Census Bureau projects that the older baby boomers (aged 45 to 54) will be the fastest growing population group during this decade.

The effects of these demographic trends on housing demand have been debated in the economics literature for several years. In 1989, Gregory Mankiw and David Weil predicted that the aging of the baby boomers and the small size of the following "baby bust" generation would substantially reduce housing demand and cause housing prices to collapse during the 1990s.²⁰ Other researchers disagree. Reductions in housing demand due to aging of the baby boom generation could be offset by many factors, including rising incomes, pent-up demand for homeownership by those priced out of the housing market during the 1980s, and high levels of immigration.21

(2) *Immigration*. The continued increase in immigration during the 1990s will help offset declines in the demand for housing caused by the aging of the baby boom generation. During the 1980s, 6 million legal immigrants entered the United States, up from 4.2 million during the 1970s and 3.2 million during the 1960s. The Hispanic population residing in the U.S. increased by 50 percent during the 1980s, while the Asian population doubled. About one-quarter of the Hispanics living in the U.S. in 1990 had immigrated during the 1980s. Immigration is projected to add even more new Americans in the 1990s than it did during the 1980s. Asians and Pacific Islanders are expected to be the fastest growing group, with annual growth rates that may exceed 4 percent in the 1990s. Total population is now projected to rise by 25 million in each of the decades from 1991 to 2020. The tendency of immigrants, particularly Hispanics, to locate in certain 'gateway'' cities (e.g., Los Angeles and Miami) will place increased demands on the housing stock in some major urban areas.

(3) *Non-traditional Households.* While overall growth in new households has slowed, non-traditional households have become more important. With later marriages, divorce, and other non-traditional living arrangements, household growth has been fastest among single-parent and single-person households. The number of single parents with one or more

children under 18 was 10.5 million in 1992; the vast majority of those single parents were women.²² About 62 percent of African-American families with children were single-parent families in 1992, compared with 34 percent for Hispanics and 24 percent for Whites. Since only 35 percent of singleparent households are homeowners compared to 74 percent of married couples, their increase should spur demand for rental housing and for affordable ownership opportunities. In addition, HUD's analysis of the nation's worst case housing needs shows that female-headed households suffer some of the most severe housing problems.

(4) Single Person Households are playing an increasingly important role in the housing market. Singles accounted for one-fourth of all households in 1990. While one-half owned their own home, many of these were elderly people with little or no mortgage debt and probably no intention of entering the housing market. Never-married singles, on the other hand, have been a significant factor in the homebuying market in large urban areas. Never-married singles rose as a proportion of first-time homebuyers from just over one-quarter in 1990 and 1991 to roughly a third in 1992 and 1993 before declining to about a 30 percent share in 1994.23 As discussed above, ownership rates among non-elderly single individuals rose steadily during the 1980s. Low interest rates during the past two years apparently enticed even more single renters to become homeowners.

(5) Growing Income Inequality in the distribution of income over the last 20 years has made it more difficult for those at the bottom of the income distribution to purchase adequate shelter. The share of the nation's income received by the richest 5 percent of American families rose from 18.6 percent in 1977 to 24.5 percent in 1990, while the share received by the poorest 20 percent fell from 5.7 percent to 4.3 percent. This widening income inequality was due in large part to a widening disparity in earned incomes; as the economy has moved away from manufacturing to more service industry jobs and more advanced computer and technologically-intensive industry jobs, the wages of unskilled, entry-level, and blue collar workers have fallen relative to the wages of professional and

technical workers. The result has been an increase in the working poor and a decrease in the middle class.

In addition, higher real interest rates and declining inflation through the 1980s increased the return to capital, raising nonwage incomes of upper and upper middle income families. This too contributed to the increasing inequality in the distribution of income.

b. Economic and Housing Conditions— Single-Family Market

(1) Interest Rate Trends. As the 1980s began, mortgage interest rates were above 12 percent and rose quickly to over 15 percent. After 1982, they drifted slowly downward to the 9 percent range in 1987 before rising to over 10 percent in the 1989–1990 period. Rates returned to 9.3 percent in 1991 and then fell further to 8.2 percent in 1992 and 7.2 percent in 1993. The October 1993 rate of 6.80 percent was the lowest level in more than twenty years.²⁴ Rates rose nearly a full percentage point in 1994, and peaked at 8.3 percent in early 1995, but have since fallen by about 50 basis points.

Volatile interest rates were a principal cause of the housing market volatility of the 1980s and they continue to be a major determinant of housing and mortgage market activity. During 1992 and 1993, homeowners responded to the record low rates by refinancing existing mortgages. While refinancing accounted for less than 25 percent of mortgage originations in 1989–90 when interest rates exceeded 10 percent, the sharp decline in interest rates led refinancings to account for over 50 percent of all mortgage originations in 1992 and 1993.²⁵ Because of the heavy refinancing activity, single-family mortgage originations surged from less than \$500 billion in 1990 to record levels of \$894 billion in 1992 and over \$1 trillion in 1993. As mortgage rates rebounded from the 1993 lows, refinancing subsided and home purchase returned as the predominant component of mortgage originations. Origination volume totalled \$773 billion in 1994 and is projected to be about \$650 and \$700 billion in 1995 and 1996, respectively.

Single-family housing starts have also responded to interest rates, with record low volumes in 1981 and 1982, peaks in 1986 and 1987, and less severe lows in 1990 and 1991. Low interest rates and economic recovery in 1992 and 1993 made homeownership more affordable
