyone -- Nobody

(See material above on Identity versus Individuality.)

It may be confusing to the preclear that being everybody can be conceived at both ends of the tone-scale. The difference is that at the bottom end of the scale, the preclear is making the mistake of considering the “somebodies” around him as MEST. He can be their MEST identities. At the top of the scale, while still retaining his own identity, he can be anyone’s identity but this is on a theta level and is disassociated from MEST. That preclear who goes around believing he is other people is usually at the bottom end of the tone scale and has confused his own body with the bodies he sees because he does not have a proper view of his own body and so can easily mistake it for the bodies of others.

When an individual is low on the tone-scale, he easily does a life continuum for others because he himself is so encased in MEST and so poorly recognizes his own identity that he can conceive himself to be anyone without knowing what he has done.

The question of valences and life continuums is difficult to resolve in direct ratio that the preclear conceives himself to be MEST.

MEST, lacking the ability to create space and to produce directive action is, of course, nobody. When a man is convinced he is a nobody he has been convinced at the same time that he is MEST.

Always -- Never

We have already seen that objects give us the illusion of time. The ability to create objects is interchangeable with the ability to have an actual forever.

There would be an illusory forever which would be dependent upon the duration of an object and its apparent solidity. One might also say that the MEST universe seeks to own one by pretending that immortality is something difficult to buy and is only purchased by achieving an identity or being an object. The ultimate in this is, of course, being a part of the MEST universe. One might say jocularly that every planet in the MEST universe was once one or more people. A considerable reaction can be got from a preclear by making him conceive a feeling of devotion toward the "older" gods who were here and who built this universe and who have left it to him. Deeply religious feelings are very often based upon this idea. Some astonishing reactions can occur in a preclear when running this concept.

The real way to be assured of a great deal of time is to be able, of course, to create time, and this would be to a thetan the true concept of always. Time is created, at least in this universe, by creating energy and objects, and by being able to make the universe agree with oneself, not by having the universe continually making one agree with it.

Motion Source -- Stopped

The ability to cause motion is dependent, whether the individual realizes it or not, upon the ability to conceive space. Creation of space is the first requisite for the creation of motion.

When one can no longer create space and cannot conceive any space to be his own, he can be considered to be stopped.

That individual who is tremendously concerned with being stopped is losing his ability to create space. When he is no longer able to create space, he is himself MEST.

Somebody once said that it was a poor man who was not king in some corner. One might add to this that one is not only poor but he does not exist when he cannot create a corner. One could obtain a very amusing viewpoint of this by watching the conduct of a dog who, theta-motivated like every life form, is bravest in his own front yard; and even a mastiff proceeds with some caution when in the front yard of a Pekinese. This is a case of ownership of space and, in some slight degree, the ability to create a space to own.

One processes this by moving mock-ups into an auto created space.

Truth -- Hallucination

The highest one can attain to truth is to attain to his own illusions. The lowest one can descend from truth is a complete acceptance of MEST universe reality, for this below a certain level becomes scrambled and brings on the condition known as hallucination. Hallucination is not self-generated; it comes about only when a person is an effect to such an extent that he is almost dead.

What is commonly believed to be truth is agreement upon natural law. This would be the truth of the MEST universe which would be the lowest common denominator of agreement upon any one subject. Where the MEST universe is concerned, acceptance of such truths is dangerous.

In Scientology one is studying the lowest common denominators of agreement which bring about an acceptance of the MEST universe and prohibit the creation of one's own universe, which latter ability alone makes possible perception of the MEST universe which is itself an agreed-upon illusion.

Truth in Scientology is the study of the lowest common denominator of agreement, plus the establishment of the true ability of the thetan. The true ability of the thetan is a truth much higher than the truth of the MEST universe itself and, if it has ever before been known, the difficulties of communicating it have been such as to inhibit its promulgation.

It can be seen there is truth above what passes for "truth" in the MEST universe. Scientific truths gained from deductive observations of behavior of the MEST universe are themselves manifestations of agreements on the part of beings -- thetans -- who are capable of much wider creation and agreement than that represented in the MEST universe.

We have answered in Scientology a good portion of "what is truth?"

Faith -- Distrust

There is no more over-rated quality in existence than faith.

The subject who, under the hands of a hypnotist operator, conceives an enormous agreement with the hypnotist, is experiencing faith as it is commonly understood. In this state the subject can perceive anything which the hypnotist may direct.

In order to understand faith, one must be able to differentiate between faith-in and faith. The difference between these two conditions is a direction of flow which earlier we found to be reality itself. Faith-in is an inflow of agreement and the placing of one's beingness and doingness under the control of another, and is, in other words, the sacrifice of one's universe. This is the basic mechanism wherein, all along the whole track, thetans have been recruited in some cause or mystery, and have surrendered to this their own identity and ability. A little of this goes a very long distance. It is in essence the basic trick of hypnotism and by it one can convert and reduce the abilities of a subject for any purpose.

Faith-in is an inflow and brings about the acceptance of reality other than one's own. Faith itself would be without flow where one was in a full state of beingness and, with this condition, one could occasion faith itself to occur within his own universe, or could occasion people to have faith in him.

The auditor will find one of the more aberrative phases of the preclear in his failure to obtain from others faith in himself, and his acquiescence to their demands on any dynamic that he have faith in them.

Because it is entirely true that a being lacking in faith is low in tone, the fact can be traded upon with great ease.

Distrust is not the lowest end of the scale, but begins to set in as a neurotic or psychotic condition at about 1.5. Actually faith interchanges with distrust in gradient levels all the way down the tone-scale and they alternate one with the other as one goes deeper and deeper into the MEST universe. The lowest level of this scale is not distrust but complete faith-in, which is the condition held by MEST which is supine to any sculptor.

This column might also be called the column of belief -- disbelief or the column of reality -- unreality. The auditor can expect the preclear as he rises up the tone-scale to pass through the various shades of distrust and the various shades of faith. This is often quite upsetting to the preclear for he cannot conceive himself to be rising in tone.

It is very noteworthy that a preclear, when low in tone at the beginning, will pass inevitably through various strata of revulsion for the MEST universe and then for his own universe. The revulsion he can conceive for the MEST universe objects and for being in the MEST universe can become unthinkably distressing to him. When this condition has occurred, the auditor can be reassured by the fact that the preclear is rising in scale but has hit upon one of the levels of this column, and that a higher level and a more comfortable one immediately succeeds as processing is continued. This is simply a problem of reversing directions of flow. If the auditor is running flows he will find that an inflow is shortly succeeded by an out-flow and this out-flow is shortly succeeded by another in-flow. These are in essence agreements and disagreements alternating one after the other and each one is slightly higher on the tone-scale than the last.

I Know -- I Know Not

Epistemology has long been the senior study of philosophy; Scientology is itself the science of knowing how to know.

The study of knowledge is in essence, in the MEST universe, a study of data. Data in the MEST universe are usually recorded in facsimiles. Thus one can go in two directions toward knowledge. The first is knowing what one is, and the second is knowing what has happened to one in the MEST universe and searching for identity in the MEST universe.

There is no more tragic track than the sordid ransacking of facsimiles to discover TRUTH for all one discovers is what is true for the MEST universe. This wandering and endless trail is bleak with the bones of lost beingness. Earlier explorers have, almost without exception, destroyed themselves in this search for TRUTH in the MEST universe, for all they discovered was further and further agreement and more and more facsimiles and all they achieved as individuals were the traps and snake-pits of implants on the whole track.

To stand at last near the heights of discovered beingness has withered the sadness of standing on other men's bitter and, until now, probably unrewarded search. It was necessary to ransack the facsimiles, which are themselves one's sole inheritance for travail in the MEST universe, to discover the common denominators of facsimiles and to discover that they were only facsimiles, how they were created and how experience was impressed upon the individual. One might well have the feeling of having narrowly escaped a terrible tragedy when he views the thinness on which he stood to view this brink of oblivion, for it was obviously never intended that anyone should recover from participation or even spectatorship in or of the game called MEST universe. Dante's inscription above the portals of Hell might very well be written best on the gates of entrance into this universe.

The common denominator of all difficulty an individual has in the MEST universe may be summed up under the heading "facsimiles." Originally, in his own universe, he used the mechanism of energy creation to make objects. In the MEST universe this ability reduces to the

use of energy solely for the recording of data about the MEST universe so that one can agree with that data. And in this process lies death, not only as a body periodically but as a thetan.

What has commonly been mistaken for knowledge has been the MEST universe track of seeking agreement with the MEST universe by discovering all possible data about what one should do in order to agree with the MEST universe. The more data one achieved, the more facsimiles he had; the more facsimiles he had, the more MEST he was. It was necessary to win through this trap in order to recognize, isolate and evaluate the common denominators of facsimiles, and to discover that self-created energy has been utilized to enforce agreement upon oneself so as to enslave one's beingness and lead it to its final destruction.

No adventure in the MEST universe can exceed the adventure of making orderly anatomy from the chaos of commingled matter, energy and space which comprise the planets, galaxies and island universes of this Black Beyond which awaited to devour the universe self-constructed of any thetan or group of thetans. The slaying of a roaring beast of fire held in it, in olden times, less action and danger.

These lines are not written from any self-congratulatory motive, for fame is a rock. But by these lines the auditor may be impressed by the actuality of what he handles, and so that he can appreciate his own gallantry in fronting an adversary of such insentient brutality.

The road to knowledge led through the anatomy of the space and energy masses called the MEST universe. The data did not lie in the MEST universe. The ransacking of facsimiles for data about one's identity, about one's "past history" in the MEST universe, should be tolerated by the auditor only insofar as it gives him materials for creative processing. He should never directly begin the direct processing of facsimiles, whether engrams or secondaries, save only in the case of an assist. He needs only to know so much of a preclear's beingness on the whole track to know what to mock up for the preclear's running.

The difficulty the preclear is having is not so much the content of various facsimiles but, on this high echelon of Scientology on which we are now operating, the fact that he has facsimiles. The path of better techniques is the path toward permitting the preclear to step away from all his facsimiles.

The track to knowledge, then, has two directions. It is possible at this time to take the better path. The essence of true knowledge is the essence of existing so that one can create beingnesses and data to know. All other data are junior to this.

A control operation of some magnitude was once perpetrated in the late 18th century. It was stated with great authority that anything worth knowing would always be beyond the bounds of human experience. This sought, knowingly or unknowingly, further to block the search for beingness. It should never be considered by anyone or under any circumstances that anything which can affect him could be beyond his ability to know the full nature of what he is experiencing. If any lesson is contained in Scientology, it is the lesson that the gates to all knowingness are open.

One should have the knowledge of the composition of the MEST universe as a fox might have use for the knowledge of a trap. It is cruelty to make a theta clear without at the same time educating him so as to permit him to avoid those pitfalls which brought him where he is found -- in a MEST body on a planet named Earth (Solar System, Galaxy 13, MEST Universe).

Top-scale knowing would be top-scale ability to create beingness. The identity assigned to one by others and the data contained in facsimiles are knowingness not worth having.

Cause -- Full Effect

Above the level of all else on the Chart of Attitudes is Cause. Causation is the highest attainment which can be envisaged by the thetan, but this is not necessarily the highest possible attainment, and much higher levels may be envisionable by the thetan when he has attained high on the level of causation.

To be Full Cause, one would have to be able to cause space and many other manifestations. Everyone, to a greater or lesser degree, attempts to be cause until he is at last the full effect. The fullest effect in this universe is to be MEST itself.

One of the principles of causation is outlined in the cycle of action, but it is not necessarily true that one can only cause a cycle of this pattern or that one must cause cycles at all, for it is excellent processing to mock-up with reverse cycles going from death back to creation with objects which one has mocked up.

It is one of the “facts” of objects that space and energy must have been caused before the object could exist in the MEST universe. Thus any object has prior cause. For this reason when anyone in the MEST universe begins to study in order to resolve some of the riddles of the MEST universe, he falls into the trap of supposing all cause to be prior and time itself to exist. This would make one the later effect of everything he caused. In other words, if he made a postulate, he would then immediately afterwards become the effect of that postulate. Causes motivated by “future” desire, enforcement and inhibition of havingness, do not lie in the past but only in the condition of havingness in this universe which states that any object must have had a “prior” cause.

The preclear has become aberrated by the process of making an effect out of him and taking from him the ability to be cause by convincing him that it is better to be an effect.

Freud had one of the major aberrations in view when he declared his libido theory in 1894 and decided therein that sex was the only aberration. It is certainly a major one in homo sapiens, for in sex one desires to be the cause of little or nothing and desires to be the effect of pleasurable sensation.

Anything in the MEST universe which one desires, he desires because it will have a pleasant effect on him. Thus he is searching for sensation caused exterior to himself which will make on him an effect. How much of an effect can he become? MEST! The snare of pleasurable sensation leads one to accept energy other than one’s own. Desire for this energy or objects then puts one in the condition of being an effect. When one is surrounded by as many powerful possible energy sources as one finds in the MEST universe, he cannot but become a low level cause.

When a preclear is at a level on the tone-scale where he is concerned with bad and good (above 8.0 both these are seen broadly enough to understand that they are viewpoints) he is very concerned if he thinks that he is or could be bad cause and is desirous of being what he considers good cause. He judges these things by moral codes and so bends his conduct as to make bad cause antipathetic to himself and others. Thus he gives away responsibility for bad cause and in that very action becomes the effect of bad cause. When he has found himself to be what he considers bad cause, he ceases to “trust” himself and begins to blame himself and then others.

All angels have two faces. They are commonly represented in mythology as having a black and white face. To be complete cause, theoretically, a person would have to be willing to be bad cause and good cause. Only in this wise, in the MEST universe, could he escape the liability of becoming the effect of bad cause.

The criminal who has elected himself bad cause through having found it impossible to trust himself (and a criminal career always begins at the moment when the criminal-to-be loses his self-respect; a career of prostitution cannot begin until self-respect is lost; and self-respect is

only lost when one considers himself to be bad cause) can only escape becoming an effect by fighting all good cause. The reformation or reclamation of the criminal does not depend upon punishment, which only seeks to make him more MEST than he is, nor yet upon good cause, which he must fight, but upon the reestablishment of the criminal's self-respect; for only after this is he capable of being good cause.

An entire process evolves around "what would you cause on (each one of the dynamics)?" An assessment of the preclear with a meter should seek to establish where the preclear feels he would be bad cause, for it is on this point that he will be found to have lost his self-respect and where it will be discovered why he cannot trust himself. Self-trust, self-respect and the ability to be cause are conditions in the same order of magnitude and can be interchangeably approached.

I Am -- I Am Not

On the Chart of Attitudes which accompanies the Handbook for Preclears, it will be found at 22.0 "I am myself." The only true identity is "myself." It is not a name, it is not a designation. Orders, titles, ranks, praise and enduring fame alike do not bring about the condition "I am" or an actual identity; they bring about instead an identification, with all the liabilities of identification. The finality of identification is 0.0 or lower on the tone-scale.

The concept of infinite mind is not new, but it has always been assigned to another beingness than self. The preclear will be found to be intensely aberrated who has sworn allegiance to some infinite beingness and has then agreed that all space belonged to that beingness, and that the rights of creation and energy belonged to that beingness and did not belong to self. This is a handy and, to the very badly aberrated, acceptable method of denying any responsibility for anything. It is also the shortest route toward I AM NOT. Infinite mind is individualistic. All mankind does not depend upon or share a portion of the infinite mind. On the contrary, the highest individualism attainable is the individualism of the infinite mind. It was beyond the power and grasp of the intellect applying itself to the field of philosophy, to conceive a multiplicity of infinite minds, and these commentators had agreed sufficiently with the MEST universe to conceive that the only space was the MEST universe space and they could not understand that this was an illusion, and that the existence of space does not depend upon existing space. Just as there can be an "infinity" of ideas, so can there be an "infinity" of "infinities" of space. Two beings theoretically, each with an infinite mind, and each capable of the production of an infinity of space, could yet co-produce sufficient space to communicate with each other. This may be difficult to conceive until one has attained a level of the tone-scale sufficient for an expansive viewing of his potentialities, at which moment it becomes simplicity itself.

There is a psychosis which has as its manifestation the illusion that one is God and the ruler of the universe. This psychosis comes about from the effort of an individual who is well below complete agreement with the MEST universe, to shift into the valence of what he has already accepted to be the creator of the universe. Instead of being himself, he has become unable even to be a MEST body in a sane condition, has conceived God to be MEST, and has then shifted into the valence of God. God, in this case, will be found to be conceived to be a MEST object. As an aside to this, below the level of complete agreement that the MEST universe is the only reality, begins the state which could be described by the statement, "I agree, I am still agreeing, and yet you are still punishing me." The unfortunate fact about the MEST universe is that it is MEST and is designed to punish and cares nothing about agreement with it beyond the point that one agrees with it, and has no spirit of fair play whereby punishment ceases when one has acknowledged the winner. Recognition of this brings on insanity in an effort to further back away from responsibility and further escape from punishment. In the MEST universe, this escape from punishment is, of course, impossible. Thus there is a level below 0.0 for any immortal being.

One of the first confusions on the part of the preclear which the auditor will encounter is the fact that the preclear considers himself to be in the state of I AM when he has a body and a

name. This is high-tone compared to the sub-zero state in which the thetan quite often finds himself, but it is very far from optimum. Here the preclear is confusing identity with his own sense of beingness. His sense of beingness does not depend upon and, indeed, is confused by a MEST identity such as a name assigned to him and a body with which he can be recognized.

To a large degree the society of Earth requires, as part of its structure, names and the means to identify. The state finds itself very satisfied whenever it increases its ability to readily identify its citizenry, and will resort to almost any pretext to collect the fingerprints and dossier of one and all.

Identity is such a liability and is so thoroughly MEST that individuality is really not possible in the presence of sharply defined identity. Reaching down into the sub-zero tone-scale, the thetan finds it expedient not only to mask his beingness, but to hide his identity with great thoroughness even from himself. This passion for non-identity is the spasm of clinging to the last shreds of individuality which would otherwise be lost. Thetans from some of the corps operating in space have thoroughly agreed to be amongst themselves completely black, the better to hide in the blackness of space. This blackness is found in the occluded case in many instances.

The commonest plea on the part of the preclear is "Who am I?" He feels that if he could only answer this, he would be happy. He then ransacks his facsimiles for all of his past identities on his many spirals and as these amount to hundreds of millions, he finds no surcease. He succeeds only in damaging himself with the many injuries contained in facsimiles through which he is searching. He is identifying to the point where he is searching not for the state of I AM but for WHAT HAVE I BEEN LABELLED? The attainment of the state of I AM depends upon one's ability to again be able to create space, energy and objects in and for his own universe, by himself or in co-operation with other thetans, and the rehabilitation of the many additional abilities of the thetan for the creation of energy is but one of a very large number. Thus the state of I AM is reached through creative processing and postulate processing rather than the processing of MEST universe facsimiles or endless searching with an E-meter to discover what one has been.

There are gods above all other gods. Anything which has wide acceptance and has been successful, wherever suns shine and planets swing, is based upon some fundamental truth. There is no argument here against the existence of a Supreme Being or any devaluation intended. It is that amongst gods, there are many false gods elected to power and position for the benefit and use of those who would control and make into the basest slaves the most sublime beings. As an ancient Greek said, when one has examined the descriptions of God written by men, he finds in that Being at best a thirst for self-aggrandizement and adulation which would be disgusting in any man. Man has sought to make his God a god of mud because the Early Greek and even more distant peoples, made idols in the form of men by which they thought to entrap the beingness of some local divinity who troubled them; more modern man has fallen into the error of making God into the body of a homo sapiens and posting him somewhere on high with a craving for vengeance and a pettiness in punishment matched only by the degradation of homo sapiens himself.

There are gods above all other gods, and gods beyond the gods of universes, but it were better, far better, to be a raving madman in his cell than to be a thing with the ego, cruelty, and jealous lust that base religions have set up to make men grovel down.

Win -- Lose

It is noteworthy that as the preclear ascends the tone-scale, his desire to win increases. Those low on the tone-scale, even when they think they are trying to win, will almost uniformly set up their problems and solutions so that they will lose.

Homo sapiens has little converse with true competence. There is an astonishing level of winningness above 4.0 where competence becomes a joy like poetry.

Regret of competence ensues when one has employed competence to injure another being drastically. The duellist begins with joy in competence of sword-handling and before long, because of the counter-emotion he receives from his practice of the art, conceives disgust for competence. In a later life, he will carry this into everything he does, so fearing that he will employ competence to injure that he dares not practice competence in the smallest things; and by failing to practice competence, so introduces losingness, to the injury of himself and others. A man who instinctively recoils from competence and perfection, at the wheel of a car, will sometimes cause an accident rather than avoid one if competence of a high order is required in the avoidance.

To win one must wish to win; when one no longer desires to win, one no longer desires to live. (Note -- The remaining three columns of the chart of attitudes are covered broadly in the earlier text.)

The Emotional Scale and Sub-Zero Tone-Scale

The emotional scale has been covered often and exhaustively elsewhere. As has been discussed in this text, it is dependent upon that characteristic of energy known as affinity which itself is established by flows, dispersals and ridges.

Below zero on the tone-scale is applicable only to a thetan.

It has been quite commonly observed that there are two positions for any individual on the tone-scale. This occurs because there is a position for the composite of the thetan plus his MEST body operating in a state of unknowingness that he is not a MEST body, and behaving according to social patterns, which give him some semblance of sanity. The other position on the tone-scale is the position of the thetan himself, and it is necessary for us to demonstrate a negative scale in order to find the thetan at all.

For the thetan you will find the scale as follows:

40.0	Serenity of beingness
8.0	Exhilaration
4.0	Enthusiasm
3.0	Conservatism
2.5	Boredom
2.0	Antagonism
1.8	Pain
1.5	Anger
1.2	No-sympathy
1.0	Fear
0.9	Sympathy
0.8	Propitiation
0.5	Grief
0.375	Making amends
0.05	Apathy
0.0	Being a body
-0.2	Being other bodies
-1.0	Punishing other bodies
-1.3	Responsibility as blame
-1.5	Controlling bodies
-2.2	Protecting bodies
-3.0	Owning bodies

-3.5	Approval from bodies
-4.0	Needing bodies
-8.0	Hiding

This sub-zero tone-scale shows that the thetan is several bands below knowingness as a body, and so he will be found in the majority of cases. In our homo sapiens he will be discovered to be below zero on the tone-scale. The zero-to-four plus tone-scale was formulated on, and referred to, bodies and the activity of thetans with bodies. In order, then, to discover the state of mind of the thetan, one must examine the sub-zero scale. He has some trained patterns as a body which make it possible for him to know and to be. As himself, he has lost all beingness, all pride, all memories and all self-determined ability, but yet has an automatic response-mechanism in himself which continues furnishing his energy.

EACH ONE OF THE ABOVE POINTS ON THE SCALE IS RUN AS POSITIVE AND NEGATIVE. Example: The beautiful sadness of needing bodies. The beautiful sadness of NOT needing bodies. The beauty of being responsible for bodies, the beauty of NOT being responsible for bodies. Each one is run as itself and then as the reverse with the addition of NOT.

The sub-zero to 40.0 scale is the range of the thetan. A thetan is lower than body death, since it survives body death. It is in a state of knowingness below 0.375 only when it is identifying itself as a body and IS, to its own thinking, the body. The BODY-PLUS-THETAN scale is from 0.0 to 4.0, and the position on this scale is established by the social environment and education of the composite being and is a stimulus-response scale. The preclear is initially above this 0.375 on the BODY-PLUS-THETAN range. Then, on auditing, he commonly drops from the FALSE TONE of the BODY-PLUS-THETAN scale and into the true tone of the thetan.

This is actually the only self-determined tone present -- the actual tone of the thetan. From this sub-zero he quickly rises up scale through the entire range as a thetan and generally settles at 20.0 and in command of the body and situations. The course of auditing then takes the preclear, quite automatically, down from the FALSE TONE of the BODY-PLUS-THETAN scale to the actual tone of the thetan. Then the tone of the thetan rises back up the scale level by level.

It is not uncommon to find the preclear (who IS the thetan) quite raving mad under the false "vener" of social and educational stimulus-response training and to discover that the preclear, while behaving quite normally in the BODY-PLUS-THETAN state, becomes irrational in the course of auditing. BUT DESPITE THIS, the preclear is actually being far more sane and rational than ever before and the moment he discovers himself as himself, as THE source of energy and personality and beingness of a body, he becomes physically and mentally better. Thus the auditor must not be dismayed at the course of tone, but should simply persevere until he has the thetan up into rational range. A raving mad thetan is far more sane than a normal human being. But then, as you audit, observe it for yourself.

The Dichotomies

While the auditor can do much solely by reducing facsimiles, he soon will find that his preclears are not always able to erase facsimiles easily. He will find occasionally that he often has a difficult time when a particularly heavy facsimile is in restimulation and, do what he will, the auditor may find his preclear's tone remains unchanged and that the preclear's attitudes have not evolved to a better high.

We now come to "The Governor" mentioned in a lecture in the autumn of 1951. The speed of a preclear is the speed of his production of energy.

The most important step in establishing a preclear's self-determinism, the main goal of the auditor, is the rehabilitation of the preclear's ability to produce energy.

A being is, apparently, an energy production source. How does he produce live energy without mechanical means, cellular activity, or food?

The basic principle of energy production by a being has been copied in electronics. It is very simple. A difference of potential of two areas can establish an energy flow of themselves. Carbon batteries, electric generators, and other producers of electrical flows act on the principle that a difference of energy potential in two or more areas can cause an electrical impulse to flow between or amongst them.

The preclear is static and kinetic, meaning he is no-motion and motion. These, interplaying, produce electrical flow.

A preclear as a static can hold two or more energy flows of different wavelengths in proximity and between them obtain a flow.

A preclear can hold a difference of flow between two waves and a static so long (and arduously) that the effect of a discharging condenser can be obtained. This can "explode" a facsimile.

The preclear flows electrical currents of command at the body. These hit pre-established ridges (areas of dense waves) and cause the body to perceive or act. The preclear takes perception from the body with tractor beams. He holds the body still or braces himself against it by wrapping a tractor (pulling) beam around it while he places a pressor (pushing) beam at his back to command himself into action. (You can almost break a preclear's spine by asking him to contract his own tractor around his body and yet withhold the pressor against his spine.)

All an auditor really needs to know about this is the elementary method of using a difference of potential. That creates energy.

The only thing wrong with a preclear with an aged MEST body is that he has too many facsimiles of his tractors and pressors handling his own MEST body and the rickety state of the body feeds back "slowness" so that he thinks his energy is low -- and until worked with some method such as this, facsimiles do not reduce.

Any difference of potential played one against the other creates energy. Aesthetic waves against a static produce energy. Aesthetic waves against analytical waves produce energy. Analytical waves against emotional waves produce energy. Emotional waves against effort waves produce energy. Effort against matter produces energy.

The last is the method used on Earth in generating electrical current for power. The others are equally valid and produce even higher flows. This is a gradient scale of beingness, from the zero-infinity of theta to the solidity of matter.

The differences of potential most useful are easy to run.

This is, actually, alternating current running. There can be DC running or chain fission running but these are very experimental at this writing.

AC is created by the static holding first one, then the other, of a dichotomy of two differences of potential. A flow is run in one direction with one of the pair, then in the other direction with the other. The dichotomies are:

- | | | |
|---------|----------|-----------|
| 1. | Survive | 12. Faith |
| Succumb | Distrust | |

2. No affinity	Affinity Truth	13. Imagine
3. No communication	Communication Not believe	14. Believe
4. Disagree	Agree	15. Always Never
5. Stop	Start	16. Future Past
6. Be not	Be	17. Everyone Nobody
7. Know not	Know	18. Owns all Owns nothing
8. Effect	Cause	19. Responsible Not responsible
9. No change	Change	20. Right Wrong
10. Win Lose	21. Stay Escape	
11. I am I am not	22. Beauty Ugliness	
23. Reason Emotion	27. Sane Insane	
24. Emotion Effort	28. No sympathy Sympathy	
25. Effort Apathy	29. Sympathy Propitiation And the state of Static, a motionlessness sometimes necessary to run.	
26. Acceptance Rejection		

How are these used?

One asks the preclear to flow agreement, then disagreement. He flows a feeling, a thought (NEVER the phrase!) of “agreement” out or in, in the direction he chooses relative to himself. He lets this flow until it turns smoky grey or white, then black. Then he changes the direction of flow and gets the thought or feeling of “disagreement”. He runs this until it turns grey or white, then black. When this has turned black or dark, he again runs “agreement” in its direction until he gets grey or white, then again black. Now he reverses the flow and flows the thought “disagreement” until he gets grey or white, then blackness. And so on and on.

It will be noted that at first it may take some little time for a flow to run from black through white to black. As the preclear continues to run, after minutes or many hours, he begins to run faster, then faster and faster, until at last he can keep a flow blazing and crackling.

A method of aberrating beings was to give them white and black energy sources in their vicinity. These show up on a very low tone occluded case as blazing white and shining white. That is an electronic incident, not his own energy flow. These run blazing white in one direction for minutes or hours before they go black. They then run the other way, blazing white, almost as long.

WHEN BLACK PREDOMINATES IN SUCH INCIDENT WHAT HE “HAS TO DO” TO GET THE INCIDENT ALL WHITE.

As the preclear runs, he finds the speed of the change of flow changes, more and more rapidly until it runs like a vibration. This vibration, theoretically, can increase to a strong current which becomes so great it is well to ground your preclear by using an E-meter or letting him hold a wire in each hand which is connected to a bare water pipe or radiator. Otherwise, his MEST body may be damaged by the flow.

Run a dichotomy only against its mate. Run in alternating directions until the flow turns black.

Don't run a black “flow.” It doesn't flow or run out.

Methods a Running

There are many methods of running facsimiles and of handling ridges and flows. These have been covered in other publications; all of them have validity and can advance cases.

In the present publication there are only two processes which are stressed and these processes are superior to others published prior to December 1st, 1952. A great many tests have established the fact that two processes, both of them simple, produce far better results than any of the others.

The title “Scientology 8-8008” means the attainment of infinity by the reduction of the MEST universe's apparent infinity to zero and the increase of the zero of one's own universe to an infinity of one's own universe. This road is attained by postulate processing and creative processing.

To run any incident or use any process it is necessary for the auditor to have a very sound idea of what he is doing, and to this end it is recommended that he know and be able to use the following:

Processing

The Code

The Theta Entity

The Entities

Running Engrams

Running Secondaries

Running Locks

Concepts and Feelings

Running Ridges (Circuits)

Running Live Flow

Freeing the Thetan by Concept and Feeling

Freeing the Thetan by Present and Future

Randomity

Freeing by Dichotomies

Freeing by Tone Scale

Freeing the Thetan by Orientation

Freeing the Thetan by Positioning and Exhaustion of Flows

Postulate Processing

Actually energy is produced by the thetan simply by postulating that it will be in existence. What he says will be so, becomes so for him; if he becomes extremely powerful, it becomes so for others. This condition has been misused by most thetans who, often in the past, have been afraid of making postulates that will come true. They believe that if they say a thing will happen, it will then happen -- to such an extent that they now revulse against stating anything will happen.

Another aberrative condition with regard to postulates is that for the sake of randomness, the thetan at some time or another has set up the postulate that every time he makes a postulate a reverse postulate will occur which he will not know about, in such a way that he can "play chess with himself" without spoiling the game by knowing what his left hand is doing when his right makes the move.

It is not true that postulates have to be located all through the facsimiles and worn out by repetition. It is just as easy to make new postulates; but first one must recover from the depths to which his postulates have taken him. The most dangerous postulates are those postulates where one decided to agree with something which would become aberrative.

You can see by examining any facsimile in the preclear related to an accident that the most aberrative things in that facsimile are what the preclear himself decided.

Postulates are accompanied by evaluations and conclusions. It is often possible to "loosen" a postulate by discovering to the preclear why he made it, or what data he was using at the time.

As a preclear becomes very aberrated and believes himself to be more and more MEST, his postulates become as unwieldy to use as actual objects, and he finds them as difficult to change as objects.

When doing creative processing and moving objects and energy in created space and time, the preclear is doing this by making postulates. It comes as a shock to some preclears that they are handling time by shifting space. One handles time by simply saying that he had a thing and now he does not have it, or that he will have or will view a thing in the future. One does not shift time by shifting space, nor does one continue to look at something he has put into the past. He says it is in the past and so it becomes in the past.

When the thetan is unable to handle postulates about time, the auditor should ask him about some MEST universe incident such as breakfast, and then enquire how he remembered that he had breakfast, and if he will have something to eat on the morrow, and then how he knows he will have something to eat on the morrow. He does not look at his breakfast to find out if he had breakfast, he knows that he ate breakfast; and he does not go into tomorrow to find out if he will probably eat on the morrow, he knows -- or, at least, believes it possible -- that he will eat on the morrow. Moving time, as in any other postulate, is knowingness not viewingness. An object goes into the past in the same space as it was in, in the present; and in the future may be in the same space as it was in in the past. The space does not change the condition of havingness changes, and one estimates this by some degree of knowingness.

The entire subject of postulates is the subject of certainty and self-belief. That preclear who has a low self-belief finds it difficult first, to make a postulate which he will believe and second, to undo one he has made. Creative processing and postulate processing alike remedy this.

Rising-scale processing is another way of doing postulate processing. One takes any point or column of the Chart of Attitudes as given in this text, which the preclear can reach, and asks the preclear then to shift his postulate upwards toward a higher level.

In order to do this the auditor says, "Now, on the subject of rightness and wrongness, how wrong do you think you generally are?" The preclear tells him. The auditor says, "How

high can you shift this attitude toward believing yourself right?" The preclear shifts the attitude as high as he can. The auditor takes this as the next level from which he will work upward until he attains as nearly as possible a postulate which will "hold" to the effect that the preclear believes himself right. Rising-scale processing should not be confused with the processing of flows. One can process all these columns in terms of flows. Rising-scale processing is simply a method of shifting postulates upward toward optimum from where the preclear believes he is on the chart. Rising-scale processing is essentially a process directed toward increasing belief in self by using all the "buttons" on the Chart of Attitudes.

The preclear is generally found to be quite uncertain about his postulates. He does not know whether or not what he says will take effect or, if he says it and if it takes effect, if it will not rebound upon him. He becomes afraid to make postulates for fear he will make some postulate destructive to himself or others and may even discover himself making postulates to convince himself he should be ill.

One has to tell oneself what to be before one is. Recovery of this ability is the essence of processing a thetan.

Postulate processing is a very vital process to apply to the thetan: when he is exteriorized, he can change his postulates rapidly. If he finds himself thinking slowly and doing other things which are not optimum when he is outside, One can better his situation and condition by asking him to change postulates.

Creative Processing

Standard Operating Procedure for theta clearing is the backbone of processing in Scientology. It is easily followed but the auditor should have an excellent command of all types of processing in order to use it more successfully.

SOP is most easily done and most successfully by an auditor who is a theta clear. Auditors who are not theta clear seldom understand it, and a low-toned uncleared auditor who cannot himself leave his body very often acts to pin a preclear inside his body. It is noteworthy that many auditors have been unable to obtain successes with theta clearing before they themselves have been cleared, but immediately after the auditor was cleared, he was successful with each successive case without exception. The fear of some thetans from various causes of leaving the body causes the auditor -- who is the thetan -- to make other thetans stay in bodies, and it is actually quite dangerous to be audited by auditors who are not theta clears. The process is not dangerous; uncleared auditors are.

Standard Operating Procedure, Issue 3

This process is done in steps. The auditor with EVERY preclear makes no other judgment than to begin with Step I and, failing to accomplish that immediately, to go to Step II; if he fails to accomplish this immediately, he goes to Step III; and so on. When he is able to accomplish a step he labels the case as that step number, i.e., a III. He then begins working with that step. After a few hours' work, he again starts at the top with the preclear with Step I and progresses on through. Eventually the preclear becomes a Step I.

STEP I -- POSITIVE EXTERIORIZING: Ask the preclear to be a foot back of his head. If he does, make him go back further, then up, then down, practising placement in space and time. Then one asks him to see if there are any items in the body he would like to repair and proceeds to let the preclear repair them according to the preclear's own ideas as to how he should do it. Then educate the preclear by making him create and destroy his own illusions into finally getting a certainty of illusion and from this a certainty of perceiving the real universe with all perceptions. (Note. The most real universe is, of course, one's own illusory universe and should be completely rehabilitated before one attempts to perceive or handle or worry about the MEST universe. Rehabilitated, sonic, visio, etc. of the MEST universe are very clear and

very certain. Clear perception in early stages is not a test of being outside. The only test is whether the preclear KNOWS he is outside.) Failing the first line of this step, go to Step II.

STEP II -- BY ORIENTATION: Ask the preclear, still inside, to locate the inside of his forehead. Ask him to put a pressor beam against it and push himself out the back of his head. Supplement this by asking him to reach out through the back of his head and grab the wall with a pulling beam and pull himself out. Ask him to steady himself outside and then, by means of beams, to raise and lower himself while outside and to move to various parts of the room while still outside. Use creative processing. By orientation as a thetan, placing himself as a thetan in time and space, he becomes sure of his whereabouts. Have him find and cast off old lines which have their terminals fixed to him. Have him find those lines wherever they are and attach them to radiators and water taps as the energy will drain out of him. (The II ordinarily has enough lines to cause him to snap back in the head when he releases beams.) Failing this, go to Step III.

STEP III -- SPACE PROCESSING: In that the MEST universe has forced upon the thetan its spatial dimensions and directions, the thetan is likely to become a point which is being subjected to all the counter-efforts and counter-emotions of his environment, for his entire concept of space is being determined by the MEST universe. Have the thetan, still inside, find his feet in the opposite direction from where the MEST body is located by the MEST universe. Have him turn the feet around. Have him create differences in his body and reverse various limbs and positions according to his viewpoint, each one in disagreement with the MEST universe, particularly as appertaining to gravity and other influences. This sets up an ability to disagree with the MEST universe in terms of space. Have him locate his eyes in the back of his head, on the soles of his feet and in other places. Have him assume other bodies, each time changing them slightly, and putting them away. Then have him gather himself into his normal MEST universe spatial areas and go to Step I.

STEP IV -- RIDGE RUNNING: Ask the preclear to give himself a command to walk. Let him locate the white flow line which results inside his head. When this line goes dark, have him locate the tiny ridge inside the skull that stopped it. Have him run the flow from this barrier (these barriers, are tiny ridges and each has a thought with it such as "Can't walk" or "Too bored to walk") back toward the spot where he told himself to walk. It will run white for a moment, then go black. Have him give himself the command to walk again and "watch" this flow line. It may run through two or three tiny barriers and then stop. Again have him run the "objection" to walking. Have him watch this "objection" flow until it goes black. Then have him give himself the command to walk again and so on and so on. He will wind up at some outside point. Now have him give himself the command "Listen" and have him run this and its back flows on "black and white" until he is exterior on the subject of listen. Then use the command "Talk" similarly. Then the command "Nod," then the command "Move," etc. Give "Look" last for it may "blind" his perception of black and white. He may each time get out to a distance in another quarter. If he can do all this, start with Step I again. Failing this step, failing to "see" black and white energy manifestations, go to Step V.

STEP V -- BLACK AND WHITE CONTROL PROCESSING: Give the preclear a complete E-meter assessment, using the principles of what he would create or destroy or would not create and would not destroy. Use this data to make mock-ups. Then have the preclear create and perceive black spots and then white spots, black crosses and white crosses, and move these here and there through the room or through his own space. Turn them on and off, interchange them, put them in yesterday, put them in tomorrow, make them get larger, make them get smaller; each time doing as much as the preclear can do. Each time one asks him to perceive one of his own created illusions in terms of black and white spots or crosses, one attempts to coax him into successful control of it. Audit very persuasively and lightly. This preclear ordinarily is frightened of blackness because it either can contain dangerous things or contains nothing, and he cannot differentiate which. Thus he cannot control blackness and, in being unable to control blackness, flounders in it. He also has a more basic computation: that blackness is the only safe thing in which to hide and, therefore, blackness is a thing to have. Further, blackness "takes" things for him. This preclear may be afraid of the police, may

believe himself to have a hideous body, thetawise, and has many other reasons why he cannot exteriorize. Drills on creating and perceiving black and white should be continued until he can handle each easily. The trouble with this preclear and preclears lower than this is that they have agreed too heavily with the MEST universe and must be very cautious in confronting it, since in that direction they conceive to lie a much more complete defeat even than that from which they are now suffering. Audit him also very heavily on Creative Processing.

Then go through steps again. If the preclear is immediately perceived to have little or no reality on ANY incident, go to Step VI.

STEP VI -- ARC STRAIGHT WIRE: Drill, by direct questioning, on locks until the preclear can remember something really "real" to him, something which he "really loved," something with which he was in communication. Then drill him on creating illusions until he is certain he has created one which really isn't real, which he is certain HE put the emotion and perceptions into. Then go through steps again. Failing Step VI after a quick test, go to Step VII.

STEP VII -- PRESENT TIME BODY ORIENTATION: Have preclear locate a part of his body and recognize it as such. Have him locate furniture, fixtures, auditor in room. Have him locate the town and country he is in. Get him to find something in present time which is really real to him, with which he can communicate. Work on this until he can do this. Then go to Step VI. Then go to Step I.

General Processing

Anything which rehabilitates the self-determinism of a preclear, whether education, change of environment, running facsimiles, theta clearing or the creation of one's own universe, is valid processing. Any one of these will raise the tone of the preclear markedly. At the end of 80,000 hours of investigation of beingness in the MEST universe, I have concluded that those processes which make it possible for the preclear to disagree with the MEST universe also make it possible for him to handle the MEST universe, or to create his own or be part of a group which creates a universe, as the case may be.

Scientology 8-8008 is remarkable for its ability to better the beingness and action potentials of the individual. It is, sadly enough, the only technique which I have seen produce excellent and fast results in the hands of trained auditors. Mainly the reason is that homo sapiens has and will continue to use, any technique delivered into his hands for the control and enslavement of others, for homo sapiens is frightened. Even when an auditor was competent with earlier techniques, it would often occur that his preclear would return into his past environment and would relapse.

This occurred because others had a vested interest in the preclear's continuation in a state of aberration; and others would lose no moment in starting again to crush this preclear down the tone-scale to a point where they conceived he was more easily controlled. Mest is the most easily controlled item in the MEST universe, and the closer a human being could be pressed toward MEST, the easier, it was thought, to control him.

That his value and ethical sense deteriorated in direct ratio to the degree he was depressed down the tone-scale, was overlooked by the homo sapiens who had a passion for slavery.

The primary benefit of Scientology 8-8008 is that it works so swiftly even when indifferently used that the persons in the environment of the preclear are over-reached rapidly by the preclear and find themselves subject to his control when they act to continue his aberration.

Further the auditor is seldom aware of the height his preclear attains until the preclear has attained it. Processing has always worked in the hands of a competent auditor; and it were

better for any technique, no matter how dangerous, to be known to Man if it could benefit at least a few, for homo sapiens has no psycho-therapy. In Dianetics he had his first thoroughly validated psychotherapy and Dianetics worked and still works uniformly in the hands of those skilled in its application.

