The Applicants have requested the Administrator to issue specific exemptions for the use of cymoxanil and/or dimethomorph on potatoes to control late blight. Information in accordance with 40 CFR part 166 was submitted as part of these requests.

Recent failures to control late blight in potatoes with the registered fungicides, have been caused almost exclusively by immigrant strains of late blight *Phytophthora infestans*, which are resistant to the control of choice, metalaxyl. Before the immigrant strains of late blight arrived, all of the strains in the U.S. were previously controlled by treatment with metalaxyl. The Applicants state that presently, there are no fungicides registered in the U.S. that will provide adequate control of the immigrant strains of late blight. The Applicants state that both dimethomorph and cymoxanil have been shown to be effective against these strains of late blight. Both of these materials hold current registrations throughout many European countries for control of this disease. The Applicants state that losses in some states have been greater than \$10 million per year for the past 3 years, due