In Scientology in general, and in theta clearing in particular, the upper limits of homo sapiens as such have been transcended and it would not be good semantics to call a theta clear a homo sapiens or even, exactly speaking, a person, for he is a thetan with a body he uses for purposes of action and communication, and his viewpoint is quite altered. His general health is more or less directly under his control, but there is no goal for the body as a final goal in Scientology, for the body is a tool. The genetic entity which built the human body really wanted to be served.

The complexities and ridges which he developed speak of a craving for energy and self-service which could only be the basest aberration, and, true enough, the genetic entity is aberrated almost beyond belief, as any thetan discovers when he seeks to clear the genetic entity.

The body is quite alive and self-motivated without the thetan, as the thetan soon discovers; but it is so used to taking orders from successive lines of thetans which themselves some day would probably become part of this complex system of ridges, that its "mental activities" are quite stupid. The thetan who has lived in this association and has believed himself to be the body is early quite appalled at the character of the genetic entity who is cowardly, a thing of stimulus-response, without further will or goals than to grow a body, and obsessed entirely with the idea of growing one.

The thetan can repair the body quite easily if he so chooses, but quite often sees it as a pointless activity; for one's personality is not even faintly dependent upon the body but is only debased by association with one. When one has learned to control a body from a distance, he is usually content to let it get along as best it can, for the reduction of all counter-efforts of the genetic entity would be a reduction of the entire body. The genetic entity has his whole track and has had his own travails. In other parts of space, not too incredibly, "dolls" are used by thetans -- things which can be animated easily by theta energy and which are disposable and which do not have the uncomfortable circumstance of being themselves any more alive than any other MEST.

The MEST universe itself has a considerable cravingness in it. It is composed of energy which was emanated in order to have, and the energy still contains as its basic characteristic Have and Not Have, and is itself, when contacted, found to possess a craving which does not make the MEST alive but which speaks of that which made the MEST. This cravingness is an essential part of all matter. Certain metals contain the desire to be had much more than others, and certain other metals contain the craving not to be had. This is one way of looking at positive and negative reactions.

The body's being composed of such energy makes it feel as though it is holding on to the thetan. Nothing is really holding on to the thetan since he has no substance which can be held. Even the genetic entity does not hold on to the thetan, but probably considers him some sort of far off commanding god -- if he thinks of the thetan at all.

Space has its own demanding quality and insists on its dimensions being accepted by anything in the universe, for it was erected and is erected on a command basis in the MEST universe.

Processing must resolve this havingness on the part of matter, and the commandingness on the part of space. To confront these directly is, for most preclears, an impossibility, for it only drives them further into an apathy of agreement with MEST. The preclear has long contested with the MEST universe and has continually sought to create his own universe only

to find the MEST universe declaring itself stronger each time and compressing the illusion to nothing.

The war cry of the MEST universe is: "Must have gotten it somewhere," and "It must have gone somewhere." It will not tolerate the vaguest possibility that one created himself or could destroy anything himself. The whole sub-zero scale is a manifestation of one's efforts to combat this demandingness on the part of the MEST universe. Hiding, protecting, owning, are all mechanisms to answer the question, "Where did you get it?" "What did you do with it?" The MEST universe, in this light, is essentially a police universe, for it operates upon force and intolerance and demands with pain that its laws be accepted. In that its laws are based solely upon agreement, it is only necessary to discover how one can disagree with them to abolish what has been called "natural law" for oneself. Upon the abolishment of this agreement depends the health, progress and advancement of the thetan.

This universe is a major expanding trap of finite dimensions and rather idiotic simplicity. If one were to leave the MEST universe, one would solely create space of his own and maintain enough knowledge of what could happen with regard to the MEST universe to defeat its encroachment and its salesmen. No universe, however cunningly constructed, is entirely proof against this expanding trap. The MEST universe is a game which has gone on too long and of which even the players are tired. Earth could be considered to be at this time an egress terminal.

It is noteworthy that one must not accept or know any of these conditions to have these processes work. They act very swiftly and uniformly on any homo sapiens and upon other beings. A considerable number of the principles which have been discovered in Scientology exist above the MEST universe. The MEST universe itself might be considered to be the "inevitable average" of illusion once it starts in a certain direction. We have in natural law as applied to the MEST universe the sum of agreement upon illusion. Tracing the principles of Scientology as they apply specifically to the MEST universe, is the tracing of the agreements which brought about the MEST universe. The axioms of 1951 are, in the main, a tracing of this agreement.

The inevitability and "diabolical accuracy" of these predictions of human behavior depend upon their being held in common by Man, which they are. They extend as well to other beings below the level of player in this universe and have applied to many sets of players, while much of the data which has been recovered in this investigation seems, to the narrow scope of homo sapiens, quite wild, the wildness depends on the absence of investigation in the past and can be compared only to the stupidity which remained ignorant of them; for these matters were an unseen and insidious causation underlying the grief of Earth, at best a pawn in a minor game in a minor galaxy.

The Anatomy of Space

Before energy can exist in this universe, space must exist. His inability to create space is one of the most aberrative characteristics of the thetan whom we find in a MEST body. He has become reduced to a point even in his own concept, and perhaps even less than a point for he has no space of his own but must depend upon bodies and other conditions to believe that he has space.

It is of the utmost importance for the auditor to understand space. Space can be considered to be a viewpoint of dimensions. It does not matter how many dimensions there are or what conditions are set up for these dimensions: the resulting condition is known as "space." There are only three dimensions in space in the MEST universe. Throughout all of its galaxies it has only length, breadth and depth. Space warps and other things of equal interest can exist in one's own universe, but they do not exist as such, evidently, in the MEST universe.

The assignation of dimension is the essence of space, but even before dimension can be assigned, one must have viewpoint. If one is assigning dimension from his viewpoint, he is

cause; if dimension is being assigned to his viewpoint, he is effect. He is cause or effect to the degree that he can assign dimension and call it space.

The preclear has a viewpoint and is the center of that viewpoint. Splitting his attention often finds him occupying several viewpoints. He is capable of assuming many. Where he is aware of being aware is, however, his central viewpoint; and, although this may be communicated with or interlocked to some other viewpoint which he could call his own -- even on some other planet or here on earth -- he is yet as himself the center of assignation of dimension where he is and as he is.

In many preclears this becomes so blurred that he does not know whether he is in or out of the body. Here even the center of viewpoint has been overridden by MEST assignation of dimension.

An essential in agreement with any illusion is the acceptance of the dimensions it assigns or that one may assign to it, Space is no more complicated than this, but when a preclear has been overridden by enforced assignation of dimension to an enormous degree, his own viewpoint may be found to be scattered or dispersed. It is this condition which finds the preclear unable to tell whether he is in or out of his body; when this condition exists he is in the state of being incapable of confronting the MEST universe, even to the point of asserting the ownership of a center of viewpoint.

The solution of this problem is simple, in principle, although it may require many hours of auditing. Where the preclear has a certainty of center of viewpoint he exteriorizes immediately and can become a theta clear in a very few hours; when he has been compressed by counter-efforts and emotions into an acceptance of MEST dimension to the point where he cannot even be certain of a center of viewpoint, it is necessary to recover this center of viewpoint in order to recover a point from which space can be assigned and, even more importantly to the auditor, where the preclear can be exteriorized easily and in a knowing condition.

One of the first "tricks" in auditing is to get the preclear to look from the center of his head at his environment and the room. He very often sees it clearly and as it is and does, by this, adjust his vision to see through his ridges. Even an occluded case can sometimes do this, and can then be exteriorized rapidly. The next "trick" is to find some segment of the environment which the preclear can see and ask him what is in the areas where he can see nothing or does not wish to see. He will say this or that may be in these areas. The auditor then has him create those things or change those things and shift those things which he is afraid may be in those areas until he is no longer interested, at which time he can envision the actual surroundings. By continuing this "trick" of rehabilitation of potential occupation of space (for a preclear will not occupy space which he considers dangerous), the preclear may be found to exteriorize suddenly and sometimes with violence. In such a case he believes himself to be occupying yet another space, hiding perhaps in the darkness of deep MEST space, as well as in a body. Routine orientation and creative processing remedies this.

By making the preclear alter the body he is occupying, making mock-ups which he superimposes and changes around in disagreement with the MEST universe -- upside down and right side up -- he becomes better able to have a viewpoint from which he can create space or from which he can at least handle MEST universe space.

The preclear who does not exteriorize readily is not sure he is here at all and, indeed, he may be co-occupying other areas. A study of the preclear with the E-meter, locating him in other spaces and bringing him into the space where he is being audited, can best be done with creative processing, not by running facsimiles, for these only make him disperse even further. This preclear often has difficulties with time and has space confused with time. Time is not handled by moving space; time is handled simply by having and not having. The MEST universe insists that anything that disappears must have gone somewhere; thus the preclear is saddled with the belief that he must create space to put things in whenever time changes.

Having the preclear conceive time change in the space which he occupies by refusing to let him go on looking at it in yesterday or to see it in tomorrow, but simply making him know that it is now in yesterday and the space is the same, does much to rehabilitate his orientation.

Drills in which space is assigned are highly beneficial to any preclear, and particularly so to those preclears who do not exteriorize readily or who cannot easily find themselves when they are out of their body. Simply have the preclear disagree with dimensions round him and see them with purposeful, creative distortion and he will at length focalize his viewpoint so that he can handle space and know that he is the center. A being can be knowingly in many places but being scattered into many places unknowingly is the worst of conditions.

Creation and Destruction

Self-determinism seeks as its goal the attainment of the goal of theta itself.

Theta has the capability of locating matter and energy in time and space and of creating time and space.

Any action requires space and time, for space and time are necessary to motion.

Motion can be defined as change of location in space, and any change of location requires time.

Thus we have an interacting triangle, one corner of which could be labelled space, another corner time, and the third energy. Matter is not included in the triangle because matter is apparently cohesion and adhesion of energy.

The cycle of a universe could be said to be the cycle of creation, growth, conservation, decay and destruction. This is the cycle of an entire universe or any part of that universe; it is also the cycle of life forms.

This would compare to the three actions of energy which are Start, Change and Stop, where creation is Start, growth is enforced Change, conservation and decay are inhibited Change and destruction is Stop.

The two extremes of the cycle -- creation and destruction or, in the terms of motion, Start and Stop -- are interdependent and are consecutive.

There could be no creation without destruction; as one must eradicate the tenement before building the apartment house, so, in the material universe, must destruction and creation be intermingled. A good action could be said to be one which accomplished the maximal construction with minimal destruction; a bad action could be said to be one which accomplished the minimal construction with maximal destruction.

That which is started and cannot be stopped and that which is stopped without being permitted to run a course, are alike actions bordering upon the psychotic. Unreasonableness itself is defined by persistence in one or the other of these courses of starting something which cannot be stopped (as in the case of an A-bomb) or of stopping something before it has reached a beneficial stage.

Unlimited creation without any destruction would be insane; unlimited destruction without any creation would be similarly insane.

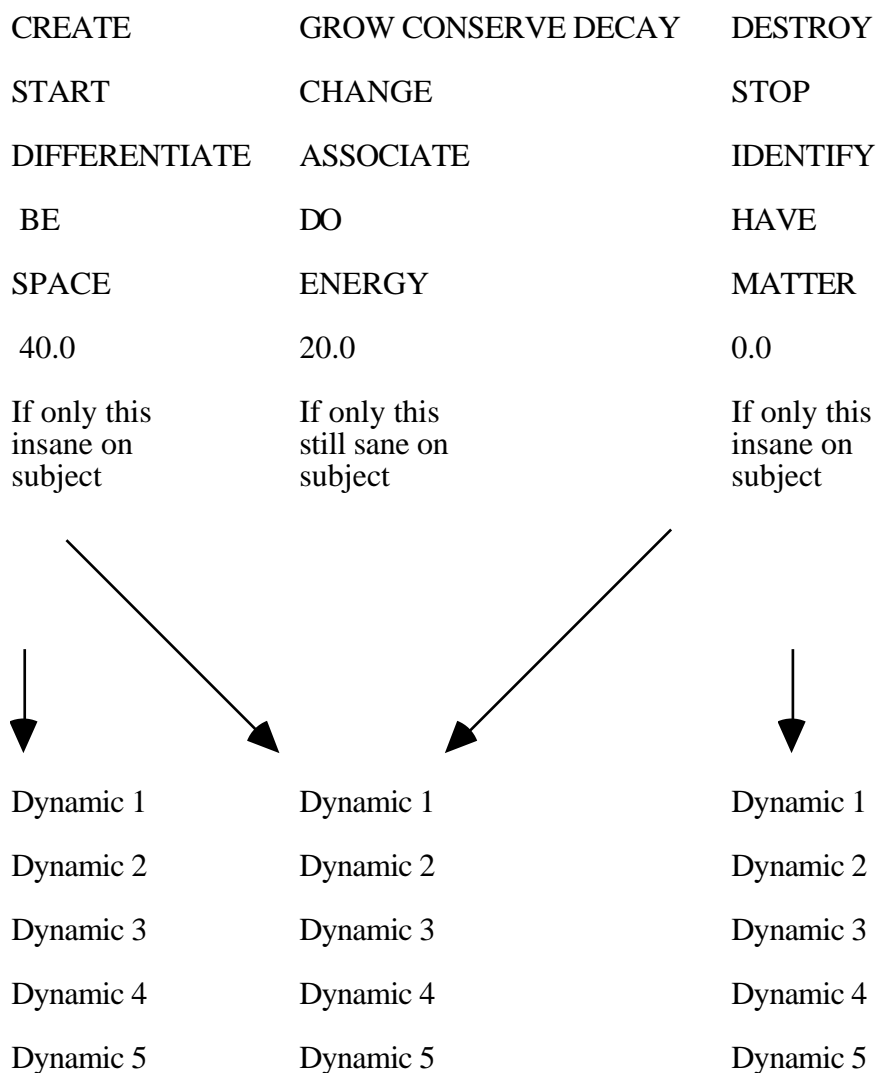

In actuality, insanity can be grouped and classified, detected and remedied by a study of creation and destruction.

An individual will not be responsible for that on which he will not use force. The definition of responsibility is entirely within this boundary. That person will not be responsible in that sphere where he cannot tolerate force, and if one discovers in an individual where he will not use force, he will find where that individual will also refuse to be responsible.

An assessment of a case can be done by use of the accompanying graph. We see here creation with an arrow pointing straight downward and find there the word insane, and, under this, we list the dynamics. Wherever along any of these dynamics the individual cannot conceive himself to be able to create, on that level he will be found aberrated to the degree that he does not believe himself able to create. This might be thought to introduce an imponderable but such is not the case, for the individual is most aberrated on the first dynamic and, rightly or wrongly, conceives that he could not create himself. This goes to the extent, in homo sapiens, of believing that one cannot create a body and, rightly or wrongly, one is then most aberrated on the subject of his body.

Potentially, because of the character of theta itself, an individual in an absolute and possibly unattainable state, should be able to create a universe. Certainly it is true that every man is his own universe and possesses within himself all the capabilities of a universe.

To the extreme right of the graph we have the word destroy and an arrow pointing downwards toward insanity and, beneath this, the list of the dynamics. That individual who can only destroy along any of these dynamics and cannot or will not create could be said to be aberrated on that dynamic. He is aberrated to the degree that he would destroy that dynamic.

Dynamic 6	Dynamic 6	Dynamic 6
Dynamic 7	Dynamic 7	Dynamic 7
Dynamic 8	Dynamic 8	Dynamic 8

Looking again at the column of creation, one finds the individual aberrated anywhere along the dynamics in that column where the individual will only create and will not destroy.

In the destruction column, one finds the individual aberrated on any dynamic in that column where he will not destroy.

In the middle ground of the graph, we find that a balance of creation and destruction is sanity, and in the dynamics below it we find the individual sane wherever he will create and destroy.

Use of this graph and these principles enable the auditor to assess hitherto hidden compulsions and obsessions on the part of the preclear. This is an auditing graph. If one looks at it another way than that of an auditor, he finds there laid out what has been occasionally posed as a philosophy of existence. Friedrich Nietzsche, in his book "Thus Spake Zarathustra," presents as a desirable code of conduct unlimited willingness to destroy. Philosophically the graph has little or no workability. In order to survive in any universe, conduct must be regulated by a sense of ethics. Ethics are possible on a reasonable level only when the individual is high on the tone-scale. In the absence of such height, ethics are supplanted by morals, which can be defined as an arbitrary code of conduct not necessarily related to reason. Should one attempt to regulate his conduct on the basis of unlimited creation or destruction, he would find it necessary to act entirely without judgment to put his philosophy into effect. It is noteworthy that the late Nazi regime can serve as a clinical test of the workability of a scheme of things wherein unlimited creation and destruction are held as an ideal. I heard a rumor lately that Adolf Hitler was dead.

Be, Have and Do

The physicist has long been on a carousel with regard to the component parts of the material universe.

He has had to define time in terms of space and energy, space in terms of time and energy, and energy in terms of time and space, and matter as a combination of all three. When three factors exist at such an altitude in a science, there can be no further clarification unless the material can be related to experience of an equal magnitude.

The current definition in Scientology has this liability: if self-determinism is the location of matter and energy in time and space, and the creation, change and destruction of time and space, then there is no comparable data by which to evaluate this level. The physicist has found the interrelationship of time, space and energy to be invaluable and has, indeed, produced a civilization from this interrelationship. Just as, with our definition of self-determinism, it is possible to de-aberrate an individual and increase his potentialities in a way never before suspected possible, and with a speed which exceeds all past estimates even in the science of Scientology.

Because we are now working from a higher understanding than time, space and energy, it is possible to compare these to experience in such a way as to broaden their use and modify their force or increase it. Control of time, space and energy comes now well within our capabilities.

Space, time and energy in experience become Be, Have and Do, the component parts of experience itself.

Space could be said to be BE. One can be in a space without change and without time; one can also be, without action.

The essence of time is apparently possession. When possession ceases, the record of time ceases. Without possession change cannot be observed; in the presence of possession change can be observed. Thus it is deduced that time and possession are interdependent.

The past could be subdivided into Had, Should Have Had, Did Not Have, and Got, Should Have Gotten, Did Not Get, and Gave, Should Have Given, Did Not Give.

The present could be subdivided into Have, Should Have, Do Not Have, and Giving, Should Be Giving, Not Giving, and Receiving, Should Be Receiving, Not Receiving.

The future is subdivisible into Will Have, Should Have, Will Not Have, and Getting, Will Be Getting, Will Not Be Getting, and Will Receive, Will Not Receive.

In each of the above, past, present and future, the word would apply for any individual or any part of the dynamics to all the other dynamics.

The way one knows there was a past is by knowing the conditions of the past. The most revelatory of these is the facsimile which was taken in the past. However, without any important possession in the present stemming forward from the past, the past becomes unimportant; or, because possession ceased, the past is obliterated. The single matter of the body of a past life not being in the present life invalidates the existence of the past life to the individual who then does not -- or does not care to -- remember it. Yet the facsimiles can be nevertheless effective upon him.

Similarly the individual does not conceive to any extent time, past the death of his body, since he will have no body.

Energy, whether in the field of thought, emotion or effort, can be summed into DO. It requires beingness and havingness in order to achieve doingness. Here we have the static of space acting against the kinetic of possession to produce action in the field of thought, emotion or effort, the various categories of doingness.

Should one care to test this as a process on a preclear, he will find that the missing portions of the preclear's past have to do with loss of something. Loss itself is the single most aberrative factor in living. It has long been known in this science that the release of a grief charge was an important single improvement in the preclear. Grief is entirely and only concerned with loss or threatened loss. Pain itself can be defined in terms of loss, for pain is the threat which tells one that loss of mobility or a portion of the body or the environment is imminent. Man has pain so thoroughly identified with loss that in some languages the words are synonymous.

Loss is always identified with HAVE, for if one doesn't have, one cannot lose.

The Hindu sought to depart into his Nirvana by refusing to have anything to do with having. He sought thus to promote himself into Being. He saw that so long as he retained a grasp on a body in any degree he was Having, and thus was pressed into Doing.

Having and Being are often identified to the degree that many people attempt exclusively to Be only by Having. The capitalist judges his own beingness solely by the degree of possession, not even vaguely by the degree of action he is able to execute.

Possessions absorb and enforce time; only without possessions would one be able to regulate time at will. This is a singular attribute of the cleared theta clear, and to him possession of MEST is extremely unimportant.

One can make up for a lack of Having by Doing, and by Doing accomplishes Having and thus regulates time.

Having enhances either Being or Doing, as is sometimes severely recognized by one who would like to take a vacation or a trip to foreign lands.

Doing can enhance either Being or Having: a balanced Doing slants in both directions, but if one does without Having, his Being increases, as is well known by anyone who insists on doing favors without recompense, and without gain.

There is an optimum speed of Doing. If one travels less than that speed he has little Being and Having; if one travels greater than that speed, he has to abandon both Being and Having. This is applicable especially to the MEST universe. The case of a race driver is in point. He must assume a contempt for Being and Having in order to achieve the speeds he does.

When change is too rapid both Beingness and Havingness suffer. When change is too slow both Beingness and Havingness suffer. For Change is essentially the redirection of energy.

In the assessment of a preclear one can easily trace, by use of the triangle, Be, Have and Do, and by placing this over a second triangle with space at the point of Be, time at the point of Have and energy at the point of Do, where the preclear is overbalanced and why the preclear cannot handle time or why he is trying to occupy too much space without being able to fill it, or why his life is complicated with too much havingness and has reduced his beingness to nought.

In the MEST universe as well as in a constructed universe, these three factors should be balanced for orderly progress.

Creative Processing

The whole of the data covered in this volume is utilized in creative processing. When one has mastered the component parts of the mind and the interrelationships of space, energy, items and experience, he will find creative processing surprisingly easy to apply and productive of very swift results. The goal of this process is the rehabilitation of as much of the thetan's capability as possible to permit him to utilize or be free of bodies as he chooses and, even in lesser magnitude, to rid the preclear of psycho-somatics, eradicate compulsions, obsessions and inhibitions, to raise his reaction time and intelligence level. This process does whatever has been previously intended by earlier processes -- utilizing a knowledge of these in order to assess the state of the preclear, and in order to parallel this difficulty with creation, change and destruction of mock-ups.

Gradient scales are vitally necessary in the application of creative processing. The term "gradient scale" can apply to anything, and means a scale of condition graduated from zero to infinity. Absolutes are considered to be unobtainable. Depending on the direction the scale is graduated, there could be an infinity of wrongness and an infinity of rightness. Thus the gradient scale of rightness would run from the theoretical but unobtainable zero of rightness, up to the theoretical infinity of rightness. A gradient scale of wrongness would run from a zero of wrongness to an infinity of wrongness. The word "gradient" is meant to define lessening or increasing degrees of condition. The difference between one point on a graduated scale and another point could be as different or as wide as the entire range of the scale itself, or it could be so tiny as to need the most minute discernment for its establishment. The gradient scale of

the creation of a being could be -- but in creative processing generally is not -- concerned with time. In creative processing, the gradient scale, as it would refer to the creation of a person, could be, first, the envisionment of an area where the person might have been or might be; then the envisionment of an area the person commonly frequented; at last, the creation of a footprint the person had made, and then perhaps some article of apparel or a possession such as a handkerchief. The creative steps would then continue until more and more of a person was established, and at last the entire person would have been created. Likewise in the destruction of a person, the gradient scale could, but generally would not, begin with blowing him up or making him grow old. If the auditor finds the preclear diffident about destroying an illusion of some person, the environment can first be diminished slightly; then perhaps the person's shadow might be shortened, and so on until the entire person could be destroyed. The essence of gradient scale work is to do as much creation, change or destruction in terms of illusion as the preclear can accomplish with confidence, and to go from successful step to greater step until an entire success in destruction, alteration or creation (or their companion states of experience, such as start, change and stop) is accomplished.

The mind works easily if led through successive successes into a complete confidence. The mind can be confused and set back enormously by demanding that it do too much too fast. The same "too much" can be accomplished by requesting of the mind that it do small portions of the task; this does not mean that processing should go slowly or that illusions which are easy to create, change or destroy should have much time spent on them. It does mean that as soon as an auditor has established a disability on the part of the preclear in creating illusions of certain places, persons, conditions, things, colors or any other thing in this or any other universe, he approaches the subject gradually by gradient scale and by accomplishing repeated successes with the preclear of greater and greater magnitude, finally achieving a complete banishment of the disability.

The reason a preclear cannot alter a postulate, or change or start or stop, lies in the influence upon him of his agreements and experiences in the MEST and other universes.

To run out these agreements and experiences as such would be, in part, to agree with them over again. The mind is actually quite free to alter postulates and change its own condition, if permitted to do so at a speed that it finds comfortable. The mind will not take wide divergences which seem to it to tend toward its own diminishment or destruction. It was by a gradient scale of agreement that he came at last to accept and very nearly succumb to the MEST universe itself. The build-up of illusion was so slow and insidious that only the closest assessment would reveal to the preclear and the auditor how far these tiny steps of agreement led at last.

The motto of the MEST universe could be said to be: "Thou shalt have no force nor illusion, nor thine own space, nor self-made energy or thing, for all illusion is mine and with that thou shalt agree. If thou art, I shall not be." By a series of minute agreements, the preclear has at last given up all his own belief in his ability to make a universe, or even to create and maintain minor illusions. He does not know or even suspect that he is capable of producing illusions sufficiently strong to be observable by others, and if he thought this were true, he would attribute it to some mysterious thing and, so short and final are the punishments of the MEST universe, he would tend to shy away from this; but upon his ability to create illusion depends the very existence of all his hopes and dreams and any beauty he will ever see or feel.

In truth, all sensation which he believes to come from these masses of illusory energy known as the MEST universe, are first implanted through agreement upon what he is to perceive and then perceived again by himself, with the step hidden that he has extended his own sensation to be felt and perceived by himself. He is fully convinced that the MEST universe itself has sensation which it can deliver to him, whereas all the MEST universe has is an enforced agreement which though of no substance, yet by a gradient scale came to be an illusion which seems very masterful to a preclear.

To prove the reality and solidity of the MEST universe, the preclear could pound his fist upon a desk and demonstrate that his fist had met something. He is making again the error of implanting sensation and not knowing he has implanted it, for the fist which he pounds on the desk is a MEST universe fist consisting of MEST universe energy, which is itself a MEST universe agreement, and it is meeting a desk which is MEST universe; he is only demonstrating that when the MEST universe is perceived to impact upon the MEST universe, one can then implant a realistic impact and perceive it for his own wonderful edification. Reality, then, is a delusion because it is one's own illusion which has been disowned by one and is then received by one as being another thing.

Only by shedding all responsibility for one's own energy can one fall into this covert trap. If one is unwilling to be responsible for energy, he is capable of using energy and then not perceiving that he uses it. One who blames others continually can be discovered to effect most of the things for which he is blaming other people. In such a way, an individual with the "very best MEST universe, Mark 10,000 ears" takes no responsibility for having implanted the sensation of sound in order to receive the sensation of sound. A preclear as he comes up the tone-scale more and more often catches himself doing this, and even though he does not know the principles involved (for no preclear has to be educated in Scientology to receive benefit from it), he recognizes that even in the case of a loud crash, his continuation of association from his environment permits him to perceive with others that a crash has taken place of objects which he with others continuously recreates solidly, and that he must actually cause for his own perception the sound of the crash. In that the beingness of an individual is actually extended for miles in all directions around him, if not much further, any idea or thought or past thought (as there is no past) is part of his beingness, and so he must continually strive to be "faithful to his agreements with the MEST universe."

To undo this state of affairs it is only necessary to rehabilitate the awareness of the preclear that he himself is capable of creating illusions. As he rehabilitates this faculty, the preclear, without any coaching or evaluation on the part of the auditor, begins to recognize that his viewpoint is expanding and that he is becoming all-pervasive, but that he can collect his awareness at any point, and that the "brutal reality" all around him is continuously manufactured by himself out of agreements and association with other viewpoints.

So long as he is fixed in a condition where he is in agreement with all spaces and viewpoints, he sees and feels automatically with all other such viewpoints. He is above the level of energy, if one can use the term, on the same wavelength with all other beingness, a condition which does not permit differentiation. As he rehabilitates his abilities in independent creation, he can change this "wavelength" at will, and can go into or out of agreement with all other points of beingness.

The matter of perceiving, then, becomes entirely a matter of self-choice. It is, for instance, quite startling of a preclear to discover that as soon as he is free of the ridges of the body (which is to say, when he has discovered he can change his viewpoint) that he is already partly out of agreement with other viewpoints, and that the MEST universe becomes slightly jumbled. He is apt to be very anxious about this, for it is in conflict with the agreements to which he is subject. He immediately may struggle very hard to regain a state of affairs whereby he can view the MEST universe as everyone else views it.

Indeed, the auditor must continually be on guard to prevent the preclear from attempting to reassume these agreements. A badly-trained auditor can always be identified by the fact that he shares the preclear's anxiety that the preclear view the environment as the environment "should be." The reason why a non-cleared auditor does not do well with these processes is that he is very anxious for the preclear to continue agreement with all others and to perceive the surroundings as exactly when exteriorized as he did when he was looking through MEST eyes and perceptions (which is to say, when the preclear was at his exact, agreed-upon point of viewpoint).

The ability to perceive the MEST universe is the ability to agree. The preclear's accuracy of perception of the MEST universe is of no consequence. An auditor can act to permit or even encourage a preclear to try to see, feel and hear the MEST universe when exteriorized long before the preclear is prepared to do so with equanimity. The auditor when doing this, is dramatizing his own urge to agree with viewpoints and perceive. A preclear who exteriorizes readily may find with a shock that he is not perceiving the MEST universe as he commonly supposes it should be perceived and quickly go back into his body to reassure himself that he is "keeping his contract of agreement."

If the auditor demands that the preclear perceive the environment when exteriorized, then the auditor will discover that the preclear will drop in tone and that, when he has gone into his body once more, a great deal of patient auditing is necessary to regain the preclear's confidence in himself. The preclear exteriorizing may find himself in all sorts of space and time cross-ups, for he has insufficient command of space and energy to independently sort out viewpoints when unassisted by the orientation of the MEST body itself, which is, of course, in debased and degraded agreement of a very set nature.

There are two "shuns." These are invalidation and evaluation.

The auditor must eschew them vigorously. The major invalidation which could be practiced in using Scientology 8-8008 would be a demand that the preclear see the environment as it is seen through MEST perception or to criticize him for not being able to do so. The majority of the preclear's perceptions may be correct but some percentage of his perception is going to be enough "off wavelength" with other agreement viewpoints to cause him to perceive strangely.

After a very large amount of auditing, when the preclear has regained his ability to create with considerable solidity his own illusions, it will be found that the preclear can at will perceive the MEST universe and can do so with accuracy. He can further, without the aid of a body, move objects and do a thousand other "interesting tricks" which could very well be viewed with considerable awe, for they have not been seen on earth in recorded history but have lived in legend.

Using Standard Operating Procedure, Issue 3, as given in this volume, the auditor yet takes a very thorough assessment of his preclear with an E-Meter. He discovers, in accordance with information in this book, what the preclear is unable to start, change, stop; create, alter, destroy; be, do or have; differentiate, associate or identify; on each and every one of the eight dynamics and their component parts. The auditor makes a complete list. This is the Can't list. Exteriorized, if possible, or interiorized as in the later numbered cases, the preclear is then made to "mock-up" illusions about each one of these Can'ts and to change the size, character and position of the illusion or any part thereof in space, shift it in time simply by knowing it has been shifted by him, until at last the preclear is able to handle the whole object of the Can't with complete facility.

Can'ts may be an inability to destroy women or snakes or specific persons, or create machinery, or write legibly. The preclear is requested to accomplish by illusions the smallest gradient of the Can't with which he can successfully start; and, under auditor direction, by moving this small portion of the whole here and there in space, tipping it this way and that and making it, in particular, disobey "natural laws" in the MEST universe, the preclear is led to an ability to create, change or destroy the Can't.

The Can't is also the Must. Can't is an inhibition; Must is an enforcement. What must the preclear do and what must be done to him? By whom? By creative processing and gradient scales, he achieves mock-ups until each one of these musts becomes a "Can if I want to, but don't have to."

There are also the Desires. These are the cravings for sensation or possession or identification which brought the preclear into and made him continue agreements. Behind every

case the Desires are paramount and of greater importance than the Can'ts. Why does he desire bodies? Why is his second dynamic aberrated? Why does he feel he cannot be free? Can he differentiate between his own actual wantingness and the wantingness of MEST itself which is trying to have him? The desires are resolved by creative processing wherein the preclear does mock-ups of the necessary acts which he desires or the necessary behaviors which brought him into agreement until he can at last laugh at them.

In that creative processing does not take long in terms of time, the assessment list can afford to be very broad and to cover every possible phase through the system of the dynamics and the cycles of action.

This is a list of things the preclear must be able to do with an illusion:

- Create the condition, energy or object
- Conserve it
- Protect it
- Control it
- Hide it
- Change it
- Age it
- Make it go backwards on a cycle of action
- Perceive it with all perceptions
- Shift it at will in time
- Rearrange it
- Duplicate it
- Turn it upside down or on the side at will
- Make it disobey MEST laws
- Be it
- Not be it
- Destroy it.

In order to accomplish these things, if the whole of any condition cannot be fulfilled by gradient scale some tiny portion of the condition must be fulfilled.

When a small condition has been fulfilled, the condition is then enlarged until the whole condition can be fulfilled.

That preclear who cannot get even a shadow of an illusion so that he can perceive it in any manner must be coaxed to see white spots, black spots, of his own creation, and to change those in space and time, enlarge and contract them, until he has a certain command and control of black and white. This must be done with such a preclear without regard to the number of hours it takes or the patience of the drill. It can be done with the eyes open or closed, whichever the preclear finds best.

When the preclear is discovered to be trying to prevent a motion or condition, the auditor should magnify that very condition with new mock-ups related to it, i.e., if objects keep rushing in on the preclear, mock up objects rushing in until the action is enormously magnified but under the preclear's complete control. If the preclear cannot start something, make him stop it. If he cannot reverse a direction, make him change the nature of the object which he is trying to reverse enough times to permit him to reverse the original disability. If the preclear cannot create something, have him create anything even vaguely associated with it, and by association at last have him mock up the actual thing.

The essence of creative processing is moving objects in space when they have been mocked up. They are moved near and far, to the right, left, behind the preclear, below his feet, above his head and in front of him. He must know that he has changed the location of the object. If he cannot make a large change, have him do a small change of location. If he cannot do a small change of location, have him alter the object by turning it different colors, or by

enlarging or contracting it, or by pushing it away or bringing it near him, until he can make it move sideways. In failing to do this, have him do a change with some allied object.

The essence of creative processing is a continuation of success. Be careful not to give the preclear things which make him fail. Do not let his failures mount up. Estimate the preclear and pay attention to what he is doing; find out from him continually the condition of his illusions, if you yourself as an auditor cannot see them. Putting objects into yesterday or tomorrow or well into the future or into the past is vitally necessary to processing.

Control of the illusion is the essence of commands. The preclear must be able to create, grow, conserve, decay and destroy; start, change and stop; be, do and have; differentiate, associate and identify; handle in space, with energy and in time, any object, actual or mythical, in all the eight dynamics, and with high preference given to anything which disobeys "natural laws" of the MEST universe.

That auditor with a high order of imagination who is himself clear, finds mock-ups very easy to "think up" and request of the preclear, but it is not necessary to have such an imagination, as a routine assessment will discover immediately that the most ordinary things fall into the Can't, Must and Desire brackets in the preclear's life.

The preclear will be discovered on the first dynamic, quite ordinarily, not to be able to create, change or destroy, especially destroy, his own body or bodies in which he thinks he is encased within his own body (old time-track bodies such as a Fifth Invader Force body). He will be found to be incapable in many directions with facsimiles, communication lines and other matters on the first dynamic alone. On the second dynamic, many incapacities will come to view, and so on along all the dynamics. On the fifth dynamic, he will quite ordinarily be found incapable of handling snakes, spiders, vicious fish, bacteria, wild animals and domestic pets. On the seventh dynamic he will be discovered unable to handle other thetans, even in the most elementary fashion of bringing two dots of light into proximity and then separating them (an exercise which blows head ridges in many preclears quite explosively). On the eighth dynamic his limitations quite ordinarily become too obvious for comment, but on each and every dynamic he must be able to do or fulfil any of the above cycles or conditions.

Standard Operating Procedure tells how to exteriorize a thetan. Creative processing, rising-scale postulate changing, postulate processing, are then necessary to bring him toward a state of a cleared theta clear. The state of theta clear simply demands that the preclear remains outside his body when the body itself is hurt, and the state is adequate to prevent his being trapped again by a body except in unusual circumstances. There is no guarantee of long continuance in the condition. The state of cleared theta clear is, however, another thing, for it means a person who is able to create his own universe; or, living in the MEST universe, is able to create illusions perceivable by others at will, to handle MEST universe objects without mechanical means and to have and feel no need of bodies or even the MEST universe to keep himself and his friends interested in existence.

STANDARD OPERATING PROCEDURE 8

The basic technology of this operating procedure is to be found in The Factors, Scientology 8-8008 and at the Professional School.

In using this operating procedure, the auditor should give every heed to the AUDITOR'S CODE. Further, he should audit the preclear in the presence of a third person or another auditor.

This operating procedure is best done by an auditor who has been thoroughly trained in all processes involving the reduction of the past and its incidents; the untrained auditor may encounter manifestations with which only a professional auditor would be familiar.

This operating procedure retains the most workable methods of preceding procedures and, in itself, emphasizes POSITIVE GAIN and the present and future rather than negative gain of eradication of the past.

The thetan, exteriorized and rehabilitated, can handle and remedy by direct address of his own energy to the body and the removal of old energy deposits, all body malfunctions or mental aberrations attacked by older processes. The goal of this procedure is not the rehabilitation of the body but of the thetan. Rehabilitation of a body incidentally ensues.

The goal of this procedure is OPERATING THETAN, a higher goal than earlier procedures.

The auditor tests the preclear for each step from Step I on until he finds a step the preclear can do. The auditor then completes this step and then the next higher step until the thetan is exteriorized. With the thetan exteriorized, the auditor now completes all seven steps regardless of the step performed before exteriorization. He may complete all these steps and all parts of these steps rapidly. But they must be done to obtain a theta clear and they must be done thoroughly to obtain an OPERATING THETAN.

The techniques involved herein were developed by L. Ron Hubbard and after testing by him, were tested by other auditors on a wide variety of cases. It is doubtful if any earlier process of any kind in any age has been as thoroughly validated as this operating procedure. However, it works only when used as stated. Disorganized fragments of this material, given other names and emphasis, may be found to be harmful. Irresponsible and untrained use of this procedure is not authorized. Capricious or quasi-religious exteriorization of the thetan for other purposes than the restoration of his ability and self-determinism should be resisted by any being. The goal of this process is freedom for the individual to the betterment of the many.

STEP I -- Ask preclear to be three feet behind his head. If stable there, have him be in various pleasant places until any feeling of scarcity of viewpoints is resolved; then have him be in several undesirable places, then several pleasant places; then have him be in a slightly dangerous place, then in more and more dangerous places until he can sit in the center of the sun. Be sure to observe gradient scale of ugliness and dangerousness of places. Do not let preclear fail. Then do remaining steps with preclear exteriorized.

STEP II -- Have preclear mock up own body. If he does this easily and clearly, have him mock up own body until he slips out of it. When he is exteriorized and knows it thoroughly (the conditions of all exteriorization) do Step I. If his mock-up was not clear, go to Step III immediately.

STEP III -- SPACATION: Have preclear close his eyes and find upper corners of the room. Have him sit there, not thinking, refusing to think of anything, interested only in the corners until he is completely exteriorized without strain. Then do a spacation (constructing own space with eight anchor points and holding it stable without effort) and go to Step I. If preclear was unable to locate corners of the room easily with his eyes closed, go to Step IV.

STEP IV -- EXPANDED GITA: (This is an extension of "Give and Take" processing.) Test preclear to see if he can get a mock-up he can see, no matter how vague. Then have him WASTE, ACCEPT UNDER DURESS, DESIRE and finally be able to TAKE OR LEAVE ALONE each of the items listed below. He does this with mock-ups or ideas. He must do the sequence of WASTE, etc., in the order given here for each item. He wastes it by having it at remote distances in places where it will do no good, being used or done or observed by something which cannot appreciate it; when he is able to waste it in vast quantities the auditor then has him accept it in mock-up form until he no longer is antagonistic to having to accept it even when it is unpleasant and great force is applied to make him take it; then, again with mock-ups, he must be able to bring himself to desire it even in its worst form; then, by mock-ups of it in its most desirable form he must come to be able to leave it entirely alone or take it in its worst form without caring. EXPANDED GITA remedies contra-survival abundance and

scarcity. It will be found that before one can accept a very scarce (to him) thing, he has to give it away. A person with a milk allergy must be able to give away, in mock-up, enormous quantities of milk, wasting it, before he can accept any himself. The items in this list are compounded from several years of isolating what factors were more important to minds than others; the list lacks very few of the very important items if any; additions to or subtractions from this list should not be attempted. Viewpoint, work and pain should be heavily and often stressed and given priority.

WASTE, HAVE FORCED UPON, DESIRE, BE ABLE TO GIVE OR TAKE, IN THAT ORDER, EACH OF THE FOLLOWING: (Order of items here is random). VIEWPOINT, WORK, PAIN, BEAUTY, MOTION, ENGRAMS, UGLINESS, LOGIC, PICTURES, CONFINEMENT, MONEY, PARENTS, BLACKNESS, POLICE, LIGHT, EXPLOSIONS, BODIES, DEGRADATION, MALE BODIES, FEMALE BODIES, BABIES, CHILDREN MALE, CHILDREN FEMALE, STRANGE AND PECULIAR BODIES, DEAD BODIES, AFFINITY (LOVE), AGREEMENT, BEAUTIFUL BODIES, PEOPLE, ATTENTION, ADMIRATION, FORCE, ENERGY, LIGHTNING, UNCONSCIOUSNESS, PROBLEMS, ANTAGONISM, REVERENCE, FEAR, OBJECTS, TIME, EATING HUMAN BODIES, SOUND, GRIEF, BEAUTIFUL SADNESS, HIDDEN INFLUENCES, HIDDEN COMMUNICATIONS, DOUBTS, FACES, DIMENSION POINTS, ANGER, APATHY, IDEAS, ENTHUSIASM, DISAGREEMENT, HATE, SEX, REWARD, EATING PARENTS, EATEN BY MOTHER, EATEN BY FATHER, EATING MEN, EATEN BY MEN, EATING WOMEN, EATEN BY WOMEN, START, BROKEN COMMUNICATIONS, WRITTEN COMMUNICATIONS, STILLNESS, EXHAUSTION, WOMEN STOPPING MOTION, MEN STOPPING MOTION, CHANGING MOTION WOMEN, CHANGING MOTION MEN, CHANGING MOTION BABIES, CHANGING MOTION CHILDREN, STARTING MOTION MEN, STARTING MOTION WOMEN, STARTING MOTION CHILDREN, STARTING MOTION OBJECTS, STARTING MOTION SELF, OMENS, WICKEDNESS, FORGIVENESS, PLAY, GAMES, SOUND, MACHINERY, TOUCH, TRAFFIC, STOLEN GOODS, STOLEN PICTURES, HOMES, BLASPHEMY, CAVES, MEDICINE, GLASS, MIRRORS, PRIDE, MUSICAL INSTRUMENTS, DIRTY WORDS, SPACE, WILD ANIMALS, PETS, BIRDS, AIR, WATER, FOOD, MILK, GARBAGE, GASES, EXCRETA, ROOMS, BEDS, PUNISHMENT, BOREDOM, CONFUSION, SOLDIERS, EXECUTIONERS, DOCTORS, JUDGES, PSYCHIATRISTS, ALCOHOLIC LIQUOR, DRUGS, MASTURBATION, REWARDS, HEAT, COLD, FORBIDDEN THINGS, GOD, THE DEVIL, SPIRITS, BACTERIA, GLORY, DEPENDENCE, RESPONSIBILITY, WRONGNESS, RIGHTNESS, INSANITY, SANITY, FAITH, CHRIST, DEATH, RANK, POVERTY, MAPS, IRRESPONSIBILITY, GREETINGS, FAREWELLS, CREDIT, LONELINESS, JEWELS, TEETH, GENITALIA, COMPLICATIONS, HELP, PRETENCE, TRUTH, LIES, ASSURANCE, CONTEMPT, PREDICTABILITY, UNPREDICTABILITY, VACUUMS, WHITE CLOUDS, BLACK CLOUDS, UNATTAINABLES, HIDDEN THINGS, WORRY, REVENGE, TEXTBOOKS, KISSES, THE PAST, THE FUTURE, THE PRESENT, ARMS, STOMACHS, BOWELS, MOUTHS, CIGARETTES, SMOKE, URINE, VOMIT, CONVULSIONS, SALIVA, FLOWERS, SEMEN, BLACKBOARDS, FIREWORKS, TOYS, VEHICLES, DOLLS, AUDIENCES, DOORS, WALLS, WEAPONS, BLOOD, AMBITIONS, ILLUSIONS, BETRAYAL, RIDICULE, HOPE, HAPPINESS, MOTHERS, FATHERS, GRANDPARENTS, SUNS, PLANETS, MOONS, SENSATION, LOOKING, INCIDENTS, WAITING, SILENCE, TALKING, KNOWING, NOT KNOWING, DOUBTS, FAC ONE, REMEMBERING, FORGETTING, AUDITING, MINDS, FAME, POWER, ACCIDENTS, ILLNESSES, APPROVAL, TIREDNESS, FACES, ACTING, DRAMA, COSTUMES, SLEEP, HOLDING THINGS APART, HOLDING THINGS TOGETHER, DESTROYING THINGS, SENDING THINGS AWAY, MAKING THINGS GO FAST, MAKING THINGS APPEAR, MAKING THINGS VANISH, CONVICTIONS, STABILITY, CHANGING PEOPLE, SILENT MEN, SILENT WOMEN, SILENT CHILDREN, SYMBOLS OF WEAKNESS, SYMBOLS OF FORCE, DISABILITIES, EDUCATION, LANGUAGES, BESTIALITY, HOMOSEXUALITY, INVISIBLE BODIES, INVISIBLE ACTS, INVISIBLE SCENES, ACCEPTING THINGS BACK, GAMES, RULES, PLAYERS, RESTIMULATION, SEXUAL RESTIMULATION, SPACE

REDUCTION, SIZE REDUCTION, ENTERTAINMENT, CHEERFULNESS, FREEDOM FOR OTHERS TO TALK, ACT, FEEL PAIN, BE SAD, THETANS, PERSONALITIES, CRUELTY, ORGANIZATIONS.

WARNING: SHOULD YOUR PRECLEAR BECOME UNSTABLE OR UPSET DOING THIS PROCESS TAKE HIM TO STEP VI, THEN RETURN TO THIS LIST.

COMMENT: The mind is sufficiently complicated that it can be expected to have computations on almost all the above. Thus there is no single clearing button and search for it is at the dictate of a circuit, the mechanism of circuits being to search for something hidden. Thus your preclear may begin to compute and philosophize and seek to find the "button" that will release all this. All this releases all the buttons so tell him to relax and go on with the process every time he starts to compute.

NOTE: Running the above will bring to the surface without further attention the "computation on the case" and the service facsimile. Do not audit these. Run Expanded Gita.

STEP V -- PRESENT TIME DIFFERENTIATION. EXTERIORIZATION OF SCENERY. Have preclear, with his body's eyes, study and see the difference between similar real objects such as the two legs of a chair, the spaces between the back, two cigarettes, two trees, two girls. He must see and study the objects, it is not enough to remember objects. The definition of a CASE V is "no mock-ups, only blackness." Have him continue this process until he is alert. Use liberally and often.

Then exteriorize by having the preclear close his eyes and move actual places on Earth under him, preferably places he has not been. Have him bring these up to him, find two similar things in the scene and observe the difference between them. Move him over oceans and cities until he is certain that he is exteriorized.

Then, preferably while exteriorized, have him do STEP I.

This case has to know before he can be. His viewpoint is in the past. Give him present time viewpoints until he is a STEP I by the methods given for STEP V.

(COMMENT: PRESENT TIME DIFFERENTIATION is a very good general technique and resolves chronic somatics and improves tone.)

STEP VI -- A-R-C STRAIGHT WIRE using next to last list of SELF ANALYSIS IN SCIENTOLOGY which asks preclear to recall something really real to him, etc. Then use the lists in SELF ANALYSIS. This level is the neurotic level. It is identified by the preclear having mock-ups which will not persist or which won't go away. Use also PRESENT TIME DIFFERENTIATION. Then go to STEP IV. At any drop in tone, return case to STEP VI.

STEP VII -- PSYCHOTIC CASES.* Whether in or out of body, the psychotic looks to be in such desperate straits that people often err in thinking desperate measures are necessary. Use the lightest possible methods. Give case space and freedom where possible. Have Psychotic IMITATE (not mock up) various things. Have him do PRESENT TIME DIFFERENTIATION. Get him to tell the difference between things by actual touch. Have him locate, differentiate and touch things that are really real to him (real objects or items). If inaccessible mimic him with own body whatever he does until he comes into communication. Have him locate corners of the room and hold them without thinking. As soon as his communication is up, go to STEP VI but be very sure he changes any mock-up around until he knows it is a mock-up, that it exists and that he himself made it. Do not run engrams. He is psychotic because viewpoints in present time are so scarce that he has gone into the past for viewpoints which at least he knew existed. By PRESENT TIME DIFFERENTIATION, by tactile on objects, return his idea of an abundance of viewpoint in present time. If he has been given electric shock, do not process it or any other brutality. Work him for very brief periods

for his attention span is short. Always work psychotics with another person or a companion present.

NOTE: ALL STEPS FOR ALL CASES. IF IN DOUBT AS TO CONDITION OF CASE, TEST WITH STEP VI.

NOTE: An Operating Thetan must also be able to manufacture particles of admiration and force in abundance.

STEP I -- The Operating Thetan must be able to manufacture and experience to his complete satisfaction all sensations including pain in mock-up form and all energies such as admiration and force. It will be found that some STEP I cases will not be able to manufacture admiration particles.

STEP II -- Be very careful not to make a lower step preclear, while still in a body, mock up his own body too long. Any mock-up will appear if it is simply put there often enough and long enough -- providing the preclear doesn't spin in the process. The long term manufacture of mock-ups of one's own body and of admiration may not produce quite the results expected -- communication lines which should remain shut may open with bad results. These lines that are shut appear like hard, black cords to the preclear.

There are two types of techniques in general: POSITIVE GAIN and NEGATIVE GAIN as defined in the above text. POSITIVE CAN BE ADMINISTERED IN UNLIMITED AMOUNTS WITHOUT HARM. Negative gain techniques such as the reduction of engrams and locks double-terminalling, black and white, are often limited in the length of time they can be given: after a few hundred hours of early type auditing the case could be found to slump. Thus we have in POSITIVE GAIN the unlimited technique which improves the analytical mind; in NEGATIVE GAIN we have a limited (in terms of the time it can be audited) technique. In SOP 8 the following steps and processes may be audited without limit: STEP I, STEP III, STEP V, STEP VI, STEP VII.

The following steps are limited and should not be audited many hours without changing to another type (unlimited for a while, after which the following steps could be resumed): STEP II, STEP IV.

THE FOLLOWING STEPS CAN BE USED ON GROUPS: Step III, Step V, part 1 and part 2, Step VI, Step VII.

The following is a list of effective procedures as of April 28th, 1953. If a procedure is labelled (U) it is unlimited and could be audited thousands of hours and only improve a case: if labelled (L) it is limited and must be handled with discretion and alternated with an unlimited technique: if it is labelled (S) it is seldom used: if labelled (A) it is used in assists.

- * Engram Running, Book One (L) (A)
- * Grief and Other Secondaries (L) (A)
- Lock Scanning (L) (A)
- Emotional Curves (L) (S)
- Service Facsimile Chain as Engrams (L) (S)
- Effort Processing (L) (A)
- ARC Straight Wire, Science of Survival (A)
- Negative Exteriorization (L)
- Ridge Running (L)
- * Ded-Dedex (L) (S) (Current lifetime used for fast releases)
- Motivator-Overt (L) (S)
- Matched Terminals in Mock-ups (L) (S)
- Double Terminals in Mock-ups (L) (A)
- * Positive Exteriorization (Step I SOP 8) (U)
- * Own Body Mock-up (Step II SOP 8) (L)

- * Spaciation (Step III SOP 8 and General Usage) (U)
- * Expanded Gita (Step IV SOP 8) (L)
- * Present Time Differentiation (Step V SOP 8) (U)
- * Exteriorization by Scenery (Step V SOP 8) (U)
- * Self Analysis in Scientology and British S.A. in Dianetics (same volume) (Step VI SOP 8) (U)
- * Imitation of Things (Step VII SOP 8) (U)
- * Creative Processing (as in Scientology 8-8008) (U)

The symbol (*) before a process above means it is recommended.

ADDITIONAL NOTE ON EXPANDED GITA: The governing rule here is that the preclear craves exactly what he has and must waste whatever he doesn't have. It is better, in the opinion of a thetan, to have anything no matter how "bad" rather than have nothing. He craves those things which are scarce but he can't even have those things which are scarcest. In order to have what he cannot have he first must be able to waste it (in mock-up) in quantity. An abbreviated form of this process would involve, over and over, wasting, accepting under duress, the following items in turn:

TRY FIRST: HEALTHY BODIES, STRONG BODIES, GOOD PERCEPTION, GOOD RECALL, VIEWPOINTS, PAIN, WORK, FREEDOM FOR OTHERS TO HAVE VIEWPOINTS.

The preclear cannot be free himself until he has freed others. This does not work out in the MEST universe but it works out in mock-ups.

CIRCUITS GO INTO ACTION ON MANY OF THESE PROCESSES: DON'T PERMIT YOUR PRECLEAR TO THINK, DON'T BE INTERESTED IN WHAT HE THINKS, FAILURE TO FOLLOW THIS RULE WILL CAUSE THE PROCESS TO FAIL.

COMPARISON OF MEST OBJECTS TO MOCK-UPS RESOLVES WHY THETANS MAKE FACSIMILES AND DISCLOSES TO THE PRECLEAR THE MECHANISM, THIS IS A GOOD PROCESS AND CAN BE DONE AT STEP IV AS AN ADDITIONAL PART OF IV. HAVE PRECLEAR MAKE A MOCK-UP THE SAME AS A MEST OBJECT AND PUT THE MOCK-UP ALONGSIDE OF THE MEST OBJECT AND THEN COMPARE THEM. THE MOCK-UPS WILL GRADUALLY IMPROVE, THEN KEY OUT THE MECHANISM THAT MAKES FACSIMILES.

CERTAINTY PROCESSING

SOP-8 Appendix No. 2

The anatomy of maybe consists of uncertainties and is resolved by the processing of certainties. It is not resolved by the processing of uncertainties.

An uncertainty is held in suspense solely because the preclear is holding on so hard to certainties. The basic thing he is holding on to is "I have a solution," "I have no solution." One of these is positive, the other is negative. A complete positive and a complete negative are alike a certainty. The basic certainty is "There is something," "There is nothing." A person can be certain there is something, he can be certain there is nothing.

"There is something," "There is nothing" resolves chronic somatics in this order. One gets the preclear to have the center of the somatic say "There is something here," "There is nothing here." Then he gets the center of the somatic to say "There is nothing there," "There is something there." Then the auditor has the preclear toward the somatic say "There is something there," "There is nothing there." And then he gets the preclear to say about himself "There is something here." "There is nothing here." This is a very fast resolution of chronic somatics; quite ordinarily three or four minutes of this will resolve an acute state and fifteen or twenty minutes of it will resolve a chronic state.

This matter of certainties goes further. It has been determined by my investigations that the reason behind what is happening is the desire of a cause to bring about an effect. Something is better than nothing, anything is better than nothing. Any circuit, any effect, any anything, is better than nothing. If you will match terminals in brackets "There is nothing," you will find that a lot of your preclears become very ill. This should be turned around into "There is something."

The way one does Matched Terminals is to have the preclear facing the preclear or his father facing his father; in other words, two of each of anything, one facing the other. These two things will discharge one into the other, thus running off the difficulty. By bracket we mean, of course, running this with the preclear putting them up as himself to himself as though they were put up by somebody else, the somebody else facing the somebody else, and the matched terminal again put up by others facing others.

The clue to all this is positive and negative in terms of certainties. The positive plus the negative in conflict make an uncertainty. A great number of combinations of things can be run. Here's a list of the combinations: --

The button behind sex is "I can begin life anew," "I cannot begin life anew," "I can make life persist," "I cannot make life persist," "I can stop life," "I cannot stop life, can change life," "I cannot change life," "I can start life", "I cannot start life."

A very effective process,

"Something wrong .., "

"Nothing wrong ... " with "you, me, they, my mind, communications, various allies."

A very basic resolution of the lack of space of an individual is to locate those people and those objects which you've been using as anchor points such as father, mother and so forth and putting them into matched terminal brackets with this: -- "There is father," "There is no father," "There is grandfather," "There is no grandfather." In the compulsive line this can be changed to "There must be no father," "There must be a father." One takes all the allies of an individual and runs them in this fashion.

The basic law underneath this is that a person becomes the effect of anything upon which he has had to depend. This would tell you immediately that the sixth dynamic, the MEST universe, is the largest dependency of the individual. This can be run out, but then any dynamic can be run out in this fashion. "There is myself," "There is no self," and so on up the dynamics. "(Any dynamic) is preventing me from communicating," "(Any dynamic) is not preventing me from communicating" is intensely effective. Any such technique can be varied by applying the sub-zero scale as found earlier in this book.

One runs any certainty out because he knows that for this certainly there is an opposite negative certainty and that between these lies a maybe, and that the maybe is suspense in time. The basic operation of the reactive mind is to solve problems. It is based on uncertainties about observation. Thus one runs out certainties of observation. The most general shotgun technique would have to do with "There is sex," "There is no sex," "There is force," "There is no force." This could be run, of course, in terms of matched terminal brackets or even as concepts, but one must not neglect to run the overt act phenomenon which is to say getting somebody else getting the concept.

The processing out of certainties would then embrace "I have a solution," "There is no solution." These two opposite ends would take care of any individual who was hung on the track with some solution, for that solution had its opposite. People who have studied medicine begin by being certain that medicine works and end by being certain that medicine doesn't work. They begin by studying psychology on a supposition that it is the solution, and finish up that it is not the solution. This also happens to superficial students of Dianetics and Scientology, thus one should also run "Dianetics is a solution," "Dianetics is not the solution," This would also get one off the maybe on the subject.

We are essentially processing communications systems. The entire process of auditing is concentrated upon withdrawing communications from the preclear as predicated on the basis of the body and the preclear cannot handle communications. Thus "The preclear can handle communication," "The preclear cannot handle communications" is a shotgun technique which resolves maybes about his communications.

An intensely interesting aspect of Certainty Processing is that it shows up intimately where the preclear is aberrated. Here is the overall basic technique. One runs "There is....," "There is not..." the following: Communication, talk, letters, love, agreement, sex, pain, work, bodies, minds, curiosity, control, enforcement, compulsion, inhibition, food, money, people. ability, beauty, ugliness, presents and both the top and bottom of the Chart of Attitudes, positive and negative in each one.

Basic in all this is the urge of the preclear to produce an effect, so one can run "I can produce an effect upon mama," "I cannot produce an effect upon mama," and so forth for all allies and one will resolve the fixations of attention on the part of the preclear. Thus fixations of attention are resolved by Certainty Processing, processing out the production of effect.

One can occasionally, if he so desires, process the direct center of the maybe, which is to say doubt itself, in terms of Matched Terminals. This, however, is risky for it throws the preclear into a general state of doubt.

The key to any such processing is the recovery of viewpoints. "I can have grandfather's viewpoint," "I cannot have grandfather's viewpoint," and so on, particularly with sexual partners, will prove intensely interesting on a case. "There are viewpoints," "There are no viewpoints," "I have a viewpoint," "I don't have a viewpoint," "Blank has a viewpoint," "Blank has no viewpoint," resolves problems.

One should also realize that when one is processing facsimiles, he is processing at once energy, sensation and aesthetics. The facsimile is a picture. The preclear is being affected by pictures mainly, and so "There are no pictures," "There are pictures," forwards the case toward handling pictures; which is to say facsimiles.

A person tends to ally himself with somebody whom he considers capable of producing greater effects than himself, so “I, she, he, it can create greater effects,” “I, she, he, it can create no effect,” is quite effective.

When one is processing, he is trying to withdraw communications. Reach and Withdraw are the two fundamentals in the action of theta. Must Reach and Cannot Reach, Must Withdraw and Cannot Withdraw are compulsions which, when run in combination, produce the manifestation of insanity in a preclear.

“I can reach,” “I can’t reach,” “I can withdraw,” “I can’t withdraw,” open up into the fact that remembering and forgetting are dependent upon the ability to reach and withdraw. You will find that a preclear will respond to “You must” or “You can,” “You must not,” “You cannot,” “There is,” “There is not,” forgetting and remembering.

The only reason a person is hanging on to a body or facsimile is because he has lost his belief in his ability to create. The rehabilitation of this ability to create is resolved -- for instance, in a person who has had an ambition to write with “I can write,” “I cannot write” -- and so forth. The loss of this creative ability made the person hang on to what he had. The fact that a preclear has forgotten how to or no longer can himself generate force makes him hold on to stores of force. These are very often mistaken by the auditor for facsimiles. The preclear doesn’t care for the facsimile, he simply cares for the force contained in the facsimile because he knows he doesn’t have any force any more.

It should be kept in mind that reaching and withdrawing are intensely productive of reaction in a preclear. But that preclear who does not respond to reaching and withdrawing and certainty thereon, is hung up in a very special condition: he is trying to prevent something from happening, he is trying to maintain control. If he prevents something from happening, he also prevents auditing from happening. He has lost allies, he has had accidents, and he is hung up at all those points on the track where he feels he should have prevented something from happening. This is resolved by running “I must prevent it from happening,” “I cannot prevent it from happening,” “I must retain control,” “I must lose all control.”

Blackness is the desire to be an effect and the inability to be cause.

“I can create grandfather (or ally),” “I cannot create grandfather (or ally),” solves scarcity of allies. “I want to be aware,” “I want no awareness,” is a technique which is basic in attitudes. Run this as others, in matched terminal brackets or in Expanded GITA.

Certainty there is a past, certainty there is no past; certainty there is a future, certainty there is no future; certainty it means something else, certainty it does not mean anything else; certainty there is space, certainty there is no space; certainty there is energy. certainty there is no energy; certainty there are objects, certainty there are no objects.

GLOSSARY

THETAN: This term designates the beingness of the individual, the awareness of awareness unit, that quantity and identity which IS the preclear. One does not speak of “my thetan” any more than he would speak of “my me.” Persons referring to the thetan in such a way as to make the thetan a third party to the body and the person are not only incorrect, they betoken by this a bad state of aberration.

AUDITOR: The person who “audits,” who computes and listens, a practitioner of Dianetics and Scientology. SOP Theta Clearing is best done by an auditor who has been theta cleared. A Step V commonly acts to force the preclear to stay in his body even while pretending to free the preclear from his body.

LOCATION: The thetan is an energy unit which is commonly located in the center of the skull. A thetan who cannot leave the current body very often believes himself to be holding on only to the current body. and yet in actuality is holding on to a facsimile of an earlier body. The thetan also believes himself to be the size of some earlier body. A thetan from the Fifth Invader Force believes himself to be a very strange insect-like creature with unthinkably horrible hands. He believes himself to be occupying such a body, but is in actuality simply a unit capable of producing space, time, energy and matter.

SELF-DETERMINISM: Self-determinism is a relative state of ability to determine location in time and space, and to create and destroy space, time, energy and matter. If one can locate his facsimiles and ridges in time and space, if one is able to place persons and objects in the past, present and future in time and space, he can be considered to have high self-determinism. If one’s facsimiles place him in time and space, if people can easily place one in time and space in the past, present or future, one’s self-determinism is low. Willingness and unwillingness to locate things in time and space are the key relative states of sanity.

ILLUSION: Any idea, space, energy, object or time concept which one creates himself.

REALITY: That agreement upon illusion which became the MEST universe.

DELUSION: Things not of one’s own creation or of the MEST universe which locate one in time and space.

CERTAINTY: One is certain on a plus or minus basis and can be equally certain on either. One can be certain a thing is NOT real or he can be certain that it IS real. There are three sides to this. One is certain that a thing is his own illusion: this is the highest level. One is certain that a thing is a MEST universe reality (illusion). One can be certain that a thing is a delusion. Any certainty is a knowingness. Knowingness is sanity. Thus we have three routes of certainty by which to approach knowingness.

KNOWINGNESS: Knowingness depends upon certainty.

ABERRATION: Aberration depends upon uncertainty.

THETA PERCEPTION: That which one perceives by radiating toward an object and from the reflection perceiving various characteristics of the object such as size, odor, tactile, sound, color, etc. Certainty of perception is increased by drilling in certainties as above. Theta perception is dependent upon willingness to handle energy and to create space, energy and objects. In view of the fact that the MEST universe can be established easily to be an illusion, one must have an ability to perceive illusions before one can clearly perceive the MEST universe. The thetan who cannot perceive the MEST universe easily will also be found to be incapable of handling and orienting other kinds of illusions with certainty. Theta perception is also a direct index to responsibility, for responsibility is the willingness to handle force.

MEST PERCEPTION: Recordings the thetan takes from the organs of perception of the human body as a short cut to perception (lazy perception). The body records actual wave emanations from the MEST universe, the thetan uses these recordings. Considerably more data should be collected on this subject.

ORIENTATION: Determination of location in space and time and determination of energy quantity present. This applies to past, present, future.

RIDGES: "Solid" accumulations of energy which are suspended in space and time. Ridges can be handled variously. They can also explode.

FACSIMILES: Energy reproductions of things in various universes. They are fixed to ridges.

END OF TERMINAL: A communication line to anything has the preclear at one end and something at the other end. When the end of terminal is vacated, flow dams and the preclear must fix the vacated end to his own body. This is the mechanics behind the loss which brings about grief. ARC lines can be mocked-up and handled in the routine of creative processing, which processes will resolve end of terminal difficulties. These terminals are quite visible to the thetan who sees them either wound around the body or extending to other bodies or reaching a considerable distance into space. The thetan can actually yank on these terminals, even those which go into space, and free the other end whether he perceives it or not, and so recover and dispose of such lines.

ASTRAL BODIES: Somebody's delusion. Astral bodies are usually mock-ups which the mystic then tries to believe real. He sees the astral body as something else and then seeks to inhabit it in the most common practices of "astral walking." Anyone who confuses astral bodies with thetans is apt to have difficulty with theta clearing for the two things are not the same order of similarity. The exteriorization of a thetan, when actually accomplished, is so complete and thorough and is attended by so many other phenomena, that anyone who has made an effort to relate these two things is quite certain to recant after he has been theta cleared. The most noteworthy difference is that the thetan does not have a body. Production of illusion to which he then sought to assign MEST reality is probably the underlying factor which makes mysticism so aberrative. Data from India, even that found in the deepest "mysteries" of India, is knowingly or unknowingly "booby-trapped" so that while it contains, though unevaluated and isolated, many essential truths, it contains as well directions which are certain to send the experimenter even more deeply into the unwanted state of becoming MEST. Until recently, the nearest one could come to studying the actuality of existence was through the field of mysticism and its value should not be discounted, but its effect is to deliver an entirely opposite result to any experimenter luckless enough to hope to reach cause by becoming an effect as required in mysticism. Seeing and feeling "non-existences" is frightening and harmful only when one seeks to believe them to be existences. Only when he knows he has created them, can he obtain a certainty upon them. One can create hallucination for himself only by insisting that what he has created was otherwise created -- in short, refusing to accept responsibility for his own created illusions.

ELECTRONICS: Lower and cruder manifestations of the same order of actuality as thought.

TERMINALS: In facsimiles, ridges and electric motors, terminals operate and current flows only when they are fixed in time and space. Alternating current becomes possible only because of an overlooked item, the base of the motor, which is fixed in time and space and which keeps the terminals apart by fixing them in time and space.

THE HUMAN SOUL: The preclear.

MYSTICISM: Many right ideas but the wrong way to go about it.

FREEDOM: Ability to create and position energy or matter in time and space.

SLAVERY: Being positioned in another's time and space.

THE HUMAN BODY: A carbon-oxygen engine built of complex electronic ridges around the genetic entity which animates it.

THE HUMAN MIND: The thetan plus the standard banks.

STIMULUS-RESPONSE: The environment of the thetan activating ridges to make them activate the body.

THE REACTIVE MIND: The ridge automatic response system.

THE SOMATIC MIND: The genetic entity plus the brain system of the body.

SCIENTOLOGY: The science of knowing how to know.

KNOWING HOW TO KNOW: Being the thetan, clear of the body and its ridges and able to handle illusion, matter, energy, space and time.

THETA CLEAR: A being who is reasonably stable outside the body and does not come back into the body simply because the body is hurt. No other condition necessary.

CLEARED THETA CLEAR: A thetan who is completely rehabilitated and can do everything a thetan should do, such as move MEST and control others from a distance, or create his own universe.

A THETAN EXTERIOR: A thetan who is clear of the body and knows it but is not yet stable outside.

SIX LEVELS OF PROCESSING -- ISSUE 5

November, 1955

NOTE: Issue Five of the Six Levels of Processing is not the final issue of this operating procedure and is subject to change, especially in the matter of command wording. However, the processes here reproduced have been evolved into a workable state and have been run with success with the commands given. Issue 5 of SLP is released at this time because it is better material, not because it is the final form of SLP.

With SLP is introduced a method of auditing and a new auditing atmosphere which articulates the attitudes best calculated to maintain continuing stable gains in a case. The auditing atmosphere is A-R-C with gain marked by continuing rises in A-R-C. With SLP a somatic or boil-off means reduced A-R-C and are indications of auditing breaks in A-R-C. With SLP comes the COMMUNICATION BRIDGE, restarting sessions, maintenance of high Reality, and liberal use of processing outside an auditing room.

All assist type processes are outside SLP except for the present time problem.

The emphasis of SLP is on bettering the preclear's reality and power of choice.

Level One

RUDIMENTS

These must be established at the beginning of every session. They must be re-established each time the preclear tends to go out of session:

- (a) Find the auditor
- (b) Find the preclear
- (c) Find the session environment
- (d) Establish that a session is in progress
- (e) Accept any communication the preclear originates
- (f) Acknowledge every command execution by the preclear
- (g) Agree upon the process and the command form before using and do not confuse it
- (h) Use two-way communication liberally
- (i) Follow the Auditor's Code
- (j) Deal with the present time problem which may be present at the beginning or arise during or recur during a session
- (k) Use a Communication Bridge at every process or area change
- (l) Establish goals by two-way communication and the command "Assign an intention to _____" (auditor indicating object)

(m) Run opening procedure of 8-C as given in The Creation of Human Ability until the preclear is certainly obeying the auditing commands and is under control.

Level Two

LOCATIONAL AND NOT-KNOW PROCESSES

Run in populated places, ambulant.

(a) Energy Sources:

Have preclear spot acceptable energy sources. Do not permit him to spot statics unless he is ready for it. Run until preclear can empower terminals. Commands: "Spot an acceptable energy source."

(b) Spotting Objects:

Have preclear spot objects in a place with ample space and objects. Commands: "Spot an object." (c) Spotting people:

Have preclear spot people in populated places. Command: "Spot a person."

(d) Separateness from Objects:

Have preclear spot objects he is separate from, then objects separate from him. Commands: "Locate an object from which you are separate." "Locate an object which is separate from you."

(e) Separateness from People:

Have preclear spot people he is separate from, then have him spot people separate from him. Commands: "Locate a person from whom you are separate." "Locate a person who is separate from you." (f) Waterloo Station:

Have preclear spot people about whom he can Not-Know something and then have him spot people he is willing to have Not-Know things about him. (Auditor selects persons.) Commands: "Tell me something you wouldn't mind not-knowing about that person." "Tell me something you wouldn't mind that person not-knowing about you."

Level Three

DECISIONAL PROCESSING

Run in quiet places or auditing rooms.

(a) Think a Placed Thought:

The object is to train the preclear to think thoughts exterior to his head and thetan bank to obviate the "cave-in phenomena of Axiom 51." Commands: (auditor indicating object or position) "Think a thought in (on) that _____" Alternate command: "Do you see that (object)? Think a thought in (on) it. Did the thought appear where it is?"

(b) Choice Rehabilitation:

Using the ability acquired in Level Three (a) have the preclear make choices between two objects indicated by auditor. Command: "From (indicated point) make a choice between (indicated positions or objects)."

(c) Directed Decision Rehabilitation:

Using the ability acquired in (a) and (b) exercise the preclear on decisions. Command: "Putting the decision on (in) that (indicated object) make a decision about it." (d) Permissive Decision Rehabilitation:

Using the abilities acquired in (a), (b) and (c) turn preclear loose on decisions. Decisions must be outside head and bank. Command: "Decide something."

Level Four

OPENING PROCEDURE BY DUPLICATION (Not-Know Version)

Done in an auditing room with a book and a bottle.

Commands:

- "Do you see that book?"
- "Walk over to it."
- "Pick it up."
- "Not-know something about its color."
- "Not-know something about its temperature."
- "Not-know something about its weight."
- "Put it in exactly the same place."
- "Do you see that bottle?"
- "Walk over to it."
- "Pick it up."
- "Not know something about its color."
- "Not know something about its temperature."
- "Not know something about its weight."
- "Put it in exactly the same place."
- "Do you see that book?"

Level Five

REMEDY OF COMMUNICATION SCARCITY

The object of this step is to restore abundance on any and all communication possibilities. Done in an auditing room.

(a) Create confusion:

Commands: "Mock up a confusion." Alternate command: "What confusion could you create?"

(b) Creating Terminals:

The preclear may have to be coached into mocking up unknown confused black terminals and thus into good terminal mock ups. Commands: "Mock up a communication terminal." "Mock up another communication terminal."

(c) What wouldn't you mind communicating with:

Duplicate the auditing command exactly. Don't red-herring (go chasing after facsimiles). Command: "What wouldn't you mind communicating with?"

(d) Creating family terminals:

Have preclear mock up until he has abundance of any and all persons he has ever used as anchor points. Commands: "Mock up your (father, wife, mother, husband). "Mock him (her) up again."

Level Six

REMEDY OF HAVINGNESS AND SPOTTING SPOTS IN SPACE

Route One

An exteriorized step done as given in the Creation of Human Ability.

GAMES PROCESSING

The goal of Scientology is the rehabilitation of the game. The auditor can make a game better or make it possible for the preclear to play a game. The preclear is being audited because he is no longer able to take part in the game.

Life is a game consisting of freedom and restrictions. Play is communication. Communication requires freedom and terminals. Life units as-is with thought. To think there must be something to as-is. To grant life there must be something to grant life to. A preclear will become as free as he is reassured of the existence of barriers at that level. When a preclear is not assured of (does not have reality on) barriers at a level he will not rise to that level. A thetan will carry to extremes making something and making nothing. Auditing is that process of bringing a balance between freedom and barriers.

A game depends upon a restoration of freedom of choice on making something and making nothing. One can become obsessed with making nothing. He can become obsessed with making something. Both of these activities and the rehabilitation of the freedom of choice bring about a gain in case. There can be too many or too few universes, but when an individual is stuck in a universe it is because he does not have enough universes.

Therefore it is necessary to remedy his havingness of bodies. Remedying his havingness of bodies will clear away universes in which he is stuck by letting him have freedom of entrance into universes.

Auditing is a game of exteriorization versus havingness. There is never too much of anything if the preclear is bothered by it. He may say there is not enough of it but he usually says there is something bad about it. When he says there is something bad about it he means there is not enough of it. The preclear loses his power to postulate into existence and to unpostulate out of existence energy masses, spaces and forms.

Life is a game.

Games are composed of freedom, problems, and havingness, awareness and interest.

Each of these elements contains "mood of game" (the tone scale), penalties, and the cycle of action.

Auditing improves the level of game of the preclear.

Auditing is not a game between auditor and preclear on an opposing basis but on a team basis. The auditor, and eventually the preclear, are engaged upon a game, themselves versus the opponents to survival in life.

The preclear is usually close to a no-game condition. This is reached by a preponderance of win (no-game) or a preponderance of lose (no-game). A frozen mood of game or no-mood is reached by assuming that interest can exist on only one emotional level (whereas interest can exist on any emotional tone level) or by misusing the mood of one game in others concurrently played.

A game is any state of beingness wherein exist awareness, problems, havingness and freedom (separateness) each in some degree. A game is rehabilitated or a no-game-condition eradicated in processing by handling the elements of games and their subdivision, with reality, with the intention of bettering the game ability of the preclear.

IF YOU, THE INDIVIDUAL KNEW THE TRUTH AND YOU WERE PROCESSED TOWARDS THE TRUTH, YOU WOULD BE FREE. ONLY LIES DEGRADE YOU. THIS IS THE LESSON OF SCIENTOLOGY.

THE REMEDY OF HAVINGNESS

There is a great deal of upper-echelon theory connected with the Remedy of Havingness as a process, for here we are dealing with energy and the reasons and operations of a thetan in regard to it.

Just why a thetan should get himself so completely snarled up in energy might be an entire mystery to anyone who did not realize that a thetan has to cut down his knowingness and his total presence in order to have a game. The awareness of awareness unit builds space to cut down knowingness. Space makes it necessary, then, to look at something in order to know about it. The next thing a thetan does to cut down his knowingness is to create energy and to pass it to other thetans and to bring in the energy of other thetans so as to get a duration and a time-span. If the thetan is successful and obtains a game in this wise, he continues on with this modus operandi of having a game, and when he does not have a game he simply cuts his knowingness down once more. Of course, he reaches a point eventually where he does not get a game simply by cutting down his knowingness, and eventually assumes a fairly fixed, stupid, aspect. He is below the level of having games, but because he has cut down his knowingness he does not know, now, that he is below the level of having games and thinks that all that is necessary to get another game is to further cut down his knowingness. He is by this time obsessively dramatizing the lowering of knowingness.

When one speaks of knowingness, one should realize that one is speaking of an embracive thing. Everything on the Know to Mystery Scale is simply a greater condensation or reduction of Knowingness. At first one simply knows. Then he makes some space and some energy, and so now he has knowingness in terms of looking.

By changing the position of the particles of energy thus created, and by exchanging particles with others, extant or self-created, the thetan cuts down his knowingness further, and gets time, and so gets emotion and sensation. When these become solid, he has effort particles and masses. Now, he could cut down his knowingness further by refusing to use emotion and effort, but by thinking about them, thus introducing new vias into his line of knowingness. And, when he no longer knows entirely by thinking, he ceases to create knowingness and begins to eat, and from eating he drops into the ready-made sensation of sex instead of knowing what happens in the future. And from here he drops down into postulated mystery as something one cannot possibly know about. In other words, one gets a continued reduction of knowingness in order to have games.

The greatest chess player in the world has no game, since he can predict that he will win and predict everything that opponents will do, so he will simply demonstrate how to play chess. Sooner or later, he will announce that he is "burned out" or has lost his knack for playing chess, and will go off into some other field where he can have a game. The field he will choose will be a less wisdom-demanding field than playing chess. A boxer, such as some of the very great ones of the past, will reduce his timing, which is to say his knowingness of arrival, to a point where he can at least put on a good exhibition, and from this they will further reduce their knowingness, and then not noticing how far they have gone, get themselves thoroughly and consistently beaten. There will be a period, however, when they are fairly evenly matched against their opponents.

To understand this with any thoroughness, one would have to recognize the intention back of all communication. Creation, Survival, and Destruction is knowingness. When somebody talks to you his intention is to continue in a parity where he can have an interchange of communication, which is to say a game. He takes knowingness from you, and gives knowingness to you, with one form of communication or another. Two soldiers fighting and shooting at each other are using a bullet to make the other man know. What is there to know in this situation? That one is dead, of course, and for the victor, that one has won.

It is dangerous, alike, to a thetan, to have too many wins or too many losses. Give him too many wins, and he will correct in the direction of reducing his knowingness as represented by his dexterity, his prediction, his activity. Give him too many losses and he will seek another game, even to the point where he will die and pick up another body. Because the decision is on the basis of knowingness, the decision is always downward. One does not decide upward toward greater knowingness, actually, unless one has the full and complete intention of winning in a new game. If one discovers that there are no wins or losses either to be found in this new game, even to the point of forgetting all of his knowledge concerning it, one will reduce one's own knowingness in order to ensure a game.

As there is not a infinity of games in progress, one is apt, as he comes down seventy-four trillion years of track, to play out the available games and to put them in the category of "it must not happen again". One then becomes bored. One is only bored when there is no game possible, from his viewpoint. Actually, all he has to do is become enthusiastic about the game on his own consideration and he will begin to know more about it again.

A thetan considers that some form or mass is necessary in order to have a game. He gets into the belief that he cannot create new masses, and so he begins to hold on to old masses, and here, whether he is exteriorized or in a body, we find him holding on hard to old facsimiles, old significances, old decisions, rather than take on new decisions.

The Remedy of Havingness directly addresses the problems of giving the thetan something 'to play with'. When he discovers that he can have new masses, he will begin to let go of old masses. It is an easily observed phenomenon while having a preclear Remedy Havingness, that old engrams go into restimulation, go into restimulation and run out, that they show up in front of his face and suddenly explode or disappear. The Remedy of Havingness actively does run out engrams.

This process is used from boredom up to conservatism for its best results.

This process is done by asking the preclear to mock up something and pull it in, or mock up something and throw it away. When a thetan is exteriorized, if you want to see him get very unhappy, make him change space until he begins to lose all the energy he is holding on to, and then fail to remedy his havingness. The thetan will become convinced that he is only a thought, and is therefore, by his standards unable to have a game. Tell him to mock up eight anchor points in the form of the corners of a cube around him and pull them in upon himself. Ask him to do it several more times, and he immediately brightens up and becomes very happy. Why is this? You have reassured him that he can have a game.

The cutting down of knowingness and the Remedy of Havingness have opposite vectors. The Remedy of Havingness will knock out old energy masses the thetan is holding on to, or that the body is holding on to, which tell the thetan he is stupid. The supplanting of these by new energy masses which do not have the postulate of cut-down knowingness in them of course makes the thetan brighter.

When you find a theory detached from a process and not demonstrating itself in a process there must be something wrong with the theory. Similarly, if what I say here about condensed knowingness being all other things, and the cut-down of knowingness, were not demonstrated in the process of Remedy of Havingness, then we would have to get ourselves a new theory. However, this is demonstrated very definitely. For those people who cannot remedy havingness wherever they are on the tone scale can be brought to a point where they will remedy havingness simply by asking them what they wouldn't mind knowing. The consideration of what they are willing to know then begins to rise.

If you only could see a "black five" operate you would see that his barriers are all erected toward knowing something. Of course he is very afraid of being told something bad, and so doesn't want to be told anything at all, and when the auditor gives him a command he never receives the command as given, but does something else. He has a block up against

knowingness to such a degree that he will eventually permit himself to be pressed into complete inactive stupidity. What are those black screens for? Basically to keep him from knowing. Knowing what? Then one will have to look closely at the definition of a datum. A datum is an invention which has become agreed upon and so solidified. In other words, a datum is to some degree a solidity, even if it is merely a symbol. To get into this state it has to be agreed upon. When it is thoroughly agreed upon it becomes, then, a truth. It is not at all a truth. It is an invention. What made it sure or what made it real was the fact that it was agreed upon. This opens the doors further to other processes.

In order to get the preclear in good condition we would have to put him into some kind of a condition so that he could create. The first thing he is liable to be able to create in auditing is a lie. The word lie is simply invention with a bad connotation. Society gives invention that connotation because of its anxiety to have a game and to agree, and so be able to communicate with one another.

Thus society frowns upon the invention of facts, yet the preclear's sanity and continued happiness absolutely depend upon his ability to create new facts. The technique which remedies this is included in "The Creation of Sanity", number R2-29: "Start lying". One can vary this auditing command with "Tell me some lies about your past", and then keep the preclear at it long enough so that the preclear is able to come out of the complete blur which will follow on the heels of his taking over the function of and running of his memory machines. The invention of data is a step immediately toward the remedy of havingness. Simply asking the preclear what he wouldn't mind knowing, what he wouldn't mind having other people knowing about him will bring him into a condition where he can mock up and remedy havingness.

The Remedy of Havingness is the companion process to Spotting Spots, which will be taken up in the next PAB. The Remedy of Havingness, simply as a process by itself, if worked up to by getting the preclear willing to know things, and willing for other people to know things, and run thoroughly so that whole avalanches of masses can pour into him or pour out of him, will actually run out an entire engram bank, and thus is an extremely valuable process.

It has been reported by several auditors that exteriorization was accomplished on preclears by making them remedy havingness and do nothing else for eight or ten hours.

The auditing commands for the Remedy of Havingness are: "Mock up something", "Pull it in", until the preclear is doing this easily. Then, "Mock up something", "Throw it away", until the preclear can do this easily. The significance of the object may be added by the auditor with "Pull in an ideal body", or some such thing, but the actual fact is that the actual significance does nothing for the preclear. It is the mass which counts. The auditor can have the preclear pull things in two at a time, six at a time. He can have the preclear mock up something, copy it a dozen times, one time after another, then pull in the whole mass, but the real reason he is doing this with the preclear should never drop from sight. The auditor is remedying havingness in order to give the preclear enough mass to permit him to discard old masses which he is holding on to and doesn't know anything about.

Remedy of Havingness -- The Process "When in doubt, remedy Havingness."

This is a motto which can well be followed by an auditor doing any process on the preclear.

But, if there is a process which one should do with any other process, then that process would be understood thoroughly, for if done incorrectly it would be likely to produce confusion into all the other processes of Dianetics and Scientology.

Therefore, in the first place, let us examine with rigor the name of this process. It is **REMEDY OF HAVINGNESS**. By "remedy" one means the correction of any aberrated condition. By "havingness" one means mass or objects. The process could also be called "Remedy of Unhavingness." It could also be called "Remedy of Acceptingness." It could also be called "Remedy of Rejectingness."

To those people who are deficient in Havingness, the process is liable to mean that the auditor should increase the Havingness of the preclear. Such an auditor with the misunderstanding would have the preclear put up large masses and push them into his body or himself. The auditor would neglect having the preclear throw away objects and masses.

If the auditor misunderstood the process and simply assumed that it had something to do with Havingness, and if his own Havingness were too great, he would be likely to specialize on all preclears by having the preclear throw things away.

Actually, the auditor should have the preclear push things into himself and his body and throw things away from himself and his body until the preclear can do both with equal ease. When this has been accomplished the preclear's Havingness has been "remedied".

What, then, does a Remedy of Havingness mean? It means the remedy of a preclear's native ability to acquire things at will and reject them at will. Amongst the Havingnesses which would require remedy, would be an obsessive inflow of money, sexual objects, troubles, somatics, and difficulties in general. Whenever one of these appeared in the preclear's environment it would have a tendency to inflow on the preclear. The reverse difficulty would be an obsessive outflow, whereby the preclear threw away or wasted anything which he had, such as money, clothes, cars, or living quarters. When the process "Remedy of Havingness" has been done thoroughly and completely, the preclear should be able to reject or accept, at his own discretion, anything in his environment as well as anything in the engram bank.

The earliest use of this process is to be found in GITA which is to say "Give and Take Processing," one of the early SOP's, which became an SOP-8 "Expanded GITA." In Issue 16-G of the Journal of Scientology we have a long list of key items. The preclear was asked to waste, accept, and desire these items at will. This was the Desire-Enforcement-Inhibit Scale, or DEI Scale. This process is the immediate ancestor of the Remedy of Havingness. Indeed, one could do far worse than to take the DEI Expanded GITA list as given in Issue 16-G, and in the form of mock-ups use it as such upon the preclear, or more modernly employ it directly on the Remedy of Havingness on these objects.

If one were to employ such a list in the Remedy of Havingness, one would, of course, have to employ gradient scales. The use of the gradient scale has never been discarded, and the concept and principle of doing things by gradient scales is inherent in auditing itself, for one starts with a process which the preclear can do, and gives him some wins, and on a gradual scale gives him larger and larger wins until he is cleared. Similarly, in remedying Havingness, the preclear must be started at the lowest end of the scale and advanced on up to the higher ends of the scale. Quantity is one of the methods of doing this. At first one can ask a preclear to mock up one of an item and shove it into his body or throw it away, and then go, finally, when he is doing that well, to two items, three, four, five, six, all the same, but a greater quantity of the item. An even lower gradient on this scale would be to simply get the idea that something was there, and to progress on forward with the idea into the actual mass. An expert auditor working with this from the idea on through to the object would discover that he had no preclears who could not mock up.

He would have the preclear get the idea out in front of him of a ball, and get the idea of the ball being thrown away; get the idea of a ball up in front of him and get the idea of a ball coming in. He would then, when the preclear could do this excellently, move forward into the actual mock-up of a ball. The mock-up would get better and better as the process progressed, until at last the preclear could mock up and throw away or push into his body, at will a ball. He would be able to see this ball, even feel its texture and its weight.

Now, exteriorization by Remedy of Havingness is a newer process than the old Remedy of Havingness. It is accomplished by having the preclear SHOVE or PUSH things into his body. One no longer has the preclear PULL things into his body. Simply by having the preclear mock up things and shove them into his body, mock them up and throw them away,

mock things up and shove them into his body, mock things up and throw them away, a preclear, who has already been run on the earlier steps of the six basic processes, will, at this stage exteriorize quite neatly after as little as fifteen or twenty minutes of the process. If he does not, then the earlier processes have been skimmed and the preclear was really not ready for a full, forthright remedy of Havingness.

Even when doing Route 1, the preclear is told to push things into himself. This will rather take his flitter away for a moment, for he is there being one viewpoint, and in order to push something into himself, he has to be a second viewpoint. In view of the fact that a thetan gets into trouble by being only one viewpoint, this remedies the viewpoint scarcity of the thetan, and he pushes himself up into two viewpoints with great rapidity. Thus we are doing duplication of the thetan at the same time that we are remedying Havingness, so one even has the thetan shove things into himself, rather than pull things into himself.

In short, one never has anyone pull things into his body any more. One has people push things into the body. One has, for instance, the preclear mock up a planet, and push it into the body; mock up a planet and throw it away; mock up a planet and push it into his body; and then one says, "Where are you pushing it from?" The preclear says: "Out here in front of the body." The auditor simply goes on doing the process, and very shortly the preclear will, if the earlier steps have been done well -- the Six Basic Processes below Remedy of Havingness -- exteriorize neatly and will be ready for Route 1.

One would omit, in such an instance, running Spotting Spots as such, for Change of Space Processing and Communication Processing has a great deal to do with spotting spots already.

If you were to do Remedy of Havingness forthrightly and all-out, and you were to accept this as the only process we had, we would work with its cousin process R2-63 as given in "The Creation of Human Ability," "Accept -- Reject." One would ask the preclear for things he could accept, one after the other until the communication lag was flat, and then would ask the preclear for things he could accept, one after the other until the communication lag was flat, and then would ask the preclear for things he could reject, one after the other until the communication lag was flat on that. One would then move into the Expanded GITA list and would have the preclear mock up and shove into his body (if interiorized) or into himself (if exteriorized) the various items on the Expanded GITA list as given in Issue 16-G of the Journal of Scientology. This would be a long process, and not entirely successful on all counts, but would nevertheless be a very effective and efficient process from the standpoint of gain. One would certainly get the preclear over a very large number of aberrations and would do a great deal for him. However, this is not the advised way of handling this process, for the process itself is not an end-all. Aberrations can be handled much more easily by Communication Processing.

The exact use and commands of Remedy of Havingness in ordinary and routine auditing is simple and effective. One has been asking a preclear a great many questions which "as-ised" large masses of energy. One, in handling Change of Space or interiorization and Exteriorization into objects while the preclear is exteriorized, has been "burning up" large masses of energy. Any time the preclear begins to feel dopey or "boil off" he has either run too long on a flow in one direction, in which case reverse the flow, or he has simply reduced his havingness down to a point where he feels tired or sleepy. Without waiting for this manifestation to occur the good auditor simply in the course of Straight Wire or Description Processing, or many other processes, such as those contained in Route One, remedies Havingness. Having achieved something like a momentarily flat communication lag on a process, the auditor says to the preclear: "Mock up a mass out in front of you." When the preclear has done this, the auditor says: "Shove it into your body." When the preclear has done so, the auditor says: "Mock up another mass out in front of you." And when the preclear has done so, the auditor says: "Throw it away." That, as given, is for preclears who are interiorized. It is simply repeated over and over. The mass is not specified. It can be almost

anything, and in fact it does not matter much what type of significance the mass has. Any mass is better than no mass, according to the thetan.

If the preclear is exteriorized, the auditor already starts him on the Remedy of Havingness in the Route One step where the preclear is asked to copy what he is looking at (R1-5). When one is doing R1-5 one must be very careful to obey the gradient scale principle behind Remedy of Havingness. One would not make the preclear make twenty copies and then push all of them into himself or the body. One would make the preclear make two or three copies and push them in, one at a time, until the preclear could remedy his Havingness with ease.

The auditor would then have the preclear mock up a mass and “Shove it into yourself.” And then: “Mock up a mass and throw it away,” and do this back and forth until the preclear could do this easily and well, at which time the auditor would tell the preclear: “Mock up two masses and shove them into yourself,” and then, “Mock up two masses and throw them away,” until finally the auditor has the preclear mock up eight masses as though they were the corners of a cube around the preclear, and “Shove them into yourself,” and then “Mock up eight masses and throw them away.”

One must remember that in spite of the fact that he cannot duplicate mass actually as himself, having no space or mass, natively, the motto of the thetan is “anything is better than nothing.” When you tear up a lot of facsimiles for a thetan and throw them away, he becomes very unhappy unless you have him reconstruct those facsimiles or remedy the mass according to what he has lost. When you are having a thetan go into and out of MEST universe masses, a certain amount of energy is burned up, and after a thetan has been run for a short time on this step (R1-9 in the “Creation of Human Ability”), one must be particularly careful to remedy his Havingness with eight masses shoved into himself and eight masses thrown away, several times. A thetan who has been run a great deal without Remedy of Havingness comes to what is to him a horrible thought: “I am just a concept”, and he will sag in tone. He does not come to this state as long as Havingness is consistently remedied.

It may be, as one looks at Scientology, that one has come to the opinion, watching Remedy of Havingness work, that all there is to anything is the Remedy of Havingness, that it is all based on the Remedy of Havingness. If one has a preclear shove enough Havingness into his body he will exteriorize in most cases. If one remedies enough Havingness while the thetan is chasing around the universe, as in the Grand Tour, the thetan will discover and as-is a great many communication lines which otherwise might be very detrimental. However, it is not true that Havingness is the entire key to the Human mind. Havingness is the “gimmick” or “weenie” for which the game is played, and having something is very much like winning.

Above Havingness there is Doingness, and above Doingness there is Beingness, and above Beingness there is Communicatingness, and above Communicatingness there is Knowingness, and above Knowingness there is Postulatingness. We see, thus, that we have a long way to go above Havingness in order to get to the top activity of a thetan, which is making postulates or unmaking them.

One could, of course, rationalize each and every action of the thetan with regard to Havingness. One could even extend Havingness to space, although it normally refers to objects. One could do all manner of interesting things with Havingness. One could get as specific and as significant as one likes, or as insignificant as one likes and still find Remedy of Havingness working, but we do not have here, in Remedy of Havingness, the total clue, total key. But we do have a process and an item which must not be overlooked in auditing.

In the Six Basic Processes, the Remedy of Havingness comes after the Opening Procedure by Duplication as a process, itself, but remember that Remedy of Havingness is done and can be done at any time during any other process as long as the preclear is even vaguely in communication with the auditor. It does not matter how vague the mass is that the preclear is using to remedy his Havingness. Here is a place where certainty is not necessary.

An unreal, vague, or flimsy mass, if this is all the preclear can get, will still remedy his havingness.

A case comes to mind out of the Advanced Clinical Course, where a student was unwilling, after his second day, to continue his studies. He did not believe that he could stand the “hammer and pound”, as he put it, of the terrifically intense schedule. I took him into my office, asked him what he was doing in life, and he replied to me that he was a machinist. Also, it seemed to turn out that he had something to do with a ship which had sunk under him, although his recollection of this was very unclear. I asked him what kind of a machine he had customarily run, and he told me. Then I had him mock up this machine, and remedied his Havingness with it. Then I had him mock up the ship and remedied his Havingness with that, just as given above. I did this for about fifteen minutes, and enough change occurred in his case to entirely return his confidence in his ability to stand up to the course and to audit. Yet the mockups he was getting were so thin that he could barely vaguely discern them at all.

Mockups get unreal because the thetan is Not-Ising existence. He is trying to destroy masses by saying that they do not exist, that they are not real. He is so bent upon this system of destruction that he is making everything unreal or black. One of the cures for this is End of Cycle Processing run in the following fashion:

One has the preclear mock himself up dead (no matter how unreal the mockup is). Then have the mockup waste away to bone, and have the bones waste away to dust, and then have the preclear shove the dust into himself, or alternately, throw it away. One once more has the preclear mock himself up dead, have the mockup waste away to bone, have the bones waste away to dust, and then have the preclear remedy his Havingness with the dust. One continues this for two or three hours with the preclear if one really wishes the case to make a change. Where a preclear is getting no reality on mockups or blackness he is most commonly stuck in that Para-Scientological thing, that thing horribly abhorred by psychologists who have become Dianeticists, or by people who are just plain scared, a past death. If you wanted to convince somebody that past deaths exist, you would run End of Cycle Processing on them. This is a cousin process to the Remedy of Havingness. One could go a very long distance with this process and have the preclear mock up his mother dead, have her waste away to bones, and remedy Havingness with the dust, or do this with the dust, or do this with the father or brothers, or grandparents, with a considerable change in the case.

This End of Cycle Processing, by the way, is a very fine process. It has been with us about a year and it has been successful whenever used. It has a tendency to fall into disuse because it has not, until now, had an exact place on the Six Basic Processes. But End of Cycle is actually an additional process to the Remedy of Havingness and is an effective way of remedying Havingness. Do you remember in the old days the Dianetics “Corpse Case,” who would lie upon the couch with his arms crossed neatly all ready for a lily, and would always audit in this fashion? The solution to this corpse case is End of Cycle Processing, as given here. The preclear is so fixed in a death that he is trying to make everything unreal, and the only real thing, to him, would be the unreality of death.

The Importance of Havingness

A careful study of staff auditors’ reports reveals that the only advances worthy of the name of Scientology occur when the auditor repairs or remedies havingness on the preclear. Without the repair and remedy of havingness no real gains become apparent. A preclear will not progress when his havingness is impaired.

What are the symptoms of loss of havingness? Running any as-ising techniques the preclear may become anaten, slightly nervous, agitated, want a cigarette, or seem to break out of the session in some fashion. In either case, he is “down on havingness”. In other words he has burned up, used up, or as-ised, too much of his physical body energy in the auditing itself. In view of the fact that every subjective technique puts a sort of hole in the middle of the

electronic mass surrounding a preclear, parts of that mass then begin to cave in on the preclear. Thus running an as-ising technique on a preclear beyond the ability of the preclear to sustain the consequent loss of havingness will bring on in the preclear many new engrams which he did not have before. A technique which as-ises energy, if used without a repair or remedy of havingness, will bring about a worsening of the case of a preclear.

Now exactly what is happening is very simple. A preclear starts to go anaten and the auditor keeps on running the process. He hasn't realised that he ought to interrupt a process at any time if the preclear demonstrates a loss of havingness. Anaten is such a demonstration of loss of havingness. All right, another example: the preclear becomes agitated or upset; he reaches for a cigarette; he begins to twitch; his foot begins to wobble; he begins to talk excitedly; he begins to cough while being audited. All of these things demonstrate a loss of havingness. These same conditions by the way, can result from the preclear believing that the auditor has broken the auditor's code in some fashion or has overcome his power of choice. Both a repair and remedy of havingness are immediately indicated on the observation of anaten or agitation on the part of the preclear. In addition the auditor should carefully go over the session itself to find out, if anywhere, the preclear believed his power of choice was being overcome, or if the preclear believed the auditor's code had been broken. You understand that the auditor didn't necessarily have to overcome the preclear's power of choice or break the auditor's code in order that the preclear should believe that this had happened. However, this could be overlooked entirely if the auditor had been careful enough to repair or remedy the havingness of the preclear.

The slightest drop of alertness on the part of the preclear, or the slightest agitation or somatic, should immediately indicate to the auditor that havingness has dropped and must be immediately repaired or remedied. A great deal of time can be spent on the subject of repair and remedy of havingness, and it is time spent with great benefit. It is better to "waste" time spent repairing and remedying havingness than to blunder on through. Now there is another thing I have noticed with regard to this. Auditors are running these days toward cognition. Very well, if they expect a preclear to cognite they should not expect him to pull in a bank upon himself. If an auditor runs a very obvious process which should bring the preclear toward cognition, runs it several auditing commands and then stops and repairs and remedies the preclear's havingness, and then after that asks him the same auditing question two more times, he will discover that he has blown a cognition into view. In other words you could remedy the havingness of a preclear while his mind was on one particular subject and bring a cognition into existence.

This becomes particularly important today, since a few months ago I discovered that you could remedy the havingness of anybody, and I mean just that!! You can remedy anybody's havingness and you can turn on mockups on anybody. In view of the fact that the preclear who has a black field can be caused to mock up blacknesses or invisibilities and shove them into his body brings us into an era of being able to make anybody turn on mockups. By getting the preclear to postulate that the mocked up blackness is bad for the body, will cause that blackness to snap into the body. By getting the preclear to postulate that the invisible mass he has mocked up is bad for the body it will snap into the body. Of course, after this has been done a few times, the consideration of the preclear will change. Then perhaps the blackness or invisibility will only snap in when the preclear postulates that it is good for the body. He may also have a residue left. It is very important to get rid of these repair and remedy of havingness residues. By various postulates such as that the residue is a threat to the body: it is good for the body; it is bad for the body, the residue too will snap in.

Let's differentiate at once here the difference between a repair of havingness and a remedy of havingness. We used to call repair of havingness "giving him some havingness". It needs a better technical term. Therefore let us call this "Repair of Havingness". It means having the preclear mock up anything he can mock up, and in any way it can be done get him to shove (never pull) that mock up into the body, and by similar means to get rid of the residue which went along with the mockup. That is a repair of havingness. It is a one-way flow; it is an inflow.

Now a remedy of havingness is getting him to mock up and shove into the body enough masses to bring him to a point where he can eventually throw one away. In other words repair or havingness is simply having him mock up things and have him shove them into the body and a remedy of havingness is having him mock up and shove in and throw away the same type of mock up. Remedy of havingness is always a superior operation to a repair of havingness. Repair of havingness is a very crude stopgap, but can be used any time. However, a preclear who is working well, and on whom havingness can be remedied, should, at all times, have his havingness remedied, not repaired. In other words any type of mock up should be both shoved into the body and mocked up and thrown away. This should be done in considerable quantity until the preclear is quite relaxed about that particular type of mock up. One does this, remember, every time the attention of the preclear drops, or he becomes agitated.

There is one other little point connected with this which is quite important, and that is auditors very often audit a preclear into an area of time when the preclear exteriorized. This, on a preclear who does not exteriorize easily, brings on a considerable grief and sadness. The way to get rid of this is, of course, to remedy the preclear's havingness or only repair it, and to ask the preclear to recall times when he was not exteriorized. This will bring up at once times when he did exteriorize and where fear of exteriorization was built up considerably.

I have noticed another special condition regarding this exteriorization phenomena which is quite important. A preclear will occasionally repair and remedy havingness up to a point where the body disappears for him. He doesn't quite know where to put the mass he has mocked up since he cannot find the body. This is particularly true of preclears who have a very low threshold on havingness. An auditor would be stupid indeed to simply plow along beyond that point where the preclear has already said that he couldn't find any body to push any havingness into. The moment the preclear does that the auditor should suspect that the preclear has gotten into an exteriorization type incident. It is not, however, necessary that he immediately flounder around and try to find this incident as recommended in the paragraphs just above. He can also repair and remedy havingness in this fashion, and it is very important to know this. Although it is disastrous for a preclear to be asked "What could your body have," since he will simply strip the bank of various old facsimiles, it is a very, very good repair of havingness to ask a preclear "What is there around this room (area) which your body could have," and then have him pick out specific objects in the environment which he says the body could have. If he does this he will come up the gradient scale of havingness, and his havingness will be repaired immediately or directly on the Sixth Dynamic. A preclear who cannot get mock ups and where the auditor has either been too clumsy to get the preclear's mock ups turned on, or it really was impossible, more or less, the preclear's havingness can be repaired by having him do this process. So this is a very, very important process, and one that ought to go down in red letters.

This whole subject of repair and remedy of havingness and its effect upon auditing, and the fact that it has not been stressed at all in training, being up there at level six in the old Basic Processes, brings us to SLP Issue 8. The entirety of level one in SLP 8 will be devoted to the repair and remedy of havingness.

In SLP Issue 7 we have a great many phenomena associated with the remedy of the body's havingness. The reason for their position is to bring about an adjustment of the condition of the body before one goes on to other and more complicated ways of processing. Now, in Issue 8, all of these various things will be retained, but they will be paralleled with a complete remedy of havingness and that particular level of SLP will be gone over. In actual experience it is better to remedy the havingness of a preclear, no matter where he is on the tone scale, and no matter by what process, than to run any significant process. Further, if a preclear cannot at least repair his havingness, to run Waterloo Station is to invite disaster because in this particular process of level 2 he is liable to get himself into a "down havingness" situation and of course will not be able to not-know anything. He may be chewing up too much energy or trying to not-know. Thus we would have the failures which have occasionally occurred in

Waterloo Station. They were simply havingness failures, not a failure of Waterloo Station. Further there has been a new command suggested for Waterloo Station: "What would you be willing to not-know about that person?" This seems to be a better command, at least for the British Isles.

We also take care of the vacuums and separatenesses and everything else with repair or remedy of havingness and running it in with certain other things, such as problems, etc. When we discover by two-way communication a weak universe, we could then ask the individual preclear "Invent a problem that person (weak universe) could be to you." Then, watching him very carefully, and repairing his havingness on the subject of that person's possessions, get a very rapid separation of universes. I have noticed that the weak universe came about when the person elected by the preclear to be a weak universe first began to put mest anchor points around the preclear. In other words, valuable presents. I am as pleased as can be to get a finger on this point and I know well that if east, west, north and south, would begin to repair and remedy havingness, and stop specializing in significances, without repair or remedy of havingness, we are going to start shooting people up to the top of these Scientometric graphs. We can't help it. Let me call your attention specifically to the old phenomena of the emotional scale and the engram. We find out that when one engram was keyed in it fixed the emotional tone of the individual. Then we had him run this and as he converted the engram to usable havingness, we found that his tone rose. We discover on these Scientometric charts that the "unhappy" section does not move if we don't change the mass of the preclear.

Sacrifices

The latest news from the research front has to do with the fact that the GE demands and requires and has to have, evidently, sacrifices. The GE does not run on an overt act-motivator sequence, which makes one suspect he is not a thetan. A GE runs exclusively on being sacrificed to. If you have the preclear mock up sacrifices to the GE, you will find these become very readily assimilated. On a lower level the body accepts motivators; as soon as it is through this motivator band, it accepts sacrifices and finally comes up to a point where it will accept live bodies. When one considers that eating is entirely a matter of absorbing death, one sees this death hunger in processing by running Sacrifices. A person who has had bad legs should have a sacrifice of legs run on him and so forth. This is astonishing material. It is almost unbelievable that the GE will not be sacrificed to anything, but will only be sacrificed to, and this phenomenon that the GE is thereby demanding death tells us at once that the Atomic Bomb will be used and that there are people in the world who will actually crave this sacrifice of cities and even nations. Aside from being a fantastically workable process, more of which anon, this matter of sacrifices tells us at once a great deal about the future. There will be no moral restraint where the Atomic Bomb is concerned. For about the highest level in some areas of the world is, to case, "operating GE." This tells us, too, why soldiers will go to war. This explains a great deal of conduct. The GE evidently operates on the postulate that as long as anything else is alive it can't live. However, it is becoming more and more doubtful that there is any more life in the body than the thetan puts there, and that the body is a single machine operating on some implanted postulate contained in the energy masses which are activated by the thetan somewhat on the order of the old "pole" theta trap. Many of these considerations can be changed around rather easily. Nothing changes them quite so fast as these sacrifice processes. In mocking up sacrifices the auditor should use all the skills of creative processing and ensure that the preclear is actually mocking up and is not dragging in old facsimiles from the bank and restimulating genetic line incidents. This can be obviated by having the persons in the mock ups dressed in modern clothing; mocking up the incident as happening tomorrow; altering the mock up in some manner, such as turning the face green or something of this nature. Any reasonable way in which you can ensure that you are dealing with mock ups and not past track facsimiles.

This gives auditors another tool with which to handle chronic somatics.

There is another process which has a great deal of workability with chronic somatics. I know that some months ago and earlier than that it seemed rather fatal to us to continue to fixate the preclear's attention on the chronic somatic. But that is not a problem with us right now. It

ceased to be a problem the moment I invented an auditing command exactly as follows: "Invent a problem that (leg, arm, nose, eye, body) could be to you." Running this command, which is in itself a sort of remedy of havingness, and repairing and remedying the havingness of the preclear as we go, we will discover that practically any and all phenomena associated with the service facsimile will come away and clear up and the limb, nose or eye will get well. This can be used as a word of warning: **ONLY ON ACTUAL TERMINALS**. Never use this command, and I mean **NEVER**, on actual conditions. Never ask him to invent problems lameness could be to him. Never ask him what problem blindness could be to him. Lameness and blindness are conditions. We want to know what problems legs or eyes can be to him, since legs and eyes are terminals. In running this command we reduce havingness too rapidly whenever we are stressing conditions. Therefore we run it only on terminals. In running it use only terminals. Handled in this way we do have the answer as of this moment, to chronic somatics. With these processes in SLP and the adequate repair and remedy of havingness we can push our preclears right up through the top.

L. RON HUBBARD

5212C01 PDC-1 Scientology -- How to Understand and Study It

Homo Sapiens is a four part entity:

1. thetan
2. body
3. thetan machinery
4. reactive/somatic mind

The PC is what you are working with, and he is a non-dimensional point in space who is an energy production unit.

Definition: Spacation is a process having to do with the rehabilitation of the creation of space. A second meaning is that spacation is the subject of space. This is above the subject of energy.

It is a dirty trick to make a person into a theta clear without giving him data about it. He knows this data potentially, but is not aware of it. If he knew about it, he wouldn't be in the MEST universe. This subject is the anatomy of universes: the construction, maintenance, and destruction of universes of different kinds and dimensions. The study of the basic structure and experience called the MEST universe is a basic one. The laws of the MEST universe, or "natural laws", are the inevitable average of agreement. Starting with the study of natural law, we get to the study of that which made natural law: that thing capable of making agreements which become natural law. In auditing a PC, you are undoing the agreement that makes him a part of the natural law. $E=MC$ squared probably wasn't true 30 or 40 trillion years ago in Arslucus, where the PC spent 10,000 lives working at the same job. Arslucus got bigger and bigger. It was just built out in space. One day, people got the idea of mass, agreed to it, and got careful about it. Arslucus blew up and everybody was glad to see it go. At this point, the law of gravity was widely agreed upon.

There is a natural tendency to push out of the group those individuals who don't agree with the group. Thus a person who thinks that the MEST universe is his universe gets sent to the spin bin. In Scientology, we are not trying to disagree with the MEST universe; we are just taking it and making it appear and disappear at will for any individual. Every now and then a PC in processing gets an uneasy feeling that there's some thought he doesn't dare think. He's coming up against agreement and doesn't want the responsibility of undoing it because he can't handle that much energy. If you could get him to where he could handle the energy, he'll face the thought. Probably all that would happen is that the MEST universe would momentarily disappear for him. Then he'd fish around to get an orientation point to get back into it. You just have to know how to handle space to get into and out of the MEST universe.

People use the old energy of the MEST universe instead of creating stuff from scratch. They hang onto being identities, using bodies like ID cards, instead of being individuals. This does furnish randomness and provides emotions that one can pretend to be the effect and not the cause of. The identification card permits the individual to make a living so he can feed the ID card!

The Tarot is a philosophical machine, preserved as playing cards. These cards represent concepts of human experience. Thus, for instance, the Fool could represent a person at 45 on the tone scale. Such a person would have passed out of agreement by knowing all agreement.

The sequence of events relating to agreement with the MEST universe is:

1. Agreement.
2. Agree or else

3. We don't care if you agree; we are going to punish you anyway.

4. Below agreement: a not-is of agreement.

MEST is in complete confusion of having agreed to everything, owning and controlling nothing.

Society builds into people a conditioned social tone. One has the tone level of one's society as a being + body combination. That's the tone level a PC's bank will have, the tone of his facsimiles and ridges. As a being one has a different tone level.

One cannot study scientology from the point of view of any other system. One can only study it by looking at you or the other people you know, applying the definitions and seeing what is or isn't there.

scientology consists in the study of:

1. Progressive examination of the agreements that came to bring about the MEST universe.
2. The science of how agreements are made.
3. What are the beings that make these agreements?

Child Scientology

L. Ron Hubbard

Save the child and you save the nation.

If, in the course of the next fifteen years, Scientologists were to specialize in the group processing of children, it might well follow that all of the goals of Scientology would thereby be realized. Thus, by processing children between the ages of six and ten, we would achieve in fifteen years a sanity and alertness never before obtained in that portion of the populace between the ages of 21 and 26, the age bracket which contains the energy and influence most strikingly felt by a civilization.

Child Scientology could very well be, in terms of practice, the most important single field of endeavor in the science. So used, without other addresses or assistances, Scientology might well bring about the condition of world peace—even if only by eradicating, through the restoration of sanity, the enthusiasm of youth for the sham glory of war. Therefore, we address here a subject which is broader than “what will I do to cure Johnnie’s sneezes.” Whether or not we are interested in those sneezes, whether or not we have tolerance or intolerance for children, whether or not we care to give time to the problems of child adjustment and sanity, each of us who has a vested interest in the continuation of Earth and of Man should be willing to invest some of his industry in the investigation and application of the group processing of children.

Hence, this article is written, not to those who are interested in children, not to those who have family problems, not even to those whose duty it is to instruct children, but to anyone interested in the goals of Scientology.

In order to utilize Scientology in the attainment of the goal of a sane stratum of the populace, do you need special training? No, not beyond the contents of this article and a knowledge of the book *Self Analysis in Scientology*, a simple text.

What passport do you need to help children? None.

What recommendations, papers, figures, historical documents, statistics, and other buffoonery do you need to assist children? None.

Is there any lack of groups of children? No. Where are groups of children to be found? In schools, in hospitals, in orphan asylums, in children’s societies, in boy and girl organizations such as the Boy Scouts, in the YMCA’s, in Sunday Schools, and anywhere that interested people forward the battle to prepare the child of today to become the sane adult of tomorrow. There has been a gallant struggle in the face of almost insuperable odds. It is time these people had some help.

Historically, child therapy has been as difficult as it is now simple.

Let us be very blunt—we are not interested in the problems of the child’s mind. In Scientology, we are no longer concerned with the inopportune and conceited short-circuit between epistemology and the human brain which has resulted in the “science” of psychotherapy. The Scientologist practicing with groups of children should disabuse anyone in authority of any lingering thought that the Scientologist might be using psychotherapy. The concern of psychotherapy is with the thinking processes of the human brain. The concern of the Scientologist is purely with the beingness of the child, which is to say his spirit, his potentialities, and his happiness. A Scientologist working with children, who permits himself to be led into arguments concerning psychotherapy is permitting to exist and be part of the

argument the erroneous concept that gains in learning and behavior are attainable through a rearrangement, by direct address, of the physical habits or fears of the child.

It is possible to reform a child's attitude toward existence by working with his mind. The best results in the field of psychotherapy were obtained by Dianetics, but even prior to Dianetics, many child psychotherapists had obtained considerably improved attitudes and behavior on the part of children by directly addressing the individual child and forming with the child a personal friendship which opened the child's interest sufficiently to permit an awareness of the existing conditions of present time. This was possible because the child's awareness of present time could be suppressed by incidents which, having force and stress contained in them, sought to represent in themselves that they were present time. But this does not say that the optimum results are obtainable by this process of addressing the past in order to heal the present. Psychotherapy could be said to be a series of processes by which the past is addressed to remedy the present or by which physical matter, such as the human brain, is rearranged (as in a prefrontal lobotomy) in order to inhibit odious conduct in present time. The 500 or 600 percent gains obtainable by the application of Child Scientology to groups of children are not obtainable by addressing the past to remedy the present.

Scientology increases the beingness and potentialities of beingness of the child in present time in order to secure the capabilities of the child in the future. It does this by exercising the capabilities of beingness of the child, and is about as closely related to psychotherapy as penmanship might be, or, for that matter, any other subject in the school curriculum. Thus, no one can reasonably object, on the grounds that psychotherapy is being practiced, to the education of the child in present time so as to fit him for his future.

It will be very difficult for the Scientologist to keep himself from being led into this snare, because tests in child psychology on those in his group will indicate that their reading ages leap under this process, that children who have never been able to master even rudimentary subjects begin to learn, and that behavior which, in the past, has been highly lacking in good order and discipline turns markedly for the better. These and many other advantages to be gained in the application of Child Scientology to groups of children cannot be classified as psychotherapy simply because they attain the goals of psychotherapy. Because a thing obtains the goals another thing hoped to obtain, is no reason to assume that the two are identical. This obtaining of goals was never accomplished in terms of groups by psychotherapy, and, indeed, psychotherapy never attained these goals—even on individual children. But that person who immediately proclaims that we now have child psychotherapy simply because we have Child Scientology is making an extremely bad error in thinking and in semantics.

Significantly, camping out, hiking, hobbies, and excellent and personable group leaders have obtained results similar to these, down through the ages. But one does not classify these as psychotherapy. What we have done in Scientology is render available to those in authority over groups of children the means of procuring results of magnitude in the absence of highly personable instructors, camping out, hobbies, individual attention to the child, perfect home life, and other intensely desirable but very scarce commodities. Any expert in the field of child study can inform you that it is possible to take any child and, by giving him enough time, improve him. Parents can tell you this. Anyone, in short, could have gotten results from a child by sufficiently devoting himself to the child's interests. When one realizes that this might consume dozens or thousands of hours per child, one sees immediately that without the fundamentals of Scientology the mass resolution of the problems of children is impossible. The question has been "How do we do it without devoting this special time to each and every child, since it is not possible to devote that time?" The answer, of course, lies in the fact that a group of 30 or 500 children simultaneously can be given Child Scientology by one untrained person, and that these children will accrue the various gains to be realized in the past only by individual address and interest.

What is the process given to groups of children?

Taking a copy of *Self Analysis in Scientology*, the instructor, the Scientologist, the scout leader, or other person, delivers to the assembled group imaginary scenes to envision. The children envision these scenes, one after another.

The imaginary scenes are taken from the lists found in *Self Analysis in Scientology*. They are selected and re-formed from these lists in accordance with the ability of the children to understand them.

This process is continued for about 20 minutes per day. It may be continued for as short a time as three weeks for any group of children with excellent results, but, more optimally, may be incorporated permanently into their routine activities.

The Scientologist will discover in his first session that the children in the group divide roughly into three classes: (1) those who cannot get any mock-ups at all, (2) those who get them too fast or too slow, and (3) those who get them well. He divides his group into three sections. He gives processing—as described above—to each of the sections, processing those who cannot get mock-ups the most, and processing those who are too fast or too slow slightly more than the third group, which is given the continued routine processing. Ordinarily, it will be found that the three groups will assume a parity in a short time, and so can be continued as one group.

The person delivering the lists must know that he should not give special attention to individuals in the group simply because these individuals are having trouble, for this would mean to each child in the group that he or she would have to have trouble so as to get individual attention.

The instructor must also know that the children often become quite active, dramatic, and emotional when they do this process, for they find it a great deal of sport, and, in the case of a school, he should be prepared to have complaints from adjoining rooms, should he be so unwise as not to arrange for a suitable period of the day for processing.

The instructor or Scientologist should know that a child will occasionally “boil off.” This, as a manifestation of unconsciousness, is very mild, and simply means that some period of the child’s life wherein he was unconscious has been slightly restimulated. He should know that all he has to do to arouse the child from this state is to have him remember something that is real to him, a time when he was in good communication with somebody, and a time when he felt that somebody loved him.

The person applying the lists should also know that he should not rebuke, criticize, evaluate, or tease the children because of their mock-ups or their troubles with them. He should also know that he must not evaluate these mock-ups or try to interpret them as dreams, since whatever relationship they may have to dreams and regardless of how fascinating they may be, their interpretation will reduce the effectiveness and ability of the child. In fact, their evaluation for the child is actually destructive to his pride and beingness, and such interpretation not only has no part in his processing but is expressly forbidden as being intensely harmful.

What else can be expected immediately?

A small percentage of the children will not respond at all. A small percentage will become worried because of the activities and noise of the other children. A small percentage will be unchanged, though responsive. The remaining 75 or 85 percent will advance variously in their intelligence quotients, their behaviors, and their personal abilities (in particular, their ability to learn).

By experience, no disabilities will occur because of this process, excepting those which are occasioned by sudden upsets in home life or by reason of teasing or evaluation on the part of an applicator.

By all standard tests of learning ability, reading skill, differentiation, and so forth, it will be discovered that the group, as a group, has progressed very far beyond what anyone has ever had the right to expect from the application of any form of child improvement. This should not be labelled a wild claim; it is rather a sober fact which is based upon very wide, careful testing and observation under many differing conditions, under many types of instructors, and under many groups of children.

Quite incidentally, and certainly of no great interest except that it makes good telling, psychosomatic difficulties, perception inhibitions (such as stuttering), and various other disabilities, the correction of which is classed entirely in the field of psychotherapy, have a tendency to deintensify or disappear in the child who is part of a group undergoing this processing. Such improvements—no matter how dramatic they may be—are not the reason why this processing is given to the group, but instead are simply an added bonus, and entirely a by-product. Indeed, it is a rather grim joke that Scientology so employed and without

direction toward the release of such ills, does rather routinely what medicine has been unable to do. It is of no great concern to the Scientologist that this happens. Certainly, he does not want to prevent it from happening, but he must not lose sight of the fact that he is not processing a group to make it happen. He will be given his greatest thanks as a result of such cases and his benefits will be measured by them, but this should not turn his head from the main goal of the process, which is to make a group of able children far more able. Parents, for instance, who have spent thousands of dollars on little Johnny's asthma, discover one day, after he has been part of such a group for some time, that he is no longer troubled with asthma. Further, it is doubtful if he will ever be troubled with asthma again. Parents presented with such evidence have a tendency either to become angry or to be grateful, depending upon their level of sanity.

The group auditor is not there to cure, heal, repair, patch up, treat, advise, counsel, or otherwise to mend children. By definition, the group auditor is one who works to create a new state of beingness in a group of people by the administration of lists prepared by the H.A.S. or himself. It should be clearly understood that we are attempting something which has never happened before. We are achieving a state in people which has not previously existed. We are taking another step forward with Man. We are not trying to bring children back to normal, nor are we trying to remedy existing conditions. We are factually striking out to attain a level of culture and civilization higher than those attained before, in which we include any period of any nation anywhere. The group auditor has about as much relationship to psychotherapy as a stonemason at work on a new city has to the proprietor of a junkyard. The group auditor is not working to return children to normal. They have never been other than they are and, in the absence of what we know now, never could have been what we hope them to be. People who try to classify the group auditor as one who is making children normal by treating them are actually insulting the group auditor. In the absence of Scientology, or whatever it would have been called had it been discovered in the past or future, such repair work was the best that could be done. The attainment of gains by the eradication of something differs considerably from the attainment of gains by the creation of something. All processing in Scientology today is positive-gain processing and is, in fact, creative; the work of the auditor is creative whether he is working on an individual or a group.

The special problems of individual children which confront the group auditor should be referred by him to a professional auditor, or handled by himself as a professional auditor providing he is trained in that capacity. Therefore, parents or interested persons desiring special consideration for individual problems should be directed elsewhere by the group auditor. The group auditor's interest is in terms of mass production. He is creating with his work a new state of beingness, a new type of childhood.

This is a state that is desirable not simply because it contrasts with former states, but desirable because it means a better civilization or perhaps one might say, a civilization.

What theory underlies this?

The group auditor needs no more theory than that contained in this article and in *Self Analysis in Scientology* to succeed in his work. Indeed, he need not even have a solid grip on that much theory for the process to work for him. However, in the absence of background data, many things may strike him as strange or unexplained, and, lacking the data, he may believe himself to be dealing with an imprecise thing and so wander off course. Thus, the best group auditor would be the one who is best founded in theory and who is a professional auditor as well. The next-best group auditor would be one who has studied this article and *Self Analysis in Scientology* and who has attended the tape-recorded lecture course consisting of six hours of lectures on this subject, which is available at the H.A.S., at associate offices, or as reels from the Publications Section of the H.A.S.

Although this is apparently very simple—that we just get a child to imagine something and the child is then better—and although people will occasionally try to tell the group auditor that it has been long known that creative imagination plays a considerable role in the life of the child, yet mock-up processing from prepared lists is based upon fundamental precisions which are quite invariable.

With much too much simplicity, it can be stated that here the imagination is being utilized in such a way as to bring it under the control, direction, and self-discipline of the child. The knowledge that we are not actually dealing with imagination as it has been classified in the

past, and that in reality we are dealing with quite another function—namely, clarification of the role of imagination—at least makes one feel himself conversant with what is happening.

In mathematics, even in that pallid thing called arithmetic, it is necessary to observe and realize the existence of a problem and the factors of the problem, and to combine these to predict an answer. In the entire field of life, it is imagination which delivers answers. If one cannot imagine he cannot predict. The factors of life are more complex than the factors of arithmetic, but they do not differ so far as mental functioning is concerned. There are simply many more of them. One can teach a child by rote that two plus two equals four, but many an instructor and many a parent with the fondest hopes for the future of a child have, after the child's education was complete, discovered that the child either cannot or will not utilize the data to resolve problems in his own existence. In such a child, the ability to imagine the answer by recombining existing factors has not been developed or disciplined. Many an engineering school has been embarrassed by turning forth honor graduates who yet failed dismally in the reduction of rudimentary practical problems to workable solutions. Even a thing as apparently precise as mathematics yet requires, in the good mathematician, an enormous amount of imagination. In general, symbols and figures, statistics and data, serve only to assist the functioning of the mind in a solution of problems. These are at best crutches to be utilized by an active intelligence. The mind is always the servo-mechanism of mathematics, a thing which even the better mathematicians are apt to overlook. Thus, when we are trying to teach a child, whether to be proficient in geometry or in handling his body, we must teach him as well to predict a future state of beingness; if he cannot predict a future state of beingness, he cannot resolve problems. As a statement, the phrase "prediction of a future state of beingness" almost encompasses the function of the human mind. Prediction of beingness is somewhat different from simple prediction. It is not necessary to have pictures to tell one what is going to happen, but it is necessary to have the potentiality of imagining what is going to happen to accurately assess a situation.

Thus, it may be seen that the inhibition of the imagination of a child directly results in the inhibition of the child's ability to resolve problems relating to his own environment and his own life. This nullification of imagination should not exist; however, the individual should be able to utilize this imagination, and the imagination should be under the discipline of the individual. A good instructor realizes that it is the discipline of the student's mind by the student himself which accrues to the student the benefits of education.

The discipline of the imagination is essential in any learning process. The infant and the child are peculiarly prone to utilize their imaginations in such a way as to make their imaginations utilize them. Their imaginations are not wild; they are simply not founded upon fact and are not correlated with the existing state of affairs. At night, the child is hounded by nightmares and delusions; by day his imagination conjures up for him images based upon factual and unimportant data of his environment which frighten and inhibit him. He is given to believe, then, that there is some hidden thing in his vicinity which is inhibitive to his further survival. Delusion is imagination out of control. The control and discipline of imagination and its employment for the artistic and practical gains of the individual would be the highest goal of a training process. There have been great instructors in the past, great teachers who could lead their students forward by their own personal magnetism. Their effort was centered upon giving the student into his own hands, and this was accomplished by causing the student to desire to discipline his own beingness. However, the discipline of beingness is not necessarily the limitation of beingness. It is better to be able to decide and control a few things to be, than to be under the whip of an imagination which drives one to be a great many things, none of which are under one's control. These processes, then, aim directly towards disciplining the imagination and bringing it under the control of the individual child.

Throughout the day, and every day of his life, the child is told that things do not belong to him. If he is given a pair of shoes, he is informed that they are not his shoes by the first command from the parent that he polish them. In the case of nearly all children, even though they seem to have possessions, they themselves do not believe themselves to own anything. Their bodies, their minds, their toys, their clothes, their habits, their mannerisms, and their likes and dislikes, are all under the continuous impact of the MEST universe and other intelligences. There is something, however, which a child can own—an image which he creates himself. In fact, he will only attain to those images which he does create for himself, because, in his opinion, any attempt to reach images created for him by others (particularly by duress) is

antipathetic to his survival. At every hand he is driven from possession and driven from beingness, for the child can possess only those things which he feels free to be.

The creation and control of mental images performs another function in that it utilizes and disciplines energy. In creating mental images which he then controls, the child discovers first that he can own something, next that he can control something, next that here is something he is free to be, and next that he has control over mental functions. Dignity and purpose are native to the child; badness and uncontrol are not. Thus, by envisioning images the child comes into possession of his own beingness and is convinced that he is free to be something. The change which comes with this realization is not an ultimate or absolute thing, for there is a gradient scale of beingness and there are always new heights above any last plateau reached. This is a gradual and continuous process, this creation of beingnesses (or, symbolically, mock-ups), and the process continues in any phase of life so long as the person has life in him. The direct attack on this problem by the use of mock-up processing results as one would expect; it brings the child under his own discipline and makes him capable of being what he wants to be, not what he is forced to be. At the same time, it renders him less reactive toward disciplinary actions undertaken for his own good and toward educational measures which are provided for his future security. Acceptance will be found to replace resentment of education.

The goal of an instructor is to instruct. There is an old story about the Rough Riders, a regiment in the Spanish-American War. Their most famous exploit was the taking of San Juan Hill, yet there is an incident in this which is worthy of our notice. The orders of the day were posted and stated explicitly that they were to "jump off" from El Caney at five o'clock the following morning and were to take San Juan Hill.

The Rough Riders awoke at 4:30 a.m. to discover that one small thing had been omitted from their plans: they had, as yet, to take El Caney. Thus, before they could execute their orders they had to assault and take another objective, which they did take with severe losses, and from which they finally carried out the main assault, many hours overdue, again with enormous casualties. Thus it is that a military organization can suffer frightfully from trying to fight one battle when another has to be fought first. The instructor is supposed to educate children, the camp leader is supposed to entertain them, and the hospital nurse is supposed to make them well. Yet, standing as an obstacle before each one of these and any other individuals attempting to handle children, is, in actuality, the lack of a child. Bluntly, the child is not there. He is sitting in the classroom but his mind is elsewhere. He is in the hospital as a body, but is maundering about the scene of the accident which sent him there. He is supposed to be having a good time in camp, yet he is actually at home playing with his dog. Any attempt to work with a child is an attempt to contact and get into communication with the child. Unless one can get into communication with the child he cannot perform his duties as pertain to that child.

The task of communicating with a child does not begin with talking to the child. It begins with finding a child to talk to. There are many tricks which lead a child's interest sufficiently into present time to allow one to communicate with him. Anyone dealing with children knows that this is the primary problem in that task. But it is a very terrible strain trying to maintain the child's attention in present time while one communicates with the child. If one had a process which made it possible for the child to be in present time and to get him there easily, that process would, of course, be very welcome to the child. The group processing of children, or the use of the same process on an individual child, is a workable answer to this problem.

There is no reason to go back into the past after the child (as in psychotherapy) if one has a modus operandi to bring the child into the present. You certainly would not actively go after things which easily came to you. Application of these lists in this fashion to groups of children brings them into present time, and thus to their instructor or leader. Consequently, once he has used it, an instructor finds this processing as necessary a part of classroom activity as ringing the school bell. It is one thing to get the body into class; it is another thing to get the mind into class. The instructor is being paid to instruct, but before he can instruct there must be somebody there to be instructed. This is terribly elementary, but it is a problem which has been overlooked, and it is a problem which, in many cases, has made education an arduous process. Children in present time are very easy to look after, very easy to instruct, and very easy to live with. Children out of present time, bent on revenge, and fresh from a quarrelsome breakfast table in an antipathetic home, form a noisy and rebellious group. The behavior of a child out of present time is not easily predicted, and this unpredictability is a considerable strain to the

child's leader. A child out of present time walks off the curb into heavy traffic, falls down fire escapes, gets hit with gymnasium equipment, hurts himself in games, and causes those multitudes of upsets which make the life of a child shepherd an onerous one, at times.

The problem of the parent in the home is no different from the problems of the instructor. The continual nag-nag-nag necessary with children is occasioned solely by two things: one is that the child has no real understanding of his role (for it has never been explained to him) and so has no beingness in the house as part of the family, part of an economic unit, or part of a work team; and the other is that the child is not there. The more one corrects and punishes the child, the less the child is there, since, in essence, correction is "go back into the past and pick up punishment data to remind you that the future is going to be unpleasant."

The process of mocking up is peculiarly suited to children, for in the main they possess brilliant ability. An adult preclear is filled with envy at the ability of a child to obtain mock-ups and control them. The time to salvage a human being and get him out of the past into the present time is when that human being is a child, for he thus benefits most from his environment and all his education within it. Out of present time, the data and experience are going nobody knows where.

All the theory one needs to know in order to apply Child Scientology to groups is contained here. There is a great deal to know in addition to this (although almost all of it is as simple) and it should all be known before much individual work is done on a particular child. This, however, will suffice for groups.

What is a mock-up?

A mock-up is not a mental image but an additional beingness. One is afraid and troubled by those things which he cannot be but must fight. One's effort is mainly expended in fighting shadows in the belief that these shadows are things which one must not be or cannot be. The limitation, rather than the increase, of beingness is the common course of existence. One finds out "by experience" (most of it incorrect) that he cannot be a great many things. His ability to be is also his ability to communicate, for the things which he is are those things which demark the amount of space he can occupy.

A mock-up, then, is more than a mental picture; it is a self-created object which exists as itself or symbolizes some object in the MEST universe. It is a thing which one can be. One can be it because one can see it. Those things which one cannot see, he cannot see because he cannot be them. In terms of human experience, beingness is space. Space is a viewpoint of dimension. The points which mark an area of space are called anchor points, and these, with the viewpoint, alone are responsible for space. The creation of anchor points, then, is the creation of space, which is, in itself, the creation of beingness. The essential in any object is the space which it occupies. Thus, the ability to be an object first depends upon the ability to be the space which it occupies.

When one puts out pictures which he himself creates, he at once demarks space and occupies, with his own creation, an area of space. Thus, he knows it is safe to occupy this space. Thus, he knows that he can be that space. Thus, he can be that object. It does not follow that he is that object simply because he creates that object, but he has assumed by its creation that there is a new thing which he can be and a new space which he can occupy.

A mock-up, then, is a picture, preferably in full color, with three dimensions and in motion. There is, however, an astonishing variety of disabilities connected with mock-ups. The mock-ups of one individual are flat, those of another have no color, and yet another gets them only on the far side of a black curtain. Some mock-ups have no motion in them, and some have too much. The term "mock-up" embraces all these conditions.

"Mock-up" is derived from the World War II phrase which indicated a symbolized weapon or area of attack. Here, it means, in essence, "something which a person makes up himself."

The mock-up actually contains energy and mass. It occupies space. It should be under the control of the individual.

A mock-up differs from a delusion in that in order for a thing to be a mock-up, it must answer three conditions: (1) it must be created by an individual, (2) he must know that it is his, and (3) he must get it under control so that it does not do things unless he commands it.

A mock-up can be of anything, and it can be located in any direction or at any distance from the individual creating it.

The ability of an individual to get a mock-up is an index of the individual's distance from present time. That person who gets very clear, brilliant mock-ups which are definitely under his control and which do not perform erratically without his consent, is in present time. This graduates on down to an inability to get mock-ups of any kind, which means one is very far from present time.

One can generally establish the quality and character of a person's mock-ups, and, consequently, the distance of that person from present time.

How will other factors in the child's environment affect this process?

The child who is a member of a group can be expected to have many factors in his environment which are antipathetic to his best survival. Such things as quarrelsome homes, lack of parents, and physical disability, all occasion problems for the group member which are beyond the scope of the applicator of these processes. Children who have special problems need special processing. This does not mean, however, that these special problems would not be alleviated in greater or lesser degree by the child's being a member of a group which is being given Scientology. Many remarkable gradual or sudden recoveries from disabilities, as well as adjustments to antipathetic surroundings, have been noted and logged when these techniques were in their experimental stages, but such recoveries or adjustments should not be expected of the process.

A child who receives Scientology as part of the group can be expected to cope better with those problems which are assailing him than he could in the absence of Scientology; just as a child who is poorly fed at home can be expected to do better if he receives a hot meal in the middle of the day at school.

Invalidation of the benefit he might get from group processing might be given the child by a neurotic parent. One case has been noted where the child returned to the group after a short absence and was unable to get any mock-ups of any kind whatsoever. It was discovered, however, that as the work progressed without any further special attention than noting the child was suffering from a sudden disability, the ability returned. The parental admonition, in other words, had no lasting effect upon the child. It might be a matter for caution on the part of the applicator not to discuss the process with the parents, although this would be rather an extreme measure, taken to prevent such invalidations and resultant temporary incapacities, in a small number of cases.

One applicator who consistently did not give end-of-session processing after having given ten minutes of mock-ups to his group, found that one child was badly out of present time as a result of the process. The error in this case was the omission of end of-session processing, as contained in the back of *Self Analysis in Scientology*; the total damage involved was the momentary inability of the child to demonstrate an arithmetic problem. The child was only a little way out of present time. He had become so entranced with his mock-up that he was still with it.

Children occasionally experience sharp pains while doing mock-ups, and in such instances, they're letting go of old incidents and punishments. The end-of-session lists take care of any such occurrence.

It is noteworthy that a group undergoing this processing during an epidemic of measles had a lower loss-of-attendance rate than the other classes in the same school which were not undergoing processing.

Here's how it is done.

The applicator opens his copy of *Self Analysis in Scientology*, goes to the beginning of the list, looks for a mock-up (the first one in that list that he can use for delivery to children), and says, "All right. Now let's see if we can get a picture of you enjoying something." He pauses, and as soon as it is apparent to him that the majority of the class have such a picture, he gives the next application.

After a short period of this, he asks for a show of hands to find out how many have been getting mock-ups easily. He then selects this group out of the group, and then asks for a show of hands as to how many got no mock-ups at all and selects this group out. He then has three groups. He can, himself, render processing to each of these groups separately; or he can delegate the processing of the no-mock-up group to a student of that group, and the processing

of the too-slow group to another student, retaining for himself the easy group. It is desirable that he retain the processing of the easy group for himself, because this group will be the largest group and out of it will come the very best results. He should always remember that he is trying to make the able more able, and he should repress in himself any instinctive closure with the most nearly disabled.

The two groups which are not as able as the easy group are processed exactly as the main group is processed; the reason for their separation is that the less able hold back the able, and the ability of the able rouses the envy of those who are poor at the game and tends to press them into apathy about it.

The applicator gives approximately 15 minutes of Scientology out of the lists to his group, and then gives the group the end-of-session list which is Exercise 14 of the book *Self Analysis in Scientology*. This consists of: (1) rapidly sketching over the session, (2) sketching over what has been going on again, with particular attention to how each member has been sitting, (3) going over the session again with regard only to present-time surroundings, (4) fixing each individual's attention upon a pleasant object near to him now. This is repeated until the group is refreshed, and requires only five or ten minutes. The total period of application of the entire process is about 20 minutes, and should be done at least once a day for a period of three weeks to get a very marked change in a group. When achieved, however, such a change is then noted to be considerable. Children who have never been able to study before, or who have been very poor at their lessons will be found to be interested in and good at them.

There's a special case of the child whose school work is of a low quality, yet who has a very high I.Q. This child is found to be unable to mock up anything he hasn't actually seen. He would be able to mock up his instructor, and he would be able to mock up a glass of soda water, but he would not be able to mock up his instructor drinking a glass of soda water since he has not actually seen this. This child should be watched for; it will be discovered that the mock-ups he gets are not really his. This is remedied by simply changing them until he knows they are his. He is actually a no-mock-up case although he can get pictures; a picture is not a mock-up, a mock-up belongs to the preclear. If a child cannot mock up creatively, his work will bear no relationship to his I.Q. If a child has a high I.Q. but no creative mock-ups, then his work will be poor.

This is all the background one needs to apply Scientology to groups of children or groups of adults. Groups of adults are handled in exactly the same way, and they respond as well as, but with not quite the same lucidity as, children. On this basis, an individual can build with his own experience. Such experience is essential to a deep insight into what is happening, for nothing written here beyond the basic data can supplant the actual experience of taking a group and bearing with it for several weeks and then seeing what has happened to it and in it. This, in itself, is sufficient recompense for the trouble taken.

It is expressly recommended that the professional auditor take up the processing of groups of children by going to local schools and institutions and getting the consent of those in charge to conduct this game. He need have no qualms about what might happen, for, as tests have proven, the institution and even the highest authority in relation to that institution will not be anything but pleased with what occurs (unless, of course, some intensely personal factor enters).

A professional auditor would do well to acquire the six-hour taped lecture course on group processing which supplements the above data, and give it free-of-charge to school teachers and others in his area. First and foremost, it will accomplish the goals of Scientology, and second, but sometimes important to an auditor, here is opened the most certain source of preclears known, for parents who are aware of the benefits being achieved with the child are prone to see that the child gets even further benefit in the form of professional processing. People, wisely or not, will pay more to have their children well than they will pay to have themselves well. Thus, even in the narrowest economic sense, it is extremely good business for a professional auditor to give great quantities of his time to the processing of groups of children or adults. He can be certain that he will get auditing assignments at least equal to the amount of time invested with such a group.

This particular highway of approach to the problems of the world has been found workable. It is extremely easy to introduce these processes into a school and to incline instructors into their use. It is easy to put these processes to work in nursing homes, in veterans' establishments, and in many other places. The amount of help an individual can

deliver per capita with these processes easily is greater than with any other single method now in existence, for he is giving men back to themselves, and there is no greater gift at his command.

SCIENTOLOGY 8-8008

UNLIMITED TECHNIQUES

As of May 1, 1953, we have several techniques which are susceptible of being audited without time limit. These we call Unlimited Techniques. They are Positive Gain Processes. Engram running, Expanded Gita and all negative gain processes can be audited with benefit only a short time. Double Terminal is an excellent assist—it cannot be audited more than a few hours before the case must be patched up with an unlimited.

HOLDING MEST POINTS: The pc is requested to shut his eyes and to locate and then “feel” the upper two corners of the room and sit there without thinking, just keeping contact, being interested in the two upper corners of the room. Circuits clamor and other interesting things happen. He must not cease from his interest in the two corners. Can be done for thousands of hours, evidently, always with benefit. Gets pc to PT.

COMPARISON: Two similar MEST objects are observed in fact (not in memory) by the pc and compared one to the other. Then two new objects or spaces are observed, their difference noted. This is done outside and inside with cars, people, trees, grass blades, anything. Spaces, of course, are different because they have different boundaries. You see what happens: He is matching terminals and then stopping the discharge by seeing differences. This is one of the most valuable techniques we have, simple as it is. Can be done for thousands of hours. Pc uses MEST (body’s) eyes.

DUPLICATION: The pc is shown a MEST object, person or space. Then beside it he mocks up a mock-up like it. Then he finds the difference between them. Of course he cannot get mock-ups of any duration or value at first. He simply keeps it up, each time taking a new object, person or space, each time noting the difference. This triggers out the automaticity of making facsimiles. It cuts down the competitive feeling about his own and the MEST universe. Can be audited endlessly, always with benefit.

LIST MOCK-UPS: *Self Analysis* and similar lists.

SPACATION: Putting out one, then eight anchor points to make a box in space either in general or around mock-ups or objects. This is the creation of space.

UNMOCKING: Practicing seeing through MEST objects or spaces, done by creating new space where they are and in which they do not exist.

You see what makes a technique unlimited: It builds up confidence in pc’s own universe as in straight LIST MOCK-UPS; or it causes pc to confront the existing state of present time and discover that the MEST universe seldom bites; or it gives the difference between one’s own universe and the MEST universe and raises ability to differentiate between them. Unlimited techniques are all differentiative, all deal with present time.

PROFESSIONAL AUDITOR'S BULLETIN

From L. RON HUBBARD

Via The Office of L. Ron Hubbard
30 Marlborough Place, London N.W.8

10 May 1953

**GENERAL COMMENTS, GROUP PROCESSING and
A SUMMARY OF NEW WORK: CERTAINTIES**

This is the first issue of the *Professional Auditor's Bulletin*, mailed as of May 10, 1953, from 30 Marlborough Place, London N.W.8. It will be followed from time to time, probably every fortnight, with its successive issues.

The bulletin is airmailed where the professional auditor to whom it is going has provided airmail postage, a sum of \$10 for one year of 26 issues. It is sent regular mail to all others. Airmail arrives into the United States and other parts of the world in four days. Regular mail arrives in seventeen days. The cost of the bulletin is covered in the professional membership fees of the HAS and although I am putting it out and paying for it, it is to be considered a service of the HAS.

The content of this bulletin is technical and promotional. Its intent is to give you and your preclears the best possible processes and processing available at the moment it becomes available. And it intends to assist you in getting preclears. And it intends to arm you with statistics which will make your arguments stick. And it hopes also to help us organize into a team and coordinate our work with the associates and groups. Its outright intent is to make professional auditors as a class wealthy and respected.

Why this sudden burst of enthusiasm from Ron after all these years of comparative silence? The answer is SOP 8, SOP 8A, SHORT 8, SHORT 8A. I've up and took "El Caney."* In September of 1950 I found that the science wasn't working too well for many on many cases. I forthrightly and loudly said that I was going to leave business and organization alone and continue with investigation until I had a process that worked fast for everybody on anybody. I said I was going to do that and let organizations go to hell if they did but that the subject would go as fast and far as it worked and that a fast, workable general process was the basic of a sound organization and that I would get that first. I continued to release everything I discovered and did what I could to keep up morale without actually going into organization itself. I didn't care who or what this antagonized or what it did to press or what rumors would start. The only answer to any problem we had was a fast, completely workable process. Parasitic publications, money mad millionaires, crooked, dishonest and incompetent management were not important when stacked up against a workable process for all.

If you read the enclosed paper on what I am trying to do you will see that our very first goals, the control of the reactive mind and betterment of the analytical mind, are reached. Instead of reducing the reactive mind until it is tame, we detach the analytical mind and boost it up until it can handle ANY reactive mind. How does that differ from Book One? You bought that goal. Now we are achieving that goal.

Not a scrap of your training has been wasted. True your patience has been tried, in many cases beyond endurance. Many of you have taken your loyalties elsewhere. Many of you have panned me mercilessly. Sure, why not. I let you down by overestimating the ability of

auditors to handle a process, by underestimating how tough some cases can be. Or you let me down by calmly or frantically demanding of me a non-human job of sweeping up all the aberrations of Mankind and handing out the answer tied with a silk bow. Any auditor who knew his business got results from May, 1950 forward. But lots of cases stalled and too much Book One processing actually started cases down instead of up, a thing which doesn't happen now. Well, who cares who has done what. That was yesterday. This is today, May, 1953, so let's come up to PT and get a good look at what's happened here.

Guess what! We can process groups of from five people up to as many as we can reach with speaker systems if necessary. And we can get excellent results all the way. And anybody in any group so processed should see some change in himself as a result. Now because group processing is gunshot stuff, special auditing is quite vital to reach above the group high.

What does this mean to the auditor? It means he can process groups for free and get the special auditing which results in good pay. It means that at least one night per week a professional auditor can group process a group with SHORT 8 or 8A at no charge to any member of that group. And it means that any member of that group will feel that something has happened in just those two hours in the group. And it means that some of them are going to want special—personal—auditing. So the professional can fill up his appointment book with paid auditing in the ratio that he gives free group auditing.

Does group auditing work? Ask the instructors and students at the professional schools where they do nothing else these days. And are you going to get results on the individual preclears? On the occluded cases, on the neurotics who WANT to be sick? You sure are if you only use SOP 8 or 8A and leave the engrams alone.

If we start out as a group of skilled people to audit whole sections of the population, we'll attain every goal we ever thought a good one to attain. Thus group auditing just doesn't get preclears for you, it goes right out on the main line and gets the job done. Of course some auditors will tend to settle down and get fat when they have a wide group and a good practice but men's communities are always subject to this thing.

Today, instead of going all out on an IDEAL level and having to have everything "just right" before we begin, let's look over our tools, collect our groups and begin. Maybe if we do that first, everything will get "just right" second. In other words, let's get terribly PRACTICAL about this. Let's realize we aren't all white knights but let's realize too that we aren't all goldbricks and bums either. Let's realize that each of us has to eat, but let's also understand that there's enough business to keep us all eating and forego a spirit of "competition" by which some would eat and, because of gossip and rumor, others would starve. And let's keep the snapping and snarling amongst ourselves and snap and snarl if we must, but present at the same time a good unified face to the public and meet *their* snaps and snarls with a blank refusal to condemn other HCAs or the organization. Let's be a team and make it our individual responsibility to keep the team going. Not one of us will lose by it.

The thing which solves all our problems in economics is ABUNDANCE. So long as preclears are scarce, we will have team difficulties. The moment they become plentiful, teamwork of the very highest sort becomes possible.

Now what will create that abundance? A group process which changes for the better the members of the group so much that they KNOW we have something will bring in members of that group for individual processing to a sufficient extent to keep us in a good state of solvency. We have that process in SHORT 8 or SHORT 8A. It gets around the fact that some people can't get mock-ups. By substituting tactile for sight, it even reaches the blind.

How would we put this group processing formula to work? Well, the package is very standardized both as to procurement and delivery. Our slogan is "making the able more able" and our appeal is to people to increase the cultural level and production standards of the country. In a newspaper, a magazine, on the word-of-mouth line, by sending direct mail

invitations to lists out of the classified phone directory (such as to all osteopaths or all registered nurses, etc., etc.) we collect, as an HCA, the first group. On a certain night, say Thursdays, of each week, we pack into our own quarters or into a hired room at a hotel, we process this group for two hours using SHORT 8 or SHORT 8A. We charge them nothing, not for the hall or anything else. We sell them nothing. But we have available certain things.

First we have available a little sheet, neat and brief, even part of the first *Pro Course Booklet*, which says what SCIENTOLOGY is. Then we have, on the back of that sheet, what professional processing is, how much, and the name and address of the auditor of this group. We make clear on this sheet that our purpose in processing people is part of an international effort to make the able more able in order to bring about, in their fields, a bettered society for Man. We don't get glowing or fanatical and we don't condemn the existing society.

Next we have available membership forms in the HAS, again making it clear that we don't care if anybody joins or not. The auditor collects, as a membership fee £2.10.0 or \$7.50 U.S. and he sends £1.15.0 or, in the U.S., \$5.00 to the main office of the HAS along with the form. The HAS makes out the card of membership and returns it to the member and sends as well, for one year, the magazine *Scientology*, a fact which is made plain on the form available for the group.

On hand also is a form which requests special processing. This again has the auditor's name and phone number on it. But it doesn't pressure sell individual processing.

Also to hand are various texts on Dianetics or Scientology. The auditor can procure these, in most cases, at a 30% discount from associates or the main HAS office.

Revenue from books and memberships should itself pay the auditor well for processing a group, and pay the costs of mailings. But the auditor will have respect and effectiveness and response to the degree that he is casual about selling and to the degree that he stresses this as part of a program to raise the cultural level of Man by putting its leaders into a very high state of effectiveness, and other similar arguments.

An auditor can also give the Group Auditor's Course for teachers and others but he will find this a convenience only and should not look to it to produce revenue beyond good public relations unless, of course, he has started out on the line of processing children by interesting teachers in processing children, as groups, with *Self Analysis*, as discussed in the *Journal*, Issue 1 4-G. An auditor can carry forward both programs.

An associate, by advertising and direct mail procurement of people to be a member of groups, can turn off such persons to auditor's groups, benefiting only by training. And indeed, with auditors doing the auditing and associates doing training and general advertising and good will, all this not only could work out but is working out in several quarters.

Well, you've got SOP 8A coming shortly. SOP 8, mild as it looks, tears cases to pieces and assembles new people. SHORT 8A is effective on both groups and individuals and is very easy to audit. You may cling to the idea that the pc has to suffer through engrams even if SOP 8 makes him well. If so, use some yourself. Waste some pain and find out why.

And now your own case. A lot of auditors are here to help their own cases. SHORT 8A, if you have the persistence, if used without deviating from it, is a self processing technique. And it can make you clearer than Book One ever could have made anybody. But nothing beats good auditing from a good auditor so look to you and another pro being a co-audit team. No pro can be audited by some pc he's taught. If he thinks he can, he's fooling himself.

Write me. I've got answers here. You need me and I need you. So here, with PAB No. 1, let's get, as a team, a show on the road.

[1953, ca. end May]

GENERAL COMMENTS SOP 8 and
A SUMMARY OF SOP 8A

GENERAL COMMENT

According to the letters I have been receiving SOP 8 fell like a minor bomb in some quarters: and all the letters are reporting the sudden resolution and dissolution of cases which had previously been considered very difficult. Some of the letters reflect the fact that none of the materials of Scientology had been available because the auditor had been out of touch. But the main thing which is being reflected is the sudden understanding of what I've been trying to do in Scientology. It had not occurred to many that the effort to treat the reactive mind was lengthily unnecessary if one could actually separate out the analytical mind and bring it up to a point where it could handle any reactive mind. Where we want the strength in validation is of course in the analytical mind. I went into this pretty thoroughly in Issue 1 5-G of the *Journal of Scientology* released a short time ago, and it is wonderful and beautiful to me (1) how auditors everywhere completely missed the point and (2) how I had overlooked telling them what the point was. It is very gratifying in some quarters that this realization alone makes us all friends again.

I am also getting some early reports on groups and some suggestions concerning the handling. One of the suggestions is of very great interest. After one has a group formed and is group processing it, it is very well worth his while to take the names and addresses of his group members and make a personal call around on these people, without any formal appointment, and ask them how they're going along and if the group processing did them any good and so forth. This all by itself seems to produce the personal contact necessary with some to ask for private and personal auditing. This is a pretty easy thing to do after all. One simply makes sure that he gets the names and addresses of everyone who comes into the group and then one calls around on them personally after they've been there a time or two and finds out how they're getting along. The same auditor also remarked that most of his preclears came from the vicinity of preclears where his results had been successful, and that he did his best acquisition of preclears by writing to all of his old preclears at regular intervals and asking them how they're getting along. In other words, after he'd processed a preclear, he made a point, about a week later, of writing him a letter asking him how he was getting along. About three weeks after that he wrote him another letter. About a month after that he wrote him another letter. And then he let a period of about three months elapse and wrote him again. This quite often produced an additional intensive run and it certainly produced, in the vicinity of the preclear, new preclears.

I have also received the comment that hardly any auditors ever took me at my word when I said that one could simply go out on the street and stop people who had things obviously wrong with them, make an appointment and process the person and get paid for it. Every auditor who has tried this has found that it was a successful method of getting the word around. One simply stopped somebody on the street, inquired after his health, asking him how he got that way. Then he simply tells him he's going to give him some processing. An auditor who has a professional card on him with a definition of Scientology printed on the back of it,

can give the person a card, but he should not count on the person to make any advance because that person is out of communication. If a person has anything wrong with him, that person can be reached but that person will not reach. Therefore it's up to the auditor to do the reaching. If he sits and waits for the public to come to him, the public who has anything wrong with it cannot and will not come to him simply because they cannot reach out away from themselves and communicate, but they can be communicated to and can be reached, and are actually quite obedient to anybody who reaches to them. This is such a workable method of getting a practice going that we are considering installing it as a necessary act in professional training.

I received a letter not long ago from an auditor who had gone around the manufacturing plants and had pushed his way in to see a big enough name to get action with the proposition that he cut down the loss of work hours of the company by giving emergency treatment to absentees who were just then costing the company money. He also stated that he was able to walk through plants and pick up the names and addresses of people who were absent and then tell the management he was going to send them back to work, which he did. This was intensively productive of interest, and was quite remunerative.

Remember and do not forget that in the building of a practice and its continuance, one is dealing only with people who can be reached but who will not reach. These people are dramatizing "must not reach," but only a few of them are dramatizing "must not be reached"; and all of them can be reached but it is up to the auditor to go out and do the reaching. Any occluded case is actually dramatizing to some degree "must not be reached." An auditor who is an occluded case is liable to take himself out of the general swim and wait for the lame, halt and blind to come to him. The lame, halt and blind do not come to him for the simple reason that they are waiting for him to come to them. They do not know he exists.

Many of you would consider it brassy in the extreme to go from house to house down one block after another and ask at each door if there were anybody chronically ill in the household; then explain what he was there for and say he was going to straighten them out and make an exact statement that his fee was so-and-so. An auditor who would not do such a thing actually is going to have a poor practice. An auditor who would not do such a thing is suffering from stage fright. Under new techniques which you will know about, this auditor should simply run the concept in brackets: "**Audiences exist**" "**Audiences do not exist**", and not fumble about any uncertainties but simply run the positive and negative of the fact that audiences do and do not exist. This stage fright will turn on and off and go away; and after that he can go out and procure preclears. He can run in concepts, mock-ups or in brackets "**People exist**" "**People do not exist**" and without touching any in-betweens discover, after he's done quite a bit of this, that he's capable of reaching people. In order to have any kind of a practice it is necessary for the auditor to reach people because the practice which he will build will be built out of people who must not reach. Anybody who has anything wrong with any part of his body simply cannot get into communication with it. This means he cannot reach that part of his body. If a person cannot reach a part of his body how can he reach another person? And how can he reach an auditor? An auditor who waits for people to come and apply to his group for entrance, who waits for preclears to come and knock at the door, is liable to sit there for a very long time. He must practice on quite a few people in any given area before the word starts to get around. All he has to have is a few successful cases and the word will begin to get around and people who can reach will be bringing around people who can't reach. But even so, this is a slow way to go about it.

The number of hours of auditing which preclears need is steadily reducing and an auditor could actually start building his practice in terms of very short sessions, seeing a great many people for a very short time rather than seeing one person for a long time.

It has been observed that a lot of auditors impede their practice by standing around trying to explain what Scientology or Dianetics is to somebody. A patient doesn't want to know what Dianetics or Scientology is: he wants to get well. The auditor is most successful with new preclears who simply says, "I am a consulting Scientologist; we handle all sorts of human difficulties and malfunctions. Now what's yours?" And sails on from there to get results. By

explaining there is something new in the world he is immediately bringing the preclear into the state of uncertainty of “Will it work or won’t it work?”

Burke Belknap wrote in to say that one of the first things he did with a preclear was to run concepts on the basis of auditors were no good, the thing wouldn’t work on him, nothing would ever change. This is very excellent. Under present techniques this could be run in this fashion: **“Nothing will ever change” “Everything is going to change.”** One runs this in concepts, mock-ups, brackets, and runs it until he has a preclear that’s going to change. It doesn’t take very long to do this. He will immediately discover that the preclear isn’t changing because the preclear’s afraid that if he starts to change, everything will go into complete confusion. When the preclear discovers it doesn’t, he is then willing to change. You could work the most beautiful techniques in the world on a pc who was trying madly to stay stable, and produce nothing if you did not first shake loose the fear of change. You are trying to change this pc’s communication lines, therefore it’s necessary for you to hit the case on the basis of change. Another thing: you want to make your pc more aware; he will get as well as he becomes aware. If you want anybody to become aware, you have to raise their communication line. If a person is madly holding onto communication shut-offs, how can he become more aware? The test as to whether or not a case is getting well is whether or not that case suffers a communication change. The communication lag index is the most important method of telling whether or not a person is sick or well. A person who answers quickly (and rationally) is in much better condition than a person who answers after a long consideration. A person who’s being impartial, conservative, etc., is hung up on a maybe so hard that it would take tugs to get him off.

One old-time auditor has written in to tell me that auditing still remains an art and no matter how hard I try to teach it as a rote, it will still be an art. This has some truth in it. Therefore, if an auditor wants a pc to get well, the auditor had better be a shining example of something that is well. This in itself inspires certainty and confidence. More important than this, a person has to have a very high level of communication before he can indulge in art. One is actually to date creating new people rather than repairing old, broken down homo sapiens. Creation is the work of the artist. In order to do very well, run **“Something can be created” “Nothing can be created”** on himself until he recovers all those artistic impulses of his youth. True enough, it will help his auditing.

I recently had an interesting example of how case level influences the numerousness of a practice and the number of results which an auditor got. Two auditors were in the same area. One had had a lot of successes and had a good practice; the other had had several failures and had a very poor practice, and was, in fact, thinking of chucking it all when SOP 8 and the Group came out and revived his activities. The second auditor was an occluded case. Now, with these techniques which take apart an occluded case, there isn’t any excuse for an auditor to be occluded and be low in tone. By the way a trained Scientologist can to a marked degree audit himself. This isn’t possible for somebody who isn’t trained in the subject because that somebody runs across all sorts of computations and circuits and starts to figure, figure, figure, and almost drives himself mad because he’s into so many maybes. A person can stay in the field of certainty and audit himself. He’s got to have enough training and enough sense to stay in the field of certainties and not wander off into uncertainties and speculations. Anybody who starts self-auditing should audit to technique which is laid out in front of him. Anything I am giving you in the way of technique in this bulletin can be done by an individual on himself. However, he should be very careful not to stray off. The technique starts exciting circuits into action and the auditor starts doing figure, figure, figure, which is very far from certainty.

In Issue 16-G, which may be a bit delayed, I am laying out this whole subject of Scientology as “Science of Certainty.” Scientology deals now in nothing but certainties. Those things which are uncertainties, such as metaphysics, spirits, other worlds, space opera, whole track, GE Line, are all being put into the bin called para-Scientology. The auditing we do is directed towards the establishment of certainties, and in itself works only with certainties. Prenatals, engrams and facsimiles—anything which anybody would consider uncertain does not belong on the main line.

What is the level of awareness which we will accept as being a level of awareness? It would be: Can a man stand looking at a tree and know that he is standing there looking at a tree, or if he is blind, can he stand there and feel a tree and know that he is feeling a tree? This man is sufficiently aware to be considered for our purposes fairly sane. Awareness goes from there on up into expanding certainties. How aware is awareness? It is as aware as it is certain. What is knowledge? Knowledge is certainty. Is data knowledge? No, data is not knowledge. A certainty is knowledge. Therefore knowledge depends upon perception. Is certainty an absolute? No, it is relative. What are the two ends of the spectrum of certainties? Here you're looking straight at the theta-MEST theory. There is nothing, there is something. Here you have the nothingness of the static and the somethingness of all motion. Now, what are we considering, then, at the bottom level of all acceptable certainty? It is a certainty when one is standing looking at a tree and one sees a tree; or, if one can't see, having no MEST vision, one can feel a tree: that is certainty. And that is the bottom level of certainty that we're going to accept as a certainty. What's the top level of certainty? Well, we're not interested in the top level of certainty because it goes too high to observe. In the last bulletin I talked about three universes. There are numbers of viewpoints of these universes and one is as certain as he is certain of these three universes. But one can become more certain than that to the degree that he is aware. Communication establishes awareness as a mechanism. The three universes give us something of which to be aware. Therefore, this perception is in itself certainty and this certainty is in itself knowledge and thus we can achieve what we would consider an acceptable certainty. What is an acceptable certainty? It is a certainty that the three universes exist in terms of perceptions: one's own universe, the MEST universe and the other fellow's universe. When we have established these, we will find that an individual can assume viewpoints which are not dependent upon the body and can perceive these universes as an analytical mind directly. We don't ask anybody to be certain of this until it happens. Thus from these three certainties with MEST eyes, we go into these three certainties on a direct level. What we will call a "stability" for want of a better word at this time and to replace the word "clear" about which there is a tremendous amount of confusion, would be one who can, without the assistance of MEST eyes, perceive with complete certainty the three universes from many viewpoints. We reach this state with a person by leading him up the gradient scale of certainties, taking him at the certainty level where we find him, wherever that is—even if it is psychotic, neurotic or normal level—and raising him on upscale until he is certain of his own universe, the MEST universe and other people's universes.

You have observed the phenomenon of people who were theta exteriors getting back into the body and not being able to get out again. This is because they were actually insufficiently aware and because they ran into this one single aberration: "They must not reach away from MEST."

If you think for a moment that it is the purpose of Scientology to produce something intensely spectacular like a ghost that can move cigarette papers or mountains, you have definitely gotten the wrong idea. We are interested in well men, we are interested in people with well bodies who think straight and who co-operate on optimum solutions. We are not making magicians. There are a great many things which a thetan or the analytical mind can do, but all these, until you are certain of them, belong in the field of para-Scientology and are only interesting data. We have no interest in their truth or untruth. If you start filling your pc full of an education about the whole track and electronic incidents and other doubtful things, you are giving him more and more uncertainties and he'll start on down tone scale. By giving him a gradient scale of certainties, you will surely and securely bring him up the line to stability. The actual horrible truth of the matter is that an individual below the level of what we are calling "stability," will continue throughout the remainder of his life going on down tone scale. We can make a 4.0 in Dianetics by very arduously swamping up via negative-gain processing the reactive mind, and he will remain relatively stable and with greater longevity, and is as defined in the first book; but we have not put aside the normal course of ageing in the body nor have we completely proofed this individual against the shocks and upsets of existence which would come from new incidents of pain and unconsciousness. It has been completely overlooked that the first "clear" was a relative thing and definitely not an absolute thing. It was an intensely

hard thing to gauge. An auditor had to be a very good expert on the subject to produce anything like a 4.0 because the uncertainty in the auditor himself about what he was doing would introduce uncertainties into the pc and so would impede the processing. I fought this for a couple of years before I got it through my own head that pcs reacted to my certainty, got their recalls back simply because I was certain they would, and were content to drill never beyond their own depth but always in the level of what they could reach when they could reach it. A few auditors achieved this but they were all certain people. Even so we got lots of clears, but the bashfulness of the beast dropped him out of sight, for everybody insisted on making a circus curiosity of him and everybody was so uncertain about his state that they very often took an uncertain clear and turned him into an aberree again. I have had this thing happen to theta clears. Man is not exactly kind to his fellow man. Man is basically good, but, believe me, he has a long way to travel up the tone scale to reach that basic goodness. If you don't believe that Man can be slightly unkind, look what the more aberrated amongst us say about yours truly.

Now you have some sort of idea about what I mean by a positive-gain process. A positive-gain process is a positive-gain of certainty; a negative-gain process, although it eradicates engrams and alters the pattern of behavior of the individual, actually makes that individual at times more uncertain than before, for he has been plunged into things he didn't know were there and in fact has been made wrong. If you keep on using negative-gain processes such as erasure, remember to back them up right away with positive-gain processes. Otherwise you've not brought the pc up toward being a "stability."

Now in the last bulletin I told you I'd resolved this problem and sent to most of you SOP 8, "The Factors" and Short 8. I sent those along so you could get acquainted with them, not because they contain all the basic information you should have to work them. There is a philosophy and goal behind that modus operandi which must be employed in order to produce the results which are expected. And you don't have the final technique on this, for that requires the essay which follows. There is a whole process which is devoted to and dedicated solely to cases of Step IV and V. This we call SOP 8A. SOP 8 solves these when they are not too bad, but SOP 8A should be immediately employed the moment it is discovered the pc's very uncertain of his own mock-ups or if he is occluded. The IV and V steps work in SOP 8 but there is a much faster way of going about it which blows the occluded case. Within these faster processes and SOP 8A we also resolve at one fell swoop special kinds of trouble; any pc who steps up with a special somatic or a special worry is run on SOP 8A. It then is actually an office technique and in 10 or 15 minutes produces quite marked changes in the individual. I will not say how many hours it takes to resolve a completely occluded case, since some cases are more occluded than others, but it doesn't take very many hours. All this got shockingly simple, and if you don't do it simply, you're simply working yourself unnecessarily, putting the pc through a lot more things than he should go through.

In the first place, in the use of SOP 8A, we omit any explanations to the pc. If he happens to know Dianetics or Scientology, that's tough, but it is included in the techniques of SOP 8A. These things can be self-audited, but remember, auditor, that they can only be self-audited by a trained Scientologist. These buttons are hot. It is not even a dramatic statement to say that one had to walk along the edge of hell to find these techniques and that these techniques lie straight through insanity itself. Thus, when one is auditing a pc, he can expect momentarily, even in one he has considered very sane, fantastic reactions.

An auditor recently mentioned to me that everyone around a certain area considered anything I had labelled as "unlimited technique" and a "positive-gain technique" as a necessarily faint or weak technique. Just because a thing could be done forever seemed to indicate also that it was weak in its operation. The matter of two anchor points to the back corner of the room and holding them there was considered by the auditors round the area to be a faint technique. Actually that is about the hottest technique you ever threw a pc into. To understand this you will have to understand that "reach" and nothing but "reach" is in itself the basic center of the hurricane called insanity. You have somebody reaching with theta energy to the corners of the room. He is not supposed to reach away from MEST. You could run simply the concept of *must not reach away from MEST* and produce some very interesting results in an individual.

When a person has been told to hold the corners of the room in this fashion as in SOP 8, an auditor should expect repercussions, if not during the session, certainly during the next day or two. The technique has to be done over and over because there is an enormous amount of material which it sets loose. The individual is made thereby to let go both sides of the engram. He is holding the engram in to him and not knowing that he is doing so and he feels the effect of doing so and holds it out from him. You're asking him simply to let go and reach MEST. He's reached MEST, he's not supposed to reach away from it. Certainly all of his old holds on the bank will disappear and the technique is very effective and it can be done for long periods of time. Do not think for a moment it is a faint technique; it definitely isn't. Any of those unlimited techniques are powerful above and beyond running engrams as the Empire State Building is bigger than a doll house. So make up your mind to the fact that you have a handful of dynamite. You have to use it for a little while to discover this and then use it for a little while longer to be certain that, carried through, it brings about the desired result.

It is definitely none of my business how you apply these techniques. I am no policeman ready with boards of ethics and court warrants to come down on you with a crash simply because you are "perverting Scientology." If there is any policing done, it is by the techniques themselves, since they have in themselves a discipline brought about by their own power. All I can do is put into your hands a tool for your own use and then help you use it.

Now one further comment: There is a further issue of "The Factors" which contains two or three new lines. The basic motivation and the reason behind the decision to be is the desire or curiosity, the enforcement and inhibition of production of effects. Don't mistake it for a moment and think this is not the center button. It is the reason behind beingness: the production of effects, the enforcement of effects, the nullification of effects. All the pc is trying to do when he first comes to you is to produce an effect upon you; don't forget this. He is using sickness to produce effects. Any effect is better than no effect. Anything is better than nothing. Any sensation is better than no sensation. Any circuit is better than no circuit. And as far as badness and goodness are concerned, these things are evaluations, determined by viewpoint. So anything bad is better than nothing. This should explain human behavior to you as nothing before did. What is your pc trying to do? He's trying to produce an effect. How sick is he? He's as sick as he has to be in order to produce an effect. If he's sick at all, it means that he hasn't been able to produce effects without being sick. If you try to take away from him the modus operandi of producing effects, i.e. his service facsimile or his sickness, you're in for trouble. Thus you have to rehabilitate in him the belief that he can produce effects and that he could obtain good effects from others. His goal is to produce effects upon others and obtain good effects from others; that's all his goal and that's why he's being what he is being. That is the reason behind the decision. You've many times asked what is the reason for all this? The answer is to produce an effect. What is the basic mechanical operation of producing an effect? It is reaching, pushing and pulling. Reaching is the keynote of this. What is the basic certainty? The basic certainty is dual; there is a positive and a negative certainty; there is no in-between certainty: there either is an effect or there isn't an effect, so the basic certainties are "**There is an effect**" "**There is no effect.**" The next basic certainty to that is "**There is no beingness**" "**There is beingness.**"

I am not going to try to give you very much in this bulletin. There are other bulletins to follow. I want to know whether or not you want these bulletins. Thus I am writing down here the basic heart of SOP 8A which follows:

A SUMMARY OF SOP 8A

In order to be and to produce effects one must have knowledge. Knowledge is certainty. Certainty is awareness. Awareness change is the indication of effect. One must then be able to produce changes of awareness, which is merely changes in communication, in order to be certain he has produced an effect. Certainty of the production of effects and uncertainty as to the production of effects are the up and down of lifetimes.

“There is something here” “There is nothing here” are the basic certainties of beingness. One runs a chronic somatic simply by picking out an area of the body which is painful or numb and having that area of the body alternately state to the pc by having him run the statements in that area or having him run feelings which approximate the statements in that area **“There is nothing here” “There is something here,” “There is nothing there” “There is something there.”** Does one for a moment ask what the something is or let the pc evaluate about the something or nothing? No, he certainly doesn’t. All manner of queer sensations, covertnesses, malice and so forth turn on in the areas; we’re not even vaguely interested in these reactions and these effects. The pc will try to pass them off on us as effects; we’re not interested in that, we’re interested in getting that area of the body alive or over its pain. Any numb area of the body run in this fashion will recover feeling; any pain in the body any place will recover a normal state if this is done.

To realize the full value of SOP 8A one must know something about entities. The pc has compartmented off various parts of the body for which he takes no further responsibility. These appear to be individuals operating against him. Actually these parts of the body have individual characteristics and answer up on E-Meters. These are basically demon circuits but they are the things which produce the circuits; they are the things which hold on to facsimiles, they are not themselves facsimiles. Each one of these is holding on to numerous facsimiles, and they supply these facsimiles to the pc. The pc says he’s not responsible for this. We run in each area where there is any disturbance, first in the pc and then as though it’s happening out in front of the pc alternately, **“There is something here” “There is nothing here,” “There is something there” “There is nothing there.”** This knocks out the entities and, therefore, automatically knocks out the mechanisms which are making the pc sick. We don’t care whether there are entities or aren’t entities; it’s simply that he is certain that something is deviling him from a certain area. He is certain of this; we can be certain of it because he complains of it. We use this technique to knock it out. The word “entity” simply designates an area of the body which has an independent point of communication.

Going back to the theory of epicenters, one then finds that there is a sub-brain in various parts of the body. When one is dealing with a Case IV or V, he is dealing with the reactive mind and he has to take apart the reactive mind to some degree in order to produce freedom for the analytical mind. The epicenters would be such parts of the body as the “funny bones” or any “judo sensitive” spots: the sides of the neck, the inside of the wrist, the places the doctors tap to find out if there is a reflex. These things are sub-brains picked up on the evolutionary line probably—we’re not even interested in where they come from, we’re not even interested in the pictures they hold; we are interested in the fact that they have a monitoring effect on the body and the individual. We run these on the above techniques and we produce a considerable change in the reaction in communication of the individual.

We recall at all times while running this technique that we are dealing with a positive in the vague certainty, but nevertheless certainty, of “something,” and in the negative certainty of “nothing.” And what do we have here? We have the theta MEST theory. How simple is this problem? This problem is the direct application of the theta-MEST theory to auditing as directly as it can be applied. Life is essentially nothing but something which can produce an effect. There is one thing Life must not be and that is nothing. You can run on a pc as a matched or double terminal **“I can be nothing” “I can be something,” “I can be nothing” “I can be something”** and produce a considerable release in him since he has been forcing himself all along the line to be something so that he could produce effects, and he has never been able to be anything. Of course he can’t be anything, he is nothing. Fear of being nothing, then, is the driving fear. **“There is no future” “There is a future.”** These are essentially dichotomies, but they are more precise dichotomies than we have ever run before.

We handle the whole problem of pictures simply in this fashion. **“There are no pictures” “There are pictures.”** Any occluded case vaguely remembers having recalled pictures. Pictures start to turn on when this is run or start to drop out. We can apply this to any mechanism, and we can apply it with creative processing, we can apply it with any concept

running, we can apply it with brackets, we can apply it with matched terminals. A matched terminal is simply a mock-up, no matter how black, facing a mock-up.

Why is the occluded case occluded? He actually isn't occluded, he's holding on to the last certainty he has anything to do with. There are several things which turn a case black. One is the defection of a friend. This is the loss of another viewpoint. Another is simply loss, and loss in any form. What happens when an individual loses something? He starts holding on to any certainty he can hold on to. The most certain certainty he can hold on to is blackness. No light or painted object is as certain as a completely black object. Blackness is an effort to disappear and hide. Blackness has many uses. When blackness shows up, one can run "can't reach" and he will have wider blacknesses there.

A person gets into blackness which is like glue. This can be run on the positive negative basis of "**There is something**" "**There isn't anything.**" Does one run this to agree with how long the blackness stays on and when it turns white and when it turns black again? No, one does not, because this is agreement with the MEST universe. One runs these things almost at random.

Betrayal is the action of having things pounded in and held against one. Ridicule is the action of having something taken out away from one and held there where one cannot reach it. Both of these things are matters of reaching. If one wants to go on and run reaching concepts one must be prepared to run into the hottest of suppressions and the hottest compulsions he has ever been called upon to handle. It may be necessary to run some of these. However, the concepts of "**There is something here**" "**There isn't anything here,**" "**There are pictures here**" "**There are no pictures here,**" "**Pictures can affect me**" "**Pictures cannot affect me**" and particularly "There is change" "There is no change" produces superior results to running reaching. One must know about this button *reaching* because it is THE button of insanity. Compulsion to reach and the inability to reach combined produce a state of mind which one wouldn't wish on anyone.

Sex plays a very heavy part in all of this because it is the symbolism of mock-ups and many other things. Thus one would do well to run "**There are men**" "**There aren't men,**" "**There are women**" "**There aren't women,**" "**There is sensation**" "**There isn't sensation**" in order to resolve this problem. But basically below all this there is "**There is something here**" "**There is nothing here,**" "**There is something there**" "**There is nothing there.**"

Does one pay any particular attention to blackness? Yes, sometimes it is necessary. It will be found in an occluded case that one side of a body is blacker than the other. This comes about from an old imbalance of control centers. One control center is reaching and ignoring the other control center. The control center which is ignored and can't reach is black. Thus one finds the blackest part of the body that part of the body which is the most disabled by the other part of the body. Fears of war and of anarchy inside the body which come about in terms of control centers have nothing to do with the analytical mind. The analytical mind is very puzzled as to why this body is suddenly so disobedient. One can run the basic combination of something and nothing here, something and nothing there on the body or on an idea of the body.

Is it better to run things in the body or away from the body? It is usually better to run things away from the body as this has the effect of putting out anchor points. When one runs too many things close to the body, one has the effect of concentrating the individual's attention on his own body. This actually has a tendency to collapse his space. Thus these concepts should be run at a distance from the body.

One handles one of these concepts as long as the pc can hold it there as "certain there is nothing" or "certain there is something." This is very beneficial in terms of matched terminals. One runs matched terminals by having the pc put them up as though they were himself facing himself and then as though somebody else is putting them up facing somebody else on the

same concept and on others putting them up for others. In this way, one runs out matched terminals and brackets simultaneously, a combination of techniques which is very effective.

Does the pc have to have a mock-up in order to put up a feeling or concept in front of him? No.

It must be kept in mind that the basic disability of the pc is to reach away from MEST; it is not to reach MEST and it is not not to reach MEST; it is the disability to reach *away* from MEST. MEST has a gravitic attraction for him and he's gotten to the point where he can't escape it and therefore all of his space is collapsing.

It will be discovered that running any of the techniques of SOP 8 on a positive negative basis on a low level case is beneficial. Thus one has a V level case with his MEST eyesight compare two MEST objects which are similar and then see nothing in those two spots with his MEST eyes. This runs "there is something," "there is nothing." He can do this. You have to run these alternates on a IV and V because he's incapable of getting up to a level of disobedience of MEST laws. One wants to get him up to a disobedience of MEST laws as fast as possible because this gets him into command of energy rather than being the effect of energy.

The trouble with a V is that he cannot permit himself to be reached while he himself must reach. This can be run directly or much more swiftly with the basic technique. In view of the fact that one is holding on to blackness because it is a certainty, one has to have a higher level of certainty on something else before he can let go of any of the blackness. The more MEST one loses, the more sensation one is suddenly denied, the less one feels he can create, the more one has to hold on to any certainty he can reach; and when that certainty is as low a level as blackness, an auditor really has to do some auditing in order to give the individual a high enough level of certainty so that he can let go some of the blackness. The blackness is being held in place in most instances by things which are no longer under the control of the pc. Thus it is an automatic holding-in-place. The pc is not directly doing this himself.

This is a preview of the process. The only thing that one must do and be careful of in the process is to keep the preclear from figuring, thinking, guessing, wondering and so forth. One has to deal in certainties; the certainty of nothing and the certainty of something are the basic certainties of life itself.

SOP 8A attacks the problem of uncertainty armed with new and important data which ranks with the discovery of the engram. The first is that certainty is knowledge and knowledge is certainty. Art itself is certainty, and where one has failed in the arts, he has failed simply because too many uncertainties have been introduced. The anatomy of maybe could be restated as the anatomy of uncertainty; and with this I have evolved the fact that uncertainty stays in suspension in time simply because one is holding on so hard to certainties. Thus by processing out the certainty on any subject, one processes out at will, paying no attention to it, the uncertainties on that subject. One does not process the uncertainties, one processes the certainties. The pc's holding on to the certainties and trying to avoid the uncertainties; thus the uncertainties are available for processing. The techniques I evolved to take care of this concern brackets, matched and double terminaling in terms of brackets; which is to say a person putting a thought out in front of him facing another thought for himself, having two thoughts out there as though placed there by somebody else, and having two others placing thoughts out there for others. This can be done by the most occluded case. It can also be done by mock-ups and one gets an automatic discharge on the double terminal system. This runs out and exhausts aberrative material. The things which are there to be exhausted are the certainties. The auditor who possesses uncertainties is playing into the hands of aberration.

The next important datum is the matter of viewpoint. People have viewpoints confused. Viewpoint is only a point of awareness from which one can perceive. That is an actual viewpoint. People think of viewpoints as a method of thinking about something from a certain attitude. This is an uncertain affair and is a circuit. If one can see something completely, he

certainly doesn't do a lot of supposing and predicting about it. One must get rid of the circuit compulsions in order to get perception. The greatest scarcity is the scarcity of viewpoints. This brings him out to the point where he thinks he's avoiding other people's opinions. Opinions are unimportant. The points of awareness from which things can be viewed are important; and this law comes forward with this: That a person most heavily uses the viewpoint of another when the other has evaluated for him. Any person is heavily using the viewpoints of people who have evaluated for him. Thus, where he has had an ally who is dead, he has once had a viewpoint which was alive and now can no longer use that viewpoint. This is the basic loss and the basic occlusion. It is the loss of a viewpoint. If mother, father, grandmother, grandfather, etc., at all evaluated greatly for the pc, then the pc's using their viewpoints. He is as occluded as he has lost these people; hence his blackness. The viewpoint has arrested it somewhere in time and he cannot see beyond that spot; this brings him into the past. He is doing a life continuum and is in the valence of that person who has evaluated the most for him. The technique to run is being able to reach and not being able to reach other viewpoints. These life continuums show up automatically and, more importantly, they resolve. Another factor which has arisen here is the fact that one wants a viewpoint in order to create an effect and therefore will assume the viewpoints of those who create the greatest effects.

Running in matched terminal brackets **"I (he, she, it, they) have a viewpoint"** **"I (he, she, it, they) do not have a viewpoint,"** **"I (he, she, it, they) do not want viewpoints"** **"I (he, she, it, they) want viewpoints,"** **"I (he, she, it, they) cannot reach a viewpoint"** **"I (he, she, it, they) can reach a viewpoint"** "gunshots" the reactive mind and the thetan and resolves all of his aberrations of whatever kind. One runs these only so long as the person runs them in a mood of certainty. The moment he gets uncertain (which will show up on an E-Meter) he switches over and runs the other side of the dichotomy from that which he was running. He holds each one as long as he is certain; he uses this technique simply over and over. Where one has spotted a specific life continuum, he runs **"I have the viewpoint of (grandfather, grandmother, mother, father)"** **"I do not have the viewpoint of (the person)"** and reversely **"(The person) has my viewpoint"** **"(The person) does not have my viewpoint."** He runs this in matched terminals and brackets.

Of course, the reversal of *to reach is withdraw*; *reach away from* is not quite the same as *withdraw*, but *withdraw* serves. That which is wrong with a V is that he cannot withdraw from MEST and MEST and engrams will not withdraw from him. He is in a situation where he hopes he cannot be reached and that "they" will never reach him. His conviction that he cannot withdraw is such as it would never enter his mind unless an auditor told him to run it. The idea of withdrawing or anything withdrawing from him is novel and unsupportable. Immediately below this, of course, there is a level where everything has withdrawn from the person. This is handled by **"(Any dynamic) will not withdraw"** **"(Any dynamic) will withdraw"** and is assisted by running **"They will reach me"** and **"They will never reach me"** and running with **"Bodies will not withdraw"** **"Bodies do withdraw,"** and this is assisted by running **"There is space"** **"There is no space."** The glee of insanity and other manifestations show up. One must remember to run whenever he touches these reach and withdrawal techniques, the certainty that there is something there and the certainty that there is nothing there afterwards, because the phenomena which show up in running such techniques are so explosive that they leave a V considerably unsettled. He must then reach a certainty on the matter by running out the certainties of something and the certainties of nothing.

This is actually all there is to the solution of a Case V. He has an uncertainty about everything. He has to figure about everything; he has to know before he goes, and he has to hide but he knows he can't hide, and he depends on logic to serve for all of his predictions because he can't look. An amazing array of complexities can arise and an amazing number of "new techniques" can be developed off these basics. However, it is well to remember that these are the basics and when one strides too far off them, examining single pictures, he should remind himself that he will do better running on the pc or himself techniques which take care of all pictures; for the number of pictures are limitless.

There are thousands and thousands of variations of this and this is far from all there is to know on this subject, but it is easy auditing and it will work easily for you in the resolution of cases. I will have considerably more data on this in succeeding bulletins. It got awfully simple, didn't it?

I would appreciate those HDAs, HCAs and BScns who are not yet members of the HAS to apply for early membership. Founding Members who are also HDAs or HCAs are automatically professional members from here on. Professional membership brings with it a year's subscription to the *Journal of Scientology*, brings the *Professional Auditor's Bulletin*, brings direct referral service. Professional membership is \$25 per annum. Only professional memberships valid are those of Founding Members, those who have graduated from associate or doctorate schools since the 1st of January, 1953, and those who have already submitted their professional membership. Anyone else has had his professional membership run out and should renew it. Fees for professional membership should be sent by personal check or cash to the HAS in London, 163, Holland Park Avenue, London W.11, England. This does not mean that all professional memberships are in the British organization; it simply means that this is the coordination of communication headquarters at this time. Professional memberships can also be procured from Philadelphia. Those who are not professional members already amongst certified graduates are, at this time, in the minority.

I am going over to France for a while to get some material assembled. These bulletins will continue. I am very glad to hear from you. What you care to write is very acceptable and will, whether positive or negative, assist other auditors. My address will continue to be 30 Marlborough Place, London N.W.8, England.

CERTAINTY PROCESSING

The anatomy of *maybe* consists of uncertainties and is resolved by the processing of certainties. It is not resolved by the processing of uncertainties.

Issue 16-G is recommended to you for your processing and your public representation. It contains the anatomy of *certainty*.

An uncertainty is held in suspense solely because the preclear is holding on so hard to certainties. The basic thing he is holding on to is "I have a solution" "I have no solution." One of these is positive, the other is negative. A complete positive and a complete negative are alike a certainty. The basic certainty is "There is something" "There is nothing." A person can be certain there is something; he can be certain there is nothing.

"There is something" "There is nothing" resolves chronic somatics in this order. One gets the preclear to have the center of the somatics say, "**There is something here**" "**There is nothing here.**" Then he gets the center of the somatic to say, "**There is nothing there**" "**There is something there.**" Then the auditor has the preclear say toward the somatic, "**There is something there**" "**There is nothing there.**" And then he gets the preclear to say about himself, "**There is something here**" "**There is nothing here.**" This is a very fast resolution of chronic somatics. Quite ordinarily three or four minutes of this will resolve an acute state, and fifteen or twenty minutes of it will resolve a chronic state.

This matter of certainties goes further. It has been determined by my recent investigations that the reason behind what is happening is the desire of a cause to bring about an effect. Something is better than nothing, anything is better than nothing. Any circuit, any effect, any anything, is better than nothing. If you will match terminals in brackets "**There is nothing**" you will find that a lot of your preclears become very ill. This should be turned around into "**There is something.**"

The way one does Matched Terminals is to have the preclear facing the preclear or his father facing his father; in other words, two of each of anything, one facing the other. These two things will discharge one into the other, thus running off the difficulty. By bracket we mean, of course, running this with the preclear putting them up as himself to himself; as though they were put up by somebody else, the somebody else facing the somebody else; and the matched terminal again put up by others facing others.

The clue to all this is positive and negative in terms of certainties. The positive plus the negative in conflict make an uncertainty. A great number of combinations of things can be run. Here's a list of the combinations:

The button behind sex is "**I can begin life anew**" "**I cannot begin life anew,**" "**I can make life persist**" "**I cannot make life persist,**" "**I can stop life**" "**I**

**cannot stop life,” “I can change life” “I cannot change life,” “I can start life”
“I cannot start life.”**

A very effective process: **“Something wrong with (you, me, they, my mind, communications, various allies)” “Nothing wrong with (you, me, they, my mind, communications, various allies).”**

A very basic resolution of the lack of space of an individual is to locate those people and those objects which you’ve been using as anchor points, such as father, mother and so forth, and putting them into matched terminal brackets with this: **“There is father” “There is no father,” “There is grandfather” “There is no grandfather.”** In the compulsive line this can be changed to **“There must be no father” “There must be a father.”** One takes all the allies of an individual and runs them in this fashion.

The basic law underneath this is that a person becomes the effect of anything upon which he has had to depend. This would tell you immediately that the sixth dynamic, the MEST universe, is the largest dependency of the individual. This can be run out, but then any dynamic can be run out in this fashion. **“There is myself” “There is no self”** and so on up the dynamics. **“(Any dynamic) is preventing me from communicating” “(Any dynamic) is not preventing me from communicating”** is intensely effective. Any such technique can be varied by applying the sub-zero scale as found in *Scientology 8-8008* which is also to be found in an earlier issue of the *Journal of Scientology*.

One runs any certainty out because he knows that for this certainty there is an opposite negative certainty and that between these lies a maybe, and that the maybe stays in suspense in time. The basic operation of the reactive mind is to solve problems. It is based on uncertainties about observation. Thus one runs out certainties of observation. The most general shotgun technique would have to do with **“There is sex” “There is no sex,” “There is force” “There is no force.”** This could be run, of course, in terms of matched terminal brackets or even as concepts, but one must not neglect to run the overt act phenomenon, which is to say getting somebody else getting the concept.

The processing out of certainties would then embrace **“I have a solution” “There is no solution.”** These two opposite ends would take care of any individual who was hung on the track with some solution, for that solution had its opposite. People who have studied medicine begin by being certain that medicine works and end by being certain that medicine doesn’t work. They begin by studying psychology on a supposition that it is the solution, and finish up believing that it is not the solution. This also happens to superficial students of Dianetics and Scientology; thus one should also run **“Dianetics is a solution” “Dianetics is not the solution.”** This would get one off the maybe on the subject.

We are essentially processing communications systems. The entire process of auditing is concentrated upon withdrawing communications from the preclear as predicated on the basis of the body and that the preclear cannot handle communications. Thus **“The preclear can handle communications” “The preclear cannot handle communications”** is a shotgun technique which resolves maybes about his communications.

An intensely interesting aspect of Certainty Processing is that it shows up intimately where the preclear is aberrated. Here is the overall basic technique. One runs **“There is—” “There is not—”** the following: **communication, talk, letters, love, agreement, sex, pain, work, bodies, minds, curiosity, control, enforcement, compulsion, inhibition, food, money, people, ability, beauty, ugliness, presents,** and both the top and bottom of the Chart of Attitudes, positive and negative in each one.

Basic in all this is the urge of the preclear to produce an effect, so one can run **“I can produce an effect upon mama” “I cannot produce an effect upon mama,”** and so forth for all allies, and one will resolve the fixations of attention on the part of the preclear.

Thus fixations of attention are resolved by Certainty Processing, processing out the production of effect.

One can occasionally, if he so desires, process the direct center of the maybe, which is to say doubt itself, in terms of Matched Terminals. This, however, is risky for it throws the preclear into a general state of doubt.

The key to any such processing is the recovery of viewpoints. **“I can have grandfather’s viewpoint” “I cannot have grandfather’s viewpoint”** and so on, particularly with sexual partners, will prove intensely interesting on a case. **“There are viewpoints” “There are no viewpoints,” “I have a viewpoint” “I don’t have a viewpoint,” “Blank has a viewpoint” “Blank has no viewpoint”** resolves problems.

One should also realize that when one is processing facsimiles, he is processing at one time energy, sensation and aesthetics. The facsimile is a picture. The preclear is being affected by pictures mainly, and so **“There are no pictures” “There are pictures”** forwards the case toward handling pictures, which is to say facsimiles.

A person tends to ally himself with somebody whom he considers capable of producing greater effects than himself, so **“(I, she, he, it) can create greater effects” “(I, she, he, it) can create no effect”** is quite effective.

When one is processing, he is trying to withdraw communications. Reach and Withdraw are the two fundamentals in the action of theta. Must Reach and Can’t Reach, Must Withdraw and Can’t Withdraw are compulsions which, when run in combination, produce the manifestation of insanity in a preclear.

“I can reach” “I can’t reach,” “I can withdraw” “I can’t withdraw” open up into the fact that remembering and forgetting are dependent upon the ability to reach and withdraw. You will find that a preclear will respond to **“You must”** or **“You can,” “You must not” “You cannot,” “There is” “There is not” forgetting and remembering.**

The only reason a person is hanging on to a body or facsimile is that he has lost his belief in his ability to create. The rehabilitation of this ability to create is resolved, for instance, in a person who has had an ambition to write, with **“I can write” “I cannot write”**—and so forth. The loss of this creative ability made the person hang on to what he had. The fact that a preclear has forgotten how to or no longer can himself generate force makes him hold on to stores of force. These are very often mistaken by the auditor for facsimiles. The preclear doesn’t care for the facsimile, he simply cares for the force contained in the facsimile because he knows he doesn’t have any force any more.

It should be kept in mind that Reaching and Withdrawing are intensely productive of reaction in a preclear. But that preclear who does not respond to Reaching and Withdrawing and Certainty thereon, is hung up in a very special condition: he is trying to prevent something from happening, he is trying to maintain control. If he prevents something from happening, he also prevents auditing from happening. He has lost allies, he has had accidents, and he’s hung up at all those points on the track where he feels he should have prevented something from happening. This is resolved by running **“I must prevent it from happening” “I cannot prevent it from happening,” “I must retain control” “I must lose all control.”**

Blackness is the desire to be an effect and the inability to be cause.

“I can create grandfather (or ally)” “I cannot create grandfather (or ally)” solves scarcity of allies. **“I want to be aware” “I want no awareness”** is a technique which is basic in attitudes. Run this as others, in matched terminal brackets or in Expanded GITA.

Certainty there is a past, certainty there is no past; certainty there is a future, certainty there is no future; certainty it means something else, certainty it does not mean anything else; certainty there is space, certainty there is no space; certainty there is energy, certainty there is no energy; certainty there are objects, certainty there are no objects.

Professional membership in the HAS gives you the *Journal of Scientology*, *Professional Auditor's Bulletin* and other services as they are developed. It gives you as well professional standing. A certificate of membership for framing is sent to all the professional members. All the latest materials are sent to professional members and the fee assists in the general public interest in Dianetics and Scientology. We have here now Scientology, the Science of Certainty. We have sidestepped all the questionable material and have techniques which are built on things of which people are very certain. This is the beginning of a big push. Your membership fee is necessary to make it possible. Founding Members and Fellows of Scientology are professional members, where they are HDAs, in perpetuity without further payment. Send your \$25.00 membership fee by check, U.S. money order or U.S. cash to the International Office of the HAS located at 30 Marlborough Place, London N.W.8. Your card and certificate of membership will be forwarded to you. Give the number of your certificate and the school that issued it.

There are a few auditors in the field whose experience is such as to command considerable respect from other auditors. The grade of Hubbard Graduate Auditor has been instituted and is awarded by nomination from other auditors or by selection from the HAS to designate those auditors whose experience and results have brought them into prominence. The doctorate schools award BScn and HGA, but only HGA by nomination. This is more or less an honor award. Please send your nominations for such auditors through to the International Office. A small fee is charged to cover the cost of handling and certifying and the certificate itself. The fee is \$25.00. When HGAs are awarded the *Journal* carries notice of the fact. Be very certain in your own minds that this is not an effort to get another \$25.00; it is an effort to winnow out the very good auditors and give them a public recognition which their work actually elicits. While it does not in any way reflect upon the students who attended, the main reason for severance with the last Foundation was its diploma mill attitude about certificate awards, and it gave certificates to all comers. This has since, as it did then, posed many problems. The HGA certificate is an effort to recognize the merit of the really good auditors and to remove from their minds any feeling that their skill has not been recognized and to give the public certain auditors of whom they can be very confident.

BEINGNESS and CERTAINTY PROCESSING

The reason behind beingness is the drama of cause and effect. It has been isolated that the total reason for activity which explains all other activities is "to produce an effect." In this we have a dimensionless CAUSE ambitious only to produce an EFFECT and to handle effects which are produced on it.

BEINGNESS is the modus operandi of effects. The thetan would rather have less than more identity and becomes only when he cannot otherwise produce an effect.

The one thing a thetan is afraid of being is what he is in terms of this universe: nothing. Thus it is better to be anything than nothing. So it is better to handle, produce or have any effect than to handle, produce and have no effect. Thus the service facsimile, thus the conduct of the preclear.

Awareness on high scale is aware of producing effects and of effects without proof via energy. Awareness lower on the scale requires the proof of perception and thus energy and force.

As one moves from pure CAUSE into beingness one becomes involved with his own developed energy and the energy of others. Living is the battle of effects. Dying is the final dramatic effect one who has a body can always produce.

The thetan is never otherwise concerned than with effects. The problem of awareness and of effects in general is communication. Communication, not affinity or reality, is the monitor of any processing.

The phenomenon of facsimiles is produced by the thetan to prove to himself what he has done. He knows without facsimiles. He is already low in tone when he starts dealing with them. Energy, force, responsibility and perception are the same order of problem and thing.

Occlusion is the loss of viewpoint of effects. When one has lost a viewpoint with which to perceive effects and upon which he depended for all perception of effect he is very occluded. Viewpoint and evaluation are, aberratedly, synonyms. Thus a law: a person takes the viewpoint of that person who has most evaluated for him. If that person then dies, the result is the apparent loss of that other's viewpoint which brings about loss in general. This is solved by remedying the need of the now dead viewpoint.

Communication is defined as any RITUAL by which effects can be produced and perceived. Thus a letter, a bullet, the output of theta "flitter" are all, to us, communication. Men communicate with women with difficulty mainly because they have found that women cannot handle their communications: force and sexual particles. But men communicate even more poorly with men for there is no particle adequate. Women communicate poorly with men because they have found danger in the receipt of any male communication. Hence the

breakdown of interpersonal relations. Women find it all but impossible, for instance, to communicate with women; there is no particle.

Awareness is the first requisite of a communication system. If one is TOO aware, he is hurt. If one is not aware enough, he is hurt. A bad communication is a sudden impact. Gentle communications are seldom remembered.

Any certainty can be classified as knowledge. Certainties exist in three universes from many viewpoints. Awareness of a heavy flood of energy becomes a certainty.

Any certainty, just as any effect, is better than no certainty. Thus we find the preclear suspended on the track anywhere he has had a high certainty. Thus his suspension in electronics and such. A certainty is positive or negative—that something exists, that something does not exist. Run, as though it speaks, **“There is something here”** and **“There is nothing here”** in any numb or painful body area, and then the pc the same as though he speaks to it, and the somatic will abate or the numbness vanish. This can be applied to the outer areas around the preclear as well.

Matched or Double Terminals in brackets is a fast and effective technique. It is run on certainties. One runs only those things of which the pc is certain. They alone create a “maybe” and a “maybe” alone aberrates. A high level process is Matched or Double Terminals in brackets: **“I want more awareness”** with the emotion of certainty; **“I want less awareness”** with an emotion of certainty. **“I want no awareness”** **“I want some awareness.”** This pin knocks a case that is hanging fire into a willingness to perceive and, hence, communicate better. One resolves also the problem of lost viewpoints with brackets on **“I have my (mother’s) viewpoint”** and **“I do not have my (mother’s) viewpoint”** and on all persons who saw or evaluated for the preclear. Also in brackets **“(Any dynamic) can handle communications”** **“(Any dynamic) cannot handle communications.”**

The key theta actions are “REACH” and “WITHDRAW.” The auditor is trying to withdraw communications from the preclear. This restimulates in the auditor trying to withdraw or wait for communications in his own past. An auditor must match-terminal **“I must (must not) withdraw the communication”** on himself to get into good shape to audit.

My best to you.

ABOUT PABs

The response in terms of letters to the *Professional Auditor's Bulletin* is very heartening. Some have called it "the first auditor's newscast since Book I." Reports of cases which had long "hung fire" breaking under the onslaught of the data in the PABs puts a "long continuation" on the service.

The *Professional Auditor's Bulletin* was inaugurated to be timed with the simplicity of data as contained in the *Journal of Scientology* Issue "THIS IS SCIENTOLOGY, Science of Certainty." Here begins an era lacking in doubt and complexities for we gaze now at a solved problem, the human mind and human behavior. Many other problems may be solved as well but we KNOW and we are CERTAIN that change can be effected in any preclear in a reasonable length of time. And we have as well, various group techniques which are many times as effective as the individual techniques of '50-'52.

It was entirely necessary to pass through and to release data about many things which can be found in people and we are fortunate in having this data. But it is no longer necessary to answer challenges about the "authenticity" of things which have been mysterious these thousands of years. Like recent medical society releases (*Time Magazine*, June 8, 1953) demonstrate a growing alertness as to the actuality of "birth" and "prenatals" as described in Book One, someday perhaps all these other matters such as "whole track" will likewise receive widespread agreement.

This is beside the point. The point is that the engram can be solved in quantity lots irrespective of content and a man can be made free to his desired limits of freedom. This is all we have tried to do, make Man happier and better in a sometimes unkind universe. Perhaps the basic difference between "investigation" and "research" is that the investigator should seek truth, and "research" all too often seeks only agreement from the crowd. I find what I do and do what I do either because it is, to my way of thinking, the best thing to do or is the only thing I can do at the moment when confronted by many difficult obstacles; I have been too long in the "professions of applause" to care much for applause; my goal is the simplicity of getting a job done. And the job of making Man well is the job I have had the temerity to assume, not because I thought it would enrich anyone and certainly not for that odious thing called fame—for it is rather amusing that my name is not Hubbard and the fame, if it ever came, would go only to a legal trademark, a thing without body or spirit. Little men with great fears have often made the task hard; but it is being done and its results are being reported in the *Professional Auditor's Bulletin*.

CASE OPENING

Here begins the first of the series of *Professional Auditor's Bulletins* which deal with the auditor's own case and which can be "self-audited." Later the auditor may care to use the steps of this series on difficult preclears.

I am assuming throughout this series that the auditor is a difficult case *but* to get to the top and *stay* at the top the auditor, whatever he believes his case to be, should follow through on these steps.

We are going to pursue the following course here: the body, the analytical mind, the reactive mind, the rehabilitation of force and perception. We are going to take, at one session every two weeks, quite a little time at this. You've been ruining yourself for a score or two of years so you can expect a score or two of weeks to get unruined.

Now, to begin, I have often offered a point to you which is nearly always missed—the mind and the body are part of a gradient scale of creation. The mind is at a high point on this scale, the body at a low point. The mind has all the capabilities of the body, but the body has lost many of the capabilities of the mind. Thus the mind can function independently of the body *so long as it does not have its attention continually on the body.*

When the mind fixates *wholly* upon the body we have that extreme degree of introversion visible in psychotics or neurotics. No exterior world remains—there is only the body. The dwindling spiral toward oblivion is this road of greater and greater fixation upon the body.

You can observe that the child is *very* exteriorized in interest, sympathy, projects and you can trace the curve of his growing unhappiness through a life which at last is most concerned with eating or the inability to eat.

The downward curve of any case is this curve.

How does the mind become fixated upon the body? If you know your engrams you can see the sudden introversion caused by a blow. Kick somebody and observe his attention turn to the point of contact and only then turn out again to resent the kick. If you keep on kicking him and if he cannot use the motion to kick you he will turn all the way inwards about kicks and be in apathy. He is now a body willing to accept the exterior directions of your mind.

The compounded poundings of a lifetime bring about, in the natural course of events, this fixation upon the body. To get well, you must reverse this course, not by going into the past where there were no kicks (the effort of the neurotic) but by reducing or erasing the impacts (as per Dianetics) or by extroverting the attention (as in Scientology). These two methodologies have been developed by myself in order to make people well. There are many

ways in Dianetics and Scientology to achieve this. None of these ways include shocks and impacts upon the body, as these, of course, reverse the process and parallel the dwindling spiral of the MEST Universe.

If you have studied Issue 16-G of the *Journal of Scientology*, you will understand the simplicities with which we are dealing. While there is much more to Scientology than will be found in 16-G, none of it exceeds these basics.

Some are so extremely dense or so spun in that such simplicity of background is subject to grave suspicion and some are so far gone on voodoo that this separation of high level mental awareness (the analytical mind) and low level awareness (the reactive mind) must, of course, be witchcraft or charlatanism. When we separate the analytical mind from the body we discover most often that it very unclearly perceives this universe. It knows it is *not* in the body but it can't see walls. It can't even move mountains. The *body is* convinced about walls; the analytical mind, more highly aware, *isn't* convinced about walls for it hasn't been hit by that many walls. Very much more aware of truth, the analytical mind, wonderfully serene, sees or doesn't see walls at choice. The point is, the conviction of the existence of a universe depends upon the chronic restimulation of impacts. A fabulously interesting, utterly unbelievable communication system, complete with its own time, comes about through these impacts. The reactive mind (the body) believes it utterly. It isn't sane to be MEST or to be a body. Watch the skidding psychotic and observe his greater and greater conviction that thought *is* MEST, that words *are* objects, and watch first his growing anxiety about the body and then his frantic efforts to retain sensation and then his loss of all. This cure is worth studying, for it is the cure of illness, aberration and difficulty on any dynamic.

The primary difference between the analytical mind and the body is the ability of the analytical mind to have nothing and the inability of the reactive mind, the body, to have nothing. The body *knows* things exist and *knows* there are things it must have and things it must not have. By *things* we mean things with molecules in them.

Thus in this first session, we are going to ask the preclear, namely you, to put some attention on your body—medically and dietetically.

You won't find in any of my lectures or writings any discounting of the physical ills of the body. They comprise 30% of the 100% of Man's ills. On the contrary, you will find me asking time after time to be aware of, to observe, that your preclear may be physically sick. Physical illness is predisposed by, precipitated by and prolonged by mental aspects and difficulties. But you don't run engrams on a preclear with a curable physical ailment. Cure the ailment or alleviate it and *then* run engrams.

All right. Now observe the mental curve of a physically ill person. It approximates, in the various stages of the sickness, the various depths of the tone scale. A physically ill person is a mentally ill person. In the sanitariums *if* they had anybody there to observe it, some percentage of their "insane" are only ill physically, but this chronic physical illness is bad enough to make them act insane. One notable case comes to mind of a psychiatrist electrically shocking an inmate many times to discover finally (without any embarrassment, being professionally beyond shame) that the patient was in continual agony from cancer. An operation arrested the cancer. The electric shock was not so easily repaired.

Very well, not to infer anybody is insane, be aware that a chronic low tone, anxiety and insecurity *can* stem from a prolonged but not entirely suspected physical illness which in this day of Aureomycin may be cured.

Being particular about my practice, unlike some people I won't name, I always send a preclear to a medico before I audit whenever I suspect some chronic illness for maybe the medico can cure it quickly. If he can, then I can audit with speed. Auditing a physically sick preclear is *slow* work. In many instances where Dianetics failed in auditors' hands, the auditor didn't look at his preclear. He audited a preclear who secretly took drugs, who was ridden by

some disease, who didn't eat properly—in other words the failure was a failure to observe the simple rule that when a man is thirsty, while auditing might help a bit, it's easier to give him a drink of water.

All right. In this session, I am going to ask you to see if you aren't thirsty or hungry or sick before we go into your engrams.

How about dropping in on the local insurance examiner for a fast three-dollar checkover, asking him in particular to look for any possible chronic illness.

Now, it is 70% possible that whatever worries you or (if it is) makes your case hard to run, is psychosomatic. Let's wipe out the 30% chance that any trouble you're having is a physical stick on the tone scale, not a mental one.

Of course, you may be having no trouble with your own case. Fine. But if you are holding on to your bank and your body like mad, remember that it may be because your body is holding on to you.

In those around you and in preclears, you will find it very sound advice to observe for physical ills as well as mental. It may be true that *all* ills are mental BUT it may be possible to cure something fast with a simple diet change.

As for food—I can tell you at once, without even looking you over that you are deficient across the boards. I'm no food faddist and I would use Gaylord Hauser for you know what, but I've fed men on three expeditions and during an entire war and modern rations are so deficient in vitamins and minerals that it's a wonder you stagger around at all. Get this—the B1 normal of the average being comes about only through administering in tablet form about 250 mg. per day. By knocking B1 out of the body I can reproduce any and every kind of restimulation. It is a bumper between the restimulable engram and the preclear.

As for the body itself, it was made to be used—worked. Not used, it goes to the devil quickly. The favorite whine of America is “I don't want to work.” You might as well say “I want to be sick.” The American Banker has sold America and a lot of Great Britain on the glories of getting enough saved so one can retire. Death and retirement, if you care to look at the statistics, are damned close together. Retiring or “going away for a rest” are usually followed by illness. The only ambition of a sane body is to be permitted to work in harness until it drops dead in harness.

Now you happen to be using a body. Before we worry about your mind let's clean up the primary communication relay point, the body. And for two weeks, let's do these things:

1. Clean up your MEST, get done the various odd jobs you've “been meaning to do.”
2. Bring yourself up to date socially and give a letter or a ring or a personal call on people you've neglected.
3. Take a one-hour walk *every* day, simply starting away from home *very early* (dawn is best) for half an hour and then walk back, a different direction every day. (If you can't walk, get out in the yard and throw things for half an hour. If you can't throw, spit at something for half an hour—and I mean throw and spit literally.)
4. Get a physical examination and if anything is chronic get it cured.
5. Take twice a day 100 mg. of B1 (200 mg. total) and supplement it with 250 mg. of vitamin C.

If you will do these things, you will be ready in a couple of weeks for some auditing. And if you feel you're in such top condition you need no auditing, I dare you to do the above and feel the change.

This is good advice. But it is better than advice. It's an invitation to start living.

If you won't take it, then you want auditing to supplant living and you think processing will furnish you with an easy regimen or a painless suicide.

How about it?

L. RON HUBBARD

P.A.B. No. 7
PROFESSIONAL AUDITOR'S BULLETIN

From L. RON HUBBARD

Via Hubbard Communications Office
4 Marylebone High Street, London W.1

[1953, ca. mid-August]

Come on and bear a hand with your professional or special membership. Send your \$28 or £10, if you haven't already sent it, to London—4 Marylebone High Street, London W.1, or to the HAS in Philadelphia—237 North 16th Street. I need your fee to help bear the freight on investigation, PABs and the *Journal*. You need this data, this service.

Occasionally you may not like what I say but remember that small fault can be found with silence. You may not like what people say I do—remember that *all you know for sure* about what I do is that I do my job—it being my simple-minded belief that that is the only way for anybody to get anywhere. I want you as a member. There are darned few of us to get this show on the road as it is. So send in your membership fee if you haven't already. I need it. If you have a better "reason," charge it up to \$28 worth of auditing from Hubbard.

The International Congress of Dianeticists and Scientologists is scheduled September 30, 1953 (Tuesday to Saturday inclusive) in Philadelphia, Pennsylvania. Write to HAS, 237 N. 16th Street, Philadelphia for more data—or just be there if it is in easy reach. The entrance fee will be minor. I'm going to give ten hours of rundown on SOP 8L and auditing and demonstrations. And there will be lots of case reporting. Professional organizations will get under way in earnest for the first time. You may not be aware of it but with 16-G and other material, we are toeing the mark to take over psychotherapy in the U.S. That's not ambitious, there not being any besides ours. Hope you can make it. If you can't, a few months later there will be a Western conference in Phoenix.

Somebody may be interested in a personal project of clinical and research training. We have too few top-notch boys and girls in auditing and almost none in investigation. For the six weeks following the Congress I am going to groom a handful personally, picking out the most promising I can. There will be an \$800 fee, a guaranteed clearing, and an award of HGA to the successful ones. Needless to say, I only want experienced auditors for material. Also, I will listen if somebody is impatient to have his case cracked by me. I'm cracking occluded ones, even in Spanish and French these days—and I speak darned little of that!

As a personal note, I'm homeward bound by freighter, being shepherd to a couple of racing vehicles. Susie, who knew no Spanish at all but *pronto* (and *all* Texans know that), now holds long and involved conversations with the baby's Spanish nurse, shopkeepers, professors and officials. Confidentially, her accent is very Texan-Spanish with a southern drawl. The baby, of course, isn't speaking anything even though she understands what I tell or ask her. She's a real cute kid. All grin and giggle.

About Scientology, the universities in America would be ashamed of themselves if they could see and hear the high repute in which the work is held in Europe. Over here they *know* something happened in 1950.

Well—to business.

SIX STEPS TO BETTER BEINGNESS

Easy to Learn, Quick to Act

With regard to your own case or any case, be advised that as of this writing of August, 1953, six short easily learned processes exist which, separately or in combination, markedly and simply alter and improve a case. They solve those problems encountered in Dianetics as well as in Scientology. These processes are unlimited. They are not difficult to do. They work fast and they require no more time to learn than it would take to instruct a preclear.

When I step back and look at them I am a little shocked at myself for not developing them 25 years ago instead of this year, and I am more than a little shocked that Man, in 3,500 or 4,500 years of written history, could have remained ignorant of them.

Of course Man, in many cults and systems, borders on these. But make no mistake—if you think you know one of these because you saw it in Mysticism or Capitalism or some other cult, read it again here, for you have missed it. “Taking nothing” is not *denial*, for denial implies a shunning of something, and “taking nothing” doesn’t even imply a something exists. This, for example, is an *all* technique. It is a certainty of nothing-in-existence. Hard to do at first, perhaps, but productive. And so it is with other processes. Read well, for the thing may be so simple you will miss it.

Now what are these six wonder-workers? SOP 8? No, but they appear there. Formula H? Takes skill to use that. SOP 8L? No, we aren’t even covering these here. Our six processes have been around for a while and they are given to you as tested, for many auditors have worked with them. And they are given to you as self-processing techniques, for a trained auditor can use them on himself. Any one of these, used alone, would probably effect a theta clear. But that isn’t our goal just now. Many of you have no reality in that. Instead, let us use, one after the other, these six just to become better beings.

In subsequent PABs we will do processes which bring you to know about Life through your own certainty. In this one we will aim toward the goal of getting you to know that you are alive. Oh, you do already? Not, I am afraid, to as great a degree as you could. In this PAB we are going to cover the certainty that something can happen.

Now those of you who exteriorize easily need alter these processes here only to the extent of doing them while exteriorized. These apply to any case, mock-ups, black or what-room.

The processes are, by proper name:

- (1) Ten Minutes of Nothing.
- (2) Duplication (Step E, Short 8).
- (3) Spacation (Step III, SOP 8).
- (4) Contact (Step VII, SOP 8).
- (5) *Self Analysis* (Step VI, SOP 8).
- (6) The Opposite Pole.

They rank approximately in the above importance and they can be run in the above order.

Certainty Processing, Formula H, and SOP 8L are to be the subjects of later PABs. The above six serve our purpose here. They serve our purpose so well, these six—that an auditor cannot use them on a preclear without changing markedly the state of the case. In fact, it is my belief that an auditor, after testing these on himself and a preclear, could not honestly go back to using off-brand psychotherapy *unless* he had something else besides psychotherapy in mind, such as, shall we say, sadism or coercion. For these six by themselves or with Certainty, SOP 8, Short 8, SOP 8L and Formula H, produce any beneficial mental result possible according to my experiments, data and reports. Remember, all these are Scientology, they are not Dianetics. They go on a 180° vector to Dianetics. I developed these in 1953. I carefully point this out in

order to unstick a few people on the time track. The phenomena in Dianetics are still there but Dianetics requires too much skill *and* leaves too wide a margin for unscrupulous auditing. Dianetics isn't better—it's just too difficult, and takes too long.

These six are a backbone of Scientology, Science of Certainty. And they give you and your preclears all the certainty of recovery you could desire. They undo travail. They do their job easily without auditor restimulation. And you can self-audit them.

(Read ALL the PAB before Self-Processing.)

To begin the session, if you were here in person I would ask you to double terminal with **certainty** “**I can't make people well**” “**I can make people well**” in brackets, for it might be standing in your road. You can try it if you like but you don't need to. We'll pick up all that when we learn about LIFE in SOP 8L. Or I might have you run “**Must reach**” “**Can't reach,**” “**Must withdraw**” “**Can't withdraw**” on your favorite somatic first. But again, that isn't necessary.

Let's go straight to (1) of these processes:

(1) **Take Ten Minutes of Nothing.** This technique means Oh so literally what it says. It isn't ten minutes of “relaxation” or “relief” or “rest.” It isn't ten minutes of you, a body. It isn't ten minutes of somatics. It means ten minutes of no body, no engrams, no walls, no MEST Universe, no sound, no thought, really nothing. All one's life he is trying to get, to work, to be, to perceive *SOMETHING*. Now for Ten Minutes let us have utterly *NOTHING*. The gettingness of something makes a one-way flow. Also the dwindling spiral. Also, the one thing the analytical mind cannot be, it thinks, yet all it is is nothing, is in MEST terms: Nothing. Mind you, fear of NOTHING is enough to make one's stomach curl for Nothing is death itself. This is unlimited in running time. It *always* improves a case in the long run if not instantly, as it often does. The preclear discovers sooner or later he CAN be nothing, that he doesn't have to strive to be. What a relief! Lao-tse was *so* right about striving.

The MEST Universe itself is mainly nothing even in the science of physics. In sound, concentrate on the silences between the beats, not the beats, for instance.

You can use NOTHING in Matched Terminal Brackets, you can have Nothing of particular somethings such as dead kinfolk. But the basic technique and the one used here is simply “Ten Minutes of Nothing.”

If you or the preclear get too ill the first time (the illness would abate if the process were kept up and always abates in subsequent periods) use the next-to-the-last list of *Self Analysis* (something real, etc.).

Now to (2). This is **Duplication**. This process appears in Short 8 as Step E. But it appears so briefly that its use and variation has not been understood.

The analytical mind has come to depend entirely for perception upon the body while, it can be demonstrated easily, it is itself capable of vision.

Further, the body has a nasty and uncontrollable trick of duplicating everything it sees. This makes engrams. The body perceives continuously as we learned in Dianetics. Duplication is the action of making mental pictures. Duplication processing brings the mechanism of taking pictures under the aware control of the analytical mind. The body “makes pictures” of everything. It is *certain* of MEST because it has apparently been punished into agreeing with the solidity of MEST.

The analytical mind is not so “sold” on MEST. Thus, remember this, it doesn't make clear pictures or “see” well at first. It dubs in a thing of no consequence in theta clearing. The process begins by having the preclear (or yourself) look with the body's eyes at MEST objects

and, one by one, put *beside* each object selected a mock-up or duplicate of it. This is done rapidly with far more attention to quantity than quality. This is done for a couple of minutes. The second, longer step consists of advising the preclear or yourself to “look” with eyes shut at MEST objects and, eyes still shut, put a duplicate or mock-up beside each object selected, and perceived. One does not at first select the preclear’s body. One selects objects in the room, then outside the house. The last necessitates “seeing through walls.” At no time lead the preclear, if doubtful, to do more than “pretend to see.” But don’t tell him he must only pretend either, for this is invalidation. The certainty comes in on the duplicate. The preclear knows he is duplicating even if he is only pretending to see the actual object. Tell him to see the house next door and duplicate it with a mock-up beside it. Tell him to see a bush and duplicate that. Keep this up for *many many* objects. The preclear may or may not tell you he feels he is away from his body. If he is, good. Don’t tell him to get back in. Just keep up the process regardless. You are not interested at this stage or with these processes in theta clearing, but it happens anyway.

Finally have the preclear view and mock up beside it his own body and parts of his body from various angles. This process resolves scarcity of engrams and viewpoints and is intensely useful and valuable.

(3) **Spacation** is Step III of SOP 8. This is a specialized version of nothingness. It is very murderous to aberration. Its first phase is to have the preclear, with his eyes closed, “reach” up and find the two corners of the room behind him and get interested in them and NOT THINK. You can do this for hours. No matter how bad you feel or from what, you can always improve with this one. This puts the preclear in present time. And as circuits are never in present time, they key out. This process resolves all your out-of-present-time Dianetic problems.

The preclear is holding on to both sides of the engram bank, taking responsibility for one side only—thus he is an effect. This is “Spacation with MEST.” Your preclear, I am sorry to say, will eventually exteriorize whether he knows about it or not.

A total spacation is completed by having the preclear put eight anchor points of his own out, ignoring MEST, to make and use his own space. There are many uses for this process. All ills are basically lack of one’s own space. This Step III is basically a nothingness process. People who are afraid of nothingness can’t make space.

(4) Contact is Step VII of SOP 8. More data is needed here. Auditors have been writing me frantically telling me that their “sane” preclears get big tone rises on this and that this is *not* limited to psychotics. The process consists of having the preclear see, feel or otherwise sense objects in the room, reach for them with hands and then withdraw from them. It can be repeated theta-wise.

(5) Self Analysis (Step VI of SOP 8) is, of course, the total of *Self Analysis in Scientology*, published by the HAS in Philadelphia. It is mock-up processing. It (a) creates space, (b) takes attention off engrams, (c) recovers the use of energy, (d) improves aesthetics, and several other things. The next-to-the-last list in the book is still excellent—Recall a time when something was real to you, when you were in good communication, when you knew some affinity was present. This can be supplemented by having the preclear mock up an entirely fictitious series of past and future incidents—for TRUTH when it means MEST Universe is Total Agreement with the past; and that is death, that is MEST.

(6) **Opposite Pole** processing is new to you but it is a logical follow-through on three universes. We have here more than adequate to make one sure of his own universe, enough to make one sure of the MEST Universe, but not enough to make the preclear certain of the “other fellow’s universe.” (See Issue 16-G of the *Journal of Scientology*, “This is Scientology,” [page 378].) Certainty on three universes is necessary.

The Opposite Pole is, as I will cover in later PABs, quite important. Here I will give the rudimentary process:

There are two phases. The first is allied to Certainty Processing. The second is a resolution of valences. Its name is "Wearing Heads."

In the first, one puts an imaginary point before, behind, above, below, to each side of him, one place at a time, and has this point *think* "**I am going to destroy you**"; also have the points saying "**I will betray you**" and "**I won't reply**" and then the preclear thinks at the point "**Nothing there.**" This is a simple form. The point can think all sorts of threatening or cowardly things, and also "**Nothing there**" meaning all manner of things at the point. But the primary phase of having the point think "**I am going to destroy you,**" "**I will betray you**" and "**I won't reply**" and having the preclear think "**Nothing there**" and varying the position of the point will suffice when Opposite Pole is used with the remaining five processes.

"Wearing Heads" is the second phase of Opposite Pole. One has the preclear, or himself, make a list of early allies, pets, enemies, current associates, the wife or husband and objects and then, one after another, put on the head (mocked up over his own head or around him if exteriorized) of the other person or thing. One does this rapidly. The preclear gets some insight into the 3rd Universe. "Wearing Heads" is quite effective. If there are some heads he *won't* wear or if he gets one "stuck on" and "can't get it off," recall that this process is the last on the list and one goes from it to "Take Ten Minutes of Nothing" and around we go again.

Now if you really are serious about your own case or about getting results on your preclear, you will sit down or lie down for half an hour or an hour or so a day for the next two weeks and go through each one of these six, giving each a few minutes and then going on to the next. I won't tell you you'll be a clear in two weeks. You will have to have an insight of some depth into life to be a stable clear and you get that by getting audited on or auditing yourself on Certainty, Formula H and SOP 8L on the routine to be given in future PABs. But if you use these six steps as given here and don't wander and don't let your circuits get you into "mazes of philosophy" and don't get fascinated by engrams, you'll be a passable release after a while. You may even find out you're alive! Breathing and everything!

Here's the routine:

SIX STEPS FOR SELF-AUDITING (SSSA):

- (1) Ten Minutes of Nothing.
- (2) Duplication.
- (3) Spacation.
- (4) Contact.
- (5) *Self Analysis*.
- (6) Opposite Pole.

Do each not longer than ten minutes at a time. Do all in one session.

Use for any case, for auditing or self-auditing.

Send in for your membership so I can see you next fortnight.

[1953, ca. late August]

VIEWPOINT PROCESSING

A few weeks ago I was able to tell the various schools of the HAS in an Associate Newsletter not to bother with or work with their extremely tough cases for a little while since I had to hand a process which easily remedied their difficulties. I discovered Viewpoint Processing about the same time as The Factors, but wished to make completely certain of the results to be obtained by Viewpoint Processing and to go on for a few months investigating the possibilities that there might be another even more easily workable process by which the difficult case or any case could be resolved.

To give you an entire list of the processes developed and examined and applied for the purposes of test would be a lengthy and at this time unprofitable task. I should, however, for the use of future investigators, give you some outline of the processes developed and investigated. In addition to the developments which you see in the various books and articles I have written on the subjects of Dianetics and Scientology, and which delineate many processes, and in addition to lectures I have made on my investigations and applications in the field of the human mind, I have tested in excess at this date of ten thousand mental combinations of computations, various types of nothingness, facsimiles, postulates, force, perception and other factors designed to alter, enhance or nullify mental conditions. In addition to this purely thought investigation a great many mechanical aids, biochemical combinations of substances, various diets and regimens have either been tested or developed and tested in an effort to resolve endocrine and purely structural problems attendant upon mental and physical deficiencies in an effort to locate in structure a sweepingly simple answer. All of these efforts pointed toward and assisted in the development of the technology and methodology of SOP 8, Short 8, Six Steps for Self-Auditing (SSSA) and techniques evolved directly from the data given as The Factors, the five Pre-Logics and the Axioms and Logics as given in the *Handbook for Preclears*.

Investigation forced one toward the conclusions which follow: The problems of structure and bacteria are best resolved first by a direct address to the mind; second (but first in the case of emergency surgery) mechanical rearrangement of structure; and third, diet and regimen within the tolerances of the body; fourth, the administration of biochemical substances of a preventive, supplementary or curative nature, but only in the presence of obvious and well established acute or chronic illnesses or deficiencies. From the standpoint of technique, it could be said that those techniques which most apply creation and observation produce the best and most rapid effects. Those techniques which employ nullification or eradication are substantially less effective, and those techniques which employ evaluation for the patient or which cause him to combat or shun one phenomenon or another are directly harmful. Techniques which stress viewpoint creativeness, space and action are far superior to techniques which stress ideas or objects. Techniques which bring about anaten in any form or which stress somatics are not in the long run workable above a very low level. Any technique which introverts is inferior to a technique which extroverts the attention. The goal of processing could be said to be the restoration of the highest possible level of freedom of attention for the purposes of creation and observation. Emergency mental conditions alone excuse the running of engrams, the use of

concepts, matched and double terminals; but such a practice should be altered to unlimited techniques after no more than half an hour. Certainty Processing is apparently the only exception to this rule, but here the ingredient of certainty alone on past, present and future excuses the use of nullification. Some hundreds of tests applying viewpoint attention and other matters to Certainty Processing demonstrate it to be an emergency technique to be employed only to that level where observational creative techniques can be used. The remedying of scarcity and abundance in terms of Creative Processing as represented by SOP 8 (Step IV) is senior to, by far, Double Terminaling, Matched Terminaling and running concepts or Postulate Processing in any form. Restoration of the patient's ability to evaluate and an eradication of invalidation by restoring his confidence through direct observation are excellent techniques.

Auditing failure evidently comes about by the unwillingness on the part of the auditor to have other people "look." Auditing difficulties are found to lie more generally with the auditor than with the preclear. It could be said generally that an auditor is not in a position to audit unless he can comfortably out of a clear conscience permit other people to observe. The auditor's own fear of discovery of data in his own life is found to impede the progress of preclears markedly and is the basic reason for auditor fixation upon nullification techniques rather than observational techniques.

There are in the process of test four mechanical aids for the treatment of the psychotic which may or may not obviate auditing. Nevertheless such mechanical aids would have to be applied by an auditor. Pending the final testing of these mechanical aids, the auditor is invited to let alone for the time the problem of the psychotic and psychotic patients. But if he does feel called upon to treat the psychotic, his attention is invited to Step VII of SOP 8. It is highly probable that this step, succeeded by as much of the remainder of SOP 8 as can be assimilated, is the only mental treatment in existence for the remedy of psychosis or severe neurosis which will deliver good results without danger of worsening the psychosis. A long investigation of shock treatment by an unbiased investigator financed by myself has resulted in the incontrovertible conclusion that shock treatment of any kind, whether by use of noise, gas, electricity or physical blows, not only worsens but confirms mental derangement and is used in this civilization at this time solely because the level of acceptance of the psychiatrist is a psychotic person, which level of acceptance will not permit a raising of that person into the level of sanity. The use of surgery and shock upon the mentally deranged is bluntly criminal.

The recommended battery of techniques for the betterment of the preclear as of this date is as follows:

- Viewpoint Processing
- SSSA
- Certainty Processing
- SOP 8
- Short 8
- Formula H
- SOP 8L

Viewpoint Processing is contained in this issue of the PAB. SSSA has been covered in PAB No. 7. Certainty Processing is contained in Appendix 2 for SOP 8 [PAB No. 3]. SOP8 and Short8 are contained in Issue 16-G of *the Journal of Scientology*. Formula H [PAB No. 9] and SOP 8L will be covered in later PABs.

Although viewpoints may be handled in many ways and are best handled purely from observation, there is that case which is intensely occluded which cannot at the beginning of auditing observe well as a body if at all as a thetan. This is either the occluded or the delusory case. If the case is delusive, its entrance is via Step VII of SOP 8. If the case is merely occluded the obvious and immediate entrance to the case is Viewpoint Processing.

The blackness on the case is indicative of a scarcity of viewpoints, a necessity for safeguarding and protective "screens," a defensive and propitiative attitude towards existence,

too much loss of allies and goods, too much loss of space, and finally and most importantly, loss of those who have evaluated for the preclear. The sudden departure of the person who has evaluated for the preclear results in loss of that viewpoint which the preclear unwittingly had assumed. That one person evaluates for another solely in the most common concourse of communication is not aberrative, but where evaluation has taken on an extreme aspect as in the case of a mother, father, husband or wife, then the preclear has come to assume that if the person evaluates for him, the person is looking and listening and feeling for him as well. The loss, by any cause, of the evaluating personality causes the preclear to believe that he has lost his source of perception. There is no radical difference, and only a gradient scale, between "observing for" and "thinking for." "Thinking for" is much lower than "looking for" the preclear.

Direct observation is infinitely superior to thought which seeks to know before looking. Thought could be said to be the manifestation of evolving a low-level certainty of observation from a number of past observations. The combination of past observations to derive a future observation could be said to be the process of thinking itself.

Thus we find the occluded case very often very brilliant, very sane and very reasonable but inhibited in observation. The brilliant occluded case has achieved the almost impossible level of being able to know through past experience without looking at all. This could be said to be the generation of a theory: the combining of past experience to predict future experience, the role and function of a theory. Where the ability to think is combined with the ability to observe directly, one has a genius. The case which can observe but thinks poorly or shallowly is known to us as the wide-open case. The case which cannot observe but thinks obsessively is known to us as the psychotic. This does not mean that there are not combinations of wide-open and occluded cases, and it does not mean that all wide-open cases cannot think, nor does it mean that all occluded cases cannot observe. I have here presented only the two extreme aspects of "all observation without thinking" and "all thinking without observation."

All manifestations of thought break down into relative positions in space. A person is happy when contra-survival things are far from him and pro-survival things are near to him and unhappy when contra-survival things are close to him and pro-survival things are far from him. In other words, all manifestations of thought and all difficulties of thought find as their basic the five Pre-Logics, the substance of which is that theta locates things in time and space and creates time and space in which to locate things and creates things to be located in time and space.

It will be found that the spatial concepts and observations of the difficult occluded case are at fault: things are too near to him or too far from him; things are in improper relation one to another. The use of Step VII of SOP 8 upon an occluded case, even where the case is not even vaguely "insane," all can produce this startling result, for this step remedies relative position in space of various objects. This is mentioned in passing because the occluded case who comes to the auditor is usually merely worried or wants to be better and the auditor overlooks the fact that here is a very powerful mind holding well in check and compensating for lack of reality on spatial position. It will be found immediately that this case has been from early childhood extremely concerned one way or another by spatial position. This denotes a former dependency upon one person or another for the MEST universe itself to keep objects located relative to one another in space, and dependence upon the judgment of another as to whether things are near or far. It will be found immediately that somewhere in the current lifetime background of this preclear there was a person who was extremely concerned about the nearness or farness of things and who was obsessed on the subject of distances. A quick relief of this condition is the discovery with an E-Meter of the identity of this person and then the application of Viewpoint Processing, using that person as the one who has most evaluated for the preclear. The E-Meter, not the preclear, will be able to locate this person.

Although the occluded case will always inform one with great rapidity that he cannot get mock-ups, his statement is quite relative and is based upon his desire to defeat the auditor. It

will be found that the case can get some vague impression in one fashion or another sufficient to work the case.

The occluded case is afraid of sight. He will be found to recoil from a momentary bright mock-up or a facsimile. These frighten him. In Para-Scientology it has been discovered that a cycle of Can't-See, Can-See, has taken place somewhere in this occluded case's past. It has been offered that a person was blind in a lifetime and on death, of course, recovered suddenly his state of vision. So long as he was blind he was alive, the moment he could see he was also dead, so to see means to die. This has solved some of the blindness cases in Scientology. It will also be noted that the occluded case, when asked to exteriorize or when he exteriorizes for the first time, will feel a considerable amount of grief. In Para-Scientology this has been traced to past lives and the death (for exteriorization is an approximation of death).

It does not particularly matter whether the sadness of the occluded case, on the thought of exteriorizing, is occasioned by "past deaths" or whether his fear of perceiving is traceable to sudden visions of a body, now dead, to the end of believing that seeing makes him dead. These are matters for Para-Scientology and they only feed the occluded case's circuit which compels him to look always for a prior cause, a reason.

Indeed, his search for a reason is what marries him so thoroughly to a body, for a body always has reasons, reasons for everything. How far can you get from observations? A reason. The occluded case has to *know* before he can go, has to compute what he will see before he looks. He is the best customer for the map-maker.

The dear old Royal Auto Club with its wonderful fund of knowledge about touring, its beautiful travel directions, yet is an example of having to know before we can go. The RAC can tell you the number of pebbles on any road in Tibet, much less France. It is the best and most efficient club of its kind in the world. Just so, we do not object to this trait of the occluded case—to have to study books and maps before he can move—but the occluded case himself at length concludes that he isn't too happy even when he gets there. His longing for adventure is thwarted by his thirst for knowing before he is. He has to know, for example, all about the conditions of being a clear before he is audited. Then he approximates in auditing what he has now computed a clear should do. And his case stands still. Why? Because it isn't being audited—his circuits (calculators) are. On concepts and nullification techniques in general his improvement is very, very slow, for he is processing something while the auditor is processing him—and the auditor is not processing the preclear, but, via the preclear, a circuit. The answer to this is blunt: "Look! Don't think! Look!"

It will be found that the occluded case never looks at a thing. He looks at something besides a thing. He is "steered off" that which he would observe by charge. Ask him for an observation—you will get an indirect reply, a reason, an explanation, a description—and if he is in "bad shape" you will get an answer, not to your question, but to something else. By this alone you can tell an occluded case. A case pretending to be wide-open is actually occluded if it behaves thus. Many a "wide-open" case with "clear recalls" actually can't see anything or is seeing nothing but delusion. The positive key is, how direct is the communication with this person?

Another characteristic of the occluded case is that he "has been betrayed." Any case that talks much about betrayal is an occluded case, even if he represents himself otherwise.

The occluded case is sometimes a criminal, sometimes intensely honest. In a search for truth, he has interpreted truth as "agreement exactly with the past." This is honesty. It is also being MEST itself. So if you cannot get a case to lie to you, know that it is occluded. If you cannot get a case to act without a reason, it is occluded. If a case claims to be doing one thing and is actually doing another, if its actions are hidden behind a mask of TRUTH (if it is really a liar) you have a spun occluded case that has entered delusion. This person is crazy. And dangerous to the auditor and his reputation.

The *only* safe way to audit is with an E-Meter. Only *then* can an auditor know the preclear is doing what the auditor says. Spend twenty hours of auditing an occluded case if you will, without an E-Meter, come to the end of the period, as you will, without any marked benefit to the case, assume then that the technique didn't work (and you will), but don't expect any sympathy from me if you don't *always* use an E-Meter. If the preclear is running as you direct there is always a needle response, particularly on the new Mathison 54—no occluded case can get by one—but they can get by an auditor for the whole being if the occluded case is geared to defend and defeat other motion while yet emanating motion.

There is a type of occluded case, very low in reasoning ability, which may have given rise to the “vampire” idea—the personality which absorbs the life and lives on the life of others. This case, of course, is near-psychotic (you must understand that occlusion and psychosis are *not* synonymous). It has a peculiar trick which identifies it—it ignites and extinguishes matches. I remark on this type because it typifies in a peculiar way what the occluded case is doing: **THE OCCLUDED CASE IS DOING ALL POSSIBLE TO STOP OR ABSORB MOTION.**

Here we have the gradient scale of cases:

- Clear viewpoint (Cleared On)
- Viewpoint of facsimiles
- Viewpoint partially occluded (the average case)
- Viewpoint entirely occluded
- Viewpoint partially occluded, partially delusive
- Viewpoint of delusive facsimiles (the dub-in case)

It is a shock to the occluded preclear to find out what he is doing—for he is using every facsimile or ridge he can muster to *absorb* around him light, sound, feeling, motion, distance, and viewpoints. He is rigging himself up as a sponge for all motion that is forbidden or destructive. When you start to process this man, you will be astonished to find he is holding to him (with no responsibility) waterfalls to deaden sound, stove lids to stop fire, mats to deaden impacts. He is a walking soft-armor tank. In a light stage he is heavily built. When he is thin, he has begun to retreat from his armor plate.

He has followed this scale downward:

- 40.0 Cause (Emanating)
- 30.0 Mainly Cause, sometimes Effect
- 20.0 Half Cause, half Effect
- 4.0 More Effect than Cause (High Toned Man)
- 2.0 Mainly Effect, destructive Cause down
- 0.0 All Effect

Note: 4.0 was and is the goal of Dianetics. 30.0 to 40.0 is the goal of Scientology. This goal of Dianetics was so difficult or impossible to attain by my early auditors that I returned entirely to investigation in October of 1950. I had considerably overestimated the capabilities of auditors and seriously underestimated the difficulty of some cases.

Whatever process you use on an occluded case, you will find the above holds true. And of course it continues to hold true down into delusion. To make this case recover by wiping out engrams or postulates is bluntly impossible, for the case has mimicry of gravity and is grasping to it every incoming impact.

It is remarkable that the delusive or dub-in case is best told by its pretending to have facsimiles (a complete corruption of an intolerable past) and yet manifesting the other

manifestations of a completely occluded case. There aren't many of these delusive cases around; auditors in the old days commonly mistook these cases for near-clears, and thought to bring them up to a state of clear by auditing out engrams. Of course, the preclear could manufacture and believe (automaticity of engram manufacture) more engrams than could ever be eradicated by auditing and the case would simply stay on the same level or would even get worse. The auditor had failed to apply the small tests offered in Book One to distinguish a dub-in case. The wide-open case (delusive but clear recalls of non-factual material) is distinguished, then, by having the same manifestations in life as the occluded case, which is to say, a fear of and protest against sound, a general protest against life, a defensive and defeating attitude. But this case is in far worse condition than the occluded case and this condition is most easily noticed by endocrine disorders. This is denoted by sterility, untimely fat on the back of the ankles (startlingly common in the current civilization) and perceptic difficulties. In auditing this delusive case, it will be found that sonic and visio go off and the case becomes an occluded case before it rises far enough up the tone scale to have (and not need) proper facsimiles, or a good memory of past events. If the auditor thinks the occluded case is difficult, he should realize that this wide-open case is death and destruction to all around it, for the case is capable actually of nothing but destructive action and desires no other mental state in those around it than a complete apathy. The occluded case quite commonly supposes himself to be badly off; the delusive case rarely, if ever, believes there is anything wrong with him or her. The occluded case is high toned for homo sapiens and is therefore far more common amongst the leaders of society than even auditors suppose.

In Viewpoint Processing we are looking for the person in the preclear's past who did not enjoy certain positions on the tone scale. You must know that love, hate, enjoyment and admiration are not positions on the tone scale. You will not find them on any tone scale that has been released by me for they are attitudes toward emotion or characteristics of energy rather than emotion. Emotions are a set band of reactions. Any person who can be freely emotional and enjoy a "good cry," or even enjoy being apathetic, also can hate "having a good cry," and so it is as well with love and admiration. In what the Russians laughingly call a civilization (and you would be shocked at how far that is from anything Europe or America thinks is civilized) practically the only enjoyed emotions are apathy, grief and fear. The remaining emotions in that culture are all but unknown. This holds true on the tone scale, in spite of the fact that these emotions are actually enjoyed.

In the old days the Russians thought nothing was more fun than for everybody to go into the barn and burn it down. They have not much changed. In Germany the most enjoyed emotion is hate amongst the Junkers class. They hate up and down the entire emotional band with an abandon which brings out the sporadic excursions they take down into France. Love, if you have ever noticed, does not much care where it sits on the tone scale, as we find a young man deeply in love starving himself to death (a characteristic of apathy) and a young girl in love in a dreamy enthusiasm which makes her bloom. We find love used in Christianity about twelve feet below 0.0 and in New York precisely at 2.5 on the tone scale. Admiration is a particle which unites and resolves like the universal solvent all types of energy, particularly force. Hate coheses and hardens energy. Love is the human manifestation of admiration. All this so you will know why it is that an occluded case sticks at being an occluded case while another case does not. The reason is in the people who have evaluated for the preclear. One of these has taught the preclear arduously to dislike (hate) all manner of things, has taught the preclear that many things are bad (it's so bad over there you'll have to look back at me). Another has taught the preclear that he must love everything. The predominant teaching is "Do not enjoy," "Do not be happy" (happiness being a state of admiration of things).

The cycle, then, of the preclear who has been taught to hate things is that he begins to resist them and eventually piles up energy against them to such a degree that he makes an actual deposit, which is an occlusion and which has on his side of it complete blackness and on the reverse side of it the piled-up facsimiles of that thing which he is resisting. This screen, then, has a hunger for the thing which it was resisting, and if this screen is fed whatever it was set up to resist, it will dissolve. This accounts, in part, for the step of Expanded Gita. As a test, I fed

the screen of one preclear the loathsome item which it had been set up to resist for thirteen hours before the screen resolved.

In processing it is far better to pick up the evaluation which began the screens than it is to set out on the adventure of trying to dissolve the screens.

However, if you want to see a cleared MEST body it is probable that you will have to feed these screens on Expanded Gita, wasting and accepting in brackets for, perhaps, a hundred hours. This solves the actual hunger which depresses the acceptance level of the preclear down to the things which he is resisting.

The best trick the MEST universe has is to teach somebody he must not enjoy something, that that thing is bad and therefore he must resist it. Once this cycle of resistance is started, the preclear edges down toward the bottom.

In auditing Viewpoint Processing, then, with the preclear on the E-Meter, one should take an assessment of all the people with whom he has been surrounded to discover which one of those people enjoyed things the least and hated things the most, and which one of those people insisted that the preclear love everything. It will be found that both of these will probably wind up with a stuck needle when discovered, for the preclear winds up hating the individual who insisted upon love for everything. The sudden loss of a sexual partner runs the cycle from love to hate with rapidity and leaves the preclear hung at that portion of the track where he lost the person. By resisting the loss he resists the person, and if the person has done anything to engender hate, we will find the preclear in a strange state of hating love. If he has to resist all love and affection, then, the chances of his getting enough particles of admiration to make life enjoyable to him are nil. This person is probably earlier in the preclear's life than marriage.

What we are trying to do here, then, is not to run out all the engrams in the bank, but to release and free the viewpoints which are being resisted. This is somewhat like opening a safe. It was difficult to learn the proper combination; the proper combination consists of breaking down the resistance of the preclear to that viewpoint which loved everything and which evaluated for the preclear and tried to get him to love everything. It will be found that this person has departed from the life of the preclear and the preclear will probably tell you with a sudden realization, yes, his emotions shut off just about that time.

The screen which has been set up to resist this person may be based on an earlier screen, so one should take a second look and find out if there was somebody else who loved everything who is resisted by the preclear. It will generally be found that there are one or more earlier screens than the first one the auditor will discover.

Having found this screen, it is necessary then to have the preclear, whether he can see his mock-ups clearly or not, mock up in abundance the person being resisted in the attitudes of "looking for the preclear" and of "pointing things out to the preclear to be loved."*

Another variation of this process employs a principle which is very old to us— Cause and Effect. The actual computational difficulty with this case is that the case is seeking to be an Effect rather than to be a Cause. The case will tell you that it has been betrayed. This is, in essence, saying "I have been the effect of a bad action"; it is an apology for failure. It will tell you during one session that such-and-such was cause, during the next session that so-and-so was cause, during the session following that that somebody else was cause, during the session following that the engrams so-and-so were the cause, and will actually, when it is very badly off, write you very long notes concerning computations as to what was cause. All of these computations break down into the category of "Something else is cause other than myself." This is what the auditor is trying to remedy, for unless this cause can assume the role of causation, the case cannot emanate energy sufficient to remove the bank or to move around the spaces in which his engrams are contained—for his problem in being unable to move his engrams around is the problem of being unable to handle space. If he could handle engrams

and could handle space, it would be a very simple matter for him to pick up all these black screens and hang them on some building and forget about them. But so long as he is saying that something else is cause other than himself, he will not handle space, he will not handle energy and, truth told, he backs away from objects. And this level of case tends to accept very poor and out-of-repair objects, energies and spaces. This case and cases below this level will dramatize the poor man's outlook and will accept enMEST rather than MEST.

Thus it is very simple to get this case to run anything which will place the cause somewhere in his environment rather than in himself. The case actually wants to be an effect so as to receive sensation. This accounts in part for the absorption screens which are found in its vicinity. The desire-enforcement-inhibition curve runs down from wanting to be an effect through having to be an effect to trying to inhibit being an effect. When it gets down to inhibiting being an effect, it begins to fight the entire environment.

In more than one occluded case I have found the assumption to be the basic cause. Although this is part of Para-Scientology it is interesting that the auditor encounters it so often. The occluded case has stolen the baby. Papa, mama, no one else, must realize this. And at length the case itself will not realize it. The occluded case quite often is found stuck in birth. But it is stuck at the assumption point, where the thetan has taken over the baby, rather than the obstetrical end. Now and then some auditor starts to run a birth and finds a black hand reaching in for the baby. This is not the doctor's hand: the doctors do not reach in very often: this is the assumption. It will be found that the preclear will immediately steer away from this and, indeed, some preclears will fight it so hard that it cannot be run. Those preclears who fight this very hard are those preclears who have had families who did not appreciate them. The family was thought by the preclear to be saying continually, "See what you have done; we do not want you," and so on. This makes the preclear try to disavow his responsibility in having taken over the child. Wasting babies has a marked effect upon such a case.

Using the motive of cause and effect in Viewpoint Processing, one runs the preclear in vast quantities saying to the environment "**You are cause,**" saying to people "**You are cause,**" saying to his engram bank "**You are cause,**" and runs vast quantities of people saying to the preclear "**You are cause**" and people saying to other people "**You are cause**"; then large numbers of the preclear saying "**I am an effect,**" large numbers of people saying to the preclear "**I am an effect**" and large numbers of people saying to large numbers of people "**I am an effect.**" The wording of the thought can be varied in the last: "**You have betrayed me—an informer—it is your fault**" or "**You are to blame.**" One preclear on whom this was run after a couple of minutes sat up on the couch with a startled look on his face and said, "You know, it isn't saying that to me." When I asked him what he meant he informed me that although he had not before realized it, he considered that every wall and every tree was saying to him, "You are to blame for this." His case took an immediate upsurge.

Assigning cause and declaring effect is very high echelon processing and is a primary variation of Viewpoint Processing.

It should be realized that all the foregoing material consists of variations of Viewpoint Processing which is in itself susceptible to many combinations and uses.

VIEWPOINT PROCESSING

This process seeks to resolve the problems set up by the evaluation of one being for another. It resolves in particular dependence upon people, objects, bodies and special systems of communication.

Expanded Gita resolves scarcities. Viewpoint Processing resolves dependencies.

A being tends to close terminals with anything on which he depends, and attempts to widen terminals on things on which he dare not depend.

Upset and disillusionment about life becomes an obsessive desire for independence which in a body is, of course, impossible. The concept "I must be the only one" demonstrates the terrible urge not to be dependent upon anything. However, life works in two directions. A person who is trying to be "the only one" at the same time will be trying to make other beings dependent upon him. Thus the dependency of other beings upon him will eventually bring him downscale no matter how hard he tries to be the only one. "The only one" is a resistive computation and in a body is impossible to carry out and so results in a dwindling spiral.

To be "the only one," in other words to be entirely independent, in the lower tones the individual resists all evaluation for himself and evaluates for others. This in the higher tones is a native characteristic of life, but, just as any other characteristic of life can be debased and exaggerated, so it is in the lower tones. All life seeks to be independent; it is only when it becomes obsessively independent that difficulty results. In a democracy, for instance, the general feeling that all must be equal is fought against so that one finds in a democracy an excessively large number of people maintaining "computational" independence.

A body is grossly dependent upon other life forms and other MEST combinations for its existence. It is quite impossible for a body eating every day to be independent. The analytical mind in close position to this body and believing itself dependent upon the body eventually, of course, begins to believe that it itself is the body and thus we get the buried and mysterious loss of identity on the part of the thetan, who is, in essence, the analytical mind to the body.

One runs Viewpoint Processing on all dynamics. In particular the 5th, 6th, 7th and 8th dynamics must not be neglected.

In sanitariums the briefest observation demonstrates that the 8th dynamic is most prominently the aberrative dynamic, for here we have the idea that God inhabits all space, thus making it impossible for the preclear to have any space of his own. The preclear must either have no space or must be himself God. To solve the God problem, one simply rigs up large spaces in abundance "full of God" and more large spaces "full of preclear" until the preclear can have large spaces of both. It is interesting that in preclears whose families were connected with the Church, the problem of space is most acute.

This process is done by mock-ups of a very large order and of no particular distinctness.

Although any computation can be run, the following computations will prove effective: Cause, Effect, enjoy things, hate things, look, don't look, motion, no motion, sound, sight, feeling, work, pain, no-sound, no-sight, no-feeling, no-work, no pain, babies, no-babies, spirits, no-spirits, Christ, no-Christ, God, no-God.

The technique is run in this fashion: Brackets are used. One has the preclear put up a number of people or objects as himself putting them up, then has him put up people or objects as though somebody else were putting them up; then has others putting them up for others, all in quantity.

One should use those things of which the preclear is certain. In other words, where you have a case which has a great deal of black silence on it and constricted space, you should run cubes of blackness which is silent, the preclear putting them up for others, another putting them up for the preclear, and others putting them up for others.

The object here is a great many items put up rather than one set put up and held. One should put up many sets and should not hold them. If all he can put up are black cubes or patches of blackness, then he should put these up with the thought in each one such as "Cause."

It must be kept in mind that what one is doing with this process is resolving some of the evaluations which have been done for the preclear to the end of resolving a scarcity of viewpoints. The reason one keeps putting up very large numbers of points which are evidently thinking toward a direction is, in essence, the remedying of a scarcity of viewpoints. One takes it at the level of accepting less desirable viewpoints, and it will be found that more desirable viewpoints are much more easily wasted by the preclear, so that the process can be varied by having these viewpoints, as mocked up, waste large amounts of desirable things, such as babies. These viewpoints as mocked up will waste things that are desirable in torrents. We at once remedy the scarcity of viewpoints and the evaluation which those viewpoints have done. Thus one mocks up hundreds of thousands of grandfathers, pointing this way or that, or saying things are too distant, or saying simply, "You are the cause"; and one mocks up thousands of the preclear having him evaluating for others.

Don't-depend-on-me and depend-on-me is a key button, but all the buttons included in Step IV of SOP 8 can be used in this process.

The primary requisite of the viewpoint is that it has position relative to points. A change of viewpoint necessitates on the actual level a change of positions rather than a change of idea. The change of position is primary; the change of idea is secondary. Evaluation is the shifting of viewpoints or the effort to do so. On an actual rather than a thought level, this would necessitate transplantation from one spatial position to another spatial position. Shifting a baby from one side of the room to another side of the room is, in essence, evaluating for him, for it demonstrates to him a new point of view and new points to view. Dropping a curtain before one would be, in essence, evaluating for him. Locking a person in a closet or forcing a child to stay or sleep in a dark room would be forcefully evaluating for him.

A child best accepts his mother's viewpoint if his mother has been that person who most changed his position in space and who furnished for him locomotion. Not in quite the same order, an automobile or an aeroplane evaluates for one by shifting his spatial position from one point to another. Fixation upon vehicles of transportation is very noticeable in people and the loss of a vehicle is bound to be damaging to perception, for the vehicle furnished not only a point from which to view but changed that point. Thus distance is definitely involved, both in viewpoints and in evaluation. You will find preclears "stuck on the track" in places where their position in space was forcefully changed or interrupted. This could be said to be a forceful evaluation. All problems of thought reduce to spatial relationships, quantity, velocity or characteristics of energy, and these interacting bring about time.

Gaps in time such as in unconsciousness are a loss of viewpoint and are dependent upon others to view during the period, thus all evaluation for an individual brings about a restimulation of unconsciousness—those periods when a person lay unconscious, not knowing where he was, completely dependent for the safeguarding of his possessions upon others about him or completely at the mercy of those others. The first being safeguarded is restimulated by protective evaluation such as "If you do so-and-so you will get hurt," and the latter is restimulated by betrayal; because periods of unconsciousness contain within them pain and discomfort, protective evaluation and betrayal restimulate alike somatics, and could be said to bring about psychosomatic illness.

Where the preclear has had about him someone who told him what he did while he was asleep, he is likely to get that person confused with a doctor or nurse according to sex, in some operation, thus bringing the operation into constant restimulation. This is resolved simply by mocking up in brackets this evaluating person evaluating to the preclear and being evaluated to by the preclear.

Mocking up hordes of doctors and nurses will restimulate the somatics of operations. This is best resolved, if it becomes very acute, by simply feeding the preclear a great many operations much worse than the one he has and placing these in future; for he is running in the case of any operation which restimulates "It must not happen again."

The entire sub-zero tone scale is of great use in Viewpoint Processing. Ownership could be said to be that area being covered and protected by the preclear. As he goes on in life, this area will narrow down to just his own body and then to just a portion of his own body. This is because he has been driven back, step by step, conviction by conviction, to the point where he does not believe he can protect anything. He gets to the point where he apparently does not want a viewpoint but wants instead battlements, ramparts, caves, and any other place in which he might be able to hide. He tries to make his engram bank into such a fortress. In this case it is very good to give him tremendous numbers of protective viewpoints; stone walls, doors, caves, and thus satisfy his “hunger” for a place in which he himself cannot be viewed. He will gradually come up on this to a point where he is cautiously willing to view something. I have had a preclear give tremendous sighs of relief at being permitted for an hour to insert in the darkness about him barricades of various sorts.

A preclear who is very occluded does not think himself strong enough or does not sufficiently trust himself to offer very much protection to anything. Thus he cannot take responsibility for items around him and will be found not to be taking responsibility for several areas of the body.

The preclear will be found to have, if occluded, an enormous desire to view the future and will be found to have had in his past association which pretended to evaluate the future for him. Spirits are the commonest; thus one must not neglect the 7th and 8th dynamics.

The time factor of the viewpoint is tremendously interesting. The occluded preclear does not view the present. From the present he started viewing the future, and from the future started viewing the past. What he calls knowledge is the certainty of impact which has happened to him in the past and which he is certain is going to happen to him in the future. He *knows* that this is going to happen again. He knows in ratio to the violence of the impact. Thus seeking knowledge, he finds impact. If you ask him to run simply **“It is in the present”** he will rapidly discover that much of the blackness he is looking at is believed by himself to be in the future. In this case a special point of Viewpoint Processing is used wherein quantities of horrible and terrible events are placed in the future. As this is done, it will be found quite ordinarily that he begins to move on the time track and may quite suddenly get with these future mock-ups brilliantly clear forms and adequate space. In other words, we give him a viewpoint of the future in its most terrible and drastic form (he is, remember, not actually interested in the past: he is interested in the future and knows that such horrible things have happened and will happen again that he cannot adventure further in time).

It will be found additionally that he is expecting a great many people to appear in the future. The preclear is quite startled when Certainty Processing is used to find out that he actually believes certain people are present. This knowledge is suppressed, and Certainty Processing brings it to light. In Viewpoint Processing one gives numbers of people to the preclear coming to him from the future, particularly enemies he has known in the past.

It is peculiar to the occluded case that he believes himself, quite often, under arrest; therefore one should give him a great many police and uniformed people calling him here and taking him there; and one should also give him large quantities of schoolrooms and jails—there being very little difference between them in the preclear’s mind. He will become quite upset in this process unless he is also permitted to waste motion in wide spaces. The school and the courtroom have much in common in that they dispose of spatial positions with no recourse on the part of the preclear, and evaluate for him also on a thought level.

Books can, say, “do the looking” for one. This is one of the best reasons why science stagnated and why science becomes increasingly complex instead of increasingly simple. All the scientists are very busy looking in the books of other scientists instead of at the material universe and their own universes. To remedy this one can have the preclear get enormous stacks of books with the idea that they are looking for him. In the case of fiction, the books also feel and hear for the preclear; and more than one preclear’s sonic is lost in the silence of the written word.

In that a viewpoint does not only look but also perceives along other channels, it will be found that the preclear who has very little perception is actually expecting a totality of non-perception in the future. He believes that death is such a totality. He is holding on to incidents in the past which tell him that he will lose all perception in the future and this, in itself, shuts off his own perception. To remedy this, one should get in the future being deaf, being blind, being solidly stuck in coffins, and in general, having no viewpoint.

Invalidation is basically non-attention. Attention itself is quite important, for attention is necessary before an effect can be created. Thus the attention of the preclear will be found to be fixed or dispersed and not entirely under his control, which would account for the phenomenon of occlusion. The preclear cannot unfix his attention from things which he expects to happen. The auditor actually shifts his attention by having these things happen in the future in mock-up form and in tremendous quantities. One need not be too particular to discover what the preclear is afraid will happen; one only need take various possible disasters, all of them summing to a loss of viewpoint.

That thing which is most feared is that thing with which the preclear will close terminals. He actually creates those things which he fears.

Viewpoint Processing can be combined, of course, with Certainty Processing.

It will be found that Viewpoint Processing is very effective but that it does not even vaguely supplant observation. Certainty Processing and Viewpoint Processing should be used in conjunction with such a process as SSSA, using it between the six steps. It is, like all concept, postulate, matched or double terminal processing, a propitiation of the circuits.

Now I have given you this rather expansive look at Viewpoint Processing so that you would understand what we are trying to do to run the computation amongst all computations, the center central of all thinking, which can be run on an occluded case. It is one thing to have, you must realize, the center of all thinkingness and quite another thing to have it in a form which can be run. I am giving you here following the form in which it can be run. The technique with which it is run is Viewpoint Processing.

In other words, we have here three things in conjunction. We have the center centerness of all thinking; we have the form in which it can be run, which is to say, the words which express the thought which will run on the case, no matter how occluded that case is; and we have the technique with which it is run. These are three separate items.

The center centralness of all thinking is, of course, change of position in space. If you recall your Axioms you will understand that this is known to us as time, it is also known to us as motion. A particle moves from one position to another position and this change requires a certain amount of what we arbitrarily call time. The change cannot take place instantaneously, otherwise the particle would be in both positions at the same time.

At the International Congress of Dianeticists and Scientologists [September 30—October 4, 1953, Philadelphia, Pennsylvania], this matter of spatial position will be given at length and probably as you receive this will already have been given, in which event the tapes most likely will be in the possession of your nearest Associate.

The change of position of spaces is an operation in which the preclear must be able; if he is not able to change the position of his own spaces, then he cannot change the position of his facsimiles. The inability to change these spaces means an inability to “keep up with time” and sticks the individual in the engram.

The two most prevalent viewpoints to impress one with how bad something is are that one must change his position in space and that one must not change his position in space. Indeed, a communications system is dependent upon not changing one's position in space. Thus attention tends to fix one in space.

The dwindling spiral of the MEST universe is the desire to remain fixed in space. This eventually immobilizes a person. Perception, action, doingness, sensation, sonic, hearing and even happiness depend upon an ability to change in space. Money, security and communications systems themselves tend to fix a person in space.

All this twist to thinkingness comes about from motion itself. An explosion is not enjoyable to the person in the center of it. Thus one attempts not to disperse, which is to say, change position all over space. An impact seeks to fix a person in space. People dramatize the dispersal by insisting that everyone move around in space, as in the case of an enthusiasm dramatization (which, by the way, most people bent on security do not like) or that, in the case of the impact, people stay where they are and not move. Because impacts are more common than explosions it could be said that the engrams dictate a dwindling spiral with greater and greater fixation upon being "well fixed," to use the colloquial term which best fits the master engram of them all.

In the Axioms you saw where thought is preceded by motion. This is quite true. Obsessive thoughts are preceded by too much motion in too little time. This, indeed, produces the sensation of pain.

Along with this we have, of course, the insistence that one must not change spaces. Here in the MEST universe we have only one space actually, but to have a time track one must continually make space. One confuses MEST universe space with his own ability to make and put space into the past and so becomes extremely tangled the moment he decides not to have a great deal of mobility. This is seen in the young man who gets married and has to "settle down." The 1.5 is obsessed with the idea of people staying in one place, remaining fixed, not moving. This, of course, is death.

You have also noted the franticness which comes over some people when they have lost some material object. It has disappeared into space, which is to say, it cannot be located or it cannot be fixed in space, much less changed in its spatial position. It is then, without observation, evidently changing its spatial position. This is the action of a hidden influence and is quite frightening to the individual. All religion uses this fear in order to evaluate for people.

With Viewpoint Processing, one mocks up hordes of spirits, gods, people declaring first that everything is lost in space, then that everything must be fixed in space, then that everything must be changed in space, then that the spaces must be changed and then that spaces must be fixed. One does this and intersperses it with minutes of nothingness; the last is necessary to run out the suppression the preclear has put on these viewpoints. One runs it as well in brackets. One has hordes of the preclear in various forms and aspects declaring that nothing can be found in space, that everything must be fixed in space, that everything must be changed in space, that spaces must be changed, that spaces must be fixed.

One does not bother with the reasons why the spaces must be changed; the body has lots of reasons for everything. They are entirely unimportant. The biggest bugaboo your preclear has is that he has to have a reason to do something. If he has enough reasons, he'll be good and dead.

One does not, when he is running this process, permit the preclear to go wandering off and running people with other ideas than this simple one, change in space. Once in a while he will want to re-phrase the same idea and that is, of course, quite permissible.

Getting two spots out in front of the occluded case which are saying, “**Do not change in space**” is quite effective and will quite likely produce considerable somatics of tiredness, for that is the main excuse for not changing in space: one is too tired to go.

Your occluded case, then, breaks down to one of two kinds: one will get mockups which will persist and not go away, the other will get mock-ups which vanish instantly. The former is stuck in an impact engram, the latter is stuck in an explosion engram.

The phenomenon of seeking to know is actually a search for a certainty. The greatest certainty is the certainty of impact. Thus, when one goes toward a great certainty without this knowledge and these techniques one tends to go downhill toward engrams which contain an impact and which, of course, remain more and more fixed in space. Thus you have the scholar who becomes more and more immobile and, indeed, you have that operation of the State known as “education” wherein the State delivers into the mind of the child in sixteen years of sitting still in classrooms knowledge which could be delivered in a compact form in two or three years at the most. It is, in short, a control operation.

In running this, one will find the phenomenon of black and white turning up. If he is running lots of people with “must not change in space” and the field of vision remains black, then he should be running “must change in space,” at which moment it will be seen that the field lights up. Sometimes “must change in space” and “must not change in space” alike do not light up the dark field; at this, one should run “lost in space” or “lost in the darkness,” at which time the field will probably light up. This can be watched on the E-Meter. Whenever the field goes entirely dark the E-Meter sticks; in addition, the energy involved in the material is not running out when the needle is stuck. So long as the needle is gradually rising, the auditor can be sure that the field is fairly white before the preclear. When somatics flick on the needle, when it gives small jumps or sticks, it is time to reverse the concept. When all concepts tend to make the needle stick, simply give the preclear in brackets a moment or two of nothingness until the needle is again free.

We will call this Triple Process of the right button with the right phrasing with the right mechanical process “Change Processing” for further reference.

If you cannot now finish off your occluded cases with a few hours of auditing, I disown all of you.

This is the third of the series of the *Professional Auditor's Bulletins* which delineate techniques to assist the auditor's own case and to give him data he may use upon his preclears.

Viewpoint Processing may be self-audited within reason if the individual thoroughly makes up his mind to use it as an intermediate step between the steps of Process SSSA as delineated in PAB No. 7. Otherwise it will leave him wallowing in his circuits, not that this, for many an occluded auditor, would be anything new.

Author's Note: This paper was written in Seville, Spain, in what the Spaniards laughingly call a civilization. They have electricity of varying voltages which is off for many hours of the day, water which only comes out of the faucets between eleven and one, a mailman who, surprisingly enough, delivers packets. Of course the castanets and beautiful nights make up for all this and nobody worries about anything and it all somehow gets done manana, but it doesn't particularly add to the quality of technical papers which get dictated, when there happens to be electricity, from notes which the maid overlooked destroying in her clean-up. Understand, then, that this paper is very informal. It is sent through to you now as it is because the information is three years overdue already.

[1953, ca. early September]

FORMULA H

In early 1953 I developed Formula H as a basic resolution in terms of emotion and effort of insane impulses, neuroses, obsessions and compulsions. It is a limited technique. Formula H is the end development of Effort Processing, and is run with all the technology learned in Effort Processing itself.

FORMULA H: THE EFFORT TO REACH AND WITHDRAW, TO GRASP AND LET GO OF ONESELF, OF OTHERS FOR THEMSELVES, OF ONESELF FOR OTHERS AND OTHERS FOR ONESELF AND OTHERS FOR OTHERS: FOR FORCE, PERCEPTION AND ADMIRATION WHEN RUN RESOLVE THE TENACITY OF ENGRAMS.

The first example of the use of Formula H would be applied to present time. One would ask the preclear to run the effort to reach and to withdraw *into* and *from present time* in terms of force, in terms of admiration and in terms of perception. He would run as well for force, admiration and perception the effort to grasp and the effort to let go. He would then run present time as an entity, reaching and withdrawing, grasping and letting go the preclear. He would find that there is a duplicity of effort wherein the preclear can run withdrawing while something else withdraws, reaching while something else withdraws, withdrawing while something else reaches, and reaching while something else reaches, grasping while something else grasps, grasping while something else lets go, letting go while something else grasps, letting go while something else lets go. This can be run in brackets, which is to say with the preclear doing it as though others were doing it and the preclear doing it for others doing it in regard to others.

One could run this generally, which is to say without any specific object in contest with the preclear, and one could run it on pictures alone or on engrams alone if the preclear knows what an engram is.

Of course, this is a limited technique. It can be run only until such time as the preclear's case is moving more easily.

The technique can be run slowly or rapidly, which is to say, one can run the cycle and withdraw as fast as the preclear can think it or slowly. This would depend in large measure on the use of an E-Meter. The needle should keep rising while the preclear is reaching and withdrawing, but when it reaches a stop then the effort should be changed or reversed.

The use of Formula H is entirely an emergency measure. Formula H is not intended to clear anyone. It is intended to put a case in shape to run more easily. Immediately after Formula H is applied, Acceptance Level and SOP 8 can be applied. In other words, Formula H should not be continued indefinitely. The reason this technique should not be used indefinitely lies in the fact that after it has shaken the case loose, its continued use will bog the preclear down in

some other part of the time track, for the use of the technique primarily is to shake the preclear loose from the time track. The emotion of insanity—and indeed, there is an emotion of insanity—is discovered in the preclear by having him run something withdrawing while he is reaching or something reaching while he is withdrawing. This is an actual emotion; such a case has insane impulses. This technique should find, bring to view and run out these impulses, for it is an intensely uncomfortable emotion.

Reaching and withdrawing, grasping and letting go are the actions of theta itself. It does this with beams, particles and forms. Thus the formula exactly parallels theta operation, thus its effectiveness. But its continued use on the individual, the analytical mind or the thetan, the production energy unit, or whatever else you want to call it, in the body produces sufficient energy to shake loose engrams which might be better left untouched. Thus the limitation of its use.

It will be found while using it that the emotion of insanity can be turned on or a manic state can be turned on in a case. These emotions will run out simply if the auditing session is continued a little longer. If these become very acute, however, turn to Step III of SOP 8 and have the preclear hold the two upper corners of the room. This will clear away these impulses.

Commonly a preclear runs with this formula into a situation where, if he is a man, the sensation of a woman trying to eat him and a woman being white and himself black, in reversing the reaching and withdrawing, he finds himself trying to eat a woman, himself white and the woman black. This situation, when encountered, can simply be run one way and then the other way until all these impulses cease. Considerable sexual sensation will turn on during the running of this and they should not be left in restimulation. Formula H is called Formula H because the “H” stands for Hope. It can be used on a very difficult case if it does not immediately respond to auditing. Something can happen with sufficient drama and he can know he can get better. This gives to the auditor a tool which will produce relatively fast effects. It also gives the reassurance that the auditor can do something with this person which has not been done to this person before.

Formula H can be self-audited because, of course, Formula H applies mostly to the body. But if so used, it should not be used very long and it should be used with Six Steps to Better Beingness [SSSA].

RESOLUTION OF GEOGRAPHICAL AREAS

It is quite important for the auditor to understand the nature of geographical areas in their role in aberration. As an example of this, let me tell you a story about a little dog on a ranch I once had which, indeed, is responsible for calling my attention to the fact that it is the *location* not the personnel that is at fault.

This little dog was running down a quarter-of-a-mile-long road when a careless driver hit him with a front bumper. At the moment of impact the driver reacted with sufficient speed to keep the wheel from going over the dog. The driver did not see the dog had not gone under the car, and when he got out the dog was gone. Evidently it had run immediately after being struck into the brush beside the road. He was gone for three days and could not be found in the entire area although looked for. At the end of the three days he came back, running up the same road. When he came within 30 feet of the spot where he had been hit, although no car was now standing there, he lit out into the brush and scouted the area, coming back on the road again well beyond the spot, thus avoiding the place in the road.

On subsequent days the little dog, coming down this road came closer and closer to the area where he had been struck, each time noted it and avoided it. He had at the same time no fear of the car which had struck him and no fear of the motor of the car and no fear of the people who had been in the car.

After about two weeks, he would walk all the way down the road without going into the brush. Each time he passed the geographical spot where he had been hit he lowered his head and looked frightened when he passed. There is no difference between this dog's reaction and the reaction of a man. In Book One you will find the mechanism of avoiding a restimulator. The person will not look at (as discovered in a hypnotic test) the thing which is motivating his action. If the signal he is being given in a post-hypnotic command is the hypnotist touching his tie, he will find fault with the room, with the hypnotist, with the hypnotist's clothes, but very rarely with the hypnotist's tie, the actual signal. This tells you, then, that man avoids geographical areas and will not look at them, and at the same time will say that he is not in that area because of people, because of incidents, because of many things. He has been injured in some geographical area. Pain and unconsciousness have taken place at some point on the globe, some city, some ocean, some altitude, some depth. Afterwards, he avoids such a point.

In Para-Scientology, it has been established without any great certainty that man has been here in this universe for some time and that men have a great many recorded experiences much earlier in existence. It does not matter whether this is true or not; it does matter that men have geographical antipathies. They are avoiding many spots in their own home, around their own towns, around their own state, their own country, their own continent—all over the world. This comes to a pass, finally, where a person is avoiding the entire world. Also in Para-Scientology we have turned up in many cases what the preclear claims is "space opera." The only thing that is very certain in each one of these cases is that the preclear so claiming actually avoids space. He avoids space just as the little dog avoided the point on the road. In other words, this person has been injured in space and because space is so difficult to locate and points in space are so difficult to establish, he begins to avoid all space and so we get the case which is hard packed all around with engrams. He is trying to be solid so as not to have any space. If we work this case on the Formula H given above as we discuss in a moment, we will discover that there are many points specific and exact in space in the vicinity of the solar system which the person is particularly antipathetic towards. He may or may not have an explanation for this but the point is he does avoid space and points in space.

In view of the fact that the person who wants no space is avoiding the entire MEST universe and because any point in or the entire MEST universe can be a geographical area, we get what is this tremendous antipathy for the MEST universe on the part of preclears. This resolves by processing geographically all of the areas of which the auditor can think or read about from an atlas.

Geographical processing is quite surprising in its results. It is done with Formula H. One gets the preclear's efforts to reach and withdraw from, to grasp and let go, various geographical areas; and gets the preclear getting others trying to reach and withdraw from, grasp and let go, the same geographical areas; and gets the geographical areas trying to withdraw from and reach, grasp and let go, the preclear; and gets the areas reaching and withdrawing from, grasping and letting go, others.

The peculiar nostalgia generated by reason of a person's being raised in a certain area (which in its acute state is homesickness) is resolved by the use of Formula H on the area of the childhood home. If one were to be processing children in a summer camp, he would find that many of these were suffering acutely from homesickness and could not enjoy themselves. If he would simply take a group of them and get them to reach and withdraw from home, he would possibly, through a bath of tears, restore the vitality of many who were ailing.

Particularly for the case who is having difficulty with space, this is a recommended process. An example of its running follows:

Auditor: Get the effort to reach the place you lived when you were five.

Preclear: Tries to recall place and cannot.

Auditor: What part of the United States was it in?

Preclear: Somewhere in the Midwest.
Auditor: Try to reach the Midwest.
Preclear: Does so.
Auditor: Get trying to withdraw from some place in the Midwest.
Preclear: Does so.
Auditor: Now try to see (reach) some place in the Midwest.
Preclear: Does so.
Auditor: Now try not to see some place in the Midwest.
Preclear: Does so.
Auditor: Now try not to admire (withdraw from) a place in the Midwest.
Preclear: Does so.
Auditor: Now try getting to admire a place in the Midwest.
Preclear: Does, remembers that it is Sioux Falls and achieves a visio on the area and develops at the same time a considerable body warmth which is uncomfortable.
Auditor: Now gives the preclear the same as above, as though Sioux Falls were trying to reach and withdraw from the preclear. Then the auditor runs:
Auditor: Get the effort to let go of Sioux Falls.
Preclear: Does so.
Auditor: Get the effort of Sioux Falls to let go of you.
Preclear: Does so.
Auditor: Get the effort of Sioux Falls not to look at you.
Preclear: Does so.
Auditor: Get the effort of Sioux Falls to grasp you.
Preclear: Does so, and suddenly finds himself engram wise in a room having the measles.

This is the hold on the track about Sioux Falls. Somatics become acute, warmth excessive. The preclear keeps saying that the sickroom alternates with the county jail. It suddenly develops that he was in quarantine during his illness and felt like a prisoner and has felt degraded ever since.

The auditor now uses Acceptance Level Processing or Expanded Gita. As the former has not been covered, the latter will be illustrated.

Auditor: Start mocking up lots of rooms full of measles.
Preclear: Does so, and is astonished that they keep falling in on him. He does this and suddenly remembers how nice his mother was to him during the measles.
Auditor: Gets the preclear to throw away rooms full of measles until the preclear can do so easily.
Preclear: Fever has abated, engram has been run out.
Auditor: Gives the preclear the effort to reach and withdraw from present time, and the effort of present time to reach and withdraw from the preclear until the preclear is very alert.

End of Session.

You will find that Formula H used in any combination is productive. If used in conjunction with geographical areas, it is extremely productive.

It is recommended for all cases early in processing; it is not recommended for cases late in processing which are progressing satisfactorily. It is not recommended that Formula H be run longer than for two or three hours on a case except where the auditor has set out to process geographically the entire MEST universe. Processing the entire MEST universe and points in its space would be identical with the above illustration except that points in the MEST universe would be substituted for first the Midwest and then Sioux Falls as the "Sioux Falls" particular points showed up with the preclear.

It cannot be too forcefully stated that the emotion called insanity is an actual emotion and is turned on and is run out by Formula H. It may or may not be good processing for an auditor to attempt to discover and locate this emotion of insanity on preclears who aren't neurotic or insane and so discharge it. This would depend entirely on the skill of the auditor. When the emotion of insanity is turned on in a preclear who is otherwise sane, it should simply be run out by Formula H.

CHANGE PROCESSING

In *Professional Auditor's Bulletin* No. 8 we have a variation of Change Processing which utilizes the factors given in that PAB to excellent advantage.

We find as a law that a person takes the opinion viewpoint of that person or thing which has most changed him in space.

It will become apparent immediately that the reason soldiers will obey a sergeant's command to go forward into battle lies in their training in close order drill. This sergeant has placed them here and there on the drill field, has posted them on sentry duty—in other words, fixed them in space—and in general has altered their positions in space to such a degree that now the opinion of the sergeant that they should go forward even to certain death has much higher validity than the soldier's own opinion.

We see as well that the mother, having carried the child in the womb, having carried the infant here and there, and the father, having carried the infant about and having changed the mother in space during gestation, both, then, have enormous opinion value for the individual. This is basic on the reason why the preclear is so anxious about his personal relations with his parents. This is also why he has obeyed his parents so implicitly or has had to fight so hard not to obey them. Because his parents have changed him in space, his parents evaluate for him.

It will also be seen in a motor-happy society that machinery very soon begins to evaluate for the individual, for a car changes the person in space. Machine tools and large stationary engines fix a person in place. It is as much evaluation to fix a person in space as to change him in space, for, indeed, fixing a person is actually to make him do otherwise than he himself would do, so is, in effect, a change in space against the person's own self-determinism.

As soon as we examine fixation in space, we are examining fixations on subjects. We have here, in a breath (but with a rather dirty trick beneath it which will be covered in a later PAB), the entire secret of education. They fix the student in space and thus can evaluate for him. This is doubly vicious as it also reduces the space of the individual. If you wish to see your preclear upset and dumbfounded, simply have him fit the corners of his kindergarten and early grade to the corners of the room in which he is being processed and keep duplicating these rooms, which is to say, fixing the old space in this new space, until he gets a good facsimile of his early school. Incidents where he was punished or degraded will immediately turn up. This is an investigatory rather than a therapeutic process, for it takes much too long.

Of course there are two sides to moving things in space. It is a question whether the child moves the mother in space more than the mother moves the child in space. Of course, the child, being smaller, is apt to take the view that the mother is moving him in space; yet the mother's actions are being monitored continually by the necessities of the child. In such a way there are two evaluations of an automobile. One is that an automobile is moving the person in

space and the other is that the person is moving the automobile in space. The difference between these two viewpoints is self-competence. We are looking here at above 2.0 on the tone scale and below 2.0 on the tone scale. Above 2.0 the individual feels that he is moving the automobile in space; below 2.0 the individual is certain that the automobile is moving him in space. This is also the difference between happiness and unhappiness. A person is happy as long as he feels that he is the causative mover and is unhappy to the degree that he feels that he is the effect of something which moves him.

Illustrative of this point is an airline pilot, one of the best on the Company payroll, who, as long as he flew the airplane, was an excellent pilot. This individual at the end of his run would quite often “deadhead” to the city where he had his home. He would ride as a passenger, and it was a source of amusement over the entire airline that this crack pilot in the smoothest air would be airsick every time he was a passenger. In the first case, he was moving the airplane in space; in the second case, as a passenger, the airplane was moving him in space. Being moved in space by an airplane occasioned terror; moving the airplane in space occasioned happiness.

During the constructive or active moments, the thetan is moving the body, but there are times when the body’s necessities—as in the case of urination and bowel movements—move the thetan. Thus we find that the latter are quite aberrative in the individual.

In the Pre-Logics we found that the prime function of theta was to locate or alter objects in space and time, and also to create space and time and objects to locate in them. So here we have viewpoints and the prime purpose of theta interlocking-and discover that we have come on two roads to the same point.

A method of running evaluation, particularly aberrative evaluation where the preclear has been surrounded by somewhat neurotic parents or marital partners, is a very simple one consisting of mocking up the parent and then, in mock-up, having the parent shift a mock-up of the preclear up in the air, down low, to the right, to the left, before and behind. One then repeats the process of having the mock-up of the preclear move the mock-up of the parent before and behind, to the right, to the left, above and below. One can even have the preclear simply mock up the parent and start moving the parent until he is certain that the parent can be moved. One has the preclear move the mock-up of the parent from before him to behind him, to his right, to his left, above him and below him. One does this with the parents, marital partners and working machinery, and also with vehicles.

As soon as one starts Creative Processing to the end of convincing the preclear that he can change things in space, he begins to find quite ordinarily that the preclear will get visios of roads. The road, of course, is the one thing which constructively changes the preclear in space. There is, of course, a scarcity of roads, and one remedies this with Viewpoint Processing by having the preclear mock up a great many roads for himself, somebody else with roads for themselves, and others mocking up roads for others, until the scarcity of roads is remedied. The road is also aberrative because it threatens momentary impacts to those persons who have been in accidents. Automobile accidents are, then, excessively aberrative since they are a hold-motion and a fixation on something which is intended as a continuance of motion. One of the simplest ways to handle this latter situation is simply to run the engram of the accident or to mock up accidents until the preclear is surfeited with them (by this last, of course, I mean that one has the preclear mock up the accidents).

One can also repeat this by having the preclear mock up the thetan moving the body as above and having the body moving the thetan. This last process is very productive. One does it in brackets. One has the preclear mock up something which he calls the thetan and then has this move the body as in the case of the parents above. Then he has others being moved around by their thetans and thetans moving others around, and then others doing this for others.

P.A.B. No. 11
PROFESSIONAL AUDITOR'S BULLETIN

From L. RON HUBBARD

Via Hubbard Communications Office
4 Marylebone High Street, London W.1

[1953, ca. early October]

During these last many PABs, I trust that something has been happening to your own case. I am trying to bring it along on a self-auditing basis. All techniques I have been giving you since we started in these sessions can be self-audited.

You will find, however, as you self-audit things, that a very basic law is at work. This law consists of *THE ENTIRE PROCESS OF THOUGHT IS AN EFFORT TO OBSERVE SOMETHING WITHOUT LOOKING AT IT*. You will find yourself, if you self-audit, dramatizing this by preferring those techniques which deal with thoughts and concepts rather than those techniques which specialize in looking. Thus, I dare say, you will have avoided doing the Six Steps to Better Beingness and will probably have done Viewpoint Processing in preference. Let me assure you, however, that the Six Steps to Better Beingness are on a higher level than any process which merely processes thoughts.

There is another law involved which explains this matter of not wanting to look which we will take up in PAB No. 12. In this present PAB we will set forth what the thetan is trying to do.

WHAT THE THETAN IS TRYING TO DO

With all the books of philosophers before you, with all the religions of the world to consult, with all the closest scrutiny of Man and his involved behavior, it would still be difficult to guess what the thetan is actually trying to do. Indeed, one would be more prone to believe that the thetan is entirely idle and is not trying to do anything; for, such is the complexity of behavior resulting from the extreme simplicity of the original effort that the entire activity is lost in a maze of complexity.

The thetan is trying to do something very simple: he is trying to put up mock-ups of his own; that is really all he is trying to do. But in order to do this, he comes in conflict with other thetans and he finds that his effort is complicated to the degree that these thetans, putting mock-ups in front of him, seek to obstruct him, even when they only want these mock-ups admired. Thus the thetan's activity enters its second step, which is to nullify or divert mock-ups placed before him, which is to say his viewpoint, by other thetans.

As soon as he enters this activity of trying to destroy or divert mock-ups placed before him, he runs into the first levels of subterfuge. These consist of the various emotions by which people seek to convince him that his activities in shunting their mock-ups aside are very bad. Of course he himself has begun this subterfuge in trying to put up mock-ups of his own. He is trying to convince others that when they destroy his mock-ups, they are doing something very vicious and wicked to him.

After a few failures in getting mock-ups of his own which persist and failures in destroying or diverting mock-ups which are thrust in front of his face, he conceives the idea of being multiple. He becomes more than one viewpoint or he teams up with other thetans and these, together then, seek to put up mock-ups which persist. These are fought back against by other groups of thetans and so on up the dynamics. This, in effect, is the basic game all of us are playing. This is adequately proven out by processing.

The field of least certainty is the observation of what others are trying to do to others. This, then, becomes aberrative. One doesn't quite know what the rest of the world is doing or thinking. And this becomes complicated because others pretend to be the friend of the thetan, only to betray him. As soon as this occurs he begins to watch very closely the behavior of other thetans' mock-ups in order to gauge what is happening to them so as to prevent things from happening to himself.

With these three things—the thetan trying to put up mock-ups of his own which persist, trying to divert the mock-ups of others, and trying to observe what others are doing to others—we have what we call a “bracket” in Scientology.

The processing of this activity is of the simplest kind. You will find, even on an occluded case, that there is a zone beyond the occlusion where the preclear can put up a mock-up. The worst cases will not be able to see it, but they will know that they have put a mock-up out there. In view of the fact that the basic impulse of the thetan is simply to put a mock-up out there which will move and which will persist, we have as our most certain—if by far not our shortest process—that one given in *Self Analysis in Scientology*. One simply has the preclear go on putting mock-ups out there until the preclear at length can put them up in excellent order and condition.

One can enter this in a little more complex vein and have the preclear receiving before him mock-ups which “others” have put up and destroying these mock-ups. It will be found at first that the preclear has a very hard time destroying mock-ups which so appear before him, even though he himself is putting them there for others. After a while he will be able to divert and destroy these mock-ups at will and his tone will improve as a result.

No matter how much complexity may enter into this, no matter how many lines of thought, how many values of knowledge or evaluations occur, at any given instant the basic impulse of the individual is to create something and maintain it while preventing the mock-ups or creations of others from interfering with his activity. The best test of this process is its workability and it is found that the process is extremely workable.

Very few auditors have the patience to sit through a couple of hundred hours of *Self Analysis in Scientology*. They are prone to assign it as homework or to avoid it. However, remember it is the very best process which we have, for it exactly parallels what the thetan is trying to do.

As the auditor processes this on the preclear, the preclear will begin to notice various things, which is to say he will put up three mock-ups, one after the other, and will find that the third mock-up is much weaker than the first one he put up. This is because he believes that the first two have been destroyed and thus his impulse to put up a mock-up is lessening. One alters this simply by having him put up more mock-ups.

Additionally, this process feeds energy into an energy-starved bank.

By using this process in company with the other five steps of Six Steps to Better Beingness and with SOP 8, results are enormously speeded. But remember, whatever else you know, you would be able to make clears simply if you persisted with the process given herein and which is detailed at some length in *Self Analysis in Scientology*. Perhaps with this understanding and evaluation of what the thetan is trying to do, you may care to go more deeply into this, even on your own case, to using *Self Analysis* half an hour a day.

IMPORTANT ADVANCE

Change Step 6 (Opposite Poles) of SSSA to be done as follows:

Get a point before, above, etc. the preclear to say **“You will be ridiculed”** and have the preclear say **“Nothing there.”** Then have the preclear say to a point as before **“You will be ridiculed”** and have the point say **“Nothing there.”**

In “Wearing Heads” have the preclear put on various heads and have others take them off and hold them away. Then have the preclear take various heads off (mock-up) people and have him hold them away.

The reason for this change is my observation that everyone suffers from contracted space. This inferred that they were most afraid of expanded space. Expanded space (held out anchor points by others) gives the emotion of ridicule and this change when I tested it on preclears brought the highest tone rise observed for a single quick process. People are afraid of ridicule—they prefer the serious attitude of betrayal. Ridicule includes scorn.

This technique can be employed using brackets and all pronouns.

The Theory of Communication

L. Ron Hubbard

As we have gone forward in Dianetics and Scientology, we have come into possession of more and more significant evaluations of the interrelated factors of life. One of the simplest and yet one of the most significant emergences has been the factor of communications as the most important single factor in the triangle of Affinity Reality-Communication.

This ARC triangle, when I formulated it in Elizabeth in the early summer of 1950, resolved a great many things for auditors, but for the following three years much discussion ensued on the nature of the triangle itself. Generally, though, acceptance of it was swift and glad, for with its use came an understanding of human behavior, and with that triangle the tone scale itself, as it appeared in *Science of Survival*, was born. The earliest tone scale is in Book One, and is the first chart in that book.

Communication did not certainly emerge as a more important factor than either Affinity or Reality until the inclusion in the science of new data concerning the physical universe. It then became apparent that communication was, in essence, the shift of a particle from one part of space to another part of space. In its crudest definition, this is communication. It does not matter whether the communication particle is a bullet, a word, a thought or a light particle. It is still communication if it travels from one part of space to another. Not even terminals are necessary in order to establish the existence of a communication, but in the accepted sense of the word, communication is something which emanates from one terminal and travels through space to arrive at another terminal.

To achieve a full understanding of how communication is important, one need only do a very simple exercise to discover that almost any process involving itself with communication is powerfully effective on the mind.

If one seats himself in one of two chairs which are set facing each other, and looks at the other empty chair, and then gets up and sits down in the other empty chair, then rises and sits in the first empty chair, then goes and sits in the second empty chair, he will realize that something can happen with this technique, even though no words are spoken and no thoughts thought.

In the most accepted sense of the word, communication expects a return. In other words, a particle going from Point A in space to Point B in space is expected, if Life has anything to do with it, to then of itself, or with an approximation of it, go from Point B back to A again. A complete communication cycle is from Point A in space to Point B, and Point B back to Point A. In order to demonstrate the degree to which this affects human behavior, one need only perform another simple technique.

One takes two chairs, sitting some few feet apart, facing each other. He sits down in one of the chairs and looks at the empty chair and says, "Why don't you answer?" He says this aloud to the empty chair. He then gets up and sits down in the empty chair and faces the chair he just vacated and refuses to answer. He gets up again and returns to the first chair, sits down, and says, "You must answer me." He then removes himself to the second chair, then actually looks at the first chair, then says, "All right. What do you want to know?" He then gets up out of the second chair and goes to the first chair and says, "Are you all right?" He then removes himself to the second chair and says, "Yes, I am all right." He will experience full relief if he does this.

Almost any computation of this chair act can be worked out, but the one having to do with answering is the most effective. This explains to you why a communication lag on the part of another person can be transferred as an aberration.

We discover, then, that the most basic communication is one which does not have any reason connected with it. It is simply the interchange of a particle from one space to another space, and, preferably, the return of that particle, or a particle like it, to the first position in space.

Any communication is an anchor point. In order to understand the significance of an anchor point, one only has to realize the actual definition of space. For many centuries, in fact, during all of written history, man has not had an accurate, workable, definition of space. This omission is extremely peculiar, because he lives and exists continually in space. Of course, he really avoids space. He would much rather look at a person who is occupying a space, than the space surrounding the person. He is avoiding space to such a degree that he is always trying to work toward something, and is never trying to work toward the gain of nothing, except during some low-toned activity like war.

You can readily establish for yourself the correctness of this definition of space. *Space is the viewpoint of dimension.*

In the earlier editions of the Encyclopaedia Britannica, one discovers under the heading of "Time and Space" a long article which says bluntly that time and space are matters of psychology, not matters of physics. They must be resolved in the field of the human mind before they can be resolved by the physicists. This proves to be true, for with the introduction of space as a viewpoint of dimension, not only human behavior, but many intricate and complex problems in physics fall apart. Like all things worth knowing, this definition is idiotically simple, but tremendously workable. It is workable to the degree that its direct application in processing can produce, with no other aid, a clear.

The first application of this definition in the theory of processing is to have the preclear sit in a chair and from "inside himself" reach out to the two upper corners of the room behind him and simply hold on to those corners, without thinking. If he does this for a long period of time, he will simply become better and better. He may have some bad periods while he does this, but nevertheless the technique inevitably results in a better condition. If just this technique and no other technique were used this person, at the end of perhaps fifty or eighty hours, would be in good physical and mental condition, if not a Theta clear.

In this technique we are putting theory directly into practice. More and more, we are beginning to use these two things as identities. Theory is practice, and that auditor or that instructor who is trying to separate theory from practice is missing a great deal in the science, and is not getting too good results in his practicing.

In essence, holding on to two corners of the room is making space, but again, this is maintaining a condition of communication. One has an anchor point of his own up in each of the two back corners of the room. One can just as well hold all eight corners of the room with an anchor point of his own and his eyes closed. However, this technique is often too vigorous for a preclear. He can also do a total spaction, which is to say, perform Step III of SOP-8.

When we understand that communication is a fundamental, and is a first action of space, as well as the first action which takes place in space, we can advance our processing markedly. In the first place, we have an immediate index as to how aberrated our preclear may be. Preclears are aberrated if they have a communication lag. They have a communication lag as long as they have no space. In other words, communication lag is inverse to the amount of space a person has. This may sound very technical, but it is only as technical as you care to make it. There is nothing simpler than sitting down and making with eight points a cube of space, and then moving a particle, which you have created, from one point to another point inside the space you have created. In this way, it is possible to understand both space and communication.

Affinity and Reality have taken secondary roles because they are dealing with nothing more than the particle pattern or the number of viewpoints which agree upon the particle pattern. The pattern or velocity of the particle creates the degree of affinity, whether emotion or effort, and the reality depends upon the number of viewpoints which are in agreement upon the pattern of the particle. In both affinity and reality it can be traced that these are secondary to the condition of the existence of a particle and its change in space.

In working Standard Operating Procedure 8 (as given in Issue 16-G of the *Journal*) one does not have in the seven steps an immediate index of the sanity of the individual. These are steps relating to techniques used at various levels of difficulty with techniques. These are not necessarily an indication of the sanity of a person, even though Number VII is marked "Psychotic" and Number VI "Neurotic." VII and VI are so marked only to direct the auditor's attention to the fact that these two techniques are so good that they can be used on any level of case and that he should not use other techniques on psychotic or neurotic people. These definitions of the steps are not to be construed by a preclear, if they are used upon him, to mean that he is psychotic. In order to have a theory of evaluation of cases which matches with the seven steps of SOP-8, it is necessary to move the preclear out of the seven steps and into a step gradient we could call A, B, C, D, E, F, G.

This step gradient would be the gradient scale of the communication lag of the preclear. This is a direct index of sanity. A, which compares to Step I, would be an almost instantaneous response, and G, at the other end of the gradient scale, would be a lag so long that it did not return. In other words, this is a communication-return index.

In using SOP-8, if one exteriorizes an individual by using Step III, he often finds that the individual's communication speeds up markedly or slows down. If he is to continue the practice on the preclear while the preclear is exteriorized, then it is necessary for him to re-evaluate the preclear. If the preclear remains at the same communication speed as before being exteriorized, the auditor simply goes on using the same step level which exteriorized the preclear. However, if the communication level of the preclear speeded up markedly, then the auditor shifts from the step which he used to exteriorize the preclear to a higher, faster motion step. If the preclear's communication lag became greater when exteriorized, then the auditor moves over into the ABCDEFG scale, locates his communication lag, and moves back into SOP-8, using a lower level step such as VI or VII on the preclear, after the preclear has been exteriorized. As communication is the single most important factor today in processing itself, the auditor will do well to regard it as such.

THE CYCLE OF ACTION OF AN EXPLOSION

The role which an explosion plays in Scientology processing is as spectacular as the explosion itself.

To experience the impact of an atomic bomb, it is not necessary to know the mechanics of nuclear fission. Just so, a preclear need not know the Scientology mechanics of the explosion and its role in experience to benefit from the process. An auditor, however, should understand the mechanics underlying explosions in order to use the process to its fullest extent.

That thing which most closely approximates life itself in the material universe is the explosion. It changes things in space; it disorganizes MEST; it puts out particles from an apparent viewpoint; it alters compounds; and it has closely following its beginning a mirror effect, which is to say, that if one could stop an explosion in its flight, he would find that its center was sufficiently smooth to act as a mirror. It is, then, extremely simple for theta to identify itself with an explosion; and theta has done this to such an extent that science itself, at least at this writing, subscribes widely to the theory that life originates solely from the interactivity of chemical compounds. It could be said that the explosion itself is the basis for this mis-identification.

The cycle of action of life in the MEST universe is the cycle of action of an explosion. In the first book on Dianetics you will find repeated the ancient Vedic formula that things are born, grow, decay and die. I have expanded this to include the end action. First there is nothing; then there is a something; the something increases, then decreases; and again there is nothing. Thus you have a complete basic cycle of action.

There is a process known as Cycle of Action Processing wherein the preclear with creative mock-ups completes the cycles which he has begun and which he has not ended. It will be found that the preclear is trying to complete cycles of action begun often at some long forgotten time, and this accounts for some of the goals which he is rationally or irrationally attempting.

The basic cycle of action of life itself in this universe is the cycle of action of an explosion. While this is not true of all universes, it applies very firmly to the MEST universe. Life has attempted since its inception to approximate things in this universe so as to effect a conquest of the MEST universe. That thing in the universe most like life is the explosion, and life, therefore, in this universe follows the cycle of the explosion. This will become adequately apparent in processing and upon further examination.

An explosion begins with nothing, grows, recedes and at its end there is again nothing. Here we have the desire-enforcement-inhibition cycle and here, indeed, we have the pattern of all the cycles mentioned in the doctorate lectures and the book *Scientology 8-8008*.
